It is, of course, also possible to change the degree of order of the magnetic dipoles by means of an externally applied magnetic field. Once this field is again removed the dipole system finds itself at a temperature different from that of the surrounding medium. It will then tend to return to the temperature of the surroundings by exchanging with the latter sufficient energy to re-establish a suitable degree of disorder. This process is called relaxation. The time necessary for complete relaxation clearly depends again on the interaction of the dipole system with its surrounding, and this interaction will in turn be affected by the degree of order of the various systems which make up the surrounding. Much useful information not only about the dipole system but also about the neighbouring systems can thus be obtained from a study of magnitude and the temperature dependence of these relaxation times.

In addition to the many areas of physical research in which the use of low temperatures forms only a part of a general investigation and analysis of a basic phenomenon, there exist two fields of study unique to cryogenics: the behaviour of liquid helium and the phenomenon of superconductivity. A detailed description of these two is, therefore, particularly germane to this article.

The Behaviour of Liquid Helium.— When H. Kamerlingh Onnes achieved the liquefaction of helium in 1908, he did not expect this element to have much intrinsic interest, and was mainly concerned with the extension of the experimentally available temperature range to lower values. It soon became apparent. however, that liquid helium was not only very useful to cool other substances, but had itself such unusual and unexpected properties as to warrant extensive and detailed investigation. In fact, these investigations, carried out for almost 20 years exclusively at Leyden, and later in cryogenic laboratories in many other countries, uncovered behaviour so unlike that of any other substance that a full theoretical understanding is still lacking. This behaviour and its possible explanations will be discussed in terms of three aspects: the fluidity of helium under moderate pressures down to absolute zero; the existence of a phase transition to a second liquid phase; and the highly anomalous transport characteristics of this phase.

The Fluidity of Helium at 0° K.—Fig. 2 shows the phase diagram of helium. uhich is quite different from that of a normal substance. At atmospheric pressure the latter is in the gaseous

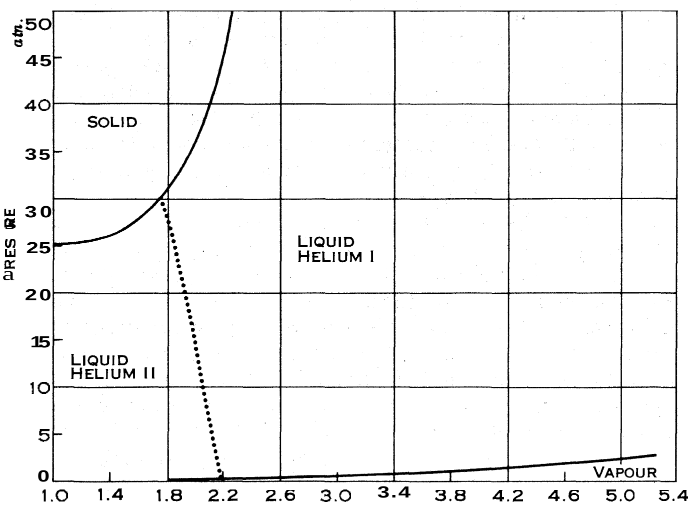

FIG. 2.—PHASE DIAGRAM OF HELIUM

phase at sufficiently high temperatures, condenses into a liquid upon cooling and finally freezes into a solid at some rather low temperature. This is, of course, to be expected from the concept of the relation between the temperature and the degree of disorder of a substance, from which one would conclude that with decreasing temperature, the molecules of a substance would acquire increasing order in space. The phase diagram of helium, however, shows that for pressures below about 25 atm., helium remains liquid down to the absolute zero. In fact, the horizontal melting-pressure curve shows, by application of the Clausius-Clapeyron equation (*see* THERMODYNAMICS), that at sufficiently low temperatures the entropy and therefore the degree of order of the liquid is the same as that of the solid phase.

Clearly this cannot be an order in space, which is precluded by the high mobility of the molecules even in a normal liquid. Instead there must occur, in liquid helium, an ordering of velocities, a possibility which follows from and is in this case actually dictated by the fundamental principles of quantum mechanics (*q.v.*). According to this modern view of the physical universe, the velocity and the position of any particle are of equal importance, and our instinctive emphasis on position is really only due to the fact that spatial ordering is more common and easier to visualize than ordering of velocities. The basic Heisenberg uncertainty principle of quantum mechanics goes one step further in stating that it is impossible to determine simultaneously the position and the velocity of a particle with arbitrary precision, and that the more accurately we measure the one, the more uncertain we become about the other. This means, therefore, that the close definition of the position of molecules upon freezing is accompanied by an uncertainty about their velocity; *i.e.,* the more narrowly a molecule is confined to a certain location, the greater the magnitude of the velocity with which it oscillates about this point. Another way of saying this is that any attempt to minimize the potential energy of a particle, by placing it in the most favourable position with respect to other bodies which either repel or attract it, is accompanied by an increase in the kinetic energy of the particle, which is the greater the more the particle is localized.

This means that at absolute zero a substance still has some potential and kinetic energy, adding up to what is called the zero-point energy. This is in sharp contrast to the classical view that at absolute zero a substance has lost all energy by having all its particles immobile in the position of minimum potential.

The increase in the particle's kinetic energy due to localization can easily be shown to be inversely proportional to the mass of the particle. With a helium atom, therefore, this energy is unusually large, while at the same time the weak forces existing between helium atoms render quite small the decrease in potential energy gained by having an atom in its most favourable position. It is thus energetically not favourable to localize the helium atoms, and thereby to create order in space; instead a lower total energy can be obtained by minimizing the kinetic energy, which is equivalent to reducing and hence ordering the velocity, at the cost of a small increase in potential energy.

The Phase Transition (λ *point.*)—When liquid helium is cooled under its own vapour pressure, it undergoes a transition from one liquid phase into another at about 2.18° K. These phases are designated by Roman numerals, and one speaks, respectively, of liquid helium I and liquid helium II, the latter denoting the phase existing at lower temperatures. Several of the characteristic variables of the liquid undergo an abrupt change at this transition; in particular its specific heat has a discontinuity, as shown in fig. 3. The resemblance of the shape of this curve to a reversed Greek letter lambda has led to the designation of the transition point as the λ point. The dotted line in fig. 2 is called the λ line and indicates the different pressures and temperatures at which phases I and II are in equilibrium with one another. The highly unusual behaviour of liquid helium II will be discussed presently.

Certain features of the λ transition led F. London (1935) to suggest that it is a so-called order-disorder transition, similar to the Curie point of ferromagnetic substances. Between the normal boiling point and the λ point the ordering which occurs in liquid helium is much like that occurring in any liquid with decreasing temperature: the molecules are distributed over fewer and fewer of the energy levels corresponding to different velocities. At all these temperatures, however, the distribution is such that only an infinitesimal number of the molecules occupy the lowest or ground state. Below a certain quite sharply defined temperature, however, a finite number of the molecules are "condensed" into the ground state, corresponding to the lowest permitted velocities.

It is well to remember that this so-called zero-point velocity is not zero, since the partial localization of the atoms by the walls of the box in which they are contained precludes, according to the uncertainty principle, a vanishing and hence sharply defined velocity.

Below this transition, therefore, the liquid can be considered as consisting of two entirely intermixed components, one comprising all the atoms still distributed over the higher energy levels, and the other consisting of the atoms in the ground state. The former component is qualitatively similar to any liquid, and is therefore in this phenomenological view called the normal component.

The second component, however, should exhibit very astonishing features, since by inverting the uncertainty principle argument just used to show that the ground state velocity is finite, it is clear that the position of these atoms in the ground state is only defined by the walls containing the liquid as a whole. In a way, therefore, these ground-state atoms must be considered as being everywhere in the container at once, and hence should be able to move throughout the container without any friction. Because of this, this component is called the superfluid one. As the temperature decreases from the transition point an increasing number of atoms are condensed into the ground state and hence the superfluid component comprises an increasing fraction of the liquid as a whole, until at the absolute zero the entire liquid is superfluid.

London's phenomenological model of the λ transition received much support with the discovery, isolation and investigation of a rare isotope of helium of mass 3. The condensation of many atoms into the ground state is possible only if these atoms follow Bose-Einstein statistics, and such a process is called Bose-Einstein condensation. The atoms of the prevalent isotope of helium, with mass 4, do follow such statistics, but the atoms of He^3 follow Fermi-Dirac statistics for which; according to the Pauli exclusion

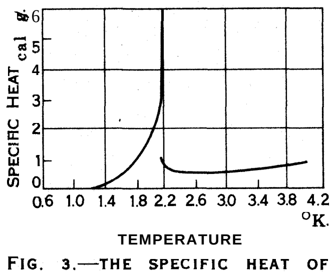

FIG. 3.—THE SPECIFIC HEAT OF LIQUID HELIUM UNDER ITS VAPOUR PRESSURE AS A FUNCTION OF TEMPERATURE

principle, any energy level can only be occupied by a single particle. Thus, according to London, He^3 should not have a λ transition, although it too should remain liquid down to the absolute zero since the arguments for this fluidity are independent of statistics.

Indeed it has been found experimentally that down to the lowest temperatures at which it has been investigated (about 0.29° K.) He^3 does remain liquid but does not change into a superfluid phase.

At sufficiently low temperatures there begins to occur instead spontaneous alignment of the atomic magnetic dipoles.

These highly qualitative arguments of course do not constitute an explanation for the behaviour of liquid helium but at best indicate a possible mechanism for the λ transition and the peculiarities of helium II. In particular it must be remembered that the division of this liquid into two components is highly artificial, as of course it is not possible to label any one atom as normal and some other as superfluid. The only distinction between them is that one carries a quantum of energy which the other does not. Any interaction between such atoms results in the transfer of this quantum from the one to the other, with a resulting exchange of identity with respect to being normal or superfluid. In fact. a most fruitful systematic approach to a theory of liquid helium from first principles is that of L. Landau, who considers these freely interchangeable quanta of energy (generally called elementary excitations) separately as an independent system superimposed on a sea of particles all in the ground state.

The Characteristics of Helium 11.—The principal features of liquid helium II are its ability to flow through narrow slits and capillaries without apparent viscosity, its almost unlimited thermal conductivity and its formation of thin films by means of which it flows over the rims of beakers, etc.. to the lowest attainable level. Qualitatively, at least, the mechanism for most of these effects can be deduced from the two-component model described above. The nonviscous flow through narrow apertures is a consequence of the frictionless flow of the superfluid component. This also explains the film flow. The anomalously high ability to conduct heat arises from the fact that at any given temperature the liquid can be thought of as containing a certain fraction of superfluid which decreases with increasing temperature. If some heat is introduced into the liquid at one place, the fraction of superfluid there will decrease, with a corresponding increase in the number of normal atoms. Equilibrium will be re-established by an internal convection process in which superfluid atoms will travel toward the hot spot, and normal atoms away from it. As this counterflow occurs without viscosity due to the nature of the superfluid, it is all but impossible to establish a thermal gradient in liquid helium II. *A* spectacular demonstration of this is the fact that whereas liquid helium I in a Dewar vessel boils violently, the liquid becomes completely quiescent as soon as the λ point is passed. This is because the boiling in a normal liquid is due to bubbles created at local hot spots, and these do not exist in liquid helium II.

Full descriptions and illustrations of the fascinating and often amusing behaviour of liquid helium II can be found in the first two books listed in the bibliography.

The Phenomenon of Superconductivity.— One of the first experimental uses to which Kamerlingh Onnes put his newly acquired liquid helium was the investigation of metallic conductivity at low temperatures. While measuring the electric resistance of mercury he found, in 1911, that this variable at first decreased gradually with decreasing temperature. as expected, but that at about 4° K. the resistance fell very abruptly to a very low value. All attempts to measure this resistance failed, and Onnes concluded that below this transition point mercury was what came to be called a superconductor with vanishing electric resistance.

Extensive experimental work since that time in many different laboratories has established that 22 metallic elements and a large number of intermetallic compounds become superconductive at temperatures ranging from about 17° K. down to about 0.1° K. The superconductive elements and their transition temperatures are listed in Table II. There is some reason to believe that at temperatures below 0.1° K. five more elements become superconducting, namely molybdenum, tungsten, ytterbium, scandium and protactinium.

TABLE II.—*The Superconducting Elements and Their Transition Temperatures* (T_c)

Element	T_c(° K.)	Element	T_c(° K.)
Aluminum	1.197		3.729
Titanium	0.387	Lanthanum	5.4
Vanadium	4.89	Hafnium	0.37(?)
Zinc	0.905	Tantalum	4.38
Gallium	1.103	Rhenium	1.699
Zirconium	0.546	Osmium	0.71
Siobium	8.70	Mercury	4.173
Technetium	11.2	Tellurium	2.392
Ruthenium	0.47	Lead	7.2
Cadmium	0.560	Thorium	1.37
Indium	3.396	Uranium	0.8

While there is no room here for a detailed description of the characteristics of a superconductor, it is possible to discuss briefly the three major experimental discoveries which ultimately led to an understanding and theoretical analysis of the phenomenon.

Destruction of Superconductivity by a Magnetic Field.—A few years after the initial discovery of superconductivity Onnes and co-workers at Leyden found out that the superconducting properties of a substance below its transition temperature could be destroyed by the application of an external magnetic field. Detailed investigation showed that this so-called threshold field increased from a zero value at the transition temperature to a maximum at the absolute zero. varying in this range approximately as the square of the difference between the transition temperature and the temperature of measurement.

It was realized several years later that this property made possible a thermodynamic treatment of superconductivity with the assumption that the transition from the normal to the superconductive state is reversible, but without any further knowledge of the details of the superconducting mechanism. If one considers the normal and the superconductive state of a metal as two phases which are in equilibrium at any point on the threshold magnetic-field curve, then the free energies of the two phases must be equal at any point on this curve. This makes it possible to relate the difference of the free energies of the two phases to the threshold field, and in turn allows one to express the difference in the entropies and the difference in the specific heats of the normal and superconductive phases in terms of the temperature derivatives of the threshold field: which can be experimentally determined. The relation for the entropy difference immediately shows that the superconductive entropy is less than the normal one at all finite temperatures below the transition, which means: as expected. that the degree of order of a superconductor is higher than that of the same metal in the normal phase. *A* further consequence, also experimentally verified, is that the specific heat shows a discontinuity at the transition.

The Meissner Effect.—The application of a simple thermodynamic treatment to superconductivity depends, as was mentioned, on the reversibility of the transition. This condition is not fulfilled for a perfect conductor, as indicated in the following example. Consider a potential superconductor at some temperature above the transition, and in an external magnetic field. When the temperature is lowered below the transition and the magnetic field removed, the sample will be superconductive, and if the transition is indeed reversible it should make no difference which of these steps is taken first. With a perfect conductor, however, it does matter: if the temperature is lowered in the presence of the field, and the field is then removed, Faraday's law of induction, together with the ability of the substance to maintain currents without dissipation, requires that the magnetic induction inside the sample remain at the value which it had when the external field reached the threshold value. If, on the other hand, the field is first removed, and only then the temperature lowered, the magnetic induction inside the sample will be zero.

W. Meissner and R. Ochsenfeld showed in 1933 that in a superconductor the magnetic induction is zero regardless of the path along which the transition has occurred. They concluded that the vanishing of the magnetic induction inside a superconductor (called the Meissner effect) is a basic characteristic. It has, in fact, come to be considered more fundamental than the property of infinite conductivity.

The Meissner effect not only ensures the reversibility of the superconductive transition and thus allows the application of simple thermodynamic treatment, but has also enabled F. and H. London to draw up a set of very successful phenomenological equations governing the electromagnetic characteristics of superconductors.

The Isotope Effect. — Our understanding of superconductivity was further greatly increased when C. Reynolds, B. Serin and coworkers, and E. Maxwell discovered independently in 1950 that the superconductive transition temperature of an element depends on its isotopic mass. As this mass is a property only of the metallic lattice, and the superconductive behaviour obviously involves the conduction electrons, this so-called isotope effect indicates beyond any doubt that the fundamental mechanism responsible for superconductivity involves the interaction between these electrons and the lattice. H. Frohlich had suggested this possibility in 1950 on theoretical grounds without being aware of the concurrent experiments.

That this interaction should be responsible for superconductivity is in a sense quite remarkable, for it was mentioned earlier that it is just this interaction which in normal metals inhibits conductivity and is responsible for electrical resistance. However, J. Bardeen and co-workers in 1957 were able to show from first principles that under certain conditions and at sufficiently low temperatures this interaction affects the electronic energy levels in such a way as to make energetically favourable a type of condensation into low-lying levels with a resulting ordering of the velocities. The behaviour of these condensed electrons had previously been shown by Bardeen to lead to the basic superconductive characteristics, including the vanishing of the magnetic induction and the perfect conductivity.

See also REFRIGERATION.

BIBLIOGRAPHY.—By far the best nontechnical discussion of low-temperature physics is F. Simon *et al., Low Temperature Physics* (1952). The best starting point for a more detailed study of any of the subjects mentioned in this article are vol. xiv and xv of the *Encyclopedia of Physics (Haizdbuch der Pkysik)*, ed. by S. Fluegge (1956). These volumes contain articles in English on the production of low temperatures, low-temperature transport, thermal and magnetic properties of solids, superconductivity and liquid helium. Each of these articles in turn contains a full list of more detailed references. Of interest also are the regularly published volumes of "Progress in Low Temperature Physics," ed. by C. J. Gorter, which contain up-to-date reviews of current research. (E. A. L.)

LOWTH, ROBERT (1710–1787), English bishop and student of Hebrew poetry, was born at Winchester on Nov. 27, 1710. He was educated at Winchester college, and New college, Oxford, and in 1741 was appointed professor of poetry at Oxford. Lowth was consecrated bishop of St. David's in 1766 and in the same year was translated to Oxford and in 1777 to London. He died at Fulham palace on Nov. 3, 1787.

Lowth's *Lectures on the Sacred Poetry of the Hebrews* (Eng. trans. from Latin, with notes, 1793), his chief work, had a great influence in England and on the continent. Their chief importance lay in the idea of looking at the sacred poetry as poetry, and examining it by the ordinary standards of literary criticism. He described the typical forms of Hebrew poetry as these occur in the Psalms. Lowth defined the principle of parallelism as the fundamental principle in Hebrew poetry, in contrast with the principle of metre which is fundamental in European poetry.

See P. Hall (ed.), *Sermons and Other Remains of Robert Lowth* (1834), with introductory memoir.

LOXODROME, the line on the earth's surface making a constant angle with the meridian.

LOYALISTS (TORIES), AMERICAN, the names given to colonists who retained their allegiance to Great Britain during the American Revolution. Contemporaries bitterly called them "Tories" but their descendants in Canada and elsewhere and later generations of Americans have referred to them as "Loyalists." According to the most generally accepted estimate; about one third of the North American colonists were Loyalists. Scholars have tried to determine just what classes comprised the Loyalists but have not agreed on any precise classification. Loyalists were not confined to particular groups; they were in every section, every calling and every class of the thirteen colonies. In general, loyalism was strongest among officeholders and others who served the crown or proprietors; Anglican clergymen and their parishioners in the north; Quakers and other conscientious pacifists, such as members of German religious sects; large landholders, particularly in the north; and wealthy merchant groups in New York, Philadelphia, Baltimore, Charleston and elsewhere whose businesses and property were affected by the war. A considerable proportion of the professional and intellectual talent, mainly physicians, lawyers, teachers and writers, also opposed the revolutionary movements.

Motivations. — Colonial officeholders, usually men of eminence and power, had a vested interest in upholding the authority of the crown. Many had been born in England and lived in the colonies only because of their employment. Upon entering their positions, they had, moreover, taken special oaths of allegiance to the crown, oaths they considered binding. The Anglican clergy had likewise vowed allegiance and obedience to their king; many had been born in Britain, all had been ordained there, and large numbers received part of their incomes from England. Throughout the Revolutionary War most of them preached obedience and submission to authority and they undoubtedly influenced the political attitudes of their parishioners. This was not true in the south, however. There many of the most distinguished Patriots, or Whigs as they called themselves, were adherents of the established church and men chose sides with little reference to their church affiliation. Among Quakers many deplored the measures of the British government but as a matter of religious conviction abstained from violence and resistance and their leaders counseled obedience and respect for authority.

Among men of status and property who resisted change, detested the "vulgar mob," were appalled by the destruction of property and feared an uncertain future of independence, self-interest was the dominant motive in loyalism. But the most commonly shared trait among all Loyalists appeared to be an innate conservatism coupled with a deep devotion to the mother country and the crown. Numerous Loyalists at first urged moderation in the struggle for colonial rights; some sided with Great Britain slowly, others were driven into active loyalism by their radical fellow colonists who denounced as Tories all who would not join them. The Revolutionary War left no place for moderates or those who wished to remain neutral. More than any other single factor, apparently, the resort to violence by the radicals confirmed the conservatives in their position.

Loyalists were most numerous in the south, New York and Pennsylvania. New York, the most aristocratic of the colonies, was the Loyalist stronghold and contained more of them than any other colony. Two thirds of its land belonged to the Loyalists or the crown. New Jersey, Delaware, Maryland and Virginia had large Loyalist minorities. In North Carolina the Loyalists and Patriots were about equally divided. South Carolina and particularly Georgia contained Loyalist majorities. New England had fewer than any other section.

Loyalist War Efforts. — Even though Loyalists did not rise in a body in support of the British army, as British authorities had hoped they would, some joined the army and others organized guerrilla bands who, with Indian allies, terrorized the frontier from New York to Georgia. New York alone furnished some 23,000 Loyalist fighters, perhaps as many as all the other colonies combined. A few Loyalist units, such as Patrick Ferguson's "American Riflemen," Banastre Tarleton's "Legion," Sir John Johnson's "Loyal Greens," and Walter Butler's "Tory Rangers," fought effectively. The Loyalist fighters aroused a vengeful hatred among the Patriots and when taken in battle were treated as traitors. George Washington detested them, saying as early as March 1776 that "they were even higher and more insulting in their opposition than the regulars." (Lorenzo Sabine, *A Historical Essay on the Loyalists of the American Revolution*, p. 14, The Walden Press, Springfield, Mass., 1957). When Gen. Charles

Cornmallis surrendered at Yorktown in 1781, Washington would grant no terms to the Loyalists who had fought against him, saying they were guilty of treason and deserved its penalties.

Congress recommended repressive measures against the Loyalists and all states passed severe laws against them, usually forbidding them to hold office, disenfranchising them and confiscating their property or taxing it heavily. Practically every state struck at them with a test act requiring citizens to renounce allegiance to George III and to promise to support the state against the crown. Some Patriots took the position that, as the late George M. Wrong wrote in *Canada and the American Revolution* (1935), "a Tory is a thing whose head is in England and its body in America and its neck ought to be stretched." Almost everywhere the Loyalists suffered persecution. Beginning in March 1776 when Sir William Howe evacuated Boston for a safer base at Halifax, Nova Scotia, with about 1,000 Loyalists, some 100,000 Loyalists fled into exile. (This was between 3% and 4% of the total number of settlers in the colonies, estimated at 2,500,000—3,000,000 during the Revolutionary period.) The majority of those who fled (about 60,000) ultimately went to Canada, where they and their descendants became known as "United Empire Loyalists." The remainder spread to the Bahamas, the West Indies, Florida and England.

Postwar Settlements. — The peace treaty of 1783 brought the Loyalists little comfort, even though it provided that congress would "earnestly recommend" to the states the restitution of Loyalist property and that there should be no further prosecutions of Loyalists or confiscations of their estates. Americans greeted those terms with flurries of protest and state legislatures refused to heed the recommendations of congress. In the first two years after the peace, returning Loyalists were sometimes tarred and feathered, mobbed and even hanged. Finally, by the beginning of the new government under the federal constitution in 1789, many regained their estates, but the confiscation laws were not repealed by the states, and in fact all the laws against the Loyalists were not erased until after the War of 1812. The British, meantime, had used the continued mistreatment of the Loyalists as one excuse for retaining certain military posts on American territory in the old northwest until 1796 in violation of the peace treaty.

Beginning during the war, the British government tried to care for exiled Loyalists by giving them lucrative positions, food, clothing, shelter and new homes in Canada and by compensating them for losses in property and income. At the end of the war, Loyalist officers received pensions at half pay and grants of land according to rank. In July 1783 parliament appointed commissioners, numbering ultimately five, to investigate Loyalist claims and establish schedules for compensation. As late as 1792 the British government was still meeting claims by grants of land. In all, it expended some $30,000,000 in behalf of the Loyalists.

Van Tyne, *The Loyalists in the American Revolution* (1902), the standard work; L. Sabine, *Biographical Sketches of Loyalists of the American Revolution with an Historical Essay*, 2 vol. (1864); G. M. Wrong, *Canada and the Anzerican Revolution* (1935); L Einstein, *Divided Loyalties* (1933); A. G. Bradley, *The United Empire Loyalists* (1932). (A. DE C.)

LOYALTY, as a general term, signifies a person's devotion or sentiment of attachment to a particular object, which may be another person or group of persons, an ideal, a duty or a cause. It expresses itself in both thought and action and strives for the identification of the interests of the loyal person with those of the object. Loyalty turns into fanaticism when it becomes wild and unreasoning; and into resignation when it displays the characteristics of reluctant acceptance. A man without loyalty does not exist. It stirs and arouses him, brings meaning, direction and purpose into his life and unifies his activities. At the same time, loyalty has a social function. Only by man's willingness, in co-operation with others, to invest his intellectual and moral resources generously and wholeheartedly in something beyond his own narrow circle has it been possible for communities of various kinds to emerge and continue to exist; among them, family, church and nation. Both man and community are unthinkable without loyalty.

Political loyalty is devotion to, and identification with, a political cause or a political community, its institutians, basic laws, major political ideas and general policy objectives. A cause to which persons are loyal is often considered "lost" by those who do not share the loyalty; in the face of what seemed to others fearful odds, the Irish, Poles and Zionists never wavered in their loyalty to the cause of their national independence, which they ultimately regained. Loyalty to the laws of Athens, which brought him into the world and nurtured and educated him, was the chief motive of Socrates in accepting death at the hands of a regime that he had opposed and ridiculed, rather than fleeing from prison when given the chance to do so.

The nature and content of political loyalty has varied greatly through the ages. In Greek political thought the principle of unity in life tended to preclude the possibility that a variety of important loyalties might lay claim to the individual and alienate him from the polis, the city-state. Aristotle's famous dictum that man is by nature a political animal stated well the conviction that man could realize his aspirations only by active participation in the affairs of the city-state, which was the highest of all communities because it aimed at a more comprehensive good than any other, and at the highest good, the perfection of human development. A man was expected to be loyal to the city-state and no one else.

Occasionally, however, a conflict of loyalties did arise. Loyalty to the vague concept of a Greek commonwealth of nations, standing over and above individual city-states and overriding local loyalties, inspired Athens' rejection of an alliance with Persia. In Sophocles' *Antigone* the heroine counters the ruler's decree forbidding the burial of her brother with a moving appeal to the moral law of Zeus, which, she believes, has more valid claims to her loyalty than the duly constituted government. Plato's *Republic* expressed concern that the enjoyment of family life and private property by the governing guardian class would result in a conflict of loyalties from which the state would emerge second best.

Other people in antiquity also searched for unity through the state. The Romans, extolling the virtue of political duty, proudly professed their loyalty in the saying *civis Romanus sum*, "I am a Roman citizen." In the Hebrew theocratic state, ruled by the agents of Yahweh, the very essence of life consisted in serving and preserving the state, which was equivalent with obedience to God.

Christianity rejected the classical principle of unity in life through the state. While the state, as a divine institution. exercised powers originating with God and was therefore entitled to loyalty as long as it functioned within its natural limits, man could never hope to fulfill his spiritual destiny within the framework of a political organization. To achieve this end, man had to turn elsewhere. The dualism of loyalty postulated by Christianity is affirmed in Jesus' famous dictum, "Render unto Caesar the things that are Caesar's but unto God the things that are God's." Man was, as St. Augustine put it, a citizen of two cities, the city of man and the city of God. Political theorists have often given support to this concept of dual loyalty by defending, for example, the right to resist arbitrary or tyrannical governments, especially if the right is claimed in consequence of one's loyalty to God and the moral law. The Niirnberg and Adolf Eichmann trials have shown that absolute loyalty to the state may be demanded only if the state is guided by principles of right and justice.

The efforts of the rulers of the slowly emerging nation-states to enlist nationwide loyalties took place within the framework of feudalism. On the continent of Europe the result was often disappointing. In France, for example, vassals would owe loyalty only to their immediate lords rather than to the king; the latter. therefore, had no direct contact with the lesser vassals, who even retained the right to make war against him.

In England William I, determined to be a true sovereign rather than one feudal lord among many, imposed an oath upon all the important landowners. In 1086 at Salisbury they swore that they would be faithful to him against all other men. This oath, repeated under later monarchs and extended to all people, even the peasants, by Henry II (1176), was a "national act of homage and allegiance."

Allegiance, later defined by William Blackstone as "the tie or *ligamen,* which binds the subject to the King, in return for that protection which the King affords the subject," has become a powerful legal weapon in the hands of governments, especially those of English-speaking peoples, to promote loyalty and to punish disloyalty. Allegiance assisted the integration of the Norman "foreigners" with the English natives; formed the basis of British nationality; played a part in transforming the British empire into the Commonwealth of Nations, a result foreshadowed by the Balfour report of the 1926 imperial conference, according to which Britain and the self-governing dominions were "united by a common allegiance to the Crown"; and has been crucial in the definition of treason, which is a breach of the allegiance owed to the king in person.

In deference to the commonwealth countries, allegiance lost some of its legal significance; under the British Nationality act of 1948 a British subject is a commonwealth citizen. "Allegiance is no longer a source of British nationality but it may be a consequence of it" (O. H. Phillips, The *Constitutional Law of Great Britain and the Commonwealth,* p. 473 [1957]); and since 1949, nations also qualify for membership in the commonwealth when they accept the monarch "as the symbol of the free association of its independent member nations and as such as the Head of the Commonwealth."

Under the influence of nationalism Englishmen developed a second loyalty, one to the kingdom itself as distinguished from allegiance to the king as a person. On occasion, such as in 1399, 1689 and 1936, the conflict between the old allegiance and the new loyalty resulted in the victory of the latter over the former and the king's deposition or abdication. Thus, the new loyalty was certainly an important political factor. Yet, the law, refusing to take comprehensive cognizance of changes affecting the sovereign, continued to recognize allegiance to him rather than the newly discovered loyalty to his realm. Thus, treason has technically never ceased to be a crime against the king, although actually the state rather than the sovereign himself has been involved.

However. in Britain, as elsewhere, prosecution for treason is only one of the weapons to combat disloyalty. Especially in the era of fascist and communist world-wide conspiracies, loyalty investigations have been considered necessary for survival by executive departments and legislatures, in the United States notably by the house un-American activities committee and the internal security subcommittee of the senate judiciary committee.

Penal laws directed against disloyal individuals imperiling security include those dealing with espionage, sabotage, sedition, the advocacy of the overthrow of the government by force and violence (United States Smith act, 1940), and trading with the enemy.

Among measures designed to prevent disloyalty of individuals are oaths of allegiance for such purposes as naturalization and holding public office; detention, as provided by the British Emergency Powers Defence act (1939) and Regulation 18B issued thereunder and by the United States Internal Security act (1950); the denial of passports; and deportation of aliens.

Disloyal organizations are outlawed either by legislation, such as the United States Communist Control act (1954), which keeps the Communist party off the election ballots. or by judicial determination, such as the decision of the German federal constitutional court, which in 1956 declared the Communist party unconstitutional. At times, prohibitive legislation is restricted to reprehensible practices rather than outlawing the organizations themselves; this approach is found in Britain's Public Order act (1936), which makes it an offense to wear publicly uniforms signifying association with political parties.

President Truman's loyalty program (1947) was intended to afford the United States maximum protection against infiltration of disloyal government employees and to protect loyal employees from unfounded accusations. As the standard for the refusal of, or removal from, employment, the existence of reasonable grounds for believing that a person was disloyal was changed in 1951 to reasonable doubt concerning his loyalty. To administer the program, a loyalty review board heard appeals from loyalty boards established in each department. President Eisenhower's program (1953) substituted security for loyalty as the new standard. No person should be employed unless such employment was clearly consistent nith the interests of national security. All loyalty boards were abolished, with the head of an agency making the final decision in each case.

Both the U.S. programs, including loyalty oaths, and their counterparts abroad have been criticized on the ground that they deny basic individual rights. Defending the Canadian system, Prime Minister Louis Stephen St. Laurent asserted in a personnel security case in 1951 that the sole question was whether a certain person could or could not be trusted with secret defense material. "Assessment of character may be the only consideration in some instances. That is not a matter of charge, or trial or of proof. It is a matter of judgment."

Similarly, in 1956 a British conference of privy councilors stated that, while some of the measures that the state was driven to take to protect its security were distasteful and alien to tradition, it was right to continue the practice of tilting the balance in favour of greater security for the state rather than in the direction of safeguarding the rights of individuals.

In the effort to secure loyalty, totalitarian systems have accepted Rousseau's recommendations that there should be no independent associations within the state because they are formed at its expense.

By contrast, in democracies a wide variety of such groups is not only tolerated but encouraged because they all, subversive~excepted, contribute to the formation of national loyalty—as illustrated by the British party out of power, called "her majesty's loyal opposition." Loyalties to nonnational groups, such as Jehovah's Witnesses, may even be permitted to take precedence over the highest symbol of national loyalty, as evidenced by the U.S. supreme court's opposition to compulsory flag salutes in public schools.

Those who, like the historian Arnold Toynbee, take a dim view of nationalism believe that national loyalties must be ultimately transferred to mankind as a whole. Only then will it be possible to realize not necessarily a new international organization but what the American philosopher Josiah Royce called "the hope of the great community." See also TREASON AND SEDITION.

LOYALTY ISLANDS (Isles Loyauté), a group in the Sodth Pacific ocean belonging to France, about 60 mi. E. of New Caledonia. with a total land area of about 800 sq.mi. Pop. (1956) 10,946. There are three large islands, Uea or Uvéa (the northernmost), Lifu (Lifou) the largest island, with an area of 650 sq.mi., Maré or Nengone, and several small islands. They are coral islands of comparatively recent elevation, and in no place rise more than 250 ft. above the level of the sea.

The Loyalty islanders are Melanesians; the islands have separate languages, and in Uea one tribe uses a Samoan and another a New Hebridean form of speech. The Loyalty group was discovered at the beginning of the 19th century, and Dumont d'Urville laid down the several islands in his chart. Christianity was introduced into Maré by native teachers from Rarotonga and Samoa. Enough of the rocky surface is covered with a thin coating of soil to enable the natives to grow yams, taro and bananas. Fresh water, rising and falling with the tide, is found in caverns in Lifu, and by sinking to sea level a supply may be obtained in any part of the island. Coconuts are the chief product; copra and rubber the chief exports. The Loyalty Islands are political dependencies of New Caledonia; *see* Pacific Islands: *The French* Union *in the Pacific.*

LO-YANG, an ancient city in the lower valley of the Lo Ho, a right bank tributary of the Yellow river, in northern Honan province, China. Pop. (1953) 171,200. Possibly the first true city at the site was built in the 11th century B.C., about 10 mi. E. of the present city. This served as the eastern capital of the Chou dynasty until about 770 B.C., when it became the chief capital, remaining so until 2jj B.C. It was the eastern Han dynasty capital from 2j to 221 A.D. 'The Tu'pa (Toba) removed their capital southward to Lo-yang at the end of the jth century, and Sui rulers resided there at intervals during the 6th century. Lo-yang was a Buddhist centre during the 6th and 7th centuries. After the 10th century the city declined to a position as a local administrative and trade centre. Thus Lo-yang occupies an important historical niche in Chinese culture and, because of its many ruins, tombs and walls, was for centuries one of the historic tourist centres of China. It was called Honanfu until 1913.

In 1955 a tractor factory was constructed amid the tombs and ruins on the western outskirts of the city. A new steam electric plant and mining machinery plants followed. Hard coal deposits near the city were mined. Cotton. wheat and other staple crops are grown and processed in this region, and the city regained importance as a regional trade centre. Since Lo-yang is on the east-west Lunghai railway, with north-south connections close by, its location is favourable to development. (J. E. Sr.)

LOYOLA, SAINT IGNATIUS OF (Íñigo López de Loyola) (1491–1556), founder of the Society of Jesus, was born in the ancestral castle of the Loyolas in the Basque province of Guipuzcoa, Sp., in 1491. His life falls into four periods. The first (1491–1521) covers the years when secular ideals dominated him; the second (1521–24) is the critical period of reorientation; the third (1524–38) comprises the years of his belated studies; and the fourth (1539–56) those during which he founded and governed the Society of Jesus.

Ignatius, the youngest son in a noble and wealthy family. became in 1506 a page in the service of a relative, Juan Velázquez de Cuéllar, treasurer of the kingdom of Castile. In 1517 Ignatius passed as a knight into the service of another relative, Antonio Manrique de Lara. duke of Nájera and viceroy of Navarre, who employed him in military undertakings and on a diplomatic mission. While defending the citadel of Pamplona against the French, Ignatius was hit by a cannonball on May 20, 1521, sustaining a bad fracture of his right leg and damage to his left. This ends the first period, during which he was, on his own admission, "a man given to the vanities of the world. whose chief delight consisted in martial exercises, with a great and vain desire to win renown" *(Autobiography,* 1). Although his morals were far from stainless, Ignatius uas in his early years a proud rather than sensual man. He stood just under five feet two inches in height and had in his youth an abundance of hair of a reddish tint. He delighted in music, especially sacred hymns.

The second period of Ignatius' life is perhaps the best known. After treatment at Pamplona. he nas transported to Loyola in June 1521. There his condition became so serious that for a time his life was despaired of. When out of danger, he chose to undergo painful surgery to correct blunders made when the bone was first set. The result was a convalescence of many weeks during which he read a life of Christ and a book on the lives of the saints, the only reading matter the castle afforded He also passed time in recalling tales of martial valour and in thinking of a great lady nhom he admired In the early stages of this enforced reading his attention was centred on the saints. The anonymous version of the lives of the saints he was reading contained prologues to the various lives by a Cistercian monk nho conceived the service of God as a holy chivalry This view of life profoundly moved and attracted Ignatius After much reflection, he resolved to imitate the holy austerities of the saints in order to do penance for his sins.

In Feb. 1522 Ignatius bade farewell to his family and went to Montserrat, a place of pilgrimage in northeastern Spain. He spent three days in confessing the sins of his whole life, hung his sword and dagger as symbols of his abandoned ambitions near the statue of the Virgin Mary, and, clothed in sackcloth, spent the night of March 24 in prayer. The next day he went to Manresa, a town 30 mi. from Barcelona, to pass the decisive months of his career, from March 2j, 1522, to mid-Feb. 1523. He lived as a beggar, ate and drank sparingly, scourged himself and for a time neither combed nor trimmed his hair and did not cut his nails. Daily he attended mass and spent seven hours in prayer, often in a cave outside Manresa.

The sojourn at Manresa was marked by spiritual trials as well as by joy and interior light. While sitting one day on the banks of Cardoner river, "the eyes of his understanding began to open and, without seeing any vision, he understood and knew many things, as well spiritual things as things of the faith" *(Autobiography,* 30). At Manresa Ignatius sketched the fundamentals of his little book *The Spiritual Exerczses.* Until the close of his studies at Paris (1535) he made some additions to it. Thereafter there mere only minor changes until Pope Paul III approved it in 1548. *The Spiritual Exercises* are a manual of spiritual arms, containing a vital and dynamic system of spirituality. During his lifetime Ignatius used it to give spiritual retreats to others, especially to his followers. The booklet is indeed an adaptation of the Gospels for such retreats.

The remainder of the decisive period was devoted to a pilgrimage to Jerusalem. Ignatius left Barcelona in March 1523 and traveling by way of Rome, Venice and Cyprus, reached Jerusalem on Sept. 4. He would have liked to settle permanently there, but the Franciscan custodians of the shrines of the Latin church would not listen to this plan. After visiting Bethany, the Mount of Olives, Bethlehem, the Jordan and Mount of Temptation, Ignatius left Palestine on Oct. 3 and, passing through Cyprus and Venice, reached Barcelona in March 1524.

"After the pilgrim had learned that it was God's will that he should not stay in Jerusalem, he pondered in his heart what he should do and finally decided to study for a time in order to be able to help souls" (*Autobiography,* 50). So Ignatius, who in his *Autobiography* refers to himself as the "pilgrim," describes his decision to acquire as good an education as the circumstances permitted. He probably could have reached the priesthood in a few years. He chose to defer this goal for more than 12 years and to undergo the drudgery of the classroom at an age when most men have long since finished their training. Perhaps his military career had taught him the value of careful preparation. At any rate he was convinced that a well-trained man would accomplish in a short time uhat one without training would never accomplish.

Ignatius studied at Barcelona for nearly two years. In 1526 he transferred to Alcalá. By this time he had followers, and the little group assumed a distinctive garb. Ignatius fell under suspicion of heresy, was imprisoned and tried. Although found innocent, he left Alcalá for Salamanca. There not only was he imprisoned but his companions were also apprehended. Again he won acquittal but was forbidden to teach until he had finished his studies. This prohibition induced Ignatius to leave his disciples and Spain.

He arrived in Paris on Feb. 2, 1528, and remained there as a student until 1535. He lived on alms and in 1528 and 1529 went to Flanders to beg from Spanish merchants. In 1530 he went to England for the same purpose. In Paris Ignatius soon had another group of disciples whose manner of living caused such a stir that he had to explain himself to the religious authorities. This episode finally convinced him that he must abstain from public religious endeavour until he reached the priesthood.

During his long stay in the French capital, Ignatius won the coveted M.A. of the famous university. He also gathered the companions who were to be cofounders with him of the Society of Jesus, among them Francis Xavier (*q.v.*), Peter Favre, Diego Laynez (*q.v.*) and Alphonsus Salmeron. On Aug. 15, 1534, he led the little band to nearby Montmartre, where they bound themselves by vows of poverty, chastity and obedience, though as yet without the express purpose of founding a religious order.

Early in 1535, before the completion of his theological studies, Ignatius left Paris for reasons of health. He spent more than six months in Spain and then went to Bologna and Venice where he studied privately. On Jan. 8, 1537, his Parisian companions joined him in Venice. All were eager to make the pilgrimage to Jerusalem, but war between Venice and the Turkish empire rendered this impossible. Ignatius and most of his companions were ordained on June 24, 1537. There followed 18 months during which they acquired experience in the ministry while also devoting much time to prayer. During these months, although he did not as yet say mass, Ignatius had one of the decisive experiences of his life. He related to his companions that on a certain day while in prayer he seemed to see Christ with the cross on his shoulder and beside him the Eternal Father, who said, "I wish you to take this man for your servant," and Jesus took him and said, "My will is that you should serve us." On Christmas day 1538 Ignatius said his first-mass at the Church of St. Mary Major in Rome. This ends the third period of his life, that of his studies, which were far from a formality. Diego Laynez, a clever man, judged that despite handicaps Ignatius had as great diligence as any of his fellow students. He certainly became in the difficult field of ascetical and mystical theology one of the surest of Catholic guides.

The final period of Loyola's life was spent in Rome or its vicinity. In 1539 the companions decided to form a permanent union, adding a vow of obedience to a superior elected by themselves to the vows of poverty, chastity and obedience to the Roman pontiff which they had already taken. In 1540 Pope Paul III approved the plan of the new order. Loyola was the choice of his companions for the office of general.

The Society of Jesus developed rapidly under his hand. When he died there were about 1,000 Jesuits divided into 12 administrative units, called provinces. Three of these were in Italy, a like number in Spain, two in Germany, one in France, one in Portugal and two overseas in India and Brazil. Loyola was in his last years much occupied with Germany and India, to which he sent his famous followers Peter Canisius and Francis Xavier (*qq.v.*). He also dispatched missionaries to the Congo and to Ethiopia. In 1546 he secretly received into the society Francis Borgia (*q.v.*), duke of Gandia and viceroy of Catalonia. When knowledge of this became public four years later it created a sensation. Borgia organized the Spanish provinces of the order and became third general.

Loyola left his mark on Rome. He founded the Roman college, embryo of the Gregorian university, and the Germanicum, a seminary for German candidates for the priesthood. He also established a home for fallen women and one for converted Jews.

Although at first Loyola had been somewhat opposed to fixing his companions in colleges as educators of youth, he came in the course of time to recognize the value of the educational apostolate and in his last years was busily engaged in laying the foundations of the system of schools which was to stamp his order as largely a teaching order.

Probably the most important work of his later years was the composition of the *Constitutions* of the Society of Jesus. In them he decreed that his followers were to abandon some of the traditional forms of the religious life, such as chanting the divine office, corporal penances of rule and penitential garb, in favour of greater adaptability and mobility; they also renounced capitular government with its democratic character in favour of a more monarchial regime; and their vows were in general of such a nature that separation from the order was easier than had been usual in similar Catholic groups. The Society of Jesus was to be above all an order of apostles "ready to live in any part of the world where there was hope of God's greater glory and the good of souls." Loyola insisted on long and thorough training of his followers. Convinced that women are better ruled by women than by men, after some hesitation he resolutely excluded a female branch of the order. The special vow of obedience to the pope Loyola called "the cause and principal foundation" of his society.

Loyola and his work were much admired during his lifetime. But he also met with opposition in the church and outside it. His innovations in the religious life were criticized and, while Protestant leaders early came to look on him as one of their principal opponents, some Catholics accused him and his followers of being secret Protestants.

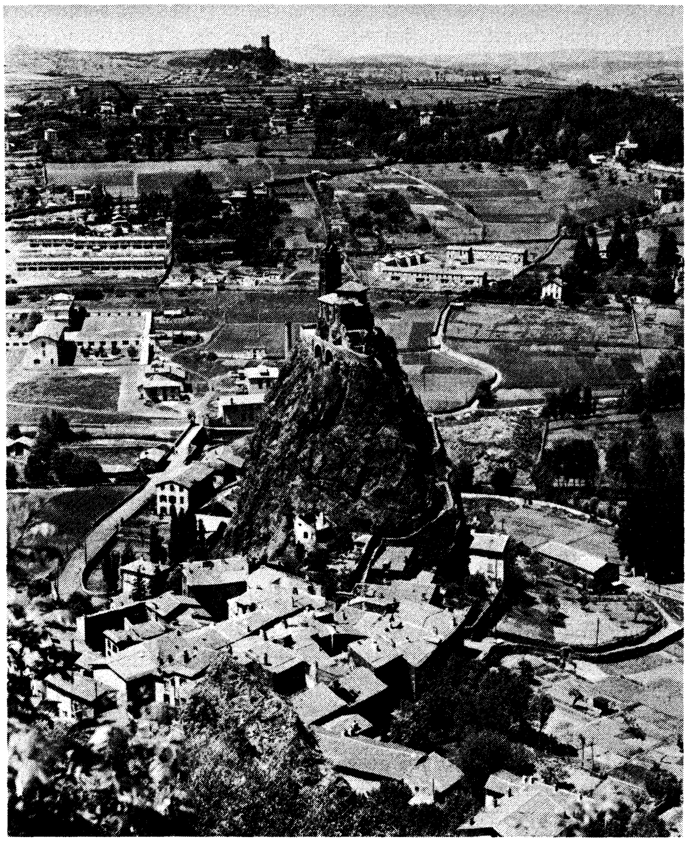
As general Loyola was frequently sick. In Jan. 1551 he became so ill that he begged his associates, though to no purpose, to accept his resignation as superior. Despite his condition he continued to direct the order until his death on July 31, 1556. Since his days at Manresa, Loyola had practised a form of prayer which in his last years appears to have rivaled that of the greatest mystics.

Ignatius Loyola was beatified by Pope Paul V in 1609 and canonized by Pope Gregory XV in 1622; his feast day is July 31. In 1922 he was declared patron of all spiritual retreats by Pope Pius XI. His enemies no less than his friends agree that Ignatius Loyola was a maker of history. Scores of books could be cited in proof of this statement. The spirit of Loyola lives on in the Society of Jesus and in the Jesuit *Constitutions,* which still regulate the lives and aspirations of over 30,000 Jesuits, scattered through most countries of the world. The *Spiritual Exercises* molded 27 canonized saints, three of them, Francis Xavier, Peter Canisius and Francis Borgia, intimates of the saint. His achievements and those of his followers form a chapter in the history of the Roman Catholic Church which cannot be neglected by those who desire to understand that institution. *See* also JESUS, SOCIETY OF.

BIBLIOGRAPHY.—The sources of the life of Ignatius have been published in more than 20 volumes in the *Monumenta Historica Societatis Iesu* (1894–1918; 1934–48). Loyola's *Autobiography* can be found in *St. Ignatius' Own Story*, trans. by W. J. Young (1956); *The Spiritual Exercises*, trans. by L. J. Puhl (1951).

Lives by Catholics include A. Astrain, *A Short Life of St. Ignatius* (1928); P. Dudon, *St. Ignatius of Loyola* (1949); J. Brodrick, *The Origin of the Jesuits* (1940); and *St. Ignatius Loyola, the Pilgrim Years* (1956). Lives by non-Catholics are: H. D. Sedgwick, *Ignatius Loyola* (1923); R. Harvey, *Ignatius Loyola* (1936); P. Van Dyke, *Ignatius Loyola* (1926); R. Fülop-Miller in *Power and Secret of the Jesuits* (1930) and in *The Saints That Moved the World* (1945). (E. A. R.)

LOZÈRE, a *département* of southeastern France belonging to the central plateau, composed of almost the whole of Gévaudan and of some portions of the old dioceses of Uzès and Alais, districts all formerly included in the province of Languedoc. Pop. (1954) 82,391. Area 2,000 sq.mi. It is bounded north by Cantal and Haute-Loire, east by Ardèche and Gard, south by Gard and Aveyron and west by Aveyron and Cantal. The north of this mountainous *département* includes the granitic mountains of La Margeride, reaching 5.098 ft. and wooded on their lower slopes, and the volcanic range of Aubrac (4,826 ft.), both orientated north-north est and south-southeast. South of these the Lot crosses the *département* on its way from the Cévennes in the southeast. The southwest of the *dkpartement* is occupied by the arid, cal-



JEAN ROUBIER FROM RAPHO GUILLUMETTE

CHAPEL OF SAINT MICHEL D'AIGUILLE, LE PUY, HAUTE-LOIRE, NEAR LOZÈRE, FRANCE

careous Jurassic plateau (3,000 ft. average) called the *causse* de Sauveterre and the *causse* de Méjan, the two causses being separated by the beautiful Tarn gorge. On the Mediterranean versant there are 76 in of rain; in the Garonne basin 46 in. and in that of the Loire only 28 in. Sheep and cattle raising and cheese making are the chief occupations Bees are kept and, among the Cévennes, silkworms. Large quantities of chestnuts are exported from the Cévennes

In the valley of the Lot wheat and fruit are the chief products; elsewhere rye is the chief cereal, and oats, barley, meslin and potatoes are also grown. There is much terrace cultivation. Silver, lead, copper and antimony are found. Sawmilling, wool spinning, the manufacture of wooden shoes and of woolen goods are carried on. Of mineral springs, those of Bagnols-les-Bains are most frequented.

The arrondissements are Mende and Florac: the cantons number 24, the communes 198. Lozère forms the diocese of Mende and part of the ecclesiastical province of Albi. It falls within the region of the 16th army corps (Montpellier), the acadtmie (educational division) of Montpellier and the appeal court of Kimes. Mende (*q.v.*) is its most important town.

LOZI (MALOZI): see BAROTSE.

LUANG-PRABANG, a province in northwest Laos. Population (1959 est.) 322,100. Area 14,363 sq.mi. Luang-Prabang town (pop., 1957 est.. 18,000) is the site of an important airfield. At the head of Mekong river navigation, it has a small trade in rice. silk, wax, sticklac and a wide variety of timbers. gums, resins and other forest products. The Chinese and Shans carry on most of the trade. The Mekong is much less important as a trade artery than other large oriental rivers, for as many as eight transshipments between Saigon and Luang-Prabang are made necessary by the rapids, at low water.

The French projected a highway from Saigon to Luang-Prabang, and in 1943 the Japanese broadcast claims to having completed the 1.049-mi. project.

For centuries Luang-Prabang was the centre of a great kingdom, covering much of Laos (*q.v.*) and some of Thailand. Thai-Annamite rivalry in the 18th and 19th centuries established the sovereignty of the former, although the king of Luang-Prabang was not deposed. The French took the two-thirds of Luang-Prabang on the Mekong's east bank in 1893 and the remainder in 1904.

In 1941 the Thai won back the western part in a border war, re-establishing the Mekong as boundary. (J. R. A.)

LUANSHYA, known as "the garden town of the copper belt," in the western province of Northern Rhodesia, Federation of Rhodesia and Nyasaland, situated 4,250 ft. above sea level, 21 mi. S.W. of Ndola. Pop. (1956) 8,080 (non-Africans and employed Africans). The public township contains residential, business and industrial areas and there is a separate mine township (Roan Antelope).

A rail terminus, Luanshya is also connected by macadamized roads to the other copper belt towns and has an airfield; the nearest airport is Ndola. Besides copper mining there are steel. welding and general machine shops, and concrete, furniture and clothing industries. (L. R. B.)

LUBA. The Luba people, or Baluba, are a Bantu group of the southeastern Republic of The Congo. They inhabit a wide area extending from the extreme south of Rivu province through the major part of Katanga province to the southeast of Kasai province. The name Luba applies to a variety of tribes which, although of different origins, speak closely related languages, exhibit many common cultural traits and participate in a common political history founded on the beginnings (16th century) and breakdown (17th century onward) of the Luba empires. The present population amounts to more than 1,500,000. Three main subdivisions may be recognized: the Baluba-Shankaji of Katanga, the Baluba-Bambo of Kasai (both patrilineal and viripatrilocal and speaking respectively Kiluba and Ciluba) and the Baluba-Hemba of northern Katanga and southern Rivu who are either matrilineal or bilineal, practice virilocal marriage and speak Kiluba. All are historically. linguistically and culturally linked with other Congo peoples. such as the Benalulua, the Bakwaluntu, the Benakanyok and the Basonge. The Shankaji branch is also connected with the early founders of the Luunda dynasty. Luba tribes are also mixed with other groups of miscellaneous origin. Finally, since the 17th century there has been an ever-growing expansion of Luba-Bambo in the Rasai province.

The Luba are savanna and forest dwellers; they practise hunting, food gathering and agriculture (manioc. maize) and keep small livestock; they fish the Congo and its main tributaries intensively. High marriage payments (bride-service) are common. Polygyny, leviratic marriage and sororate exist, but not cross-cousin marriage; parallel and cross-cousins are called by the same terms as brothers and sisters. Luba are subdivided into large dispersed clans and localized lineages; the latter form exogamous units and may be linked by an elaborate system of political and ritual status. In the 16th and early 17th centuries most of the Luba were ruled by a paramount chief (*mulopwe*), although smaller independent chiefdoms already existed. The breakdown of the empire resulted in the development either of smaller chiefdoms or of small autonomous local lineage groups.

Luba practise circumcision and women's initiation; they have associations for hunting, magic and medicine. They have a strong belief in a Supreme Being and worship ancestors and natural spirits. Literature, including epic cycles, is well developed. The

Shankaji and Hemba are renowned wood carvers, especially of anthropomorphic figures, ceremonial axes and headrests.

LUBBOCK, seat of Lubbock county, is the industrial, financial and commercial hub of the south plains area of western Texas, G.S., about 100 mi. S. of Amarillo. The first settlers were ranchers who arrived in the late 1870s. The town, laid out in 1891, when Lubbock county was created out of Bexar territory and named for Tom S. Lubbock, a Confederate soldier, was incorporated in 1909, and adopted a mayor-commission-manager form of government in 1917.

Although Lubbock has a diversified economy, regional agriculture (cotton, grain sorghums, Sudan grass, wheat and vegetables) supported by irrigation from underground water is its base. In the late 1950s the south plains produced almost a fifth of the nation's cotton. Lubbock is one of the world's leading inland cotton markets and cotton oil centres. Other major industries include poultry and dairy products, feed mills, cattle feeding. irrigation pipes and oil. The city is also the regional centre for government offices and medical care.

Cultural institutions include Texas Technological college (1923), Lubbock Christian Junior college, the West Texas museum and two public libraries. The annual Panhandle South plains fair, a large coliseum, a number of city parks, Mackenzie State park (548 ac., with its "prairie dog town") and Buffalo lakes provide recreational facilities.

After World War II, Lubbock witnessed a rapid growth with its population increasing from 31.895 in 1940 to 128,691 in 1960. Population (1960) of its metropolitan area, which comprises Lubbock county, was 156.271. (E. WE.)

LÜBECK, a city and former state of Germany. The former state of Liibeck was situated on an arm of the Baltic between Holstein and Mecklenburg-Strelitz. The state consisted of the city of Liibeck. the town of Travemunde, villages and the country districts. Liibeck in 1937 lost its status as a state, and became a city in Schleswig-Holstein.

The constitution of the former state was republican, and by the constitution of 1925 consisted of two assemblies: (1) the house of burgesses (*Bürgerschaft*) consisting of 80 members elected by free suffrage. This was the supreme authority and elected (2) the senate executive which consisted of 12 members.

At the first rise of the town justice was administered by the *Vogt* (*advocatus*) of the count of Holstein. Simultaneously with its incorporation by Henry the Lion, duke of Saxony, there appeared a magistracy of six, chosen probably by the *Vogt* from the *Schöffen*. By the middle of the 13th century the number of magistrates had increased, ranging from 20 to 40 and upward. In the face of so much self-government the *Vogt* presently disappeared. There were three classes of inhabitants: full freemen, half freemen and guests or foreigners. People of Slav origin being considered unfree: all intermarriage with them tainted the blood: hence, nearly all surnames point to Saxon, especially Westphalian. and even Flemish descent. The magistracy was for two centuries almost exclusively in the hands of the merchant aristocracy, who formed companies such as the *Bergen-fuhrer*, *Novgorod-fahrer*, *Riga-fuhrer* and *Stockholm-fahrer*. Tradesmen and handicraftsmen who had settled in the town, though not eligible for the council, shared to a certain extent in the self-government through the aldermen of each corporation or guild, of which some appear as early as the statutes of 1240.

After an attempt to upset the merchants had been suppressed in 1384, the guilds succeeded in 1408. In 1416, however, because of the pressure brought to bear by the Hansa, by the emperor Sigismund and by Eric, king of Denmark, there was a restoration. The aristocratic government was again expelled under the dictatorship of Jurgen Wullenweber (c. 1492–1537), till the old order was re-established in 1535. In the constitution of 1669, under pressure of debt, the great companies yielded a specified share in the financial administration to the leading guilds of tradesmen. From 1813 the popular representatives had some share in the management of the finances. But the reform committee of 1814, whose object was to obtain an extension of the franchise, had made little progress when the events of 1848 led to the establishment of a representative assembly of 120 members, elected by universal suffrage.

The City.—Liibeck was formerly the head of the Hanseatic league. It lies between the rivers Trave and Wakenitz, 10 mi. S.W. of the mouth of the former in the bay of Liibeck, 40 mi, by rail N.E. of Hamburg, at the junction of lines to Eutin, Biichen, Travemünde and Kleinen and consists of an inner town and three suburbs. Pop. (1950) 238,276. Its five chief churches are Gothic. Of them, the *Marienkirche* (13th century), is one of the finest specimens of early Gothic in Germany. The cathedral, or *Domkirche*, founded in 1173, contains some curious sarcophagi and a fine Memling altarpiece. The *Rathaus* (town hall), dating from the middle ages, is famous for its staircase, the vaulted wine cellar of the city council beneath and wood carving.

Its position as the first German emporium of the west end of the Baltic was impaired by Hamburg and Bremen after the construction of the North Sea and Baltic Canal, and by the growth of Stettin. In order to counterbalance their rivalry, the quays were extended and a canal was opened in 1900 between the Trave and the Elbe.

The chief imports are coal, grain, timber, copper, steel and wine, and the exports are fertilizers, gypsum and manufactured goods.

HISTORY

Old Liibeck, which stood on the left bank of the Trave where it is joined by the river Schwartau, was destroyed in 1138. Five years later Count Adolphus II of Holstein founded new Liibeck, a few miles farther up, on the Baku peninsula, where the Trave is joined on the right by the Wakenitz. An excellent harbour, sheltered against pirates, it became almost at once a competitor for the commerce of the Baltic. Henry the Lion, duke of Saxony, who, about 1157, had forced his vassal, the count of Holstein, to give up Liibeck to him, issued the first charter to the citizens and constituted them a free Saxon community. The population grew rapidly in wealth and influence by land and sea, so that, when Henry was attainted by Frederick I, who came in person to besiege Liibeck in 1181, the emperor, "in consideration of its revenues and its situation on the frontier of the Empire," fixed by charter (Sept. 19, 1188) the limits, and enlarged the liberties, of the free town. By the end of the next century the statutes of Liibeck had been adopted by most Baltic towns with a German population: it was the court of appeal for nearly all these cities and even for the German settlement in Novgorod. From the beginning of the 14th century Liibeck presided over a league of cities, including Wisbeck, Rostock, Stralsund and Greifswald. Liibeck was the leading spirit in the nominally federal armament directed against Waldemar IV, the destroyer of Visby, which captured Copenhagen and enforced the peace of Stralsund (May 24, 1370); the burgomaster of Liibeck, Brun Warendorp, commanding the combined naval and land forces and dying on the field of battle. The seal of the city was in 1368 adopted as the common seal of the confederate towns. Though the power of the Hanseatic league was hemmed in at the end of the 15th century by.the rise of the power of Burgundy, of Poland and Russia, and of Scandinavia, Lubeck was able to carry on war against Denmark (1501–12) and Sweden (1536–70) and under its democratic burgomaster, Jiirgen Wullenweber, was in 1534 and 1535 a powerful force in the north of Europe.

From this time the power of Liibeck began to decline. The herring, a great source of early wealth, had begun to forsake the Baltic as early as 1425. The last Hanseatic diet was held in 1630. Signs of some small recovery began to appear at the end of the 18th century, but the Danes occupied the town in 1801; in 1803 it was sacked by the French and in 1810 annexed to Napoleon's empire. It was declared a free and Hanse town of the German Confederation, after his fall, by the Act of Vienna (June 9, 1815). Liibeck joined the North German Confederation in 1866.

LUBLIN, a province of Poland, bounded north by Bialystok, east by the U.S.S.R. (the Bug forming the boundary), south by Rzeszów, and west by Kielce (the Vistula separating the two) and Warsaw. Area 9,584 sq.mi. The surface is an undulating plain of Cretaceous deposits, 800 to 900 ft. in altitude, reaching in one place 1,050 ft. It is largely covered with forests of oak, beech and lime, intersected by ravines and thinly inhabited. A marshy lowland extends between the Vistula and the Wieprz. The area is drained by the Vistula and the Bug and by their tributaries, the Wieprz, Liwiec and Tanev. Parts of the province, being of black earth, are fertile, but other parts are sandy. Agriculture is in good condition. Many Germans settled in the area before immigration was stopped in 1887; in 1897 they numbered about 26,000.

Rye, oats, wheat, barley and potatoes are the chief crops, rye and wheat being exported. Flax, hemp, buckwheat, peas, millet and beetroot are also cultivated. Horses are carefully bred. Pop. (1960) 1,799,900. Industrial establishments consist chiefly of distilleries, sugarworks, steam flour mills, tanneries, sawmills and factories of bentwood furniture.

The province is divided into 16 districts, the chief towns of which are Lublin, capital of the province (180,700), and Chelm (31,000).

The province was overrun by German troops in the early stages of World War II.

LUBLIN, a town of Poland, capital of the province of the same name, 109 mi. by rail S.E. of Warsaw, on a small tributary of the Wieprz. Pop. (1960) 180,700. It is one of the centres of the manufacture of thread yarn, linen and hempen goods and woolen stuffs; there is also trade in grain and cattle. It has an old citadel, a university, several palaces of Polish nobles and many interesting churches and is the see of a Roman Catholic bishop. The cathedral dates from the 16th century. Of the former fortifications nothing remains except the four gates, one dating from 1342.

Lublin was in existence in the 10th century and has a church which is said to have been built in 986. During the time the Jagellon dynasty ruled over Lithuania and Poland it was the most important city between the Vistula and the Dnieper, having 40,000 inhabitants (70,000 according to other authorities) and all the trade with Podolia, Volhynia and red Russia. Indeed, the present town is surrounded with ruins, which prove that it formerly covered a much larger area. But it was frequently destroyed by the Tatars (*e.g.,* 1240) and Cossacks (*e.g.,* 1477). In 1568–69 the union of Poland and Lithuania was decided there. In 1702 another convention was held in Lublin, in favour of Augustus II and against Charles XII of Sweden, who carried the town by assault. In 1831 Lublin was taken by the Russians. Returned to Poland in 1918, it was taken by Germany in 1939 and returned again to Poland in 1945.

LUBRICATION concerns itself with the reduction of frictional resistance between two contacting surfaces forced to slide over one another. As secondary objectives lubrication tends to minimize wear and prevent corrosion. Lubrication is accomplished by inserting a thin film of lubricant between the sliding surfaces; thus lower fluid friction is substituted for the higher dry, metal friction. Any material placed between the surfaces to lessen friction is a lubricant. (See FRICTION.)

In a machine civilization, lubrication is vitally important. Friction wastes energy. It has been estimated that over 30% of the energy generated is consumed in friction; *i.e.,* heat. As an art lubrication probably commenced when primitive man noted the eased skidding that resulted, because of sap lubrication, when the bark was removed from the trunk. From this crude start to the operation of delicate instruments on a man-made satellite, man's most persistent problem has been the reduction of friction and wear. He began, however, only in the 20th century to understand the mechanism of friction and lubrication.

As man continued to analyze the phenomena, the art of lubrication gradually evolved into an exact science. Not long ago the task of lubricating the crude machines of industry was just a messy chore. A low-rated employee equipped with little more than an oil can would irregularly proceed to oil all bearings with often only a single oil. Mass production, higher speeds, larger machines, long space flights, all these have changed the chore into a scientifically engineered phase of preventive maintenance. Better lubricants, special additives, automatic dispensing systems, all are receiving continuous attention.

Dispensing.—The best lubricant is useless until it is applied properly to the bearing, or gear, or guideway needing it. Where points to be lubricated are few and frequency of application is not critical, manual methods are sufficient. Modern machines, however, contain many bearings, precision-built to operate under severe conditions. The lubricant must, therefore, be applied with regularity, according to a precisely controlled plan: it is essential to get the right lubricant to the right place at the right time. Consequently, application by use of mechanical means is common procedure.

Many varieties and types of dispensing devices are available, ranging from simple units that lubricate a single bearing to fully automatic central systems capable of lubricating all the machines in a plant.

The oil can, though providing unreliable, inefficient and irregular lubrication is proper in some cases. Rough units such as chains, hoists and farm machinery are appropriate for oil can lubrication. Where it is wise to partly control the oil fed to the bearing, drop feed, wick feed, bottle oilers, ring oiling and such shown in fig. 1 are used. Bath and splash methods are effective in heavy, slow machinery.

FIG. 1.— SEMIAUTOMATIC LUBRICANT DISPENSERS: LEFT, GRAVITY FEED OILER: RIGHT, WICK FEED OILER

For positive, adjustable, reliable lubrication mechanical force feed systems (fig. 2) are best. Oil fog lubrication is one of the latest techniques being developed to get the lubricant to the surface needing lubrication.

History. — The major portion of industrial lubricants are derived from crude petroleum. The history of lubrication, therefore, closely parallels the growth of the petroleum industry. Actually petroleum is not a new discovery. Ancient Assyrians and Egyptians, and later Greeks and Romans, all used petroleum for lighting and embalming.

American Indians used petroleum medicinally. The colonists, however, when coming across it while drilling for salt, considered it a nuisance and poured it away as waste. In 1859 the Drake well in Pennsylvania was drilled to 69 ft. and produced 25 bbl. of crude daily; in 1901 the Lucas gusher, drilled in the Spindletop field, emitted up to 100,000 bbl. daily, and signaled the abundant availability of petroleum and its products. This order of production marked the beginning of a new era that was to see petroleum rise to become mankind's major source of lubricants. Thus, the internal combustion engine. the automobile. the airplane, the diesel train. the turbojet were all made possible, by the use of petroleum both as a fuel and as a lubricant. It also became possible to design production machinery for larger capacity and higher speed because improved lubricants could be tailored to satisfy more severe operation conditions.

FIG. 2.—MULTIPLE-FEED AUTOMATIC MECHANICAL LUBRICATION SYSTEM

The history of lubrication has followed closely and at times even determined the industrial progress of many nations. From the crude lubricants of yesteryear and the engineered oils of the second half of the 20th century has been a long road, with numerous significant as well as important events—elation and heartaches, strife and harmony, failure and success.

Lubricants.— If this function of reducing resistance to sliding of one surface over the other is to be performed satisfactorily for a reasonable length of time, the lubricant must possess particular properties. Thus, a lubricant must be a versatile, multi-functioned product. It must reduce not only friction but wear as well; it must also carry the heat away, prevent corrosion, disperse contaminants, inhibit foam formation and remain intact under severe requirements. In addition it must flow through the bearing easily in order to perform all its functions well.

Lubricants may be grouped into five convenient categories. These are (1) petroleum or mineral oils; (2) fixed or animal oils; (3) synthetic lubricants; (4) solid lubricants; and (5) greases.

Petroleum Lubricants.—Petroleum lubricants are produced from crude oil, a complex mixture of hydrogen, carbon and oxygen plus traces of nitrogen and sulfur. Clay, water, chemical elements, resins and mineral salts are also often present in the crude oil. Obviously then, refining becomes necessary. Distillation, known as fractionation, is the key step in the refining process. In order to convert the crude into the finished lubricant many other steps are performed. Dewaxing, filtering, solvent refining to remove asphalts, cracking to convert heavy into light oils, blending to meet the many specia! requirements, and the addition of chemical compounds to enhance, improve or impart desirable characteristics to the lubricant stock are other steps.

Each of the crude oils originating in many petroleum fields scattered over our planet differs somewhat in composition from every other. Many variations in refining are therefore needed. However. the process is so advanced that by the time the finished lubricant is ready for the bearing, the distinction between crudes has mostly vanished. Thus the changing and varied lubrication requirements that accompany advances in machines, in engines (see INTERNAL-COMBUSTION ENGINES), in delicate instruments, in nuclear reactors, in space missiles are satisfied.

Fixed Oils.—These are animal and vegetable extracts. Animal oils (tallow, neat's-foot, whale, lard, cod-liver, degras) are produced by heating the fatty tissue. Vegetable oils, on the other hand, are extracted by pressing and chemically dissolving seeds of castor, rape, olive, cotton, peanut, coconut and palm. These oils can seldom be used directly as lubricants because they are quite unstable at ordinary operating temperatures, oxidizing into a varnishlike sludge. Their principal use is in the manufacture of greases and as agents or additives in mineral oils.

Fatty oils contain oxygen and fatty acids in addition to the basic hydrocarbon constituents. When mixed with mineral oils, the fatty acids appear to activate the mineral oil molecules into more effectively oriented layers, an action that results in a higher oiliness property with the tendency to wet and adhere to the metal surface even under high pressure.

Oiliness is particularly important in thin-film lubrication where it helps to better prevent direct metal-to-metal contact and so reduces friction and wear.

Synthetic Lubricants.—Although costlier, synthetic oils have found extensive use in the second half of the 20th century. Better stability at higher temperatures and an improved viscosity index (the higher this index the smaller the change in viscosity with temperature) at ordinary temperatures are the principal reasons. Furthermore when many of these synthetic oils undergo thermal decomposition, the resulting products are fluids quite similar to the original product or, otherwise, are volatile materials that evaporate without depositing gummy residues.

Five general types of synthetic lubricants and lubricant agents are in common use. These are the polyalkylene glycols, the silicones, the polymer oils, the organic chlorine compounds and the diesters. Of these the polyalkylene glycols are probably most used because of their inherently wide temperature tolerance, their low solvent action on rubber and their high resistance to sludge formation. A widespread application exists in this group—from 400° to 500° F. temperatures in industrial kiln cars to low temperatures in liquified hydrocarbon gas pumps. An interesting experience illustrating the unusual antiwear property of glycols is illustrated by their use on highly loaded gears. In a controlled test, gears lubricated with a mineral oil pitted severely in six months while similar gears lubricated with a glycol lubricant showed only traces of wear after a full year of operation.

The silicones also possess good thermal stability and general chemical inertness. The silicones are primarily alkyl polymethyls and polymethyl phenyl siloxanes. Use over the 10° F. to 500° F. temperature range is common. They are more critical, however, than mineral oils with respect to metal combinations. On the other hand, they inhibit foaming almost magically.

The polymer oils, derived from the polymerization of low molecular weight paraffines, are used primarily as carriers of active lubricating ingredients. They are so used extensively because of their very clean burn-off properties at temperatures as high as 750° F.

The chlorine lubricants or aroclors are not good lubricants by themselves but are most effective additives as extreme pressure agents. The esters of dicarboxylic acids, the fifth group, serve well in various demanding applications. To date their major use has been in high quality instrument oils and specialized greases.

Solid *Lubricants.*—The solid lubricants are of mineral and chemical compound origin. Graphite, talc, soapstone and mica are representative of the mineral group. Molybdenum disulfide is the most important chemical compound type. The solid lubricants are good for temperatures at which liquids become impractical. The direct application of solid lubricants is, in general, quite difficult. They are therefore usually .suspended in volatile, liquid carriers that flash off at elevated temperatures, leaving a thin deposit of the solid lubricant.

Satural graphite, a black, lustrous mineral is usually used in the dry form. Sometimes a binder is mixed in to form a paste that is pressed in grooves or layers in bronze and babbitt bearing sleeves (see fig. 3). Colloidal graphite is a soft, greasy substance, almost 'chemically pure. It is much easier to "carry" in this small particle size and proves itself a good lubricant in the high-temperature range.

The soft molybdenum disulfide is extracted from a natural ore. The favoured solid lubricant over a wide temperature range, it has been used successfully in liquid nitrogen valve systems at temperatures as low as $-300°$ F. Its use has been reported at 1.600° F. in a vacuum and at 2,400° F. in argon atmospheres. In normal atmospheres it is stable up to 7j0° F. The National Aeronautics and Space administration (NASA), formerly the National Advisory Committee for Aeronautics (NACA), claims the most effective molybdenum disulfide (molykote) surface to be one that is obtained when a bearing is smeared with the molykote suspended in a fluid. baked at around 650° F., and finally buffed to a high finish.

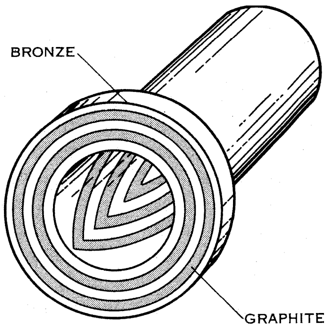

FIG. 3.—GRAPHITE LUBRICANT PRESSED IN BRONZE BEARING

Certain metallic dispersions can also be considered solid lubricants. Finely powdered lead and indium have been dispersed in oil and other vehicles with interesting lubricating results. Metallic, thin platings of copper, indium and aluminum have also been tried with some success. In addition several chemical coatings, deposited as reaction products, have been found to possess lubricating properties.

Greases.—Grease is a plastic solid, a mixture of saponified fat in a liquid lubricant. Plastic solids (see Theory below) do not flow at ordinary temperatures. Officially the American Society for Testing Materials (A.S.T.M.) defines greases more broadly, "Lubricating Grease: A solid to semisolid product of dispersion of a thickening agent in a liquid lubricant. Other ingredients imparting special properties may he included." (American Society for Testing Materials, *Standard* Definitions of *Terms Relating* to *Petroleum*, 1959.) Greases vary extensively both in composition and in physical properties.

Many different soap bases—calcium. lithium, sodium. barium. silica—are used in combination nith various petroleum oils. as well as some of the synthetic lubricants.

In general, greases are inferior wherever liquid lubricants can be used. Greases suffer greater power losses because of the thickening soap. For the same reason greases are used where a liquid lubricant cannot be constantly supplied and where lubricant leaks or spattering may be objectionable or even detrimental to the product, such as food or cloth. Also in rough, heavy machinery, where boundary conditions are likely to exist, grease lubrication is preferred. Comparative advantages of grease and oil are shown in Table I.

The lubricating power of greases depends on both the liquid and soap constituents. The soap base acting as a sponge absorbs the oil to release it to the bearing during operation by squeeze action. On the other hand the soap molecules are adsorbed into the metal to hold the rubbing surfaces separated and thus lubricated. Probably where bearing clearances are comparatively large the liquid constituent is more important while at smaller clearances the molecular soap layers provide the lubrication.

Table I.—*Comparative Advantages of* **Grease** *and* **Oil in** *Bearings*

Advantages of Grease	Advantages of Oil
1. Maintenance may be reduced. no oil level to maintain; regreasing is infrequent.	1. Oil is easier to drain and refill. Thii is Important ii lubricating intervals are close together.
2. Proper grease quantity is easily confined in housing Simplifies design of bearing enclosure.	2. Use of oil makes it eaiier to control the correct amount of lubricant,
3. Freedom from leakage is important in food, textile and chemical industries.	3. Same lubricant may be used on other types of bearings on the same machine.
4. Improves efficiency of labyrinth enclosures, gives better bearing c i o n	4. If bearing must operate under high temperatures, conditions favour oil

Adapted irom J. J. O'Connor, "Bearings and Lubrication," *Power* (Dec. 1951)

Greases may be divided into five groups: (1) the water-resistant; (2) the water-soluble; (3) the multipurpose; (4) the synthetic; and (5) the special purpose greases.

(1) Calcium forms the base of the water-resistant group. Lube oil and a small amount of stabilizing water are the other constituents. In general these water-resistant greases are satisfactory up to about 200° F. as a maximum. Above this temperature the water will boil off allowing the oil to separate and "bleed" off, leaving the sticky, gummy soap.

When not stabilized with water the grease may work at slightly higher temperatures. Aluminum oleate or palmitate is also used as the base.

(2) The water-soluble greases contain a sodium hydroxide base. Since these greases offer very little resistance to water washing, they cannot be used where water or steam is present. However, because of the absence of water they may be used at temperatures up to 300° F.

(3) The multipurpose members contain either a barium or a lithium base. Both bases make the grease reasonably water resistant—better than sodium but not quite as good as the calcium greases. In continuous service the multipurpose greases may be used up to about 350° or 400° F. The need for this group arises, of course: from the desire to have a single grease serve many purposes. a good example being automobile servicing.

(4) The synthetic greases are the latest development in the industry. Some contain standard soaps in synthetic oils, while others are mixtures of synthetic thickeners (bases) in petroleum oils.

The silicones, on the other hand, are greases in which both the base and the oil are synthetic. The synthetic greases are made in water-soluble and water-resistant forms. As a result they may be used over a wide temperature range. In addition the synthetics can be used in contact with natural or other rubbers because they are quite inert to these materials.

(j) In the attempt to obtain some especially desirable characteristic two or more soap bases are used to produce the special purpose greases.

In some cases additives, like extreme pressure agents, are used to gain the special property.

Additives.—Chemical compounds are added to lubricants to improve certain properties or impart new ones. Some additives affect the lubricant chemically, others physically. Most compounds are interdependent. complementing and supplementing each other. In some cases additives affect each other adversely. As a result, additive compounding is a most complex problem. This complexity. in turn, adds much value to procedures developed and facts learned; the latest information is, therefore, seldom published or otherwise publicly expounded.

Better-known addition agents include oxidation inhibitors, detergents, dispersants. anticorrosives, foam inhibitors, antiwear agents, oiliness compounds, pour point depressors and viscosity index improvers (see Viscosity and *Viscometry* below). Many different organic compounds, mettalo organics and soaps in various proportions are used. Each lubricant producer has his own formulas and compounding techniques. Compounds containing sulfur and phosphorus, amines, phenols and naphthanates, silicone and methacrylate polymers, soaps of calcium, barium: cobalt and strontium are all typical additives.

A special group of additives are contained in boundary range lubricants. When speed is too low. high loads exist, or excessive temperatures reduce viscosity, the oil film is difficult to maintain; thus metal-to-metal contact occurs. Satisfactory lubricants are expected to remain in at least molecular thickness under these conditions. Proper additives appear to bring this about by either adsorption or reaction. In either case a layer of lower shear strength is "bonded" to the metal providing at least minimum lubrication.

The additives of polar structure, such as lard oil, are identified as extreme pressure or (EP) agents. In turn the product itself is called an EP lubricant.

Viscosity.—The internal friction between molecules of a fluid-liquid or gas—is, in general, viscosity. The viscosity of a lubricant is of vital importance. The friction developed in a bearing in which the rubbing surfaces are separated by a fluid film depends directly upon the viscosity of the fluid. Viscosity also impedes the flow through the bearing.

When two surfaces, moving with a velocity v relative to each other, are separated by a fluid film, the velocity of film layers is as shown in fig. 4. The velocity of the layer in contact with the fixed surface is zero; that of the layer in contact with the moving layer is v. The velocity in between varies linearly.

A pull (force) must be applied to the upper plate if it is to move. Shear between successive layers of the film results from the pull. Sir Isaac Newton established in 1668 the mathematical relationship describing the shearing stress. He wrote

$$S_r = \frac{F}{A} = \mu \frac{v}{h}$$

where F is force in pounds, A is area of the film, v is velocity of upper plate in feet per second, and h is the film thickness in inches. In turn (see fig. 5) the viscosity becomes algebraically

$$\mu = \frac{Fh}{Av}$$

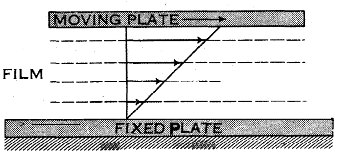

FIG. 4.— STREAMLINE FLOW OF FLUID BETWEEN TWO PLATES VELOCITIES ARE PROPORTIONAL TO DISTANCE FROM FIXED PLATE

A unit of viscosity is thus the viscosity which requires one unit force to move one unit surface at unit velocity when one unit length away from the fixed surface. A unit viscosity in the metric system is called a poise in honour of J. L. M. Poiseuille who investigated extensively the flow of liquids in capillaries in the 1840s. Because of the size of a poise a smaller unit, one-hundredth the size, called a centipoise is customarily used. It so happens, and quite conveniently, that the viscosity of water at 68.4° F. is one centipoise. In the English system a unit of viscosity is measured in pound-second per square inch. It is called a reyn in honour of Sir Osborne Reynolds, father of hydrodynamic lubrication.

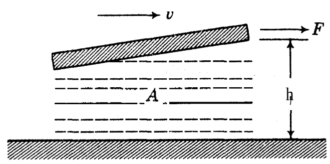

FIG. 5.—PLATE MOVING ON OIL FILM

Obviously the measurement of viscosity—viscometry—is quite essential. Literally hundreds of kinds of viscometers have been built and used. The most popular is the capillary tube type, which uses the principle first recognized by Poiseuille. The viscosity is obtained indirectly by measuring the pressure needed to force the liquid through the small tube, the tube dimensions and the rate of flow. An example of such an instrument, depending upon gravity as the driving force, is the A.S.T.M. modified Ostwald viscometer.

Another type of viscometer is based on Newton's viscosity law or the measurement of the force needed to pull one surface past another with a liquid between them. The rotational viscometer, in which torque is the measured quantity, is probably the best known Newton type.

Great skill is required to manipulate the above mentioned instruments. Because of this fact and the delicacy of such instruments, industry has found them unsuited for use outside the laboratory. More rugged devices simpler in operation, have been standardized for general use. The time taken by a given volume of oil to flow through a standard orifice is measured in seconds and recorded as an arbitrary expression of viscosity. Of such efflux viscometers, the Saybolt is popular in America, the Redwood in Britain and the Engler in Germany.

Viscosity of fluids varies greatly with temperature. Because of the difficulty of mathematical expression, charts are used to present this variation. A special logarithmic ordinate scale makes the viscosity-temperature plot a straight line.

Where the viscosity of liquids decreases as the temperature increases, that of gases increases, curiously enough. Viscosity of a gas is determined with viscometers very similar to those already described. The viscosity of some better known fluids, lubricants included, is given in Table II.

Lubricants change viscosity with pressure as well, the viscosity increasing with an increase in pressure. The increase does not, however, become large until very high pressures are reached. At commonly used bearing pressures, therefore, the change is low enough to be negligible and so is not accounted for.

A greatly simplified, but convenient, indication of the change in viscosity within the temperature range common in bearing operation is the viscosity index (VI), which is used extensively by the lubricant industry. The oil having the smallest change in viscosity between 100° F. and 210° F. is assigned a VI of 100, that having the largest change has a VI of 0 (zero). A new oil, falling somewhere in between, will carry a number proportionately between 0 and 100. Since lubricants being developed in the second half of the 20th century are quite different from those used to establish the VI scale in 1929, it is possible to have a VI larger than 100 or less than 0.

Lubricant Analysis.— Lubricating oils must be tested at every step of their manufacture if the quality of the finished product is to be ascertained. Tests must also be conducted to check and insure the ability of a specific lubricant to meet particular requirements. As already indicated, the most significant test is the viscosity measurement.

TABLE II —*Viscosity of Some Better-Known Materials*

Material	Viscosity at 70° F. Centipoise
Honey	1,500
SAE 50 Oil	800
Glycerin	500
SAE 30 Oil	300
SAE 10 Oil	70
Ethylene Glycol	20
Kerosene	2
Water	1
Gasoline	0.4
Air	0.018
Hydrogen	0.009

Other tests regularly used are pour point, specific gravity, ash content, flash point and neutralization. Most of these tests are conducted according to A.S.T.M. procedures. The pour point is the lowest temperature at which an oil just barely flows. For application at reduced temperatures or outside, winter use, this reading is most important. The specific gravity, its weight relative to water, defines its bulkiness and gives some indication of its heavier constituents.

A measure of the amount of metal contained in an oil is obtained in the ash test.

The flash point test determines the lowest temperature to which the lubricant must be raised to evolve enough vapour to ignite when brought in contact with a flame in the presence of air. It is a safety test but it also indicates the presence of contaminants. The neutralization number, milligrams of potassium hydroxide used in neutralizing one gram of oil, is a measure of the corrosive acid or base content. This test also determines the presence of certain additives.

Other tests are conducted to check properties useful in particular applications. The colour test indicates the nature and extent of refining. The carbon residue test determines the hydrocarbon base. The foam test indicates how readily the lubricant mixes with air to form objectionable foam. How easily the lubricant will absorb oxygen is measured in the oxidation test. Rust-preventive characteristics are found in the rust test.

Greases are also similarly examined. Major tests are penetration, ash content, oxidation stability and evaporation. The penetration of a standard cone classifies greases into grades. It is a kind of viscosity measure. The amount of nonvolatile metallic compound present in the grease is measured in the ash test. Oxidation stability determines resistance to oxidation under storage conditions.

The evaporation test measures the rate at which the grease loses oil. Tests used primarily in manufacture control are the water test, soap test, oil test, alkali test and drop point.

In research and in development of new or improved lubricants, analyses other than control and application tests are essential. Lubricants are here studied by microchemical, instrumental and even radioactive techniques. Microanalysis is the technique that makes use of very small samples, ten milligrams or less. Such micro techniques aid research greatly because large sample quantities can then be made after more favourable materials have been proven.

Fast methods of testing, which instrumental procedures permit, eliminate the tedious, time-consuming process of net-chemistry. Furthermore, instruments often give more accurate results because much personal error is eliminated. X-ray, absorption, mass and emission spectroscopy are major instrumental devices. Spectroscopy, concerned with relationships between radiant energy and matter, dates from 1672 when Sir Isaac Newton discovered the spectrum of primary colours into which white light is diffracted when passed through a prism.

Nuclear fission, discovered during World War II, made available many radioactive isotopes. 'They can be used as tracers in wear studies. The mechanism of basic lubrication phenomena can also be studied for better understanding.

Theory.—Rheology is the science that deals with the intrinsic flow of materials. When a shearing force is applied, the material assumes a shearing strain. If the shearing stress—force per unit area—is plotted against the rate of shearing strain—strain per unit thickness—the flow phenomenon is graphically defined. Such a chart is shown in fig. 6. The "true" or Newtonian liquid (see VISCOSITY: The *Coefficient* of Viscosity) is represented by a straight line starting at the origin. The slope of this line determines the very important property called viscosity. The non-Newtonian fluid starts at the origin also, but is partly or wholly a nonlinear curve—the viscosity is not constant. In general, real liquids are non-Newtonian; but, if the graph is exactly or very nearly straight over the range of operation, the fluid is assumed Newtonian. When some initial shearing stress must be applied before flow begins, the material is a plastic solid. The general plastic solid will have curved portions while the ideal or Bingham plastic solid is all straight. Greases are usually considered plastic solids. The Pascal fluid is a material, not found in nature, but theoretically interesting, which has zero viscosity; *i.e.,* it intrinsically spreads out indefinitely. Hydraulic fluids are sometimes assumed as such.

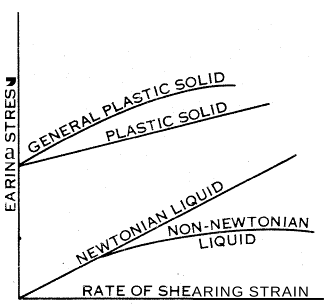

FIG. 6.—RHEOLOGY CHART (*see* TEXT)

All materials used as lubricants, whether gas, liquid or solid, are considered either Newtonian fluids or Bingham plastic solids. *See* also Index references under "Lubrication" in vol. 24.

LUCAN (MARCUS ANNAEUS LUCANUS) (A.D. 39–65), Latin poet who wrote the Bellum *Civile,* better known as the *Pharsalia,* a historical epic more remarkable for rhetoric than poetry though with flashes of poetic fire. Born at Corduba (Cordova). Sp., grandson of the older, and nephew of the younger, Seneca, he was educated at Rome, among his teachers being the Stoic, Cornutus, who also taught the satirist Persius. He was given a quaestorship by Nero, but it was not long before his republican opinions were outraged by Nero's tyrannous conduct, and in the year 65 he was one of the leaders (*paene signifer,* says Suetonius in his life of Lucan) in Piso's conspiracy to assassinate Nero (although Tacitus says that he was also embittered because Nero had forbidden him to give public recitations of his poetry). When the conspiracy was discovered, he was compelled to commit suicide by opening a vein. While he was dying, Tacitus records: "he remembered a poem composed by himself, in which he had told of a wounded soldier dying by the same kind of death. He repeated the lines, and that was his last utterance."

The Bellum Civile, his only surviving poem, is an epic of the war between Caesar and Pompey, carried down to the arrival of Caesar in Egypt after the murder of Pompey, until in the tenth book it abruptly stops. Lucan was not a great poet, but he was a great rhetorician and had remarkable political and historical insight for so young a man, though it must be admitted that his hatred of Caesar and his admiration for Pompey are both excessive. The work is naturally imitative of Virgil, his predecessor in Latin epic, but Lucan dismisses the gods from his scene, a wise precaution in a poet dealing with not too distant history.

The narrative is not always clear and is marred by overlong speeches and digressions, particularly on geographical matters, although his interest in geography does not often enable him to make his battles intelligible. He is not as dramatic as Virgil; sometimes, as in the account of Pompey's murder, because the writing is perfunctory and sometimes because he exaggerates or strains after rhetorical effect. Although the style and vocabulary are usually commonplace and the metre is monotonous, the rhetoric is often lifted into real poetry by its energy and fire, like Byron's, and appears at its best in the magnificent funeral speech of Cato on Pompey. Pompey's parting with his wife (in book v) is also very fine; and scattered through the poem are noble sayings and telling comments, expressed with the terse vigour and directness of which the Latin language has such command. As the poem proceeds, the poet's republicanism becomes more and more marked, no doubt because, as Nero's tyranny grew, he began to look back with greater longing to the old Roman republic; yet it is true that he does not make the republicanism of Pompey seem either attractive or effective. It has been said that Cato, who appears very little until after Pompey's death, is the real hero of the epic, and certainly the best of Lucan's own Stoicism appears in the noble courage and endurance of his Cato, in continuing the hopeless struggle after Pompey had failed.

LUCANIA (or Basilicata), a region of southern Italy, comprising the provinces of Matera and Potenza, part of the ancient Lucania. It is bounded on the north by the province of Foggia, northeast by those of Bari and Lecce, east by the Gulf of Taranto (for a distance of 24 mi.), south by the province of Cosenza and west by the Mediterranean and the provinces of Salerno and Avellino. Area 3,856 sq.mi. The region is mountainous, with Mt. Pollino (7,375 ft.), the highest peak in the southern Apennines, on the boundary of Cosenza; Mt. Vulture (4,354 ft.) at the northwestern extremity, is an extinct volcano. The mountains descend by a gradual slope to the coastal plain of the Gulf of Taranto. Five rivers, the Bradano (anc. Bradanus), Basento (Casuentus), Cavone or Salandrella, Agri (Aciris) and the Sinni (Siris) run southeast or east into the gulf. The railway from Naples to Taranto and Brindisi passes through Potenza and meets the east coast line from Taranto to Reggio di Calabria at Metaponto. Branch lines run elsewhere through Lucania. The mountains are still to some extent clothed with forests; in places the soil is fertile, especially along the Gulf of Taranto. Olive oil is the most important product. Pop. (1951) 627,586. There are no large towns.

The ancient Lucania extended from the Tyrrhenian sea on the west to the Gulf of Tarentum on the east. To the north it adjoined Campania, Samnium and Apulia and to the south it was separated by a narrow isthmus from the district of Brutii. It thus comprised almost all the area of the modern Lucania together with the greater part of the province of Salerno and a part of Cosenza. As in the modern region, almost the whole of ancient Lucania was occupied by the Apennines. Two important rivers of the ancient province, the Crathis (mod. Crati), forming its southern limit and the Silarus (Sele), constituting its northern boundary, are not included in the smaller modern Lucania.

Lucania was so-called from the Lucani (Lucanians) who conquered it about the middle of the jth century B.C. Before that it was included under the general name of Oenotria, applied by the Greeks to southernmost Italy. The mountainous interior was occupied by Oenotrians and Chones, while on the coasts on both sides were powerful Greek colonies which doubtless exercised a protectorate over the interior (see MAGNA GRAECIA). The Lucanians were a southern branch of the Samnite or Sabelline group, who spoke Oscan (*q.v.*). After much intertribal conflict they fought the Tarentines and Alexander, king of Epirus, who was called in by that people to their assistance, 326 B.C. In 298 B.C. they made alliance with Rome, and Roman influence was extended by the colonies of Venusia (291 B.C.), Paestum (273) and above all Tarentum (272). On the landing of Pyrrhus in Italy (281 B.C.) they were among the first to declare in his favour and found themselves exposed to the resentment of Rome when the departure of Pyrrhus left his allies at the mercy of the Romans. After several campaigns they were reduced to subjection (272 B.C.). They sided with Hannibal during the Second Punic War (216 B.C.), and their territory during several campaigns was ravaged by both armies. The country never recovered from these disasters, and under the Roman government fell into decay, to which the Social War, in which the Lucanians took part with the Samnites against Rome (90–88 B.C.) gave the finishing stroke. For administrative purposes under the Roman empire, Lucania was always united with the district of the Bruttii. The two together constituted the third region of Augustus.

The towns on the east coast were Metapontum, a few miles south of the Bradanus; Heraclea, at the mouth of the Aciris; and Siris, on the river of the same name. Close to the southern frontier stood Sybaris, destroyed in 510 B.C., but subsequently replaced by Thurii. On the west coast stood Posidonia, known under the Romans as Paestum; below came Elea or Velia, Pyxus, called by the Romans Buxentum, and Laus, near the frontier of the province toward Bruttium. Of the towns of the interior the most considerable was Potentia, still called Potenza. To the north, near the frontier of Apulia, was Bantia; due south from Potentia was Grumentum, and still farther in that direction were Nerulum and Muranum. In the upland valley of the Tanagrus, a tributary of the Silarus, were Atina, Forum Popilii and Consilinum; Eburi (Eboli) and Volceii (Buccino), though to the north of the Silarus, were also included in Lucania. The Via Popillia traversed the district from north to south, entering it at the northwest extremity; the Via Herculia, coming southward from the Via Appia and passing through Potentia and Grumentum joined the Via Popillia in the southwest of the district; another nameless road followed the east coast. (T. A.; X.)

LUCARIS, CYRILLOS (1572–1637), Greek prelate and theologian, was a native of Crete. In his youth he travelled, studying at Venice and Padua, and at Geneva coming under the influence of the reformed faith as represented by Calvin. In 1602 he was elected patriarch of Alexandria, and in 1621 patriarch of Constantinople. He was the first great name in the Orthodox Eastern Church since 1453 and dominates its history in the 17th century. The great aim of his life was to reform the church on Calvinistic lines, and to this end he sent many young Greek theologians to the universities of Switzerland, Holland and England. In 1629 he published his famous *Confessio,* Calvinistic in doctrine, but as far as possible accommodated to the language and creeds of the Orthodox Church. It appeared the same year in two Latin editions, four French, one German and one English, and in the Eastern Church started a controversy which culminated in 1672 in the convocation by Dositheos, patriarch of Jerusalem, of a synod by which the Calvinistic doctrines were condemned. Lucaris was several times temporarily deposed and banished at the instigation of his orthodox opponents and of the Jesuits, who were his bitterest enemies. Finally, when Sultan Murad was about to set out for the Persian War, the patriarch was accused of a design to stir up the Cossacks, and to avoid trouble during his absence the sultan had him killed (June 163;).

See the article "Lukaris" by P. Meyer in Herzog-Hauck, *Realencyklop.,* 3rd ed (Leipzig, 1902), which gives further authorities.

LUCARNE, a French architectural term for a dormer window; in English usage. applied to the dormer windows of spires.

LUCAS, CHARLES (1713–71), Irish physician and politician, was an apothecary in Dublin. He issued in 1748–49 a series of political addresses; the house of commons voted him an enemy to the country and issued a proclamation for his arrest. Lucas escaped to the continent and qualified in medicine at Leyden in 1;52. In 1753 he started practice in London. He was elected member for the city of Dublin in 1761, his colleague in the representation being the recorder, Henry Grattan's father. On the appointment of Lord Halifax as lord lieutenant in the same year Lucas wrote him a long letter (Sept. 19, 1761, manuscript Irish State Paper office) setting forth the grievances which Ireland had suffered in the past. His contributions to the press and his *Addresses to the Lord Mayor* and other political pamphlets made him one of the most popular writers in Ireland. He died on Nov. 4, 1771.

See R. R. Madden, *History of Irish Periodical Literature from the End of the 17th to the Middle of the 19th Century,* 2 vol. (1867); Francis Hardy, *Memoirs of the Earl of Charlemont,* 2 vol. (1812); W E H Lecky, *History of Ireland in the 18th Century,* vol. i, ii (1892).

LUCAS, EDWARD VERRALL (1868–1938), British man of letters, was born at Brighton and educated at University college. London. He then started journalism, working first on a Sussex newspaper. then in London with the *Globe,* and became a frequent contributor to *Punch* and later its assistant editor. He acted for many years as publisher's reader to the firm of Methuen and became head of this company after the death of its founder (1925). He is best known as a light essayist. His edition of the *Letters of Charles and Mary Lamb* (1903–05) and his *Life of Lamb* (1905) showed how congenial was his talent with that of Elia. He wrote many charming books of travel impressions, among these being *A Wanderer in Holland* (1905), *A Wanderer in London* (1906) and *A U7anderer in Paris* (1909), and his books on art showed powers of wide appreciation, as in *The British School* (1913), *Vermeer of Delft* (1922), *John Constable* (1924). *Vermeer the Magical* (1929).

LUCAS, JOHN SEYMOUR (1849–1923), English painter, was born in London, Dec. 21, 1849, and was a student at the Royal Academy schools. He was elected A.R.A. in 1886 and R.A. in 1898, and was a constant exhibitor of pictures of historical and domestic incidents, notably of the Tudor and Stuart periods. One of his works is a panel in the Royal exchange, representing William the Conqueror granting the first charter to the city (exhibited R.A. 1898); and one of his earlier pictures, "After Culloden: Rebel Hunting" (R.A. 1884), is in the Tate gallery. He died at Southwold. Suffolk, May 8, 1923.

LUCAS VAN LEYDEN (LUCAS HUGENSZ or JACOBSZ; known in Italy as LUCA D'OLANDA) (1494–1533), Dutch painter and engraver, has been described as the greatest of the Dutch artists who laid the foundation of 17th-century Dutch painting. He was probably born at Leyden, where, according to Karel van Mander, he was taught by his father Huygh Jacobsz before entering the studio of Cornelis Engelbrechtsen. According to the same author, he painted at the age of 12 a "Legend of St. Hubert," for which he was paid a dozen florins He was only 14 when he finished a plate representing Mohammed taking the life of Sergius, the monk. At 15 he produced a series of nine plates for a "Passion," a "Temptation of St. Anthony," and a "Conversion of St. Paul." The list of his engravings in 1510 includes subjects as various as a celebrated "Ecce Homo," "Adam and Eve expelled from Paradise," a herdsman and a milkmaid with three cows and a "Woman with a Dog." According to Albrecht Durer's diary, Dürer met Lucas at Antwerp and exchanged the Dutchman's prints for his own and drew his portrait (British museum). The effect of this contact with the great German artist is traceable in Lucas' drawings. He is likely to be the "Lucas de Hollandere, scildere," who registered at the Antwerp guild in 1522. In 1527 he made a tour of the Netherlands, giving dinners to the painters of the guilds of Middleburg. Ghent. Malines and Antwerp. The journey ruined his health; after a long illness he died at Leyden in 1533.

After Durer, Lucas was the most important engraver of his time. Existing engravings ascribed to him number 172. He also designed a number of woodcuts. and about 20 pictures by him are in public and private collections. Early works are the "Chess Players" in the Berlin museum; the "Beheading of John the Baptist" in the Johnson collection. Philadelphia; the triptych of the "Epiphany" in the Barnes collection, Philadelphia; the triptych of the "Last*Supper" in the Aachen museum; "Lot and his Daughters" at the Louvre, Paris; the "Temptation of St. Anthony" in the Brussels gallery; and a remarkable self-portrait in the Brunswick museum. Then follow the paintings in a more fluent style—"St. Jerome" and "The Virgin Enthroned" in Berlin;

the "Card Players" at Wilton house; the "Predication" in the Rijksmuseum, Amsterdam, and a portrait in the National gallery.

In 1522 he painted the "Virgm and Child With the Magdalen and a Kneeling Donor" (gallery of Munich). His manner was then akin to that of Mabuse. The "Last Judgment" (commissioned in 1526), in the town gallery of Leyden, is composed on the traditional lines yet some of the heads are painted with great delicacy and modeled with exquisite feeling. His last important work was a triptych now at the Hermitage at Leningrad (executed, according to Van Mander, in 1531),.representing the "Blind Man of Jericho Healed by Jesus Christ." Here may be observed great finish and warm flesh tints with a gaudy scale of colours.

BIBLIOGRAPHY.—Martin Conway, *The Van Eycks and Their Followers* (1921); M. Friedlaender, *Die Altn. Malerei*, vol. 10 (1932). and *Lucas van Leyden* (1932).

LUCCA, town and archiepiscopal see of Toscana, Italy (anc. Luca), capital of the province of Lucca, 13 mi. N.E. of Pisa by rail. Pop. (1957 est.) 86,995 (commune). It is 62 ft. above sea level, in the valley of the Serchio. and looks out for the most part on hills and mountains. The fortifications, pierced by four gates, begun in 1504 and completed in 1645, are well preserved and picturesque, with projecting bastions planted with trees.

The city is well built and has numerous churches, mainly of well-marked basilican type, having richly decorated exteriors, fine apsidal ends and quadrangular campaniles, in some cases with battlemented summits, and windows increasing in number as they ascend. They follow Pisan style. The cathedral of St. Martin was begun in 1060 by Bishop Anselm (later Pope Alexander II); but the apse with its tall columnar arcades and the campanile are probably the only remnants of the early edifice, nave and transepts having been rebuilt in Gothic style (14th century), while the west front is by Guidetto (identified with Guido Bigarelli of Como) (1204) and "consists of a vast portico of three magnificent arches, and above them three ranges of open galleries." The ground plan is a Latin cross, the nave being 273 ft. in length and 84 ft. in width, and the transepts 144 ft. in length. In the nave is a little octagonal shrine for the most precious of the relics of Lucca, a cedarwood crucifix, carved, according to legend, by Nicodemus, and miraculously conveyed to Lucca in 782. The Sacred Countenance *(Volto Santo)* of the Saviour is shown three times a year. The chapel was built in 1484 by Matteo Civitali, a local sculptor (1436–1501). The cathedral contains several other works by him —the tomb of P. da Noceto, and the altar of S. Regulus as well as the tomb of Ilaria del Caretto by Jacopo della Quercia of Siena. In the cathedral choir is good stained glass of 1485. The church of St. Michael, founded in the 8th century, and built of marble within and without, has a magnificent western façade (12th–13th century, as that of the cathedral)—an architectural screen rising much above the roof of the church. The interior is good but rather bare. The basilican church of S. Martino at Arliano near Lucca belongs to the first half of the 8th century. S. Frediano or Frigidian dates originally from the 7th century, but was built in Romanesque style in 1112–1147, though the interior, originally with four aisles and nave, shows traces of the earliest structure; the front occupies the site of the ancient apse; in one of its chapels is the tomb of Santa Zita, patroness of servants and of Lucca itself. In S. Francesco, a fine Gothic church, is the tomb of Castruccio Castracane (d. 1328). San Giovanni (originally of the 12th century), S. Cristoforo, S. Giusto, San Romano (rebuilt in the 17th century, by Vincenzo Buonamici), and Santa Maria Forisportam (of the 12th century) also deserve mention.

Among secular buildings are the old ducal palace, begun in 1578 by Ammanati, and later the residence of the prefect and seat of the provincial officers and the public picture gallery; the early Renaissance Palazzo Pretorio. or former residence of the podestà, the seat of the civil and correctional courts; the palace, erected in the 15th century by a member of the Guinigi family, of brick. in Italian Gothic, the 16th-century palace of the marquis Guidiccioni, a depository for the archives. the earliest documents going back to A.D. 790. The Palazzo Mansi contains a collection of Dutch pictures. There are several other fine late 16th-century palaces. The principal marketplace in the city has taken possession of the arena of the ancient amphitheatre, the outer arches of which can still be seen in surrounding buildings. The whole building, belonging probably to the early Empire, measured 135 by 105 yd., and the arena 87½ by 58 yd. The outline of the ancient theatre can be traced in the Piazza delle Grazie, and some substructure walls are preserved. The ancient forum was on the site of the Piazza S. Michele. Remains of the city walls have also been found. The rectangular disposition of the streets in the centre of the town is a survival of Roman times. The archiepiscopal library and archives are also important, while the treasury contains some fine goldsmith's work, including the 14th-century Croce dei Pisani, made by the Pisans for the cathedral.

The river Serchio affords water power for numerous factories. The most important industries are the manufacture of jute goods (carried on at Ponte a Moriano in the Serchio valley, 6 m. N. of Lucca), tobacco, silks and cottons. The silk manufacture was introduced about the close of the 11th century, and in the early 16th formed the means of subsistence for 30,000 of its inhabitants. The bulk of the population is engaged in agriculture. The water supply is maintained from the Pisan mountains by an aqueduct with 459 arches, built in 1823–32.

The ancient Luca, commanding the valley of the Serchio, is first mentioned as the place to which Sempronius retired in 218 B.C. before Hannibal, after his defeat at the Trebia (*q.v.*). It was there that Julius Caesar in 56 B.C. held his famous conference with Pompey and Crassus; Luca was then still in Liguria, not in Etruria. In the Augustan division of Italy Luca was assigned to the 7th region (Etruria); it was a meeting point of roads—to Florentia, Parma, Luna and Pisae. Though plundered and deprived of part of its territory by Odoacer, Luca appears as an important city and fortress at the time of Narses, who besieged it for three months in A.D. 553, and under the Lombards it was the residence of a duke or marquis and had the privilege of a mint.

The dukes gradually extended their power over all Tuscany, but after the death of the famous Matilda the city began to constitute itself an independent community, and in 1160 it obtained from Welf VI, duke of Bavaria and marquis of Tuscany, the lordship of all the country for 5 mi. around. on payment of an annual tribute. Occupied by the troops of Louis of Bavaria, sold to a rich Genoese Gherardino Spinola, seized by John, king of Bohemia, pawned to the Rossi of Parma, by them ceded to Martino della Scala of Verona, sold to the Florentines, surrendered to the Pisans, nominally liberated by the emperor Charles IV and governed by his vicar, Lucca managed, at first as a democracy, and after 1628 as an oligarchy, to maintain "its independence alongside of Venice and Genoa, and painted the word Libertas on its banner till the French Revolution." In 1546 Francesco Burlamacchi made a noble attempt to give political cohesion to Italy, but perished on the scaffold (1548); his statue by Ulisse Cambi was erected on the Piazza San Michele in 1863. As a principality formed in 1805 by Napoleon in favour of his sister Elisa and her husband Felice Baciocchi, Lucca was for a few years wonderfully prosperous. It was occupied by the Neapolitans in 1814; from 1817 to 1847 it was governed as a duchy by Maria Luisa, queen of Etruria, and her son Charles Louis; and it afterward formed one of the divisions of Tuscany.

(T. A.)

LUCCA, BAGNI DI (Baths of Lucca), town of Toscana, Italy, province of Lucca, containing a number of famous watering places in the valley of the Lima. a tributary of the Serchio. Pop. (1957 est.) 11,471 (commune). Ponte a Serraglio (16 mi. north of Lucca by rail) is the principal village, but there are warm springs and baths also at Villa and Bagni Caldi. The springs do not seem to have been known to the Romans. The temperature of the water varies from 98° to 130" F.; in all cases it gives off carbonic acid gas and contains lime, magnesium and sodium products. In the valley of the Serchio, 3 mi. below Ponte a Serraglio, is the medieval Ponte del Diavolo (1322), with its lofty central arch.

LUCCEIUS, LUCIUS, Roman orator and historian, friend and correspondent of Cicero. Disgusted at his failure to become consul in 60, he retired from public life and devoted himself to writing a history of the social and civil wars. Cicero wrote to him asking him to write a history of his (Cicero's) consulship and offering to supply the material.

Nothing remains of any such work or of his history. In the civil war he took the side of Pompey but was pardoned by Caesar and returned to Rome.

See Cicero's *Letters* (ed. Tyrrell and Purser), especially *Ad Fam.* v. 12; and Orelli, *Onomasticon Tullianum.*

LUCCHESI, ANDREA (1741–*c.* 1800), Italian musician and composer, was born in hiotta, Venice. on May 28. 1741. In his youth he studied under Paolucci. Seratelli and Cocchi. In 1771 he went to Bonn, Ger.. and in 1774 he succeeded the grandfather of Ludwig von Beethoven as conductor of the court orchestra. Under him Beethoven, then only a boy, played the viola in the orchestra. Lucchesi composed eight operas, two symphonies, six sonatas for violin and cembalo, four piano quartets and some church music.

LUCCHESINI, GIROLAMO (1751–1825), Prussian diplomatist, was born at Lucca on May 7. 1751, the eldest son of Marquis Lucchesini. In 1779 he entered the service of Frederick the Great in Berlin. Frederick William II sent him in 1787 to Rome to obtain the papal sanction for the appointment of a coadjutor to the bishop of Mainz, with a view to strengthening the German Fiirstenbund.

In 1788 he was sent to Warsaw and brought about a rapprochement with Prussia and a diminution of Russian influence at Warsaw. Frederick William was at that time intriguing with Turkey, then at war with Austria and Russia. Lucchesini was to rouse Polish feeling against Russia and to secure for Prussia the concourse of Poland in the event of war with Austria and Russia. He concluded a Prusso-Polish alliance in March 1790, and in the autumn of that year was sent to Sistova. where the terms of peace between Austria and Turkey were being discussed. Before he returned to Warsaw his treaty was a dead letter and Prussia was contemplating the second partition of Poland. Lucchesini was recalled and employed on the Rhine in liquidating the intervention in the French Revolution.

In 1793 he was appointed ambassador to Vienna, with the ostensible object of securing financial assistance for the Rhenish campaign. His anti-Austrian bias made him extremely unpopular with the Austrian court. which began asking for his recall in 1795. The request was granted in 1797.

In 1800 he was sent by Frederick William III on a special mission to Paris. Napoleon, too, sought his recall but eventually (in 1802) accepted him as regular ambassador. He consistently sought friendly relations between France and Prussia but was unsuccessful and was superseded as ambassador just before the outbreak of war between the two countries in 1806. After the Prussian defeat at Jena he tried to negotiate terms of peace, but his first draft was refused by Napoleon and his second by Frederick William.

He was dismissed from the Prussian service and joined the court of Elisa, grand duchess of Tuscany and after Napoleon's fall devoted himself to writing. He died on Oct. 20, 1825.

He published in 1819 three volumes, *Sulle cause et gli effetti della confederazione rhenana,* at Florence. His memoirs remained in ms. His dispatches were edited by Bailleu in *Preussen und Frankreich* (1887, *Publikationen aus den preussischen Staatsarchiven).*

LUCE,. CLARE BOOTHE (1903–), U.S. playwright and public official, was born in New York. N.Y., April 10, 1903. Privately educated in Garden City and Tarrytown, N.Y., she was associate editor of *Vogue* in 1930; associate editor and managing editor of *Vanity Fair* from 1930 to 1934. After having been divorced from her first husband. George Tuttle Brokaw, in 1929, she married Henry R. Luce (*q.v.*) in 1935. Mrs. Luce wrote a number of plays. including *The Women* (1936) and *Kiss the Boys Goodbye* (1938), satires on two phases of American life; and *Margin for Error* (1939), an anti-Fascist play. She also wrote the books *Stuffed Shirts* (1931) and *Europe in the Spring* (1940). She was Republican congresswoman from Connecticut in the 78th and 79th congresses. In Feb. 1953 Pres. Dwight D. Eisenhower appointed her ambassador to Italy, from which post she resigned in 1956 because of ill health.

LUCE, HENRY ROBINSON (1898–), U.S. magazine editor and publisher, was born in Tengchow, China, on April 3, 1898. son of Henry Winters Luce, a Presbyterian missionary. He was sent to the United States at 15 to attend Hotchkiss school, graduated from Tale in 1920 and later studied for a year at Oxford. After a brief reporting career on Chicago and Baltimore newspapers. Luce and a Yale classmate Briton Hadden. founded the weekly news magazine *Time* in 1923 on an investment of $86.000 and with 12,000 subscribers. Attracting attention by brightness, eccentricities of style, accent on personalities and editorial orderliness, *Time* was an immediate success. Hadden died in 1929.

Heading Time Inc., Luce founded *Fortune,* a monthly magazine of business, in 1930; *Life,* a weekly with its main emphasis on pictures in 1936; and *Sports Illustrated,* a weekly, in 1954. The newsreel "March of Time" was produced from 1931 to 1953. Time Inc, purchased *Architectural Forum* in 1932, and 20 years later split from it *House & Home*. The gross income of Time Inc. by 1955 was $200,000,000; it was one of the most influential and profitable publishing concerns in the world.

After divorce from his first wife, the former Lila Ross Hotz, Luce married in 1935 Clare Boothe *(see* LUCE, CLARE BOOTHE).

(F. L. MT.)

LUCE, JOHN (1870–1932), British admiral, was born Feb. 4, 1870, in England. In the Battle of Falkland Islands in World War I, he commanded the light cruiser H.M.S. "Glasgow," which, with the nelp of another British ship, sank the German cruiser "Leipzig." From 1921 to 1924, he was admiral superintendent of the Malta dockyard. In 1925 he was retired and in 1930–31 he served as high sheriff of Wiltshire. Luce died Sept. 22, 1932.

LUCE, STEPHEN BLEECKER (1827–1917), U.S. naval officer, first president of the Naval War college, was born in Albany, N.Y., March 25, 1827, and became a midshipman in Oct. 1831. As a young officer he became interested in the training of seamen for the navy and for the merchant marine; this interest developed into practical plans and methods for the improvement of naval education in general.

Luce was chosen for duty at the U.S. Naval academy, where he produced an excellent textbook on seamanship. A practical and efficient seagoing officer as well as a teacher of theories, he was a successful commanding officer of fighting ships, during the Civil War, and of training vessels. He is best known for the development of the Naval War college, at Newport, R.I., becoming the first president. Oct. 6, 1884. The U.S. army and many foreign navies afterward copied this idea of higher professional education for officers. When he became a rear admiral in 1886, Luce was succeeded as head of the War college by Alfred Thayer Mahan (*q.v.*), whom he had chosen for the faculty. After his retirement, in 1889, he continued as a special adviser at the War college until 1910. He died July 28, 1917. (J. B. HN.)

LUCENA, a municipality (with administrative centre and 15 *barrios* or districts) and capital of Quezon (the second largest province in Luzon, called Tayabas until 1946), Philippine Islands, located near Tayabas bay along the route of the Manila-Hondagua railway line, and 133 mi. from Manila. Pop. (1948) 33,092.

Lumbering is an important industry, and a planing and sawmill were established there. Good automobile roads lead to other towns, and Lucena is a commercial centre.

The inhabitants represent various Malay strains and some of the aboriginal Negritos are found in the adjacent region. Tagalog and Bikol are the leading vernaculars, but other dialects are also used.

LUCENA, a town of Spain, in the province of Cbrdova, 37 mi. S.S.E. of Cbrdova, on the Madrid-Algeciras railway. Pop. (1950) mun., 36,181. Lucena is situated on the Cascajar, a minor tributary of the Genil. The parish church dates from the beginning of the 16th century.

The chief industries are the manufacture of matches, brandy and pottery, especially the large earthenware jars (*tinajas*), used throughout Spain for the storage of oil and wine. There is considerable trade in agricultural produce, and the horse fair is famous throughout Andalusia. Lucena was taken from the Moors early in the 14th century. King Boabdil of Granada was taken prisoner in 1483 in the attempt to recapture it.

LUCERA, town and episcopal see, Apulia, Italy, province of Foggia $12\frac{1}{2}$ mi. W.N.W. of the town of Foggia by rail. Pop. (1936) 17,472 (town), 18,447 (commune). It is upon a lofty plateau, the highest point of which (823 ft.), projecting west, was the ancient citadel, which is occupied by the immense and well-preserved castle of Frederick II (1233), who lived there in oriental splendour. It was later enlarged by Charles I of Anjou. It is the largest mediaeval fortress in Apulia, and within it was the palace, the treasury, the mint, the harem and a menagerie of wild beasts. The cathedral, originally Romanesque but restored after 1300, is in the Gothic style. The interior was restored in 1882. The town occupies the site of the ancient Luceria, the key of the whole country. According to tradition the temple of Minerva, founded by Diomede, contained the Trojan Palladium, but in history it is first heard of as on the Roman side in the Samnite Wars (321 B.C.), and in 315 or 314 B.C. a Latin colony was sent there. It is mentioned in subsequent military history, and its position on the road from Beneventum, via Aecae (mod. Troja) to Sipontum, gave it some importance.

Its wool was also renowned. It contains no ancient remains above ground, though mosaic pavements have been found and there are traces of the foundations of an amphitheatre outside the town on the east. The town hall contains a statue of Venus, a mosaic and some inscriptions.

In 663 it was destroyed by Constans II and was only restored in 1223 by Frederick II, who transported 20,000 Saracens thither from Sicily. They were at first allowed religious freedom, but many were slaughtered and the rest became Christians under compulsion in 1300. Up to 1806 Lucera was the capital of the provinces of Basilicata and Molise.

See A. Haseloff, *Bauten der Hohenstaufen in Unteritalien,* vol. i, pp. 97 ff. (1914).

LUCERNE (Ger. Luzern), a canton of Switzerland. Its total area is 575 sq.mi., of which about 90% is classed as productive (forests covering nearly one-fifth of the total). It contains no glaciers or eternal snows, its highest points being the Brienzer Rothhorn (7,710 ft.) and Pilatus (6,959 ft.), the Rothstock summit (5,453 ft.) and the Kaltbad inn, both on the Rigi. The northern portion of the Lake of Lucerne, the lakes of Sempach and Baldegg and small portions of those of Hallwil and of Zug are in the canton.

Its chief river is the Reuss, which flows through it for a short distance only, receiving the Kleine Emme that flows down through the Entlebuch. In the northern part the Wigger, the Suhr and the Wynen streams flow through shallow valleys, separated by low hills. The canton is fairly well supplied with railways. (For the city of Lucerne, see LUZERN.)

In 1950 the population numbered 223,249 of which the great majority were German-speaking Roman Catholics. Its capital is Luzern; the other towns are Kriens, Willisau, Ruswil, Littau, Emmen and Escholzmatt.

The density of the population is 387 per sq.mi. The peasants, outside the chief centres for foreign visitors, have retained many local customs.

The canton ranks officially third in the Swiss confederation, next after Zurich and Berne. It was formerly in the diocese of Constance and is now in that of Basle. It contains 5 administrative districts and 107 communes. By existing cantonal constitution, the legislature or *Grossrath* is elected on a proportional basis by universal suffrage, while the executive is elected by a popular. vote.

The canton every three years elects nine members to the Conseil National and sends two members to the Conseil des Etats (federal council). Citizens have the right of "initiative" as to constitutional amendments or legislative projects.

The canton is composed of the vanous districts which the town acquired, the dates being those at which the particular region was finally secured—Weggis (1380), Rothenburg, Kriens, Horw, Sempach and Hochdorf (all in 1394), Wolhusen and the Entlebuch (1405), the so-called "Habsburger region" to the N.E. of the town of Luzern (1406), Willisau (1407), Sursee and Beromunster (1415), Malters (1477) and Littau (1481), while in 1803, in exchange for Hitzkirch, Merenschwand (held since 1397) was given up.

LUCERNE, LAKE OF, the name usually given by foreigners to the principal lake of central Switzerland. In French it is called the *Lac* des Quatre Cantons, and in German the *Vier*waldstattersee, the cantons being Lucerne, Unterwalden, Uri and Schwyz. It is named after Lucerne, at the west end, where the Reuss issues from the lake, after having entered it at Flüelen at the east end; the Muota enters the lake at Brunnen (north) and two mountain streams, the Engelberg and the Sarnen Aa, at Buochs and Alpnachstad respectively (south). The lake is most beautifully situated between steep limestone mountains, the best known being the Rigi (north) and Pilatus (southwest), and great promontories thrust themselves into its waters, such as Horw (south j, Bürgenstock (south), Meggenhorn (north) and Seelisberg (south), giving it a romantic irregularity. It occupies an old terminal basin of a glacier and along its shores are evidence of damming by moraines.

It is composed of four main basins (with two side basins), which represent four different valleys, orographically distinct, and connected only by narrow and tortuous channels. There is, first, the most easterly basin, the Bay of Uri, extending from Flüelen (south) to Brunnen (north). At Brunnen the delta of the Muota forces the lake west, so that it forms the Bay of Gersau or the Gulf of Buochs, from the promontory of Seelisberg (east) to that of Burgenstock (west). Another narrow strait between the two "Noses" (Nasen) leads west to the Basin of Weggis, between the Rigi (north) and the Biirgenstock promontory (south). This bay forms the eastern arm of the "Cross of Lucerne," the western arm being the Bay of Lucerne, the northern arm the Bay of Kussnacht and the southern arm that of Hergiswil, prolonged southwestward by the Bay of Alpnach, with which it is joined by a narrow channel, spanned by the Acher iron bridge. The Bay of Uri offers the sternest scenery, and at Brunnen the Everlasting league of 1315 was made, while the legendary place of meeting of the founders of Swiss freedom was the meadow of the Rütli (purchased by the Confederation in 1859), and the site of Tell's leap is marked by the Chapel of Tell (east).

In the Bay of Gersau is the village of Gersau (north), an independent republic (1390–1798), and now in Schwyz (1818 onward). In the next basin to the west is Weggis (north), and on the northern shore of the lake is Vitznau, whence a rack railway leads up to the top of the Rigi ($4\frac{1}{4}$ mi.), while on the southern shore of the lake is Kehrsiten, with electric railway to the Bürgenstock promontory. The town of Lucerne is connected with Flüelen by the St. Gotthard railway. On the promontory between Lucerne and Kussnacht stands the castle of New Habsburg, while from Kussnacht a motor road leads through the "Hollow Way" (Hohle *Gasse*), the scene of the legendary murder of Gessler by William Tell.

The western shore of the southern arm is traversed from Horw to Alpnachstad by the Brunig railway ($5\frac{1}{2}$ mi.), which continues toward Sarnen (Obwalden) and the Bernese Oberland, and southwest from Alpnachstad, whence a rack railway leads northwest up Pilatus ($2\frac{3}{4}$ mi.).

Lucerne is the only town of importance, but several spots serve as ports for neighbouring villages (Brunnen for Schwyz, Fliielen for Altdorf, Stanstad for Stans, Alpnachstad for Sarnen). Most of the villages are summer resorts (Gersau also in winter), especially Hertenstein, Weggis, Gersau, Brunnen, Beckenried and Hergiswil, while hotels have been built on heights above, as well as on the Rigi, Pilatus and the Stanserhorn. The area of the lake is 44 sq.mi., and it is about 24 mi. long. At its broadest point, the Lake of Lucerne is only 2 mi. wide; at its greatest depth it is 702 ft.; while the surface of the water is 1,424 ft. above sea level.

Parts of the lake are in the cantons of Lucerne ($15\frac{1}{2}$ sq.mi.), Nidwalden (13 sq.mi.), Uri ($7\frac{1}{2}$ sq.mi.), Schwyz ($7\frac{1}{2}$ sq.mi.) and 1 sq.mi. in Obwalden.

LUCERNE: see ALFALFA.

LUCHAIRE, ACHILLE (1846–1908), French historian, whose original work on the Capetians had great value, was born in Paris on Oct. 24, 1846, and died there on Nov. 4, 1908. In 1879 he became a professor at Bordeaux and in 1889 professor of medieval history at the Sorbonne; in 1895 he became a member of the Académie des Sciences Morales èt Politiques. The most important of Achille Luchaire's works are *Histoire des institutions monarchiques de la France sous les premiers Capétiens* (1883 and again 1891); *Manuel des institutions françaises: pkriode des Cape'tiens directs* (1892); *Louis VI le Gros, annales de sa vie et de son règne* (1890); *Etude sur les actes de Louis VII* (1885); *Innocent III* (6 vols., 1904–08); and contributions on the 13th century to E. Lavisse's great history of France.

LUCHOW (LU-CHOU, LU-HSIEN), a river port, road and regional trade centre on the Yangtze river in southwestern Szechwan province, China. Pop. (1953) 289,000. The city is located at the mouth of the T'o Chiang (sometimes Lu river), navigable in its lower course much of the year by native craft. Luchow is an old trade and transport centre, on the Yiinnan-North China route, and a distributing centre for salt and sugar, these products being produced at Tzu-liu-ching and Nei-chiang, to the north.

LUCHU ISLANDS: *see* RYŪKYŪ ARCHIPELAGO.

LUCIAN, SAINT (LUCIAN OF ANTIOCH, LUCIAN THE MARTYR) (d. 312), Christian theologian and martyr, was born at Samosata. His parents, who were Christians, died when he was 12. In his youth he studied under Macarius of Edessa, and after receiving baptism he adopted a strictly ascetic life. Settling at Antioch (*q.v.*) he became a presbyter, and is regarded as the founder of the theological school of Antioch. He is represented as the connecting link between Paul of Samosata and Arius (*qq.v.*), but his identification with the heretic of the same name referred to by Alexander of Alexandria (Theodoret, *Church History*, i, 3, 4) has been questioned. However, Arius seems to have been among his pupils. In any case he was in good standing at the outbreak of persecution, and the reputation won by his high character and learning was confirmed by his courageous martyrdom.

Lucian was carried to Nicomedia before Maximin Daza, and persisting in his faith perished on Jan. 7, 312 under torture and hunger, which he refused to satisfy with food offered to idols. His defense is preserved by Rufinus (ix, 6) and Eusebius (*Church History*, ix, 9). His remains were conveyed to Drepanum in Bithynia, and under Constantine the town was founded anew in his honour and exempted from taxes (A.D. 327). There in 387. on the anniversary of his death, Chrysostom delivered the panegyrical homily from which (with notices in Eusebius, Theodoret and the other ecclesiastical historians, the life by Jerome, but especially from the account by Metaphrastes) the facts given above are derived.

Jerome says that Lucian wrote *Libelli de fide* and several letters, but only a short fragment of one epistle remains. The authorship of a confession of faith ascribed to Lucian and put forth at the semi-Arian synod of Antioch (A.D. 341) is uncertain. Lucian's most important literary labour was his edition of the Greek Old Testament corrected by the Hebrew text, which, according to Jerome. was in current use from Constantinople to Antioch. From his work derives the text commonly used until modem times, probably for the New Testament as well. St. Lucian's feast day is Jan. 7. *See* BIBLE: *Old Testament*.

(E. R. HY.)

LUCIAN (Λουκιανός) (*c.* A.D. 125–*c.* 190), Greek sophist and satirist, was born at Samosata (*Hist.* 24), the chief town of Cornmagene in Syria, on the west bank of the Euphrates (*Pisc.* 19). The precise dates of his birth and death are uncertain, and the little that is known of his life is derived from his own works, supplemented by the notice in Suidas: "Lucian of Samosata, surnamed 'the blasphemer,' because in his dialogues he alleges that the things told of the gods are absurd. . . . He was at first an advocate in Antioch, but, having ill success in that, he turned to the composition of discourses, and his writings are innumerable. He is said to have been killed by dogs, he having been rabid against the truth. For in his 'Life of Peregrinus' he attacks Christianity and, wicked man, blasphemes against Christ himself. Wherefore for his madness he suffered meet punishment in this life, and hereafter with Satan he will be inheritor of the everlasting fire." First apprenticed to his uncle, a sculptor (*Somn.* 2), he soon abandoned sculpture for the study of rhetoric, in particular forensic oratory. After practising as an advocate in Antioch he adopted the profession of a sophistic rhetorician, and in this capacity he travelled widely, visiting various parts of Asia Minor, Macedonia, Greece, Italy and Gaul (*Alex.* 57, *Bis accus.* 27, *Apol.* 15, *De electo* 2). In Rome he made the acquaintance of the Platonist Nigrinus, as he describes in the dialogue of that name. About A.D. 165 he settled in Athens, where he made his home for the next 20 years. Here he devoted himself to writing dialogues of a satiric character. Towards the end of his life he accepted an official post in Egypt, defending himself in the *Apologia* against the charge of inconsistency to which he thus exposed himself, he having in his earlier *De mercede conductis* denounced the practice of serving for hire. In this post he seems to have died, but nothing is known as to the date or circumstances.

Under the name of Lucian we have some 79 prose works, and, in addition, two mock tragedies (the theme being gout) and a collection of 53 epigrams. Neither of the tragedies, *Tragodopodagra* and *Ocypus*, is now considered genuine (the latter having apparently been written by the 4th century rhetorician, Acacius, the correspondent of Libanius), nor is much confidence to be placed in the authenticity of the epigrams, which in any case contain nothing notable, save perhaps No. 17 Ἓξ ὧραι μόχθοις ἱκανώταται, αἱ δὲ μετ' αὐτὰς γράμμασι δεικνύμεναι "ζῆθι" λέγουσι βροτοῖς, *i.e.*, Six hours are enough for work; the next four, expressed in letters (ζ', q', θ', ι'), say to men "Live" (in the emphatic sense of "enjoy life" as in Martial's *sera nimis vita est crastina: vive hodie*).

Several of the prose writings are considered spurious on grounds of varying certainty—*Lucius or the Ass*, *Nero Macrobii*, *Philopatris* (written in the 10th century), *Halcyon*, *De sacrificiis*, *De Syria dea*, *De astrologia*, *De parasito*, *De saltatione*, *Calumniae non temere credendum*, *Hippias*, *Charidemus*, *Demosthenis encomium*, *Amores*. The chronological order of his writings is uncertain, but in general the rhetorical works may be regarded as mainly belonging to his earlier period, the satirical dialogues as the work of his maturity, written for the most part during his residence in Athens.

1. Rhetorical Declamations — As typical of these may be named the *Tyrannicide* (a man goes to slay a tyrant but, finding not him but his son, slays the latter, leaving his sword in the wound. The tyrant finds his son slain, takes the sword, and kills himself. The man claims the reward of a tyrannicide); *Phalaris* I. and II. (in I., Phalaris, sending the brazen bull to Delphi, transmits therewith a defence of his own life and conduct; in II., a Delphian priest advises acceptance of the offering); *The Disinherited*, Ἀποκηρυττόμενος (a disinherited son learns medicine and, curing his father's madness, is received again into his family, but refusing to cure his step-mother is again disinherited. He pleads against this sentence); *Praise of the Fly*; *The Trial of the Vowels* (an action is brought by the letter sigma [s] against tau [τ] for the encroachments of the latter in the case of Attic ττ for σσ, etc., the vowels forming the jury).

2. Literary Criticism. — Representative of this type are the *Teacher of Orators*, ironical advice how to become a successful rhetorician by means of claptrap and impudence; *Pseudo-sophist*, a dialogue in which the interlocutors are Lucinus (*i.e.*, Lucian) and a Solecist, and the discussion is of certain solecisms and the distinction of similar words and phrases; *Lexiphanes*, in which the interlocutors are Lucinus and Lexiphanes. The latter recites a *Symposium* composed by himself and packed with far-fetched phraseology and recondite words. Meeting a doctor he receives

an emetic, which cures his distemper by causing him to disgorge a flood of abstruse vocables. There are interesting references to the Altar of Dosiades and the Alexandra of Lycophron. But the best specimen of his literary criticism is contained in the essay How History *Should* be Written, which belongs probably to an early period of his residence in Athens, and which contains sound, if not particularly profound, criticism. The description of the ideal orator (*Hist.* 41) may be quoted: "I would have the historian to be fearless and incorruptible, independent, a lover of frankness and truth, one who, as the comic poet says, will call a fig a fig and a spade a spade; indulging neither hate nor affection, unsparing and unpitying, not shy nor shamefast, an impartial judge, benevolent towards both sides but giving neither more than its due; knowing in his writing no land and no city, bowing to no authority and acknowledging no king, not considering what this man or that will think, but stating facts as they occurred." His remarks on the style appropriate to the historian are also admirable.

3. Biographical Works.—These include On the Dream, which is autobiographical; the Life of *Demonax,* an account of Demonax of Cyprus, a cynic philosopher whose society Lucian enjoyed at Athens (Vit. Demon. 1); Alexander, or the False Prophet, an indictment of the Paphlagonian religious impostor of that name—written after A.D. 180, since in sec. 48 θεὸς Μάρκος, i.e., divus Marcus, implies that M. Aurelius (died March 17, 180) was already dead; On the Death of Peregrinus, written about 166, an account of the death of Peregrinus (Proteus) of Parium, who, after professing Christianity, became a cynic and finally committed suicide by publicly burning himself at Harpina near Olympia in A.D. 165, Lucian being an eye-witness (Peregr. 2). The references to Christianity in this dialogue (11 seq.) and in the Alexander (25 and 38) are of interest, particularly the references to Christ, "that great man who was crucified in Palestine because he introduced this religion into life" (Peregr. 11), to the unsparing devotion of the Christians, and to their beliefs: "for these unhappy men have persuaded themselves that they will be immortal and live for ever; wherefore they despise death and willingly sacrifice themselves. Further, their first lawgiver has persuaded them that they are all brothers one of another, when once they renounce the gods of the Greeks and worship that crucified sophist and live in accordance with his laws" (Peregr. 13).

4. **Romances.**—*Lucius* or the Ass seems not to be genuine. The story is that of one Lucius who, visiting Thessaly, sees his hostess transform herself by a drug into a bird. Trying the same experiment, but using the wrong drug, he turns himself into an ass and goes through various adventures before he is able to procure roses (the antidote to the drug), which he eats and regains human form. The same theme seems to have been used by Lucius of Patrae in the 1st century A.D. (Phot. cod. 129) as it was again by Apuleius in his Metamorphoses in the 2nd century. The True History, in two books, is a novel of adventure, describing the marvellous experiences of certain voyagers who, setting sail from the Pillars of Hercules, are caught up into the air, fight for the men of the moon against the men of the sun over the colonization of the morning star, are swallowed, ship and all, by a huge sea-monster, from which they at last escape and voyage to the islands of the blest, etc. The writer warns the reader at the start: "I write of things which I have neither seen nor suffered nor learned from another, things which are not and never could have been, and therefore my readers should by no means believe them" (V.H. i. 4).

5. Satirical Dialogues.—The satirical dialogues may be taken as the most mature and characteristic work of Lucian. In the *Twice* Accused Lucian is arraigned by Rhetoric on a charge of desertion (κάκωσις). Rhetoric tells how she found him quite a youth, "still a barbarian in speech and all but dressed in the Assyrian fashion, wandering about Ionia and not knowing what to do with himself," and how she educated him in the art of speaking and made him famous, travelling with him not merely in Ionia and Greece but even so far afield as Italy and Gaul (Bis *accus.* 27). Lucian in his reply admits the benefits which he received from Rhetoric, but he pleads that it was only when he found her abandoning the Demosthenic style of oratory for a more meretricious fashion, "decking herself and wearing her hair in the manner of a courtesan, using paint and pencilling her eyes," that he resolved to desert her for Dialogue: "In any case it was well for me, a man of some 40 years of age, to be done with those tumults and lawsuits and to leave 'gentlemen of the jury' alone; to escape from tirades against tyrants and praise of princes, and to go to the Academy or the Lyceum and walk with this most excellent Dialogue, conversing quietly and requiring no praise or applause" (Bis accus. 32). On the other hand, Dialogue arraigns Lucian in an action for insult (ὕβρις), complaining that whereas he (Dialogue) had previously held high discourse of the gods and nature and the universe, soaring high above the clouds, where Zeus drives his winged car, Lucian had dragged him down to earth and broken his wings, robbing him of his mask of tragedy and wisdom and substituting for it a mask of another sort, comic and satyric and almost ridiculous, associating him with jest and lampoon and cynicism and Eupolis and Aristophanes, "scoffers at serious things and mockers of what is well ordered," and finally Menippus, "a terrible dog who bit while he laughed" (*Bis* accus. 33). Lucian in reply substantially admits the accusation, but pleads that by abandoning the subtleties of philosophy and introducing comic relief he had caused Dialogue to "walk upon the earth after the manner of men" and thus to become more generally attractive.

In the *Nigrinus* Lucian makes that philosopher describe himself as "sitting as it were aloft in a crowded theatre surveying the actions of men, some capable of affording amusement and laughter, others calculated to try the firmest heart" (*Nigrin.* 18). If the function of the chorus in Greek tragedy as the κηδευτὴς ἄπρακτος (an interested party who takes no part in the action) is comparable to that of the Wedding Guest, Lucian in his rôle of the laughing philosopher may be compared to the Casual Spectator, for whom in his detachment and unconcern all the world's a stage and all the men and women merely players. This is a notion to which Lucian again and again recurs, e.g., *Menippus* 16: "You have often seen, I imagine, on the stage those tragic actors who, according to the exigencies of the play, appear now as Creon and now as Priam or Agamemnon, and the same person, who a little before had with great dignity represented Cecrops or Erechtheus, comes forth at the bidding of the poet as a menial; and, when the drama is ended, each doffs his gold-bespangled dress and lays aside his mask and stepping down from his still-boots walks about, a poor and humble man, no longer Agamemnon the son of Atreus, or Creon the son of Menoeceus, but Polus son of Charicles of Sunium, or Satyrus son of Theogeiton of Marathon." This detached and external point of view is obtained in the *Menippus* by a descent to Hades; and so, too, in the Dialogues of the Dead (with which may be classed the *Cataplus*) the theme is the contemplation of the fugitive vanities of human life from the point of view of those for whom "what comes after life" (τὰ μετὰ τὸν βίον, Mort. Dialog i. 1) is no longer a matter of speculation but a present reality. In the *Icaromenippus,* on the other hand, the vantage-ground is got by an ascent to Heaven; in the *Charon* by piling upon Ossa Pelion, then Oeta, then Parnassus, whence Charon with his guide Hermes contemplates a series of celebrities, and, beholding the futility of human endeavour, is moved to cry "O foolish men! Wherefore are ye so busied about these things? Cease from your labours, for ye will not live for ever None of those earthly dignities is abiding, and a man can carry none of them with him when he dies, but must depart naked, while his house and lands and gold will own one master after another" (*Charon* 20). In the Anacharsis we have Greek institutions as they present themselves to the eye of a barbarian, and a justification of them against his criticisms.

Besides the dialogues already referred to may be mentioned the Hermotimus (written when Lucian was 40 years of age, Herm. 13), the upshot of which is that all philosophy is vanity; the Ship, emphasizing the vanity of human wishes; the Symposium, describing a riotous banquet at which the philosophers behave rather worse than others; the Sale of Lives, in which the lives of various philosophers are auctioned at market value; the Timon, in which the Athenian misanthrope (whose tower was seen by Pausanias, i. 30) is restored to wealth to find himself once more the centre of a crowd of flatterers.

The English writer whom Lucian most recalls is Swift, who, as he probably took the idea of *Gulliver's* Travels from the True History, may have found the inspiration for the Letter of Advice to a Young Poet in the Teacher of Orators. In ease and lucidity of style Lucian's Greek (founded on the best Attic models and only in some minute details aberrant from them) is not inferior; and if he suggests less of the saeva indignatio of the conventional satirist, that may well mean not any lack of personal conviction and moral earnestness but a stricter fidelity to what he conceived to be the function of the satirist — ridentem *dicere* verum.

LUCIDOR, LASSE, pseudonym of LARS JOHANNSON (1638–1674), Swedish lyric poet, author of some of the most powerful poems of the baroque period in Swedish literature. was born in Stockholm in 1638. Lasse studied at Greifswald and Leipzig, and spent several years abroad as a wandering scholar and, perhaps. actor. On returning to Sweden, he lived first in Uppsala and, after 1669, in Stockholm. becoming known as the writer of funeral elegies and epithalamiums. His most personal poems are drinking songs and funeral hymns — a typically baroque combination. His models were the German baroque poets, among them Andreas Gryphius, but his best poems surpass theirs in intensity of feeling and power of expression. His most famous song "Skulle Jag sorja så vore Jag tokot" ("Were I to grieve, then I were a fool"), was written in prison, after an accusation of using disparaging words in a poem to a noble family. He was killed in a tavern brawl in Stockholm. Aug. 13, 1674.

Lucidor's poetry was posthumously published in Helicons Blomster (1689). His Samlade Dikter were edited by F. Sandwall in a commented edition (1914–30). (CL. FN.)

LUCIFER (d. 370/371), bishop of Cagliari in Sardinia, was a supporter of Athanasius (*q.v.*) and the founder of a small rigorist sect named after him. Nothing is known of his life until after the Arianizing council of Arles in 353, when he tried to obtain a new and impartial council. At the council of Milan (355) he refused to sign the condemnation of Athanasius, and was exiled to the east, where he wrote five polemical tracts remarkable more for their violent language against Constantius II than for correctness and wealth of doctrine. His quotations from scripture, however, are of value for the study of the Old Latin text. Of his letters, two survive.

Allowed by Julian's edict to return home, Lucifer declined an invitation to attend the synod of Alexandria (362), and passed through Antioch, where he refused to recognize Meletius as bishop, and consecrated Paulinus, leader of the Eustathian faction, in his stead, thus prolonging the Antiochene schism for many years. Lucifer refused ecclesiastical fellowship with all those who had signed, even under duress, the Arianizing formula of Rimini (359), as he considered them fallen from their clerical dignity through heresy. The short-lived sect which he founded comprised small groups in Spain, Gaul and even Rome. Its best-known members were Gregory, bishop of Elvira (Granada); Ephesius, Luciferian bishop of Rome; and the two Roman priests Faustinus and Marcellinus who presented a petition *Libellus* precum on behalf of the sect to Theodosius I in 384.

LUCIFER, Latin "light-bringer," is a name given in classical mythology to the planet Venus when it appears above the eastern horizon before sunrise. It is used in Isa. xiv, 12 (Authorized version; "day star" in Revised Standard version) to translate the Hebrew epithet "shining one," applied to the king of Babylon, fallen from his high estate to Sheol. The Fathers interpreted the words of Jesus, Luke x, 18, "I saw Satan fall like lightning from heaven," as a reference to this passage in Isaiah, so that "Lucifer" came to be regarded as the name of Satan before his fall. It is so used by Milton in Paradise Lost, and the idea underlies the proverbial phrase "as proud as Lucifer."

LUCILIUS, GAIUS (c. 180–*c.* 102 or 101 B.C.), the earliest Latin satirist, of whose writings only fragments remain, was born at Suessa Aurunca, on the Campanian confines of Latium. He was of good family and education. and served under Scipio Aemilianus in the Numantine War in Spain, 134–133 B.C. He was a friend of learned Greeks and well acquainted with Greek manners and thought, was on intimate terms with Scipio and mixed with other great figures of his time. He spent the greater part of his life at Rome but was living at Naples when he died. His career as a writer extended from 131 B.C. to nearly the end of his life. His works were collected in a posthumous edition of 30 books, of which the last five were the earliest in date. In his four earliest books Lucilius composed in *septenarii* and senarii, as well as in hexameters. After his fourth book, he chose the hexameter except for some poems in elegiacs. Of his work about 1,300 complete or partial lines have survived.

Lucilius may be regarded as the inventor of poetical satire, as he was the first to give to the formless Latin satura that distinctive character of critical comment on manners, politics and literature which the word "satire" still denotes. Unlike other forms of Latin literature, it owes virtually nothing to Greek. In his style and his choice of subject Lucilius was equally original. He ridiculed the donventional language of epic and tragic poetry and used the style of familiar speech, even to the point of frequently employing Greek, which was then fashionable in educated circles. For his subjects he abandoned the hackneyed ground of Greek and Roman mythology and treated of the politics and wars, the business and pleasure, the scandals and vices of his own day. These he handled, not in Juvenal's spirit, but, like Horace, from the standpoint of a man of the world and the associate of men of affairs. But he differed from Horace in being a thoroughly gcod hater, and also in a savage outspokenness of attack characteristic of the public life of his age.

Lucilius' unpolished and vigorous poetry was something new. Its topics were various: politics, social life, luxury, marriage, aims in writing, history, literary and dramatic criticism, grammar, rules of spelling, a letter to a friend, a journey. But it was largely self-portraiture, and this is borne out by Horace, whose artistic development in his hexameter writings owed much to Lucilius' work. Lucilius is recorded as saying that he wrote neither for the most ignorant nor for the most learned. Quintilian says that some men of his day preferred Lucilius not only to all other satirists but to all other poets. Certainly the loss of his work, except for fragments, is one of the most grievous in Latin literature.

LUCINA, "light bringing," an epithet applied to both Diana and Juno (*qq.v.*) but particularly to the latter as protectress of women, especially in childbirth. As a goddess especially of moonlight, and hence controller of the menses, Lucina's functions spread over the entire birth cycle: fertility, conception, pregnancy, nourishment of the fetus, labour and delivery, lactation, etc. On coins Juno Lucina is represented as a matron holding a child and a flower, symbols of fertility. A shrine of Juno Lucina on the Cispius dated from 375 B.C., and the introduction of the cult went back traditionally to Titus Tatius.

LUCIUS, the name of three popes.

LUCIUS I, SAINT (d. 254), pope from 253 to 254, succeeded Cornelius in the summer of 253. Exiled at first, he returned to Rome at the accession of Valerian and received a letter of congratulation from St. Cyprian. Cyprian, writing later to Pope Stephen I, referred to Cornelius and Lucius as being in agreement with Cyprian's policies. St. Lucius died in March 254. His feast day is March 4. (F. X. G.)

LUCIUS II (Gherardo Caccianemici) (d. 1145), pope from 1144 to 1145, was born at Bologna, was cardinal and papal chancellor and succeeded Celestine II on March 12, 1144, the year the Romans proclaimed a constitutional republic, rejecting papal civil rule. Lucius made a truce with King Roger II of Sicily and recognized Portugal as a papal fief. He died on Feb. 15, 1145, following an assault on the Campidoglio.

LUCIUS III (Ubaldo Allucingoli of Lucca) (d. 1185), pope from 1181 to 1185, Cistercian monk and cardinal since 1141, was elected on Sept. 1, 1181, as successor to Alexander III. He was unable to remain in Rome with its autonomy-minded republic. Unable also to agree, despite his willingness, over outstanding problems with Frederick I (Verona, 1184), except for action against the Catharist and other heresies, Lucius died on Nov. 25, 1185, at Verona, before an open break occurred, still hopeful of promoting the Crusade cause.

LUCK (LUTSK), a town in the Volynsk oblast, Ukrainian S.S.R., U.S.S.R., on the Styr river, 85 mi. N.E. of Lvov. Formerly in Poland, the town was ceded to the U.S.S.R. in 1945. Pop. (1959) 49,000. In the 11th century it was known as Luchesk, and was the chief town of an independent principality. In the 15th century it was the seat of a bishop and became wealthy. but during the wars between Russia and Poland in the second half of the 16th century, and especially after the extermination of its 40,000 inhabitants, it lost its importance. In 1791 it was taken by Russia; it reverted to Poland in 1821. The town was occupied by the Russians in 1939 and fell to the Germans in 1941. It is an agricultural centre producing leather, lumber, flour and agricultural implements.

Among its buildings is a 16th-century castle. Luck was the seat of a Roman Catholic bishop.

ŁUCK or **LUTSK, BATTLES OF.** Under this heading are described the Russian attacks on their south-westem front, which extended from the Pinsk marshes to the northern frontier of Rumania, during the summer and autumn of 1916. These attacks are generally known as "the Brusilov offensive." The original break-through of the Austrian front occurred near the town of Łuck (Lutsk), in Volhynia, on the river Styr, which thus gives its name to the whole series of operations.

The general situation in May 1916 was such that despite the failure of the attacks in March which it had launched, the Russian supreme command had set to work to prepare a large scale offensive on the front west of Molodeczno as its contribution to the great general Allied offensive which was to open on all fronts on July 1. Since the great offensive of the Central Powers against Russia had come to an end in the autumn of 1915, their forces on the Eastern front had been considerably reduced. The Germans had taken troops for their Verdun offensive, and the Austrians during the spring had withdrawn formations for an offensive against Italy. The Russians, on the other hand, had recovered rapidly from their disasters of the previous year; the ranks were full and munitions more plentiful than they had been formerly.

Preparation of **Brusilov's Offensive.**—Gen. Brusilov succeeded Ivanov as Commander-in-Chief of the south-westem front in March. He was a cavalry soldier and had commanded the 8th Army since the commencement of the war with conspicuous success. He received instructions to prepare attacks on the south-western front to distract the enemy's attention from the main Russian effort at Molodeczno. The four armies under Brusilov were: the 8th (Kaledin) from the Kowel-Kiev railway near Rafalowka to about Kremenets, 11 divisions and four cavalry divisions; the 11th (Sakharov) from Kremenets to near Tarnupol, eight divisions and one cavalry division; the 7th (Shcherbachev) from near Tarnupol to Potok, seven divisions and 3½ cavalry divisions; and the 9th (Lechitski) from Potok to the Rumanian frontier, ten divisions and three cavalry divisions. There was one corps (two divisions) in reserve.

The Austrian 4th Army (Archduke Joseph Ferdinand), from near Rafalowka to Dubno, with 10½ divisions and one cavalry division, and the 2nd Army (Bohm-Ermolli), from Dubno to near Kremenets, with eight infantry and two cavalry divisions, were opposed to Kaledin; the German Southern Army (von Bothmer) with one German and nine Austrian divisions and two cavalry divisions, held a long front, corresponding approximately with those held by the Russian 11th and 7th Armies; while the Austrian 7th Army (Pflanzer-Baltin), with 8½ divisions and four cavalry divisions, opposed Lechitski. In the actual number of divisions there was little disparity between the total forces at the disposal of either side; the Russians had 38 divisions and 12 cavalry divisions to the Austro-German 37 divisions and nine cavalry divisions; but the Russian divisions were larger. The Austrian front had 'been strongly fortified and organized, and in spite of the removal of some of their most reliable divisions and much heavy artillery to the Italian front the Austrians were confident of being able to hold their ground.

About the middle of April, Brusilov had ordered each of his army commanders to select a sector of attack and to make preparations with the resources at his disposal within his own army to penetrate the enemy's front in that sector. Preparations were to be complete before the middle of May. These attacks were designed simply as aids to the main Russian offensive in the north, timed for July 1. On May 14, however, the Austrians began an offensive in the Trentino against Italy. The Italians appealed to the Russians to relieve the pressure by attacking the Austrians on their front. Brusilov accordingly launched his attacks on all four army fronts on June 4, without any expectation of a decisive break-through or arrangements for exploitation of success on a large scale.

The Break-through at **Łuck.**—The sector of attack chosen by Kaledin, commander of the 8th Army, centred on the village of Olika, east of Luck. The bombardment began on June 4 and the assault was made by the 40th and 8th Corps early on June 5. The 40th Corps carried three lines of enemy trenches and penetrated over two miles, and the 8th Corps, though less successful, made considerable progress. The advance continued on June 6 and on June 7 reached Luck. By this time a wide gap had been made between the Austrian 4th Army and the 2nd Army farther south, and a great opportunity for the numerous Russian cavalry seemed to have come. But of the four cavalry divisions allotted to Kaledin's army, two had been used to hold trenches so as to enable infantry to be concentrated for the assault and one was despatched by Brusilov in a fruitless raid along the railway towards Kowel through marshes entirely unsuited for cavalry action. The one remaining division could accomplish little. Meanwhile the left wing of the 8th Army occupied Dubno on June 9; on June 10 the front of the army lay along the line of the rivers Styr and Ikwa, from Rozyszcze through Łuck to Dubno.

Attacks of the **11th,** 7th and 9th Armies.—The attack of the 11th Army north-west of Tarnupol was a failure. Shcherbachev's 7th Army attacked in a sector on its extreme left near the village of Jaziowec. After two days' bombardment the infantry assaulted early on June 6 and carried the enemy positions; next day the Austrians were driven behind the Strypa. The Russians crossed the river on the 8th and gained further ground during the next two days. Counter-attacks then arrested their advance for the time being. Lechitski's 9th Army attacked some zom. north of Czernowitz, near the village of Okna, with complete success. By June 10 the front was broken and the Austrians retreated in disorder behind the Prut. Czernowitz was captured on June 17.

Consequences of **Brusilov's Success.**—Thus by the middle of June the Austro-German front south of the Pinsk marshes was completely broken on both flanks, and two armies, the 4th and 7th, were in full retreat. In the centre Bohm-Ermolli's and von Bothmer's armies still held, though their outer flanks had been driven in. On three-quarters of the whole Russian south-western front their armies were moving forward. These entirely unexpected results of an offensive undertaken purely as a demonstration reacted instantly on the whole strategy both of the Russians and of the Central Powers. On the Russian side the new situation demanded the immediate transfer of the principal reserves from the north, where they had been grouped for the Molodeczno offensive, if Brusilov's success in the south were to be exploited. The decision was taken promptly enough: the Molodeczno offensive was abandoned. Lesh's 3rd Army astride the Pripet was added to Brusilov's command and troops were hurried south as rapidly as the capacity of the railways would permit. Unfortunately for the Russians the poverty and the low efficiency of their communications gave the enemy time to concentrate sufficient reinforcements to restore their front before the full weight of the Russian reserves could give a fresh impetus to the advance.

For the Germans the sudden reverse came at a difficult time, for they were fully engaged at Verdun and were expecting a Franco-British offensive at an early date; obviously, too, events might have a decisive influence on the attitude of Rumania. Reinforcements were at once collected to restore the situation; to close the principal gap it was decided to stage a counter-attack on a large scale on both sides of the Kowel-Rowne railway. This attack was entrusted to von Linsingen, the German commander of the Austro-German army holding the area of the Pinsk marshes opposite the Russian 3rd Army. He was reinforced by three German divisions from the northern part of the Eastern front, four from France and two Austrian divisions from the Trentino. During the whole of the latter half of June, as these reinforcements arrived, he counter-attacked persistently towards Luck and to the north and south of it. These attacks, though they brought the Austro-German forces little gain of ground, had at least the effect of limiting Kaledin's break-through. On July 4 the left of Lesh's 3rd Army, in conjunction with Kaledin's right, launched an attack in the bend of the Styr east of Kowel and drove von Linsingen's army back to the Stochód river. This put an end to the Austro-German counter-attacks, and there were no further important operations on this part of the front till the end of July.

Meantime, Lechitski in the south with the Russian 9th Army was completing the conquest of the Bukovina. After the capture of Czernowitz, part of the Austrian 7th Army retreated precipitately south to the Carpathians, pursued by the left wing of Lechitski's army, which occupied Kimpolung on June 24. His right wing, advancing between the Dniester and the Prut, won a victory on June 28 and occupied Kolomyja on the following day. At the beginning of July the Austrians in the south received reinforcements and made a series of counter-attacks opposite Kimpolung and Delatyn. These were defeated, and Lechitski's right wing occupied Delatyn on July 10. His army was now, however, enormously extended and had to halt to await reinforcements.

Reorganization of Command by the Central Powers.—The German command, which had since the beginning of June sent 16 divisions to the front south of the Pinsk marshes, naturally claimed an increased influence on the direction of operations on this front. Very shortly after the first break-through at Luck they had insisted on the removal of the Archduke Joseph Ferdinand from his command of the 4th Army and on the extension of von Linsingen's sphere of command southwards to the northern frontier of Galicia. The greater portion of Pflanzer-Baltin's 7th Army had also been transferred to von Bothmer commanding the German Southern Army. It was now proposed to appoint Hindenburg to the supreme command of the Eastern front as far south as Lemberg; the remainder of the front, on both sides of the Dniester and in the Carpathians, was to be under the Austrian heir apparent, the Archduke Charles, with the German Gen. von Seeckt as his chief of staff.

This arrangement was eventually brought into force early in August. The Archduke Charles had originally come from the Italian front at the beginning of July to command a 12th Army, which was to be formed from troops on the spot and fresh reinforcements, and was to deliver a counter-attack on a large scale on both sides of the Dniester in a south-easterly direction But as the incoming reinforcements had always to be thrown into the battle as soon as they arrived, the formation of the 12th Army and the proposed counter-offensive never took place. Instead, the 3rd Army command from Tirol took over the troops between the Carpathians and the Dniester. The Archduke's command thus comprised the 7th, 3rd and Southern armies.

Concurrently during the latter half of July, while the Russian 8th and 9th Armies on the flanks paused to await reinforcements, Brusilov ordered Sakharov's 11th Army, which had extended its front northwards to beyond Dubno, to take the offensive. It attacked near Boromel, south-west of Luck, on July 16, and drove the enemy back across the Lipa. Sakharov then moved south on Brody, which he captured with 40,000 prisoners on July 28—a fine victory. Meanwhile Shcherbachev's 7th Army, in spite of repeated attacks north-west of Buczacz towards Monasterzyska, had failed to make much impression on von Bothmer's Southern Army. Lechitski, however, at the end of July gained some ground towards Stanislau.

Attack on **Kowel.**—Towards the end of July the Russian Guard Army (1st and 2nd Guard Corps, 1st Corps, 30th Corps, Guard Cav. Corps) detrained from the north and took up a front between the 3rd and 8th Armies. The Guard had not been in action since the previous September and had been carefully trained and kept in hand for a great occasion. It was now decided to use it to force the line of the Stochód river and capture Kowel. It is difficult to understand why this line of advance was chosen for a supreme effort. The terrain is mainly marsh and advance is usually possible only on narrow causeways. The attacks, which commenced on July 28 and were continued up to Aug. 10, resulted in a complete and costly failure. The Guard Army lost 55,000 men for a trifling gain of unimportant ground. Brusilov thereafter abandoned the direct advance on Kowel, but continued up till the middle of October attempts to enlarge the Luck salient in the direction of Wlodzimierz Wolynski. All these attempts ended in failure.

In the south the Russian Army commander, Lechitski, attacked again south of the Dniester on Aug. 7 and drove back Kovess' 3rd Army. He occupied Stanislau on Aug. 10 and Nadwórna on Aug. 12. On this latter date the 7th Army occupied Monasterzyska. Under the threat from this flank and pressure from Sakharov's army south of Brody, von Bothmer now at last gave up the original line which he had held throughout all the turmoil and withdrew towards Brzezany.

Austro-German counter-attacks in the Carpathians in the first half of August had little success. On Aug. 20 the Russians reorganized their front so as to allow Lechitski's 9th Army to have as its only task the forcing of the Carpathian passes between Delatyn and Kimpolung in order to protect the right flank of the Rumanians, who joined the Allies on Aug. 27. In spite of severe fighting throughout September little progress was made on this front. Nor was any appreciable advance made elsewhere on the south-western front in spite of repeated assaults. In October the defeat of the Rumanians necessitated the transfer of troops to that theatre and the abandonment of further offensive operations. The summer which had opened so brilliantly ended in disappointment and failure.

Results of the Offensive.—Although Brusilov had recaptured practically the whole of the Bukovina and large portions of Eastern Galicia and Volhynia and had taken some 350,000 prisoners and over 400 guns, the cost had been exceedingly heavy. The casualties on the south-western front were over 1,000,000. These losses and those suffered in the abortive attacks on the Northern and Western fronts in 1916, at Lake Naroch, Baranowicze and Riga, were in the end the principal cause of the rapid infection of the army with anti-war propaganda when the Revolution came. Hailed by her Allies as proof of the complete regeneration of the Russian army, Brusilov's offensive was really its death-knell.

Hoffman, *The War of Lost Opportunities* (1924); E. Ludendorff, *My War Memories* (1919). *(See* also WORLD WAR I: *Bibliography.)* (A. P. W.)

LUCKA, EMIL (1877–1941), Austrian author and philosopher, born in Vienna on May 11, 1877, came to the forefront of Austrian literature in 1912. His novels and shorter tales are as rich in thought as in invention, their plots being laid either in the middle ages, as in *Isolde Weisshand* (1909), *Heiligenrast* (1919), *Der Weltkreis* (1919), *Fredegund* (1924); or in Vienna society, as in *Das Brausen der Berge* (1918) ; or in the Austrian Alps, as in *Am Sternbrunnen* (1925). In *Die drei Stufen der Erotik* (1913) Lucka gives a representation of the development of love throughout the ages; in *Grenzen der Seele* (1916) he presents the psychology of genius; and in *Urgut der Menschheit* (1924) he discusses the problem of how the primaeval myths may be revived to meet the needs of modern civilization. Later works included a biography of Michelangelo (1930); a novel, *Der blutende Berg* (1931) ; *Die Verwandlung des Menschen* (1934); and *Die grosse Zeit der Niederlande* (1936).

LUCKE, FRIEDRICH (1791–1855), German theologian, was born on Aug. 24, 1791, near Magdeburg. He studied theology at Halle and Göttingen. After holding various academic posts he became in 1827 professor of theology at Göttingen, where he remained until his death on Feb. 4, 1855. Liicke, one of the most influential of the so-called "mediation" school of evangelical theologians (*Vermittelungstheologie*), is chiefly remembered for his *Kommentar über die Schriften d. Evangelisten Johannes*, 4 vol. (1820–32; 3rd ed. 1856).

LUCKENWALDE, a town in the Potsdam *Bezirk* (district), German Democratic Republic, on the Nuthe, 30 mi. S. of Berlin, on the line to Dresden and Leipzig. Pop. (1959 est.) 28,680. The site of Luckentvalde was occupied in the 12th century by a Cistercian monastery, but the place did not become important till the reign of Frederick the Great though it became a town in 1430. Its cloth and hat manufactories were among the most extensive in Prussia. Among its other industries are brewing, and the making of metal and bronze goods, paper and pianos.

LUCKNOW, the second largest city, and a district and division, of Uttar Pradesh, Republic of India. The city was the capital of Oudh from 1775 until the chief commissionership was merged into the United Provinces in 1901; thereafter it in effect shared with Allahabad the position of provincial capital, but in 1949 it became officially the capital of Uttar Pradesh (as the province was by then called). Pop. (1961) 662,196. It lies mainly on the right bank of the winding river Gumti. East of the city the civil lines stretch for a distance of more than 2 mi.; then comes a well laid-out cantonment with a substantial civil population and accommodation for troops of all arms.

Lucknow is a place of parks, gardens and imposing monuments, though most of the latter are of inferior architecture and material. It is the seat of the Uttar Pradesh state legislature; the high court is at Allahabad, but a bench sits in Lucknow throughout the year. Lucknow university is a federation of eight residential colleges, of which Canning is by far the largest; three of the other colleges are for women; another is a medical college, one of the finest in northern India; clinical teaching is provided in the well-equipped hospital adjoining. The Colvin school is intended for the education: on British public-school lines, of the sons of the talukdars, or large landlords of Oudh; and La Martinière school, housed in a picturesque building, takes most Anglo-Indian boys and is partly supported by an endowment left by Gen. Claude Martin in 1800. There are several important industrial establishments, chiefly paper mills, printing presses and metal works; but the city as a whole swarms with the decayed families of the hangers-on of the overgrown court of the old Oudh kingdom. The chief indigenous industries are the manufacture of gold and silver brocades, muslins, embroidery, brass, copper and ivory ware, beaten-silver vessels and ornaments, and pottery and moulding in clay. Lucknow is an important railway centre, and there are large workshops.

The Residency. — Among the events of the Mutiny of 1857 the defense of the Lucknow residency comes, in historic interest, second only to the tragedy of Cawnpore. The name "residency" is now applied not only to the residency itself, but to the whole of the outbuildings and entrenchments in which Sir Henry Lawrence concentrated his small force. These entrenchments covered almost 60 ac. of ground and consisted of a number of detached houses, public edifices, outhouses and casual buildings, netted together, and welded by ditches, parapets. stockades and batteries into one connected whole. On the summit of the plateau stands the shell of the residency proper. the official residence of the chief commissioner, a lofty building three stories high, with a fine portico. Near the residency comes the banqueting hall, and beyond the Baillie Guardgate lie the ruins of the surgeon's house, where Sir Henry Lawrence died of a shell wound, and where the ladies of the garrison were sheltered in underground rooms. Round the line of the entrenchments are pillars marked with the names of the various "posts" into which the garrison was distributed. The most dangerous of these was the Cawnpore battery post. where the stockade was directly exposed to the enemy's fire. Close to the residency is the Lawrence memorial, an artificial mound 30 ft. high crowned by a marble cross.

Other Monuments. — Among the other buildings of interest in Lucknow is the Imambara, which is one of the largest rooms in the world (162 by 54 it.). having an arched roof without supports. This room was built by the Nawab Asaf-ud-dowlah in 1784, to afford relief to the famine-stricken people. The many monuments of his reign include his country palace of Bibiapur, outside the city. Among later buildings are the two palaces of Chhattar Manzil, erected for the wives of Ghazi-ud-din Haidar (1814) and now used as a club; the remains of the Farhat Baksh, dating from the previous reign, and adjoining the greater Chhattar Manzil; the observatory (now a bank) of Nasir-ud-din Haidar (1827); the imambara or mausoleum and the unfinished great mosque (Jama Masjid) of Mohammed Xli Shah (1837), and the huge debased Kaisar Bagh. the palace of Wajid Ali Shah (1847–1856), now divided up into apartment houses. Modern buildings. such as the railway station and the council chamber, have been designed to fit in with the old.

The DISTRICT OF LUCKNOW lies on both sides of the river Gumti, and has an area of 977 sq.mi. Its general aspect is that of an open champaign. well studded with villages, finely wooded and in parts most fertile and highly cultivated. In the vicinity of rivers. however, stretch extensive barren sandy tracts (*bhúr*), and there are many wastes of saline efflorescence (*usár*). The country is an almost dead level, the average slope, which is from northwest to southeast, being less than a foot per mile. The principal rivers are the Gumti and the Sai with their tributaries. The population in 1961 was 1,345,494.

The DIVISION OF LUCKNOW contains the western half of the old province of Oudh. It comprises the six districts of Lucknow, Unao, Sitapur, Rae Bareli. Hardoi and Kheri. Its area is 12,099 sq.mi. and its population in 1951 was 7,152,237.

LUÇON, a town of western France, in the *département* of Vendée, 23 mi. S.E. of La Roche-sur-Yon. on the railway from Nantes to Bordeaux, and on the canal of Lucon (9 mi. long!. which affords communication with the sea in the Bay of Aiguillon. 'Pop. (1954) 6,927. Between Luçon and the sea stretch marshy plains, the bed of the former gulf, partly drained by numerous canals, and in the reclaimed parts yielding excellent pasturage, while in other parts are productive salt-marshes; and ponds for the rearing of mussels and other shellfish. Luçon is the seat of a bishopric, established in 1317, and held by Richelieu from 1607 to 1624. The cathedral, 12th-century and later, nas originally an abbey church. The cloisters are of the late 15th century. Near by is the bishop's palace, possessing a large theological library. There is an ecclesiastical seminary there.

LUCRE, money which is the object of greed (Lat. *lucrum*, gain). In the adjective "lucrative." profitable. there is, however, no sense of disparagement. In Scots lan the term "lucrative succession" (*lucrativa acquisitio*) denotes the taking by an heir, during the lifetime of his ancestor, of a free grant of any part of the heritable property.

LUCRETIA, a Roman lady, wife of Lucius Tarquinius Collatinus, distinguished for her beauty and domestic virtues. Having been outraged by Sextus Tarquinius, one of the sons of Tarquinius Superbus, she informed her father and her husband, and, having exacted an oath of vengeance from them, stabbed herself to death. Lucius Junius Brutus, her husband's cousin, put himself at the head of the people, drove out the Tarquins, and established a republic (traditional date, 509 B.C.). The accounts of this tradition present many points of divergence.

LUCRETILIS MONS, a mountain in Sabine Hills, mentioned by Horace as visible from his farm, generally (and rightly) identified with Gennaro, a limestone peak 4,170 ft. high. Excavations on the site of Horace's farm have led to the discovery of the building itself, with baths added at a later date.

LUCRETIUS (TITUS LUCRETIUS CARUS) (earlier half of last century B.C.), Latin poet and philosopher, whose one poem, *De rerum natura* ("On the Nature of Things") renders in hexameters the atomic theory of Epicurus (*q.v.*). Its declared purpose is to free mankind from religious fears by proving that the soul is material and is born and dies with the body, and that, though gods exist, they cannot intervene to help or harm men. Apart from his poem almost nothing is known about him. What little evidence there is, is quite inconclusive. Jerome in his chronicle, for 94 B.C. (so most manuscripts; others 96 or 93 B.C.), states that Titus Lucretius the poet was born in that year; afterward he became mad from a love potion, and having written in lucid intervals some books, which Cicero afterward emended, he killed himself in his 44th year (*i.e.,* 51 or 50 B.C.). Donatus in his "Life" of Virgil notices that Virgil put on the *toga virilis* in his 17th year, on his birthday (*i.e.,* Oct. 15, 54 or 53 B.C., according to whether Virgil was entering or completing his 17th year), and that Lucretius died that same day; but Donatus contradicts himself by stating that the consuls that year were the same as in the year of Virgil's birth (*i.e.,* Crassus and Pompey, consuls in 70 B.C. and again in 55 B.C.). This last date, 55 B.C., seems partly confirmed by a sentence in Cicero's reply to his brother in Feb. 54 B.C. (*Ad Quintum fratrem* 2, 9, 3). The sentence, though variously interpreted or emended, suggests that Lucretius was already dead and also that Cicero may have had something to do with the publication of his poem: "The poems (*poemata*) of Lucretius are as you write in your letter—they have many high lights of genius (*lumina ingeni*), yet also much artistry (*ars*). But more when you come." The coincidence noticed by Donatus, of Lucretius dying on the day that Virgil came of age, looks like the neat invention of literary history. Again, though Lucretius clearly died before finally revising his poem, it is surprising to find no other reference to the remarkable circumstances of his life and death alleged by Jerome. They may belong to a late story put about by Christian polemic developed perhaps from an ignorant or wishful misunderstanding of *docti furor arduus Lucreti* (Statius, *Silvae,* 2, 7, 76). Excepting the single mention in Cicero, the only contemporary who names Lucretius is Nepos (*Atticus* 12, 4) in the phrase "after the death of Lucretius and Catullus," and the only contemporary whom Lucretius names is the Memmius to whom he dedicates his poem, probably C. Memmius (son-in-law of Sulla, praetor of 58 B.C., patron of Catullus and Cinna) for whose friendship Lucretius "hopes" (i, 140).

Theme of "De Rerum Natura."—*De rerum natura* translates the title of the chief work of Epicurus, *Peri Physeos,* as also of the didactic epic of Empedocles (*q.v.*), of whom Lucretius speaks with admiration only less than that with which he praises his master Epicurus (*cf.* i, 731 ff. with iii, 14 ff.). The poem is the fullest statement extant of the physical theory of Epicurus, but it also alludes to his ethical and logical doctrines. The argument in outline is as follows.

1. No thing is created out of nothing and no thing can be reduced to nothing. The universe is infinite: an infinite extent of empty space (or void) and an infinite number of irreducible particles of matter (or atoms), there being a finite number of different kinds of atoms, but an infinite number of atoms of each kind. Atoms differ only in shape, size and weight. They are absolutely hard, changeless, everlasting, the limit of physical division. They are made up of inseparable "minimal parts" or units, which are the limit of mathematical division. Bigger atoms have more such parts; but there is a limit to the size of atoms, and even the biggest are minute. Atoms of all kinds move always at an equal and constant velocity many times greater than the velocity of light (ii, 161 ff.). All atoms would move everlastingly downward in infinite space, and never collide to form atomic systems unless they swerved at times a minimal degree from the vertical. To these indeterminate swerves is due the creation of an infinite plurality of worlds, and also free will. All things that exist or happen consist ultimately only of matter and void: they are systems of moving atoms, separated by greater or smaller intervals of void, which cohere more or less according to the shapes of the constituent atoms. All systems are divisible and therefore perishable (except the gods). Only systems of atoms have "secondary" properties: colour, taste, heat, smell, or sensation. All change is explainable in terms of addition, subtraction or rearrangement of changeless atoms.

2. The soul is made of atoms exceedingly fine, and has two connected parts: the *anima* distributed throughout the body, which is the cause of sensation, and the *animus* in the breast (not the head), the central consciousness where thinking, willing, and the emotions of joy and fear occur. The soul is born, grows, and dies with the body. At death it escapes, like "smoke," into the air and disintegrates more quickly than even the body.

3. The gods exist, but neither made nor manipulate the world. They themselves are creatures of the atomic process, systems of exceedingly fine atoms, human in shape, yet by some principle of existence everlasting. They live remote, in between worlds, unconcerned with human affairs, examples to men of the ideal life of perfect happiness (absence of mental fear and bodily pain). Their excellent being is perceived at times by some sort of intuition of the mind.

4. We know by sense perception; and argue by reason, correctly if according to certain rules (the *Canonica*). The senses are infallible. Reason however can make false inferences. We see objects because they discharge from their surface representative films which strike the eye. Similarly hearing, smelling, etc., are explained by atomic discharges striking the appropriate sense organ. Separate atoms are in principle imperceptible because they have no dischargeable parts. The senses perceive the existence of matter; reason infers that it exists in the form of atoms, and also that void, untouchable and so imperceptible, exists to explain the perceived movement of matter.

5. We know from feelings of pleasure or pain what we should do or not do. Our aim should be so to conduct our lives that we get, on balance, the maximum of pleasure and the minimum of pain.

Structure of the Poem.—Lucretius distributes his argument into six books, beginning each with a highly finished exordium. Books i and ii establish the main principles of the atomic universe, refuting rival theories of Heraclitus, Empedocles and Anaxagoras (*qq.v.*), and covertly attacking the Stoics. Book iii demonstrates the atomic structure and mortality of the soul, and ends with a triumphant sermon on the theme: "death is nothing to us" (iii, 830). Book iv describes the mechanics of sense perception and thought and certain bodily functions, ending with a violent condemnation of sexual love. Book v describes the creation and working of this world and the celestial bodies, the evolution of life and human society. Book vi explains remarkable phenomena of the earth and sky, in particular thunder and lightning. It ends with a description of the plague at Athens, a sombre picture of death contrasting with that of spring and birth in the invocation to Venus with which the poem opens.

Use and Adaptation of the Latin Language.—The problem of Lucretius was to render the bald and abstract prose of the Greek Epicurus into Latin, and into hexameters, at a time when Latin as yet had no philosophic vocabulary. He had to find scanning equivalents for Greek terms as well as synonyms for the sake of poetic variety. He succeeded admirably in spite of repeated complaints about "the poverty of our native speech" (i, 136 ff.). He applied common words to a technical use. So he used *concilium,* "assembly of people" for a "system of atoms," and *primordia,* "first-weavings" for the "atoms" which make up the texture of things. When necessary he invented words, *e.g., clina-*

men for the "swerve," usually on the pattern of the Greek originals. In poetic diction and style his debt to the older Latin poets, especially Ennius, is apparent (i, 117; iii, 1025). He freely used alliteration and assonance, solemn and often metrically convenient archaic forms, and old constructions. He formed with almost Greek facility expressive compound adjectives of a sort rejected by Augustan taste, *e.g.,* "the light-sleeping hearts of dogs" (v, 864), "forest-breaking winds" (i, 275). He imitated or echoed Homer, Aeschylus, Euripides, Callimachus, Thucydides and Hippocrates. His hexameters can be said to stand halfway between those of Ennius who introduced the metre into Latin, and Virgil who perfected it. An ear familiar with Virgil will notice some incoherence of rhythm due to words ending with the end of the second foot, to spondaic words occupying the fourth foot, or to words of one or more than three syllables concluding the verse, as well as harsh elisions and examples of unusual prosody. The influence of Lucretius on Virgil is pervasive and unmistakable, especially in the Georgics, the next masterpiece of didactic poetry in Latin and it is in evident allusion to the author of De *rerum* natura that Virgil wrote Felix qui potuit *rerum* cognoscere *causas* (Georgics ii, 490).

Poetical Power and Moral **Fervour.**—Lucretius wrote his poem with the conviction of a proselytizing convert. Epicurus to him nas a saviour "god" (v, 8 ff.), greater than the mythical benefactors of mankind, Ceres, Liber or the Stoic hero Hercules. But Epicureanism seemed bitter to the "gross" of men (i, 945). So Lucretius was offering the medicine cup of beneficial wormwood, edged with the deceptive honey of poetry. His poem opens with an invocation to Venus, mother of Aeneas, mistress of Mars, the only divinity in the Pantheon competent to grant his prayer for beauty for his words and peace for the Roman world, the natural symbol of pleasure and of the creative moment in the atomic process. The argumentative runs of the poem read less "pleasantly," but are relieved by finished passages of a higher strain, more impressive in their poetical power than almost any other ancient poetry. Even in his more cobbled verses interest is sustained by his evident will to convince, and by the energy, propriety and perspicuity of his language. The style ranges from classic economy (*e.g.,* v, 1188–1193) to the persuasive redundancies of the enthusiastic lecturer. His mind is visual. His eye notices the curious particularity of nature. The argument by analogy prescribed by the Canonica (that hypotheses of reason must agree with, or not contradict, sense perception) gives him his opportunity as a poet. He regularly follows an abstract exposition by a concrete picture. The constant motion of imperceptible atoms within an apparently still object he illustrates by the distant view of grazing sheep, which appear as a "white stationary gleam on a green hillside" (stare *videntur* et in *campis* consistere fulgor. ii, 332).

He speaks to mankind as well as to the "sons of Aeneas" in austere compassion for the ignorant, unhappy human race. His moral fervour expresses itself in gratitude to Epicurus and in hatred of the seers (vates i, 102) of the Graeco-Roman world who inculcate religious fears (religiones) by threats of eternal punishment after death, of the Etruscan soothsayers (*haruspices,* vi, 381) with their lore of thunder and lightning, of the false philosophers—Stoics with their belief in divine providence, or Platonists and Pythagoreans who teach the transmigration of immortal souls. The first appearance of *religio* in the poem is as a monster which thrusts its fearful head from the augural quarters of the sky (i, 62 ff.). Epicurus, not intimidated by theological myths or by thunder and lightning, had ranged beyond the "flaming ramparts of the world" through the infinite universe, broken into the citadel of nature, and brought back in triumph the knowledge of what can and what cannot be, of that "deep-set boundary stone" which divides the separate properties of things, the real from the not-real. "So religion is crushed beneath our feet and his victory lifts us to the skies" (i, 78 ff.).

LUCRINUS LACUS [LUCRINO], in Campania, Italy, about ½ mi. N. of Lake Avernus, and only separated from the sea (Gulf of Pozzuoli) by a narrow strip of land, traversed by the coast road, Via Herculanea, which runs on an embankment traditionally attributed to Heracles in Strabo's time, and the modern railway. Its size was reduced by the rise of the Montenuovo crater in 1538. Its greatest depth is about 15 ft. In Roman days its fisheries were important and were let out by the state to contractors. Its oyster beds are renowned; their foundation is attributed to Sergius Orata, about 100 B.C. It was also a resort for excursions from Baiae. On the banks were many villas; the best known was Cicero's Cuman villa (also called the Academia), on the east bank. The remnants of this villa, with the village of Tripergola, disappeared in 1538. In 1922 almost all the fish in the lake were killed by exhalations of steam and sulphuretted hydrogen from vents on the east bank.

LUCULLUS, LUCIUS LICINIUS, surnamed Ponticus, (c. 110–56 B.C.), Roman general, was noted for his wealth and luxurious banquets. The son of Lucius Licinius Lucullus and a sister of Metellus Numidicus, he joined the party of Sulla early in life; after service in the Social War (90) he went with Sulla as quaestor to Greece and Asia in 88. While Sulla besieged Athens, Lucullus raised a fleet and drove Mithradates out of the Mediterranean, winning a great victory off Tenedos. Lucullus was praetor in 77, with the province of Africa to follow, and consul in 74. In the allotment of provinces he drew Cisalpine Gaul, but contrived to exchange it for Cilicia, while his colleague Cotta took Bithynia, the two provinces between them involving the joint command against Mithradates (*q.v.* for further information about this campaign). Lucullus' first season was mainly occupied in relieving Cyzicus, besieged by Mithradates, who had heavily beaten Cotta. Most of 73 and 72 were taken up in clearing the sea and the coast of Pontus, but an expedition up country to Cabeirus led to a major success. and Mithradates fled to Tigranes in Armenia. Lucullus left the final reduction of the Pontic kingdom to his lieutenants while he attended to the administration of Asia, which the combined exactions of Sulla and the publicani had left in a desperate condition. By drastically limiting interest rates he cleared the province of debt; but his reforms left a legacy of unpopularity for him at Rome, where the capitalist interests set themselves to destroy his reputation. Similarly his strict discipline and his moderation after victory made for trouble with the army.

In 70 B.C. Lucullus sent to Tigranes to demand the surrender of Mithradates. Tigranes refused, and Lucullus, with a small force, crossed the Euphrates and struck direct for Tigranocerta, the new capital (69). Tigranes fled, and returned with a vast army to raise the siege, but was defeated. Lucullus captured the city and dispersed its inhabitants, and wintered on the Tigris. The rest of his campaign is anticlimax. Mithradates and Lucullus were both negotiating with Parthia; Lucullus attempted to force Parthia's hand, but his troops refused to go on, so he turned north for Artaxata, won another victory, and again his troops mutinied. So he returned, took Nisibis and wintered there. The next year (67) things were worse; it was now known that he was to be superseded; he could exert no authority; he could only watch Mithradates regaining Pontus and Tigranes overrunning Cappadocia. It was left for Pompey to reap where Lucullus had sown.

On his return to Rome he was attacked by the popular party, which succeeded in delaying, though it could not prevent his triumph. He was very rich, and politics were not attractive. He retired into that elegant leisure, that luxury refined by good taste and tempered by philosophy.

Lucullus is one of the interlocutors in Cicero's *Academica;* he had a great library; and he wrote a history in Greek. His occasional interventions in public affairs were not very successful.

BIBLIOGRAPHY.—Plutarch, *Lucullus;* Appian, *Mithridatic* War; *C.I.L.* i, 292; many allusions in Cicero; G. Boissier, Cicero and His Friends (Eng. trans., 1897); W. Drumann, *Geschichte Roms* (1899).

His brother, MARCUS LICINIUS LUCULLUS, was adopted by

Marcus Terentius Varro, and was hence known as Marcus Terentius Varro Lucullus In 82 B C. he served under Sulla against Marius. In 79 he was curule aedile with his brother, in 77 praetor, and in 73 consul with Gaius Cassius Varus. While praetor he forbade the carrying of arms by slaves and. with his colleague in the consulship. passed the *lex Terentia Cassia,* which gave authority for purchasing corn with the public money and retailing it at a fixed price at Rome. As proconsul in Macedonia in 72 he made war with great cruelty against the Dardani and Bessi, and compelled them to acknowledge the supremacy of Rome. Having enjoyed a triumph, he was then sent out to the east to settle the affairs of the provinces conquered by his brother. Siding with Cicero during the Catilinarian conspiracy, he did his utmost to prevent Cicero's banishment, and subsequently supported his claim for the restoration of his house. He was one of the better representatives of the optimates and enjoyed some reputation as an orator.

LUCUS FERONIAE, an ancient shrine in Etruria. It was visited both by Latins and Sabines even in the time of Tullus Hostilius and was plundered by Hannibal in 211 B C. It was in the territory of Capena; but in imperial times became an independent community receiving a colony of Octavian's veterans (*Colonia Iulia felix Lucoferensis*) and possessing an amphitheatre. It is probably to be placed at Nazzano, which was reached by the Via Tiberina.

LUCY, SAINT, a martyr at Syracuse in Sicily, probably during Diocletian's persecutions. whose veneration is attested by a 4th/5th-century inscription found at Syracuse. Her legend, which is historically worthless. relates how she was martyred for refusing to marry because she had taken a vow of virginity. It closely resembles that of St Agnes and other virgin martyrs, and was widely diffused: the English St. Aldhelm (d. 709) used it in his *De laudibus virginitatis* and *De laudibus virginum.* St. Lucy is named in the canon of the Roman mass. and her feast day is Dec. 13. Probably because of her name *(lux,* "light") she is invoked by those with eye trouble, and is sometimes represented in art with a dish containing her eyes which were said to have been torn out by her persecutors. There was much popular devotion to St Lucy and she was well known in folklore; for example, the saying "Lucy-light, shortest day, longest night."

See H Thurston and D. Attwater (eds), *Butler's Lives of the Saints,* rev, and supplemented, vol. iv, pp. 548–549 (1956). (D. AR.)

LUCY, SIR HENRY (1845–1924), British journalist, was born at Crosby, near Liverpool, on Dec. 5, 1845. Educated in Liverpool, he began life in a Liverpool merchant's office, but soon became a reporter for a Shrewsbury periodical. In 1870 he joined the staff of *The Pall Mall Gazette,* London, and in 1873 became parliamentary reporter to *The Daily News,* with which paper he had a long connection in various capacities. In 1881 he also joined the staff of *Punch* and won a great reputation as the contributor of its parliamentary sketch signed "Toby M. P." He was knighted in 1909 and retired from parliamentary work in 1916. He published his autobiography, *Sixty Years in the Wilderness,* in 1909, and *The Diary of a Journalist* in 1920. He died on Feb. 20, 1924.

LUCY, RICHARD DE (d. 1179), called the "loyal," chief justiciar of England, appears in the latter part of Stephen's reign as sheriff and justiciar of the county of Essex. He became, on the accession of Henry II., chief justiciar conjointly with Robert de Beaumont, earl of Leicester; and after the death of the latter (1168) held the office alone for 12 years. The chief servant and intimate of the king, he was among the first of the royal party to incur excommunication in the Becket controversy. In 1173 he played an important part in suppressing the rebellion of the English barons, and commanded the royalists at the battle of Fornham. He resigned the justiciarship in 1179, though pressed by the king to continue in office, and retired to Lesnes abbey in Kent, which he had founded and where he died. Lucy's son, Godfrey de Lucy (d. 1204), was bishop of Winchester from 1189 to his death in Sept. 1204; he took a prominent part in public affairs during the reigns of Henry II., Richard I. and John.

See J. H. Round, *Geoffrey de Mandeville* (1892); Sir J. H. Ramsay, *Angevin Empire* (1903); and W. Stubbs, *Constitutional History,* vol. i.

LUCY, SIR THOMAS (1532–1600), the English Warwickshire squire who is traditionally associated with the youth of William Shakespeare, was born on April 24, 1532, the son of William Lucy, and was descended, according to Dugdale, from Thurstane de Charlecote, whose son Walter received the village of Charlecote from Henry de Montfort about 1190. Walter is said to have married into the Anglo-Norman family of Lucy, and his son adopted the mother's surname. Three of Sir Thomas Lucy's ancestors had been sheriffs of Warwickshire and Leicestershire, and on his father's death in 1552 he inherited Sherborne and Hampton Lucy in addition to Charlecote, which was rebuilt for him by John of Padua, known as John Thorpe, about 1558. By his marriage with Joyce Acton he inherited Sutton Park in Worcestershire, and became in 1j86 high sheriff of the county. He was knighted in 1565. He is said to have been under the tutorship of John Foxe, who is supposed to have imbued his pupil with the Puritan principles which he displayed as knight of the shire for Warwick in the parliament of 1571 and as sheriff of the county, but, as Mrs. Carmichael Stopes points out, Foxe only left Oxford in 1545, and in 1547 went up to London, so that the connection must have been short.

Lucy often appeared at Stratford-on-Avon as justice of the peace and as commissioner of musters for the county. As justice of the peace he showed great zeal against the Catholics, and took his share in the arrest of Edward Arden in 1583. In 158j he introduced into parliament a bill for the better preservation of game and grain, and his reputation as a preserver of game gives some colour to the Shakespearian tradition connected with his name. Nicholas Rowe, writing in 1710, told a story that Lucy prosecuted Shakespeare for deer-stealing from Charlecote Park in 1585, and that Shakespeare aggravated the offence by writing a ballad on his prosecutor. The trouble arising from this incident is said to have driven Shakespeare from Stratford to London. The tale was corroborated by Archdeacon Davies of Sapperton, Gloucestershire, who died in 1708. The story is not necessarily falsified by the fact that there was no deer park at Charlecote at the time, since there was a warren, and the term warren legally covers a preserve for other animals than hares or rabbits, roedeer among others.

Shakespeare is generally supposed to have caricatured the local magnate of Stratford in his portrait of Justice Shallow, who made his first appearance in the second part of *Henry IV.,* and a second in the *Merry Wives of Windsor.* There are many considerations which make it unlikely that Shallow represents Lucy, the chief being the noteworthy difference in their circumstances. Lucy died at Charlecote on July 7, 1600.

For a detailed account of Sir Thomas Lucy, with his son and grandSon of the same name, *see* Mrs. C. Carmichael Stopes, *Shakespeare's Warwickshire Contemporaries* (and ed., 1907). *Cf.* also an article by Mrs. Stopes in the *Fortnightly Review* (Feb. 1903), entitled "Sir Thomas Lucy not the Original of Justice Shallow," and J. O. Halliwell-Phillipps, *Observations on the Charlecote Traditions* (Brighton, 1887).

LUDDITES, the name given to organized bands of English rioters for the destruction of machinery, who made their first appearance in Nottingham and the neighbouring districts towards the end of 1811. The "Ludds" or Luddites were generally masked, and operated at night. Their leader, real or imaginary, was known as "General Ludd" from a probably mythical "Xed Ludd" of whom various stories were current. Great distress had been caused by the dismissal of handicraftsmen in the areas in which textile machinery was introduced; and even those handicraftsmen who did not lose their employment suffered considerable worsening of conditions owing to competition. The riots began with the destruction of stocking and lace framee, and, continuing through the winter and the following spring, spread into Yorkshire, Lancashire, Derbyshire and Leicestershire The riots were directed not merely against reductions of wages but also against the poor quality goods (especially stockings) produced by the new machines The rioters were supported by local public opinion, and they abstained from bloodshed or violence against living beings, until in 1812 a band of them was shot down by soldiers on the request of a threatened employer, Horsfall, who was afterwards murdered. They were met by severe repressive legislation, introduced by Lord Liverpool's government, a notable feature in the opposition to which was Lord Byron's speech in the House of Lords. The organization was temporarily broken up by a mass-trial at York in 1813, which resulted in many hangings and transportations: somewhere among the victims was probably the real "King Ludd," for the elaborate organization suddenly collapsed. In 1816 similar rioting was resumed, caused by the depression which followed the peace of 181j and aggravated by one of the worst of recorded harvests. In that year, although the centre of the rioting was again in Nottingham, it extended over almost the whole kingdom. The rioters were also thoroughly organized. While part of the band destroyed the machinery, sentinels were posted to give warning of the approach of the military. Vigorous repressive measures, and, especially, reviving prosperity, brought the movement to an end.

Sykes (Huddersfield. n.d.) is a "novel" in which is concealed much genuine history written from the Luddite point of view. *See* also the Home office papers in the Record Office.

LUDENDORFF, ERICH (1865–1937), German soldier, was born at Kruszevnia, in the province of Posen, April g, 1865. When 18 years old, he entered the Prussian army. In 1894 he joined the general staff, and, except for an interval of two years as company commander, remained on it from 1894 to 1913, under Count Schlieffen and the younger General von Moltke. As chief of the *Aufmarschabteilung* since 1908 he played a prominent part in the mobilization preparations. The last great increase in the strength of the army in 1913 was largely due to his initiative and energy. During the year preceding the outbreak of the World War he commanded first the 39th Fusilier Regiment at Dusseldorf, and afterwards an infantry brigade at Strasbourg.

At the outbreak of the World War Ludendorff was quartermaster general of the II. Army. His voluntary assumption in the beginning of August of a decisive *rôle* at the capture of the fortress of Liége gave him his first great opportunity. He took over the command of the 14th brigade of infantry, in the place of General von Wussow who was killed, and, breaking through the ring of fortifications at its head, seized the interior of the town. He was rewarded on Aug. 22 by being made chief of staff to Hindenburg in the VIII. Army which was fighting in East Prussia.

Campaigns in East **Prussia.**—The battle of Tannenberg revealed his powers of generalship, for he there demonstrated the justice of the theory of annihilation. The victory of Tannenberg over the Russian army of the Narew was more than another Cannae. For in this case there was not, as in former days, merely one enemy to be dealt with. On the contrary, the attempt was made to envelop the greatly superior main body of Russians in the presence of a second enemy force threatening the rear. And the attempt proved successful. In the subsequent operations which led to the first battle on the Masurian lakes and to the heavy defeat of the Russian army of the Niemen, the enemy's right wing was supported on the lake, and so only an envelopment of the southern wing was possible. The operations, therefore, took the form of an attack on the enemy's front and on his exposed flank.

The strategic success lay in the liberation of East Prussia from the enemy. The German Army of the East became available for the immediate support of the Austro-Hungarian ally, by this time in dire straits. This support was rendered in the brilliant October campaign of the newly-formed IX. German army directed through Southern Poland upon the Vistula. Its purpose—to facilitate the Austrian efforts in Galicia by drawing off upon the IX. Army the strongest possible body of Russian troops—was attained in a degree entailing grave danger to the outnumbered Germans themselves. The menace of envelopment by a vastly superior enemy, pouring up from the direction of Warsaw, was parried and beaten off by Ludendorff by means of an exceedingly gallant defensive action, carried out during withdrawal. In November after a rapid regrouping of the main German forces, an advance was made from the Wreschen-Thorn line against the right flank of the main body of the Russians, lying in West Poland. In the absence of sufficient strength a simultaneous frontal attack was impossible. But even so, the success achieved in the battle of Lódź was great. The Russians were definitely relegated to the defensive—and, in the pursuit which followed, were flung back behind the Bzura and the Rawka.

During the fighting in Masuria in Feb. 1915 Ludendorff achieved the destruction of another Russian army in the region of the Upper Bobr. This was followed by a period of relative inactivity on the German eastern front lasting for several months. Not before the middle of July 1915 did the army group of Hindenburg resume the war of movement. By an attack directed upon and beyond the Lower Narew it relieved, by means of a converging offensive, the army group of Mackensen which had advanced from Galicia into Southern Poland between the Vistula and the Bug. In the ensuing operations the Russian army was driven out of the Vistula positions and out of the whole of Poland towards the East. After a brief resistance the fortresses of Warsaw, Nowogeorgiewsk (Modlin) and Kovno fell. But no decisive issue was reached, because General von Falkenhayn, chief of the German general staff, rejected the proposal of Hindenburg and Ludendorff, which was to advance with the German left wing in a northerly direction through Kovno and Vilna upon Minsk, thereby cutting the Russian railway communications, to the north of Polesia. Had the operations been conducted in accordance with the views of Hindenburg and Ludendorff, the Russian army might have been dealt a mortal blow in the summer of 1915. Later, in September, the attempt was made on the German left wing, but with inadequate forces, to embarrass the retreat of the section of the Russian army withdrawing northwards from Polesia past Vilna; but the moment for success on a grand scale had gone.

After the victorious conclusion of the Balkan campaign in the winter of 191j–16 Ludendorff contemplated a great offensive into the heart of the Ukraine, with the object of breaking the back of the economic resistance of Greater Russia, which was already cut off from the sea. The offensive necessitated the occupation of Rumania; but General von Falkenhayn rejected this scheme, and chose Verdun instead of Kiev as the objective for operations. Accordingly in the year 1916 the eastern front of the allied Central Powers was assigned the duty of protecting the rear of the offensive movement in France. This task was amply fulfilled on the northern wing but on the southern wing, held by the Austrians, the front completely collapsed in June and July at Luck and in Galicia. The balance in the East was restored with difficulty by the intervention of the German command.

On Aug. 29 Field-Marshal von Hindenburg assumed the office of chief of the general staff of the armies in the field, in the place of Falkenhayn, and Ludendorff became first quartermaster general. In contrast with their predecessor's point of view, the two men still promised themselves triumph, but a triumph which could only result from a more vigorous conduct of the war by drawing upon the whole available strength of the country in wealth and population. The methods adopted for the utilization of these resources were expressed in the so-called "Hindenburg programme" of war industries and in the so-called law of auxiliary services; and here Ludendorff could only co-operate by means of suggestions and demands. In his own sphere too, he found that, owing to the almost desperate military situation inherited from his predecessor, he was not at first able to put into practice Schlieffen's doctrine of annihilation. The result of the offensive against Rumania was that this new enemy was overthrown in the winter of 1916. This victory was of inestimable value to the Central Powers, for new sources of economic power were thereby opened up.

Submarine Warfare.—After the defeat of the Rumanian army there remained but one further task. This was the frustration of the attacks of the enemy in the west, greatly superior in numbers and material. The restoration of the balance of strength thus aimed at was to enable the Central Powers later to deliver an offensive with decisive effect. A favourable diversion of this kind, however, could only be counted upon, if, during the strategical defence on land, England could be reduced to desperate straits. An intensified U-boat warfare in the blockade area round England was therefore adopted, a weapon, recourse to which had hitherto always been postponed on the score of political considerations. The disadvantage of this course was that it would give the United States a pretext for war on the side of the Entente; but regarding this as inevitable, Ludendorff hoped to render England disposed for peace before the Americans should be in a position to throw considerable forces into Europe.

Unrestricted U-boat warfare did not altogether fulfil expectations. The technical perfection of the enemy's defensive weapons and the ample scale upon which they had been completed contributed to this in a very material degree. On the other hand, without the adoption of unrestricted U-boat warfare the strategy of the Central Powers would have been altogether unable to hold the balance on land in suspense until, aiter Russia's collapse in the spring of 1918, there dawned a well-founded prospect of forcing a decision in France before the American forces on land became effective.

In the spring of 1917 in the western theatre of war Ludendorff was enabled, by a timely withdrawal to the Siegfried position and by the elasticity of his defensive tactics. to impose a check upon the Allied attack carried out with a gigantic expenditure: of men and material. Subsequently he had another opportunity of vindicating his theory of annihilation in the warfare on land. Under the blows dealt by the German hammer at Tarnopol, Riga, Dagö and Ösel, Russia fell. The reckoning with Italy followed in the autumn of 1917, but the situation in the west, particularly in Flanders where the fighting raged with undiminished fury, rendered it impossible for Ludendorff to secure a decisive victory.

The Offensive of **1918.**—The German resolution to take the offensive in the spring of 1918 was rendered imperative by the general position. The psychological condition of the army peremptorily demanded that the *rôle* of anvil should be exchanged for that of hammer. Conditions at home called for a potent remedy against the threefold poison instilled by the hunger blockade. enemy propaganda and revolutionary agitation. Germany's hard pressed allies had for long rested their sole hopes of delivery on the efforts of Germany. Ludendorff saw only one road by which a tolerable peace, in harmony with the honour of the German people, could be reached, the road of military victory. This again could be attained solely by means of an offensive which should be decisive, and in taking this course he hazarded everything. A series of small attacks with limited objectives or a powerfully conducted defence would in favourable circumstances only have secured a temporary advantage, but could not prevent the enemy from finally giving full effect to his superior strength in a battle of annihilation. It is questionable whether the choice of direction for the offensive on French territory can be defended. Many critics would have preferred an offensive in Italy, but apart from the natural difficulties, even the destruction of the Italian arrny could at best only have preceded the main decisive operations on French soil.

It has been questioned whether Ludendorff assembled adequate forces for the spring offensive of 1918. In March, at the beginning of this offensive, the Germans disposed of 193 divisions and three brigades in the Franco-Belgian theatre of war. The estimates of the forces commanded by the Entente in France and Belgium at the beginning of the spring offensive vary between 167 and 180 divisions. The Germans, therefore, enjoyed a slight superiority in the number of divisions. The original intention that a section of the Austro-Hungarian forces should take part. in the decisive encounter in France was finally thwarted by the opposition of the Habsburg emperor. Ludendorff accordingly chose the expedient of indirect assistance to he rendered by a relieving offensive carried out hy the Austro-Hungarian army in Upper Italy. This offensive. however, was undertaken much too late for the objective in view, in the middle of June, and, moreover, ended with a severe reverse. The occupation of Rumania called imperatively for four divisions and a greater number of Landsturm formations. The invasion of the Ukraine, carried out in February and March, demanded about 20 weak divisions, including eight divisions of Landwehr and three of cavalry. It is disputable whether it would have been wiser to abandon the enterprise in the Ckraine. The secretary of State of the *Kriegser*-nahrungsamt urged with the utmost emphasis that the economic resources of the Ukraine should be thrown open to Germany. Failing this, the Austrians' system of food supplies would collapse. The delivery of meat was important for Germany, too, and the delivery of horses was, above all, a matter of the greatest urgency.

On political and military grounds Ludendorff had resolved to deal the first decisive blow in the west against the English. For this purpose he chose the southern flank, on both sides of St. Quentin, as tactically the least defensible, with the intention of forcing his way through at this point and by advancing north of the Somme towards the northwest, to roll up the whole front gradually and press the English towards the sea. The southern wing of the German offensive was to guard his flank against a relieving attack on the part of the French. This strategy became subject to certain changes in consequence of the unexpected magnitude of the initial success of the German southern wing, which continued the offensive across the Somme and the Crozat canal against the French, in order to effect a cleavage between the English and French at and beyond Amiens. This end was not completely attained. and the result of the first offensive, though great from the tactical standpoint was strategically nugatory. A second attack on the Lys front, against the English and Portuguese, was made in the middle of April and was designed to gain possession of the commanding heights north of Bailleul and to cut off the Ypres salient; its result, however, was indecisive.

During the following months, in spite of successive brilliant diversive attacks carried out against the French front, no further headway was made in forcing a decisive engagement in Flanders; and the heavy toll of the spring offensives could not be made good rapidly enough. And yet, prior to the last great attempt to break through on both sides of Reims in July 1918, there still remained a prospect of final victory for the German arms. The goal had nearly been reached—which was a proof that the strategy adopted might have succeeded and was, therefore, the right strategy. But the fortune of war was against Ludendorff. His plans were revealed by treachery to the enemy, at a time when everything depended on secrecy and surprise. The great successes hitherto achieved had led to a wide extension of the German front, calling for the employment of disproportionately large forces and offering in its many angles and salients dangerous surfaces to the enemy's attacks. These factors now made their disastrous influence felt.

But the final cause of Ludendorff's inability to resume the initiative lay in the absence of a free command of reserves, due to the drying up of the sources of supply at home. When the German command fell back on the defensive before hostile attacks, Ludendorff realised that there was nothing to be done except to hold out until diplomacy succeeded in securing a tolerable peace, or to perish with honour. On Oct. 26, however, he was overthrown by the cabinet of Prince Max of Baden. The collapse of Germany's allies, combined with difficulties at home, rendered hopeless any further resistance by the army in the field now thrown upon its own resources.

General Ludendorff was above all a man of action, and one who rated formation of character and the attributes of leadership more highly than the acquisition of comprehensive learning. His resolution, his almost super-human and invincible powers of work and action, his understanding of the moral factors in warfare, inspired the German army with boundless confidence in his leadership and qualified it for mighty exploits If like Hannibal and Lee he failed in the final issue, it was through no fault in generalship, but was partly due to slowness in realising that his weapon had grown blunt and that the population at home was no longer capable of the effort of endurance and the indispensable will to victory. His powers of leadership reflected his character; brain, heart and will were all unsparingly enlisted in the service of one aim, the honour of his country. Along this path he was impelled to travel, whether it led to victory or defeat. (W. Fo.)

Ludendorff's complete collapse at the end of the war was one of the tragic sensations of the time. After demanding an unconditional armistice. when the armistice was actually concluded, he abandoned his country and fled to Sweden. In the spring of 1919 he returned to become, with his former chief of staff. Col. Max Bauer, the focus of all extreme reactionary conspiracies. With Bauer he was the initiator and organizer of the Kapp *Putsch* of March 1920; although he remained in the background and avoided responsibility, nevertheless his role was known, and he retired to the more conservative atmosphere of Munich to engage in fresh intrigues which showed a complete lack of any sense of political reality.

In 1923 he emerged into the open in connection with the attempted coup of Adolf Hitler, the National Socialist leader. After wavering between the rival conspiracies of Hitler and Gustav von Kahr. Ludendorfi joined the former in an attempt to establish an anti-Marxist dictatorship in Germany. The coup (Nov. 8, 1923) proved an ignominious fiasco. but Ludendorff's past reputation saved him from its consequences. In May 1924 he entered the Reichstag as a National Socialist and in 192j stood for president of the reich, securing slightly over 1% of the votes cast. In the same year he retired from the presidency of his small party and began to take a less prominent part in politics. He died in Munich, Dec. 20, 1937.

Ludendorff published several books on World War I, the most important of which are: *Meine Kriegserinnerungen 1914–18* (Eng. trans.. *My War Memories*) (1919); *Urkunden der obersten Heeresleitung über ihre Tatigkeit 1916–18* (1919); *Kriegführung und Politik* (1921); *Das Friedens- und Waffenstillstandsangebot* (1919). Among his polemical writings may be mentioned *Vernichtung der Freimaurerei durch Enthüllung ihrer Geheimnisse* (1927).

See H. Delbreck, *Ludendorffs Selbstportrat.* 10th ed. (1922). (C. A. M.)

LÜDENSCHEID, a town in the *Land* of North Rhine-Westphalia. German Federal Republic. lies in the wooded Sauerland at the watershed of the Lenne and Volme rivers. 19 mi. S.E. of Hagen at an altitude of 495 m. (1,625 ft.). Pop. (1950) 51,705; (1959 est.) 57,582. The main business street, the Wilhelmstrasse, joins several other streets at the city centre, while at the centre of the old town is the Church of the Saviour with a tower dating from 1072. There is a modern hospital, a park and recreational facilities. Liidenscheid is an industrial centre and manufactures aluminum. plastics and synthetics, light metal products and rolled and semi-finished goods.

A Frankish settlement in the 9th century and chartered in the mid-13th century. Liidenscheid became during the middle ages a centre of the iron industry, and was a member of the Hanseatic league. In the 17th century it passed with Cleves-Mark to Brandenburg; during the French occupation of 1806–15 it belonged to the grand duchy of Berg. In 1723 the town was destroyed by fire. (R. A. Kr.)

LÜDERITZ, a town in South-West Africa on the bay of same name (26° 40′ S., 15° 5′ E.). Pop. (1961 census) 3,604. Liideritz grew out of a trading station, which was established in 1883. It is the chief centre of the diamond diggings.

The hinterland is desert: the mean annual rainfall is 0.64 in. A railway leads inland: and links up with the south African system at De Aar. The town has to bring its water from Garub, 65 mi. away by train.

The local fishing grounds are extraordinarily rich, and. since the British occupation fish canning factories have been opened. Calling ships have to anchor in the bay, and cargo must be transshipped to or from lighters. Neighbouring islands yield about 8.000 tons a year of guano.

LUDFORD, NICHOLAS (*c.* 1480–*c.* 1542). English composer of masses, motets and a magnificat, is believed to have been a member of the Chapel Royal. but his name does not appear on its records. He married in 1535, and on June 1, 1542, his widow was given a lease to lands and a watermill in Warwickshire.

In the British museum is a collection of seven of his masses, probably one for each day of the week. Six of the masses (Roy. App 45–48) are in good condition, but the seventh (Add. RISS. 30.520) is a mutilated fragment. The fragment is known as the "Le Roy" mass because it is based on a melody by that name written by John Taverner. All seven masses are written for a solo voice and three-part chorus (treble, tenor, countertenor) with a sequence betneen the gloria and credo. The seven masses are believed to have been written before 1536 since the binding bears the arms of Catherine of Aragon, who died in that year.

LUDHIANA, a town and district of Punjab state. India. 'The town is 8 mi. from the present left bank of the Sutlej, 228 mi. by rail northwest of Delhi. Pop. (1961) 244,238. It is an important centre of trade in grain and has manufactures of shawls, etc., by Kashmiri weavers; and of scarves, turbans, furniture and carriages. There is a U.S. Presbyterian mission, and there are four colleges affiliated to the Panjab university (including an agricultural college and one for women).

The District of Ludhiana lies south of the Sutlej river, and north of the northern districts of the former state of Pepsu (the Patiala and East Punjab states union). Area 1.323 sq.mi. The district consists for the most part of a broad plain. without hills or rivers, stretching northward from the state borders to the ancient bed of the Sutlej. A branch of the Sirhind canal irrigates a large part of the southwestern area. The population in 1961 was 1,021,-190. The principal crops are wheat, millets, pulse, maize and sugar cane. The district is crossed by the main line of the Northern railway from Delhi to Lahore, with two branches.

During the Moslem epoch, the history of the district is bound up with that of the Rais of Rajkot, a family of converted Rajputs, who received the country from the Sayyid dynasty about 1445. The town of Ludhiana was founded, in 1480 by two of the Lodi race (then ruling at Delhi). from whom it derives its name.

The Lodis continued in possession until 1620, when it again fell into the hands of the Rais of Rajkot. Throughout the palmy days of the Mogul empire the Rajkot family held sway. but the Sikhs took advantage of the troubled period which accompanied the Mogul decadence to establish their supremacy south of the Sutlej. In 1806 Ranjit Singh crossed the Sutlej and reduced the obstinate Mohammedan family, and distributed their territory among his coreligionists.

After the British occupation of the Punjab, Ludhiana grew in wealth and population.

LUDLOW, EDMUND (*c.* 1617–1692), English parliamentarian. son of Sir Henrv Ludlow of Maiden Bradlev. Wiltshire. He went to Trinity college. Oxford. and was admitted to the Inner Temple in 1638. When the Great Rebellion broke out, he engaged as a volunteer in the life guard of Lord Essex and served through successive campaigns until 1646, when he was elected M.P. for Wiltshire in the room of his father and attached himself to the republican party. He was one of the chief promoters of Pride's purge in 1648 was one of the king's judges and signed the warrant for his execution. In February he joined the council of state.

In Ian. 1611 Ludlow was sent into Ireland as lieutenant general of horse, holding also a civil commission. Ireton, the deputy of Ireland, died on Nov. 26. 1651; Ludlow then held the chief command and had practically completed the conquest of the island when he resigned his authority to Fleetwood in Oct. 1652. On returning to England in Oct. 16jj he was arrested, as he refused to acknowledge Cromwell's authority as protector, but he was allowed to retire to Essex.

Ludlow sat in Richard's parliament of 1659, but opposed the continuance of the protectorate. He was a member of the restored Rump. and of its council of state and of the committee of safety after its second expulsion. and a commissioner for the nomination of officers in the army. In July he was sent to Ireland as a commander in chief. He came back to England in Oct. 1659 and, after a brief visit to Ireland at the end of the year, was impeached in the restored parliament.

Ludlow, having vainly sought to oppose the restoration of the monarchy, surrendered to the speaker on June 20, but, finding that his life was not assured, although he was not named for capital punishment, he escaped to Switzerland, where he lived at Vevey. In 1689 he came back to England but was forced to return to Vevey, where he died in 1692.

BIBLIOGRAPHY.—Ludlow's Memoirs, up to 1672, were published in 3 vol. at Vevey in 1698–99 and have often been reprinted; see the edition with introductory memoir by Sir Charles Harding Firth, 2 vol. (Oxford, 1894); also Firth's article in *Dictionary of National* Biography, vol. xxxiv (London, 1893).

LUDLOW, a market town and municipal borough in the Ludlow parliamentary division of Shropshire, Eng., on the left bank of the Teme below its confluence with the Corve, near the Herefordshire border. It is 28 mi. S. of Shrewsbury by road and 2 mi. N. of Hereford. Pop. (1951) 6,456. Area 1.7 sq.mi. On the peninsula the castle, now ruined, founded about 1085 by Roger de Lacy, occupies a commanding position. Interesting features are the late Norman circular chapel, the Decorated Gothic state rooms and Perpendicular and Tudor details. John Milton's masque *Comus* was first performed in the castle.

Ludlow is supposed to have existed under the name of Dinan in pre-Saxon days. Robert William Eyton identified it with one of the "Ludes" mentioned in Domesday Book. The name is said to mean "hill by the rapid." Its position on the Welsh border, particularly in relation to routes north and south and into Wales past Bishop's Castle (*q.v.*), ensured it an important place in the military and commercial life of the middle ages. Ludlow was a borough by prescription in the 13th century, but the burgesses owed most of their privileges to their allegiance to the house of York. Of the confirmation of early charters the last, dated 1665, continued in force until the Municipal Corporations act of 1835. The Council of the Marches held its court at Ludlow from the reign of Henry VII until 1689.

The greater portion of the old town wall, together with one of the original seven gates, still remains. Thanks to its strong position, Ludlow was the last Shropshire fortress to yield to the parliamentary forces in 1646.

The town has many beautiful half-timbered buildings and several Georgian houses. The parish church of St. Lawrence is of great size with a lofty central tower and a fine east window with 15th-century glass. Notable is the Butter Cross, an 18th-century building. The medieval Ludford bridge on the Teme has been declared an ancient monument. Ludlow is now a thriving market town, a noted centre for sales of Hereford cattle and, by virtue of its situation halfway between Shrewsbury and Hereford, a business and social centre for the surrounding rural area. It is also a tourist resort.

Besides the several industries connected with agriculture, there are light engineering works.

LUDMILA, SAINT (d. 921), wife of Borivoj, the first of the Czech princes to adopt Christianity in 874, and grandmother of St. Wenceslas, was born at Psovka, near Melnik. Her relationship with her daughter-in-law Drahomira, mother of Wenceslas, turned into a feud that ended with Ludmila's murder on Drahomira's instigation at Tetin near Beroun in 921. Ludmila was known as a pious woman, who had brought up Wenceslas in the faith, and oral tradition soon surrounded her with a martyr's halo. Only a short time elapsed before the first legends arose: a "prologue on St. Ludmila" in Church Slavonic, one of the oldest works to have arisen independently on Bohemian territory, and a Latin life based on it. The best-known legend is the Latin life of both Wenceslas and Ludmila written by the monk Christian in the 10th century. Ludmila's feast day is Sept. 16.

See J. Pekar, Die *Wenzels-* und Ludmilalegenden (1906).

LUDWIG, EMIL (1881–1948), German-born author and playwright, was born in Breslau, Jan. 25, 1881, of a Jewish family named Cohn. As a young man he practised law, and had some practical commercial experience; but from a very early age was engaged in literary productions, mainly dramatic, in prose and verse.

A number of these works were staged; they include *Ein* Friedloser, *Ein Untergang,* Napoleon, Die *Borgia,* Tristan *und* Isolde, *Atalanta* and *Ariadne* (ballet). Ludwig spent some time in England shortly before World War I studying modern tendencies, and during the war was employed as the foreign correspondent of a Berlin paper in the chief political centres of German-speaking Europe. During this period he wrote novels (Manfred und Helena; *Diana*) and sketches (An die *Laterne*), besides more dramatic pieces (*e.g.,* Friedrich *Kronprinz von Preussen*).

He now began to indulge his real bent for "humanizing" historical biography in a series of biographies, in which the main emphasis was laid on the psychological motive, represented in a vivid and flamboyant style. His subjects were Goethe (1920 and 1923), Wagner, Bismarck (a trilogy: *Volk und Krone* and Die *Entlassung,* 1922, *Genie und Charakter,* 1923), *Napoleon* (1924); *Wilhelm II* (1925) and Christ (*Menschensohn*) (1928). Of these the works on the emperor William and Bismarck were written with considerable inside political knowledge and in a stimulating and controversial fashion, which aroused great interest, especially in England, where a series of his works were translated (Wilhelm *II* and Bismarck, 1926; Napoleon and Goethe [the latter containing only half of the original German edition], 1927; The Son of Man, 1928).

The works on Napoleon, and still more that on Christ, revealed, on the other hand, an unhistorical manner, not redeemed by their psychological insight. From 1906–40 Ludwig lived almost continuously in Switzerland, becoming a citizen of that country. In 1940 he went to the United States. His later works included The Nile (1936), Roosevelt: a Study in Fortune and Power (1938), Bolivar (1942) and The Mediterranean (1942). He died Sept. 17, 1948, in Ascona, Switz.

LUDWIG, KARL FRIEDRICH WILHELM (1816–1895), German physiologist, one of the founders of 19th-century German physiology and teacher of many notable physiologists, was born at Witzenhausen, near Cassel, on Dec. 29, 1816. He studied at Erlangen and at Marburg, where he taught anatomy and physiology until 1849. He then became professor at Zürich, Switz. Subsequently he went to Vienna and later organized the newly created chair of physiology at Leipzig, 1865–95. He died on April 23, 1895.

Ludwig was ingenious in devising instrumentation for the study of physiological processes. To be especially mentioned are his adaptation of the Thomas Young kymograph for recording arterial blood pressure and respiration and the floating writing point on the mercury manometer introduced by J. L. M. Poiseuille.

His researches comprised a variety of fields. All modern theories of urine and lymph formation stemmed from his original communication on urine secretion (1844). He devised the first blood gas pump and the first instrument for determining the velocity of blood flow in the larger arteries (Stromuhr). With Élie de Cyon he discovered the depressor nerve (1866) and with Baxt the accelerator nerves to the heart. He studied the effect of certain drugs on the heart with Oswald Schmiedeberg and Sir Thomas Lauder Brunton, localized the vasomotor centre in the medulla and studied capillary blood pressure. With Wooldridge he studied certain phases of the coagulation of the blood and with H. P. Bowditch discovered the all-or-none law (*q.v.*), of cardiac muscle and the indefatigability of nerve.

Ludwig was the first to demonstrate that human digestive glands might be under the influence of secretory nerves, when he demonstrated that the chorda tympani nerve had such an effect on the submaxillary and sublingual glands. He also demonstrated that stimulation of the nervi erigentes caused a vasodilation.

See the biography by Walter J. Meek in the Gamma Alpha Record, vol. xxiii, no. 2, pp. 31–43 (May 1933). (F. L. A.)

LUDWIG, OTTO (1813–1865), German writer remembered for his realistic stories, which contributed to the development of the Novelle, was born at Eisfeld, Thuringia. on Feb. 12, 1813. Showing an early aptitude for both literature and music, he was sent to Leipzig in 1839 to study music under Mendelssohn. Later he changed to literary studies, in particular dramatic theory, his principal interest from 1844 to 1849, when he lived in Meissen. His last years were spent in Dresden, where he died on Feb. 25, 1865. His work is Heimatkunst (regional art) at its best; he coined the expression "*Poetischer Realismus,*" later used to describe the writing of several of his contemporaries. An admirer of Shakespeare but a sharp critic of Schiller, Ludwig strove to create dramas embodying his theories. *Der Erbforster* (1850), an attempt to depict the psychology and environment of the middle class, owes much to the Schillerian tragedy, despite Ludwig's efforts to avoid this effect. His other plays are forgotten, but his graphic stories of Thuringian life are still read, *e.g., Die Heiterethei* (1854), the humorous tale of a village love-affair, and the psychological masterpiece *Zwischen Himmel und Erde* (1855; Eng. trans., *Between Heaven and Earth,* 1928), in which a tragic conflict between two brothers is played out against the background of the slaters' trade. Ludwig's collected works were published by A. Stern and E. Schmidt (6 vol., 1891); unfinished critical edition by P. bferker (6 vol., 1912–22).

For biographies, studies and other editions *see* W. Kosch, *Literatur-Lexikon,* vol. ii (1953), pp. 1587–88. (L. H. C. T.)

LUDWIGSBURG, a town in the *Land* of Baden-Württemberg, Ger., 9 mi. N. of Stuttgart and 1½ mi. from the Neckar river. Pop. (1950) 58,489. It was founded at the beginning of the 18th century by the duke of Wiirttemberg, and was enlarged and improved by Duke Charles Eugene. Constructed as the adjunct of a palace, the town has straight streets and spacious squares. The former royal palace which stands in a park and contains a portrait gallery and the burial vault of the rulers of Wiirttemberg is now a museum. The industries include the manufacture of organs and pianos, of celluloid, watchcases, cotton, woolen and linen goods, chemicals, iron and wire goods, and brewing and brick-making. From 1758 to 1824 the town was famous for the production of a special kind of porcelain.

LUDWIGSHAFEN, a town of Germany, in the *Land* of Rhineland Palatinate, on the Rhine, immediately opposite Mannheim. Pop. (1885) 21,042, (1950) 123.869. Founded in 1843 by Louis I, king of Bavaria, Ludwigshafen was not made a town until 1859. It has trade in iron, timber, coal and agricultural products. fostered by a harbour opened in 1897 which is also a free port; and also large factories for making aniline dyes, soda, cellulose, tobacco, carriages, artificial manure, flour and malt; there are sawmills, iron foundries and breweries. During World War II it was severely bombed by the British Royal Air Force.

LUEGER, KARL (1844–1910), Austrian administrator, burgomaster of Vienna, was born on Oct. 24, 1844, the son of an usher, and, studying under the greatest material difficulties, succeeded in qualifying as an advocate (1874). He was at first a partisan of the Democratic party, then a leader of the Christian Socialists, an anti-Semite and advocate in the courts for artisans and "small men." He was a deputy to the Austrian parliament in 188j and 1891. He overthrew the German-Liberal municipal government of Vienna: and was elected burgomaster in 1895, but the emperor did not confirm the appointment, and Vienna was placed under the governorship of a state commission. In the new elections Lueger allowed another member of his party to be set up as dummy burgomaster, while he himself in form became vice-burgomaster. In 1897, however, when the people's candidate, Lueger, was again elected burgomaster, the emperor confirmed his election and repeatedly honoured him. He held the post for ten years. He was a zealous Catholic, and wished to "capture the university" for the church; he would have neither Social Democrats nor Pan-Germans nor Jews in the municipal administration. He secured good treatment for Czech immigrants and established Viennese municipal electrical stations, gasworks and streetcars, independent of the English gas and streetcar companies. He planned to make Vienna one of the most beautiful of garden cities. He died on March 10, 1910, in Vienna.

See Tomola, *Unser Biirgermeister, Dr. Karl Lueger* (1904); and Stauracz, *Dr. Karl Lueger, zehn Jahre Biirgermeister* (1907).

LUFFA or LOOFAH, the name given to the fruit of *Luffa cylindric~a* herbaceous plant of the family Cucurbitaceae (*q.v.*).

LUGANO, the most populous and thriving town in the Swiss canton of Ticino on the lake of Lugano at an altitude of 906 ft. Pop. (1950) 18,122, almost all Italian speaking. To the south is San Salvatore (2,992 ft.), on the southeast (across the lake) Monte Generoso (5,584 ft.) and to the east Monte Bré (3,061 ft.). All three are accessible by railways. By rail Lugano is 124 mi. from Lucerne and 51½ mi. from Milan. Situated on the main St. Gotthard railway line, Lugano is much frequented by visitors (largely German) in spring and in autumn. Though politically Swiss since 1512, Lugano is Italian in appearance and character. The railway station is connected with the quays by a funicular railway. The principal church, San Lorenzo, in part dates back earlier than the 15th century. This church is now the cathedral church of the bishop of Lugano, a see with jurisdiction over the Italian parts of Switzerland. The church of Santa Maria degli Angioli, built about 1499, and until 1848 occupied by Franciscans, contains several frescoes painted 1529–30 by Bernardino Luini. During the struggle of 1848–66 to expel the Austrians from Lombardy, Lugano served as headquarters for Mazzini. Books and tracts intended for distribution in Italy were produced there and at Capolago and the Austrian police were powerless to prevent their circulation.

LUGANO, LAKE OF, lying between Lago Maggiore and the Lake of Como, north Italy (anc. Lacus Ceresius). The great promontory of San Salvatore (2,992 ft.) nearly cuts off the western arm from the main lake. The area is 19 sq.mi., greatest length about 22 mi., greatest width 2 mi. and greatest depth 945 ft., surface 889 ft. above sea level. Between Melide (south of the town of Lugano) and Bissone (on the east shore) the lake is so shallow that a great stone dam has been built across for the St. Gotthard railway line and the road. The chief town is Lugano (at its north end), which by the St. Gotthard line is 19 mi. from Bellinzona and 9 mi. from Capolago, the station at the southeastern extremity of the lake, which is but 8 mi. by rail from Como. At the southwestern extremity a railway leads southwest from Porto Ceresio to Varese (9 mi.). Porlezza, at the east end of the lake. is 8 mi. by rail from Menaggio on the Lake of Como. while Ponte Tresa, at the west end of the lake, is about the same distance by electric railway from Luino on Lago Maggiore. Of the total area of the lake, about 12 sq.mi. are in the Swiss canton of Ticino (Tessin), formed in 1803 out of the conquests made by the Swiss from the Milanese in 1512. The remainder of the area is in Italy to which also belongs the small enclave of Campione, almost opposite the town of Lugano. The lake lies among the outer spurs of the Alps that divide the Ticino (Tessin) basin from that of the Adda, where the calcareous strata have been disturbed by the intrusion of porphyry and other igneous rocks. It is fed by numerous torrents issuing from short glens in the surrounding mountains, while it is drained by the Tresa, an unimportant stream flowing into Lago Maggiore. The first steamer was placed on the lake in 1856. (W. A. B. C.)

LUGANSK: *see* VOROSHILOVGRAD.

LUGARD, FREDERICK JOHN DEALTRY LUGARD, 1ST BARON (1858–1945), British administrator, son of the Rev. F. G. Lugard. was born on Jan. 22, 1858. He entered the army in 1878 and served in the Afghan War (1879–80), in the Sudan campaign (1884–85) and in Burma (1886–87). In May 1888 he took command of an expedition organized by the British settlers in Nyasaland against the Arab slave traders on Lake Nyasa, and was severely wounded. In April 1889 he was engaged by the Imperial British East Africa company. In their service he explored the Sabaki river region, and elaborated a scheme for the emancipation of the slaves in the Zanzibar mainland. In 1890 he was sent by the company to Uganda, where he secured British predominance and put an end to the civil disturbances, though not without severe fighting, chiefly notable for an unprovoked attack by the "French" on the "British" faction. While administering Uganda he journeyed round Ruwenzori to Lake Edward, mapping a large area of the country. He also visited Albert Nyanza, and brought away thousands of Sudanese who had been left there by Emin Pasha and H. M. Stanley.

In 1892 Lugard returned to England, where he opposed the abandonment of Uganda by Great Britain, contemplated by the fourth Gladstone administration. In 1894 Lugard was dispatched by the Royal Niger company to Bornu, where. distancing his French and German rivals, he secured treaties with the kings and chiefs acknowledging the sovereignty of the British company. In 1896–97 he took charge of an expedition to Lake Ngami on behalf of the British West Charterland company. He was recalled by the British government and sent to west Africa, to raise a native force to protect British interests in the hinterland of Lagos and Nigeria against French aggression. In Aug. 1897 he raised the West African Frontier force, and commanded it until the end of Dec. 1899. The differences with France were then composed, and, the Royal Niger company having surrendered its charter, Lugard was chosen as high commissioner of northern Nigeria. The part of northern Nigeria under effective control was small, and Lugard's task in organizing this territory was impeded by the refusal of the sultan of Sokoto and many other Fula princes to fulfill their treaty obligations. In 1903 a successful campaign against the emir of Kano and the sultan of Sokoto facilitated the extension of British control over the whole protectorate, and when in Sept. 1906 he resigned his commissionership, the whole country was being peacefully administered under the supervision of British residents. *(See* NIGERIA.) In April 1907 he was appointed governor of Hong Kong. He was appointed in March 1912 governor of both northern and southern Nigeria, with instructions to amalgamate the two administrations. The amalgamation became effective on Jan. 1, 1914, Sir Frederick being given the personal title of governor general. He guided the affairs of Nigeria throughout World War I, retiring in 1919, and was made a privy councilor in 1920. In 1922 he published *The Dual Mandate,* a book dealing with the duties of European powers in tropical Africa. From November of that year until 1936 he was a member of the permanent mandates commission of the League of Nations. *(See* MANDATE; NIGERIA.)

Lugard was created knight commander of the Order of St. Michael and St. George in 1901 and knight of the grand cross of the Order of St. Michael and St. George in 1911. He became a colonel in 1905, and held the local rank of brigadier general. He married in 1902 Flora Louise Shaw (daughter of Maj. Gen. George Shaw, companion of the Bath, Royal Academy), who had been a distinguished writer on colonial subjects for the *Times* (London). Lord Lugard, then Captain Lugard, published in 1893 *The Rise of Our East African Empire* (partly autobiographical), and was the author of various valuable reports on Northern Nigeria issued by the colonial office. Throughout his African administrations Lugard sought to ameliorate the condition of the native races, especially by the exclusion of alcoholic liquors, and by the suppression of slave raiding and slavery. He was created a baron in 1928. He died April 11, 1945, at Surrey.

LUGEON, MAURICE (1870–1953), French geologist, a brilliant pioneer in the development of modem Alpine geology, was born at Poissy near Paris on July 10. 1870. He moved with his parents to Lausanne, Switz., in 1876 and graduated at the university in 1893 where he later became extraordinary professor of geology and physical geography in 1898 and ordinary professor eight years later. Lugeon was closely connected with Hans Schardt's tectonic discovery of the far-traveled nature of the rocks of the Prealps that extend from Lake Geneva to Lake Thun and subsequently played the leading part in developing the tectonic ideas thus liberated and in providing a comprehensive interpretation of the Alps as a whole. In *Les grandes nappes de recouvrement des Alpes du Chablais et de la Suisse* (1901) he developed his great synthesis showing that from the Arve to Salzburg the north front of the Alpine chain is composed of large superimposed nappes. His tectonic interpretations were extended by him to regions outside the main Alpine province, notably to the Carpathians, Sicily and Morocco. Lugeon won international renown as a consultant on dam sites and published authoritative memoirs in this field: *Etude gkologique sur le projet de barrage du Haut-Rhône français à Génissiat* (1912) and *Barrages et gkologie* (1933). He died in Lausanne on Oct. 23, 1953. (C. E. T.)

LUGO, a maritime province of northwestern Spain, formed in 1833 of districts taken from the old province of Galicia, and bounded north by the Atlantic, east by Oviedo and León, south by Orense, and west by Pontevedra and Corunna. Pop. (1950) 521,213; area, 3,815 sq.mi. The coast, which extends for about 40 mi. from the estuary of Rivadeo to Cape de Vares, is extremely rugged and inaccessible, and few of the inlets, except those of Rivadeo and Vivero, admit large vessels. The province, especially in the north and east, is mountainous, being traversed by the Cantabrian chain and its offshoots; the sierra which separates it from Leon attains in places a height of 6,000 ft. A large part of the area is drained by the Miiio. This river. formed by the meeting of many smaller streams in the northern half of the province, follows a southerly direction until joined by the Sil, which for a considerable distance forms the southern boundary. Of the rivers flowing north into the Atlantic, the most important are the Navia, which has its lower course through Oviedo; the Eo, for some distance the boundary between the two provinces; the Masma, the Oro and the Landrove.

The principal agricultural wealth is on the Miiio and Sil, where rye, maize, wheat, flax, hemp and a little silk are produced. Agriculture is in a backward condition, mainly owing to the extreme division of land that prevails throughout Galicia. Iron is found at Caurel and Incio, arsenic at Castroverde and Cervantes, argentiferous lead at Riotorto. There are also quarries of granite, marble and various kinds of slate and building stone. There are manufactures of leather, preserves, coarse woolen and linen stuffs, timber and osier work.

LUGO, capital of the province of Lugo, Spain, on the river Miiio and on the railway from Corunna to Madrid. Pop. (1950) 52,093 mun. Lugo (Lucus Augusti) was a flourishing city under Roman rule *(c.* 19 B.C.–A.D. 409) and was made by Augustus the seat of a *conventus iuridicus* ("assize"). Its sulfur baths were then well known. It was sacked by barbarians in the 5th century, and suffered greatly in the Moorish wars of the 8th century. Franco's forces captured it in the civil war of 1936–39.

Lugo is an episcopal see, and was formerly the capital of Galicia. Suburbs have grown up round the original town, the form of which, nearly quadrangular, is defined by a massive Roman wall 30 to 40 ft. high and 20 ft. thick, with projecting semicircular towers which numbered 85 as late as 1809, when parts of the fortifications were destroyed by the French. The wall now serves as a promenade. The Gothic cathedral, on the south side of the town, dates from the 12th century, but was modernized in the 18th. The principal industries are tanning and the manufacture of linen and woolen cloth. About 1 mi. S., on the left bank of the Miño, are the famous hot sulfur baths of Lugo.

LUGSAIL: *see* RIGGING.

LUGUDUNUM, an old Celtic place name (fort or hill of the god Lugos or Lug) used by the Romans for several towns in ancient Gaul. The most important was the town at the confluence of the Saône and Rhône, now called Lyons *(q.v.).* This place had in Roman times two elements. One was a Roman *colonia* (municipality of Roman citizens, self governing) on the hill near the present Fourviéres (Forum vetus). The other was the temple of Roma and Augustus, to which the inhabitants of the 64 Gallic cantons in the three Roman provinces of Aquitania, Lugdunensis and Belgica—the so-called Tres Galliae—sent delegates every summer to hold games and otherwise celebrate the worship of the emperor which was supposed to knit the provincials to Rome. The two elements composed the most important town of western Europe in Roman times. Lugudunum controlled the trade of its two rivers, and that which passed from northern Gaul to the Mediterranean or vice versa; it had a mint; it was the capital of all northern Gaul, despite its position in the south, and its wealth was such that, when Rome was burned in Nero's reign, its inhabitants subscribed largely to the relief of the Eternal City.

LU HSUN (LUSIN; pseudonym of CHOU SHU-JEN) (1881–1936), Chinese writer, scholar, teacher and translator, was born of gentry stock at Shao-hsing, Chekiang. The imprisonment of his grandfather and the death of his father reduced the family circumstances when he was still a child and embittered his outlook. He matriculated at the School of Railways and Mines, Kiangnan Military academy, Nanking, and later studied western medicine, philosophy and literature in Japan on a government scholarship, returning home an ardent anti-Manchu revolutionary and a moderate cultural protectionist. In 1912 he joined the republican ministry of education, moved to Peking and devoted his leisure time to antiquarian pursuits. At the urging of friends associated nith the nascent literary movement, he wrote the short story "A Madman's Diary" (1918), a pungent satire on the dark, animal forces of traditional, Confucian-oriented society. *The True* Story of *Ah* Q (1921) is his representative work. A mixture of humour and pathos, it is a repudiation of the old order and a classic portrayal of the national psychology. Other stories in Call to Arms (1923), the work that brought him national prominence, the volume Hesitation (1926) and the various symbolic prose-poems, reminiscences and retold classical tales all reveal a modern sensibility informed by a sardonic humour and biting satire. Although Lu Hsun is better known abroad for his works of fiction, the prose essay is more characteristic of his genius. Forced by political circumstances to flee Peking in 1926. he eventually found sanctuary in the Shanghai International settlement, where, alienated from the right and courted by the left, he turned increasingly to direct prose expression. His Outline *History* of *Chinese* Fiction and companion compilations of classical fiction remain standard works. Translations, largely from the Russian, also occupy a large place in his complete works. Independent, antimaterialistic and antiauthoritarian, and imbued with a profound sense of moral justice, Lu Hsun nevertheless was adopted posthumously as the exemplar of socialist realism by the Chinese Communist movement.

CHOU TSO-JEN (1885–), eminent literary figure known for the casual, sophisticated essay, and CHOU CHIEN-JEN (1889–), scientist, teacher, politician and Communist governor of Chekiang province, are brothers of Lu Hsun. (W. R Sz.)

LUINI (LUVINI), **BERNARDINO** (fl. 1512–1532), Lombard painter, is best known for his religious frescoes. Although his fame has long been considerable, exceedingly little is known of his life. even Giorgio Vasari giving the minimum information. The earliest surviving painting certainly his work is a fresco of the "Madonna and Child" at the Cistercian monastery of Chiaravalle, near Milan. A contemporary record states that this was painted in 1512 by "B. Luino." This is also the earliest certain evidence of the painter's existence, statements concerning his birth and apprenticeship which are sometimes given as fact being derived from sources too late to be reliable. An altarpiece of the "Madonna and Child With Saints," now in the Musée Jacquemart-André, Paris, bears the inscription "Bernardin (us) Mediolanensis faciebat MDVII" and may be an early work of Luini, but the omission of the surname in the signature precludes certainty. An altarpiece of the "'Lamentation Over the Dead Christ" in the church of Sta. Maria della Passione at Milan is likewise frequently, but not universally, considered an early work of Luini, but it has no signature or documentation to support it.

Between 1512 and his death in 1532 a number of paintings are signed or otherwise reliably attributed, and still others can be ascribed to Luini with confidence on the strength of resemblance to the first group. Of these numerous works. the most important among those with religious subjects are the series of paintings in the churches of S. Giorgio al Palazzo and S. Maurizio at Milan. the frescoes in the church of Sta. Maria dei Miracoli at Saronno, the two Adorations "of the Magi" and "of the Shepherds" in Como cathedral, the huge fresco of the "Crucifixion" in the church of Sta. Maria degli Angeli it Lugano and the altarpieces at San Magno, Legnano. and in the Di Rovasenda collection at Turin (from Mendrisio). Of Luini's fewer paintings of secular subjects, the most important are two series of frescoes, subsequently detached and dispersed. One of these came from the Villa Pelucca, near Monza. It consists of various mythological subjects and also some from the Old Testament. Most of the pieces are now in the Brera, Milan. The second, from Casa Rabia, Milan, is divided between the state museums, Berlin and the National Gallery of Art at Washington, D.C. The subjects are the stories of Europa and of Cephalus and Procris. Luini's work is represented in other galleries in Europe and the United States and in Canada.

The art of Luini in its entirety fits naturally into the Lombard tradition of the second half of the 15th century and the opening years of the 16th, as exemplified by Vincenzo Foppa, Bernardino Butinone, Bernardino Zenale, Borgognone, Bramantino and Andrea Solari. To many scholars. honever, one of the main points of interest is its relation to that of Leonardo da Vinci. The periods of the latter's second residence in Milan were 1506–07 and 1508–13 and while it is certain that his work was known to Luini, no evidence of personal contact is forthcoming. Although Luini, on at least one occasion. incorporated a design of Leonardo's into a painting ("Holy Family" in the Ambrosiana, Milan, from Leonardo's cartoon now at the Royal Academy, London), he showed in general greater independence with regard to the great Florentine than did most of his Milanese contemporaries, The excellence of his craftsmanship and the unstudied sweetness of his pictures were the qualities which endeared him to John Ruskin and to the later 19th century.

See Angela Ottino della Chiesa, Bernardino Luini (1956).

(C. H. M. G.)

LUKE, SAINT, "the beloved physician," a companion of St. Paul (*q.v.*), the traditional author of the third Gospel and the Acts of the Apostles, the most literary of New Testament writers (*see* ACTS OF THE APOSTLES; LUKE, GOSPEL ACCORDING TO SAINT). His gentile origin is indicated by the name Loukas, a short form for the Latin Lucius or Lucanus (like Silas, Acts xv, 40. for Silvanus. I Thess 1, 1). Possibly he was the son of a freedman of some Roman family. The Anti-Marcionite Prologue, Eusebius of Caesarea and Jerome refer to him as a Syrian from Antioch. This probably means that he lived there and first met Paul there. Luke's connection with the early Antiochene church is abundantly illustrated by the detailed information he supplies in Acts (xi, 19 ff.; xiii. 1 ff.; xiv, 26–xv, 35) concerning the origin and growth of that community. Nothing is known of the time or circumstances of his conversion; if the reading of the Bezan codex in Acts xi. 28 is correct, "When we were assembled," this personal reference would indicate that Luke was an early member of the Antiochene community.

Paul calls Luke "the beloved physician" (Col. iv, 14), who undoubtedly attended the physically afflicted Apostle (II Cor. xii, 7; Gal. iv, 13–15). It can no longer be held, as it once was, that Lucan vocabulary proves that the author was a physician; however, later studies, showing that many of Luke's words formerly regarded as distinctively medical are to be found not only in medical writers but also in Josephus, Plutarch, Lucian and the Septuagint, have not done away with all the evidence. Some passages of the Marcan source that mention diseases when modified by Luke reveal the terminology and interest of a professional physician (Luke iv, 38; v. 12; viii, 44). While not proving that their author was a physician, these passages nevertheless support the tradition.

Luke accompanied Paul on his second missionary journey. The "we-sections" of Acts (*see* ACTS OF THE APOSTLES) recount how Luke joined Paul at Troas (*c.* A.D. 50) and passed over to Macedonia with him (Acts xvi, 11–12). Luke most likely remained at Philippi until the end of Paul's third mission (Passover, A.D. 58), when he joined him again as the latter set out for Troas on his return to Jerusalem (Acts xx, 5–xxi, 18). Finally, Luke accompanied Paul from Caesarea to Rome (Acts xxvii, 1–xxviii, 16). Writing from his Roman captivity, Paul refers to Luke as a "fellow worker" (Philem. 24; see Col. iv, 14) and faithful companion to the end (II Tim. iv. 11). Origen was the first to identify Luke nith the "brother who is famous among all the churches for his preaching of the gospel" (II Cor viii, 18) He seems to be the only non-Macedonian (as demanded by II Cor. ix, 2–4) of Paul's entourage eligible at the time for such identification (see Acts xx. 4).

A tradition that can be traced back to Irenaeus (c. 185) regards Luke as the author of the third Gospel. This attribution was probably also known to Justin in the middle of the 2nd century. The Muratorian canon (c. 190; see BIBLE) ascribes both the third Gospel and Acts to Luke. The Lucan authorship of both books is generally (though not universally) accepted by modern scholars.

Luke belonged to cultivated Hellenistic circles, uhere he learned to write with ease good, idiomatic Greek. His writings betray an acquaintance with the historical method of his day, and the

"Semitisms" that shine through his Greek style reveal a deep contact with the Greek Old Testament. In fact, his imitation of the style of the latter is at times surprising. He was a perceptive, sensitive writer with a knack for telling a story and depicting a scene, and his Gospel has been described as "the most beautiful book" ever written. His two books constitute the earliest history of the Christian church.

The Anti-Marcionite Prologue records that Luke wrote his Gospel in Greece, was not married and died in Boeotia (or Bithynia?) at the age of 84. But further details about his life come from either later traditions or legends; *e.g.,* that he was martyred, that he was one of the Seventy (Luke x, 1), that he was the unnamed disciple of Emmaus (Luke xxiv, 13–35), that he was a painter.

Luke is the patron of physicians and artists; in the Roman martyrology his feast day is Oct. 18. His symbol is an ox, the sacrificial animal, because his Gospel begins with the story of Zechariah, the priest, the father of John the Baptist.

Bibliography. — *See* Introductions to commentaries, as J. M. Creed, *The Gospel According to St. Luke* (1953), and C. S. C. Williams, *A Commentary on the Acts of the Apostles* (1958); A. H. McNeile, *An Introduction to the Study of the New Testament,* 2nd ed., by C. S. C. Williams (1953); J. Dupont, *Les Problemes du Livre des Actes d'apres les travaux recents* (1950); M. J. LUKE, GOSPEL ACCORDING TO SAINT, the third Gospel of the New Testament. It is the first volume of a longer work which the author addressed to the same patron, Theophilus; another New Testament book, the Acts of the Apostles (*q.v.*), is the additional volume.

Sources. — As the third of the three synoptic Gospels the Gospel of Luke is closely related to Matthew and Mark; like Matthew it is based on the Markan narrative and it also uses Matthew's Saying-Source Q (see Mark, Gospel According to Saint; Gospel). In addition to these, Luke employs at least one other source which contained traditions unknown to Matthew and Mark, thereby preserving in his Gospel the following unique materials:

Luke i, 1–80:	promise of the Baptist's birth, annunciation, visitation, "Magnificat," birth of the Baptist, "Benedictus"
ii, 1–52:	nativity of Jesus, circumcision and presentation in the Temple, Jesus at 12 years
iii, 10–14:	John's sociological teaching
iv, 16–30:	first preaching in Nazareth
v, 1–11:	Peter's draught of fishes
vi, 24–26:	woes to the wealthy
vii, 11–17:	the widow's son at Nain
vii, 36–50:	the woman who was a sinner (41–43: parable of the two debtors)
viii, 1–3:	the ministering women
ix, 51–56:	the unhospitable Samaritans
x, 1, 17–20:	sending and return of the Seventy
x, 29–37:	parable of the good Samaritan
x, 38–42:	Martha and Mary
xi, 5–13:	parable of the friend at midnight
xi, 27–28:	the blessedness of Christ's mother
xii, 13–21:	parable of the rich fool
xii, 47–48:	parable of punishment and responsibility
xiii, 1–9:	call to repentance and parable of the fig tree
xiii, 10–17:	Sabbath healing of the bent woman
xiii, 31–33:	Jesus and Herod (leaving Galilee)
xiv, 1–6:	Sabbath healing of the man with dropsy
xiv, 7–14:	discourse at the banquet
xiv, 28–32:	parables of the architect and the king
xv, 8–32:	parables of the lost coin, and the prodigal son
xvi, 1–31:	parables of the unjust steward, and Dives and Lazarus
xvii, 7–10:	parable of the servant's wages
xvii, 11–19:	healing of the ten lepers
xvii, 20–21:	on the coming of the Kingdom
xviii, 1–14:	parables of the unjust judge, and the Pharisee and the publican
xix, 1–10:	Zacchaeus
xxii, 15–38:	special account of the Lord's Supper, and last words to the disciples
xxiii, 27–32:	words on the road to Calvary
xxiii, 39–43:	the two crucified criminals
xxiv, 13–35:	the road to Emmaus
xxiv, 36–49:	the appearance in Jerusalem
xxiv, 50–53:	the Ascension

The character of the source for this special Lucan material is debated. But whether there was actually a Proto-Lucan Gospel, or only a number of written "collections" (of parables, infancy narratives, resurrection accounts), the peculiarities of arrangement and outline of the present Gospel certainly are the work of its author, who impressed his own literary skill and theological insight upon the various sources used by him.

Style and Technique of Composition. — Luke is a writer of distinctive qualities of mind and style. Though he shares with other New Testament writings the vernacular flavour of 1st-century Greek, his language is more literary than that of his sources. He repeatedly improves Mark's wording, and also avoids foreign words, whether Latin or Aramaic, used by his sources.

Luke connects single narratives much more smoothly than does either Mark or Matthew; he sometimes localizes two scenes in the same setting (*e.g.,* v, 29–32 and 33–38), often establishes a temporal sequence and frequently employs connecting participle constructions. But Luke also realizes that a monotonous sequence of single stories would result in a rather unconvincing picture of Jesus' life. He therefore makes single incidents appear as illustrations of the whole of a continuous history; this purpose is served by the frequent introductory phrase "(and) it came to pass (when). . ." (Authorized Version), often connected with a date.

For purposes of division or connection he formulates summary statements (i, 80, etc.), a specifically Lucan device also employed in Acts (*e.g.,* ii, 42–47). Significant for Luke as a historian is his attempt to relate the history of Jesus to world history (i, 5; ii, 1–3; iii, 1–2; xxiii, 6–7).

A characteristic of the Gospel is Luke's intermittent use of sources in the following way (Q = synoptic Saying-Source; S = special Lucan sources; minor deviations are not mentioned):

Luke i, 5–ii, 52:	S
iii, 1–iv, 30:	synthesized from Mark, Q, and S
iv, 31–vi, 19:	Mark (insertions from S)
vi, 20–viii, 3:	Q (insertions from S)
viii, 4–ix, 50:	Mark
ix, 51–xiii, 30:	Q (insertions from S)
xiii, 31 – xv14:	S (insertions from Q)
xviii, 15–xxiv, 11:	Mark (insertions from Q and S)
xxiv, 13–53:	S

Thus, introduction (birth narrative) and conclusion (Resurrection appearances) are taken from special sources, whereas the body of the Gospel (iii, 1–xxiv, 11) retains the Marcan structure. But a large central section, the "travel narrative" (ix, 51–xviii, 14), is composed almost entirely on the basis of Q and S, without any use of Mark. Luke, however, adds and omits, rearranges and reinterprets the source material whenever necessary to express his own theological evaluation of Jesus' history.

Luke's View of History. — Luke, who in the manner of a Greek historian introduces his Gospel with a preface (i, 1–4), is the first to conceive of the life of Jesus as a revelation pertaining to a former period of an ongoing history. Thereby the early Christian twofold eschatological scheme of "this age and the age to come," within which Mark had understood the Jesus event as the eschatological turning point of the two ages, is replaced in Luke by a tripartite view of history in which the time of Jesus is the centre rather than the end. Luke's Gospel presents Jesus' life as this centre of history in its relation to the preceding period, the time of the Law and the Prophets, and to the following period, the time of the church, in the following way:

Luke i, 5–iv, 13:	the end of the prophetic era as preparation for the revelation
iv, 14–xxii, 2:	the revelation in Jesus' ministry as the centre of time
xxii, 3–xxiv, 53:	the beginning of the time of the church in Jesus' Passion and Resurrection

The beginning of the central period is marked by the departure of Satan after the temptation (iv, 13). The Baptist still belongs to the former period of the Prophets (xvi, 16), preaching only the "baptism of repentance" (iii, 3), but not the coming of the Kingdom (as in Matt. iii, 2). His imprisonment is told before Jesus' appearance, and he is not mentioned at Jesus' baptism (compare Luke iii, 21 with Mark i, 9).

The end of Jesus' ministry does not look forward to the end of the world and time (as in Mark xiii), but to the next period of history, the time of the church, which actually begins with the return of Satan at the beginning of the Passion of Jesus (Luke xxii, 3). It will be a time of temptation and suffering, as it is prefigured in Jesus' Passion, but it remains part of the ongoing history, and Luke repeatedly warns against mistaking events of this history as signs of the end—neither Jesus' Passion (xvii, 20–25), nor his Resurrection (Acts i, 4–11), nor the fall of Jerusalem (compare Luke xxi, 20–24 with Mark xiii, 14–20).

As a result the Gospel of Luke rightly can be understood as containing the proper conclusion of the Old Testament in its first chapters, whereas the last chapters have their direct continuation in the Acts of the Apostles (compare Luke xxiv, 49–53 with Acts i, 4–11 and ii, 1–31). The life of Jesus itself, as the time without Satan and without temptation, is the period of revelation and the sacred centre of history.

Geographical Scheme.—Corresponding to this historical structure of the Gospel is a certain geographical scheme used as a meaningful device of theological characterization.

1. The end of the prophetic period is closely connected with the sacred places of the Jewish people: Jerusalem (ii, 22, 41), Bethlehem (ii, 4, 11), the Jordan (iii, 3; iv, 1). the wilderness (iii, 2; iv, 2).

2. Jesus' ministry as the central period of history is limited to Jewish districts, Galilee and Judea (see especially xxiii, 5), which Jesus never leaves during His ministry, neither for Samaria (xx, 51–56), nor for the surrounding gentile country (compare Luke ix, 18 with Mark viii, 27). He also avoids the sacred places of the prophetic period. except in the Temple ministry and even on this occasion Luke does not say that Jesus entered the city of Jerusalem itself (compare Luke xix, 45 with Mark xi, 11, 12).

3. The beginning of the church era, however, is closely connected with Jerusalem, the place of Jesus' Passion and death (see xiii, 33). In contradiction to Mark and Matthew. Luke presents no Resurrection appearance in Galilee, but only in and around Jerusalem (xxiv, 13 ff., 33, 36 ff.; compare Luke xxiv. 6 with Mark xvi, 7). There also the disciples witness the Ascension (xxiv, 50–53) and there they are to wait for the sending of the Spirit (xxiv. 49; Acts i, 4). Thus Jerusalem, the Holy City and centre of prophecy, also becomes the birthplace of the church

Similarly, Luke's geographical details have special significance. He bypasses the Sea of Galilee as the centre of Jesus' early ministry and preaching (Luke viii, 4 omits the "sea" when reproducing Mark iv, 1), for example, and refers to it as a "lake" (of Gennesaret) where messianic epiphanies occur (Luke v, 1–11; viii, 22–25). In a similar way, "the mountain" is omitted in the temptation (iv, 5; compare Matt. iv, 8) and in the Lucan parallel to the Sermon on the Rfount (Luke vi, 12–17; compare Matt. v, 1), and exclusively designates the place of revelations and prayer (vi, 12, etc.).

Obviously such a reconstruction of the locality often is in contradiction to traditional information, and sometimes is geographically quite improbable. But Luke looks upon Palestine as the "Holy Country" of Jesus' sacred history, and, therefore, the primary significance of the locality is theological.

Jesus' Ministry as the Centre of Time.—This is portrayed by Luke in three phases:

Luke iv, 14–ix, 50:	wandering in Galilee and Judea
ix, 51–xix, 27:	traveling through Galilee and Judea to Jerusalem
xix, 28–xxii, 2:	the Temple ministry

In the first phase Jesus is wandering about like an itinerant Christian missionary, driven by the Holy Spirit (iv, 14; compare Acts xiii, 2 and passim). Jesus' works—no longer understood as the manifestation of the eschatological battle with Satan (see MARK, GOSPEL ACCORDING TO SAINT)—are attestations of his divine authorization (see Acts ii, 22). They always precede the discourses, in which Jesus sets forth the novelty of the "Christian way" as distinguished from that of the Pharisees and the Baptist (v, 30–39, etc.). The main purpose of this section is to assemble the witnesses. To the rejection at home (iv, 16–30) corresponds the call of foreigners (v, 1–11, 27–28; vi, 12–16), and the substitution for Jesus' family of all those who "hear the word of God and do it" (viii, 19–21). But the disciples who recognize Jesus as the "Christ of God" (ix, 20) witness the messianic epiphanies (viii, 22–25; ix, 28–36), receive the authority of healing and preaching (ix, 1–2) and are introduced to the necessity of suffering (ix, 22–27).

In the second phase the location (Galilee and Judea) and the general structure of Jesus' ministry ("acting and preaching") are retained; this section also begins with a "rejection" (ix, 51–56; compare iv, 16–30). But there are several new elements. Jesus is now traveling to a certain goal—Jerusalem (ix, 51, etc.). He repeatedly turns to His disciples with special instruction, especially discourses about the time of the church, whereas to "those outside" Jesus speaks only in parables (*e.g.,* xii, 13–21; compare xii, 1–12 and 22 ff.). Halfhearted followers are rebuked, especially by Jesus' demand to give up wealth, and any missionary emphasis is completely absent. Jesus is now the Messiah who decidedly travels toward His destination; who consciously faces the necessity of His suffering as the fulfillment of prophecy (xviii, 31 as compared with Mark x, 33); who is already watched by those who will kill Him, the Pharisees and lawyers, who are always nearby, offended by His behaviour and discussing His authority (xi, 25–37, etc.).

In the last phase the centre of Jesus' activity is the Temple, into which He enters upon arrival from Jericho, and the Mount of Olives. Preaching in the Temple, He is surrounded by three groups: (1) the people with their meaningless appreciation; (2) the leaders of Jerusalem who try to find an opportunity to destroy him; (3) the disciples who learn to distinguish between the historical event of the fall of Jerusalem and the eschatological events that bring time and history to a definite end (xxi, 5–36; compare Mark xiii, 1–37).

The Temple ministry as an exemplary description of the situation of a Christian missionary concludes the time of revelation. The Passion and Crucifixion of Jesus portray the typical death of a martyr, but according to Luke they do not have a special meaning for salvation. It is the opening chapter of the history of the church—a period without the presence of Jesus, but under the guidance of the Holy Spirit.

Literary History.—The author of the third Gospel (and of Acts) was, according to the tradition, Luke the physician and associate of Paul (Philem. 24; Col. iv, 14). This tradition encounters major difficulties in Acts, since the contradictions between Acts' narratives about Paul and Paul's own letters should not have arisen if the author had actually been Paul's assistant (see ACTS OF THE APOSTLES). In any case, the Gospel was written by a man who knew about Jesus only through traditions of the church and written sources. Whether he was a Jewish Hellenist or a gentile by birth, his Greek style and vocabulary were as educated as that of Greek writers like Xenophon, and he lived in a time for which not only the life of Jesus but also the "apostolic age" belonged to past history. Since the Gospel of Mark is also used, and the prophecy in Luke xxi apparently reflects the actual fulfillment in the year A.D. 70, the last two decades of the 1st century A.D. are probably the best date; some scholars even prefer the beginning of the 2nd century A.D., since neither the Gospel nor Acts was used before II Clement, Justin and the heretic Marcion.

About the place of writing, nothing can be said with certainty. If Luke's geographical picture of Palestine is really incorrect, it is more likely that he wrote in Asia Minor or Greece than in Syria. Nor is anything known about Theophilus, to whom both Gospel and Acts are addressed. See also BIBLE.

LULEA, a seaport of Sweden, capital of the district (*län*) of Norrbotten, on the Sando peninsula at the mouth of the Lule river. Pop. (1950) 22,638. Lulea as founded by Gustavus Adolphus was 7 mi. higher up the river, but was moved to the present site in 1649. It was connected at Boden (22 mi. N.) by rail from Stockholm to Gellivara and Narvik on Ofoten fjord in Norway. It ships iron ore mined at Gellivara, 127 mi. N.W., and there are smelting works at Karlsvik. Timber is exported, being floated down the Lule river. As a rule the port is closed by ice from November to the end of May. The town was almost entirely burned in 1887.

LULEAN, an independent linguistic stock of South American Indians, so called from the Lules, the most important tribe. They lived on the western border of the Argentine Chaco, on the Salado river in the provinces of Santiago del Estero and Tucuman. They were a semiagricultural folk of simple culture, and known only from brief references by the 18th-century writers. There is considerable uncertainty as to just what tribes are to be included in the stock, the data available being very meagre and conflicting. The Vilela, on the Vermejo, who were near neighbours of the Lule, are, however, certainly members of the stock.

LULE BURGAS, BATTLE OF: *see* BALKAN WARS, 1912–1913.

LULL (or LULLY), **RAIMON** (or RAYMOND) (*c.* 1235–131*j*), Catalan author, mystic and missionary, was born in Palma, Majorca. Married at an early age to Blanca Picany, he led a dissipated life till his conversion (1266). when he resolved to devote himself to evangelical work among the heathen. to write an exposure of infidel errors and to promote the teaching of foreign tongues in seminaries. He dedicated nine years to the study of Arabic, and in 1275 showed such signs of mental exaltation that, at the request of his wife and family, an official was appointed to administer his estate. He withdrew to Randa, there wrote his *Ars major* and *Ars generalis,* visited Montpellier. and persuaded the king of Majorca to build a Franciscan monastery at Miramar. There for ten years he acted as professor of Arabic and philosophy, and composed many controversial treatises. After a fruitless visit to Rome in 1285–86, he journeyed to Paris. residing in that city from 1287 to 1289 and expounding his bewildering theories to auditors who regarded him as half insane. In 1289 he went to Montpellier, wrote his *Ars veritatis inventiva*, and removed to Genoa where he translated this treatise into Arabic. In 1291, after many timorous doubts and hesitations for which he bitterly blamed himself. Lull sailed for Tunis where he publicly preached Christianity for a year; he was finally imprisoned and expelled. In Jan. 1293 he reached Naples, where his efforts to interest Clement V and Boniface VIII in his favourite project of establishing missionary colleges mere unavailing. In 1300 he sailed to Cyprus to seek support for his plan of teaching oriental languages in universities and monasteries. He was rebuffed once more, but continued his campaign with undiminished energy. Between 1302 and 1305 he wrote treatises at Genoa, lectured at Paris, visited Lyons in the vain hope of enlisting the sympathies of Pope Clement V, crossed over to Bougie in Africa, preached the gospel and was imprisoned there for six months. On being released he lectured with increasing effect at Paris, attended the general council at Vienne in 1311 and there witnessed the nominal adoption of his cherished proposals. Though nearly 80 years of age, Lull's ardour was unabated. He carried on his propaganda at Majorca, Paris, Montpellier and Messina, and in 1314 he crossed over once more to Bougie. There he again resumed his crusade against Mohammedanism and raised the fanatical spirit of the inhabitants. was stoned outside the city walls and died of his wounds. The circumstances of Lull's death caused him to be regarded as a martyr, local patriotism helped to magnify his merits and his fantastic doctrines found many enthusiastic partisans. The *doctor illuminatus* was venerated throughout Catalonia and afterward throughout Spain as a saint: a thinker and a poet; but his doctrines were disapproved by the powerful Dominican order, and in 1376 they were formally condemned in a papal bull issued at the instance of the inquisitor, Nicolas Emeric The authenticity of this document was narmly disputed by Lull's followers, and the bull was annulled by Martin V in 1417. The controversy was renened in 1503 and again in 1578; but the general support of the Jesuits and the staunch fidelity of the Majorcans saved Lull from condemnation.

The speculations of Lull became obsolete outside Majorca where his philosophy still flourished in modern times, but his more purely literary writings are extremely curious and interesting. In *Blanquerna* (1283), a novel which describes a new Utopia, Lull renews the Platonic tradition and anticipates the methods of Sir Thomas More, Campanella and Harrington, and in the *Libre de Maravelles* (1286) he adopts the oriental apologue from *Kalilah and Dimnah.* And as a poet Lull takes a prominent position in the history of Catalan literature; such pieces as El *Desconort* (1295) and *Lo Cant de Ramon* (1299) combine in a rare degree simple beauty of expression with sublimity of thought and impassioned sincerity. (J. F.–K.)

LULLY or LULLI, **JEAN BAPTISTE** (1632–1687), French composer, of Italian birth, was born in Florence on Nov. 28, 1632. Through the duc de Guise he entered the service of Madame de Montpensier as scullery boy. He then studied the theory of music under Métra and entered the court orchestra, being appointed director in 1652 and court composer in 1653. The influence of his music produced a radical revolution in the style of the dances of the court itself. Instead of the slow and stately movements which had prevailed until then, he introduced lively ballets of rapid rhythm. The music for his ballets was arranged as orchestral suites, a new form which was cultivated in Germany as well as in France. In Dec. 1661 he was naturalized as a Frenchman, his original name being Giovanni Battista Lulli. For 15 years (1672–87) Lully was the director of the Paris opera. While directing a *Te Deum* on Jan. 8, 1687, with a rather long baton he injured his foot seriously and a growth resulted which led to his death on March 22. Lully was the founder of French opera, forsaking the Italian method of separate recitative and aria for a dramatic consolidation of the two and a quickened action of the story. Moreover, he laid more stress on rhythm and less on melody. He improved the composition of the orchestra, into which he introduced several new instruments. Lully was a friend of Molière, for some of whose best plays he composed illustrative music. Of his church music his *Miserere,* written for the funeral of the minister Séguier, is a work of genius: and on his deathbed he wrote *Bisogna morire, peccatore.*

LUMBAGO, a term in medicine applied to a painful ailment affecting the muscles of the lower part of the back. often regarded as of rheumatic origin. An attack of lumbago may occur alone or be associated with rheumatism in other parts of the body. It usually comes on suddenly as severe pain in the small of the back, greatly aggravated on movement, especially in attempting to rise from the recumbent posture and in drawing a deep breath, coughing or sneezing. The absence of any great constitutional disturbance beyond the pain renders the diagnosis a matter of no great difficulty. Lumbago seems to be brought on by exposure to cold and damp. Sometimes it follows a strain of the muscles of the loins. The attack is in general of short duration, but occasionally it continues for a long time as a feeling of soreness and stiffness on movement. The treatment includes remedies to allay the pain and the recognition of the cause which is often strain or other disorder of the sacroiliac, lumbosacral joints or intervertebral discs. (F. L. A.)

LUMBERING is a term applied to the growing and harvesting of the timber products of the forest and their conversion into various sizes and shapes for commercial use. The oldest industry in the United States, lumbering comprises a complex and highly competitive number of timber growers, contract loggers, lumber manufacturers, wholesalers, retailers and commission salesmen, all operating more or less independently of one another within the structure of the private enterprise system.

The forest was one of the first major obstacles that beset the early American settlers, and, other than supplying them with logs for shelter and wood for fuel, was of little economic value. Trees had to be removed in vast numbers to clear the ground for agricultural pursuits, and to these felled logs the settlers applied the term "lumber." Later, small quantities of "lumber" were shipped to England, sometimes serving merely as ballast for ships crossing the Atlantic. British sailors referred to the bothersome material as "just so much lumber."

In its modern concept, the term lumber is restricted to include only those products of the saw not further manufactured other than by sawing, resawing, passing lengthwise through a standard planing machine and crosscut to specific lengths and matched. Lumber includes boards, planks, structural timbers, scantlings, sawed crossties, flooring and dimension and pattern stocks, all of which are usually measured on the board foot basis.[1] Lumber is manufactured from both softwood (conifers) and hardwood (broad-leaved) species. For purposes of convenience lumber is divided into four broad categories as dictated by size and usage, viz.,(1) yard lumber,(2) factory and shop lumber, (3) structural lumber and (4) special lumber.

Yard lumber is practically restricted to softwood species, and embraces many sizes of materials usually destined for general construction. Four classes of yard lumber are recognized: (1) strips, pieces less than 2 in. thick and less than 6 in. in width; (2) boards, pieces likewise less than 2 in. in thickness but 8 in. or more in width; (3) dimensions, pieces from 2 in. to (but not including) 5 in. in thickness and 2 or more inches in width; and (4) timbers, pieces 5 in. or more in their least dimension. Yard lumber seldom exceeds a length of 20 ft. or a width of 12 in., and is usually cut to lengths in multiples of 2 ft. and in widths in multiples of 2 in.

Factory and shop lumber is lumber to be used for further manufacture into such products as sash and doors, millwork, box shook, furniture and similar products. It is usually produced in standard thicknesses expressed as multiples of 1/4 in.; *i.e.*, 3/4, 4/4, 5/4, 6/4, 8/8, etc. Shipments are usually made in random widths and lengths.

Structural lumber comprises pieces 2 or more inches in thickness and 4 or more inches in width. Pieces from 2 to (but not including) 5 in. in thickness and 4 or more inches in width are classed as joists, rafters and planks; those 5 in. or more in their least dimension are termed beams, stringers, girders, columns and posts. Structural lumber is an engineering material, and a number of stress grades have been developed for both softwood and hardwood species in order that they may safely sustain loads imposed upon them.

Sometimes it is necessary to develop a type of lumber for specific use. This is special lumber, of which aircraft-grade spruce lumber is an example. It is manufactured to rigid specifications which place limitations upon specific gravity, growth rings per inch, grain alignment and permissible defects.

A large volume of hardwood lumber is consumed annually in the production of furniture, flooring and a host of other commodities. Hardwood lumber is commonly produced in 6/4 and 8/4 stock and resawed into hardwood dimension. Hardwood flooring and dimension mills are commonly operated in connection with sawmills, or they may be run as entirely separate enterprises. In fact, flooring and dimension plants in some areas prefabricate their products to any required stage of completion.

The manufacture of hardwood lumber represents one of the most complex segments of the U.S. lumber industry, not only because of the diverse tree species involved but also because of the many uses developed for it.

Many other wood-using industries in the United States; such as pulp and paper, veneers and plywood, naval stores, wood distillation and cooperage, are dependent to various degrees upon the lumber industry, and in numerous instances lumbering becomes an integral part of their operations.

Development of **U.S.** Lumbering.—The forests, principal source of materials for shelter in early American times: provided lumber for houses and stockades and for fuel in bountiful measure. To provide safety from Indians and to develop arable lands for agricultural pursuits, great tracts of timber had to be cleared. and in these clearings developed the early American communities. Spars and ship timbers were delivered to England even before tobacco and other agricultural products were exported (a shipload of southern yellow pine hand-rived clapboards was sent from Jamestown, Va., to England in 1608). The first boards made in the new world were hand rived—split out of logs and hewn into shape with axes. A crude two-man saw soon replaced the axe, and boards were made by placing a log over a pit with one man working above the log and the other below it. The first power-driven sawmills were erected at York, Me., in 1623, Jamestown, Va., in 1625 and Berwick, Me., in 1631. These early mills were operated by water power but were capable of producing only a few hundred board feet of lumber daily. Water-driven mills were operating in the American colonies many years before any were erected in Great Britain. By the early 1700s water-powered "up and down" mills had become popular, many of them operated in conjunction with gristmills. About 1830 circular ripsaws were in common use, and at about this same period steam power was introduced. Then followed the introduction of the gang saw, consisting of a series of 24 to 42 parallel sash saws mounted on a heavy metal frame. Band saws came into use about 1880.

The development of the American lumber industry can be traced concurrently with the expansion of agriculture. Likewise. the shifting of lumber centres from New England to the north, south and west closely parallels the industrial development of the United States For years Maine led in lumber production, supplying home and foreign markets with white pine spars. staves and shipbuilding lumber. Virginia and the Carolinas produced large quantities of oak. and the Carolinas and other southern states supplied yellow pine lumber and rosin, an essential material in the shipbuilding industry of the times.

By 1840 lumber production in the United States approximated 8,000,000,000 bd ft. The centre of the industry was now in the state of New York. which was producing 20% of all lumber manufactured. In 1859 Pennsylvania took the lead. but ten years later surrendered it to Michigan, which in turn gave way to Wisconsin by 1899. Minnesota also came into prominence as a lumber-producing state at about that time, but the peak of lumber production in the lake states was reached in 1892. Beginning about 1895, southern yellow pine supplied from 20% to 40% of the total annual cuts, and more lumber was produced in the south and southeast than in any other forest region in the United States. The Pacific coast states, notably Washington and Oregon, came into prominence about 1900. From 1905 to 1922 (except 1920) Washington and Louisiana were the leading lumber-producing states. In 1920, and from 1923 to 1937, Washington and Oregon led in the order named. From 1938 Oregon led annually in the total production of lumber.

U.S. Production and Consumption.—The average annual production of lumber in the United States for the five-year period 1923–28 was approximately 37,000,000,000 bd.ft., of which 31,000,000,000 were softwood and 6,000,000,000 hardwood. In the five-year period 1933–38 annual production averaged 21,200,000,000 bd.ft., of which 17,700,000,000 were softwood. By 1953 annual production of lumber had reached a total of 36,742,000,000 bd.ft. Approximately 30.8% of the 1953 cut was produced in the south and 49.8% in the Pacific northwest and California. Nearly 80% of the 1953 production was in softwoods, with Douglas-fir and the southern yellow pines the leading species. Oak, yellow-poplar, sweetgum and maples were the principal hardwood species.

The United States is the world's largest consumer of lumber and uses between 65% and 70% of its annual production for building and construction. About 8% of the total cut is used by railroads for ties, timbered structures and car construction, and 24% is used by other manufacturers. In addition to the lumber and lumber products mentioned. approximately 3,620,000,000 cu.ft. of wood are consumed annually as fuel wood. The paper industry converted approximately 10,400,000 cords (1 cord = 128 cu.ft.) of pulpwood in 1937; by 1953 consumption had risen to 26,435,000 cords.

[1]The board foot is the standard unit of measurement for most lumber. It is a piece of lumbrr 12 in. wide, 12 in. long and 1 in. thick, or its equivalent volume in other dimensions.

There were about 53,000 mills producing lumber in the United States in 1953. These facilities employed approximately 719,900 persons earning wages and salaries totalling $2,086,000,000 and produced goods valued at $3,500,524,000. Approximately 37% of the lumber was produced by 5.000 mills; 75% by 5,600 mills. Only about 10% of the mills were located west of the Rocky mountain region. No one mill or company operating two or more mills produced as much as 5% of the total cut.

The largest mills are located in the Pacific northwest, where at least two have daily production capacities in excess of 1,800,000 bd.ft. Small mills, that is, those producing less than 5,000,000 bd.ft. annually, comprise about 80% of the western mills, but account for less than 20% of the lumber produced in that region. In the northern Rocky mountain region 93% of the mills are of the small type and produce 30% of the region's lumber output. In the east and south 99% of the mills each produce less than 5,000,000 bd.ft. annually, but they account for nearly 80% of the production in these two areas. In 1950 the Southern Pine Industry committee reported that of the 11,153 softwood and hardwood mills in the 11 southern states, 8,233 were of the mobile or portable type and only 2.920 mere regarded as perinanent installations. Only j38 of these mills were capable of producing more than 5,000,000 bd.ft. annually, and about 4,000 of them each had an annual production of less than 1,000,000 bd.ft.

In the 1950s the United States produced about a third of the world's lumber supply. Prior to World War I, about 3,000,000,000 bd.ft. of lumber were exported annually. In 1928 U.S. exports reached a high of 3,200,000,000 bd.ft., but by 1942 had dropped to a low of 300,000,000 bd.ft. An estimated 1,000,000,000 bd.ft. were exported in 1951. Lumber imports exceeded exports after 1940, and in 1950, 3,400,000,000 bd.ft. of lumber were imported, 85% of which came from Canada.

Some interesting statistics on lumber consumption were compiled by the National Lumber Rlanufacturers association in the publication. *Lumber Front Forest to You*. "Since the birth of this nation in 1,776, its lumber industry has produced an estimated 2,800 billion board feet of lumber. This is enough lumber to build 57 million urban homes, 13 million farm homes, 2.3 million schools and libraries, 720,000 churches, and 500,000 factories. If piled in one stack it would cover a large city block and stand 400 miles high; it would build a six-foot walk from the earth to the sun!"

TABLE I.—*Distribution of U.S. Saw-Timber Stands*
(in 000,000 bd.ft.)

Timber Available in the U.S. for Lumbering Operation.—In connection with the quantity of timber available in the United States for lumbering operations, there are several factors of varying character such as changes in the standards of lumber-mill utilization, growth of small trees to saw-log size and conditions of markets for other nood products which may at any time divert saw timber into other uses such as pulp, poles. pilings, shakes and ties because of the higher prices offered for such uses.

The tendency in some parts of the country is to increase the minimum size of trees cut in lumber manufacture by the practice of selective logging. Although the portion of available timber to be used for lumbering cannot be forecasted. an estimate of the quantities that probably will be so used if conditions continue to follow current trends can be made.

In Tables I and II classifications have been made by regions based on the character of forest growth. The northeast region embraces all of New England, Delaware, New York, Pennsylvania, Maryland and New Jersey. Michigan, Minnesota and Wisconsin comprise the region of the lake states. The central region includes the states of Ohio, Indiana. Illinois. Kentucky, Missouri, West Virginia and Tennessee. The south includes the 11 states along the southern Atlantic coast and the Gulf of Mexico, from Virginia to Texas and Oklahoma. Iowa, Kansas. Nebraska, North Dakota and eastern South Dakota make up the plains region. The Douglas-fir region consists only of western Washington and western Oregon, uhile the western pine region (redwood region included) is a vast area embracing the South Dakota Black hills area, eastern Washington, eastern Oregon and all western states not otherwise noted above.

Technological developments made it possible to produce paper pulps from species formerly regarded as wholly unsuited for such use A large newsprint industry was established in the south using southern yellow pine and new processes were developed for pulping Ion-grade hardwoods within the region. It was estimated that more than 75% of rayon production was manufactured from wood pulp. Increasing demands for pulpwood in some areas made it feasible to utilize trees of saw-log size for pulpwood.

The estimated depletion of timber in the United States for 1944 stood at 13,661,000,000 cu.ft Of this total, the timber cut for commodities was 12,182,000,000 cu ft. Fire accounted for a loss of 460,000,000 cu.ft., while insects and disease destroyed another 1,019,000,000 cu.ft. The present stand, plus growth, less depletion and losses, may be said to give an indication of the life of the lumber industry. During the second quarter of the 20th century the application of good forest management practices more efficient fire suppression systems and the reforestation of much idle acreage together aith rising stumpage prices did much to increase the production of timber on both public and private lands. In 1920 the ratio of forest drain to forest growth was an alarming 4 34 to 1. Dire predictions of a timber famine in the United States were heard from all sides However, between 1920 and 1944 the ratio dropped to 1 02 to 1. Thus. if the 1944 ratio were maintained or even bettered, it would appear that there was no longer a threat of such a famine. While forest growth was keeping up with forest drain in the 1950s, such a statement without qualification could be misleading. since no recognition of the qualitative factors is included With the depletion of old-growth virgin timber stands, log quality was greatly reduced. and a critical shortage of high-grade logs of several species developed. While there was no shortage of wood per se, several species were in short supply in the late 1950s.

U.S. METHODS OF MANUFACTURE

In the American colonial period. the manufacture of lumber was a comparatively simple. crude and inexpensive process. Trees were felled as needed. and the logs rived or hand-sawed into rough boards, planks and timbers for local and immediate use. With the development and expansion of the new nation, demands for lumber rose sharply, and more efficient lumbering procedures were created to keep pace with ever-increasing demands for lumber and other forest products. As forests became depleted the lumber industry shifted its centres of activity, and each new region presented new problems in logging. manufacture and distribution because of climatic conditions. variation in species, topography of the land and available labour. All of these factors had a marked influence on the development of modern lumbering methods.

Logging.—Logging has been one of the most interesting features of the American lumber industry. In the early days, and until relatively recently in most areas, the lumberman depended slmost entirely upon natural forces in the logging operations. In the northeastern and northern states the fall and winter seasons were devoted to felling trees. The logs were hauled out on snow sleds, either to sawmills close by or to concentration points on the banks of streams; in the latter case, the logs were rolled into the floodwaters as soon as the ice had broken up and floated downstream to sawmills or market centres. In the south the lumbermen had to resort to other means of transportation because of the lack of swift-moving streams and winter snows. Oxen and high-wheel carts were the principal means of log transportation for many years and are still used today in some of the low-lying districts along the south Atlantic coast. In mountainous country in both the east and west chutes and flumes mere used. Later came the use of wire cables stretched across the valleys and canyons. The logs were hung from a pulley and then, by gravity, travelled to the lower end of a cable. Although these relatively primitive methods of transportation are still used in hauling logs from woods to log concentration yards or "log landings" in some areas, they have been largely supplanted by tractors. At the landing the logs are loaded on trucks or railroad cars for transportation to the mill. Many of the larger companies built their own railways or truck roads. There were approximately 30,000 mi. of private logging railroads in the United States in the late 1950s, and probably an even greater mileage of truck roads. The use of tractors and the development of truck hauling made large areas of timber available which previously were regarded as commercially inaccessible, and in turn extended the life of many sawmills for years after the expiration of the expected cutting period.

The early crude logging camps consisted of as few buildings as possible. The loggers or lumberjacks lived in rough shacks or bunkhouses. Conditions were often unsanitary and as late as the 20th century many logging camps were more primitive than the early communities in Massachusetts or Virginia. Recreation consisted of "swapping" stories, fighting and drinking. Only at the end of the logging season did the lumberjack come out of the woods and mingle with civilization. Such lumber camps, however, have been largely replaced by lumber towns, and the average lumberjack and his family have available schools, churches, stores, medical care, modern sanitation and various forms of modern amusement and recreation.

The methods of felling trees and converting them into logs are generally the same in all forested regions. First the tree is undercut with an axe or a power saw on the side of the fall. A two-man crosscut saw or a power saw is employed opposite the undercut. Where the ground is flat, the men cut from the ground; but where the ground is rough or sloping and irregular, and particularly on the west coast, the undercutting and sawing are done from a platform or springboard. After felling, branches are trimmed off and the tree is sawed or bucked into log lengths, usually 16 ft. except in the northwest, where much longer lengths are handled (24 to 40 ft. are common, and in the most modern operations 40 to 65 ft. are the most favoured units of length). Certain other districts also cut logs to lengths greater than 16 ft. After bucking, the logs are dragged or skidded to concentration points, for the most part with either power skidders or tractors. Where steel cables are employed over valleys and canyons, the method is called high-lead skidding. Other methods are overhead skidding (the logs are hoisted up over the brush and ground for some distance) and ground-line skidding, which is the dragging of the log over the ground by means of a cable.

In the northwest a spar tree frequently is employed in the skidding operations. This tree is selected for its height and favourable location with regard to the surrounding trees to be felled. A man known as a high climber ascends the tree, aided by climbing spurs affixed to his shoes and a rope around the tree. He is equipped with a saw and axe, and as he ascends he cuts off interfering branches until he reaches the desired height, which is usually about 175 to 200 ft. and about 30 to 50 ft. from the treetop. Then he saws off the top, waits until the swaying caused by the top's rebound has stopped and descends The rigger next ascends, carrying equipment for rigging. Finally the spar is rigged at the top with cable and pulleys and a loading boom is affixed about 20 ft. above the ground. A cable with grab hooks on the end is carried to the log to be skidded and then, by means of a steam or electric skidder, the log is dragged within distance of the loading boom which raises the log off the ground and loads it on a nearby car or truck or stacks it for future loading. When the logs reach the mill centres they are stored in log ponds uhich usually cover a number of acres They are kept there until ready for manufacture. The ponds facilitate sorting and cleaning and also prevent deterioration which would occur if the logs were left on the ground for any appreciable length of time.

Sawmill Practice.—The first sawmills in the United States, as noted previously, mere built at Jamestown. Va., and York and Berwick, Me. Production was small until steam power supplanted water power around 1850. About the same time the single sash sa gave way to the circular saw and the latter was uidely used until about 1890, at which time the band saw became popular in the larger mills. For the next 20 years lumber production increased rapidly. Many new inventions and more efficient methods of operation contributed to the development of the lumber industry aith almost astonishing rapidity.

Most modern sawmills employ the same general type of machinery and follow somewhat similar plant layouts. Band sans of varying types such as single-cutting, double-cutting, vertical and horizontal band resaws and gang saws are common in the larger mills. Many labour-saving devices are employed. Various types of conveyors and other machinery permit the log to enter the mill and pass out as manufactured lumber with little handling or moving by hand The modern methods of lumber manufacture are so intricate and so efficient as a rule that the term sawmill has been supplanted in some measure by that of lumber manufacturing plant.

The following method of lumber manufacturing is prevalent, with variations to fit certain local requirements. The logs enter the head mill from the pond over an inclined chute or log slip. They are transported by an endless spiked conveyor known as a jack ladder or jack chain. As logs ascend the slip they are sprayed with water to remove grit and dirt that might dull the saws. From the slip the jack ladder carries the log under a large circular saw known as the deck saw, which is used if the log is to be shortened; otherwise the log is "kicked" off onto the log deck by steam-driven steel arms. From the log deck the log rolls onto the log carriage. A steam or air "nigger" (mechanically operated steel arms) helps to place the log in the proper position. The carriage is a long, flat platform which is made to travel back and forth rapidly on a track, keeping the log against a band or head saw which squares it and reduces it into flitches or cants. The log is turned from time to time on the carriage by means of the "nigger." If the log is to be used as a timber, it is squared and edged and passed immediately to the rear of the mill, where the timber dock usually is located. If it is to be converted into lumber, the flitches or cants enter the remanufacturing plant directly behind the head mill, where they pass to the gang saws and edgers and then to the trimmers.

From the remanufacturing plant the lumber passes through sorters. To explain this step the following description is given of a large modern lumber manufacturing plant in the northwest. Joining immediately on the end of the remanufacturing mill are three sorters. The first is a two-inch yard sorter where nothing is handled except t o-inch common lumber, all lengths and widths, which will be segregated into various packages as to grades. widths and lengths. These packages are then delivered by a monorail hoist to cars which are drawn by storage battery locomotives to the greenyard. The second is a one-inch sorter on which nothing is handled except one-inch common lumber to the yard. The third is a drop sorter, which automatically drops different lengths of lumber into separate and individual pockets, which in turn deliver each length to what is known as the Whaley sorter. With the use of the latter, each length of lumber is segregated to five different stacking units. Thus, all lengths, widths and thicknesses are separately put on kiln cars for kiln drying. From the drop sorter the rough lumber is delivered to automatically controlled dry kilns in which superheated steam is the usual drying agent. After leaving the kilns the lumber is passed to cooling sheds. thence to the dry sorters nhere the lumber is graded and sorted, picked up by overhead cranes and delivered to an endless conveyor which runs through unstacker sheds into rough lumber storage sheds and on to the planing mill.

Not all lumber passes from the kilns to the planing mill. a very important and necessary part of a lumber manufacturing plant. Some of it is placed in stock. Other packages pass on to the planing mill where the lumber is surfaced as plain boards and dimension or worked into ceiling, flooring. siding, moulding, partition, casing, etc. From the planing mill the lumber is conveyed to the dressed lumber sheds to be stored or to the loading sheds, ready for shipment. Waste resulting from the various steps of manufacture is converted into short-length lumber wherever possible; some of it goes into the manufacture of paper and pulpboard, and some is ground up for fuel. Wood is the principal source of fuel for power in lumber operations. The larger slabs and edgings may be converted into a number of small wooden items or reduced to chips for pulping.

WORLD TIMBER PRODUCTION AND LUMBERING METHODS

It was estimated that more than 51,000,000,000 cu.ft. of round wood were produced in the forested regions of the world during 1953. The geographical origins of this vast harvest, together with summaries of the total fellings. by both species groupings and kinds of wood, are presented in Tables III and IV.

TABLE 111.—*Total Fellings by Regions. 1953*

Region	Total fellings (in 000,000 cu.ft.)	Per cent
Europe	8,072	17.5
U.S.S.R.	14,400	27.5
North America	13,428	26.0
Latin America	5,968	11.0
Africa	3,888	7.5
Asia	4,572	9.0
Pacific area	792	1.5
Total	51,120	100.0

Source: United Nations Food and Agriculture Organization *Yearbook of Forest Products Statistics, 1954* (Rome, 1954).

About 60% of the forested areas of the world are found in Africa, Asia, Latin America and the Pacific area, yet collectively these regions produce less than 30% of the world's output of round wood. On the other hand, round wood extraction from the temperate forests of the northern hemisphere. where methods of harvesting and transportation have had their greatest development, comprises somewhat more than 70% of the world's annual output.

The extent to which harvesting and transportation develops in an area, and especially the degree to which such operations are mechanized, is dependent upon a number of factors, not the least of which are the economic and industrial developments within the region itself. The pattern of any lumbering enterprise is also influenced by the kipds, sizes and distribution of commercially acceptable timber species, the nature of available transpprtation facilities, either natural or man-made, the acquired skills of local labour and markets.

Europe. — Lumbering methods in northern Europe are exemplified by those employed in both Scandinavia and in Germany. These areas are moderately to heavily industrialized. yet the use of powered mechanical equipment in forest operations is by no means nidespread.

Extensive stands of both softwoods and hardwoods proximate to a network of navigable waterways makes unnecessary the construction of a labyrinth of woods roads and logging railways over much of Sweden, Norway and Finland. The axe and crosscut san are in almost universal use; powered chain saws are seldom used. however. Animal and tractor skidding were found to be less costly than the more elaborate, highly mechanized systems.

Much of the logging in Sweden takes place during the winter months when agricultural activity is at low ebb and when there is usually an abundance of farm labour. Skidding to watercourses or log concentration centres is accomplished over ice roads using horses, tractors and, occasionally, trucks. Northern coniferous timber is usually floated downstream during spring and early summer to manufacturing centres. In the south, however, where waterways cannot be depended upon, logs are usually moved by rail or truck. The heavier hardwoods of the north, the "sinkers," are also usually transported in this manner.

Manual felling of trees is also common to the countries of southern Europe, but skidding practices, depending upon timber size and topography, may be either primitive or highly mechanized. In Yugoslavia, for example, practically all skidding was done with horses in the 1950s, while in Switzerland, particularly in rugged terrain, power cable skidding was commonly employed and power winches and mechanical loaders were used for loading.

U.S.S.R.—Until about the end of the first quarter of the 20th century, logging tools and techniques in the U.S.S.R. were both crude and primitive. Harvesting of timber was a winter enterprise dependent upon muscle power, while river driving constituted the primary means of transporting logs. After World War II, however, mechanization of forest operations was rapid, and by the 1950s more than 91% of the felling practices. 60% of the skidding operations and 88% of the transportation methods employed a variety of mechanical devices.

Chain saws are used extensively. A major portion of skidding and loading is done with electrically operated skidders similar in design to those used in the Pacific northwest region of the United States and in British Columbia. It is of interest to note that wood waste is used to make producer gas which in turn serves as the fuel to drive electrical generating equipment. Wood waste is also used to power steam-driven equipment.

Truck roads and narrow-gauge railroads are the chief transport arteries for logs, and new roads are quickly opened with the use of bulldozers. Pole: plank and ice roads, similar to those found in Sweden and Finland, continued to be used in some of the more remote areas in winter operations.

Various types of machinery are used in connection with river driving, rafting and towing; both portable and stationary cranes and conveyors are employed to place logs in or remove them from water. Bundling and rafting when required is commonly done with machinery patterned after types found in Sweden and Finland.

Latin America. — This vast area remains largely undeveloped both economically and industrially, and only relatively recently did

LOGGING AND THE MANUFACTURE OF LUMBER

1. Transporting a sugar-pine log by truck
2. Train of logs on the way to the mill
3. Band mill or "head rig" cutting a big log. The head sawyer at the left gives signals to the setter (right) for the cut
4. A gang saw in operation
5. Nose-lift lumber carrier which stacks and unstacks units of lumber
6. Lumber piles and overhead crane

domestic demand for lumber and other wood products become manifest in certain Latin-American countries. A very large proportion of the forests of Latin America lie in the tropical Amazon and Orinoco valleys, a vast, thinly populated region without either modern transportation or communication facilities. There the forest resources remain virtually untouched.

The valuable Paraná pine and hardwood forests of temperate Latin America are also separated from centres of consumption by distance and difficult topography. Transportation facilities are poorly developed, and lumbering in both temperate and tropical forests is limited to the most readily accessible areas. As a result, pine stands were clear-cut without provisions for forest regeneration, while in the tropical forests only a few of the most valuable hardwoods were harvested.

The rivers of Amazonia (including most of Brazil and parts of Bolivia, Peru, Colombia, Ecuador and Venezuela) are the highways, and sawmills are supplied with logs rafted from upstream areas. Manpower is the only source of power in the lumbering areas, and removal and movement of logs from stumps to waterways are uncertain and costly. Operations are restricted to water frontages and are scattered over vast areas. In practice, logs are rolled irom stump to water on primitive track made by parallel placement of logs. Felled timbers are slowly and tediously manoeuvred along these tracks, with or without the use of levers, to the nearest stream. There they are made up into rafts and floated to downstream mills. The harvest is largely restricted to manageable-sized mahogany and Spanish cedar trees.

In the Guianas, particularly British Guiana, some use is made of mechanical skidding, loading and truck transportation. Felling of the large tropical hardwoods is still done with single-bit axes. Because of strongly buttressed and fluted trunks, stumps are usually high; to facilitate dragging, log ends are generally tapered; and many logs for export are squared in the woods. All three such practices are very wasteful, and it was estimated that the current annual losses of usable wood left in the forest ran to 400,000 cu.ft., or about 11% of the total quantity produced in 1951. Loading and skidding equipment commonly consist of inefficient winches driven with underpowered automobile engines of various makes, while logs are hauled by truck over poorly constructed roads to the rivers.

The temperate forests of Chile, and to a considerable extent those of Argentina, because of location and a dearth of transportation facilities, also were ineffectively exploited. Sawmills in Chile are all of the portable type and located close to a supply of timber. Logging is a seasonal operation carried on with local rural labour during the slack agricultural season.

The inefficiency of lumbering practices in modern times stems from the lack of suitable equipment needed to transport timber of large size. Trees are not only felled with axes, but bucked into logs with the same tools. The use of crosscut saws is extremely rare. Carts or two-wheeled bummers, drawn by oxen, haul logs to nearby sawmills, but because of the capacity of vehicles of this sort, the largest and most valuable trees ordinarily cannot be harvested.

Africa.—Lumbering practices in the accessible forest areas of the African continent were until relatively recently very primitive and production was low. After World War II, however, improved methods were introduced on the west coast, in the Belgian Congo and in South Africa. Motor vehicles, tractors and trucks had the greatest influence in changing lumbering practices in the forested areas of the Airican tropics. These vehicles are used for both long and short hauls over a network oi good forest roads made possible by the introduction of the bulldozer.

In South Africa logging formerly was largely restricted to manual operations, supplemented with animals and trek chains. Tractors and other power devices were later used, however, including cranes, loaders and trucks.

Asia.—Logging in the wet Asiatic forest regions is based mainly on hand methods and the use of animal power for skidding. Hand squaring of timbers and pitsawing of boards are still common practices. In the teak iorests of Burma and India, buffalo and oxen are used on gentle terrain, but on steep, rocky slopes no power-driven contrivance had yet proved as economical as the elephant as of the late 1950s. The use of heavy-duty tractors, bulldozers and trucks was intensified in Thailand in later years. Much of the teak in Burma. and Thailand is floated to sawmills, while other hardwoods, generally too heavy to float, are transported by animal, truck and rail. Occasionally valuable, heavy hardwoods buoyed by bamboo floats are rafted out of otherwise inaccessible forests.

In eastern Pakistan the extraction of large timbers on private holdings is by elephant; on the larger government holdings tractors are in common use. Logs are usually delivered to mills by floating. By contrast, in western Pakistan, where timber tends to be of smaller size, felling and on-the-site hand-sawing of logs into cants is commonly practised. These cants are usually hauled from the forest to truck roads or riverbanks by manpower alone, or with the aid of donkeys, thence to mills by rail or water.

In Japan, which is much more highly industrialized than any other Asiatic nation, logging and the movement of logs to railheads or trucking points were almost entirely by hand labour in the late 1950s. Even the largest logs were loaded solely with manpower. Skidding in rough terrain was sometimes accomplished using cables, but more often the logs were moved by gravity using sleds or flatcars over crudely constructed narrow-gauge tracks. Only on national forestlands was modern mechanical lumbering and railroad or truck hauling practised.

Logging in the Philippines is more highly mechanized than in any other Asiatic area. The early methods of band-sawing logs into hoards still persisted in the late 1950s in isolated spots, but exploitation in the more important forested regions was based largely on surplus U.S. army equipment made available at low cost after World War II. Heavy tractors, modern loading machines and cable systems were used even in difficult terrain. Transportation of logs to mill was almost completely by truck.

Pacific Area.—Except for Australia, New Zealand and the Fiji Islands, there is little information on logging and lumbering methods in the forests of the Pacific area. Methods are generally primitive, however, except in the three countries noted above. Many of the larger operations in Australia and New Zealand are not too unlike those in the United States and Canada. In the Fiji Islands, log extraction is done by ground skidding using cable systems and steam-driven winches. Logs are moved to mills on small trucks mounted on wooden rails and hauled by tractors.

Canada.—The economic development of Canada has been intimately associated with the growth and expansion of its lumber industry. Lumbering leads all other Canadian enterprises in total employment, and came to be third in terms of both net value of derived products and in total wages and salaries paid.

The forests of Canada comprise 37% of the nation's land area, or 1,299,759 sq.mi.; more than 712,000 of these are in productive forests, of which 68%, or 484,000 sq.mi., are regarded as accessible for exploitation. While Canada's volume of commercial timber is estimated at approximately 308,279,000,000 cu.ft., only 56% of the more than 237,927,000,000 cu.ft. of softwood timber and 84% of the 70,352,000,000 cu.ft. of hardwood timber was accessible to arteries of transportation in the late 1950s. The residual, covering an area of nearly 228,000 sq.mi., represented a timber reserve for the future.

The demand ior Canadian lumber has been great; notwithstanding the losses caused by fire, insects and decay, productivity, as of the 1950s, had not been seriously impaired. In 1950 the logging industry employed about 150,000 workers to produce 3,322,000,000 cu.ft. of merchantable timber, while the lumber industry in the operation of approximately 7,500 sawmills had more than 60,000 people on its payrolls.

Generally speaking, logging and milling practices differ little if at all from those of the adjacent timbered areas of the United States, where forest composition, topography and climatic conditions are similar.

Logging operations in the forests east of the Rocky mountains are, for the most part, carried out as a part of the over-all operations of the lumber companies. The use of trucks for hauling logs from forest to mill materially reduced seasonal operations and dependence upon rivers for moving timber downstream to the mills. Power-driven loading devices and jammers mounted on trucks are examples of late developments in loading and unloading equipment. Tractors and snowmobiles are also used for hauling.

In the interior, notably that region between the Rocky mountains and the east slopes of the coastal ranges where species of secondary importance prevail, year-around logging increased after the adoption of mechanized equipment, tractors and power saws.

Unlike the industry in eastern Canada, logging on the west coast of British Columbia has been a strong, independent enterprise for many years. There are, however, a number of the larger lumber companies which operate their own logging units. In this region truck logging almost completely replaced railroads, which in turn made possible the removal of timber previously regarded to be commercially inaccessible.

In 1950, 16% of Canada's lumber was manufactured, in Quebec, 14% in Ontario and 53% in British Columbia. Mill output for the year was estimated at 6,500,000,000 bd.ft. of lumber, 4,400,000 crossties, 3,100,000 squares of shingles and 114,000,000 lath. These products, together with the box shooks and cooperage produced, had a gross value of $493,000,000.

Canadian exports of wood products steadily increased for a number of years. In 1946, 965,000,000 bd.ft. of lumber valued at $60,000,000 were exported to the United States. In 1950 these figures had risen to 3,024,000,000 bd.ft. and $2,500,000,000 respectively. The second largest importer of Canadian lumber is the United Kingdom, which with the United States accounted for about 92% of Canada's timber exports for 1950.

LUMBINI, the grove, located near the village of Paderia in southern Nepal, in which, according to Buddhist legend, Gautama Buddha was born. There are two references to the name in the Pali scriptures, the first in the narrative poem prefixed to the *Nalaka-sutta* in the *Sutta-nipata,* where it is related how the gods rejoicing in the sky inform the sage Asita that "the Bodhisatta, the incomparable jewel, has been born for weal and happiness in the world of men, in a village of the Sakyas, in the Lumbini country." The other reference is in the *Kathavatthu,* one of the latest works in the canon. The detailed story of the birth as known to Pali Buddhism first occurs in the introduction to the commentary on the *Jataka.* This account says that Queen Mahamaya (of the Sakya people), when her time was come, desired to go to her parents' home at Devadaha. On the way she 'stopped in the Lumbini grove, her pains came upon her and there the future Buddha was born. The earliest canonical accounts of the birth are not in the Pali canon but in the Sanskrit scriptures of two other schools, the *Mahavastu* (ii, 18) and the *Lalitavistara* (ch. 7). Neither of these works can be put earlier than the 3rd or 4th century A.D., but the discovery of an inscription of Asoka makes it probable that the whole legend was established at least as early as the 3rd century B.C. The inscription, found in 1896, a few miles within the border of Nepal and several miles east of the site of Kapilavatthu (Kapilavastu), the city of Buddha's family, records that "Piyadasi [*i.e.,* Asoka], after he had been consecrated 20 years, came in person and worshipped, because here was born Buddha Sakyamuni. . . ." This makes the date 249 B.C., according to the accepted chronology of Asoka's reign. There is a shrine at the place, now increasingly a site of pilgrimage for modern Buddhists. The shrine contains a bas-relief repfesenting the birth of the Buddha. The legends with their fabulous details are not historical documents, but the archaeological evidence which has accumulated increases the probability that they originated in a historical event.

LUMHOLTZ, CARL (1851–1922), Norwegian explorer and naturalist, was born in 1851 at Faberg in Gudbrandsalen. After graduating in theology at the University of Oslo (then Christiania) in 1876, he was sent by the university to Australia. where he spent four years (1880–84) in collecting zoological materials and anthropological data. In 1890 he went on behalf of the American Museum of Natural History to Mexico, accompanied by the Swede Hartmann, and there he succeeded in tracing and communicating with the Tarahumare Indians of Sierra Madre — descendants of the Aztecs. A unique collection, containing more than 1,700 photos, was the result of this expedition, which, with two later visits to Mexico, was described in his *Blandt Mexicos Indianere* (Christiania, 1902–03), later translated into English and Spanish; *New Trails in Mexico* (1912) deals more especially with the second of these expeditions. During World War I Lumholtz went to India, and in 1915–17 to Borneo. From Borneo he brought home a large zoological collection and valuable anthropometrical measurements, with new information on the language and customs of the Dyaks, recorded in *Through Central Borneo, Two Years' Travel in the Land of the Head Hunters* (2 vol., New York, 1920). He died at Saranac Lake, N.Y., on May 5, 1922.

LUMINESCENCE, the process by which certain materials are excited and emit light while the material is at low temperatures, such as ordinary room temperature. Familiar examples of luminescence emission are the light from (1) electronically excited gases, such as in neon lamps and lightning; (2) certain organic materials undergoing oxidation, for example luciferin in fireflies and glowworms; and (3) certain inorganic solid materials used as coatings in luminescent watch dials. television and radar kinescopes, fluorescent lamps and X-ray fluoroscope screens. In most of these examples, the temperature of the luminescing material is near room temperature. Luminescence emission, therefore, is sometimes loosely called cold light to contrast it with the incandescence emission from very hot materials.

Following are the main sections and divisions of this article:

I. INTRODUCTION

Excitation of the luminescent material is usually accomplished by injection of energy in the form of X-rays, ultraviolet radiation, electrons or alpha particles into the material. Another form of excitation is by application of electric fields to energize electrons or ions in the material. Energy liberated during some chemical reactions also may serve to excite suitable luminescent materials.

There are a few luminescent materials that are efficient enough for practical use. Useful luminescent materials are generally custom-made to be excited by a particular exciting agent, and to give a particular colour and intensity of luminescence emission. The colour of luminescence emission is determined chiefly by the chemical composition of the luminescent material. The intensity of luminescence emission depends not only on the composition of the material, but also on the intensity and nature of the excitation.

As mill be discussed later, the essential action in luminescence is electronic. A distinctive feature of the luminescence process is the localized absorption of energy that excites one or more electrons bound to a discrete atom, or group of atoms, without requiring agitation of the atoms as a whole. The excited atom, or group of atoms, then radiates (emits) at least part of its excitation energy as light.

1. Luminescence and Thermal Radiation. — Incandescence emission, or more generally thermal radiation, arises from a different process than luminescence and one that actually interferes with luminescence. Thermal radiation is produced by atomic motion and collision. Interatomic collisions or vibrations dissipate the localized electronic excitation energy needed for luminescence. Excitation of an incandescent material is accomplished simply by heating it; that is, raising its temperature until all of the atoms in the material are strongly agitated. Some of the thermally agitated atoms acquire enough energy, by collisions with neighbouring atoms, to become electronically excited and to radiate (emit light). Every material emits thermal radiation with a colour and intensity that is determined chiefly by the temperature of the material. All materials at room temperature have finite but imperceptible thermal radiation. Furthermore, most of the emission is located in the invisible far-infrared region of the spectrum. As the temperature of the material is increased, the intensity of thermal radiation increases, and the emission shifts to shorter wave lengths, moving toward and into the visible region of the spectrum When the material becomes hot enough to exhibit visible thermal radiation, the phenomenon is recognized as incandescence. Familiar examples of incandescence emission are the light from burning wood or candles, and from the very hot tungsten filaments in conventional incandescent lamp bulbs.

2. Luminescence and Pigment Action. — Luminescent materials have a distinctly different function from that of simple dyes and pigments. A suitable luminescent material, when irradiated with daylight, produces colour effects by absorbing some of the light and emitting visible radiation in excess of the normally imperceptible thermal radiation of the material. Dyes and pigments, however, produce colour effects by selectively reflecting incident radiation. without emitting appreciable radiation in excess of their thermal radiation. A red pigment, for example, reflects red light and absorbs the remainder of incident daylight. The energy of the absorbed light is converted into heat that increases the temperature and thermal radiation of the pigment by an inappreciable amount.

It is noteworthy that the colours of luminescing materials are additive. being provided by emitted light; whereas the colours of simple dyes and pigments are subtractive, being provided by selectively absorbed and reflected incident light. For example, when blue-emitting and yellow-emitting luminescent materials are mixed, as in monochrome television kinescope screens, the resultant blue-plus-yellow emitted light appears white. When, however, blue and yellow pigments are mixed and viewed under white light, each pigment selectively absorbs some of the incident light and the residual reflected light appears green.

Some luminescent materials may function simultaneously as dyes or pigments and as luminescent materials. These luminescent dyes can, for example, selectively reflect red light and, by luminescence, convert the energy of absorbed blue and green light into additional emitted red light. Such luminescent dyes are used to produce vivid colour effects in outdoor advertising displays. Other special dyes transmit white light and, by luminescence, convert the energy of absorbed ultraviolet into additional emitted blue or blue-white light. Such luminescent dyes are incorporated in detergents used in washing and coating white fabrics to enhance their lustre in sunlight.

II. EARLY HISTORY

Luminescence has been manifested for eons by lightning and the aurora borealis. Later in the earth's history there appeared luminous organisms, such as bacteria in the sea and in decaying organic matter, glowworms and fireflies. These apparently unrelated luminous apparitions in the air, sea and living things served mainly to appall and mystify man for thousands of years. According to available records, the first significant inquiry into luminescence was started in about 1603 by a cobbler-alchemist, Vincenzo Cascariolo of Bologna, Italy.

Contrary to what one would reasonably expect, Cascariolo did not begin with studies of the naturally available luminescences in gases, liquids and living matter. Nor did he start by discovering and studying luminescence in one of the various luminescent minerals that have existed on the earth since its genesis. He began, instead, by empirically synthesizing and testing a new, man-made, inorganic luminescent material.

1. The **Bolognian** Stone of **Cascariolo.**—Cascariolo found on Monte Paterno, near Bologna, some stones that were unusually heavy and had a silvery white colour. The stones were pieces of the mineral heavy spar (barite) which is now known to be chiefly barium sulfate. In typical alchemical fashion, Cascariolo pulverized the stones and heated the powder in contact with coal. The cooled product was a dull-coloured, friable, porous cake. Cascariolo, in common with other alchemists, sought to convert new-found minerals into precious metals and gems, or to synthesize the coveted philosopher's stone that was conceived of as having the power to transmute baser metals into gold. The attempt was unsuccessful, but Cascariolo noticed at night a continuous purple-blue glow from the cake of new material. The weak glow kindled hopes of magic properties, particularly when it was found that the material absorbed the "golden light of the sun," and the alchemical symbol for gold was the sun (Sol). The material was named *lapis solaris,* or "sun stone," and attempts were made to use it to transmute ignoble metals into gold. Despite the failure of *lapis solaris* to function as the illusory philosopher's stone, it gained fame for its property of absorbing light by day and glowing at night. News of the phenomenal *lapis solaris* was transmitted to several Italian scientists, including Galileo who gave samples to Gulio Cesare Lagalla of the Collegio Romano in Rome. Lagalla was the first to write of the *lapis solaris,* or Bolognian stone, in his book. *De phaenomenis in orbe lunae* (Venice, 1612).

2. Phosphorus and Phosphors. — Many names were proposed for Cascariolo's new material, including *lapis lunaris, lapis illuminabilis, lapis lucifer, luna terrestris* and *spongia solis*. The various Latin names lost favour, however, after the first monograph on the Bolognian stone was published. The monograph, by Fortunio Liceti, in 1640. bore the Greek title *Litheosphorus,* or "stony phosphorus" ("light bearer"). Thereafter, the word phosphorus increased in popularity as a designation not only for the Bolognian phosphorus, but for other luminescent materials. The term phosphorus was applied, also, to the chemical element, now bearing that name, after it was extracted from urine by Hennig Brand in 1669. It was natural to call the new element a phosphorus because it too glowed in the dark when it was in moist air. The element phosphorus did not require previous excitation by daylight, however, and we now know that its luminescence emission is the result of a chemical reaction (oxidation), that ceases when the source of oxygen is removed or the phosphorus is consumed. The original Bolognian phosphorus, on the other hand, luminesces as the result of an internal physical (electronic) action, that proceeds best in the absence of chemical change, and so the material may continue to luminesce indefinitely in a vacuum. Modern usage restricts the term phosphorus to the chemical element, as applied by Johann Sigismund Elsholz in 1677. while the shortened term phosphor is used to designate the original Bolognian phosphor and subsequent thousands of other solid luminescent materials.

3. Phosphorescence. — In the early experiments with phosphors, daylight was the sole known means for their excitation, and the light emission of the excited phosphor had to persist for a time long enough to permit removal to a dark place for observation. It was then that the term phosphorescence was introduced, and was associated with the long persistent emissions by phosphors. The apparent porous structure of early phosphors led to the postulate that phosphorescence was a simple spongelike absorption of light by the material, followed by gradual release of the selfsame light in the dark. This viewpoint had to be abandoned when, in 1652, Nicolai Zucchi showed that the colour of phosphorescence emission was the same whether the phosphor was excited by white light, or by light of several other colours, produced by passing white light through coloured glasses. In later years, Zucchi's experiments

were confirmed and refined by other experimenters who used prisms to provide purer coloured light for excitation. The implication of these results is that excited phosphors are generators of light; not storehouses of light. The foregoing correct interpretation was not obvious, however, in an age of mysticism when some persons associated light with the human soul, and other persons considered light to be a fifth element in addition to earth. air. fire and water.

4. Fluorescence and Luminescence.— As the news of the Bolognian phosphor spread, there was a quickening of interest in other lands and in other kinds of luminescence. A German Jesuit, Athanasius Kircher, busied himself with the Bolognian phosphor, light from the sea and light from living matter. In his book *Ars magna lucis et umbrae* (Rome, 1646), Kircher called attention to the peculiar appearance of an aqueous solution containing an extract from a wood called lignum nephriticum. This solution had first been described in 1565 as having an unusually intense blue colour by the Spanish physician Nicolás Monardes who recommended the liquid for treatment of kidney ailments. Kircher and, later, Francesco Maria Grimaldi of Italy, and Robert Boyle and Isaac Newton of England, reported that the tincture appeared blue by "reflected" white light, and yellow by the light that was transmitted through the liquid. All of these investigators referred to the blue light as being reflected; the concept of luminescence excitation and emission eluded them. It was not until 1852, after informative studies of the mineral fluorspar by the French mineralogist René Just Haüy, and of fluorspar and solutions of lignum nephriticum, quinine sulfate and chlorophyll, by the English astronomer John Herschel and the Scottish physicist David Brewster, that the blue light of lignum nephriticum was correctly identified as a luminescence emission by the English mathematician-physicist George Gabriel Stokes. The excitation, in this case. is by violet and ultraviolet radiation in sunlight. Stokes used prisms and optical filters, that were opaque to each others' light, to demonstrate that incident light of one narrow band of wave lengths, such as blue. was absorbed and instantaneously produced, in certain clear solids and solutions, emitted light of another colour, such as yellow, whose wave lengths were not contained in the incident light.

For this luminescence, which apparently ceased immediately when the incident light was shut off, Stokes proposed "to coin a term and call it fluorescence, from fluor-spar, as the analogous term opalescence is derived from the name of a mineral." The term fluorescence was thenceforth loosely applied to denote short-lived luminescence emission; also, luminescence emission during excitation, irrespective of duration after cessation of excitation. Through these, and other, indiscriminate usages, the term fluorescence has become ambiguous and misleading. It is now recommended that the generic term phosphorescence be used to denote persistent luminescence in general. Fluorescence should be used only to denote certain limiting cases of short-duration phosphorescence, such as from an isolated, simple excited atom. A typical value of fluorescence persistence is ten millimicroseconds (10^{-8} second) for emission of visible light. The general term luminescence, of Latin origin, including both fluorescence and phosphorescence, was first introduced by the German physicist Eilhard Wiedemann, in 1888, for "all those phenomena of light which are not caused solely by a rise in temperature."

In its original context, luminescence was associated with the production of visible light. When it became known that invisible radiations, such as ultraviolet and infrared, are also afforded by luminescence processes, the term was correspondingly broadened. Luminescence is used here in the broad sense, recognizing that there are other detectors of radiation than the human eye. If a more appropriate general term, such as radiescence, becomes established, usage of the term luminescence may revert to its original limited meaning.

III. LUMINESCENCE EXCITATION

From Cascariolo's time on, new materials were subjected to many different exposures and treatments, in order to discover new luminescent materials and new methods of excitation. Extensive studies disclosed that many materials were capable of exhibiting feeble luminescence, and that several means of excitation were capable of producing luminescence emission. Jacopo Bartolomeo Beccari, professor of physics. medicine and chemistry at Bologna, reported in 1744 and 1747 that some bodies. such as glowworms, certain marine life. rotten wood and the flesh of some birds and animals, throw out light spontaneously during putrefaction and chemical changes. whereas other materials. the phosphori, require excitation which may be accomplished by attrition, heat, exposure to air or exposure to light. Beccari's account gives a scrambled catalogue of some of the types of luminescence classified according to the means of excitation.

Modern terminology employs a distinctive prefix to indicate the means of excitation; for example, bioluminescence (as in glowworms), chemiluminescence (as in rotting mood), triboluminescence (as in grinding a phosphor) and photoluminescence (as in irradiating a phosphor with light).

1. Bioluminescence and **Chemiluminescence.**—One of the earliest references to naturally occurring luminescence, in glowworms and fireflies, is in the Chinese *Shih Ching,* or "Book of Odes," from the period 1200–1000 B.C. Aristotle (384–322 B.C.) wrote of seeing light come from decaying fish, and fostered the concept of cold light by mentioning in his De *coloribus* of the Opuscula: "some things though they are not in their nature fire nor any species of fire, yet seem to produce light." The experimental approach was first applied to natural luminescent matter by the pioneer Francis Bacon who described his experiments on decaying wood that luminesced (published posthumousiy in 1627). Alexander von Humboldt showed, in 1799, that rotting wood ceased luminescing when placed in nitrogen or carbon dioxide, and resumed its emission of light when placed in oxygen or air. Humboldt showed. also, that a living jellyfish, could be electrically stimulated into forced bioluminescence emission.

All of the cited luminescences of natural organic matter, both animate and inanimate. are now known to be essentially a chemiluminescence, wherein the excitation energy is supplied from excited molecules, molecular fragments or electron transfers that occur during a chemical reaction. The chemical reaction usually involves oxidation, and so these chemiluminescences utilize the same basic mechanism that provided light emission when the inorganic. chemical element phosphorus was first isolated and observed in moist air, in 1669. Bioluminescences are chemiluminescences that occur in living things.

Bioluminescences in the plant kingdom are occasioned by luminous bacteria and fungi that emit light continuously, whereas bioluminescences in the animal kingdom occur in higher-order organisms that can control their light emission. Some animals regulate the chemical reaction by valving the admission of air into their interiors where the oxygen of the air reacts with certain special organic fluids that are synthesized in the animal. Glowworms and fireflies so regulate their luminescences to exhibit periodic light emission for the purpose of attraction during courtship. According to Thomas Bartholin, Carolus Vintimillia in about 1647 first called attention to the intense periodic glow that female fireflies use as a signal to male fireflies at night. The railroad worm of South America has a sophisticated bioluminescence system. in that it emits red light from a spot on its head, and greenish-yellow light from rows of spots along each side. This rare worm, about two inches long, is actually the larva of a beetle. Its glow can be stimulated, as can the bioluminescences of other animals, by mechanical and electrical means. The greenish-yellow sidelights can be made to glow by shaking the worm, and the red headlight is made to glow by blowing air on it.

2. Triboluminescence.—The emission of light upon the scratching or breaking of cakes or large crystals of sugar was mentioned by Francis Bacon in his book *Advancement* of *Learning* in 1605. This type of luminescence came to be called triboluminescence. although the name is inappropriate because the prefix *tribo* comes from the Greek word meaning "to rub." The luminescence is genuine, being displayed by numerous organic and inorganic materials, and is allied to the blue glow that is observable when certain kinds of adhesive tapes are unrolled in the dark. The surfaces that are separated by breaking, scratching or pulling apart

1. Photoluminescence in a glass tank containing water. Very dilute solutions of the luminescent dyes fluorescein and rhodamine are dropped into the tank, forming graceful vortex rings and whorls as they descend. 1(a) shows the glass dropper above the tank, a second dropper at the left having been removed before a flashbulb was set off directly above the tank. Light from the flashbulb excited the luminescent dyes. 2. Red photoluminescence emission of a chemical substance in the Harderian gland of a rat under "black light" (ultraviolet radiation). At left is a normal rat with Harderian gland exposed by displacement of the eyeball. Rat at right received a diet deficient in pantothenic acid. In this rat the porphyrins excreted by the Harderian gland have migrated to the nose through the naso-lachrymal duct. These studies were made by H. J. Figge of the University of Maryland as part of a search for carcinogenic agents. 3. Photoluminescence, under ultraviolet radiation, of a bottle of milk surmounted by a smaller bottle of evaporated milk. On the right is a circular disk of butter and en the left one of margarine. The four ovals are hen's eggs whioh luminesce with a scarlet colour due to the presence of a luminescent material with whiah they became coated during their passage through the oviduct. 4. A specimen of the mineral scheelite, from Tulare county, Calif., photographed (a) in daylight and (b) under ultraviolet radiation in the dark. 5. Specimens of photoluminescent materials. The blue-emitting crystals on the left are fluorspar from which the name fluorescence was derived. 6. A specimen of the mineral willemite with a centre strip of calcite under ultraviolet radiation. The non-luminescent portions are chiefly franklinite. Specimen from Franklin, N.J. 7. Another specimen of scheelite from Lucin, Utah, photographed under ultraviolet radiation in the dark

EXCITATION OF LUMINESCENT MATERIALS

Top: Luminescent minerals and synthetic microcrystalline phosphors under (left) white light and (right) ultraviolet radiation in a dark room. Most useful phosphors simply reflect white light, but absorb ultraviolet rays and generate light with a colour that is determined by the composition of the phosphor. Phosphor crystals in the centre row of vials are zinc-cadmium sulfides with 0.01% silver activator. As the proportion of cadmium is changed from zero to 100%, the luminescent colour changes from blue to red. The phosphors in the trays below are zinc-beryllium silicates with manganese activator. As the proportions of beryllium and manganese am increased, the luminescent colour changes from green to red. Duratlon of phosphorescence (afterglow) also varier. with comporltion

Centre: Patches of synthetic microcrystalline phosphors on a plate in an evacuated cathode-ray tube under (left) white light and (right) under a beam of 12,000 volt electrons from an electron gun. The electron beam was deflected from patch to patch on the outer circle by manually rotating a bar magnet near the neck of the tube. When the magnet was removed, the beam struck the centre patch

Bottom: Left, separate pigments or dyes that selectively reflect blue and yellow light from incident white light provide a mixture that reflects green light. Right, separate phosphors that emit blue and yellow light under ultraviolet irradiation, in a dark room, provide a mixture that emits white light have unequal electrical charges that produce an electric discharge through the intervening air. The blue glow obtained on unrolling adhesive tape comes from atmospheric nitrogen that is excited by the discharge, and the glow obtained on breaking sugar, some candies and certain other triboluminescent materials is caused by excitation of the air and of the material itself by the electric discharge. These luminescences could more appropriately be called electroluminescences produced by mechanical means.

3. **Thermoluminescence.**—This name, another misnomer, was used to denote light emission from luminescent crystals that were warmed. Robert Boyle observed such emission from a diamond in 1663, and J. S. Elsholz observed similar effects in specimens of fluorspar in about 1676. The effects were real, but they served more to confuse than enlighten. The confusion arose because the phenomena seemed to indicate that heat alone could excite a luminescent material. More than two centuries of experimenting subsequently elapsed before it was realized that the heat simply accelerated the emission of light by a material that had been previously excited by some other means, such as exposure to ultraviolet radiation or electric discharges. The correct designation for this luminescence phenomenon is thermostimulated phosphorescence.

4. **Photoluminescence.**—Luminescence emission from a material excited by light was observed as early as 1565 when Monardes mentioned the intense blue colour of his wood extract, but the appreciation that a material could be photoexcited to produce light was delayed until Cascariolo's nocturnal discovery in 1603. Nearly two centuries then went by before the existence of invisible radiation, such as ultraviolet and infrared, became known. Johann Wolfgang von Goethe reported in his book *Zur* Farbenlehre, 1810, that he and Thomas Johann Seebeck in 1792 performed an experiment in which they exposed a specimen of the Bolognian phosphor to rays from a prism. They observed that particularly strong emission was obtained when the phosphor was held in the invisible region just beyond the visible violet rays. This instance of using a phosphor to disclose the existence of invisible rays was a forerunner of several other occasions when phosphors were vital detectors of important invisible radiations.

Positive identification of ultraviolet rays was made by Johann Wilhelm Ritter in 1801, and Ritter tested phosphors not only under ultraviolet rays, but also under the infrared rays that were discovered at about the same time. He found that ultraviolet rays excited phosphors very well, but he and Seebeck found that infrared rays decreased the phosphorescence emission of phosphors. The phosphorescence-quenching effect of infrared was later found to be specific for certain phosphors and certain wave lengths of infrared radiation. With some other phosphors, and selected wave lengths of infrared, it was found that a phosphorescence-stimulation effect occurred. The photostimulation of phosphorescence by infrared radiation, providing an accelerated emission of light by a previously excited phosphor, is similar to thermostimulation by heat. but the detailed mechanisms are not the same. In the photoquenching effect, infrared radiation facilitates dissipation of excitation energy in a phosphor, converting the potential emission energy into heat instead of light.

5. Stokes's Law.—G. G. Stokes made some dramatic experiments with luminescent liquids and solids exposed to ultraviolet radiations in about 1852, and showed that the wave length of the emitted light is always equal to or longer than the wave length of the exciting light. His discovery of a definite relationship between the wave lengths of the exciting and emitted light led to the labeling of this relationship as Stokes's law. The law was disputed for several decades, but its validity became firmly established for all except some rare instances in which thermal energy can contribute slightly to the excitation process of photoluminescence. In modern terms. Stokes's law is another way of stating the law of conservation of energy on a quantum basis.

6. **Electroluminescence.**—In 1672, Otto von Guericke, mayor of Magdeburg, Ger.. noticed that light was emitted when he rubbed a ball of sulfur in the dark, and he likened the light emission to that obtained when sugar is ground. We now know that rubbing electrified the sphere, and the light came from luminescent air molecules that were excited by an electric discharge from the sphere into the surrounding air. Guericke noticed, also, roaring and crackling sounds from his electrified sphere. He thus took a major step toward Benjamin Franklin's identification. in 1752, of the electric discharge as the exciting agent responsible for the natural luminescence phenomenon known as lightning. Natural lightning and Guericke's man-made luminescence are both caused by energetic electrons in electric discharges through a gas. and both phenomena are correctly called electroluminescence. Electroluminescence is luminescence in any material, gas, liquid or solid, that is excited by electrons. It is common to use electric fields to accelerate electrons and make them energetic enough to excite luminescent materials. The electric field may be constant or alternating, and the source of the electrons may be outside or inside the material.

The first reported electroluminescence in an evacuated vessel is attributed to Jean Picard, a French astronomer and priest, who in 1675 noticed a glow above the mercury in his barometer as he carried the barometer into a dark room. The glow ceased when the mercury was still, and the glow appeared when the mercury was moving downward, but not upward, in the glass tube. This "mercurial phosphor" was studied by Johann Bernoulli, a Swiss mathematician, who in 1700 reported that an evacuated clean glass phial containing some clean mercury glowed whenever the phial was shaken. The effect is due to electric discharges from the glass. Discharges occur when the mercury is moved rapidly away from an area on the glass. The newly exposed glass is left in a surface-charged condition previously induced by electrons acquired from the mercury. The electric charging effect was established by Christian Friedrich Ludolff, a physician of Berlin, in 1745, when he observed movements of silk threads suspended near the moving surface of the mercury next to the glass wall of the tube. Francis Hauksbee. a self-educated English scientist, had also studied the "mercurial phosphor," and during 1705–1711 performed experiments in which he obtained light by electric discharges from many materials. including glass. oyster shells, wool and flint, that were electrified by rubbing or fracturing in a partial vacuum.

Further studies of light emission associated with electrical phenomena led the English physicist John Canton, in 1768, to observe that phosphors could be readily excited by exposure to electric sparks. As the means for achieving higher voltages and stronger electric discharges in rarefied gases were improved, there was increasing interest in the possibility of using electroluminescence to provide a practical electric light. One of the earliest demonstrations of an electric discharge lamp was by J. P. Gassiot at a meeting of the Royal society, in London, in 1860. Gassiot's lamp utilized a high-voltage discharge through carbon dioxide at low pressure to give "a brilliant white light." Gaseous-discharge lamps were further developed by D. McFarlan Moore, of the U.S., and by Georges Claude, of France, in the period 1890–1900.

The practical combination of a gas-discharge lamp and a phosphor, the now common fluorescent lamp, did not appear. however, until the latter part of the 1930s. The modern fluorescent lamp utilizes a combination of electroluminescence and photoluminescence, in that electrons excite mercury-gas atoms that emit ultraviolet radiation which in turn excites a phosphor coating that emits visible light.

7. **Cathodoluminescence.**—This name is a partial misnomer, because it is luminescence excited by injection of high-velocity electrons into a luminescent material. Cathodoluminescence is a subclass of electroluminescence. The misnomer arose because the term cathode rays was introduced before the rays were identified and named electrons.

In 1858, J. Pliicker discovered that rays emitted from the cathode in an evacuated electron-discharge vessel could be magnetically deflected, as evidenced by the movement of a spot of light that was emitted from the glass wall of the vessel where the rays impinged. The luminescence emission of the glass served as a visible indication of the presence and motion of the invisible rays. Further experiments, especially by A. E. Becquerel. J. P. Gassiot, J. W. Hittorf, E. Goldstein, E. Wiedemann, F. Lecoq de Boisbaudran, William Crookes and P. Lenard, established that the rays could produce bright luminescence emission from many phosphors, including some natural minerals. Goldstein discovered, in 1876, that the rays from the cathode could be electrostatically deflected, and he named them cathode rays (German, *Kathodenstrahlen*). It was not until 1897 that the cathode rays were proven to be electrically charged particles by J. J. Thomson, who called them corpuscles. The name electron, which was first suggested in 1881 by G. Johnstone Stoney for the unit of electric charge, was not universally adopted until after 1900.

The relatively intense light emission obtained from cathode-ray bombardment of phosphors, spurred investigators to seek new luminescent materials to be excited by the invisible beams of electrons. Thousands of substances and minerals were subjected to cathode-ray beams, and striking displays of cathodoluminescence were obtained from platinocyanides, uranium salts, diamonds, rubies and many other solid materials.

The first useful combination of phosphors and a beam of cathode rays was in the cathode-ray oscilloscope tube invented by Karl Ferdinand Braun in 1897. This electron tube made it possible for scientists to observe electric and magnetic fluctuations that are too rapid to be followed by mechanical means.

Starting in the 1920s, the Braun tube was modified and improved. by providing more efficient cathodoluminescent phosphors and introducing means for modulating the intensity of the electron beam. The cathode-ray tube has since become the television and radar kinescope, or image-reproducer tube. Another prominent use of cathodoluminescence is in the viewing screens of electron microscopes, to transform invisible electron patterns into visible images with minute details.

8. Ionoluminescence, **Anodoluminescence.**—The discovery of cathode rays mas followed by E. Goldstein's discovery of rays from anodes, first called canal rays, in 1886. These rays, later identified as positive ions, also produced luminescence in certain gases and solids, but ions are less convenient and less effective exciting agents than electrons. Ionoluminescence is the most appropriate term for luminescence excited by ions, both negative and positive, but the terms anodoluminescence and radioluminescence have sometimes been used as synonyms.

9. **Radioluminescence.**—After cathode rays, anode rays and X-rays had been discovered in the period 1858–1886, Antoine Henri Becquerel of France sought to ascertain whether similar penetrating invisible radiations might be emitted from phosphorescing materials as an adjunct to their emission of visible light. In 1896, Becquerel excited a number of his father's luminescent materials by exposing them to light, and then placed them on a photographic plate that was wrapped with black paper. When the photographic plate was developed, Becquerel found that one of the luminescent materials, a uranyl potassium sulfate, had darkened. the plate. He then repeated the experiment, but without previous exposure of the material to sunlight, and obtained the same result.

Becquerel did not find the additional luminescence emissions that he sought. His experiments led, however, to the discovery of radioactivity; that is, to the finding of the penetrating rays that are spontaneously emitted from atomic nuclei in uranium, radium, thorium and other radioactive substances. These rays were then found to be capable of exciting phosphors, and the luminesccnces obtained under excitation by rays from radioactive substances were called radioluminescence. The term is ambiguous because rays from radioactive substances include electrons (beta rays). ions (alpha particles) and photons (gamma rays). Early use was made of the so-called radioluminescence by admixing a phosphor and a radioactive material in a paint vehicle to make self-luminous dial markings for watches and other instruments to be observed at night. The scintillations caused by individual alpha particles bombarding phosphor crystals are visible, to the dark-adapted eye, when the luminous markings on a timepiece are observed through a strong magnifying glass in the dark. The separate flashes of light are direct evidence that the excitation is by discrete particles.

The aurora borealis is a large-scale radioiuminescence. The primary exciting agents are elementary, charged particles that are sporadically ejected by the sun during violent fluctuations of its basic nuclear reactions. When the charged particles, especially protons, approach the earth, they are deflected by the earth's magnetic field and converge toward the magnetic poles. As the energetic particles enter the earth's atmosphere they bombard air molecules and produce heterogeneous showers of mesons, electrons, positrons, ions, photons and other secondary particles. The showers of primary and secondary particles vary in intensity. composition and penetration to produce varicoloured luminescence emission on deceleration as they excite gases in different strata of the atmosphere.

10. **Roentgenoluminescence.**—This luminescence, which is excited by X-rays, bears as a prefix the name of the discoverer of X-rays, Wilhelm Conrad Rontgen, a physicist of Wiirzburg, Ger. In 1895, when Rontgen was experimenting with a cathode-ray tube that he had enclosed in an opaque black-paper wrapper, he noticed that some barium platinocyanide crystals lying near the tube emitted light when the tube was operating. Subsequent work disclosed that there were new, invisible rays coming from the glass wall of the tube where it was struck by the cathode rays. The new rays. which were called roentgen rays or X-rays, were not deflected by electric or magnetic means, and they were much more penetrating than any radiations known theretofore. The rays were later identified as being the same as light, but of much shorter wave length.

Many phosphors were found to be luminescent under X-ray excitation, and phosphors were used to make the X-ray fluoroscope screens and intensifier screens that are employed in making visible details of bone structure and other internal structure of the human body. The production of X-rays is itself a fluorescence process, and so roentgenoluminescence is the second luminescence in a two-stage process.

IV. LUMINESCENT MATERIALS AND PHOSPHOR CHEMISTRY

During the search for new means for excitation, there was a parallel search for new luminescent materials that might be bright enough for some practical use. The Bolognian phosphor of 1603, a barium sulfide, was used to make novelty drawings and pictures that glowed feebly at night, after exposure to sunlight. In moist air, the material decomposed and evolved malodorous hydrogen sulfide. Despite these shortcomings, the recipe for making the phosphor was so highly prized that it was kept semisecret for nearly a century. When the formula eventually became widely known, efforts were made to improve the material by using different ingredients and preparative techniques. One of the first improvements was accomplished in 1700 when a calcium sulfide phosphor was made by Friedrich Hoffmann, a court physician in Prussia. Hoffmann used Cascariolo's technique, and calcined gypsum ($CaSO_4$) with coal to make a brighter phosphor. **A** better technique for making the same phosphor was devised by John Canton in 1768. He heated a mixture of ground oyster shells and sulfur to make a superior phosphor. Although Canton's phosphor glowed brighter than the Bolognian phosphor, both phosphors were difficult to reproduce, and both decomposed obnoxiously in humid air. The first stable sulfide phosphor, a zinc sulfide, was prepared in 1866 by the French mineralogist, Theodor Sidot, who heated zinc oxide in a stream of hydrogen sulfide.

1. Sulfide-Type Phosphors, Activators, Fluxes. — The difficulty of making uniform phosphors, even when using a standardized technique, led to the suspicion that the bulk material needed the absence or presence of certain trace ingredients. As the then infant art of chemistry progressed, purification and analysis were applied to phosphor ingredients and to completed phosphors, to ascertain and control their compositions.

In 1870, there appeared the first commercial phosphor, called Balmain's paint, and in 1879 a German patent on "Leuchtfarben" was issued. Balmain's paint was a calcium sulfide phosphor made with deliberate inclusion of about 0.01% of a compound of bismuth. It was not until 1886, however, that the French chemist **A.** Verneuil proved that a pure calcined calcium sulfide was nonluminescent, whereas the same pure substance after heating with a trace of a compound of bismuth gave the violet emission of Balmain's paint. Verneuil thus established the need for what is now called an activator (*e.g.*, bismuth) which must be incorporated in small proportions in the host crystal (*e.g.*, calcium sulfide) in order to convert the nonluminescent host crystal into a phosphor. In retrospect, it is apparent that Cascariolo's heavy spar ($BaSO_4$) and Canton's oyster shelis ($CaCO_3$) contained approximately the correct proportion of bismuth impurity to provide the necessary activator ingredient in their calcined products. It was found that Sidot's green-emitting zinc sulfide phosphor, on the other hand, had been prepared from ingredients that had a few thousandths of a per cent of copper impurity that functioned as the activator in his completed phosphor.

The best sulfide phosphors were made with about 2% of certain salts mixed with the other ingredients before they were heated at high temperatures. Sodium chloride (NaCl) was particularly effective as an additive in making efficient zinc sulfide: copper phosphors. but several other alkali halides gave nearly equivalent results. The seeming catalytic action of these salts led to their being called fluxes, a name derived from metallurgy wherein certain salts are used to facilitate the high-temperature welding of metals.

2. Oxide-Type Phosphors, Poisons. — After the discovery that a pure nonluminescent host crystal could be made luminescent by incorporating in it a trace of a certain impurity, called the activator, the search for new phosphors continued with more attention given to minor ingredients. Entire mineral collections were exposed to the new invisible radiations, and some specimens that were found to luminesce brightly were analyzed. As examples, bright red emission was obtained from specimens of ruby (aluminum oxide with chromium activator), green emission from some specimens of willemite (zinc silicate with manganese activator) and blue emission from specimens of scheelite (calcium tungstate, which requires no added impurity for an activator). These materials were then synthesized, and man-made phosphors were obtained with higher efficiencies than those of the best specimens of the corresponding natural minerals.

The higher efficiency of the synthetic phosphors was attributable to elimination of spurious ingredients, thorough purification of the essential ingredients and to intimate mixing, combining and crystallizing of the ingredients at an optimum high temperature (usually about 1,000° C.). Great care had to be taken to avoid the introduction of undesirable impurities, particularly iron and certain other elements, that decreased the efficiency of phosphors. Such efficiency-reducing impurities became known as poisons or killers, and individual phosphors were found to be hypersensitive to certain poisons, but relatively insensitive to others. Another selective feature that eventually emerged was that fluxes, which were essential in making efficient sulfide-type phosphors, were found to be unessential, and even poisonlike, in making most oxide-type phosphors.

3. Centres, Intensifier Activators, Originative Activators, **Coactivators.**—Speculations on the roles of activators in phosphors led to the concept of special and distinct atoms or groups of atoms, which P. Lenard in 1890 called centres, wherein the luminescence action takes place. In this concept, the host crystal functions as a medium in which to suspend foreign activator atoms which, with their neighbouring host-crystal atoms, provide discrete centres for localized absorption of excitation energy, followed by emission of part of the absorbed energy as light. As a corollary, poisons were conceived of as foreign atoms that incapacitate nearby centres.

It was found that there is an optimum proportion of activator, which is about 0.001% to 0.3% of the weight of the host crystal, and so it became evident that when centres are packed too densely in a host crystal they poison each other.

The centre concept is readily applicable for those phosphors that require deliberate inclusion of foreign activator atoms. Some phosphors, however, are luminescent even when made without any added activator.

Examples are pure calcium tungstate ($CaWO_4$), and pure zinc silicate (Zn_2SiO_4). In those phosphors the luminescent centres may be identified with certain distinct structural groups in the host crystal, such as the octahedral tungstate group (WO_6) in $CaWO_4$, and the tetrahedral silicate group (SiO_4) in Zn_2SiO_4.

When about 0.2% of titania (TiO_2) is incorporated in pure Zn_2SiO_4, or in some other pure silicates, the violet emission of the pure silicate is greatly increased. The titanium impurity beneficially perturbs the SiO_4 centres. making more of the SiO_4 groups capable of luminescing. For such instances. where an impurity intensifies a latent host-crystal luminescence, the impurity is called an intensifier activator.

When about 0.2% of manganese oxide (MnO) is incorporated in pure Zn_2SiO_4, honever, the violet emission of the SiO_4 centres in the host crystal disappears and is replaced by a strong green emission occasioned by the manganese centres. Manganese atoms replace some of the zinc atoms to form new, luminescent MnO_4 centres. For such instances. where an impurity produces a new luminescence emission, not ascribable to centres of the pure host crystal, the impurity is called an originative activator.

Another type of activator action was traced to the fluxes used in preparing sulfide-type phosphors. When pure ZnS is crystallized with 0 01% of a copper salt, and 2% of NaCl flux, the resultant solid is a phosphor with a strong green emission. It was found that trace amounts of chloride ions (Cl^-) from the flux were incorporated in the ZnS where they served to facilitate the incorporation of the copper activator ions (Cu^+), and to compensate their electrical charges. For such instances, where an additional impurity, such as Cl^-, facilitates the formation of luminescent centres associated with another activator impurity, such as Cu^+, the additional impurity is called a coactivator.

Identification of the centres, activators and poisons is a formidable challenge in some phosphors, because known purification and analytic techniques are often inadequate to cope with the minute proportions involved. In a very pure ZnS, for example, as little as 0.0000001% (10^{-7}%) of copper activator gives a readily discernible green emission. In the same phosphor. as little as 0.00001% of nickel or iron poison-impurity discernibly decreases the efficiency of the phosphor. Organic phosphors also exhibit sensitivity to impurities. The green emission that was for many years attributed to pure anthracene was eventually found to be due to traces of naphthacene impurity. Pure anthracene has a blue emission from its host-crystal centres, nhich consist of the planar anthracene molecule, $C_6H_4:(CH)_2:C_6H_4$. When a trace of naphthacene is incorporated in anthracene, the naphthacene molecule. $C_6H_4:(CH)_2:(CH)_2:C_6H_4$, functions as an originative activator and gives nearly the same green emission colour as that obtained from pure naphthacene.

There is a system of shorthand designation of phosphors which consists of denoting the crystal class of the host crystal, the chemical composition of the host crystal. the identity of the activator, the proportion of activator (usually in per cent by weight, of the host crystal), the identity of any auxiliary impurity. the crystallization temperature. the crystallization time and other essential data. On this basis one can denote some of the foregoing phosphors and their congeners as shown in Table **I.**

TABLE I.— Typical Onide-Type and Sulfide-Type Phosphors

Phosphor	Emission	
	Colour	Persistence
rhombohedral-Zn_2SiO_4:Mn(0.3%), 1,200° C., 60 min., slow cool	green	short
β-Zn_2SiO_4:Mn(0.3%), 1,600° C., 10 min., quench cool	yellow	short
cubic-ZnS:Cu(0.003%):[Cl], 950° C., 10 min., slow cool	green-blue	long
hexagonal-ZnS:Cu(0.003%):[Cl], 1,250° C., 10 min., slow cool	green	very long

The particular examples of phosphors were chosen to show that the structure of the host crystal can have considerable influence on the luminescences of some phosphors. Zn_2SiO_4:Mn, for example, can be converted from the yellow-emitting form to the structurally different green-emitting form, and vice versa, without altering the chemical composition of the material. In both phosphors, the manganese activator atom in the MnO_4 centre is the origin of the luminescence emission, and the manganese atom is significantly influenced when its four surrounding oxygen atoms have their positions altered by the transition of the host crystal from one structural arrangement to another.

For general use, phosphors may be symbolized with shorter designations, such as rhbdl.-Zn_2SiO_4:Mn, hex.-ZnS:Cu:[Cl] and tetr.-$CaWO_4$, without specifying the activator proportions and conditions of preparation. Each such general symbol. however. represents a family of phosphors, because phosphors prepared with different proportions of activator, or crystallized at different temperatures, behave differently. Hundreds of thousands of different phosphors have been synthesized and tested during luminescence research of the past few decades. Almost all of the known phosphors are original compositions, not found in the natural state. Of the many synthetic phosphors, about **36** are in practical use.

4. Gases, Liquids, Crystals, Photons. — Studies of the luminescences of condensed matter, both solid and liquid, were extended to studies of rarefied matter after the invention of the vacuum pump by Guericke in about 1650. A major virtue of studies of rarefied gases is the ability to determine the luminescence characteristics of isolated, simple atoms.

FIG. 1.—PART OF THE ENERGY-LEVEL DIAGRAM FOR AN ISOLATED (FREE) ATOM OF MERCURY (Hg)

Extensive investigations disclosed that every kind of elemental atom, of which there are now over 100, can be excited and will emit light when it is alone in space. When the light emitted from excited isolated atoms, and ions. was passed through a prism or spectroscope, it was found that there were sharp lines of emission in some parts of the spectrum, but no emission in the wave length regions in between. The emission lines, which were different in location (wave length) and intensity for each different kind of atom and ion, were catalogued and eventually interpreted with the aid of the quantum theory of the atom (see QUANTUM MECHANICS; SPECTROSCOPY).

A pertinent feature of the quantum theory is that an isolated atom can exist indefinitely in an unexcited state (the ground state), or it can exist transitorily in numerous excited states which are discrete and are characteristic of the kind of atom or ion. In other words, a given kind of atom can be excited to exist briefly in one of several separate and distinct states of higher energy, but not in any intermediate state. Each state of the atom corresponds to a different configuration of its electrons. When the excited atom drops in energy from one of the sharply defined high-energy levels to a similarly sharp lower energy level, the difference in energy is emitted as a discrete quantum of radiation, or bit of light energy, that is called a photon.

Having established that all isolated atoms are luminescent, it is appropriate to inquire about the luminescences of isolated molecules, which are small groups of atoms that are tightly bound to each other. A lone excited atom can dispose of its excess energy only by radiation. in the absence of collisions with other atoms. An excited atom in a molecule, however, is bound to one or more neighbours that influence the energy levels of the excited atom and can dissipate the excitation energy by converting it into increased oscillation of the atoms relative to each other. Spectroscopic analysis of the light emitted by luminescing molecules shows that the energy levels of the constituent atoms are altered and proliferated into many additional closely spaced levels that are due to the vibrations and rotations of the atomic ensemble in the molecule. A multiatom ensemble, generally has a lower efficiency of luminescence than an isolated atom, because the assemblage of atoms can dissipate excitation energy by converting it into atomic motion, which in condensed matter is thermal agitation (heat).

The probability of dissipating potential luminescence emission energy, by conversion into heat energy, is enormously increased on going from an isolated atom to an atom bound to myriads of identical atoms in a pure, elemental liquid or solid. As would be expected, therefore, most pure, elemental liquids and solids are either nonluminescent, or are inefficiently luminescent. Mercury is an efficient luminescent gas, but it becomes nonluminescent when it is condensed to a liquid. Liquids are particularly inefficient, because their thermal agitation has nearly destroyed the structural regularity (crystallinity) of the assemblage, and every atom is buffeted by neighbouring atoms whose number and arrangement are changing rapidly. There are pure, nonelemental liquids, however, that have relatively high luminescence efficiencies. An example is benzene, C_6H_6, which is luminescent as a rarefied gas, as a liquid and as a solid. In this substance, the hexagonal benzene molecule functions as the ultraviolet-radiating luminescence centre in all three states of matter. In benzene, as in many other organic molecules, the strength of bonding between atoms in the molecule is much greater than that between molecules. The individual molecules, then, can function as discrete centres, even when they are associated with other molecules in liquids and crystals. Crystals are generally more advantageous than liquids and amorphous solids as hosts for luminescence centres. 4 crystal provides fixed kinds, numbers and arrangements of neighbouring atoms around its luminescence centres. In crystals, also, the ordered structures may be made favourable for the ingress of excitation energy, internal transfer of energy and egress of emitted photons.

V. LUMINESCENCE PHYSICS

1. Energy and Spectra, Excitation, Energy Levels, Black Light. — The basic mechanism in luminescence is conceptually simple. An isolated atom, for example, absorbs energy, becomes electronically excited and then returns to the unexcited state by emitting the absorbed energy as a photon of light. According to quantum mechanics, the energy (E) of the photon is related to the frequency and wave length of the light by the fundamental equations,

$$E = h\nu = hc/\lambda \text{ electron volt (ev)} \tag{1}$$

where $h = 4.141 \times 10^{-15}$ electron-volt second (Planck's elementary action constant, in ev sec.); ν is the frequency of the light, in cycles per second (= sec.$^{-1}$); $c = 2.998 \times 10^{18}$ angstroms per second (velocity of light in a vacuum, in Å sec.$^{-1}$); λ is the diffraction wave length of the light, in A. (Note: 1 electron volt = 1.6×10^{-12} erg = 3.8×10^{-20} calorie, and 1 angstrom = 10^{-8} centimetre = 10^{-4} micron.) The average human eye can see light that has photon energies ranging from about 1.8ev (deep red, near 6,900 A) to 3.1ev (deep violet, near 4,000 A).

In accordance with Stokes's law, excitation of luminescent materials may be accomplished by particles, such as photons or charged material particles (electrons, ions), with energies equal to or greater than the energies of the photons to be emitted. There is no known upper limit to the energies of primary particles ca-

(OF Hg) BUT GENERALLY BROADEN AND BECOME DIFFUSE BANDS AT 10^4 CM. ALSO, THE MEAN RADIATED-POWER DISTRIBUTION SHIFTS TOWARD LONGER WAVE LENGTHS WITH INCREASING PRESSURE

pable of exciting luminescent materials.

As a practical matter, the primary-particle energies used to excite luminescent materials generally range from about 3.4 ev, for photons in the near ultraviolet, to billions of electron volts, for energetic particles produced in accelerators, such as cyclotrons and synchrotrons. Under certain conditions, visible luminescence emission may be produced by applying quanta of much lower energy, as is described later in connection with solid-state electroluminescence.

Some phosphors, such as blue-emitting hex.-ZnS:Ag:[Cl], may be excited by electrons having energies ranging from about 6 ev to over 10,000,000 ev. The foregoing phosphor is used in television kinescopes, where it is excited by beams of electrons wherein each electron has an energy of about 20,000 ev. It is noteworthy that the colour of the light emitted by the phosphor is nearly independent of the energy of the particle used for excitation. The energies of the photons emitted by a luminescent material are determined chiefly by the composition and structure of the material.

The detailed mechanism in luminescence is complex, because an atom consists of a nucleus and 1 to 100-odd electrons. These subatomic particles have intricate interactions, and an atom can exist in only certain over-all energy states wherein its electrons exist in many different substates. As an example, a few of the energy levels of an isolated atom of mercury (Hg) are shown in fig. I.

Each energy level corresponds to a particular over-all state, or configuration, of the mercury nucleus and its surrounding 80 electrons. The excited-state energy levels, above the ground-state level, are those in which the two outermost electrons of the mercury atom have been put into abnormal configurations. By bombarding a mercury atom with an electron having somewhat more than 6.7 ev of energy, for example, the two outermost mercury electrons which were originally in the $6s^2$ singlet configuration may be excited into the 6s6p singlet configuration (see SPECTROSCOPY). When the excited atom returns to the ground state, the excess 6.7 ev is radiated as an ultraviolet photon with a wave length of 1,850 Å. If, however, more than 10.42 ev of energy were to be absorbed in the primary excitation, then one of the electrons would be ejected from the atom, whereupon the atom would become a singly charged positive ion (Hg^+).

Luminescence transitions in a mercury atom occur in the region between the ground state, at 0 ev, and the ionization threshold, at 10.42 ev. Within that energy span there are many excited-state energy levels that may be achieved by direct excitation from the ground-state level, by multiple-stage excitation from a lower-lying excited-state level, or by emission transitions from higher-lying excited-state levels. Not all interlevel transitions occur, however, and those that do occur have unequal probabilities of occurring.

Some of the permitted transitions are shown in fig. 1, with corresponding spectral locations shown in fig. 2.

The 2,537-Å emission is particularly strong when rarefied mercury gas, at about 10^{-5} atmosphere pressure, is bombarded by about 100-ev electrons. Under the stated conditions, at room temperature about 60% of the input electron energy is converted into the 2,537-Å electroluminescence radiation that is used to excite phosphors in fluorescent lamps (the phosphors, in turn, convert the invisible 2,537-Å radiation into visible light). As indicated in the caption of fig. 2, the spectral quality of luminescence emission from mercury gas alters as the pressure of the gas is increased.

At high pressures, the excited atoms have a high probability of colliding with other atoms which can alter the energy levels of the excited atoms, or de-excite, or further excite the already excited atoms. When mercury-vapour lamps are operated at about 8 atmospheres pressure, the 3,650-Å emission transition is prominent. Such lamps are used, with suitable optical filters that pass only ultraviolet radiation, to provide invisible near-ultraviolet radiation.

Ultraviolet radiation is commonly called black light. Ultraviolet, or black light, lamps are used to excite photoluminescent materials for decorative and theatrical effects. The lamps are used, also, in prospecting for luminescent minerals; in disclosing otherwise invisible luminescent markings for laundries, flaw detection and criminological investigations; in detecting diseased tissues in agriculture and surgery; and in disclosing flow and seepage paths of luminescent fluids in animate and inanimate matter. Incidentally, natural teeth luminesce with a pale blue glow under ultraviolet irradiation.

2. Time Aspects, Growth and Decay, Trapping, Stimulation, Quenching.— The first observations of the persistence of luminescence, after cessation of excitation, were made with the unaided human eye. A century and a half elapsed before it was found that the visual process itself is persistent, and was eventually found to persist for about 0.1 second. Luminescences that persisted longer than 0.1 second were the first to be observed, and were called phosphorescence. When Stokes, in 1852, identified a luminescence that had an imperceptibly short persistence, he called it fluorescence; and incorrectly contended that fluorescence was distinct from phosphorescence. A. E. Becquerel, in 1854, disputed Stokes's contention, and then devised a mechanical-optical device, called a phosphoroscope, to show that there are phosphorescences that are as short as 0.0001 second. Since 1897, cathode-ray oscilloscopes have been used to show intensity of phosphorescence emission as a function of time, down to times as short as 10^{-9} sec. At present, fluorescence is recognized as a limiting case of the general phenomenon of phosphorescence. Fluorescence is an uninhibited, spontaneous, luminescence emission, such as may be exhibited by a simple, isolated, excited atom.

The duration of fluorescence is a fundamental quantity that is related to the energy, or frequency, of the spontaneously emitted photon. For an allowed radiative transition of an excited, isolated atom, the natural fluorescence lifetime of the atom in the excited state is

$$\tau_f = \tfrac{1}{2}\pi\Delta\nu \text{ sec.} \qquad (2)$$

where $\Delta\nu$ is the frequency width, measured at half the peak intensity, of the emission line. Classically, for emitted photons of frequency ν_0,

$$A_P = 3.93 \times 10^{-23}\nu_0^2 \text{ sec.}^{-1} \qquad (3)$$

from which the energy width of the emission line is

$$\Delta E = h(\Delta\nu) = 1.66 \times 10^{-37}\nu_0^2 \text{ ev} \qquad (4)$$

and, according to the uncertainty principle for complementary energy and time, the minimum value of τ_f is

$$\tau_f \approx h/2\pi\Delta E \text{ sec.} \qquad (5)$$

From equations (1), (4) and (j) one obtains for emission of optical photons with a wave length of 6,000 Å, $\nu_0 = 5\times10^{14}$ sec.$^{-1}$, $\Delta E \approx 4\times10^{-8}$ ev and a fluorescence duration $\tau_f \approx 1.6\times10^{-8}$ sec. For emission of X-ray photons, with wave lengths less than 1 Å, line widths as large as 3 ev have been observed, and the corresponding fluorescence duration from equation (5) is $\tau_f \approx 2\times10^{-16}$ sec. (A more precise expression for $\Delta\nu$, which does not greatly change the indicated value of τ_f for optical photons, is given by quantum theory, as

$$\Delta\nu = 32\pi^3\nu_0^{\,3}|\mu|^2/3hc^3 \text{ sec.}^{-1}$$

where μ is the quantum-mechanical matrix element of the dipole moment. For photons of wave length 6,000 A, μ would have a value of about 6×10^{-18} electrostatic units [E.S.U.] to correspond to the classical expression given in equation [3].)

If there be a number N^* of excited, isolated atoms (centres) at time t, then the intensity of spontaneous luminescence emission from the N* atoms is

$$\mathrm{L} = -dN^*/dt = aN^* \tag{6}$$

which states that the number of photons emitted at time t is equal to a rate constant times the number of excited atoms existing at time t. Integration of equation (6) gives

$$-\log_\epsilon L = -\log_\epsilon N^* = \text{at} + [\text{constant}] \tag{7}$$

and, when $t=0$ (instant of cessation of excitation) and $N^* = N_0^*$, the [constant] $= -\log_\epsilon N_0^*$. The rate constant a is equal to the reciprocal of the lifetime r of the excited state,

$$\text{a} = \tau^{-1} \tag{8}$$

and r is the time taken by the assemblage of excited atoms to decrease (decay) in emission intensity to $L_0\epsilon^{-1}$ $(=0.368L_0)$ when L_0 is the intensity of emission at $t=0$. On this basis, equation (7) becomes

$$L = L_0\epsilon^{-at} = L_0\epsilon^{-t/\tau} \tag{9}$$

The foregoing equation represents a simple exponential decay of emission intensity with time, and is identical in form with the familiar equation for the decay of radioactivity.

When a luminescent material exhibits a simple exponential decay of emission intensity after excitation, it exhibits also an exponential growth of emission intensity during excitation. During excitation,

$$\mathrm{L} = dN^*/dt = I(N_0 - \mathrm{N}^*) - aN^* \tag{10}$$

where I is the intensity of excitation applied to the initial N_0 unexcited centres. On rearrangement, integration, solving for the integration constant at $t=0$, and substitution, one obtains from equation (10)

$$\mathrm{L} = aIN_0(1 - \epsilon^{-(a+I)t})/(a + \mathrm{I}) \tag{11}$$

At low excitation intensities, the time required for the emission intensity to increase and become substantially constant is approximately τ $(=a^{-1})$, and the emission intensity L is determined chiefly by the excitation intensity I. At excitation intensities higher than the value of I required to excite all of the N_0 centres in a time r, the time required for the emission intensity to become constant is shorter than r and is inversely proportional to I. In this saturated condition, the emission intensity is determined chiefly by N_0a $(=N_0/\tau)$.

If the excited atoms (centres) come in contact with other atoms during their excited-state lifetimes r, some of the N* atoms can become de-excited by radiationless transitions. Their potential photo-emission energy is then converted into heat by an alternative de-excitation process. Under such conditions, which obtain in dense gases, liquids and solids, the effective excited-state lifetime r, includes the foregoing temperature-insensitive radiative decay-rate a, and a temperature-sensitive nonradiative decay-rate a', such that

$$\tau_e = (\text{a} + a')^{-1} = (\text{a} + \nu_c\epsilon^{-\Delta E^*/kT})^{-1} \tag{12}$$

where ν_c is the number of collisions per second suffered by the excited centres, ΔE^* is the activation energy that must be imparted to the excited centre to cause it to transfer its excitation energy into heat energy, $k = 8.62\times10^{-5}$ ev degree^{-1} (Boltzmann's constant, in ev deg.$^{-1}$) and T is the temperature of the luminescent material, in degrees Kelvin (° K.). Substituting τ_e for r in equation (9), one obtains

$$L = L_0\epsilon^{-(a+\nu_c\epsilon^{-\Delta E^*/kT})t} \tag{13}$$

which is representative of the actual exponential decays of many dense luminescent materials.

In a crystal, the collision frequency ν_c is approximately the same as the highest vibration frequency of the atoms in the solid. A typical value of ν_c is about 10^{12} sec.$^{-1}$, and so an excited centre whose lifetime is as short as 10^{-8} sec. experiences about 10,000 thermal-agitation collisions during its excited-state lifetime. Under these conditions, the activation energy ΔE^* should exceed about $30kT$ in order to have a high probability that the excited centre will emit a luminescence photon. At room temperature, which is nearly 300° K., the value of kT is about 0.025 ev, and $30kT$ is about 0.75 ev. Lower values of ΔE^* require lower operating temperatures for efficient luminescence.

It is possible to decrease the observed decay time of luminescence emission to times shorter than r, or even τ_f $(\approx10^{-8}$ sec.), by either decreasing ΔE^* or by increasing T. Both expedients decrease the efficiency of the luminescent material. The value of ΔE^* in a phosphor may be decreased by increasing the proportion of activator beyond the optimum proportion, or by incorporating poison-type impurities in the phosphor.

Decay times longer than 10^{-8} sec. can be obtained by using semiallowed radiative transitions in isolated atoms, or by using suitable neighbouring atoms to alter the excited-state lifetimes of certain atoms or centres in a liquid or solid. Examples of the influence of the host crystal on the lifetime of the excited state of manganese centres in several phosphors are given in Table II. All of the listed phosphors have exponential decays of phosphorescence emission.

The data in Table II provide clear evidence of the potency of atomic interactions in altering the excited-state lifetimes and energy levels of luminescence centres in solids. Advantage is taken of atomic interactions to custom-make phosphors, and other electronically active solids, with specific characteristics for practical uses. For this purpose, inorganic solids are usually more versatile than organic solids. Inorganic solids: (1) permit broad use of combinations of all of the known species of atoms without requiring carbon to be a member of the combination; (2) provide the most degrees of freedom in using ionic, covalent and intermediate types of interatomic bonding; and (3) provide the greatest range of bonding energies, as attested by the high melting points of many inorganic solids.

Table 11.—Effective Excited-State Lifetimes τ_e of Some Phosphors With About 0.3%, by Weight, of Manganese Activator

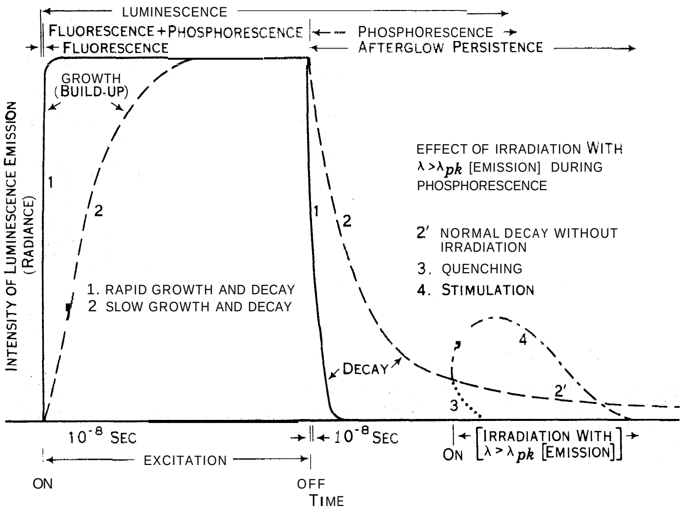
There is another prominent mechanism for extending the duration of phosphorescence emission. In many solids this mechanism proceeds as follows: (1) excitation energy ejects an electron from a luminescence centre in a host crystal; (2) the excited electron is trapped in an imperfection elsewhere in the crystal; (3) additional energy, usually supplied by heat or infrared radiation, must then be imparted to release the electron from the trap; and finally (4) the electron returns to the ionized centre to be captured and



BY COURTESY OF RCA LABORATORIES

FIG. 3—DIAGRAMMATIC REPRESENTATION OF THE DYNAMICS (GROWTH AND DECAY) AND TERMINOLOGY OF LUMINESCENCE EMISSION

make a radiative transition to the ground state in the usual manner. By inserting a trapping step between the excitation and emission steps, it is possible to prolong phosphorescence for days and even years. Trapping was responsible for the long afterglow of the Bolognian phosphor, and was responsible also for the phenomenon that was mistakenly called thermoluminescence.

The trapping mechanism in solids has its counterpart in the metastable excited states of isolated atoms in gases. A metastable state, such as the 6s6p, $^3P_0$ state of mercury shown in the centre of fig. 1, is a state from which a spontaneous, radiative transition is forbidden. The excited atom cannot contrive to go directly from its metastable-state electronic configuration to a configuration with lower energy. Instead, additional energy must be supplied to excite the atom into a higher energy level, such as the 7s, $^3S_1$ level, from which a radiative transition can occur. The additional energy can be supplied by collision with other atoms, or by photons. If collision energy be used, the release of stored energy in metastable states is strongly temperature-dependent and follows a relation of the type

$$N^* = -dN_m^*/dt = N_m^* \nu_c \epsilon^{-\Delta E^*/kT} \tag{14}$$

where N^* is the number of atoms elevated from the metastable state to a given excited state from which radiative transitions can be made, N_m^* is the number of atoms in the given metastable state, ν_c is the frequency of collisions (proportional to $T^{1/2}$ in a gas), and ΔE^* is the energy difference between the N^* radiative level and the N_m^* metastable level. Under these conditions, in the absence of retrapping in the metastable state, equation (14) leads to a phosphorescence emission that has a temperature and time dependence according to

$$L \doteq L_0 \epsilon^{-\nu_c t \epsilon^{-\Delta E^*/kT}} \tag{15}$$

Equation (15) represents the rate-determining process for the simplest case of transitions between one discrete trapping level and one discrete radiative level. In crystals, however, there are usually many trapping levels with different values of ΔE^*. The contributions of different numbers of traps with different depths requires that equation (15) be expanded into a series of terms, with different values of L_0 and ΔE^*. For a hypothetical uniform trap distribution, that is, an equal number N_t^* of traps of all depths

$$L = N_t^* kT(1 - \epsilon^{-\nu_c t})/t \tag{16}$$

which reduces to a hyperbolic relationship

$$L = N_t^* kT/t \tag{17}$$

when $\nu_c t$ is much larger than unity. Many sulfide-type phosphors at room temperature have phosphorescence emissions that decrease approximately as the reciprocal of the time after excitation is stopped. The exact reciprocal relationship cannot be exhibited, however. because then the total light output, called the light sum, would integrate to infinity.

A summary depiction of luminescence growth and decay, with corresponding terminology is given in fig. 3. The slow-decay curve, 2, is typical of phosphors, such as hex.-ZnS:Cu:[Cl], that have traps that are about 0.5 ev deep, that is, $\Delta E^* \approx 0.5$ ev. Heat, at room temperature, suffices to release trapped electrons and give phosphorescence emission that can be seen for many hours by the dark-adapted eye. Integration of the decay curve, and comparison with the volume of excited phosphor, gives light sums as high as 10^{18} photons (traps) per cubic centimetre.

The identity of the traps is obscure in most phosphors, but in cub.-Sr(S:Se):Sm:Eu:[$SrSO_4$:CaF_2] the samarium (Sm) has been identified as providing the traps, while the europium (Eu) provides the luminescence-emission centres and the ingredients indicated in brackets are fluxes. In this sulfoselenide phosphor, which is distantly related to the Bolognian phosphor: (1) 3 ev of excitation energy (*e.g.*, a photon of blue light) ejects an electron from a Eu^{2+} centre, which becomes Eu^{3+}; (2) the excited electron is captured by an Sm^{3+} trap, which becomes Sm^{2+}; (3) 1 ev of heat or infrared stimulation energy releases the electron from the Sm^{2+}, which reverts to Sm^{3+}; (4) the electron is recaptured by an Eu^{3+}, which becomes an excited Eu^{2+}; and (5) the excited Eu^{2+} centre makes a radiative transition to the ground state, emitting a photon with an energy of 2.2 ev (yellow light). The cub.-Sr(S:Se):Sm:Eu:[flux] phosphor is able to store trapped electrons for many months, even at room temperature, because its trap depth is very large relative to the heat energy (kT) of the solid. This phosphor has been used in devices for viewing scenes at night by reflected infrared radiation from an infrared lamp. Deep-trap phosphors can be used, also, for storage and later readout of information.

Some of the spectral and dynamic aspects of the luminescence of a cub.-Sr(S:Se):Sm:Eu:[flux] phosphor are given in fig. 4. The photostimulation curve (c), representing accelerated release of trapped electrons by infrared irradiation, has its counterpart in a thermostimulation curve, wherein the accelerated release is accomplished by heating the excited phosphor. When such a phosphor is excited at a low temperature and later heated, the curve of

FIG. 5.—THE ROOM-TEMPERATURE LUMINESCENCE EMISSION SPECTRUM OF A TYPICAL PHOSPHOR [HEX.-ZnS Ag(0 015), 1,250° C], AND THE THERMAL RADIATION SPECTRA OF A BLACK BODY AT VARIOUS TEMPERATURES

By varying the intensity of excitation, the relative height of the luminescence spectrum may be varied from zero to values much higher than the indicated black-body spectra. The black-body spectra are drawn to scale relative to each other

thermostimulated emission as a function of time of heating is called a glow curve.

Light sums may be obtained by integration of photostimulation curves or thermostimulation curves. The conventional phosphorescence of a trap-type phosphor, at room temperature, is a thermostimulated phosphorescence.

As shown in figs. 3 and 4, stimulation, which leads to luminescence emission, has its opposite in quenching, which converts stored excitation energy into heat. Quenching may be accomplished by having poison-type impurities in a phosphor, and then ejecting electrons so vigorously from traps that the electrons go far afield and encounter the poison sites. Incorporation of a trace of iron in hex.-ZnS:Cu:[Cl], for example. transforms the normal stimulation effect of broad-band infrared radiation into a rapid quenching of phosphorescence emission.

3. Emission Spectra of Phosphors, Cascading, **Sensitization.**—The sharp lines of emission from isolated atoms, as shown in fig. 2, become broadened when the excited atoms collide with other atoms. In a luminescent gas. the extent of the broadening increases with increasing temperature and density of the gas. In liquids and solids the alteration of energy levels is so pronounced that most, but not all, phosphor emission spectra are bands instead of lines at room temperature. The luminescence emission band of a hex.-ZnS:Ag:[Cl] phosphor is contrasted, in fig. 5, with the bands of thermal radiation obtained from matter at several different temperatures. Luminescence emission is a photon emission in excess of thermal radiation.

In contrast with thermal radiation: the intensity of luminescence emission generally decreases with increasing temperature, and the spectrum of luminescence emission is generally a narrow band of wave lengths whose shape and spectral location are relatively insensitive to changes in temperature. As shown in fig. 6, the emission spectrum of the luminescence centres in zinc sulfide crystals may be shifted gradually from the blue (curve 1) to the red (curve 8) by substituting increasing proportions of cadmium for zinc in the host crystal. This family of phosphors is typical of several other phosphor families in which the emission colour can be made to order by suitable choice of ingredients and conditions of preparation.

In kinescopes for black-and-white television for example, the luminescent screen is a mixture of microcrystals of a blue-emitting phosphor and a yellow-emitting phosphor. The blue-emitting phosphor is the one shown as curve 1 in fig. 6, while the yellow-emitting phosphor has a composition and emission spectrum between curves 6 and 7 in the same figure. Kinescopes for colour television have luminescent screens made of a blue-emitting hex.-ZnS:Ag:[Cl] phosphor, a green-emitting rbhdl.-Zn_2SiO_4:Mn phosphor and a red-emitting rhomb.-$Zn_3(PO_4)_2$:Mn phosphor. Inner coatings for white-emitting fluorescent lamps may be made of a blue-emitting monocl.-$MgWO_4$ phosphor mixed with a yellow-emitting rbhdl.-$(Zn{:}Be)_2SiO_4$:Mn phosphor, or of a single white-emitting phosphor, hex.-$3Ca_3(PO_4)_2\,CaF_2$:Sb:Mn. wherein the Sb centres emit blue light and the Mn centres emit yellow light.

Another example of a family of luminescent materials is the sequence of aromatic organic substances: benzene , naphthalene , anthracene , naphthacene  and pentacene 
Each of these ring-chain molecules is excited by photons in bands of wave lengths just below a certain demarcation wave length, and emits photons in bands of wave lengths just above the given wave length. The approximate demarcation wave lengths for this family are:  2,700 Å,  3,100 Å,  3,800 Å,  4,700 Å and  over 6,000 Å. Luminescence wave length increases progressively with increasing length of the molecule. just as the optimum wave length of a dipole antenna increases with increasing length of the antenna. Such an orderly unidimensional correlation is not observed in inorganic phosphors, whose centres generally involve a relatively small number of atoms bound in a multidimensional complex of host-crystal atoms.

It is possible to use luminescent materials in cascade, such that photons emitted by one material can be used to excite another material. In the preceding sequence of organic molecules, the emission from benzene. could excite naphthalene, whose emission could excite anthracene and so forth. Cascade luminescence is used in certain radar kinescopes that have composite luminescent screens made of a coating of a yellow-emitting hex.-(Zn:Cd)S:Cu:[Cl] phosphor covered with a coating of a blue-emitting her.-ZnS.Ag.[Cl] phosphor.

Electrons in the cathode-ray beam excite the blue-emitting phosphor whose photons excite the pello\?-emitting phosphor. The final phosphor has traps that provide long persistence of emission to retain the radar image for later observation. Direct excitation of the final phosphor by the cathode rays is unfavourable, because the highly energetic electrons in the beam heat the material and empty the traps too rapidly. Cascade luminescence may be accomplished, also. in a single phosphor by having two or more kinds of centres, such that the emission band of one centre overlaps the excitation band of another kind of centre.

There is another type of co-operative interaction, called sensi-

	3,650-Å UV*	217	148	114	109	110	99	60	47

*CR = cathode rays; UV = ultraviolet radiation tization, that can occur between different kinds of centres in a given host crystal. As an example, rbhdl.-$CaCO_3$:Mn emits orange light under excitation by cathode rays. but is not excited by 2,537-Å ultraviolet radiation, whereas the same orange light is emitted by rbhdl.-$CaCO_3$:Pb:Mn under the 2,537-Å ultraviolet irradiation. A mechanical mixture of the host crystals with the two activators incorporated separately gives no emission under ultraviolet irradiation, proving that cascade luminescence is not involved In the host crystal with both activators. the lead centres introduce a new excitation band into the host crystal and transfer absorbed energy to the manganese centres by an energy-exchange interaction that does not involve photon emission. A similar sensitization occurs in gases. For example, thallium gas alone is not excited by **2.537-A** photons, but when a little mercury gas is added. the mercury atoms are excited by the **2,537-A** photons and transfer their excitation energy to the thallium atoms on collision. In this indirect fashion. the thallium atoms are excited and they emit their characteristic spectral lines of radiation.

4. Solid-State Energy-Level Diagrams, Solid-State **Electroluminescence.**—The numerous emission lines of isolated atoms, as exemplified in fig. 2. contrast sharply with the single emission bands of centres in many crystalline phosphors, as exemplified in fig. 6. Luminescence in solids. therefore. requires description in terms of energy-level diagrams that differ considerably from the discrete-level diagram shown in fig. 1. Several kinds of diagrams have been evolved, and some have been found useful for general qualitative descriptions. The diagrams are not generally useful, however, for detailed, quantitative descriptions.

One type of solid-state energy-level diagram, shown in fig. 7, is adapted from the conventional diagram used to describe luminescence of an isolated diatomic molecule. As applied to a centre, the potential energy E_p of the centre is plotted as a function of the average distance $\bar{x}$ between the atoms. where $\bar{x}_0$ is the average interatomic spacing of the unexcited centre, and $\bar{x}^*$ is the average interatomic spacing of the centre in its lowest excited state. In a tetrahedral MnO_4 centre. for example. $\bar{x}$ would be the average distance between the central Mn atom and an oxygen atom at a corner of the tetrahedron. Higher allowed excited states are not shown.

At absolute zero of temperature, 0° K., the ground-state energy level would be nearly at the bottom of the lowest curve, corresponding to minimum amplitude of atomic vibration. At a higher temperature, such as room temperature. 300° K., the centre has considerable vibrational energy, and so the ground-state level lies higher, such as at a. If now, a bit of excitation energy approximating the energy represented by *b–a* is absorbed by the centre, the centre may be raised in energy into the excited-state level near E_b^{**}. The excited centre has a different electronic configuration than the unexcited centre, and the atoms of the excited centre readjust in about 10^{-12} sec. to a new equilibrium spacing $\bar{x}^*$ and excited-state level E_c^*. After the readjustment, the atoms may be arranged differently, with disproportionate changes in distances and angles from the central atom. The energy difference *b–c*, corresponding to the atomic readjustment,is given up as heat to the surrounding host crystal. With the centre in the excited-state level *c*, the length of time before there occurs a spontaneous radiative transition from *c* to *d* depends on the nature of the centre and its host-crystal environment, as indicated in Table II. After the centre has emitted the energy *c–d* as a photon of light, the electronic configuration has changed back to that of the unexcited centre, and the atoms again readjust in about 10^{-12} sec. to the original spacing $\bar{x}_o$, and ground-state level E_a, giving up the energy d–a as heat.

The radiative transition is practically independent of temperature, but the probability of a nonradiative transition to the ground state via $c \rightarrow f \rightarrow a$ increases exponentially with temperature, as discussed in connection with equation (13). The energy difference $f-c$ is equal to ΔE^* in equation (13). The observed decrease of luminescence efficiency with increasing temperature corresponds to a raising of the excited-state level *c* so that there is an increasing amplitude of interatomic vibration. When the highly agitated centre attains level f, the localized potential energy of the excited centre is converted into kinetic energy of atomic agitation that is dissipated away into the surrounding host crystal. If, at a given temperaturejthe energy $f-c$ is much less than $30kT$, then the centre quickly dissipates excitation energy by converting it into heat. When activator centres are located too near each other in a host crystal: they interact to reduce each others' energy f–c, thereby exerting a poisoning action on each other. A poison impurity atom exerts a similar debilitating action on a nearby activator centre. The diagram indicates, also, that a luniinescence centre that is efficiently radiative at low temperatures becomes increasingly nonradiative, and dissipative, as the temperature is raised. There are very few phosphors available for efficient operation at temperatures above about 400° C. An outstanding exception is a boron nitride phosphor that luminesces even when it is heated to a temperature above 1,100° C. In general. phosphors should be operated at as low temperatures as possible, with the exception of some trap-type phosphors that should be operated at temperatures high enough to eject excited electrons from the traps. Trapping, which is not indicated in fig. 7. corresponds to ionizing the centre and having the ejected electron caught in a remote potential well, of the type shown as the excited-state curve in fig. 7, except that radiative transitions do not occur in the trap.

Only one excited state is required to describe a single emission band. The apparent absence of higher excited states for radiative transitions is made plausible by assuming that such states correspond to ionization in the solid, or that only nonradiative transitions occur from other higher states below the ionization level. The width of the emission band, which can be of the order of an electron volt. is describable in terms of radiative transitions occurring from any point on the heavy excited-state curve below line c to any point directly below on the heavy ground-state curve. Additional band-broadening can be caused by differences of environment in the ensemble of centres in a given host crystal. Such differences may be caused by fluctuations in degree of thermal agitation, which alters level c, and by random distributions and perturbations of centres and other imperfections, including impurities. and displaced and omitted host-crystal atoms.

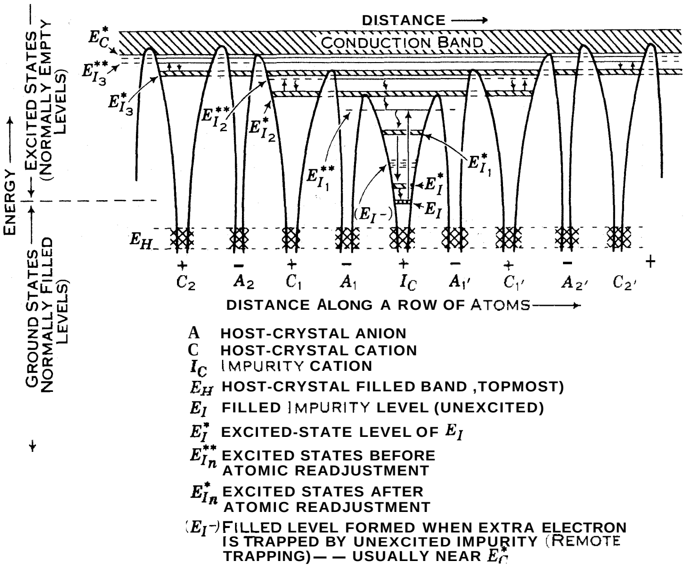
FIG. 7.— GENERALIZED ENERGY. LEVEL DIAGRAM OF A TYPICAL ACTIVATOR CENTRE AS A FUNCTION OF AVERAGED INTERATOMIC CONFIGURATION FOR THE GROUND STATE AND ONE (LOWEST) EXCITED STATE

Another type of energy-level diagram, shown in fig. 8. depicts the energy levels of a luminescence centre as a function of distance along a row of atoms in the crystal. This type of diagram indicates that the host-crystal energy levels are bands. The broadening of energy levels into bands is caused by interaction of electrons of all of the atoms in the crystal. There are about 10^{23} atoms per cubic centimetre in a crystal. and the Pauli exclusion principle permits only two electrons (of opposite spin) to occupy the same energy level in a given system (see QUANTUM MECHANICS). Each pair of electrons, therefore, must occupy a different energy level. Unlike the previous diagram, fig. 8 is drawn for a specific $\bar{x}$, and so one should imagine that the spacings and potential barriers between the atoms change with every energy change of the centre.

According to the given diagram, the activator atom I_C: (1) lowers the potential barriers between the neighbouring host-crystal atoms; **(2)** introduces an additional ground-state level E_I, occupied by an electron, into the forbidden zone of host-crystal energy; and **(3)** introduces one or more unoccupied excited-state levels E_I^* whose lateral extensions are short and thus localize excitation energy. The excitation transition $E_I \rightarrow E_{I_1}^{**}$ in fig. 8 corresponds to $a \rightarrow b$ in fig. 7, and the radiative transition $E_{I_1}^* \rightarrow E_I^*$ corresponds to $c \rightarrow d$. As drawn, this process is highly localized. and the spontaneous decay of luminescence emission is exponential with time, as represented by equation (9) in the absence of competing processes.

When the excitation energy is large, an electron can be raised into the ionization continuum. which is here called the conduction band E_C^*, where it moves away from the centre and out into the host crystal. The freed electron may be trapped, as previously discussed, by a remote imperfection from which it must be released by supplying additional energy. An electron so released can then return to an ionized centre, drop down to a radiative excited-state level, and make a radiative transition to the ground-state level. The foregoing ionization process may start with direct raising of a host-crystal electron in the normally filled band E_H up into the normally unoccupied conduction band E_C^*. The electron vacancy, called a positive hole, in the filled band can then wander through the host crystal, by an electron-exchange process until it encounters the unexcited activator centre I,. At that point, an electron from the filled level E_I of the activator can drop down to neutralize the positive hole. The activator atom is then in an ionized state and is ready to capture the excited electron in the conduction band. When trapping is involved in luminescence, phosphors may exhibit chiefly so-called power-law decays of emission intensity, such as are indicated in equations



BY COURTESY OF RCA LABORATORIES

FIG. 8.— GENERALIZED ENERGY-LEVEL DIAGRAM OF A PHOSPHOR LUMINESCENT CENTRE AS A FUNCTION OF DISTANCE ALONG A ROW OF ATOMS PASSING THROUGH THE CENTRE

(15) through (17), or they may exhibit initial exponential decays that trail off into power-law-decay tails. The spectral character of the emission is substantially constant during the decay time, even when there is a mixture of exponential and power-law decays. As is to be expected from fig. 8, electronic conduction occurs during the luminescences of trap-type phosphors, whereas little or no electronic conduction is observed when the luminescence decay of a phosphor is a simple exponential function of time, and is independent of temperature (equation [9] and fig. 7).

There are many mechanisms of luminescence excitation, because there are many ways of absorbing and transferring excitation energy. In photoluminescence, for example, the actions of excitation and emission may both occur in a given centre, or they may occur in separate sites with energy-transfer between the sites. Specifically, a single 3.4-ev ultraviolet photon may pass without loss of energy through a given phosphor host crystal until it is completely absorbed by a luminescence centre, which then emits one 2-ev photon of light. On the other hand, X-ray photons, and high-energy particles in general, excite atoms indiscriminately. The bulk of the energy of a high-energy particle is imparted in bit-wise fashion to the numerically preponderant host-crystal atoms. Energy transfer from the site of absorption to the luminescence centre can occur by several means, including mobile electrons, positive holes and excitons (paired electrons and positive holes). In cathodoluminescence, a single 20,000-ev cathode-ray electron gives up its energy stepwise and indirectly excites about 1,000 centres along its path in a phosphor crystal. Each excited centre then emits one photon of visible light (1.7- to 3.1-ev photons).

In another method of excitation, an alternating electric field is applied to special phosphor microcrystals embedded in a thin insulating layer of glass or organic material between two electrodes. A suitable phosphor for this purpose is hex.-ZnS:Cu:[I], which is made with a very high proportion of copper activator, and with careful incorporation of the iodine coactivator. In the completed phosphor, much of the copper is contained in the outer layers of the phosphor crystals. The copper-rich layers are apparently vital for absorption of energy from the applied electric field, and for conversion of the absorbed energy into a form suitable for transfer to the luminescence centres farther inside the crystals. Intense luminescence emission may be obtained by applying several hundred volts, at several thousand cycles per second, across a 0.01-centimetre-thick layer of hex.-ZnS:Cu:[I] microcrystals in castor oil. The phenomenon is a solid-state electroluminescence which has afforded sustained luminances higher than 1,000 millilamberts.

An analogous electroluminescence phenomenon occurs in gases on application of high-frequency, alternating, electric fields. Rarefied mercury gas, for example, luminesces visibly when it is subjected to millimetre-waves of electromagnetic radiation. At first glance, this phenomenon seems to violate the law of conservation of energy, because low-energy photons produce high-energy photons. Energy is conserved, however, because many low-energy photons must be absorbed to produce one high-energy photon. The process can start, when the electric field is applied, by accelerating some of the electrons and ions present in the gas, such as the charged particles produced by cosmic rays, or by electrification contact of gas atoms with the walls of the container, Some of the accelerated particles will have their directions reversed by elastic collisions with mercury atoms, so that on cyclic reversal of the electric field an accelerated-and-reversed particle is further accelerated. and so on until the energy of the particle becomes high enough to excite or ionize a mercury atom.

Solid-state electroluminescence may be produced also by injecting electrons and positive holes (extracting electrons) into a crystal from electrodes connected to a direct-current source. Referring to fig. 8, electrons may be injected into the conduction band E_C^*, and positive holes into the normally filled band E_H. The electrons and positive holes can recombine across the entire width of the forbidden band $E_C^*-E_H$ to produce recombination radiation characteristic of the host crystal, with $h\nu=E_C^*-E_H$, or they can recombine through a luminescence centre to produce radiation characteristic of the centre. Radiations resulting from recombination-transitions, across the forbidden band and in centres, have been observed in crystals of elemental germanium and silicon, and in crystals of compounds such as silicon carbide and cadmium sulfide. Another variation of electroluminescence occurs at the surfaces of oxidized electrodes, particularly aluminum electrodes, during electrolysis. This phenomenon, which is sometimes called galvanoluminescence, was observed by F. Braun in 1898.

5. Efficiency and Luminance. — Efficiency of luminescence, on both a quantum and energy basis, can approach 100% for resonance excitation and radiation of isolated atoms in a rarefied gas. Under these ideal conditions, each absorbed primary photon excites an atom that then emits a luminescence photon of the same energy as the primary photon. The input and output quanta are nearly identical in number and energy. When the energy of the primary particle is greater than that of the emitted photon, however, the energy efficiency is decreased. In the off-resonance condition, there is less effective coupling between the primary excitant and the system to be excited, and at least part of the energy difference is dissipated as heat. Heat losses are aggravated in condensed luminescent materials, such as liquids and crystals. When phosphors are excited by high-energy particles, as

in kinescopes, X-ray fluoroscope screens, and scintillation-counter crystals, the energy efficiency of the process is usually less than about 20%. The remaining 80% or more of the input energy is wasted as heat. Solid-state electroluminescence, and the electroluminescences of gases excited by radio-frequency waves, is also relatively inefficient, with over 90% of the absorbed energy usually dissipated as heat. In a gas excited by millimetre-wave radiation, much of the input, small-quantum energy is converted into atomic motion when the accelerated charged particles collide with atoms. There is a major technical challenge in the problem of attaining high efficiency of luminescence when the energy of the input excitation quanta differs greatly from the energy of the quanta of emitted radiation.

The emission intensities, or radiances, of luminescent materials are limited chiefly by the excitation intensity and by the numerical density and excited-state lifetime of the radiative centres that participate in luminescence. Intensities of visible emission greater than 10^7 millilamberts have been obtained from certain cathodoluminescent phosphors under short pulses of cathode rays. A luminance of 10^7 millilamberts corresponds to the emission of over 10^{20} photons per square centimetre per second. Under sustained excitation, however, the average luminance of cathodoluminescent materials may not exceed about 10^5 millilamberts without unduly heating the material and decreasing its efficiency and output. For comparison purposes, the luminance of fresh sno in full sunlight is about 10^4 millilamberts, an intensity that is painful to the eye. The radiances of luminescent materials after excitation are determined by their decay characteristics and light sums under the operating conditions.

It is likely that the intensity of phosphorescence emission first observed by Cascariolo, an hour or more after excitation, was less than 0.0001 millilambert. From that feeble beginning, research has achieved such commonplaces as television kinescopes, uith luminances of about 30 millilamberts. and fluorescent lamps, with luminances exceeding 3.000 millilamberts.

The practical uses of luminescence are many, and their number continues to increase. From the scientific standpoint, luminescence is uniquely useful as an instantaneous detector of invisible energetic particles, and as an ultrasensitive indicator of changes of composition, structure and atomic interactions in many different materials. See also BIOLUMINESCENCE; LIGHT.

LUMPSUCKER or LUMPFISH (*Cyclopterus lumpus*), a marine fish, of the small family Cyclopteridae. The lumpsuckers have the ventral fins united into a circular concave sucker which enables them to attach themselves firmly to rocks or stones. The body is short and thick with a thick, scaleless skin covered with rough tubercles. The first dorsal fin is a mere lump on the back. The lumpsucker inhabits the coasts of both sides of the North Atlantic; it is not rare on the British coasts, but becomes more common farther north. In the spring the fish approaches the shores to spawn, clearing out a hollow on a stony bottom in which it deposits an immense quantity of pink-coloured ova. The male guards the spawn very assiduously until the young are hatched. A lumpsucker may weigh as much as zo lb. The male is only one-half or one-third the size of the female, and during the breeding season becomes bright blue, with red below. The bones are soft and contain little inorganic matter.

LUNA, ALVARO DE (d. 1453), constable of Castile, grand master of Santiago and favourite of King John II of Castile. was the natural son of Alvaro de Luna, a Castilian noble. Sent to court as a page by his uncle. Pedro de Luna, archbishop of Toledo, in 1410, he early acquired an ascendancy over the young prince. When Ferdinand, John's uncle. was elected king of Aragon, and the regency remained in the hands of the king's mother, Constance, daughter of John of Gaunt. Alvaro became a very important person. He was a master of all the accomplishments the king admired—a fine horseman, a skillful lance and a writer of court verse. Until he lost the king's protection he was the central figure of the Castilian history of the time. His story is in the main one of expulsion from the court by victorious factions and of his return when his conquerors fell out among themselves. Expelled in 1427, he was recalled to court in 1428; in 1431 he sought to employ the turbulent nobles in a war for the conquest of Granada. Some successes were gained, but a consistent policy was impossible with a rebellious aristocracy and a king of indolent character. In 1445 the Infantes de Aragon, Alvaro's main enemies, were beaten at Olmedo, and the favourite, who had been constable of Castile and count of Santesteban since 1423, became grand master of Santiago by election of the knights. His fall was caused by Isabella of Portugal, the king's second wife, who urged her husband to free himself from slavery to his favourite. In 1453 Alvaro was arrested and executed at Valladolid on June 2, 1453.

LUNACHARSKY, ANATOLY VASILIEVICH (1875–1933), Russian politician, author and dramatist. was born in Poltava of well-to-do parents. He joined the revolutionary movement when at college in Kiev, and afterward studied natural science and economics at Zurich. He began his revolutionary activities in Russia in 1892 and was deported to Vologda in 1898, where he remained for three years, achieving a reputation as a brilliant writer and lecturer on socialism. In 1903 Lunacharsky joined the Bolshevik wing of the Social Democratic party. He met Lenin in the following year. and joined the editorial staff of the Bolshevik *Vpered* ("Forward"). He was chiefly concerned with Social Democratic propaganda and with lectures and political meetings for Russian students and political refugees abroad. During the revolution of 190j Lunacharsky was imprisoned. and when the reaction set in he left Russia for Italy. Together with Gorky and Bogdanov, a well-known Social Democrat, he formed the so-called left wing of Bolshevism (opposed to Lenin on theoretical points), and was one of the promoters of the Social Democratic party schools at Capri and Bologna.

During World War I Lunacharsky maintained a determined internationalist attitude, and disseminated violent antiwar propaganda in Paris and Switzerland, renewing closer contact with the Lenin group after a temporary estrangement. In March 1917 he joined Lenin and Trotsky in Russia. He was arrested after the Bolshevik rising in July; but was subsequently liberated. In the initial stages of the November revolution and during the civil war, Lunacharsky was one of the ablest speakers of the party, and acted as emissary of the military revolutionary council to the various war fronts.

As people's commissar for public instruction, 1917–29, in the new government, Lunacharsky ensured the preservation of works of culture and art during the civil war. He promoted mass instruction, while his special concern for the welfare of the theatre furthered the development of the Russian stage.

Lunacharsky wrote 14 plays (published in 2 vol.), of which several were produced with conspicuous success in Russia and in Berlin. *Vasilisa* the Wise, Faust and the City and The Magi were translated into English by Leonard Magnus and published under the title of Three Plays (1923). He was appointed ambassador to Spain in 1933. He died Dec. 26, 1933.

LUNACY: see INSANITY.

LUNARDI, VINCENZO (1759–1806), pioneer balloonist who made the first aerial voyage in Great Britain. Born in Lucca, Tuscany, Jan. 11, 1759, he became secretary to the Neapolitan envoy in London and took a keen interest in balloons. On Sept. 15, 1784, he ascended in his hydrogen-filled balloon from the artillery ground at Moorfields, London, taking a cat, a pigeon, various equipment and provisions. He barely touched down at North Mimms (where the cat was left) and finally landed at Standon near Ware, in Hertfordshire; he covered 24 mi. in 2 hr. 15 min. He was the hero of the day, and went on to make other flights. The first Englishwoman to fly, Letitia Ann Sage, was to be his most distinguished passenger, with George Biggin; but on June 29, 1785, the balloon would not lift all three, and Lunardi sent his two passengers off together to make a successful journey to Harrow. Lunardi died in Lisbon, Port., July 31, 1806.

See J. E. Hodgson, *The History of Aeronautics in Great Britain* (1925), pp. 117–139. (*C.* H. G.-S.)

LUNATION, the period of return of the moon (luna) to the same position relative to the sun; for example, from full moon to full moon. Its duration is 29.5305884 days (see MOON).

LUND, a city of Sweden, in the district (*län*) of Malmohus, 10 mi. N.E. of Malmo by rail. Pop. (1950) 33.828. Lund (*Londinum* Gothorum), the "Lunda at Eyrarsund" of Egil's saga. was of importance in Egil's time (c. 920). In the middle of the 11th century it was made a bishopric, and in 1103 the seat of an archbishop who received primatial rank over all Scandinavia in 1163, but in 1536 Lund was reduced to a bishopric. Close to the town, at the hill of Sliparabacke, the Danish kings received the homage of the princes of Skane. A university was founded there in 1668 by Charles XI, with faculties of law, medicine, theology and philosophy. Its library is entitled to receive a copy of every work printed in Sweden. The folk museum near the university with its reconstructed old houses is important. The chief industries are sugar refining, iron- and brickworks and the manufacture of furniture and gloves.

LUNDY, BENJAMIN (1789–1839), U.S. philanthropist, prominent in the antislavery conflict, was born at Hardwick, N.J., on Jan. 4, 1789. From 1808 to 1812 he lived at Wheeling, Va. (now W.Va.), an important headquarters of the interstate slave trade. There he first became deeply impressed with the evils of the institution of slavery. In 1815 he organized an antislavery association, known as the Union Humane society. In 1821 he founded at Mount Pleasant, O., an antislavery paper, the Genius of Universal Emancipation, which he edited at irregular intervals and in diverse places until his death.

From Sept. 1829 until March 1830 Lundy was assisted in the editorship of the paper by William Lloyd Garrison (*q.v.*). Lundy traveled extensively on behalf of the cause, visiting Haiti twice, in 1825 and 1829, the Wilberforce colony of freedmen and refugee slaves in Canada in 1832 and Texas three times, 1830–31, 1833–34 and 1834–35. These visits were made, in part, to find a suitable place outside of the United States to which emancipated slaves might be sent. He was bitterly denounced for his antislavery agitation, and in Jan. 1827 was assaulted and seriously injured by a slave trader, Austin Woolfolk.

He was closely associated with John Quincy Adams in an effort to prevent the annexation of Texas. In 1836–38 Lundy edited in Philadelphia a new antislavery weekly, the National Enquirer, which under the editorship of Lundy's successor, John G. Whittier, became the Pennsylvania Freeman. The last year of his life Lundy spent in Illinois where he died Aug. 22, 1839. (R. F. N.)

LUNDY, an island, with two lighthouses, at the entrance to the Bristol channel, 12 mi. N.N.W. of Hartland point on the north coast of Devon, Eng. Pop. (1951) 43. Area 1.6 sq.mi. It is granite, except for some slate in the south, and an extreme elevation of about 450 ft. is found in the southern half. Most of the coast is cliffbound. The landing (southeast) is sheltered by small Rat Island, where the once common black rat survives.

Puffins and other sea birds breed on Lundy. The island, held at least from the reign of Henry II to about the 14th century by the turbulent and piratic Marisco family, has been captured by the Turks, Spaniards and by various pirates. In the 17th century it became a hiding place for French privateers.

LÜNEBURG, a town in the former Prussian province of Hanover and after 1945 in Lower Saxony, Ger., near a small hill named the Kalkberg, on the Ilmenau, 14 mi. above its confluence with the Elbe and 30 mi. S.E. of Hamburg. Pop. (1950) 58,139.

Luneberg existed in the days of Charlemagne, and gained importance after the erection of a convent and a castle on the Kalkberg in the 10th century. After the destruction of Bardowiek, then the chief commercial centre of north Germany, in 1189, Luneburg inherited much of its trade and subsequently became one of the principal towns of the Hanseatic league. Having belonged to the duchy of Saxony it was the capital of the duchy of Brunswick-Liineburg from 1235 to 1369; later it belonged to one or other of the branches of the family of Brunswick. The reformed doctrines were introduced into the town in 1530, and it suffered heavily during the Thirty Years' War. It reached the height of its prosperity in the 15th century, and in the 17th century it was the depot for much of the merchandise exported from Saxony and Bavaria to the mouth of the Elbe; after a period of decay the 19th century witnessed a revival of its prosperity. In 1813 the German war of liberation was begun by an engagement with the French near Luneburg.

The gypsum and lime quarries of the Kalkberg afford the materials for cement works. Other industries are the making of beer, spirits, chemicals, ironware, carpets and haircloth.

LÜNEBURGER HEIDE, a region of Germany, in Lower Saxony, lying between the Aller and the Elbe. Its main character is that of a broad saddleback, running for 55 mi. from southeast to northwest (greatest height, Wilseder Berg, 554 ft.). The soil is quartz sand and is chiefly covered with heather and brushwood. In the north and in the deep valleys there are extensive forests of oak, birch and beech, and in the south of fir and larch. Its main products are sheep, potatoes, bilberries, cranberries and honey. The region is also remarkable for numerous megaliths, popularly called Hun graves. It has an area of 2,852 sq.mi.

LUNETTE, a crescent-shaped or semicircular object. In architecture the term is applied to any semicircular shape or panel which is decorated, and especially to those which occur under semicircular arches or vaults. By extension, the term is used of small vaults intersecting a larger vault at right angles, especially if used for lighting the larger vault, as in the clerestories of St. Paul's cathedral in London and St. Peter's in Rome. Oval or circular openings through any vault are also sometimes known as lunettes.

LUNEVILLE, an industrial and garrison town of northeastern France, capital of an arrondissement in the *département* of Meurthe-et-Moselle, 21 mi. E.S.E. of Nancy. Pop. (1954) 20,-512. The name of Lunéville (Lunae villa) is perhaps derived from an ancient cult of Diana, the moon goddess, a sacred fountain and medals with the effigy of this goddess having been found at Léormont, about 2 mi. E. of the town. Lunéville belonged to Austrasia and, after various changes, fell in 1344 to the house of Lorraine. A walled town in the middle ages, it suffered in the Thirty Years' War and in the campaigns of Louis XIV from war, plague and famine. The town flourished again under Dukes Leopold and Stanislas, on the death of the latter of whom, at Lunéville, Lorraine was united to France (1766). The principal industries of Lunéville include cotton spinning and various manufacturing industries. Trade of the area is in grain, wine, tobacco, hops, cotton goods, etc.

LUNG, in anatomy, the name of each of the pair of organs of respiration in man and other air-breathing animals, the organs in fishes with the corresponding function being the gills. See RESPIRATORY SYSTEM, ANATOMY OF.

LUNG, DISEASES OF comprise all those disorders affecting the lungs. Other diseases of the chest are discussed in RESPIRATORY SYSTEM, DISEASES OF and PLEURA, DISEASES OF.

Lung Cancer.—Cells of the membrane lining the air passages in the lung undergo a change which leads to uncontrolled cell growth. The result is a malignant tumour which invades and destroys contiguous structures, blocks the air passages and spreads from its point of origin through the lymph channels and the blood stream to other parts of the body with results invariably fatal unless the growth is removed at an early stage. Bronchogenic cancer may be detected by the conventional chest X-ray examination, but the shadows cast by early symptomless cancers, often resembling harmless conditions, are difficult to identify. Thorough medical examination and sometimes exploratory surgery is necessary.

The remarkable increase in lung cancer during the 20th century has caused great concern throughout the world. It has become the most frequently encountered malignant tumour in men, occurring five to ten times more frequently in men than in women. Multiple causative factors may be involved, but the carcinogenic (cancer-causing) chemicals known to be present in the products of combustion are probably of greatest importance. Foremost among the fumes of combustion which enter the human lung in concentrated form is tobacco smoke, and statistical data are available to indicate that smokers are peculiarly susceptible to bronchogenic carcinoma. The gaseous wastes from combustion of motor fuels and other atmospheric pollution have been accused of causing the high incidence of lung cancer in large cities. (See also CANCER.)

Tuberculosis.—Although tuberculosis has diminished as a cause of death in most countries where hygienic conditions are optimal, it has diminished less rapidly than other preventable infectious diseases. In some countries it remains a principal cause of disability and death and is a serious social and economic drain upon human resources.

Diagnosis of tuberculosis requires routine chest X-ray examinations of well-appearing persons, especially if a positive reaction to the tuberculin skin test has occurred. Shadows on the X-ray film suggesting tuberculosis require general examination and study of sputum and blood for other indications of active infection. Some cases of inactive tuberculosis or those of uncertain activity must be examined repeatedly for many months or years to detect the earliest evidence of activity.

Treatment of active tuberculosis requires the administration of two or more of the several potent antituberculosis drugs. Isoniazid, streptomycin and PAS (para-aminosalicylic acid) are the most commonly used and most safe and effective drugs in treatment of tuberculosis. Treatment is ordinarily prolonged long after every indication of activity has disappeared, two years of specific drug therapy being frequently recommended. Surgical treatment of tuberculosis is necessary to remove areas of infected lung which cannot be treated successfully with drugs alone. Lung collapse, once a popular procedure in the opinion of many specialists, is necessary only in unusual cases.

The prevention of tuberculosis requires that contagious cases be diagnosed promptly and treated successfully, remaining segregated during the period of communicabilitv. Vaccination with bacilli of low virulence, such as the BCG strains, produces some degree of immunity, and such vaccination is desirable in those countries which lack adequate facilities for treatment and isolation of communicable tuberculosis. It is not generally recommended in countries where high standards of hygiene are maintained. (See also TUBERCULOSIS.)

Pneumonia and Pneumonitis.—Inflammation of the lungs, ordinarily acute and extensive, is called pneumonia. Less severe inflammation with less consolidation (filling of air spaces with exudate) is sometimes called pneumonitis. Many inflammatory agents can produce pneumonia, but bacteria and viruses are of greatest importance. Of the many bacteria which alone or in combination may cause pneumonia, the pneumococcus is best known and most often productive of very acute and dense consolidation of one or more lobes (lobar pneumonia).

Diagnosis frequently can be made by physical examination, but X-ray examination is necessary to follow the course of the disease and to detect complications. Distinction between lung cancer, tuberculosis, fungus infections and slowly resolving pneumonia may be very difficult. Treatment of the bacterial pneumonias with antibacterial drugs (antibiotics and other chemotherapeutic substances) is usually successful, and their use has resulted in a greatly diminished mortality rate, especially in cases of pneumococcus pneumonia. Treatment of the virus-caused pneumonias is less specific, but these infections are less likely to cause death and complications are rare. (See also PNEUMONIA.)

Fungus Infections.—Specific treatment (Amphotericin B) is available for serious cases of fungus infections. Coccidioidomycosis in certain dry areas (especially southwestern U.S.) and histoplasmosis of moist climates frequently cause no recognized symptoms but occasionally cause serious disease, sometimes confused with tuberculosis and cancer of the lung. Blastomycosis, cryptococcosis (torulosis) and actinomycosis are rare and often serious infections. (See also FUNGUS INFECTIONS.)

Emphysema.—Overinflation of the lung, an inability to exhale air from the abnormally dilated terminal air sacs (alveoli), is the essential feature of the usual type of pulmonary emphysema. It is attributed to loss of lung elasticity and to obstructive changes in the finer air passages. The obstruction is either of inflammatory origin or due to spasm of the involuntary muscles which encircle the smaller bronchi. Very prolonged and recurrent bronchial asthma and excessive tobacco smoking are among the recognized causes of pulmonary emphysema. The symptom of progressive shortness of breath on exertion, associated with an abnormally rounded chest (barrel chest), with or without wheezing respiratory sounds, most frequently prompts the patient to seek diagnosis and treatment. Unfortunately treatment is often ineffective when the condition is advanced, and prevention of further injury is all that the physician can hope to accomplish. (See also EMPHYSEMA.)

Bronchiectasis.—Bronchiectasis is a common disorder characterized by dilatation of the bronchi of one or more of the lung segments. Infection often becomes implanted in these bronchi where secretions stagnate. Symptoms of infection with cough, expectoration and recurrent episodes of lower respiratory tract infection are common. Bleeding from the lung is not uncommon. Medical treatment may yield temporary relief, but removal of the diseased segments is necessary for cure. (See also BRONCHIECTASIS.)

Pulmonary Embolism.—Blood may clot within the veins, especially leg veins, under abnormal conditions (thrombosis). If the clot (thrombus) becomes dislodged and is carried to the lungs it lodges in an artery of the lung and is called an embolus. A large embolus may interrupt blood flow and cause almost instantaneous death; small emboli cause less serious manifestations. Thrombosis and embolism occur most commonly after prolonged illness, certain surgical manipulations, fractures and prolonged immobilization. Obesity, varicose veins, advanced age and heart failure are additional predisposing factors. (See also THROMBOSIS AND EMBOLISM.)

Miscellaneous Disorders.—Prolonged inhalation of harmful dusts, especially silicon dioxide and asbestos, may cause permanent lung injury. Mild or severe temporary injury may result from inhalation of irritating fumes (pulmonary edema). (See also DANGEROUS OCCUPATIONS; PNEUMONOCONIOSIS.) Lung trauma in wartime and in such injuries as occur from automobile accidents may cause lung puncture and other impairments of function requiring emergency treatment to prevent early death. Lung abscess is usually attributed to inhalation of contaminated and irritating materials such as vomitus and to bronchial obstruction from cancer. foreign body. etc. Many malignant growths, some generalized infections and such disorders as the collagen diseases, sarcoidosis, allergic conditions and parasitic infestations may involve the lungs as well as other organs. See also HEART AND LUNG, SURGERY OF.

LUNGCHOW (LUNGTSIN), a town in the province of Kwangsi, south China, near the frontier of Tonkin (Vietnam). It was opened to foreign trade in 1889 in the hope of building a railway from Tonkin to Kwangsi, but the Tonkin railway terminated at the frontier so trade remained insignificant. After the fall of Canton in 1938 and the strengthening of the Japanese sea blockade, efforts were made to complete the railway to Hengyang, and a brief trade increase resulted. In 1940 the Japanese attacked Lungchow and occupied it, but the Chinese recaptured it the same year.

LUNGFISH, a name given to the fishes of the order Dipneusti (double breathers), with gills and with the air bladder closely resembling the lung of higher vertebrates, and used for breathing air. Neoceratodus of Queensland only occasionally comes to the surface to breathe air. The Lepidosirenidae, including Protopterus of Africa and Lepidosiren of South America, inhabit swamps and marshes and rise to breathe air at frequent intervals; in the dry season, when the swamps dry up, the fishes curl up and sleep at the bottom of a burrow, the entrance to which is closed with a plug of mud, with one or more openings for the admission of air. It may be noted that fishes of other groups have the air bladder primitive and lunglike in structure and use it for breathing air, particularly the African Polypterus. See FISHES.

LUPERCAEIA, an ancient Roman festival. Its rites were under superintendence of a corporation of priests called Luperci, whose institution is attributed either to Evander (*q.v.*) or to Romulus (*q.v.*) and Remus. But the festival itself, which was held on Feb. 15, contains no reference to these late fictions. It began with the sacrifice by the Luperci of goats and a dog, after which two of the Luperci were led to the altar, their foreheads were touched with a bloody knife and the blood wiped off with wool dipped in milk; then the ritual required that the two young men laugh.

The sacrificial feast followed, after which the Luperci cut thongs from the skins of the victims and ran in two bands round the walls of the old Palatine city. A blow from the thong was supposed to cure sterility. The celebration of the festival went on until A.D. 494, when it was changed by Pope Gelasius I into the feast of the Purification.

The Luperci were divided into two colleges, called Quinctiliani (or Quinctiales) and Fabiani, from the gens Quinctilia (or Quinctia) and Fabia; at the head of each of these colleges was a magister. In 44 B.C. a third college, Luperci Iulii, was instituted in honour of Julius Caesar, the first magister of which was Mark Antony. In imperial times the members were usually of equestrian standing.

The ritual is apparently in honour of no god; Lupercus, whom authorities sometimes name, seems a mere invention, Faunus is a guess of the moderns.

LUPINE, any plant of the genus *Lupinus,* which comprises more than zoo species of annual and perennial herbaceous plants of the pea family (Leguminosae).

Native American species (*Lupinus perennis* and related species) with digitate leaves are found in moist fields and grassy hills along the cool Pacific coast from British Columbia to northern Chile. A few species occur in the Mediterranean regions. Others, with single leaflets, are found in Brazil and eastern North America. Many of these are good subjects in the wild garden.

The species of which earliest mention is made is probably L. *termis,* which was cultivated by the ancient Egyptians. It is wild in some parts of the Mediterranean area and is extensively cultivated in Egypt. Its seeds are eaten by the poor after being steeped in water to remove their bitterness. The lupine of the ancient Greeks and Romans was probably L. *albus,* which is extensively cultivated in Mediterranean countries for forage, for soil enrichment and for its round flat seeds, which form an article of food. Yellow lupine (L. *luteus*) and blue lupine (L. *angustifolius*) are also cultivated in Europe as farm crops for green manuring. L. subcarnosus, the state flower of Texas, is the bluebonnet.

The flowers, borne on long spikes above the dark-green foliage, are of the usual pealike form and range in colour from white, yellow and shades of pink to blue and purple. Grown chiefly for ornamental purposes in the U.S. and especially in England (where the climate is very favourable), the one- to five-foot plants are well adapted to borders and beds and are beautiful as cut flowers. Numerous garden hybrids of unknown parentage have been developed and are easily cultivated in any rich light sandy soil (neutral to acid) in full or partial sun. Perennials, including the fine Russell hybrids, should be seeded in summer and given adequate winter protection for flowering the following summer. The roots of young plants may be divided in very early spring. Annuals are best sown in place early in the spring. As with all leguminous plants, inoculation with nitrogen-fixing bacteria encourages root nodules and increased vigour.

LUPUS is a term applied to certain diseases which characteristically involve the skin. The important variety is lupus erythematosus, the cause of which is not known. The commonest type is discoid lupus, characterized by lesions on the nose and cheeks arranged in a butterfly pattern. The patches are reddish and may be covered with superficial scales, associated with follicular plugging and in the healing stages with atrophy and scarring. Occasionally, the patient with the chronic discoid form may suddenly develop acute systemic manifestations.

The systemic form of lupus erythematosus has varied manifestations associated with lesions of connective tissue in the vascular system, the dermis and the serous membranes. There is usually a prolonged course characterized by exacerbations and remissions over years, during which many systems of the body may be involved. The characteristic laboratory feature is the antinuclear antibodies found in the gamma globulin portion of the serum. Arthritis and kidney disease are commonly present. The active manifestations of the disease usually can be controlled by adrenocortical steroid therapy, but this is not curative. Certain antimalarial drugs such as chloroquine are reported to be helpful, particularly in the discoid type.

Lupus vulgaris, tuberculosis of the skin, occurs chiefly on the face, about the nose, cheeks or ears, but may affect the skin of the body or limbs. The lesions are small nodules covered with thin crusts which may ulcerate, leaving disfiguring scars. Treatment is with antituberculous chemotherapy and the prognosis is excellent. (A. M. HY.)

LUQMAN or **LOKMAN,** the name of two, if not of three, persons famous in Arabian tradition. The first was of the family of 'Ad, and is said to have built the great dike of Marib and to have received the gift of life as long as that of seven vultures, each of which lived 80 years. The name of the second Luqman, called "Luqmān the Sage," occurs in the Koran (31, 11). Two accounts of him are found. According to Masudi (i. 110) he was a Nubian freedman who lived in the time of David. According to some commentators on the Koran he was the son of Ba'ura, one of the sons of Job's sister or maternal aunt. Derenbourg in his Fables de *Loqmân le* sage (1850) identifies Ba'ura with Beoi, and believes the name *Luqmān* to be a translation of Balaam. The grave of Luqman was shown on the east coast of the lake of Tiberias, also in Yemen.

The so-called Fables of *Luqmān* are known to have existed in the 13th century, but are not mentioned by any Arabian writer. They were edited by Erpenius (1615) and have been reprinted many times. For the relation of these to similar literature in other lands, see J. Jacobs's edition of Caxton's Fables of Aesop, vol. i (1889).

LURAY CAVERN, a large limestone cave in Page county, Va., U.S., near the town of Luray. The largest cave in the state, it embraces a total of 64 ac., of which 27 are open to the public.

After 1878 when it was discovered, wide natural corridors and the installation of indirect lighting have revealed its beauties to millions of tourists.

Luray cavern was formed millions of years ago by underground rivers and seepage of acid-bearing water through layers of limestone and clay. In time the clay was washed away, leaving only the limestone shell. Long after the formation of the cavern and after many stalactites had developed from the dripping of water impregnated with lime, the excavation was completely filled with glacial mud. This mud was charged with acid which eroded the dripstone and altered its shape. When the mud was subsequently removed by flowing water the older eroded forms remained alongside the new growth. This turbulent history has made the striking display of many-hued stalactites, stalagmites, columns and cascades one of the most remarkable in the world, including massive columns wrenched from their perpendicular position and hurled on the floor. Clear water, apparently containing no forms of life, is found in basins up to 50 ft. in diameter and 15 ft. in depth. The temperature in the cave remains at 54° F. throughout the year. Of particular interest is the "stalacpipe" organ which substitutes carefully selected stalactites for organ pipes. (G. M. Be.)

LURGAN, a market town and municipal borough of County Armagh, N.Ire., 21 mi. S.W. of Belfast. Pop. (1951) 16,183. It is a modern town, taking its rise from a grant of land made by James I to William Brownlow, and in 1619 it consisted of 42 houses all inhabited by English settlers. Lurgan shared in the vicissitudes of subsequent Ulster history. It became a manufacturing town, carrying on all branches of the linen industry; and knitwear, handkerchiefs and optical goods also are made there. In 1839 the Brownlow family received the title of Baron Lurgan.

LURIA, ISAAC BEN SOLOMON (1534–1572), Jewish mystic, was born in Jerusalem. From his German descent he was surnamed *Ashkenazi* ("the German"). In 1559 Luria was living in Cairo and trading as a spice merchant with his headquarters in Alexandria. He had come to Egypt as a boy after his father's death, and was brought up by his wealthy maternal uncle Mordecai Francis.

When Luria was 17 a copy of the Kabbalistic "Bible"—the *Zohar* of Moses de Leon (*q.v.*)—came into his hands. In order to meditate on the mystic lore he withdrew to a hut by the Nile, returning home for the Sabbath. It is said that Elijah, who had been his godfather in his babyhood, now paid him frequent visits, initiating him into sublime truths. By night Luria's soul ascended to heaven and conversed with celestial teachers who had once been men of renown on earth.

In 1566 at the earliest Luria removed to Safed, where there was a large circle of Talmudists in existence. He died at Safed in 1572. But these six years were momentous for Judaism. Luria founded a school of mystics who powerfully affected Judaism after the master's death.

The Holy Spirit, we are told, rested on him, drawn to him by the usual means of the mystics—self-flogging, ablutions and penance. He had wonderful gifts of insight, and spoke to the birds. Miracles abounded. He went on long walks with enthusiastic disciples, whom he taught without books. Luria himself wrote no mystical works; what is known of his doctrines and habits comes chiefly from his Boswell, Hayim Vital.

There was little of originality in Luria's doctrines; the theory of emanations, the double belief in the Process of the Divine Essence as it were self-concentrating (*Zimzum*) and on the other hand as expanding throughout creation; the philosophical "scepticism" which regards God as unknowable but capable of direct intuition by feeling—these were all common elements of mystical thought.

Luria was an inspirer of saintly conduct rather than an innovator in theories. Not beliefs, he said, but believers need rebirth. He or his school introduced innumerable ritual customs.

LURISTAN, in the more restricted sense, a former province of Iran, from 1938 part of Iran's sixth province, or *ostan;* in the wider sense, the "land of the Lurs," namely that part of western Iran which was bounded by Iraq on the west and extended for about 400 mi. S.E. from Kermanshah with a breadth of 100 to 140 mi. The area is chiefly mountainous, being intersected by numerous ranges running northwest-southeast. The central range has many summits, rising to 13,000 ft. and more, and in it are the sources of Iran's most important rivers. Between the higher ranges are many fertile plains and low hilly districts.

The Lurs are thought to be aboriginal Persians with a mixture of Arab blood. Their language is a dialect of Persian. Outwardly Moslems of the Shia sect, most of them showed little veneration for either prophet or Koran. The northern part of Luristan is inhabited by the Feili Lurs, divided into the Pishkuh (cismontane) Lurs in the east and the Pushtkuh (ultramontane) Lurs in the west adjoining Iraq.

Little Luristan was governed by independent princes of the Khurshidi dynasty, called atabegs, from 1155 to the beginning of the 17th century when the last atabeg, Shah Verdi Khan, was removed by Shah Abbas I, and the government of the province given to Husain Khan, the chief of a rival tribe, with the title of vali. The descendants of Husain Khan retained the title. The southern part of Luristan, known as Luri-i-Buzurg (great Luristan), was composed of the Bakhtiari district of the province and the districts of the Manasani and Kuhgalu. Great Luristan was an independent state under the Fazlevieh atabegs from 1160 until 1424, and its capital was Idaj, now only mounds and ruins at Malamir, 60 mi. S.E. of Shushtar.

Luristan acquired fame in 1929 and immediate subsequent years when local diggers discovered powerfully designed, technically competent bronzes—vessels, implements, personal adornments and, particularly, horse trappings—covering a period from 2600 B.C. to A.D. 800, the majority of the finest pieces datable by cuneiform inscriptions between the 12th and the 19th century B.C.

The area of Luristan is 16,325 sq.mi., with a population (1956 census) of 629,776. The chief town is Khurramabad, linked by roads with Ahwaz, Kermanshah, Hamadan, Qum (Ghom) and Isfahan. Luristan is crossed by the trans-Iranian railway (Bandar Shahpur-Tehran-Bandar Shah).

LUSAKA, the capital of Northern Rhodesia and the seat of its government, lies in the centre of the Federation of Rhodesia and Nyasaland, on a limestone plateau 4,200 ft. above sea level. Its population at the 1956 census totaled 28.700 non-Africans and employed Africans. Cairo road, Lusaka's main thoroughfare, with its tree-lined boulevard and modern multistoried buildings, is regarded as one of the finest streets and shopping centres in the federation. In the town are the legislative assembly building and offices as well as the Northern Rhodesia high court building, the British South Africa company's offices and the largest and most modern secondary schools in the federation. Owing to its situation in an extensive limestone area, large quantities of cement are manufactured at Lusaka. It is also the centre of a major farming district which provides a large proportion of Northern Rhodesia's food. (C. L. Cs.)

LUSATIA (German Lausitz, Lusatian Lužica, from *luž,* "meadow"), the name of a territory inhabited by the Luzicane or Srbi, whom the Germans called Lausitzer Sorben or Wenden. Unconnected with the Serbs of Yugoslavia, they are the smallest of the Slavonic peoples who alone withstood Germanization north of Bohemia and west of the Oder-Neisse line.

Their country was conquered by the Germans in 938, incorporated with Poland in 1018, reconquered by the German empire, sold to the margraves of Brandenburg in 1303 and made part of Bohemia in 1368. It was a part of Saxony from 1635 to 1815 when it was partitioned. Saxony retained Bautzen (Budysin), or upper Lusatia, while lower Lusatia was divided between the Prussian provinces of Silesia with Hoyerswerda (Hojerky) as the main centre and that of Brandenburg with Kottbus (Chocebuz) as the chief town.

By 1815 the western part of Lusatia was germanized; but its eastern marshy and sandy part offered but a small prize and there the Lusatians retained their language, dress and customs. After 1871 intensive germanization started, through the schools, and considerably reduced the number of Lusatian-speaking people.

In 1935 the Lusatian National council or *Domowina* ("homeland") petitioned Chancellor Adolf Hitler for the creation of a

Reichsgau Lausitz of about 4,900 sq.mi. In *1938* the *Domowina* was dissolved by the Germans and its chairman, Pawel Nedo, arrested. The Lusatian daily newspaper, *Srbske Nowiny*, was closed down and its publisher, Fr. Jan Cyz, arrested. Both Nedo and Cyz survived, reformed the *Domowina* in 1945 and claimed territorial autonomy.

In 1949 article 11 of the constitution of the German Democratic Republic guaranteed to the Lusatian people equal development of their language and culture. A daily newspaper *Nowa Doba* and five periodicals were published, and a teachers' college was opened at Radibor.

In 1952 Wilhelm Pieck, president of the republic, officially visited the *Domowina* at Bautzen. (K. SM.)

LUSHAI HILLS (correctly MIZO), a mountainous district of Assam, south of Cachar, on the border between Assam and Burma. Area *8.134* sq.mi.; pop. (1951) *196,202*. The hills are for the most part covered with dense forest or bamboo jungle, in which there are clearings for cultivation. They are sparsely inhabited by the Lushais and cognate tribes. The earliest known inhabitants were Kukis: the Lushais were not heard of until *1840* when they invaded the district from the north. Their warlike spirit and predatory habits made them one of the most troublesome tribes on the northeast frontier of India, but military operations in 1890 resulted in the pacification of the northern Lushais, and in *1892* of the eastern Lushais. The final submission of the chiefs of the southern Lushai hills, who were under the control of the government of Bengal, was not secured till *1895*. The latter hills were transferred in 1898 to Assam and amalgamated with the northern hills in one district. The limits of the district were extended by the inclusion of 900 sq.mi. between the south of the Lushai hills and the Chin hills in Burma. The villages are, as a rule, perched on the tops of ridges or spurs. Each is ruled by a chief or headman.

LUSIGNAN, the name of a family, of Poitevin origin (10th century), which gave a line of kings to Cyprus (1192–1475). In the 13th century, moreover, the Lusignans were important in France during the struggle between Capetians and Plantagenets: they rebelled against John of England in 1201, when he deprived Hugh (afterward Hugh X; d. 1249), son of Hugh IX, count of La Marche, of his fiancée Isabella of Angoulême, and their appeal gave the French king a pretext for confiscating John's French fiefs. Hugh X. however, was defeated in 1242 after he had reverted to the English side.

The elder branch of the family became extinct in 1303. But from the time of Hugh VI the Devil, who took part in the crusade of 1100–01 and was killed at Ramleh, the Lusignans had been interested in the east.

The house of Lusignan d'Outre-Mer sprang from Guy and Amalric, the third and fourth sons of Hugh VIII the Brown, who went to the Holy Land in 1164 and was taken prisoner at Harenc (Harim, east of Antioch) in *1165*. Guy reached Palestine *c.* 1180 and quickly won the good will of the leper king Baldwin IV and the love of his sister and heiress Sibylla, whom he married, receiving the counties of Ascalon and Jaffa He was made regent *(1183)* on Baldwin's becoming blind, but soon fell from favour and was deprived of all right of succession. In *1186*, however, on the death of Baldwin V, he became king of Jerusalem in spite of the opposition of Raymund of Tripoli. Next year he suffered a crushing defeat at the battle of Hittin and was taken prisoner by Saladin. Released in *1188*, he at once broke his parole and began the siege of Acre. Difficulties, however, had arisen with Conrad of Montferrat; and after Sibylla's death, Conrad won fresh support and was generally recognized as king in *1192*.

Though Conrad was almost immediately assassinated, the crown did not return to Guy, but went to Henry II of Champagne, who married Isabella, Sibylla's sister. Guy bought from the Templars the island of Cyprus and reigned there for the last two years of his life (1192–94). He is judged harshly by contemporary writers, as *simplex* and *insufficiens*, perhaps largely because the kingdom of Jerusalem was lost in his reign.

Guy mas succeeded in Cyprus by his brother Amalric, who acquired the title of king of Cyprus from the emperor Henry VI and became king of Jerusalem in 1197 by his marriage to Isabella, after the death of Henry of Champagne. *(See* AMALRIC II.) Amalric was the founder of a dynasty of kings of Cyprus which lasted till 1475; while after *1269* his descendants regularly enjoyed the title of kings of Jerusalem. For the history of the Lusignan kings *see* CYPRUS.

The most famous were Hugh III the Great (1267–85) to whom, apparently, St. Thomas dedicated his *De Regimine Principum;* Hugh IV (1324–59), to whom Boccaccio dedicated one of his works and who set on foot an alliance with the pope, Venice and the Hospitallers, which resulted in the capture of Smyrna (1344); and Peter I (1359–69), who with his chancellor Philippe de Mézières represented the last flicker of the crusading spirit. *(See* CRUSADES.)

Five short-lived kings of a branch of the house of Lusignan ruled in Armenia after 1342, "Latin exiles," as W. Stubbs says, "in the midst of several strange populations all alike hostile." The kingdom of Armenia fell before the sultan of Egypt, who took prisoner its last king Leo V in 1375, though the kings of Cyprus afterward continued to bear the title; the kingdom of Cyprus itself continued to exist under the house of Lusignan for 100 years longer. The mother of the last king, James III (who died when he was two years old) was a Venetian lady, Catarina Cornaro. She had been made a daughter of the republic at the time of her marriage to the king of Cyprus; and on the death of her child the republic first acted as guardian for its daughter and then, in *1489*, obtained from her the cession of the island.

See J. M. J. L. de Mas-Latrie, *Histoire de l'île de Chypre sous les princes de la maison de Lusignan,* 3 vol. (Paris, 1852–61); W. Stubbs, *Lectures on Mediaeval and Modern History,* 3rd ed. (Oxford, 1900).

LUSTRATION, a term that includes all the methods of purification and expiation among the Greeks and Romans. Among the Greeks two ideas prevailed; that human nature must purify itself (κάθαρσις) from guilt before it is fit to enter into communion with God or even to associate with men, and that guilt must be expiated voluntarily (ἱλασμός) by certain processes which God has revealed.

The methods of purification consist in ceremonies performed with water, fire, air or earth, or with a branch of a sacred tree, especially of the laurel, and also in sacrifice and other ceremonial. The torch and sulphur (τὸ θεῖον) were also powerful purifying agents. Purification by air was most frequent in the Dionysiac mysteries; puppets suspended and swinging in the air *(oscilla)* formed one way of using the lustrative power of the air. Rubbing with sand and salt was another method. The sacrifice chiefly used for purification by the Greeks was a pig; among the Romans it was always, except in the Lupercalia, a pig, a sheep and a bull (*suovetaurilia*). On extraordinary occasions lustrations were performed for a whole city. So Athens was purified by Epimenides after the Cylonian massacre, and Delos in the Peloponnesian War *(426* B.C.) to stop the plague and appease the wrath of Apollo.

In Rome. besides such annual ceremonies as the *Ambarvalia, Lupercalia, Cerealia, Paganalia,* etc., there was a lustration of the fleet before it sailed, and of the army before it marched.

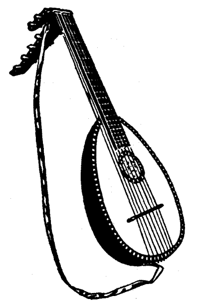
LUTE, an ancient stringed musical instrument, derived in form as well as name from the Arabs. The complete family consisted of the pandura, tanbur or mandolin as treble, the lute as alto or tenor, the barbiton or theorho as bass and the chitarrone as double bass. The Arabian instrument, with convex sound body, pointing to the resonance board or membrane having been originally placed upon a gourd, was strung with silk and played with a plectrum of shell or quill. It was adopted by the Arabs from Persia. Instruments with vaulted backs are all undoubtedly of Eastern origin; the distinct type, resembling the longitudinal section of a pear, is more specially traced in ancient India, Persia and the countries influenced by their civilization.

As long as the strings were plucked by fingers or plectrum the large pear-shaped instrument may be identified as a forbear of the lute. When the bow, obtained from Persia, was applied to the instruments by the Arabs, a fresh family was formed which was afterwards known in Europe as rebab and later rebec. The lute family is separated from the guitars, also of Eastern origin, by the formation of the soundbody which is in all lutes pear-shaped and joined directly to the sound board without the sides or ribs necessary to the structure of the flat-backed guitar and cither.



BY COURTESY DIRECTOR OF VICTORIA AND ALBERT MUSEUM
THE LUTE

Observing this distinction, the little Neapolitan mandolin of 2 ft. long is included in the lute family no less than the large double-necked Roman chitarrone, which was not infrequently 6 ft. long. Mandolins are partly strung with wire, and played with a plectrum, indispensable for metal or short stiff strings. Perhaps the earliest lyres were so played, but the large lutes and theorbos strung with catgut have been invariably touched by the fingers only.

The lute was in general use during the 16th and 17th centuries. In the 18th it declined though J. S. Bach wrote a partita for it. Peri, Caccini and Monteverde used theorbos to accompany their newly devised recitative, the invention or which in Florence, from the impulse of the Renaissance, is well known.

Handel wrote a part for a theorbo in Esther (1720); but after that date it appears no more in orchestral scores, but remained in private use until near the end of the century.

LUTETIUM (formerly lutecium, symbol Lu, atomic number 71, atomic weight 174.99) derives its name from Lutetia, the Roman name for the city of Paris. The element has a stable isotope, Lu^{175} (97.4%), and a naturally occurring radioactive isotope, Lu^{176} (2.6%).

Lutetium is one of the least abundant elements of the rare-earth group and was discovered by G. Urbain in 1907 and independently by Auer von Welsbach, who named the element cassiopeium. Lutetium occurs along with yttrium, ytterbium, etc.. in the minerals gadolinite, euxenite, xenotime, etc. It is usually separated from the other members of the group by fractional crystallization of the bromates. It forms a white oxide (Lu_2O_3); the salts are colourless, giving no absorption spectra, but give a characteristic spark spectrum. In general the salts are more soluble than those of ytterbium; the pure salts should be diamagnetic. Minute amounts of its salt have been reduced to the metal by thermoreduction with the alkali metals. It crystallizes in the hexagonal close pack system ($a=3.509$ A, $c=5.559$ A) with a calculated density of 9.740 g. per cubic centimeter. (See RARE EARTHS.) (F. H. SP.)

LUTHER, MARTIN (1483–1546), the great German religious reformer, was born on Nov. 10, 1483, at Eisleben, in the county of Mansfeld, whither his parents, Hans Luther and Margaret Ziegler, who belonged to the free peasant class, had migrated from Mohra in Thuringia. Six months later they removed to the town of Mansfeld, the centre of the iron ore mining and smelting industry, in which his father found employment as a miner. Within the next decade Hans Luther became the lessee of several smelting furnaces and one of the four elected members of the town council. For some years he had a hard struggle to maintain his growing family, and Luther in later years speaks of the poverty of his childhood. The atmosphere of the home was a pious one, and there is no ground for the tale that his father was a Hussite and was disaffected to the traditional Church. Luther was reared in the current religious beliefs and popular superstitions, which the parents taught their children. Both were strict disciplinarians, and Luther later complained of the harshness of his upbringing, whilst recognizing that his parents meant well by it and cherishing a deep affection and gratitude towards them. The harsh discipline prevailed in the local Latin school, to which he was sent in his seventh year and in which he passed through a graduated course in Latin grammar and syntax, as set forth in the text-books of Donatus and Alexander de Ville Dieu, in select passages from some of the classical authors, and in religious instruction and singing. According to Mathesius he was a diligent and apt pupil, and he evidently profited from this early training, in spite of his later drastic criticism of the schools and schoolmasters of the pre-Reformation period. In his 14th year (1497), he was sent to Magdeburg to continue his education, and in accordance with the practice of the time earned his bread by singing in the streets. His teachers at Magdeburg were members of the Brotherhood of the Common Life, which devoted itself specially to education and was distinguished by its practical reforming spirit. On the conclusion of the school year he removed to Eisenach, where he attracted the interest of an opulent burgher, Kuntz Cotta, and his wife, who received him into their home and relieved him from the necessity of singing for his bread in the streets. He was fortunate, too, in finding in the Rector Trebonius and his assistant Wigand efficient teachers of the higher courses in Latin grammar, composition, rhetoric, and poetry, in which he easily out-distanced his fellow pupils. At the close of this training, which extended over three years, he entered the University of Erfurt in the spring of 1501. At this period the fame of Erfurt exceeded that of all the German universities. The curriculum for the bachelor of arts degree, which he took in the autumn of 1502, included grammar, logic, rhetoric, physics, and philosophy. Two years further study were required for the master's degree, the course including, besides higher instruction in the subjects already studied, mathematics, metaphysics, and ethics. At the age of 22 his ability and proficiency secured him the second place in a list of 17 candidates who passed the master's examination in the winter of 1505.

As the result of these four years of intensive study he had acquired a firm grasp of the current scholastic philosophy, and had developed a marked dialectic skill. He was the ornament of a circle of fellow-students, who met to discuss philosophy, and to whose intercourse his musical gifts contributed an additional charm. Among his teachers were Trutvetter and Ulsingen who professed the Nominalist philosophy as expounded by William of Occam, the great English Franciscan of the 14th century. Under their influence Luther became an enthusiastic adherent of the Occamist or "modern" school of thought as against the various forms of Realism represented by Thomas Aquinas and Duns Scotus. He speaks of Occam as "my master," and refers to his school as "my sect," and he retained his predilection for the philosophic teaching of the great schoolman even after he came to differ from his distinctive theology. He owed allegiance, too, to the authority of Aristotle, whose logic and philosophy dominated all the schools, including that of Occam. Whilst thus absorbed in the conventional scholastic study, he does not seem to have been influenced at this period to any appreciable extent by the humanist movement, which only later took a firm hold of the university, though he found both pleasure and benefit in reading some of the Latin authors, including Cicero, Virgil, and Livy,

The Augustinian Friar.—At the desire of his father, rather than from personal inclination, he entered on the study of law in May 1505. Two months later (July 17) he suddenly renounced the world and entered the monastery of the Augustinian Eremites at Erfurt. There is a difference of opinion among his biographers whether his resolution to become a monk was the result of a sudden impulse, or the climax of a gradually maturing predilection for the monastic life, due in part to certain influences, religious and psychic, working on his high-strung temperament. On the whole the evidence tends to show that his decision was unpremeditated. He himself ascribes it to the fear of sudden death during a thunderstorm, which overtook him, on the road near Erfurt, whilst returning from his home at Mansfeld, when he was prostrated by a flash of lightning and vowed to become a monk. It was in pursuance of this vow that, to the distress and bitter chagrin of his father and the astonishment and regret of his friends, he immured himself in the Erfurt monastery. In any case he regarded his involuntary vow as a call from Heaven, and its fulfilment as an imperative act of obedience to God. It had thus a religious significance which he could not ignore, and he devoted himself to his new vocation with consuming thoroughness.

The Erfurt Augustinians belonged to the strict section of the order, in contrast to the Conventuals or laxer section. After a year's novitiate Luther took the vows of obedience, poverty and chastity, and submitted to the drudgery which was an essential part of his training. Under his preceptor, Nathin, he then went through a course of theological instruction in preparation for his ordination as priest, which took place in 1507. Thereafter he continued his theological studies for the degrees of biblical bachelor and master of the sentences *(Sententiarius)*, or dogmatic theology, as expounded in the Sentences of Lombardus, attending the lectures of the theological faculty of the university as well as the theological school of the monastery. In accordance with the prescribed course, he studied the Bible, the Sentences, and the works of Occam, and his disciples D'Ailly and Biel, and dipped into those of St. Bernard, Duns Scotus, and Augustine. He continued these studies at Wittenberg, where he spent a year from the autumn of 1508 to that of 1509 as lecturer on Aristotle's *Ethics,* and where he enjoyed the personal intercourse of John Staupitz, professor of theology and vicar-general of his order. On his return to Erfurt he obtained the degree of *sententiarius,* and began to lecture on the Sentences. The books which he read in his preparation of these lectures were discovered in the library at Zwickau in 1889, and contain on the margins a large number of notes (given in vol. ix. of the Weimar edition of his works) in his own handwriting, which throw light on his theological and philosophical thought and standpoint at this stage of his development. Whilst displaying a critical, enquiring mind, they show no material departure from the scholastic method and the scholastic theology in its Occamist form, though some modern theologians like Seeberg find evidence in them of a distinctive divergence from his theology. At most they reveal a growing predilection for the teaching of Augustine.

This lectureship he filled till the late autumn of 1511, when, at the instance of Staupitz, he was transferred to the monastery at Wittenberg, of which he was ere long appointed sub-prior at a meeting of his order at Cologne in the following year. In Oct. 1512 he took the degree of doctor of theology of the university and became the successor of Staupitz as professor of biblical literature. Towards the end of 1510 he had paid a short visit to Rome on business connected with his order, and though his visit was that of the devout pilgrim, he appears to have been painfully impressed by the secularized ecclesiasticism and the low moral standard of the Holy City. There is, however, no evidence for the oft-repeated statement that the discovery of his distinctive doctrine of justification by faith came to him as he climbed on his knees the steps of the Scala Sancta at the Lateran church.

Conversion.—It was only during the winter of 1512–13 that this decisive illumination dawned on his mind as he meditated in the Black Monastery at Wittenberg on Romans i. 16-17, and suddenly attained a new apprehension of this doctrine. Despite the most punctilious performance of the minutiae of the rule of his order, the most rigorous asceticism, he had hitherto failed to find peace of conscience, the assurance of acceptance in the sight of God, and he had been periodically harassed by doubts on the score of his personal salvation. Hence the long spiritual struggle in the quest for a gracious God, which had clouded his early years as a monk and which Denifle unwarrantably contests as a later fabrication invented by him to justify his apostasy from the Church. Luther's testimony as to the reality of this spiritual ordeal cannot be thus invalidated, even if we make due allowance for the later tendency to exaggerate it under the influence of his changed religious standpoint.

The root of this struggle to find a gracious God lay in his personal temperament, his lofty religious and moral ideal and in the religious the practical, and the theological teaching of the mediaeval Church. In temperament he was high-strung, emotional, impressionable, and liable to fits of depression which took at times an acute form. He had a sensitive conscience and a keen sense of sin, which the meticulous observance of the rule of his order only tended to intensify. To him sin and the sinful tendency (concupiscence) were terrible realities in keeping with his exalted conception of God as perfect righteousness and the retributive character of this righteousness *(justitia Dei)*, which impels Him to judge and condemn the sinner, and which was emphasized in the teaching and practice of the mediaeval Church. How to attain to the ideal divine righteousness and thus enter into a proper relation of acceptance and fellowship with God, and thereby also ensure salvation from the Divine retribution for sin, was the problem that obsessed him and led to this recurring spiritual conflict (*Anfechtungen*). In the sacrament of penance the Church sought to ensure the penitent sinner against this retribution by imposing penitential works in satisfaction for sins. Luther, however, could not be sure of the sufficiency either of his contrition or of his penitential satisfaction in spite of official absolution. The Church further sought to ensure the sinner against the Divine judgment by its doctrine of merits, based on the relative freedom of the will to do the good whereby, with the aid of God's grace, he could conciliate the Divine favour on the day of judgment. Here again Luther, conscious of the weakness of the will to attain the absolute good which alone could avail in the sight of a perfectly righteous God, failed to find the assurance of salvation in this teaching. In addition he was distressed over the doctrine of predestination, which had for him not only a speculative, but a religious significance. How could he be sure that he was among the number of the elect whom God had predestined and chosen, according to the Occamist teaching, by an act of his absolute, arbitrary will.

The vicar-general, Staupitz, during his sojourn at Wittenberg in 1508–09, as well as his preceptor and his confessor in the Erfurt monastery, did their best to help him, and to them he owed at least a relative appeasement of his spiritual distress. He owed something, too, to the sermons of St. Bernard, to which an old monk directed him, and to the writings of Gerson. But his full deliverance came to him only in the winter of 1512–13, when, as the result of long and intense meditation on Romans i. 16-17 he grasped the truth that the righteousness of God in this passage is not to be understood of his retributive justice (*justitia activa)*, by which he judges the sinner according to his merits, but in the sense of the righteousness which he mercifully gives or imputes to the sinner *(justitia passiva)*, and which the sinner receives by faith, and is thereby justified in His sight and made capable of entering into a filial relation to Him, living the divine life in active obedience to the will of a merciful God. Justification is thus due solely to the mercy or grace of God and the merit of Christ appropriated by faith, not to human works or merits which, being vitiated by sin, can in no way avail to avert the retributive justice of God, or bring the soul into a feasible and assured relation to Him.

This conception is already reflected in his lectures on the Psalms (1513-15), and is elaborated in those on the Epistle to the Romans (1515–16) in which the influence of Augustine and also the mystic teaching of Tauler and the "German Theology" (*Theologia Deutsch)* on the one hand, and the reaction from the scholastic theology are alike apparent, though he still makes use of the scholastic method and terminology. As the result of this elaboration of his new religious conception on the basis of this fundamental doctrine, he could justly claim to be the exponent of a "new theology," though he was still unconscious of any material divergence from the received teaching of the Church, whilst boldly attacking the philosophy of Aristotle and the scholastic theology which was based on it (98 Theses against the scholastic theology, Sept. 1517, which one of his students defended in a public disputation for the degree of biblical bachelor).

The 95 Theses.—In the lectures on Romans he already appears as the practical reformer, and in the year 1517 he emerged in this capacity from the academic sphere with his epoch-making challenge to the work of reformation in his 95 Theses against the abuse of indulgence, which he posted up on Oct. 31, in the door of the Castle church at Wittenberg. The practice of indulgence had grown out of the penitential system of the ancient Church, which punished grave sins by temporary exclusion from the fellowship of the Christian community. In course of time it became customary to mitigate this discipline by permitting the delinquent to make satisfaction, in part at least, in the form of a money contribution. In the later middle age it was extended by the popes as a means of inciting the faithful to participate in the crusades against the infidel (the Cross Indulgence). Those taking part in the holy war or contributing for this purpose were thereby guaranteed the relaxation of penance due for their sins, or even the plenary remission of sin. The practice brought large sums into the papal treasury. With the decline of the crusading spirit, it was extended by Pope Boniface VIII. in connection with the celebrations of the jubilee year 1300. The revenue brought in by this jubilee indulgence was increased by the subsequent expedient of reducing the jubilee years from 100 to 50, or even 25 years and thereby establishing more frequent jubilee celebrations. Indulgences were also issued in connection with other projects such as the rebuilding of St. Peter's at Rome, and by the beginning of the 16th century, the practice had become a regular financial expedient for increasing the papal revenue. In 1447 the efficacy of indulgence was extended by Pope Calixtus III. to souls in purgatory.

The practice was based on the doctrine of the "Treasure of the Church," consisting of the infinite merits of Christ and the superfluous merits of the saints, which was elaborated by Thomas Aquinas and officially sanctioned by Pope Clement VI. in 1343. According to this doctrine, the pope could draw on this inexhaustible source for the benefit of the faithful, whose own merits were insufficient. Theoretically confession and contrition were incumbent on those desiring the benefit of an indulgence. It was further assumed that it could not take away the guilt and eternal punishment of sin, which was only obtainable in the sacrament of penance through the absolution of the priest. It could only ensure the remission of the temporal punishment of actual sins to which the sinner was still liable in this life and in purgatory, and the attainment of this benefit pre-supposed contrition and confession for these sins on the part of the applicant. In the case of the buying of an indulgence in behalf of souls in purgatory, however, contrition and confession on the part of the purchaser were not deemed essential. The practice was liable to great abuse, inasmuch as the indulgence preachers, in their striving to raise as much money as possible for the specific object of any given indulgence, did not always make the conditions and limitations underlying it clear to their hearers. There was besides difference of opinion among the doctors of the Church on both the doctrine and the practice, especially on the question of the application of indulgence to souls in purgatory, as well as widespread dissatisfaction over its abuse.

On both doctrinal and practical grounds Luther felt impelled to attack the system in connection with the Indulgence of 1515–17, which was issued by Pope Leo X. professedly for the rebuilding of St. Peter's. In reality its object was to enable Albrecht of Brandenburg, Archbishop of Mainz, who also held the sees of Magdeburg and Halberstadt, to pay the large debt which he had incurred to the banking house of the Fuggers of Augsburg in payment of the papal dispensation, plus the usual fees, to enable him to acquire the additional office. John Tetzel and other preachers, to whom the archbishop entrusted the business of selling the indulgence, were doing a brisk trade in these pardons when Luther, who discovered in the confessional their misleading teaching on the subject and its nefarious moral and spiritual effects, intervened by posting up his 95 Theses and sending a copy, with a strongly worded letter of protest, to the archbishop. In these theses he distinguished between true repentance and mere penance for sin, maintained that the pope could only remit penalties imposed by his own authority or that of canon law, that God alone can remit the guilt of sin, which is obtained only in the sacrament of penance, not by papal indulgence, and that in the sacrament, pope and priest have only a declaratory power of remission, which is due to the grace of God in Christ as proclaimed in the Gospel—the true "Treasure of the Church." He further denied that the remission of canonical penalties through the papal indulgence applies to souls in purgatory, and, whilst recognizing the principle of indulgence in a strictly limited sense, vigorously denounced the false teaching and the pernicious activity of the indulgence preachers, and asserted the right of every penitent Christian to remission apart from this mercenary traffic in pardons.

The proposed disputation did not actually take place. But the theses were widely circulated, both in the original Latin and in a German translation, and before the end of the year were being eagerly read and discussed throughout the empire, and even beyond its bounds. The attack provoked a counter attack on the part of Tetzel and the Dominican Order, of which he was a member, in the form of a series of anti-theses in defence of the traditional doctrine, which, though ascribed to Tetzel, were drawn up by Wimpina, professor of theology in the University of Frankfurt-on-the-Oder. In a couple of effusions under his own name, Tetzel roundly accused Luther of heresy and schism; and a more formidable opponent, John Maier of Eck, otherwise known as Dr. Eck, professor of theology at Ingolstadt, repeated the charge in a communication to the bishop of Eichstadt, entitled "Obelisks," which, though not printed, was circulated in manuscript. Both Tetzel and Eck maintained that the 95 Theses were an attack on the papal power as well as on a received institution of the Church. Luther replied to Wimpina and Tetzel in a "Sermon on Indulgence and Grace"; to Eck in a series of "Asterisks," in which he stoutly rebutted the charge of heresy. At a congregation of his Order at Heidelberg (April 1518) he expounded and defended his distinctive theology, and amplified his theses in a work entitled *Resolutiones,* which shows a distinct advance in their standpoint, and explicitly emphasizes his fundamental doctrine of justification by faith as the criterion of faith and practice. This work he sent to the pope as a vindication of his action and a confutation of the charges of his opponents, coupled with a respectful and submissive, but outspoken letter (May 1518).

Citation to Rome.—By this time the pope, to whom the archbishop had sent the theses, and who was at first disposed to regard the controversy as a mere monks' quarrel, had decided to take action. As the result of an official examination of Luther's Theses by Prierias, the master of the palace, Leo cited him to appear at Rome within 60 days as a heretic and a rebel against ecclesiastical authority. The citation was forwarded to the learned Dominican, Thomas di Vio, otherwise known as Cardinal Cajetan, the papal legate in Germany. Through the intervention of the elector Frederick of Saxony and for political reasons connected with the prospective election of a successor to the emperor Maximilian I., the pope ultimately consented to forego the citation and to refer the case to the legate, who was empowered to receive Luther's submission. In accordance with this decision he appeared before Cajetan at Augsburg in Oct. 1518. During the interview the legate insisted on unconditional retractation, and Luther stoutly refused to retract unless he was proved from Scripture to be in error, and, appealing from the cardinal to the pope, he secretly left Augsburg. He published an account of the proceedings (*Acta Augustam),* and in November appealed from the pope to a general council.

The issue of a papal decretal on the subject of indulgences left no doubt that Luther's standpoint was irreconcilable with the official doctrine and practice. The attempt of Miltitz, whom the pope sent as his nuncio to Germany to confer the Golden Rose on the Saxon elector, to bring about an accommodation proved fruitless. At a conference at Altenburg in Jan. 1519 Luther went the length of agreeing to refrain from further discussion and to refer the case to the arbitration of a German bishop, on condition that his opponents also observed silence. Miltitz also, in his eagerness to play a rôle in the case which was not warranted by his commission, sent a misleading report to the pope, representing that Luther was not only prepared to refrain from further agitation, but to retract his errors. In reply the pope invited him in a friendly spirit to Rome for this purpose (March 29, 1519). This missive, which never came into Luther's hands, was based on a complete misunderstanding of his real position. What he had refused to Cajetan he was not prepared, at the instance of a busybody like Miltitz, to concede to the pope himself, though at the instigation of the elector he wrote an *Instruction to the People,* in which, whilst emphasizing the abuses in the institutions of the Church, he still recognized the papal supremacy and the duty of obedience to the Roman Church.

Controversy with Eck.—The death of the emperor Maximilian on Jan. 11, 1519, and the long negotiations relative to the election of his successor, brought a lengthy pause in the further consideration of his case as far as the Roman Curia was concerned. Meanwhile the condition of the truce between him and his opponents was broken by the intervention of Eck, who challenged him to a debate at Leipzig on the subject of the papal power. Luther accepted the challenge and in preparation for the disputation made an intensive study of the constitution of the ancient Church and the later claims of the bishop of Rome to its headship, as expressed in the papal decretals. Thus carefully prepared, he encountered his formidable antagonist in the famous disputation which took place in July 1519 and forms another landmark in the development of his reforming teaching. In the course of it he controverted the divine right of the papacy, asserted the supreme authority of Scripture, maintained that John Hus had been unjustly condemned by the council of Constance, and questioned the infallibility of a general council. Eck, who was a practised debater, had skilfully led him into these compromising admissions and claimed the victory. He had at all events shown that he was at variance with the received teaching of the Church, not merely in the comparatively minor subject of indulgences, but on fundamental doctrines. Though both parties had at the outset agreed to refer the contest to the judgment of the universities of Paris and Erfurt, both continued it in a number of controversial writings, to which new adversaries—Alveld. Emser, Dungersheim. Hoogstraten—contributed on the side of Eck, and Melanchthon, Occolampadius, Bucer, Hutten and others on the side of Luther. Luther himself, as well as Eck, added an important quota in the *Resolutiones Lutherianae,* a sermon on the sacrament of the altar, and a treatise on good works, which only widened the breach between him and his opponents.

Bull of Condemnation.—Ultimately Eck betook himself to Rome to prosecute the suit against Luther which the Curia had determined to resume and bring to a final issue. As the result of the re-examination of his case by a series of commissions appointed by the pope in the spring of 1520, the bull *Exsurge Domine,* condemning 41 errors in his teaching. was formulated, and after discussion in the consistory, was issued in June. It granted to the heretic an interval of 60 days after its publication in Germany for the purpose of retracting and returning to the Church. Failing compliance, he and his adherents were to be excommunicated, arrested and punished as notorious and pertinacious heretics. Excommunication was also denounced against all, of whatever rank, who should refuse to comply with the provisions of the bull, which Eck and Aleander were commissioned, as papal nuncios, to publish throughout the empire.

The Bull of Condemnation only fanned the pugnacious spirit of the reformer. At first he professed to see in it a fabrication of Eck, and denounced it in two defiant philippics, *Eck's New Bulls and Lies,* and *Against the Execrable Bull of Antichrist.* Then, recognizing its authenticity, he renewed his appeal to a general council, and finally, on Dec. 10, 1520, publicly consigned it, with a copy of the canon law and other documents, to the flames. During the previous summer and early autumn he had sent forth his three great reform treatises—the *Address to the German Nobility, The Babylonic Captivity of the Church* and *The Freedom of a Chrirtian Man.* In the first he arraigned in passionate language the abuses rampant in the Church, and appealed to the secular power to undertake the work of reformation on the ground of its divine institution, its Christian character, and its ethical functions which entitle it to summon a general council to rectify what is amiss in the Church, and even to undertake this clamant duty in case the Church refuses to reform itself. In the second he attacked the mediaeval sacramental system, reduced the number of the sacraments from seven to three, and asserted the right of the individual Christian to emancipate himself from priestly bondage. In the third he expounded anew in simple, non-controversial terms his fundamental doctrine of justification, which involves alike the freedom of the individual from the work-righteousness of mediaeval religion and the obligation of self-discipline and service for others as the indispensable fruit of justifying faith.

The Diet of Worms.—In Jan. 1521, the pope, in consequence of Luther's refusal to retract and submit to the authority of the Church, launched a Bull of Excommunication against him *(Decet Romanum),* and called on the emperor Charles V., the successor of Maximilian, to execute it forthwith. Instead of complying, the emperor, in deference to the intervention of the Saxon elector and the will of the majority of the diet, which met at Worms at the end of January and continued its sittings till May, decided to summon him to appear for examination before the diet under the imperial safe conduct, whilst promulgating an edict against his writings at the instigation of the papal nuncio Aleander. On April 16, Luther entered Worms. On his appearance before the assembly on the following day he acknowledged the authorship of the books on the table, the titles of which were recited by a secretary. But, in answer to the question whether he was prepared to recant any part of them, he asked for time for consideration on the ground of the importance of the issue involved. He was granted an interval of 24 hours. Late on the morrow, the 18th, he was asked by the official of the archbishop of Treves, Dr. John von der Ecken, who acted as interrogator, whether he was now prepared to defend all the books which he had recognized as his. In reply he proceeded to show why he should not be asked straight away to recant, and requested to be convinced of his errors from Scripture. If thus convinced he would forthwith revoke and be the first to throw his books into the fire. In a long harangue the official rebuked his audacity in arrogating a knowledge of the Scriptures against all the doctors of the Church, and concluded by demanding a definite and straightforward answer to the question whether he would retract his errors or not. Then came the fateful words uttered in firm and clear tones: "Unless I am convinced by the testimony of Scripture or by an evident reason *(ratione evidente)*—for I confide neither in the pope nor in a council alone, since it is certain that they have often erred and contradicted themselves—I am held fast by the Scriptures adduced by me, and my conscience is taken captive by God's Word, and I neither can nor will revoke anything, seeing that it is not safe or right to act against conscience. God help me. Amen." On retiring from the excited assembly he was greeted by the emperor's Spanish guards with the cry "To the fire with him!" whilst he and his adherents passed on with uplifted hands after the old German fashion of celebrating a victory. "I am through," he cried joyfully on reaching his lodging and receiving the congratulation of his friends. He persisted in his refusal before a committee appointed by the diet to bring about a feasible accommodation, and was commanded by the emperor to leave Worms on April 26. On May 4 he was intercepted by a party of horsemen in the Thuringian forest, in accordance with a previous arrangement of the elector of Saxony and two of his trusty councillors, and was furtively lodged in the electoral castle of the Wartburg, overlooking Eisenach. On May 26, after the close of the diet on the previous day, the emperor, having received the assurance of the papal support in his war against Francis I. of France, formally signed the Edict of Worms placing him and his adherents under the ban of the empire and instituting a rigorous censorship of the press. It professed to be issued "with the unanimous consent and will" of the estates of the empire. In reality it had been submitted on the previous evening to only a fraction of the members after the formal closing of the diet, and did not represent the mind of the German people. As the result of these four years of strenuous conflict, the breach between Rome and Luther was complete and irretrievable, and the indomitable, heroic monk had won the sympathy and support of a large proportion of his countrymen on material and economic as well as religious grounds.

The Wartburg.—Luther remained at the Wartburg under the pseudonyrn of "Knight George" till the spring of 1522. He continued and extended the attack on Rome in a series of controversial writings, including those on auricular confession, on the abrogation of private Mass, and on monastic vows, and kept in touch with his colleagues and friends by a voluminous correspondence. He began and completed the translation of the Greek New Testament which, after revision with the co-operation of Melanchthon, was published in Sept. 1522. It is a monument of his linguistic ability in moulding the vernacular into a fitting medium of the language and thought of the Greek original. He challenged the resumption of the indulgence traffic under the auspices of the archbishop of Mainz at Halle, and so potent had his influence become that the archbishop was fain humbly to apologize and put a stop to the business. He wrote a series of sermons (Postille) for the instruction of the people in the new evangelism, which afford an insight into his distinctive power and style as a preacher. Early in Dec. 1521 he paid an incognito visit to Wittenberg and enjoyed for a few days the renewed personal intercourse with his colleagues. He expressed his satisfaction with all that he had seen and heard in spite of the popular demonstrations against the old religion which had resulted in student riots, but which he did not take very seriously. On the other hand, the spirit of religious and social unrest among the people, which he had observed by the way, impelled him to issue a *Warning Against Tumult and Revolt,* in which he inculcated his characteristic doctrine of submission to constituted secular authority in the matter of religious innovations, the necessity of leaving the Word of God to work gradually the transformation of traditional beliefs and institutions, and the inadmissibility of irresponsible violence in the work of reformation.

This passive attitude did not commend itself to the more militant reformers at Wittenberg like Carlstadt and Zwilling, who in the winter of 1521–22 introduced communion in both kinds, demanded the removal of images from the churches and championed the marriage of the clergy. In this forward policy they had the support of the university theological faculty and the town council, and the town council embodied it in an ordinance regulating on evangelical lines the religious and social life of the community. But it encountered the opposition of the elector on political grounds, and the *impasse* which supervened led Luther to leave the Wartburg at the beginning of March 1522 and resume his public activity at Wittenberg.

The Reformed Worship.—Though he approved on principle of communion in both kinds and the marriage of the clergy, he was a striking combination of the conservative and the revolutionary, and was disposed to consider the expediency of actual changes before making them, and of avoiding precipitate measures which the weaker brethren were not prepared to approve. In a series of eight consecutive sermons during the first week after his arrival, he won over his hearers to his own policy of the gradual institution of an evangelical order in place of the old usages, and modified the ordinance in this direction. It was not till the following year that he deemed the time ripe for a more incisive reform of worship and usages and the reorganization of the church at Wittenberg and elsewhere in accordance therewith, though these changes were to be made without constraint of conscience. Hence the *Formula Missae,* or reformed communion service, which he drew up for Wittenberg, and the order of worship for the church at Leisnig which served as a model for other reformed churches.

At the same time he carried on a brisk campaign against his Romanist opponents, whose antagonism these innovations tended to intensify. These controversial writings included an onslaught on the hierarchy, *Against the Falsely called Ecclesiastical Estate of the Pope and the Bishops,* and a reply to King Henry VIII., who had written an anti-Lutheran *Defence of the Seven Sacraments (Assertio Septem Sacramentorum adversus Martinum Lutherum).* He added a *Vindication of Married Life* as a divine and natural institution on behalf of the marriage of the clergy. In 1525 he himself followed the example of the increasing number of married ex-priests, monks, and nuns by contracting a union with Catherine von Bora, who had renounced the conventual life, and bore him a family of three sons and two daughters, and proved a worthy helpmate throughout the remaining 20 years of his wedded life.

As the result of this propagandist activity and the co-operation of a growing band of preachers, drawn largely from the ranks of the secular and regular clergy, the evangelical movement ere long attained such formidable dimensions that it was practically impossible to enforce the edict of Worms throughout a large part of the empire. The diet which met at Nuremberg during the winter of 1522–23 refused to support the demand of pope Adrian VI., the successor of Leo X., for its execution, declined to suppress the evangelical preachers, and, whilst authorizing the punishment of married priests and apostate monks, insisted on the convocation within a year in some German city of a free Christian council in which the laity should have a voice. "Luther's doctrine," reported the archduke Ferdinand to his brother, Charles V., "has taken such deep root that among a thousand persons there is not one who is not to some extent touched by it." A second diet, which assembled in the same city during the winter of 1524, proved less recalcitrant under the manipulation of Campeggio, the legate of Adrian's successor, Clement VII. But it would only undertake to enforce the edict against Luther "as far as possible," and renewed the demand for the convocation of a free council in Germany. In reply Luther launched a strongly-worded philippic *(Two Contradictory Mandates concerning Luther)* in which he unsparingly aspersed the emperor as well as the majority of the diet.

The Peasant Revolt.—Towards the close of 1524 the influence of the evangelical movement on the mass of the people received a startling exemplification in the rising of the peasants which followed the miscarried attempt of Franz von Sickingen and Ulrich von Hutten to vindicate by force the rights of the lesser nobility against the princes in the previous year. In his tract *On the Civil Power* (1523), Luther, in contrast to his attitude to the State on the *Address to the German Nobility* three years previously, sharply distinguished bet een the political and spiritual spheres, and, whilst denouncing the misgovernment of the princes, inculcated anew the duty of the subject to submit to the civil power and the established order in the State and to suffer, not actively repel, injustice. Some of the evangelical preachers were, however, less restrained, and actively sympathized with the demand of the peasants for social emancipation and the radical modification of the feudal system to this end. Moreover, Thomas Münzer, the leader of the extreme wing of the evangelical party, advocated a social and religious revolution by forcible methods, and Carlstadt, who had by this time been estranged from Luther, though less violent, also actively espoused the cause of the peasants. On theological grounds Luther was repelled by these extremists, who professed a more subjective type of religious thought, based not exclusively on the Word of God, but on the illumination of the individual believer in direct communion with God (the "inner light"). Their association with the social movement contributed to prejudice him against it, though he had pleaded for a more equitable treatment of the common man in the spirit of the Gospel. At the same time his own revolt against the traditional Church, his resounding appeals for its drastic reformation, and on behalf of the rights of the individual mind and conscience enlightened by the Word of God, his doctrine of justification by faith alone, and especially of the spiritual priesthood of all believers, contained democratic implications which the mass of the people were not slow to apply in the service of a social as well as a religious reformation, and of a far-reaching transformation of the prevailing order in the State and society as well a, the Church. This popular movement found expression in the *Twelve Articles* of the Swabian peasants which were evidently drawn up under the influence of evangelical preachers like Schappeler and Hubmaier, if not actually composed by them, demanded the abolition of serfdom and the preaching of the pure Gospel, and were widely adopted. The leaders of the peasants submitted these articles, which were couched in a moderate spirit, for Luther's judgment, and whilst deprecating the resort to force, he expressed sympathy with the reasonable grievances of the common man, and counselled both sides to seek an accommodation *(An Exhortation to Peace in Response to the*

Twelve Articles of the Swabian Peasants, April, 1525). When, however, the peasant bands in southern, western, and central Germany discarded his advice and took arms to enforce this programme of social reforms, he took the side of the princes and lords and issued a sanguinary and ill-judged appeal to a war of extermination against the rebels *(Against the Murderous and Thieving Peasant Bands,* May, 1525). Not only was the rising ruthlessly suppressed; the princes and lords sullied their victory by a savage retribution, of which many thousands of their subjects became the victims, and which both dashed the hope of achieving the legitimate social aspirations of the masses in connection with the religious reformation, and embittered the common man against the reformer, whom they denounced as the accomplice of their oppressors.

Organization of Reform.—In this year Luther was deprived by death of his potent protector, the elector Frederick. His successor, the elector John, was, however, a confirmed adherent, and his cause had won the ardent support of the landgrave Philip of Hesse, Albert of Brandenburg, grand master of the Teutonic order, and other princes, as well as a large number of cities, and its princely supporters were beginning to league themselves in its defence. On the other hand, the archduke Ferdinand of Austria. the two dukes of Bavaria, the elector of Brandenburg, and Duke George of Saxony had combined to stem the progress of the movement, and the persecution of his adherents had already begun in Romanist territories. In the diet which met at Spires in 1526 the Lutheran princes, in conjunction with the moderate Roman Catholics, were strong enough to carry a resolution to suspend the edict of Worms pending the meeting of a general, or at least a national, council; and meanwhile so to act in the matter of the edict as its members should answer to God and the emperor.

The evangelical princes interpreted the decision as entitling them to organize the evangelical Church within their territories, and for this purpose Melanchthon, by direction of the elector John, drew up, and Luther revised, a church ordinance (*Kirchenordnung*) which formed alike a confession of faith, a directory of public worship, a scheme of educational reform, and contained the germ of the later consistorial form of Church government, which consigned the ecclesiastical administration to a body of State officials or consistory, composed of theologians and jurists, under the supremacy of the territorial prince. At the second diet of Spires in 1529 the emperor Charles, through his commissioners, succeeded in reversing the decision of the previous diet. On this occasion the extreme Catholics were in the majority and carried a resolution enforcing the diet of Worms in Catholic territories and disallowing further religious innovations in the Lutheran States, whilst prohibiting the profession of the Zwinglian and Anabaptist forms of the reformed faith. Against these decisions the Lutheran minority appealed and protested and this Appellation and Protestation was signed by 14 cities as well as by the elector of Saxony, the landgrave of Hesse and four other princes. Hence the name Protestant as a designation of the evangelical party.

The Zwinglian Controversy.—This reverse to the Lutheran reformation was aggravated by the dissension between Luther and the Swiss theologians on the doctrine of the Lord's Supper. Whilst rejecting the mediaeval doctrine of transsubstantiation, Luther firmly believed in the bodily presence of Christ in the bread and wine (consubstantiation). Zwingli, the reformer of Zurich, and the south German theologians, on the other hand, accepted only a spiritual presence in the elements, and a bitter controversy had been proceeding for some years over this question before the landgrave Philip, in the hope of uniting the warring parties, summoned the leaders to a conference at Marburg in October 1529. During the three days' debate Luther doggedly argued in support of the literal interpretation of the words, "This is my body" *(Hoc est meum Corpus)* against Zwingli and his Swiss and South German colleagues Occolampadius, Bucer and Capito, who contended in favour of the figurative sense of the words They further adduced the impossibility of the presence in the elements of Christ's body, which had ascended into Heaven, against Luther's contention on behalf of its ubiquity in virtue of Christ's divine nature which was not subject to any human limitations. Neither party would give way on these two fundamental points, and the debate ended in a complete deadlock Luther refused to extend the right hand of fellowship to Zwingli. who was prepared to agree to differ for the sake of unity. Despite this *impasse* the landgrave, after the formal close of the debate in the afternoon of Oct. 3, made a final effort to secure unanimity. He besought both parties to consider in private the possibility of finding a formula uhich they could subscribe. In response Luther drew up a formula which, while asserting that "the body of Christ is truly *i.e.,* essentially and substantially" present in the sacrament, waived further discussion on the question as to the mode of its presence This was undoubtedly a considerable concession on Luther's part, and Bucer was at first disposed to accept it as a satisfactory solution. Zwingli and Occolampadius, on the other hand, could not bring themselves to subscribe this Lutheran formula in the course of the private discussion of the following day, and held to their view that Christ is present only in a spiritual sense. The next best thing in the interest of the landgrave's policy of a comprehensive evangelical union was to give expression to their agreement on the other doctrines of the reformed faith, and Luther joined with his opponents in subscribing the Marburg Articles which he drew up for this purpose. The Marburg conference was thus not a total failure. The inability to see eye to eye on the sacramental question resulted, however, in an unfortunate estrangement between the Lutheran and the Swiss and south German Churches for the time being at least, and frustrated the project of a great evangelical alliance in defence of the Reformation to meet the menace of the impending imperial attempt to suppress it.

The movement had by this time lost the support of Erasmus and the older humanists, whilst retaining the adhesion of the younger votaries of the new learning like Melanchthon and Bucer. Up to the diet of Worms Erasmus had exerted his influence to shield Luther from the hostility of his scholastic opponents of Cologne, Louvain and other centres of the scholastic theology, who were also his own enemies. He used his influence with the German princes to secure him a fair hearing, and denounced the obscurantism and intolerance of the heresy hunters Luther who had a deep sense of the value of the new learning for the evangelical movement had cultivated his friendship, whilst disapproving of his theological standpoint. After the diet of Worms and the actual initiation of the Reformed Church, Erasmus, in his fear of revolution, became more critical, and at length yielding to the solicitations of powerful patrons, entered the lists against his theological teaching in a controversial work on Free Will (*De Libero Arbitrio,* 1524). Luther replied with a counter attack in the Unfree Will *(De Servo drbitrzo, 152j),* and though both observed a relative moderation of style in these writings, the breach between them in the theological sphere was henceforth irretrievable.

The Augsburg **Confession.**—As an outlaw Luther was not present at the diet of Augsburg in 1530, at which the emperor appeared in person, and to which Melanchthon presented a confession of the Lutheran faith (the Confession of Augsburg). But he energetically intervened by his letters to the elector John and to his pliant colleague who, in the course of the long negotiations, was in danger of conceding more than he was prepared to approve He thus stiffened their opposition to the final ultimatum of the emperor to agree to a matenal modification of its teaching in a Romanist sense. Thus strengthened, the elector left the diet in the face of the imperial demand for surrender to his Romanist policy; and Luther at last overcame his scruples on the score of active resistance to the imperial authority in defence of the evangelical cause. He not only consented to the defensive Protestant League of Schmalkald, which the elector and the landgrave cemented, but published a manifesto asserting the right of such rrsistance to authority oppressively exercised over conscience and the Gospel. (*Warning to the Germans,* October 1530, and *Declaration* of November 1530.) In consequence oi this combination and the menace of a Turkish invasion by the sultan Solyman, Charles was fain to agree to an accommodation in the religious peace of Nuremberg (1532).

In further negotiations with Bucer and the South German theologians on the sacramental question, Luther relaxed somewhat in his exclusive dogmatism on the subject, and agreed to the Wittenberg Concord (1536). Though the agreement did not include the Zwinglians, he meantime maintained friendly relations with Bullinger, Zwingli's successor at Zurich, and was impressed by the mediating view of Calvin, though he never came into direct contact with the Genevan reformer. Towards the anabaptist movement, on the other hand, he adopted an attitude of uncompromising antagonism. These sectaries, who took their rise at Zurich in 1525, and rapidly spread their views from Switzerland over the Empire, continued the more radical tendency of Miinzer, whose revolutionary teaching was adopted by the more extreme section and eventuated in the fantastic and fanatic attempt to establish the reign of the saints at Münster in Westphalia. The more moderate section led by Hubmaier, Hetzer, and Denck, all of them men of scholarly attainments, eschewed revolutionary violence, and advocated adult baptism as the exclusive scriptural practice, and a more literal revival of primitive Christianity as they understood it. To Luther both sections were alike obnoxious as subverters of religious and social order, and he ultimately belied his own principle of freedom of conscience by supporting the persecution to which both sections were alike subjected in Protestant as well as Roman Catholic territories, and in joining Melanchthon in pronouncing for the infliction of the death penalty for persistent profession of Anabaptist error (1536).

Last Years.—In spite of the increasing ill-health from which he suffered during the last ten years of his life, he continued to toil at the task of maintaining and vindicating the Reformation. Whilst compromising it by his secret, though reluctant sanction of the bigamous marriage of the landgrave, Philip (1540), which ere long leaked out and was not rendered less scandalous by his honest, but warped attempt to justify it, Luther continued the warfare against the papacy as anti-Christian in a closing series of controversial works. He staunchly opposed the policy of Paul III. to effect a reunion with Rome through a general council, which the pope at last agreed to convene. Such a reunion could only be achieved at the price of sacrificing the essential principles of the Reformation as a revival of the teaching and the institutions of the New Testament and the early Church, which he claimed to have vindicated against the corrupt and secularized Roman distortion of them. He maintained a sceptical, though less uncompromising attitude towards the attempt of the emperor, for political reasons, to bring about a feasible accommodation *(The Wittenberg Reformation,* Jan. 154*j).* His more constructive contribution to the movement during these declining years is the revision, with the assistance of his colleagues, of his translation of the Old Testament, which he had completed between 1523 and 1532, as well as that of the New Testament. By the year of his death the number of editions of this Luther Bible, or parts of it, had risen to 377, exclusive of the Low German versions of it. Had he contributed nothing else besides this literary and religious treasure to the Reformation, he would amply deserve the title of the greatest religious benefactor of his people in modern times. He added to the value of this service by his commentaries on the books of the Bible, which entitle him to a high place among biblical exegetes, and which were the fruit of his expositions of Holy Writ in the classroom. Next to the influence of his translation of the Bible, may be placed that of the hymns with which he enriched the reformed worship, and the two catechisms which he composed in 1529 for instruction in the distinctive doctrines of the Christian faith.

He did not live to experience the force of the blow to his cause which the emperor was at last preparing to deliver. He died on Feb. 18, 1546, at Eisleben, where he had been born 63 years before. He had paid a visit to his birthplace to arbitrate in a dispute between Counts Albrecht and Gebhard of Mansfeld. He successfully accomplished his mission, and preached several times to crowded congregations. But the exposure to the inclement weather during the journey thither, and the protracted negotiations, proved too great a strain for his infirm body, and in the early morning of the 18th he passed quietly away. His last word was an emphatic "yes" to the question of Jonas whether he remained steadfast in the doctrine which he had taught. Count Albrecht would fain have laid him to rest in his native Eisleben. But the elector, John Frederick, insisted on the transference of his body to Wittenberg, where his life work had been done, and there, on Feb. 22, it was interred in the Castle church, in the presence of his stricken widow and children and a great concourse of notables, disciples and burghers.

The impression produced by his personality and his work on his closest associates is reflected at first hand in the funeral sermon preached by Bugenhagen and the funeral oration delivered by Melanchthon to this great assembly. A man, said Bugenhagen, who never feared anyone, however great and mighty, in much the same words as the regent, Morton, used at the grave of John Rnox. Though to some he appeared too sharp and bitter in reproof and denunciation, this was his due prerogative as a prophet, as it was of Christ himself in his conflict with the scribes and the Pharisees. In his rôle as a prophet sent by God, he rediscovered and vindicated the Gospel and delivered the Church from the corruption and tyranny of Rome. The preacher could only liken him to the angel of the Apocalypse who flew in mid-heaven with the everlasting Gospel to proclaim to the dwellers on earth, and the effects of his prophetic mission could only be described in the words of the second angel, "Fallen, fallen is Babylon the great!" Dead in the body, Luther would live in his work in accordance with his own prophecy, *Pestis eram vivus, moriens tua mors ero Papa* ("In life *I* was thy pestilence; dying, I will be thy death, O Pope").

For Melanchthon, Luther was the unique praeceptor. He belonged to the long line of God-inspired teachers and leaders who from the days of the patriarchs onwards had successively preserved and renewed the Church. In this succession he was worthy to stand beside Isaiah, John the Baptist, Paul, Augustine. He was the great renovator, not the innovator of the Church, which he had striven to purify from error and abuse. Strife and division had ever been an inevitable concomitant of the working of the Divine Spirit at such crises in its history, and the responsibility for this division lay with those who refused to hear the truth. Melanchthon assumes that what Luther taught in his long struggle with his opponents was the true doctrine, of which he gave a rapid summary. He combined in the highest degree the gifts of the great Christian teacher and the active reformer. As in the days of Nehemiah the builders of Jerusalem rebuilt the walls with the one hand and held the sword in the other; so Luther had maintained the struggle with the enemies of the true doctrine, and had at the same time, by his writings and his translations of the Scriptures, brought enlightenment and comfort to a multitude of burdened consciences. For this double work pious Christian hearts would be eternally grateful to him and thank God for him. Melanchthon, who had sometimes to suffer under his masterfulness and his vehemence, indicated, indeed, that there might be truth in the complaint of some—and these good-hearted people—that Luther was too hard and rough in his controversial writings. In the face of such a charge he reminded his hearers of the reputed saying of Erasmus, "God in these last times, in which great and terrible diseases have prevailed, has given the world also a sharp physician." As God placed His Word in the mouth of Jeremiah to tear up and break down, to plant and to build, so in the case of Luther. Certain it was that, in defending his teaching, he was acting solely in obedience to his conscience, not merely from quarrelsome and malevolent motives. All who knew him must bear him this testimony. They would, too, readily testify to his amiability, his kindliness, his goodness in private intercourse. "His heart was true and without falseness, his utterance friendly and kindly, and his striving ever to observe the Apostles' command, 'Whatsoever things are true, etc.'" Undeniable, too, his deep piety, his striving to exercise himself in the Christian virtues and in all good and useful studies and arts, his continence and freedom from vice, his readiness to conciliate and arrange the quarrels of others, his hatred of intrigue and trimming, his singleness of purpose, his constant recourse to prayer in the midst of the trial and stress of affairs, his unfailing courage in reliance on God's help as his immovable rock, his rare intellectual acumen and quickness in dealing with difficult situations and problems, his power of observation and ability to read character, his devotion to study, his wide knowledge, his aptness to apply it in his writings and lectures, and his wonderful gift of language.

The picture is, in the circumstances, naturally drawn from the angle of a poignant sense of loss. Nevertheless, the words addressed by one who had been Luther's close associate as disciple, co-worker and friend for nearly 30 years to an audience which had known him in daily intercourse for a longer period, leave on the reader the impression of having been uttered in complete sincerity and truth. *(See* also REFORMATION.)

(J. M.)

LUTHERANS, the general title given to those Christians who have adopted the principles of Martin Luther as opposed to those of the Roman Church, the followers of Calvin, and the sectaries of the times of the Reformation. Lutheran churches often term themselves Evangelical as distinct from Reformed, but these uses are not strictly applied in all cases. Lutheran dogmatic symbols are usually said to include nine separate creeds which together form the *Book of Concord (see* CONCORD, BOOK OF). Three belong to the early Christian church—the *Apostles' Creed,* the *Nicene Creed* (in its western form; *i.e.,* with the *filioque*), and the so-called *Athanasian Creed;* six come from the 16th century—the *Augsburg Confession,* the *Apology for the Augsburg Confession,* the *Schmalkald Articles,* Luther's two *Catechisms* and the *Formula of Concord.* But only the three early creeds and the *Augsburg Confession* are recognized by all Lutherans. Luther's *Catechisms,* especially the shorter of the two, have been almost universally accepted, but the *Formula of Concord* was rejected by many Lutheran churches who did not like its strict and detailed doctrinal statements. The *Augsburg Confession* and Luther's *Short Catechism* may therefore be said to contain the distinctive principles which all Lutherans are bound to maintain, but, as the principal controversies of the Lutheran church all arose after the publication of the *Augsburg Confession* and among those who had accepted it, it does not contain all that is distinctively Lutheran. Its universal acceptance is perhaps due to the fact that it exists in two forms (the *variata* and the *invariata*) which vary slightly in the way in which they state the doctrine of the sacrament of the Supper. The *variata* edition was signed by Calvin, in the meaning, he said, of its author Philipp Melanchthon.

Development in Germany.—After Luther's death the more rigid Lutherans declared it to be their duty to preserve the *status religionis in Germania per Lutherum instauratus,* and to watch over the *depositum Jesu Christi* which he had committed to their charge. As Luther was a much greater preacher than a systematic thinker, it was not easy to say exactly what this deposit was, and controversies resulted among the Lutheran theologians of the 16th century. (1) The Antinomian controversy was the earliest (1537–60). It arose from differences about the precise meaning of the word "law" in Luther's distinction between law and gospel. Luther limited the meaning of the word to mean a definite command accompanied by threats, which counts on terror to produce obedience. He declared that Christ was not under the dominion of the law in this sense of the word, and that believers enter the Christian life only when they transcend a rule of life which counts on selfish motives for obedience. But law may mean ethical rule, and the Antinomians so understood it, and interpreted Luther's declaration to mean that believers are not under the dominion of the moral law. (2) The Arminian controversy in the Reformed church, the Jansenist controversy in the Roman Catholic church, had their parallel in disputes among the Lutherans lasting from 1550 to 1580. In the end it was generally agreed that sin had not totally destroyed man's ethical nature: and that grace changed what was morally insensitive into what was morally sensitive, so that there could be a co-operation between God's grace and man's will ("synergism"). (3) The controversy raised by Andreas Osiander was more important. He felt that Luther had omitted to make adequate answer to an important practical question, how Christ's death on the cross could be brought into such actual connection with every individual believer as to be the ground of his actual justification. It was answered that the principal effect of Christ's work on the cross was to change the attitude of God toward the whole human race, and that, in consequence, when men come into being and have faith, they can take advantage of the change of attitude effected by the past historical work of Christ. The Reformed church, on the other hand, had its own distinctive doctrine of the atonement, with a strong emphasis on predestination. (4) The other controversies concerned mainly the doctrine of the sacrament of the Supper, and Luther's theory of consubstantiation. This required a doctrine of *ubiquity,* or the omnipresence of the body of Christ extended in space, and therefore of its presence in the Communion elements. Calvin had taught that the true way to regard substance was to think of its power *(vis),* and that the presence of a substance was the immediate application of its power. The presence of the body of Christ in the sacramental elements did not need a presence extended in space. Melanchthon and many Lutherans accepted the theory of Calvin, and alleged that Luther before his death had approved of it. Whereupon the more rigid Lutherans accused their brethren of crypto-Calvinism, and began controversies which dealt with that charge and with a defense of the idea of ubiquity. The University of Jena, led by Matthias Flacius, was the headquarters of the stricter Lutherans, while Wittenberg and Leipzig were the centres of the Philippists or followers of Melanchthon.

Conferences only increased the differences. The Lutheran Church seemed in danger of falling to pieces. In the end, the greater proportion adopted the *Book of Concord* (1580). Its recognition was mainly due to the efforts of Augustus, elector of Saxony. The churches within Germany which refused the Book of Conrord became for the most part Calvinistic or Reformed. They published as was the fashion among the Reformed churches, separate creeds for themselves, but almost all accepted the Heidelberg Catechism (*q.v.*). These differences in the German Protestant churches of the second half of the 16th century are reflected in the American Lutheran church. This church exists in three separate organizations. The General Synod of the Evangelical Church of the United States, organized in 1820, has no other creed than the Augsburg Confession, so liberally interpreted as not to exclude Calvinists. The Synodical Conference of North America, organized in 1872, compels its pastors to subscribe to the whole of the nine creeds contained in the Book of Concord. The General Council, a secession from the General Synod, was organized in 1867, and accepts the "unaltered" (*invariata*) Augsburg Confession in its original sense, and the other Lutheran symbols as explanatory of the Augsburg Confession.

The divided state of German Protestantism, resulting from these theological differences, contributed in no small degree to the disasters of the Thirty Years' War, and various attempts were made to unite the two confessions. Conferences were held at Leipzig (1631), Thorn (1645), Cassel (1661); but without success. At length the union of the two churches was effected by the force of the civil authorities in Prussia (1817), in Nassau (1817), in Hesse (1823), in Anhalt-Dessau (1827) and elsewhere. These unions for the most part aimed, not at incorporating the two churches in doctrine and in worship, but at bringing churches or congregations professing different confessions under one government and discipline. They permitted each congregation to use at pleasure the *Augsburg* Confession or the Heidelberg Catechzsm. The enforced union in Prussia was combined with the publication of a new liturgy intended for common use. This led to secessions from the state church. These seceders were at first treated with great harshness, but have aon their way to toleration, and form the Lutheran Free or Old Lutheran churches of Germany.

The liturgies of the Lutheran churches exhibit the same diversities in details as appear in their constitutions. It may be said in general that while Luther insisted that public worship ought to be conducted in a language understood by the people, and that all ideas and actions which were superstitious and obscured the primary truth of the priesthood of all believers should be expurged, he wished to retain as much as possible of the public service of the mediaeval church. The external features of the mediaeval churches were retained; but the minor altars, the tabernacula to contain the Host, and the light permanently burning before the altar, were done away with. The ecclesiastical year with its fasts and festivals was retained in large measure. In 1526 Luther published the German Mass and Order of Divine Service, which, without being slavishly copied, served as a model for Lutheran communities. It retained the altar, vestments and lights, but explained that they were not essential and might be dispensed with. The peril attending the misuse of pictures in churches was recognized, but it was believed to be more than counterbalanced by the instruction given through them when their presence was not abused. In short Luther contented himself with setting forth general principles of divine service, leaving them to be applied as his followers thought best. The consequence was that there is no uniform Lutheran liturgy. Divergences are the wider, since the Reformed tradition commonly rejected all the liturgical practices of the mediaeval church, substituting for them bare and severe forms of divine service.

The divergences in ritual and organization, the principal underlying all the various ecclesiastical unions; viz.. to combine two different confessions under one common government, and, resulting from it, the possibility of changing from one confession to another, have all combined to free the state churches from any rigid interpretation of their theological formulas. A liberal and a conservative theology (rationalist and orthodox) exist side by side within the churches, and while the latter clings to the theology of the 16th century, the former ventures to raise doubts about the truth of such a common and simple standard as the Apostles' Creed. Up to the end of World War I, the relation of the Lutheran Church to the state was essentially as follows. In each state the sovereign was held to be the *summus episcopus*. He appointed a minister of public worship, and through him nominated the members of the governing body. the Oberkirchenrath or consistcrium or *directorium*. This council dealt with property, patronage and all other ecclesiastical matters. But each parish elected its own council for parochial affairs, which had a legal status and dealt with such matters as the ecclesiastical assessments. Delegates from these parish councils formed the Landessynode. In cases that called for consultation together, the consistorium and the synod appointed committees to confer. The income of the state churches was derived from four sources. The state made an annual provision for the stipends of the clergy, for the maintenance of fabrics and for other ecclesiastical needs. The endowments for church purposes, of which there were many, and which were destined to the support of foreign missions, clerical pensions, supply of books to the clergy, etc., were administered by the *consistorium*. The voluntary contributions of the people were all absorbed in the common income of the national churches and were administered by the supreme council. Each parish was legally entitled to levy ecclesiastical assessments for defined purposes.

Reorganization after World War I aimed at the separation of church and state in Germany. The churches were guaranteed diminishing state support, with the ultimate purpose of divorcing them entirely from the state, or Lander, governments. The acute economic depression of 1922–24 affected most disastrously those elements of the laity from which the greatest measure of church support was to be expected, and it subjected the clergy to severe privations.

During the nazi rule (1933–45) leading Lutherans took a prominent part in the "Confessing Church" movement which resisted nazi efforts to use Christianity for its own ends. After the defeat of Germany in 1945 the Protestant churches were particularly affected by the partition of Germany into western and Soviet zones. The area of Germany controlled by the U.S.S.R. was the most Protestant part of the country, and of the 11,000,000 or so refugees from the east in the Federal Republic in 1954 the great bulk were Protestant, for the most part Lutherans.

Outside Germany. — From the first days of the Reformation Lutheranism spread quickly from Germany to other countries but its course of development elsewhere was different. The most important converts to Lutheranism were the peoples of the Scandinavian countries.

Sweden and Finland, Denmark and Norway adopted Lutheranism as the religion of their countries in the 16th century, and their Lutheran churches are all established by law and count the overwhelming majority of the people as their members. In 1953 the membership was reckoned as: Sweden 6,580,000; Denmark 4,156,500; Norway 3,036,844; and Finland 3.996.442. All four of these churches have retained the traditional episcopal system of the mediaeval church, but only Sweden has kept the line of episcopal consecration unbroken, though Finland has restored it. The Scandinavian churches have made notable contributions to the intellectual life of Lutheranism in theology. Iceland is also mainly Lutheran (140,000) as a result of its Danish connection.

After World War I the winning of independence by the Baltic states resulted in independent Lutheran churches there (Latvia, Estonia and Lithuania). Their organization was disrupted by successive Russian and German occupations during World War II and after, and many of their members became refugees from Communist rule at the end of that war. The numbers of Lutherans in these countries in 1953 was calculated to be 1,615,000.

The only Lutheran churches of any size in Slavonic lands are those in the U.S.S.R. and Slovakia. The former was permitted to organize itself in 1924: the latter (430,000 in number) has had a vigorous life in a predominantly Roman Catholic environment. Smaller Lutheran churches are to be found in Hungary. France. Austria and the Balkan countries, and some Lutherans are found in almost every land in the world. Outside Europe and North America, Brazil. Indonesia and South Africa have the largest Lutheran churches.

Particularly after 1945 American Lutheranism played a big part among Lutherans everywhere. Huge sums of money were collected by Lutherans in the United States to help Lutherans in distress, particularly in Germany. The main organ of this activity was the Lutheran World federation, organized and financed by Americans: it claimed about 70% of the world's Lutherans as its members. The Missouri synod was also active and the policy of both these organizations was to encourage the formation of Lutheran churches where they did not exist, and their expansion where they did. In Great Britain, for example, their policy after 1945 was to bring together all the Lutheran refugees in Britain in order to form one British Lutheran church. The Lutheran World federation represents the liberal Lutheran tradition and the Missouri synod the extremely conservative outlook, but their policies coincide in some points. Lutheran leaders play an important part in the World Council of Churches, and American Lutherans from 1945 onward were generous in helping needy Christians of other churches as well as their own Lutheran brethren.

UNITED STATES AND CANADA

In 1953 the Lutheran Church in the United States and Canada had 6,869,066 baptized members, of whom 202,885 were in Canada. They were divided into three major groups of almost equal size: the United Lutheran Church; the Lutheran Synodical Conference, a consultative federation of five bodies of which the Lutheran Church — Missouri Synod was by far the largest; and a group of five bodies, loosely associated in the American Lutheran Conference until 1954, when negotiations for a closer union were under way. The remainder, slightly more than 1% of the total membership, was divided among five small, independent bodies.

History. — There were Lutherans among the earliest American colonists who settled in New Netherland and New Sweden, and these were followed by German colonists who settled especially in the present Middle Atlantic states, in the Shenandoah valley, in Georgia and in Nova Scotia.

The geographical spread of Lutherans was extended by migrations to the western frontier and by the large immigrations during the 19th and early 20th centuries of Germans, Norwegians, Swedes, Danes, Finns, Slovaks, Hungarians, Icelanders and others. Many of these immigrants settled in the middle west, and from there Lutherans later pushed on to the far west. Consequently Lutherans came to be distributed among all the states of the United States and the provinces of Canada. Since they brought with them from Europe a variety of languages and customs, they organized congregations, and later synods, according to their national origins, and originally the names of synods usually reflected their European provenance. In the American environment Lutherans in time adopted the English language, more quickly in the east than in the west where the effects of immigration were felt longer, and this was accompanied not only by the discarding of national references in synodical titles but also by closer associations on the part of people who had before been separated by linguistic differences.

Organization. — Although there are some differences in polity, as a rule a strong sense of the independence of local congregations marks Lutheranism in America. This is modified, however, by the delegation of authority to synods and to the conventions of larger bodies. Hence a mingling of congregational and presbyteral elements is observable, and the authority exercised by synodical and other presidents also suggests the presence of an episcopal element.

The first permanent synod was organized in 1748, to which about 100 others were added later. These were gradually reduced by mergers to 17 bodies, the largest of which by the mid-20th century were the United Lutheran Church with 2,143,372 members (1953), the Lutheran Church — Missouri Synod with 1,916,510 members, the Evangelical Lutheran Church with 919,840 members, the American Lutheran Church with 824.535 members, the Augustana Lutheran Church with 499,640 members, and the Joint Synod of Wisconsin with 322,947 members. Two-thirds of the Lutherans in North America (often exclusive of the Synodical Conference) act co-operatively in many areas — including publicity, social action, education, missions and welfare — through the National Lutheran council, an agency of the churches formed in 1918. The lines betneen Lutheran bodies are also crossed by federations and associations of Lutheran men, women, young people, educators, publishers, editors, statisticians, etc. A majority of the churches in North America are associated with Lutherans in other parts of the world in the Lutheran World federation and with other Christians in the World Council of Churches.

Doctrines. — The distinguishing mark of Lutherans is neither their form of organization nor their form of worship (which is moderately liturgical) but their confession of faith. All Lutherans in North America adhere to the *Augsburg Confession* and Luther's *Small Catechism*, most of them also embracing the other confessions in the *Book of Concord* (1580). The unity thus demonstrated has sometimes been disturbed by doctrinal controversies, but these have usually been carried on within the framework of the confessions and have accordingly involved interpretations of these standards. The conservatism in doctrine characteristic of Lutherans spared them the sharp divisions which other Protestants in North America sometimes suffered.

LUTHULI, ALBERT JOHN (1898–), South African political leader, the winner of the Nobel peace prize for 1960, was born in Southern Rhodesia, the son of an African Christian missionary of Zulu stock, to whose family home at Groutville. Natal. he was taken while still a boy. Having completed his education at Adams college, near Durban, he taught there for 15 years till 1935, when he was elected tribal chief of Groutville. He then did much to improve the economic position of African sugar farmers in Groutville and elsewhere. Just before World War II he was a delegate to an international missionary conference at Madras, India, and in 1948 he went to the United States to lecture about Christian missions in South Africa. Long interested in the political advancement of Africans, he had finally joined the African National congress (A.N.C.) at the end of World War II. An advocate of nonviolent resistance to the South African government's policy of *apartheid*, he helped to organize a campaign of civil disobedience in 1952. For refusing to resign from the A.N.C., of which he was elected president (also in 1952), he was deprived of his chieftainship by the Native Affairs department. Arrested on a charge of high treason in 1956 but later released, he was in 1959 banished for five years to his home district; in 1960 the A.N.C. was banned. The award of the Nobel peace prize to him was made in 1961.

LUTON, market town and municipal and parliamentary borough in the South Bedfordshire parliamentary division of Bedfordshire. Eng., 20 mi. S. of Bedford. Pop. (1961) 131.505. It lies where the river Lea passes through the Chiltern hills (Luton = "Lea town"). Long famous for its manufacture of straw hats, it has achieved a new reputation for hats of felt and other materials and an even greater reputation as an engineering centre.

Luton has large motor-vehicle works and other manufactures include electrical equipment and precision instruments. In the museum in Wardown park can be seen the history of the straw-hat industry which originated with the colony of straw-plaiters transplanted by James I from Scotland. The most striking modern building is the town hall (1936). The municipal airport is of the same date. Two miles south-southeast is the mansion of Luton Hoo, with the priceless Wernher collection of art treasures (see BEDFORDSHIRE).

LUTSK: see LUCK.

LUTTRELL, HENRY (*c.* 1765–1851), English wit and writer of society verse, was the illegitimate son of Henry Lawes Luttrell, 2nd earl of Carhampton. In 1820 he published his *Advice to Julia,* of which a second edition, altered and amplified, appeared in 1823 as Letters to Julia in Rhyme. This poem, suggested by the ode to Lydia in the first book of Horace's Odes, was his most important work. His more serious literary contemporaries nicknamed it "Letters of a Dandy to a Dolly." In 1827 in *Crockford* House he wrote a satire on the high play then in vogue. Byron characterized him as "the best sayer of good things, and the most epigrammatic conversationist I ever met"; Sir Walter Scott wrote of him as "the great London wit," and Lady Blessington described him as the one talker "who always makes me think." Luttrell died in London on Dec. 19, 1851.

LÜTZEN, a town in the district of Halle, Ger., in former Prussian Saxony (pop. [1950] 5,375), chiefly famous as the scene of a great battle fought on Nov. 6–16, 1632, between the Swedes, under King Gustavus Adolphus, and the imperialists, under Wallenstein. After being foiled in his prolonged effort to bring Wallenstein to battle at Nürnberg (see THIRTY YEARS' WAR), Gustavus moved south to the Danube. But instead of being drawn by this threat to Bavaria, Wallenstein advanced into Saxony. The menace led Gustavus to march rapidly north, pausing at Nürnberg, 60 mi. south of his rival at Leipzig, to await reinforcements. As Gustavus had thrown up entrenchments Wallenstein, assuming that no immediate attack was likely, allowed Pappenheim to take a large detachment in order to lay siege to a small castle near Halle. When Gustavus heard of Pappenheim's departure he determined to strike while his enemy was thus weakened.

About noon Gustavus gave the signal to advance. The king himself commanded the right wing. The Swedes charged and routed the first line of the imperial cavalry but were stopped by the second line, and at that moment Gustavus galloped away to the centre where a gap had opened and was killed leading a countercharge. The news of Gustavus' death spread and the fire of the assault died out. Wallenstein recaptured his guns and drove the Swedes back.

But the fiery Duke Bernhard of Saxe-Weimar took up the command and ordered a fresh advance. Again the imperialists were driven in and their guns recaptured, this time all along the line. About three in the afternoon the Swedes were slowly bearing back Wallenstein's stubborn infantry when Pappenheim appeared and charged at once in direction of the enemy's right. Wallenstein thus gained time to re-establish his order, and once more the now exhausted brigades of the Swedish first line were driven over the road. But Pappenheim fell in the moment of victory, and his death disheartened the imperialists. For the last time Bernhard forced the Swedes to the attack and thus carried the day.

Lutzen is famous also as the scene of a victory of Napoleon over the Russians and Prussians on May 2, 1813. (*See* NAPOLEONIC CAMPAIGNS.) This battle is often called Gross Gorschen.

LÜTZOW, ADOLF, FREIHERR VON (1782–1834), Prussian lieutenant general, was born in Berlin on May 18, 1782, and entered the army in 1795. At the outbreak of the "war of liberation," he received permission from Scharnhorst to organize a "free corps" consisting of infantry, cavalry and Tirolese marksmen, for operating in the French rear and rallying the smaller governments into the ranks of the allies. At Kitzen (near Leipzig) the whole corps, warned too late of the armistice of Poischwitz, was caught on the French side of the line of demarcation and, as a fighting force, annihilated. Lützow cut his way out with the survivors, and recruited and reorganized the corps, which fought at Gadebusch (where Korner fell), Gohrde (where Lützow was wounded) and at the siege of Jülich. At Ligny Lützow led the 6th Uhlans to the charge, but they were broken by the French cavalry, and he was captured, escaping, however, on the day of Waterloo. He died at Berlin on Dec. 6, 1834. One of the last acts of his life for which Lützow is remembered is his challenge (which was ignored) to Bliicher, who had been ridden down in the rout of the 6th Uhlans at Ligny, and had made, in his official report, comments thereon, which their colonel considered disparaging.

See K. von Lutzow, *Adolf Lützows Freikorps* (1884); Fr. von Jagwitz, *Geschichte des Lützow'schen Freikorps* (1892).

LUWIANS, an extinct people of ancient Asia Minor, also known as Luites. Their language, Luwian (Luvian, Luish) is known from cuneiform texts of the 14th and 13th centuries B.C. found at Boğazköy, the capital of the Hittites (*q.v.*), where it is referred to by the adverb *luwili* (lu-u-i-li), "in Luwian." This language is related to, but distinct from: Hittite; with Hittite and Palaic it belongs to the Anatolian group of Indo-European languages (see ANATOLIAN LANGUAGES). The language written with the so-called Hittite hieroglyphs, which were used for inscriptions from the 14th to the 7th century B.C., is very close to Luwian, probably nothing but a dialect of it; and the Lycian language, written in a variety of the Greek alphabet in the 5th and 4th centuries B.C., is equally related and may go back to still another dialect of Luwian. Personal names that have been claimed as Luwian are attested in Asia Minor from the 19th century B.C. to the Roman period.

Language.—Luwian shares with Hittite and Palaic the following characteristics: (1) it has only two genders, masculine-feminine (genus *commune*) and neuter; (2) the verb has a present and a preterit tense in the indicative mood and an imperative but no other moods; (3) it has an active and a middle form. The main differences between Luwian and Hittite are: (1) replacement of the genitive by a possessive adjective in *-assi-;* (2) a case in -ti serving as ablative and instrumental; (3) plural of the genus commune in *-nt:* nominative in *-nzi,* accusative in *-nza* (in cuneiform Luwian only, not in hieroglyphic). (4) The verb has 1st singular present in *-wi* (against Hittite -mi), 3rd singular in -ti, plural in *-nti* (against Hittite *-zi, -nzi*), preterit *-ta, -nta* (against Hittite *-t,* plural *-er*). (5) In the vocabulary, Luwian has a set of connective particles different from the Hittite. Some words are identical with or very close to their Hittite counterparts (often replacing Hittite *e/i* by a); others are different, such as tati, "father," against atta; and *massana,* "god," against *siuni,* etc.

Distribution and History.—The Hittite laws, datable to about 1500 B.C., mention Luwia as a foreign country. One copy of the laws replaces "Luwia" by "Arzawa." The term Luwia is not used thereafter, whereas Arzawa (Arzava) is frequent as the name of a large region comprising several principalities, probably in southwestern Asia Minor. If the variant means that "Luwia" and "Arzawa" were roughly synonymous (the older term standing for or at least including Arzawa), then Luwians would have lived in the southwest. The language is, however, also attested in Kizzuwatna, a country including the Cilician plain in the south, so that the old term Luwia may include that region also. Both Arzawa and Kizzuwatna were independent kingdoms during the Old Hittite period (c. 1700–1370 B.C.) but later became vassals of the Hittite empire, Kizzuwatna under the ruler Suppiluliuma (*c.* 1370 B.C.) and Arzawa under his son, Mursili II. Apparently Luwians both shared in and contributed to Hittite civilization. The Luwian texts found in the Hittite capital (mostly magic spells) as well as the use of hieroglyphs throughout the empire and the appearance of Luwian loanwords in Hittite texts testify to the penetration of the Hittite empire by Luwians, a process that increased toward the end of the empire, in the 13th century.

Since Luwians lived in southwestern and southern Anatolia, attempts have been made to ascribe to them certain types of pottery found in those regions, but these attributions remain hypothetical. Similarly, place names formed with the suffixes *-nd-* and *-ss-*, which are found in parts of Asia Minor and in Greece, have been claimed as Luwian. Closer examination of the place names occurring in Hittite texts has shown, however, that many of them are not Luwian and that they also occur outside the Luwian area. Personal names of Luwian type first occur in limited numbers toward the end of the Assyrian merchant colony period (c. 1800 B.C.). They were common in the Hittite period and survived until Roman times.

After the downfall of the Hittite empire (c. 1200 B.C.) hieroglyphic inscriptions in Luwian are common in southeastern Anatolia and northern Syria. Their appearance in Syria indicates an expansion of Luwians into regions not previously held by them. The history of the Luwians in the 1st millennium B.C. thus is the history of the so-called Late Hittite principalities—Tabal (biblical Tubal) around Kayseri, Tuwanuwa (classical Tyana), Gurgum with capital Marqasi (Maraş), Milit (Melitene, Malatya). Carchemish on the Euphrates, Hattina (the plain of Antioch) and Amatu (Hamath). The hieroglyphic inscriptions are of votive character, containing little more than the names of rulers. sometimes with genealogies. Most historical information about these states comes from the annals of Assyrian kings, who repeatedly raided them and imposed tributes, until Sargon II (722–705 B.C.) incorporated them as provinces into his empire. Most Syrian states were conquered by Aramaeans prior to the Assyrian conquest; but in the Anatolian principalities (Tabal, Tuwanuwa, Milit) and above all in Carchemish, the most important kingdom of the group, Luwian proper names and hieroglyphic script remained in use until the end. From roughly 700 B.C. also is dated the bilingual inscription in Phoenician and hieroglyphic Luwian discovered at Karatepe in eastern Cilicia. What little is known about Lycia (*q.v.*), finally, comes from classical sources.

Religion and **Civilization.**—Luwian gods were incorporated into the pantheon of the Hittites. On the whole, the beliefs of the two peoples were very similar so that their gods could easily be identified with one another. The chief god in both systems was a god of thunderstorm and rain, called Tarhunt in Luwian. The Luwian sun god was called Tiwat; the moon god had the same name, Arma, in both languages. Other gods worshiped in Luwian belong to different ethnic groups; *e.g.*, Kupapa, the main goddess of Carchemish. A Luwian dialect was used in the cult of the gods of the town of Istanuwa (location unknown). The presence of Luwian magical rituals in the Hittite capital indicates that Luwians had a certain reputation as magicians. In the late hieroglyphic inscriptions some of the gods known from earlier cuneiform texts recur. In these inscriptions the gods are asked to punish anyone who might damage the object or the text.

As stated earlier, the Luwians partook in the general Hittite civilization. Whatever institutions or cultural traits may have been typically Luwian remains to be determined. The small Luwian states of the 1st millennium carried on the Hittite tradition, as witnessed by the traditional Hittite names of some of their rulers, such as Lubarna, Sapalulme, Katuzili or Muwatalli, and by the name "Hittite" given them by both the Assyrians and the Israelites of the period of the monarchy. The art of these states combines Hittite motifs with others of more generally near-eastern origin; its style, which differs markedly from that of the Hittite empire, was influenced by that of the Aramaeans and, later, of the Assyrians, so that it is hard to identify specifically Luwian characteristics. On the whole it appears that the main importance of the Luwians lies in the continuation of Hittite tradition after the downfall of the empire.

LUXEMBOURG, FRANÇOIS HENRI DE MONTMORENCY-BOUTEVILLE, DUKE OF (1628–1695), marshal of France, the comrade and successor of the great Condé, was born at Paris on Jan. 8, 1628. He was the son of the comte de Montmorency-Bouteville, and was brought up by his aunt, Charlotte de Montmorency, princess of Condé, with her son, the duc d'Enghien. The young Montmorency (or Bouteville as he was then called) shared his cousin's successes and reverses throughout the troubles of the Fronde. He returned to France in 1659 and was pardoned, and Condé arranged his marriage to the greatest heiress in France, Madeleine de Luxembourg-Piney, princesse de Tingry and heiress of the Luxembourg dukedom (1661), after which he was created duc de Luxembourg and peer of France. At the opening of the War of Devolution (1667–68), Condé, and consequently Luxembourg, had no command, but during the second campaign he served as Condé's lieutenant-general in the conquest of Franche Comté. In 1672 he held a high command against the Dutch. He defeated the prince of Orange at Woerden and ravaged Holland, and in 1673 made his famous retreat from Utrecht to Maestricht with only 20,000 men in face of 70,000, an exploit which placed him in the first rank of generals. In 1674 he was made captain of the gardes du corps, and in 1675 marshal of France. In 1676 he commanded the army of the Rhine, but failed to keep the duke of Lorraine out of Philipsburg; in 1677 he stormed Valenciennes; and in 1678 he defeated the prince of Orange, who attacked him at St. Denis after the signature of the peace of 'Nijmwegen. Luxembourg spent some months of 1680 in the Bastille, but on his release took up his post at court as *capitaine* des gardes.

When the war of 1690 broke out, the king and Louvois gave Luxembourg command of the army of Flanders. On July 1, 1690, he won a victory over the prince of Waldeck at Fleurus. In 1691 he commanded the army which covered the king's siege of Mons and defeated William III. of England at Leuze on Sept. 18, 1691. Again in the next campaign he covered the king's siege of Namur, and defeated William at Steenkirk (*q.v.*) on June 5, 1692; and on July 29, 1693, he won his greatest victory over his old adversary at Neerwinden, after which he was called *le tapissier de Nôtre* Dame from the number of captured colours that he sent to the cathedral. He was received with enthusiasm at Paris by all but the king, who looked coldly on a relative and adherent of the Condés. In the campaign of 1694, Luxembourg did little in Flanders, except that he conducted a famous march from Vignamont to Tournay in face of the enemy. He died on January 4, 1695. As a general he was Condé's grandest pupil. Though slothful like Condé in the management of a campaign, at the moment of battle he seemed seized with happy inspirations, against which no ardour of William's and no steadiness of Dutch or English soldiers could stand. He left four sons, the youngest of whom was a marshal of France as Maréchal de Montmorency.

See, besides the various memoirs and histories of the time, Beaurain's *Histoire militaire du duc de Luxembourg* (Hague and Paris, 1756); *Mémoires pour servir à Phistoire du maréchal duc de Luxembourg* (Hague and Paris, 1758); Courcelles, *Dictionnuire des généraux français*, vol. viii. (Paris, 1823). *See* Ségur *La jeunesse du mare'chal de Luxembourg, 1628–68* (1900); *Le mare'chal de Luxembourg-et le prince d'Orange, 1668–98* (1902) and *Les dernières années du mare'chal de Luxembourg* (1904), also Canonge, *Le mare'chal duc de Luxembourg* (1924).

LUXEMBOURG. A sovereign grand duchy of Europe, Luxembourg comprises part of the southern Ardenne uplands and part of the adjoining plateau of Lorraine. It is bounded on the north and west by Belgium, on the east and southeast by Germany and on the south by France. It has an area of 2,586 sq.km. (999 sq.mi.), with maximum distances of 82 km. (51 mi.) from north to south and of 57 km. (35 mi.) from east to west.

The Ardenne region (or Oesling) in the north constitutes nearly one-third of the grand duchy and has an altitude of 1,300 to 1.850 ft.; the southern half of the country (Gutland or the Bon Pays) has an average elevation of 900 ft. The whole of Luxembourg is dissected by deep valleys, whose rivers drain mostly eastward into the Sûre, which in turn runs into the Moselle on the eastern frontier.

History.—At the time of the Roman conquest between 57 and 50 B.C. the area of what is now Luxembourg was inhabited by a Belgic tribe, the Treveri. The population received a fair Roman infusion during the occupation. After A.D. 400 Germanic invaders began to penetrate into the region, and it became part of the Frankish kingdom of Austrasia and later of Charlemagne's empire. By the treaty of Verdun (843) the area was included in the central division of the three into which that empire was split, but it became an independent entity in 963 under Siegfried, count of Ardenne. Conrad (d. 1086), a descendant of Siegfried, took the title of count of Luxembourg *c.* 1060, and his successors enlarged their possessions, chiefly by marriage. Conrad's great-granddaughter the countess Ermesinde (1196–1247) granted charters of franchise to most of the important towns of the county. Her great-grandson Hen IV became German king in 1308 and Holy Roman emperor as Henry VII, and the Luxembourg dynasty was continued on the imperial throne in the persons of Charles IV, Wenceslaus and Sigismund (d. 1437). In 1354 the emperor Charles IV made the county a duchy. The French branch of the house of Luxembourg descended from Waleran of Ligny, younger son of Ermesinde's son Count Henry II.

The country was bought (1442) by Philip the Good of Burgundy from Sigismund's Habsburg successors but reverted to the Habsburgs on the partition of Burgundy in 1506. Spanish domination began in 1555–56, with the abdication of the emperor Charles V. In the revolt of the Low Countries against Philip II, Luxembourg took no part; it was to remain united with what is now Belgium as the Spanish Netherlands. During the 17th century the French under Louis XIV annexed several towns of the area, and Luxembourg itself was captured in 1684 but was returned 13 years later to Spain by the treaty of Ryswick. In 1713 Luxembourg with Belgium passed from the Spanish to the Austrian Habsburgs. It was occupied by the French republic in 1795 and became a department of France under Napoleon.

The congress of Vienna in 181j gave Luxembourg as a grand duchy to William I, king of the Netherlands. Districts lying to the east of the Moselle, Sûre and Our were handed over to the king of Prussia. Luxembourg had the legal position of an independent state, in personal union only with the Netherlands, and was included within the German confederation. However, William I succeeded in uniting the grand duchy de *facto* and *de jure* with his kingdom, as its 18th province. But when the Belgian provinces revolted against William the greater part of the country, with the notable exception of the town of Luxembourg itself (then garrisoned by Prussians), sided with them. In Nov. 1831 the powers divided the country into two parts, of which the larger (now the Belgian province of Luxembourg) went to Belgium and the smaller, in the east, was retained by William I, who, however, refused to accept the decision until 1839. From that year until 1867 the grand duchy was administered separately from the Netherlands. It received from William II a restricted constitution in 1841 and a more liberal one in 1848. After the dissolution of the German confederation in 1866 the link which bound Luxembourg to Germany was broken. but the Prussian garrison still remained in the capital. In 1867. by the treaty of London, this garrison was withdrawn; the neutrality of the grand duchy was guaranteed by the powers, and its sovereignty was vested in the house of Nassau. On the death of William III of the Netherlands in 1890 aithout male heir, the grand duchy passed. in accordance with the Nassau Succession agreement (1783). to Adolphus, duke of Nassau-R'eilburg (d. 1905), who was succeeded by his son William (d. 1912). In 1914 the neutrality of Luxembourg was violated by Germany. On Jan. 1j. 1919, after its liberation, William's daughter, the gracd duchess Marie-Adélaïde, who had shown pro-German sympathies. abdicated in favour of her sister Charlotte. Charlotte, born at the Berg castle, Lux., on Jan. 23, 1896. was married on Nov 6 1919 to Prince Felix of Bourbon-Parma. Prince Jean, their eldest son (b. Jan. 5, 1921). the heir apparent. was married on April 9, 1953, to Princess Josephine Charlotte (b. Oct. 11, 1927), daughter of former king Leopold III of Belgium. On April 16, 1955, she gave birth to a son, Henri.

Luxembourg was occupied again by the Germans from 1940 to 1944, during World War II. Civil government was finally re-established in Sept. 1944. Though it suffered some damage in the fighting of 1944, the industrial capacity of Luxembourg was not seriously impaired, and the country soon regained its prosperity.

Population. — The population of Luxembourg was 290,992 in the census of 1947 and 314,889 in 1960. The chief tonns (1960 census) are Luxembourg (71,653), Esch-sur-Alzette (27,954) and Differdange (17,637).

TABLE I.—Population Statistics, 1910–58

Year	1910	1922	1930	1935	1947	1958
Male	134,101	132,023	154,405	149,429	145,096	163,346
Female	125,790	128,744	145,588	147,484	145,896	158,697
Total*	259,891	260.767	299,993	296,913	290,992	322,043
Foreigners	39,723	33,436	55,831	38,369	29,142	

*Foreigners included

The people are essentially a peasant stock, hard-working and thrifty, individual and conservative and inspired by a strong sense of nationality. They form a bilingual nation and possess, in addition to French and German, a widely spoken dialect. Both French and German became official languages in 1830 and this was confirmed by the constitution of 1848. There are no special areas in which one or the other is exclusively spoken, and education is given in both tongues. The native dialect. *Letzeburgesch,* is a Moselle Franconian (one of the West Middle German group) and is used by all classes. In Oct. 1939 it was made the third official language of the country. About 98% of the population are Roman Catholic. An episcopal see was created at Luxembourg in 1870.

Government and Administration. — The grand duchy is a constitutional monarchy, ruled by a hereditary grand duke or grand duchess. Should the sovereign die without legal issue, the chamber of deputies elects a successor. The sovereign power is vested in the nation and is exercised by the monarch according to the constitution and laws of the country.

The constitution, modelled on that of Belgium, was proclaimed in Oct. 1868. Modifications introduced in 1918 vested sovereignty in the nation (article 32) and instituted election to the chamber of deputies on the basis of universal suffrage of all citizens over 21 years of age exercised according to a system of proportional representation. Every citizen has equality before the law, freedom of religious belief, of expression and of association. etc. The constitution had defined the international status of Luxembourg by guaranteeing the perpetual neutrality of the state in accordance with the treaties of 1839 and 1867, but this was abolished by a revision of 1948, and the country became a signatory to the Brussels and North Atlantic treaties.

Legislative poaer is shared by the sovereign and the chamber of deputies. The sovereign exercises the executive power and has the right to initiate legislation. A council of government appointed by the monarch and consisting of a minister of state (prime minister) and five other ministers (*directeurs-généraux*), uho may each be responsible for several departments. constitutes the administration which in practice, though not in theory, is based upon the support of the chamber.

All laws must be passed by the chamber. This body is elected on the basis of one member to constituencies (grouped in four electoral districts) of 5,500 inhabitants, with one extra representative for a residue of 3,000. Deputies hold office for six years, and one-half their number retires every three years. Decisions are by a majority vote. and debates are in French.

There is also a council of state, of not more than 1j members, appointed for life by the sovereign. This body considers any proposed legislation or any administrative problems submitted to it by the sovereign or government From its members is elected every six years a committee of seven (*comité du contentieux*), which acts as a final judicial court in cases relating to the powers of the administration

Five professional chambers (*chambres professionelles*) were set up by a law of April 4, 1924, to share in legislation. These bodies are composed of representatives from agriculture, handicrafts, commerce, private employees and labour. No law affecting a particular occupation can be passed by the chamber of deputies until the opinion of the interested professional chamber(s) has been given.

The basic unit of local government is the commune. Each commune is administered by an elected council and has a burgomaster and two aldermen (*échevins*). The council is both a local administrative body and an instrument of the central authority. Its term of office is six years, one-half its members retiring every three. The burgomaster and the kchevins (except for the city of Luxembourg) are appointed by the government; those for Luxembourg are nominated by the sovereign. These officials are the executive heads of the communes. As in Belgium, the commune has a great measure of independence. and within the competence of its council fall such matters as public undertakings, elementary education, public health, etc.

The communes themselves are grouped into cantons and these in turn into arrondissements administratifs, each of which is administered by a *commissaire* du district, who represents the government in general matters of policy and administration and is appointed by the sovereign.

The Legal System.—Judicial power is exercised by courts and tribunals, whose decisions are executed in the name of the sovereign. The system and conception of law has been influenced by the Napoleonic code. Constitutional rights are similar to those of Belgium, and the penal code is based on the Belgian one of 1867. There is a close parallel with German economic and social legislation, a result of the country's inclusion within the Zollverein from 1842 to 1918.

Administration is centralized in a minister of justice. and the law is codified. Judges are appointed for life. The lowest court is that of jusfice de paix within each canton. Here the *juge* dc la paix has summary jurisdiction in the case of a breach of police regulations and in certain minor civil and commercial cases. Next, within the, two *arrondissements* judicinires of Luxembourg and Diekirch, come the tribunaux d'arrondissement, composed of a president and a number of judges. They serve as courts of appeal against the verdicts of the lower courts; their correctional jurisdiction embraces all offenses except serious crimes. with civil and commercial matters in the first instance. At the head of the judicial hierarchy is a cour *supérieure* de jusfice, which acts as a court of appeal and a court of cassation (*i.e.*, for the revision of legal procedure). Every three months the cour *supérieure* appoints a cour d'assises, which acts as a central criminal court, its six judges being also jurors and giving their verdict by majority vote, with acquittal in the case of an equal division.

In 1930 a central state police force (police sociale *étatisée*) was established. Gnder a chef de corps are three commissioners, each responsible for one of the police districts of Luxembourg (city), Diekirch and Grevenmacher. Local police commissioners within the communes are nominally under the authority of the burgomaster but are in practice supervised by the district commissioners. The police are supplemented by a small force of gendarmes.

Trade and Finance.—The economic union concluded between Luxembourg and Belgium in 1921 was dissolved in 1940 but was re-established in May 1945. A partial customs union was concluded between these two countries and the Netherlands in March 1947, and thencefor ard the possibility of a more complete economic integration between the two former countries and the latter was repeatedly explored. Luxembourg also became a member of the European Coal and Steel community, which began to function on Aug. 10, 1952, and was designed to integrate the industries within five west European countries (France, German Federal Republic, Belgium. Luxembourg. Italy).

TABLE 11.—*Budget*[a]

(In millions of francs)

Year	1938	1946	1948	1950	1953	1954†	1956†
Receipts	365	2,313	5,115	3,511	4,604	3,867	3,606
Expenditure	355	2,655	4,640	3,341	4,625	4,379	4,141
Balance	+10	−342	+475	+170	−21	−512	−535

*In 1913 receipts amounted to 21,743,000 fr., expenditure to 21,724,000 fr., leaving a balance of +19,000 fr. †Estimated.

TABLE 111.—*Public Debt*

(In millions of francs)

Year	Consolidated at each year end			Floating debt (year end)			Grand total
	Internal	External	Total	Internal	External	Total	
1913	...	10	10	...	...	17.1	27.1
1938	404.0	220.7	624.7	102.8	...	102.8	727.5
1945	456.5	329.8	786.3	360.0	1,026.6	1,386.6	2.172.9
1954	2,649.3	660.0	3,309.3	1,826.3	2,185.0	4,011.3	7,320.6

The monetary unit is the Luxembourg franc, which by decree of Oct. 14, 1944, was made equal to the Belgian franc. Tables II and III show the state budget and the public debt.

Communications.—The roads of the grand duchy are classified as follows: *routes* de l'ktat, which connect the principal centres; roads belonging to the communes but maintained by the state; and the two grades of local roads, which belong to the communes. The length of roads is 4,503 km. (2,796 mi.).

The railway system forms a link in communications between Belgium, the Netherlands, France, Germany and Switzerland and thus carries a considerable amount of international transit traffic. The standard-gauge lines belong to two companies, the Guillaume-Luxembourg and the Prince Henri. and have a length of 244 mi. Narrow-gauge (one metre) light railways are run by the state and have a length of 52 mi. The Moselle will carry 200-ton barges.

Agriculture and Industry.—Agriculture is the occupation of approximately a quarter of Luxembourg's working population (33,470 in 1938; 33,536 in 1950); since, however, the crop yields are low in comparison with those of neighbouring countries and there is no adequate system of tariffs, it has to be protected by subsidies and credits at low rates of interest. Gutland or the Bon Pays is an area of light and fertile soil, with a good climate. Farmhouses are concentrated into villages, and the fields of individual farmers are often scattered. Crops are distributed evenly between grain, roots and green fodder. Wheat, rye and potatoes are mostly raised for human consumption, oats, barley, roots and clover for animal. Considerable areas of the Ardenne are forested or covered with too poor a soil for cultivation. Arable land is found on the plateaus rather than in the steep-sloped narrow valleys, and the main crops are oats and potatoes. Vineyards extend along the slopes of the Moselle and the lower Siire.

TABLE IV.—*Number of Workers in Mining and Steel Industry*

Year	1929	1938	1947	1950	1955	1956
Native	17,390	16,138	15,016	16,993	18,850	19,110
Foreign	11,548	4,279	2,795	3,464	3,170	3,210
Total	28,938	20,417	17,811	20,457	22,020	22,320

TABLE V.—*Mining and Metallurgical Production*

(In thousand metric tons)

Year	1929	1938	1946	1952	1954	1955
Iron ore	7,571	5,141	2,247	7,246	5,892	7,205
Pig iron	2,927	1,551	1,365	3,076	2,796	3,085
Steel	2,703	1,437	1,295	3,002	2,832	3,225

The raising of livestock, especially cattle, forms the major part of agriculture, and the majority of holdings each support a few head of cattle throughout the country. Sheep raising has been long declining, and pig breeding, particularly in the Bon Pays, was tending to supplant it at mid-20th century. Almost all farm produce is absorbed by the home market, and throughout the country there are many co-operative societies for its marketing.

The two major industries of the grand duchy are mining and metallurgy (see Tables IV and V). The large-scale exploitation of ore (termed minette) began with its working in central and southern Luxembourg as early as the 17th century. The most important deposits, which are an extension of the Lorraine field, are found in the extreme southwestern corner of the grand duchy and cover an area of 9,000 ac. in the basins of Esch, Rumelange-Dudelange and Pktange-Differdange. The iron ore content varies considerably, averaging 31%. It is relatively easy to extract, but requires 1,250 kg. of coke to produce a ton of pig iron.

Other industries include a small amount of engineering, textiles, tanning and leather, chemicals and cement.

Education.—Education, compulsory between the ages of 6 and 13, is administered by two government departments. Primary,

secondary and higher education is under a permanent director general. Responsibility for technical education is that of the department of public works. In each commune is a school committee under the burgomaster, and expenditure is shared jointly by it and the state. Primary education is free and entirely under state control. Schools are divided into kindergarten, primary, higher-grade primary and continuation (*cours post-scolaires*). Secondary schools are also supported by the state and communes, and pupils enter them at about 12 years of age. There is no university in Luxembourg, but students are permitted to continue their education in foreign ones.

LUXEMBOURG, province of southeast Belgium, formed of the high wooded Ardennes. Area 1,706 sq.mi.; pop. (1955 est.) 216,394. The upper Ourthe and lower Semoise valleys are much visited. The extreme south, often called Belgian Lorraine, has mines of minette (iron ore) and there, to the south of the high Ardennes, cultivation also prospers. On the higher ground are forest industries and slate quarrying at Vielsalm, Herbeumont, Bertrix, Martelange, etc. The chief towns are Arlon (the capital), Virton, Marche, and Bastogne. There are 5 administrative *arrondissements,* 20 cantons and 233 communes.

LUXEMBOURG or Lutzelburg (the little fortress or town), capital of the grand duchy of the same name (*see* above), situated on the Alzette, a tributary of the Sûre. Pop. (1960 census) 71,653. It is situated on cliffs which overhang the river, and the principal portion of the town with the palace and public buildings covers a central plateau. The more densely populated parishes of Clausen, Pfaffenthal and Grund lie in the valley. The fortress, considered the strongest in Europe after Gibraltar, was dismantled in 1867. Two viaducts carry the railway and the approach from the railway station to the town. The Alzette is lined with tanneries, breweries and distilleries. The Hôtel de Ville contains a collection of antiquities. The church of Notre Dame was built in 1613, and that of St. Michael dates in part from 1320. There are two annual fete days, one in honour of Our Lady of Luxembourg, patroness of the city, held on the Sunday before Ascension Day, and the other the annual fair or *Schobermesse* (tent fair), instituted in 1340 by Count John of Luxembourg, king of Bohemia, and held on Aug. 24.

LUXEMBURG, ROSA (1870–1919), German revolutionary, known as "rote Rosa," was born at Zamość, Russian Poland, on Dec. 25, 1870. An active worker among Polish socialists, she migrated about 1895 to Germany, where she married a German workman in order to acquire German nationality. In 1898 she edited the Saxon *Arbeiterzeitung,* but shortly afterwards joined the staff of the *Leipziger Volkszeitung.* She took part in the Russian revolution of 1905, and on her return to Germany founded with Karl Liebknecht the Spartacus league. In 1914 she was sentenced to a year's imprisonment for inciting to insubordination and throughout World War I remained in preventive custody. After the revolution she edited, with Liebknecht, the communist paper, *Rote Fahne.* They were arrested on Jan. 15, 1919, on the charge of instigating the street fighting in Berlin which had taken place a few days earlier. While being conveyed to the Moabit prison they were brutally attacked by army officers. Liebknecht was murdered and Rosa Luxemburg died a few hours later from injuries received. Her body was thrown into the canal, and only found some days later.

Bibliography.—Her works include *Die Akkumulation des Kapitals* (1913); *Die Krise der Sozialdemocratie* (1919) under the pseudonym "Junius"; *Briefe aus dem Gefängnis* (1920) and *Briefe an Karl und Luise Kautsky, 1896–1918. See* also G. Zinoviev, *Karl Liebknecht et Rosa Luxemburg* (1919); C. P. A. F. Liebknecht, *The Murder of Karl Liebknecht and Rosa Luxemburg* (1924).

LUXOR, more properly El-Aksur, "The Castles" (plur. of kasr), a town of Upper Egypt, on the east bank of the Nile, 450 mi. above Cairo by river and 418 mi. by rail. It is the centre for visitors to the ruins of and about Thebes, and has several fine hotels. There are Anglican and Roman Catholic churches, and a hospital opened in 1891. The district is the seat of an extensive manufacture of forged antiques.

The temple of Luxor is one of the greatest of the monuments of Thebes (*q.v.*). It stands near the river bank on the S.W. side of the town and measures nearly 300 yd. from back to front. There may have been an earlier temple here, but the present structure, dedicated to the Theban triad of Amen, Mut and Khansu, was erected by Amenhotep III. The great colonnade, which is its most striking feature, was apparently intended for the nave of a hypostyle hall like that of Karnak, but had to be hastily finished without the aisles. After the heresy of Amenhotep IV (Akhenaton), the decoration of this incomplete work was taken in hand by Tutenkhamon and Horemheb. The axis of the temple ran from southwest to northeast; a long paved road bordered by recumbent rams led from the façade to the temples of Karnak in a somewhat more easterly direction, and Rameses II adopted the line of this avenue in adding an extensive court to the work of Amenhotep, producing a curious change of axis. He embellished the walls and pylons of his court with scenes from his victories over Hittites and Syrians, and placed a number of colossal statues within it. In front of the pylon Rameses set up colossi and a pair of obelisks (one of which was taken to Paris in 1831 and re-erected in the Place de la Concorde). Alexander the Great rebuilt the sanctuary. The chief religious festival of Thebes was that of "Southern Opi," the ancient name of Luxor. The sacred barks of the divinities preserved in the sanctuary of Karnak were then conveyed in procession by water to Luxor and back again; a representation of the festal scenes is given on the walls of the great colonnade. The Christians built churches within the temple, and a mosque used to cover its western end. Clearance and restoration was begun by the Service des Antiquités in 1885, and has been vigorously pursued since. The principal street of Luxor follows the line of the ancient avenue.

LUXORIUS, Roman writer of epigrams, lived in Africa during the reigns of the Vandal kings Thrasamund, Hilderic and Gelimer (A.D. 496–534). He speaks of his poor circumstances, but, from the superscription *clarissimus* and *spectabilis* in one ms., he seems to have held a high official position. About a hundred epigrams by him in various metres (the elegiac predominating) have been preserved. They are after the manner of Martial, and deal chiefly with the games of the circus and works of art. Luxorius also wrote on grammatical subjects (*see* R. Ellis in *Journal of Philology,* viii, 1879). The epigrams are contained in the *Anthologia Latina,* edited by F. Bücheler and A. Riese (1894).

LUXURY. The word luxury is derived from the Latin *luxus,* which may be translated "superfluous abundance." As generally used, it implies the notion of a relatively large consumption of wealth for unessential pleasures. But there is no absolute definition of luxury, for the conception is essentially relative to both time and person. It is a commonplace of history that the superfluities of one generation may become the necessaries of a subsequent period; there is no hard and fast line which can be drawn between luxuries, comforts and necessaries. The private bath was one of the greatest luxuries of the Roman empire; in the 19th century its use was largely confined to the wealthy; today it may be ranked amongst the necessaries of life. Looked at from one important standpoint, luxury might be defined as any expenditure which is in excess of the normal and customary standard of living of the class to which the individual concerned belongs.

The problem of luxury is one which involves economic, social and ethical considerations.

The Economic Aspect.—Viewed from the economic standpoint luxury has undoubtedly played a great role in the history of economic development. W. Sombart in his *Luxus und Kapitalismus* has shown that the luxurious expenditure of the papacy and of the courts in the middle ages had a not unimportant share in the growth of modern capitalism. The rentals of distant estates were concentrated at some central spot; wealth was accumulated there; a relatively large market was created for the products of certain industries and the necessary conditions for the development of capitalist enterprise were fulfilled.

In France, the classic land of luxury, the continual drain of wealth from the countryside to Paris and Versailles combined as it was with a vicious system of taxation and the burdensome restrictions of feudal tenure, produced, on the one hand, a considerable amount of industrial activity carefully fostered by the mercantilist policy of Jean Colbert and his successors; but, on the other hand, it led eventually to the disruption of the old social order amidst the turmoil of the French Revolution. It is one of the paradoxes of history that a precisely opposite view and method of life—that of the Puritans, with their strong moral condemnation of luxury and their emphasis on the value of hard work and abstinence from all unnecessary consumption—should have contributed even more notably to the gron th of capital and to the expansion of industry and commerce.

In other directions, also, luxury has made its influence felt. Thus in Italy the rise of the merchant princes gave a new direction to the whole course of art, for the mediaeval church ceased to be the chief patron of the artist, who now had to conform in his work to the standards and tastes of those who provided the market for his products. The simple piety of the primitives gave place to the sumptuous paganism of the Renaissance period. and that in turn to the elaborate ornamentation and decorative inventiveness which was perhaps at its best in the metal work of Benvenuto Cellini, until at length the over-refinements of a decadent social life killed all artistic inspiration.

Luxury is the inevitable concomitant of the growth of wealth, which brings with it the increase and the differentiation of wants. The fact that the fundamental needs of mankind for a minimum of food, clothing and protection from the weather are relatively soon satisfied gives rise to a demand for greater variety and finer qualities as soon as income rises above the bare subsistence level. This demand, which is especially strong among the feminine portion of the human race has, in the past, been a great stimulus to economic progress for it has provided an enormously strong incentive to work and effort.

The attitude of the great majority of people towards the luxurious expenditure of the rich is a mixture of envy, often devoid of any feeling of resentment, and of approval based on popular economic reasoning. It is a very widespread belief that such expenditure is good for trade because it makes money circulate and therefore increases employment. The classical economists, down to and including Alfred Marshall, had no hesitation in declaring that this reasoning was based on a fallacy. They agreed that the maintenance of racing stables or private yachts, the purchase of magnificent furs or jewellery, does give employment to those engaged in the trades concerned, and that the localities in which these trades are situated benefit from such expenditure. But they argued that the fallacy of such reasoning lay in ignoring the fact that the aggregate real resources of producing power in a country are limited at any one time. A large amount of capital and labour is required to make and equip yachts and racing stables, and this capital and labour is withdrawn from other uses to which it would be put. If the wealth consumed extravagantly was saved and invested, the volume of capital would be increased, the rate of interest would tend to fall and there would be a larger demand for labour to co-operate in the production of goods consumed by other sections of the community. If, in a capitalist society, there was a sudden change in the standards of expenditure of the wealthy classes such that all expenditure commonly recognized as luxurious was regarded with strong social disapprobation, these persons would find themselves impelled to save on a much larger scale than formerly, and a great deal more capital would be available for production. But as the ultimate aim of production is consumption the net effect of the change of policy in regard to expenditure would be to transfer additional spending power to all the less wealthy members of the community. The latter would benefit by higher money wages, owing to the greater demand for their services, and from the still higher *real* wages, owing to the fall in the rate of interest and to the larger production of the type of commodities which they consume. Some proportion of this increased wealth would be consumed by the poorer classes in the form of luxuries, as we have defined this term above, or in an increased enjoyment of the quasi commodity, leisure. The ultimate consequences of such a change would depend, firstly, upon the economic and social effects of this transfer of real income to the poorer classes and secondly, upon the willingness of the wealthier classes to continue to work as hard and efficiently as formerly to produce incomes which they do not themselves enjoy by consumption, and the spending power of which they in fact transfer to other people. The classical view of the economic effects of luxurious expenditure was accepted thus far. Later, however, and particularly under the influence of the ideas put forward by Lord Keynes, a fresh turn was given to the discussion.

When closely examined the classical view is found to depend for its validity upon the assumption of full employment of the community's available resources. If there are idle resources and if the saving portion of the community prefer to hold their savings in the form of money rather than in the form of investing them in some income-yielding use (other than the purchase of old securities), then any additional expenditure on the part of any section of the community will increase the volume of employment and make the total national income larger than it would otherwise have been.

While it is true, on the one hand, that the country as a whole cannot save what it cannot invest, any given level of investment and saving may fall short of occupying fully all the resources of the economy. Under these conditions a decision by an individual to save rather than to spend part of his income may merely have the effect of inflicting an equivalent loss on other individuals. The saver will, it is true, hold a larger command over the community's wealth than before, whether in the form of money, or in the form of securities which have had to be sold by other members of the community in order to finance their losses, but the total savings of the community have not been increased, they have diminished, because of the resultant fall in the national output and income. It still remains true that the community will normally benefit more by an expansion of investment than by an increase of luxurious expenditure, but if the savings would otherwise run to waste in an increase of hoarding, then a rise in what is called the "propensity to consume" will increase the total volume of employment and output, and will not, as in the classical case, be at the expense of an equivalent amount of investment which would otherwise have been made. In this way the popular argument has partially come into its own again in relation to short period analysis and to certain phases of the trade cycle when there is a shortage of effective demand.

The Social Aspect.—As T. B. Veblen showed in his *Theory of the Leisure Class*, the evils of bad standards of expenditure are not confined to the wealthy classes from which they spring; they propagate and perpetuate themselves by example and imitation right down the social scale from top to bottom; what is called snobbishness is a very potent social force, but it is one which may as easily work for the good as for the harm of humanity. It has been well said that mankind is nowhere more vulgar than in the way in which it spends its income.

No amount of time, effort or thought is grudged to the acquiring of wealth, but when we come to consume it we dissipate the fruits of our labours often with small gain to ourselves and with unforeseen and undesired repercussions on the welfare of the community as a whole. What R. H. Tawney termed — in The *Acquisitive Society* — is the outcome of false social values inspired by the all-pervading impulse to acquire riches to the elimination, or at least repression. of other higher ideals.

While the churches wrangled over doctrine, they largely ignored the great problem of the art of spending which had become so large a part of the art of living.

The **Moral** Aspect. — Moralists of all ages have attacked luxury on ethical grounds — the Stoics, because it ran counter to their ideals of simplicity of life; the early Christian fathers, because they exalted asceticism and poverty into an ideal; the Puritans, because they feared lest the distractions and temptations of luxury might imperil the immortal soul and endanger its chances of salvation; the Socialists, because they hold unnatural and immoral the coexistence of luxury on the one side and poverty on the other.

In later times the tendency was increasingly for the moral judgment of luxury to be associated with the general problem of the unequal distribution of wealth—a view which, as is pointed out above, overlooks the fact that luxury is not confined to the richer sections of the community. The rigid condemnation of all luxury on moral grounds is untenable, if only for the reasons that there is no absolute measuring rod by means of which the ultimate social ethical value of expenditure can be tested, and that economic progress and changing standards of life so quickly alter contemporary notions of the types of expenditure that may be included under the category of luxuries. However, a great deal of luxury is undoubtedly a waste of life, not only because of the ill effects it may have upon the individuals, themselves, but also because the resulting satisfaction is frequently out of all proportion to the expenditure. As A. C. Pigou pointed out in his Economics of *Welfare*: "It is at least arguable, that, after a point, as growing wealth gives a man command over more and more luxuries the satisfaction that he gains from each one is, as it were, taken out of relaxed interest in the others, so that the satisfaction which he derives on the whole is not substantially increased."

Consumption has its ethical as well as its economic aspects and there are heavy moral responsibilities involved in the exercise by the individual of his right of disposal over the wealth which economic forces and social laws have placed in his hands.

LUXURY TAXES. The imposition of indirect taxes, whether in the form of a general sales tax or of taxes on specific commodities, raises difficult questions in welfare economics. In the case of a general sales tax, since rich and poor are taxed alike on each pound or dollar spent, taxation will take a larger portion of low incomes than of high ones. In the case of new or increased taxes on specific commodities, the consequent rise in price may either reduce sales and output or, where demand is inelastic, reduce the demand for other commodities. Unless the taxed article is a luxury, consumed only by a small number of people, the tax will be regressive and social hardships may ensue.

In the late 18th and early 19th century, taxes were levied in England on carriages and manservants in order to secure revenue from the rich. Such taxes contrasted with those on corn, sugar and timber, which fell also on the poor, often calamitously. While the development of a progressive income tax has modified the whole fiscal structure, luxury taxes on certain commodities, like perfume and furs, have remained.

There are three problems relating to luxury taxes. First, they may lead to a heavy fall in demand and to a reduction in revenue. The English window tax (1695–1851) reduced the number of windows considerably. Against the background of a progressive tax system, a second problem arises even where demand is inelastic. High luxury taxation reduces the volume of private savings and consequently may increase the amount of taxation required for adequate revenue. The third problem concerns the definition of "luxury." Clergymen and doctors complained persistently in the middle of the 19th century that carriages were "*bona fide* articles required for the practice of a hard-working profession" and should be exempt from duty, as were carts and horses used by farmers and tradesmen. Apart from such burdens on special groups of consumers, "the luxuries of today become the necessities of tomorrow." High luxury taxation may inhibit the distribution of commodities which would fall rapidly in cost given greater demand.

The favourite argument used by exponents of luxury taxation has been moral rather than economic. Paternalist governments have imposed luxury taxes to restrict private expenditure in certain directions. In England from the 14th to the 16th centuries there was a wealth of sumptuary legislation, designed to repress the ostentation and extravagance of private persons. In the 19th and 20th centuries, increased emphasis has been placed on private expenditure upon alcohol, tobacco, entertainment and automobiles. Such expenditure is superfluous in the sense that a large part of it is in excess of what is required for economic efficiency and personal well-being, and governments have justified high taxation on such goods and services on the grounds that the uncontrolled consumption pattern is an unwise one.

Two additional considerations often enter this argument. In time of war it is often considered socially desirable to interfere with the consumption pattern. William Pitt introduced a wide range of sales taxes during the Napoleonic Wars, while during World War II a purchase tax was levied on a long schedule of commodities. In time of peace, also, there is often pressure to impose luxury taxation for reasons connected with the balance of payments. One of the motives of mediaeval sumptuary legislation was the reduction of imports of foreign materials. Similarly during the 18th century laws against the wearing of French lawns and laces were designed partly to protect English manuiacturers and partly as a weapon of offense against the French. In the 20th century import-restriction policies, since 1939, have often been associated with luxury taxation. (A. BRI.)

United States. — Unlike the bold groupings and sharply differentiated rates of the British excise and purchase taxes, the varied rates of U.S. excises reflect no clear-cut classification as to degree of essentiality. Perhaps the closest parallel to the British system is found in the heavy reliance upon liquor and tobacco taxes, an expression of the moralistic conception of luxury taxation. Thus, in the 1950s, these two taxes accounted for about 7% of total tax revenues of the central governments of Canada and the United States, as well as about 9% of the tax revenues of the 48 states.

Such revenue importance could only be achieved by heavy consumption in the face of very high tax rates. For example, in the United States the federal whisky tax in 1955 was $10.50 per proof gallon, to which the states typically added $1 to $3. Beer was taxed at $9 per barrel by the federal government, plus $1 to $3 in most states. To the federal cigarette tax of 8 cents per pack of zo, most states added 3 cents or 4 cents, and municipalities in several states added a third tax layer. The Canadian excises on whisky and beer were at much the same levels (plus a 10% federal manufacturers' excise tax), but the cigarette tax mas almost double that in the United States.

Apart from commodities whose consumption is thought to be harmful, those which legislators consider nonessential for a "reasonable" or "decent" standard of living or more likely to be bought by the rich than by the poor are often embraced in the concept of luxury taxation. Of about 50 items subject to U.S. excise taxation in the late 1950s, few met this dual test. The excises levied (mostly at 10%) on furs, jewellery, leather goods, silverware, cameras and films, admissions, dues and initiation fees and a few other items were widely recognized as taxes on nonnecessities. Moreover, consumer studies suggested that these taxes as well as those on new automobiles, electrical appliances, radios, television sets, phonographs and musical instruments were in fact progressive in their impact, taking a larger proportion of high than of low incomes. Yet even this list includes several items whose designation as luxuries would be challenged by many. The remaining federal excises—on transportation oi persons and property, telegraph and telephone communications, gasoline, auto parts, tires and tubes, electric light bulbs, matches, toilet preparations and a few others — fall out oi the luxury category entirely.

A different approach to luxury taxation, much less frequently found, seeks to single out the luxury component oi spending on a given object rather than taxing specified goods and services as luxuries. One example of this is the Massachusetts 5% tax on restaurant meals of $1 or more (a dividing line which may have singled out luxury dining in the 1930s when it was enacted, but did not serve this purpose after the post-World War II inflation). The federal rate differential between watches selling above and below $6; was another case in point. Difficulties of definition as well as administrative complexity militate against wide use of this approach. If these difficulties could be overcome, luxury components of spending on such basic items as food, clothing, furniture and shelter would become eligible for special taxation. (W. W. HR.)

LUYNES, CHARLES D'ALBERT (1578–1621), 1ST DUKE OF, was brought up at court and attended the dauphin, who later became Louis XIII. He was high in Louis's favour, and used his influence to intrigue against the queen mother Marie de Medici and her favourite Concini. Luynes, with Vitry, captain of the guard, arranged the plot that ended in Concini's assassination (1617) and secured all the latter's possessions in Italy and France. He was appointed captain of the Bastille and lieutenant general of Normandy, and married Marie de Rohan, daughter of the duke of Montbazon. In 1619 he negotiated the treaty of Angoulême by which Marie de Medici was accorded complete liberty. He was made governor of Picardy in 1619; suppressed an uprising of nobles in 1620; and in 1621 was appointed constable of France. Luynes undertook an expedition against the Protestants, but died at Longueville in Guienne, on Dec. 15, 1621.

See *Recueil des pièces les plus curieuses qui ont esté faites pendant le règne du connestable M. de Luynes* (2nd ed., 1624) and B. Zeller, *dtudes critiques sur le règne de Louis XIII: le connétable de Luynes, Montauban et la Valteline* (1879).

LUZÁN CLARAMUNT DE SUELVES Y GURREA, IGNACIO (1702–1754), Spanish critic and poet who introduced neoclassical theories into Spain, was born in Saragossa on March 28, 1702, but was brought up and educated in Italy, where he studied under the philosopher Vico and adopted the literary principles of classicism. Returning to Spain in 1733, he published *La Poe'tica o reglas de la poesía en general y de sus principales especies* in 1737. It is based largely on Lodovico Muratori's treatise on poetry, and to a lesser degree on earlier Italian commentators on Aristotle, as well as on Boileau and other French critics. He was elected to the Real Academia, held various government posts and died in Madrid on May 19, 1754. He translated from many languages, and published versions of Greek poets and Milton. Luzan's own poetry is much less important than his criticism.

La Poe'tica is typical of neoclassic literary theory, which Luzán saw as the means of rehabilitating Spanish literature. He severely censured the poetry and especially the drama of the 17th century, which he attacked for having forsaken the classical unities, for a lack of moral sense and for the superficiality of its characters. This criticism proved powerless to produce literary works of appreciable merit, but Luzán's influence was greater than can be measured by the overt failure of the neoclassic formula in Spain, and informs some of the most important writing of the first half of the 19th century. (J. F. SR.)

LUZERN (Fr. LUCERNE), the capital of the Swiss canton of the same name. It is one of the principal tourist centres of Switzerland, being situated on the St. Gotthard railway line, by which it is 59 mi. from Basel and 180 mi. from Milan. The nucleus of the town was the monastery, founded about 750 on the right bank of the Reuss by the abbey of Murbach in Alsace, of which it long remained a "cell." It is first mentioned in a charter of 840 under the name of "Luciaria," and the form "Lucerrun" is first found in 1252.

The germs of a municipal constitution appear in 1252, and in 1291 the Habsburgs purchased Lucerne from Murbach, an act that led a few weeks later to the foundation of the Swiss Confederation, of which Lucerne became the fourth member (the first town to be included) in 1332. It finally freed itself of Habsburg domination after the victory of Sempach (1386). That victory led also to the gradual acquisition of territory ruled by and from the town. At the time of the Reformation Lucerne clung to the old faith, of which ever since it has been the great stronghold in Switzerland, and the papal nuncio resided there from 1601 to 1873. In the 16th century, as elsewhere in Switzerland, the town government fell into the hands of an aristocratic oligarchy, whose power, though shaken by the peasant revolt (1653), lasted until 1798. Under the Helvetic republic (1798–1803) Lucerne was the seat of the central government, under the act of Mediation (1803–14) one of the six "Directorial" cantons and from 1815 to 1848 one of the three ruling cantons.

The patrician government was swept away by the cantonal constitution of 1831, but in 1841 they regained power, called in the Jesuits (1844) and so brought about the Sonderbund War (1847) in which they were defeated. The Radicals lost power in the canton in 1871, after which date the Conservatives became predominant in the canton, though in the town the Radicals were in the majority. Its prosperity has always been bound up with the St. Gotthard pass, so that the successive improvements effected on that route (mule path in the 13th century, carriage road 1820–30, and railway tunnel in 1882) hdve had much effect on its growth. Railways also ronnect Luzern with Meiringen, Bern, Zug, Geten and Lenzburg. Luzern is situated on the banks of the Reuss river,, just as it issues from the Lake of Lucerne, while to the southwest rises the range of Pilatus, balanced on the east by the ridge of the Rigi. To its north still stand nine of the towers that defended the old town wall.

The Reuss is crossed by two old wooden bridges, the upper being the Kapellbrucke (adorned by many paintings illustrating the history of Switzerland and the town and clinging to the Wasserthurm) and the lower the Muhlenbrucke (with paintings of the Dance of Death). The old Hofbriicke (on the site of the Schweizerhof quay) was removed in 1852.

The principal building is the twin-towered Hofkirche (dedicated to St. Leger or Leodegar) which, though in its present form it dates only from 1633–35, originally formed part of a Benedictine monastery. It has a 17th-century organ. The 16th-century town hall (Rathhaus) now houses the cantonal museum. Both the cantonal and the town libraries are rich in old books. The Lion monument, designed by Thorwaldsen, dedicated in 1821, and consisting of a dying lion hewn out of the living sandstone, commemorates the officers and men of the Swiss Guard, who were slain while defending the Tuileries in Paris in 1792. In the immediate neighbourhood is the Glacier garden, a series of potholes worn in the sandstone rock bed of an ancient glacier.

In 1799 the population numbered only 4,337, but had doubled by 1840. Thereafter the rise was rapid and continuous: 29,255 (1900); 47,066 (1930); 54,841 (1941) and 60,526 (1950). The majority are German-speaking.

For canton of Luzern, *see* LUCERNE.

LUZON, the main and largest island of the Philippines, located in the northern part of the archipelago. Area 40,420 sq.mi. Most of the island lies north of Manila in a north-south oriented rectangular area; south of Manila lies the volcanic Batangas peninsula and extending southeast of this is the long, narrow, irregular Bicol peninsula. The island has extreme dimensions of 460 mi. by 140 mi., and a coast line measuring 2,242 mi. In 1958 it had an estimated population of 10,780,965, or an over-all density of 267 people per square mile. Densities are very high along the northwest coast, in the Central plain and many parts of the Bicol peninsula. The east coast and the Sierra Madre mountains have very low population densities; the Mountain province and the Cagayan valley are moderately populated.

The more important mountain ranges are the Cordillera Central in the north, the Sierra Madre following much of the east coast and the Zambales range on the central west coast. Mt. Pulog, 9,606 ft., in the Cordillera Central, is the highest peak. Isolated volcanic cones, as the near perfect Mt. Mayon, 7,943 ft., are found in the Bicol peninsula.

Agriculturally Luzon is the leading island, producing over 65% of the country's rice; the Central Luzon plain, stretching for 100 mi. N. of Manila, is the chief centre. On the Bondoc and Bicol peninsulas are found the most extensive coconut plantations in the world; this is a leading area for the export of copra. The southern end of the Bicol peninsula is noted as a producer of abacá while both the Ilocos provinces and the Cagayan valley provide tobacco surpluses. Spectacular rice terraces have been built by the peoples of the Mountain province. Sugar cane is an important cash crop in the Central plain and in Batangas. Manufacturing is largely limited to Manila and suburbs, a notable exception being the modern petroleum refinery at Batangas.

Iron, gold and manganese are mined in the Camarines provinces while Zambales is noted for the production of both chromite and copper. The Cordillera Central produces large amounts of gold and copper and has good pine forests which provide considerable timber for the mining industry. Other forest areas, notably aiong the east coast, produce excellent hardwoods for cabinet work and the production of quality veneers.

Administratively, the island is divided into 24 provinces, Abra, Albay, Bataan, Batangas, Bulacan, Cagayan, Camarines Norte, Camarines Sur, Cavite, Isabela, Laguna, La Union, Mountain, Nueva Ecija, Nueva Vizcaya. Pampanga, Pangasinan, Quezon, Sorsogon, Tarlac (*qq.v.*), Rizal, Zambales, Ilocos Norte and Ilocos Sur. Its chartered cities include Baguio, Manila, Quezon and San Pablo (*qq.v.*).

For the ethnology and history of Luzon *see* PHILIPPINES, REPUBLIC OF THE. (R. E. HE.)

LUZZATTI, LUIGI (1841–1927), Italian economist and financier, was born of Jewish parents at Venice on March 11, 1841. He studied law at Padua, was driven into exile by the Austrian police for a short time, became professor of constitutional law at Padua (1867), at Perugia (1894), and finally at Rome (1898).

Luzzatti popularized in Italy the economic ideas of Schultze-Delitzsch, worked for the establishment of a commercial college at Venice, and contributed to the spread of people's banks on a basis of limited liability throughout the country.

An enthusiast for all forms of co-operation, Luzzatti founded the first co-operative store in Italy. In 1869 he was appointed by Minghetti under secretary of state to the ministry of agriculture and commerce, in which capacity he abolished government control over commercial companies and promoted a state inquiry into the conditions of industry.

Though theoretically a free trader, he helped to create the Italian protective system. In 1877 he participated in the commercial negotiations with France. in 1878 compiled the Italian customs tariff and subsequently took a leading part in the negotiations of all the commercial treaties between Italy and other countries.

He was minister of the treasury in four cabinets between 1891 and 1909. During his last term of service at the treasury he achieved the conversion of the Italian 5% debt (reduced to 4% by the tax) to $3\frac{3}{4}$% to be eventually lowered to $3\frac{1}{2}$%; although the actual conversion was not completed until after the fall of the cabinet of which he formed part the merit is entirely his.

Luzzatti was minister of agriculture and commerce in 1909, and in 1909–11 prime minister. He received many honours, including the title of minister of state for life. He died on March 29, 1927.

LUZZATTO, MOSES HAYIM (1707–1747), Hebrew dramatist and mystic, was born in Padua 1707, and died at Acre in 1747. He attacked Leon of Modena's anti-Kabbalistic treatises, and as a result of his conflict with the Venetian Rabbinate left Italy for Amsterdam, where, like Spinoza, he maintained himself by grinding lenses. There, in 1740, he wrote his popular religious manual the Path of the Upright (Messilath *Yesharim*) and other ethical works. Luzzatto's most lasting work is in Hebrew drama. His best-known compositions are the Tower of Victory (*Migdal 'Oz*) and Glory to the Upright (Layesharim Tehillah).

See Grätz, *History of the Jews,* v, ch. vii; I. Abrahams, *Jewish Life in the Middle Ages,* pp. 190, 268; N. Slouschz, *The Renascence of Hebrew Literature,* ch. i.

LVIV (Ukr. Lvov; Pol. Lwow), the capital of Lvov oblast of the Ukrainian Soviet Socialist Republic, lying 850 ft. above sea level on part of the continental divide between the Vistula and Dniester basins, was founded in 1250 by Danilo Romanovich, prince of Halicz (Halych). In 1340 the principality became part of Poland. King Casimir the Great built a new city centre in a basin surrounded by hills, replaced the old wooden castle by one of stone and surrounded the city with a wall. The economic progress of Lwow began in 1380 when it received the "right of emporium," which secured it a virtual monopoly of the eastern trade. By the end of the 14th century it had become the most important and populous city of Poland.

A Roman Catholic archbishop of the Latin rite resided there from 1412 and one of the Armenian rite from 1626. A Greek Catholic or Uniate see was transferred there from Halich in 1807. The Roman Catholic cathedral (1370) was rebuilt at the end of the 15th century and restored in the 18th. The Armenian cathedral was built in 1364 (twice restored since) and the Jewish synagogue in 1582. The so-called Wallachian Uniate church, a beautiful Renaissance building, was completed in 1629. The Uniate cathedral of St. Yury was built in Baroque style in 1743–58.

Bogdan Chmielnicki (*q.v.*) besieged Lwow unsuccessfully in 1648 and 1655, but the Swedes took and plundered it in 1704. King John Casimir founded a university there in 1661. In 1772, at the first partition of Poland, Lwow became Austrian. When autonomy was granted to Galicia, Lwow became the capital of the province and seat of the Galician diet or *sejm*. The constitutional era favoured the revival of Lmow, the population of which rose from 87,000 in 1870 to 206,113 in 1910. The city mas occupied by the Russians from Sept. 3, 1914, to June 22, 1915. On Nov. 1, 1918, Lwow was occupied by the Ukrainian Nationalists but the Poles freed it on Nov. 22. From Sept. 22, 1939, it was occupied by the Soviet army; on June 30, 1941, it fell to the Germans and was reoccupied by the Soviet army on July 27, 1944. By the Soviet-Polish treaty of Aug. 16, 1945, eastern Galicia and Lwow became part of the Ukraine. Its population in 1959 was 410,000.

(K. SM.)

LVOV, PRINCE GEORGE EUGENIEVICH (1861–1925), Russian statesman, belonged to the old Russian nobility. He spent the greater part of his life in Zemstvo (local government work), being a member of the executive board of the Tula Zemstvo from 1888 and president, 1902–05. In 1905 he was elected member of the first state duma and joined the right wing of the constitutional democratic (kadet) party. During the Russo-Japanese War and World War I he took an active part in the organization for the relief of sick and wounded soldiers and in the latter war was president of the All-Russian Union of Zemstvos. On March 14. 1917, Lvov was elected prime minister and minister of the interior of the first Russian provisional government. His government proved a complete failure. A new coalition cabinet was formed on May 16, and Lvov again accepted the leadership of the cabinet and the portfolio of the interior, but he had no real influence in political life, and he resigned from both offices on July 7. (See RUSSIA.) After the Bolshevist revolution in November, Lvov was arrested and imprisoned, but he escaped to Siberia and later settled in Paris. He died on March 6, 1925.

LYALLPUR, a municipality, tehsil and district in the Multan division of West Pakistan. The municipality (pop., 1951, 179,127), 75 mi. west of Lahore, named after Sir James Lyall, lieutenant governor of the Punjab, 1887–92, is a centre of the cotton-ginning and pressing industry.

LYALLPUR TEHSIL had a population of 702,074 in 1951.

LYALLPUR DISTRICT was formed in 1904 as the "Chenab colony," being mainly the waste portion of Jhang district, irrigated by the Lower Chenab canal. Area 3,534 sq.mi.; pop. (1951) 2,152,863.

LYAUTEY, LOUIS HUBERT GONZALVE (1854–1934), French marshal, was born at Nancy (Meurthe-et-Moselle) on Nov. 17, 1854. Having passed through St. Cyr and the Staff college, he first served as a cavalry officer, and was then appointed in 1894 to the staff of the troops in Indochina, where he took part, under Gen. Joseph Gallieni, in the operations against the pirates of upper Tongking. He accompanied General Gallieni to Madagascar, where he applied himself to working out and putting into practice new and eminently successful methods of colonial government. Having returned to his regiment as its colonel, he was soon after appointed to the command in the territory of Ain Sefra, which was being disturbed by incursions from Morocco. He was then placed in command of the Oran division, and was entrusted with the carrying out of international agreements with regard to Morocco. Having restored order on the Algerian-Moroccan frontier, as far as Moulouya and Guis, he took command of the 10th corps at Rennes.

In April 1912, in view of the serious situation at Fez. the government sent him to Morocco as high commissioner and resident general to quell disturbances and to consolidate the recently declared protectorate. Immediately on his arrival he relieved Fez and initiated the work of pacification and colonization which was to result in a few years in the creation of a well-organized government on a solid basis. On the declaration of World War I, although formally ordered by the government to evacuate the interior of Morocco, so as to liberate the greater part of his forces, he maintained his ground for four years against all attacks, while he actually increased the subjugated territory.

In Dec. 1917 he was appointed war minister, but resigned after three months in order to return to Morocco. From 1920 to 1924 he conquered the Atlas, and established a defensive barrier to the north of Ouergha. As a reward for these services he was made a marshal of France in Feb. 1921. He organized a victorious resistance to the attacks of the Rifi under Abdel Krim, and did not resign the post of resident general until order was completely restored in 1925 (*see* MOROCCO). He was made a member of the French academy in 1914, and wrote numerous articles on colonial administration.

Lyautey died July 27, 1934.

See his *Lettres de Tonkin et de Madagascar, 1894–99* (1920); and a volume of speeches entitled *Paroles d'action, 1900–26* (1927); also Britsch, *Le Maréchal Lyautey* (1921).

(M. GU.)

LYCANTHROPY. This term, though by derivation strictly applicable only to the taking by men of wolf forms, is applied generally to the belief in the transformation of men into wolves or other carnivorous animals, the forms taken being ordinarily those of the most formidable wild animals of the country—bears in Scandinavia, wolves on the Continent of Europe, jaguars in South America, tigers and leopards or hyenas in Asia or Africa, the latter form being particularly associated with attacks on corpses rather than on living beings. The actual practice of lycanthropy is clearly associated with a form of hysteria and a pathological condition (frequently recorded in pregnant women) manifesting a depraved appetite and an irresistible desire for raw flesh, often that of human beings, frequently accompanied by a belief on the patient's part that he or she is transformed into an animal. In the Malay race such a state is deliberately induced by suggestion in persons subject to a form of extreme suggestibility known as latah. Cases of tiger spirits and the like induced to enter human bodies and resulting in similar symptoms must be classed with latah forms of the affliction, while the salves, skins, girdles, etc., used by wer-wolves particularly in Europe, to effect transformation are probably to be regarded as material aids to hallucination.

Ideas on lycanthropy have also become confused with beliefs as to the separable soul which often appear in cognate forms. Beliefs in witches and their familiar spirits, in the power of witches to assume other bodily shapes, to alienate their souls or their vital principles, and keep them for safety in some obscure animal or plant in distant places; belief in the general possession of a bush soul, or nagual, as in central America; belief in totem ancestors, and in the re-incarnation of the soul in predatory creatures, such as tigers, alligators and sharks (see METEMPSYCHOSIS) ; belief in vampires, belief in possession by evil spirits—all these ideas associated with the experienced facts of lycanthropy have engendered a large number of variable, confused and sometimes fantastic beliefs associated with lycanthropy in various parts of the world.

The lycanthropist was known to the Greeks, who spoke also of kynanthropy, and Marcellus of Sida describes men as usually attacked early in the year, frequenting cemeteries and living like dogs and wolves. The Romans used a more general term *Versipellis* (cf. English "turnskin") for lycanthropists; Virgil (Ecl. viii.) ascribes metamorphosis into wolf form to the action of drugs. Pliny gives a story of an hereditary transformation associated with Jupiter Lycaeus; Agriopas describes a man as turned into a wolf after assisting at a human sacrifice to the same god, and Petronius tells a typical wer-wolf story. In Scandinavia and England lycanthropy seems to have been associated with outlawry, and the term berserker (*q.v.*) probably implies a man who was not only subject to excesses of bestial fury but who wore garments of bear or wolfskin. In the case of berserker the lycanthropic tendency seems to have been involuntary, but in Europe generally it is ascribed to deliberate choice and throughout the middle ages persons were believed to use magical means to transform themselves into wolves. The tradition is not extinct on the continent of Europe, and in the British Isles still lingers (in Somersetshire and Arran, for instance) in the belief in old women who turn themselves into hares. If the hare be hurt a corresponding hurt remains in the human body, which is characteristic of the belief generally. The usual method of effecting the change in Europe was by rubbing with magic salve or by putting on a girdle of wolf—or sometimes of human skin. Involuntary transformation also occurs as the result of enchantment as in Marie de France's poem "Bisclaveret," or of miracles such as that of St. Patrick who changed Veretius, king of Wales, into a wolf. Although in the European form transformation is usual, another type of lycanthropy is described by Rhanaeus as occurring in Courland, in which there is no bodily transformation; the human body remains in a cataleptic trance but in such sympathy with a real wolf attacking cattle that the human limbs move and twitch as the wolf commits his depredations. This form of lycanthropy corresponds precisely with a form taken in Assam. The wer-wolf is called vrkolak by Bulgars and Slovaks, and by modern Greeks βρυκόλακας. Here again the body remains cataleptic while the soul enters a wolf. After its return the body is exhausted and aches as after violent exercise. This form is connected in popular belief with vampires, and Serbs give the same name *vlkoslak* to both, thus affording a link between the corresponding wer-tiger and vampire beliefs in Assam, where the vampire's astral body devours persons' livers and causes their death.

Wer-wolves (*loup-garou*) appear to have been particularly active in France during the 16th century, but by the middle of it the true nature of the malady was recognized. In the cases of Roulet tried at Angers in 1598 and of Jean Grenier in 1603 at Bordeaux the accused, though convicted, were treated as insane. The description given of Roulet is not unlike those given of the "wolf children" who turn up from time to time in India, and in the latter case the wer-wolf asserted that he became a lycanthropist under the bidding of a supernatural being who came to him in the forest, an account identical with that given by Sema wer-leopards in Assam. Cases of cannibalism are recorded in Scotland in the 15th century, but the cannibals do not seem to have been even accused of being wer-wolves, though the belief lingered, and Verstegan (Restitution of Decayed Intelligence, 1625), says of wer-wolves that they "doe not onely unto the view of others seem as wolves, but to their owne thinking have both the shape and nature of wolves . . . and dispose themselves as very wolves." In Asia Minor we find the belief in Armenia, where sinful women are punished by becoming lycanthropists at the bidding of a spirit who brings them a wolf skin. They eat their own children. Herodotus mentions the Neuri, a Scythian tribe, as lycanthropists who changed into wolf form annually, and associates them with head-hunters; and in Assam we still find head-hunting Nagas subject to lycanthropy individually and believing that there are neighbouring tribes who are wer-tigers communally. The belief in lycanthropy is current in India in connection with both the wolf and the tiger. Both sexes of the Kols of Central India are believed to turn into tigers, and Dalton reports a case of a Kol tried for murder who had followed the tiger, which had devoured his wife, to the house of another Kol named Pusa. This man's own relations said he had long been suspected of such malpractices and abetted the killing of him, and explained that they had known of his devouring an entire goat one night and that he had roared like a tiger while doing so, and that on another occasion he had expressed a longing for a particular bullock, and the same night the bullock was killed by a tiger. The "wolf children" who appear periodically, whether or not they have actually been suckled by wild animals, often display symptoms of a depraved appetite similar to those of lycanthropy. A case occurred in Bhagalpur between 1912 and 1919 in which' one Rupa Sao, a shop-keeper, attacked and killed a little girl by biting her throat. He was convicted of murder, but the High Court, on a reference, ordered him to be confined as a lunatic. In Assam some tribes are lycanthropic while their neighbours are not; thus the Garos are, but not the pure Khasi; the Sema Nagas are, but not the Angami Nagas; while among many tribes such as the Kachari there are clans claiming descent from or relationship with tigers. The Angami believe that lycanthropy is caused by drinking from a certain well; but the Sema, who are subject to lycanthropy, both men and women, regard it to be involuntary and acquired normally under supernatural influence. The body is not transformed, but falls into a mild cataleptic fit during which the soul is inhabiting the body of a real leopard. Apparently some sympathetic association is set up between the human being and a wild animal, as in the Ao Naga tribe a relationship of this kind is set up without any lycanthropic symptoms on the part of the human being (see Mills, *The Ao Nagas*, pp. 250 seq.). The Lhota Naga medicine men have leopard familiars, but generally the Naga idea of lycanthropy rather suggests the central American idea of the *Nagual* or bush soul. Wer-tigers are believed in in Burma, where Tamans of the Chindwin valley are reputed to transform themselves into tiger form by rolling on earth on which they have micturated. In Malaya lycanthropy is common and is associated with latah, as it appears to be a regular amusement to hypnotize a boy subject to this disorder and to cause him to think he is a civet cat and behave as such, running on all fours and devouring live chickens. Skeat (Malay Magic, p. 160–163) mentions the case of one Haji 'Abdăllah caught naked in a tiger trap in Sumatra, but the wer-tigers of the Malay Peninsula are thought invulnerable in their transformed state—a curious exception to the almost universal belief that a wound on the animal causes a corresponding injury on the human form. In the Celebes the Toradja belief approximates to that of the Naga hills, the soul, *lamboyo,* which undergoes transformation, being apparently identical with the *anoana* of the Poso-Alfures (see METEMPSYCHOSIS). As in the Naga hills the lycanthropic habit may be acquired by eating food left by a lycanthropist. In Java the practice may be voluntary, acquired by spells, etc., or may be inherited, as in Assam, and this view has no doubt some pathological justification. As by the Khonds of India, the transformation is sought in Java for purposes of revenge, or to guard the crops, as in Yucatan, which possibly brings lycanthropy into connection with fertility cults, as does the use of an animal form and the association with witches in Europe.

In Africa the leopard and the hyaena are the animals usually connected with lycanthropists, who are generally women in Abyssinia, where the lycanthropist is regarded as possessed and belongs as a rule to the blacksmith class The Bondas, however, claim actual transformation, which is reported to have been witnessed by a European who also claims to have shot hyaenas with gold ear-rings in their ears. In West Africa an intimate relation is created by a blood bond between a man and an animal, and, as in the Naga hills, if the latter die the former will also die, though in the Naga hills it is (significantly) not until he hears of the death of the leopard. The Bori dancing of Nigeria also seems to connect in some respects with the *latah* of Malaya. How strong the instinct of the beast may be can be judged from Tremearne's account of a child of one of the cannibal tribes found in the bush and brought up in an institution where, having heard of the death of another child, he managed to get at the corpse and eat its face (Tailed Head-Hunters of Nigeria, p 184). The societies of "human leopards" and "human alligators" in West Africa appear to be organized manifestations of a depraved taste for human flesh like that displayed in the hyaena forms of lycanthropy combined with ideas akin to those underlying head-hunting (*q.v*), and ghouls in Syria have also been associated with temporary wolf or hyaena forms. That this propensity is not entirely destroyed by civilization is shown by a case which occurred in 1849 in Paris, when an officer was convicted of digging up and mutilating corpses in cemeteries under pathological conditions suggesting lycanthropy. The outbreaks of cattle-maiming that occur from time to time in Great Britain are probably likewise attributable to a survival of the lycanthropic instinct.

(J. H. H.)

LYCAON, a mythical king of Arcadia. At Mount Lycaeus a very extraordinary ceremony in honour of *Zeus Lukaios* took place; it is alleged (Plato, Rep, viii., 565 D) that a man was sacrificed to him, and his entrails put with those of more usual victims; that anyone who tasted them became a wolf; to which later authors (see especially Pausanias, viii., 2, 6, with Frazer's note) add that the man thus transformed belonged to a particular clan, and that he remained a wolf for nine years (a sacred number), after which he might become a man once more if in that time he had not tasted human flesh again. The whole story is unpleasantly suggestive of the Lion and Leopard societies of Africa. In explanation the following story was told. Lycaon, in early days, was an impious and cruel king. Having occasion to entertain Zeus, he, or his sons, set before him human flesh (in some versions, the flesh of Lycaon's own son, Nyctimus). The god was not deceived, and in wrath caused the deluge which in Deucalion's time devastated the earth. It has several times been suggested that behind the figure of Lycaon is concealed some ancient local god, afterwards identified with Zeus; a theory in no way impossible, but which leads us little further, since there is no agreement as to the nature of the supposed god.

(H. J. R.)

LYCAONIA, a region in the interior of Asia Minor, north of Mt. Taurus, bounded on the east by Cappadocia, on the north by Galatia, on the west by Phrygia and Pisidia; to the south it extended to the chain of Mt Taurus, where it bordered on the country popularly called Cilicia Tracheia The boundaries of Lycaonia varied greatly at different times. It is mentioned by Xenophon as traversed by Cyrus the younger on his march through Asia. That author describes Iconium as the last city of Phrygia; and in Acts xiv. 5 St. Paul, after leaving Iconium, crossed the frontier and came to Lystra in Lycaonia.

Lycaonia is described by Strabo as a cold region of elevated plains, affording pasture to wild asses and tc sheep. Amyntas, king of Galatia, to whom the district was for a time subject, maintained there not less than 300 flocks. It forms part of the interior tableland of Asia Minor, and has an elevation of more than 3,000ft. It suffers from want of water, aggravated in some parts by abundance of salt in the soil, so that the northern portion, extending from near Iconium to the salt lake of Tatta and the frontiers of Galatia, is almost wholly barren. In ancient times great attention was paid to storing and distributing the water, so that much land now barren was formerly cultivated and supported a large number of cities

The plain is interrupted by some minor groups of mountains, of volcanic character, of which the Kara Dagh in the south rises above 7,000ft.

The Lycaonians were to a great extent independent of the Persian empire, and were like their neighbours, the Isaurians, a wild and lawless race of freebooters; but their country was traversed by one of the great natural lines of high road through Asia Minor, from Sardis and Ephesus to the Cilician gates, and a few considerable towns grew up along or near this line. The most important was Iconium, in the most fertile spot in the country, of which it was always regarded by the Romans as the capital. It was the capital of the Seljuk Turkish empire for several centuries. A little farther north, stood Laodicea (Ladik); and in the south, near the foot of Mt. Taurus, was Laranda, now called Karaman, which has given name to the province of Karamania. Derbe and Lystra, which appear from the Acts of the Apostles to have been considerable towns, were between Iconium and Laranda. Lycaonia was Christianized very early; and its ecclesiastical system was more completely organized during the 4th century than that of any other region of Asia Minor.

After the defeat of Antiochus the Great (*q.v.*), Lycaonia was given by the Romans to Eumenes II., king of Pergamos. About 160 B.C. part of it was added to Galatia; and in 129 B.C the eastern half (usually called during the following 200 years Lycaonia proper) was given to Cappadocia. Its administration and grouping changed often under the Romans. In A.D. 371 Lycaonia was first formed into a separate province.

The Lycaonians appear to have retained a distinct nationality in the time of Strabo, but their ethnical affinities are unknown. The mention of the Lycaonian language in the Acts of the Apostles (xiv. 11) shows that the native language was spoken by the common people at Lystra as late as A.D. 50.

See Sir W. M. Ramsay, *Historical Geography of Aria Minor* (1890), *Historical Commentary on Galatians* (1899), and *Cities* of St. *Paul* (1907); M. Delahaye, *Gaianopolis* (1910).

LYCEUM, the name of a gymnasium and garden with covered walks near the temple of Apollo Lyceus at Athens (Gr. Λύκειον). Aristotle taught here, and hence the name was applied to his school of philosophy. The name has been used in many languages for places of instruction, etc. In France the term *lycée* is given to the larger secondary schools which are administered by the State.

LYCEUMS AND CHAUTAUQUAS. Early in 1826 Josiah Holbrook, of Derby, Conn., outlined a plan for a world-wide federation for the advancement of learning, calling it a lyceum, from the place where Aristotle lectured to the youth of Greece. His plan provided for organizations graduated from the community to an international lyceum, the latter to have 52 vice-presidents chosen from distinguished scholars and men of affairs from all over the world. This international organization was never realized, but a national (U.S.) lyceum was organized in New York city in 1831, and flourished for eight years. It included delegates from at least eight State lyceums which, in turn, embraced scores of county and local lyceums.

That the lyceum answered an existing need is shown by the rapid spread of its local branches. The Millbury, Mass., branch was organized in Nov. 1826. Within two years 100 other branches, and by 1834 nearly 3,000 branches, in practically every State in the Union, had been established. These local lyceums were voluntary associations for self-culture, community instruction and discussion of public questions. Essays, debates, discussions and lectures, all home-talent productions, were presented at weekly meetings. After about a decade the custom of inviting outside lecturers, to whom fees were paid, became established. Lowell, Thoreau, Beecher, Holmes, Greeley and others were among those who frequently addressed the lyceums. Many of Emerson's essays were written for lyceum lectures.

The last convention of the national lyceum, in 1839, was the most largely attended and most enthusiastic held. It formed many ambitious plans, adjourned, and never met again. The cause of this sudden demise is not known. In its eight years of life, it accomplished definite and far-reaching results. It forwarded education in Cuba, Venezuela and Mexico; it inspired many cultural movements, some of which still exist, and all of which made important contributions to American education. The lapse of the national lyceum did not affect the local branches, which flourished until the Civil War. A demand for attractions other than lectures led the bureaux to supply musicians, readers and entertainers.

Parallel with the lyceum movement is the chautauqua, which began at Fair Point (later called Chautauqua), N.Y., where a Methodist Episcopal camp meeting was annually conducted. Rev. (later bishop) John H. Vincent and Lewis Miller successfully undertook to change that camp meeting into an assembly for the study of the Bible and Sunday school methods. The first such assembly was held in 1874. Gradually the purpose expanded until it embraced the whole field of education, with popular entertainments included. Chautauqua institution, at Chautauqua, N.Y., annually conducts a ten-week assembly. This assembly was quickly copied by many communities throughout the land, each operating independently of all others, and each engaging its talent either directly or through the lyceum bureaux, which thus became a connecting link between the two movements. Their programmes were attractive combinations of lectures, music and entertainments (with drama added in later years). Distinguished men and women have contributed through these programmes towards the creation of an American culture and an informed public opinion. The wasteful extravagance resulting from the independent operation of these rapidly multiplying assemblies led to the development, in 1904, of the circuit chautauqua plan. The lyceum bureaux led in this development, organizing chautauqua committees in a circuit of towns to which a standardized programme of lectures, music and entertainment was supplied.

LYCHNIS, a genus of plants of the pink family, Caryophyllaceae (*q.v.*), including numerous species, several of which are cultivated. L. ckalcedonica (Maltese cross), three feet high, has dense heads of bright scarlet flowers, both single and double. L. *coronata,* one to two feet high, has clusters of scarlet, crimson, pink and white flowers.

Other garden species are L. fulgens and L. haageana. L. *flos-cuculi* is the ragged robin. Several species are native to western North America, including L. *drummondi,* found from Manitoba to Nebraska and west to the Pacific coast. All are hardy herbaceous perennials.

LYCIA, a district in the south-west of Asia Minor, occupying the coast between Caria and Pamphylia, and extending inland as far as the ridge of Mt. Taurus. It is a rugged, mountainous country, traversed by offshoots of the Taurus range, which terminate in lofty promontories. The coast is indented by a succession of bays—the most marked of which is the Gulf of Macri (anc. *Glaucus* Sinus) in the extreme west. A number of smaller bays and broken, rocky headlands, with a few small islets, constitute the coast-line thence to the south-east promontory of Lycia, known in ancient times as the "Sacred Promontory" (*Hiera* Akra). Though the mountain ranges of Lycia are all offshoots of Mt. Taurus, in ancient times several of them were distinguished by separate names. Such were Daedala in the west, adjoining the Gulf of Macri, Cragus on the sea-coast, west of the valley of the Xanthus, Massicytus (10,000ft.) nearly in the centre of the region, and Solyma in the extreme east above Phaselis (7,800ft.). The steep and rugged pass between Solyma and the sea, called the Climax ("Ladder"), was the only direct communication between Lycia and Pamphylia.

The only considerable rivers are: (1) the Xanthus, which descends from the central mass of Mt. Taurus, and flows through a narrow valley till it reaches the city of the same name, below which it forms a plain of some extent before reaching the sea, and (2) the Limyrus, which enters the sea near Limyra. The small alluvial plains at the mouths of these rivers are the only level ground in Lycia, but the hills that rise thence towards the mountains are covered with a rich arborescent vegetation. The upper valleys and mountain sides afford good pasture for sheep, and the main Taurus range encloses several extensive upland basin-shaped valleys (*vailas*). (See ASIA MINOR.)

According to Artemidorus, the towns that formed the Lycian league were 23 in number; but Pliny states that Lycia once possessed 70 towns, of which only 26 remained in his day. Recent researches have confirmed the fact that the sea-coast and the valleys were studded with towns. On the Gulf of Glaucus stood Telmessus, while a short distance inland were the small towns of Daedala and Cadyanda. At the entrance of the valley of the Xanthus were Patara, Xanthus itself, and, a little higher up, Pinara on the west and Tlos on the east side of the valley. Myra, one of the most important cities of Lycia, occupied the entrance of the valley of the Andriacus; on the coast between this and the mouth of the Xanthus stood Antiphellus, while in the interior, at a short distance, were found Phellus, Cyaneae and Candyba. In the alluvial plain formed by the rivers Arycandus and Limyrus stood Limyra. Arycanda commanded the upper valley of the river of the same name. On the east coast stood Olympus, one of the cities of the league, while Phaselis, a little farther north, which was a much more important place, never belonged to the Lycian league and appears always to have maintained an independent position.

History.—The name of the Lycians, Lukki, is first met with in the Tel el-.%mama tablets (1400 B.C.), and in the list of the nations from the eastern Mediterranean who invaded Egypt in the reign of Mineptah, the successor of Rameses II. At that time they seem to have occupied the Cilician coast. Their occupation of Lycia was probably later and, since the Lycian inscriptions are not found far inland, we may conclude that they entered the country from the sea. According to Herodotus (i. 173; vii. 92), the original inhabitants of the country were the Milyans and Solymi, the Lycians being invaders from Crete. In this tradition there is a reminiscence of the fact that the Lycians had been sea-rovers before their settlement in Lycia. The Lycian Sarpedon was believed to have taken part in the Trojan war. The Lydians failed to subdue Lycia, but after the fall of the Lydian empire it was conquered by Harpagus, the general of Cyrus (i. 171). While acknowledging the suzerainty of Persia, however, the Lycians remained practically independent, and for a time joined the Delian league (*q.v.*). They were incorporated into the empire of Alexander, but, even after their conquest by the Romans, preserved their federal institutions as late as the time of Augustus. Under Claudius, Lycia was annexed to the Roman empire and united with Pamphylia; Theodosius made it a separate province.

Antiquities. — Few parts of Asia Minor were less known in modern times than Lycia up to the 19th century. Visits of Sir Charles Fellows to the country in 1838 and 1840 were followed by an expedition sent by the British Government in 1842 to transport to England the valuable monuments now in the British Museum. The monuments thus brought to light are among the most interesting of those discovered in Asia Minor, and prove the existence of a distinct native architecture, especially in the rock-cut tombs. But the theatres found in almost every town, some of them of very large size, are sufficient to attest the influence of Greek civilization; and this is confirmed by the sculptures, which are for the most part Greek.

Numerous inscriptions have been discovered in the native language of the country, written in an alphabet peculiar to Lycia. A few of these inscriptions are bilingual, in Greek and Lycian, and the clue thus afforded to their interpretation has been followed up. (*See* ANATOLIAN LANGUAGES.)

The alphabet was derived from the Doric alphabet of Rhodes, but ten other characters were added to it to express sounds not found in Greek. The attempts to connect the language with the Indo-European family have been unsuccessful. Most of the inscriptions are sepulchral; by far the longest and most important is that on an obelisk found at Xanthus.

Lycian art was modelled on that of the Greeks. The rock-cut tomb usually represented the house of the living, with an elaborate façade, but in one or two instances, notably that of the so-called Harpy-tomb, the facade is surmounted by a tall, square tower, in the upper part of which is the sepulchral chamber. Lycian sculpture followed closely the development of Greek sculpture, and many of the sculptures with which the tombs are adorned are of a high order of merit. The exquisite bas-reliefs on a Lycian sarcophagus now in the museum of Constantinople are among the finest surviving examples of classical art. The bas-reliefs were usually coloured. For the coinage, *see* NUMISMATICS: *Asiatic Coins.*

LYCOPHRON, Greek poet and grammarian, was born at Chalcis in Euboea. He flourished at Alexandria in the time of Ptolemy Philadelphus (285–247 B.C.), for whom he arranged the comedies in the Alexandrian library. As a result he wrote a treatise On *Comedy.*

His own work was mostly in tragedy; Suïdas gives 20 titles, but only a few fragments survive. One poem, the *Alexandra* or *Cassandra,* in iambics, has been preserved. The poem, in which Cassandra prophesies the future of Troy and later events, is a masterpiece of erudition, full of archaisms and obscurities, and poetically quite worthless. It was very popular in the Byzantine period, and annotated by the Tzetzes brothers. The fragments of his tragic verse are very much superior to this.

LYCOPODIUM is a genus of the Lycopodiaceae, a family of the Lycopsida, a subdivision of the vascular plants comprising the club mosses and their allies, fossil and living. The lycopods are spore-bearing near-herbs; their stems, covered with small, simple leaves, more or less spirally arranged, may be erect, prostrate, creeping, or epiphytic and pendent. No lycopod stem has a cambium. The fertile leaves (sporophylls) may be somewhat similar to the vegetative leaves, in which case they are present in alternating zones on the stem, or they may be aggregated in conical strobili at the tips of branches. In this case, the sporophylls may differ markedly in size and shape from the vegetative leaves. Each sporophyll bears on its upper surface a single, kidney-shaped spore case (sporangium) which produces large numbers of thick-walled, cutinized spores. Very few of these spores appear to germinate in nature. The evidence suggests an inability to absorb water. Scarifying the spore wall or centrifuging the spores in water at considerable speed causes many more to germinate.

When grown on a sugar-mineral salt nutrient medium, the germinated spores grow well and all species tried produce green, much-branched, rhizoid-bearing, hermaphroditic prothallia. By contrast, in the limited number of cases described from nature since the mid-19th century, the prothallia are green and branched if on the surface of the ground or somewhat colourless and fleshy if below.

The prothallia of all species described prove to have an endophytic fungus in symbiotic relation, possibly obligate.

Probably 200 or more species of lycopods exist, nearly cosmopolitan in distribution, but most abundant in the tropics. The 13 species found in North America occur most abundantly in the cool, wooded regions of the eastern United States and Canada.

The Pacific coastal states and adjacent parts of Canada have only nine of these species. Great Britain has five, chiefly in mountainous districts.

The small size of the spores of *Lycopodium* and their high content of finely divided oil droplets make for inflammability. They have been used, as lycopodium powder, in fireworks and in flash-light photography.

LYCURGUS (Gr. Λυκοῦργος), in Greek history, the reputed founder of the Spartan Constitution. Plutarch opens his biography of Lycurgus with these words: "About Lycurgus, the lawgiver, it is not possible to make a single statement that is not called in question. His genealogy, his travels, his death, above all, his legislative and constitutional activity have been variously recorded, and there is the greatest difference of opinion as to his date." Nor has modern historical criticism arrived at any certain results. Many scholars, indeed, suppose him to be in reality a god or hero, appealing to the existence of a temple and cult of Lycurgus at Sparta as early as the time of Herodotus (i. 66) (cf. *Camb. Ancient Hist.*, vol. iii.). If this be so, he is probably to be connected with the cult of Apollo Lycius or with that of Zeus Lycaeus. But the majority of modern historians agree in accepting Lycurgus as an historical person, however widely they may differ about his work.

According to the Spartan tradition preserved by Herodotus, Lycurgus was a member of the Agiad house, son of Agis I. and brother of Echestratus. On the death of the latter he became regent and guardian of his nephew, Labotas (Leobotes), who was still a minor. Other accounts give him a different origin, and make him regent for Charillus. According to Herodotus he introduced his reforms immediately on becoming regent, but the story which afterwards became generally accepted represented him as occupying for some time the position of regent, then spending several years in travels, and on his return to Sparta carrying through his legislation when Charillus was king. He is said to have visited Crete, Egypt and Ionia, and some versions even took him to Spain, Libya and India. In any case details of his life are almost certainly mythical. Herodotus derives his constitutional ideas from Crete, but there is a 5th century tradition ascribing them to the initiative of Delphi.

The Reforms. — Herodotus says that Lycurgus changed "all the customs," that he created the military organization and instituted the ephorate and the council of elders. To him, further, are attributed the foundation of the apolla (the citizen assembly), the prohibition of gold and silver currency, the partition of the land (γῆς ἀναδασμός) into equal lots, and, in general, the characteristic Spartan training (ἀγωγή). Some of these statements are certainly false. The council of elders and assembly are not peculiar to Sparta, the ephorate is not generally allowed to be his, and the partition of land never seems to have taken place at Sparta at all—it is probably an attempt to give traditional sanction to the ideals of Agis and Cleomenes in the 3rd century. We may conclude that Lycurgus did not create any of the main elements of the Spartan Constitution, though he may have regulated their powers and defined their position. But tradition represented him as finding Sparta the prey of disunion, weakness and lawlessness, and leaving her united, strong and subject to the most stable Government which the Greek world had ever seen. Probably Grote comes near to the truth when he says that Lycurgus "is the founder of a warlike brotherhood rather than the lawgiver of a political community." To him we may attribute the unification of the several component parts of the State, the strict military organization and training which soon made the Spartan hoplite the best soldier in Greece, and above all the elaborate and rigid system of education which rested upon, and in turn proved the strongest support of, that subordination of the individual to the State which, perhaps, has had no parallel in the history of the world.

Lycurgus's legislation is very variously dated, and it is not possible either to harmonize the traditions or to decide with confidence between them. Tradition substantially agrees in placing him in the 9th century.

Bibliography.—Our chief ancient authorities, besides Plutarch's biography, are: Herodotus i. 65; Xenophon, *Respublica Lacedaemoniorum;* Ephorus *ap.* Strabo x. 481, 482; Aristotle, *Politics,* ii.; Pausanias iii. and v. 4; and scattered passages in Plato, Isocrates, Polybius, Diodorus, Polyaenus, etc. Of modern works the most important are: E. Meyer, "Lykurgos von Sparta," in *Forschungen zur alten Geschichte* (Halle, 1892), i. 211 *sqq.;* A. Kopstadt, *De rerum Laconicarum constitutionis Lycurgeae origine et indole* (Greifswald, 1849); H. K. Stein, *Kritik der Überlieferung über den spartanischen Gesetzgeber Lykurg* (Glatz, 1882); S. Wide, "Bemerkungen zur spartanischen Lykurglegende," in *Skand. Archiv.* i. (1891), *go sqq.;* E. Nusselt, *Das Lykurgproblem* (Erlangen, 1898); H. Bazin, *De Lycurgo* (Paris, 1885); C. Reuss, *De Lycurgea quae fertur agrorum divisione* (Pforzheim, 1878); A. Busson, *Lykurgos und die grosse Rhetra* (Innsbruck, 1887); H. Gelzer, "Lykurg und die delphische Priesterschaft" in *Rhein. Mus.* xxviii. 1 *sqq.;* F. Winicker, *Stand der Lykurgischen Frage* (Graudenz, 1884); G. Attinger, *Essai sur Lycurgue et ses institutions* (Neuchâtel, 1892); E. Kessler, *Plutarch's Leben des Lykurgos;* the general Greek histories, and the works on the Spartan Constitution cited under Sparta.

LYCURGUS (*c.* 396–325 B.C.), son of Lycophron, one of the "ten" Attic orators. He shared with Demosthenes and Hypereides the leadership of the opposition to Philip. He left the care of external relations to his colleagues, and devoted himself to internal organization and finance. He managed the finances of Athens for twelve successive years (338–326), at first directly as treasurer of the revenues (ὁ ἐπὶ τῇ διοικήσει) for four years, and in two succeeding terms, when the actual office was forbidden him by law, through his son and a nominal official chosen from his party. Part of one of the deeds in which he rendered account of his term of office is still preserved in an inscription. During this time he raised the public income from 600 to 1,200 talents yearly. He increased the navy, repaired the dockyards, and completed an arsenal, the σκευοθήκη designed by the architect Philo. He also reconstructed the great Dionysiac theatre and the gymnasium in the Lyceum, and built the Panathenaic stadium on the Ilissus. He proposed a law that statues of the three great tragedians should be erected in the theatre, and that their works should be carefully edited and preserved among the state archives. Alexander the Great demanded his surrender, but the people refused to give him up. He died while president of the theatre of Dionysus, and was buried on the road leading to the Academy at the expense of the state. (*See* Hicks, *Greek Historical Inscriptions,* no. 145.)

Lycurgus was a man of action; his orations, of which fifteen were published, were criticized by the ancients for their awkward arrangement, harshness of style, and the tendency to digressions about mythology and history, although their noble spirit and lofty morality were highly praised. The one extant example, *Against Leocrates,* fully bears out this criticism. After the battle of Charroneia (338), in spite of the decree which forbade emigration under pain of death, Leocrates had fled from Athens and on his return was impeached by Lycurgus but acquitted.

Bibliography.—The speech has been frequently edited. Editio princeps (Aldine, 1513); F. G. Kiessling (1847) with M. H. E. Meier's commentary on pseudo-Plutarch's *Life of Lycurgus* and the fragments of his speeches; C. Rehdantz (1876); T. Thalheim (1880); C. Scheibe (1885); E. Blass (ed. major, 1889), with bibliography of editions and articles (ed. minor, 1902); E. Sofer (Leipzig, 1905), with notes and introd. There is an index to Andocides, Lycurgus and Deinarchus by L. L. Forman (Oxford, 1897). The exhaustive treatise by F. Dürrbach, *L'Orateur Lycurgue* (1890), contains a list of the most important review articles on the financial and naval administration of Lycurgus and on his public works; *see* also C. Droege, *De Lycurgo publicarum pecuniarum administratore* (Minden, 1880). Several fragments of his various laws have been preserved in inscriptions (*Corpus inscriptionurn atticarum,* ii. 162, 163, 173, 176, 180). And *see* authorities under Demosthenes.

LYCURGUS, "The Logothete" (1772–1851), Greek leader in the War of Independence, was born in the island of Samos. He was educated at Constantinople and accompanied Constantine Ypsilanti when he was appointed hospodar of Wallachia and served Ypsilanti's successor, Alexander Soutzos, as treasurer and chancellor (Logothete). In 1802 he returned to Samos. When the War of Independence began he induced his countrymen to declare Samos independent, and was chosen ruler. His share in the War of Independence is chiefly memorable because he provoked the massacre of Chios in 1822. He was afterwards deposed by the Samians, but recovered some influence and had a share in the defence of Samos against the Turks in 1824. When the island was left under the authority of Turkey by the protocol of the 3rd of February 1830, he helped to obtain autonomy for the Samians. He retired to Greece and died on May 22, 1851.

See G. Finlay, *History of the Greek Revolution* (London, *1861).*

LYDD, a municipal borough which comprises the old town of Lydd, Dungeness, Lydd-on-Sea and Greatstone, in the Folkestone and Hythe parliamentary division of Kent, Eng., about 30 mi. S.S.W. of Canterbury by road. Pop. (1951) 2,774. Area 18.6 sq.mi. After the Norman Conquest Lydd became a seaport of some consequence, but it now stands nearly 3 mi. inland. The borough however has 9½ mi. of coast line, including Dungeness (*q.v.*) point with its lighthouse and fishing industry. At some time before the reign of Edward I Lydd was made a member of the Cinque Port of Romney, and in 1290 it was granted the same liberties and free customs as the Cinque Ports on condition of supplying the crown with one ship and crew. This charter was confirmed by Edward III in 1364. Its incorporation was granted in 1885. The church of All Saints, with a portion of the original stone Saxon church, has a Perpendicular tower with rich vaulting within; the tower is a widely known landmark. On and adjacent to land known as the Rypes, granted to the barons of Lydd as a reward for their valour in repelling the Danes, are a large military camp and mortar ranges and an extensive housing estate. Close to the north-eastern approach to the town is Lydd (Ferryfield) airport with a 20-minute car ferry service to the continent. The borough is mainly agricultural and there are extensive beach quarrying plants. The coastal area attracts a great many summer visitors.

LYDEKKER, RICHARD (1849–1915), F.R.S. (1894), English naturalist and geologist, was born in London on July 25, 1849, and educated at Trinity college, Cambridge. From 1874 to 1882 he was on the staff of the geological survey of India. He died at Harpenden on April 16, 191j.

His works include *Catalogues* (10 vol., 1891) of the fossil mammals, reptiles and birds in the British Museum; *A Manual of Palaeontology* (with H. A. Nicholson, 2 vol., 1889); *Phases of Animal Life* (1892); *The Royal Natural History* (with W. H. Fowler, 8 vol., 1893–96); *The Great and Small Game of India, Burma and Tibet* (1900).

LYDENBURG, a town in the Transvaal, 25° 10′ S., 30° 40′ E., altitude 4,860 ft. Pop. (1951) 4,646 (2,363 white). The surrounding district is devoted largely to sheep farming, and cotton, tobacco and wheat are grown. Gold is produced in the neighbourhood. The town was founded by Boers in 1846. Ten years later they separated from their brethren and proclaimed an independent republic, which was, however, incorporated in the South

African republic of 1860. The first successful gold field in the Transvaal was opened there, but it was not until 1910 that railway communication was established.

LYDFORD, a village in the Tavistock rural district of Devonshire. Eng.. about 22 mi. N. of Plymouth by road. Pop. of parish (1951) 2,071. The village is on the small river Lyd, which traverses the deep narrow chasm of Lydford gorge, a famous Devon beauty spot; and at a little distance a tributary stream forms a cascade, known as the White Lady, with a fall of 150 ft.

Lydford was one of the four Saxon boroughs of Devon, and possessed a mint in the days of Aethelred the Unready. It first appears in recorded history in 997, when the Danes made a plundering expedition up the Tamar and Tavy as far as "Hlidaforda." In the reign of Edward the Confessor it ranked after Exeter, but the Domesday survey relates that 40 houses had been laid waste since the Conquest, and the tonn never recovered its prosperity. The history from the 13th century centres round the castle, built in 1195 and in the reign of Ednard III fixed as the prison of the stannaries and the meeting place of the forest courts of Dartmoor. A guild at Lydford is mentioned in 1180. and the pipe roll of 1195 records a grant for the re-establishment of the market. In 1238 the borough was bestowed by Henry III on Richard. earl of Cornwall, who in 1268 obtained a grant of a Wednesday market and a three days' fair at the feast of St. Petrock. The borough was never incorporated by charter, and only once, in 1300, returned members to parliament. In the 18th century the castle was restored and again used as a prison and as the meeting place of the manor and borough courts. The castle keep remains.

LYDGATE, JOHN (*c.* 1370–*c.* 1450), English poet, was born at the village of Lydgate near Newmarket. Probably he was educated at the school attached to the Benedictine abbey at Bury St. Edmunds, and in his *Testament* he has drawn a lively picture of himself as a typical orchard-robbing boy, who had scant relish for matins, fought, and threw creed and paternoster at the cock. He was ordained subdeacon in 1389. deacon in 1393, and priest in 1397. Lydgate passed as a portent of learning, and, according to Bale, he pursued his studies not only at both the English universities but in France and Italy. Certainly he knew France. and he visited Paris in an official capacity in 1426. It is improbable that he lived many years after 1446, when John Baret, treasurer of Bury, signed an extant receipt for a pension which he shared with Lydgate, and which continued to be paid till 1449. If it be true, as Bishop Alcock of Ely affirms, that Lydgate wrote a poem on the loss of France and Gascony, he must have lived two years longer, which would indicate the year 1451, or thereabouts, as the date of his death.

In 1434 Lydgate retired from the priorate of Hatfield Broadoak (or Hatfield Regis), to which he had been appointed in June 1423. After 1390—but while he was still a young man—he made the acquaintance of Geoffrey Chaucer, with whose son Thomas he was intimate. This friendship appears to have decided Lydgate's career. and in his *Troy Book* and elsewhere are reverent and touching tributes to his "master." The themes of his more ambitious poems can be traced to Chaucerian sources.

Lydgate is a most voluminous writer. *The Fall of Princes* alone comprises 7,000 stanzas; and his authentic compositions reach the enormous total of 140,000. As the result the bulk of his composition is wholly or comparatively roughhewn. That he was capable of finished work is shown by two allegorical poems—the *Complaint of the Black Knight* and the *Temple of Glass* (once attributed to Hawes), in which he reveals himself as a not unworthy successor of Chaucer. For a couple of centuries Lydgate's reputation equalled, if it did not surpass, that of his master. This was in a sense only natural, since he was the real founder of the school which ruled English letters during the long interval between Chaucer and Spenser. One of the most obvious defects of this school is excessive attachment to polysyllabic terms. John Metham is amply justified in his censure—

> Eke John Lydgate, sometime monk of Bury,
> His books indited with terms of rhetoric
> And half-changed Latin, with conceits of poetry.

But Lydgate is lucid in style; and his writings are read more easily than Chaucer's. In spite of that, Lydgate is characteristically mediaeval—mediaeval in his prolixity, his platitude, his want of judgment and his want of taste; mediaeval also in his pessimism, his Mariolatry and his horror of death.

Dr. Schick's preface to the *Temple of Glass* embodies practically all that is known or conjectured concerning this author, including the chronological order of his works. With the exception of the *Damage and Destruction in Realms—an* account of Julius Caesar, his wars and his death—they are all in verse and extremely multifarious—narrative, devotional hagiological, philosophical and scientific, allegorical and moral, historical. satirical and occasional. *The Troy Book,* undertaken at the command of Henry V, then prince of Wales, dates from 1412–20; *The Siege of Thebes* from 1420–22; and *The Fall of Princes* toward 1430. His last work was *Secreta Secretorum* or *Secrets of Old Philosophers,* rhymed extracts from a pseudo-Aristotelian treatise. Lydgate certainly possessed extraordinary versatility, which enabled him to turn from elaborate epics to quite popular poems like the *Mumming at Hertford, A Ditty of Women's Horns* and *London Lickpenny.*

See publications of the Early English Text Society, especially the *Temple of Glass,* edited by Dr. Schick: Koeppel's *Lydgate's Story of Thebes, eine Quellenuntersuchung* (Munich, 1884), and the same scholar's *Laurents de Premierfait und John Lydgates Bearbeitungen von Boccaccios De Casibus Illustrium Virorum* (Munich, 1885); Warton's *History of English Poetry;* Ritson's *Bibliotheca Anglo-Poetica;* Furnivall's *Political Poems* (E.E.T.S.); and Sidney Lee's article in the *Dict. Nat. Biog.*

LYDIA, a district of Asia Minor. the boundaries of which are difficult to fix, partly because they varied at different epochs. The name is found (*c.* 660 B.C.) under the form of *Luddi* in the inscriptions of the Assyrian king Assur-banipal. In Homer we read only of Maeonians (*Zl.* ii. 865, etc.), and the place of the Lydian capital Sardis is taken by Hydē (*Il.* xx. 385). According to Herodotus (i.7). the Meiones (called Maeones by other writers) were named Lydians after Lydus, the son of Attis. in the mythical epoch which preceded the rise of the Heraclid dynasty. In historical times the Maeones were a tribe inhabiting the district of the upper Hermus. The Lydians must have been an allied tribe which bordered upon them to the north-west, and occupied the plain of Sardis or Magnesia. They were cut off from the sea by the Greeks, who were in possession, not only of the Bay of Smyrna, but also of the country north of Sipylus. Northwards the Lydians extended at least as far as the Gygaean lake and the Sardenē range. The plateau of the Bin Bir Tepē, on the southern shore of the Gygaean lake, was the chief burial-place of the inhabitants of Sardis, and is thickly studded with tumuli, among which is the "tomb of Alyattes" (260ft. high). Next to Sardis the chief city was Magnesia (*q.v.*) ad Sipylum in the neighbourhood of which is the famous seated figure of "Niobe" (*Il.* xxiv. 614–7), cut out of the rock, and probably intended to represent the goddess Cybele, to which the Greeks attached their legend of Niobe. Under the Heraclid dynasty the limits of Lydia must have been already extended, since the authority of Gyges reached as far as the Troad. The successes of Alyattes and of Croesus finally changed the Lydian kingdom into a Lydian empire, and all Asia Minor westward of the Halys, except Lycia, owned the supremacy of Sardis. Lydia never again shrank to its original dimensions. After the Persian conquest the Maeander was regarded as its southern boundary, and in the Roman period it comprised the country between Mysia and Caria on the one side and Phrygia and the Aegean on the other.

Lydia proper was exceedingly fertile. The hill-sides were clothed with vine and fir, and the rich broad plain of Hermus produced large quantities of corn and saffron. The climate of the plain was soft but healthy. The Pactolus, nhich flowed through the centre of Sardis, into the Hermus, was believed to be full of golden sand. Maeonia on the east contained the curious barren plateau known to the Greeks as the *Katakekaumenē* ("Burnt country"), once a centre of volcanic disturbance. The Gygaean lake (where remains of pile dwellings have been found) still abounds with carp.

Race and Religion.—The Lydian race was probably a mixed one, consisting of aborigines and Aryan immigrants. It was characterized by industry and a commercial spirit. The religion of the Lydians resembled that of the other civilized nations of Asia Minor. It was a nature worship, which at times became wild and sensuous. By the side of the supreme god Medeus stood the sun-god Attis, as in Phrygia the chief object of the popular cult. He was at once the son and bridegroom of Cybele (*q.v.*), or Cybebe, the mother of the gods, whose image was adored on the cliffs of Sipylus (Paus. iii. 22). At Ephesus, where she was adored under the form of a meteoric stone, she was identified with the Greek Artemis (see also GREAT MOTHER OF THE GODS). The priestesses by whom she was served are depicted as armed with the double-headed axe, and the dances they performed in her honour with shield and bow gave rise to the myths which saw in them the Amazons (*q.v.*) a nation of woman-warriors. The pre-Hellenic cities of the coast—Smyrna, Samorna, (Ephesus), Myrina, Cyme, Priene and Pitane,—were all of Amazonian origin, and the first three of them have the same name as the Amazon Myrina, whose tomb was pointed out in the Troad. The prostitution whereby the Lydian girls gained their dowries (Herod. i. 93) was a religious exercise, as among the Semites, which marked their devotion to the goddess Cybele.

Lydian Dynasties.—According to the native historian Xanthus (460 B.C.) three dynasties ruled in succession over Lydia. The first, that of the Attiads, is mythical. To this mythical age belongs the colony which, according to Herodotus (i.94), Tyrsenus, the son of Attis, led to Etruria. Xanthus, however, puts Torrhebus in the place of Tyrsenus, and makes him the eponym of a district in Lydia. The second dynasty was also of divine origin, but the names which head it prove its connection with the distant East. The Hittites, an Oriental people, deeply imbued with the elements of Babylonian culture, had overrun Asia Minor and established themselves on the shores of the Aegean before the reign of the Egyptian king Rameses II. Their subject allies include the Mysians and the Dardani of the Troad, while the Hittites have left memorials in Lydia. G. Dennis discovered an inscription in Hittite hieroglyphics attached to the figure of "Niobe" on Sipylus. We learn from Eusebius that Sardis was first captured by the Cirnmerii 1078 B.C.; and since it was four centuries later before the real Cimmerii (*q.v.*) appeared on the horizon of history, we may perhaps find in the statement a tradition of the Hittite conquest. As the authority of the Hittite satraps at Sardis began to decay the Heraclid dynasty arose. After lasting five hundred and five years, the dynasty came to an end in the person of Sadyattes. The name Candaules, given him by Herodotus (i.7), meant "dog strangler," and was a title of the Lydian Hermes. Gyges (*q.v.*) put him to death and established the dynasty of the Mermnads, 687 B.C. Gyges initiated a new policy, that of making Lydia a maritime power; but towards the middle of his reign the kingdom was overrun by the Cimmerii (*q.v.*). The lower town of Sardis was taken, and Gyges sent tribute to Assur-banipal, as well as two Cimmerian chieftains he had himself captured in battle. A few years later Gyges joined in the revolt against Assyria; the Cimmerian hordes returned, Gyges was slain in battle (652 B.C.), and Ardys his son and successor returned to his allegiance to Nineveh. Alyattes, the grandson of Ardys, finally succeeded in extirpating the Cimmerii, as well as in taking Smyrna, and thus providing his kingdom with a port. The trade and wealth of Lydia rapidly increased, and the Greek towns fell one after the other before the attacks of the Lydian kings. Alyattes's long reign (609–560) saw the foundation of the Lydian empire. All Asia Minor west of the Halys ackno ledged his sway. The Greek cities were allowed to retain their own institutions and government on condition of paying taxes and dues to the Lydian monarch, and the proceeds of their commerce thus flowed into the imperial exchequer. The result was that the king of Lydia became the richest prince of his age. Alyattes was succeeded by Croesus (*q.v.*), who had probably already for some years shared the royal power. He reigned alone only 15 years, Cyrus (*q.v.*) the Persian after an indecisive battle on the Halys, marching upon Sardis, and capturing both acropolis and monarch (j46 B.C.).

Persian Conquest.—The revolt of the Lydians under Pactyas, whom Cyrus had appointed to collect the taxes, caused the Persian king to disarm them. Sardis now became the western capital of the Persian empire, and its burning by the Athenians was one of the contributing causes of the Persian War. After Alexander the Great's death, Lydia passed to Antigonus; then Achaeus made himself king at Sardis, but was defeated and put to death by Antiochus. The country was presented by the Romans to Eumenes, and subsequently formed part of the proconsular province of Asia. By the time of Strabo (xiii. 631) its old language was entirely supplanted by Greek. (See ANATOLIAN LANGUAGES.)

The Lydian empire may be described as the industrial power of the ancient world. The Lydians were credited with introducing or inventing the game of dice and also coined money. The oldest known coins are the electrum coins of the earlier Mermnads (Madden, *Coins of the* Jews, pp. 19–21), stamped on one side with a lion's head or the figure of a king with bow and quiver; these were replaced by Croesus with a coinage of pure gold and silver. The electrum coins of Lydia were of two kinds, one weighing 168.4 grains for the inland trade, and another of 224 grains for the trade with Ionia. The standard was the silver mina of Carchemish which contained 8,656 grains. Originally derived from Babylonia, this standard was passed on to Asia Minor during the Hittite conquest, but was eventually superseded by the Phoenician mina of 11,225 grains (see also NUMISMATICS). The inns, which the Lydians were said to have been the first to establish, were connected with their attention to commercial pursuits (Herod. i.94). Their literature has wholly perished. They were celebrated for their music and gymnastic exercises, and their art formed a link between that of Asia Minor and that of Greece. Lydian sculpture was probably similar to that of the Phrygians. Phallic emblems, for averting evil, were plentiful; the summit of the tomb of Alyattes is crowned with an enormous one of stone, about 9 ft. in diameter.

The tumulus itself is 281 yds. in diameter and about half a mile in circumference. It has been partially excavated, and a sepulchral chamber discovered in the middle, composed of large well-cut and highly polished blocks of marble. The stone basement which, according to Herodotus, formerly surrounded the mound has disappeared.

LYDUS ("THE LYDIAN"), **JOANNES LAURENTIUS,** Byzantine writer on antiquarian subjects, was born in A.D. 490. From an early age until his dismissal in 552 he held high court and state offices. The date of his death is not known, but he probably did not survive Justinian (d. 565). Of his literary works there survive: (1) De Ostentis (Περὶ διοσημειῶν), on the origin and progress of the art of divination; (2) De *Magistratibus reipublicae* Romanae (Περὶ ἀρχῶν τῆς Ῥωμαίων πολιτείας); (3) De *Mensibus* (Περὶ μηνῶν), a history of the different festivals of the year.

The chief value of these books consists in the fact that the author made use of the works (now lost) of old Roman writers on similar subjects.

Editions of (1) by C. Wachsmuth (1897), of (2) and (3) by R. Wünsch (1898–1903); *see* also Christ-Schmid, *Geschichte der Gr. Lit.;* and Klotz in Pauly-Wissowa, *Realencyclopädie.*

LYE, the name given to the solution of alkaline salts obtained by leaching or lixiviating wood ashes with water; to solutions of a caustic alkali (sodium or potassium hydroxide); or, more generally to any strong alkaline solution especially one used as a detergent.

In the United States it is the trade name for sodium hydroxide. (*See* ALKALI; ALKALI MANUFACTURE.)

LYELL, SIR CHARLES (1797–1875), British geologist, son of Charles Lyell of Kinnordy, Forfarshire, was born on Nov. 14, 1797, on the family estate in Scotland. His father (1767–1849) was known both as a botanist and as the translator of the Vita *Nuova* and the *Convito* of Dante: the plant *Lyellia* was named after him. As a boy Lyell had a strong inclination for natural history, especially entomology. In 1816 he entered Exeter college, Oxford, where the lectures of William Buckland first attracted him to geology. After graduating he entered Lincoln's Inn, and in 1825 he was called to the bar, and went on the western circuit for two years. In 1819 he had been elected a fellow of the Linnean and Geological societies, communicating his first paper, "On a Recent Formation of Freshwater Limestone in Forfarshire," to the latter society in 1822, and acting as one of the honorary secretaries in 1823. In that year he went to France, and in 1824 made a geological tour in Scotland in company with Buckland. In 1826 he was elected F.R.S., and in 1827 he finally abandoned law for geology.

He had already begun to plan his chief work, *The Principles of Geology* (3 vols., 1830–33). With Sir Roderick Murchison he wrote joint papers on the volcanic district of Auvergne and the Tertiary formations of Aix-en-Provence. He then studied the marine remains of the Italian Tertiary strata, and conceived the idea of dividing this geological system into three or four groups, characterized by the proportion of recent to extinct species of shells. To these groups, after consulting William Whewell as to the best nomenclature, he gave the names later universally adopted—Eocene *(dawn of recent),* Miocene *(less of recent)* and Pliocene *(more of recent)*—and with the assistance of G. P. Deshayes he drew up a table of shells in illustration of this classification. Between 1830 and 1876 12 editions of *The Principles of Geology* were published, each so much enriched as to form a complete history of the progress of geology during that interval.

In 1838 Lyell published the *Elements of Geology,* which became a standard work on stratigraphical and palaeontological geology. This book, which was based on lectures, went through six editions in Lyell's lifetime. In his third great work, *The Antiquity of Man* (1863), he gave a general survey of the arguments for man's early appearance on the earth, derived from the discoveries of flint implements in post-Pliocene strata in the Somme valley and elsewhere; he discussed also the deposits of the Glacial epoch, and in the same volume he first gave in his adhesion to Charles Darwin's theory of the origin of species.

In 1833 Lyell married Mary (1809–1873), eldest daughter of Leonard Horner, who was thenceforward associated with him in all his work.

In 1834 Lyell went to Denmark and Sweden, the result of which was his Bakerian lecture to the Royal society "On the Proofs of the gradual Rising of Land in certain Parts of Sweden." He also brought before the Geological society a paper "On the Cretaceous and Tertiary Strata of Seeland and Moen." In 1835 he became president of the Geological society. In 1837 he was again in Norway and Denmark, and in 1841 travelled through the United States, Canada and Nova Scotia. This last journey, together with a second one to America in 1845, resulted not only in papers, but also in two works not exclusively geological, *Travels in North America* (1845) and *A Second Visit to the United States* (1849). He estimated the rate of recession of the falls of Niagara, the annual average accumulation of alluvial matter in the delta of the Mississippi, and studied those vegetable accumulations in the "Great Dismal Swamp" of Virginia, which he afterward used in illustrating the formation of beds of coal. He also studied the coal formations in Nova Scotia. and discovered, in company with Sir John W. Dawson (*q.v.*) of Montreal, the earliest known land shell, *Pupa vetusta,* in the hollow stem of a Sigillaria.

On a visit to Madeira and Teneriffe he accumulated evidence on the age and deposition of lava beds and the formation of volcanic cones. He revisited Sicily in 1858, and his observations upon the structure of Etna refuted the theory of "craters of elevation" upheld by Christian von Buch and Jean Élie de Beaumont. (See *Phil Trans.,* 1859.)

Lyell was knighted in 1848 and created a baronet in 1864, in which year he was president of the British association at Bath.

In later life he became blind. He died on Feb. 22, 1875, and was buried in Westminster Abbey.

The LYELL **MEDAL** was established in 187; under the will of Sir Charles Lyell, to be awarded annually (or from time to time) by the council of the Geological society. The medallist might be of any country or either sex. It was stipulated not less than one-third of the annual interest of a sum of £2,000 would be awarded with the medal, the remaining interest, known as the Lyell Geological fund, would be given in one or more portions at the discretion of the council for the encouragement of geological science.

See *Life, Letters and Journals of Sir Charles Lyell, Bart.,* edited by his sister-in-law, Mrs. Lyell, 2 vols. **(1881)**; *Charles Lyell and Modern Geology,* by T. G. Bonney **(1895)**.

LYLY, **JOHN** (1554?–1606), English author most famous for his novel, *Euphues,* was born in Kent in 1553 or 1554. After leaving Oxford, he apparently entered the service of Lord Delawarr, and in 1580 that of Edward Vere, earl of Oxford. In 1578 he soared to fame through the publication of *Euphues, or the Anatomy of Wit. Euphues and His England* appeared in 1580. The most fashionable English writer in the 1580s, Lyly was praised as the creator of "a new English," and as Edward Blount, his first editor, reported in 1632 (in the *Sixe Court Comedies),* "that Beautie in Court, which could not Parley, *Euphueisme,* was as little regarded; as shee which now there, speakes not French."

After the publication of *Euphues,* Lyly abandoned the novel and devoted himself almost entirely to playwriting. It is known that *c.* June 1583, through Oxford's influence, he gained control of the first Blackfriars theatre and dabbled in theatrical ventures that led, a year later, to brief imprisonment for debt. In this theatre his earliest plays, *Campaspe* and *Sapho and Phao,* were produced by a company called Oxford's boys, perhaps a short-lived amalgamation of Paul's boys and the children of the Chapel. That Lyly ever served as vice-master of Paul's (a nonexistent post), as has been alleged, seems rather implausible. All that remains certain is that all Lyly's plays, except *The Woman in the Moon,* were presented by Paul's boys, either alone or with the Chapel children.

Pappe With an Hatchet (1589) was a tract in defense of the bishops in the Marprelate controversy. About the same time (probably in 1588) Lyly presumably received at least a promise of the reversion of the mastership of the Revels whenever Edmund Tylney (appointed 1579) should retire. After the inhibition of Paul's boys *(c.* 1590), however, Lyly's fortunes rapidly declined. Though a member of parliament during the 1590s, he apparently suffered from both a meagre income and a disastrously waning popularity caused by the rise of Thomas Kyd, Robert Greene, Christopher Marlowe and Shakespeare. Nor was the mastership of the Revels any nearer; Tylney held the post till 1610. In despair Lyly finally addressed to Elizabeth I two bitter petitions, dated conjecturally 1598 and 1601. In the first he complained of having wasted ten years hanging about the court in hope of preferment; his increasing despondency may be gauged from the singularly reckless tone of the second. "Thirteene yeeres your Highnes servant: but yet nothinge. Twenty frendes, that though they saye they will be suer, I finde them suer to be slowe. A thousand hopes, but all nothinge, a hundred promises, but yet nothinge. Thus castinge up the Inventorye of my frendes, hopes, prommisses and tyme: the *summa totalis* amounteth in all to just nothinge." Blount says vaguely that Elizabeth "graced, and rewarded" him, but of this there is little evidence, though he may have received something out of the Essex forfeitures. He was buried in London on Nov. 30. 1606. He had married in 1583 Beatrice Browne of Mexborough, Yorkshire, by whom he had several children.

Comedies.—The dating of Lyly's plays remains conjectural, though scholarly opinion has settled upon the following dates of probable composition: *Campaspe* and *Sapho and Phao* (1583, in this sequence); *Gallathea* (1584); *Endimion* (1586–87); *Love's Metamorphosis* and *Midas* (1589, in this sequence); *Mother Bombie* (1589–90); and *The Woman in the Moon* (1594–95). Of these all but the last are in prose. During the 1590s Lyly also wrote a number of entertainments for aristocratic audiences. Lyly's comedies mark an enormous advance upon those of his predecessors and give him a secure place among the playwrights who distinguished the last two decades of Elizabeth's reign. His skill in acclimatizing to England Italianate pastoral and Latinate comedy of intrigue; his ability to bring together into a cohesive plot fanciful and mythological characters and characters from the lower ranks of English life; his delicate analysis by allegorical means (both topical and philosophical) of the nature of love, as the Renaissance understood it; and the grace and charm of his witty dialogue set aesthetic standards that younger, more gifted dramatists dared not ignore. How these standards were met and surpassed by Shakespeare can be seen in such plays as *A Midsummer flight's Dream* and *As You Like It*. Lyly's classical and pastoral plots and characters, and his lapses into Renaissance pedantry, may seem anemic to modern readers; nevertheless his finest play, *Endimion,* precious though it be, remains a masterpiece. Francis Meres in *Palladis Tamia* (1598) cites Lyly as among "the best for comedy," and Ben Jonson lists him among the foremost rivals whom Shakespeare outsung.

Euphues.—It was as the author of *Euphues,* however, that Lyly made his most enduring impression upon the Elizabethan world. This essentially Renaissance "novel" introduced a new sense of form into English prose style. Lyly's preoccupation with the exact arrangement and selection of words, with balance, antithesis and alliteration, demonstrated that the English language could be disciplined into a flexible vehicle capable of competing on equal terms with Latin and Greek. Lyly was not the first to experiment with the artificialities of euphuism (*q.v.*), but he brought the style to its highest point and through his very exaggerations conferred a lasting benefit upon English prose. Euphuism served as one model for the malleable prose of Shakespeare, who paid Lyly the final compliment of parodying the style in 1 *Henry* IV (II, iv), where Hal and Falstaff in the famous "play extempore" burlesque Ring Henry's euphuistic grandiloquence.

(W. N. KG.)

LYME REGIS, a municipal borough and seaside town in the West Dorset parliamentary division of Dorsetshire, Eng., 25 mi. W. of Dorchester by road. Pop. (1951) 3,200. Area 1.9 sq.mi. It is situated at the mouth of a narrow valley opening upon a fine coast line of almost vertical cliffs made of horizontal layers of blue-gray limestones and shales which contain many fossils. The beach is shingle with sand at low tide and there is a small harbour between the jetty, on the east, and the massive curved wall known as the Cobb, which also forms a pier. The picturesque town, built on a steep hill, contains many Georgian houses and the church of St. Michael the Archangel, which is mainly Perpendicular with a Norman tower. The chief industry is the tourist trade. A Royal Air Force marine craft unit base was established in 1938.

Three manors of Lyme are mentioned in 1086 and the town was first known as Lyme Regis in 1316. It was a port in 1234 and was granted a charter by Edward I in 1284, making it a free borough with a merchant guild. At that date it was trading with France and by 1311 it was an important port. Further charters were granted by Elizabeth I (1591), James I, Charles II and William III. Lyme returned two members to parliament from 1295 to 1832 when the membership was reduced to one; it was disfranchised in 1867. Fairs were granted in 1553 for Feb. 1 and Sept. 20, but are no longer held. In 168j James, duke of Monmouth, landed at the Cobb which is also associated with Jane Austen's *Persuasion.* Sir George Somers (1554–1610), who first settled the Bermudas, Thomas Coram (1668–1751), who started the Foundling hospital, and Mary Anning (1799–1847), who in 1811 found the fossilized remains of an ichthyosaurus which is now in the British museum (South Kensington), London, were natives of Lyme.

LYMINGTON, a municipal borough and seaport in the New Forest parliamentary division of the county of Southampton (geographical Hampshire), Eng., on the river Lymington where it flows into the Solent, and 18 mi. S.W. of Southampton by road. It is bordered on the north by the New forest. Pop. (1951) 22.699. Area 21.5 sq.mi. Stone Age flint instruments and a Bronze Age burial urn have been found in the district and nearby was a Roman camp. In Domesday Book. Lymington is called Lentune and its first charter, one of the earliest in England. was granted by Baldwin de Redvers, 2nd earl of Devon, in 1150 and celebrated in 1950 by a week's festivities. The 6th earl granted another charter extending the borough (called old and new boroughs) to contain about 105 ac.; this remained unaltered until 1888 when Old and New Lymington were formed. The charter of Isabella de Fortibus, in 1270. gave almost complete freedom to the burgesses. These charters were later confirmed but no alteration has ever been made by the crown. The charter of 1605, formally incorporating the borough, remained in force until 1835 when. under the Municipal Corporations act, the government of the town (by a mayor and burgesses) was reformed. In 1932 the borough was extended to include Milford, New Milton (a holiday resort), Barton-on-Sea (famous for fossils), Hordle, Pennington (where there is a bird sanctuary on the marshes) and part of Sway. From 1584 until 1867, when the number was reduced to one, two members were returned to parliament; in 1885 the representation was merged in that bf the county. Two fairs were granted in the 13th century and were for centuries important events in May and October. The present Saturday market is also ancient but declined in magnitude with the coming of the railways.

The first mention of salt works, later very important, is in a grant of tithes to Quarr abbey in 1147. The old borough was made a port in Henry I's reign and rivaled Southampton in prosperity, chiefly owing to the salt industry. By 1845 the salt pans, or salterns, were worked out and the industry came to an end. Yachting and the building of yachts and other craft has been carried on since the early 19th century and the other main industry (established in 1919) is the making of piston rings. Regular passenger and car ferries serve Yarmouth in the Isle of Wight.

LYMPH AND LYMPHATIC SYSTEM. The lymphatic system consists of two main components: (1) a system of closed tubes. the lymphatics, containing a fluid, the lymph; and (2) the lymphoid complex, an aggregate of different types of lymphoid tissue containing varying combinations of cells, among which lymphocytes predominate. Scattered lymphocytes also occur in large numbers throughout the body. Though the two main components of the lymphatic system are closely associated, they are best considered separately for descriptive purposes.

This article is divided into the following sections:

4. Function of the Lymphocyte
5. Lymphoid Tissue and Virus Infections
6. Lymphoid Tissue and the Endocrine System

IV. Diseases of the Lymphatic System
1. Lymphadenitis
2. Tuberculous Lymphadenitis
3. Lymphangitis
4. Filarial Infestation: Elephantiasis
5. Reticuloses
6. Hodgkin's Disease (Lymphadenoma)
7. Reticulo-Sarcoma
8. Leukemia

I. LYMPH AND LYMPHATICS

In the higher animals the blood vessels form, with one or two possible exceptions, a closed system in which the most numerous vessels are the thin-walled capillaries. Through the capillary walls materials pass from the blood to the tissue fluid, which surrounds the individual cells and is in close contact with them. The term "tissue fluid" is a convenient one, but it must be emphasized that under normal circumstances it contains little if any free fluid. It consists of a gelatinous material, through which fluid can readily pass, but is not normally "free" in the sense that it forms localized accumulations. The water is associated with the colloid gel which forms the ground substance of the connective tissue, consisting in the main of mucopolysaccharide protein complexes, in which are embedded in varying proportions collagen and elastic fibres. It is probable that fluid moves through the connective tissues in thin films, between and around the fibres, by the action of surface forces. P. D. McMaster and R. J. Parsons (1939) refer to these as "captured" films. It is only when there is inflammatory or other edema that the accumulation of free fluid in pools may be observed, due to hydration of the colloid gel beyond a certain point.

The tissue fluid acts as a middleman in the transport of substances between the blood and the tissue cells (see also CIRCULATION OF BLOOD). Water and crystalloids can diffuse freely and rapidly in and out of the blood through the endothelium of the blood capillary. In addition, the hydrostatic pressure in the capillary causes fluid to filter out into the tissues. The extent and speed of the movement of water and crystalloids has been shown very clearly by the use of heavy water (G. Hevesy and C. F. Jacobsen, 1940) and radioactive isotopes. L. B. Flexner and his colleagues showed that in man 105% of plasma water and 78% of plasma sodium are exchanged per minute, while in the guinea pig the water exchange is even greater (140%). The absolute figures in man may be gauged from the fact that in the human adult the total blood volume is about 5 l., and of this approximately 3 l. are plasma, separated by the capillary endothelium from 10–12 l. of extravascular tissue fluid. Rapid fluid movements are essential if the composition of the tissue fluid is to remain reasonably constant.

Though the capillary endothelium so readily permits the free passage of water and crystalloids, it holds back most of the blood proteins. However, possibly as a result of the relatively high pressure of blood within the capillary, protein molecules do occasionally escape into the tissues. Over a 24-hour period something like 50% or more of the total plasma proteins leave the blood, the smaller albumin molecules escaping more frequently than the larger molecules such as globulin. Furthermore, in some parts of the body, protein leaves the blood stream more freely than in others. Once the protein molecules have passed out of the blood capillaries they cannot be directly reabsorbed into the blood. Some of this extravascular protein may be used by the tissue cells, but most of it can be removed only via the lymphatic capillaries. The prime purpose of the lymphatic system is thus to drain away from the tissues any excess protein which has escaped from the blood vessels and ultimately to return it to the blood by the main lymph ducts entering the veins. It would follow from this that wherever there are blood capillaries, lymphatic capillaries must also be present. In general this is true, and exceptions, such as the central nervous system, the bone marrow, the splenic pulp and possibly the skeletal muscle bundles, are due to local circulatory peculiarities which render the presence of lymphatics unnecessary.

1. Structure and Arrangement of Lymphatic Vessels.—The lymphatics begin as a network of capillaries with blind extremities; like the blood capillaries they are separated from the tissue fluid by a continuous layer of thin cells called endothelium (see fig. 1). Though this endothelium looks very like that of the blood capillary, it is much more freely permeable, to large molecules such as protein and even to particulate matter, which therefore readily enters the lymphatics after injection into the tissue spaces. It was at one time thought that the lymphatics communicated directly with the tissue spaces, through small openings or stomata, but it is now believed that the lymphatic system is completely closed. From the network of lymphatic capillaries there emerge plexuses of larger vessels with thicker walls, but unlike the veins these do not undergo progressive increase in calibre as they near their destination. The smallest lymph capillaries consist of a single layer of flattened endothelial cells, but the larger vessels resemble veins in having an inner coat of endothelium, a middle unstriped muscle coat and an external fibrous coat.

Valves are numerous, even in vessels of very small calibre, though they are not present in the capillaries. They usually consist of two cusps, set so as to prevent flow toward the periphery. When the vessels are engorged the sites of the valves are marked by constrictions, producing a beaded appearance. The lymph plexuses of the organs and tissues are drained by the lymphatic trunks, which usually course with the main blood vessels of the part. The main trunks from the hind limbs and abdominal organs are united into one large vessel, the cisterna chyli, from which the thoracic duct passes up on the left side of the esophagus to drain into the commencement of the left innominate vein. A smaller duct, the right lymph duct, drains the right side of the head and neck and the right upper limb, entering the commencement of the right innominate vein (fig. 3). In addition. a number of other lymphatico-venous communications may occur irregularly in the thorax and abdomen. Lymph vessels coming from organs or limbs pass at some part of their course through one or more lymph nodes, and it must be rarely, if ever, that lymph reaches the venous system without passing through at least one node.

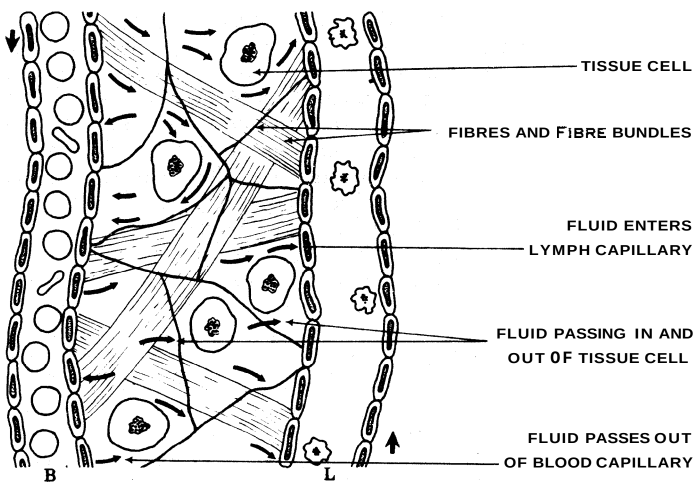

FIG. 1—DIAGRAM SHOWING FLUID EXCHANGES TAKING PLACE IN ACTIVE TISSUE.

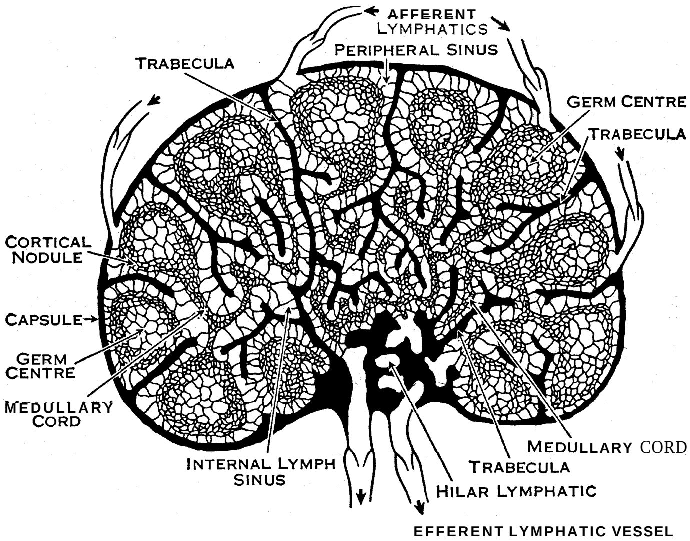
Arrows indicate the direction of flow of the fluid as it comes from the blood vessels and passes between the tissue cells into the lymph capillary, where it forms lymph. Arrows also indicate fluid exchange between the cells and surrounding tissue fluid. (Key: B = blood capillary; L = lymphatic capillary)

In certain fishes are seen vessels—venous lymphatics—which contain blood and lymph in varying proportions. In these animals the lymph vessels do not possess valves, and fluid is driven through them by contractile lymph hearts. In amphibia and reptiles lymph is no longer mixed with blood; lymphatic valves have not yet appeared, but functional lymph hearts are present, to effect a sluggish but direct flow of lymph to the blood. In most birds the lymph hearts disappear after embryonic life and the lymph vessels contain valves, just as do those of mammals.

2. Composition of Lymph. — Lymph is the colourless or yellowish fluid, containing formed elements, salts and varying amounts of protein and fat, which fills the lymphatic vessels. There is general agreement that the crystalloids of lymph are substantially identical with those of the tissue fluid. Like it, they consist chiefly of the cations, sodium, potassium, calcium and magnesium, and the anions, chloride, bicarbonate and phosphate. C. K. Drinker and his associates brought forward considerable evidence that



ADAPTED FROM A. A. MAXIMOW AND W. BLOOM, "A TEXTBOOK OF HISTOLOGY," 6TH ED., 1952; BY COURTESY OF W. B. SAUNDERS AND CO.

FIG. 2.— LYMPH NODE

this identity with the tissue fluid extends to the protein content also; *i.e.,* that peripheral lymph can fairly be regarded as the counterpart of tissue fluid. which undergoes little if any modification as it crosses the extremely permeable lymphatic endothelium.

Lymph derived from the intestine differs from lymph in other situations. since it is intimately associated with the absorption of several substances. If the animal has been fed some time previously with a fatty meal, the lymph has a milky appearance, which is due to the presence of innumerable fine droplets of fat (chylomicrons) about 0.5μ–0.75μ in diameter. The fat is absorbed by the lymphatics of the small intestine. which because of their white appearance during digestion are called lacteals. Among other substances known to be absorbed from the intestine via the lymphatics are vitamin K and certain sterols.

3. Amount of Lymph. — No precise data are available on the total lymph flow. Most of the information is based on thoracic duct lymph flow in anesthetized animals, and from this it would appear that the flow is about 2 ml. per kilogram per hour in nonruminants, and rather more than this in ruminants. The flow of lymph in all the other ducts combined is about 50% of the thoracic duct flow. Direct measurements had not been made in man, except for a feu- diseased persons in whom the flow ranged from 0.3 1. to 2.8 1. a day. The total volume of all the lymph in the lymphatics and lymphoid tissues at any given time cannot be accurately determined.

4. Relation of Lymph to Lymphoid Tissue. — In the lymph glands the lymphoid tissue is traversed by a lymph stream which reaches the glands by afferent lymph vessels and leaves them by efferent vessels. The subepithelial lymphoid tissue (nasopharyngeal and intestinal, as also the thymus) possesses efferent but not afferent vessels. The lymphoid tissue of the spleen is related to the blood stream and possesses neither afferent nor efferent lymph vessels. In the case of lymph glands, lymph which has not yet traversed a gland is known as peripheral lymph. If it has passed through one gland but still has to flow through another, it is intermediate lymph, while if it is on its way to the blood without further glandular interruption it is central lymph.

5. Formed Elements in Lymph. — The majority of the white cells in central lymph are lymphocytes, of which about 95% are small br medium lymphocytes and 5% large basophilic cells, capable of mitosis (*i.e.,* cell division). A few monocytes and granulocytes may be present. Most studies of central lymph have been made on lymph from the thoracic duct. The actual number of cells present at any time is quite variable. both in the same and in different species. In general, the smaller the animal, the greater the concentration of lymphocytes. In the dog and cat J. M. Yoffey and C. K. Drinker found that peripheral lymph contained a mean lymphocyte count of 280 and 370 per cubic millimetre, while thoracic duct lymph contained 7,800 and 12,000 lymphocytes per cubic millimetre, respectively. The lymphocyte count in thoracic duct lymph may on occasion greatly exceed this figure. Peripheral lymph contains small numbers of red and white cells, while central and intermediate lymph contain large numbers of white cells, almost entirely lymphocytes, which are being carried in the lymph to the blood stream.

6. Mode of Production of Lymph. — The forces subserving the transference of substances through the blood capillary wall to the lymphatic vessels appear to be of a physical character, though the capillary endothelium, being composed of living cells. is capable of altering its degree of permeability. It appears to be at all times freely permeable to dissolved salts. but its permeability to protein is variable. The physiological conditions under which this permeability alters are not known, but under various pathological conditions the proteins are able to pass freely through the injured epithelium, as also are the formed elements of the blood in lesser degree.

It is now considered that there are three forces producing a transference of fluid and dissolved substances from the interior of the capillary to the tissue spaces; they are blood pressure, diffusion and osmosis. The excess hydrostatic pressure existing in a blood capillary over that in the extravascular tissue spaces causes a filtration through the endothelial wall of fluid mith the same composition in salts as blood but varying in protein content. At the same time diffusible substances at a greater concentration in the blood tend to pass to a region of lesser concentration in the tissues. The third force. that of osmosis, depends on the fact that water passes through the capillary more quickly than salts and even more quickly in relation to the plasma proteins. Thus if a hypertonic solution of sodium chloride is injected intravenously there is a passage of water from the tissues to the blood, which becomes greatly increased in volume, with a concomitant dessication of the tissues. At the same time salt passes more slowly from the blood into the tissues until a new equilibrium is reached. In the reverse direction similar changes would follow an increased molecular concentration in the tissues. These factors would be sufficient to account for the major part of the exchange of water and dissolved substances between blood and tissues.

Osmotic pressure of the plasma proteins, however (as first clearly pointed out by E. H. Starling in 1896), is essential for maintaining the full balance of fluid exchange through the capillary membrane. According to what is now known as the Starling hypothesis, the endothelium of the blood capillary functions as a semipermeable membrane in relation to the plasma proteins. At any given time the amount of plasma protein which leaks through the capillary wall is small in relation to that which does not. and the protein within the capillary exerts an osmotic pressure of about 30–40 mm. Hg (mercury). There are thus two opposed forces. The capillary pressure causes water to pass out of the capillary into the tissues, while the osmotic pressure of the plasma proteins causes it to be absorbed from the tissues into the capillary. The most important of the plasma proteins for this purpose is the albumin, which has a molecular weight of 69,000. "Whereas capillary pressure determines transudations the osmotic pressure of the proteids of the serum determines absorption." The truth of Starling's hypothesis was confirmed by direct measurement of the pressure changes in individual capillaries in the frog's mesentery (E. M. Landis, 1927). Later J. R. Pappenheimer and A. Soto-Rivera (1948), using an isolated mammalian hindleg preparation, showed that the same was true for mammalian capillaries and that, in respect of the absolute figures for the capillary pressure and the osmotic pressure of the plasma proteins, the rate of fluid transfer depended on the net difference between these two forces.

A number of additional factors, though they do not affect the essential validity of Starling's view, call for consideration. Thus there is some protein in the tissue fluid and it exerts an osmotic pressure in the opposite direction to the plasma proteins. The effective osmotic pressure of the plasma proteins is therefore lessened by this amount. Furthermore, Landis showed by direct measurement that there is a fall in pressure from the arterial to the venous end of the capillary, with corresponding differences in the final fluid exchange. It is estimated that at the arterial end of the capillary the hydrostatic pressure is greater than the osmotic, whereas at the venous end it is lower. At the arterial end, therefore, the excess of hydrostatic pressure causes fluid to flow from the capillary to the tissue spaces. At the venous en3 the excess of osmotic pressure produces the reverse phenomenon and fluid passes from the tissue spaces into the capillary. The difference between the two ends may be diminished. however, by the fact that, as first suggested by F. P. Rous. the permeability of the blood capillary is not the same throughout its length, but exhibits a gradient, increasing from the arterial to the venous end.

The balance between the forces controlling fluid exchange is very nicely regulated, and it is possible that if it were not for the leakage of protein, lymphatics would be quite unnecessary. There are regions of the body in which. when at rest, the lymphatic system plays very little part, so that a constant interchange between blood and tissue fluid can take place without the production of a single drop of lymph. If a cannula is inserted into the main lymph trunk of a limb at rest almost no lymph can be obtained. If, however, the limb is thrown into action, the arterioles and capillaries of the part dilate and the hydrostatic pressure in them consequently increases; that is to say, the length of the capillary in which resorption can occur, by virtue of the excess of osmotic over hydrostatic pressure. is lessened so that fluid tends to accumulate in the tissue spaces. That it does not normally accumulate there is due to the fact that it is taken away by the lymphatics.

It must be emphasized, however, that the lymphatic vessels cannot deal with large quantities of fluid and if there is more than a moderate increase in the escape of fluid from the blood capillaries, it accumulates in the tissues, which become waterlogged and edematous.

7. Structure and Properties of Blood Capillary **Endothelium.**—The formation and drainage of lymph involve the passage of fluid first through the endothelium of the blood capillary and second through that of the lymphatic capillary. The lymphatic capillaries appear to consist solely of cells joined by intercellular cement. The blood capillary has the same essential structure. but in addition there is usually a pericapillary sheath of fine connective tissue, while on the inner surface of the endothelium there may be a noncellular lining derived from the plasma proteins (R. Chambers and B. W. Zweifach, 1947). The intercellular cement is readily demonstrated in most capillaries by the reduction of silver nitrate. It may well be that the cement lines constitute areas of increased permeability. Electron microscope studies suggest that true capillary pores may in fact exist in certain situations.

The distinctive feature of lymphatic endothelium is its great permeability. Not only do large protein molecules pass through it readily, but even solid particles such as india ink, bacteria or cells. This fact is the basis of the classical method of demonstrating lymphatics, namely, interstitial injection—the injection of a particulate suspension into the tissue spaces or interstices, whence the particles readily enter the adjacent capillaries. This property can readily be demonstrated in the lymphatics of the peritoneal surface of the diaphragm. If a suspension of graphite is injected into the peritoneal cavity of a rabbit, the subperitoneal lymphatics can be seen filled with the black material. Red cells, too, can be removed by this route from the peritoneal cavity in considerable numbers; and F. C. Courtice, J. Harding and A. W. Steinbeck showed that they reach the blood stream through the right lymph duct. There appears to be a slow steady movement of cells from the blood stream through the tissues and into the lymphatics. The precise significance of this is not clear.

The high degree of permeability of the lymphatic endothelium has a further consequence in that substances of low molecular weight which have been absorbed by lymph capillaries may, during their passage along these channels. diffuse out again into the surrounding tissue fluid to be reabsorbed by the blood vessels or by other lymphatics. An interesting observation on the permeability of lymphatic vessels to diffusible substances was made by M. R. Lewis. If histamine or adrenaline is inserted into the skin by puncture, some of the substance is taken up into the lymphatics, but leakage out again into the tissue fluid occurs during passage up the lymphatics, as is shown by the occurrence of a reddish line of dilated capillaries and venules in the case of histamine, and a white line due to the contraction of these vessels in the case of adrenaline.

8. Propulsion of Lymph.—Lymph hearts (that is, organs for pumping lymph through the lymphatic vessels) are not present in mammals. Rhythmical contraction of lymphatic vessels has occasionally been noted (*e.g.*, in the mesenteric lymph vessels of the rat and guinea pig), but, in the main, the propulsion of lymph in mammals is due to extrinsic and not intrinsic forces. In the first place, the slight tissue pressure helps to drive fluid from the tissue spaces into the lymphatic capillaries. Though the head of pressure is not great (in the mouse's ear 1.9 cm. of water outside the lymphatic capillary, 1.2 cm. in its lumen), it exerts a continual effect, augmented by movement. All the larger and most of the smaller lymphatic trunks are liberally supplied with valves, which consist usually of two cusps and which permit the flow of lymph in one direction only, namely to ard the heart. In the limbs, movement and muscular contraction are the main propelling agents. If a cannula is inserted into a lymph trunk in a limb, no lymph flows if the limb is at rest, but there is considerable flow if it is either massaged or made to move, whether actively or

FIG. 3.—SCHEME OF THE MAIN LYMPH VESSELS IN MAMMALS

passively. In the intestine, contraction squeezes out lymph very effectively into the cisterna chyli and the thoracic duct. This can be shown readily by observing the great increase in thoracic duct lymph flow after the administration of drugs such as pilocarpine which stimulate peristalsis. Once lymph has found its way into the cisterna chyli (see fig. 3), the pressure changes associated with each inspiration—namely, increased intra-abdominal pressure expelling it from the abdomen, and negative intrathoracic pressure sucking it into the thorax and great veins—form the final link in the chain of extrinsic propelling agents.

In some situations, an additional aid to lymph flo may be the transmitted pulsation from adjacent arteries; *e.g.*, the aorta and the thoracic duct. Occasionally, the lymph vessels may even form plexuses around the arteries.

9. Pressure in Tissue Spaces.—The relation between the tissue pressure and that within the lymphatic capillaries raises the problem of the patency of these vessels, which might be expected to collapse if the pressure of the fluid outside them were greater than that inside. This might conceivably be an even more difficult problem nhen the tissue pressure is increased as in cases of edema. It was long ago observed. however. by W. A. Gaskell that fibres passed from the walls of the lymphatic vessels into the surrounding tissues in the epiglottis, so that if the tissues became swollen with fluid, these fibres were pulled on and helped to keep open the lumen of the vessel to which they were attached. These observations later were confirmed by B. D. Pullinger and H. W. Florey in experimentally induced edema in the ear of the mouse. in which fine argyrophilic connective tissue fibres could be demonstrated passing from the walls of widely patent lymph capillaries into the surrounding edematous tissues.

II. LYMPHOID COMPLEX, LYMPHOID ORGANS AND LYMPHOID TISSUES

The second great component of the lymphatic system consists of the lymphoid complex, a group of organs and tissues formed by: (1) lymph nodes; (2) subepithelial lymphoid tissues, lying under the mucous membrane of the alimentary canal; (3) the spleen; (4) the thymus; and (5) hemolymph nodes. In addition, there are large numbers of lymphocytes scattered throughout the connective tissues, especially abundant in the bone marrow.

1. Total Amount of Lymphoid Tissue.—It is difficult to assess the total amount of lymphoid tissue in the body, and the method which has been employed, namely the careful dissection and weighing of all the scattered lymphoid masses, is far from ideal. E. Andreasen estimated that in young adult rats the total amount of lymphoid tissue. including the thymus, is 0.5%–1% of the body weight.

2. Age Changes.—Lymphoid tissue undergoes age changes. Well developed until puberty, when it reaches its maximum, it then undergoes atrophy. In old age the thymus and subepithelial lymphoid tissues have for the most part disappeared, but the spleen and lymph nodes persist.

3. Relation Between Different Members of the Lymphoid Complex.—Though all members of the lymphoid complex are referred to as lymphoid tissue, there are marked points of difference. In the case of the thymus. it has been questioned whether it really is a lymphoid organ. and it has been suggested that though the thymic cells bear a superficial resemblance to lymphocytes they do in fact form a distinct cell species. However, thymocytes and lymphocytes both have the same characteristic movement, the nucleus forming a rounded head, the cytoplasm a short stumpy tail.

There are significant differences between the members of the lymphoid complex in the ability to form antibodies. The spleen can. when required, produce large amounts of antibody, the thymus none, while the lymph nodes are intermediate in this respect.

4. Lymph Nodes.—Lymph nodes or lymph glands are the most numerous of all the lymphoid organs. They are pink bodies situated on the course of the lymphatics and they therefore possess both entering (afferent) and draining (efferent) lymph vessels. They are rounded or bean-shaped (see fig. 2) and vary in size from small nodules to flattened masses perhaps two inches long, large nodes being commonest in the groin. Each node has a fibrous capsule from which trabeculae pass toward the interior, where they break up and interlace to form a network, the intervals being filled by lymph sinuses and cell columns. Beneath the capsule of the node is a peripheral lymph sinus into which the afferent lymphatic vessels enter, usually from the convexity of the node. Subsidiary lymph sinuses traverse the node from the peripheral sinus and are collected together at the hilus (where the blood vessels enter) as one or more efferent lymphatic trunks. The node is subdivided by the internal lymph sinuses and trabeculae into rounded nodules of lymphoid tissue in the cortical region and elongated cords in the medullary region. In the centre of each cortical nodule there may be a lighter area of large cells, the germ centre, while considerable regions may be occupied by diffuse lymphoid tissue without any nodules. The complete endothelial lining of the entering lymphatic vessels is not continued to line the sinuses of the node. which are rather spaces in the reticular tissue. often traversed by fine bridgelike strands of reticulum, to which adhere many large, flattened, reticulo-endothelial cells. These latter cells, in contrast to the lymphocytes, are highly phagocytic and readily take up foreign particles which enter by the lymph. Thus the thoracic nodes of city dwellers are black from carbon strained off in its passage from the lungs. In a similar way, invading bacteria which have been taken up by the lymphatics tend to be arrested in the nodes draining the affected region.

The exact position of the various groups of lymph nodes is very important from a medical point of view. The tendency for an infection to spread to the draining lymph nodes just mentioned is a case in point. Another is the tendency of malignant tumours to spread and involve the lymph nodes. It is not possible here to describe in detail the positions of the nodes and groups of nodes. Full descriptions are given in treatises on anatomy.

Besides being adapted to filtering off foreign particles, the slow seepage of the lymph through the node permits easy entry of cells from the node into the lymph. Indeed, lymphocytes that are formed in the node and then enter the lymph as it traverses the node are an important source of the free lymphocytes of the blood. Lymphocyte formation can occur in diffuse lymphoid tissue even in the absence of germinal centres, but the latter seem to develop whenever maximal production of lymphocytes is required.

Lymph nodes reach their highest development in mammals. Simpler nodes are present in marsupials. Among the birds only certain aquatic species possess them, but they are of very simple structure and are present only in certain situations; viz., a pair at the thoracic inlet and a similar pair in the abdomen. In some birds there are quite appreciable accumulations of lymphoid tissue in the walls of blood vessels. In fishes and amphibia lymphoid tissue does not occur by itself. but is found in the lympho-myeloid organs, where it is closely associated with tissue which forms myelocytes, granulocytes and erythrocytes.

5. Subepithelial Lymphoid Tissues.—The subepithelial lymphoid tissues lie under, and in close association with. the mucous membrane of certain parts of the alimentary canal. At the upper end are situated the palatine tonsils, the nasopharyngeal tonsils (known as adenoids when enlarged) and the lingual tonsil, which lies posteriorly on the dorsum of the tongue. These three sets of tonsils thus form a group surrounding the entrance to the pharynx. Throughout the intestine there occur solitary nodules, but they are most numerous in the small intestine: in the terminal part of which they also form large aggregations known as Peyer's patches. The submucosa of the appendix is closely packed with lymphoid tissue. The subepithelial lymphoid tissues have a simpler type of organization than lymph nodes. As they have no afferent lymph vessels and therefore no lymph sinuses traversing them, the subepithelial lymphoid tissues consist of lymphoid nodules with germ centres and a variable amount of diffuse lymphoid tissue, surrounded by a network of lymphatic capillaries.

6. Lymphoid Tissue in the Spleen.—The spleen is enclosed in a capsule which is muscular and contractile in many animals, but in man is mainly fibroelastir. From the capsule trabeculae ramify throughout the organ, forming a framework the meshes of which are occupied by the splenic pulp. The latter is of two types, the white pulp, which is composed of lymphoid tissue as described above, and the red pulp. This consists of venous sinuses among which are a spongy network of cells, the splenic cords, containing lymphocytes and numerous macrophages, either free, or arranged as a network (the pulp reticulum). On the cut surface of the organ the white pulp is visible as rounded or elongated gray areas up to one millimetre in' diameter, sometimes known as the Malpighian bodies, and usually surrounding the arteries. No lymphatic channels are present in the pulp, which possesses instead

a highly specialized blood vascular arrangement which allows intimate contact of the cellular and fluid elements of the blood with the lymphoid and reticulo-endothelial cells of the pulp. This permits the spleen, quite apart from its reservoir function, to entrap foreign particles circulating in the blood stream in the same fashion as a lymph node arrests particles in the lymph stream. (See also SPLEEN.)

7. Thymus.—The thymus, situated in man behind the upper end of the sternum, consists of a dense mass of round cells embedded in a reticular framework. Draining lymphatics are present, but no entering lymphatics. Besides the small round cells or thymocytes, groups of epitheliallike cells (Hassall's corpuscles) are present. Controversy still exists as to whether the thymus is a true lymphoid organ, for in some ways it reacts differently from lymphoid tissues elsewhere, though the differences are usually of degree rather than of kind. On the whole, the available evidence appears to favour the view that the thymocyte and the small lymphocyte are identical; in tissue culture they both show the same type of distinctive movement. The thymocytes tend to be the smallest of the small lymphocytes, with a bare minimum of cytoplasm, resembling most closely the small lymphocytes in bone marrow. The evidence suggests that the thymus is the most vigorous cell producer of all the lymphoid organs, being four to six times as active as lymph node tissue. (See also THYMUS.)

8. Hemolymph Nodes.—These bodies are similar to simple lymph nodes but their sinuses contain blood. They are most conspicuous in ruminants such as the sheep. In man they are found only within the abdomen and are of very small size and minor physiological importance. They are in all probability lymph nodes whose afferent lymph vessels have contained an abnormally large number of erythrocytes, which then accumulate in the sinuses of the nodes.

9. Lymphoid Tissue in Bone Marrow.—Certain aspects of this question are considered in the discussion below on the fate of the lymphocyte. Here it need only be noted that mammalian bone marrow does not normally contain organized lymphoid tissue of the type associated with lymphocyte production in all other situations. It may contain scattered small lymphocytic aggregates, and it usually has a large number of small lymphocytes, which seem not to have been formed in the marrow but to have entered it from the blood.

10. Functions of Lymphoid Tissue.—Two main functions have been assigned to lymphoid tissue: (1) defense and (2) lymphocyte formation. The defense theory was originated by R. Virchow, who maintained that noxious particles entering the lymph stream were held up in the sinuses of the nodes. This simple barrier theory was later extended to include antibody production. The view that lymphocyte production is an important function of lymphoid tissue received a strong impetus from the observation by W. Flemming (1885) that the germinal centres contained abundant mitoses.

III. LYMPHOCYTES

Lymphocytes are often described in terms of size as large. medium or small, though there are other differences associated with these size relationships. The most numerous cell type—and also still the centre of acute controversy—is the small lymphocyte. In fresh wet preparations of blood or lymph the small lymphocytes are rounded cells. usually about eight microns in diameter. The nucleus almost fills the cell and is round, oval or bean-shaped. If kept at body temperature the lymphocytes move about rapidly for short periods, and then round off to a resting state in which small pseudopodia may form and retract. The movement is distinctive. since the nucleus forms a rounded head and the cytoplasm the tail. The number of moving cells increases from the first to the ninth hour, by which time most of the cells are moving. This is in contrast to the behaviour of the polymorphs. which are most active initially but are almost rounded and inactive after six hours.

The cytoplasm of the lymphocyte is clear, and mitochondria can be seen in unstained cells. In fixed preparations treated with Romanowsky stains the nucleus of the lymphocyte is coloured an intense dark purple, while the cytoplasm is a clear pale blue, though in the large lymphocytes it may be much more basophilic. Ultraviolet absorption studies indicate that the nucleus of the small lymphocyte contains the diploid number of chromosomes.

1. Genetic Relations of Lymphocytes.—Lymphocytes develop either from other lymphocytes or from nonlymphocytic precursors in the various lymphoid tissues, but the details of their origin and development are matters of dispute, as part of the larger question of the origin and interrelationships of blood cells generally. M. M. Wintrobe (1946) emphasized that one of the main points of disagreement between the proponents of the various general theories of blood formation is in regard to what constitutes a lymphocyte. With regard to developmental potentialities, the question has been most acute in relation to the small lymphocyte.

It has been maintained on the one hand that the small lymphocyte is totipotential. capable of developing into all the other cells of the blood and connective tissue, and on the other hand, that it is incapable of further development; intermediate views have been held. If the small lymphocyte is totipotential, then it must be regarded as a specialized form of the primitive mesenchymal cell, reduced to the smallest possible size to facilitate rapid mobilization and transport through the blood stream from one part of the body to another.

2. Production of Lymphocytes and Entry Into **Blood.**—The study of lymphocyte production is beset with many difficulties. Newly formed lymphocytes may enter the blood indirectly, by first entering the lymph stream, or directly, by passing through the walls of the blood capillaries in lymphoid tissue. The indirect entry lymphocytes reach the blood by the thoracic duct, the right lymph duct or other and irregular lymphatico-venous communications. In the past, it was assumed that most of the lymphocytes enter the blood by way of the thoracic duct. and numerous quantitative studies have been based upon this assumption. In a typical experiment, samples of lymph are collected at intervals from the thoracic duct over a period of several hours. Then from the total volume of lymph flow. and the number of lymphocytes per unit volume, it can readily be calculated that the number of lymphocytes entering the blood stream a day by this route alone is considerably in excess of the total number of lymphocytes in the blood. Since there is no clear evidence that lymphocytes are destroyed while in the blood, it must be assumed either that there is a continuous circulation of lymphocytes between blood and lymph, or that the lymphocytes leave the blood stream and are continually replaced by the newly formed cells which are entering it. J. M. Yoffey (1936) estimated that in the dog the blood lymphocytes were replaced about $2\frac{1}{2}$ times a day, and termed this the daily replacement factor (D.R.F.). A. G. Sanders. H. W. Florey and J. M. Barnes found in the rabbit a D.R.F. of about five; and in general. the smaller the animal the higher the D.R.F. Studies of cell multiplication in the lymphoid tissues themselves suggest that lymphocyte formation may be considerably more active than the thoracic duct data indicate. As to the relative contribution of the different members of the lymphoid complex, it is probable that the thymus is the most active of all the lymphocytopoietic tissues and that the intestinal and mesenteric lymphoid masses rank next in importance.

3. Fate of the Lymphocytes.—H. S. Sjövall (1936) maintained that the lymphocytes continually recirculated between blood and lymph. and experiments involving prolonged drainage of thoracic duct lymphocytes have been interpreted as supporting this view. It is, however, difficult to reconcile this with the active synthesis of deoxyribonucleic acids (DNA) in lymphoid tissues. The existence of a very rapid turnover for lymphocytes poses acutely the question of the fate of these cells. It is unlikely that lymphocytes undergo degeneration on any considerable scale while in the blood stream. It is also improbable that there are large numbers of lymphocytes lost to the body by migration through the epithelium of the intestine. though a certain number may be so.

Lymphocytes are constantly migrating into the connective tissues. but there is no evidence to prove that this extravascular migration occurs on a sufficiently large scale to account for the "disappearance" of the lymphocytes. Another suggestion is that the lymphocytes are filtered out of the biood into the bone marrow. This concept would fit in admirably with the view that lymphocytes are totipotential and capable of developing into the other blood cells, but on this point there is no general measure of agreement. From a quantitative point of view. it is significant that very large numbers of lymphocytes occur in normal marrow. and all the evidence points to their reaching the marrow from the blood. The number of lymphocytes present in the marrow is more than adequate to account for the numbers daily disappearing from the blood.

The question of the transformation of lymphocytes into other cells has ,been extensively investigated not only in the tissues of the organism but also in living organisms by the technique of tissue culture. Some observers have claimed that starting with pure cultures of lymphocytes they have noted the subsequent appearance of monocytes. macrophages, fibroblasts, granulocytes and erythroid cells. But their claims have not met with general acceptance.

4. Function of the Lymphocyte.— It has long been widely held that the lymphocyte plays a part in the defense mechanisms of the body. Many familiar observations form the basis for this belief, among them the increase in the blood lymphocytes in many infectious diseases; the accumulation of lymphocytes around areas of subacute or chronic inflammation, especially when due to organisms such as those of syphilis and tuberculosis; the mantle of lymphocytes around an invading tumour; and the collections of lymphocytes in parts subjected to mechanical or chemical irritation. The anatomical arrangement of the masses of lymphoid tissue has been advanced as support for the protective role of the lymphocyte. Thus the tonsillar ring of lymphoid tissue is often described as guarding the gateway to the alimentary canal from the entry of organisms; a similar protective function is assigned to the lymphoid nodules of the intestine, while the disposition of lymph nodes as filters along the course of the lymph stream has given further support to these views.

Direct factual evidence has become available about the role of the lymphocyte in these defense processes. The small lymphocyte lacks phagocytic powers and is incapable of producing antibodies to bacteria or foreign proteins. In 1935 P. D. McMaster and S. Hudack, following up earlier work, demonstrated specific agglutinins in the lymph nodes draining an infected area, though they were unable to show which cells were responsible. W. E. Ehrich and T. N. Harris (1942) found that the injection of antigen into the pad of a rabbit's foot was followed by a hyperplasia of the popliteal node, with an increase in the cell count and the antibody content of the lymph issuing from a cannula inserted into the efferent lymphatic. But subsequent work led Ehrich and his collaborators to the view put forward by A. Fagraeus (1948) and others, that it was the plasma cell which was in the main responsible for antibody formation, not the lymphocyte. A. Coons and his co-workers applied an ingenious technique involving the use of fluorescent antigen and antibody, as a result of which they showed not only that it is not the small lymphocyte in lymph nodes which is responsible for antibody formation. but that the plasma cells which are responsible are derived from the primitive reticular cells and large lymphocytes from which small lymphocytes also arise.

The part played by the reticulo-endothelial cells is not altogether clear. F. R. Sabin (1939) used a coloured antigen to study antibody production, and suggested that this process occurred in the phagocytic cells of the reticulo-endothelial system which ingested the antigen. It was later shown that antigen was indeed retained for 11 weeks and longer in the macrophages of lymphoid organs, even though these cells were not in themselves responsible for antibody formation. It would appear, therefore, that when antigen reaches a lymph node it is taken up mainly by the reticulo-endothelial cells, and that subsequently the node reacts by producing increased numbers of both plasma cells and lymphocytes. The plasma cells remain in the node and are a source of antibody; the lymphocytes are discharged in the efferent lymph and enter the blood. When the antigenic stimulation is at an end the formation of plasma cells ceases and lymphocytopoiesis becomes once again the dominant activity. Antibody formation proceeds most actively in the spleen. to a lesser extent in lymph nodes, and seems to be completely absent in the thymus. (See IMMUNITY.)

5. Lymphoid Tissue and Virus Infections.— In the case of virus infections, lymph nodes may constitute a mechanism for the dissemination of virus particles. Viruses are cytotropic, and when from a focus of infection they enter the lymphatics and come to the regional lymph nodes, they obtain access to the various cells, including the lymphocytes. When virus-containing lymphocytes leave the node they take virus with them to the blood stream, and so it becomes rapidly disseminated through the body. This mechanism of virus transport was first shown in the case of vaccinia. Viruses such as those of poliomyelitis were long thought to be exclusively neurotropic in their spread, but there is an increasing body of evidence to suggest that even with these viruses the lymphoid mode of dissemination may occur.

6. Lymphoid Tissue and the Endocrine System.—There exists only scanty information about the mechanisms by which the growth of lymphoid tissue is controlled. A good deal of attention has been directed toward the possibility of lymphoid tissue's being controlled through the endocrine system, more especially the adrenal glands. From the time when Thomas Addison (1855) first noted a lymphoid tissue hyperplasia in one of the 11 cases on which he based his description of the disease named after him, evidence has steadily accumulated to indicate a close connection between lymphoid tissue and the adrenal cortex. H. Selye (1937), in his first account of the adaptation syndrome. emphasized the role of the pituitary in stimulating the secretion of the adrenal cortex with resultant atrophy of the thymus. T. F. Dougherty and A. White in 1944 attributed an important role to the pituitary adrenotropic hormone in the regulation not only of the lymphocytes but also of the other cellular elements of the blood.

IV. DISEASES OF THE LYMPHATIC SYSTEM

A distinction must be drawn between. on the one hand, those conditions which primarily affect the lymphatic system, and, on the other, the reactions of the lymphatic system to disease of some other system or systems. Important in the latter connection is the role of the lymphatic system in edema and in the dissemination of tumours or bacteria. For information on these topics ***see*** CANCER; EDEMA; etc.

1. Lymphadenitis.— This disease, an inflammatory infection of lymph nodes, is characterized by hyperemia of. and exudation into, the lymph node, which becomes firmer. redder and enlarged. Three varieties may be distinguished: simple, suppurative and tuberculous. The cause is the arrest in the node of toxic or infective material, usually of viral or bacterial origin. This may occur in several of the acute infectious diseases, notably scarlet fever, diphtheria and German measles; and the infectious material may reach the lymph nodes either through the lymphatic vessels or from the blood stream. The lymph nodes of the neck are often enlarged, especially in children when chronic infection is present in the tonsils. In chronic infectious diseases such as syphilis and typhoid fever, many groups of nodes may be involved. Simple lymphadenitis usually subsides of its own accord if viral in origin, but it may progress to suppuration if the causal agent is pyogenic.

2. Tuberculous Lymphadenitis.— This is due to infection of the lymph nodes with the tubercle bacillus. Involvement of the draining nodes in this way is apt to follow tuberculous disease in any situation, as there is a particular tendency for the organisms to spread by the lymphatics. Thus, in pulmonary tuberculosis, the bronchial and mediastinal nodes are commonly involved in the process. Especially in young children. these nodes may become massively enlarged, even when the primary focus in the lung itself is small. In the neck there may be extensive involvement of many nodes with no obvious primary focus. In this case, although the matter has been considerably disputed, there is a good deal of evidence pointing to the tonsil as a common portal of entry.

Tuberculous disease is also not uncommon in the mesenteric lymph nodes. In this instance, the infection is from swallowed organisms. A sufferer from pulmonary tuberculosis may swallow some of his infected sputum instead of expectorating it, and so set up an intestinal and mesenteric infection. Afore important, however, is the abdominal tuberculosis resulting as a primary infection in children from the ingestion of milk from tuberculous cows.

The earliest manifestations of tuberculous lymphadenitis are an enlargement of the node and the formation within it of minute tubercles. It is possible in this stage for spontaneous healing to occur. but the disease often progresses to caseation, in which death of the tissue occurs and is followed by conversion of the dead material into a cheesy mass. This latter stage may end in calcification. but often the caseous material softens, so that the node may become a single abscess cavity. If left to itself, the "cold abscess" (as it is called) sooner or later penetrates the capsule of the node into the surrounding connective tissues. where it may track for some distance. In disease of the cervical nodes, the abscess may penetrate the skin at one or several points. through which the caseous contents are discharged. In diseases of internal nodes such as the mediastinal. the abscess may ulcerate into a blood vessel. with a resulting general dissemination of the disease. (See also TUBERCULOSIS.)

3. Lymphangitis.—In cases where an infective agent such as a hemolytic streptococcus is very virulent. there may be seen thin red lines in the skin tracking from the focus of infection (which may be quite trivial) toward the nearest group of lymph nodes. These lines indicate the spread of the organisms up the superficial lymphatics. The draining node may arrest the process, but in very severe cases localization of the infection may not occur, and organisms will then enter the blood stream.

4. Filarial Infestation: Elephantiasis.— A chronic lymphangitis occurs in filarial infestation. The adult worms, both male and female. live in the lymphatics. commonly those of the lower abdomen. pelvis or groin. The young microfilariae pass into the blood stream. The presence of the adult parasites in the lymphatic trunks causes obstruction. peripheral dilatation and irritation of the vessels. In certain cases the condition of elephantiasis may then supervene, possibly as a result of superadded infection. In the majority of such cases a lower limb is the part affected, (*See* also FILARIASIS.)

5. **Reticuloses.**—Mention has already been made of the diverse types of cells n-hich are present in lymphoid tissue. It is not surprising therefore that primary diseases of this tissue should present. as in fact they do present. a bewildering variety of appearances and behaviour. Particularly is this the case in the hyperplastic conditions, and especially so in neoplastic (tumorous) conditions, where there is often a marked tendency for the cells of the tumour to revert to more primitive types. In such a confusing group of diseases classification is difficult and at the best only provisional. Where knowledge is scanty, definite opinions cannot be expressed. Nevertheless. the term reticulosis. or reticulo-endotheliosis, has been introduced by pathologists to include any systematized overgrowth of lympho-reticular tissue. whether neoplastic or non-neoplastic. Included in this category are Hodgkin's disease (lymphadenoma), lymphosarcoma, reticulosarcoma, leukemia. the generalized lipoidoses. as well as the systematized lymphadenitis seen in syphilis, kala azar. malaria and typhoid fever.

6. Hodgkin's Disease **(Lymphadenoma).**—This disease, fully described by Thomas Hodgkin in 1832, is characterized by a progressive enlargement of the lymph nodes all over the body, generally starting in the nodes of the neck. The majority of cases occur in young adult males. The first sign is usually the enlargement of a node in the neck, followed by progressive growth of the nodes in the submaxillary region and axilla. The inguinal group is early involved. and the abdominal nodes later. The swellings are at first painless. but in the later stages of the disease symptoms occur as a result of pressure on surrounding organs. When the disease starts in the deeper groups of nodes. the first symptom may be pain in the chest and cough, or pain in the abdomen. or pain and edema in the legs. For a long time the-nodes remain discrete and rubbery. but in the latter stages of the disease they may become mntted together. In the majority of cases the spleen enlarges. Secondary anemia is common, slight irregular fever may be present; and eventually a great and progressive emaciation takes place.

The course of the disease is slowly and progressively fatal. In the early stages, treatment may cause rapid decrease in the size of the masses, but when the nodes have become fibrotic there is little response.

Microscopic examination of the nodes shows a gradual replacement of the normal architecture of the lymphoid tissue by larger cells of various types, including giant cells with several nuclei. Areas of necrosis often occur. There is a marked and characteristic increase of reticulum (shown by silver staining) and. in the later stages of the disease. of dense fibrous tissue, which may almost obliterate the proliferating cells.

7. **Reticulo-Sarcoma.**—This group comprises frankly malignant tumours of various types. including (among many others) those formerly classed as "lymphosarcoma" and the so-called "Hodgkin's sarcoma." They are, in general, more rapidly fatal than is Hodgkin's disease. and present a great variety of appearances and behaviour, in keeping with the multiple potentialities of the cell of origin (a relatively undifferentiated reticulo-endothelial cell) and the higher degree of malignancy. Although rare exceptions have been reported, overflow of the malignant cells from the lymphoid tissues into the blood stream does not occur. a feature which serves to distinguish these affections from leukemia.

8. Leukemia. — There are two main types of leukemia. namely, lymphatic and myelogenous. Lymphatic leukemia affects the lymph nodes most obviously. though it has been suggested that it may begin in the thymus. Myeloid leukemia is primarily a disease of the bone marrow, in which the enlargement of the lymph nodes is a secondary phenomenon due to the infiltration of the nodes by the proliferating myeloid cells. In chronic lymphatic leukemia the lymph nodes, liver and spleen become greatly enlarged. owing to the accumulation of great numbers of lymphocytes. In contradistinction to Hodgkin's disease, the nodes do not remain discrete, but soon become matted together. In addition, there is usually a great increase in the circulating lymphocytes of the blood. a phenomenon which does not occur in Hodgkin's disease or reticulo-sarcoma. More rarely the condition is acute, and in these cases the primitive lymphoblasts may be present in the blood. although the lymph nodes are only slightly enlarged. Death may occur in a few weeks in such cases.

The outcome of leukemia is inevitably fatal. after a long or short course. depending mainly on the acuteness of the process. Treatment directed to the bone marrow and lymphoid organs may arrest the process for a time. See also BLOOD; LEUKEMIA.

LYMPHOGRANULOMA VENEREUM, a venereally acquired virus infection of lymph channels and nodes which may be manifested by ulcerations. rectal strictures and enlargement of lymph nodes and the genitalia. *See* VENEREAL DISEASES.

LYNBROOK, a village in Nassau county. on Long Island, N.Y., U.S., about 2 mi. E. of the New York city line. Primarily a residential community. Lynbrook also has light industry including electronic supplies. plastic buttons, hats, laboratory supplies and several mail order houses. The village was incorporated in 1911.

For comparative population figures see table in NEW YORK: *Population.* (M. *H.* LE.)

LYNCH, BENITO (1885–1951), Argentinean novelist and short-story writer, whose works examine the psychology of uncomplicated persons at everyday activities. was born in Buenos Aires in 1885, of Irish ancestry. From his second until his tenth year he lived on a cattle ranch in the province of Buenos Aires, gaining an intimate knonledge of rural life. Being of independent means, he preferred later to live quietly and do his writing in La Plata. He died in Buenos Aires on Dec. 23. 1951.

Lynch's first important novel. *Los caranchos de la Florida* (1916), although somewhat melodramatic. opened a modern phase of the gaucho novel in Argentina. In the major novels *Raquela* (1918), *El inglés de los güesos* (1923)—generally considered his best work—and *El romance de un gaucho* (1933), he gives a unique interpretation of country folk in Argentina, diverging from the usual dramatic or sensational myth of the gaucho and using a simple. ironic style. His art is intuitive rather than intellectual, and his general approach is that of realism. Lynch's skill in shorter forms is best shonn in the novelette *El antojo de la patrona* (1925) and the stories in *De los campos porteños* (1931).

See Arturo Torres-Rioseco, *Grandes novelistas de la América Hispana,* vol. i (1941). (A. Cs.)

LYNCHBURG, a city adjacent to but independent of. Campbell county in central Virginia, U.S., is located on the James river in the foothills of the Blue Ridge, 50 mi. E.N.E. of Roanoke. It was settled largely by Quakers in 1757 at a ferry established by John Lynch, after whom it was named. Despite its steep hills. it became a tobacco market of importance. Hogsheads of tobacco were rolled in from surrounding fields, lowered by ropes to the river below, and poled in flatboats to the tidewater at Richmond. Strict attention to grading made Lynchburg famous for its dark-leaf tobacco. which, flavoured with licorice, became a favourite chewing tobacco throughout the south.

The village was incorporated as a town in 1805, and by 1829 had grown into a bustling place of 4.630 inhabitants, with warehouses and stores. The importance of Lynchburg was enhanced by the construction of the James river canal in 1840 which enabled horse-drawn barges and packets loaded with freight and passengers to move between the town and Richmond. Canal traffic was gradually replaced by railroad transport in the 1850s. The town was incorporated as a city in 1852.

During the American Civil War it was an important Confederate supply base and link in communication between besieged Richmond and the west. After the war Lynchburg boomed. It acquired additional railroad connections and increased in population to 19,000 by the end of the 19th century. The city developed into a shoe and iron manufacturing centre and. although the change in smoking taste from dark to bright tobacco in the form of cigarettes shiited the centre of tobacco growing away from the red clay soils surrounding Lynchburg, the city continued to grow moderately. acquiring textile mills, garment factories and tool shops, Manufactures include drugs and cosmetics. hosiery, batteries. machine gears and steel products. Lynchburg was the home of Jubal Anderson Early, famous Confederate general. and John W. Daniel. orator and senator, and was the birthplace of Carter Glass. Samuel Untermyer and Robert L. Owen. authors of the Federal Reserve act (1913). It is the seat of Lynchburg college (affiliated with Christian Church and chartered 1903 as Virginia Christian college); Randolph-Macon Woman's college (Methodist. 1891) and Virginia Theological seminary and college (Segro, 1888). Sweet Briar college for women (private, 1901) is 11 mi. N.N.E. *Etude,* the music publication, was founded there by Theodore Presser in 1883. The Lynchburg Little Theatre dates from 1920.

The city adopted the council-manager form of municipal government in 1920. Pop. (1960) 54,790. (F. B. S.)

LYNCHING AND LYNCH LAW are terms loosely used to designate various forms of mob violence peculiar to the United States from the middle of the 18th century. The mob executes the offender, often also torturing him and mutilating his body, without trial and regardless of existing courts of law, under the pretense of administering justice. The origin of the terms is uncertain, but the commonly accepted explanation is that they derive from Charles Lynch, a Virginia farmer and patriot, who, during the American Revolution, headed an irregular organization formed to punish thieves, outlaws and Tories. *(See* Thomas Walker Page, "The Real Judge Lynch," in *Atlantic Monthly,* vol. lxxxviii [Dec. 1901].) The legal definition of lynching varies from state to state. but it includes the execution, without due process of law by three or more persons, of an individual suspected or convicted of a crime, or accused of an offense contrary to prevailing custom. Some states require that the lynch victim must have been in the hands of a peace officer before being seized by the mob.

The summary killing of an individual by a mob as a penalty for real or supposed crime has been practiced in all countries where unsettled conditions prevailed; and informal organizations of people have attempted to supplement or replace legal procedure by dealing with criminals outside the law. Hence American lynching is sometimes compared to such historic forms of private administration of criminal justice as the *Vehmgericht* in medieval Germany, the gibbet law and Cowper justice of border districts in England. the Jedburgh justice in Scotland, and the *Santa Hermandad* in Spain. Likewise the pogroms of Russia and Poland, and the treatment of Jews in Germany under Hitler in more modern times, are somewhat similar to lynching practices.

The English colonists in America were not slow to follow the old world practice of taking the law into their own hands, and mob law prevailed in the colonies prior to the Revolution. Examples are to be found in the extralegal organizations to punish Indian scalpers in New England; in the Rangers of Pennsylvania; in the Regulators of New York and North Carolina; and in the popular tribunals organized during the Revolution to mete out speedy punishment to robbers, bandits and Loyalists. Development of civil institutions did not keep pace with the westward expansion of population after independence had been gained, and the frontiersmen established agencies outside the law to deal aith horse thieves. gamblers, murderers and others who violated generally accepted standards of conduct. The region beyond the Appalachian mountains furnished many examples of lynch law. Frontiersmen demanded immediate and personal justice. They were impatient of legal forms and technicalities, and they chose to take the law in their own hands. The extralegal governments of the state of Franklin and the Oconee republic. and the extralegal organizations of Squatters associations in the midwest and vigilantes of California and the Rocky Mountain frontier played an important role in the development of the great west. But the disregard of law and order fostered by frontier conditions carried over into mob violence and lynching long after the frontier stage of society had ended.

Conditions in the southern states also fostered a lawless spirit. Frontier conditions persisted until after the Civil War, but far more significant was the prevalence of slavery and a growing sectional bitterness over the institution. Southerners exercised their absolute control over slave property by flogging even to death their refractory slaves. Later they resorted to mob violence with increasing frequency and severity against persons accused of tampering with slavery. Vigilance committees flogged, tarred and feathered and hanged abolition agitators and persons accused of aiding fugitive slaves. After the Civil War, southerners organized the Ku Klux Klan, the Order of the White Camellia and similar bodies which molested and frightened the former slaves out of the exercise of their civil rights and lynched untold numbers of Negroes. These practices carried over into the later south as did frontier practices in the west. But the south and the west held no monopoly on lynching. Only Massachusetts, New Hampshire, Rhode Island and Vermont have a clean record in this respect.

The victims of western lynchings were largely white men, although a few Negroes were lynched, and the major offenses aith which they were charged were murder and crimes against property. In the south lynching crystallized into a traditional method of summarily punishing Negroes for offenses, chiefly murder and rape, against whites. Some few whites were lynched in the south, and occasionally Negroes lynched white men.

Fairly reliable data on lynchings are available since 1882. Compiled largely at Tuskegee institute in Alabama and published in the annual *Negro Year Book,* these data show that, between 1882 and 1951, 4,730 persons were lynched in the United States Of these 1,293 were whites and 3.437 were Negroes. The crimes charged against the victims were: homicide 41%, rape and attempted rape 25.3%, robbery and theft 4.9%, felonious assault

4.3%, insult to whites 1.8%, and all others 22.7%. Between 1882 and 1901 the largest number lynched in any one year was 230, the smallest number 96; and between 1902 and 1935 the largest number lynched in any one year was 99, the smallest number was 8.

Gradually public criticism of mob violence brought about a reduction of lynching. Chief among the agencies effecting the decline were the National Association for the Advancement of Colored People, the Southern Commission on Interracial Cooperation, the Association of Southern Women for the Prevention of Lynching, and the Southern Regional Committee. Individual journalists and educational and religious leaders, both white and Negro, also played a prominent role in the movement. They worked to elevate the economic and social position of the Negro and to improve relations between whites and Negroes. They have emphasized the harmful consequences of lynching in debasing the reputation of the south, in brutalizing those who participate in lynchings, and in the general disrespect for law, order and human rights which lynchings tend to develop. All the southern states as well as several in the north and west have enacted legislation looking toward the punishment of those who participate in mob violence and lynchings. Between 1947 and 1959, 44 persons were indicted for participating in lynchings. One was convicted and sentenced to death, five were sentenced to life imprisonment, and others received shorter prison terms.

After 1935 the number of lynchings drastically declined. Between 1935 and 1952 only 61 lynchings were recorded; between 1947 and 1959 there were only 9 while 61 were prevented. The character of lynch mobs has also changed: mobs have become more secretive; there have been few or no spectacular man hunts; and mob leaders no longer boast that they serve race, tradition and justice.

(F. M. G.)

LYNDHURST, JOHN SINGLETON COPLEY, 1ST BARON (1772–1863), lord chancellor of England, was born at Boston, Mass., on May 21, 1772, the son of John Singleton Copley, the painter. He was educated at an English private school and at Cambridge university, where he was second wrangler and fellow of Trinity college. Called to the bar at Lincoln's Inn in 1804, he gained a considerable practice and was raised to the dignity of serjeant-at-law in 1813. As one of the counsel for James Watson, tried in 1817 for his share in the Spa Fields riot, he so distinguished himself as to attract the attention of the Tory government, under whose patronage he entered parliament as member for Yarmouth, Isle of Wight. Later he sat for Ashburton (1818–26) and for Cambridge university (1826–27). He was appointed king's serjeant and chief justice of Chester in 1818, solicitor general in 1819 (with a knighthood), attorney general in 1824, master of the rolls in 1826, and lord chancellor in April 1827 (in George Canning's ministry), with the title of Lord Lyndhurst. In this latter capacity he was particularly acceptable to George IV on account of his anti-Catholic views; but in 1829 he supported the government's Catholic relief bill.

During this period it was unusual for the lord chancellor to retire on a change of government, unless it was a "total" change, as in 1806 and 1830. Lord Lyndhurst, the supremely successful careerist of his time, would have welcomed an invitation to remain in office under Lord Grey in Nov. 1830. However, political necessity compelled the Whigs to appoint Henry Brougham, and although Lyndhurst was made lord chief baron of the exchequer (1831–34), this did not prevent him from vigorously opposing the Whig reform bill. He was again lord chancellor in Sir Robert Peel's brief administration of 1834–35. During Lord Melbourne's ministry (1835–41) he figured conspicuously as an obstructionist in the house of lords. In these years it was a frequent practice with him, before each prorogation of parliament, to entertain the house with a "review of the session," in which he mercilessly attacked the Whig government. His former adversary Lord Brougham, disgusted at his treatment by the Whig leaders, soon became his most powerful ally in opposition, and the two dominated the house of lords. In the Peel administration of 1841–46 he resumed the office of lord chancellor for the last time. As Peel never had much confidence in Lord Lyndhurst, the latter did not exert so great an influence in the cabinet as his position and experience entitled him to do. But he continued a loyal member of the Tory party. He died in London on Oct. 12, 1863.

Of Lord Lyndhurst as a judge opinions have differed; there is authority, including Lord Selborne himself, for the view that he was not a just chancery judge. His heart was not in the business. But the qualities of a just chancellor in those days were of a very special order, and in the house of lords he was more at home, though the estimate must stand that he was "a judge for the parties rather than a judge for the lawyers." His greatest moment in the house of lords was his success in averting what would have been a disastrous precedent—the attempt of lay members to vote in an appeal to the house of lords, theoretically permissible, but a violation of a strict constitutional understanding (Daniel O'Connell's case, Sept. 4, 1844).

(A. AL.)

LYNDSAY, SIR DAVID (*c.* 1485–*c.* 1555), Scottish poet, and author of *Ane Satyre of the Thrie Estaits,* the only surviving Scots morality play, was the son of David Lyndsay of the Mount, near Cupar-Fife, and of Garmylton in East Lothian. He may have been at St. Andrews *c.* 1508. Entering the service of James IV, he became usher to the infant prince born in 1512, and married Janet Douglas, a court seamstress, *c.* 1522. Dismissed from court in 1524, when his charge, now James V, fell under the control of the Douglas faction, he returned to the king's service four years later. He acted as chief herald from *c.* 1530, and became Lyon king of arms in 1542. His duties took him on several missions overseas. In 1531 he accompanied a Scottish ambassador to Flanders, in 1536 he went with the royal envoys to France to negotiate a marriage alliance and after James's death in 1542 he went to the courts of Henry VIII, Charles V and Francis I, to return orders conferred on his master. Little is known of his last years.

Most of his verse, with a work on heraldry, was written during his prosperous years at court. It survives as follows:

(1) *The Dreme;* 1,134 ll. (?1528) is a vision of John Commonwealth and the ill-condition of Scotland, written in an old tradition, with a delightfully personal epistle to the king. This is his earliest surviving, though probably not his first, work in verse; he reminds James of the many stories he had "done discryve" for him in the nursery.

(2) *The Testament and Complaynt of Our Soverane Lordis Papyngo* (completed Dec. 1530; stanzaic, 1,185 ll.), is a mixture of satire, comedy and moral instruction. The king's parrot, dying, gives advice to king and court and makes its testament. This poem again illustrates Lyndsay's preoccupation with mutability and with the corruption of the commonweal. The prologue contains a valuable catalogue of Scots poets.

(3) *An Answer quhilk Schir David Lyndsay maid to the Kingis Flyting* (?1536) is a short and ribald example of the satirical *genre* best illustrated by William Dunbar and Walter Kennedy (*qq.v.*) and apparently popular at court. James V's contribution has not survived.

(4) *The Complaynt and Publict Confessioun of the Kingis Auld Hound callit Bagsche* (*c.* 1536) is a short didactic piece, satirizing court life through the mouth of the dog—a device used by Dunbar and others and revived by Robert Burns.

(5) *The Deploratioun of the Deith of Quene Magdalene* (1537).

(6) *The Justing betuix James Watsoun and Jhone Barbour Servitouris to King James the Fyft* is a burlesque description of a jousting said to have been part of James's wedding celebration in

1538. again in a traditional mode.

(7) *Kitteis Confessioun* and (8) *Ane Supplicatioun directit to the Kingis Grace in Contemptioun of Syde Taillis,* both of uncertain date, are short satires in couplets. The first is an attack, in a comic framework, on the confessional; the second calls for the abolition of the absurdly long trains then in fashion among women.

(9) *The Tragedie of the Cardinall* (1547) is a rather tedious piece of moralizing on the pattern of Boccaccio's *De Casibus Virorum Illustrium* (434 ll.).

(10) *The Historie of Ane Nobill and Vailyeand Squyer, William Meldrum* (written after 1550) is a vigorous tale of love and war, celebrating, in the romance tradition, the heroic life of a Fifeshire laird (1,594 ll. in 8-syllable couplets), with a pendant fictitious testament (36 stanzas). This is the liveliest and most nearly nondidactic of Lyndsay's poems, and the last and most original of Scottish romances.

(11) *Ane Dialog betuix Experience and ane Courteour of the Miserabyll Estait of the World* (?1553; 6,333 ll.), commonly known as the *Monarche,* is a universal history from the Creation to the fifth (papal) empire, with a view of the last judgment, in four books. Stanzaic complaints are inset in the couplet narrative. The matter of the poem is drawn mainly from such authors as Josephus and Orosius, and is its only attraction. The style is flat, and the solemnity of tone is seldom relieved.

(12) *Ane Satyre of the Thrie Estaits* is the only complete Scots morality play to survive. It began as an interlude of "the mysdemeanours of Busshops Religious persones and preists within the Realme." written for the feast of the Epiphany at Linlithgow palace in 1540. Enlarged, with a deal of coarse comedy, it was performed at Cupar, Fife, on June 7, 1552; and again on the slopes of the Calton hill, Edinburgh, on Aug. 12, 1552, before the queen regent "and ane greit part of the Nobilitie . . . fra .ix. houris afoir none, till .vi. houris at euin." It is a dramatic representation of the crucial issues of the mid-century in religion, government and social life, with all Scotland crowded on the stage. Some of the long didactic speeches are nobly rhetorical; the comic passages are written in a strong, colloquial Scots. There is something here for every class of society; each is mirrored, admonished and entertained. Lyndsay draws freely from a range of poetic genres: sermon, farce, debate, satirical "character," and song. The perennial interest and power of the Satyre was revealed by the brilliant revival at the Edinburgh festival of 1948.

BIBLIOGRAPHY.—*Manuscripts: Ane Dialog* survives in a manuscript at Lambeth palace, London; the Bannatyne manuscript (1568), in the National Library of Scotland, contains the "banns" and the "mirry Interludis" of the version of the *Satyre* performed at Cupar; *The Register of Arms* (1542; published 1821, 1878), an authoritative document on Scottish heraldry, in the National library oi Scotland.

Editions: Most minor pieces were included in the Paris (1558) or Edinburgh (1559, 1568) editions; the *Papyngo* was first published in London in 1538 (there may have been an earlier edition), *Ane Dialog* at St. Andrews (1554), *The Historie of Squyer Meldrum* at Edinburgh (1582; earliest surviving edition, 1592) and *Ane Satyre* at Edinburgh (1602); H. Charteris published a collected edition at Edinburgh (1569). The first critical editions are by F. Hall, J. Small and J. A. H. Murray, for the Early English Text Society, 5 parts (1865–71), and by D. Laing, 2 vol. (1871); 3 vol. (1879). The standard edition is by D. Hamer, for the Scottish Text Society, 4 vol. (1931–36). Modern editions of single works are *Ane Satyre of the Thrie Estaits,* by J. Kinsley (1954), with a critical discussion by A. M. Mackenzie and an account of the 1948 revival by I. Brown; *The Historie of Squyer Meldrunz,* by J. Kinsley (1959), with critical discussions.

Houk, "Versions of Lyndsay's Satire," *Publications of the Modern Language Association of America,* lv (1940); E. S. Miller, "The Christening of the Three Estates," *Modern Language Notes,* ix (1945); C. S. Lewis, in *English Literature in the Sixteenth Century* (1954); *Scottish Poetry: A Critical Survey,* ed. by J. Kinsley (1955); J. Kinsley, "Lyndsay's Satyre and the Modern Theatre," *The Saltire Review,* iv, 12 (1957). For a full account of Lyndsay's life and work *see* D. Hamer's Scottish Text Society edition. W. Murison's *Sir David Lyndsay* (1938) is a short general study. For a scholarly account of the complicated bibliography of the poems, *see* D. Hamer in *The Library,* x (1929). (J. Ky.)

LYNEDOCH, THOMAS GRAHAM, 1ST BARON (1748–1843), British general. was born on Oct. 19, 1748. Graham was traveling in the Mediterranean when he fell in with Lord Hood's fleet on its way to Toulon. He joined it as a volunteer, served on Lord Mulgrave's staff during the British occupation of Toulon, and returned, after the failure of the expedition, to Scotland, where he organized a regiment of infantry, the 90th Foot, Perthshire Volunteers (now 2nd Battalion Scottish Rifles). Graham's men were the first regiment in the army to be equipped and trained wholly as light infantry. In the same year (1794) Graham became member of parliament, in the Whig interests, for the county of Perth. He saw some active service in 1795, being then a brevet colonel; in 1796 he was appointed British commissioner at the headquarters of the Austrian army in Italy. He sat for Perthshire in parliament until the year 1807. Graham was with Moore in Sweden in 1808 and also in Spain from 1808 to 1809. In 1809 he became a major general, and after taking part in the disastrous Walcheren expedition he was promoted lieutenant general and sent to Cadiz (1810).

In 1811, acting in conjunction with the Spanish army under General la Peña (*see* PENINSULAR WAR), he took the offensive, and won the brilliant action of Barossa (March 5). The victory was made barren of result by the timidity of the Spanish generals. After refusing with contempt the offer of a Spanish dukedom, he resigned his command in the south and joined Wellington in Portugal. He took part in the siege of Ciudad Rodrigo, and commanded a wing of the army in the siege of Badajoz and the advance to Salamanca. In July 1812, his eyesight becoming seriously impaired, he went home, but rejoined in time to lead the detached wing of the army in the wide-ranging maneuvre which culminated in the battle of Vittoria. Graham captured San Sebastian (Sept. 9, 1813). He then went home, hut in 1814 accepted the command of a corps to be dispatched against Antwerp. His assault on Bergen op Zoom mas, however, disastrously repulsed (Feb. 3, 1814). At the peace Graham was created Baron Lynedoch of Balgowan in the peerage of the United Kingdom. He died at London on Dec. 18, 1843.

LYNN, a city of Essex county, Mass., U.S., on the northern shore of Massachusetts bay. 11 mi. N.E. of Boston.

In 1629 Edmund and Francis Ingalls came south from Salem into the Indian territory of Nahanteau and established a settlement called Saugus. It was organized as a village in 1631, and in 1637 was renamed after Lynn Regis (King's Lynn) in England, the home of the pastor. It was incorporated as a city in 1850.

Lynn harbour was not particularly good and many of the pioneers turned to farming, but the beginnings of industry appeared very early. The first smelting works in America was built there in 1643, several tanneries were established during the same period, and shoemaking, beginning in 1635, had by the middle of the 18th century brought prominence and prosperity to the town. A century later, the introduction of the sewing machine and steam power led to the development of the factory system, an influx of immigrant workmen and Lynn's emergence as the foremost shoe centre in the country.

During the 1930s shoe manufacture declined in importance and by the second half of the 20th century electrical machinery and transportation equipment had become the principal manufactures. Pop. (1960) 94,478. (L. G. BA.)

LYNTON and **LYNMOUTH,** seaside villages in the Lynton urban district (pop., 1951, 2,120) of Devon, Eng., on the Bristol channel; they lie about 17 mi. N.E. of Barnstaple. Both are summer resorts. Lynmouth is at the mouth of the East and West Lyn rivers, while Lynton is on the cliff top 500 ft. above. The villages are situated approximately in the centre of the Exmoor National park in which is the Doone valley, made famous by R. D. Blackmore's novel *Lorna Doone;* a part of the valley of the East Lyn (owned by the National Trust), here called Badgworthy water; and Watersmeet, where two streams, the East and West Lyn, join. In Aug. 1952 the little Lyn, swollen by rains, changed course and ravaged Lynmouth, killing 31 persons. There are some prehistoric remains near Castle rock, Lynton.

LYNWOOD, a residential city of Los Angeles county. Calif., is S.E. of Los Angeles. Its origin dates from the building of the Lynwood dairy in 1896, the land being part of an early Spanish grant, the Rancho San Antonio. Actual development began in 1913 when the opening of an 800-ac. subdivision followed completion of the Pacific Electric railway.

Lynwood has over 100 small industries within the city limits. but a majority of the residents are employed in the surrounding metropolitan area. Schools from kindergarten through high school are combined in a single unified district. The city has a 400-bed hospital, a large civic centre, completed in 1957 and a swimming pool built to Olympic specifications. Incorporated in 1921, Lynwood established the council-manager form of government in 1945. For comparative population figures see table in CALIFORNIA: Population. (R. C. GM.)

LYNX, a genus of mammals of the family Felidae (see CARNIVORA). Lynxes are found in the north temperate regions of both the old and new worlds; they are smaller than leopards and larger than true wildcats. with long limbs, short stumpy tail, ears tufted at the tip and pupil of the eye linear when contracted. They have extraordinary powers of vision. Their fur is generally long and soft, and always longish upon the cheeks. Their colour is light brown or gray, with generally darker spots. Their food consists of any mammals or birds which they can overpower. In Canada the number of lynxes is governed each year by the number of hares; their chief diet, produced the previous year. They frequent rocky places and forests, being active climbers and passing much of their time among the branches of the trees. Their skins are of considerable value in the fur trade. The northern lynx (L. *lynx*) of Scandinavia, the U.S.S.R., northern Asia and until relatively recently of central Europe inhabited Britain during the Pleistocene age. The pardine lynx (L. *l.* pardinus) from southern Europe is handsome, rufous above and white beneath. Several lynxes are found in North America; the most northerly is the Canadian lynx (L. *canadensis*); the bay lynx (L. *rufus*), with a rufous coat, ranges from southern Canada south to Mexico and lower California.

LYON, MARY (MASON) (1797–1894), U.S. educator and pioneer in the field of higher education for women, was born on Feb. 28. 1797, on a farm near Buckland, Mass. She began to teach when she was 17, and in 1817, with earnings from spinning and weaving, she went to Sanderson academy, Ashfield, where she was distinguished by her extraordinary mental quickness. She supported herself there and at the other academies she attended by teaching, her desire to acquire and impart learning seeming insatiable. Her success as a teacher and administrator and the demand for the young women she trained led to her plan for "a permanent institution consecrated to the training of young women for usefulness . . . designed to furnish every advantage which the state of education in this country mill allow . . . to put within reach of students of moderate means such opportunities that none can find better." She was aided in this effort by Edward Hitchcock, the geologist, with whom she had studied. This assistance, reinforced by her own enthusiasm and practical common sense, secured for her plan the necessary financial support. In 1835 a site was selected near the village of South Hadley and Mt. Holyoke. The school was incorporated in 1836 as Mt. Holyoke Female seminary; and on Nov. 8, 1837. it opened with Mary Lyon as principal and Eunice Caldwell, afterward well known as Mrs. J. P. Cowles of Ipswich academy, as assistant. Miss Lyon died at Mt. Holyoke on March 5, 1849. having served nearly 12 years as principal of the seminary. Her work at Mt. Holyoke represented an important step in the higher education of women.

BIBLIOGRAPHY —Edward Hitchcock, Life and Labors of *Mary Lyon* (1851); Beth B. Gilchrist, Life of *Mary* Lyon (1910); E. C. Adams and W. D. Foster, Heroines *of Modern* Progress (1913); Gamaliel Bradford, *Portraits* of *American Women* (1919).

LYON, NATHANIEL (1818–1861), U.S. soldier during the early phase of the American Civil War. was born in Ashford, Conn., July 14. 1818. After graduating from the U.S. Military academy in 1841 he was assigned to fighting the Seminole Indians in Florida. He served in the Mexican War. and after spending several years in California was sent to "Bleeding Kansas" in 1854. He joined the Republican party and wrote several articles for the *Manhattan* (Kans) Express attacking Buchanan and Douglas and supporting Abraham Lincoln. Lyon was transferred to St. Louis on Feb. 6. 1861. He immediately got in touch with Francis P. Blair. Jr., and other leading Gnionists in that city. After Blair's intercession. Lyon was placed in command in eastern Missouri. He seized the Confederate base at Camp Jackson on May 10, 1861, and began the arming of Union volunteers. He took part in a final attempt at compromise, meeting with Blair, Maj. Gen. Sterling Price and the secessionist governor, Claiborne F. Jackson. at the Planters hotel. The attempt failed and Lyon commented upon its conclusion. "This means war." On June 13, Lyon moved up the Missouri river with 2,000 regulars, capturing the Missouri capital at Jefferson City, June 15, and Boonville, June 17. He followed the Confederate forces into southwestern Missouri, finally bringing them into battle at Wilson's creek, Aug 10. Although Lyon himself was killed and his forces defeated, his prompt actions in eastern and central Missouri were a large factor in saving that state for the Union. See also MISSOURI History. (J. M. WO.)

LYONIA, a genus of evergreen or deciduous shrubs of North America and Asia, belonging to the heath family. They have alternate, short-petioled leaves and white or pinkish flowers in axillary clusters or racemes or panicles. Three species are common in the eastern United States and may sometimes be grown as ornamentals. these are, male berry or he-huckleberry (L. *ligustrina*), a deciduous shrub to 12 ft.. bearing oval leathery leaves, occurring from Maine to Florida. fetterbush (L. *lucida*), an evergreen nith lustrous leaves, to 6 ft. high, found from Virginia to Florida, and staggerbush (L. *mariana*). a deciduous shrub to 6 ft.. found from Rhode Island to Florida. (J. M. BL)

LYONNAIS, THE, a former province or *gouvernement* of France, bounded on the north by Burgundy, on the east by the Saône and Rhône rivers (separating it from Dombes and from Dauphiné), on the south by Languedoc and on the west by Auvergne and by the Bourbonnais and comprising not only the pays of the Lyonnais proper (the hinterland of Lyons, *q.v.*) and of the Franc-Lyonnais (around Vimy, now Neufville-sur-Saône) but also those of the Beaujolais and of Forez (taken by Francis I from the constable-duke of Bourbon). It is now divided between the *départements* of Rhône and of Loire.

LYONNESSE, LYONESSE, LEONNOYS or LEONAIS, a legendary country off the south coast of Cornwall. Eng. Lyonnesse is the scene of many incidents in the Arthurian romances, and especially in the romances of Tristan and Iseult. It also plays an important part in Cornish tradition and folklore. Early English chronicles, such as the *Chronicon* e *chronicis* of Florence of Worcester (d. 1118), described minutely and without a suggestion of disbelief the flourishing state of Lyonnesse and its sudden disappearance beneath the sea. The legend may be an exaggerated version of some actual subsidence of inhabited land.

LYONNET, PIERRE (1707–1789), Dutch naturalist and insect anatomist, was born at Maastricht, Holland, on July 22, 1707, and after being trained as a lawyer, devoted most of his time to engraving objects of natural history. He made the drawings for Lesser's Theology *of* Insects (1742) and for A. Trembley's treatise on hydra, *Mémoires pour servir à l'histoire d'un* genre de *Polypes d'eau douce* (1744). Finally he produced a monograph on insect anatomy published in 1760 under the title *Traité anatomique de* la Chenille *qui ronge* le bois de *Saule*. He engraved his own figures on copper. and his drawings are remarkable not only for their skill but also for the extraordinary amount of detail shown. He distinguished no fewer than 4.041 separate muscles in the caterpillar of the goat moth and showed the nerves and tracheae in a manner never previously attempted. The extraordinary character of these dranings caused a sensation. and Lyonnet was accused of using his imagination. In a second edition, published in 1762, Lyonnet ansnered his critics by giving drawings of his instruments and a description of his methods. His monograph remains one of the most beautiful accounts of insect anatomy ever published. He died at The Hague on Oct. 10. 1789. Notes and drawings intended for a *Recueil historique*, illustrated by 54 plates dealing with various insects were published in the *Mémoires du Musée d'Histoire naturelle* (1829–32). (ED. HE.)

LYONS, SIR JOSEPH (1848–1917), British businessman, was born in London on Sept. 29, 1848, and educated at a Jewish school. In early life he studied painting and exhibited at the Royal institute, but by 1886 he had turned to business enterprises, in conjunction with the brothers Isidore and Montague Gluckstein. This led to the foundation of the catering firm of J. Lyons and Co., Ltd., of nhich he became chairman. He began by catering at public exhibitions, and next opened teashops in London, the first in 1894. Twenty years later these numbered more than 200 and provided inexpensive food for the large numbers of clerical workers and junior members of professions. Later he opened several restaurants of a more ambitious nature. as well as hotels, on the no-tipping principle. He was knighted in 1911, and died in London on June 22, 1917.

LYONS, RICHARD BICKERTON PEMELL LYONS, 1ST EARL (1817–188j), British diplomat. elder son of the first Lord Lyons (see above), was born at Lymington, Hampshire, on April 26, 1817. He was educated at Winchester and Christ Church, Oxford, and entered the diplomatic service as attaché to his father at Athens, in 1839. He served at Dresden, Florence and Rome, in turn, and went to Washington. D.C.. as British minister in 1859, remaining until 1865. During the Civil War his tact helped to prevent an Anglo-American war from arising out of the arrest of Confederate envoys on the British mail steamer "Trent." After a brief spell as ambassador at Constantinople, he succeeded Lord Comley in 1867 at the Paris embassy, where he remained for 20 years. Emperor Napoleon III trusted him, and he took part in the secret and fruitless disarmament negotiations early in 1870.

An exceptionally able and judicious public servant, Lyons had the rare gift of making no enemies, and enjoyed the full confidence of successive governments in London and Paris alike, even when French opinion was as intensely inflamed against Great Britain as it was in the early days of the British occupation of Egypt and during the Boulanger crisis. In-1886 he refused an offer from Lord Salisbury of the foreign secretaryship, as his health was giving way. He had succeeded to the barony in 1858, and was advanced to a viscountcy in 1881 and an earldom in 1887; as he never married, and his brother had been killed in the Crimea, his titles became extinct on his death in London on Dec. j, 1887.

See Lord Newton, *Lord* Lyons, 2 vol. (London, 1913).

(M. R. D. F.)

LYONS, the chief town of the *département* of the RhBne, France, the seat of an archbishop and the headquarters of a military region, lies 319 mi. S.E. of Paris and 219 mi. N. of Marseilles by rail. Sheltered by the foothills of the Massif Central to the west and by the southern heights of the Jura mountains to the northeast, Lyons is situated at the confluence of the Rhône and Saône, on the narrow peninsula between the rivers and on their opposite banks. Pop. (1954 census) 462,657.

The contrasting heights of the hills on which the city is built, varying from 450 to over 1,000 ft., give Lyons an unusually picturesque appearance. The summit of Fourvière on the right bank of the Saône is reached by funicular railway and offers the best view of the whole town—of its rivers, its 27 bridges, and roofs of pinkish tiles. At Fourvière (Forum *vetus*) excavations begun in 1933 have revealed a theatre of the Graeco-Roman type and an odeum (for musical contests) of the 1st and and centuries A.D. The hill, covered with convents and hospitals, is dominated by the church of Notre Dame de Fourvière. This modern basilica (1894), with its elaborate marble and mosaic decoration, is a place of pilgrimage. Close by, a metal tower 262.5 ft. high, built in 1893, supports the television aerials. Bordering the right bank of the SaBne, "Old Lyons," grouped around the cathedral, is an extraordinary accumulation of medieval and Renaissance buildings having great windows and inner courtyards with galleries and turrets. The cathedral, dedicated to St. John the Baptist, was built between the 12th and 15th centuries. Its apse is a masterpiece of Lyonnais Romanesque; the Gothic nave dates from the 13th and 14th centuries as does the fine stained glass in the choir; there is some remarkable carving on the west front. At the northern point of the Fourvikre promontory is the church of St. Paul with its octagonal lantern tower dating from the 12th century. The exchange (by J. Soufflot), now a Protestant church, and the archbishop's palace (since 1911 housing the municipal library) are both 18th-century buildings. The ponderous law courts are of the following century. On the peninsula, among buildings of diverse styles, traces of the old medieval city can be seen here and there. The Romanesque porch of St. Pierre-des-Terreaux and the oldest church in Lyons, St. Martin d'Ainay (1107), are examples. The straight roads running from north to south on the peninsula, Rue Victor Hugo, Rue de la République and Rue de l'Hôtel de Ville, since 1958 renamed Rue Président Herriot, which carry much of the business traffic, were constructed in the latter half of the 19th century. To the north is the hill of Croix Rousse with the tall houses of the silk weavers. and at its summit the baroque church of St Bruno-des-Chartreux. The 17th-century group of buildings around the Place des Terreaux is particularly beautiful, especially the *hôtel* de *ville*, begun in 1646 by the Lyonnais Simon Maupin, one of the masterpieces of French civic architecture, and the palace of St. Pierre, formerly a Benedictine abbey, built between 1659 and 1685 in the Italian baroque style. In front of the *hôtel* de *ville* is a fountain designed by the 19th-century sculptor, F. A. Bartholdi. The churches of St. Nizier and St. Bonaventure are Gothic buildings of little interest. The opera house, the Bourse and the Théâtre des Célestins, built in the 19th century, are also in this district. Facing the RhBne between the Wilson bridge and the La Guillotikre bridge is the 17th-century Hôtel Dieu for which Soufflot designed the façade in the following century. The Bellecour quarter is characterized by elegant 18th-century hotels and buildings. From the Place de Bellecour, with its equestrian statue of Louis XIV, the Rue Victor Hugo leads via the Place Carnot to the Perrache quarter with its docks, hostels and warehouses. This district, at the southern tip of the peninsula, was named after the most famous of the 18th-century engineers who worked to extend the confluence farther south.

East of the RhBne are the new districts of Lyons with busy streets and broad shady embankments. There are the university and the prefecture, and also the wealthy residential quarter built around the large park of La Tête d'Or, in which are a lake, a zoological collection and fine botanical gardens. Farther east are the manufacturing suburbs of Villeurbanne and Montchat where the industrial outskirts are constantly extending into the plain of Dauphiné. The university which, although the newest in France, is the most important after Paris, has a veterinary school founded by C. Bourgelat in 1762 (the oldest in the world). Mention should also be made of the Central School of Lyons (1857), the dental school, the Institute of Industrial Chemistry (1883), the Military Medical school and the National Institute of Applied Science, which was opened in 1957. In addition to the university library, there is the municipal library possessing a fine collection of books, manuscripts, incunabula, prints and engravings. The most important of the city's 21 museums are: the museum of fine arts in the Palais St. Pierre, where Perugino's altarpiece, works of the 19th-century Lyonnais school and a fine picture of the Tahiti period by Paul Gaugin are among the chief treasures; the museum of textiles and the museum of decorative arts in the 18th-century houses of the Rue de la Charité, where the history of the weaving industry is illustrated; the historical museum in the old Hôtel de Gadagne, a hich contains an international collection of marionettes; the Guimet museum (natural history); and the museum of printing in the former medieval town hall.

Transport and Communications.— Situated on the banks of two rivers and guarded by the surrounding hills, Lyons naturally commands a number of routes: to Paris by the valley of the SaBne, across Burgundy to the Rhine, to Switzerland and Italy by the upper RhBne, westward through the valley of St. Étienne and to the Mediterranean by the corridor of the lower RhBne. Since the beginning of its history, Lyons has owed much of its prosperity to river traffic. In spite of the junction of road and rail routes, three harbours are in use, and shipping in these doubled between 1926 and 1955. In the latter year shipping on the Saône (connected by canal with the basins of the Loire, Seine and RhBne) amounted to 3,000,000 tons, while cargo carried by the RhBne barges is annually 1,000,000 tons. Roads from east to west across the dividing peninsula are connected by no fewer than 27 bridges. The problem of traffic in this direction has been made easier by the tunnel of the Croix Rousse, the longest road tunnel in France (5,748 ft.), connecting the Delattre de Tassigny bridge on the RhBne to the Clemenceau bridge on the SaBne. Trunk roads to Paris and Marseilles were planned in the 1950s.

The first railway in France to use a steam engine was built between St. Étienne and Lyons (1826–33), and the great Paris-

Lyons-Mediterranean line was built in 1850. Since the electrification of the line. some of the fastest trains in the world run between Paris and Lyons, which is also a main-line station for Switzerland and Italy. Other lines connect Lyons with Brittany, Alsace and Languedoc.

Air services operate from the aerodrome of Bron, the first to be built in France (1929). It was destroyed in World War II, but was later reconstructed and steadily improved. Apart from daily services with Paris. most flights are to North Africa.

Industries. — Since the 15th century, Lyons has been the centre of a silk industry originally derived from Italy. The monopoly was granted to the city in 1450 by Charles VII and under succeeding royal patronage the industry developed rapidly. The "Grande Fabrique" was the most important source of the city's prosperity until the 19th century. The designs were made by artists such as Philippe de la Salle but the work was done by the local weavers in the town and surrounding countryside. The invention of the weaving loom by J. M. Jacquard (1752–1834) gave a new impetus to the industry. In the mid-19th century more and more silk-weaving factories were established in the southeast, but, nevertheless, Lyons remained the controlling centre for the silk trade of the world. The manufacture of chemicals, dyes and synthetic fibres has developed largely to meet the silk industry's requirements. and Lyons' chemical industries are second only in importance in France to those of the Paris region. Industries allied to that of silk produce mineral and vegetable colouring matters, gelatin, glue. fertilizers and pharmaceutical and plastic products.

The metal industry is the most important, however, employing in the Rhône *département* 70,000 workers (late 1950s) in mechanical construction and motor and electrical engineering. The electric cables of Lyons are world famous and there are sheet-iron works. foundries and wire mills. In 19j6 the output of Lyons represented 4.5% of the total output of the country and 8% excluding Paris.

History. — The earliest Gallic people who occupied the territory at the river confluence were Segusians. In Oct. 43 B.C. Lucius Munatius Plancus, Julius Caesar's lieutenant, founded a colony, Copia Lugdunum, on the hill above the confluence. The importance of the site as a node of communications had turned Lyons into a political centre by the 2nd century. Five great roads radiated from it, toward Aquitaine, the Atlantic. the Rhine, Italy and the Mediterranean; three towns surrounded it, the Roman Fourvière. the Gallic Condate on the slopes of the Croix Rousse, and the settlement of boatmen and merchants on the Isle of Ainay.

Augustus and Caligula lived at Lugdunum and the emperors Claudius. who gave Roman citizenship to the Lyonnese, and Caracalla were born there. In the 2nd century Christianity reached Lyons. In 177 its Christian community was persecuted by hlarcus Aurelius and in 197 the city was burned and ravaged by Septimus Severus. so that by the jth century it was no more than the chief town of a province of Gaul.

The barbarian invasions preceded the coming of the peace-loving Burgundians who made Lyons their capital in 470. Under the Franks. churches and monasteries were built by the bishops. In 1032 Lyons was incorporated into the Holy Roman empire under Conrad II. having previously been the chief town of the kingdom of Provence and then of part of Burgundy. The real power lay with the archbishops and under their authority two ecumenical councils were held there, one in 1245 when Innocent IV deposed the emperor Frederick II. and one in 1274 when Gregory X proclaimed the reunion of the Greek and Latin churches. In 1305 Clement V. the first pope of Xvignon, and in 1316 John XXII. both Frenchmen. were crowned popes at Lyons. The Lyonnese. having revolted against their prince-archbishop, appealed to Philip the Fair who. in 1312, annexed the town to the French crown. From then on it was administered by 12 elected consuls.

Lyons remained faithful to the king during the Hundred Years' War. Louis XI granted it the privilege of four annual fairs in 1463 and in the 16th century it entered into its most prosperous period. During the wars with Italy Lyons was the seat of the court and the government. the wealth of its merchants. bankers and printers, and the work of its writers and poets. such as Louise Labé and Maurice Scève (*q.v.*), made it, in fact, the political and literary capital of France and the biggest commercial and financial centre. This prosperity was lost during the wars of religion. the Protestant occupation of 1j62 and the Lyonnese massacres of St. Bartholomew of 1jjz. Held in check by the absolute monarchy, Lyons once again became no more than the chief town of the united province of Lyons. Beaujolais and Forez.

At the time of the Revolution the town was suffering from an economic crisis. It was besieged by the army under Gen. F. C. Kellermann from Aug. 8 to Oct. 9, 1793, and was forced to surrender to the republicans. It was condemned to partial destruction and to the loss of its name for that of "*commune-affranchie*," and 2.000 of its citizens were guillotined or shot. Under the first empire its prosperity returned. The wretched condition of the working classes provoked the risings of 1831. 1834 and 1849.

The 20th century saw the steady urban and industrial expansion of the city. An annual international sample fair was first staged in 1916 by Édouard Herriot. the city's most illustrious mayor (from 1905 to 1957), who became prime minister and president of the national assembly. Under German occupation (1940–44) in World War II, Lyons was the headquarters of the French resistance movement and, in its region alone, 5,000 people were executed by the Gestapo.

Deniau, *Lyon et ses environs* (Grenoble, 1953); P. Wuilleumier, *Lyon métropole des Gaules* (Paris, 1953) (HY. J.)

LYONS, COUNCILS OF. The first Council of Lyons met at the summons of Pope Innocent IV in June and July of 1245 to deliberate on the conflict between Church and emperor, on the assistance to be granted to the Holy Land and the eastern empire, on measures of protection against the Tatars and on the suppression of heresy. Among these tasks the most important, in the eyes of the pope, was that the Council should lend him effectual aid in his labours to overthrow the emperor Frederick II. The condemnation of the emperor was a foregone conclusion and the objections of the emperor's representative, Thaddeus of Suessa, that the accused had not been regularly cited, that the pope was plaintiff and judge in one, and that therefore the whole process was anomalous, achieved as little success as his appeal to the future pontiff and to a truly oecumenical council. On July 17 the verdict was pronounced by Innocent IV, excommunicating Frederick and dethroning him on the grounds of perjury, sacrilege, heresy and felony.

All oaths of fealty sworn to him were pronounced. null and void, and the German princes were commanded to proceed with the election of a new sovereign.

See J. D. Mansi, *Collectio conciliorum* (1759, etc.) tom. xxiii; C. G. Hefele, *Conciliengeschichte,* and ed., vol. v, pp. 1,105–26 (1886); Fr. W. Schirrmacher, *Kaiser Friederich der Zweite* (Gottingen, 1859–65); A. Folz, *Kaiser Friedrich II. u. Papst Innocenz IV.* (Strasbourg, 1905).

The second Council of Lyons met from May 7 to July 17, 1274, under the presidency of Pope Gregory X. Its chief result was the regulation that future elections to the papacy should be held by the college of cardinals in conclave (*q.v.*). It is also important through the appearance of representatives of the eastern emperor Michael VIII. who acknowledged the supremacy of the pope over the eastern Church.

See J. D. Mansi, op. *cit.*, tom. xxiv; C. G. Hefele, *op. cit.*, vol. vi p. 119 *seq.*

LYOT, BERNARD FERDINAND (1897–1952), French astronomer, famous for his invention of the solar coronagraph, who started his researches in the 1920s with measurement of polarization of light from the moon and planets, using a new sensitive polarimeter constructed by himself, was born in Paris on Feb. 27, 1897. He showed that the moon's surface behaves as though covered with a layer of dust, that Mercury can have at most a very tenuous atmosphere, that polarization from Mars is sometimes affected by haze or dust and that there are irregularities over the Martian south polar cap, attributable to the formation of clouds. Venus was found to be covered by a continuous cloud layer composed of droplets of diameter about 2μ and of refractive index near that of water.

In 1931 Lyot successfully observed the solar corona in broad daylight, an achievement at that time generally regarded as impossible, using a new form of telescope, much of which he carried to the summit of the Pic du Midi himself, on skis. Two years later he perfected a polarizing filter, of the type now known by his name, permitting single exposure monochromatic photography of the whole sun in a band width about one Angstrom. During the 1930s he measured day-to-day changes in the solar corona, particularly in the light of the 5,303 and 6,374& lines, and also added much to our knowledge of the coronal spectrum. His pioneer cinematograph films, showing movement in solar prominences in the light of the red hydrogen Hα line, were unsurpassed in quality for many years and added new and unexpected knowledge in this field. At the Pic du Midi he also made some of the finest planetary photographs obtained until that time. He showed that if the moon has an atmosphere the density cannot exceed one hundred millionth of that of the earth's atmosphere.

Lyot relied greatly on apparatus with virtually flawless optical surfaces and therefore invented new and sensitive methods of examining very small defects of glass structure or of surface polish. He designed a large new spectrograph for examining the light of the night sky. One of his last achievements was the construction of electronic apparatus allowing observations of the solar corona from places near sea level.

Lyot's work. consistently of the finest quality, was characterized by great originality and elegance He was awarded the gold medal of the Royal Astronomical society in 1939 and the Bruce medal of the Astronomical Society of the Pacific in 1946. He died on a train between Cairo and Helwan, Egy., April 2, 1952.

LYRA ("the Harp"), in astronomy, a constellation in the northern hemisphere. It contains Vega, the brightest star in the northern hemisphere and the fourth brightest star in the sky. The name Vega is a remnant of an Arabic phrase meaning "falling eagle"; Altair (in Aquila) is a similar remnant of "flying eagle." The star β Lyrae is an eclipsing variable with a period of 12.92 days; the system presents some abnormal features, perhaps owing to the very low densities of the two components.

ϵ Lyrae is a double double; a binocular or even the unaided eye shows two stars which can only be loosely connected. and a small telescope resolves each of these into two components. The Ring nebula in Lyra (Messier 57) is the brightest example of this class of nebula.

LYRE, a type of stringed musical instrument that was widespread in the ancient Mediterranean world and near east and is still used in Arabia and parts of Africa. It is characterized by a sound box from which project two arms joined by a yoke: the shape of the sound box varies between instruments. The strings run from the sound box over a bridge to the yoke, where they are tuned by means of twisted thongs or pegs; they are plucked with the fingers or with a plectrum.

The lyre is known in Mesopotamia from the Sumerian period onward; it was introduced into Egypt not later than the 19th century B.C. Size, construction and the number of strings vary greatly. Splendid specimens have survived from Ur (25th century B.C.). These are about 3 ft. 6 in. high. Giant lyres that stand on the ground and are played by a seated player are seen on Mesopotamian reliefs from the 3rd millennium and later in Egypt (Amarna period). Smaller, portable instruments (Babylonia, Egypt. Syria, Assyria) were held horizontally or lying in the arms; their construction was often asymmetrical. The Hebrew *kinnor* was probably a lyre.

In Greek lands there is evidence of lyre-type instruments with seven or more strings—probably related to Asiatic types—during the Minoan-Mycenaean civilizations. Vase paintings of the 8th century B.C. show a simple variety with from three to five strings that can be identified with the phorminx of Homer. From the 7th century B.C., probably under renewed Asiatic influence, the main classical varieties became established, with seven strings at first.

The lyra had a sound box made of tortoise shell (later wood) and slender curved arms. This was the instrument of the schoolboy and the amateur; players are generally shown seated with the lyre resting on the left hip. The barbiton, a subtype of the lyra. had longer strings and lower pitch.

FROM M. WEGNER, "DAS MUSIKLEBEN DER GRIECHEN" (W. DE GRUYTER AND CO., BERLIN. 1949)

INSTRUCTOR AND PUPIL PLAYING THE LYRE BENEATH HANGING CITHARA AS DEPICTED IN SCHOOL SCENE ON ATHENIAN VASE. 5TH CENTURY B.C.

The instrument of the professional was the cithara. which was larger and more solidly built, the hollow arms forming a substantial prolongation of the sound box. The citharoedus (singer to the cithara) stood on a small platform, his decorative instrument resting against his body and supported in position by a band attached to his left wrist.

There were two main varieties of cithara: the first, an elaborately constructed instrument with a flat base; the second, a much simpler instrument with a rounded base that was favoured by less pretentious players.

With both the lyra and the cithara, the left hand was spread over the strings, while the right hand held a plectrum. The precise function of the two hands is still uncertain. Though strings numbering up to 12 mere added to the cithara by virtuosos of the Iate 5th century B C., the number 7 was canonical in the classical period. It is debated whether each string provided one note only or whether it was possible to obtain notes of higher pitch by stopping.

During the Roman period new varieties of cithara emerged. The lyre of medieval Europe (rote) tended to depart from the type by the addition of a finger board and the use of a bow; e g., the Welsh *crwth* (*q.v.*), which was still played in the early 19th century. A similar instrument, the kantele, is still played in Finland and Estonia.

In Africa, *e.g.,* Sudan, Ethiopia, Uganda, the lyre survives in a form not unlike that of the ancient world and is used, as in Homer's day, to provide an accompaniment for the professional singer.

Wegner, *Das Musikleben der Griechen* (1949), *Die Musikinstrumente des alten Orients* (1950); F. Behn, *Musikleben im Altertum und fruhen Mittelalter* (1953). (R. P. W.-I.)

LYREBIRD, the name for Australian birds of the genus *Menura,* allied to the scrubbirds (*q.v.*). Somewhat smaller than a pheasant, the common species (*M. superba*) is remarkable for the three kinds of feathers composing the tail of the cock, giving the latter the appearance of an ancient lyre. It is shy, inhabiting the thickest bush. The cock displays on small hillocks, which he scratches up, and has a fine song. The food consists of insects, myriapods and snails.

The lyrebird's nest is on or near the ground, closely woven of roots and fibres and lined with feathers. A single purplish-gray egg; blotched with purplish-'brown, is laid. The young bird is clad in dark down.

M. superba inhabits New South Wales, south Queensland and Victoria. There are two other species, M. *victoriae,* having much the same range as the last, and M. *alberti,* which is more northerly. The plumage of all three is brown.

LYRICAL POETRY, a general term for all poetry which is, or can be supposed to be, susceptible of being sung to the accompaniment of a musical instrument. In the earliest times it may be said that all poetry was of its essence lyrical. The primaeval oracles were chanted in verse, and the Orphic and Bacchic Mysteries, which were celebrated at Eleusis and elsewhere, combined, it is certain, metre with music. Homer and Hesiod are each of them represented with a lyre, yet, if any poetry can be described as non-lyrical, it is surely the archaic hexameter of the *Iliad* and the *Erga.* These poems were styled epic, in direct contra-distinction to the lyric of Pindar and Bacchylides, but inexactly, since it is plain that they were recited, with a plain accompaniment on a stringed instrument. However, the distinction between epical and lyrical, between what was said and what was sung, is accepted, and neither Homer nor Hesiod is among the lyrists. It is, however, as Hegel insists, the personal thought, or passion, or inspiration, which gives its character to lyrical poetry, while the metrical form is also to be taken into consideration. Since, as a rule, the lyric is short, its lines attain unusual speed and direction. It may be said that the lyric is a direct, arrow-like flight, a spontaneous flash of emotion which makes its own music.

There was an early distinction, soon accentuated in Greece, between the poetry chanted by a choir of singers, and the song which expressed the sentiments of a single poet. The latter, the *μέλος* or song proper, had reached a height of technical perfection in "the Isles of Greece, where burning Sappho loved and sung," as early as the 7th century B.C. That poetess, and her contemporary Alcaeus, divide the laurels of the pure Greek song of Dorian inspiration. By their side, and later, flourished the great poets who set words to music for choirs, Alcman, Arion, Stesichorus, Simonides and Ibycus, who lead us at the close of the 5th century to Bacchylides and Pindar, in whom the tradition of the dithyrambic odes reached its highest splendour of development. The practice of Pindar and Sappho, we may say, has directed the course of lyrical poetry ever since, and will, unquestionably, continue to do so. They discovered how, with the maximum of art, to pour forth strains of personal magic and music, whether in a public or a private way. The ecstasy, the uplifted magnificence, of lyrical poetry could go no higher than it did in the unmatched harmonies of these old Greek poets, but it could fill a much wider field and be expressed with vastly greater variety. This was proved even in their own age. The gnomic verses of Theognis were certainly sung; so were the satires of Archilochus and the romantic reveries of Mimnermus.

At the Renaissance, when the traditions of ancient life were taken up eagerly, and hastily comprehended, it was thought proper to divide poetry into a diversity of classes. The earliest English critic who enters into a discussion of the laws of prosody, William Webbe, lays it down, in 1586, that in verse "the most usual kinds are four, the heroic, elegiac, iambic and lyric." Similar confusion of terms was common among the critics of the 15th and 16th centuries, and led to considerable error. It is plain that a border ballad is heroic, and may yet be lyrical; here the word "heroic" stands for "epic." It is plain that whether a poem is lyrical or not had nothing to do with the question whether it is composed in an "iambic" measure. Finally, it is undoubted that the early Greek "elegies" were sung to an accompaniment on the flute. Thus a poem may be heroic, iambic, or elegiac, and at the same time, in all senses of the word, lyrical.

More difficulty is met with in the case of the sonnet, for although no piece of verse, when it is inspired by subjective passion, fits more closely with Hegel's definition of what lyrical poetry should be, yet the rhythmical complication of the sonnet, and its rigorous uniformity, seem particularly ill-fitted to interpretation on a lyre. When F. M. degli Azzi put the book of Genesis (1 joo) into sonnets, and Isaac de Benserade the *Metamorphoses* of Ovid (1676) into rondeaux, these eccentric and laborious versifiers produced what was epical rather than lyrical poetry, if poetry it was at all. But the sonnet as Shakespeare, Wordsworth and even Petrarch used it was a cry from the heart, a subjective confession, and although there is perhaps no evidence that a sonnet was ever set to music with success, yet there is no reason why that might not be done without destroying its sonnet-character.

Jouffroy was perhaps the first aesthetician to see quite clearly that lyrical poetry is, really, nothing more than another name for poetry itself, that it includes all the personal and enthusiastic part of what lives and breathes in the art of verse, so that the divisions of pedantic criticism are of no real avail to us in its consideration. We recognize a narrative or epical poetry; we recognize drama; in both of these, when the individual inspiration is strong, there is much that trembles on the verge of the lyrical. But outside what is pure epic and pure drama, all, or almost all, is lyrical. Complexity of form, rhythmical and stanzaic, takes in most lyrics much of the place which was taken in antiquity by such music as Terpander is supposed to have supplied. In a perfect lyric by a modern writer the instrument is the metrical form, to which the words have to adapt themselves. There is perhaps no writer who has ever lived in whose work this phenomenon may be more fruitfully studied than it may be in the songs and lyrics of Shelley. The temper of such pieces as "Arethusa" and "The Cloud" is indicated by a form hardly more ambitious than a guitar; "Hellas" is full of passages which suggest the harp; in his songs Shelley touches the lute or viola da gamba, while in the great odes to the "West Wind" and to "Liberty" we listen to a verse-form which reminds us by its volume of the organ itself. On the whole subject of the nature of lyric poetry no commentary can be more useful to the student than an examination of the lyrics of Shelley in relation to those of the song-writers of ancient Greece.

LYS, BATTLE OF THE. In the general scheme of the great German offensive of 1918, the idea of breaking through the British-Portuguese front in French Flanders was considered by the German High Command. Although this scheme became secondary to the great offensive further south, the preparations for it were carried out, firstly in order to mislead the British and Allied headquarters, and secondly that the Germans might be able to revert quickly to it in case the Somme offensive should come to a standstill.

When on March 30 it became obvious that no further progress was possible in the southern battle area, the German Supreme Command decided to put into effect the Flanders attack, the preparations for which were nearly complete. Although they did not anticipate that they would be able to force a decision in this area, there were certain definite advantages to be obtained from a successful blow in the direction of St. Omer-Hazebrouck and the local situation favoured, in their opinion, the prospect of success. This was to be the second blow struck against the British army, a great proportion of which had already been employed on the southern front.

The abnormally dry weather gave good grounds for hope that the Lys valley would be practicable, a state of affairs which was not the case till much later in the spring in a normal year. The only lateral lines of communication in this sector of the British zone, other than the coast railway, ran through St. Pol-Lillers-Hazebrouck, and if the use of this could be denied to the British, problems of supply and reinforcement would be immeasurably complicated. It was above all important, in the view of the German Supreme Command, to retain the initiative, and to strike a second blow before the French could organize a counter-attack against the somewhat vulnerable southern flank of the salient which had been created by the success of the Somme offensive.

Plan of Attack.—The general plan of attack was that the main blow should be struck by Quast's VI. Army on the front between Armentières and the La Bassée canal, in the direction of Hazebrouck. If the VI. Army's attack met with sufficient success, the IV. Army under Arnim was to advance north of Armentières, which was to be made to fall by envelopment, with the eventual object of securing the heights stretching from Kemmel to Mt. des Cats, south of the Ypres-Poperinghe road. If this were achieved the British and Belgian positions in the Ypres salient and on the Yser would be threatened from the rear. The extension of the attack southwards was a secondary consideration, but it was hoped that at least the destruction of the important mining area south of Bethune might be achieved.

The forces available for the operation of the German VI. Army were four corps, from north to south, the Bavarian II. and German XIX., LV. and IV., to which were allotted nine divisions in the first line and five in corps reserve. Three more divisions were retained in army reserve. The subsidiary attack of the German IV. Army was to be delivered by the X. and XVIII. Res. Corps, with three divisions in the first and one in the second line.

The initial blow fell on the left of the I. and right of the II. British Armies, under Sir Henry Home and Sir Herbert Plumer, the point of junction between which was, on April g, the Lys, east of Armentikres. The XI. Corps (British jjth and Portuguese 2nd Divs.) and the XV. Corps (40th and 34th Divs.) held the front from the La Bassée canal to the Lys, while the IX. Corps (25th, 19th and 9th Divs.) continued the line from the Lys to the Ypres-Comines canal. With the exception of the 55th, all these British divisions had already taken part in the southern battle and had been rapidly made up with reinforcements from home. Three more battle-worn divisions were in corps reserve. The 1st Portuguese division had been withdrawn from the line on April 5 and the 2nd was also to be relieved on April 9, but, pending their relief, it had taken over the whole corps sector.

The Battle Opens.—At about 4 A.M. on April 9 the battle opened with an intense bombardment of the whole front from Lens to Armentikres, with both gas and high-explosive shell. The front trenches were subjected to a rain of high explosive, while battery positions, cross roads, headquarters and railheads far in rear were treated with both gas and high explosive. Armentières itself and the British position south of the La Bassée canal were deluged with mustard gas. The foggy morning made observation difficult, and, according to German accounts, the counter-bombardment was ineffective. Between 8 and 9 A.M. nine German divisions were launched against the two British and one Portuguese divisions. In the centre the weight of the attack of the German XIX. and LV. Corps overwhelmed the Portuguese 2nd Div., and both corps advanced steadily towards their objectives. The right of the Bavarian II. Corps was held firmly by the 40th Div., but the left of the Bavarians succeeded in advancing past the right flank of that division. On the British right the 55th Div. held stoutly on to Givenchy and north of that place withdrew slowly from the outpost position to the main line of resistance which ran just east of Festubert.

All available British reserves were hurried up; the reserve brigade of the 55th Div. was employed to form a defensive flank facing north, from Festubert to the Lawe. The 11th Cyclist Bn. and King Edward's Horse were rushed up to Lacouture and Vieille-Chapelle, and by their heroic resistance effectually prevented any extension of the break through to the south. The 51st and 50th Divs. were moved up from the back areas to the river Lawe and the neighbourhood of Estaires respectively. Meanwhile the 55th Div continued to hold its position at Givenchy and Festubert throughout the day and in counter-attacks against elements of the enemy, which had penetrated into their position, captured over 750 prisoners. The magnificent fight put up by this division completely broke the attack of the Prussian IV. Corps.

On the northern flank of the battle, the Bavarian II. Corps succeeded eventually in occupying the forward posts of the right battalion of the 40th Div , and gradually worked their way northwards By noon the division was forced back by pressure in front and flank to a position facing south from Bois Grenier through Fleurbaix to Sailly-sur-Lys. Owing to the rapid advance of the German centre the 50th Div. was unable to gain touch with the 40th, the right flank of which withdrew across the Lys at Bac St. Maur early in the afternoon. The remainder of this division, reinforced by troops of the 34th Div., successfully maintained their line covering the approaches to Erquinghem and Armentières from the south, till the evening.

The Saxon XIX. Corps had rapidly followed up the right of the 40th Div. and about 3 P.M. succeeded in passing small bodies of troops across the Lys at Bac St. Maur. During the night the Germans established themselves firmly on the north bank, in the gap between the 40th and 50th British Divisions.

On April 10 the attacks were renewed all along the line. Practically no progress was made by the IV. Corps on the left. It was only just before nightfall that the LV. Corps succeeded in gaining a footing on the west bank of the Lawe between Lestrem and Vieille-Chapelle. At Estaires the 50th Div. defended itself with great gallantry and inflicted very heavy casualties on the enemy in the street fighting which continued all day. It was only at nightfall that this division was forced to withdraw to a prepared position north and west of the town. East of Estaires the German Corps, which had now got up artillery in support of its infantry and machine guns, pushed back the thin British line to a position north of Steenwerck, where the arrival of reinforcements for a time effectually held up the German advance.

Extension of the Attack.—Meanwhile, after an intense preliminary bombardment of the British positions between Frélinghien and Hill 60 north of the Ypres-Comines canal, the German IV. Army about 5.30 A.M. attacked the British VIII. Corps. The outposts of the 25th and 19th Divs. were driven in and under cover of mist the German X. and XVIII. Res. Corps worked their way up the valleys of the Warnave and Douve rivers on the flanks of the British positions in Ploegsteert Wood 'and Messines. By midday the village of Ploegsteert, the south-east corner of the wood and Messines had been captured. During the afternoon the German attack succeeded in capturing the outpost position as far north as the Ypres-Comines canal, but was held up on the crest of the Wytschaete ridge and in front of Hollebeke by the 9th Division. The South African brigade of the same division retook Messines during the afternoon. This further success of the Germans, combined with the progress made by the right flank of the German VI. Army, gravely imperilled the situation of the 34th Div. which was holding the original line east of Armentikres and had not been attacked. A withdrawal to the north bank of the Lys was therefore decided on, and was completed by 9:30 P.M. when the Lys bridges were destroyed.

On April 11 the attack was continued. The German IV. Corps again failed to make any progress between Givenchy and the Lawe river. North of Locon the British 51st and 50th Divs., weakened by continuous fighting, were slowly pushed back by the German LV. and XIX. Corps. The British divisions fought with the greatest gallantry, but bodies of German infantry worked their way through gaps in the attenuated line and by nightfall they had reached Neuf-Berquin and were in occupation of Merville. Further east progress was checked by a counter-attack of the 31st Div., which had arrived from the southern battlefield, but the Bavarian II. Corps pushed forward through Nieppe to Steenwerck. Slight progress was made by the German IV. Army between Nieppe and Messines.

Renewed Attacks.—During April 12 the arrival of reinforcements, mostly from the southern battle front, began to have its effect. The right flank of the British still held firm, but the German LV. Corps, attacking before dawn in the mist, broke through the left centre of the 51st Div., and reached Riez du Vinage, where their progress was checked by two batteries of artillery. The British 3rd Div. had come into action about Locon, which village was lost to the German LV. Corps, but the German advance was checked. The right flank of the same German Corps was checked in Calonne by the 61st Div., which, like the 3rd, had arrived from the Somme battle area.

Meantime the Bavarian II. and German XIX. Corps attacked between Vieux Berquin and Steenwerck. In spite of the gallant defence put up by the 29th and 31st Divs. they succeeded in forming a gap south-west of Bailleul, which enabled them to penetrate to and seize Merris. This gap was eventually blocked by a brigade of the 33rd Div. reinforced by a party of cyclists, a pioneer battalion and every available man from the local schools and reinforcement camps. Further north the 25th, 34th and 49th Divs. maintained their positions against all attacks.

During April 12 headquarters of Prince Rupert's group of armies issued orders for the continuance of the attack by the inner wings of the two armies, with the dual objectives of Hazebrouck and the range of hills north of Bailleul. The VI. Army was also to prepare to continue the pressure of their left wing towards Bethune. On April 13 the German attacks north of the Lys were continued with great vigour. On the left, elements of the LV. Corps, which had penetrated into the outskirts of the Nieppe forest, were driven back by the British 5th Div., which finally checked the German advance in this area. In the centre the German XIX. Corps continued to attack the 29th and 31st British Divs., now greatly diminished in strength by continuous fighting. Except at Vieux Berquin, which was captured by the Germans, who brought up guns to point blank range, those divisions carried out their instructions to hold their positions at all costs and cover the detrainment of the Australian 1st Division. The arrival of the Australians in the evening definitely closed the approach to Hazebrouck. Further north a succession of heavy attacks was repulsed.

Early on the morning of April 14 the British troops withdrew without interference to a new line in front of the Ravelsburg heights between Bailleul and Neuve Eglise. The latter village, after intense fighting all day, was finally captured by the Germans by midnight. Elsewhere all attacks were repulsed, and the British 4th Div., coming up, recaptured Riez Du Vinage. On April 15 the German attacks were renewed. By this time their troops had been reinforced by the Guard Res. Corps on the left wing of the IV. Army. The IX. Res. Corps had come in on the right of the IV. Corps, and the Bavarian III. Corps had replaced the Bavarian II. Corps Heavy attacks developed during the day culminated in the capture of Bailleul and the Ravelsburg Ridge.

British Withdrawal. — On the night of April 15–16 a withdrawal of the British troops from the Ypres salient to a line east of Ypres through St. Julien and along the Westhoek and Wytschaete ridges was completed without interference. This move had been commenced on the night of the 12–13 by direction of British G.H.Q. in order to set free additional troops, and to forestall any plans the Germans might be entertaining for the extension of the battle front to the north. The withdrawal was well timed, as the Germans were preparing an offensive from the Houthulst forest, and the preparations were almost complete when the British withdrawal took place.

On April 16 strong local attacks were made at various points on the Meteren-Wytschaete front, all of which were repulsed by the 25th, 34th and 49th Divs., except on the extreme flanks, where both villages, after intense fighting, eventually fell into German hands. On the following day determined efforts to take Mt. Kemmel and to advance on the Meteren-Merris front were repulsed, and the Belgian army achieved a notable success in defeating a powerful assault against their right flank about the Ypres-Staden railway.

Meantime the Germans had been preparing to renew the attack on the British right flank, and on the 18th, after a very intense bombardment, the IV. and IX. Res. Corps advanced to the assault of the British positions about Givenchy-Festubert and Mt Bernenchon-Hinges. On the British right they penetrated at certain points, but were thrown back by the 1st Div. which had relieved the 55th. Everywhere else they failed to obtain even an initial success. For nearly a week the battle died down. In the left centre of the British front French troops, which had been brought up from the south, relieved some of the wearied British divisions, and by the morning of the 21st had taken over the sector between Meteren and Spanbroekmolen.

New German Plan. — During this pause the German Higher Command readjusted their plan. On the 18th the Army Group suggested that the main operations should be abandoned, and it was finally decided on the 20th that further operations should be limited to the capture of Mt. Kemmel on the north, and the villages of Givenchy and Festubert on the south. No success whatever was obtained on the southern flank, but the attacks about Mt. Kemmel led to further bitter fighting.

At 3.30 A.M. on April 25 an intense bombardment was opened on the French and British positions extending from Bailleul to the Ypres-Comines canal. The main object of the attack was the capture of Kemmel hill by direct assault on the French, combined with an attack on the British right south of Wytschaete, intended to separate it from the French. The attack was entrusted to the XVIII. Res., Alpine and X. Res. Corps, to which were allotted nine divisions, five of which were fresh. Between 6 and 7 A.M. the German infantry advanced, supported by large numbers of squadrons of battle planes and bombers. After intense fighting they succeeded by 10 A.M. in wresting Kemmel hill and village from the French, detachments of whom, however, though surrounded, held out till late in the day. The weight of the initial attack on the British front fell on the 9th Div, who inflicted very heavy casualties on their enemy but by midday were forced back to Vierstraat. Further north the 21st Div., after a gallant resistance, was in the afternoon compelled to withdraw to a line Hill 60-Vormezeele.

On April 26, 27 and 28 local fighting continued without substantial alteration in the situation. During the night of April 26–27 the salient east of Ypres was further reduced by a withdrawal without interference to the line Pilkem-Zillebeke-Lake-Voormezeele.

The German final effort took place on April 29. The action started with a bombardment of exceptional intensity at 3.10 A M. At 5 A.M. powerful attacks commenced against the French and British troops from west of Dranoutre to Voormezeele After very heavy fighting the Germans gained a temporary success north of Locre, but were driven back by the French troops holding the sector. On the British front the positions held by the 21st, 49th and 25th Divs. were again and again attacked unavailingly by German infantry.

Results of the Battle. — Thus ended the battle of the Lys. The second great German offensive had succeeded in penetrating the British front on a front of about 20 m. to an extreme depth of about 12 miles. A large number of towns and villages had been taken and nearly 30.000 Allied prisoners and 450 guns had been captured. But the attack had failed to gain its main objects The lateral railway communication between St. Pol and Hazebrouck was still intact. Except for the detached hill of Remmel, the high ground dominating the Poperinghe-Ypres road still remained in Allied hands. A pronounced salient had been formed in the German front which was to cost them dear in the succeeding months. On the other hand, the British had been forced to abandon the almost equally pronounced salient east of Ypres, and with it all the ground which had been gained at so great a cost in the battle of Passchendaele the previous year. The losses on both sides had been very heavy. To achieve these results the Germans had employed 42 divisions, of which 33 were fresh; 25 British divisions were employed, of which only eight had not been engaged in the battle of the Somme.

LYSANDER (Gr. Λύσανδρος), son of Aristocritus, Spartan admiral and diplomatist. Aelian (*Var. Hist.* xii. 43) and Phylarchus (*ap.* Athen. vi. 271 e) say that he was a *mothax, i.e.*, the son of a helot mother (*see* HELOTS), but this tradition is at least doubtful; according to Plutarch he was a Heraclid, though not of either royal family. He first appears as admiral of the Spartan navy in 407 B C. The story of his influence with Cyrus the younger, his naval victory off Notium, his quarrel with his successor Callicratidas in 406, his appointment as ἐπιστολεύς in 405, his decisive victory at Aegospotami, and his share in the siege and capitulation of Athens belong to the history of the Peloponnesian War (*q.v.*). By 404 he was the most powerful man in the Greek world and set about completing the task of building up a Spartan empire in which he should be supreme in fact if not in name. Everywhere democracies were replaced by oligarchies, directed by bodies of ten men (δεκαρχίαι) under the control of Spartan governors (harmosts, ἁρμοσταί).

But Lysander's boundless influence and ambition, and the superhuman honours paid him, roused the jealousy of the kings and the ephors, and, on being accused by the Persian satrap Pharnabazus, he was recalled to Sparta. Soon afterwards he was sent to Athens with an army to aid the oligarchs and established the Council of Thirty on the same model as the other oligarchies he had set up throughout Greece; but Pausanias, one of the kings, followed him and brought about a restoration of democracy. On the death of Agis II., Lysander secured the succession of Agesilaus (*q.v.*), whom he hoped to find amenable to his influence. But in this he was disappointed. Though chosen to accompany the king to Asia as one of his 30 advisers (σύμβουλοι), he was kept inactive and his influence was broken by studied affronts, and finally he was sent at his own request as envoy to the Hellespont. He soon returned to Sparta to mature plans for overthrowing the hereditary kingship and substituting an elective monarchy open to all Heraclids, or even, according to another version, to all Spartiates. But his alleged attempts to bribe the oracles were fruitless, and his schemes were cut short by the outbreak of war with Thebes in 395. Lysander invaded Boeotia from the west, receiving the submission of Orchomenus and sacking Lebadea, but the enemy intercepted his despatch to Pausanias, who had meanwhile entered Boeotia from the south, containing plans for a joint attack upon Haliartus. The town was at once strongly garrisoned, and when Lysander marched against it he was defeated and slain. He was buried in the territory of Panopeus, the nearest Phocian city.

An able commander and an adroit diplomatist, Lysander was fired by the ambition to make Sparta supreme in Greece and himself in Sparta. To this end he shrank from no treachery or cruelty; yet, like Agesilaus, he was totally free from the characteristic Spartan vice of avarice, and died, as he had lived, a poor man.

LYSANIAS, the tetrarch of Abilene in the time of John the Baptist (Luke iii, 1). The only Lysanias who was mentioned in profane history as exercising authority in this district was executed in 36 B C. by Mark Antony. He was the son of Ptolemy Mennaeus, the ruler of an independent state, of which Abilene formed only a small portion. According to Josephus (Ant. xix. 5, 1) the emperor Claudius in A.D. 42 confirmed Agrippa I. in the possession of "Abila of Lysanias" already bestowed upon him by Caligula. It is argued that this cannot refer to the Lysanias executed by Mark Antony, since his paternal inheritance must have been of far greater extent. It is therefore assumed by some authorities that the Lysanias in Luke (A.D. 28–29) is a younger Lysanias, tetrarch of Abilene only, one of the districts into which the original kingdom was split up after the death of Lysanias I. This younger Lysanias may have been a son of the latter, and identical with, or the father of, the Claudian Lysanias. On the other hand, Josephus knows nothing of a younger Lysanias, and it is suggested by others that he really does refer to Lysanias I.

LYSIAS (459?–380? B.C.), Attic orator, was born, according to Dionysius of Halicarnassus and the author of the life ascribed to Plutarch, in 459 B.C., a date obtained from the founding of Thurii in 444 B.C.; tradition says that Lysias went there at the age of 15. Cephalus, his father, was a native of Syracuse, and on the invitation of Pericles had settled at Athens. The opening scene of Plato's Republic is laid at the house of his eldest son, Polemarchus, in Peiraeus. The family were obviously well known to Plato.

At Thurii, a new foundation on the Tarentine gulf, Lysias began his studies in rhetoric under Tisias, according to tradition. The destruction of the Athenian expedition in 413 led to an anti-Athenian outburst, and the expulsion of Lysias and Polemarchus, who returned to Athens. There they settled as favoured aliens (ἰσοτελεῖς), Polemarchus in Athens itself and Lysias in Peiraeus, near their shield factory, a large concern employing 120 slaves. The attack of the Thirty Tyrants on the resident aliens in 404 was fatal to Polemarchus, and Lysias only just escaped from imprisonment by a large bribe. He took refuge in Megara; from there he gave assistance to the exiles, and in the restoration in 403 Thrasybulus moved to bestow the citizenship on him, a measure defeated on a technical objection. The recent disturbances had probably reduced Lysias to comparative poverty, and the rest of his life was spent in composing speeches for the law courts. Little is known of his personal life. He made his only personal appearance in 403, when he indicted Eratosthenes, one of the Tyrants. There is a tradition that he delivered his own *Olympiacus* at the festival of 388, to which Dionysius of Syracuse had sent a magnificent embassy. The speech is an appeal to Greece to deliver Sicily from Dionysius' tyranny. The latest speech we can date (For *Pherenicus*) belongs to 381 or 380. Lysias probably died in or soon after 380 B.C.

Lysias was a man of kindly and genial nature, warm in friendship, loyal to country, with a keen perception of character, and a fine though strictly controlled sense of humour. The literary tact which is so remarkable in the extant speeches is that of a singularly flexible intelligence, always obedient to an instinct of gracefulness. He owes his distinctive place to the power of concealing his art. It was obviously desirable that a speech written for delivery by a client should be suitable to his age, station and circumstances. Lysias was the first to make this adaptation really artistic. His skill can be best appreciated if we turn from the easy flow of his graceful language to the majestic emphasis of Antiphon, or to the self-revealing art of Isaeus. Translated into terms of ancient criticism, he became the model of the "plain style" (ἰσχνὸς χαρακτήρ, genus *tenue*). Greek rhetoric began in the "grand" style; then Lysias set an exquisite pattern of the "plain"; and Demosthenes might be considered as having effected an almost ideal compromise.

The vocabulary of Lysias is pure and simple. Most of the rhetorical "figures" are sparingly used—except such as consist in the parallelism or opposition of clauses, due to the still surviving influence of the Sicilian school. Lysias excels in vivid description; he has also a happy knack of marking the speaker's character by light touches. He has equal command over the "periodic" style (κατεστραμμένη λέξις) and the non-periodic or "continuous" (εἰρομένη, διαλελυμένη). His disposition of his subject-matter is always simple. The speech has usually four parts—introduction (προοίμιον), narrative of facts (διήγησις), proofs (πίστεις) and conclusion (ἐπίλογος). It is in the introduction and the narrative that Lysias is seen at his best. In his greatest extant speech —that Against Eratosthenes—and also in the fragmentary *Olympiacus,* he has pathos and fire; but these were not characteristic qualities of his work. In Cicero's estimate of the various Greek orators (De *Orat.* iii. 7, 28) the quality in which Lysias is supreme is subtilitas (refinement). Nor was it oratory alone to which Lysias rendered service; his work had an important effect on all subsequent Greek prose, by showing how perfect elegance could be joined to plainness. And his style has an additional charm for modern readers, because it is employed in describing scenes from the everyday life of Athens.

In literary and historical interest, the first place among his extant speeches belongs to that Against Eratosthenes (403 B.C.), one of the Thirty Tyrants, whom Lysias arraigns as the murderer of his brother Polemarchus. The speech is an eloquent and vivid picture of the reign of terror which the Thirty established at Athens; the concluding appeal, to both parties among the citizens, is specially powerful. Next in importance is the speech *Against Agoratus* (399 B.C.), one of our chief authorities for the internal history of Athens during the months which immediately followed the defeat at Aegospotami. The *Olympiacus* (388 B.C.) is a brilliant fragment, expressing the spirit of the festival at Olympia, and exhorting Greeks to unite against their common foes. The Plea *for* the Constitution (403 B.C.) is interesting for the manner in which it argues that the wellbeing of Athens—now stripped of empire—is bound up with the maintenance of democratic principles. The speech *For Mantitheus* (392 B.C.) is a graceful and animated portrait of a young Athenian ἱππεύς, making a spirited defence of his honour against the charge of disloyalty. The defence *For the Invalid* is a humorous character-sketch. The speech *Against Pancleon* illustrates the intimate relations between Athens and Plataea, while it gives us some picturesque glimpses of Athenian town life. The defence of the person who had been charged with destroying a *moria,* or sacred olive, places us amidst the country life of Attica. And the speech *Against Theomnestus* deserves attention for its curious evidence of the way in which the ordinary vocabulary of Athens had changed between 600 and 400 B.C.

Thirty-four speeches (three fragmentary) have come down under the name of Lysias; 127 more, now lost, are known from smaller fragments or from titles. The ἐρωτικός in Plato's *Phaedrus,* pp. 230 E-234 has generally been regarded as Plato's own work; however, the certainty of this conclusion will be doubted by those who observe (1) the elaborate preparations made in the dialogue for a recital of the ἐρωτικός which shall be *verbally exact* and (2) the closeness of the criticism made upon it. If the satirist were merely analysing his own composition, such criticism would have little point. Lysias is the earliest writer who is known to have composed ἐρωτικοί; it is as representing both rhetoric and a false *Epws* that he is the object of attack in the *Phaedrus.*

All mss. of Lysias yet collated have been derived, as H. Sauppe first showed, from the Codex Palatinus X. (Heidelberg). The next most valuable ms. is the Laurentianus C (15th century), which I. Bekker chiefly followed. Speaking generally, we may say that these two mss. are the only two which carry much weight where the text is seriously corrupt. In *Oratt.* i.–ix. Bekker occasionally consulted 11 other mss., most of which contain only the above nine speeches: viz., Marciani F, G, I, K (Venice); Laurentiani D, E (Florence); Vaticani M, N; Parisini U, V; Urbinas O.

Editio princeps, Aldus (Venice, 1513); by I. Bekker (1823) and W. S. Dobson (1828) in *Oratores Attici;* C. Scheibe (1852) and T. Thalheim (1901, Teubner series, bibl.); C. G. Cobet (4th ed., by J. J. Hartman, 1905); with variorum notes, by J. J. Reiske (1772). Editions of select speeches by J. H. Bremi (1845); R. Rauchenstein (1848, revised by C. Fuhr, 1880–81); H. Frohberger (1866–71); H. van Herwerden (1863); A. Weidner (1888); E. S. Shuckburgh (1882); A. Westermann and W. Binder (1887–90); G. P. Bristol (1892), M. H. Morgan (1895), C. D. Adams (1905), all three published in America. There is a special lexicon to Lysias by D. H. Holmes (Bonn, 1895). *See* also Jebb, *Attic Orators* (1893) and *Selections from the Attic Orators* (2nd ed., 1888) and F. Blass, *Die Attische Beredsamkeit* (2nd ed., 1887–98); W. L. Devries, *Ethopoiia. A rhetorical study of the types of character in the orations of Lysias* (Baltimore, 1892). (R. C. J.; X.)

LYSIMACHUS (c. 355–281 B.C.), Macedonian general, son of Agathocles, was a citizen of Pella in Macedonia. During Alexander's Persian campaigns he was one of his immediate bodyguard and distinguished himself in India. After Alexander's death he was appointed to the government of Thrace and the Chersonese. For a long time he was chiefly occupied with fighting against the Odrysian king Seuthes. In 315 he joined Cassander, Ptolemy and Seleucus against Antigonus, who, however, diverted his attention by stirring up Thracian and Scythian tribes against him. In 309, he founded Lysimachia in a commanding situation on the neck connecting the Chersonese with the mainland. He followed the example of Antigonus in taking the title of king. In 302 when the second alliance between Cassander, Ptolemy and Seleucus was made, Lysimachus, reinforced by troops from Cassander, entered Asia Minor, where he met with little resistance. On the approach of Antigonus he retired into winter quarters near Heraclea, marrying its widowed queen Amastris, a Persian princess. Seleucus joined him in 301, and at the battle of Ipsus Antigonus was slain. His dominions were divided among the victors, Lysimachus receiving the greater part of Asia Minor.

Feeling that Seleucus was becoming dangerously great, he now allied himself with Ptolemy, marrying his daughter Arsinoë. Amastris, who had divorced herself from him, returned to Heraclea. When Antigonus's son Demetrius renewed hostilities (297), during his absence in Greece, Lysimachus seized his towns in Asia Minor, but in 294 concluded a peace whereby Demetrius was recognized as ruler of Macedonia. He tried to carry his power beyond the Danube, but was defeated and taken prisoner by the Getae, who, however, set him free on amicable terms. In 288 Lysimachus and Pyrrhus invaded Macedonia, and drove Demetrius out of the country. Pyrrhus was at first allowed to remain in possession of Macedonia with the title of king. but in 285 he was expelled by Lysimachus.

Domestic troubles embittered the last years of Lysimachus's life. Amastris had been murdered by her two sons; Lysimachus treacherously put them to death. On his return Arsinoe asked the gift of Heraclea, and he granted her request, though he had promised to free the city. In 284 Arsinoë, desirous of gaining the succession for her sons in preference to Agathocles (the eldest son of Lysimachus), intrigued against him with the help of her brother Ptolemy Ceraunus; they accused him of conspiring with Seleucus to seize the throne, and he was put to death. This atrocious deed of Lysimachus aroused great indignation. Many of the cities of Asia revolted, and his most trusted friends deserted him. The widow of Agathocles fled to Seleucus, who at once invaded the territory of Lysimachus in Asia. Lysimachus crossed the Hellespont, and in 281 a decisive battle took place at the plain of Corus (Corupedion) in Lydia. Lysimachus was killed; after some days his body, watched by a faithful dog, was found on the field, and given up to his son Alexander, by whom it was interred at Lysimachia.

LYSIPPUS (fl. late 4th century B.C.), Greek sculptor, was head of the school of Argos and Sicyon in the time of Philip and Alexander of Macedon. He worked in bronze and was said to have produced some 1,500 works, several of them colossal. He modified the canon of Polyclitus toward a more slender type, and introduced an element of impressionism. Lysippus represented the acme of lifelike naturalism. Pliny and other writers mentioned many of his statues. Among the gods he seems to have produced new and striking types of Zeus, Poseidon, the sun-god Helios and others. He made several statues of Hercules, stressing the motif of weariness exemplified in the later Farnese Hercules.

Lysippus made many portraits of Alexander the Great and became the court sculptor of the king, from whom and from whose generals he received many commissions. The extant portraits of Alexander vary greatly and it is impossible to determine which among them go back to Lysippus.

As head of the great athletic school of the Peloponnese, Lysippus sculptured many athletes; a figure by him of a man scraping himself with a strigil (skin scraper) was a great favourite of the Romans in the time of Tiberius; and this has been usually regarded as the original copied in the Apoxyomenus of the Vatican. More than 40 ancient copies of his "Eros" exist. His "Kairos," a personification of opportunity, has often been imitated. He also did drunken flute players, and satyrs dancing.

See F. P. Johnson, *Lysippos* (1928); *M.* Bieber, *The Sculpture of the Hellenistic Age,* pp. 38–39 (1955). (P. G.; D. M. R.)

LYSIS OF TARENTUM (fl. *c.* 400 B.C.), Greek philosopher, a member of the Pythagorean community in southern Italy, is said to have escaped from a massacre there to Thebes, where he became the teacher of Epaminondas. A letter of his, whose genuineness is doubtful, is given in Iamblichus, *Life of Pythagoras,* 75–78.

LYSISTRATUS, a Greek sculptor of the 4th century B.C., brother of Lysippus of Sicyon. Pliny relates in his *Natural History* that he followed a strongly realistic line, being the first sculptor to take impressions of human faces in plaster.

LYTE, HENRY FRANCIS (1793–1847), English clergyman and hymn writer, was born near Kelso on June 1, 1793, and was educated at Enniskillen school and at Trinity college, Dublin. He took orders in 1815, and eventually settled, in 1823, in the parish of Brixham. He died at Nice on Nov. 20, 1847.

Lyte is remembered for his *Poems, chiefly Religious* (1833) and

The Spirit of the Psalms (1834). His best known hymns are "Abide with me!"; "Jesus, I my cross have taken"; "Praise, my soul, the King of Heaven." See his *Remains* (1850) with memoir.

LYTHAM ST. ANNE'S, a municipal borough (1922) and seaside town in the South Fylde parliamentary division of Lancashire, Eng., on the north side of the Ribble estuary, about 12 mi. W. of Preston and 8 mi. S.E. of Blackpool by road. Pop. (1951) 30,343. Area 9.1 sq.mi. There are five public parks and an extensive promenade; there are sands at low tide. A Benedictine cell was founded at Lytham in the 12th century by Richard Fitz-Roger, lord of the manor.

LYTHRACEAE, the loosestrife family consisting of about 23 genera and 475 species of dicotyledonous herbs, shrubs or trees, widely distributed but abundant in the American tropics. They have mostly opposite entire leaves, stipules minute or wanting, flowers bisexual, mostly axillary, solitary or in cymes or panicles, generally actinomorphic, calyx free from the 1-4-locular many-seeded ovary, and petals sometimes wanting. Among the best-known ornamental members are crape myrtle (Lagerstroemiu), spiked or purple loosestrife (Lythrum), cigar flower (*Cuphea*) and henna (*Lawsonia*). See LOOSESTRIFE; HENNA. (J. M. BL.)

LYTTELTON, ALFRED (1857–1913), British politician, mas born Feb. 7, 1857, the youngest child and eighth son of the 4th Lord Lyttelton. His mother, daughter of Sir Stephen Glynne and sister of Mrs. W. E. Gladstone, died six months after his birth. All the eight boys were brought up to be keen cricketers, the cricket ground at Hagley, Worcs., their home, being close to the house; all went to Eton, and six were in the Eton eleven.

Alfred was the most famous cricketer of them all. Indeed for nearly all ball games he had an extraordinary aptitude. He excelled in football of three kinds, and in fives, racquets and especially tennis — holding the amateur championship for tennis from 1882 to 1896. At cricket he was equally good as a bat and as a wicket keeper. He went to Trinity college, Cambridge, and was called to the bar in 1881. In 1895 he became M.P. for Warwick and Leamington as a Liberal Unionist, retaining the seat until 1906, when he was defeated. After a few months' interval, he was returned for a London constituency, St. George's, Hanover Square.

He was appointed, in 1900, chairman of a commission to inquire into the various concessions which Pres. Stephanus Rruger and the Volksraad had granted in the Transvaal. In pursuance of the investigation he spent the autumn of 1900 in South Africa, and Lord Milner hoped to secure him as his successor. But it was as colonial secretary, in the Conservative government of Balfour in 1903, that his South African experience was utilized. He incurred much odium by sanctioning the scheme for importing Chinese coolies into South Africa in order to remedy the shortage of native labour and to restart the mines and thereby the whole economic machinery of South Africa.

Lyttelton died on July 5, 1913, after an injury in a local cricket match.

See E. S. Lyttelton, Alfred Lyttelton (1923).

LYTTELTON, GEORGE LYTTELTON, 1ST BARON (1709–1773), English statesman and man of letters, born at Hagley, Worcestershire, was a descendant of the great jurist Sir Thomas Littleton (*q.v.*). He was the eldest son of Sir Thomas Lyttelton, 4th bart., (d. 1751). Lyttelton was educated at Eton and Oxford, and in 1728 set out on the grand tour, spending considerable periods at Paris and Rome. On his return to England he sat in parliament for Okehampton, Devonshire. From 1744 to 1754 he held the office of a lord commissioner of the treasury. In 1755 he succeeded Legge as chancellor of the exchequer, but in 1756 he quitted office, being raised to the peerage as Baron Lyttelton, of Frankley, in the county of Worcester. In the political crisis of 1765, before the formation of the Rockingham administration, it was suggested that he might be placed at the head of the treasury, but he declined. The closing years of his life were devoted chiefly to literary pursuits. He died on Aug. 22, 1773.

His Works were published by his nephew, G. E. Ayscough, in 1774. See Sir R. Phillimore's *Memoirs* and *Correspondence of* Lord Lyttelton (2 vols., 1845).

LYTTELTON, a borough of New Zealand, the port of Christchurch on the east coast of South Island, on an inlet on the northwestern side of Banks peninsula. Pop. (1956) 3,589. It is surrounded by abrupt hills rising to 1.600 ft., through which a railway communicates with Christchurch (8 mi. northwest) by a tunnel $1\frac{3}{4}$ mi. long. Great breakwaters protect the inner harbour, which has an area of 105 ac., with a low-tide depth of 20 to 33 ft. There is a graving dock accessible for vessels of 462 ft.×54 ft. beam. The produce of the rich agricultural district of Canterbury is exported, frozen or preserved. Lyttelton was the original settlement in this district (1850).

LYTTON, EDWARD GEORGE EARLE LYTTON, BULWER-LYTTON, 1ST BARON (1803–1873), English novelist and politician, the youngest son of Gen. William Earle Bulwer of Heydon Hall and Wood Dalling, Norfolk, was born at London on May 25, 1803. He had two brothers, William (1799–1877) and Henry (1801–72), afterward Lord Dalling (*q.v.*). Bulwer's father died when the boy was four years old. His mother, Elizabeth Barbara, daughter of Richard Warburton Lytton of Knebworth, Hertfordshire, after her husband's death settled in London. Bulwer was educated at private schools and at Trinity college and Trinity hall, Cambridge. Before he went to Cambridge he had published a volume of verse: and had fallen in love. The lady married another, to Bulwer's lasting grief. After leaving Cambridge he published some volumes of juvenilia which he afterward ignored.

Meanwhile he had begun to take his place in society, being already known as a dandy of considerable pretensions, who had acted as second in a duel and experienced the fashionable round of firtation and intrigue. He purchased a commission in the army, only to sell it again without undergoing any service, and in Aug. 1827 married, in opposition to his mother's wishes, Rosina Doyle Wheeler (1802–82), an Irish beauty, niece and adopted daughter of Gen. Sir John Doyle. Upon his marriage with her, Bulwer's mother withdrew the allowance she had hitherto made him. In the year of his marriage he published *Falkland,* and in 1828 *Pelham,* a novel for which he had gathered material during a visit to Paris in 1825. This intimate study of the dandyism of the age was immediately popular, and gossip was busy in identifying the characters of the romance with the leading men of the time. In the same year he published The Disowned, following it up with *Devereux* (1829), *Paul* Clifford (1830), *Eugene Aram* (1832) and Godolphin (1833). All these novels were designed with a didactic purpose, somewhat upon the German model. To embody the leading features of a period, to show how a criminal may be reformed by the development of his own character, to explain the secrets of failure and success in life, these were the avowed objects of his art. Meanwhile he became a follower of Bentham, and in 1831 was elected member for St. Ives, Huntingdon. In 1836 he and his wife were legally separated. Three years later his wife published a novel called *Cheveley,* or *the Man* of Honour, in which Bulwer was bitterly caricatured, and in June 1858, when her husband was standing as parliamentary candidate for Hertfordshire, she appeared at the hustings and indignantly denounced him. She was placed under restraint as insane, but liberated a few weeks later. For years she continued her attacks upon her husband's character, and outlived him by nine years, dying at Cpper Sydenham in March 1882.

After representing St. Ives, Bulwer was returned for Lincoln in 1832, and sat in parliament for that city for nine years. He spoke in favour of the reform bill, and secured the reduction of the newspaper stamp duties. His pamphlet, issued when the Whigs were dismissed from office in 1834, entitled "A Letter to a Late Cabinet Minister on the Crisis." led to an offer from Lord Melbourne of a lordship of the admiralty, which he declined. He continued to write indefatigably. Godolphin was followed by *The Pilgrims* of the Rhine (1834), The Last Duys of *Pompeii* (1834), and *Rienzi* (1835). These books were received with enthusiasm, and Ernest *Maltravers* (1837) and Alice, or *the* Mysteries (1838) were hardly less successful. In 1831 he became editor of the *New Monthly,* but resigned in the following year. In 1841, the year in which he published Sight and *Morning,* he started the *Monthly* Chronicle, a semiscientific magazine, for which he wrote *Zicci,* an unfinished first draft afterward expanded into *Zanoni* (1842). Simultaneously he was writing plays. In 1838 he produced *The Lady of Lyons*, a play which Macready made a great success at Covent Garden: in 1839 *Richelieu* and *The Sen Captain*, and in 1840 *Money*. All, except *The Sea Captain*, were successful. and this solitary failure he revived in 1869 under the title of *The Rightful Heir*. Of the others it may be said that, though they abound in examples of strained sentiment and false taste, they have nevertheless a certain theatrical *flair*, which enabled them to survive a whole library of stage literature of greater sincerity and truer feeling. *The Lady of Lyons* and *Money* long held the stage, and the latter provided a good part for many comedians.

In 1838 Bulwer was created a baronet, and on succeeding to the Knebworth estate in 1843 added Lytton to his surname, under the terms of his mother's will. From 1841 to 1852 he had no seat in parliament, and spent much of his time in continental travel. His later historical romances are *The Last of the Barons* (1843), *Lucretia, or the Children of the Night* (1847), and *Harold, the last of the Saxon Kings* (1838). In the intervals between these he had produced a volume of poems in 1842, another of translations from Schiller in 1844, and a satire called *The Sew Timon* in 1846, in which Tennyson. who had just received a civil list pension. was bitterly lampooned. His most ambitious work in metre, a romantic epic entitled *King Arthur*, had no success. His best work in the novel was still to come. His historical novels are much better than it has been the fashion to think. In *The Caxtons* (1849) he turned to English society, and in *My Novel* (1853) and *Kenelm Chillingly* (1873) he gave an unrivalled picture of English society in the mid-Victorian era. Other late works are A *Strange Story* (1862). *The Coming Race* (1871) and *The Parisians* (1873).

In 1852 he entered the political field anew, and in the Conservative interest. He had differed from the policy of Lord John Russell over the corn laws. and now separated finally from the Liberals. He stood for Hertfordshire and was elected, holding the seat until 1866. when he was raised to the peerage as Baron Lytton of Knebworth. His eloquence gave him the ear of the house of commons. and he often spoke with influence and authority. In 1858 he was appointed secretary for the colonies. In the house of lords he was comparatively inactive.

See T. H. S. Escott, *Edward Bulwer, 1st Baron Lytton of Knebworth* (1910).

LYTTON, EDWARD ROBERT BULWER-LYTTON, 1ST EARL OF (1831–1891), English diplomat and poet, a notable viceroy of India from 18; 5 to 1880, was the only son of the first Lord Lytton (*q.v.*), and was born at London on Nov. 8, 1831, and educated at Harrow and Bonn. In 1850 he entered the diplomatic service as unpaid attache to his uncle, Sir Henry Bulwer, then minister at Washington, D.C. He rose fast in the service through several European capitals, and by 1865 was minister at Lisbon, Port. In 1864 he married Edith Villiers, niece of the earl of Clarendon, and in 1873 he succeeded to the barony.

In Nov. 187j Disraeli chose him to succeed Lord Northbrook as governor-general of India. Relations with Afghanistan were in a particularly delicate state; Russian influence there was growing, and Lytton took with him orders either to counteract it, or to secure a stronger frontier by force. Eleven months of negotiations had produced no result when he abruptly suspended them in March 1878; and he forced on a war in November. His government quickly won it; the amir. Shere Ali Khan, fled; a son, Yakub Khan, was installed in his place, and granted by the treaty of Gandamak (May 26. 1879) a more defensible "scientific" frontier with India, and a British residency at Kabul to control Afghan foreign policy. But on Sept. 3 the resident, Sir Louis Cavagnari, and his staff were murdered. and war began again. Lytton immediately dispatched Gen. Sir Frederick Roberts on a successful campaign: which was still being pursued when the governor-general resigned, with the Conservative government, in the spring of 1880. Lytton received an earldom on resignation. His successor, Lord Ripon, disapproved and revised his "forward" Afghan policy. Though Afghanistan received most attention in Great Britain during Lytton's viceroyalty, and his conduct there was sharply criticized, he had done much for Indian administration: he supervised effective measures for famine relief, abolished internal customs barriers, decentralized the whole financial system. proclaimed the queen empress of India at a splendid durbar at Delhi (Jan. 1, 1877), and reserved one-sixth of the civil service vacancies for Indians.

After seven years at home without a post, he was appointed late in 1887 to be ambassador at Paris, where his winning personality did much to improve Anglo-French relations. He died there, very suddenly. on Nov. 24, 1891. His elder surviving son (b. 1876) succeeded him.

Lytton is known as a poet under the pen name of Owen Meredith. *Selections* from his poems were published, with an introduction by his daughter, Lady Betty Balfour, in 1894. Besides many volumes of verse, Lytton published a biography of his father (1883).

BIBLIOGRAPHY.—The *Personal* and *Literary Letters of Robert, 1st Earl of Lytton* were edited *by* Lady Betty Balfour, 2 vol. (London, 1906). For his viceroyalty *see* her *History of Lord Lytton's Indian Administration (1876–80)* (London, *1899)* and G. E. Buckle, *Life of Benjamin Disraeli, Earl of Beaconsfield,* vol. v and vi (London, New York, 1920).

(M. R. D. F.)

M THE letter M corresponds to the Semitic (mem) and to the Greek (mu). The Semitic form may derive from an earlier sign representing waves of water. Early Greek forms from Thera, Attica and Corinth closely resemble the early North Semitic , . The Lydian alphabet also had the form . These forms differ only in the direction of the writing. The Etruscan form was similar, but with an additional stroke, . The Ionic alphabet had the form . Since this form is rare in Etruscan, the Latin form M may have been borrowed directly from the Chalcidian.

Curious forms occurred in the various Italic alphabets. Umbrian had or . Oscan , Faliscan . The rounded form appeared in the uncial writing of the 5th or 6th centuries, . The cursive hands of the 6th century showed m and on this was based the Carolingian . The modern minuscule does not differ essentially from the majuscule letter. The sound represented by

the letter has been from the beginning the labial nasal. The nasals of all sounds are least liable to change, a fact that is reflected in the consistent history of the letter. See also ALPHABET. (B. F. C. A.; J. W. P.)

MAAS, NICOLAS: see MAES, NICOLAES.

MAASDORP, SIR ANDRIES FERDINAND STOCKENSTROM (1847–1931), was born at Malmesbury, Cape Colony, on Jan. 14. 1847, and educated at Graaff Reinet college, Cape Colony, and University college, London. He was called to the bar in 1871. He returned to Cape Colony. and from 1874 to 1878 was a member of the legislative assembly of Cape Colony, and from 1878 to 1897 solicitor-general. From 1900 he was a member of the Special Treason court, until 1902, when he was appointed chief justice of the Orange River colony (Orange Free State province) division of the supreme court of South Africa. He resigned in 1919.

MAASTRICHT, a frontier town and the capital of the province of Limburg, Netherlands, on the left bank of the Maas at the influx of the Geer, 19 mi. by rail N.N.E. of Liége in Belgium, is the seat of a court. Pop. (1957 est.) mun., 86,665. Maastricht was originally the *traiectus* superior (upper ford) of the Romans, and was the seat of a bishop from 382 to 721. Having formed part of the Frankish realm, it was ruled after 1204 jointly by the dukes of Brabant and the prince-bishops of Liége. In 1579 it was besieged, taken and plundered by the Spaniards under the duke of Parma. It was taken by the French in 1673, 1748 and 1794. A small portion of the town, known as Wyk, lies on the right bank of the river.

A stone bridge connecting the two sections replaced a wooden structure as early as 1280, and was rebuilt in 1683. Formerly a strong fortress, its ramparts were dismantled in 1871–78. The town hall, completed in 1683, contains pictures and tapestry. The old town hall (Oud Stadhuis), a Gothic building of the 15th century, is a museum of antiquities. The church of St. Servatius, founded by Bishop Monulphus in the 6th century, is the oldest church in Holland; according to one account it was rebuilt and enlarged as early as the time of Charlemagne. The late Romanesque church of Our Lady has two ancient crypts and a 13th-century choir, but the nave suffered severely from a restoration in 1764. The original church of St. Martin (in Wyk) occupied the supposed site of an old heathen temple.

The Protestant St. Janskerk church, a Gothic building of the 13th and 15th centuries, with a fine tower, was formerly the baptistery of the cathedral. The town did not reap the full advantages of its situation till the opening of the railways between 1853 and 1865. At first a trade was carried on in wine, colonial wares, alcoholic liquors and salt; there are now manufactures of china. glass and crystal, also breweries, tobacco and cigar factories, and a trade in corn and butter.

A short distance south of Maastricht are the great sandstone quarries of Pietersberg, which were worked from the time of the Romans till the end of the 19th century, resulting in subterranean labyrinths covering an area of 15 mi. by 9 mi. In the time of the Spanish wars these underground passages served to hide the peasants and their cattle. Five miles distant are the medieval castles of Amstenrade, Neubourg and Mheer. Maastricht was assaulted by the Germans, May 11, 1940—the second day of the invasion of the Low Countries.

MABILLON, JEAN (1632–1707), Benedictine monk and scholar of the Congregation of St. Maur, was born on Nov. 23, 1632, the son of a peasant living near Reims. In 1653 he entered the abbey of St. Remi at Reims and in 1664 was placed at St. Germain-des-Prés in Paris, the great literary workshop of the Maurists. There he lived and worked for 20 years, at first under Luc d'Achéry, with whom he edited the nine folio volumes of *Acta* of the Benedictine saints (1668–1701). In Mabillon's prefaces (reprinted separately) these lives were for the first time made to illustrate the ecclesiastical and civil history of the early middle ages.

Several journeys—in Flanders, Lorraine, Burgundy, southern Germany and Switzerland—proved exceptionally fruitful. Many of Mabillon's discoveries were promptly published in his *Vetera Analecta* (4 vol., 1675–85). Prompted by the excessive skepticism of the Jesuit Daniel Papebroch, who in his *Propylaeum antiquarium* circa veri ac *falsi* discrimen in *vetustis membranis* (1675) had declared that nearly all Merovingian documents were spurious and that no authentic charters existed for the period before 700, Mabillon with the help of several of his confrères produced a classic work, his *De re diplomatica* (1681; supplement, 1704), in which were first laid down the principles for determining the authenticity and date of medieval charters and manuscripts. It practically created the science of Latin paleography. Work on the Lectionary of Luxeuil. discovered in the early days of the *Iter Germanicum* (1683), stimulated him to write the *De liturgia Gallicana* (1685), and the most profitable journey of all. that in Italy, led to the publication of the *Museum Italicum* (1687–89), which included not only the famous Missal of Bobbio but also the precious *Ordines Romani*. These important texts have been splendidly re-edited since, but for more than two centuries they were the only resource available to scholars. On his return to Paris from Italy Mabillon was called upon to defend against the Trappist abbot A. J. le B. de Rancé, the legitimacy for monks of the kind of studies to which the Maurists devoted themselves. This called forth hlabillon's *Traité des études monastiques* and his *Réflexions sur la réponse de M. l'abbé de la Trappe* (1691–92), works embodying the ideas and program of the hlaurists for ecclesiastical studies.

Mabillon produced in all about 20 folio volumes and as many of lesser size, nearly all works of monumental erudition. He died in Paris on Dec. 27, 1707, in the midst of the production of the colossal Benedictine *Annales* (4 vol., 1703–07; vol. 5, posthumously. 1713; vol. 6, the work of other authors, 1739).

BIBLIOGRAPHY.—The chief authority for Mabillon's life is the *Abrégé de la vie de D. J. M.* (also in Latin), by T. Ruinart (1709), reprinted (1933) under the title *Mabillon* (Collection *Pax,* xxxv). *See* also R. P. Tassin, *Histoire littéraire de la congregation de St. Maur* (1770). Excellent introductions to the study of Mabillon's career are the articles by J. Baudot in *Dictionnaire de Thkologie catholique,* vol. ix, and by H. Leclercq in *Dictionnaire d'Archéologie chrétienne et de Liturgie,* vol. x. The modern biographies include those of E. de Broglie, 2 vol. (1888), S. Baumer (1892) and Henri Leclercq, 2 vol. (1953–57), this last mork in many respects the most valuable of all. Especially useful is J. U. Bergkamp's dissertation, *Dom Jean Mabillon and the Benedictine Historical School of Saint-Maur* (1928).

(E. C. B.; AM. S.)

MABINOGION, THE, the title of a collection of 11 medieval Welsh tales. *Thr White Book of Rhydderch* (*c.* 1300–25) is the first manuscript extant to contain any considerable number of them; *The Red Book of Hergest* (*c.* 1375–1425) the first to contain them all. The form *mabinogion* was long regarded incorrectly as a plural of *mabinogi,* which meant, first "youth." then "a tale of youth" and, lastly "a tale." The stories of the *Mabinogion* are (1) "The Four Branches of the *Mabinogi,*" consisting of "Pwyll Prince of Dyfed." "Branwen daughter of Llŷr," "Manawydan son of Llŷr" and "Math son of Mathonwy"; (2) the native Arthurian tales "Culhwch and Olwen" and "The Dream of Rhonabwy"; (3) "The Dream of Macsen Wledig" and "The Adventure of Lludd and Llefelys" and (4) the French Arthurian romances "Owain and Luned" (or "The Lady of the Fountain"), "Geraint and Enid" and "Peredur son of Efrawg." These anonymous tales, taken from oral stories. are based on mythology. folklore. heroic traditions and etiological elements and range from the second half of the 11th century to the close of the 13th century.

(T. Js.)

MABUSE (MALBODIUS), **JAN** (JAN GOSSAERT or JENNI GOSSART) (*c.* 1478–1532), was the name adopted (from Maubeuge in northern France. where he or his family originally came from) by the Flemish painter Jan Gossaert. He is most likely to be identified with the Jennyn van Hennegouwe who registered as master in the guild of St. Luke at Antwerp in 1503. His most important early work extant is the "Adoration of the Kings" in the National gallery, London. which is signed by him. There he throws together some 30 figures on an architectural background. carefully elaborated and Romanesque in style. He surprises us by pompous costume. His figures, like pieces on a chessboard, are often rigid and conventional. The landscape which shows through the ruined architecture is adorned with towers and steeples in minute fashion. This picture, probably painted for the abbey of St. Adrian, Grammont, is the work of a man trained in the old Flemish traditions.

That he was an admirer of Jan van Eyck is shown by his picture in Madrid of "Jesus, the Virgin and the Baptist," in Gothic framework One of hlabuse's most distinguished works, the little triptych at Palermo was probably also painted at this early period. Jean Carondelet, who was Mabuse's patron, was archbishop of Palermo and chancellor of Flanders, and he probably transferred the picture to Sicily. It is a wonderful piece of pictorial elaboration. containing features taken from Dürer. 'Another early mork is the moonlight scene representing "The Agony in the Garden," in the Berlin museum.

After living for a few years at Antwerp, Mabuse took service with Philip. bastard of Philip the Good, at that time lord of Somerdyk and admiral of Zeeland One of his pictures had already become celebrated—a "Descent From the Cross" uith 50 figures, ordered by Philip of Burgundy for the high altar of the church of Middelburg; and the value which was then set on the picture is apparent from the fact that in 1521 Diirer came expressly to Middelburg to see it, noting in his diary that it was not so good in design as in execution. In 1j68 the altarpiece perished by fire A smaller "Descent From the Cross," seen by Van Mander at Delft, is probably the one now in the Hermitage at Leningrad. In 1508 Mabuse accompanied Philip of Burgundy on his Italian mission, and this led to an important revolution in the art of the Netherlands. Mabuse not only brought home a new style. but also introduced the fashion of traveling to Italy; and from that time until the age of Rubens and Van Dyck it was considered proper that all Flemish painters should visit the peninsula.

In the summer of 1509 Philip returned to the Ketherlands, and, retiring to his seat of Suytburg in Zeeland, surrendered himself to the pleasures of planning decorations for his castle and ordering pictures from Mabuse and Jacopo de Barbari. Being in constant communication nith the court of Margaret of Austria at Malines, he gave the artists in his employ fair chances of promotion Barbari nas made court painter to the regent. while Mabuse received less important commissions. Records prove that Mabuse painted a portrait of Leonora of Portugal, and other small pieces, for Charles V in 1516. But his only signed pictures of this period are the "Neptune and Amphitrite" of 1j16 at Berlin. the composition of which is taken from Durer's famous engraving, and the Madonna, with a portrait of Carondelet of 1517, at the Louvre. In these last two we clearly discern that Giorgio Vasari only spoke by hearsay of the progress made by Mabuse in "the true method of producing pictures full of nude figures and poesies," for the types are ugly, though drann delicately and modeled elaborately. Of similar type is the "Hercules and Deianira," dated 1517, in the Barber institute, Birmingham. In later forms of the same subject—the "Adam and Eve" at Hampton court, or the other version at Berlin—we observe more nudity. combined nith realism.

Mabuse's "St. Luke Painting the Portrait of the Virgin" in the Narodni Galerie at Prague, and a variety of the same subject in the Vienna museum, prove that travel had left many of Mabuse's fundamental peculiarities unaltered. His figures still retain the character of stone; his architecture, now in Italian Renaissance style. is as rich and varied; his tones are as strong as ever. But bright contrasts of gaudy tints are replaced by soberer grays, and a cold haze pervades the surfaces. In this form the Madonnas of Munich (1527) and Vienna. in the collections of Max Wassermann in Paris. and E. Simon in Berlin, are fair specimens of his skill.

As early as 1523, when Christian II of Denmark came to Belgium, he asked Mabuse to paint the likenesses of his dwarfs. In 1528 he requested the artist to suppress the design for his Queen Isabella's tomb and epitaph in the Abbey of St. Pierre near Ghent. It was no doubt at this time that Mabuse completed the portraits of John. Dorothy and Christine, children of Christian II. of which replicas are at Hampton court, at Wilton house and at Longford castle, Wiltshire. It is as a portrait painter that Mabuse can be seen to the best advantage. His portraits of Carondelet in the collection of M von Guttmann in Vienna and L. Hirsch in London; of Marquise de Vere in the Gardner museum at Boston, Mass., and others in the galleries of Copenhagen, London, Paris, Berlin, and in the Pratt collection, New York city, are remarkable for their strength and plasticity. In his later portraits the rendering of the hands becomes remarkably expressive of the sitter's personality. Carondelet's portrait in Vienna formed part of a diptych. The opposite wing is now in the Tournay museum and carries a half-length of St. Donatian. This diptych is one of the most powerful works of Mabuse.

When Philip of Burgundy became bishop of Utrecht, and settled at Duerstede, near Wyck, in 1517, he was accompanied by Mabuse, who helped to decorate the new palace of his master. At Philip's death. in 1524, Mabuse retired to Middelburg, where he took service with Philip's nephew, Adolph, lord of Veeren. He died at Breda in 1532.

MAC, a Gaelic word meaning "son," and the distinguishing prefix in a large number of Scots and Irish personal names; frequently contracted to Mc and M' in the written form. Its use in forming Celtic patronymics is ancient in both Scots and Irish records, and may be compared with Welsh Xp (originally *mab* or map, the Brythonic equivalent of *mac*), Irish O' in such names as O'Donnell (Scots MacDonald and MacDonnell) and Anglo-Norman Fitz, etc. In the 8th century the Pictish king Angus MacFergus (Aonghas MacFhearghuis) prepared the way for the union of Picts and Scots, and in the following century Kenneth MacAlpin became the founder of the first dynasty to rule over a united Scotland; Shakespeare's *Macbeth* has rendered familiar the name of MacAlpin's descendant two centuries later on the Scottish throne. The advent of the Norsemen, and their colonization of the outer isles from the Shetlands to the Isle of Man and Northern Ireland, accounts for a number of Celticized names of old Norse origin which now also make their appearance, such as the Gaelic *mac Amhlaibh, mac Mhanuis, mac Iamhair,* etc., from old Norse Olaf or Olave, Magnus or Manus, Ivar or Ingvar, Thorketill, Lochlann. from which the more familiar forms of Macaulay. MacManus, MacIvor, MacCorquodale, Maclachan are derived. Association of the prefix with English names, such as M'Ritchie, M'Dicken, M'Cutcheon, M'Watt (*i.e.,* Richardson, Dickinson, Hutchinson, Walter's son) is uncommon and always late in origin.

The Celtic names so formed are both fewer in number and more regular in structure than the wide diversity of forms and spellings that have been derived from them. Ferguson. Farquharson, Duncanson are more correctly rendered in the original "Fergus' son," or Fergusson, etc. (though using a prefix in place of a suffix). From *mac* Aonghais, son of Angus, come M'Ainsh, M'Innes. M'Quinness (Ir M'Guinness), M'Neish; from *mac* Coinneach, son of Kenneth, M'Kinnie, M'Kenzie, M'Kenna, M'Whinnie; from *mac* Eachainn, son of Hector, come M'Kechnie, M'Geachie, M'Kichan; while Meikleham from M'Ilquham shows a still further process of change by ellipsis. (Cf. Welsh Map-Richard and Map-Rhys, which became Ap-Ritchard, Ap-Rhys, and finally Pritchard, Price and Bryce.) The conversion of the Gaelic inflected *mh* and bh into its equivalent sound of v is also common, as M'Vanish son of Manus, from MacMhanuis; M'Tavish. son of Thomas, from MacTamhais, etc. (Cf. Scott's Vic Ian Vor in *Waverley,* i.e., *Mhic* lain *Mhór,* Son of Big John.)

Among the elements that enter into these name processes, besides the simple personal names, such as MacGregor, MacFarlane, MacAlister, from Gregory, Bartholomew (Gael. Parlain), Alexander (Gael Alasdair), are names of crafts, rank, personal description, etc.. such as Macduff from Gaelic dubh, dark. whence also M'Duffie. M'Phee, M'Fie; M'Dougall and M'Dowall from dubh ghal or Dugald. the dark stranger, MacFarquhar from *fhear* char, the dear man; MacKinnon, the fair born, and MacIntyre (*Mac* nn t-snoir), son of the carpenter, besides a number of names of religious origin. such as M'Kellar, M'Nab. M'Gillespie, M'Taggart (*Mac* an t-sagaart). son of the prior abbot, bishop, priest (another form of which is M'Millan, the bald or

Names incorporating initial Gil, Il, Le, etc.. are derivatives from *gille* or *ghill',* a lad or servant, which is common to names of religious origin and in naming after saints, as M'Gilchrist (*Mac gille* Chriosd), M'Ilhose or Maclehose, M'Gillivray or M'Ilwraith. M'Lean, M'Clure, son of the servant of Christ, of Jesus, of judgment (bhràith), of John, and of the Book (Leabhair) or Bible. MacIntosh (*Mac* an tdisclz), son of the chief, is an instance of a name of rank. In Celtic Scotland the *tòiseach* was the head of a district under the *maormaers* or stewards of the great provinces. who later became earls, while tdiseach is frequently translated thane in English, though without the English sense. Under the clan system which reached its greatest development later, it may be more exactly rendered the chief of the clan in a particular district. It is also owing to this community system that the use of the patronymic to decide relationship. at first of father and son, and by extension all children or descendants. became part of the social heritage and structure of the Scots, and took the place of the feudal relationships which spread elsewhere.

MACABEBE, a municipality (with administrative centre and 18 barrios or districts) of the province of Pampanga, Luzon, Philippine Islands, on the Pampanga river, about 10 mi. above its mouth and about 25 mi. N.W. from Manila. Pop. (1948) 17,637. Macabebe was long a recruiting ground for the Spanish *guardia* civil and later for the Philippine scouts which formed an adjunct of the United States army in the archipelago. The inhabitants are traders who travel. Agriculture is also a leading industry, the principal crops being palay (rice) and sugar. Alcohol is distilled from the nipa palm and abaci (Manila hemp) and cotton fabrics are woven into cloth. Pampango is the vernacular.

MACABRE: see Dance of Death.

McADAM, JOHN LOUDON (1756–1836), Scottish inventor, who gave his name to the system of road making known as "macadamizing," was born at Ayr. Scot., on Sept. 21, 1756. In 1770 he went to New York city, entering the countinghouse of a merchant uncle. He returned to Scotland with a considerable fortune in 1783, and purchased an estate at Sauhrie, Ayrshire. The highways of Great Britain were at this time in a very bad condition, and McAdam, who was a road trustee in his district, at once began to consider how to effect reforms. At his own expense he began at Sauhrie, despite much opposition, a series of experiments in road making.

In 1798 McAdam moved to Falmouth, where he had received a government appointment, and continued his experiments there. His general conclusion was that roads should be constructed of broken stone (see Roads and Streets). In 1815. having been appointed surveyor general of the Bristol roads, he was able to put his theories into practice. In 1819 he published a Practical Essay on the *Scientific* Repair and Preservation of Roads, followed, in 1820, by the Present State of Road-making. In 182; he mas appointed by the government general surveyor of roads.

He died at Moffat. Dumfriesshire, on Nov. 26, 1836.

See M. R. *R.* Pember-Devereux, *The Colossus of Roads: a Life of John Loudon McAdam* (1936).

McADOO, WILLIAM GIBBS (1863–1941), U.S. lawyer and politician. was born near Marietta: Ga., Oct. 31, 1863. He entered the University of Tennessee but did not finish his course. In 1882 he became clerk in the U.S. circuit court of Chattanooga: read law and three years later was admitted to the bar. He began practice in Chattanooga, but in 1892 removed to New York city. There he became interested in the problem of passenger transportation. In 1902 he formed the New York and New Jersey Railroad company. which took over the abandoned Hudson river tunnel from Hoboken to New York, and in March 1904 this tunnel was completed. In 1909 the tunnel under the Hudson river to downtown New York also was finished. He was a strong supporter of Woodrow Wilson for president. and on the latter's election he was appointed, in 1913, secretary of the treasury. In this position he contributed largely to the working out of the new federal reserve banks system.

After C.S. entrance into World War I he was called upon to raise very large sums of money He was successiul in floating four Liberty Loans betneen May 1917 and Oct. 1918. amounting in all to more than $18,000,000,000. He also secured the creation of a bureau of war risk insurance for shipping, later extended to include life insurance for soldiers and sailors in World War I. When the railways were taken over by the federal government in 1917 he was appointed director-general He favoured the League of Nations, woman suffrage and the prohibition amendment. He resigned the secretaryship of the treasury in Dec. 1918, and the directorship of railways the following January. He then resumed the practice of law, first in New York and later at Los Angeles, Calif. McAdoo emerged from public service as the acknonledged leader of a large segment of the Democratic party. He made a strong showing as a candidate at the nominating convention in San Francisco in 1920. On the first ballot he received the highest number of votes, but the nomination finally went to James M. Cox. McAdoo's candidacy for the nomination in 1924 at New York, where a near majority of the delegates supported him, precipitated the famous deadlocked convention nhich. after 16 days, nominated John W. Davis on the 103rd ballot. McAdoo was elect'ed United States senator from California for the term 1933–39, and supported the New Deal policies of Pres. Franklin D. Roosevelt, whom he had helped to nominate in 1932. McAdoo died in Washington, D.C., on Feb. 1. 1941. His career is well-documented by the large collection of his personal papers in the Library of Congress. An autobiography, *Crowded Years,* was published in 1931.

MACAIRE, a French *chanson de geste. Macaire* (12th century) and *La Reine Sibille* (14th century) are two versions of the story of the false accusation brought against the queen of Charlemagne, called Blanchefleur in *Macaire* and Sibille in the later poem. *Macaire* is preserved only in the Franco-Venetian *geste* of Charlemagne (Bibl. St. Mark ms. fr. xiii). *La Reine Sibille* exists only in fragments. but the tale is given in the chronicle of Alberic Trium Fontium and in a prose version. *Macaire* combines two legends: that of the unjustly repudiated wife and that of the dog who detects the murderer of his master. (For the former motive *see* GENEVIÈVE OF BRABANT.) The second is found in Plutarch, *Script. moral.,* where a dog, like Aubri's hound. stayed three days without food by the body of its master, and subsequently attacked the murderers. thus leading to their discovery. The duel between Macaire and the dog is paralleled by an interpolation by Giraldus Cambrensis in a manuscript of the *Hexameron* of St. Ambrose. Aubri's hound received the name of the "dog of Montargis," because a representation of the story was painted on a chimney piece in the château of Jlontargis in the 15th century. The tale was early divorced from Carolingian tradition. and Jean de la Taille. in his *Discours notable des duels* (1607). places the incident under Charles V.

McALESTER, city and seat of Pittsburg county. Okla.. U.S., 120 mi. S.E. of Oklahoma City. was developed in 1870 from a Choctaw and Chickasaw Indian territory trading post built by a pioneer settler. J. J. McAlester. for whom it was named. at the crossroads of the well-traveled California trail and Texas road. Its early settlement resulted from coal mining and the construction of the Jlissouri-Kansas-Texas railroad, later crossed by the Rock Island railroad. Thereafter it became a trade centre for a diversified farming area (cotton, corn, oats, dairy products). When coal and cotton production diminished in the 1920s. livestock, meat packing and clothing manufacture became significant. In 1906 the city of South McAlester (incorporated in 1899) and McAlester were amalgamated. and in 1919 the commission-manager form of municipal government was adopted.

Long a centre of Freemasonry, McAlester is known for its temple. Indian-Scottish Rite consistory, and as the birthplace and headquarters of the Order of the Rainbow for girls. It is the site of the Oklahoma state penitentiary, and a large U.S. naval ammunition depot is nearby. For comparative population figures *see* table in OKLAHOMA: *Population.* (J. D. Mo.)

McALLEN, a city of Hidalgo county, in southeastern Texas, U.S., about 50 mi. W.N.W. of Brownsville and 7 mi. from the International bridge over the Rio Grande at Reynosa, Mex. It was founded in 1905, incorporated in 1911 and named for John McAllen, a Scottish settler from whose ranch the townsite was carved. McAllen is a leading winter resort. It is the centre of oil-field operations in the Lower Rio Grande valley. McAllen is also a packing and shipping centre for an irrigated district devoted to citrus culture and vegetables, and a port of entry for trade with Mexico. hlanufactures include clothing, food processing and petroleum products For comparative population figures *see* table in TEXAS: *Population.* (O. Mo.)

MACALPINE (MACCABEUS), **JOHN** (d. 1557), Scottish reformer and theologian, was from 1532 to 1534 prior of the Dominican convent of Perth; but having in the latter year been summoned with Alexander Ales and others to answer for heresy before the bishop of Ross. he fled to England. where he was granted letters of denization on April 7, 1537, and married Agnes Macheson, a fellow exile for religion; her sister Elizabeth became the wife of Miles Coverdale. The reaction of 1539 made England a doubtful refuge and on Nov. 25, 1540, Macalpine matriculated at the University of Wittenberg, Ger. In 1542, having assumed the name of Maccabeus or Machabeus. he became professor of theology at the University of Copenhagen. There he took a prominent part in building up the Lutheran Church of Denmark. A joint exposure by Peter Plade and Macalpine of Andreas Osiander's errors was published in 1552 and reprinted at Leipzig and Copenhagen in 1768; and Macalpine was one of the four translators of Luther's German Bible into Danish. He died at Copenhagen on Dec. 6, 1557.

MACAO, a Portuguese colony on the coast of South China, on the west side of the entrance to the Canton river, opposite to and about 35 mi. distant from Hong Kong Island. It comprises the peninsula of Macao and the small islands of Taipa and Colôane: the area of the whole colony being about six square miles. On the peninsula, which is about three miles long and a mile broad, is situated the picturesque city of Macao, extending up a hillside to overlook a fine bay. Its multicoloured buildings reveal a quaint combination of oriental and European features. The mean monthly temperature reaches 84° F. in July, but in no month falls below 60° F. Its tropical climate. with an annual rainfall of 60 in.. is relieved by southwest sea breezes This, with the 124 good schools. as well as the unrestricted gaiety, has attracted many well-to-do Chinese and European residents.

Direct trade by sea between Europe and China began through Portuguese enterprise as early as 1516. Macao was established in 1557 and is the oldest European outpost in the trade with China It was an early centre of Jesuit missionary activity and in 1580 the bishopric of Macao, which includes also Timor (East Indies) and the Christians of Malacca and Singapore, was created; in 1680 the first governor was appointed, but the Portuguese remained largely under the control of the Chinese nith nhom there nere constant disputes concerning the extent of Portuguese jurisdiction. A rental was paid for the peninsula until 1849, when the Portuguese abolished the Chinese customs house and declared the independence of the port. It was not. however, until 1887 that China formally recognized Portuguese sovereign rights in a treaty whereby China confirmed the perpetual occupation and government of Macao and its dependencies by Portugal, which in turn undertook never to alienate Macao and its dependencies without the consent of China, and to co-operate in the work of the opium revenue at Macao on the same lines as Great Britain at Hong Kong. This did not put an end to disputes, and the delimitation of the colonial boundaries is still an unsettled question.

During the 18th century Macao was the chief centre in the

Sino-European trade, but the rapid development of Hong Kong (ceded to Great Britain in 1842) was responsible for its decline, as also was the rapid silting of Macao harbour. As a free port it remained a distribution centre for rice, fish, lumber, silk, piece goods and oil; but it also had an unenviable reputation for opium smuggling and gambling. The League of Nations' efforts reduced its opium trade value from $1,500,000 (U.S.) to about $200,000 (U.S.) before 1939. In 1939, after the capture of Canton and the closure of the Hong Kong-Kowloon border, Macao enjoyed briefly the available import and export trade of South China. The Lappa Customs figures are: Imports, 1938, $784,359 (U.S.), 1939, $3,184,288 (U.S.); Exports, 1938, $1,503,074 (U.S.), 1939 $2,384,425 (U.S.). In 1938, 6,406 vessels cleared the port, a total of more than 3,100,000 tons. Its fishing industry employed about 1,800 junks and 40,000 people, and distributed annually more than $750,000 (U.S.) worth of fish to neighbouring cities of the Canton delta. The great bulk of the fish exported is salted. and Macao's position as the second fish port in China is in large measure due to the imports of foreign salt, which is much cheaper than Chinese government-taxed salt. The chief manufactures are those of cement, preserves, fire-crackers, vegetable oil, and also metalworking.

In 1920 a definite scheme for harbour improvement was launched and a contract placed with the Netherlands Harbour Works. The construction of an artificial deepwater harbour began in 1923; and this entailed the dredging of a four-mile channel to the open sea. These harbour works were completed in 1926, having cost $10,000,000, and have led to the reclamation of 130 acres of land surface.

Pop. (1940) 374,737; (1950) 187,772 (2,942 Portuguese); (1960) 169,299. The so-called Macanese are descended from the original 1,000 Portuguese families, now with a dominance of Chinese blood through intermarriage. Revenue is derived from ground rents, industrial taxes, gambling and opium monopolies, and the 1942 budget was 46,798,761 escudos. The city, with its famous 1½-mi. long Praia Grande, comprises a Chinese and a non-Chinese ward under separate administration. In March 1940, the Japanese army demanded Portuguese recognition of the near-by "puppet" government at Chungshan, the evacuation of Portuguese troops from the islands of Lappa and Wantsai, and the right of house-to-house search in Macao, etc. In Aug. 1943 Japanese troops seized the British steamer *Sian* in Macao, killing some 20 guards. In September they demanded the installation of Japanese "advisers" under the alternative of military occupation.

MACAQUE, a name for the monkeys of the mainly Asiatic genus *Macaca,* of which one species, the Barbary ape, inhabits North Africa and the rock of Gibraltar. Displaying great variation in the length of the tail, macaques are heavily built monkeys, with longer muzzles than their compatriots the langurs *(see* PRIMATES), and large naked callosities on the buttocks. They range over India and Ceylon, thence northward to Tibet. and eastwards to China, Japan, Formosa, and the Malay region. Mention of the more important species is made in the article PRIMATES. Like most monkeys, macaques go about in troops, each headed by an old male. They feed on seeds, fruits, insects, lizards, etc.; and several of the species are mainly terrestrial.

MACARA, SIR CHARLES WRIGHT (1845–1929), 1st Bart. (cr. 1911), English business man, was born on Jan. 11, 1845, at Strathmiglo, Fifeshire, and educated privately and at Edinburgh. From 1892 for 34 years he acted as chairman of the Manchester and district cotton employers' association, and was partly responsible for the Brooklands agreement which ended the strike of 1892. He acted as president of various associations connected with the cotton trade, taking an active part in their work. and the establishment of the Industrial Council by the government in 1911 was largely due to his efforts. From 1912 to 1916 he was president of the Employers' Parliamentary Association, and in September 1922 was appointed chairman of the provisional emergency cotton committee, set up to consider the action to be taken in view of the state of the cotton trade. He died Jan. 2, 1929.

His many publications on social and industrial questions include: *Social and Industrial Reform* (1918); *Recollections* (1921); *Getting the World to Work* (1922); *Trade Stability and how to obtain it* (1925); *Modern Industrial Tendencies* (1926).

MACARONI, a preparation of a glutinous wheat originally peculiar to Italy, where it is an article of food of national importance (from dialectic Ital. *maccare,* to bruise or crush). The same substance in different forms is also known as *vermicelli, pasta* or Italian pastes, *spaghetti, taglioni, fanti,* etc. These substances are prepared from the hard, semi-translucent varieties of wheat which are largely cultivated in the south of Europe, Algeria and other warm regions, and distinguished by the Italians as *grano duro* or *grano da semolino.* These wheats are much richer in gluten and other nitrogenous compounds than the soft or tender wheats of more northern regions, and their preparations are more easily preserved. The various preparations are met with as fine thin threads (vermicelli), thin sticks and pipes (spaghetti, macaroni), small lozenges, stars, discs, ellipses, etc. (pastes). These various forms are prepared in a uniform manner from a granular product of hard wheat, which, under the name of semolina or middlings, is a commercial article.

The semolina is thoroughly mixed with boiling water and incorporated in a kneading machine, such as is used in bakeries, into a stiff paste or dough. It is then further kneaded by passing frequently between rollers or under edge runners, till a homogeneous mass has been produced which is placed in a strong steam-jacketed cylinder, the lower end of which is closed with a thick disc pierced with openings corresponding with the diameter or section of the article to be made. Into this cylinder an accurately fitting plunger or piston is introduced and subjected to very great pressure, which causes the stiff dough to squeeze out through the openings in the disc in continuous threads, sticks or pipes, as the case may be. Vermicelli is cut off in short bundles and laid on trays to dry, while macaroni is dried by hanging it in longer lengths over wooden rods in stoves or heated apartments through which currents of air are driven. It is only genuine macaroni, rich in gluten, which can be dried in this manner; spurious fabrications will not bear their own weight, and must, therefore, be laid out flat to be dried. In making pastes the cylinder is closed with a disc pierced with holes having the sectional form of the pastes, and set of knives revolving close against the external surface of the disc cuts off the paste in thin sections as it exudes from each opening.

True macaroni can be distinguished by observing the flattened mark of the rod over which it has been dried within the bend of the tubes; it has a soft yellowish colour, is rough in texture, elastic and hard, and breaks with a smooth glassy fracture. In boiling it swells up to double its original size without becoming pasty or adhesive. It can be kept any length of time without alteration or deterioration.

MACARONICS, burlesque poetry, in which modern words with Latin endings are introduced into Latin verse, so as to produce a ridiculous effect. Sometimes Greek is used instead of Latin. The founder of the practice was Teofilo Folengo (1491–1544), whose mock-heroic *Liber Macaronicus* appeared in 1517. Folengo (*q.v.*) was a Benedictine monk, who escaped from his monastery and lived a dissolute life, supporting himself by his absurd verses, which he described as an attempt to produce in literature something like macaroni, a gross, rude and rustic mixture of flour, cheese and butter. His poem is a burlesque epic, containing an extraordinary medley of chivalrous feats, ridiculous and squalid adventures and satirical allegory. Its effect upon Rabelais was so extraordinary that no examination of *Pantagruel* can be complete without a reference to it. It was imitated in Italy by a number of minor poets; and in France Antonius de Arena published at Avignon in 1573 a burlesque account of Charles V.'s disastrous campaign in Provence. Folengo in Italy and Arena in France are regarded as the macaronic classics. Great popularity was achieved later by an anonymous macaronic, *Funestissimus trespassus Micheli Morini,* who died by falling off the bianch of an elmtree:—

De branche in brancham degringolat, et faciens pouf
Ex ormo cadit, et clunes obvertit Olympo.

Molière employed macaronic verse in the ceremonial scene with the doctors in Le *Malade imaginaire.* Works in macaronic prose are rarer. An Anti-Clopinus by Antony Hotman may be mentioned and the *Epistolae obscurorum virorum* (1515).

The use of true macaronics has never been frequent in Great Britain, where the only prominent example of it is the *Polemo-Middinia* ascribed to William Drummond (*q.v*). This describes a quarrel between two villages on the Firth of Forth.

MacARTHUR, ARTHUR (1845–1912), U.S. army officer, was born at Chicopee Falls, Mass, June 2, 1845. He served throughout the American Civil War in the 24th Wisconsin volunteer infantry, being advanced through the ranks from lieutenant to colonel of the regiment when but 20 years of age. His regiment gained fame in Gen. Philip Sheridan's division of the Army of the Cumberland nhere he was affectionately known as the "Boy Colonel of the West." He was wounded three times, brevetted four times, and cited for "gallant and meritorious service" in the battles of Perryville, Stone River. Missionary Ridge, Resaca, Dalton, Jonesboro, Kenesaw Mountain, Atlanta and Franklin. He mas anarded the Medal of Honor for seizing the colours of his regiment at a critical moment and planting them on the captured works on the crest of Missionary Ridge. At the close of the nar he entered the regular army and from 1866 to 1886 participated in Indian campaigns in the southwest. At the outbreak of the Spanish-American War (1898) he was appointed a brigadier general and assigned to the Philippine command. His brigade captured the town of Malate and thus prepared the way for the taking of Manila. He was cited by Gen. Wesley Merritt for gallantry and conspicuous service and appointed a major general to command the 2nd division. When the insurrection under Gen. Emilio Aguinaldo broke out in February of 1899 he commanded the main column which defeated the insurgents. He succeeded Gen. E. S. Otis in command of the 8th corps, the army of the Philippines, and as the military governor. In the latter capacity (1900–01) he helped to lay the foundations for a free and independent Philippine republic, introducing the nrit of habeas corpus, revising the Spanish law and establishing the free public school system and other democratic concepts. During the Russo-Japanese War he was detailed as a special observer with the Japanese army. In 1906 he was appointed a lieutenant general and became the senior ranking officer of the U.S. army. He retired from the army in 1909 and died Sept. 5, 1912, at Milnaukee, Wis. (D. MacA.)

MacARTHUR, DOUGLAS (1880–), U.S. army officer who commanded Allied forces in the Pacific during World War II, served as supreme commander of occupation forces in Japan and of United Nations forces during the first nine months of the Korean war, was born on Jan. 26, 1880, at Little Rock barracks, Ark., the son of Arthur MacArthur (*q.v.*). In 1903 he graduated from the G.S. Military academy, West Point. first in his class and senior officer in the corps of cadets. He served with the military survey in the Philippines and on a study of colonial lands in the far east, including Korea (1905). He took part in the Veracruz (Mexico) expedition (1914), and in World War I rose to command the 42nd (Rainbow) division. After the mar he was put in charge of the U S. occupation sector along the Rhine. He served as superintendent of the G.S. Military academy (1919–22) and in 1925 was a member of the court-martial which tried aviation advocate Col. William ("Billy") Mitchell (*q.v.*). Although MacArthur is popularly believed to have voted for acquittal at this famous trial, the actual voting of the court members was, according to standard army procedure, not revealed. He served as department commander in the Philippines (1928–30) and as US. army chief of staff (1930–35). In preparation for Philippine independence. MacArthur, in 1935, was appointed military adviser to organize the islands' defenses. He was made a field marshal in the Philippine commonnealth army the folloning year, and continued to serve in the islands after his retirement from the G.S. army on Dec. 31, 1937.

World War **II.**—With tension mounting in the Pacific, MacArthur was recalled to active duty on July 26, 1941, to command U.S. and Philippine troops. When the Japanese attack came in December, his outnumbered forces made a heroic stand on Luzon, falling back to the Bataan peninsula and the island of Corregidor where they were forced to capitulate during April and May 1942. For this gallant defense MacArthur was awarded the medal of honor, the same decoration his father had received more than 50 years before. Ordered by Pres. Franklin D. Roosevelt to leave the Philippines before the surrender, MacArthur arrived in Australia on March 17, 1942, after a daring 3.000-mi. dash through enemy-controlled seas. He opened his offensive campaign in the fall of 1942 with the invasion of New Guinea, and began to retake the areas conquered by Japan in the war's initial stages. Approaching the Philippines in 1944, he was ordered to by-pass and neutralize them as he had many other Japanese strong points during the preceding two years. His arguments in favour of a Philippine invasion, however, persuaded President Roosevelt to allow him to retake the islands. Landings were made at Leyte in Oct. 1944 and by the following July the Philippines were again in Allied hands. Two months later, on Sept. 2, 1945, MacArthur, who had been appointed to the newly created rank of general of the army, accepted the Japanese surrender on board the *U.S.S. Missouri* in Tokyo bay. During the next five years, as supreme commander allied poners he supervised the reconstruction of Japan and the establishment there of a democratic form of government.

Korean **War.**—When North Korean Communist troops crossed the 38th parallel and invaded South Korea in June 1950, MacArthur was put in charge of UN forces. Despite heavy odds against him, he was finally able to stop the Communist advance near the port of Pusan and, with the arrival of fresh UN units, plan his offensive, a surprise landing by amphibious troops at Inchon. far to the enemy rear. Subordinates and other high military officials at first opposed the plan but MacArthur was able to convince them of its feasibility and on Sept. 15, 1950, U.S. marine and army units landed at Inchon. At the same time UN forces to the south broke out of the Pusan perimeter and rolled north to effect a juncture with the amphibious forces. During the next two months the North Korean army was routed and all but destroyed. The intervention of the Chinese Communists late in November precipitated what MacArthur called a "new war" and UN forces were forced to withdraw south of the 38th parallel. By March 1951 MacArthur, having stopped the Chinese advance, was able to resume the offensive. Contrary to the policy of Pres. Harry S. Truman (*q.v.*), with whom he had conferred in Oct. 1950 at Wake Island, MacArthur urged the bombing of Communist bases in Manchuria, the blockade of the Chinese coast and the employment of Chinese nationalist forces based on Formosa. This conflict of viens led to his being relieved of his command on April 11, 1951.

Returning to the U.S., MacArthur addressed both houses of congress in a memorable speech, outlining; explaining and defending his policies in the far east. Thereafter, having been placed on the active list for life as general of the army, he retired to private life. The folloning year he delivered the keynote address at the Republican national convention.

See World War II; Korean War; see also index references under "MacArthur, Douglas" in the Index volume.

MACASSAR (Makasar), the chief port in the island of Celebes, Indon., and capital of the government of Celebes and its dependencies. (Also spelled Makassar; native *M*angkasar.) The first Dutch settlement there was in 1607; it was known then as Vlaardingen. In 1618 the colonists were massacred, but in 1667 the power of the sultan of Macassar was shattered by the Dutch, who established themselves very firmly at Macassar, which served as a useful base in the Dutch operations against the sultans of states in Celebes. It had aluays been retarded by lack of harbour and wharf facilities, but after 1925 Macassar became a first-class port. The main commodities exported are copra, gums and resins, coffee and rattan; minor ones are kapok, ebony, maize, spices. hides and skins. It is normally the great centre for distribution of imports from Europe, America, India and the far east and destined for Celebes, the Moluccas, Lesser Sundas and New Guinea.

Macassar tonn, pop. (1956 est.) 346,085, is picturesque, seen from the sea. Parallel roads run from the harbour along by the sea. through old Macassar and China-town, to the old Fort Rotterdam, facing which there is a large green square containing a monument in memory of the officers and men who fell in the last expedition to south Celebes. Near the town's newer part is the grave of Dipa Negoro, leader of the Java rebellion of 1825, who was exiled and died there. The port was invaded and occupied by the Japanese from Feb. 1942 to the end of World War II. In 1949 it became part of the Republic of Indonesia.

The natives, the Mangkassaras, are a branch of the Malay race similar to if not identical with the Bugis (*q.v.*) of Sumatra.

(E. E. L.; X.)

MACAULAY, THOMAS BABINGTON MACAULAY, Baron (1800–1859), English historian, essayist and politician, was born at Rothley Temple, Leicestershire, on Oct. 25, 1800. His father Zachary Macaulay (1768–1838), had been governor of Sierra Leone, and was in 1800 secretary to the chartered company which had founded that colony; an ardent philanthropist, he was one of the group who worked for the abolition of the slave trade, and he edited the abolitionist organ, the *Christian Observer*, for many years. Before Thomas was eight years of age he had written a *Compendium of Universal History*, and a romance in the style of Scott, in three cantos, called *The Battle of Cheviot*. A little later he composed a long poem on the history of Olaus Magnus, and a vast pile of blank verse entitled *Fingal, a Poem in Twelve Books*. Young Macaulay was sent to a private school, then, in October 1818, he went to Trinity college, Cambridge, where he afterwards became a fellow. He gained in 1824 a college prize for an essay on the character of William III. He also won a prize for Latin declamation and a Craven scholarship, and wrote the prize poems of 1819 and 1821.

In 1826 Macaulay was called to the bar and joined the northern circuit. But he spent many more hours under the gallery of the house of commons than in the court. His first public speech, made at an anti-slavery meeting in 1824, was described by the *Edinburgh Review* as "a display of eloquence of rare and matured excellence." In Aug. 1825 began Macaulay's connection with the *Edinburgh Review*, which was at this time an organ of the growing opinion which leant towards reform, and a literary tribunal from which there was no appeal. His essay on Milton (Aug. 1825), so crude that the author afterwards said that "it contained scarcely a paragraph such as his matured judgment approved," established at once his great literary reputation. The sudden blaze of popularity kindled by this single essay, is partly to be explained by the dearth of literary criticism in England at that epoch. For, though a higher note had already been sounded by Hazlitt and Coleridge, the public mind was still satisfied with the feeble appreciations of the *Retrospective Review*, or the dashing and damnatory improvisation of Wilson in *Blackwood* or Jeffrey in the *Edinburgh*. Still it seems surprising that a social success so signal should have been the consequence of a single article. The explanation is that the writer of the article on Milton was also a brilliant talker. At the university Macaulay had been pre-eminent for inexhaustible talk and genial companionship among a circle of such brilliant young men as Charles Austin, Romilly, Praed and Villiers. He now displayed these gifts on a wider stage. He was courted and admired by the most distinguished personages of the day. He was admitted at Holland House, where Lady Holland listened to him with deference, and scolded him with a circumspection which was in itself a compliment. Samuel Rogers spoke of him with friendliness and to him with affection.

Macaulay now began to aspire to a political career. But commercial disaster fell on the house of Babington and Macaulay, and the son saw himself compelled to work for his livelihood. His Trinity fellowship of £300 a year expired in 1831; he could make at most £200 a year by writing; and a commissionership of bankruptcy, which was given him by Lord Lyndhurst in 1828 was swept away in 1830. Macaulay was reduced to such straits that he had to sell his Cambridge gold medal In Feb. 1830 he entered the House of Commons for the "pocket borough" of Calne, offered to him by Lord Lansdowne. The offer was accompanied by the express assurance that the patron had no wish to interfere with Macaulay's freedom of voting. Macaulay made his maiden speech on April 5, 1830, on the second reading of the bill for the Removal of Jewish Disabilities. In June the king died and parliament was dissolved; the revolution took place in Paris. Macaulay, who was again returned for Calne, visited Paris, eagerly enjoying a first taste of foreign travel. On March 1, 1831 the Reform Bill was introduced, and on the second night of the debate Macaulay made the first of his reform speeches, of which Sir Robert Peel said that "portions were as beautiful as anything I have ever heard or read." On the triumph of Earl Grey's cabinet, and the passing of the Reform Act in June 1832, Macaulay, whose eloquence had signalized every stage of the conflict, became one of the commissioners of the board of control, and applied himself to the study of Indian affairs. Giving his days to India and his nights to the House of Commons, he could only devote a few hours to literary composition by rising at five in the morning. Between Sept. 1831 and Dec. 1833 he furnished the *Edinburgh Review* with eight important articles, besides writing his ballad on the Armada.

In the first Reform parliament, Jan. 1833, Macaulay took his seat as one of the two members for the new borough of Leeds. He replied to O'Connell in the debate on the address, meeting the great agitator with high, but not intemperate, defiance. In July he defended the Government of India bill in a speech of great power, and he was instrumental in getting the bill through committee without unnecessary friction. When the abolition of slavery came before the house as a practical question, Macaulay had the prospect of having to surrender office or to vote for a modified abolition, *viz.*, twelve years' apprenticeship, which was proposed by the ministry, but condemned by the abolitionists. He placed his resignation in Lord Althorp's hands, and spoke against the ministerial proposal. But the sense of the house was so strongly expressed as unfavourable that, finding they would be beaten if they persisted, the ministry gave way and reduced apprenticeship to seven years, a compromise which the abolition party accepted; and Macaulay remained at the board of control. He then (1834) accepted a seat in the supreme council of India, created by the new India act. The salary of the office was fixed at £10,000, out of which he calculated to be able to save £30,000 in five years.

Macaulay's appointment to India occurred at the critical moment when the government of the company was being superseded by government by the crown. At this juncture there was more need of statesmanship directed by general liberal principles than of a practical knowledge of the details of Indian administration. The part he took in India has been described as "the application of sound liberal principles to a government which had till then been jealous, close and repressive." He vindicated the liberty of the press; he maintained the equality of Europeans and natives before the law; and as president of the committee of public instruction he inaugurated the system of national education. Macaulay was appointed president of a commission to inquire into Indian jurisprudence. The draft of a penal code which he submitted became the basis of the Indian criminal code.

In 1838 Macaulay and his sister Hannah, who had married Charles Trevelyan in 1834, returned to England. He at once entered parliament as member for Edinburgh. In 1839 he became secretary for war, with a seat in the cabinet in Lord Melbourne's ministry. His acceptance of office diverted him for a time from prosecuting the plan he had already formed of a great historical work. But in less than two years the Melbourne ministry fell. In 1842 appeared his *Lays of Ancient Rome*, and in the next year he collected and published his *Essays*. He returned to office in 1846, in Lord John Russell's administration, as paymaster general. In the sessions of 1846–47 he spoke only five times, and at the general election of July 1847 he lost his seat for Edinburgh. The balance of Macaulay's faculties had now passed to the side of literature. At an earlier date he had relished crowds and the excitement of ever new faces; as years went forward, and absorption in the work of composition took off the edge of his spirits, he recoiled from publicity.

He retired into private life with a sense of relief. He gradually withdrew from general society, but he still enjoyed close and constant intercourse with a circle of the most eminent men that London then contained. At that time social breakfasts were in vogue. Macaulay himself preferred this to any other form of entertainment. Of these brilliant reunions nothing has been preserved beyond the names of the men who formed them—Samuel Rogers, Henry Hallam, Sydney Smith, Lord Carlisle, Lord Stanhope, Nassau Senior, Charles Greville, Henry Hart Milman, Sir Anthony Panizzi, G. C. Lewis, Van de Weyer. His biographer thus describes Macaulay's appearance and bearing in conversation: "Sitting bolt upright, his hands resting on the arms of his chair, or folded over the handle of his walking-stick, knitting his eyebrows if the subject was one which had to be thought out as he went along, or brightening from the forehead downwards when a burst of humour was coming, his massive features and honest glance suited well with the manly sagacious sentiments which he set forth in his sonorous voice and in his racy and intelligible language. To get at his meaning people had never the need to think twice, and they certainly had seldom the time."

In these years he was working with unflagging industry at the composition of his *History*. His composition was slow, his corrections both of matter and style endless; he spared no pains to ascertain the facts. He sacrificed to the prosecution of his task a political career, house of commons fame, the allurements of society. The first two volumes of the *History of England* appeared in Dec. 1848. The success was in every way complete beyond expectation. The sale of edition after edition, both in England and the United States, was enormous.

In 1852, when his party returned to office, he refused a seat in the cabinet, but the city of Edinburgh returned him at the head of the poll at the general election in July of that year. He had hardly accepted the summons to return to parliamentary life before fatal weakness betrayed itself in deranged action of the heart; from this time forward till his death his strength continued steadily to sink. He was oppressed by the thought that the great work to which he had devoted himself would remain a fragment. Once again, in June 1853, he spoke in parliament, and with effect, against the exclusion of the master of the rolls from the house of commons, and at a later date in defense of competition for the Indian civil service. But he was aware that he made these efforts at the cost of more valuable work.

In Nov. 1855 volumes iii and iv of the *History* appeared and obtained a vast circulation. Within a generation of its first appearance more than 140,000 copies of the *History* were printed and sold in the United Kingdom alone; and in the United States the sales were on a correspondingly large scale. The *History* was translated into German, Polish, Danish, Swedish, Hungarian, Russian, Bohemian, Italian, French, Dutch and Spanish. Flattering marks of respect were heaped upon the author by foreign academies. His pecuniary profits were (for that time) on a scale commensurate with the reputation of the book: the cheque he received for £20,000 has become a landmark in literary history.

In May 1856 he quitted the Albany, in which he had passed 15 happy years, and went to live at Holly Lodge, Campden Hill,·then, before it was enlarged, a tiny bachelor's dwelling, but with a lawn whose unbroken slope of verdure gave it the air of a considerable country house. In the following year (1857) he was raised to the peerage by the title of Baron Macaulay of Rothley. But his health was every year visibly failing. In the house of lords he never spoke. Gradually he had to acquiesce in the conviction that his physical energies would not carry him through the reign of Anne; and, though he brought down the narrative to the death of William III, the last half volume wants the finish and completeness of the earlier portions. He died on Dec. 28, 1859. On Jan. 9, 1860, he was buried in Westminster abbey.

Lord Macaulay never married. A man of warm domestic affections, he found their satisfaction in the attachment and close sympathy of his sister Hannah, the wife of Sir Charles Trevelyan, Her children were to him as his own. Macaulay was a steadfast friend, and no act inconsistent with the strictest honour and integrity was ever imputed to him. When a poor man, and when salary was of consequence to him, he twice resigned office rather than make compliances for which he would not have been severely blamed. In 1847, when his seat in parliament was at stake, he would not be persuaded to humour, to temporize, even to conciliate. He had a keen relish for the good things of life. and desired fortune as the means of obtaining them; but there was nothing mercenary or selfish in his nature. When he had raised himself to opulence, he gave away with an open hand, not seldom rashly. His last act was to write a letter to a poor curate enclosing a cheque for £25. The purity of his morals was not associated with any tendency to cant.

The life of Macaulay was eminently happy. Till the closing years (1857–59), he enjoyed life with the full zest of healthy faculty, happy in social intercourse, happy in the solitude of his study, and equally divided between the two. For the last 15 years of his life he lived for literature. His writings were remunerative to him far beyond the ordinary measure, yet he never wrote for money. He lived in his historical researches; his whole heart and interest were unreservedly given to the men and the times of whom he read and wrote. His command of literature was imperial. Beginning with a good classical foundation, he made himself familiar with the imaginative, and then with the historical, remains of Greece and Rome. He went on to add the literature of his own country, of France, of Italy, of Spain. He learned Dutch enough for the purposes of his history. He read German, but for literature of the northern nations he had no taste, and of the erudite labours of the Germans he had little knowledge and formed an inadequate estimate. The range of his survey of human things had other limitations more considerable still. All philosophical speculation was alien to his mind; nor did he seem aware of the degree in which such speculation had influenced the progress of humanity. A large—the largest—part of ecclesiastical history lay outside his historical view. Of art he confessed himself ignorant and even refused a request to furnish a critique on Swift's poetry to the *Edinburgh* ***Review.*** He declared that Lessing's *Laocoon*, or Goethe's criticism on Hamlet, "filled" him "with wonder and despair."

Of the marvellous discoveries of science which were succeeding each other day by day he took no note; his pages contain no reference to them. It has been told already how he recoiled from the mathematical studies of his university. These deductions made, the circuit of his knowledge still remains very wide—as extensive perhaps as any human brain is competent to embrace. His literary outfit was as complete as has ever been possessed by any English writer; and, if it wants the illumination of philosophy, it has an equivalent resource in a practical acquaintance with affairs, with administration, with the interior of cabinets, and the humour of popular assemblies. Nor was the knowledge merely stored in his memory; it was always at his command. Whatever his subject, he pours over it his stream of illustration, drawn from the records of all ages and countries. His *Essays* are not merely instructive as history; they are, like Milton's blank verse, freighted with the spoils of all the ages. As an historian Macaulay has not escaped the charge of partisanship. He was a Whig; and in writing the history of the rise and triumph of Whig principles in the latter half of the 17th century he identified himself with the cause. But the charge of partiality, as urged against hfacaulay, means more than that he wrote the history of the Whig revolution from the point of view of those who made it. When he is describing the merits of friends and the faults of enemies his pen knows no moderation. He has a constant tendency to glaring colours, to strong effects, and will always be striking violent blows. He is not merely exuberant but excessive. There is an overweening confidence about his tone; he expresses himself in trenchant phrases, which are like challenges to an opponent to stand up and deny them. His propositions have no qualifications. Uninstructed readers like this assurance, as they like a physician who has no doubt about their case. But a sense of distrust grows upon the more circumspect reader as he follows page after page of Macaulay's categorical affirmations about matters which our own experience of life teaches us to be of a contingent nature. We inevitably think of a saying attributed to Lord Melbourne: "I wish I were as cocksure of any one thing as Macaulay is of everything" Macaulay's was the mind of the advocate, not of the philosopher; it was the mind of Bossuet, which admits no doubts or reserves itself and tolerates none in others, and as such was disqualified from that equitable balancing of evidence which is the primary function of the historian. (M. PA.; X.)

Macaulay's whale works were collected in 1866 by his sister, Lady Trevelyan, in 8 vols. The first four volumes are occupied by the *History;* the next three contain the *Essays,* and the *Lives* which he contributed to the *Encyclopædia Britannica.* In vol. viii are collected his *Speeches,* the *Lays of Ancient Ronze,* and some miscellaneous pieces. The "life" by Dean Milman, printed in vol. viii of the edition of 1858–1862, is prefixed to the "Peopleis Edition," 4 vol. (1863–1864). Longmans, Green & Co. published a complete edition, the "Albany," in 12 vol., in 1898. There are numerous editions of the *Critical and Historical Essays,* separately and collectively; they were edited in 1903 by F. C. Montagu.

The Life and Letters of Lord Macaulay, 2 vol. (1876), by his nephew, Sir George Otto Trevelpan, is one of the best biographies in the English language. His long correspondence with T. F. Ellis, which was utilized by Trevelyan in preparing the life, but only in part, was presented by Ellis's grandson to Trinity college, Cambridge, together with some unpublished poems and translations. The life (1882) in the "English Men of Letters" series was written by J. Cotter Morison. For further criticism, *see* Hepworth Dixon, in his *Life of Penn* (1841); John Paget, *The New Examen: Inquiry into Macaulay's History* (1861) and *Paradoxes and Puzzles* (1874); Walter Bagehot, in the *National Review* (Jan. 1856), reprinted in his *Literary Studies* (1879); James Spedding, *Evenings with a Reviewer* (1881), discussing his essay on Bacon; Sir L. Stephen, *Hours in a Library,* vol. ii (1892); Lord Morley, *Critical Miscellanies* (1877), vol. ii; Lord Avebury, *Essays and Addresses* (1903); Thum, *Anmerkungen zu Macaulay's History of England* (1882). A bibliography of German criticism of Macaulay is given in G. Korting's *Grd. der engl. Literatur,* 4th ed. (1905).

McAULEY, CATHERINE ELIZABETH (1787–1841), foundress of the Sisters of Mercy: was born in County Dublin, Ire., Sept. 29, 1787. The McAuley children, orphaned at an early age, were entirely dcpcndent on Protestant relatives, but Catherine could not be induced to join in Protestant worship. Left a small fortune, she invested it in a large building on Lower Baggot street, Dublin. and on Sept. 24, 1827, opened it as an institution for destitute women, orphans and the poor in need of schools.

At first there was no intention of forming a religious institute, but the work and way of life of Catherine McAuley's group soon led authorities to desire that they join the newly formed Irish Sisters of Charity. This situation was solved by the founding of a new congregation which was to combine the silence and prayer of the Carmelites with the active labours of the Sisters of Charity. The first novices were invested with the habit of the Sisters of Mercy on Dec. 12, 1831. At this same time Catherine McAuley was named superior, an .office she held for the remainder of her life. She died in Dublin on Nov. 11, 1841. Her cause for beatification has been handicapped by the lack of authenticated miracles and primary documents.

McAULIFFE, ANTHONY CLEMENT (1898–), U.S. army officer in the European theatre during World War II, was born in Washington, D.C., July 2, 1898. He graduated from the United States Military academy at West Point in 1919 and was commissioned in the field artillery. After routine service and school appointments during peacetime, McAuliffe served with air-borne troops in World War II. He was acting commander of the 101st air-borne division in Dec. 1944 during the "battle of the bulge," and in this post his stout defense of Bastogne checked the German drive in the Ardennes and contributed to the ultimate German defeat. His terse reply to a German summons to surrender Bastogne—"Nuts!"—became a classic of World War II. During the postwar period, McAuliffe held various command and staff' appointments, ending his military career as commanding general of the 7th army in Germany in 1953–55 and as U.S. army commander in Europe in 1955–56. He retired from the army as a full general on May 31, 1956, to enter industry. (W. R. E.)

MACAW, any of about 18 species of very large, long-tailed, magnificent parrots (*q.v.*) confined to Central and South America, and having brilliant, contrasted colours, naked space around the eye and a powerful hooked beak used to crack very hard palm nuts.

Macaws are named for eating the violet-perfumed oil nuts of the macaw palm (*Acrocomia*) of Brazil. They fly well, have loud, harsh, screaming voices and are popular in zoological gardens. They are gregarious but monogamous. They lay two white eggs in hollow trees. They constitute two genera in the subfamily Psittacinae.

Most species belong to the genus Ara, with naked lores, the important species taking their names from their principal colours. The blue and yellow macaw (*A. ararauna*), eastern Panama to east-central Brazil and northern Paraguay, is blue with yellow-orange underparts; the red, blue and yellow macaw (*A. macao*), 33 in., tropical Mexico to tropical Brazil, is scarlet with blue and yellow on the wings; the red, blue and green macaw (*A. chloroptera*), eastern Panama to the Argentine Chaco and Misiones, is darker red with green instead of yellow on the wing; the green macaw (A. *militaris*), 27 in., tropical Mexico to tropical Bolivia, has blue back, rump, wings and tail. Several species, all extinct, once inhabited Cuba and the Isle of Pines, Martinique, Guadalupe and Jamaica. The little light-green *A. severa,* 17.5 in., lives in northern South America; A. *spixii,* 22 in., of eastern Brazil, is nearly uniform blue. Several other species, nearly uniform cobalt, hyacinthine or greenish blue, belong to the genus *Anodorhynchus,* with feathered lores. The hyacinthine macaw (A. *hyacinthinus*), nearly 3 ft., about ponds in dense forests of interior Brazil, lays its two eggs in a hole excavated in a bank; the green-blue macaw (*A. glaucus*) is found in Paraguay, Uruguay and southeastern Brazil, but the home of the rare Lear's macaw (*A. leari*) of Brazil has not been located. (G. F. Ss.)

MACBETH, king of Scotland (d. 1057), was the son of Findlaech, *mormaer* or hereditary ruler of Moreb (Moray and Ross), who had been murdered by his nephews in 1020. He probably became mormaer on the death of Malcolm, one of the murderers, in 1029, and he may have been one of the chiefs (the Maclbaethe of the Saxon Chronicle) who submitted to Canute in 1031.

Marianus records that in 1040 Duncan, the grandson and successor of Malcolm king of Scotland, was slain by Macbeth. Duncan had shortly before been defeated by Thorfinn, the Norwegian earl of Orkney and Caithness, and it was perhaps this event which tempted Macheth to seize the throne. As far as is known he had no claim to the crown except through his wife Gruach. who appears to have been a member of the royal family. Macbeth was a generous benefactor to the church, and according to S. Berchan, his reign was a time of prosperity. More thnn one attempt was made by members of the Scottish royal family to recover the throne; in 1045 by Crinan, the lay abbot of Dunkeld, son-in-law of Jfalcolm II, and in 1054 by Duncan's son Malcolm with the assistance of Siward, earl of Northumbria, himself a connection of the ousted dynasty. In 1057 Malcolm and Siward again invaded Scotland and defeated Macbeth, who was slain at Lumphanan. Macbeth is chiefly famous as the central figure of Shakespeare's great tragedy.

MACBETH, ROBERT WALKER (1848–1910), British painter, was born at Glasgow on Sept. 30, 1848. He studied art at the Royal Scottish Academy, and in 1871 came to London where he was for some time on the staff of the *Graphic.* Both as painter and etcher he was very popular. He died at Golders Green on Nov. 1, 1910. Among his best-known works are "Dunster Castle" (1895); "The End of a Good Day" (1897); and "Naval Manoeuvres" (1899).

McBRIDE, SIR RICHARD, K.C.M.G., 1912 (1870–1917), Canadian politician, was born at New Westminster on Dec. 15, 1870, and was educated first in that city and later at Dalhousie university. Halifax, Nova Scoria. He was called to the Canadian bar in 1892, and entered the British Columhian parliament as member for Dewdney in 1898. In 1900 he became minister of mines and in 1902 leader of the Opposition. In June 1903 he became prime minister for the province and retained that position until 1915, when he became agent-general for British Columbia in London. He died in London on Aug. 6, 1917.

MACCABEES, the name (in the plural) of a distinguished Jewish family dominant in Jerusalem in the 2nd century B.C., effective in preventing the destruction of Judaism by Hellenism. According to I Macc. ii, 4, the name Maccabee, or Maccabaeus, was originally the distinctive surname of Judas, third son of the Jewish priest Mattathias, who struck the first blow for religious liberty during the persecution under Antiochus IV Epiphanes. Subsequently, however, it obtained a wider significance, having been applied first to the kinsmen of Judas, then to his adherents, and ultimately to all champions of 'religion in the Greek period. It is now customary to apply it only to the sons and descendants of Illattathias. As, however. according to Josephus, this brave priest's great-great-grandfather was called Hasmon. the family is more correctly designated by the name of HASMONAEANS or ASMONEANS. If Maccabee is the original form of the name, it is derived from a Hebrew word which is generally believed to be *maqqabi*, "the hammerer"; hence Judas Maccabee is "Judas the Hammerer," with reference to his beating down the enemies of the Jewish nation. But as Judas was surnamed "the Maccabee" before his military exploits, it is perhaps more probable that the name is derived from the verb *maqab,* "to designate," "to appoint"; hence. "the one appointed [by Yahweh]" (A. Bevan in the Journal of Theological *Studies*, 30:191–193 [1929]).

The Maccabaean revolt was caused by the attempt of Antiochus IV, king of Syria, to force Hellenism upon Judaea (see SELEUCID DYNASTY; ANTIOCHUS). In Dec. 168 sacrifice was offered to Zeus upon an idol altar erected over the great altar of burnt offering. The issue of an edict ordaining the erection of heathen altars in every township of Palestine, and the appointment of officers to deal with recusants, brought matters to a crisis. At Modin, Mattathias, an aged priest, not only refused to offer the first 'sacrifice, but slew an apostate Jew who was about to step into the breach. Having thus given the signal for rebellion, he then with his five sons took to the mountains. Many, including the Hasidim ("the pious"). who had constituted themselves champions of the Law, flocked to his standard. and set themselves to revive Jewish rites and to uproot paganism. In 166 Mattathias died, after nominating Judas as their leader.

The military genius of Judas made this the most stirring chapter in Israelite history. In quick succession he overthrew the Syrian generals Apollonius, Seron and Gogias, and after the regent Lysias had shared the same fate at his hands he restored the Temple worship (165). These exploits dismayed his opponents and kindled the enthusiasm of his friends. When, however, Lysias returned in force to renew the contest. Judas had to fall back upon the Temple mount, and escaped defeat only because the Syrian leader was obliged to hasten back to Antioch in order to prevent a rival from seizing the regency. Under these circumstances Lysias unexpectedly guaranteed to the Jews their religious freedom (162). But though they had thus gained their end, the struggle did not cease. The Hasidim indeed were satisfied, and declined to fight longer, but the Maccabees determined not to desist until their nation was politically as well as religiously free.

In 161 Judas defeated Nicanor at Adasa, but within a few weeks thereafter, in a heroic struggle against superior numbers under Bacchides at Elasa, he was himself cut off. If in his brother Jonathan the cause which Judas had espoused did not possess so brilliant a soldier, it had in him an astute diplomatist who knew how to exploit the internal troubles of Syria. With all his cunning, Jonathan walked into a trap at Ptolemais, was made prisoner and ultimately slain (143). The leadership now devolved upon Simon, the last survivor of the sons of Mattathias, who succeeded in negotiating a treaty whereby the political independence of Judaea was at length secured in May 142. In the following year he was by popular decree invested with absolute powers, being appointed leader, high priest and ethnarch. As these offices were declared hereditary in his family, he became the founder of the Hasmonaean dynasty. The first year of his reign (143–142 B.C.) was made the beginning of a new era; issue of a Jewish coinage betokened the independence of his sovereignty. Under Simon's administration the country enjoyed prosperity! but in 13j he and two of his sons were murdered by Ptolemy, his son-in-law, who had an eye on the supreme power. Simon's third son, John Hyrcanus, warned in time. asserted his rights as hereditary head of the state.

After the death of Antiochus VII Sidetes in 128 left him a free hand. Hyrcanus (135–105) soon carved out for himself a large and prosperous kingdom, which, however, was rent by internal discord owing to the antagonism developed between the rival parties of the Pharisees and Sadducees. Hyrcanus was succeeded by his son Aristobulus, whose reign of but one year was followed by that of his brother, the warlike Alexander Jannaeus (104–78). The new king's Sadducean proclivities rendered him odious to the populace. which rose in revolt, but only to bring upon itself a savage revenge. The accession of his widow, Salome Alexandra (78–69), witnessed a complete reversal of the policy pursued by Jannaeus, for she chose to rule in accordance with the ideals of the Pharisees. Her elder son, Hyrcanus II, a pliable weakling, was appointed high priest; her younger son, the energetic Aristobulus, aho chafed at his exclusion from office, seized 20 strongholds and with an army bore down on Jerusalem. At this crisis Alexandra died, and Hyrcanus agreed to retire in favour of his brother.

A new and disturbing element now entered into Jewish politics in the person of the Idumaean Antipater, who for selfish ends deliberately made mischief between the brothers. An appeal to M. Aemilius Scaurus, who in 65 came into Syria as the legate of Pompey. led to the interference of the Romans, the siege of Jerusalem by Pompey and the vassalage of the Jews. Repeated but fruitless attempts were made by the Hasmonaeans and their patriotic supporters to throw off the Roman yoke. At length, in 40, the Parthians set up as king Antigonus, sole surviving son of Aristobulus. Through the execution of Antigonus by Mark Antony in 37 B.C. the Hasmonaean dynasty became extinct. *See* also JEWS: Greek and *Roman* Conquests; SELEUCID DYNASTY.

Another set of brothers, also called Maccabees (though not so named in II Macc. vii, where their story is given), who were executed because they refused to break the commands of the Jewish Law. were regarded as examples of martyrdom in the early Christian period and are celebrated as saints on Aug. 1 in both the eastern and western churches.

BIBLIOGRAPHY.—I and II Macc. and Josephus are the main sources for the Maccabaean history. *See* also Madden, *Coins of the Jews* (1881); *E.* Beurlier in F. Vigouroux (ed.), *Dictionnaire de la Bible,* vol. iv, cols. 479–488 (1908); C. C. Torrey in T. K. Cheyne and J. S. Black (eds.), *Encyclopaedia Biblica,* vol. iii, cols. 2850–58 (1902); H. MACCABEES, BOOKS OF, the name given to several Apocryphal books of the Old Testament. The Vulgate contains two books of Maccabees declared canonical by the council of Trent (1546) and found among the Apocrypha of the English Bible. Three other books of this name are extant. Book iii. is included in the Septuagint but not in the Vulgate. Book iv. is embraced in the Alexandrian, Sinaitic and other manuscripts of the Septuagint, as well as in some manuscripts of Josephus. A fifth book is contained in the Ambrosian Peshitta, but it seems to be merely a Syriac reproduction of the sixth book of Josephus's history of the *Jewish War*. None of the books of Maccabees are contained in the Vatican (B); all are found in a Syriac recension.

1 *Maccabees* was originally written in Hebrew, but is preserved only in a Greek translation. It probably dates from about the beginning of the 1st century B.C. As it supplies a detailed and accurate record of the 40 years from the accession of Antiochus Epiphanes to the death of Simon (175–13j B.C.), without doubt the most stirring chapter in Jewish history, the book is one of the most precious historical sources we possess. In its careful chronology, based upon the Seleucid era, in the minuteness of its geographical knowledge, in the frankness with which it records defeat as well as victory. in the restraint with which it speaks of the enemies of the Jews, in its command of details, it bears on its face the stamp of genuineness. Although written in the style of the historical books of the Old Testament the work is characterized by a religious reticence which avoids even the use of the divine name, and by the virtual absence of the Messianic hope. The observance of

the law is strongly urged, and the cessation of prophecy deplored (iv. 46; xiv. 41). There is no allusion either to the immortality of the soul or to the resurrection of the dead. Many scholars are of opinion that the unknown author was a Sadducee, but all that can be said with certainty is that he was a Palestinian Jew devotedly attached to the national cause.

2 Maccabees, the epitome of a larger work in five books by one Jason of Cyrene, deals with the same history as its predecessor, except that it begins at a point one year earlier (176 B.C.), and stops short at the death of Nicanor (161 B.C.), thus covering a period of only 15 years. Originally written in excellent Greek, from a pronouncedly Pharisaic standpoint, it was possibly directed against the Hasmonaean dynasty. It shows no sympathy with the priestly class. Both in trustworthiness and in style it is inferior to 1 Maccabees. In spite of its obvious defects, however, it forms a useful supplement to the first book. The writer's interests are religious rather than historical. The eschatology of 2 Maccabees is singularly advanced, for it combines the doctrine of a resurrection with that of immortality. It is worthy of note that the Roman Church finds support in this book for its teaching with reference to prayers for the dead and purgatory (xii. 43 *seq.*). An allusion to Jeremiah as "he who prayeth much for the people and the holy city" (xv. 14) it likewise appeals to as favouring its views respecting the intercession of the saints. Neither of Jason's work nor of the epitomizer's can the precise date be determined. The changed relations with Rome (viii. 10, 36) prove, however, that the latter was written later than 1 Maccabees, and it is equally clear that it was composed before the destruction of Jerusalem A.D. 70.

3 Maccabees, although purporting to be an historical narrative, is really an animated, if somewhat vapid, piece of fiction written in Greek somewhere between 100 B.C. and A.D. 70, and apparently preserved only in part. It has no connection with the Hasmonaeans, but is a story of the deliverance experienced by the Egyptian Jews from impending martyrdom at the hands of Ptolemy IV. Philopator, who reigned in the century previous to the Maccabaean rising (222–205 B.C.). The title is of later origin and rendered possible only by the generalization of the name Maccabees so as to embrace all who suffered for the ancestral faith. The purpose of the writer was evidently to cheer his Egyptian brethren during some persecution at Alexandria. Although the book was favourably regarded in the Syrian it was apparently unknown to the Latin Church. Among the Jews it was virtually ignored.

4 Maccabees differs essentially from the other books of this name. While it does not itself aim at being a history, it makes striking use of Jewish history for purposes of edification. It bears, moreover, a distinctly philosophical character, and takes the form of a "tractate" or discourse, addressed to Jews only, upon "the supremacy of pious reason over the passions." The material is well arranged and systematically handled.

The book is written in a cultured, if somewhat rhetorical, Greek style, and unmistakably coloured by the Stoic philosophy. The four cardinal virtues are represented as forms of wisdom, which again is inseparable from the Mosaic law. That the writer owes no slavish adherence to any philosophical system is plain from his independent treatment of the affections. Although influenced by Hellenism, he is a loyal Jew, earnestly desirous that all who profess the same faith should adhere to it in spite of either Greek allurements or barbaric persecution. It is not to reason as such, but only to *pious* reason (*i.e.,* to reason enlightened and controlled by the divine law), that he attributes lordship over the passions. While in his zeal for legalism he virtually adopts the standpoint of Pharisaism, he is at one with Jewish Hellenism in substituting belief in the soul's immortality for the doctrine of a bodily resurrection. The name of the author is unknown. He was, however, clearly a Hellenistic Jew, probably resident in Alexandria or Asia Minor. The date of composition cannot be definitely fixed. Most likely it is a product of the Herodian period.

5 Maccabees. On this *see* above.

BIBLIOGRAPHY.—C. J. Ball's *Variorum Apocrypha* will be found specially useful by those who cannot conveniently consult the original Greek. Among commentaries see those of C. L. W. Grimm (1853–1857), E. C. Bissell on 1, 2 and 3 Macc. in Lange-Schaff's commentary, 1880 (the whole Apocrypha being embraced in one volume, and much of the material being transferred from Grimm); G. Rawlinson on 1 and 2 Macc. in the *Speaker's Commentary* (1888; much useful matter, but marred by too frequent inaccuracy); Zöckler, on 1, 2 and 3 Macc. (1891; slight and unsatisfactory); W. Fairweather and J. S. Black on 1 Macc., in the *Cambridge Bible for Schools* (1897); E. Kautzsch on 1 and 3 Macc., Kamphausen on 2 Macc., Deissmann on 4 Macc. in *Die Apok. u. Pseudepigr. des Alt. Test.* (1898 ed. by E. Kautzsch, a most serviceable work for the student of apocryphal literature) and Oesterley (1M.), Moffatt (2M.) and Emmet (3M.) in *Apocrypha and Pseudepigrapha* (ed. Charles). Brief but useful introductions to all the four books of Maccabees are given in E. Schurer's *Geschichte des Judischen Volkes im Zeitalter Jesu Christi* (Eng. tr. of earlier edition, 1886–1890).

See also R. H. Charles, *Between the Old and New Testaments,* pp. 198–202, 218 seq. (1914), and A. A. Bevan in *Journ. Theol. Stud.,* Jan. 1929. (W. F.)

MacCARTHY, DENIS FLORENCE (1817–1882), Irish poet, was born in Dublin on May 26, 1817, and educated there and at Maynooth. His earlier verses appeared in *The Dublin Satirist,* and in 1843 he became a regular contributor of political verse to the recently founded *Nation.* He also took an active part in the Irish political associations. In 1846 he edited *The Poets and Dramatists of Ireland* and the *Book of Irish Ballads.* His collected *Ballads, Poems and Lyrics* (1850), including translations from nearly all the modern languages, took immensely with his countrymen on account of their patriotic ring. In 1853 he began a number of translations from the Spanish of Calderon's dramas, which won him a medal from the Royal Spanish Academy. He was granted a civil list pension for his literary services. He died in Ireland on April 7, 1882. His works include *The Bellfounder* (1857); *Under-glimpses* (1857); and *The Early Life of Shelley* (1871).

M'CARTHY, JUSTIN (1830–1912), Irish politician, historian and novelist, was born in Cork on Nov. 22, 1830, and was educated there. He worked on the staff of the *Northern Daily Times* (1853–59); the *Morning Star* (1860–68), being its editor for four years; and the *Daily News* (1870, etc.). He represented Co. Longford in parliament as a Liberal and Home Ruler from 1879 to 1885; North Longford, 1885–86; Londonderry, 1886–92; and North Longford from 1892 to 1900. He was chairman of the Anti-Parnellites from the fall of C. S. Parnell in 1890 until Jan. 1896; but his nationalism was of a temperate and orderly kind, and though his personal distinction singled him out for the chairmanship during the party dissensions of this period, he was in no active sense the political leader. His real bent was towards literature. His earliest publications were novels, some of which, such as *A Fair Saxon* (1873), *Dear Lady Disdain* (1875), *Miss Misanthrope* (1878), *Donna Quixote* (1879), were excellent. His most important work is his *History of Our Own Times* (vols. i.–iv., 1879–80; vol. v., 1897), which treats of the period between Queen Victoria's accession and her diamond jubilee. He also began a *History of the Four Georges* (1884–1901), of which the latter half was written by his son, Justin Huntly M'Carthy (1860–1936), the author of various clever novels, plays, poetical pieces and short histories. Justin M'Carthy died at Folkestone on April 24, 1912. His publications include biographies of Sir Robert Peel (1891), Pope Leo XIII. (1896) and W. E. Gladstone (1898); *Modern England* (1898); *The Reign of Queen Anne* (1902) and *Reminiscences* (2 vols., 1899).

McCLELLAN, GEORGE BRINTON (1826–1885), American soldier, was born at Philadelphia, Pa., on Dec. 3, 1826. He was educated at the University of Pennsylvania Preparatory school, and in July, 1846, graduated from West Point with such high rank that he was attached to the corps of engineers. In September of that year he was despatched to Mexico, where he served under Gen. Winfield Scott and was breveted for gallantry. At the close of the Mexican War he was assigned to West Point as instructor in practical engineering, and in 1851 superintended the construction of Ft. Delaware. In 1852 he served in the Red river expedition, and in 1853–54 was on duty in Washington Territory and Oregon as an engineer officer.

In the spring of 1855 he was directed to visit Europe, with two other officers, and to report upon the art of war. The commission witnessed the siege of Sevastopol, in the Crimea, and visited many countries and military establishments. Upon its return, McClellan not only furnished an able report under the title *Armies of Europe* (republished 1862), but also designed (1856) a saddle which was adopted by the army, and afterwards known as "the McClellan." In Jan. 1857, when captain in the 1st cavalry, he resigned his commission and accepted the position of chief engineer of the Illinois Central railroad. He was later made vice president, and subsequently president, of the Ohio and Mississippi Railroad Company. In May 1860 he married Ellen Mary Marcy, and established his residence at Cincinnati, O., where he was living at the outbreak of the Civil War. Offering his services to the Union, he was commissioned major-general of Ohio Volunteers on April 23, 1861, and on May 4, was made major-general in the army of the United States. He was placed in command of the department of the Ohio, and acting upon his own initiative, on May 26, despatched a small force across the Ohio river at Philippi. He dispersed the Confederates early in June, and, following this success by a rapid advance, secured control of so much territory for the Union cause, that the State of Sliest Virginia was separated from the Old Dominion, of which it had been a component part. This was the first successful campaign in the war between the States, and gave him such immediate popularity that he was dubbed "Little Mac: the Young Napoleon."

On July 22, McClellan was directed to turn over his command to the next in rank and to proceed to Washington, where he arrived July 26, 1861. He was there informed by President Lincoln that he had been placed in charge of the troops at the capital, and was directed speedily to bring order out of chaos. This he did, and the spirit of demoralization which obsessed the Federals after the disastrous defeat at First Bull Run quickly disappeared. With the assistance of his engineers, he soon had a ring of earthen fortifications and redoubts thrown about the city, and by drill and disciplinary measures whipped the raw levies into excellent shape before the spring of 1862. Then the so-called army of the Potomac was transported to Fortress Monroe by steamer, and began an advance upon Richmond by way of the peninsula which lies between the York and James rivers.

The Confederates delayed the march at Big Bethel, Yorktown, and Williamsburg, and although, by May 31, McClellan's forces were within seven miles of the Confederate capital, they were in a very bad strategical position, because the Chickahominy river—with its treacherous swamp land-divided the two wings of the army. To McClellan's great disappointment, the President had detained Gen. McDowell with 40,000 men to cover Washington, which made his numbers about equal to those of the Confederates. Gen. Banks in the Shenandoah valley was watching "Stonewall" Jackson's remarkable "foot cavalry," but by defeating Banks and threatening Washington, Jackson kept McDowell's division from re-enforcing McClellan. Jackson himself joined the Confederates defending their capital. Meanwhile, President Lincoln called Maj.-Gen. John Pope from the West, placing him in command of the combined armies of Banks and Frémont in the valley, and McDowell at Fredericksburg. These forces were advanced towards the Rappahannock.

McClellan was checked at the battle of Seven Pines, or Fair Oaks, where Gen. Johnston, who directed the Confederates, was wounded, and Gen. Robert E. Lee took command of the army. Seeing the advantage of attacking a portion of McClellan's divided detachments, the new commander (with the assistance of Jackson's corps) precipitated a furious assault upon the Union right wing. Then followed the terrible "Seven Days" fighting, in which McClellan was compelled to retreat (June 26 to July 1) to the James river; ending the backward movement and change of base (from White House on the Pamunkey to Harrison's Landing on the James) at hlalvern Hill, under the protection of the Union gunboats. By a petulant telegram (June 28) the defeated commander incurred the everlasting displeasure of the secretary of War, and by an ill-advised letter to the president from Harrison's Bar, engendered a similar feeling among the members of the cabinet. Yet, after his army had been transported to Alexandria and sent to the aid of Pope, who was signally defeated at Cedar mountain and Second Bull Run, so great was the need of his assistance that be was called to Washington by Gen. Halleck (military adviser of the President) and verbally ordered to take charge of all the troops retreating to the city. In this President Lincoln concurred.

The Federals were soon well in hand, but there was immediate work for them to do, as Lee had crossed the Potomac, invaded Maryland and seized Hagerstown and Fredericksburg. McClellan put the Union forces in motion towards the invaders, and on Sept. 13, 1862, had the good fortune to come into possession of an order issued by the Confederate chieftain which had been found by a private of the 27th Indiana Voluntezrs, wrapped securely around three cigars. This fully disclosed his plans. An immediate and rapid advance was ordered; the Confederates were driven through the Blue Ridge at Turner's and Fox's gaps and pursued to Antietam creek, near Sharpsburg, Md., where they offered battle. Although the Confederate army consisted of but 41,500 men, and the Union force was approximately 81,176, McClellan not only fought the battle in detail, engaging not more than two of his six corps simultaneously, but he even held two corps out of the battle almost entirely. On the 18th the Union troops were not permitted to attack, and on the next day Lee safely retreated across the Potomac at Shepherdstown. McClellan's unwillingness to risk battle in spite of superior numbers, coupled with his great delay in following the retreating Confederates so exasperated the authorities in Washington with his conduct of the campaign that he was subsequently removed from the position of commander-in-chief of the army of the Potomac (Nov. 5 1862). Major-Gen. Burnside was appointed to succeed him, and he was never afterwards tendered a command.

In 1864, McClellan became the Democratic presidential candidate upon a platform which denounced the war as a failure and proposed negotiations with the South for peace, but, as a patriotic soldier, he repudiated the platform although accepting the nomination. At the polls Abraham Lincoln was overwhelmingly re-elected president, as a result of which McClellan soon sailed for Europe, after resigning his commission in the army. Upon his return, the former leader took up his residence in New York city, where (1868–69) he was engaged in superintending the construction of an experimental floating battery. In 1871–72 he was engineer-in-chief of the City of New York's department of docks. Removing to Orange, N.J. (1877–81), he was elected governor of New Jersey upon the Democratic ticket. Although offered a second nomination, he refused it, and spent his later years in travelling abroad and preparing his memoirs. He died suddenly of heart disease, on Oct. 29, 1885, at Mayfield, Orange, New Jersey. Bronze equestrian statues at Philadelphia and Washington have been erected to this popular but unfortunate general, who always held the affectionate regard of the enlisted men.

BIBLIOGRAPHY.—Besides *McClellan's Own Story*, published posthumously by W. C. Prime in 1887, Gen. McClellan was the author of *Exploration of the Red River of Louisiana in the year 1852* (1853); *Report on the Several Pacific Railroad Explorations* (1855); *European Cavalry* (1861); *Regulations and Instructions for the Field Service of the U.S. Cavalry in time of war* (1861); *Armies of Europe* (1862); *Manual of Bayonet Exercise* (1862); *Letter to President Lincoln* (1862); *Letter to the Secretary of War* (1862); *Complete Report of the Organization and Campaigns of the Army of the Potomac* (1864); *Letter of Acceptance and West Point Oration* (1864); and *McClellan's Mexican War Diary*, not published until 1917. He wrote also a series of articles on the Russo-Turkish War for *The North American Review*. *See* memoir in the preface of *McClellan's Own Story;* Wakenfield Addey, *Little Mac and How he became a Great General* (1864); P. S. Michie, *General McClellan* in the "Great Commanders" series (1901); J. H. Campbell, *A Vindication of the Military Career of General McClellan* (1916); Capt. T. G. Frothingham, "The Peninsula Campaign" and "The Crisis of the Civil War: Antietam," in *Proceedings of the Massachusetts Historical Society*, vol. lvi. and lvii.

(C. H. L. J.)

McCLERNAND, JOHN ALEXANDER (1812–1900), American soldier and lawyer, was born in Breckinridge county, Ky., on May 30, 1812. He was admitted to the bar in Shawneetown, Ill., in 1832; in the same year served as a volunteer in the Black Hawk War, and in 1835 founded the *Shawneetown Democrat*, which he thereafter edited. As a Democrat he served in 1843–51 and in 1859–61 as a representative in Congress, where in his first term he vigorously opposed the Wilmot Proviso, but in his second term was a strong unionist. He resigned from Congress, raised in Illinois the "McClernand brigade," and was commissioned (May 17, 1861) brigadier-general of volunteers. He was second in command at the battle of Belmont (Missouri) in Nov. 1861, and commanded the right wing at Ft. Donelson. In March 1862 he became a major-general of volunteers. and at Shiloh he commanded a division. Early in January. 1863, at Milliken's Bend. McClernand, who had been placed in command of one of the four corps of Grant's army, superseded Sherman as the leader of the force that was to move down the Mississippi against Vicksburg. On Jan. 11 he took Arkansas Post. During the rest of the Vicksburg campaign there was much friction between McClernand and his colleagues: he undoubtedly intrigued for the removal of Grant: it was Grant's opinion that at Champion's Hill (May 16) he was dilatory; and on June 18 he was relieved of his command. President Lincoln, who saw the importance of conciliating a leader of the Illinois War-Democrats, restored him to his command in 1864. but McClernand resigned in November of that year. He died in Springfield. Ill., on Sept. 20, 1900.

MACCLESFIELD, EARLS OF. CHARLES GERARD. 1st earl of Macclesfield (c. 1618–94). Royalist. of an old Lancashire family. commanded a brigade at Edgehill, and, distinguishing himself at Newbury (1643) and Newark (1644). he was given chief command in Wales. His severity made him unpopular and he was removed. but was retained in command of the king's guard during the march from Wales to Oxford. and thence to Hereford and Chester. In 1645 he was created Baron Gerard of Brandon. Suffolk. but soon after was dismissed for his protest against the supersession of Sir Richard Willis. After the capitulation of Oxford (1646) he went abroad. where he remained until the Restoration. In 1660 he returned at the head of the life guards: his estates were restored and he received a pension. Gerard was created earl of Macclesfield and Viscount Brandon in 1679. but his relations with the duke of Monmouth led to an order for his arrest in 168j. He escaped abroad, but returned with William III in 1688 as commander of his bodyguard. He was made a privy councillor and president of the council of the Welsh marches. 1689. He died on Jan. 7, 1694.

His eldest son. CHARLES. 2nd earl of Macclesfield. (*c.* 1659–1701), born in Paris, was naturalized in England. He was concerned in the intrigues of Monmouth, and in 168j was sentenced to death for complicity in the Rye House plot. but was pardoned. In 1698 hlacclesfield was divorced from his wife Anne. daughter of Sir Richard Mason of Sutton, by act of parliament, the first occasion on which a divorce was so granted without a previous decree of an ecclesiastical court. The countess was the mother of two children. known by the name of Savage. whose reputed father was Richard Savage, 4th Earl Rivers (d. 1712). The poet Richard Savage (*q.v.*), claimed that he was the younger of these children. The 2nd earl was succeeded by his brother, on whose death in 1702 the title became extinct.

In 1721 the title of earl of hfacclesfield was revived in favour of THOMAS PARKER (1667–1732). He became a barrister in 1691, took part in the proceedings against Henry Sacheverell and was appointed lord chief justice in 1710, and in 1718 became lord chancellor. In 1725 he was impeached for corruption, found guilty and heavily fined. He died in 1732.

Macclesfield's only son, George (c. 1697–1764), was celebrated as an astronomer and prominent in introducing the new style of dates (1752). He was president of the Royal society and died on March 17, 1764.

See G. E. C(okayne), *Complete Peerage,* vol. viii, rev. ed. (London, 1932).

MACCLESFIELD, a municipal borough and market and manufacturing town in the Macclesfield parliamentary division of Cheshire, Eng.. 18 mi. south-southeast of hfanchester by road. Pop. (1951) 35,999. Area 7.25 sq.mi. It stands on the Bollin river in a deep gorge with heights up to 1,600 ft. on the east where the bleak upland country retains its ancient name of Macclesfield forest. Steps and terraces connect the low lying Waters Green near the river, where the Barnaby and May fairs are held, with the upper part of the town with its many steep, cobbled streets. The church and town hall crown the hill where gardens are now laid out. St. Michael's church was founded in 1278 by Queen Eleanor and was once connected with the two private chapels of the Savage and Legh families. The Savage chapel belonged to a college of secular priests founded in 1508 by Thomas Savage. A Unitarian chapel. built in 1689. stands behind a lovely wrought iron gate. The King's school was founded in 1502, as a free grammar school, and refounded in 1552. There are also a technical school and a school of art. The museum was built in 1898. The most important industry is silk manufacture; others include cork, paper, shirts, shoes and electrical appliances. Stone is quarried locally.

Before 1066 hlacclesfield was held by Edwin. earl of Mercia; in Domesday Book it is in the lands of the earl of Chester where it remained until 1244 when it lapsed to the crown. The forest remained a royal forest until after the Restoration, but by the 18th century it had been enclosed and cultivated. In 1389 John de Macclesfield obtained permission to fortify his mansion: it was later owned by the duke of Buckingham and then by the earl of Derby: it was destroyed in the Civil War when the town walls also were demolished. The names Jordangate. Chestergate and Wallgate bear witness to the ancient fortifications. The earliest of many charters was granted by Ranulf (or Randulph). earl of Chester. in 1220; in 1261 another, granted by Edward, prince of Wales. constituted Macclesfield a free borough with a merchant guild. In 1684 Charles II issued the last charter which continued until 183j. The markets. first mentioned in 1617. are still flourishing. The charter of Elizabeth I (1564) granted an annual fair in June. and Charles II granted fairs in April and September. The present fairs are held in May and October. hlacclesfield first sent two members to parliament in 1832; in 1880 it was disfranchised and in 1885 it was merged in the county division of hfacclesfield.

The manufacture of silk-covered buttons began in the 16th century and flourished until the early 18th. Charles Roe, who came to hlacclesfield in 1740, introduced silk throwing in 1756, when the first silk mill was erected. and fostered the silk and metal-working industries. By 1790 silk manufacture was being carried on on a large scale and in 1831 the Macclesfield canal. between the Trent and Mersey canal and the Peak Forest canal, was opened. In 184j the railway connected hlacclesfield with Stockport.

McCLINTOCK, SIR FRANCIS LEOPOLD (1819–1907), British naval officer and arctic explorer. who made known the fate of Sir John Franklin's expedition, was born at Dundalk. Ire.. on July 8, 1819. He went to sea at the age of 12 and served in several ships of the Royal Navy before joining the Franklin search expedition of 1848–49 under Sir James Clark Ross. as second lieutenant of the "Enterprise." During his second arctic season (1850–51) as first lieutenant of the "Assistance." and during his third (1852–54) when he commanded the ".Intrepid." he improved on Ross's sledging methods and equipment, and initiated a system of depot laying which resulted in some great man hauling journeys. McClintock's party in the spring of 1853 traveled 1,328 mi. in 105 days. and sledge journeys of comparable length were made in 1854, and during his last searching expedition of 1857–59. Much new coast line was explored, but no traces found of Sir John Franklin (*q.v.*). After many fruitless expeditions. news of the fate of the lost party was obtained in 1854 by John Rae from the Eskimo of Boothia peninsula. The government refused to equip another expedition, so Lady Franklin sent McClintock in the "Fox" to King William Island, off which Franklin's ships, the "Erebus" and "Terror." had been beset. Through him the fate of the expedition was made known and many relics discovered. including a record left on the island. These relics and McClintock's own papers are in the National Maritime museum. He died on Nov. 17, 1907.

Markham, *Life of Admiral Sir Leopold M'Clintock* (1909); and his own *Voyage of the "Fox" in the Arctic Seas* (1859) and "Reminiscences of Arctic Ice-Travel." *Journal of the Royal Dublin Society* (Feb. 1857); R. J. Cyriax, *Sir John Franklin's Last Arctic Expedition* (1939). (A. M. Ss.)

McCLINTOCK, JOHN (1814–1870), U.S. Methodist Episcopal theologian and educator! an able preacher, orator and teacher. and a versatile scholar. was born in Philadelphia. Pa.. on Oct. 27, 1814. After his graduation from the University of Pennsylvania in 183j he taught in Dickinson college for 12 years. He edited the *Methodist Quarterly Review* (1848–56), and in 1867, at the wish of Daniel Drew, became president of the newly established Drew Theological seminary at Madison, N.J., where he died on March 4. 1870.

McClintock by his editorial and educational work probably did more than any other man to raise the intellectual level of American Methodism. He put into practice the scholarly methods of the new German theology of the day, not alone by his translation with Charles E. Blumenthal of Neander's *Life of Christ* (1847), and of Bungener's *History of the Council of Trent* (1855), but by his own noteworthy project, McClintock and Strong's *Cyclopaedia oj Biblical Theological and Ecclesiastical Literature* (1867–81; supplement, 1885–87). Among McClintock's other publications are *Sketches of Eminent Methodist Ministers* (1853). *Living Words* (1871) and *Lectures on Theological Encyclopaedia and Methodology* (1873).

See G. R. Crooks, *Life and Letters of the Rev. Dr. John McClintock* (1876)

McCLOSKEY, JOHN (1810–1885), U.S. Roman Catholic archbishop of New York, the first C.S. cardinal, was born in Brooklyn, N.Y.. March 10, 1810. Educated at Mount St. Mary's college, Emmitsburg. Md., he was ordained a priest in 1834, spent two years in graduate study at the Gregorian university in Rome. and returned to New York city in 1837 as rector of St. Joseph's church. In 1841 he organized and became first president of St. John's college (later Fordham university). After serving from 1844 to 1847 as bishop coadjutor to Bishop John Hughes of New York, he became first ordinary of the newly created see of Albany, N.Y. Succeeding to the archbishopric of New York in 1864, he renewed construction of St. Patrick's cathedral, suspended during the Civil War. and dedicated the edifice on May 25. 1879 Elevated to the cardinalate in 1875, he journeyed to Rome in 1878 but arrived too late to attend the conclave that elected Pope Leo XIII. He died in New York on Oct. 10, 1885.

See J. M. Farley, *The Life of John Cardinal McCloskey* (1918). (J. A. Rs.)

McCLURE, SIR ROBERT JOHN LE MESURIER (1807–1873), British arctic explorer who commanded the first expedition to complete the Northwest passage, though Sir John Franklin was later credited with its discovery, was born at Wexford. Ire., on Jan. 28, 1807. He joined Sir George Back's arctic expedition of 1836–37, and the Franklin search expedition of 1848–49 under Sir James Clark Ross. In 1850, McClure. commanding H.M.S. "Investigator," accompanied Sir R. Collinson, in H.M.S. "Enterprise," to search again for Franklin's lost expedition. "Investigator" preceded "Enterprise" through Bering strait and discovered a northwest passage, finding one route through Prince of Wales strait and another round Banks Island. Having abandoned ship off Banks Island, the expedition joined the "Resolute" and "Intrepid" of the search expedition commanded by Horatio Austin, at Melville Island. These ships were in turn abandoned, and McClure's party went on foot to Beechey Island and thence home by ship in 1854. *(See* also ARCTIC, *THE.)* McClure died in London on Oct. 17, 1873.

BIBLIOGRAPHY.—George Back, *Narrative* . . . (1838); Sherard Osborn, *The Discovery of a Northwest Passage* (1856); Alexander Armstrong, *A Personal Narrative of the Discovery of the North-West Passage* (1857); *R.* McClure, *Voyages* . . . , 2 vol. (1884). (A. M. Ss.)

McCONNELL, FRANCIS JOHN (1871–1953), U.S. Methodist bishop, was born at Trinway, Ohio, Aug. 18, 1871. He graduated at Ohio Wesleyan university and later studied at Boston university. In 1894 he entered the Methodist ministry and was pastor successively at Chelmsford, Newton Upper Falls, Ipswich and Cambridge, all in Massachusetts, and in 1903–09 at the New York Avenue Methodist church in Brooklyn. From 1909 to 1912 he was president of De Pauw university. He was elected bishop in 1912 and served for a number of years in Mexico and afterward in the Pittsburgh district. In the latter region he entered actively into a study of industrial conditions and problems. As chairman of the Commission of Inquiry appointed by the Interchurch World Movement organization he pushed the investigation resulting in the *Report on the Steel Strike of 1919* which was influential in abolishing the 12-hour day and seven-day week in the steel industry He wrote many books, among which are *Personal Christianity* (1914); *Christianity and Coercion* (1933); *John Wesley* (1939); and *Evangelicals, Revolutionists and Idealists* (1942). Bishop McConnell retired in 1944 and died at Lucasville. Ohio. on Aug. 18. 1953

McCOOK, ALEXANDER McDOWELL (1831–1903), U.S. soldier, was born in Columbiana county. O.. on April 22, 1831. He graduated at the U.S. military academy in 1852, served against the Apaches and Utes in New Mexico in 1853–57, and in April 1861 became colonel of Ohio volunteers. He served in the first battle of Bull Run; commanded a brigade in Kentucky in the winter of 1861, a division in Tennessee and Mississippi early in 1862. and the 1st corps in Kentucky in October of the same year; was in command of Nashville in November and December of that year: and was then engaged in Tennessee until after the battle of Chickamauga. He retired in 1895, a major-general.

His father, DANIEL MCCOOK (1798–1863), killed at Buffington's island during Gen. John H. Morgan's raid in Ohio, and seven of his eight brothers (three of whom were killed in battle) all served in the Civil War; this family and that of John McCook (1806–1865). Daniel's brother. who served as a volunteer surgeon in the Civil War, are known as the "fighting McCooks"—four of John's sons served in the army and one in the navy.

McCORD, LOUISE SUSANNA CHEVES (1810–1879), U.S. author, daughter of Langdon Cheves and Mary Elizabeth Dulles Cheves, was born Dec. 3, 1810, in Charleston, S.C. A member of a colonial family, her ancestry was Scotch, Irish and Huguenot. In her early years in South Carolina Louise McCord studied French and music for young girls. Her education was continued at Grimshaw's school in Philadelphia Before her formal presentation to society in Philadelphia and Washington, D.C., native linguists were employed to perfect her in the languages. Later, under tutors selected for her brothers, she studied mathematics and kindred branches.

In association with her father and his intimate circle of public men of the state, Miss Cheves became deeply interested in the history of the U.S. Her attitude toward slavery was that the Negro was being civilized in his contact with the white Christian races of the United States. She contributed political and other essays to the *Southern Quarterly Review* in 1853 and, in 1848, published a translation of Frederic Bastiat's *Sophismes Economiques*, which influenced all of her views. Other literary efforts included a volume of poems, My *Dream*, and a five-act, blank verse drama, *Gaius Gracchus.* In 1840 Louise Cheves was married to David James McCord, a lawyer of distinction. After his death she spent two years abroad and, on her return, made her home in Columbia, S.C. During the Civil War Mrs. McCord was active in relief work; on the death of her son, Capt. Langdon Cheves McCord, in the 2nd battle of Manassas. she gave much of her time to nursing sick soldiers and other hospital work. After the Civil War Mrs. McCord removed to Charleston, S.C., where she died in Nov. 1879. She was buried with honours in Magnolia cemetery of that city.

See C. A. Mauchope, *The Writers of South Carolina* (1910); *Library of Southern Literature* (vol. viii, 1907); *Dictionary of Anzerican Biography* (vol. xi). (*E.* Row)

MacCORMAC, SIR WILLIAM, BART. (1836–1901), Irish surgeon. was born at Belfast on Jan. 17, 1836. He studied at Belfast, Dublin and Paris. After practice in Belfast and war service in France (1870) and Serbia (1876) he became (1881) assistant surgeon at St. Thomas's hospital, London. He was one of the first to apply Listerian methods in surgery and was a pioneer in operating for intraperitoneal rupture of the bladder (1886). He was president of the Royal College of Surgeons no less than five times. In 1897 he was surgeon-in-ordinary to the prince of Wales. In 1899 he was Hunterian orator. He died at Bath on Dec. 4, 1901.

McCORMACK, JOHN (1884–1945), tenor, was born at Athlone, Eire, on June 14, 1884. At the age of nine he faced his first audience when he sang at the Marists Brothers school. He was educated at Summerhill college, Co. Sligo. He won the prize at the Irish music festival, *Feis* Ceoil, and went to the U.S. on a short singing tour, returning to Dublin to sing before going to Italy where he studied under Sabatini. At his second attempt Cleofonte Campanini gave him his opportunity at Covent Garden, where he made his début in *Cavalleria Rusticana,* Oct. 15, 1907, his success the following year leading to presentation to King Edward and Queen Alexandra. Oscar Hammerstein engaged him for the Manhattan Opera house where he made his New York début in *Traviata,* Nov. 10, 1909. He afterward sang with the Chicago-Philadelphia Opera company, the Chicago Grand Opera company and the Metropolitan Opera company. In 1911 he toured Australia with Melba in Italian opera. After two further operatic seasons in the U.S., 1912, and Australia, 1913, he turned to the concert stage where he achieved extraordinary popularity as a ballad singer. He became a citizen of the United States in 1919. In 1921 he was made Knight commander of the orders of St. Gregory the Great and of the Holy Sepulchre by Pope Benedict XV, and in 1928 he was made a count in the papal peerage. McCormack died Sept. 16, 1945, in Dublin.

McCORMICK, CYRUS HALL (1809–1884), U.S. inventor of grain-harvesting machinery, was born in Rockbridge Co. (Va.), U.S.A., on Feb. 15, 1809. His father was a farmer who had invented numerous labour-saving devices for farm-work, but after repeated efforts had failed in his attempts to construct a successful grain-cutting machine. In 1831, Cyrus, then 22 years old; took up the problem, and after careful study constructed a machine which was successfully employed in the late harvest of 1831 and patented in 1834. The McCormick reaper, after further improvements, proved a complete success; and in 1847 the inventor removed to Chicago, where he manufactured his machines. He died in Chicago on May 13, 1884.

BIBLIOGRAPHY.—Herbert N. Casson, *Cyrus Hall McCormick: His Life and Work* (1909); W. T. Hutchinson, *Cyrus Hall McCormick,* vol. i, *Seed-Time 1809–1856* (1930), vol. ii, *Harvest 1856–1884* (1935); Cyrus McCormick, *The Century of the Reaper* (1931).

McCORMICK, ROBERT RUTHERFORD (1880–1955), G.S. publisher, editor and soldier, was born in Chicago, Ill., July 30, 1880. His father was a U.S. diplomat, his mother a daughter of Joseph Medill, editor and proprietor of *The Chicago Tribune.*

A graduate of Yale university (1903) and Northwestern university law school, Chicago (1906), McCormick was admitted to the bar in 1908. He served as a Chicago alderman, 1904, and president of the Sanitary District board, 1905–1910. As a staff and combat officer with the American expeditionary force (1917–18) McCormick was awarded the U.S. distinguished service medal.

McCormick was named president of the Tribune company in 1911, and with his cousin, Joseph Medill Patterson (*q.v.*), shared the functions of publisher and editor of *The Chicago Tribune* from 1914 until 1925 when he became sole editor and publisher. Under his direction the *Tribune* came to lead the U.S. in standard-size newspaper circulation and the world in newspaper advertising revenue. He built Tribune enterprises to include forest lands. paper mills, hydroelectric installations and shipping companies as well as major publishing, radio and television facilities. Tribune editorial policies voiced outspoken opposition to Prohibition, the Roosevelt and Truman administrations and U.S. political involvement in overseas conflicts. From 1925 until his death April 1, 1955, at Wheaton, Ill., McCormick was among the most powerful and controversial figures in U.S. journalism. A staunch advocate of constitutional liberties, McCormick was the author of historical works, numerous pamphlets, and public and radio addresses.

(F. C. CN.)

McCOSH, JAMES (1811–1894), Scottish minister and philosophical writer, born in Ayrshire. on April 1, 1811. He was president of the College of New Jersey, Princeton (1868–88). He died on Nov. 16, 1894.

His chief works are: *Method of Divine Government, Physical and Moral* (1850); *The Typical Forms and Special Ends in Creation* (1855); *Intuitions of the Mind Inductively Investigated* (1860); *An Examination of Mr. J. S. Mill's Philosophy* (1866).

McCOY, SIR FREDERICK (1823–99), British paleontologist, the son of Simon McCoy, was born in Dublin in 1823, and was educated for the medical profession. In collaboration with A. Sedgwick he prepared *A Synopsis of the Classification of the British Palaeozoic Rocks, With a Systematic Description of the British Palaeosoic Fossils in the Geological Museum of the University of Cambridge* (1855). After four years in Belfast he became professor of natural science in the University of Melbourne, where he lectured for more than 30 years. He established the National Museum of Natural History and Geology in Melbourne, of which he was director; and becoming associated with the geological survey of Victoria as paleontologist, he issued a series of decades entitled *Prodromus* of *the Palaeontology of Victoria.* He also issued the *Prodromus of the Zoology of Victoria.* He was elected a fellow of the Royal society in 1880 and created companion of the Order of St. Michael and St. George in 1886 and knight commander of the Order of St. Michael and St. George in 1891. He died in Melbourne on May 16, 1899.

MACCULLOCH, HORATIO (1805–1867), Scottish landscape painter, was born in Glasgow. He studied for a year under John Knox, a Glasgow landscape-painter, was then engaged at Cumnock to paint the ornamental lids of snuff-boxes, and afterwards went to Edinburgh where Lizars, the engraver, employed him to colour book illustrations. At Glasgow he was employed to paint several large pictures for the decoration of a public hall in St. George's place. MacCulloch's works form an interesting link between the old world of Scottish landscape and the new. From 1829 he exhibited regularly in the Royal Scottish academy's exhibition till his death on June 24, 1867.

A volume of photographs from his landscapes, with a biographical notice by Alexander Fraser was published in Edinburgh in 1872.

McCULLOCH, HUGH (1808–1895), U.S. financier, was born at Kennebunk (Me.) Dec. 7, 1808. He was educated at Bowdoin college, studied law in Boston, and in 1833 began practice at Ft. Wayne (Indiana). He was cashier and manager of the Ft. Wayne branch of the old state bank of Indiana from 1835 to 1857, and president of the new state bank from 1857 to 1863. He was selected by Secretary Chase as comptroller of the currency in 1863 to put the new National Banking act of 1862 into operation. He was appointed secretary of the treasury by President Lincoln in 1865, and was continued in office by President Johnson until the close of his administration in 1869. In accordance with his suggestion, an act was passed (March 12, 1866), authorizing the withdrawal from circulation of greenbacks as a preliminary to the resumption of specie payments, but it met with strong opposition and was repealed on Feb. 4, 1868, after only $48,000,000 had been withdrawn. McCulloch went to England, and spent six years (1870–76) as a member of the banking firm of Jay Cooke, McCulloch and Co. From Oct. 1884 until the close of President Arthur's term of office in March 1885 he was again secretary of the treasury.

He died at his home near Washington (D.C.) May 24, 1895.

M'CULLOCH, SIR JAMES (1819–1893), Australian statesman, was born in Glasgow. He went to Melbourne to open a branch of Dennistoun Brothers. In 1854 he was nominated to the legislative council, and was returned for Wimmera in the legislative assembly. In 1857–58 he was minister of trade and customs, and in 1859–60, treasurer. On the defeat of the third O'Shanassy ministry in June 1862 he became premier and chief secretary. M'Culloch's ministry was involved in a struggle with the council, over the ministerial policy of protection. A tariff was tacked to an appropriation bill, which the council rejected three times. M'Culloch had the support of Australia, and of the governor, Sir Charles Darling, who was recalled by the home government for partisanship. A long and bitter struggle between the two chambers over a grant of £20.000 to Lady Darling, which was also tacked to an appropriation bill, ended in 1868 when M'Culloch, who had resigned, resumed office with different colleagues. He resigned in 1869, when he was knighted, but formed a third ministry in 1870. In June 1871 he resigned again and held the office of agent-general for Victoria in London until 1873, was created K.C.M.G. in 1874 and, returning to the colony, formed his fourth ministry in 1875. After his defeat in 1877 he returned to England, where he died at Ewell, Surrey, on Jan. 30, 1893.

MACCULLOCH, JOHN (1773–1835), Scottish geologist, was born in Guernsey. Graduating at Edinburgh in 1793 as M.D. he became chemist to the Board of Ordnance in 1803, and in 1814 was appointed geologist to the trigonometrical survey. Two years later he became president of the Geological society, and in 1820 was elected F.R S. His chief work was carried out in Scotland, where he examined the structure of the range of western islands. His geological map of Scotland was published soon after his death on Aug. 21, 1835.

M'CULLOCH, JOHN RAMSAY (1789–1864), British economist and statistician, was born at Whithorn, Wigtownshire, on March 1, 1789. In 1818–19 he edited the *Scotsman.* His articles on economic questions in that paper and in various reviews, and the publication of his *Principles of Political Economy* (1825) led to his appointment in 1828 as professor of political economy at London university. He held this office until 1832, and in 1838 became comptroller of H.M. Stationery Office, where he introduced useful reforms. M'Culloch died in London on Nov. 11, 1864. He was intimate with John Stuart Mill and his circle, but remained a Whig pure and simple. His *Dictionary of Commerce and Commercial Navigation* (1832) and his *Statistical Account of the British Empire* (1837) are monumental.

McCULLOUGH, JOHN EDWARD (1837–1885), American actor, was born in Coleraine, Ireland, on Nov. 2. 1837. He went to America at the age of 16, and made his first appearance on the stage at the Arch street theatre, Philadelphia, in 1857. In support of Edwin Forrest and Edwin Booth he played second rôles in Shakespearian and other tragedies, and Forrest left him by will all his prompt books. Virginius was his greatest success, although even in this part and as Othello he was coldly received in England (1881). In 1884 he broke down physically and mentally, and he died in an asylum at Philadelphia on Nov. 8, 1885

MACCUNN, HAMISH (1868–1916), Scottish musical composer, was born at Greenock, the son of a shipowner, and was educated at the Royal College of Music. His first success was with the overture *Land of the Mountain and Flood* in 1887 at the Crystal Palace, and this was followed by other compositions, with a characteristic Scottish colouring. From 1888 to 1894 he was a professor at the Royal College of Music. His opera *Jeanie Deans* was produced at Edinburgh in 1894. He was for some years conductor to the Carl Rosa Opera company, and subsequently to other companies. His opera *Diarmid* was produced at Covent Garden in 1897, and his other music includes cantatas, overtures, part-songs, instrumental pieces and songs, all markedly Scottish in type. He died in London on Aug. 2, 1916.

MACDONALD, ALEXANDRE (1765–1840), duke of Taranto and marshal of France, was born at Sedan on Xov. 17, 1765, of an old Jacobite family, and was related to Flora Macdonald. In 1785 he joined the legion supporting the revolutionary party in Holland against the Prussians, and then received a commission in the French army. He supported the Revolution, and was appointed aide-de-camp to General Dumouriez. He refused to desert to the Austrians with Dumouriez, and was rewarded with the rank of general of brigade. He took part in Pichegru's invasion of Holland (1795), served as general of division on the Rhine and in Italy (1797), became first French governor of Rome, and later reconstituted the kingdom of Naples as the Parthenopaean Republic. His resistance against Suvarov's attack in northern Italy gained him the position of governor of Versailles, where he acquiesced in the events of the 18th Brumaire. In 1800 he received the command of the army in Switzerland, and his march (1800–01) over the Splugen Pass, is as noteworthy as Bonaparte's famous passage of the St. Bernard before Marengo. After some years as French plenipotentiary in Denmark, he became (1809) military adviser to Eugène Beauharnais, viceroy of Italy. For his share in the victory over the Austrians at Wagram Napoleon made him marshal of France and duke of Taranto. After serving in Spain (1810) and Russia (1812), he invaded Silesia in 1813, and was defeated by Blücher at Katzbach *(see* NAPOLEONIC CAMPAIGNS). Napoleon presented him with the sabre of Murad Bey for his fidelity, and directed him to submit to the new régime. At the Restoration he was made a peer of France, and became chancellor of the Legion of Honour (1815–31) and major-general of the royal bodyguard (1816). From 1830 his life was spent in retirement at Courcelles-le-Roi (Seine-et-Oise), where, greatly respected, he died on Sept. 7, 1840.

See Mathieu Dumas *Evènements militaires;* Ségur, *Lettre sur la campagne du Général Macdonald dans les Grisons en 1800 et 1801* (1802), and *Eloge* (1842); his memoirs were published in 1892 (Eng. trans. *Recollections of Marshal Macdonald).*

MACDONALD, SIR CLAUDE MAXWELL (1852–1915), British soldier and diplomatist, was born on June 12, 1852; the son of Major-General J. D. Macdonald. He was educated at Uppingham and Sandhurst, and in 1872 entered the army (74th Highlanders). He took part in the Egyptian campaign of 1882, and was appointed military attache to Sir Evelyn Baring (afterwards earl of Cromer). serving in the Suakin expedition of 1884–85. He left the post of military attaché in 1887, and after a year as consul-general at Zanzibar went to the Niger Territories for the Foreign Office. In 1891 he became first commissioner and consul-general in the Oil Rivers Protectorate, where he successfully established a stable government, and was responsible for many administrative reforms. Macdonald retired from the army in 1896, and was appointed British minister at Peking, and during the critical period which followed secured for England the leases of Wei-Hai-Wei and of the Hong-Kong extension. He also obtained many other useful concessions, including the opening of the West river to trade, and the non-alienation of the Yangtze region. During the Boxer rising of 1900 he organized the defence of the legations. In Oct. 1900 Macdonald was appointed the first British ambassador to Tokyo, and gave valuable service to the British government during the Russo-Japanese War He was admitted to the privy council in 1906 in recognition of his work in connection with the Anglo-Japanese agreement of Xug. 1905 (ended in 1921). He died in London on Sept. 10, 1915.

MACDONALD, FLORA (1722–1790), Jacobite heroine, was the daughter of Ranald Macdonald of Milton, in the island of South Uist (Hebrides). In June 1746 Prince Charles Edward (*q.v.*) took refuge, after the battle of Culloden, in Benbecula in the Hebrides, where she was living, and his companion, Captain O'Neill, sought her help. She obtained a pass to the mainland for herself, a manservant, an Irish spinning maid, Betty Burke, and a boat's crew of six men. The prince was disguised as Betty Burke. The party landed at Portree and escaped. The boatmen's talk afterwards brought suspicion on Flora and she was arrested and imprisoned in the Tower. She was afterwards allowed to live outside under the guard of a gaoler, and when the Act of Indemnity was passed in 1747 she was left at liberty. In 1750 she married Allen Macdonald of Ringsburgh and they emigrated to America (1773). He served the British government in the War of Independence, and was taken prisoner. His wife returned home in 1779, and died on March 5, 1790.

See A. C. Ewald, *Life and Times of Prince Charles Edward* (1886) ; A. MacGregor, *The Life of Flora Macdonald* (1882, later ed. 1901) ; W. Foly, *Flora Macdonald in Uist* (1886). The so-called *Autobiography* of Flora Macdonald (1870) is not authentic.

MACDONALD, GEORGE (1824–1905), Scottish novelist and poet, was born at Huntly, Aberdeenshire, the son of a farmer, and a direct descendant of a family that suffered in the massacre of Glencoe. Macdonald's youth was passed in Huntly, in an atmosphere strongly impregnated with Calvinism. He took his degree at Aberdeen university, and then studied at Highbury college, in London, for the Congregational ministry After some years in the Congregational ministry at Arundel and in Manchester, and a short visit to Algiers. he settled in London and adopted the profession of literature. He wrote: *Within and Without* (1856), a dramatic poem; *Poems* (18jj), and the "faerie romance" *Phantastes* (1858). His first conspicuous success was achieved in 1862 with *David Elginbrod,* the forerunner of a number of popular novels, which include *Alec Forbes of Howglen* (186j), *Annals of a Quiet Neighbourhood* (1866), *Robert Falconer* (1868), *Malcolm* (187j), *The Marquis of Lossie* (1877) and *Donal Grant* (1883). He also wrote some stories for the young and several volumes of sermons. In 1877 he was given a civil list pension, He died on Sept. 18. 1905. His verse is homely and direct. and marked by religious fervour. As a portrayer of Scottish peasant life he was the precursor of a large school.

MACDONALD, SIR HECTOR ARCHIBALD (1852–1903), British soldier, was born of humble parentage at Muir of Allan-Grange, Ross-shire, Scotland. In 1870 he enlisted in the 92nd (Gordon) Highlanders, and distinguished himself in the Afghan War of 1879, in the first Boer War of 1880–81, and at Majuba. In 1885 he served under Sir Evelyn Wood in the reorganization of the Egyptian army, and took part in the Nile expedition of that year. In 1889 he received the D.S.O. for his conduct at Toski. Seven years later he commanded a brigade of the Egyptian army in the Dongola expedition, and after his achievements in the final battle of Omdurman (1898) was promoted colonel and made an aide-de-camp to the queen. He became popularly known as "Fighting Mac." In 1899 he was promoted major general. and appointed to a command in India. In Dec. 1899 he was called to South Africa to command the Highland brigade, and in 1901 he was made a K.C.B. In 1902 he commanded the troops in Ceylon, but on March 25, 1903, he committed suicide in Paris.

MACDONALD, JAMES RAMSAY (1866–1937), British prime minister, was born on Oct. 12, at Lossiemouth, a little fishing village on the Moray Firth. His father was a labourer, his first home a "but and a ben." At Drainie board school he received an elementary education and continued as a pupil teacher. Going to London at 18, he worked at 12/6*d.* a week as a clerk. He continued his own education by evening classes, laboratory work and incessant reading. A breakdown in health ended his scientific career and sent him to journalism.

MacDonald's experience and reading made him a convinced socialist. He joined, in 1894, the Independent Labour party, founded by Keir Hardie, and in 1895 stood, unsuccessfully, for Southampton. As a member of the London county council he completed his training for public service and. after his marriage in 1896 with Margaret Ethel Gladstone, niece of Lord Kelvin, made frequent journeys abroad. In 1897 he paid his first visit to Canada and the United States; in 1902 he went to South Africa; in 1906, travelled through the Pacific to Australia and New Zealand; in 1910 visited India, to which he returned in 1913 and 1914 as a member of the royal commission on the civil service. He also attended the (Second) Socialist International.

Three main stages may be noted in his political career: the creation of the Labour party, World War I and the Labour government. In the 1890s, the great trade unions still stood aloof from politics, or were satisfied nith a vague alliance with the Liberal party. The propaganda of the Independent Labour party, with which he was prominently associated, was directed to convincing the unions of the need of a political party for labour; in 1899 the Trades Union congress was induced to set up a committee to consider parliamentary action. Out of this came the Labour Representation committee, of which MacDonald was secretary. Thanks largely to his energy. patience and tenacity, the hostility of some unions and the apathy of others was broken down and a Labour party came into being in 1900. After the return of 29 M P.s, run by the Labour Representation committee in 1906, the battle was won; the party became an effective force. But it was only in 1918 that MacDonald's ideas mere fully realized. The party was reorganized and thrown open to all classes.

Elected as M.P. for Leicester in 1906, by 1911 he was leader of the Labour party in the house of commons. A constructive critic of Sir Edward Grey's foreign policy, he opposed, on Aug. 4, 1914, the view that there was an "obligation of honour" to go to war. The speech mas an agreed one, but the majority of the party broke away. He had already refused suggestions of office; he now resigned his leadership. He was denounced in public and private, and had to face the fact that. his views were not accepted by the nation at war. In 1918 he lost his seat at Leicester, and in 1921 failed to get in for East Woolwich.

Although out of the house of commons till late in 1922, his influence on opinion steadily grew. By 1922, the party took his view of the peace treaties, and resisted the tendencies that split nearly every Labour party abroad. In 1912 he had opposed the demand for the substitution of industrial ("direct") for parliamentary action in his book *Syndicalism;* in 1919, when, under the stimulus of Russian events, this demand reappeared as the Communist doctrine of violent revolution, he wrote *Parliament and Revolution* and *Parliament and Democracy,* in which he gave a definite and logical lead against the tactics of violence and championed parliamentary democracy. The 1922 election registered his moral ascendancy. Labour, with 140 members, was the second party in the state, and he himself, returned for Aberavon, was chosen by his colleagues leader of the opposition.

After the sudden election of 1923, he came back with 192 followers. With the authorization of the National Labour party and the Trades Union congress MacDonald declared that Labour would take office, if given the chance, in order to render national service. On Jan. 21, 1924, he accordingly moved a vote of no confidence in the Unionists, which was carried with Liberal support. Next day the king called upon him to form a government. The first Labour cabinet was announced on Jan. 24, and on Feb. 12 the new prime minister set out its general program in the house of commons. In this, the first item was the settlement of a disturbed Europe; with this supreme object in view, he added the post of foreign secretary to his premiership.

The unsettled state of Europe: aggravated through the occupation of the Ruhr, was a primary cause of distress and unemployment in Britain. British prestige had fallen low: relations between Britain and France were bad, between France and Germany threatening. The reparations question blocked the way. In letters to Raymond Poincaré, published on Feb. 4 and March 3, MacDonald, with finn friendliness, set out the British point of view, and had soon created a new atmosphere, one of confidence and hope. When, on April 13. the experts committee on reparations issued a unanimous report, he at once accepted it on the part of Britain as a basis for settlement. In May, Poincaré was replaced by the Radical Edouard Herriot, who in June came over to London to discuss the European position with MacDonald. Friendship with Italy had been assisted by the handling of Jubaland. On July 16, 1924, an allied conference assembled in London, over which he presided, for the specific purpose of putting the experts' report into operation. Within a fortnight, agreement had been reached and the German delegates called in. On Aug. 16 the London settlement, the first negotiated agreement since the war, was initialled. By mutual consent, the experts' plan was put in effect, and the reparation problem thus lifted out of the political sphere. France, at the same time! agreed to evacuate the Ruhr within a year and certain towns at once. Negotiations for an Anglo-German commercial treaty were initialled. In September MacDonald and Herriot attended the fifth assembly of the League of Nations at Geneva, and there submitted a plan, the Protocol, for the elimination of private war and the submission of all disputes to arbitration, after general mutual disarmament.

In the house of commons, meantime, the difficulties of the government's minority position were growing. Philip Snowden's budget met with general approval, a housing act was passed and the machinery for the relief of unemployment improved. But when MacDonald sought to complete his peace work by making treaties with Russia, whose de *jure* recognition had been an early act as foreign secretary, the Liberals broke away. In October the government was defeated on a motion, calling for a select committee, on their dropping of the prosecution of J. R. Campbell, editor of the Communist *Workers' Weekly.* In the general election, then declared, the press was exceedingly hostile. and Labour was identified with Bolshevism. Polling took place on Oct. 29; as a result the Conservatives came back with a great majority. The Labour vote went up by over a million, but its representation was reduced to 150. On Nov. 4 MacDonald resigned, and resumed his leadership of the opposition. His party, in conference in 1925, confirmed his leadership.

The confidence of the party was justified by the results of the general election of May 1929. The final results gave Labour 290 seats as against 259 Conservative, 57 Liberals and 9 Independents. Baldwin resigned and the King sent for MacDonald. His cabinet included: Sankey (lord chancellor), Parmoor (lord president), J. H. Thomas (Privy seal and deputy leader in House of Commons), P. Snowden (exchequer), A. Henderson (foreign affairs), J. R. Clynes (home office), Sidney Webb (Lord Passfield) (colonies and dominions), Shaw (war), Wedgwood Benn (India), Thomson (air), A. V. Alexander (admiralty), W. Graham (board of trade), C. P. Trevelyan (education), A. Greenwood (health), Noel-Buxton (agriculture), Margaret Bondfield (labour), G. Lansbury (first Comm. of Works), W. Adamson (Scotland) and O. Mosley (Duchy of Lancaster).

A year later, in June 1930, Mr. Thomas was transferred to the Dominions Office which in view of the approaching Imperial Conference was separated from the Colonies: Mr. Hartshorn becoming Lord Privy Seal, and Dr. Addison Minister of Agriculture.

MacDonald at once resumed the peace work begun in 1924. The Optional Clause was signed in Sept. 1929 and the evacuation of the Rhineland secured, while normal relations with Russia were resumed. His visit to the U.S.A. paved the way for the Naval Treaty of April 1930, carrying out limitation of all categories, as between Britain, the U.S. and Japan, and reaching agreement on many points also with France and Italy. Work at home—a new Pensions Act, a new Unemployment Insurance Act, a Coal Mines Bill—was overshadowed by the mounting unemployment figures due to the world-wide slump. To help in dealing with this great issue MacDonald appointed an Economic Advisory Committee, and, in the summer of 1930, invited the "emergency" co-operation of the other parties.

MacDonald's contribution to British political history cannot be measured unless it is noted that he made the Labour Party, which he assisted to create, the vehicle of a new political philosophy. His socialism has modified opinion over a wider range than that of professed adherents

On the formation of the National Government in 1931, when most of his socialistic colleagues resigned, MacDonald remained prime minister, retaining this office after the general election of that year. He presided over the Lausanne Conference, 1932, and the World Economic Conference, 1933. In June 1935, for reasons of health, he resigned the premiership to Stanley Baldwin, but remained in the cabinet as lord president of the council. He died Nov. 9, 1937 in mid-Atlantic enroute to South America for a rest.

MacDonald's views on socialism can best be studied in his books. Among them the more important are: *Socialism and Society* (1905); *Socialism and Government* (1909); *The Awakening of India* (1911); *The Socialist Movement* (1911); *Syndicalism* (1912); *The Social Unrest* (1913); *National Defence* (1917); *Parliament and Revolution* (1919); *Parliament and Democracy* (1919); *The Government of India* (1919); *A Policy for the Labour Party* (1920); and *Socialism, Critical and Constructive* (1921). In addition, his biography of his wife, *Margaret Ethel MacDonald* (1912); and a volume of essays and travel pictures, *Wanderings and Excursions* (1925) may also be mentioned. See C. W. Mullins, *The Patriotism of Ramsay MacDonald and Others* (1916); L. N. Le Roux, *J. Ramsay MacDonald, Sa vie, son oeuvre et sa pensée* (1919); "Iconoclast" (M. A. Hamilton) *The Man of Tomorrow, J. Ramsay MacDonald* (1923); *J. Ramsay MacDonald, 1923–25* (1925); H. Tracey, *From Doughty Street to Downing Street. The Rt. Hon. J. Ramsay MacDonald, M.P.* (1924); J. Bardoux, *J. Ramsay MacDonald* (1924); G. Glasgow, *MacDonald as Diplomatist* (1924); U. D. C. *The Diplomacy of Ramsay MacDonald* (1925). (M. A. H.)

MACDONALD, SIR JOHN ALEXANDER (1815–1891), first premier of the dominion of Canada, was born in Glasgow on Jan. 11, 1815, the third child of Hugh Macdonald (d. 1841), a native of Sutherlandshire. The family emigrated to Canada in 1820, settling first at Kingston, Ontario. At the age of fifteen Macdonald entered a law office; he was called to the bar in 1836, and began practice in Kingston, with immediate success.

In 1844 Macdonald was elected to the provincial assembly as Conservative member for Kingston. A sentence in his first address to the electors strikes the dominant note of his public career: "I therefore need scarcely state my firm belief that the prosperity of Canada depends upon its permanent connection with the mother country, and that I shall resist to the utmost any attempt (from whatever quarter it may come) which may tend to weaken that union." In 1847 he was made receiver-general with a seat in the executive council.

One of the first acts of the Reform government which succeeded that of which Macdonald was a member was to pass the Rebellion Losses Bill. In the controversy on the British connection which followed that event, Macdonald helped to found a British-American league, having for its object the confederation of all the provinces, the strengthening of the connection with the mother country, and the adoption of a national commercial policy. He remained in opposition from 1848 till 1854, holding together under difficult circumstances an unpopular party with which he was not entirely in sympathy. The two great political issues of the time were the secularization of the clergy reserves in Ontario, and the abolition of seigniorial tenure in Quebec. Both of these reforms Macdonald long opposed, but when successive elections had proved that they were supported by public opinion, he brought about a coalition of Conservatives and moderate reformers for the purpose of carrying them. Out of this coalition was gradually developed the Liberal-conservative party, of which until his death Macdonald continued to be the most considerable figure, and which for more than forty years largely moulded the history of Canada. From 1854 to 1857 he was attorney-general of Upper Canada, and then, on the retirement of Colonel Taché, he became prime minister.

At this critical period of Canadian history a proposal was made for a coalition of parties in order to carry out a broad scheme of British-American confederation. Macdonald, at the head of a representative delegation from Ontario and Quebec, met the public men of the maritime provinces in conference at Charlottetown in 1864, and the outline of confederation then agreed upon was filled out in detail at a conference held at Quebec soon afterwards. The actual framing of the British North America Act, into which the resolutions of these two conferences were consolidated, was carried out at the Westminster Palace Hotel in London, during December 1866 and January 1867, by delegates from all the provinces working in co-operation with the law officers of the Crown, under the presidency of Lord Carnarvon, then secretary of state for the colonies. Macdonald took the leading part in all these discussions, and he thus naturally became the first premier of the Dominion. He was made a K.C.B. in recognition of his services to the empire.

The difficulties of organizing the new Dominion, the questions arising from diverse claims and the various conditions of the country, called for infinite tact and resource on the part of the premier. Federal rights were to be safeguarded against the provincial governments, always jealous of their privileges. The pledge made at confederation with regard to the building of the Intercolonial railway to connect the maritime provinces with those of the St. Lawrence was fulfilled. The North-West Territories were secured as a part of confederated Canada by the purchase of the rights of the Hudson's Bay Company, and the establishment of Manitoba as a province in 1870. Canada's interests were protected during the negotiations which ended in the Treaty of Washington in 1871, and in which Macdonald took a leading part as one of the British delegates. In this year British Columbia entered the confederation, one of the provisions of union being that a transcontinental railroad should be built within ten years. This was declared by the opposition to be impossible. It was possible only to a leader of indomitable will. Charges of bribery against the government in connection with the contract for the building of this line led to the resignation of the cabinet in 1874, and for four years Macdonald was in opposition.

During the summer of 1876 he travelled through Ontario addressing the people on the subject of a commercial system looking to the protection of native industries. This was the celebrated "National Policy," which had been in his thoughts as long ago as the formation of the British-American League in 1850. The government of Alexander Mackenzie refused to consider a protection policy, and determined to adhere to Free Trade, with a tariff for revenue only. On these strongly defined issues the two parties appealed to the people in 1878. The Liberal party was almost swept away, and Macdonald, on his return to power, put his policy into effect with a thoroughness that commanded the admiration even of his opponents, who, after long resistance, adopted it on their accession to office in 1896. He also undertook the immediate construction of the Canadian Pacific railway, which had been postponed by the former government. The line was begun in 1880, and finished in November 1885—an achievement which Macdonald ranked among his greatest triumphs.

During the remaining years of his life his efforts at administration were directed mainly towards the organization and development of the great North-West. From 1878 until his death in 1891 Macdonald retained his position as premier of Canada, and his history is practically that of Canada (*q.v.*). For forty-six years of a stormy political life he remained true to the cardinal policy that he had announced to the electors of Kingston in 1844. "A British subject I was born; a British subject I will die," says his last political manifesto to the people of the Dominion. At his advanced age the anxiety and excitement of the contested election of 1891 proved too great. On May 29, he suffered a stroke of paralysis and died on June 6.

A condensed biography by G. R. Parkin forms one of the "Makers of Canada" series (Toronto, 1907; new ed., 1909). *See* also Sir J. Pope, *The Day of Sir John Macdonald* (Toronto, 1915).

MACDONALD, JOHN SANDFIELD (1812–1872), Canadian statesman, was born at St. Raphael, Glengarry county, Ontario, on Dec. 12, 1812. He was admitted to the bar in 1840, and settled in Cornwall. In 1841 he was elected to the Canadian parliament for Glengarry, which seat he held for 16 years. In 1842 he joined the Reformers in the cry for constitutional government, and from 1852 to 1854 was Speaker of the house. He was always uncertain in his party allegiance, and often attacked George Brown, the Liberal leader. In 1862 he was called on by Lord Monck, the governor-general, to form a ministry, which by manifold shifts held office till Feb. 1864. In the debates on federation he opposed the measure, but on its passage was in 1867 entrusted by the Conservatives with the task of organizing the provincial Government of Ontario. He ruled the province with economy and efficiency, but was defeated in Dec. 1871 by the Liberals, resigned the premiership, and died on June 1, 1872.

MACDONELL, SIR JOHN (1846–1921), British jurist, was born at Brechin. Forfarshire, on Aug. 11, 1846, and was educated at the universities of Aberdeen and Edinburgh. In 1901 he was made Quain professor of comparative law in the University of London and he was president of the society of public teachers of law (1912–13), a member of several royal commissions, and editor, for many years, of *The Journal of Comparative Legislation and International Law.* In 1913 he was elected a fellow of the British Academy and in 1914 was created K.C.B. Besides editing the *State Trials* (1887), the *Civil Judicial Statistics* (from 1894) and the *Criminal Judicial Statistics* (from 1900), he published works on the subjects of capture at sea and the law of master and servact, and was the author of many papers on international law. He was also for 40 years a leader writer on *The Times,* London. He died in London on March 17, 1921.

MACDONNELL or **MACDONELL, ALESTAIR** (*i.e.,* ALEXANDER), **RUADH** (*c.* 1725–1761), chief of Glengarry, a Scottish Jacobite. The family was a branch of the clan Macdonald. Alestair ran away when a boy and entered the Royal Scots, a regiment in the French service, being sent to Scotland as a Jacobite agent in 1744. He was in France in Jan. 1745 when Prince Charles Edward landed in Scotland. Later in the year he was captured at sea while bringing help to the prince, and imprisoned for 22 months in the Tower. He then went abroad, but in 1749 he was again in London, and is believed to have acted as spy to the British Government, under the name of Pickle, enabling a close watch to be kept on the prince and on the Jacobite conspiracies. He died on Dec. 23, 1761.

See Andrew Lang, *Pickle the Spy* (1897), and *The Companions of Pickle* (1898).

MacDONNELL, ANTONY PATRICK (1844–1925), Indian and Irish administrator, was born in Co. Mayo on March 7, 1844, and educated at Athlone and at Queen's college, Galway. He entered the Indian Civil Service in 1864, and was sent to Bengal in 1865. His book, *Food Grain Supply and Famine Relief in Bihar and Bengal,* dealt with his experiences during the Bengal famine of 1873. He held successively the posts of secretary to the Bengal Government, home secretary, acting chief commissioner of Burma, chief commissioner of the Central Provinces (1890), member of the Government of India, and lieutenant-governor of the united provinces of Agra and Oudh. His particular interest was in the agrarian policy of India, and he was responsible for many reforms in the legislation affecting native tenants and cultivators. His six years' administration of the Central Provinces proved him to be a capable administrator, but his determined methods led to many misunderstandings with his subordinates. He experienced difficulties with the natives also on his introduction of Nagri (Hindi) script in place of Urdu in the courts, and Muslim political agitation has been traced to this cause. In 1897 MacDonnell personally organized the relief measures during the serious famine, and in 1901, just before the end of his term of office, he was made president of the Famine commission, and drew up the report which has become a standard authority. In Jan. 1903 he became member of the Indian Council, and of the privy council.

MacDonnell was then made under-secretary for Ireland, but with special powers over administration. His tenure of office at first appeared successful, but Wyndham, the chief secretary, was forced to resign on the question of Lord Dunraven's Devolution Act, of which MacDonnell was one of the principal authors. MacDonnell remained in office until 1908, but his special powers were annulled. On his resignation he was raised to the peerage as Lord MacDonnell of Swinford. In the House of Lords he took an active part for many years in the discussion of Irish and Indian problems, and in Aug. 1920 he attended the Irish Peace Conference in Dublin. He died on June g, 1925, the peerage becoming extinct

MACDONNELL, ARTHUR ANTHONY (1854–1930), English Sanskrit scholar, was born on May 11, 1854, and educated at Göttingen and at Corpus Christi college, Oxford. From 1880 to 1900 he was Taylorian teacher of German at Oxford, and from 1888 to 1899 deputy professor of Sanskrit. In 1922 he was appointed Stephanos Nirmalendu Ghosh lecturer on Comparative Religion at Calcutta.

His numerous publications include: critical editions of the *Sarvānukramani* and the *Anuvakānukramanī,* with Shadgurucishya's commentary (1886); *A History of Sanskrit Literature* (1900); the *Brihaddevata,* the first translation and critical edition (2 vols. 1904); Sanskrit and Vedic Grammars, and numerous articles.

MACDONNELL, SORLEY BOY (*c.* 1505–1590), Scoto-Irish chieftain, son of Alexander Macdonnell, lord of Islay and Kintyre (Cantire), was born at Ballycastle, Co. Antrim. From an ancestor who had married Margaret Bisset, heiress of the district on the Antrim coast known as the Glynns (or Glens), he inherited a claim to the lordship of that territory; and he was one of the most powerful of the Scottish settlers in Ulster whom the English Government tried to bring into subjection. He took an active part in the tribal warfare between his own clan and the MacQuillins, and by defeating the latter at Glenshesk in 1558, acquired the lordship of the Route. He was now too powerful to be neglected by Elizabeth and her ministers, who were also being troubled by his great contemporary, Shane O'Neill. Elizabeth aimed at fomenting the rivalry between the two men, and came to terms sometimes with the one and sometimes with the other. Shane O'Neill defeated Sorley Boy near Coleraine in 1564; in 1565 he invaded the Glynns, and at Ballycastle won a decisive victory, in which James Macdonnell and Sorley Boy were taken prisoners. James soon afterwards died, but Sorley Boy remained O'Neill's captive till 1567, when Shane was murdered by the Macdonnells at Cushendun (*see* O'NEILL). After the massacre of his family by the English in 1575, Sorley Boy made a successful raid on Carrickfergus and re-established his power in the Glynns and the Route. His position was further strengthened by an alliance with Turlough Luineach O'Neill, and by a formidable immigration of followers from the Scottish islands. In 1585 he regained possession of Dunluce castle. Sir John Perrot reluctantly opened negotiations with Sorley Boy, who in 1586 made submission to Elizabeth's representative. He obtained a grant to himself and his heirs of all the Route country between the rivers Bann and Bush, with certain other lands to the east, and was made constable of Dunluce castle. For the rest of his life he gave no trouble to the English Government.

See G. Hill, *An Historical Account of the Macdonnells of Antrim* (1873); R. Bagwell, *Ireland under the Tudors* (3 vols., 1885–90); *Calendar of State Papers: Carew MSS.* i., ii. (6 vols., 1867–73); D. Gregory, *History of the Western Highlands and Isles of Scotland 1493–1625* (1881); Sir J. T. Gilbert, *History of the Viceroys of Ireland* (1865).

MACDONOUGH, THOMAS (1783–1825), U.S. naval officer, who commanded the U.S. squadron at the battle of Lake Champlain during the War of 1812, was born in Delaware on Dec. 31, 1783. He entered the U.S. navy in 1800. During long service as a lieutenant, he took part in the bombardment of Tripoli and on a subsequent occasion showed great firmness in resisting the seizure of a seaman as an alleged deserter from the British navy. his ship at the time lying under the guns of Gibraltar. When war with England broke out in 1812, he was ordered to cruise in the lakes between Canada and the United States: with his headquarters on Lake Champlain. He was instrumental in saving New York and Vermont from invasion by his brilliant victory of Lake Champlain, gained on Sept. 11, 1814, with a flotilla of 14 vessels carrying 86 guns, over Capt. George Downie's 16 vessels and 92 guns. *See* WAR OF 1812, THE.

McDOUGALL, WILLIAM (1871–1938), British psychologist, who did more than any other writer at the beginning of the 20th century to establish British psychology on an experimental and physiological basis. He was born in Lancashire on June 22, 1871, and was educated at school at Weimar, Ger., and at the universities of Manchester and Cambridge, at the latter of which he studied medicine. In 1899 he joined the Cambridge anthropological expedition to the Torres straits, where he applied psychological tests to natives. He then went to Gottingen to acquire a fuller knowledge of experimental techniques from G. E. Miiller. McDougall's first important publication described a series of ingenious experiments seeking to reinstate Thomas Young's three-colour theory of vision. He turned next to the study of attention (which he identified with apperception) and its neurological correlates and formulated the hypothesis that the basis of intellectual activities is a hierarchy of neural circuits arranged in four main levels. In his *Physiological Psychology* (1905) and his *Psychology, the Study of Behaviour* (1912) he demonstrated the value of a thoroughgoing biological standpoint in place of the traditional philosophical approach. In 1901 McDougall joined James Sully as assistant in the new experimental laboratory at University college, London; and in 1904 he accepted a readership at Oxford. There he encouraged research students to apply Sir Francis Galton's method of mental testing to determine the innate factors of individual differences.

In his best-known work (*An Introduction to Social Psychology*, 1908), McDougall developed a theory of human behaviour based on the assumption of inherited instincts with their accompanying emotions and an acquired superstructure of sentiments. In 1920 he accepted the chair of psychology at Harvard university, and in 1927 moved to Duke university, Durham, N.C., where, with J. B. Rhine, he continued his earlier studies on extrasensory perception and paranormal psychology. In *Modern Materialism and Emergent Evolution* (1929) and *The Riddle of Life* (1938) he elaborated his hypothesis of interaction between body and soul and drastically criticized the materialistic revival inaugurated by the American behaviourist school and the consequent neglect of purposive factors in human life. He died at Durham, N.C., on Nov. 28, 1938. (CY. B.)

MacDOWELL, EDWARD ALEXANDER (1861–1908), American musical composer, was born in New York city on Dec. 18, 1861. His parents, who were Irish, had emigrated to America from Belfast shortly before the boy's birth. He had a varied education in music, first under Spanish-American teachers, and then in Europe, at Paris (Debussy being a fellow pupil), Stuttgart, Wiesbaden and Weimar, where he was chiefly influenced by Joachim, Raff and Liszt. From 1879 to 1887 he lived in Germany, teaching and studying, and also appearing as solo pianist at important concerts. In 1884 he married Marian Nevins, of New York. He returned to America in 1888, and settled in Boston until 1896 when he was made professor of music at Columbia university, New York. This post he resigned in 1904, and in 1905 overwork and insomnia resulted in a complete cerebral collapse. He died on Jan. 23, 1908. MacDowell's work gives him perhaps the highest place among American composers. Deeply influenced by modern French models and by German romanticism, full of poetry and "atmosphere," and founded on the "programme" idea of composition, it is essentially creative in the spirit of a searcher after delicate truths of artistic expression. His employment of touches of American folk-song, suggested by Indian themes, is characteristic. This is notably the case with his orchestral *Indian Suite* (1896) and *Woodland Sketches* for the piano.

See Lawrence Gilman, *Edward MacDowell* (1906).

MACDUFF, a small burgh and seaport of Banffshire, Scot., on the Deveron, 1 mi. E. of Banff and 46 mi. N.W. of Aberdeen by road. Pop. (1951) 3,322. The site, occupied by the fishing village of Doune (or Down), was purchased by the 1st earl of Fife, about 1732, and the name was later altered to Macduff by the 2nd earl. In honour of its constitution as a burgh in 1783 he rebuilt the market cross in front of the parish church. Behind it is a World War I memorial in the shape of a tower 70-ft. high. The harbour is safer and more accessible than that of Banff. The inhabitants are chiefly employed in the whitefish industry, and in boatbuilding. New Fishmarket buildings were opened in 1955. Grain and fish are exported and coal imported. A stone bridge across the Deveron connects with Banff.

McDUFFIE, GEORGE (c. 1788–1851), an American statesman, of South Carolina, was the son of John and Jane McDuffie, energetic, intelligent and unspoiled Scots who had migrated to Georgia after the Revolution. George was born about 1788 or 1790 (authorities differ) near Augusta. In 1804 Calhoun and Wilson, of Augusta, employed him as a clerk; and in 1810 William Calhoun, brother of James and John C. Calhoun (*q.v.*) took him into his family and sent him to Willington academy. George McDuffie justified the expectations of his patron. He graduated from South Carolina college in 1813, was called to the bar in 1814, and after a brief period of preliminary experience in law and politics entered into a partnership with Col. Eldred Simkins, of Edgefield, who possessed a good library and large practice. He secured election to the State Legislature in 1818, and to Congress in 1821.

In the national House of Representatives he won distinction and served continuously on important committees until 1834. While the Calhoun influence was strong upon him, George McDuffie maintained a vigorous intellectual independence which displayed itself in facile writing, strong debating, and an intense, rapid and fiery but logical oratory; also, in his gradual change from liberal construction to strict construction he was in advance of his contemporaries. In the end he was a free trader after the heart of Thomas Cooper, a believer in the right of revolution like Patrick Henry, supporting nullification on revolutionary rather than on constitutional grounds, and an opponent of internal improvements. But he was the leader of "the bank interest" in the house. In 1834 he denounced the Jackson administration, retired from Congress, and served as governor of South Carolina, 1834–36, with marked effectiveness, giving particular attention to the compilation of the statute laws of the State and to the reorganization of South Carolina college. He did something to promote Southern "direct trade with Europe," and while in England in the spring of 1839 was invited by J. B. Smith to participate in free trade activities of the Anti-Corn Law League, but this he declined.

In Dec. 1842 George McDuffie was elected to the U.S. Senate, where he helped to bring about the annexation of Texas, the "amicable adjustment" of the Oregon question with Great Britain and the passage of the low Walker tariff of 1846, displacing the high Whig tariff of 1842 almost in conjunction with the repeal of the British corn laws. Indeed, his bust was sent with Calhoun's to the Free Trade Hall at Manchester during this period of intimate relations between the free traders of both countries. McDuffie's public services practically ended with these adjustments in Anglo-American relations; for an old wound in the spine received in a duel in 1822 compelled him to resign his seat in the senate, Aug. 17, 1846. He died at Cherry Hill, in the Sumter district of South Carolina, on March 11, 1851. (T. P. MA.)

MACE, originally a weapon of offense. made of iron or steel, capable of breaking through armour. The mace was carried in battle by mediaeval bishops (Odo of Bayeux is represented on the Bayeux tapestry wielding one) instead of the sword. so as to conform to the canonical rule which forbade priests to shed blood. It continued in use as a weapon until the late 16th century, though many of the later examples with elaborately pierced flanges and damascened shafts seem to have been carried as a sign of rank The Turkish mace (*pushkan*), with an almost spherical head of iron sheathed in silver-gilt, was also used in the 17th century in eastern and northern Europe, mainly in those countries under Turkish domination, as a symbol of authority. The earliest ceremonial maces, as they afterward became, though at first intended to protect the king's person, were those borne by the sergeants at arms. a royal bodyguard established in France by Philip II and in England probably by Richard I. The history of the civic mace (carried by the sergeants at mace) begins about the middle of the 13th century, though no examples of that period are in existence today. Ornamented civic maces were considered an infringement of one of the privileges of the king's sergeants, who, according to the commons' petition in 1344, were alone deemed worthy of having maces enriched with costly metals. This privilege was granted, however, to the sergeants of London and later to those of York (in 1396), Norwich (in 1403–04) and Chester (in 1506). Maces covered with silver are known to have been used at Exeter in 1387–88; two were bought at Norwich in 143j and others for Launceston in 1467–68. Several other cities and towns had silver maces in the next century, and in the 16th century they were almost universally used.

The mace was carried as a symbol of royal authority, and for this reason the royal arms was set on the button at the end of the handle. During the 15th century this button was greatly expanded in size, in order to give due prominence to the royal arms. Thereafter it was surrounded by a coronet, which by the 17th century developed into an arched croun. At the same time the flanges of what had been the head dwindled into decorative brackets, and the mace was carried upside down with the crown uppermost, what had started as the head being held in the hand. As the custom of having sergeants' maces ceased, the large maces borne before the mayor or bailiffs came into general use.

In 1649 it was decided that the house of commons should have a mace of approved design; this was furnished by Thomas Maundy, who supplied many others to the same pattern for provincial towns. This pattern remained standard in England thereafter, with the exception that at the Restoration the royal devices were replaced on the head. There are two maces in the house of lords, the earliest dating from the reign of William III. Historic silver maces of the 18th century include the one of 1753 at Norfolk, Va., and that of 1756 of the state of South Carolina.

Among other maces. more correctly described as staves, in use at the present time, are those carried before ecclesiastical dignitaries and clergy in cathedrals and parish churches, and the maces of the universities. The silver mace with crystal globe of the lord high treasurer of Scotland, at Holyrood palace, Edinburgh, was made about 1690. The remarkable mace or sceptre of the lord mayor of London is of crystal and gold and set with pearls; the head dates from the 15th century, while the mounts of the shaft are early mediaeval.

MACEDO, JOSÉ AGOSTINHO DE (1761–1831), Portuguese didactic poet and a critic and pamphleteer notable for his acerbity. Born at Beja, Sept. 11, 1761, he became professed as an Augustinian in 1778. Because of his turbulent character he spent much time in prison and was constantly transferred from one community to another. In 1792 he was unfrocked but obtained a papal brief which gave him the status of a secular priest. He was soon recognized as the leading pulpit orator of the day and in 1802 was appointed one of the royal preachers.

The best examples of his didactic poetry are *A Meditação* and Newton (1813). In 1814 he produced *O* Oriente, an insipid epic dealing with Vasco da Gama's discovery of the sea route to India. He also founded and wrote for a large number of journals, and the tone and temper of these and of his political pamphlets caused one of his biographers to call him the "chief libeler" of Portugal. His malignity reached its height in a satirical poem in six cantos. *Os* Burros (1812–14), in which he pilloried, by name, men and women of all grades of society, living and dead, with the utmost licence of expression. From *c.* 1823 onward he was the virulent champion of the absolutist reaction. He died at Pedrouços, Oct. 2, 1831.

MACEDONIA, the central part of the Balkan peninsula. Macedonia was always strategically important as a crossroads: Via Egnatia, the shortest Roman route between the Adriatic coast and Constantinople, passed through places now known as Bitolj (Monastir) and Salonika. The valley of the Vardar (Axios) river was and continues to be the easiest highway from Salonika to the north. Both the Roman and the Ottoman empires based on Constantinople considered it essential to hold Macedonia, through which Serbia, Bosnia, Albania and continental Greece could be reached. This stretch of land had, therefore, a complex history and, as a result, a mixed population. When in the 19th century the national consciousness of the Balkan peoples began to waken, Macedonia became a problem of international magnitude.

Physical Geography.—Macedonia is bounded on the east by the lower Mesta (Nestos) river and the western slopes of the Rhodope (Rodopi) upland. North of the Pirin (Orvilos) massif the boundary turns west, passing south of Kyustendil (Velbuzhd), by the Shiroka Planina, Crna Gora and Shar Planina. Thence it turns southward by the Korab and Yablanitsa range and lakes Ohrid or Ochrida (2,280 ft.) and Prespa (2,798 ft.) to the massif of Grammos (8,033 ft.); then eastward, embracing the whole basin of the Aliakmion (Bistritsa) river and reaching the Gulf of Salonika near Mt. Olympus. Including the Khalkidiki or Chalcidic peninsula, Macedonia covers an area of more than 26,000 sq.mi. It is not, however, a geographical entity.

Aegean Macedonia.—The coastal belt along the Aegean sea, with the wide, flat and treeless *kampania* of Salonika and the plains of the lower Strymon (Struma) river and of Kavalla, has a Mediterranean climate, and its agricultural products are varied. They include grapes, mulberry trees for silk production, and fruit, especially figs, as well as crops such as cotton, tobacco, rice and a great variety of vegetables.

Pirin Macedonia.—Pirin Macedonia lies north of a belt of mountains through which the gorges of the Struma and Mesta rivers are the only highways to the south. While in the valleys climatic conditions are somewhat Mediterranean, the wild Pirin massif lying between them is snowbound in winter. The Belasitsa range, with a peak reaching 6,657 ft. (Radomir), is a natural boundary between Aegean and Pirin Macedonia, and the Malesh and Osogov ranges, with peaks reaching 6,312 ft. (Kadiyitsa) and 7,388 ft. (Ruyen), are the boundary between Pirin and Vardar Macedonia. The only highway leading westward from the former to the latter is the Strumitsa valley, parallel to the Belasitsa range.

Vardar Macedonia.—This lies to the northwest of Aegean Macedonia and is divided from it by the Kozhukh and Nidzhe ranges with Mt. Kajmakcalan as the highest peak (8,271 ft.).

With the exception of the Vardar valley, lower Bregalnitsa valley and lower Tsrna valley, this part of Macedonia is a plateau lying from 2.000 ft. to 3.000 it. above sea level. with mountain massifs re'aching 8,333 ft. (Yakupitsa). The climate approaches the continental type. with summer rains and often copious winter snowfalls. Chief crops are wheat, barley, maize and rye, while extensive pastures support large flocks of sheep and cattle.

HISTORY

From Alexander the Great to the Turkish Conquest.— For a relatively short period in ancient times, more than three centuries before the Christian era, there existed a state called Macedonia. It was consolidated by Philip II of Macedon and it covered the area of what is now the northern part of modern Greece and the southern parts of modern Albania. Yugoslavia and Bulgaria. The ancient Macedonians were either Greeks or superficially Hellenized Illyrians and Thracians (see ILLYRIA; THRACE). The sudden extension of Macedonian power over Asia Minor and the middle east was attributable to a combination of the Greek spirit of adventure, Philip II's military planning and the strategic genius of his successor, Alexander the Great. This empire, however, disintegrated after Alexander's death (*see* MACEDONIAN EMPIRE), and eventually, in 146 B.C., Macedonia was constituted as a Roman province. When in the 4th century the Roman empire was divided, Macedonia was assigned to the eastern half.

At that time the original Thraco-Illyrian population was probably partly Latinized and partly Hellenized. Greek, no doubt, was chiefly spoken along the Aegean coast, and the population was mainly Christian. Invasions of Goths, Vandals, Huns and Avars in the 4th and jth centuries brought devastation but no great changes in the ethnic composition of the population. But when the Slavs entered the Balkans in the 5th century they colonized hlacedonia too, and only a few towns remained Greek. In the 9th century almost the whole of Macedonia, with the exception of Salonika. was included in the first Bulgarian empire. Although themselves a Turanian people, the Bulgars were Slavicized. After the decay of the first Bulgarian empire, Macedonia remained independent under Shishman I, count of Trnovo, who in 963 founded a local dynasty. The third ruler of this dynasty, Samuel, founded an empire which is sometimes described as Western Bulgarian. It comprised Macedonia and extended over much of the Balkan peninsula, but it was destroyed by the Byzantine emperor Basil II Bulgaroctonus. The dynasty was extinguished in 1018 and its lands, including Macedonia, were returned to Byzantium.

Migratory movements and warlike invasions continued. Nomadic Vlachs found in Macedonia a region well suited to their mode of life. Turanian invaders, called Polovtsy by the Slavs and Kumans (Cumans) by the Greeks, were crossing the Danube and entering Byzantine domains; some of them settled in Macedonia and were later known as Vardariotes. While the brothers Peter and Ivan Xsen laid the foundations of the second Bulgarian empire in the 1180s, the Normans under William of Sicily captured and sacked Salonika. After the diversion of the fourth crusade to Constantinople in 1204, a Latin kingdom of Salonika was set up for Boniface of Montferrat. Boniface however mas expelled from there in 1222 by Theodore Angelus, despot of Epirus, a Greek, who styled himself emperor of Salonika and ruled over almost all Rlacedonia. He in turn was defeated in 1230 by Tsar Ivan Asen II, who included northern Macedonia in the second Bulgarian empire while its southern Aegean part was taken by the eastern Roman emperors of Nicaea. Meanwhile the Serbian state was growing strong under the dynasty of Nemanya; Stephen Dushan (1331–55) conquered the western parts of Bulgaria and all Macedonia except Salonika, Epirus and Thessaly and was crowned at Skoplje (1346) as "tsar of the Serbs and Greeks." This state, however, was as short-lived as all others in this area.

Macedonia under the Turks.—Before attacking Constantinople the Turks established themselves in the Balkans. In 1340 they began the conquest of what is now Bulgaria. In 1371 they held most of Macedonia and in 1389 they sealed the fate of the mediaeval Serbian empire by defeating King Lazar at Kossovo. Salonika fell into Turkish hands for the first time in 1387, for the second in 1391 and finally in 1430. The best lands in the plains were distributed among the Turkish chiefs and a system of feudal tenure mas developed. The Christian peasants either were driven to the less fruitful regions or remained on the lands assigned to the Moslem lords, to whom they paid a tithe.

The ethnic conditions of Macedonia were still further complicated. Large colonies of Turks were settled in the plains, while the Moslem Albanians (called Arnauts by the Turks) spread eastward, occupying much land in western Macedonia. The Serbian element, which had been strengthened under Stephen Dushan. was weakened by the great northward emigration of 1691 and 1740. The national consciousness of Serbs and Bulgars alike suffered a heavy blow when the patriarchates of Pech or Ipek (Serbian) and of Ohrid (Bulgarian) were abolished in 1766 and 1777 respectively. From that time the spiritual control of the Christian peoples in the Balkans became vested solely in the Greek Phanar or ecumenical patriarchate of Constantinople. The Greeks continued to live in towns controlling trade, but from the 16th century onward they had to face serious competition among the Sephardic Jews, who, expelled from Spain, founded prosperous communities at Salonika and in other Macedonian towns. There were also, as centuries before, Vlachs (called Kutso-Vlachs by the Greeks and Tsintsars by the Slavs) and a few Armenians.

With the decadence of the central power in the Ottoman empire the condition of the Christian population of Macedonia worsened. The reforms of 1839 and 1856, both of which proclaimed the equality of races and religions, remained unfulfilled. In 1864 Macedonia was divided into three vilayets or provinces: that of Salonika; that of Monastir (Bitolj). which included parts of Albania; and that of Kosovo, with the capital at Uskub (Skopljej. which protruded into "Old Serbia."

The Bulgarian Exarchate.— In the 19th century the Russian empire, in pursuance of its designs on Istanbul and the Turkish straits. presented itself in the Balkans in the guise of a liberator, addressing itself in particular to the Bulgars. Russia started by pressing the Porte to agree to the creation of an autocephalous Orthodox Church for the Bulgarian people. After some resistance, the Porte acquiesced, hoping to strengthen its grip on the Balkans by dividing its Christian subjects. On Feb. 28, 1870, Sultan Abd ul-Aziz issued the firman creating the Bulgarian exarchate; "Christian" and "Greek" were no longer synonymous in European Turkey. The ecumenical patriarch succeeded in postponing for two years the appointment of the first Bulgarian exarch and then excommunicated him and his flock as schismatics.

In 1878. after a victorious campaign, Russia compelled Turkey to recognize the independence of Bulgaria. By the treaty of San Stefano (March 3), the new Bulgarian state was given the whole of Macedonia, except Salonika and Khalkidiki. But Great Britain had also its protégés in the Balkans and immediately and energetically vetoed this treaty as unfair to the Greeks of Macedonia. The treaty of Berlin (July 13), to which all the Great Powers were signatories, created in the northern part of the Danube vilayet. as Bulgaria was then styled, a Bulgarian principality with Sofia as capital under the suzerainty of the sultan; in the southern part was formed an autonomous province of Eastern Rumelia, with Plovdiv (Philippopolis) as capital, under a Christian governor appointed by the Porte, with the assent of the Powers. Russian-sponsored Bulgaria was thus seriously reduced in size, but the Macedonian strongholds of Hellenism remained under Turkey.

The artificial division of Bulgaria into two units did not last long; on Sept. 18, 1885, Bulgarian nationalists deposed the governor and proclaimed the union of Eastern Rumelia with Bulgaria. To the general surprise the coup succeeded, because Turkey abstained from intervening. The Russian tsar, however. was offended because his protégé Alexander of Battenberg, first prince of Bulgaria, with the advice of Stefan Stambulov, then the speaker of the Bulgarian *sobranje*, had dared to proclaim the unification without asking for Russian help. To recover their influence in Sofia, the Russians organized a coup d'état on Aug. 21, 1886, which enforced Alexander's abdication. On July 7, 1887, Ferdinand of Saxe-Coburg was elected second prince of Bulgaria. But clumsy Russian diplomacy only increased the Bulgarian people's spirit of independence. Stambulov, now premier, saw clearly that it was in Bulgaria's interest to establish friendly relations with Turkey; he was thus able to secure exequatur for Bulgarian bishops at Ohrid and Skoplje in 1891 and at Veles and Nevrokop in 1894. In 1894 Ferdinand felt strong enough to dismiss Stambulov and to make his peace with Russia, but he continued to cultivate the good grace of the sultan, his suzerain. In 1898 Bulgarian prelates were appointed bishops of Bitolj, Debar and Strumitsa. In 1900 Bulgaria had 785 schools in Macedonia, Serbia had only 178 and Greece 927.

Komitadzhi, Andartai and **Chetnitsi.**—The Sofia nationalists argued that the Slavs of Macedonia spoke a dialect akin to Bulgarian and therefore should be regarded as Bulgars and that all Macedonia should be incorporated into Bulgaria. The Belgrade nationalists affirmed that, as the Macedonian Slavs retained the custom of *slava* (feast of ancestors), common to all Serbs but not occurring among the Bulgars, they could not be genuine Bulgars, but were at best superficially Bulgarized Serbs, whose land, it was argued, should be incorporated into a greater Serbia. The Greek nationalists maintained that the few hundred thousands of "Slavophones" whom they acknowledged to be in Macedonia were attracted by the superior Greek culture and considered themselves of Greek nationality. The Rumanians had no territorial claims in Macedonia but considered it useful to support the Vlachs. whom they called Arumanians.

The liberation of Macedonia from the Turks was desired by all non-Moslem Macedonians. To prepare it, a group of Macedo-Slavonic leaders, Damian Gruev (1871–1906), Goche Delchev (1872–1903) and others. formed a secret Internal Macedonian Revolutionary organization (Vatreshna hlakedonska Revolutsionna Organizatsia or V.M.R.O.) in Salonika in Nov. 1893, which put forward a slogan of "Macedonia for the Macedonians" and the idea of a Balkan federation. After the fall of Stambulov (who died three days after being attacked by assassins in Sofia in July 1895), the Bulgarian nationalists had reason to believe that the Russian government would attempt to restore the Bulgaria of the San Stefano treaty. In March 1895 a Supreme Committee for Macedonia and Adrianople (Vrkhoven Makedonski Odrinski Komitet) was formed at Sofia; its aim was to prepare the incorporation of the whole of Macedonia and the province of Adrianople into Bulgaria. Ferdinand was not opposed to the idea of maintaining a pro-Bulgarian agitation in Macedonia and Thrace but ordered his war ministry to keep the V.M.R.O. and the Supreme committee under control. This, he thought should be simple, because both were to be supplied with money and arms from Sofia. The first president of the Supreme committee was Traiko Kytanchev, but, as the real power was in the hands of the war ministry, the position of president was nor easy and changes were frequent. From 1899 the president of the committee was Boris Sarafov (1872?–1907). His main task was to send guerrilla bands (hence the name of *komitadzhi* or "committeemen") into Macedonia to coerce the population into declaring itself Bulgarian and to make certain that the V.M.R.O. would follow Sofia's line.

Sofia was not the only Balkan capital from which such irredentist activity was organized in Macedonia. Athens was disconcerted by the progress of Bulgarian propaganda. The Greek religious and educational organizations were well established but fighting a defensive battle. To counteract the Bulgarian activities and also to bring about a war with Turkey, a newly formed Ethniki Hetairia was sending guerrilla bands of *andartai* into Macedonia. These succeeded in provoking the Graeco-Turkish War (*q.v.*) of 1897, which ended in the complete defeat of Greece and thus benefited the Bulgarian movement. By then the Turks were sufficiently informed about the underground activities of the V.M.R.O. and of the Supremists; to counterbalance their influence the Porte inclined to favour other nationalities. Serbia, cut off from expansion in Bosnia-Hercegovina by the Austrian occupation, could look only southward. A nationalist organization controlled by the ministry of war started sending *chety* (companies) of underground fighters into Macedonia to encourage a pro-Serbian movement among the Macedonian Slavs, and a Serbian source mentions the names of Yovan Dovezenski, Djordje Skopljanche, Gligor Sokolovich and Yovan Babunski as the most famous *chetnitsi*. At the same time Belgrade began to agitate for the restoration of the Serbian patriarchate of Pech; a prolonged conflict with the Phanar secured only the appointment of a Serb, Msgr. Firmilian Drazhich, as archbishop of Skoplje in 1902. In 1905 a Rumanian bishop was appointed at Bitolj. At that time there were about 40 Rumanian schools in Macedonia, including a *gynznasium* at Bitolj founded in 1866 by the priest Apostol Margaritis. The Bulgars did not like this Serbian and Rumanian trespassing into a land that they considered their own; but they concentrated their efforts on combating the Greeks and the Grekomans (as they called pro-Greek Macedonian Slavs). At this time it was Lambros Koromylas, the Greek consul-general at Salonika, who directed the whole secret organization of agents and bands upholding Hellenism against the Bulgars.

The terrorist activities of Bulgarian *komitadzhi,* Greek *andartai,* Serbian *chetnitsi* and also of Turkish bashi-bazouks created so serious a situation in Macedonia that on Feb. 21, 1903, the Russian and Austro-Hungarian ambassadors presented identical notes to the Porte demanding the appointment of an inspector-general for the three Macedonian vilayets and the reorganization of the *gendarmerie* with the aid of foreign officers. Sultan Abd ul-Hamid accepted the scheme. and the Sofia government, under Russian pressure. pretended to have dissolved the Supreme committee.

The V.M.R.O., however, was unreachable, and on Aug. 2, on the Ilinden (St. Ilya's day), a general rising started in Macedonia. The rising was no doubt inspired by Sofia. The Supremist agents assured Gruev and Delcliev that, once the insurgents had tied down a sufficient number of Turkish forces, the Bulgarian army would intervene. By the end of September, however, the rising was suppressed and the Bulgarian army, although partly mobilized, did not cross the frontier. Having achieved a complete surprise, the insurgents had some initial successes (especially in the Bitolj area, which for a while they controlled). According to Bulgarian sources, the insurgents numbered 15,000, of whom 948 were killed as compared with 3.087 Turks killed. Turkish repression was ruthless; 105 Macedo-Slavonic villages comprising 9.830 houses were destroyed, 1,778 noncombatant Macedonian Slavs were shot and 60,953 rendered homeless. Thousands fled to Bulgaria, and their leaders, Gruev in particular (Delchev had been killed in the fighting), complained of having been betrayed by Sofia. But Ferdinand was gratified because, he thought: the federalist tendencies of the V.M.R.O. had suffered a decisive blow so that thenceforward it would be easy to control.

On Oct. 9, 1903, the Russian and Austro-Hungarian governments submitted to the Porte a second part of their reform scheme. called, after the place of signature, the Miirzsteg program, which also was accepted by the sultan. Russian and Austrian civil advisers were attached to Hussein Hilmi Pasha, the Turkish inspector-general of Macedonia, and an Italian general was entrusted with the reorganization of the *gendarmerie.*

In 1905 Hilmi carried out in the three vilayets the first census of population since the Turkish conquest, which disclosed the following results: Moslems 1,720,007; Greeks 648,962; Bulgars 557,734; Serbs, 167,601; Jews and others 77,386; total 3,171,690. Under "Moslems" were included Turks and Albanians inhabiting the western part of the Monastir vilayet and the northwestern part of the Kossovo vilayet; under "Greeks," all the "Patriarchists," whether of Greek, Slavonic or Rumanian speech; under "Serbs," only those attending Serbian churches and schools, who were confined to the northern and northwestern districts of the Kossovo vilayet.

A Bulgarian source, dealing with Macedonia proper (*i.e.,* excluding the Albanian and "Old Serbian" sanjaks of the Monastir and Kossovo vilayets), gave the following figures for 1905: in a total population estimated at 2,258,224, there were 1,370,949 Christians, 819,23j Moslems and 68,040 Jews. From the point of view of nationalities. this source stated that there were 1,181,-336 Bulgars, 499,204 'Turks, 218,702 Greeks, 128,711 Albanians, 80,767 Vlachs, 68,040 Jews, 54,557 Gypsies, 700 Serbs and 16,207 others (Armenians, Circassians. etc.).

In June 1908, when King Edward VII paid a visit to Tsar Nicholas II at Reval, an Anglo-Russian program of limited autonomy for Macedonia was prepared; but one month later the bloodless revolution of the Young Turks broke out. The internal conflicts between the various nationalities in Macedonia came temporarily to a standstill, Using this opportunity, Bulgaria proclaimed itself independent and Ferdinand took the title of tsar. The hopes of Macedonian populations that the new Turkish regime would grant them territorial autonomy were disappointed. The policy pursued by the Young Turks, who attempted to transform a multinational Ottoman empire into a national Turkish state, brought about a gradual *rapprochement* between the governments of Bulgaria, Serbia and Greece. This *rapprochement* was converted in the summer of 1912 into a military alliance, and in October the allies, declaring that promises of reform in Macedonia and elsewhere had not been fulfilled, attacked Turkey.

The Balkan Wars and World War I.—Bulgaria and Serbia concluded an agreement stipulating that Bulgaria should annex "the territory east of the Rhodope mountains and the river Struma," while Serbia was to annex the lands lying "north and west of the Shar Planina." But so great was their mutual distrust that no agreement could be reached as to the destiny of the main bulk of Macedonia. The Serbo-Bulgarian treaty of March 13, 1912, stipulated that, if autonomy for the rest of Macedonia were found to be impossible, the two states were to accept a partition along a line running roughly southwestward irom Kriva Palanka through Veles to Ohrid; alternatively, the tsar oi Russia would be asked to arbitrate and fix the Serbo-Bulgarian frontier in Macedonia. Between Greece and Bulgaria the feud was even deeper; and no previous agreement had been reached as to the ultimate distribution of territory to be taken from Turkey. Such a situation was iraught with danger, and, after the Balkan league's victorious campaign against the Turks, the Bulgars, on June 29, 1913, suddenly turned on their allies. Defeated by both Serbs and Greeks, and attacked irom the rear by the Rumanians, the Bulgars had to sue for peace. (*See* BALKAN WARS.) The treaty of Bucharest of Aug. 10, 1913, divided Macedonia as follows Greece took the southern half of it, with a new northern frontier running from Lake Prespa through Kajmakcalan to Lake Doiran, then eastward along the Belasitsa range and the lower Mesta; Bulgaria received the Strumitsa district, with the Pirin massif; and Serbia had the remainder.

When World War I broke out in 1914, Ferdinand thought that destiny had presented him with a chance of revenge and of realizing his territorial ambitions in Macedonia. Bulgaria entered the war in Oct. 1915, on the side of the Central Powers and rapidly occupied not only all Serbian Macedonia but also parts of Serbia proper. The Allies landed at Salonika to help Serbia, but only in 1918 were they able to carry through a successful offensive, which led to the Bulgarian armistice of Sept. 29, 1918. The treaty of Neuilly (Nov. 27, 1919) leit the Graeco-Yugoslav frontier unchanged but transferred the district of Strumitsa to Yugoslavia. Greek or Aegean Macedonia then had 13,361 sq.mi.; Yugoslav or Vardar Macedonia, 10,229 sq.mi; Bulgarian or Pirin Macedonia, 2,621 sq mi.

The 1920s and 1930s.—During the period between the outbreak of the first Balkan War and the end of World War I, certain movements of population had taken place in Macedonia: about 100,000 Turks had fled or been transported to Turkey in 1912–13; many pro-Bulgarian Macedonians had fled to Bulgaria in 1913 and many others in 1918; and in 1913 the Greeks from Melnik, Strumitsa and Bitolj had withdrawn to Greek Macedonia. After the treaty of Neuilly, moreover, about 25,000 Greeks left Bulgaria and 46,878 Bulgars left the eastern half of Greek Macedonia (approximately 80,000 "Slavophones," however, preferred to remain in the western hali). A much more radical exchange of population was that which took place under the Lausanne convention (Jan. 21, 1923), after Greece's deieat in Anatolia: 375,976 Turks leit Greek Macedonia and 638,253 of the 1,222,000 Greek refugees from Turkey were installed in their place.

No exchange of population took place in Yugoslav Macedonia. The Belgrade authorities considered the Macedonians as Southern Serbs and, to make the population thoroughly Serbian, took steps to repress pro-Bulgarian sentiments. This soon led to new tension. In 1920 the V.M R.O. was revived and Todor Aleksandrov (or Alexandrov) became its leader. It started a campaign of terrorism in Yugoslav Macedonia. When in March 1923 Aleksandr Stamboliski (*q.v.*), the Bulgarian premier, attempted to make terms with Yugoslavia, Aleksandrov declared "irrevocable hostility" against his government. Macedonians took an active part in overthrowing Stamboliski and in his assassination (June 1923).

A movement for an autonomous province within a federal Yugoslavia was born with Pero Shandanov as its leader, but the Belgrade government gave it no support. In April 1924, in Vienna, Dimiter Vlahov, a Macedonian Communist (and a former Bulgarian civil servant), persuaded Aleksandrov to fight for an autonomous Macedonia within a Communist Balkan federation. A manifesto along these lines, signed on May 6 and published on July 15, frightened the Sofia government; and on Aug. 31, 1924, Aleksandrov was assassinated in his Pirin hiding place. Gen. Aleksandr Protogherov (Alexander Protogueroff) and Ivan Mikhailov then became the leaders of the V.M.R.O. Mikhailov organized the assassination of many federalist Macedonian leaders and eventually of Protogherov himself, in Sofia on July 7, 1928, because he opposed the policy of assassinating federalists indiscriminately.

Yugoslav security measures made V.M.R.O. activity in Macedonia more difficult; and in the 1930s, as Fascist Italy began to exploit the organization, opposition to its activity increased also among Bulgarian politicians and army officers. On May 19, 1934, when a government headed by Kimon Gheorghiev and Col. Damian Velchev took power in Sofia, the V.M.R.O. was dissolved, its leaders were arrested and its members disarmed. Mikhailov escaped to Turkey, whence he later went to Germany.

World War II and After.—When Yugoslavia was partitioned in 1941 by the Axis powers, Bulgaria again occupied almost all Macedonia; a few northwestern districts, however, were incorporated into Albania and some southwestern ones occupied by the Italians, while Salonika (where only 9,000 of the 50,000 Jews escaped the gas chambers) was occupied by the Germans.

On July 12, 1943, at Petrich, in Bulgarian Macedonia, Dushan Daskalov, on behalf of the Bulgarian Communist party, and Yannis Ionnidis, on behalf of the Communist party of Greece, signed an agreement stipulating that the whole of Macedonia after the war should be an independent republic within the Balkan Communist iederation. By then, however, the importance of Tito (Josip Broz) was growing inside Yugoslavia. In Tito's opinion Balkan iederation should be effected under the leadership of the Communist party of Yugoslavia; and already in Feb. 1943 he had sent Svetozar Vukmanovich (General Tempo) to Skoplje to organize a Macedonian section of the Yugoslav liberation movement. In 1945 Vlahov became chairman of the presidium of the Macedonian national assembly and vice-president of the federal republic of Yugoslavia, while Lazar Kulishevski became premier of the republic of Macedonia (with Skoplje as capital).

Immediately after the war Tito was looking south, toward Salonika. At Skoplje on Oct. 11, 1945, he said: "We shall never renounce the right of the Macedonian people to unite. There are brothers in Aegean Macedonia to whose destiny we are not indifferent." The peace treaty with Bulgaria, signed in Paris on Feb. 10, 1947, nevertheless introduced no changes in the territorial settlement in Macedonia as fixed in 1919, although the Greek government attempted to put in a claim to the Pirin area. But at that time the second Communist rising in Greece was in progress and the future of the country was in the balance. At a meeting at Bled, in Aug. 1947, between Tito and Gheorghi Dimitrov, the Communist premier of Bulgaria, it was agreed that, on the successful conclusion of the Greek Communist rebellion, Greek Macedonia should be incorporated into Yugoslav Macedonia, that Greek Thrace should become part of Bulgaria and that a great South-Slav federation uniting Yugoslavia and Bulgaria should be formed. In Jan. 1948, however, Moscow, already exchanging somewhat cool notes with Tito, rebuked Dimitrov for supporting such a plan; and on June 28, 1948, the breach between Tito and Moscow was made public.

In Nov. 1948 an organization of Macedonians in Bulgaria was allowed to announce that the only correct and democratic solution of the problem was a Macedonian state equal to Yugoslavia and Bulgaria; and in March 1949 the Greek rebel government (which had its seat in the Vitsi massif in Greek Macedonia) sponsored a similar plan. Tito's reply, the closing of the Graeco-Yugoslav frontier (announced on July 10, 1949), contributed much to the crushing of the rebellion in Greece (September).

From 1950 onward Graeco-Yugoslav relations improved steadily. The pact of friendship (Feb. 28, 1953) and the subsequent military alliance (Aug. 9, 1954) between Greece, Yugoslavia and Turkey made a Graeco-Yugoslav dispute over Macedonia most unlikely.

POPULATION

Yugoslav Macedonia had in 1931 a total population of 949,958. The census of 1948 revealed a population of 1,152,986, including 762,120 (66.1%) Macedonians, 197,423 (17 2%) Albanians, 95,987 (8.4%) Turks and 9,508 (0.8%) Vlachs. According to the census of 1961, the republic of Macedonia had a population of 1,404,883.

Greek Macedonia, at the time of the census of 1928, had 1,412,477 inhabitants; by the census of 1940 this total had risen to 1,759,130. The latter figure included 1,487,571 Greek-speaking persons (84.6%) and 80,310 Turkish-speaking hut Christian Greeks (4.6%); there were also 84,751 "Slavophones" (*i.e.,* 66,665 Macedonians and 18,086 Pomaks or Bulgarian-speaking Moslems; together 4.8%), 48,874 Sephardic or Spaniole Jews and 26,750 Vlachs. The census of 1961 revealed a total population of 1,887,650.

In Bulgarian Macedonia the population census of 1934 was 206,814 and that of 1946 was 252,258 (in the districts of Gorna Dzhumaya, Razloe, Petrich, Sveti Vrach [Sandanski] and Nevrokop [Delchev]). In 1956 the population was 281,636. No Macedonian nationality was recognized in Bulgaria. The data oi 1934 showed 84.7% to be Orthodox Christians (2% of whom were Vlachs). If this basis is adopted for 1946, the population might be reckoned to comprise about

209,000 Bulgars or Macedonians or both, 5,000 Vlachs and 38,000 Turks, Pomaks and others

MACEDONIAN ARMY. The army created by Philip of Macedon, the military instrument used by his son Alexander the Great in the conquest of the Persian empire, though based on the old Doric hoplite phalanx, was so superior to it that the genius of the great Macedonian cannot be appreciated without a comparison with the older organization.

The Early Greek Army.—The phalanx was the natural tactical formation for a military citizen levy, that is, a body of men whose training and tactics had to be of the simplest nature. Battles always took place on level ground, and normally in narrow valleys where the only manoeuvre possible was a forward or backward movement to drive the enemy out of the valley or into his city, or village, situated in it. Generally speaking, sieges were but holding operations carried out in order to enable the valley to be ravaged, for the economic attack was the main object of early Greek warfare. Except in Thessaly and Macedonia, cavalry was practically unknown until after the Persian wars, and though the bow was an old and respected weapon, used on occasion, as in the Plataea campaign (479 B.C.), it was not suited to a raw citizen force, since a bowman required a far more intensive training than a hoplite.

The phalanx formed a compact tactical body of files of men in varying depth. A file of eight men seems to have constituted the normal number, but frequently this was varied according to the personal predilection of the general from two to as many as twenty-five. In a phalanx of eight deep only t o ranks were engaged, the rear ranks constituting a reserve for the replacement of casualties; also their object was to exercise physical and moral pressure on the leading two. The phalanx was based on two principles, producing opposite effects—depth which gave weight, and length which allowed for outflanking. Normally, depth was preferred to length because of the difficulty of moving a long line forward, especially if the ground was rough or at all broken.

The difficulty of harmonizing these two principles is clearly seen in the formation made use of by Miltiades in the battle of Marathon, 490 B.C. He was faced by the Persian army, which not only was numerically superior to his own but which possessed a strong cavalry force. The battlefield was a narrow plain flanked by two streams, but his phalanx if maintained eight ranks deep would have provided too narrow a front for him to rest its flanks on these obstacles. He, therefore, weakened the centre' by thinning it to probably four ranks, leaving the flanks at their normal depth. When the two armies clinched, the Grecian centre was driven in but not broken; the result of this was a double envelopment of the Persians, and their defeat.

All hoplites wore armour, for it was recognized that a man without armour was not equal to one wearing it. This armour consisted of a large oval shield, helmet, breastplate and greaves, weighing 57 lb. The offensive weapons were a strong Doric spear from 6 to 10ft. in length, and a sword. The total weight carried by the hoplite was 72 lb., an impossible load for either long or rapid marches; consequently we find that each hoplite was accompanied by a slave who acted as shield-bearer, and who took part in the engagement as a lightly armed soldier; he was also a forager and a pillager.

The weak points of the phalanx were its flanks. Should the enemy succeed in attacking a flank whilst the front was engaged, the phalanx was lost. The flanking files were not only incapable of resisting an attack, but if forced to halt and face the enemy they immediately compelled the entire phalanx to stand still. When phalanx met phalanx this defect was not serious; but when, as in the Persian wars, the Greeks were confronted by cavalry

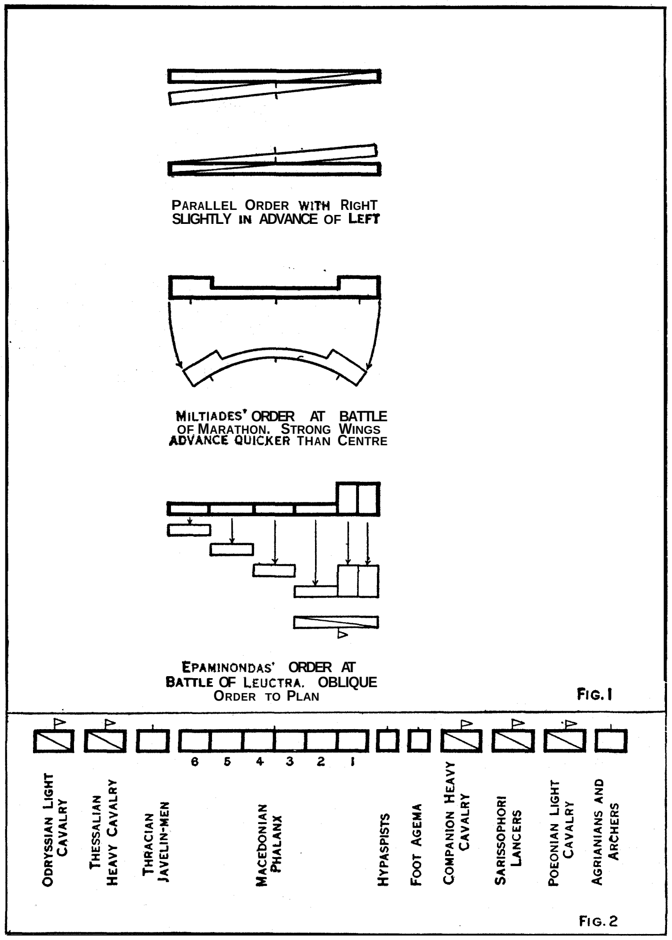

FIG. 1 SHOWS THE BATTLE ORDER OF THE GREEK PHALANXES WHILE FIG. 2 IS THE TYPICAL LINE OF BATTLE ADOPTED BY BOTH PHILIP OF MACEDON AND ALEXANDER

the danger of a charge against an exposed flank became obvious, and the result of this was a slow but noticeable interest taken in the cavalry arm. In the normal battle between hoplites, it generally happened that both sides tended to bear somewhat to their right; since each man felt that his right side was the less protected, consequently he tried to approach the enemy from the right. The tactical consequence of this was the development of an oblique order of attack, the value of which was first fully grasped by Epaminondas, and made use of by him at the battles of Leuctra (371 B.C) and Mantineia (362 B.c.). This famous general was a true artist of war, since he understood how to combine infantry and cavalry according to the value of the ground fought over. So great was his discovery of refusing one wing and concentrating his main blow in the other, that his tactics formed not only the model for Alexander but for Frederick the Great as well.

Organization of the Macedonian Army.—The tactical conception as expounded by Epaminondas was adopted and developed by Philip of Macedon. Macedonia consisted mainly of plains, and had but a small urban population. The majority of the peasants were shepherds and too poor to maintain hoplite armour, consequently their spearmen, or peltasts, were lightly and indifferently equipped; they carried a light round shield, a tunic of leather or quilted linen, several javelins and a sword. These men when required formed the national levy, but the main arm relied upon by the kings of Macedonia was a body of mounted nobles. From these two elements Philip set to work to refashion his army.

Philip, when a hostage in Thebes, the city of Epaminondas, had learnt to appreciate the strength and weakness of trained mercenaries; their discipline was magnificent but they were lacking in patriotism. On his return to his kingdom, he determined to model his troops on what was then a new idea, namely, a highly-trained and disciplined standing army. This force being patriotic and disciplined would possess both the virtue of the old militiaman and the skill of the trained mercenary. As he already possessed the best cavalry in Greece, if he could now raise an efficient force of infantry, and combine these two arms scientifically, he would create for himself an instrument more powerful than that of any city or state in Greece. The system he worked on is not fully known, but much of it can be discovered from an analysis of the army commanded by his son, for it was only towards the close of Alexander's reign that changes in Philip's organization were made. First Philip took the Spartan phalanx as his model, but in place of looking upon it as an offensive force, he organized it as a stable base from which offensive action could be developed by his cavalry, This protective base he armed with a pike called the sarissa, which was in length double, or nearly double, that of the Spartan weapon, which at this time was about $10\frac{1}{2}$ft. long. This lengthening of the pike may be conipared to increasing the range of a modern rifle, for it meant that the enemy armed with the short pike would be outranged. It is true that the sarissa was a clumsy offensive weapon, but, as far as can be gathered, Philip never intended it as such; what, apparently, he aimed at was the establishment on the battlefield of an impenetrable wall of spikes, a mobile fortress upon which his cavalry could pivot and manoeuvre. This protective tactical base was organized into six divisions, each consisting of about 5,000 men. Each of these men, as in the Spartan phalanx, was allowed one or more servants who were lightly armed and could be employed for forays, raids and operations in hilly country.

To the phalanx Philip attached two cavalry wings, mobile arms which could hit out from it; the right wing was in idea offensive, and the left defensive. The main strength of the right lay in the Macedonian cavalry—the Companions—and of the left in the Thessalian cavalry, the second best cavalry in the army. As both these forces of cavalry were mainly for shock action, Philip added to each wing bodies of light cavalry; normally, the Sarissophori, or Lancers, and the Paeonians were allotted to the right wing, and the Odryssian cavalry to the left. Between the cavalry of the right wing and the right of the phalanx Philip inserted a "joint" of highly trained and armoured infantry known as the Hypaspists, of which a picked body constituted the Agema, or Royal Foot Guards, just as a selected regiment of the Companion cavalry, the cavalry Agema, were the Royal Horse Guards. This armoured infantry carried the short pike and were not protective troops like those of the phalanx, the Pezetaeri, but mobile offensive troops which normally, when the cavalry of the right wing charged forward, simultaneously protected the cavalry's left flank and the right flank of the phalanx. Should the charge of the heavy cavalry succeed, the Hypaspists, under cover of the cavalry on their right flank and the phalanx on their left, could take advantage of the enemy's disorder and work into his shattered front. The only point of weakness remaining was the right, or outer, flank of the right wing cavalry, which Philip protected by a body of skilled light infantry, the Agrianians, archers and the Thracian javelin-men.

A comparison between the Macedonian organizations and those of the Spartans and, later on, the Thebans under Epaminondas, shows clearly the genius of Philip. In the Spartan phalanx tactics were little more than push of pike, in which drill and courage generally won the day. In Epaminondas's battle order is seen clearly the idea of concentration of force against a weak point, but the blow is still delivered by infantry and is consequently slow, the Theban cavalry being no more than a protective force to the decisive infantry attack. In Philip's order organization is scientific. First, the moral element is not only based on discipline but on patriotism; secondly, the protective element is fully developed in the armoured and sarissa-armed Pezetaeri and the light infantry; thirdly, the offensive element is represented by the Hypaspists; and fourthly, the mobile element by the cavalry. Nor was this all, for these elements were so combined as to form a single co-operative organization, probably the most wonderful ever devised by a single man, and one much more scientifically perfect than any existing to-day. In the attack, the tactical base is the phalanx, for it can engage the enemy and hold him, and whilst the left wing guards the left flank of the phalanx the right wing can punch out from it with terrific force. The Hypaspists assault, and do not merely hold; the heavy cavalry charge, and do not merely wash round the enemy, and they can do so because their outer flank is well protected by light infantry, who are secured against being ridden over by light cavalry who not only are ever ready to support them, but who, by swarming round the enemy's left wing and rear, pin down his initiative, By means of this superb organization Alexander won victory after victory. Not only was he never defeated, but whether he fought on the plains or in the mountains, his army proved itself equally adaptable to the work it was asked to carry out. That it never failed him is the greatest possible proof of the organizing genius of his father.

The Tactics of Alexander the Great.—The tactics developed from Philip's organization by Alexander were multiform, especially in his lesser campaigns. In his great battles, however, may be discovered two tactical constants which are deserving of careful study The first is the rear attack on the enemy, and the second, the protection of this attack. The rear attack was developed out of the oblique order. The phalanx advancing in echelon with its left refused struck the enemy with its right division. This division held in its grip such of the enemy as confronted it; the rest of the enemy, unopposed, moved forward until they came into contact with the divisions on its left, and when they were also fixed, the enemy's right wing attempted to envelop the left flank of the Macedonian phalanx, but was held off by repeated charges of the left-wing cavalry. Whilst this action mas being fought out the right-wing cavalry smashed through the enemy's left wing, and by wheeling to the left took the enemy's obliqued front in rear. Now as to the protection of the decisive attack which is closely connected with this operation.

If the phalanx were to advance in a solid line parallel to the enemy's front, it could simultaneously fix the enemy's front and protect the left flank of the decisive attack. *(See* fig. 3). But if it advances in echelon (a) *(see* fig. *4)* it can protect not only the inner flank of *(f)* but also its rear should an enemy attack break through (g) the archers and javelin-men *(e).* Similarly (d) and *(e)* advancing in echelon with their left forward, protect the right flank of the decisive attack. The rapid advance of (f) pulls forward the right of the phalanx and the left of *(e)* forming *a* protective funnel for the charge and probably forcing the enemy at *(h)* to *(h')*. Should attack of (f) towards *(i)* succeed, *(f)* can move by *(j)* and attack *(h')* in rear.

The Siege Train and Artillery of the Macedonian Army.—Before the days of Philip of Macedon siege warfare had been little studied by the Greek city states, consequently the defensive remained the stronger form of war. Until fortresses could be stormed there was small likelihood of any centralization of government, and this had been the outstanding curse of Greece. Philip, realizing this, turned his attention to siege warfare, and, though during his reign his siege operations were not uniformly successful, no fortress, even the immensely strong city of Tyre, successfully withstood the engineering ability of his son. In the Macedonian army there was established a special corps of engineers equipped with all the necessary machinery for carrying out sieges, and for crossing rivers. At the siege of Tyre, movable towers, rams and floating battery were used, and in India a pontoon train was added to the army so that the Indus, Jhelum and other rivers could rapidly be crossed. Though siege artillery had long been known in the east, Philip introduced field artillery in the form of wagon-carried catapults and ballistae, of which Alexander made frequent use in his mountain campaigns and in river-crossing operations. It was quite as much due to the Macedonian siege train as to the field army that Alexander was able to overthrow the Persian empire, for all its more important cities were strongly fortified.

Command and Administration of the Macedonian Army. — Though little information is forthcoming on the interior economy of the Macedonian army, it is known that its command rested absolutely in the hands of Philip, and after him in those of Alexander. This was an enormous advantage, since in most of the Greek states generals were elected yearly, and frequently more than one was placed in supreme command. Philip is reported to have said: "I envy the good luck of the Athenians; each year they are able to find ten men fit to command their armies, whilst I have only been able to find Parmenio to lead mine." Lack of unity of command was the ruin of Athens.

When Alexander ascended the throne of Macedon, in every sense, he was commander-in-chief. Under him came two deputy chiefs — Parmenio and Antipater. The first represented the military and the second the civil government, for whilst Parmenio accompanied Alexander to Asia, Antipater was left at home as viceroy. In battle Alexander commanded the right wing and Parmenio the left. For his personal staff Alexander had seven aides-de-camp, or *Somatophylaxes,* who were frequently appointed to command special detachments. Of his administrative directors and officers next to nothing is known, but those services

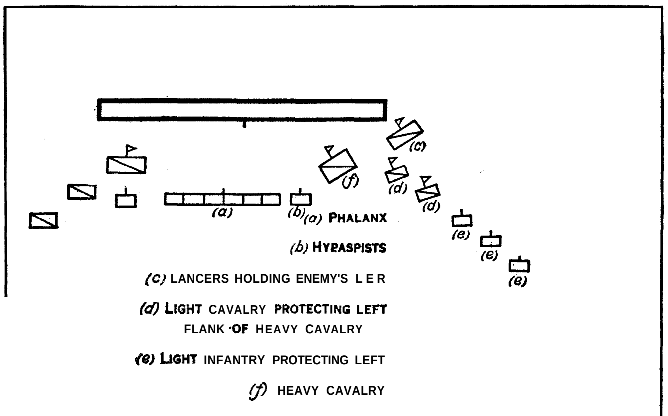

FIG. 3

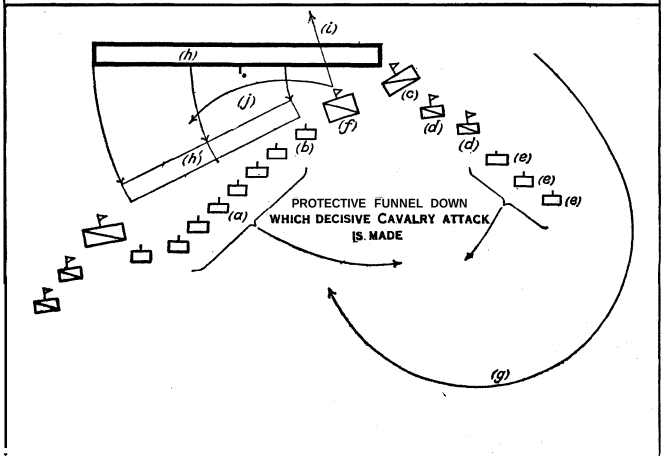

FIG. 4

FIGS. 3 AND 4. — TYPES OF DECISIVE ATTACKS EMPLOYED BY ALEXANDER THE GREAT

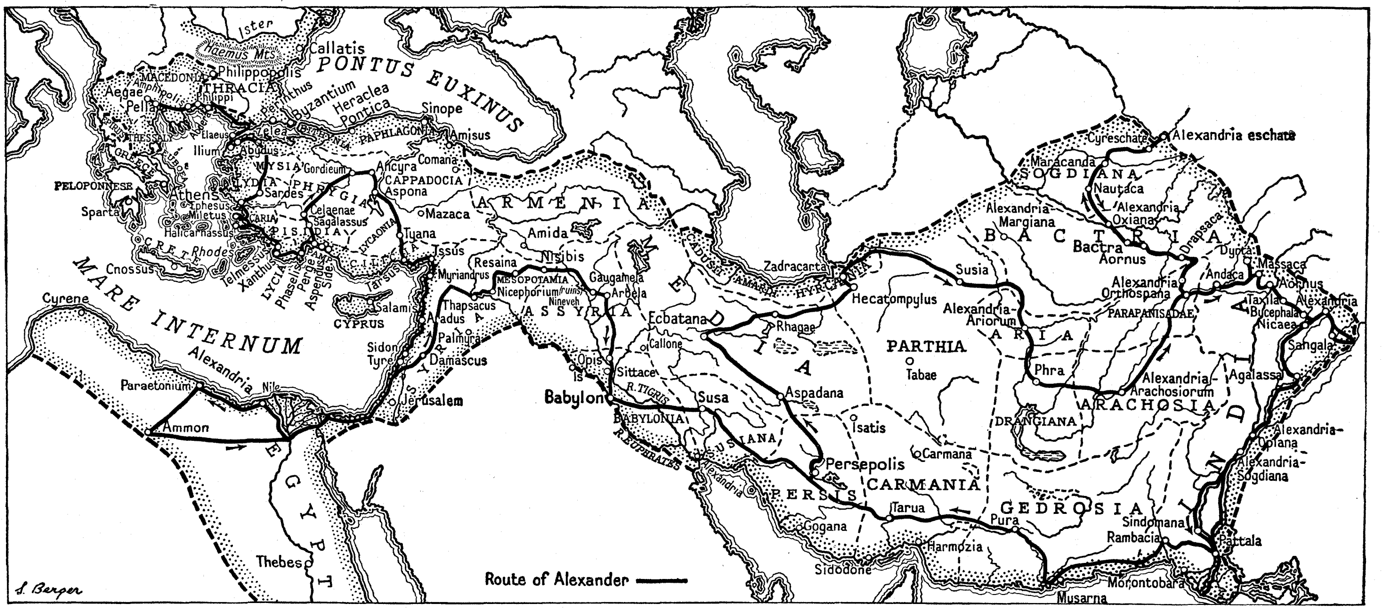
which to-day would fall under the quartermaster-general's and adjutant-general's departments, and the ordnance and medical services, must have been highly organized, otherwise it would have been impossible for him to maintain the army in Asia. To do so demanded most careful supply work and security of the lines of communication, for whilst he was in Babylonia, Persia and India, thousands of recruits were sent out to him as well as great quantities of arms and armour. To despatch reinforcements and stores across land from Greece to the Indus and beyond would require even to-day the highest administrative ability, and without these reinforcements Alexander could not have continued his conquests. Eventually, when he reached the Sutlej, the abandonment of a further advance was probably due as much to the immense time it took to supply and reinforce his army as to any other cause.

The Decline of the Macedonian Army. — The decline of the Macedonian military organization took place during the latter campaigns of Alexander, the main reason being that Greece was unable to supply him with a sufficiency of recruits. He consequently had largely to rely on Asiatics whose tactics were mainly based on projectile weapons — the javelin and the arrow. Arrian informs us that shortly before his death he reorganized his army, creating a phalanx 16 men deep, the first three ranks and the last consisting of Macedonians armed with the sarissa, and the 12 middle ranks of Persians armed with bows and javelins. This organization would appear to be a latter-day invention as are most of the tactics and drill attributed to the Macedonians by Aelian, Arrian and Vegetius.

During the wars of the Diadochi, though generalship was frequently of a high order, and strategical combinations were far more intricate than in the days of Philip and Alexander, the decline, and eventually the decay, of the Macedonian army was rapid and pronounced, until under Ptolemy II. (309–246 B.C.) we find a return to the old horde system, for according to Appian this monarch possessed an army of 200,000 infantry. 40,000 cavalry, 300 elephants and 2,000 war chariots, and a fleet of 1,500 warships and 2,000 transports. Efficiency and organization had once again been replaced by numbers and mass. There were three immediate reasons for this decline. The first was the sudden loss of Alexander's genius; the second, the imitation of his actions without understanding them, and the third the immense influx of gold from Persia. The first two have been patent to military history, the third was exceptional, and is, consequently, of particular interest.

The influence of gold on the art of war of this period was a twofold one: first, it placed mercenary service more than ever on a commercial footing; and, secondly, through the stimulus it gave to science and industry, projectile weapons began to replace shock. From the death of Alexander onwards for some 50 years the money he intended to spend on the reconstruction of his empire was expended on war, in which mercenaries were sold and bought, frequently on the battlefields themselves, as if they were commodities. Though this did not necessarily destroy the discipline of the soldiers, leadership rapidly deteriorated, and the heroism of Alexander, which was the soul of his generalship, was replaced by a more intellectual form of command, the leader of men evolving into the diplomatic commander of armies. When the campaigns of such a man as Eumenes are examined, the change is astonishing. He is as crafty as a fox, in fact is an epitome of his age. Not only does he have to keep his plans secret from his men, but even the enemy they are to battle with. Witness the artfulness of Seleucus at the battle of Ipsus; he rides round his enemy, but he does not charge home; he can charge, but he refrains from doing so until he has won over the deserters. What is seen in all these subtler actions is the replacement of the old physical attack by the moral attack but without changing the physical means. Blows give way to suggestions, and are aimed at the brain rather than the body. It is an occult transformation of military power, but once the clue is found, the change is clearly discernible, and becomes more and more so until, under Hannibal, it is developed to so high a pitch that his presence in any quarter of Italy paralyses Roman action.

The other influence of gold was the founding of great cities such as Alexandria, in which was collected the intellect of the age. Gold-power was transformed into brain-power, and, as these were warring times, warfare became more and more mechanized, muscle being supplemented by machinery. It has often been asserted by historians that the introduction of war engines caused a decadence in the art of war. This is only a half-truth, for the decline of the Macedonian system was due not to the introduction of alephants and artillery, ,but to generalship which took little notice of them, and which attempted to use men against



MAP OF THE MACEDONIAN EMPIRE AND THE ROUTE OF ALEXANDER THE GREAT OF MACEDONIA IN HIS SERIES OF MILITARY VICTORIES (334–323 B.C.)

them in the same manner as before their adoption. Valour was thus destroyed, not by invention but by stupidity. It was because so many generals of this epoch did not understand the influence of new weapons on tactics and *moral* that a decadence set in, and not because these weapons were more powerful than the older ones. Intelligence was the foundation of Philip's military system, and lack of it destroyed it rather than such weapons as the Polybolos of Dionysius, an arrow-throwing "machine-gun," or the cross-bow of Ctesibius, which was geared by pistons working in cylinders filled with compressed air. (J. F. C. F.)

MACEDONIAN EMPIRE, the name generally given to the empire founded by Alexander the Great of Macedon in the countries now represented by Greece and European Turkey, Asia Minor, Egypt, Syria, Persia and eastwards as far as northern India. The present article falls naturally into two main divisions—I. The reign of Alexander. II. The period of his successors, the "Diadochi" and their dynasties.

I. THE REIGN OF ALEXANDER

At the beginning of the 4th century B.C. two types of political association confronted each other in the lands of the Eastern Mediterranean—the Persian monarchy with its huge agglomeration of subject peoples, and the Greek city-state. Each had a different principle of strength. The Persian monarchy was strong in its size, in the mere amount of men and treasure it could dispose of under a single hand; the Greek state was strong in its *moral,* in the energy and discipline of its soldiery. But the smallness of the single city-states and their unwillingness to combine prevented this superiority in quality from telling destructively upon the bulk of the Persian empire. The future belonged to any power that could combine the advantages of both systems, could make a state larger than the Greek city, and animated by a spirit equal to that of the Greek soldier. This was achieved by the kings of Macedonia. The work, begun by his predecessors, of consolidating the kingdom internally and making its army a fighting-machine of high power was completed by the genius of Philip II. (359–336 B.C.), who at the same time by war and diplomacy brought the Greek states of the Balkan peninsula generally to recognize his single predominance. At the synod of Corinth (337) Philip was solemnly declared the captain-general (*στρατηγὸς αὐτοκράτωρ*) of the Hellenes against the king of Persia, and in 334 his son and successor Alexander delivered his attack at the head of an army composed both of Macedonians and contingents from the allied Greek states. Before this force the Persian monarchy went down, and when Alexander died eleven years later (323) a Macedonian empire which covered all the territory of the old Persian empire, and even more, was a realized fact.

System of Government.—The conquered empire presented Alexander with a system of government ready-made, which it was natural for the new masters to take over. For the Asiatic provinces and Egypt. the old Persian name of *satrapy* (see SATRAP) was still retained. The governors appointed by Alexander were, in the west of the empire, exclusively Macedonians; in the east, members of the old Persian nobility were still among the satraps at Alexander's death

Alexander had at first trusted Persian grandees more freely in this capacity, till the ingrained oriental tradition of misgovernment so declared itself that to three more provinces at least Macedonians had been appointed before his death. In the case of certain provinces, possibly in the empire generally, Alexander established a double control. The financial administration was entrusted to separate officials; we hear of such in Lydia, Babylonia and notably in Egypt. Higher financial controllers seem to have been over groups of provinces, and Harpalus over the whole finances of the empire, with his seat in Babylon. Again, the garrisons in the chief cities, such as Sardis, Babylon, Memphis, Pelusium and Susa, were under commands distinct from those of the provinces. The old Greek cities of the motherland were not formally subjects of the empire, but sovereign states, which assembled at Corinth as members of a great alliance, in which the Macedonian king was included as a member and held the office of captain-general. Of course, in fact, the power of the king was so vastly superior that the Greek cities were in reality subject to his dictation, even in so intimate a matter as the readmission of their exiles, and might be obliged to receive his garrisons. Within the empire itself, the various communities were allowed, subject to the interference of the king or his officials, to manage their own affairs. Alexander is said to have granted the Lydians to be "free" and "to use the laws of the ancient Lydians," whatever exactly these expressions may mean. So too in Egypt, the native monarchs were left as the local authorities. Especially to the gods of the conquered peoples Alexander showed respect. In Egypt and in Babylon he appeared as the restorer of the native religions to honour after the unsympathetic rule of the Persians. The temple of Marduk in Babylon which had fallen began to rise again at his command. It is possible, but not probable, that he offered sacrifice to Yahweh in Jerusalem. In Persia, the native aristocracy retained their power, and the Macedonian governor adopted Persian dress and manners. A new factor introduced by Alexander was the foundation of Greek cities at all critical points of intercourse in the conquered lands. These, no doubt, possessed municipal autonomy with the ordinary organization of the Greek state; to what extent they were formally and regularly controlled by the provincial authorities we do not know. The empire included large tracts of mountain or desert, inhabited by tribes, which the Persian government had never subdued.

Alexander, who set out as king of the Macedonians and captain-general of the Hellenes, assumed after the death of Darius the character of the oriental great king. He adopted the Persian garb, including a head-dress, the *diadema,* which was suggested by that of the Achaemenian king. We hear also of a sceptre as part of his insignia. The pomps and ceremonies which were traditional in the East were to be continued. To the Greeks and Macedonians such a régime was abhorrent, and the opposition roused by Alexander's attempt to introduce among them the practice of *proskunesis* (prostration before the royal presence) was bitter and effectual. The title of *chiliarch,* "commander of a thousand," *i.e.,* of the royal body-guard, was conferred by Alexander upon his friend Hephaestion. The Greek Chares held the position of chief usher. Another Greek. Eumenes of Cardia. was chief secretary. The figure of the eunuch, so long characteristic of the oriental court, was as prominent as ever.

Alexander, however, who impressed his contemporaries by his sexual continence, kept no harem. The number of his wives did not go beyond two, and the second, the daughter of Darius, he did not take till a year before his death. In closest contact with the king's person were the seven, or latterly eight, body-guards, Macedonians of high rank, including Ptolemy and Lysimachus, the future kings of Egypt and Thrace. The institution, which the Macedonian court before Alexander had borrowed from Persia, of a corps of pages composed of the young sons of the nobility, continued to hold an important place in the system of the court and in Alexander's campaigns.

Macedonian Army. — The army of Alexander was an instrument which he inherited from his father Philip. *(See* MACEDONIAN ARMY)

Later modifications in the army system were closely connected with Alexander's general policy, in which the fusion of Greeks and Asiatics held a prominent place. He had himself, as we have seen, assumed to some extent the guise of a Persian king. The most striking declaration of his ideals was the marriage feast at Susa in 324, when a large number of the Macedonian nobles were induced to marry Persian princesses, and the rank and file were encouraged to take Eastern wives. Among the schemes registered in the state papers was one for transplanting large bodies of Asiatics into Europe and Europeans into Asia, for blending the peoples of the empire by intermarriage into a single whole.

Divine Honours. — High above all the medley of kindreds and tongues, untrammelled by national traditions, invested with the glory of achievements in which the old bounds of the possible seemed to fall away, stood in 324 the man Alexander. Was he a man? The question was explicitly suggested by the report that the Egyptian priest in the oasis had hailed him as the son of Ammon. The Egyptians had ascribed deity to their kings, and were ready enough to add Alexander to the list. It is also not unlikely that the Persian kings had received some form of divine worship (L. Taylor, *Journ. Hellenic Studies,* 1927, p. 153, ff.) From the Greeks he certainly received such honours. It has been supposed that in offering such worship the Greeks showed the effect of "Oriental" influence, but certainly we have not to look outside the Greek circle of ideas to explain it. As early as Aeschylus (*Supp.* 991) the proffering of divine honours was a form of expression for intense feelings of reverence or gratitude towards men which naturally suggested itself — as a figure of speech in Aeschylus, but the figure had been translated into action before Alexander not in the well-known case of Lysander only (cf. the case of Dion, Plut. *Dio.* 29). Among educated Greeks rationalistic views of the old mythology had become so current that they could assimilate Alexander to Dionysus without supposing him to be supernatural, and to this temper the divine honours were a mere form, an elaborate sort of flattery. Did Alexander merely receive such honours? Or did he claim them himself? It would seem that he did. We have well-authenticated utterances of Attic orators when the question of the cult of Alexander came up for debate, which seem to prove that an intimation of the king's pleasure had been conveyed to Athens.

Commerce and Discovery. — A new life entered the lands conquered by Alexander. Human intercourse was quickened to a degree not before known. Commercial enterprise now found open roads between the Aegean and India; the new Greek cities made stations in what had been for the earlier Greek traders unknown lands; an immense quantity of precious metal had been put into circulation which the Persian kings had kept locked up in their treasuries. At the same time Alexander himself sought to win fresh geographical knowledge, to open new ways. The voyage of Nearchus from the Indus to the Euphrates was meant to link India by a waterway with the Mediterranean lands. So too Heracleides was sent to explore the Caspian; the survey, and possible circumnavigation of the Arabian coasts was the last enterprise which occupied Alexander. The improvement of waterways in the interior of the empire was not neglected, the Babylonian canal system was repaired, the obstructions in the Tigris removed. The reports of the βηματισταί Baeton and Diognetus, who accompanied Alexander's army, gave a more exact knowledge of the geographical conformation of the empire. Greek natural science was enriched with a mass of new material from the observations of the philosophers who went with Alexander; on the other hand, attempts were made to acclimatize the plants of the motherland in the foreign soil.

The accession of Alexander brought about a change in the monetary system of the kingdom With the conquest of Asia, Alexander conceived the plan of issuing a uniform coinage for the empire. Gold had fallen from the diffusion of the Persian treasure, and Alexander struck coins in both gold and silver on the Attic standard, leaving their relation to adjust itself by the state of the market. This imperial coinage was designed to break down the monetary predominance of Athens.

II. AFTER ALEXANDER

The external fortunes of the Macedonian empire after Alexander's death must be briefly traced before its inner developments be touched upon [1] There was, at first, when Alexander suddenly died in 323, no overt disruption of the empire. The dispute between the Macedonian infantry and the cavalry (*i.e.,* the commonalty and the nobles) was as to the person who should be chosen to be the king, although it is true that either candidate, the half-witted son of Philip II., Philip Arrhidaeus, or the posthumous son of Alexander by Roxana, opened the prospect of a long regency exercised by one or more of the Macedonian lords. The compromise, by which both the candidates should be kings together, was, of course, succeeded by a struggle for power among those who wished to rule in their name. During a period of confused warfare, which lasted, with intervals, for forty years, the family of Alexander was wholly destroyed; the endeavour of Antigonus, satrap of Phrygia, and of his son Demetrius, to establish a new imperial dynasty, was frustrated by the former's defeat and death at the battle of Ipsus (301 B.C.); and a similar and all but successful attempt by Seleucus, governor of Syria, ended in his assassination (280 B.C.)

About 275 B.C. a horde of Celtic warriors from the Danube lands who had crossed over into Asia Minor after a series of devastating forays in Macedonia and Greece, took possession of the central plateau and there formed a federation of tribal kingdoms known as Galatia. In Cappadocia two Persian houses, relics of the old aristocracy of Achaemenian days, had carved out principalities, one of which became the kingdom of Pontus and the other the kingdom of Cappadocia (in the narrower sense); the former regarding Mithradates (281–266) as its founder, the latter being the creation of the second Ariarathes (?302–?281). Ar-

[1] For details see separate articles on *the chief* generals.

menia, never effectively conquered by the Macedonians, was left in the hands of native princes, tributary only when the Seleucid court was strong enough to compel. In India, Seleucus had in 302 ceded large districts on the west of the Indus to Chandragupta, who had arisen to found a native empire which annexed the Macedonian provinces in the Punjab.

Whilst the Antigonid kingdom remained practically whole till the Roman conquest ended it in 168 B.C., and the house of Ptolemy ruled in Egypt till the death of Cleopatra in 30 B.C., the Seleucid empire perished by a slow process of disruption. The eastern provinces of Iran went in 240 or thereabouts, when the Greek Diodotus made himself an independent king of Bactria (*q.v.*) and Sogdiana, and Tiridates, brother of Arsaces, a "Scythian" chieftain, conquered Parthia (so Arrian, but see PARTHIA). Armenia was finally lost in 190, when Artaxias founded a new native dynasty there. Native princes probably ruled in Persia before 166 (see PERSIA). In southern Syria which had been won by the house of Seleucus from the house of Ptolemy in 198, the independent Jewish principality was set up in 143. About the same time Media was totally relinquished to the Parthians. Babylonia was Parthian from 129. In 64 the last shadow of Seleucid rule vanished, when Syria was made a Roman province by Pompey. From this time Rome formally entered upon the heritage of Alexander as far as the Euphrates, but many of the dynasties which had arisen in the days of Macedonian supremacy were allowed to go on for a time as client states.

Restoration of Despotism.—The Macedonians of Alexander were not mistaken in seeing an essential transformation of their national monarchy when Alexander adopted the guise of an oriental great king. Transplanted into this foreign soil, the monarchy became an absolute despotism, unchecked by a proud territorial nobility and a hardy peasantry on familiar terms with their king. The principle which Seleucus is reported to have enunciated, that the king's command was the supreme law, was literally the principle of the new Hellenistic monarchies in the East. But the rights belonging to the Macedonian army as Alexander inherited it did not altogether disappear. Like the old Roman people, the Macedonian people under arms had acted especially in the transference of the royal authority, conferring or confirming the right of the new chief, and in cases of the capital trials of Macedonians. In the latter respect the army came regularly into function under Alexander, and in the wars which followed his death; and in Macedonia, although the power of life and death came de *facto* into the hands of the Antigonid king, the old right of the army to act as judge was not legally abrogated. The right of the army to confer the royal power was still symbolized in the popular acclamation required on the accession of a new king, and at Alexandria in troubled times we hear of "the people" making its will effective in filling the throne, although it is here hard to distinguish mob-rule from the exercise of a legitimate function. Where it is a case of delegating some part of the supreme authority, as when Seleucus I. made his son Antiochus king for the eastern provinces, we find the army convoked to ratify the appointment. So too the people is spoken of as appointing the guardians of a king during his minority. Nor was the power of the army a fiction. The Hellenistic monarchies rested, as all government in the last resort must, upon the loyalty of those who wielded the brute force of the state, and however unlimited the powers of the king might be in theory, he could not alienate the goodwill of the army with impunity. The right of primogeniture in succession was recognized as a general principle; a woman, however, might succeed only so long as there were no male agnates.

The practice by which the king associated a son with himself, as secondary king, dates from the very beginning of the kingdom of the successors; Antigonus on assuming the diadem in 306 caused Demetrius also to bear the title of king. In the Seleucid kingdom the territorial expanse of the realm made the creation of a distinct subordinate government for part of it a measure of practical convenience. The king's government was carried on by officials appointed by him and responsible to him alone. Government at the same time, as an oriental despotism understands it, often has little in view but the gathering in of the tribute and compulsion of the subjects to personal service in the army or in royal works, and if satisfied in these respects will leave much independence to the local authorities. In the loosely-knit Seleucid realm it is plain that a great deal more independence was left to the various communities—cities or native tribes—than in Egypt, where the conditions made a bureaucratic system so easy to carry through. In their outlying possessions the Ptolemies may have suffered as much local independence as the Seleucids; the internal government of Jerusalem, for instance, was left to the high priests. In so far as the older Greek cities fell within their sphere of power, the successors of Alexander were forced to the same ambiguous policy as Alexander had been, between recognizing the cities' unabated claim to sovereign independence and the necessity of attaching them securely. In Asia Minor, the "enslavement" and liberation of cities alternated with the circumstances of the hour, while the kings all through professed themselves the champions of Hellenic freedom, and were ready on occasion to display munificence toward the city temples or in public works, such as might reconcile republicans to a position of dependence. Antiochus III. went so far as to write on one occasion to the subject Greek cities that if any royal mandate clashed with the civic laws it was to be disregarded. How anxious the Pergamene kings, with their ardent Hellenism, were to avoid offence is shown by the elaborate forms by which, in their own capital, they sought to give their real control the appearance of popular freedom. A similar problem confronted the Antigonid dynasty in the cities of Greece itself, for to maintain a predominant influence in Greece was a ground-principle of their policy Demetrius had presented himself in 307 as the liberator, and driven the Macedonian garrison from the Peiraeus; but his own garrisons held Athens thirteen years later, when he was king of Macedonia, and the Antigonid dynasty clung to the points of vantage in Greece, especially Chalcis and Corinth, till their garrisons were finally expelled by the Romans in the name of Hellenic liberty.

Commerce.—The new movement of commerce initiated by the conquest of Alexander continued under his successors, though the break-up of the Macedonian empire in Asia in the 3rd century and the distractions of the Seleucid court must have withheld many advantages from the Greek merchants which a strong central government might have afforded them. It was along the great trade-routes between India and the West that the main stream of riches flowed then as in later centuries. One of these routes was by sea to south-west Arabia (Yemen), and thence up the Red sea to Alexandria. This was the route controlled and developed by the Ptolemaic kings. Between Yemen and India the traffic till Roman times was mainly in the hands of Arabians or Indians; between Alexandria and Yemen it was carried by Greeks. The west coast of the Red sea was dotted with commercial stations of royal foundation from Arsinoe north of Suez to Arsinoe in the south near the straits of Bab-el-Mandeb. From Berenice on the Red sea a land-route struck across to the Nile at Coptos; this route the kings furnished with watering stations. That there might also be a waterway between Alexandria and the Red sea, they cut a canal between the Delta and the northern Arsinoe. It was Alexandria into which this stream of traffic poured and made it the commercial metropolis of the world. We hear of direct diplomatic intercourse between the courts of Alexandria and Pataliputra, *i.e.,* Patna. An alternative route went from the Indian ports to the Persian gulf, and thence found the Mediterranean by caravan across Arabia from the country of Gerrha to Gaza; and to control it was no doubt a motive in the long struggle of the Ptolemaic and Seleucid houses for Palestine, as well as in the attempt of Antiochus III. to subjugate the Gerrheans. Or from the Persian gulf wares might be taken up the Euphrates and carried across to Antioch; this route lay altogether in the Seleucid sphere. With Iran Antioch was connected most directly by the road which crossed the Euphrates at the Zeugma and went through Edessa and Antioch-Nisibis to the Tigris. The trade from India which went down the Oxus and then to the Caspian does not seem to have been considerable. From Antioch to the Aegean the land high-road went across Asia Minor by the Cilician gates and the Phrygian Apamea.

Finance. — Of the financial organization of the Macedonian kingdoms we know practically nothing, except the case of Egypt. Here the papyri and ostraca have put a large material at our disposal; but the circumstances in Egypt[1] were too peculiar for us to generalize upon these data as to the Seleucid and Antigonid realms. That the Seleucid kings drew in a principal part of their revenues from tribute levied upon the various native races, distributed in their village communities as tillers of the soil goes without saying. In districts left in the hands of native chiefs these chiefs would themselves exploit their villages and pay the Seleucid court tribute. To exact tribute from Greek cities was invidious, but Seleucid kings often did so. Sometimes, no doubt, this tribute was demanded under a fairer name, as the contribution of an ally, like the Γαλατικά levied by Antiochus I. The royal domains, again. and royal monopolies, such as salt-mines, were a source of revenue. As to indirect taxes, like customs and harbour dues, while their existence is a matter of course, their scale, nature and amount is quite unknown to us. Whatever the financial system of the Antigonid and Seleucid kingdoms may have been, it is clear that they were far from enjoying the affluence of the Ptolemaic. During the first Seleucid reigns indeed the revenues of Asia may have filled its treasuries, but Antiochus III. already at his accession found them depleted, and from his reign financial embarrassment, coupled with extravagant expenditure, was here the usual condition of things. Perseus, the last of the Antigonid house, amassed a substantial treasure for the expenses of the supreme struggle with Rome, but it was by means of almost miserly economies.

Special officials were naturally attached to the service of the finances. Over the whole department in the Seleucid realm there presided a single chief. How far the financial administration was removed from the competence of the provincial governors, as it seems to have been in Alexander's system, we cannot say. Seleucus at any rate, as satrap of Babylonia, controlled the finances of the province and so, in the Ptolemaic system, did the governor of Cyprus.

With the exception of Ptolemaic Egypt, the Macedonian kingdoms followed in their coinage that of Alexantler. hfoney was for a long while largely struck with Alexander's own image and superscription; the gold and silver coined in the names of Antigonid and Seleucid kings and by the minor principalities of Asia, kept to the Attic standard which Alexander had established. Only in Egypt Ptolemy I. adopted, at first the Rhodian, and afterwards the Phoenician, standard, and on this latter standard the Ptolemaic money was struck during the subsequent centuries. Money was also struck in their own name by the cities in the several dynasties' spheres of power, but in most cases only bronze or small silver for local use.

Court Customs. — In language and manners the courts of Alexander's successors were Greek. Even the Macedonian dialect, which it was considered proper for the kings to use on occasion, was often forgotten. The oriental features which Alexander had introduced were not copied. There was no *proskunesis* (or certainly not in the case of Greeks and Macedonians), and the king did not wear an oriental dress. The symbol of royalty, it is true, the *diadem,* was suggested by the head-band of the old Persian kings but, whereas, that had been an imposing erection, the Hellenistic diadem was a simple riband. The king's state dress was the same in principle as that worn by the Macedonian or Thessalian horsemen, as the uniform of his own cavalry officers. Its features were the broad-rimmed hat, the cloak, and the high-laced boots. There were other traces in the Hellenistic courts of the old Macedonian tradition besides in dress. One was the honour given to prowess in the chase. Another was the fashion for the king to hold wassail with his courtiers, in which he unbent to an extent scandalous to the Greeks, dancing or indulging in routs and practical jokes.

The prominent part taken by the women of the royal house was a Macedonian characteristic. The history of these kingdoms furnishes a long list of queens and princesses who were ambitious and masterful politicians, of which the great Cleopatra is the last and the most famous. The kings after Alexander, with the exception of Demetrius Poliorcetes and Pyrrhus, are not found to have more than one legitimate wife at a time, although they show unstinted freedom in divorce and the number of their mistresses. The custom of marriages between brothers and sisters, agreeable to old Persian as to old Egyptian ethics, was instituted in Egypt by the second Ptolemy when he married his full sister Arsinoe Philadelphus. It was henceforth common, though not invariable, among the Ptolemies. At the Seleucid court there seems to be an instance of it in 195, when the heir-apparent, Antiochus, married his sister Laodice. The style of "sister" was given in both courts to the queen, even when she was not the king's sister in reality. The "friends" of the king are often mentioned. It is usual for him to confer with a council of his "friends" before important decisions, administrative, military or judicial. They form a definite body about the king's person, admission into which depends upon his favour alone, and is accorded, not only to his subjects. but to aliens, such as the Greek refugee politicians (*e.g.*, Hegesianax, Athen. iv. 155b; Hannibal and the Aetolian Thoas take part in the councils of Antiochus III.). The friends (at any rate under the later Seleucid and Ptolemaic reigns) were distinguished by a special dress and badge of gold analogous to the stars and crosses of modern orders. The dress was of crimson; this and the badges were the king's gift, and except by royal grant neither crimson nor gold might, apparently, be worn at court. The order of friends was organized in a hierarchy of ranks, which were multiplied as time went on. As to Macedonia, whatever may have been the constitution of the court, it is implied that it offered in its externals a sober plainness in comparison with the vain display and ceremonious frivolities of Antioch and Alexandria. The position of a friend did not carry with it necessarily any functions; it was in itself purely honorary. The ministers and high officials were, on the other hand. regularly invested with one or other of the ranks specified. The chief of these ministers is denoted ἐπὶ τῶν πραγμάτων and he corresponds to the *vizier* of the later East. All departments of government are under his supervision, and he regularly holds the highest rank of a kinsman. When the king is a minor, he acts as guardian or regent. Over different departments of state we find a state secretary. Under each of these great heads of departments was a host of lower officials, those, for instance, who held to the province a relation analogous to that of the head of the department of the realm. Beside the officials concerned with the work of government we have those of the royal household: (1) the chief-physician; (2) the chief-huntsman; (3) the maître d' hôtel; (4) the lord of the queen's bedchamber. As in the older oriental courts, the high positions were often filled by eunuchs.

It was customary, as in Persia and in old Macedonia, for the great men of the realm to send their children to court to be brought up with the children of the royal house. Those who had been so brought up with the king were styled his σύντροφοι. As under Alexander, so under his successors, we find a corps of βασιλικοὶ παῖδες. They appear as a corps, 600 strong, in a triumphal procession at Antioch.

Hellenism. —,411 the Hellenistic courts felt it a great part of prestige to be filled with the light of Hellenic culture. A distinguished philosopher or man of letters would find them bidding for his presence, and most of the great names are associated with one or other of the contemporary kings. Antigonus Gonatas, bluff soldier-spirit that he was, heard the Stoic philosophers gladly, and, though he failed to induce Zeno to come to Macedonia, persuaded Zeno's disciple, Persaeus of Citium, to enter his service. Nor was it philosophers only who made his court illustrious, but poets like Aratus. The Ptolemaic court, with the museum attached to it, is so prominent in the literary and scientific history of the age that it is unnecessary to give a list of the philosophers, the men of letters and science, who at one time or other ate at King Ptolemy's table. One may notice that the first Ptolemy himself made a contribution of some value to historical literature in his account of Alexander's campaigns; the fourth Ptolemy not only instituted a cult of Homer but himself published tragedies;

[1]For Ptolemaic Egypt, see PTOLEMIES and EGYPT.

and even Ptolemy Euergetes II issued a book of memoirs. The Pergamene court was in no degree behind the Ptolemaic in its literary and artistic zeal. The notable school of sculpture connected with it is treated elsewhere (see GREEK ART); to its literary school we probably owe in great part the preservation of the masterpieces of Attic prose, and two of its kings (Eumenes I and Attalus III) were themselves authors. The Seleucid court did not rival either of the last named in brilliance of culture; and yet some names of distinction were associated with it. Under Antiochus I Aratus carried out a recension of the Odyssey, and Berossus composed a Babylonian history in Greek. Under Antiochus III Euphorion was made keeper of the library at Antioch. Antiochus IV, of course, the enthusiastic Hellenist, filled Antioch with Greek artists and gave a royal welcome to Athenian philosophers. Even in the degenerate days of the dynasty, Antiochus Grypus, who had been brought up at Athens, aspired to shine as a poet. The values recognized in the great Hellenistic courts and the Greek world generally imposed their authority upon the dynasties of barbarian origin. The Cappadocian court admitted the full stream of Hellenistic culture under Ariarathes V. One of the kings called Nicomedes in Bithynia offered immense sums to acquire the Aphrodite of Praxiteles from the Cnidians, and to a king Nicomedes the geographical poem of the Pseudo-Scymnus is dedicated. Even Iranian kings in the last century B.C. found pleasure in composing, or listening to, Greek tragedies, and Herod the Great kept Greek men of letters beside him and had spasmodic ambitions to make his mark as an orator or author.

Deification. — The offering of divine honours to the king which was begun under Alexander, became stereotyped in the institutions of the succeeding Hellenistic kingdoms. Alexander himself nas after his death the object of various local cults, like that which centred in the shrine near Erythrae. His successors in the first years after his death recognized him officially as a divinity, except Xntipater, and coins began to be issued nirh his image. At Alexandria the state cult of him seems to have been instituted by the second Ptolemy, when his body mas laid in the *Sema.* The successors themselves received divine honours. Such worship might be the spontaneous homage of a particular Greek community, like that offered to Antigonus by Scepsis in 311, to Antigonus and Demetrius by Athens in 307, to Ptolemy I by the Rhodians in 304, or by Cassandreia to Cassander, as the city's founder; or it might be organized and maintained by royal authority. The first proved instance of a cult of the latter kind is that instituted at Alexandria by the second Ptolemy for his father soon after the latter's death in 283–282, in which later 279–278, he associated his mother Berenice also, the two being worshipped together as θεοὶ σωτῆρες. Antiochus I followed the Ptolemaic precedent by instituting at Seleucia-in-Pieria a cult for his father as Seleucus Zeus Nicator. So far we can point to no instance of a cult of the living sovereign (though the cities might institute such locally) being established by the court for the realm. This step was taken in Egypt after the death of Xrsinoe Philadelphus (271), when she and her still-living brother-husband, Ptolemy II began to be norshipped together as θεοὶ ἀδελφοί. After this the cult of the reigning king and queen was regularly maintained in Greek Egypt, side by side with that of the dead Ptolemies. Under Antiochus II (261–246) a document shows a cult of the reigning king in full working for the Seleucid realm, with a high priest in each province, appointed by the king himself; the document declares that the Queen Laodice is now to be associated with the king. The official surname of Antiochus II, *Theos,* suggests that he himself had here been the innovator. Thencefornard, in the Hellenistic kingdoms of the east the worship of the living sovereign became the rule, although it appears to have been regarded as given in anticipation of an apotheosis which did not become actual till death. In the Pergamene kingdom at any rate, though the living king mas worshipped with sacrifice, the title θεός was only given to those who mere dead. The Antigonid dynasty, simpler and saner in its manners, had no official cult of this sort. The divine honours offered on occasion by the Greek cities were the independent acts of the cities.

Army. — The armies of Alexander's successors were still in the main principles of their organization similar to the army with which Alexander had conquered Asia. During the years immediately after Alexander the very Macedonians who had fought under Alexander were ranged against each other under the banners of the several chiefs. The most noted corps of veterans, Argyraspides, played a great part in the first wars of the successors, and covered themselves with infamy by their betrayal of Eumenes. As the soldiers of Alexander died off. fresh levies of home-born Macedonians could be raised only by the chief who held the motherland. The other chiefs had to supply themselves with Macedonians from the numerous colonies planted before the breakup of the empire in Asia or Egypt, and from such Macedonians they continued for the next two centuries to form their phalanx. The breed — at least if the statement which Livy puts into the mouth of a Roman general can be relied on — degenerated greatly under Asiatic and Egyptian skies; but still old names like that of *pezetairoi* attached to the phalangites, and they still wielded the national *sarissa.* The latter weapon in the interval between Alexander and the time of Polybius had been increased to a length of 21 ft., a proportion inconsistent with any degree of mobility; once more indeed the phalanx of the 2nd century seems to have become a body effective by sheer weight only and disordered by unevenness of ground. The Antigonid kings were never able from Jlacedonian levies to put in the field a phalanx of more than 20,000 at the utmost; Antigonus Doson took with him to Greece (in 222) one of 10.000 only. The phalanx of Antiochus III at Raphia numbered 20,000, and Ptolemy Philopator was able at the same time to form one of 25,000 men. The royal footguards were still described in Macedonia in 171 as the *agema.* So too the old name of "Companions" was kept up in the Seleucid kingdom for the Macedonian cavalry, and divisions of rank in it were still indicated by the terms *agema* and royal squadron. The Antigonid and Seleucid courts had much valuable material at hand for their armies in the barbarian races under their sway. The Balkan hill-peoples of Illyrian or Thracian stock, the hill-peoples of Asia Minor and Iran, the chivalry of Media and Bactria, the mounted bowmen of the Caspian steppes, the camel-riders of the Arabian desert, could all be turned to account. Iranian troops seem to have been employed on a large scale by the earlier Seleucids. At Raphia, Antiochus III had 10.000 men drawn from the provinces, armed and drilled as Macedonians, and another corps of Iranians numbering 5,000 under a native commander. The experiment of arming the native Egyptians on a large scale does not seem to have been made before the campaign of 217, when Ptolemy IV formed corps of the Macedonian pattern from Egyptians and Libyans. From this time native rebellions in Egypt were recurrent. To the troops drawn from their own dominions the mercenaries which the kings procured from abroad mere an important supplement. These were mainly the bands of Greek *condottieri,* and even for their home-born troops Greek officers of renown were often engaged. The other class of mercenaries were Gauls, and from the time of the Gallic invasion of Asia Minor in 279 Gauls or Galatians were a regular constituent in all armies. They mere a weapon apt to be dangerous to the employer. but the terror they inspired was such that every potentate sought to get hold of them. The elephants which Xlexander brought back from India mere used in the armies of his successors, and in 302 Seleucus procured a new supply. Thenceforward elephants, either brought fresh from India or bred in the royal stables at Apamea, regularly figured in the Seleucid armies. The Ptolemies supplied themselves with this arm from the southern coasts of the Red sea, where they established stations for the capture and shipping of elephants. Scythed chariots such as had figured in the old Persian armies were still used by the Greek masters of Asia, at any rate till the battle of Magnesia. The Hellenistic armies were distinguished by their external magnificence. They made a greater display of brilliant metal and gorgeous colour than the Roman armies, for instance. The description given by Justin of the army which Antiochus Sidetes took to the east in 130 B.C., boot-nails and bridles of gold, gives an idea of their standard of splendour.

During the 3rd century B.C. Egypt was the greatest sea power of the eastern Mediterranean, and maintained a large fleet. Its control of the Aegean was, however, contested not without success by the Antigonids, who won the two great sea-fights of Cos (*c.* 256) and Andros (227), and wrested the overlordship of the Cyclades from the Ptolemies. Of the numbers and constitution of the Antigonid fleet we know nothing. At the Seleucid court in 222 the admiral appears as a person of high consideration; in his war with Rome Antiochus III had 107 decked battleships on the sea at one time.

Macedonian* Rule.**—To their native subjects the Seleucid and Ptolemaic kings were always foreigners. It was considered wonderful in the last Cleopatra that she learned to speak Egyptian. Natives were employed, as we have seen, in the army, and Iranians are found under the Seleucids holding high commands. Native cults the Hellenistic kings thought it good policy to patronize. Antiochus I began rebuilding the temple of Nebo at Borsippa. Antiochus III bestowed favours on the temple at Jerusalem. Even if the documents in Joseph ***Arch. xii, §§138 *et seq.* are spurious, their general views of the relation of Antiochus III and Jerusalem is probably true.

The Macedonian kingdoms, strained by continual wars, increasingly divided against themselves, falling often under the sway of prodigals and debauchees, were far from realizing the Hellenic idea of sound government as against the crude barbaric despotisms of the older east. Yet, in spite of all corruption, ideas of the intelligent development of the subject lands, visions of the Hellenic king, as the Greek thinkers had come to picture him, haunted the Macedonian rulers, and perhaps fitfully, in the intervals of war or carousal, prompted some degree of action. Treatises "concerning kingship" were produced as a regular thing by philosophers, and kings who claimed the fine flower of Hellenism could not but peruse them. Strabo regards the loss of the eastern provinces to the Parthians as their passage under a government of lower type, beyond the sphere of Hellenic ἐπιμέλεια.

In the organization of the administrative machinery of these kingdoms, the higher power of the Hellene to adapt and combine had been operative; they mere organisms of a richer, more complex type than the east had hitherto known. It was thus that when Rome became a world empire, it found to some extent the forms of government ready made, and took over from the Hellenistic monarchies a tradition which it handed on to the later world.

For the events which brought the Macedonian empire into being *see* ALEXANDER III, THE GREAT. For detailed accounts of the separate dynasties into which it was divided after Alexander's death, see SELEUCID DYNASTY, ANTIGONUS I, PERGAMUM, etc., and for its effect on the spread of Hellenic culture see HELLENISM.

MACEDONIUS, (1) bishop of Constantinople in succession to Eusebius of Nicomedia, was elected by the Arian bishops in 341, while the orthodox party elected Paul, whom Eusebius had superseded. Paul was banished; and Macedonius was recognized as patriarch in 342. Compelled by the intervention of Constans in 348 to resign the patriarchate in favour of his former opponent, he was reinstalled in 350. He then took vengeance on his opponents by a general persecution of the adherents of the Nicene Creed. In 359, on the division of the Arian party into Acacians (or pure Arians) and semi-Arians or Homoiousians, Macedonius adhered to the latter, and in consequence was expelled from his see by the council of Constantinople in 360. He now became avowed leader of the sect of Pneumatomachi, Macedonians or Marathonians, whose distinctive tenet was that the Holy Spirit is but a being similar to the angels, subordinate to and in the service of the Father and the Son. the relation between whom did not admit of a third. He did not long survive his deposition.

See the Church Histories of Socrates and Sozomen; Art. in ***Dict. Chr. Biog.;*** F. Loofs in Herzog-Hauck's ***Realencyk.;*** H. M. Gwatkin, *Arianism.*

MACEDONIUS, (2) bishop of Constantinople (*fl.* 510), a strict Chalcedonian who vainly opposed the fanaticism of the monophysite Severus and was deposed in 513.

MACEIÓ or MACAYÓ, a city and port of Brazil and capital of the state of Alagoas, about 125 mi. S.S.W. of Pernambuco, in lat. 9° 39′ 35″ S., long. 35° 44′ 36″ W. of Greenwich. Population (1960) of the city 153,305 and of the total municipal area 170,134. The city stands at the foot of low bluffs, about a mile from the shore line. The waterside village of Jaraguá, the port of Maceió, is practically a suburb of the city. South of the port is the shallow entrance to the Lagoa do Norte or Lagoa Mundau, a salt-water lake extending inland for several miles. Maceio is attractively situated in the midst of large plantations of coconut and *dendk* palms, though the broad sandy beach in front and the open sunburned plain behind give a barren character to its surroundings. The heat is moderated by the southeast trade winds, and the city is considered healthful. The public buildings are mostly constructed of broken stone and mortar, plastered outside and covered with red tiles, but the common dwellings are generally constructed of tapia—rough trelliswork walls filled in with mud. The lighthouse, situated on a small hill near the middle of the town, is a conspicuous landmark. A streetcar line connects the city and port; the Great Western railway connects the two with various interior towns and with Pernambuco. The port is formed by a stone reef running parallel with and a half mile from the shore line, within which vessels of light draft find a safe anchorage. except from southerly gales. Ocean-going steamers anchor outside the reef. The exports consist principally of sugar, cotton and rum (*aguardente*). Maceio dates from. 1815 when a small settlement there was created a "villa." In 1839 it became the provincial capital and was made a city by the provincial assembly.

McENTEE, JERVIS (1828–1891), U.S. landscape painter of the Hudson River school. was born at Rondout. N.Y., July 14, 1828, and was a pupil of Frederick E. Church. He was made an associate of the Sational Academy of Design, New York city, in 1860, and a full academician in 1861.

In 1869 McEntee visited Europe, painting much in Italy. He excelled in pictures of autumn scenery, as in "Edge of a Wood, November" and "Yellow Autumn Woods."

McEntee died at Rondout. Jan. 27, 1891.

MACERATA, city of the Marche region, Italy, chief town of the province of hlacerata and a bishop's see, 44 mi. by rail south of Ancona. Pop. (1957 est.) 35,064 (commune). Crowning a hill 1,020 ft. above sea level, with a picturesque mass of buildings enclosed by walls and towers: Macerata looks out over the Adriatic. Besides the university (1290) with about 125 students in 1939, Macerata has a communal library founded by Leo XII, containing a small but choice collection of early pictures, and in the municipal buildings, a collection of antiquities from Helvia Ricina. Close by is the elegant Loggia dei Mercanti, by Giuliano da Maiano (1485–91). There is an enormous amphitheatre for *pallone,* a favourite ball game.

The first mention of the *castellum* of Macerata is in a document of 1022; and in 1138 it was formed into a commune. Sicholas IV (1287–1292) made it the seat of the governors of the Marches. It was enclosed in the 13th century by a line of walls more than $2\frac{1}{2}$ mi. in circuit. It remained faithful to the popes and was rewarded by many privileges. Though in 1797 the inhabitants opened their gates to the French. two years afterward the city was stormed and pillaged. The bishopric of Macerata dates from the suppression of the see of Recanati (1320).

MACEWEN, SIR WILLIAM (1848–1924), Scottish surgeon. was born on June 22, 1848, at Rothesay, and educated at Glasgow university. In 1892 he was made regius professor of surgery in the university. In 1922 he was president of the British Medical association. Macewen was a firm supporter of the methods of Joseph Lister, and experimented on the sterilization of instruments and dressings and the preparation of catgut for surgical use. He advanced the practice of bone grafting and became famous for his operative treatment of knock-knee. His paper on surgery of the brain and spinal cord marked him as a pioneer of modern cerebral surgery. He died on March 22, 1924. His best-known works are *Osteotomy* (1880); *Atlas of Head Sections* (1893); *On Pyogenic Infective Disease of the Brain and Spinal Cord* (1893); *On the Growth of Bone* (1912); and "Brain Surgery," in *Brit. Med. Journal* (1922).

See obituary notices in the *Lancet* and *British Medical Journal* for March 29, 1924.

MACFARREN, SIR GEORGE ALEXANDER (1813–1887), English composer. mas born in London on March 2, 1813, and entered the Royal Academy of Music in 1829. His *Chevy Chase* overture was written as early as 1836 and in a single night. In 1837 Macfarren was appointed a professor at the academy, and wrote his *Romeo and Juliet* overture. In 1838 he brought out *The Devil's Opera*, one of his best works. In 1845 he became conductor at Covent Garden. A gradual failure of his eyesight led to total blindness in 1860. He became principal of the Royal Academy of Music in Feb. 1875, and in March became professor of music in Cambridge university. His theoretical works. such as the *Rudiments of Harmony*, and the treatise on counterpoint, will probably be remembered longer than many of his compositions. He was knighted in 1883, and died in London on Oct 31.1887.

An excellent memoir by H C Banister appeared in 1891.

McGEE, THOMAS D'ARCY (1825–1868), Irish-Canadian politician and writer. second son of James McGee, a coastguard, was born at Carlingford. County Louth, on April 13, 1825. He early showed a remarkable aptitude for oratory. At the age of 17 he emigrated to the United States, and by his writing and public speaking in Boston, Mass., attracted the attention of O'Connell. Before he was 20 he returned to London to become parliamentary correspondent of the *Freeman's Journal*, and shortly afterward London correspondent of the *Nation*, to which he also contributed a number of poems. In 1846 he became one of the moving spirits in the "Young Ireland" party. and contributed two volumes to the "Library of Ireland." On the failure of the movement in 1848 McGee escaped in the disguise of a priest to the United States where between 1848 and 1853 he established two newspapers, the *New York Nation* and the *American Celt*.

In 1857 McGee, driven from the Cnited States by the scurrilous attacks of the extreme Irish revolutionaries, took up his abode in Canada, and was admitted to the bar of the province of Lower Canada in 1861. At the general election in 1858 he mas returned to parliament as the member for Montreal, and for four years he was regarded as a powerful factor in the house. On the formation of the Sandfield-Macdonald-Sicotte administration in 1862, he accepted the office of president of the council. When the cabinet was reconstructed a year later the Irish were left without representation, and McGee sought re-election as a member of the opposite party. In 1864 he was appointed minister of agriculture in the administration of Sir E. P. Taché, and he served the country in that capacity until his death. He actively supported the policy of federation and was elected a member of the first Dominion parliament in 1867. On April 7, 1868, he was shot by an assassin as he was about to enter his house at Ottawa. His utterances against the Fenian invasion are believed to have been the cause of the crime for which P. J. Whelan was executed.

McGee's principal works are: *A Popular History of Ireland*, 3 vol. (1862–69); *Irish Writers of the Seventeenth Century* (1846); *Historical Sketches of O'Connell and His Friends* (1844); *Memoirs of the Life and Conquests of Art McMurrogh, King of Leinster* (1847); *Memoir of C. G. Duffy* (1849); *A History of the Irish Settlers in North Anzerica* (1851); *History of the Attempts to Establish the Protestant Reformation in Ireland* (1853); *Life of Edward Maginn, Coadjutor Bishop of Dervy* (1857); *Catholic History of North America* (1854); *Canadian Ballads and Occasional Pieces* (1858); *Notes on Federal Governments Past and Present* (1865); *Speeches and Addresses, Chiefly on the Subject of the British American Union* (1865).

McGILLIVRAY, ALEXANDER (*c.* 1739–1793). American Indian chief. was born near the site of the present Wetumpka, in Alabama. His father was a Scottish merchant and his mother the daughter of a French officer and an Indian princess. Through his father's relatives in South Carolina. McGillivray received a good education, but at the age of 17 he returned to the Muscogee Indians, who elected him chief. During the Revolutionary War, as a colonel in the British army, he incited his followers to attack the western frontiers of Georgia and the Carolinas. Georgia confiscated some of his property, and after the peace of 1783 McGillivray remained hostile. Though still retaining his British commission. he accepted one from Spain. and during the remainder of his life used his influence to prevent American settlement in the southmest. So important was he considered that in 1790 President Washington sent an agent who induced him to visit New York. There he was persuaded to make peace in consideration of a brigadier general's commission and payment for the property confiscated by Georgia; and with the warriors who accompanied him he signed a formal treaty of peace and friendship. He then went back to the Indian country, but remained hostile to the settlers until his death. He mas one of the ablest Indian leaders of America and at one time wielded great power —having 5,000 to 10,000 armed followers. Before he died he saw that he was fighting in a losing cause and, changing his policy, endeavoured to provide for the training of the Muscogees in the white man's civilization. McGillivray was polished in manners, of cultivated intellect, was a shrewd merchant and a successful speculator; but he had many savage traits, being noted for his treachery, craftiness and love of barbaric display.

See Harry Lincoln Sayler, *American Romance in the South* (1908).

McGILL UNIVERSITY: *see* UNIVERSITIES.

MacGOWAN, KENNETH (1888–). U.S. writer, motion-picture producer and educator. was born in Winthrop, Mass., on Nov. 30, 1888. He graduated from Harvard in 1911 and between 1910 and 1924 urote dramatic criticism for various newspapers and magazines, afterward directing plays. He joined RKO-Radio Pictures in 1932, working as associate producer from 1933 to 1935, and served in the same capacity for Twentieth Century-Fox Film Corp., 1935–41 and 1942–44. MacGowan then acted as a producer at Paramount Pictures until 1946. He became professor and chairman of the theatre arts department, University of California, Berkeley, in 1947. His published works include *The Theatre of Tomorrow* (1921); *Footlights Across America* (1929); *The Old Stone Age in the New World* (1948); and *Early Man in the New World* (1950).

McGUFFEY, WILLIAM HOLMES (1800–1873), U.S. educator, who is remembered chiefly for his elementary school readers, was born in western Pennsylvania on Sept. 23, 1800, of Scotch-Irish parents. In 1802 they moved into the forests of the Ohio Territory four miles north of the present city of Youngstown. With little home or school instruction, McGuffey mastered the school arts and began teaching in the subscription rural schools of Ohio when he was 13 years of age. During spare time and vacations, through his 11 years of teaching in Ohio and Kentucky, he continued his own education intermittently under private tutors, in Greersburg academy and in Washington college. receiving his A.B. degree with honours in 1826.

McGuffey went to Miami university. Oxford, O., as instructor in ancient languages in Nov. 1825, became professor of languages in 1826, and during 11 years there took great interest in public education. He assisted the teachers of the elementary schools of the community and established in his own home a model school of the neighbourhood children.

In 1835 he contracted with Truman and Smith, publishers, of Cincinnati to compile four school readers, the first and second of which were published in 1836 and the third and fourth in 1837. A fifth was published in 1844, a spelling book by McGuffey's brother, Alexander Hamilton McGuffey, came out in 1846, and a sixth reader was added in 1857. These textbooks became virtually the universal readers in the expanding common schools of the great empire of the Mississippi and the south. They went through many editions and sold 122,000,000 copies.

From 1836 to 1839 McGuffey was president of Cincinnati college and from 1839 to 1843 president of Ohio university, Athens. He was one of the three founders of the common school system of Ohio. In 1845 he was elected to the chair of mental and moral philosophy in the University of Virginia, Charlottesville, which position he eminently filled until his death on May 4, 1873.

MACH, ERNST (1838–1916), Austrian physicist and philosopher. whose work, both in physics and in philosophy, had a great influence on 20th-century thought. was born on Feb. 18, 1838, at Turas in Moravia and educated in Vienna. He was professor of physics at Graz from 1864 to 186; and at Prague from 1867 to 1895, and professor of inductive philosophy at Vienna from 1895 to 1901. He was made a member of the Austrian house of peers in 1901 and died at Haar, near Munich, on Feb. 19, 1916.

Mach was a thoroughgoing positivist and took the view. which most scientists now share, that no statement is admissible in natural science unless it is empirically verifiable. His criteria, of verifiability were, however, exceptionally rigorous: they led him not only to reject such metaphysical conceptions as that of the ether and that of absolute space and time but also to oppose the introduction of atoms and molecules into physical theory. Nevertheless it was his criticism along these lines of Sir Isaac Newton's system that made the way clear for Albert Einstein's theory of relativity. As a positivist, he regarded scientific laws as purely descriptive; and he held that the choice between alternative hypotheses covering the same facts was to be made on the grounds of economy.

Mach's philosophical position was phenomenalistic. He maintained that all empirical statements, including those that occur in scientific theories, were in the end reducible to statements about sensations. He tried to lay the basis for the phenomenalist reduction in his book *Analysis of Sensations,* but neither he nor any other philosopher has yet succeeded in carrying it through. Though it would be incorrect to call him an idealist. Mach's views have a certain resemblance to those of Berkeley, and for this reason he was sharply attacked by Lenin in *Materialism and Empirio-Criticism.* His philosophy survived to become one of the sources of inspiration of the Vienna circle of the 1920s (*see* LOGICAL POSITIVISM), the members of which mostly came to reject Mach's phenomenalism but continued to support him in his hostility to metaphysics, in his positivist conception of scientific method and in his insistence upon the unity of science.

Mach's name is popularly associated with the Mach number (*q.v.*), which expresses the air speed of an aircraft in terms of its relation to the local speed of sound.

Mach's works include: *Die Mechanik in ihrer Entwicklung historisch-kritisch dargestellt* (1883; rev. ed., 1908; Eng. trans. by T. J. McCormack, *The Science of Mechanics,* 4th ed., 1919); *Beiträge zur Analyse der Empfindungen* (1886; 5th ed. *Die Analyse der Empfindungen und das Verhältnis des Physischen zum Psychischen,* 1906; Eng. trans. by C. M. Williams. *Contributions to the Analysis of Sensations,* 1897); *Leitfaden der Physik für Studierende* (1881), in collaboration with others; *Populärwissenschaftliche Vorlesungen* (1896; 3rd ed., 1903); *Die Prinzipien der Wärmelehre* (1896); *Erkenntnis und Irrtum* (1905; Fr. trans. by M. Dufour, *La Connaissance et l'erreur,* 1908). (AD. J. A.; X.)

MÁCHA, KAREL HYNEK (1810–1836) Czech romantic poet of great power and individuality. Born at Prague on Nov. 16, 1810. of poor parents, Mácha was influenced as a student by the Czech national revival and by English and Polish romantic literature. Other sources of inspiration were his wanderings amid ruined castles in the Bohemian countryside and a journey to northern Italy (1834). In 1836 he took up a legal post in Litomerice but died there, of pneumonia, on Nov. 5, 1836.

After schoolboy attempts in German he began to write poems, sketches and novels in Czech. Practically all his prose works remained unfinished but their style shows a mastery not previously attained by writers in the newly revived Czech literary language. His lyrics express a characteristic but highly individual romantic pessimism. His best work is the lyrical epic *Máj* ("May"; 1836). Strongly Byronic in subject, this poem is yet personal in treatment and style. and stands comparison with the work of such Slavonic contemporaries as Adam Mickiewicz and Lermontov. Coldly received at the time, it has exercised an almost magical fascination on poets and critics of the 20th century. The subtle melody and rhythms of Macha's verse defied the efforts of his numerous translators.

His letters and diaries, *Dilo Karla Hynka Máchy,* ed. by K. Janský, 3 vol. (1948–50), in vivid colloquial prose, are an essential supplement and background to his poetry. (R. AY.)

MACHADO, BERNADINO (1851–1944), Portuguese statesman, was born at Rio de Janeiro on July 28, 1851. An ardent patriot, a man of unfailing courtesy, unchallenged character and courage, he became a professor at Coimbra university and entered parliament in 1882. In 1893 he held office for a few months as minister of public works. Four years later he espoused openly the cause of republicanism, and his election in March 1906 as Republican deputy for Lisbon was made the occasion of a Republican demonstration which resulted in the downfall of the government. After the revolution in Oct. 1910, Machado became minister of foreign affairs in the provisional government of the republic. He became premier on Feb. 4, 1914, and held office until Dec. 13. Under his guidance and despite German intrigue Portugal proclaimed on Aug. 7 her loyalty to the British Alliance, and on Nov. 23, committed herself to participation in military operations. On Aug. 6, 1915, Machado succeeded Dr. Theophilo Braga as president. On Dec. 15, 1917, he was banished by the insurgents. On March 2, 1921, he became premier of a coalition ministry, but in consequence of a military coup d'état he resigned on May 20. He served as president again from Dec. 1925–June 1926 when a revolution removed him from power. On Feb. 25, 1927, charged with complicity in an abortive insurrection, he was ordered to leave Portugal. He returned after an amnesty was granted to him and other political exiles in May 1936 and died in Oporto, April 29, 1944. (J. SW.; X.)

MACHAULT D'ARNOUVILLE, JEAN BAPTISTE DE (1701–1794), French statesman, was the son of a lieutenant of police. After two years as intendant of Hainaut, he succeeded Orry de Fulvy as controller-general of the finances in Dec. 1745. In order to reorganize the finances after the War of the Austrian Succession, he proposed to replace the old tax of a tenth, which was evaded by many of the clergy and nobility, by a universal tax of a twentieth, but failed to carry the measure in face of opposition though retaining his office until July 1754, when he became minister of marine. He gained the ill-will of Madame de Pompadour by opposing the alliance with Austria, and she obtained his disgrace on Feb. 1, 1757. In 1794 he was arrested as a suspect, and died in prison at the age of 93.

MACHAUT or **MACHAULT, GUILLAUME DE** (*c.* 1300–1377), French poet and musician, was born in the village of Machault near Réthel in Champagne, and died at Reims in April 1377. Machaut tells us that he served for 30 years as secretary to the adventurous John of Luxembourg, king of Bohemia, while holding, at the same time, various ecclesiastical positions at Verdun (1332), Arras (1333) and Reims. He followed John of Bohemia to Russia and Poland, and, though of peaceful tastes himself, saw 20 battles and 100 tourneys. When John was killed at Crecy in 1346 Machaut was received at the court of Normandy, and on the accession of John the Good to the throne of France (1350) he received an office which enabled him to devote himself thenceforth to music and poetry. Machaut wrote about 1348 in honour of Charles III., king of Navarre, a long poem much admired by contemporaries, *Le Jugement du roi de Navarre.* When Charles was thrown into prison by his father-in-law, King John, Machaut addressed him a *Confort d'ami* to console him for his enforced separation from his young wife, then aged 15. This was followed about 1370 by a poem of 9,000 lines entitled *La Prise d'Alexandrie,* one of the last chronicles cast in this form. Its hero was Pierre de Lusignan, king of Cyprus. Machaut is best known for the strange book telling of the love affair of his old age with a young and noble lady long supposed to be Agnes of Navarre, sister of Charles the Bad; Paulin Paris in his edition of the *Voir dit* (*Historie vraie*) identified her as Perronne d'Armentières, a noble lady of Champagne. In 1362, when Machaut must have been at least 62 years of age, he received a rondeau from Perronne, who was then 18, and wished to play Laura to his Petrarch. The romance ended with Perronne's marriage and Machaut's desire to remain her *doux ami*. Its subject and length are deterrent to modern readers. Machaut with Deschamps marks a distinct transition. The *trouvères* had been impersonal. It is difficult to gather any details of their personal history from their work. Machaut and Deschamps wrote of their own affairs, and the next step in development was to be the self-analysis of Villon.

Machaut was also a musician. He composed a number of motets, songs and ballads, also a mass supposed to have been sung at the coronation of Charles V. This was translated into modern notation by Perne, who read a notice on it before the Institute of France in 1817.

E. Hoepffner, in editing hlachaut's works. rightly says that they exercised a powerful and lasting influence on the literary development of the 14th century. As a lyric poet. if he did not actually create the fixed forms, such as the ballade, chant-royal, virelai. rondeau and lay. which prevailed up to the 16th century. it was he who ensured their triumph. And he inaugurated the new lyrical art. It is true that he was profoundly influenced by the *Roman de la Rose,* but he introduced a personal, individual note hitherto lacking. He was undoubtedly the master of a new school. Froissart and Deschamps. Christine de Pisan, Oton de Cranson, even Chaucer, all studied and imitated him. In the second half of the 15th century. he was forgotten, and was not rediscovered till the 18th century, by Lebeuf and the abbé Rive.

Machaut's *Oeuvres choisies* were edited *by* P. Tarbé (Reims and Paris, 1849). There are good modern editions of his longer poems in his *Oeuvres* (edit. E. Hoepffner, 3 vols., 1908, 1911, 1321) ; and of his *Poésies lyriques* (edit. V. Chichmaref! 1909). *See* also *F. G.* Fétis, ***Biog.*** *universelle des musiciens . . .* (1862), and E. Travers, *Instruments de musique au XIV^e siècle d'après Guillaume de Machaut* (1882).

MACHEN, JOHN GRESHAM (1881–1937), **U.S.** Presbyterian theologian and churchman, one of the most eloquent spokesmen for the conservative position in the theological controversies of the 1920s and 1930s, was born at Baltimore, Md., on July 28, 1881. Educated at Johns Hopkins and Princeton universities, Princeton Theological seminary and the Universities of Marburg and Gottingen. he taught at Princeton seminary from 1906 until its reorganization in 1929. Thereupon he left to help found Westminster Theological seminary in Philadelphia, where he served as professor of New Testament until his death on Jan. 1. 1937.

Machen's leading contributions to the conservative cause in the Fundamentalist-Modernist controversy was perhaps his book *Christianity and Liberalism* (1923), which contended that theological liberalism was not really Christian in the biblical and historic sense.

Machen's most scholarly books were *The Origin of Paul's Religion* (1921) and *The Virgin Birth of Christ* (1930; 2nd ed.. 1932). His publications also included numerous pamphlets and articles, in addition to several other books, many of a popular nature. Refusing to resign from the Independent Board for Presbyterian Foreign Missions on the ground that the mandate of the general assembly of the Presbyterian Church, U.S.A., ordering its members to do so was unconstitutional, Machen was suspended from the ministry. When his appeal was not sustained, he left in 1936 to join in forming the Presbyterian Church in America, later known as the Orthodox Presbyterian Church.

Machen also enjoyed a world-wide reputation as a Greek scholar and learned Christian apologist. His theological position, he was wont to emphasize. was not fundamentalist, but the Reformed Faith of the Westminster Confession of Faith. *See* also PRESBYTERIAN.

See autobiographical sketch in V. Ferm (ed.), *Contemporary American Theology* (1932); Ned *B.* Stonehouse, *J. Gresham Machen: a Biographical Memoir* (1954). (N. B. S.)

MACHIAVELLI, NICCOLO (1469–1527), Italian statesman and writer, was born at Florence on May 3. 1469 His ancestry claimed blood relationship with the lords of Montespertoli, a fief situated between Val di Pesa and Val d'Elsa, at no great distance from the city. Niccolb's father, Bernardo (b. 1428), followed the profession of a jurist. He held landed property worth something like £250 a year in English money. His son, though not wealthy, was never wholly dependent upon official income.

Of Niccolò's early years and education little is known. His works show wide reading in the Latin and Italian classics, but it is almost certain that he had not mastered the Greek language. To the defects of Machiavelli's education we may, in part at least, ascribe the peculiar vigour of his style and his speculative originality. He is free from the scholastic trifling and learned frivolity which tainted the rhetorical culture of his century. He made the world of men and things his study, learned to write his mother-tongue with idiomatic conciseness, and nourished his imagination on the masterpieces of the Romans.

Official Life.—The year of Charles VIII.'s invasion and of the Medici's expulsion from Florence (1494) saw Machiavelli's first entrance into public life. He was appointed clerk in the second chancery of the commune under his old master. the grammarian, Marcello Virgilio Adriani. Early in 1498 Adriani became chancellor of the republic. and Machiavelli succeeded as second chancellor and secretary. This post he retained for 14 years—until 1512. The masters he had to serve were the *dieci di libertà e pace,* who, though subordinate to the *signorza,* exercised a separate control over the departments of war and the interior. They sent their own ambassadors to foreign powers. transacted business with the cities of the Florentine domain, and controlled the military establishment of the commonwealth. hlachiavelli was fully occupied in the correspondence of his bureau, in diplomatic missions, and in the organization of a Florentine militia. The first of his many missions to petty courts of Italy was in 1499, when he negotiated the continuance of a loan to Catherine Sforza, countess of Forlì and Imola. In 1500 Machiavelli travelled into France, to deal with Louis XII. about the affairs of Pisa. These embassies were the school in which Machiavelli formed his political opinions. and gathered views regarding the state of Europe and the relative strength of nations. They introduced him to the subtleties of Italian diplomacy, and extended his observation over races very different from the Italians. He acquired principles and settled ways of thinking which later he expressed in writing.

In 1502 Machiavelli married Marietta Corsini, with whom, in spite of his own infidelities, he lived on good terms; she bore him several children, and survived him twenty-six years. In the same year Piero Soderini was chosen gonfalonier for life, in accordance with certain changes in the constitution of the state, which were intended to bring Florence closer to the Venetian type of government. Machiavelli suggested military reforms which Soderini adopted, and finally was involved in ruin by his fall.

In October 1502 he was sent, much against his will, as envoy to the camp of Cesare Borgia, in Romagna, and it was Machiavelli's duty to wait upon and watch him. He witnessed the intrigues which culminated in Cesare's murder of his disaffected captains. From Machiavelli's official letters, and from his tract upon the *Modo che tenne il duca Valentino per ammazzar Vitellozzo Vitelli,* we are able to appreciate the relations between the two men, and the growth in Machiavelli's mind of a political ideal based upon his study of the duke's character. Machiavelli conceived the strongest admiration for Cesare's combination of audacity with diplomatic prudence, for his adroit use of cruelty and fraud, for his self-reliance, avoidance of half-measures, employment of native troops, and firm administration in conquered provinces. More than once, in letters to his friend Vettori, no less than in the pages of the *Principe,* Machiavelli expressed his belief that Cesare Borgia's methods of conquest, the cementing of a new state out of scattered elements, and the dealing with false friends or doubtful allies, was worthy of commendation and imitation. Cesare Borgia became idealized in his reflective but imaginative mind. That Machiavelli separated the actual Cesare Borgia, whom he afterwards saw ruined and contemptible at Rome, from his radiant Duca Valentino, is probable.

Military Studies.--On his return to Florence early in January 1503, Machiavelli turned his mind to the existing conditions of military service in Italy. He was familiar with the disadvantages of the use of professional captains of adventure and mercenary troops. The bad faith of the condottiere Paolo Vitelli (beheaded at Florence in 1499) had deeply impressed him. In the war with Pisa he had observed the insubordination and untrustworthiness of soldiers gathered from the dregs of different districts, serving under irresponsible commanders. From Livy he, learned to admire the Roman system of employing armies raised from the body of the citizens; and Cesare Borgia's method of gradually substituting the troops of his own duchy for aliens and mercenaries showed him that the plan was feasible. He now determined, with the support of Soderini, to furnish Florence with a national militia. Early in 1503 Machiavelli drew up for Soderini a speech, *Discorso sulla provisione del danaro,* in which the necessity of liberal expenditure on defence was expounded upon principles of sound political philosophy. Between this date and the last month of 1506 Machiavelli worked out memorials on the subject for his office, and suggested the outlines of a new military organization. On Dec. 6, 1506, his plan was approved by the *signoria*, and a special ministry, called the *nove di ordinanza e milizia,* was appointed with Machiavelli as secretary. The country districts of the Florentine dominion were now divided into departments, and levies of foot soldiers were made in order to secure a standing militia. A commander-in-chief was found in Don Micheletto, Cesare Borgia's cut-throat and assassin. The appointment illustrates a radical infirmity in Machiavelli's genius. His scheme in itself was inspired by principles of political wisdom and by the purest patriotism. But he failed to perceive that such a ruffian as Micheletto could not inspire the troops of Florence with patriotism and a healthy moral tone. Here, as elsewhere, he was insensible to ethical considerations.

Meanwhile Alexander VI. had died suddenly of fever, and Julius II. had ascended the papal chair. The duke of Valentinois had been checked in mid-career of conquest. The collapse of the Borgias threw Central Italy into confusion; and hlachiavelli had, in 1505, to visit the Baglioni at Perugia and the Petrucci at Siena. In the following year he accompanied Julius upon his march through Perugia into the province of Emilia, to subdue the rebellious cities of the Church. Upon these embassies Machiavelli represented the Florentine *dieci.* Meanwhile the war for the recovery of Pisa dragged on. Machiavelli had to attend the camp and provide for levies amid his many other occupations. Yet in the autumn of 1504 he began his *Decennali,* or *Annals of Italy,* a poem composed in rough terza rima. About the same time he composed a comedy *Le Maschere*, now lost, on the model of Aristophanes.

At the end of 1507 European affairs diverted Machiavelli from his duties in organizing the new militia. Maximilian was arranging for his coronation in Rome, and was levying subsidies from the imperial burghs. The Florentines thought his demands excessive, and Machiavelli was sent to his court in December. He travelled by Geneva, through Switzerland, to Bozen (Bolzano), where he found the emperor. This journey enabled him to study the Swiss and the Germans in their homes; his report on it is among his most effective political studies. remarkable for his concentrated effort to realize the exact political weight of the German nation, and to penetrate the causes of its strength and weakness. He attempts to grasp the national character as a whole, and to deduce practical conclusions. The same qualities are noticeable in his *Ritratti delle cose di Francia,* which he drew up after an embassy to Louis XII. at Blois in 1510. These French notes are more scattered than the German report. But they reveal the same imaginative penetration into the very essence of national existence.

Machiavelli returned from Germany in June 1508. Chiefly through his exertions the Pisan war was terminated by the surrender of Pisa in June 1509. Meanwhile the league of Cambrai had disturbed the peace of Italy, and Florence found herself in a perilous position between Spain and France. Soderini's government grew weaker. The Medicean party lifted up its head. To the league of Cambrai succeeded the Holy League. The battle of Ravenna was fought, and the French retired from Italy The cardinal Giovanni de' Medici, who was present at the battle of Ravenna, brought a Spanish army into Tuscany. Prato was sacked in the August of 1512. Florence, in extreme terror, deposed the gonfalonier Soderini, and opened her gates to the Medici.

Fall **of Machiavelli.**—The government on which Machiavelli depended had fallen, never to rise again. The national militia in which he placed unbounded confidence had proved inefficient to protect Florence. His political and personal enemies regarded him with jealousy as the ex-gonfalonier's right-hand man. He showed no repugnance to a change of masters, and began to make overtures to the Medici. The *nooe della milizia* were, however, dissolved; and on Nov. 7, 1512, Machiavelli was deprived of his appointments. He was exiled from Florence and confined to the dominion for one year, and on Nov. 17 was prohibited from setting foot in the Palazzo Pubblico. He was implicated in the conspiracy of Pier Paolo Boscoli in February 1513, though he had no share in it, because his name was found upon a memorandum dropped by Boscoli. He was racked, and only released upon Giovanni de' Medici's election to the papacy in March 1513. When he left his dungeon he retired to a farm near San Casciano. His political career, now at an end, left him with only disappointment and annoyance. Losing his emoluments, he could barely support his family.

He had lived a continuously active life. Much as he enjoyed the study of the Latin and Italian classics, literature was not his business; nor had he looked on writing as more than an occasional amusement. He was now driven in upon his books for the employment of a restless temperament; and to this irksomeness of enforced leisure may be ascribed the production of the *Principe,* the *Discorsi,* the *Arte della guerra,* the comedies, and the *Historie fiorentine* His letters to Vettori paint a man of vigorous intellect and feverish activity, dividing his time between studies and vulgar dissipation It is very difficult to understand the spirit in which the author of the *Principe* sat down to exchange obscenities with the author of the *Sommario della storia d'Italia.* This coarseness of taste did not blunt his intellectual sagacity. His letters on public affairs in Italy and Europe, especially those which he meant Vettori to communicate to the Medici at Rome, are marked by extrdordinary fineness of perception, and philosophical breadth.

Il Principe.—In retirement at his villa near Percussina, a hamlet of San Casciano, Machiavelli completed the *Principe* before the end of 1513. This famous book is an analysis of the methods whereby an ambitious man may rise to sovereign power It appears to have grown out of the *Discorsi sopra la prima deca di Tito Livio,* begun at an earlier date, but only finished later.

Cast in the form of comments on the history of Livy, the *Discorsi* are really an inquiry into the genesis and maintenance of states. The *Principe* is an offshoot from the main theme of the *Discorsi,* setting forth Machiavelli's views at large and in detail upon the nature of principalities, the method of cementing them, and the qualities of a successful autocrat. Being more limited in subject and more independent as a work of literary art, this essay detaches itself from the main body of the *Discorsi,* and has attracted far more attention. In the *Principe* its author had more than a speculative aim in view, and brought it forth to serve a special crisis. Machiavelli judged the case of Italy so desperate that salvation could only be expected from the intervention of a powerful despot. The unification of Italy in a state protected by a national army was the cherished dream of his life; and the peroration of the *Principe* shows that he meant this treatise to have a direct bearing on the problem, though the book was by no means exclusively directed to that end. Together with the *Discorsi,* the *Principe* contains the speculative fruits of his experience and observation combined with his deductions from Roman history. The two works form a coherent body of opinion, not systematically expressed, it is true, but based on the same principles, involving the same conclusions, and directed to the same philosophical end That end is the analysis of the conception of the state, studied under two main types. republican and monarchical. Up to the date of Machiavelli, modern political philosophy had always presupposed an ideal. Mediaeval speculation took the Church and the Empire for granted, as divinely appointed institutions Thinkers differed only as Guelfs and Ghibellines, as leaning on the one side to papal, on the other to imperial supremacy. No new substantial philosophy of any kind had emerged from humanism: the political lucubrations of the scholars of the Renaissance were, like their ethical treatises, for the most part rhetorical. Still the humanists created a new medium for the speculative faculty. Simultaneously with the revival, Italy had passed into the "age of despots." The yoke of the Empire had been shaken off. The Church had taken rank among Italian tyrannies. Principalities and sovereign cities claimed autocratic jurisdiction. These separate despotisms owned no common social tie, were founded on no common *ius* or right, but were connected in a network of conflicting interests and changeful diplomatic combinations. A keen and positive political intelligence emerged in the Italian race. The reports of Venetian and Florentine ambassadors at this epoch contain the first germs of an attempt to study politics from the point of view of science.

At this moment Machiavelli intervenes. He was aware that the strongholds of mediaeval thought must be abandoned, and that the ruins of mediaeval institutions furnished no basis for solid political edifices. His originality consists in having extended the positive intelligence of his century from the sphere of contemporary politics and special interests to man at large regarded as a political being. He founded the science of politics for the modern world, by concentrating thought upon its fundamental principles. He began to study men, not in the isolation of one century, but as a whole in history. He drew his conclusions from the nature of mankind itself, "ascribing all things to natural causes or to fortune." In this way he restored a method which had been neglected since the days of Aristotle. Machiavelli's conception of the modern state marked the close of the middle ages, and anticipated the next phase of European development. His prince prefigured the monarchs of the 16th and 17th centuries, the monarchs whose motto was *L'état c'est moi!* His doctrine of a national militia foreshadowed conscription. The remedies which he suggested for Italian decadence, in the perorations of the *Principe* and the *Arte della guerra*, have since been applied in the unification of Italy. Machiavelli saw clearly the ruin of his country, and burned to save Italy and set her in her place among the powerful nations; his very limitations and mistakes were due to an absorbing passion for the state of which he dreamed. Concentrating his attention on the one necessity for organizing a powerful coherent nation, Machiavelli forgot that men are more than political being;. He neglected religion, or regarded it as part of the state machinery. He judged private virtue to be the basis of all healthy national existence; but in the realm of politics he subordinated morals to political expediency. He held that the people, as distinguished from the nobles and the clergy, were the pith and fibre of nations; yet this same people had to become wax in the hands of the politician —their commerce and their comforts, the arts which give a dignity to life and the pleasures which make life liveable, neglected—their very liberty subordinated to the one tyrannical conception. To this point the segregation of politics from every other factor which goes to constitute humanity had brought him; and this makes us feel his world a wilderness. Yet isolation of the subject matter of this science was essential at the outset, just as the science of economics had first to make a rigid severance of wealth from other units. Only gradually have we recognized that political economy has unavoidable points of contact with ethics.

Machiavelli thought of dedicating the *Principe* to one of the Medicean princes, but without result. The Medici, as yet at all events, could not employ Machiavelli, and had not in themselves the stuff to found Italian kingdoms.

Other Works.—Machiavelli, meanwhile, was reading his *Discorsi* to a select audience in the Rucellai gardens. Towards the year 1519 both Leo X. and his cousin, the cardinal Giulio de' Medici, thought it necessary to give Florence at least a semblance of self-government. They applied to several politicians, among others to Machiavelli, for advice in the emergency. The result was a treatise in which he deduced practical conclusions from the past history and present temper of the city, blending these with his favourite principles of government in general. He earnestly admonished Leo, for his own sake and for Florence, to found a permanent and free state system for the republic. The year 1520 yielded the *Arte della guerra* and the *Vita di Castruccio*.

The first of these is a methodical treatise, setting forth Machiavelli's views on military matters, digesting his theories respecting the superiority of national troops, the inefficiency of fortresses, the necessity of relying upon infantry in war, and the comparative insignificance of artillery. The peroration contains a noble appeal to the Italian liberator of his dreams, and a parallel from Macedonian history, which, read by the light of this century, sounds like a prophecy of Piedmont.

The *Vita di Castruccio* was composed at Lucca, whither Machiavelli had been sent on a mission. Dealing freely with the outline of Castruccio's career, as he had previously dealt with Cesare Borgia, he sketched his own ideal of the successful prince. Cesare Borgia had entered into the *Principe* as a representative figure rather than an actual personage; so now conversely the theories of the *Principe* assumed the outward form of Castruccio.

In the same year, 1520, Machiavelli received a commission from the officers of the *Studio pubblico* to write a history of Florence. He left a portion of it finished, with a dedication to Clement VII., when he died in 1527. The *Historie fiorentine* is not so much a chronicle of Florentine affairs, from the commencement of modern history to the death of Lorenzo de' Medici in 1492, as a critique of that chronicle from the point of view adopted by hlachiavelli in his former writings. But the *History of Florence* is not a mere political pamphlet. It is the first attempt in any literature to trace the vicissitudes of a people's life in their logical sequence, deducing each successive phase from passions or necessities inherent in preceding circumstances, reasoning upon them from general principles, and inferring corollaries for the conduct of the future. In form it is modelled upon Livy. The style of the whole book is nervous, vivid, free from artifice and rhetoric. Machiavelli had formed for himself a prose style, equalled by no one but by Guicciardini in his minor works; it is an athlete's style, all bone and sinew, without superfluous flesh or ornament.

It would seem that from the date of Machiavelli's discourse to Leo on the government of Florence the Medici had taken him into consideration and he was employed on one or two missions of little importance. But his public career was virtually closed. A translation of the *Andria* and three original comedies from his pen are extant, the precise dates of which are uncertain, though the greatest of them, *Mandragola*, was first printed at Rome in 1524. It is the ripest and most powerful play in the Italian language.

The plot is improbable and unpleasing. But the wit, humour, vivacity and satire of the piece bring before us the old life of Florence in a succession of brilliant scenes. If Machiavelli had any moral object when he composed the *Mandragola*, it was to paint in glaring colours the corruption of Italian society. It shows how a bold adventurer, aided by the profligacy of a parasite, the avarice and hypocrisy of a confessor, and a mother's complaisant familiarity with vice, achieves the triumph of making a gulled husband bring his own unwilling but too yielding wife to shame. The whole comedy is a study of stupidity and baseness acted on by roguery. The force of healthy instincts is underestimated.

He composed a second comedy, *Clizia*, which is even homelier and closer to the life of Florence than its predecessor. It contains incomparable studies of the Florentine housewife and her husband, a grave business-like citizen, who falls into the senile folly of a base intrigue. There remains a short piece without title, the *Commedia in prosa*, which, if it be Machiavelli's, as internal evidence of style sufficiently argues, might be accepted as a study for both the *Clizia* and the *Mandragola*.

The little novel of *Belfagor* is a good-humoured satire upon marriage, the devil being forced to admit that hell itself is preferable to his wife's company. The story has a mediaeval origin, and it was almost simultaneously treated in Italian by Machiavelli, Straparola and Giovanni Brevio.

Last Years.—In the spring of 1526 Machiavelli was employed by Clement VII. to inspect the fortifications of Florence. In the summer of the same year he received orders to attend Francesco Guicciardini, the pope's commissary of war in Lombardy. Guicciardini sent him in August to Cremona, to transact business with the Venetian *Provveditori*. Later on in the autumn we find him once more with Guicciardini at Bologna. Thus the two great Italian historians of the 16th century, who had been friends for several years, were brought into intimacy.

After another visit to Guicciardini in the spring of 1527, Machiavelli was sent by him to Civita Vecchia. But what seemed like a new diplomatic opportunity ended. He died in Florence on June 20, 1527, receiving the last offices of the Church.

In person Machiavelli was of middle height, black-haired, with rather a small head, very bright eyes and slightly aquiline nose. His thin, close lips often broke into a smile of sarcasm. His activity was almost feverish. When unemployed in work or study he was not averse to the society of boon companions, gave himself readily to transient amours, and corresponded in a tone of cynical bad taste. At the same time he lived on terms of intimacy with worthy men. Varchi says that "in his conversation he was pleasant, obliging to his intimates, the friend of virtuous persons." The contradictions of which such a character was capable are seen in his 'correspondence with Vettori. It would be unfair to charge what is repulsive in their letters wholly on the habits of the times, for the published correspondence of similar men at the same epoch offers little that is so disagreeable.

MACHINE. A machine may be defined as a combination of resistant parts so connected as to have constrained motion and to be capable of transmitting or transforming energy. Although modern machines with their complex controls appear to be extremely complicated, every one is merely a combination of one or more of three basic elements: the wheel (*q.v.*) and axle, the lever (*q.v.*) and the inclined plane. Machines composed of combinations of these three basic machines may be classified according to two general functions: (1) generation and transformation of power; (2) transmission of power and performance of work, accomplished by means of such types of machinery as the pump, compressor, fan, crane, elevator and pulley (*qq.v.*) and the different types of vehicles. *See* also MACHINE TOOLS; MATERIAL HANDLING; and POWER TRANSMISSION. For specific machines not listed above, consult the index.

MACHINE GUN, a military firearm of small calibre capable of rapid, sustained fire. The modern machine gun is an automatic, belt-fed weapon that, barring a malfunction, will continue to fire as long as the trigger is held back, or until the supply of ammunition is exhausted.

The first machine guns, such as the famous Gatling gun described below, were manually operated by turning a hand crank, though they could be powered by a motor. The U.S. patent office described such weapons as being "capable of sustained fire from energy derived from an outside source." Later machine guns, such as the Maxim gun of the 1880s, required no outside source of power; they used the energy released by the burning propellant to feed, load, lock and fire each round, and eject the empty cartridge case. They were thus truly automatic machine guns.

The term automatic gun came into use after World War I to describe automatic aircraft weapons larger than the calibre .30 or calibre .50 machine guns. Such weapons were merely large machine guns (from 20 mm. to 57 mm.) and, as a rule, operated from energy released by the burning propellant. Beginning about 1945, some automatic guns reverted to the original external drive principle of the Gatling gun and employed either an electric motor or a gas turbine as a source of power. (For submachine guns, see SMALL ARMS, MILITARY: 20th-Century *Small Arms.*)

EVOLUTION OF THE MACHINE GUN

Soon after the advent of the first primitive firearms inventors began to contrive means for firing more than one shot before reloading. The first of these devices, known as ribaulds or ribaudequins, were simply bundles or rows of barrels, fired either all at once or in sequence. Many rather ingenious methods were used to control the firing, such as sliding locks that fired several superimposed charges in succession but required that the trigger be pulled for each shot. The idea of a multibore cylinder started in the matchlock period and has been used throughout the age of firearms, culminating in the most modern aircraft automatic guns. Before the invention of metallic cartridges, machine guns did not provide reliable, controlled ignition. They either suffered from stoppages or, even worse, permitted several charges to go off at once, with disastrous results.

The first soundly conceived manually operated machine gun was that patented in London, May 15, 1718, by James Puckle. The patent drawing of the Puckle gun has been widely published, but it is not generally known that the gun was actually produced, tested and found operable. Fig. 1 shows one of the production models in the Tower of London armouries. Puckle called his invention "a portable machine that discharges so often and so many bullets . . . as renders it next to impossible to carry any ship by boarding." The flintlock ignition was a limiting factor in its design, but other features were strikingly similar to those used in the Gatling and other systems of a century and a half later.

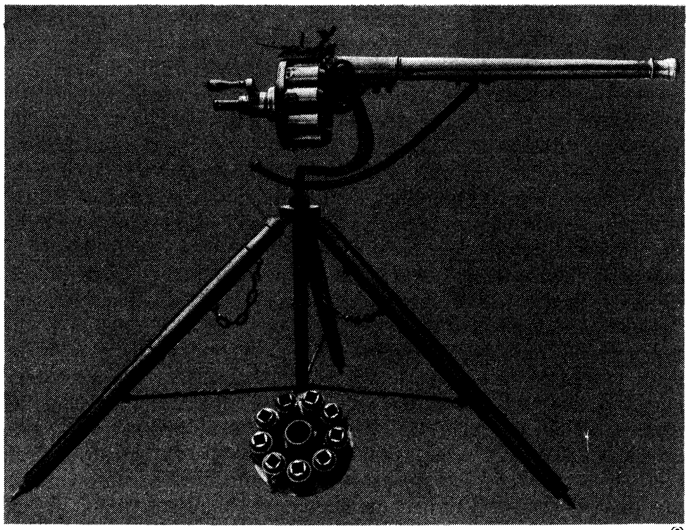

FIG. 1.— PUCKLE MACHINE GUN, 1718, WITH REVOLVING BLOCK FOR FIRING SQUARE BULLETS SHOWN IN THE FOREGROUND

The Percussion Cap.—The many problems arising from inability to ignite all charges at the same time, or with a high degree of reliability, regardless of how close the barrels were grouped, held further development almost at a standstill until 1807, when Alexander John Forsyth (1769–1843), a Scottish Presbyterian minister, patented an "application of the detonating principle to exploding gunpowder firearms." Forsyth utilized mercury fulminate, rolled into "pills" or small pellets which were placed in a nipple at the breech end of the barrel and detonated by the impact of a falling hammer.

Joshua E. Shaw (1776–1860), a U.S. sea captain, perfected a method whereby Forsyth's principle could be given a practical application—use of the percussion cap. Shaw developed a cup, made first of pewter and later of copper (about 1816), in which the mercury fulminate was placed so that the detonating mixture would be protected from the weather. would grip the sides of the nipple and could be used as a unit to transmit fire to the propellent charge. This invention opened the field for numerous weapons that were officially defined by the U.S. patent office as machine guns.

One of the earliest of the devices so classified was invented by Charles Emerson Barnes on July 8, 1856. Although there is no record of even a working model being made from the patent issued to the inventor, the illustration showing his toggle-locking action is still considered basically sound. Among other practical mechanisms of this period were the Ripley machine gun, the Ager "coffee mill" gun (commonly called the Union gun, the Claxton machine gun, the Williams machine gun and the Gorgas machine gun. The battle of Fair Oaks (Seven Pines), Va. (May 31, 1862) where the Confederates fired volleys from a battery of Williams guns, marked the first record of the use of the machine gun in warfare. There were, during the American Civil War, 11 hand-operated mechanisms that could be classified as machine guns available for service use. However, it remained for one man to resolve all the serious problems facing designers of manually powered machine guns at the time. That man was Richard Jordan Gatling (*q.v.*).

The **Gatling** Gun. — Gatling's original gun (about 1862) was a single-barrel device with a rotary chamber that combined certain features of the Ager and the Ripley guns. He employed the best ammunition available at the time. It consisted of a paper cartridge placed in a heavy-walled steel cylinder countersunk at the base and equipped with a nipple on which was placed the percussion cap. The first model of a Gatling gun using this type of cartridge was finished in time to see limited use by the Union army in the American Civil War.

Parallel with Gatling's efforts to improve gun mechanisms appeared the deciding factor which would govern the future of all machine gun design. It was first introduced to the sporting world in the form of the lightweight brass cartridge containing in a single unit a means of ignition, the propellant and the bullet. *(See* SMALL ARMS. MILITARY.) Gatling recognized the significance of this great improvement and redesigned his weapon. It consisted of a number of barrels mounted parallel one to mother and equidistantly spaced to rotate about a central shaft. The gun was actuated by a hand crank which could be turned slowly or rapidly at the will of the operator, thus providing control of the rate of fire. The positioning of the incoming cartridge in the chamber of each individual barrel was accomplished by gravity or by the camming action of the cartridge container located directly above the gun. This was done while the chamber being loaded was making a half-revolution about the central shaft. Firing then took place, followed by extraction and ejection during the second half-revolution. The combination of all factors, from the basically sound mechanism to the self-contained metallic cartridge, was vitally necessary in the evolution and perfection of the Gatling machine gun.

The introduction of the self-contained metallic cartridge made possible not only rapid fire but also bursts of long duration aith great reliability since the round could be mechanically controlled throughout the entire gun mechanism and the base of the cartridge could be designed to facilitate chambering, firing, extracting and ejecting.

Other Types. — The Gatling gun was without peer in the manually operated era and, when powered externally, could fire 3,000 rounds per minute. But its multibarreled arrangement placed a serious limitation on its tactical use. This gave other inventors the opportunity to display their genius in devising variations of hand-powered machine guns to meet specific purposes. Among the foremost of these hand-cranked weapons was the Hotchkiss (1878) developed primarily for shipboard use, being chambered almost exclusively for the large artillery type of cartridge. More mobile than the Gatling, the Gardner was another successful mechanism employing conventional military rifle calibre cartridges only. It was adopted by the navies of many world powers because the one- and two-barrel versions could be easily carried ashore by one man. The prevailing military belief that volley fire was more effective than rapid continuous shots led to the development of another type of volley-firing, hand-polyered machine gun, universally knonn as the Nordenfeldt (patented in 1879). Although never officially adopted, many other ingenious hand-manipulated mechanisms were developed between 186j and 1880 in the United States. These guns mere actually constructed and passed exhaustive government tests. Representative types were the Lowell, which mechanically indexed and fed the incoming round at high speed; the Wilder, which combined the revolver system with reciprocating action; and the Bailey, which was the first to employ belt feeding.

During the American Civil War, French observers attached to the Union and Confederate armies recognized the devastating effectiveness of grapeshot fired from light artillery against concentrated attacking personnel. From these observations there was developed in Europe a peculiar multifiring weapon resembling a piece of standard artillery. It was considered an improved method of delivering grapeshot and was called a mitrailleuse, meaning grape shooter or more literally, grapeshot shooter. This marked the beginning of French interest in machine guns and each subsequent hand-powered or automatic firing device manufactured by the French carried the marking mitrailleuse, although the meaning of the word had no connection with the weapon beyond the first effort.

For the second time in machine gun history another completely new concept entered the field and quickly made all previous efforts obsolete. This revolutionary development came through the invention (about 1885) of a new form of propellant, a progressive burning powder. By gelatinizing nitrocellulose, the burning speed of the explosive mixture could be controlled to a high degree. Another important feature of this new powder was that during combustion there was almost no smoke. Quickly acclaimed by both military and civilian observers for its smokeless qualities, it was named smokeless powder. To the machine gun inventor: however, its real significance lay not in its lack of smoke but in its progressive burning qualities. It not only yielded a higher chamber and bore pressure to give increased velocity to the projectile, but also made it possible for a metered amount of gas pressure to be used for operating a weapon. By drilling a small hole or port in the barrel a fraction of the pressure could be brought to bear on a piston or lever that provided complete control during firing.

Still another method for powering the weapon was provided by the recoil force which was also governed solely by the progressive burning qualities of the new propellant. When the weight of the charge was constant it gave the same amount of thrust with each shot. This assured consistency of the distance and speed of the recoil stroke.

Hiram Stevens Maxim (1840–1916), a U.S. engineer and inventor residing in England, conceived the idea of the first fully automatic machine gun. Again, the conception and development of the automatic machine gun was retarded initially because the inventor was forced to employ as ammunition only what was available at the time, in this case the conventional black powder cartridge. In spite of this handicap, by June 1884, Maxim had progressed to the point where he had a workable product. The principle of short recoil was used by Maxim for the complete cycling of his single-barrel weapon. Although Maxim's early experiments were conducted with black powder cartridges, and he had reached a limited degree of success, it was the introduction of the new propellant, smokeless powder, that not only assured the success of the Maxim gun but also brought about the golden era (from 1884 to World War I) of automatic machine gun inventions. His guns, as manufactured by Vickers and known by that name as well as Maxim or Vickers-Maxim, were used by every major power. The Vickers machine gun was adopted by the U.S. army as its model 191j.

Following closely behind Maxim came the prolific U.S. inventor, John M. Bromning (*q.v.*), of Ogden, Utah. His work on automatic gun mechanisms is well known; no design of his ever failed. After his entry into the field the United States used his automatic weapons almost exclusively. Official adoptions by the U.S. include the calibre .30 Browning automatic rifle (B.A.R.), the calibre .30 light Browning machine gun, the calibre .30 heavy Bromning machine gun, the calibre .45 auto-loading pistol, the calibre .50 aircraft and heavy-barrel ground-type Browning machine gun and the 37-mm. aircraft automatic gun.

From 1890 to World War I, the large standing armies prevalent in Europe furnished an impetus and ready market for tremendous activity in machine gun design, and there was an influx of U.S. aurornatic neapon designers to Europe. Among them were Hugo Borchardt. Benjamin Hotchkiss, Laurence V. Benét. Col. Isaac N. Lewis and later Browning. Consequently, both the Allies and the Central Powers during World War I armed their military forces with machine guns designed by persons of U.S. origin. such as the Maxim. Vickers, Lewis, Hotchkiss, Benét-Mercié and Browning.

The Skoda gun was used by Austria and tested by the United States. The Madsen light machine gun, made in Denmark, was used by Russia, Denmark. Norway, Argentina and several other countries. The Bergmann and Dreyse guns were used by Germany. The Schwarzlose was used by several countries. Before and during World War I, the Chauchat. Benét-Mercié, Berthier and Lewis light machine guns were extensively tested and used. During that war, the Lewis gun, in an adaptation for aircraft, became one of the favourite weapons of fighter pilots. Some of them were still in service at the beginning of World War II. A famous gun, the ZB, was developed in Brno. Czech. The British government acquired a licence to manufacture it before World War II and used it extensively. The weapon was manufactured at the Enfield plant and called the Bren gun, the name being derived from Brno and Enfield.

Designers of other nations active during this time, included Germans such as Paul Mauser, Fritz and George Walther, Theodor Bergmann, Louis Schmeisser and Reinhold Becker; the Austrian, Rudolf Frommer; the Italians, Bethel Revelli and Alfredo Scotti; the Frenchman, André Berthier; the Swiss, Marc Birkigt; and the Mexicans, Manuel Mondragon and Rafael Rlendoza. Their designs, then still in experimental stages, were not used extensively during World War I, but they laid the foundations for many subsequent developments.

World War I. often called the machine gun war, brought to the foreground the importance of the machine gun as a deadly military weapon. Lloyd George, in a speech before the British house of commons on Dec. 15, 1915, estimated that over 80% of the British casualties to that date had been inflicted by machine gun fire and it is reasonable to assume that the other participants suffered in the same ratio. This great conflict also introduced a hitherto unproved weapon, the airplane, which was destined to be combined with the machine gun as a weapon of war of vast potentiality.

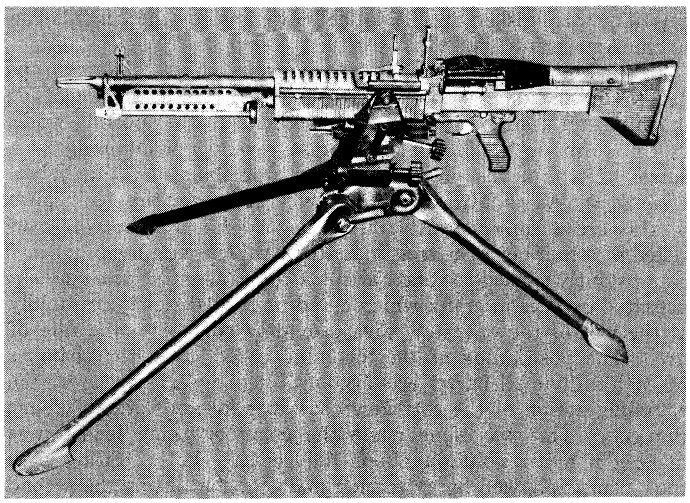
Throughout automatic n-eapon history, new situations that stimulated design always appeared. By World War I, when the ground-type machine gun had reached a stage of near perfection. aviation provided an incentive that opened up fresh concepts in automatic weapons. Certain features, hitherto unforeseen. became immediately critical. Among these were weight, compactness, high rate of fire, amount of ammunition used in comparison with allowable weight to be carried by the airplane, synchronization to fire through the propellers, mounting of weapons and ejection of empty cartridges and links. At first; with the slow flying speed, these problems were easily overcome; in fact, planes originally carried regular ground-type machine guns with slight modifications for mounting purposes.

Machine gun designers managed to stay ahead of aircraft requirements throughout the 1920s, 1930s and the early part of World War 11 However, the advent of jet-powered aircraft in the latter days of World War II introduced a new factor in machine gun design. The problem was to design an extremely light, large-calibre gun shooting an explosive projectile at a very high rate of fire to cope with the supersonic speeds, tremendous stresses and compact design of jet aircraft. However, advances in impact forming had by then developed the art of stamping to such close working tolerances that the forging and machining of receivers, feed mechanisms and internal parts became unnecessary. Metallurgists. successful in the development of new alloys of high tensile strength: found they could replace steel when weight became the important factor. As these things came into being, the weight of the automatic gun was considerably reduced, thus allowing more installations of guns per aircraft and more firepower per pound of weight carried.

To this end scientists and machine gun designers worked constantly to produce reliable, light, compact, rapid-firing automatic guns to keep pace with the ever-advancing aircraft industry. There has been a universal exploitation of systems to take advantage of certain features that are highly adaptable for a specific purpose and to design an automatic firing mechanism having the desired qualities. This resulted in a great advance in aircraft automatic weapon design. In 1957 the U.S. army adopted the M60, a lightweight, general purpose machine gun to replace three older calibre .30 machine guns. The gun could be fired from the shoulder. from the hip, from a bipod or from an aluminum tripod mount. It was chambered for the standard 7.62-mm. NATO (North Atlantic Treaty organization) cartridge.

AUTOMATIC GUNS

When aircraft were first used in combat during World War I they were armed with the types of small arms then used in ground warfare, but machine guns specially designed or adapted for mounting in aircraft were soon developed. Some were mounted in open cockpits while others were installed to fire through the propeller—synchronized so as to miss the blades. Before the end of the war, it was evident that a heavier weapon was needed for firing at



BY CCURTESY OF U.S DEPARTMENT OF ARMY

FIG. 2.—U.S. MACHINE GUN. M60. ADOPTED IN 1957

ground targets such as trucks, locomotives or light tanks. Some of the first attempts at a solution simply placed in the airplane a conventional light fieldpiece with so-called quick-fire breech mechanism. As the recoil energy to be absorbed by the aircraft structure was excessive. it became apparent that specially designed weapons were required. The Puteaux factory in France modified some 37-mm. aircraft cannon designed by Birkigt (of Hispano-Suiza) to fire through the hub of a propeller. But these did not go into service until after World War I. The Germans had placed a 20-mm. Becker gun in a ring mount and found it an effective aircraft weapon. This mas the forerunner of the no-mm. Oerlikon gun of World War II service.

In 1938 the Royal Navy adopted the 20-mm. Oerlikon gun as its standard light antiaircraft weapon on all ships. A short time later the U.S. navy took similar action. During World War II, both Japan and Germany also used the Oerlikon extensively. It was the principal Nazi aircraft gun before and during the battle of Britain.

One of the first automatic aircraft cannon used in World War I was the Revelli (Fiatj which the Italians installed in their large Caproni and Savoia-Pomilio bombers. The calibre of this gun was 25.4-mm. It could fire eight rounds in two seconds from a ring mount. The British Vickers 37-mm. automatic aircrait cannon was installed in British naval aircraft as early as 1915. Its excessive recoil made it unpopular. but during the 1930s, Vickers improved the design and produced some 37-mm. guns which were satisfactory. The size was later increased to 40-mm., and near the end of World War II a few of 57-mm. were produced.

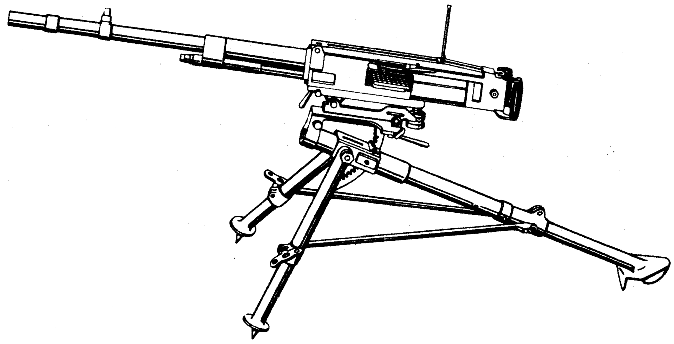


FIG. 3.— TYPICAL GAS-OPERATED AUTOMATIC MACHINE GUN (ITALIAN BREDA)

In the United States, a Browning 37-mm. aircraft cannon was used to some extent during World War II. The U.S. government furnished thousands of these weapons to Russia with Bell Aircobra fighter planes. Most U.S. aircraft carried 20-mm. guns of either Hispano-Suiza or Oerlikon type. The principal gun used by the army air forces was the 20-mm. M1 and AN M2. which operated on a combination gas and blowback principle. It used either a belt-feed mechanism or a 60-round drum magazine. It was mounted as a fixed gun in the wing or fuselage of an airplane, or in a turret. It could also be mounted to fire through the propeller hub. Its rate of fire was 600 to 700 rounds per minute.

The French developed but did not use a 2j-mm. Hotchkiss gun. They did not use it because the plant was captured early in the war. Japan, however, made the gun on a licence agreement and used it extensively. The Italian Scotti gun superficially resembled the Oerlikon, but was not used to any extent. The Danish Madsen guns in 20-mm. and 23-mm. were never very popular. The Nazi forces during World War II used several different aircraft guns, among them the Mauser 20-mm., and the Rheinmetall-Borsig in 20-mm. and 30-mm. sizes. The Swedish Bofors plant also produced aircraft guns in 20-mm. and 57-mm. sizes. Breda made some 20-mm. guns for the Italian government.

Most of the early automatic aircraft guns were mounted on flexible rings. However, some were arranged to fire through the propeller hub, and a few, notably types used in heavy US. bombers during World War II, were placed in remotely controlled turrets. But the weapon most commonly used in such turrets was the calibre .50 Browning machine gun. As first adopted by the U.S. services, this gun was known as the model 1921. It was made with either water-cooled or air-cooled barrels. The former were for antiaircraft use, the latter, either with flexible or fixed mounts, for aircraft installations. The principal type used during World War II was the M2, which is distinguished from earlier models by the fact that it could be fed either from the right or left side. Older guns fed from the left only. The variants of the M2 included aircraft models (fixed and flexible), heavy-barrel models for ground use and water-cooled models for antiaircraft fire. The aircraft guns could be fired mechanically or electrically either by an accessory or by a manual trigger. Their rate of fire was from 7j0 to 850 rounds per minute. The AA version had a rate of from 550 to 700 shots per minute, while the heavy-barrel ground gun fired at from 400 to 500 shots per minute. Late in the war an improved gun, the M3 was introduced. Its main distinction was an increased rate of fire—1,200 shots per minute.

In the Korean war the predominant weapon on planes of the United Nations was the calibre .50 aircraft gun. The Soviet MIG-15 planes were armed with a variety of larger calibre, slower firing weapons ranging in size from the calibre .50 to the 37 mm., including a 23-mm. gun with a cyclic rate of 700–800 rounds per minute. To meet the challenge of supersonic jet planes, aircraft guns firing at the rate of several thousand rounds per minute were under development. One adopted by the U.S. air force was a 20-mm. machine gun operating on the revolver principle, aith a five-chamber cylinder. Another experimental model unveiled by the U.S. army in 1957 was the 20-mm. Vulcan based on the Gatling gun principle. Its six rotating barrels could fire at the rate of about 7,000 rounds per minute. In spite of these developments, aircraft rockets and guided missiles steadily gained ground in competition with conventional machine guns. (See MISSILES; ROCKETS.)

SYSTEMS OF OPERATION

Generally speaking, there are five known practical applications for accomplishing sustained fire as outlined in the definition of an automatic gun: (1) residual pressure remaining in the bore a few milliseconds after the projectile has cleared (blowback); (2) gas pressure in the bore bled off externally through an orifice (gas operation); (3) long recoil; (4) short recoil; and (5) blast energy generated by the expanding gases after being released from the confines of the barrel at the muzzle end (muzzle blast actuation). The last application has had only limited development in automatic weapon design and is not further discussed in this article.

Principles of Blowback.—In some guns, all the energy required for the performance of the automatic cycle is obtained through blowback action while in others only a portion of the required energy is from this source, the remainder being derived from some other system of operation. In any event, the blowback effect is present, at least in part, whenever the bolt of a gun is not locked while there is powder gas pressure in the chamber. When blowback action occurs, the energy derived from the pressure of the powder gases appears in the form of kinetic energy transferred to the bolt mechanism by the empty cartridge case as it is blown from the chamber of the barrel; *i.e.*, it appears in the form of a velocity imparted to the bolt mass. The basic problem involved in blowback operation is in the complete control of this velocity so that the gun will operate as desired. There are several well-defined methods by which the control of the rearward motion of the bolt may be accomplished in guns employing blowback and these various methods are referred to as blowback "systems."

Plain Blowback.—This system is used extensively in the design of lightweight shoulder arms chambered for short-range pistol cartridges. This type of weapon is officially designated as a submachine gun—the Thompson calibre .45 submachine gun, for example. The method is also universally employed in construction of small-bore, auto-loading hand arms; *e.g.*, the calibre .22 Colt Woodsman pistol. In the plain blowback system (see fig. 4), the bolt returns to the firing position with relatively low velocity but with considerable kinetic energy and this energy is absorbed by impact before the next cycle starts. Since the bolt is stationary when the new round is fired, all of the explosive force of the round is effective in accelerating the bolt to the rear. As has been explained, this condition requires the use of an extremely heavy bolt in order to keep the bolt velocity within safe limits.

Delayed Blowback.—This may be defined as a method of operation in which the bolt remains locked until the peak powder gas pressures have passed and a safe operating limit is reached after the projectile clears the muzzle. The bolt is then unlocked by some means so that it can be blown back by the residual pressure with sufficient energy to perform the remainder of the cycle of operation. In this system, the time at which the bolt is unlocked can be controlled in the design so that any desired portion of the residual pressure can be utilized. Of course, the bolt must be unlocked while there is still sufficient impulse available from the residual pressure to produce the required operating energy.

Any gun in which the bolt is unlocked while residual pressure still exists is subject to some blowback and partakes of some of the characteristics of the delayed blowback system. Such guns include certain gas-operated and short-recoil-operated weapons in which the bolt is unlocked almost immediately after the projectile has left the muzzle. However, in guns of this type, the operating energy does not come solely from blowback but is derived also

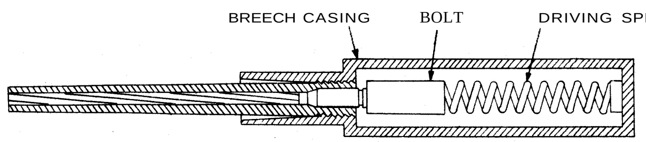

FIG. 4.— SCHEMATIC DRAWING OF PLAIN BLOWBACK SYSTEM

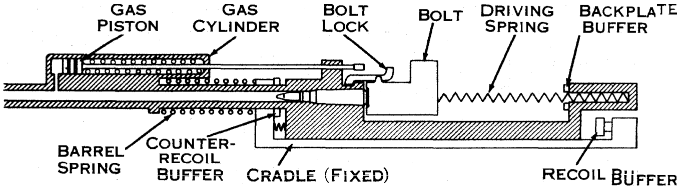

FIG. 5.— SCHEMATIC DRAWING OF GAS-OPERATED SYSTEM

from the action of the gas piston or from a mechanical accelerator actuated by the motion of the recoiling parts. This system is highly adaptable to large calibre automatic guns, such as the Birkigt 404, Hispano-Suiza and Scotti aircraft weapons.

Retarded Blowback.—In this system a special retarding mechanism is operated by the movement of the bolt. The mechanism itself is composed of relatively light parts and the inertia forces which result when these parts are set in motion by the bolt are therefore relatively small. However, the mechanism is arranged so that the bolt must act through a tremendous mechanical disadvantage to overcome the inertia forces and is accordingly subjected to a very high resistance to motion. In other words, although the bolt and the associated mechanism may be quite light, the effective resistance to bolt acceleration can be made just as great as that which would be obtained by the use of an extremely heavy bolt. The mechanism of a retarded blowback gun is similar to that of a plain blowback gun except for the presence of the retarding mechanism. This can take many forms but the basic principle underlying all of these is that the bolt must overcome the inertia forces in the mechanism by acting through a high mechanical disadvantage. Being unadaptable to large bore weapons, this system is used exclusively in design of machine guns employing rifle or pistol cartridges; *e.g.,* the Schwarzlose and Skoda machine guns.

Advanced Primer Ignition.—A substantial saving in bolt weight and other advantages can be realized by making use of the kinetic energy of the returning bolt. Instead of permitting this energy to be dissipated by impact before the next round is fired, it is possible to time the ignition so the new round is fired just before the bolt reaches its fully forward position. In this method, known as advanced primer ignition, the impulse of the propellant explosion must first slow and stop the returning bolt before it can propel the bolt to the rear. With this action, only a portion of the explosive impulse is effective in blowing the bolt back and the interval of time during which the pressure of the powder gases acts to produce a rearward acceleration of the bolt is also reduced. Both of these effects permit the use of a much lighter bolt and produce a condition in which higher bolt velocities are allowable. Thus, not only can the gun be lighter, but it is also possible to achieve a higher rate of fire. This operation is used exclusively in the design of large bore automatic guns; outstanding examples are the Oerlikon and the German MK-108.

Principles of Gas Operetion.—In all machine guns, the fundamental source of operating energy is the high-pressure gas created by the explosion of the propellent charge. This is true, in a general sense, of guns operated by any system of true automatic operation, as defined in this article. In spite of the fact that the ultimate source of operating energy in all machine guns is the pressure of the powder gases, the term gas operation is reserved for a particular type of operating system in which the pressure of the powder gases is employed in a specific way.

In a typical gun which uses the system of gas operation, an opening or port is provided in the side of the barrel. When the projectile has passed this opening, some of the high-pressure gases behind the projectile are tapped off through the hole and pass through an orifice to operate a piston or some similar device for converting the pressure of the powder gases to a thrust. This thrust is then utilized through a suitable mechanism to provide the energy necessary for performing the automatic functions required for sustained fire. These functions include unlocking the bolt, retracting the bolt and operating the other portions of the gun mechanism necessary to perform the complete cycle.

The gas operating mechanism can take many forms. Fig. 5 illustrates a commonly used device, consisting of a simple gas cylinder and a piston which is driven rearward to transfer its energy to the bolt by direct impact. In some cases, the piston may be driven forward instead of rearward, but this does not involve any significant change in the principle of operation. Even the nature of the member which is acted upon by the gas pressure is subject to great variation. Instead of being a conventional piston, this member can be in the form of a sleeve, slide or other device arranged to receive an impulse from the gas pressure.

The methods used for transferring energy from the piston to the gun operating mechanism are also extremely diverse in form and function. Instead of transferring energy directly to the bolt, the piston itself sometimes moves through a very short stroke and transfers its energy by impinging on an intermediate sliding member or lever. A great number of devices have been designed to minimize the shock involved in the energy transfer through the use of levers, links or cams. In certain instances, the shock of transfer is reduced by causing the piston to load intermediate springs which subsequently transfer their stored energy to the mechanism. Existing examples of gas-operated guns (*e.g.,* the Hotchkiss) incorporate many ingenious arrangements for tapping the energy in the powder gases and for handling related problems such as sealing, timing and adjustment.

Principles of Recoil.—These principles can be understood best by considering the forces which result from firing a cartridge in an elementary gun. Such a gun consists of a barrel having a chamber at its rear end for receiving the cartridge and a breech closure in the form of a bolt. The bolt is rigidly locked to the barrel after the cartridge is inserted and provides a firm support for the base of the cartridge case so that the case will not be blown out of the chamber by the explosion of the propellant charge. When the cartridge is fired, the explosion of the propellant results in the rapid generation of extremely high gas pressure in the chamber and the expansion of this high-pressure gas drives the projectile forward through the bore. As the powder gases expand behind the projectile, the centre of mass of the gases also moves forward. While the projectile is in the bore, the same pressure which causes the projectile and powder gases to move forward also acts simultaneously at the breech end of the gun to produce an equal and opposite reaction which tends to drive the entire gun to the rear. The force resulting from this reaction is called the recoil force, and the *magnitude* of this force at any instant depends on the chamber pressure.

The distinguishing characteristic of any recoil system is that energy used for operation is obtained from the recoil movement of the barrel and bolt while these parts are locked together. Any gun in which the bolt is locked to the barrel while there is pressure in the chamber will be subject to some recoil action, but unless the recoil is put to use in actuating the gun mechanism, the weapon is not considered to be recoil operated.

Long Recoil.—This type is defined as an operation in which energy for operating the gun mechanism is obtained from a recoil movement which is greater than the over-all length of the complete cartridge. (*See* fig. 6.) During this entire movement, the bolt remains locked to the barrel. At the end of the rearward movement, the bolt is unlocked from the barrel and is latched in its rear-most position, the barrel moving forward in counterrecoil to pull the chamber off the empty cartridge case and eject the case. When the barrel has moved forward far enough to provide a sufficient opening for feeding, and just before its counterrecoil movement is completed, the bolt is unlatched. The bolt then moves forward for loading and the cycle is completed as the bolt relocks to the barrel (*e.g.,* the Browning 37-mm. aircraft cannon).

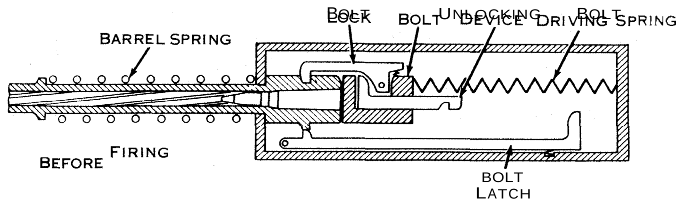

FIG 6 — SCHEMATIC DRAWING OF LONG RECOIL SYSTEM

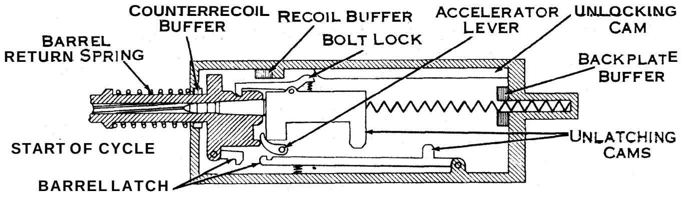

FIG. 7.— SCHEMATIC DRAWING OF SHORT RECOIL SYSTEM

Short Recoil.—In this system, the barrel and bolt remain locked and recoil together for a short distance until the powder gas pressure has dropped to a safe limit. The recoil movement then unlocks the bolt and, after unlocking, the barrel is stopped while the bolt continues to move to the rear until the opening between the barrel and bolt is sufficient to permit feeding. It would be possible for the bolt to complete this movement merely by the momentum it possesses at the instant of unlocking, but in all short recoil weapons. in order to speed up operation, the bolt is given additional momentum by an accelerating device which transfers energy to the bolt from the barrel during the short time that the barrel is still moving to the rear after unlocking. Also, unlocking usually occurs before the residual pressure reaches zero and therefore the bolt receives an additional impulse from blowback action. The basic elements of a short-recoil mechanism are shown in fig. 7. The Browning calibre .30 and calibre .50 machine guns represent this type of action.

MACHINE KNIVES are a large group of cutting tools which operate by a linear or a circular action. Among the smallest are the cutters in woodworking machines to produce moldings, and the largest are shear knives for paper. fabrics and steel plates. The edges are keen and honed up finely! and the knife must be well supported in the machine to cut truly and preserve the edge in good condition. Knives in revolving heads and drums for molding and planing wood require careful balance in order to eliminate vibration and produce good surfaces. A balancing scale is employed to test the uniformity of weight of each of a set of blades. When a knife has linear cutting action it is often set at an angle or "shear." so as to operate gradually instead of all along the edge at once. Paper, leather, tobacco, veneer and metal are among the substances cut with a linear or slicing movement. Some of the wood-planing machines combine high-speed rotary knives and fixed knives in the outfit, the wood being fed through and receiving an extra finish from the fixed knives.

MACHINE TOOLS. Of the many power-driven tools developed by man. machine tools are probably the most important because it is by means of them that other tools such as those for earth working! materials handling. etc.. are made. They are important also because they have made it possible to produce identical parts shaped to sufficiently precise dimensions as to provide complete interchangeability. It is interchangeability of parts that has made possible the assembly of products on a mass-production scale and the quick and inexpensive replacement of worn and broken parts.

Machine tools are often defined as power-driven machines, ordinarily not portable by hand, which cut, shear or press metal into desired forms. They may be classified in various ways. Perhaps the most meaningful way is that which arranges them according to their respective modes of shaping the materials, usually metals, which they are designed to work. (See table below.) Figs. 1–6 show the basic method of operation of various classes of machine tools.

Although evidence indicates that man first used hand tools as long as 35,000 years ago, during the Early Stone Age (35,000 B.C. to 15,000 B.C.), it is interesting to note that the machine tools listed below were themselves originated and developed in the very short span of about 400 years, beginning in the 16th century. Leonardo da Vinci's records show a lathe with a pole drive apparently in use in the 1500s. The basic tools in this list, however, did not assume their present general forms and characteristics until mechanical power became available during the Industrial Revolution beginning in the latter part of the 18th century. In 1794 Henry Maudslay developed his first all-metal lathe with a sliding tool rest. John A'ilkinson improved the lathe for boring purposes in 1776 for James Watt. Maudslay's adaptation of the lead screw to his lathe in 1810 made possible the construction of lathes, planers and milling machines in quantity and really laid the basis for the modern family of machine tools. By 1840 these tools were fairly well established as productive machines for industrial use. Their objective is two-fold?namely: to provide much greater power than man himself can furnish to form and shape certain of his materials of construction; and to give him skill and precision in this work which man alone cannot provide.

Classification of Machine Tools

Classification	Process	Machine tool
Cutting	Turning	Lathe
	Drilling and boring	Drill press, boring machine
	Milling	Milling machine
	Planing	Plane;
	Shaping	Shaper
	Slotting	Slotter
	Sawing	Power hack saw, band saw, circular saw
	Broaching	Broaching machine
	Filing	Filing machine
	Generatina	Hobbing machine, gear generator
Shearing . .	Shearing	Power shear, rotary shear
	Punching	Punch press, nibbler
Abrading .	Grinding	Grinder
	Honing	Honing machine
	Lapping	Lapping machine
	Polishing and buffing	Polishing machine, buffing machine
	Abrasive blasting	Sandblast, shot blast, liquid blast
	Tumbling	Tumbler, tumbling barrel
Forming (impact, bending. squeezing and pressing) . . .	Forging and upsetting	Forging press, drop hammer, forging hammer, forging machine, die-rolling mill, header. upsetter. explosion forging
	Swaging	Swaging machine
	Hammering	Power hammer, hammering machine
	Bending and forming	Roll bender, press brake, roll forming mill
	Stamping and deep drawing (punching, bending, forming, shallow drawing, swaging, coining. shaving and trimming)	Stamping press, punch press, drawing press
	Extrudinr	Extruding press, impact press
Other metal-removing processes . . .	Flame cutting	
	Spark disintegration	
	Ultrasonic grinding	
	Electrochemical disintegration	
	Chemical milling	

The basic machine tools are the lathe (*q.v.*), milling machines, drilling machines, broaching machines, sawing machines, shapers and planers, gear-cutting and metal-forming machines.

Milling Machines.—This class of machines employs a cutting process in which rotary cutters with multiple teeth are used. Flat or formed surfaces usually are produced. Diesinking (*q.v.*) is a milling process involving formed end mills for producing contour surfaces. The cut of each tooth is not continuous but intermittent on the feeding side of the cutter. In general, the cutter, mounted on an arbor fitted into the end of the spindle (a face mill is attached to the end of the spindle), rotates to provide cutting speed, while the work, mounted on the table, is fed into or past the cutter. The commonest operation is plain milling, using a cylindrical or circular section cutter, of the profile or formed type, with teeth on its periphery; side or face milling employs a cutter with teeth

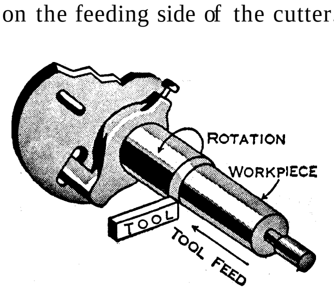

FIG. 1.—BASIC MACHINE-TOOL OPERATIONS: TURNING

projecting from its end, while end milling is a combination of plain and face milling. Milling cutters can be made in a variety of shapes for specific operations.

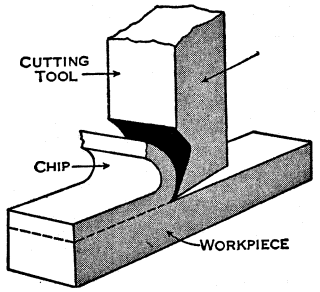

FIG. 2.—BASIC MACHINE-TOOL OPERATIONS: PLANING

Milling machines differ widely in construction and use. A classification may be based on general appearance (column-and-knee or fixed-bed type) or design (plain or universal; bench or floor mounting; horizontal or vertical spindle; hand, mechanical [lead screw] or hydraulic feed) or on the type of work handled (job shop or manufacturing; thread milling and planetary milling; diesinking).

Historically, milling is supposed to have originated in the 16th century; the cutter employed resembled a circular saw or rotary file with a large number of cutting edges spaced about its periphery. The first successful milling machine was built by Eli Whitney prior to 1818. Simeon North also used a plain miller in 1820 in the manufacture of firearms. The first universal knee-type miller is believed to have been built in Windsor, Vt., in 1852. In 1855, a fixed-bed or manufacturing type of miller was built by G. S. Lincoln in Hartford, Conn. This used the screw-and-nut table feed instead of the rack and pinion previously common. In 1862, the first fully universal milling machine, equipped with a universal dividing head, was built by J. R. Brown and used for cutting helical flutes in twist drills.

In 1906 the feed mechanism was driven from the single pulley drive shaft (making it possible to express the feed in inches per minute) rather than from the spindle (which gives inches per revolution of the spindle); in other words, it was possible to achieve constant feed per tooth of the cutter for all spindle speeds. The feed in inches per minute is the product of the feed per tooth, the number of teeth in the cutter and the rotational speed of the cutter.

The column-and-knee milling machine is used for general work in small quantity production. A rigid vise rests on the table for holding the work. In the plain type machine three motions of the table are possible (longitudinal, transverse and vertical), while the universal type, having a swivel table, permits a rotational motion. The spindles fixed in the head of the column, either vertically or horizontally, having only a rotating motion. The spindle of the vertical machine may be fixed in the head of the column or provided with a quill to permit the spindle being fed vertically by hand or power. Hand millers are usually small for light work, of the column-and-knee type. The table is fed longitudinally by hand.

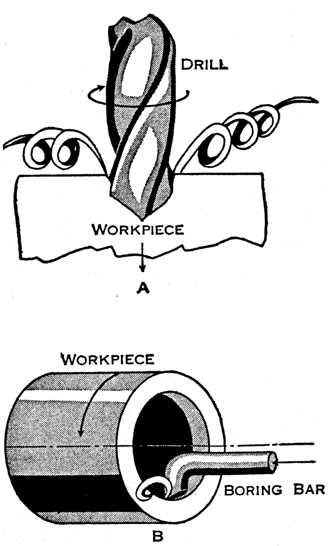

FIG. 3.—BASIC MACHINE-TOOL OPERATIONS: (A) DRILLING AND (B) BORING

The fixed-bed, or manufacturing, millers, offer rigid construction and simple operation for production of relatively small parts. The spindlehead is adjustable vertically on the column, and the table has only longitudinal feed. Large machines of this general type are called planer millers. Rotary millers are usually of the vertical spindle type. Their table is provided with fixtures and they are used for mass production in which the cutting is continuous, that is. there is no idle machine time, as the operator loads the fixture in front of the cutter and removes the finished parts prior to loading the next piece. Thread-milling machines are designed to cut threads and worms using form-milling cutters rather than single-point tools.

The horizontal boring, drilling and milling machine is provided with a horizontal spindle which is adjustable on the column and may be fed both longitudinally and vertically. The table on which the work is clamped may be fed longitudinally and transversely, or the machine may be provided with a rotary table. An almost unlimited variety of operations of boring, drilling, threading and milling may be performed on such a machine.

Drilling Machines.—A drilling machine, or drill press, is designed to hold a drill or other end-cutting tool in a spindle rotated and fed by power. The size of most drill presses is expressed by the diameter in inches of a disk the centre of which can be drilled.

Drilling machines are made in many different types and sizes, each designed to handle a class of work or specific job to the best advantage. The classification is based on design or construction, purpose and application of power. Portable drills are made in many types and sizes, sometimes mounted on a post bracket in garages or small job shops for use as fixed, single-spindle drill presses. Most have a self-contained electric-motor drive but the vertical movement of the drill is done by hand. Upright drilling machines, of the single-spindle type, for floor mounting, are general purpose machines. They are provided with a wide range of spindle speeds and feeds, and a table, vertically adjustable on the column, on which the work is supported. Tools such as drills, reamers, taps, counterbores, in interchangeable quick-change holders, may be used successively to finish holes in a part. In production, upright drilling machines are often mounted in gangs of two to eight, on a common base, so that successive operations may be performed on a part as it is passed from one spindle to the next. A multiple-spindle vertical drilling machine may have a fixed number of spindles, radially adjustable in a head so that all holes in one face of a part produced in small lots may be drilled simultaneously. Other multiple-spindle drill presses for mass production have the spindles built on fixed centres into the head for a given job. If the job is changed the head must be replaced. The radial drilling machine carries a spindle in a head mounted on a horizontal arm, the arm in turn being vertically adjustable on a column about which it swivels. The head may be moved radially on the arm, and the spindle moved vertically in the head, by hand or power feed. Radial drills are employed for general utility work, particularly on large castings and weldments. They are rigidly constructed and are provided with a wide range of speeds and power feeds, and they may be used to drive drills from one-eighth to three or four inches in diameter, as well as large boring tools, taps, etc.

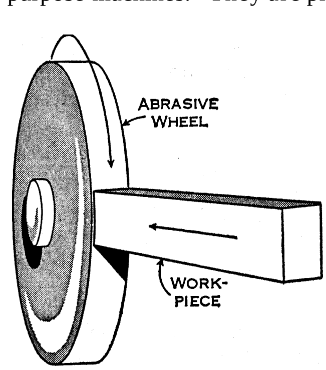

FIG. 4.—BASIC MACHINE-TOOL OPERATIONS: GRINDING

A deep-hole drilling machine, with one or two horizontal spindles, is used for such work as drilling gun barrels. The barrel is rotated at high speed while a single-lipped, sintered-carbide-tipped drill, provided with a high-pressure system for applying cutting oil at the drill point, is fed into the work. For short work, such as drilling oil holes in connecting rods from the crankpin to the wrist-pin hole, vertical, multiple-spindle machines operating on the same principle are used.

Way drilling machines for mass production of parts are built for each job and may consist of several multiple-spindle heads carrying drills, reamers, boring tools and even milling or threading tools operating simultaneously on one or several faces of the work. These are built in horizontal, vertical and a combined form. The transfer machine is an outgrowth of the way drill and represents the ultimate production tool. A complicated part such as a cylinder block is carried on a transfer bar from one machine to the next while it is machined on all surfaces successively and then discharged at the end, finished and inspected. All clamping and transfer is automatic.

Boring machines, capable of drilling or boring, are made in a variety of types and sizes for specific jobs. Precision boring for mass production of relatively small parts, such as piston-pin holes, employs one or more horizontal spindles which carry single-point tools with diamond or sintered-carbide tips. These tools operate at very high speeds to finish the previously drilled holes in such parts as bushings and aluminum pistons to great accuracy and smooth finish. The jig borer is used to drill, bore or finish holes within very close limits in such work as drilling jigs, multiple drilling-head parts and dies which are accurately spaced. They drill, bore or ream as required.

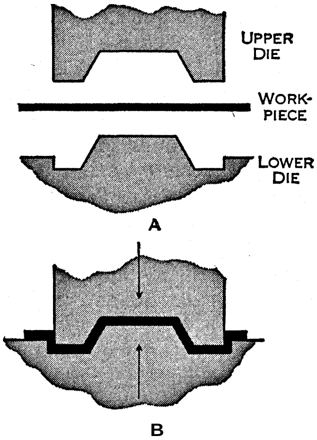

FIG. 5.— BASIC MACHINE-TOOL OPERATIONS: PRESSING

Broaching Machines.— These machines finish surfaces by drawing or pushing one or more cutters, called broaches, entirely past the surface. The broaches have a series of cutting teeth, increasing in height from the leading end. The first teeth are low to permit the broach to enter the hole (in internal broaching), or to pass over the surface (in external broaching), to catch any unforeseen high spots. The first few roughing and intermediate teeth remove most of the metal, the last few, taking lighter cuts, finish the hole or surface to size. Broaching machines may be horizontal or vertical. The broach may be pulled or pushed, or, in some cases, work is held in fixtures on a chain belt which moves past stationary broaches. Most machines are operated hydraulically.

Many broaching operations are completed in the time ordinarily taken to clamp the piece. Broaching is superior to reaming because the broach will hold its size for a much longer time, thus insuring greater accuracy. Other advantages are the good finish, great speed of production, interchangeability of mork and adaptability of the broach to produce irregularly shaped holes or forms,. such as splines. The broach will machine many more pieces before regrinding than any other type of cutter, because of the great number of teeth. Each tooth removes but a few thousandths of an inch of metal because the total depth of cut is proportioned over the total number of teeth.

Sawing Machines.— Saws for parting metals consist of thin disks of metal with cutting teeth on the periphery, or a band of metal with teeth formed on one edge. To eliminate binding between the cut surfaces and the side of the saw, either the teeth are "set'! (bent alternately to each side) or the blade below the edge of the cutting teeth is hollow-ground. The width of the groove cut by the saw blade is called the kerf.

Three types of metal-sawing machines in common use are: the hack saw, band saw and circular saw. The power hack saw has a short, straight blade, which is mounted under tension in a frame and reciprocated over the work in a straight line. The teeth are forced against the work on the cutting stroke by gravity, spring pressure, hydraulic pressure or positive screw feed but lifted on the return stroke to prevent the dragging of the cutting teeth over the work. The reciprocation on small machines is by crank and connecting rod. On some of the larger machines this is done by crank or hydraulically.

The smallest machine of the reciprocating blade type is known as the jig saw. The blade, clamped at its lower end, moves vertically through an opening in a horizontal table. Some machines of this type have holders to support the upper end of a file, used instead of a saw, so as to finish outlines smoothly after sawing. A honing stone, or lap, is also used sometimes for finishing the faces of hardened dies.

The power hack saw has a vise under the saw for clamping the mork. The small machines will take work up to 4 in. square in section and the largest up to 14 in. The small, inexpensive machines have but one reciprocating speed of about 80 strokes per minute. The larger machines usually have three speeds ranging from 50 to 150 strokes per minute. The length of the stroke is six inches in most cases. The small machine uses blades from 12 to 18 in, in length while the largest machine uses blades up to 24 in. Blades have from 4 to 18 teeth per inch, the coarse teeth are used for large, solid work, and the finer teeth for tubes, sheets and small bars.

Band saws employ a long, endless strip of steel with teeth on one edge. carried over two large diameter rotating wheels. This blade passes down through a table on which the work is mounted and fed by hand or screw into the saw. A guide to prevent saw deflection is adjustable just over the work. The machines vary in size with bands from $\frac{1}{4}$ in. to 18 in. in width. Power is applied to the lower wheel and the sawing action is continuous.

Circular saws have disk-shaped blades that may be classified in three groups: cold sawing, abrasive disk and high-speed friction disk. Cold sawing is a milling operation using thin metal-slitting saws of any desired diameter and the correct number of teeth and tooth shape for any metal. Standard milling machines are used with light cuts per tooth and conventional cutting speeds of 50–150 ft. per minute (f.p.m.) with high-speed steel cutters on hard to soft steel, or 400–1,000 f.p.m. for brass and aluminum. For large cold saws, 12–72 in. in diameter, special machines are constructed. These machines may be used to cut a bundle of bars or one large bar at a time, held rigidly in a vise. Abrasive disks made of silicon carbide, for cast iron and nonferrous metals, or aluminum oxide, for steel, are produced in wheels from $\frac{1}{16}$ to $\frac{1}{8}$ in. thick and up to 14 in. in diameter. These wheels are particularly effective on hard, abrasive material, and may be run safely at 12,000–16,000 f.p.m. They are interchangeable with steel-friction saws.

Steel-friction disks are carefully balanced and hollow-ground, usually with teeth hobbed or notched in the edge. These saws range up to 60 in. in diameter and $\frac{3}{8}$ in. in thickness and are run at peripheral speeds of 18,000–20,000 f.p.m. This speed and the pressure against the work melts the metal and carries it away. Hot or cold bars may be parted. Rails, channels, etc., from rolling mills can be cut to length in a matter of seconds.

Shapers and Planers.— The shaper was developed to machine flat surfaces on small work. The tool is held in a holder, supported on a clapper, in the head at the forward end of a ram. The ram reciprocates in a straight line while the table, carrying the vise and nork, feeds transversely on each return stroke. The clapper which carries the tool post is hinged near its top. On the cutting stroke the tool forces the clapper against its rigid seat; on the return stroke it swings outward about its hinge, as the tool is dragged back over the work, thereby relieving the cutting edge of excessive wear and reducing danger of chipping. Automatic tool lifting on the return stroke often is provided to protect the cutting edge of the tool. Tool lifting is accomplished by electromagnets. a flexible linkage or hydraulically. When carbide tools are used, tool lifting is essential to prevent chipping.

Shapers may be classified as horizontal or vertical (slotters), according to whether the ram operates horizontally or vertically; or they may be classed as plain or utility shapers for general light work and standard. heavy-duty and production shapers. Most modern shapers are driven by self-contained motors and the table has both rapid traverse and power feed. horizontally and vertically.

The planer was developed to machine flat surfaces on small or large work, too large for the shaper. The work to be machined is held in a vise or fixture bolted to the table, or may be clamped directly to the table. The table is reciprocated past the cutting tools as the tools are fed horizontally. vertically or at an angle for each stroke. The tools are held in a clapper box on a swiveling head carried on a saddle mounted on a horizontal rail. The head is fed horizontallv on the rail. Sometimes two heads are provided on the rail and a

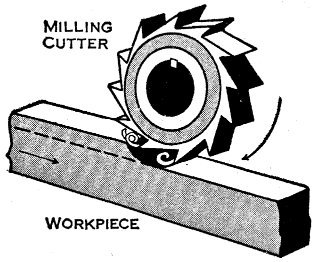

FIG. 6.—BASIC MACHINE-TOOL OPERATIONS: MILLING

third is mounted on the face of the housing. Large planers may take work 6–8 ft. in section and up to 30–40 ft. in length.

The table is driven through a rack on the underside of the table, or hydraulically. The table travel is reversed mechanically when belt drive or nonreversing motor drive is used but frequently the larger planers are driven by reversing motors. The length and position of stroke is adjustable. Cutting speeds up to 100 f.p.m. are obtainable, with table reversing speeds up to 200 f.p.m.

Gear-Cutting Machines.—There are six types of gear-cutting machines. For a composite tooth form a standard knee-type miller with dividing head is used for jobbing work. For large quantities of these gears a special production miller is used which automatically repositions the gear blank after each tooth is cut. The cutter has the approximate shape of the generated space between two teeth. This process is nongenerating and requires eight form cutters for each pitch for all gear teeth. The gear planer uses a cutter in the form of a short rack which cuts on its end as it is reciprocated across the face of the gear blank while the gear blank rolls with it, similar to a gear meshing with a rack. The gear shaper uses a disk-type cutter of the shape of a finished gear. It cuts on its end while reciprocated across the face of the blank as the two are rolled in unison. The gear-hobbing machine uses a cutter or hob consisting of a series of rack teeth arranged in a helix around the periphery of a cylinder. As the hob rotates continuously in unison with the blank to provide the generating action, it is fed across the face of the blank. The teeth of straight-tooth bevel gears are generated but, because of the tapered form, a special type of machine is needed to cause the single-tooth cutters of the rack shape to reciprocate along the cone of the pitch surface. Lastly, the spiral-bevel or hypoid-gear generator uses a cutter with single teeth of rack shape, arranged in a circle on the end of a disk, somewhat like those of a face mill. As the cutter is fed into the proper depth, it is rolled with the bevel-type gear blank to create the generating motion.

For precision gears, tooth profiles may be refinished, particularly after hardening, by special grinding or lapping machines, or by shaving. The gear-shaving machine runs the cutter and work-gear together under pressure with their axes slightly crossed, similar to the arrangement for lapping. The cutter of hardened steel is provided with multiple radial slots to form cutting edges on the tooth face. These have a side-sliding motion on the gear tooth to remove thin chips. (See also GEARS.)

Metal-Forming Machine Tools.—This large class includes machines used to shear, bend, draw, squeeze, coin, upset, swage, circle-cut, flange, forge, press, hammer. horn and wire. In all these machines a movable ram works against an anvil. Power to the ram may be furnished by gravity; mechanically by a crank, cam, toggle or knuckle joint; or through hydraulic or pneumatic systems. The machines may have one, two or three rams on moving slides. The two-ram machine may blank and draw a part, the three-ram may blank with one ram, hold with the second and form with the third. Dies, usually made in mating pairs, are an integral part of the equipment. One member of the pair is mounted on the fixed bed, or platen, of the press, and the other is attached to the lower end of the moving ram.

Flat sheets or plate stock are cut by squaring shears using a shearing action developed between a pair of straight cutting blades. The shearing action, called blanking, is employed also to cut a variety of shapes from a flat sheet. The press brake, similar to the shear, is equipped with either punching dies or bending dies to form edges.

Power presses are made in a large variety of types and sizes. some weighing nearly 1,000,000 lb. The dies used in stamping presses may also be very complicated. Cutting dies are made either plain, for one operation of punching or blanking; progressive, for performing successive operations; compound, to pierce and blank; multiple, and combination, to cut and shape. Shaping dies may be classified as bending, curling, drawing or compression dies.

Presses are made automatic and safe in operation by feeding strip metal from rolls to the dies and removing the scrap from the dies. Some presses are combined to pass the parts automatically from one to another for a series of operations.

Forging machines are also made in several types, some vertical. some horizontal. They range from the small upsetting machine which makes balls, screw blanks, springs, etc., from wire, to the large steam forging hammer for making drop forgings in dies and the large hydraulic presses which forge parts weighing tons.

Metal Removal by Nonmachining Processes.—Chemical milling is a process of shaping metal by dissolving off the unwanted material in an appropriate solution, acid or alkali, controlled to remove metal from unmasked areas at a rate of about 0.001 in. per minute. This method, developed in the aircraft industry, permits over-all reductions on complex shapes and light removals on thin sheet.

Electrical discharge machining consists in directing a series of very high-frequency spark discharges from a soft metal tool, operating as an electrode, to disintegrate hard materials and to form the cavities of dies. Holes of almost any shape can be made to close tolerances. The spark discharge passes through the space between the tool and work, about 0.001 in., which is filled with dielectric liquid, and vaporizes a small portion of the work piece as the electrode advances.

Electrolytic machining is used for sharpening tools, surfacing, forming and diemaking. Metal removal is accomplished by passing a high current of low voltage from an electrode to the work through an electrolyte. As the metal-bonded abrasive wheel. usually faced with diamonds, moves across the work, minute particles of the work are removed by the current in a "reverse-plating" operation.

Ultrasonic machining employs a flat tool of soft metal, vibrating at a frequency of about 20,000 cycles per second, with an amplitude of from .001–.003 in. A liquid carrying a fine abrasive, such as boron carbide, flows between the tool and works and acts as a crushing medium. Impressions may be sunk by this method in glass and very hard metals.

Electron beam cutting employs a very high-voltage beam similar to that of the X-ray. By means of a magnetic field, the beam is focused to produce a series of very small holes to trace out the shape desired. Small sections can be removed from thin stock in this way.

BIBLIOGRAPHY.-4. W. Boston, *Metal Processing*, 2nd ed. (1951); Herbert D. Hall and Horace E. Linsley, *Machine Tools, What They Are and How They Work* (1957); Arthur C. Ansley, *Manufacturing Methods and Processes* (1957). (O. W. B.)

MACH NUMBER, named for the Austrian scientist Ernst Mach (*q.v.*), is the ratio of a flow velocity to a velocity of sound (see SOUND: *Analysis* of Sound Propagation.) The speed of sound varies with temperature, and thus with altitude, but at sea level is approximately 760 m.p.h. The most commonly used Mach number is the "free-stream Mach number" defined for the flow about a body immersed in a uniform free stream. This number is the ratio of the uniform velocity in the free stream to the sound speed there. It is the same as the "flight Mach number," the ratio of the velocity of a vehicle flying in an atmosphere to the sound speed in the atmosphere. The free-stream Mach number is the most important parameter characterizing the flow field and aerodynamic forces. A flow is termed "incompressible" if this number is negligibly small; "subsonic" if it is not small but significantly less than one, as 0.80; "transonic" if it is approximately one; "supersonic" if it is significantly greater than one, as 1.75; and "hypersonic" if it is much greater than one.

The "local Mach number" is the ratio of the local flow velocity in a steady flow of a gas to the local sound speed. If this number is less than one the partial differential equations governing the flow field are locally of elliptic type. If this number is greater than one the equations are locally of hyperbolic type. If the flow is sufficiently close to a uniform flow, the local Mach number may be approximated at each point by the constant free-stream Mach number, and the differential equations of motion by linear ones. (W. D. Hs.)

MACHYNLLETH, an urban district and market town in the Montgomeryshire parliamentary division of Wales, 10 mi. E.N.E. of Aberdovey and the coast and 40 mi. W.N.W. of Montgomery by road. Pop. (1951) 1,875. Area 1.8 sq.mi. Lying in the Dyfi

(Dovey) valley on the threshold of mountainous country, it is a centre for anglers and for tourists.

In 1291 a charter was obtained which established the Wednesday market and the two annual fairs. Owain Glyndwr (Owen Glendower) held a parliament at Machynlleth in 1403, allegedly in a house (now the town institute) opposite Plas Machynlleth, a manor with a spacious park given to the town by Lord Londonderry. The woollen and tanning industries flourished in the 19th century.

MACÍAS (o NAMORADO) (fl. 1360–1390), Galician *trovador,* represented by five poems in the *Cancionero de Baena.* According to tradition Macias was enamoured of a great lady and murdered by her jealous husband.

His legend became a favourite subject with Spanish writers. inspiring—among others—Lope de Vega in *Porfiar hasta morir* and Larra in *Macías.*

See H. A. Rennert, *Macias, o Namorado; a Galician Trobador* (Philadelphia, 1900).

McINTIRE, SAMUEL (1757–1811), U.S. architect and craftsman, known as "the architect of Salem," was born in Jan. 1757 in Salem, Mass. One of a family of substantial housewrights, he was at 23 already working for his chief patron, the merchant Elias Hasket Derby. The solid foursquare house he created for Jerathmeel Peirce, with details derived from an English handbook, Batty Langley's *Treasury of Designs* (1740), was one of the finest houses of New England in the post-Revolutionary period. His academic style was exemplified in the Salem court house (1785; demolished 1839) and culminated in a competitive design of 1792 for the Capitol in Washington, based on plates in James Gibbs's *Book of Architecture* (1728). Charles Bulfinch meanwhile had introduced to New England the style of Robert Adam, with its attenuated proportions, its classic ornaments often cast in composition and its greater variety of forms of space, with rooms oval and circular. McIntire studied Bulfinch's first houses, and from 1793 he adopted their style and carved many of their chief ornaments. Bulfinch made the first designs and McIntire the final ones: for the lavishly decorated Derby mansion begun in 1794 (destroyed in 1815). In numerous houses McIntire placed his stamp on the town in the prosperous early years of the 19th century.

His carvings included busts, reliefs and the decorations of ships and furniture. Sofas, chairs and other pieces he carved with his typical eagles, baskets of fruit, draperies and pendants of the greatest delicacy. Over 100 pieces survive, constituting the most impressive body of U.S. furniture of the Sheraton style. Works of this modest craftsman and sober citizen: who never traveled more than a few miles from his native town, adorn the leading U.S. art museums.

McIntire died in Salem on Feb. 6, 1811.

BIBLIOGRAPHY.—Fiske Kimball, *Mr. Samuel McIntire, Carver, the Architect of Salem* (1940); Mabel M. Swan, *Samuel McIntire, Carver* (1934); B. W. Labaree (ed.), *Samuel McIntire* (1957). (F. Ki.)

MACINTOSH, CHARLES (1766–1843), F.R.S., 1823, Scottish chemist, was born on Dec. 29, 1766, at Glasgow. His experiments with one of the by-products of tar, naphtha, led to his invention of the waterproof fabrics which bear his name, the essence of his patent being the cementing of two thicknesses of india rubber together by means of naphtha. Macintosh was also responsible for important improvements in the manufacture of dyes, bleaching powder and steel. He died July 5, 1843.

See George Macintosh, *Memoir of C. Macintosh* (1847).

MAÇIP (MASIP), **VICENTE JUAN** (also called JUAN DE JUANES or JOANES) (?1523 or earlier–1579), Spanish artist, one of the chief Valencian painters of the third quarter of the 16th century, was the son of another Valencian painter, Vicente Juan Maçip the elder. Most of his work was done in Valencia, and he died in nearby Bocairente on Dec. 21, 1579. He may have studied in Italy, since his style is largely a provincial adaptation of the manner of Leonardo da Vinci's folloners. with the addition of some Florentine motifs. But his paintings also display strong Flemish influence, and the Italian elements may hare been derived from the works of Italinizing Flemings, which abounded in Spain and which were probably also the source of Maçip's somewhat grotesque realism.

Almost all Maçip pictures are religious; the "Last Supper" and the scenes from the life of St. Stephen, in the Prado museum, Madrid. are among the best known, and he painted many versions of Christ as *Salvator Mundi.* (K. MN)

MACK, CONNIE (CORNELIUS MCGILLICUDDY) (1862–1956), U.S. baseball manager, the "grand old man" of major league baseball in the first half of the 20th century, managed the Philadelphia Xthletics from 1901 to 1950, during which period they non the American league pennant nine times and the world series five times (1910, 1911, 1913, 1929 and 1930). Born in East Brookfield. Mass., on Dec. 23, 1862, and christened Cornelius McGillicuddy, he shortened his name so that it would fit on a scoreboard. A catcher, Mack entered organized baseball nith his home town team in 1883, moving the next year to Meriden, Conn.. then to Hartford, Conn. (1885). With Washington, D.C. (1886–89), Buffalo, N.Y. (1890) and Pittsburgh (1891–96), he played 69j games with a lifetime batting average of .252.

Mack caught in 664 major league games and occasionally played first base or in the outfield. He was catcher-manager of the Milwaukee, Wis., club of the Western association from 1897 to 1901, and in 1901 became manager and part owner of the Xthletics and helped establish the American league *(see* BASEBALL: *Litter History).* He spent 65 years in baseball, retiring in 1951. He died in Philadelphia, Pa., on Feb. 8, 1956. (J. D. McC.)

MACKAY, CHARLES (1814–1889), Scottish writer, mas born at Perth on March 27, 1814. As editor of the Glasgow *Argus,* he made his reputation in 1846 with the publication of *Voices from the Crowd.* He wrote songs, including "Cheer Boys Cheer," some of which were set to music by Henry Russell and Sir Henry Bishop (published 1855). Also, he wrote *Memoirs of Extraordinary Public Delusions* (1841) and edited *A Thousand and One Gems of English Poetry* (186;).

Mackay died in London on Dec. 24, 1889. Marie Corelli (*q.v.*) was his daughter. His son, Eric Mackay (1851–99), wrote *Love Letters of a Violinist* (1886).

MACKAY, CLARENCE HUNGERFORD (1874–1938), U.S. capitalist and philanthropist, who as president of the Mackay system of telegraphs and cables directed the completion of the first trans-Pacific cable between the United States and the Far East in 1904, was born at San Francisco. Calif., on April 17, 1874.

The foundations for his career were laid by his father, John William Mackay (1831–1902), California and Nevada miner, born in Dublin! Ire., Nov. 28, 1531, whose parents brought him to New York in 1840. When he was 21 he sailed for California to try his luck in the gold fields. Working with pick and shovel in the Sierra Nevada mountains, and later in western Nevada, John Mackay learned mining engineering and geology through experience. In 1873, he and his partners, James C. Flood, William O'Brien and James G. Fair, discovered the Big Bonanza of the Comstock lode that yielded approximately $120,000,000 in the next five years. With James Gordon Bennett, Mackay organized the Commercial Cable company in 1883, succeeded in breaking the communications monopoly of the Western Union Telegraph company directed by Jay Gould and established the competing Postal Telegraph company.

In 1907, the company, of which Clarence Mackay had become president after his father's death, placed a cable in service between New York and Cuba and later established cable communication with southern Europe by way of the Azores and with northern Europe through Ireland. He was the first; in 1928, to combine radio, cables and telegraphs under one management.

As a patron of the arts and education: Mackay served as chairman of the board of the Philharmonic Symphony society of New York, trustee of the Metropolitan Museum of Art and director of the Metropolitan Opera company. In memory of his father, he and his mother presented the University of Nevada with the Mackay school of mines. This and a subsequent series of gifts to that university totalled more than $1,500,000.

Mackay was a member of the French Legion of Honour, and in 1931 Pope Pius XI made him a Knight of Malta, the highest

Catholic lay honour. He died in New York city Nov. 13.1938. (W. T. J.)

McKAY, DONALD (1810–1880), U.S. shipbuilder and naval architect. was the outstanding builder of clipper ships, and built the largest and fastest ships of that type.

Born Sept. 4. 1810, in Nova Scotia, he came to New York city, in 1827 and was apprenticed ship carpenter to Isaac Webb. His indenture completed he worked at this trade in New York and Newburyport, Mass. He established his own shipyard at East Boston. Mass., in 1845 and there designed and built the ships which gave him his reputation. His first clipper ship, the "Stag Hound," launched 1850. was followed by many others. His "Lightning" sailed 436 nautical miles in 24 hours. at times reaching a speed of 21 knots. His "Great Republic" registered 4,555 tons when completed and was the largest clipper ship built.

By 1855 the demand for these specialized ships mas over and McKay closed his yard. In 1863 he equipped the yard to build iron ships and built several vessels for the U.S. navy, one. the monitor "Nausett," but was not financially successful in this work. His last sailing ship, the "Glory of the Seas,' built in 1869 lasted until 1923.

McKay died at Hamilton, Mass., on Sept. 20. 1880. (M. R. D.)

MACKAY, HUGH (*c.* 1640–1692), Scottish general, mas born in Scourie. Sutherlandshire. He entered Douglas' (Dumbarton's) regiment of the English army (now the Royal Scots) in 1660,and accompanied it to France when it was lent by Charles II to Louis XIV. In 1669 he was in the Venetian service at Candia, and in 1672 he was back with his old regiment, taking part in the invasion of Holland. Convinced that he was fighting in an unjust cause, he resigned his commission to take a captaincy in a Scottish regiment in the Dutch service. In 16Sj he returned with the Scots brigade to England to assist in the suppression of the hlonmouth rebellion. He went back to Holland, and when the prince of Orange started on his expedition to England Mackay's division led the invading corps. As major general commanding in chief in Scotland. he was called upon to deal with the formidable insurrection headed by Graham of Claverhouse, Viscount Dundee. In the battle of Killiecrankie hlackay was severely defeated, but Dundee was killed, and the English commander subdued the Highlands in one summer. He was killed at the battle of Steinkirk. Mackay invented the ring bavonet.

BIBLIOGRAPHY.—H. Mackay, *Memoirs of the War Carried on in Scotland and Ireland, 1689, 1691,* publ. by the Maitland Club (1833); J. Mackay, *Life of Lieut. Gen. H. Mackay of Scoury* (1836); J. W. Fortescue, *History of thr British Army,* vol. i (1899), 2nd ed., 12 vol. (1910–27); Mackay's papers, Bannatync Club (1883).

MACKAY, a seaport on the northeast coast of Queensland, Austr., 598 mi. north of Brisbane by rail. The city is situated on the Pioneer river, and the district is bounded by the Clarke and Leichhardt ranges. the highest peak is Mt. Dalrymple. 4.190 ft. Pop. (1954) 14,762. The climate, which is moderate generally, is very good during the main tourist season, from April to October. The average annual rainfall is jo in. The chief industry is the manufacture of sugar and others are dairying. sawmilling and the production of power alcohol. industrial methylated spirits and other sugar by-products. Large deposits of coal, so far undeveloped. are known to exist in the hinterland area, and copper mining is undertaken in a small way. Tropical fruits (bananas, pawpaws and pineapples) are grown.

Mackay has a deepwater, artificial harbour, about three miles north of the city. Mackay is serviced by daily air and rail links to north and south.

MacKAYE, PERCY (1875–1956), U.S. poet and dramatist, son of Steele MacKaye (*q.v.*), was born in New York city on March 16, 18;5. After graduating from Harvard in 1897, he traveled and studied abroad (1898–1900).

After his return to the United States, MacKaye lectured in schools and colleges and wrote *The Civic Theatre* (1912), advocating amateur community theatricals. The pageants he wrote encouraged community participation. They included *The Canterbury Pilgrims,* produced at Gloucester, Mass., in 1909, with a cast of 1.500,and *Masque of Saint Louis* (Thomas Wood Stevens, coauthor), performed in 1914 with 7,500 participants. In 1948 MacKaye received the Academy of Xmerican Poets fellowship award for his cycle of four plays. *The Mystery of Hamlet, King of Denmark* (1945). He died at Cornish. N.H.. on Aug. 31. 1956.

MacKaye's many works include, in poetry: *Poems* (collected, 1916). *Dogtown Common* (1921), *My Lady Dear, Arise!* (1940), *Intimations,* (1947): plays: *Jeanne d'Arc* (1906), *This Fine-Pretty World* (1924). *Tlze Sphinx* (1929), *What We Will* (1943); operas: *The Immigrants* (1915); masques: *Saint Louis* (1914), *Caliban* (1916). *Wakefield* (1932); essays: *Tlze Civic Theatre* (1912); folk stories: *The Gobbler of God* (1928). *Kentucky Mountain Fantasies* (1928); biography: *Epoch: the Life of Steele MacKaye* (1927), *William Butler Yeafs, A New Portrait* (1947).

MacKAYE, (JAMES MORRISON) STEELE (1842–1894), U.S. playwright, actor; theatre manager and inventor. a brilliant man of many talents who was. perhaps, the closest approximation to the Renaissance man produced by the United States in the 19th century. He was born in Buffalo. N.Y., June 6, 1842. In his youth he studied painting with Hunt, Inness and Troyon. A pupil of Delsarte and Regnier, he was the first American to act Hamlet in London (1873). At Harvard. Cornell and elsewhere, he lectured on the philosophy of aesthetics. In New York city he founded the St. James, Madison Square and Lyceum theatres.

MacKaye wrote 30 plays, including *Hazel Kirke* (performed many thousands of times). *Paul Kauvar, Money Mad,* etc.. acting in them in 17 different roles. He organizecl the first school of expression (which later became the American Academy of Dramatic Art) and originated "harmonic gymnastics;" initiated overhead lighting (1874); invented the first moving "double stage" (1879); and invented folding theatre seats. In all, he patented over roo theatrical inventions.

At the Chicago World's fair of 1892, MacKaye projected the world's largest theatre. his Spectatorium (seating 12.000, with 2j moving stages), revolutionizing stage production and anticipating motion pictures. Financial difficulties prevented completion of the theatre—the first production was to be *The World Finder,* a saga of Columbus. for which Dvorak composed his *New World Symphony*—but a scale model was later successfully demonstrated.

Though he is best remembered for *Hazel Kirke,* MacKaye's chief importance actually lies in the area of stage production and in his influence toward higher professional standards and ethics in the theatre. He died at Timpas, Colo., Feb. 2j. 1894

See Percy MacKaye, *Epoch: the Life of Steele MacKaye,* 2 vol. (1927). (S. W. H.)

MACKE, AUGUST (1887–1914), German painter. one of the leaders of the Blue Rider school. was born on Jan. 3, 1887, at Meschede. Westphalia. His youth was spent in Cologne and Bonn, and he studied art from 1904, at the Düsseldorf academy and later in Berlin with Lovis Corinth. He was influenced. particularly in his earlier work, by the older Impressionists. Cézanne, Matisse, Picasso and the Cubists. He also visited Paris, Holland and Italy. The period of his independent creation embraces the years 1909–14.

With Kandinsky, Jawlensky and Marc. Macke was one of the most important representatives of the Blue Rider group of painters from which Expressionism in Germany originated (*see* PAINTING: *Expressionism and the German School: Der Blaue Reiter*). His art combines the tradition of French painting, its sense of the grace of movement and atmosphere in landscape painting. with the cosmic sentiment of German art, without losing itself in the subtle and problematical. A journey to Tunis in the spring of 1914 inspired some of his most beautiful pictures.

Macke was killed in World War I at Perthes-les-Hurlus, Champagne. on Sept. 26. 1914.

McKEESPORT, a city in Allegheny county, southwestern Pennsylvania. U.S. Approximately 10 mi. S.E. of Pittsburgh's "golden triangle," the city was founded at the junction of the Monongahela and Youghiogheny rivers. The former has long been an important avenue for the movement of coal and steel, essential elements in the industrial complex of the Pittsburgh (*q.v.*) standard metropolitan statistical area, of which McKeesport is a part In the early 1960s about half of the community's working force was engaged in steel production.

The first settlement was made about 1755 by David McKee, who operated a ferry there, and the town was platted in 1795 by his son John It did not develop appreciably until the basic ingredients of the U.S. steel industry (coal, iron and railroads) had progressed in the late 19th century. Coal mining in the area began about 1830. The G. C Murphy chain of variety stores originated there in 1896. McKeesport was incorporated as a borough in 1842 and chartered as a city in 1890. It was a centre of dissident activity during the Whisky insurrection (*q.v.*) in 1794.

For comparative population figures see table in PENNSYLVANIA: *Population.* (P R J.)

McKEES ROCKS, a borough of Allegheny county. Pa. U S., on the Ohio river, 3 mi from downtown Pittsburgh (*q.v.*). Producing a variety of small iron and steel products, it is an integral part of Pittsburgh's industrial complex. As industry expanded. the population declined slowly from a peak of 18 116 in 1930 Through an extensive rebuilding program launched in 1954. McKees Rocks was among the first suburbs to share in Pittsburgh's renaissance.

The first permanent homes in the area were built near a 100-ft cliff overlooking the Ohio river, shortly after Pontiac's conspiracy of 1763 The cliff. later cut anay for a railroad bed, was the site of an Indian burial mound. The borough, which was incorporated in 1892, was named for the imposing rock formations along the river and for Alexander McKee, a pioneer settler For comparative population figures see table in PENNSYLVANIA: *Population.* (J A KE.)

McKENNA, REGINALD (1863–1943), British politician and financier, was born in London on July 6, 1863, and educated at King's college. He went up to Trinity Hall, Cambridge, as a scholar and graduated as senior optime in 1885. He also gained distinction as an oarsman, rowing in the university boat race in 1887. He was called to the bar in that year, and in 1895 was elected Liberal member for North Monmouthshire. When his party returned to power in Dec. 1905, he became financial secretary to the treasury. In 1907 he was promoted to the presidency of the Board of Education, but was no better able than his predecessor, Birrell, to draft a bill which would satisfy the Nonconformists and yet pass the House of Lords. His tenure of the office was brief, as, on Asquith's succeeding to the premiership in the spring of 1908, he was transferred to the Admiralty.

He entered on his new duties at a time when the country was profoundly stirred by the rapid increase of the German fleet, and was in doubt whether the preparations of the Admiralty aere on a sufficiently extensive scale. McKenna, supported by the prime minister and Edward Grey, persuaded his other colleagues to agree to the building of four battleships of dreadnought type in 1909, and to ask for power, if necessary, to prepare for the construction of four more a year later. This contingent program was also carried.

From the Admiralty McKenna went in the autumn of 1911 to the Home Office, and, as home secretary, had charge of the Welsh Disestablishment bill. In the first Coalition ministry in 1915 he was made chancellor of the exchequer, and a still more difficult task was imposed on him—to find the money to carry on the World War. By a $4\frac{1}{2}\%$ war loan a subscription of nearly £600,000,000 was obtained. In the autumn he introduced a supplementary war budget, providing for over £100,000,000 by new taxation. Income tax was raised 40%, and the abatement and exemption limits lowered; the rates of supertax were seriously heightened; all the old duties on sugar, tea, tobacco, cocoa, coffee, motor spirit and patent medicines were almost doubled; the import of luxuries such as motor cars. cinema films. clocks and musical instruments was restrained by an ad *valorem* duty of $33\frac{1}{3}\%$; and an excess profits tax of 50% was imposed. Other methods of financing the war which he adopted were war savings certificates, which realized over £40,000,000 in their first year; 5% exchequer bonds, replaced after a year for a short time by 6% exchequer bonds. but for current expenses he relied mainly on the sale of treasury bills. In his 1916 budget he raised taxation still further. Income tax was increased to 5s. in the £ and excess profits tax to 60%; there were further increases on sugar, cocoa and coffee; higher duties were imposed on motor vehicles; there were new taxes on amusements, railway tickets, matches and mineral waters.

McKenna went out of office with Asquith in Dec. 1916, and, in 1919, he accepted the chairmanship of the Midland Bank, Limited, a position he retained until his death Sept. 6, 1943, in London. He wrote *Post-War Banking Policy* (1928). (G. E. B.)

MACKENNAL, ALEXANDER (1835–1904), English Nonconformist divine, was born at Truro in Cornwall, on Jan. 14, 1835, the son of Patrick Mackennal, a Scot, who had settled in Cornwall. In 1848 the family removed to London, and at sixteen he went to Glasgow University. He entered the Congregational Ministry in 1856, and from 1877 to his death was pastor of the Congregational Church at Bowdon, Cheshire. In 1886 he was chairman of the Congregational Union. In 1892 Mackennal became associated with a movement for free church federation which grew out of a series of meetings held to discuss the question of home reunion. When the Lambeth articles put forward as a basis of union were discussed, it was evident that all the free churches were agreed in accepting the three articles dealing with the Bible, the Creed and the Sacraments as a basis of discussion, and were also agreed in rejecting the fourth article, which put the historic episcopate on the same level as the other three. Out of this grew the Free Church Federation, which secures a measure of co-operation between the Protestant Evangelical churches throughout England. Mackennal was a lifelong advocate of international peace, and made a remarkable declaration as to the Christian standard of national action when the Free Church Federation met at Leeds during the South African War in 1900. He died at Highgate, London, on June 23, 1904.

See D. Macfadyen, *Life and Letters of Alexander Mackennal* (1905).

MACKENSEN, A. L. F. AUGUST VON (1849–1945), German fieldmarshal, was born in Haus Leiptnitz, Saxony, on Dec. 6, 1849. Educated at Torgau and the University of Halle, he entered the Second Death's Head Hussars as a cadet in 1869. He saw service in the Franco-Prussian War, and in 1882 was promoted to the Great General Staff. He accompanied the German Emperor on his journey to Palestine. In 1908 he was given command of the XVII. Army Corps on the Vistula. At the outbreak of World War I he was placed in charge of the IX. Army on the Eastern Front, where he conducted successful operations against the Russians at Kutno, Łódź and Lowicz. In April 1915 he became leader of the German forces in western Galicia and was largely responsible for the German break-through at Gorlice. On June 20, 1915, he was made a fieldmarshal and in Aug. and Sept. of that year had further successes at Brest-Litovsk and Pinsk. In Oct. and Nov. 1916, as commander of the army sent against Serbia, he practically overran that country; and in 1916, with the composite army which invaded Rumania, he subjugated the Dobruja and by the middle of Jan. 1917 had to all intents and purposes occupied the country. At the Armistice, he was interned by the French at Neusatz, till Dec. 1919. He retired from the army in 1920 and was made a state counsellor in 1933. He died Nov. 8, 1945, at Celle, Germany.

See W. Renner, *Feldmarschall von Mackensen* (1915); M Luyken *Generalfeldmarschall von Mackensen, Von Bukarest bis Salonika* (1920).

MACKENZIE, SIR ALEXANDER (c. 1755–1820) Canadian explorer is believed to have been born nt Inverness. Scot. Emigrating to North America at an early age, he was for several years engaged in the fur trade at Fort Chippewyan, at the head of Lake Athabasca. His first journey (1789) was from Fort Chippewyan along the Great Slave Lake, and down the river which now bears his name to the Arctic Ocean; and his second, made in 1792 and 1793, from Fort Chippewyan across the Rocky Mountains to the Pacific coast near Cape Menzies.

Mackenzie died at Mulinearn, near Pitlochry, on March 11, 1820.

See his *Voyages on the River St. Lawrence and through the Continent of North America to the Frozen and Pacific Ocrans* (1801).

MACKENZIE, ALEXANDER (1822–1892), Canadian statesman, was born in Perthshire, Scotland, on Jan. 28, 1822. He emigrated to Canada in 1842, and later worked in Ontario as a stone-mason, later becoming a builder and contractor at Sarnia with his brother. In 1852 his interest in questions of reform led to his becoming the editor of the *Lambton Shield,* a local Liberal paper. In 1861 he became a member of the Canadian parliament, where he at once made his mark and was closely connected with the liberal leader, George Brown. He was elected for Lambton to the first Dominion house of commons in 1867, and soon became the leader of the liberal opposition; from 1871 to 1872 he also sat in the Ontario provincial assembly, and held the position of provincial treasurer. In 1873 on the defeat of Sir John Macdonald's ministry Mackenzie formed a new Government, taking the portfolio of public works and becoming the first liberal premier of Canada. He remained in power till 1878, when industrial depression enabled Macdonald to return to office on a protectionist programme. In 1875 Mackenzie paid a visit to Great Britain, and was received at Windsor by Queen Victoria; he declined knighthood. In 1880 he resigned the leadership of the opposition owing to failing health, but he retained a seat in parliament till his death at Toronto on April 17, 1892. While perhaps too cautious to be the ideal leader of a young and vigorous community, his grasp of detail, industry, and integrity won him the respect even of his opponents.

See W. Buckingham and the Hon. George W. Ross, *Alexander Mackenzie, His Life and Times* (Toronto, 1892); G. Stewart, *Canada under the Administration of the Earl of Dufferin* (Toronto, 1878).

MACKENZIE, SIR ALEXANDER CAMPBELL (1847–1935), British composer, son of an eminent Edinburgh violinist and conductor, was born on Aug. 22, 1847. Mackenzie studied at the Sondershausen conservatorium under Ulrich and Stein, and in 1861 entered the ducal orchestra as a violinist. At this time he made Liszt's acquaintance. On his return home he spent three years at the Royal Academy of Music. He took part in Chappell's quartette concerts, and started a set of classical concerts. He was appointed precentor of St. George's Church in 1870, and conductor of the Scottish vocal music association in 1873. The most important compositions of this period of Mackenzie's life were the Quartette in E flat for piano and strings, Op. 11, and an overture, *Cervantes,* which owed its first performance to the encouragement and help of von Biilow. On the advice of this great pianist, he settled in Florence in order to compose. The cantatas *The Bride* (Worcester, 1881) and *Jason* (Bristol, 1882) belong to this time, as well as his first opera, *Colomba* (1883), commissioned for the Carl Rosa Company. Mackenzie's second opera, *The Troubadour,* was produced by the same company in 1886; and his third dramatic work was *His Majesty,* an excellent comic opera (Savoy Theatre, 1897). In 1888 he succeeded Macfarren as principal of the Royal Academy of Music. This post he held until 1924, and the importance of his influence over the younger generation of English musicians was very great. From 1892 to 1899 Mackenzie conducted the Philharmonic Concerts, and was knighted in the year 1894. In the two "Scottish Rhapsodies" for orchestra, in the music to *The Little Minister,* and in a beautiful fantasia for pianoforte and orchestra on Scottish themes, he has seized the essential, not the accidental features of his native music.

Mackenzie's works include *The Rose of Sharon* (Norwich festival, 1884); three Scottish Rhapsodies: No. 1 (Glasgow, 1880); No. 2. "Burns" (Glasgow, 1881); No. 3, "Tam O'Shanter" (Int. Music Congress, London, 1911); the Pibroch suite for violin (Leeds, 1889). etc. *See* his *A Musician's Narrative* (1927)

MACKENZIE, EDWARD MONTAGUE COMPTON (1883–), British novelist, son of Edward Compton, was born at West Hartlepool on Jan. 17, 1883, and educated at St. Paul's school, London, and Magdalen college, Oxford. He saw a good deal of stage life before embarking on his literary career which began with *Poems* (1907) and a picturesque "period" novel, *The Passionate Elopement* (1911). *Kensington Rhymes* and the novel *Carnival* followed in 1912, and the long novel *Sinister Street* (2 vols., 1913–14) was characteristic of the quasi-autobiographical novels of childhood and youth which were then attracting some of the younger novelists. War experiences yielded *Extremes Meet* (1928) and other accounts of the secret service. His coloured style included picaresque action and humorous character study, and, in some of his best work, a sympathetic portrayal of religious sensibility. The last appeared in the trilogy *The Altar Steps* (1922), *The Parson's Progress* (1923) and *The Heavenly Ladder* (1924). Other works are *Guy and Pauline* (1915); *Sylvia Scarlett* (1918); *Coral* (1925); *The Windsor Tapestry* (1938); *All over the Place* (1949); and *Indian Epic* (1950).

MACKENZIE, SIR GEORGE (1636–1691), of Rosehaugh, Scottish lawyer, the grandson of Kenneth, first Lord Mackenzie of Kintail. He was born at Dundee in 1635, educated at the grammar school there, at Aberdeen, at St. Andrews and Bourges. He was called to the bar in 1659. He succeeded Sir John Nisbet as king's advocate in August 1677, and in the discharge of this officebecame implicated in all the worst acts of the Scottish administration of Charles II., earning for himself an unenviable distinction as "the bloody Mackenzie." His refusal to concur in the measures for dispensing with the penal laws against Catholics led to his removal from office in 1686, but he was reinstated in February 1688. At the Revolution, being a member of convention, he was one of the minority of five in the division on the forfeiture of the crown. King William was urged to declare him incapacitated for holding any public office, but refused. When the death of Dundee (July 1689) had finally destroyed the hopes of his party in Scotland, Mackenzie went to Oxford, where he did literary work. He died at Westminster on May 8, 1691.

While still a young man Sir George Mackenzie appears to have aspired to eminence in the domain of pure literature, his earliest publication having been *Aretina, or a Serious Romance* (anon., 1661); it was followed, also anonymously, by *Religio Stoici, a Short Discourse upon Several Divine and Moral Subjects* (1663); *A Moral Essay, preferring Solitude to Public Employment* (1665); and one or two other disquisitions of a similar nature. His most important legal works are entitled *A Discourse upon the Laws and Customs of Scotland in Matters Criminal* (1674); *Observations upon the Laws and Customs of Nations as to Precedency, with the Science of Heraldry* (1680); *Institutions of the Law of Scotland* (1684); and *Observations upon the Acts of Parliament* (1686); of these the last-named is the most important, the *Institutions* being completely overshadowed by the similar work of his great contemporary Stair. In his *Jus Regium: or the Just and Solid Foundations of Monarchy in general, and more especially of the Monarchy of Scotland, maintained* (1684), Mackenzie appears as an uncompromising advocate of the highest doctrines of prerogative. His *Vindication of the Government of Scotland during the reign of Charles II.* (1691) is valuable as a piece of contemporary history. The collected *Works* were published at Edinburgh (2 vols. fol.) in 1716–22; and *Memoirs of the Affairs of Scotland from the Restoration of King Charles II.,* from previously unpublished mss., in 1821.

See A. Lang, *Sir George Mackenzie of Rosehaugh* (1909).

MACKENZIE, HENRY (1745–1831), Scottish novelist and miscellaneous writer, the "Man of Feeling," born at Edinburgh, was educated at the high school and the university of his native town, and was then articled to George Inglis of Redhall, who was attorney for the crown in the management of exchequer business. In 1765 he was sent to London to prosecute his legal studies, and on his return to Edinburgh became partner with Inglis, whom he afterwards succeeded as attorney for the crown. His first and most famous work, *The Man of Feeling,* was published anonymously in 1771, and met with instant success. The "Man of Feeling" is a weak creature, dominated by a futile benevolence, who goes up to London and falls into the hands of people who exploit his innocence. One Eccles of Bath claimed the authorship of this book, bringing in support of his pretensions a ms. with many ingenious erasures. Mackenzie's name was then officially announced, but Eccles appears to have induced some people to believe in him. The first of his dramatic pieces, *The Prince of Tunis,* was produced in Edinburgh in 1773 with a certain measure of success. The others were failures. At Edinburgh Mackenzie belonged to a literary club, at the meetings of which papers in the manner of the *Spectator* were read. Mackenzie conducted two critical journals: *The Mirror* (1779–80) and *The Lounger* (1785–87). His critical work was good. He was the first critic to recognize the genius of Burns; he hailed the early works of Scott; and he was a faithful friend to many men of letters. His nickname, the "man of feeling," by no means represents the man of critical acumen and practical commonsense. *Waverley* was dedicated to him. No one now reads *The Man of Feeling,* but his commonplace book *Anecdotes and Egotisms of Henry Mackenzie* (edit. H. W. Thompson, 1928) is an interesting record.

Mackenzie was an ardent Tory, and wrote many tracts opposing the doctrines of the French Revolution. Most of these remained anonymous, but he acknowledged his *Review of the Principal Proceedings of the Parliament of 1784,* a defence of the policy of William Pitt, written at the desire of Henry Dundas. He was rewarded (1804) by the office of comptroller of the taxes for Scotland. In 1776 Mackenzie married Penuel, daughter of Sir Ludovick Grant of Grant. He was, in his later years, a notable figure in the social life of Edinburgh. He died on Jan. 14, 1831.

In 1807 *The Works* of *Henry Mackenzie* were published surreptitiously, and he then himself superintended the publication of his *Works* (8 vols. 1808).

See the *Prefatory Memoir,* by Sir Walter Scott, to an edition of his novels in Ballantyne's *Novelist's Library* (vol. v., 1823).

MACKENZIE, SIR MORELL (1837–1892), British physician, centre of a 19th-century *cause célèbre* over the death of the German emperor Frederick III (*q.v.*), was born at Leytonstone, Essex, on July 7, 1837. He studied at the London hospital, at Paris, Vienna and Budapest, where he learned the use of the newly invented laryngoscope under J. N. Czermak. In 1862 he took his degree and became a specialist in diseases of the throat. In 1863 he helped to found the Throat hospital in King street, Golden square, and became a leading authority.

In May 1887 Mackenzie was summoned to attend the German crown prince Frederick William, whose illness was difficult to diagnose. The summoning of the English specialist was attributed to the prince's wife, Victoria (called after his death the empress Frederick), but she was not responsible, still less, as stated in Germany, Queen Victoria. The German physicians who had attended the prince since the beginning of March had diagnosed his disease on May 18 as cancer of the throat; but Morell Mackenzie insisted (basing his opinion on a microscopic examination by R. Virchow of a portion of the tissue) that the disease was not demonstrably cancerous, that an operation for the extirpation of the larynx (planned for May 21) was unjustifiable, and that the growth might well be benign and therefore curable by other treatment. Mackenzie's opinion was followed; he was knighted in Sept. 1887 for his services, and decorated with the Grand Cross of the Hohenzollern Order. In November, however, it was ultimately admitted that the disease really was cancer; though Mackenzie, with very questionable judgment, more than hinted that it had become malignant since his first examination, in consequence of the irritating effect of the treatment by the German doctors. The crown prince became emperor, as Frederick III, on March 9, 1888, and died on June 15. A violent quarrel raged between Mackenzie and the German medical world. The German doctors published an account of the illness, *Die Krankheit Kaiser Friedrichs III* (1888), to which Mackenzie replied by a work entitled *The Fatal Illness of Frederick the Noble* (1888), the publication of which caused him to be censured by the Royal College of Surgeons. Mackenzie died on Feb. 3, 1892, leaving several books on laryngoscopy and diseases of the throat.

See R. S. Stevenson, *Morell Mackenzie: The Story of a Victorian Tragedy* (1946, 1947).

MACKENZIE, WILLIAM LYON (1795–1861), Canadian politician, was born near Dundee, Scotland, on March 12, 1795. In April 1820 he emigrated with his mother to Canada. There he became a general merchant, first at York, then at Dundas, and later at Queenston. The discontented condition of Upper Canada drew him into politics, and on May 18, 1824 he published at Queenston the first number of the *Colonial Advocate,* in which the ruling oligarchy was attacked with great asperity, and which roused great anger among the social and political set at York (Toronto), which was headed by John Beverley Robinson. In Nov. 1824 Mackenzie removed to Toronto, but he had little capital; his paper appeared irregularly, and was on the point of suspending publication when his office was attacked and his type thrown into the bay by a number of the supporters of his opponents. In an action against the chief rioters he was awarded £625 and costs, which enabled him to set up a much larger plant, and the *Colonial Advocate* ran till Nov. 4, 1834.

In 1828 he was elected member of parliament for York, but was expelled on the technical ground that he had published in his newspaper the proceedings of the house without authorization. Five times he was expelled and five times re-elected by his constituents, till at last the Government refused to issue a writ, and for three years York was without one of its representatives. In May 1832 he visited England, where he was well received by the colonial office. Largely as the result of his representations, many important reforms were ordered by Lord Goderich, afterwards earl of Ripon, the colonial secretary. While in England, he published *Sketches of Canada and the United States,* a statement of Canadian grievances. On his return in March 1834 he was elected mayor of Toronto. In Oct. 1834 he was elected member of parliament for York, and took his seat in Jan. 1835, the Reformers being now in the majority. A committee on grievances was appointed, and as chairman Mackenzie presented the admirable *Seventh Report on Grievances,* advocating responsible government.

In the general election of June 1836 the Tory party won a complete victory, Mackenzie and almost all the prominent Reformers being defeated at the polls. This totally unexpected defeat greatly embittered him. On July 4, 1836, he began the publication of the *Constitution,* which openly advocated a republican form of government. Later in the year he was appointed "agent and corresponding secretary" of the extreme wing of the Reform party. He was also in correspondence with Papineau and the other leaders of the Reformers in Lower Canada, who were already planning a rising. Early in Dec. 1837 Mackenzie gathered a mob of his followers at Gallows Hill, Toronto, with the intention of seizing the lieutenant-governor and setting up a provisional Government. The total failure of the revolt forced Mackenzie to fly to the United States with a price on his head. In the town of Buffalo he collected a disorderly rabble, who seized and fortified Navy island, in the river between the two countries, and for some weeks troubled the Canadian frontier. After the failure of this attempt he was put to the most pitiful shifts to make a living. In June 1839 he was tried in the United States for a breach of the neutrality laws, and sentenced to 18 months' imprisonment, of which he served over eleven. While in gaol at Rochester he published the *Carolina Almanac,* the tone of which may be judged from its references to "Victoria Guelph, the bloody queen of England," and to the cabinet as "Victoria Melbourne's bloody divan." He returned to Canada under the Amnesty Act 1849.

In 1851 he was elected to parliament for Haldimand, defeating George Brown. He at once allied himself with the Radicals (the "Clear Grits"), and became one of Brown's lieutenants. He was still miserably poor, but refused all offers to accept a government position. In 1858 he resigned his seat in the house, owing to incipient softening of the brain, of which he died on Aug. 29, 1861.

Turbulent, ungovernable, vain, often the dupe of schemers, Mackenzie united with much that was laughable not a little that was heroic. He could neither be bribed, bullied, nor cajoled. In 1832 he refused from Lord Goderich a position of great influence in Canada and an income of £1,500. He was a born agitator, and the evils against which he struggled were real and grave.

The *Life and Times* by his son-in-law, Charles Lindsey (Toronto, 2 vols., 1862), is moderate and fair, though tending to smooth over his anti-British gasconade while in the United States. An abridgment of this work was edited by G. G. S. Lindsey for the "Makers of Canada" series (1909). In *The Story of the Upper Canadian Rebellion* by J. C. Dent (2 vols., Toronto, 1885), a bitter attack is made on him, which drew a savage reply from another son-in-law, John King, K.C., called *The Other Side of the Story.* The best short account of his career is given by J. C. Dent in *The Canadian Portrait Gallery,* vol. ii. (Toronto, 1881). (W. L. G.)

MACKENZIE RIVER, a river of the Northwest Territories (*q.v.*), Canada, which discharges the waters of Great Slave lake into the Arctic ocean. Discovered and explored by Sir Alexander Mackenzie in 1789, it rises as the Finlay in north central British Columbia, flowing eastward to form the Peace (*q.v.*), which joins the discharge from Lake Athabasca as the Slave river and flows into Great Slave lake. From the Great Slave, the Mackenzie proper flows northwest for 1,100 mi. to empty into the Beaufort sea of the Arctic ocean near the Yukon border. The Mackenzie drains an area of 682,000 sq.mi., and is the longest river system in Canada. Ice-free from about the first week of June to the middle of October, the Mackenzie is navigable from its mouth to Great Slave lake. Connection with the railhead at Waterways, Alta., is made by way of the Slave and Athabasca (*q.v.*) rivers, with one 16-mi. portage from Fort Smith, N.W. Terr., to Fitzgerald, Alta. Boats also operate on the Liard river from Fort Nelson, B.C., to its junction with the Mackenzie at Fort Simpson and on the Peace from Peace River, Alta., to Fitzgerald except for the rapids near Fort Vermilion.

Settlements on the Mackenzie include Fort Providence, Wrigley, Fort Simpson, Fort Norman, Norman Wells, Fort Good Hope, Arctic Red River, Aklavik and Inuvik. Norman Wells is a petroleum centre, oil having been discovered there in 1920.

The mouth of the Mackenzie, a lake-strewn delta measuring 110 mi. in length and 40 mi. in width, is noted for its muskrat catch.

(J. R. M.)

MACKEREL, a common name for several genera of fishes of the family Scombridae (mackerels and tunas), which are swift, carnivorous fishes found in tropical and temperate seas, of fusiform shape, generally bluish above and silvery below, with small, thin scales, pointed head and rather large mouth. The spinous dorsal fin of slender spines that are depressible in a groove and the soft dorsal and anal fins are followed by a series of detached rays or finlets. The body ends with a slender caudal peduncle and widely forked caudal fin. The flesh is oily, generally red. These are energetic fishes in which the temperature is generally several degrees higher than that of the water.

The true mackerel genus *Scomber* includes about 10 species from tropical and temperate seas. *Scomber scombrus* is a valuable food fish found in the Mediterranean and on both sides of the north Atlantic; it reaches a length of about 18 in. It swims in large schools which approach the coasts in the spring; after spawning in the summer they return to the ocean. The air bladder is absent in *S. scombrus* but a small one is present in *S. colias,* termed Spanish mackerel in England and chub mackerel in America; this is a smaller and less valuable fish than the common mackerel and usually more southerly in its distribution. *S. japonicus,* the Pacific mackerel, which ranges from Alaska to Lower California, is an important commercial as well as an excellent game fish.

Scomberomorus and *Auxis* are important tropical genera, longer and more compressed than other Scombridae and with strong trenchant teeth. *Scomberomorus cavalla,* the king mackerel, one of the largest forms (recorded up to 100 lb.), is found from New England to Brazil. *Auxis thazard,* the frigate mackerel, ranges from Cape Cod to Puerto Rico and probably farther south.

McKIM, CHARLES FOLLEN (1847–1909), U.S. architect, who was of primary importance in the American neoclassical revival, was born in Chester county, Pa., on Aug. 24, 1847. The son of a relentless abolitionist, he was educated at Harvard and at the École des Beaux Arts and trained as a draftsman by H. H. Richardson while the latter was completing Trinity church, Boston. In 1879 he joined William Rutherford Mead and Stanford White to found McKim, Mead & White, perhaps the most successful and influential architectural firm in U.S. history. Until 1887 the firm excelled at informal summerhouses built of shingles, and McKim designed one of the most significant of these, the residence at Bristol, R.I., of W. G. Low (1887). In later years the firm was famous for championing the formal tradition of the Italian Renaissance and its classical antecedents. Among the celebrated examples of the formal planning of McKim are the Boston Public library (1887) and in New York the University club (1899), the Morgan library (1906) and the Pennsylvania station (1906–10). With D. H. Burnham and Richard Morris Hunt he charted the architectural program of the World's Columbian exposition at Chicago in 1893, which was classically inspired. He also aided Burnham in reviving Pierre L'Enfant's plan for Washington, D.C., and was the originator of the American Academy in Rome.

He died at St. James, Long Island, N.Y., on Sept. 14, 1909.

See Charles Moore, *Life and Times of Charles Follen McKim* (1920); Wayne Andrews, *Architecture, Ambition & Americans* (1955).

(W. As.)

MACKINAC, STRAITS OF, is the connection between Lakes Michigan and Huron. In their narrowest portion the straits are about 4 mi. wide but the straits area generally is considered as embracing a 30 mi.-long stretch of water which includes the passages between several islands in northwestern Lake Huron, Mackinac Island, within the straits, and an indefinitely defined portion of northeastern Lake Michigan. The straits, which provide a broad passage between the lakes, separates the lower and upper peninsulas of the state of Michigan. This natural barrier to land travel, which was traversed by state-operated ferryboats for many years, has been spanned by a bridge and two 20-in. submarine pipelines, carrying petroleum products from oil fields in the province of Alberta, across the straits from Pointe la Barbe on the north shore to McGulpin Point on the south shore.

Mackinac Bridge.—Extending from Mackinaw City, on the south side of the straits, to a point near St. Ignace, on the north side, the bridge with its approaches has an uninterrupted overwater length of 5 mi. and 44 ft. The main span is a suspension bridge with a total length of 8,344 ft. between cable anchorages. The centre span of the bridge, between towers, is 3,800 ft. long. A single deck carries four lanes of highway traffic and has a capacity of 6,000 cars per hour. The main towers are founded on bedrock more than 200 ft. below water level and extend 552 ft. above the water. The clearance under the centre span is 148 ft. above low-water datum (578.5 ft.). Built by the state of Michigan, with David B. Steinman as designer and supervisor of construction, the bridge cost $100,000,000. Construction began in July 1954, and the bridge was opened to traffic on Nov. 1, 1957.

See MACKINAC ISLAND; MICHIGAN, LAKE; HURON, LAKE.

(J. L. HH.)

MACKINAC ISLAND, a summer resort in Mackinac county, Mich., U.S., is located in the Straits of Mackinac, where the upper and lower peninsulas of Michigan nearly join. The island is 9 mi. in circumference and is covered with a thick growth of pine, cedar, birch and beech. After 1895 more than 80% of the area was operated as a state park by the Mackinac Island state park commission. It has a horse-and-buggy setting and automobiles are banned. The winter population of (1960) 942 is concentrated in the city on the south side.

The island was used by ancient Indians as a burial ground, and its name is a shortened form of the Indian Michilimackinac. Father Claude Dablon, a French Jesuit, wintered there in 1670 among the Huron Indians. During the American Revolution the British moved their fort from Mackinaw City to the island. Fort Mackinac was ceded to the Americans by the treaty of Paris in 1783, and during the War of 1812 a British landing party under Capt. Charles Roberts caught the U.S. garrison by surprise and forced its surrender. After the war the island was the centre of John Jacob Astor's fur-trading empire.

The fur trade declined in the 1830s and Mackinac, rich in historic lore and scenic attractions such as Arch rock, Skull cave, Devil's Kitchen and Sugar Loaf, was subsequently promoted as a resort centre.

Points of interest along Market street include the Astor house, the Edward Biddle house, and the Dr. William Beaumont memorial, which honours the U.S. army physician who began there in 1822 his famous experiments in digestion. Other buildings include the Grand hotel, built in 1887, and the Moral Rearmament association's world headquarters buildings. Two steamship ferry services operate from Mackinaw City and St. Ignace. (E. T. P.)

MACKINDER, SIR HALFORD JOHN (1861–1947), ranked for many years as Great Britain's outstanding geographer, but it was not until the events of World War II showed the wisdom of the forecasts he made from 1904 to 1919 that his name became widely known among students of political geography. He was born on Feb. 15, 1861 at Gainsborough, Lincolnshire. In Germany, Gen. Karl Haushofer twisted Mackinder's teachings for his own purposes in promoting his doctrine of *Geopolitik*. Mackinder's famous paper, "The Geographical Pivot of History" which he read before the Royal Geographical society in London in 1904 evaluated the age-old cleavages between the heartland and coastland, the regions accessible to horsemen and shipmen respectively, and the conflicts between their peoples, with Russia, the heartland power, at the centre of his deliberations. These thoughts were further developed after World War I in his book *Democratic Ideals and Reality* (1919). During World War II, in another classical exposé of political geography, *The Round World and the Winning of the Peace* (1942), he reiterated his concept of the heartland under the conditions of (pre-atomic and pre-guided missile) modern warfare.

It would be mistaken to consider Mackinder's contributions solely in the light of his heartland vision. His great achievement was to raise geography from the slough into which it had fallen in England. At Oxford university and later at the London School of Economics, he promoted the teaching of regional and world geography. From 1910 to 1922 he served as a member of parliament. (H. W. Wt.)

McKINLEY, WILLIAM (1843–1901), twenty-fifth president of the United States, was born in Niles, Trumbull county, O., on Jan. 29, 1843. His ancestors on the paternal side were Scotch-Irish who lived at Dervock, Co. Antrim, and spelled the family name "McKinlay." His great-great-grandfather settled in York county, Pa., about 1743, and from Chester county, Pa., his great-grandfather, David McKinley, who served as a private during the War of Independence, moved to Ohio in 1814. David's son James had gone in 1809 to Columbiana county, O. His son William McKinley (b. 1807), like his father an iron manufacturer, was married in 1829 to Nancy Campbell Allison, and to them were born nine children, of whom William, the president, was the seventh. In 1852 the family removed to Poland, Mahoning county, where the younger William was placed at school. At 17 he entered the junior class of Allegheny college. at Meadville, Pa., but he soon returned to Poland, where for a time he taught in a neighbouring country school. When the Civil War broke out in 1861 he enlisted as a Union army private, rising to the rank of major by 1865. After the war McKinley returned to Poland. and bent all his energy upon the study of law. He completed his preparation at the Albany (N.Y.) law school, was admitted to the bar at Warren, O., in March 1867, and began practice in Canton, O. He identified himself immediately with the Republican Party, and took part in the campaign work on behalf of Grant's presidential candidature in 1868. In 187j he first became known as an able campaign speaker by his speeches on behalf of Rutherford B. Hayes, the Republican candidate for governor of Ohio. In 1876 McKinley was elected to the national House of Representatives. Conditions both in Ohio and in Congress had placed him, and were to keep him for twenty years, in an attitude of aggressive and uncompromising partisanship. His Congressional district was naturally Democratic, and its boundaries were changed by Democratic legislatures for the purpose of causing his defeat. But he overcame what had threatened to be adverse majorities at all elections from 1876 to 1890, with the single exception of 1882. McKinley reflected the strong sentiment of his manufacturing constituency in behalf of a high protective tariff. In 1878 he took part in the debates over the Wood tariff bill. and in the same year he voted for the Bland-Allison silver bill. In Dec. 1880 he was appointed a member of the ways and means committee. succeeding James A. Garfield, who had been elected president in the preceding month, and to whose friendship, as to that of Rutherford B. Hayes, McKinley owed much in his earlier years in Congress. He was prominent in the debate which resulted in the defeat of the Democratic Morrison tariff bill in 1884, and in the defeat of the Mills bill for the revision of the tariff in 1887–1888. In 1889 he became chairman of the ways and means committee and Republican leader in the House of Representatives. In 1890 he introduced the tariff measure known as the McKinley bill, which reduced revenues by its high and in many cases almost prohibitive duties. Under its provision for reciprocal trade agreements reciprocity treaties were made with Germany, France, Italy and Belgium. In Europe there was bitter opposition to it by other countries. In the Congressional elections of 1890 McKinley was defeated. In 1891 he was elected governor of Ohio, and in 1893 was re-elected. In 1892 McKinley was the permanent president of the national Republican convention which met in Minneapolis and which renominated Benjamin Harrison on the first ballot, on which James G. Blaine received $182\frac{5}{6}$ votes, and McKinley, 182 votes. In 1896 he seemed for many reasons the most "available" candidate of his party for the presidency: he had no personal enemies in the party; he had carried the crucial state of Ohio by a large majority in 1893; his attitude on the coinage question had never been so pronounced as to make him unpopular either with the radical silver wing or with the conservative "gold-standard" members of the party. In the national Republican convention held in St. Louis in June he was nominated for the presidency on the first ballot. The convention adopted a tariff plank drafted by McKinley, and, of far greater immediate importance, a plank, which declared that the Republican Party was "opposed to the free coinage of silver, except by international agreement with the leading commercial nations of the world. . . ." This "gold standard" plank drove out of the Republican Party the Silver Republicans of the West, headed by Senator Henry M. Teller of Colorado. The national Democratic convention declared for the immediate opening of the mints to the free and unlimited coinage of silver at the ratio with gold of 16 to 1; and it nominated as its candidate for the presidency William Jennings Bryan of Nebraska.

There was a secession from the Democratic Party of conservatives who called themselves the National Democratic Party, were commonly called Gold Democrats, and who nominated John M. Palmer (1817–1900) of Illinois for president. McKinley, who had expected to make the campaign on the issue of a high protective tariff, was diverted to the defense of the gold standard as the main issue. The campaign was enthusiastic: the Republican candidate was called the "advance agent of prosperity" and the panic of 1893 was charged to the repeal of the McKinley tariff measure. McKinley was elected in November by a popular vote of 7,106,779 to 6,502,925 for Bryan, and by an electoral vote of 271 to 176. *(See* UNITED STATES : *History.)*

Following his inauguration the president summoned Congress to assemble in an extra session. McKinley's message urged revision of the tariff and revenue, and the Dingley tariff bill was accordingly passed through both houses, and was approved by the president on July 24.

The ensuing regular session of Congress was occupied chiefly with the situation in Cuba. President McKinley showed himself singularly patient and self-controlled in the midst of the popular clamour for intervention by the United States in behalf of the Cubans; but finally, on March 23, 1898, he presented an ultimatum to the Spanish government, and on April 25, on his recommendation, Congress declared war upon Spain. During the war itself he devoted himself with great energy to the mastery of military details; but there was bitter criticism of the war department resulting in the resignation of the secretary of mar, Russell A. Alger (*q.v.*). The peace treaty, signed at Paris, Dec. 10, was ratified by the Cnited States Senate on Feb. 6, 1899; and in accordance with its terms Puerto Rico, the Philippine archipelago, and Guam were transferred by Spain to the United States, and Cuba came under American jurisdiction pending the establishment there of an independent government. Two days before the ratification of the peace treaty, a conflict took place between armed Filipinos under the leadership of Emilio Aguinaldo and the American forces that were in possession of Manila. The warfare naged by these Filipinos against the United States, while having for the most part a desultory and guerrilla character, was of a very protracted and troublesome nature. Sovereignty over the Filipinos having been accepted by virtue of the ratification of the Paris treaty, President McKinley was not at liberty to do otherwise than assert the authority of the United States and use every endeavour to suppress the insurrection. But there was bitter protest against this "imperialism," both within the party by such men as George F. Hoar, Eugene Hale, Thomas B. Reed and Carl Schurz, and from the leaders of the Democratic Party. In the foreign relations of the United States, as directed by President McKinley. the most significant change was the cordial understanding established with the British Government. Other important foreign events during McKinley's administration were: the annexation of the Hawaiian islands (see HAWAII) in August 1898, and the formation of the Territory of Hawaii in April 1900; the cessation in 1899 of the tripartite (German, British and French) government of the Samoan islands, and the annexation by the United States of those of the islands east of 171°, including the harbour of Pago-Pago; the participation of American troops in the march of the allies on Pekin in August 1900, and the part played by McKinley's secretary of state, John Hay, in securing a guarantee of the integrity of the Chinese empire. In 1900 McKinley was unanimously renominated by the national Republican convention which met in Philadelphia in June, and which nominated Theodore Roosevelt, governor of New York, for the vice-presidency. The Republican convention demanded the maintenance of the gold standard, and pointed to the exceptional prosperity of the country resulting from the fulfilment of some of the most important of the pledges given by the Republican Party four years earlier. However, the tendency towards the concentration of capital in great industrial corporations had been active to an extent previously undreamt of, with incidental consequences that had aroused much apprehension; and the Democrats accused President McKinley and the Republican Party of having fostered the "trusts." But the campaign against McKinley and the Republican Party was not only "anti-trust" but "anti-imperialistic." William Jennings Bryan, renominated by the Democratic Party on a free silver platform, declared that imperialism was the "paramount issue" and made a second vigorous campaign. As the result of the polling in November, 292 Republican presidential electors and 155 Democratic electors were chosen. The Republican popular vote was 7,207,923, and the Democratic 6,358,133.

In the term of Congress immediately following the presidential election arrangements-were perfected for the termination of the American military occupation of Cuba and the inauguration of a Cuban republic. In the Philippines advanced steps had been taken in the substitution of civil government for military occupation, and a governor-general, Judge William H. Taft, had been appointed and sent to Manila. Prosperity at home was great, and foreign relations were free from complications. After an arduous term, the president had reached a period that promised to give him comparative repose and freedom from care. In these circumstances, President McKinley, accompanied by the greater part of his cabinet, set forth in the early summer on a tour to visit the Pacific coast. The route chosen was through the Southern states, where many stops were made, and where the president delivered brief addresses. The heartiness of the welcome accorded him seemed to mark the disappearance of the sectional feeling that had survived the Civil War. After his return he visited the city of Buffalo, New York, in order to attend the Pan-American exposition and deliver a public address. This address (Sept. 5, 1901) was a public utterance designed by McKinley to affect American opinion and public policy, and apparently to show that he had modified his views upon the tariff. It declared that henceforth the progress of the nations must be through harmony and co-operation and it maintained that the time had come for wide-reaching modifications in the tariff policy of the United States through commercial reciprocity arrangements with various nations. On the following day, Sept. 6, 1901, a great reception was held for President McKinley in one of the public buildings of the exposition. Advantage of this opportunity was taken by a young man of Polish parentage, by name Leon Czolgosz, to shoot at the president with a revolver at close range. One of the two bullets fired penetrated the abdomen. After the world had been assured that the patient was doing well and would recover, he collapsed and died on the 14th. The assassin, who professed to hold the views of that branch of anarchists who believe in the assassination of rulers, was promptly seized, convicted and executed. McKinley's funeral took place at Canton, O., on Sept. 19, amid marked public manifestations of mourning.

McKinley was married in 1867 to Ida Saxton (1847–1907).

Though he had not the personal magnetism of James G. Blaine, whom he succeeded as a leader of the Republican Party, McKinley had great personal suavity and dignity, and was thoroughly well liked by his party colleagues. As a politician he was always more the people's representative than their leader, and that he "kept his ear to the ground" was the source of much of his power and at the same time was his greatest weakness. His apparently inconsistent record on the coinage question becomes consistent if considered in the same way, as the expression of the gradually changing views of his constituency. He was an able but far from brilliant campaign speaker. His greatest administrative gift was a fine intuition in choosing men to serve him. His Speeches and Addresses were printed in 2 vols. (1893 and 1901).

Dennis, *Adventures in American Diplomacy*, 1896–1906 (1928).

McKINLEY, MOUNT, a peak of the Alaska range in south-central Alaska in lat. 63° 04' N. and long. 151° 01′ W., is the highest mountain in North America (20,320 ft. above sea level). On the north and west it rises abruptly 17,000 ft., while the southern and much more gradual slope begins from an even lower level. The upper two-thirds is covered with permanent snow fields that feed many glaciers. The greatest glaciers are on the relatively inaccessible southern slope. Muldrow (30 mi. long) and Peters are the largest on the northern slope.

The Indian name of the peak was Denali ("The Great One"). The modern name was applied in 1896 by W. A. Dickey in honour of William McKinley, who was elected president later that year. The first attempt to climb the mountain, made in 1903 by James Wickersham, was unsuccessful. Frederick A. Cook's much publicized (but fraudulent) claim that he had reached the summit inspired the conquest of the north peak in 1910 by two prospectors, William Taylor and Pete Anderson. The south peak (true summit) was finally attained June 7, 1913, after an expedition of three months duration led by Hudson Stuck and H. P. Karstens. In 1932, two climbers from a cosmic ray research expedition, Theodore Koven and Allen Carpe, lost their lives on the mountain. All successful ascents have been made from the north base, which became more accessible due to the Denali (park) highway.

The Mount McKinley National park (see NATIONAL PARK SYSTEM, THE) was created on Feb. 26, 1917. See also ALASKA.

(V. H. C.)

MACKINTOSH, CHARLES RENNIE (1868–1928), Scottish architect, designer and water-colourist, was one of the most significant personalities contributing to the rise of modern architecture. Born in Glasgow, Scot., on June 7, 1868, he was apprenticed to a local architect John Hutchison, and attended evening classes at the Glasgow School of Art. In 1889 he joined the firm of Honeyman and Keppie, becoming a partner in 1904.

In collaboration with three other students, one of whom, Margaret Macdonald, in 1900 became his wife, Mackintosh achieved an international reputation in the 1890s as a designer of unorthodox posters, craftwork and furniture. The outcome of this experimental work could be seen in four remarkable tearooms he designed for Miss Cranston in Glasgow (1896–1904) and in his domestic interiors of the early 1900s. In marked contrast to contemporary fashion this work was notable for its lightness, elegance and originality.

Mackintosh's chief architectural projects were: Glasgow School of Art (1896–1909); two unrealized projects — the 1901 International exhibition, Glasgow (1898) and "Haus eines Kunstfreundes" (1901); Windyhill, Kilmacolm (1900) and Hill house, Helensburgh (1902); the Willow Tearooms, Glasgow (1904–0j); and Scotland Street school (1904–06). Although all have some traditional characteristics, they reveal a mind of exceptional inventiveness and aesthetic perception. By 1914, however, Mackintosh had virtually ceased to practice and thereafter he devoted himself to water-colour painting.

He died on Dec. 10, 1928, in London.

See T. Howarth, *Charles Rennie Mackintosh and the Modern Movement* (1952); N. B. L. Pevsner, *Charles R. Mackintosh* (1950). (T. Hh.)

MACKINTOSH, SIR JAMES (1765–1832), Scottish publicist, was born at Aldourie on Oct. 24, 1765, and was educated at Aberdeen and at Edinburgh, where he took his degree in medicine in 1787. In 1788 he removed to London, and becoming interested in politics, in 1791 published his *Vindiciae Gallicae,* a reply to Burke's *Reflections on the French Revolution.* It was the only worthy answer to Burke that appeared, and won him a European reputation and many friends, including Burke himself. Its success finally led him to take up the legal profession. He was called to the bar in 1795. In 1797 his wife died, and next year he married Catherine Allen, sister-in-law of Josiah and John Wedgwood, through whom he introduced Coleridge to the *Morning Post.*

His greatest legal successes were his lectures (1799) at Lincoln's Inn on the law of nature and nations, and his defence (1803) of Jean Gabriel Peltier, a French refugee, tried at the instance of the French government for a libel against the first consul. In 1803 he was knighted, and received the post of recorder at Bombay, but he returned to England in 1812. He entered parliament in the Whig interest as member for Nairn, and he sat for that county, and afterwards for Knaresborough, till his death. He opposed the reactionary measures of the Tory government, supported and afterwards succeeded Romilly in his efforts for reforming the criminal code, and took a leading part both in Catholic emancipation and in the Reform Bill. From 1818 to 1824 he was professor of law and general politics in the East India Company's College at Haileybury. His *Dissertation on the Progress of Ethical Philosophy,* prefixed to the 7th edition of the *Encyclopædia Britannica,* and published in 1831, was severely attacked in 1835 by James Mill in his *Fragment on Mackintosh.* About the same time he wrote for the *Cabinet Cyclopaedia* a "History of England from the Earliest Times to the Final Establishment of the Reformation." His more elaborate *History of the Revolution* was published after his death. Already a privy councillor, Mackintosh was appointed commissioner for the affairs of India under the Whig administration of 1830. He died on May 30, 1832.

The *History of the Revolution in England,* breaking off where William of Orange is about to intervene, is chiefly interesting because of Macaulay's essay on it and its author.

See R. J. Mackintosh, *Memoirs of the Life of Sir James Mackintosh,* 2 vol., 2nd ed. (London, 1853).

MACKLIN, CHARLES (d. 1797), Irish actor and playwright, whose real name was McLaughlin; his distinguished though turbulent career, almost spanning the 18th century and made him a pillar of the English theatre. He first appeared as an actor at Bristol and in 1725 went to Lincoln's Inn Fields. London. A man of violent nature, he was a pioneer against the stilted declamation of his day. He went to Drury Lane theatre in 1733 and later was concerned in its management. In 1735 he killed a brother actor in the green room, over a dispute about a wig, but although prosecuted he received no sentence. He set the seal on his stage career at Drury Lane on Feb. 14, 1741, when he played Shylock, rescuing the part from all the comic "portrayals" with which it had long been surrounded.

Macklin played many parts with distinction but was constantly involved in disputes and lawsuits. He attempted to be a restaurateur but failed and returned to the stage. Two of his plays were outstanding, *Love à-la-mode* (1760) and *The Man of the World* (1781). He died on July 11, 1797, claiming to be 107 years old; he may indeed have been a centenarian, though this is subject to dispute.

See Edward A. Parry, *Charles Macklin* (1891). (W. J. M.-P)

MACK VON LEIBERICH, KARL, Freiherr (1752–1828), Austrian soldier, was born at Nenslingen, Bavaria, on Aug. 25, 1752. In 1770 he joined an Austrian cavalry regiment, becoming an officer seven years later. During the brief war of the Bavarian Succession he served on the staff of Count Kinsky, and subsequently under the commander-in-chief Field Marshal Count Lacy. He was promoted first lieutenant in 1778, and captain on the quartermaster-general's staff in 1783. In 1785 Mack married Katherine Gabrieul, and was ennobled under the name of Mack von Leiberich. In the Turkish war he was employed on the headquarters staff, becoming in 1788 major and personal aide-de-camp to the emperor, and in 1789 lieutenant-colonel. He distinguished himself greatly in the storming of Belgrade. Shortly after this, disagreements between Mack and Loudon, led to the former's demanding a court-martial and leaving the front. He was, however, given a colonelcy (1789) and the order of Maria Theresa, and in 1790 Loudon and Mack, having become reconciled, were again on the field together. During these campaigns Mack received a severe injury to his head, from which he never fully recovered. In 1793 he was made quartermaster-general (chief of staff) to Prince Josias of Saxe-Coburg, commanding in the Netherlands. He enhanced his reputation by the ensuing campaign, receiving a wound at Famars. In 1797 he was promoted lieutenant field marshal, and in 1798 accepted command of the Neapolitan army. Forced to take refuge from his own men, he escaped to the French camp, and was sent to Paris, whence he escaped in disguise two years later. He was not employed for some years, but in 1804 was made quartermaster-general of the army, with instructions to prepare for a war with France. He attempted hastily to reform the army, and in 1805 became the real commander (under titular commander-in-chief Archduke Ferdinand) of the army which opposed Napoleon in Bavaria, but his position was ill-defined and his authority treated with slight respect by his colleagues. (*See* Napoleonic Campaigns.)

See Schweigerd, *Oesterrezchs Helden* (Vienna, 1854); Wiirzbach, *Biogr. Lexikon* d. *Kaiserthums Oesterr.* (Vienna, 1867); Ritter von Rittersberg, *Biogr,* d. *ausgezeichneten Feldherren d. oest. Armee* (Prague, 1828); Raumer's *Hist. Taschenbuch* (1873) defends Mack.

McLANE, LOUIS (1786–1857), American lawyer, business executive, political leader and diplomat. was descended from Scottish grandparents of the Isle of Man who had moved to Philadelphia in 1731. His immediate family had settled in the three lower counties of Delaware, where Allan McLane, his father, had entered business with Robert Morris in 1773. He began the practice of law in 1807, served in Congress. 1817–27, and in the Senate, 1827–29. He first inclined toward Federalism, but by 1823 he had formed with Martin Van Buren a group of William H. Crawford Democrats and later supported Andrew Jackson when Crawford's ill-health forced him out of politics. As an able representative of the Middle Atlantic States free-trader exporting and carrying-trade interests, he was well qualified to negotiate for the opening of the British West Indian trade, which was the main business of the London post under the new Jackson Administration. His appointment was the signal for a great protectionist outcry against the "Wilmington conspiracy" to bargain away the advantages of the tariff of 1828. The Government allowed him to follow his own course in the negotiations, with the result that within ten months after he had presented his credentials, an agreement was reached which ended an irritation of nearly 50 years. The cabinet, as the British were privately informed, favoured a reduction of the American tariff; but this was not secured until the southern free-traders organized the nullification movement and brought about the adoption of the Compromise tariff of 1833, which McLane, who had returned in the meantime to the United States as secretary of the treasury, had influenced by formulating the administration tariff proposals. Then came a turning-point in his career. He refused to join Van Buren in approving Jackson's proposal to remove deposits from the bank without the authority of Congress and was transferred to the Department of State. He resigned the next year, 1834, breaking with Van Buren. From 1834–37 he was president of the Morris Canal and Banking Company (New York), and from 1837–47 president of the Baltimore and Ohio Railroad. In 1845, when the Democrats returned to office without Van Buren and when Anglo-American relations were strained over the Oregon question, McLane accepted from President Polk an appointment to return to England "upon condition that if he could induce the British Government to reconsider the rejection of the offer of '49 he. the President, would consult the Senate as to the propriety of accepting this compromise." Whatever may have been McLane's real influence upon Lord Aberdeen, he had the satisfaction of seeing another great difference between the two countries "amicably" settled, and this time in conjunction with the triumph of free trade—the repeal of the British Corn Laws and the substitution of the low Walker tariff of 1846 for the high Whig tariff of 1842.

BIBLIOGRAPHY.—There is no biography of Louis McLane, but *see* R. M. McLane's *Reminiscences, 1827–97;* Fitzpatrick (ed.), *Autobiography of Martin Van Buren;* Bassett (ed.), *The Andrew Jackson Papers;* Quaife (ed.), *Polk's Diary; The Aberdeen Papers* (ms.); *The Peel Papers* (ms.); *The C. R. Vaughan Papers* (ms.); and Benns, *The American Struggle for the British West India Carrying Trade.*

MACLAREN, CHARLES (1782–1866), Scottish editor, was born at Ormiston. Haddingtonshire. on Oct. 7, 1782, the son of a farmer and cattle dealer. He was almost entirely self-educated, and became a clerk in Edinburgh. In 1817 he established the *Scotsman* newspaper in Edinburgh and at first acted as its editor. Offered a post as clerk in the customhouse, he resigned his editorial position, resuming it again from 1820 to 1845. He was editor of the 6th edition of the *Encyclopædia Britannica* in 1820. From 1864–66 he was president of the Geological society of Edinburgh, where he died on Sept. 10, 1866.

MACLAURIN, COLIN (1698–1746), Scottish mathematician, who alone of Newton's British successors, ranked equal with continental mathematicians of his day. Born at Kilmodan, Argyllshire, and educated at the University of Glasgow, at 19 he was elected professor of mathematics in Marischal college, Aberdeen. Two years later he was admitted a fellow of the Royal society and made the acquaintance of Sir Isaac Newton. In 1719 he published *Geometria organica, sive descriptio linearum curvarum universalis,* in which he developed several theorems due to Newton, introduced the method of generating conics that bears his name and showed that many curves of the third and fourth degrees can be described by the intersection of two movable angles. In 1721 he wrote a supplement to *Geometria organica,* which he amplified in the *Philosophical Transactions* for 1735. This paper is principally based on the following general theorem, which is a remarkable extension of Pascal's hexagram: "If a polygon move so that each of its sides passes through a fixed point. and if all its summits except one describe curves of the degrees *nt, n, p,* etc., respectively, then the free summit moves on a curve of the degree *2mnp* . . . which reduces to *mnp* . . . when the fixed points all lie on a right line."

In 1722 Maclaurin traveled as tutor and companion to the eldest son of Lord Polwarth and after a short stay in Paris resided for a time in Lorraine, where he wrote an essay on the percussion of bodies, which was awarded the prize of the French Academy of Sciences for 1724. In 1725 he was made professor of mathematics in the University of Edinburgh on the recommendation of Newton.

In 1740 Maclaurin divided with Leonhard Euler and Daniel Bernoulli the prize offered by the French Academy of Sciences for an essay on tides. His *Treatise on Fluxions* (1742), written in reply to George Berkeley, contains his well-known essay on tides. In this he showed that figures of equilibrium for a homogeneous rotating fluid mass are the ellipsoids of revolution, later known as Maclaurin's ellipsoids. He also gave in his *Fluxions,* for the first time, the correct theory for distinguishing between maxima and minima in general and pointed out the importance of the distinction in the theory of the multiple points of curves. Maclaurin was the first to introduce into mechanics, in this discussion. the important conception of level surfaces. As a result of Maclaurin's suggestion, the newly formed (1731) Medical Society of Edinburgh was enlarged into the Philosophical society (1739) and later (in 1783) into the Royal Society of Edinburgh.

In 1745, nhen the rebels mere marching on Edinburgh, Maclaurin took a prominent part in preparing trenches and barricades for its defense. As soon as the rebel army got possession of Edinburgh. Maclaurin fled to England to avoid making submission to the Pretender. He died on June 14, 1746, at Edinburgh.

After Maclaurin's death his *Account of Newton's Philosophical Discoveries* was published by Patrick Murdoch, and also his *Algebra* in 1748. As an appendix to the latter appeared his *De linearum geometricarum proprietatibus generalibus tractatus,* an elegant treatise.

MACLEAN, SIR DONALD (1864–1932), British politician. the eldest son of John Maclean of Kilmoluag, Tiree, Scotland, was admitted a solicitor in 1887. After three unsuccessful contests. he entered the house of commons in 1906 as Liberal member for Bath. He failed to hold his seat at the general election of Jan. 1910, but in December of that year he was elected for Peebles and Selkirk, which he represented until 1918. He was member for Peebles and South Midlothian from 1918 to 1922, when he lost his seat. In the absence of Asquith from the house of commons, he became chairman of the Parliamentary Liberal party (1919–22). He nas deputy chairman, house of commons, 1911–18, and chairman of the London appeal tribunal, 1916–18. During World War I he was chairman of the Enemy Debt Treasury commission and of the house of commons military appeal tribunal. He was sworn of the privy council in 1916, and created K.B.E. in 1917. He died June 15, 1932.

McLEAN, JOHN (1785–1861), U.S. jurist, was horn in Morris county. N.J., on March 11, 1785. His father, a farmer, moved to Virginia in 1789, later to Kentucky and finally to Ohio. The boy's schooling was irregular, but he uent to Cincinnati to study law in the office of Arthur St. Clair, and in 1807 mas admitted to the bar. In 1812 he nas elected U.S. representative from the district which included Cincinnati, and in 1814 was re-elected. In 1816 he was appointed a judge in the supreme court of Ohio, nhich position he resigned in 1822 to become commissioner of the general land office under Pres. James Monroe. Monroe in 1823 appointed him postmaster general, in uhich office he continued throughout the administration of John Quincy Adams. His conduct of this office was notable for its efficiency and economy. and for the strict nonpartisan treatment of postmasters and other employees. Pres. Andrew Jackson continued McLean in office. but McLean refused to accept the president's views on patronage, and resigned. Jackson thereupon appointed him an associate justice of the supreme court. which position he held from 1830 until his death in 1861. His career on the bench was long and distinguished, his most famous decision, perhaps. being the dissenting opinion in the Dred Scott case. In 1848 he was considered as a presidential candidate at the Free Soil convention in Buffalo, and in 1856 he was the chief opponent of J. C. Frémont at the first Republican convention. receiving 196 votes. He received a number of votes in the Chicago convention which nominated Lincoln. His death occurred at Cincinnati on April 4, 1861.

MacLEISH, ARCHIBALD (1892–), U.S. poet, public servant and university professor, was born in Glencoe, Ill., May 7, 1892. Educated at Yale and Harvard law school, he first came to notice as a poet with *Tower of Ivory* (1917). The verse he published in the 1920s, *The Happy Marriage* (1924), *The Pot of Earth* (1925), *Streets in the Moon* (1926) and *Tlze Hamlet of A. MacLeish* (1928), shows the fashionable influence of Ezra Pound and T. S. Eliot. In *New Found Land* (1930) a simple lyric eloquence, the persistent MacLeish note, is heard.

In the 1930s MacLeish was concerned about the threats to American society, particularly the Fascist menace. *Conqziistador* (1932) is the first of his "public" poems. Others were collected in *Frescoes for Mr. Kockefeller's City* (1933), *Public Speech* (1936), and *America Was Promises* (1939). He wrote two radio verse plays on social themes, *The Fall of the City* (1937) and *Air Razd* (1938).

MacLeish served as librarian of congress (1939–44) and assistant secretary of state (1944–45), and in various governmental positions until 1949. He aided in the establishment of United Nations Educational, Scientific and Cultural organization (UNESCO). Dunng these years he wrote and spoke constantly in defense of American democracy. In 1949 he became Boylston professor at Harvard. Two later works are outstanding, *Actfive and Other Poems* (1948) and a verse drama. J. B. (1957).

MacLeish's collected works are *Collected Poems, 1917–1952* (1952); *A Time to Speak: the Selected Prose* (1941); *A Time* *to Act: Selected Addresses* (1943). (W. T.)

McLENNAN, JOHN FERGUSON (1827–1881), Scottish ethnologist who challenged the long-established theory that modern society and the state had evolved from a primordial, patriarchal family, was born at Inverness on Oct. 14, 1827, and educated at King's college, Aberdeen, and at Cambridge university. He was admitted to the bar in 1857, and in 1871 became parliamentary draftsman for Scotland. In *Primitive Marriage* (1865, reissued as *Studies in Ancient History*, 2nd series, 1896) he outlined his theory of social evolution, postulating small, promiscuous groups initially, with kinship recognized in the female line. Promiscuity was mitigated by a form of polyandry that led to reckoning descent in the male line and eventually to endogamy, or marriage within the group. The terms exogamy and endogamy mere introduced by McLennan, who also was the first to recognize the significance of totemism for the study of social origins. *The Patriarchal Theory* was published posthumously in 1885. McLennan's significance to ethnology lay in the stimulation of his challenging and persuasive theories, most of which, however, have not withstood the test of scientific criticism. He died on June 16, 1881, in Kent, England.

See E. B. Tylor in *The Academy*, vol. 20, pp. 9–10 (1885); R. H. Lowie, *The History of Ethnological Theory* (1937). (LE. A. W.)

MACLEOD, JOHN JAMES RICKARD (1876–1935), British physiologist and one of the discoverers of insulin (*q.v.*), was born on Sept. 6, 1876, near Dunkeld, Scotland, and was educated at Aberdeen grammar school, Marischal college, Aberdeen, and Leipzig university. From 1899 to 1902 he was demonstrator in physiology and then lecturer in biochemistry at the London hospital, holding also from 1901 to 1903 the Mackinnon research scholarship of the Royal society. From 1903 to 1918 he was professor of physiology at Western Reserve university, Cleveland, Ohio. subsequently becoming professor of physiology, director of the physiological laboratory and associate dean of the faculty of medicine in the University of Toronto, Ont. He died March 16, 1935.

Macleod's most important work was on the nature of the control of the metabolism of carbohydrates in the animal body, and, together with Sir Frederick Grant Banting, with whom he shared the Nobel prize for medicine in 1923, and C. H. Best, he achieved fame as one of the discoverers of insulin. Macleod's publications include *Practical Physiology* (1903); *Recent Advances in Physiology*, edited by Leonard Hill (1905); *Diabetes, Its Physiological Pathology* (1913); *Fundamentals of Physiology* (1916); *Physiology in ;Modern Medicine* (9th ed., 1941); and numerous papers on insulin, etc.

MACLEOD, NORMAN (1812–1872), Scottish divine, son of Rev. Norman Macleod (1783–1862), and grandson of Rev. Norman Macleod, minister of Morven, Argyllshire, was born at Campbeltown on June 3, 1812. In 1827 he became a student at Glasgow university, and in 1831 went to Edinburgh to study divinity under Dr. Thomas Chalmers. On March 18, 1838, he became parish minister at Loudoun, Ayrshire. At this time the troubles in the Scottish church were already gathering to a head. (*See* FREE CHURCH OF SCOTLAND.) Macleod took a middle course in the nonintrusion controversy, holding that the fitness of those who were presented to parishes should be judged by the presbyteries—the principle of Lord Aberdeen's bill. On the secession of 1843 he became pastor of Dalkeith. He was one of the founders of the Evangelical alliance, and from 1849 edited the *Christian Instructor* (Edinburgh). In 1851 he was called to the Barony church, Glasgow, where he remained until his death (June 16, 1872). Macleod instituted temperance refreshment rooms, a congregational penny savings bank, and held services specially for the poor. In 1860 he was appointed editor of the new monthly magazine *Good Words*, to which he was a large contributor. By far his best work was the spontaneous and delightful *Reminiscences of a Highland Parish* (1867). Macleod was moderator of the church assembly in 1869. In recognition of his wide sympathy and high ideals, Queen Victoria gave two memorial windows to Crathie church.

See *Memoir* of *Norman Macleod*, by his brother, Donald Macleod (1876).

MACLISE, DANIEL (1806–1870), Irish history painter, was born at Cork on Jan. 25, 1806. At the age of 16 he left the employ of a local bank to enter the Cork school of art, maintaining himself by portrait sketching. In 1825 he made sketches of Sir Walter Scott, one of which was lithographed. He went to London in 1827 and entered the Royal academy schools, where he carried off the highest honours. He exhibited subject pictures and portraits regularly at the Royal academy and in 1835 was elected associate and in 1840, academician. Maclise's fame rests on the 72 lithographed portraits of literary and other contemporary celebrities which first appeared in *Fraser's Magazine* (1830–36) under the pseudonym Alfred Croquis (later published as the *Maclise Portrait Gallery*, 1871) and the two vast (12 ft. by 45 ft.) frescoes for the Royal gallery in the house of lords. "The Meeting of Wellington and Blucher" was unsuccessfully begun in fresco in 1859 and completed in a new German "water glass" technique in 1861. Its companion "The Death of Nelson" was executed between 1861–64. Maclise's harsh colour is largely offset by his unusually retentive visual memory and gift for large-scale composition. Maclise died April 25, 1870, in London. (D. L. FR.)

MACLURE, WILLIAM (1763–1840), U.S. geologist, was born at Ayr, Scotland, Oct. 27, 1763. Maclure became known as the father of American geology, because of his publication of a geological map of the United States in 1809 which, with the exception of Guettard's mineralogical *Map of Louisiana and Canada*, was the earliest attempt at a geological map of the United States, and antedates William Smith's geological map of England by six years. The map, together with a memoir entitled *Observations on the Geology of the United States Explanatory of a Geological Map*, was the result of his voluntary and unaided labours.

Maclure was a liberal patron of science for many years and from 1817 until his death was president of the Philadelphia Academy of Natural Sciences, to which he gave his valuable private library and about $20,000. He died at San Angel, Mexico, March 23, 1840.

MacMAHON, MARIE EDMÉ PATRICE MAURICE DE, duke of Magenta (1808–1893), French marshal and president of the French republic. was born on July 13, 1808, at the château of Sully, near Autun. He was descended from an Irish family which went into exile with James II. Educated at the military school of St. Cyr, in 1827 he entered the army, and served in the first French campaign in Algeria. He gained distinction in the expedition to Antwerp in 1832. In 1833 he returned to Algeria. He led daring cavalry raids across plains infested with Bedouins, and distinguished himself at the siege of Constantine in 1837. He was almost constantly in Algeria until 1854. MacMahon commanded a division in the Crimean War, and in September 1855 he conducted the assault upon the Malakoff works, which led to the fall of Sevastopol. Declining the highest command in France, he was once more sent out, at his own request, to Algeria, where he completely defeated the Kabyles. After his return to France he voted as a senator against the unconstitutional law for general safety, brought forward in consequence of Orsini's abortive attempt on the emperor's life. MacMahon distinguished himself in the Italian campaign of 1859. Partly by good luck and partly by pushing forward without orders at a critical moment at the battle of Magenta, he secured victory. For this MacMahon received his marshal's baton and was created duke of Magenta. In 1861 he represented France at the coronation of William I of Prussia, and in 1864 he was nominated governor-general of Algeria. MacMahon's administration was unsuccessful and when the ill-fated Ollivier cabinet was formed, the emperor abandoned his Algerian schemes and MacMahon was recalled.

In 1870 MacMahon was appointed to the command of the Alsace army detachment (*see* FRANCO-GERMAN WAR). On Aug. 6, MacMahon fought the battle of Wörth (*q.v.*). He was compelled to fall back upon Saverne, and thence to Toul. The emperor then gave him supreme command of the new levies which he was mustering at Châlons, and he was directed to effect a junction with Bazaine. This operation he undertook against his will. He had an army of 120,000 men, with 324 guns; but large numbers of the troops were disorganized and demoralized. Early on Sept. 1, the decisive battle of Sedan began. MacMahon was dangerously wounded in the thigh, whereupon General Ducrot. and soon afterward General de Wimpffen, took command. MacMahon shared the captivity of his comrades, and was interned at Wiesbaden.

In March 1871 MacMahon was appointed by Thiers commander in chief of the army of Versailles; in that capacity he suppressed the Communist insurrection. and successfully conducted the second siege of Paris. On the resignation of Thiers on May 24. 1873. MacMahon was elected president of the republic by an almost unanimous vote. On Nov. 5, 1873.General Changarnier presented a motion in the assembly to confirm MacMahon's powers for a period of ten years, and to provide for a commission of thirty to draw up a form of constitutional law. The president consented, but in a message to the assembly he declared in favour of a confirmation of his own powers for seven years. and expressed his determination to use all his influence in the maintenance of Conservative principles. After prolonged debates the Septennate was adopted on Nov. 19 by 378 votes to 310. There was no *coup d'e'tat* in favour of "Henri V," as had been expected, and the president resolved to abide by "existing institutions." One of his earliest acts was to receive the finding of the court-martial upon his old comrade in arms, Marshal Bazaine, whose death sentence he commuted to one of twenty years' imprisonment in a fortress.

The president was popular in the rural districts of France, but in Paris and other large cities the Republican party was alienated by press prosecutions and the attempted suppression of Republican ideas. Matters were at a comparative deadlock in the national assembly, until the accession of some Orleanists to the Moderate Republican party in 1875 made it possible to pass various constitutional laws. In May 1877 the constitutional crisis became acute. A peremptory letter of censure from MacMahon to Jules Simon caused the resignation of the ministry. The duc de Broglie formed a cabinet. but Gambetta carried a resolution in the chamber of deputies in favour of parliamentary government. The president declined to yield, and being supported by the senate, he dissolved the chamber, by decree, on June 2;. The prosecution of Gambetta followed for a speech at Lille, in which he had said, "the marshal must, if the elections be against him, *se soumettre* ou *se démettre*." In a manifesto respecting the elections, the president declared: "I cannot obey the injunctions of the demagogy; I can neither become the instrument of Radicalism nor abandon the post in which the constitution has placed me."

But the elections in October resulted in the return of 335 Republicans and only 198 anti-Republicans, the latter including 30 MacMahonists, 89 Bonapartists. 41 Legitimists: and 38 Orleanists. As a last resort the president called to power an extraparliamentary cabinet under General Rochebouet, but the Republican majority refused to vote supplies, and after a brief interval MacMahon had to accept a new Republican ministry under Dufaure. The prolonged crisis terminated on Dec. 14,1877,and no further constitutional difficulties arose in 1878. But as the senatorial elections, held early in 1879,gave the Republicans an effective working majority in the upper chamber. they now called for the removal of the most conspicuous anti-Republicans among the generals and officials. MacMahon resigned the presidency on Jan. 30, 1879, and Jules Grévy was elected as his successor. MacMahon retired to private life. He died at Paris on Oct. 17, 1893.

A fine. tall, soldierly man, of a thoroughly Irish type, in private life MacMahon was universally esteemed as generous and honourable; as a soldier he was brave and able, without decided military genius; as a politician he was patriotic and well-intentioned, but with no real statecraft.

See Grandin, *Le Maréchal MacMahon*, 2 vol. *(1893)*; G. Hanotaux, *La France contemporaine*, vol. 2 (1905).

MacMANUS, TERENCE BELLEW (1823–1860), Irish rebel, was born at Tempo, Fermanagh. He joined the '82 Club in 1844.took part in the W. S. O'Brien outbreak in 1848,and was arrested in Cork and sentenced to death. The sentence was transmuted to transportation to Tasmania. MacManus escaped to America. He died in San Francisco in 1860. His body was taken back to Ireland and interred at Glasnevin,

McMASTER, JOHN BACH (1852–1932), U.S. educator and historian. who was a pioneer in the use of social rather than purely political materials, was born in Brooklyn, N.Y., on June 29, 1852. After he graduated from the College of the City of New York in 1872, McMaster worked as civil engineer and was an instructor in civil engineering at Princeton university, 1877–83. From 1883 until 1920he was professor of American history in the Cniversity of Pennsylvania.

His earliest writings were on engineering subjects, but he is best known for his *History of the People of the Lnited States, from the Revolution to the Civil War* (1883–1913). It was supplemented by *A History of the People of the United States During Lincoln's Administration* (1927). Among McMaster's other books are *With the Fathers*(1896) ; *A Brief History of the United States* (1907, rev. enl. ed., 1918 and 1924); and *The Life and Times of Stephen Girard, Mariner and Merchant* (1918). His textbooks were used in many U.S. elementary and secondary schools. He died in Darien, Conn., on May 24, 1932.

See E. F. Goldman, *John Bach McMaster* (1943).

MACMILLAN, the name of a family of English publishers. The founders of the firm were two Scotsmen, Daniel Macmillan (1813-j7) and his younger brother Alexander (1818–96). Daniel was born on the Isle of Arran on Sept. 13, 1813,and Alexander was born in Irvine on Oct. 3,1818. Daniel was for some time assistant to the bookseller Johnson at Cambridge, but entered the employ of Messrs. Seeley in London in 1837. In 1843 the brothers began business in Aldersgate street and in the same year they purchased the business of Newby in Cambridge. They began to publish educational works in 1844. In 1845 they took over the more important business of Stevenson in Cambridge. Daniel Macmillan died at Cambridge on June 27,1857. The firm had begun to prosper and in 18j8 a branch office was opened in London. Alexander Macmillan died in Jan. 1896. In little over half a century he had built up one of the most important publishing houses in the world which, in time, had its branches in the United States, Canada, Australia and India. Macmillan published the works of Tennyson, Charles Kingsley, T. H. Huxley, Lewis Carroll, Rudyard Kipling and many other great Victorian authors.

Frederick Orridge Macmillan(18 51–1936), the son of Daniel, became a partner in 1876 and first chairman in 1893,when the firm became a limited liability company. In 1898 the company purchased the business of R. Bentley and Son. Frederick's partners were his younger brother Maurice and his cousin George, both of whom died in 1936;they were succeeded by Maurice's sons Daniel (1886-), the chairman, and Maurice Harold (1894- ; *q.v.*), whose son Maurice Victor (1921-) is a director.

Bibliography.—T. Hughes, *Memoir of Daniel Macnzillan (1882)*; *A Bibliographical Catalogue of Macmillan & Co's Publications From 1843 to 1889 (1891)*; *C. L.* Graves, *Life and Letters of Alexander Macmillan* (1910); *C. L.* Morgan, *The House of Macmillan (1843–1943)* (1943).

McMILLAN, EDWIN MATTISON (1907-), **U.S.** physicist, recipient of the 1951 Nobel prize in chemistry, with Glenn T. Seaborg, for work on the chemistry of the transuranium elements, and co-discoverer of neptunium and plutonium, was born at Redondo Beach, Calif., on Sept. 18, 1907. He was educated at the California Institute of Technology (B.S., 1928; M.S., 1929) and Princeton university (Ph.D., 1932). He went to the University of California at Berkeley in 1932 and after a period as research fellow (1932–34) and associate (1934–35) he joined the faculty, advancing to a full professorship in 1946. From 1934 he was a member of the staff of the radiation laboratory, of which he became associate director in 1954. During World War II he was engaged in research on radar and sonar (asdic) and helped establish the Los Alamos, N.M., atomic energy laboratory, where he assisted in developing the first atomic bomb. In the spring of 1940 he discovered, with Philip H. Abelson. the first transuranium element, neptunium (atomic no. 93). thus opening the whole transuranium field. Later in 1940 he initiated the search for, and was a co-discoverer of, the next transuranium element, plutonium (atomic no. 94), with Seaborg and others. He developed the theory of the synchrotron independently of and nearly simultaneously with the U.S.S.R. physicist Vladimir I. Veksler; this theory *(Physical Review*, Sept. 1945) made possible the construction of huge machines for the acceleration of electrons and atomic projectiles to very high energies, opening the field of high energy physics and convenient study of the various fundamental particles. (G. T. Sg.; X.)

MACMILLAN, (MAURICE) HAROLD (1894–), British statesman, who was appointed prime minister on Jan. 10, 1957, and was elected leader of the Conservative party 12 days later, was born in London on Feb. 10, 1894. He came of a Scottish crofter family which early in the 19th century mas driven by poverty to find a living in England. His grandfather founded the famous London publishing house, of which Macmillan became an active director in 1924. His mother came from Spencer, Ind., (U.S.), and later acquired a peculiar love and knowledge of France. Macmillan, who was educated at Eton and st Balliol college, Oxford, served with the grenadier guards in World War I, was wounded three times and won the Military cross. In 1919 he became A.D.C. to the governor-general of Canada, the ninth duke of Devonshire, and in 1920 married one of the duke's daughters, Lady Dorothy Evelyn Cavendish.

Macmillan's political career divides itself broadly into two periods—one of party unorthodoxy (1924–40), and the other of orthodoxy which began after Sir Winston Churchill's appointment as prime minister in 1940. Macmillan sat in parliament for Stockton-on-Tees from 1924–29 and from 1931–4j, and, after defeat in the general election, was elected for Bromley, Kent, in a by-election in Nov. 1945. In his unorthodox phase he advocated a greater degree of economic control, to limit unemployment, than the bulk of his party thought desirable; he expressed his ideas in *Reconstruction: A Plea for a National Policy* (1933) and *The Middle Way* (1938). In prewar foreign affairs he was a bitter critic of Neville Chamberlain's appeasement policy. When &h-ston Churchill formed his coalition government in 1940, Macmillan was given office for the first time as parliamentary secretary to the ministry of supply. In 1942 he was made a privy councilor and after several months at the colonial office became minister resident in north Africa. A pioneer of the United Europe movement, he attended the 1948 congress out of which grew the Council of Europe. As minister of housing and local government, 1951–54, he was responsible for achieving a target of over 300,000 houses a year. He was minister of defense, 1954–55, and foreign secretary, 1955–56, and as chancellor of the exchequer, 1956–57, he introduced a premium bonds savings scheme, with periodical lottery prizes. In March 1957, soon after becoming prime minister as a result of Sir Anthony Eden's resignation, Macmillan conferred with Pres. Dwight D. Eisenhower in Bermuda on the middle east, Suez canal problems and the proposed reduction of British troops in Germany. In 1958 he toured the commonwealth and visited Washington, D.C., Ottawa and Paris. A firm advocate of holding a "summit" conference, he had exploratory talks with Kikita S. Khrushchev and other Soviet leaders in the U.S.S.R. in Feb. 1959 and visited western leaders in Paris, Bonn, Ottawa and Washington, D.C., in March. Macmillan announced a general election for Oct. 8, 1959. After a vigorous campaign the Conservative party was returned to power with a majority of 100 in the house of commons. In May 1960 Macmillan tried unsuccessfully to save the "summit" conference in Paris.

(J. F. B.; X.)

MacMONNIES, FREDERICK WILLIAM (1863–1937), U.S. sculptor and painter, whose long residence in France accounts for the strong French influence seen in all his work, was born in Brooklyn, N.Y., Sept. 20, 1863. In 1880 he was employed as a studio assistant by Augustus St. Gaudens. In 1884 he went to Paris to study sculpture with Jean Alexandre Falguière and Marius Jean Mercie. He returned to New York in 1887 and went again to Paris in 1889, where he remained until World War I. In 1891 he was awarded a medal of .the second class at the salon—an honour never before conferred on an American sculptor. His fame was established in the U.S. by his Columbian fountain, at the 1893 World's Columbian exposition in Chicago. Among the best known of his works are "Nathan Hale," in City Hall park, New York city, his "Bacchante," in the Metropolitan Museum of Art, New York city, the battle monument, at Princeton, N.J., and his decoration for the soldiers' and sailors' memorial arch at Grand Army plaza. Brooklyn, N.Y. He was also well known as a portrait painter. He died Mar. 27, 1937.

See Lorado Taft, *History of American Sculpture* (1924). (A. T. G.)

MACNAGHTEN, EDWARD MACNAGHTEN, 1ST BARON, (1830–1913), was the first law lord appointed to the British house of lords directly from the bar without previous judicial experience. Born in Bloomsbury on Feb. 3, 1830, he was educated at Dublin and Cambridge universities. He was called to the bar at Lincoln's Inn in 1857. Appointed a lord of appeal in ordinary in 1887 on the retirement of Lord Blackburn after only seven years practice as a queen's counsel, Baron Macnaghten was a distinguished practitioner in chancery; but his chief distinction as a judge was his literary gift of short summaries of the factual case before him and of simple restatement and classification of the legal rules applied. McNaghten's rule, or the right and wrong test for insanity as a defense in a criminal trial (*see* INSANITY), is not to be associated with his name but with that of a 19th-century criminal in whose case the rule was formulated. The best-known legal rule to which Baron Macnaghten's name is attached is his classification of charitable gifts into four divisions: "trusts for the relief of poverty; trusts for the advancement of education; trusts for the advancement of religion; and trusts for other purposes beneficial to the community." He died in London on Feb. 17, 1913. (A. DM.)

MACNAGHTEN, SIR WILLIAM HAY, BART. (1793–1841), British diplomat, was the second son of Sir Francis Macnaghten, Bart., judge of the supreme courts of Madras and Calcutta. He went out to Madras in 1809 and was transferred to the Bengal civil service in 1816. He was made secretary to Lord William Bentinck in 1830. In 1837 he was the trusted adviser of the governor-general, Lord Auckland, with whose policy of supporting Shah Shuja against Dost Mohammed, the reigning amir ot Kabul, he was closely identified. As political agent at Kabul he came into conflict with the military authorities and subsequently with his subordinate Sir Alexander Burnes. Macnaghten attempted to placate the Afghan chiefs with heavy subsidies; but when the drain on the Indian exchequer became too great and the allowances were reduced, this policy led to an outbreak. Burnes was murdered on Nov. 2, 1841; and because of the incapacity of the aged Gen. Sir Samuel Elphinstone, the British army in Kabul degenerated into a leaderless mob. Macnaghten tried to save the situation by negotiating with Dost Mohammed's son, Akbar Khan, by whom he was assassinated on Dec. 23, 1841.

McNAIR, LESLEY JAMES (1883–1944), U.S. army officer, who directed the training of ground combat troops during the mobilization for World War II, was born in Verndale, Minn., on May 25, 1883, and graduated from the U.S. Military academy in 1904. McNair served with Gen. Frederick Funston's expedition to Vera Cruz in 1914 and with Gen. John J. Pershing's punitive expedition into Mexico in 1916. In France during World War I, he was with the 1st division and the army of occupation in Germany.

Appointed chief of staff, general headquarters, U.S. army, in 1940 (title changed to commanding general, army ground forces, when the war department was reorganized in 1942), McNair prepared the army for combat by a rigorous training program that included the use of films, obstacle courses, live ammunition and large-scale maneuvers. He sought to perfect the military skills of the individual soldier, promote the proficiency of field force units and develop teamwork among the combined arms. By stressing standardization of military doctrine and organization throughout the army, he provided for the interchangeability of individuals and units, thereby making possible their rapid and effective utilization in the diverse theatres of operation.

Assigned to the European theatre in the summer of 1944, McNair visited the Normandy front to observe the battle and was killed near St. Lô on July 25, when bombs dropped by Allied planes fell short and landed on U.S. positions. (MN. BN.)

McNARNEY, JOSEPH TAGGART (1893–), U.S. army officer, one of the foremost military administrators of World

War II, was born at Emporium, Pa., on Aug. 28, 1893. After graduation from the U.S. Military academy at West Point in 1915, he follo ed a career in the air corps, which included service in France in World War I and school and staff experience in the 1920s and 1930s. McNarney was the chief architect of the important war department reorganization of March 1942, which established a simplified and effective structure. He was chosen immediately thereafter to be deputy chief of staff of the U.S. army, and his services in this position proved so valuable that he was not released for overseas duty until Oct. 1944, when he became commander of all U.S. forces in the Mediterranean. In Dec. 1945 he succeeded Gen. Dwight D. Eisenhower as commander of U.S. occupation forces in Germany, serving until early 1947 in that important and difficult position. McNarney retired in 1952 to enter private business. (A. GG.)

McNAUGHTON, ANDREW GEORGE LATTA (1887–), Canadian army officer, commander of the Canadian army in Great Britain during World War II, was born on Feb. 2 j, 1887, at Moosomin, Sask. While at McGill university he studied engineering and military subjects. Commissioned as a lieutenant in the Canadian artillery in 1910, he went overseas as a major in 1914, served both in France and Belgium and was twice wounded. He ended World War I as a brigadier general. In 1920 he was appointed director of military training. Three years later he became deputy chief of the Canadian general staff and in 1929 was made chief. as a major general. He held this high post until he became president of the National Research council of Canada in 1935. Keenly interested in scientific developments, particularly in aviation, he was himself joint inventor of the cathode ray direction finder.

When World War II broke out in 1939, McNaughton was recalled to the army and commanded the 1st Canadian division, which went overseas at the end of the year, and then in 1940, with the rank of lieutenant general, the 7th Canadian corps; and from April 1942 the 1st Canadian army overseas. Because of indifferent health he returned to Canada in 1944 and on Sept. 27, the date of his retirement from the army, was promoted full general. From Nov. 1944 to Aug. 1945 he was minister of national defense. From Jan. 1949 to June 1950 he acted as Canadian representative on the United Nations Security council.

(E. B. BN.)

McNEILE, HUGH (1795–1879), Anglican divine, was born at Ballycastle, Co. Antrim, on July 15, 1795, and graduated at Trinity college, Dublin, in 1810. He came under the influence of Edward Irving but was soon alienated by the latter's increasing extravagance. In 1834 he became incumbent of St. Jude's. Liverpool, where for 30 years he had great political as well as ecclesiastical influence, maintaining that "God, when he made the minister did not unmake the citizen." In 1835 McNeile entered on a long contest with the Liverpool corporation, which proposed to secularize its elementary schools by the introduction of the Irish national system. McNeile led a fierce agitation against the threatened withdrawal of the Bible as the basis of denominational religious teaching; before the new system could be introduced every child was provided for in new Church of England schools established by public subscriptions. McNeile was a zealous opponent of the Tractarian movement and a conspicuous leader of the evangelical party. In 1840 he published *Lectures on the Church oj England* and in 1846 (the year after John Henry Newman's secession to Rome) *The Church and the Churches,* maintaining the evangelical doctrine of the "invisible Church" in opposition to the teaching of Newman and Edward Pusey. In 1860 he was appointed a canon of Chester and in 1868 dean of Ripon.

MacNEILL, JOHN GORDON SWIFT (1849–1926), Irish historian and an authority on parliamentary procedure, was born in Dublin on March 11, 1849, and educated at Trinity college, Dublin, and Christ Church, Oxford. In 1875 he was called to the Irish bar. He became professor of constitutional and criminal law at King's Inn. Dublin. and from 1909 was professor in the h'ational University of Ireland. In 1887 he entered politics as the Nationalist representative of south Donegal, until the party was defeated by Sinn Fein in 1918. He was an accepted authority on parliamentary procedure and history. His books include *The Irish Parliament; What It Was and What It Did* (1885); *English Interference with Irish Industries* (1886); *How the Union Was Carried* (1887); *Titled Corruption* (1894); *Constitutional and Parliamentary History of Ireland* (1917); *Studies in the Constitution of the Irish Free State* (1925). In 1925 he published reminiscences and quotes a remark of Lord Fisher which is indicative of his political career: "Mr. MacNeill you are a damned good fighter! I wish to God I had you with me in the Navy!" MacNeill died in Dublin on Aug. 24, 1926.

MACOMER, a village of Sardinia, Italy, province of Nuoro, 95 mi. N.N.W. of Cagliari by rail. Population (1951) was 6,446. It is 1,890 ft. above sea level on the southern ascent to the central plateau (Campeda); and it is the junction of narrow-gauge lines branching from the main line eastward to Nuoro and westward to Bosa. The old parish church of S. Pantaleone has three Roman milestones in front of it, belonging to the Roman highroad from Carales to Turris Libisonis. The *nuraghe* of S. Barbara is fine. The Allies bombed Macomer in World War II.

MACON, NATHANIEL (1758–1837), U.S. political leader, was born at Macon Manor, N.C., Dec. 17, 1758. He studied at the College of New Jersey (now Princeton university) from 1774 to 1776, when the institution was closed because of the outbreak of the Revolutionary War. In 1777–80 he studied law at Bute county courthouse, N.C., and in 1781–85 served in the North Carolina senate. In 1791–1815 he was a member of the national house of representatives, and in 1815–28 of the United States senate. Macon's point of view was always local rather than national. He was essentially a North Carolinian first, and an American afterward; and throughout his career he was an aggressive advocate of state sovereignty and an adherent of the doctrines of the "Old Republicans." In congress he denounced Alexander Hamilton's financial policy, opposed the Jay treaty (1795) and the Alien and Sedition acts, and advocated a continuance of the French alliance of 1778. His party came into power in 1801, and he was speaker of the house in 1801–07. At first he was in accord with Thomas Jefferson's administration; he approved the Louisiana Purchase. and as early as 1803 advocated the purchase of Florida. For a number of years, however, he was politically allied with John Randolph in a group of about ten independents, called the "Quids." who strongly criticized Jefferson and opposed the presidential candidature of James Madison. By 1809, however, Macon was again in accord with his party, and during the next two years he was one of the most influential of its leaders. In Dec. 1809 he introduced resolutions recommending the complete exclusion of foreign war vessels from United States ports and the suppression of illegal trade carried on by foreign merchants under the U.S. flag. The substance of these resolutions was embodied in a bill which became law on May 1, 1810. This measure provided for the repeal of the Non-Intercourse act of 1809, authorized the president, "in case either Great Britain or France shall before the 3rd day of March next so revoke or modify her edicts as that they shall cease to violate the neutral commerce of the United States," to revive nonintercourse against the other and prohibited British and French vessels of war from entering U.S. waters. In 1812 Macon voted for the declaration of war against Great Britain. He opposed the Bank act of 1816, the "internal improvements" policy of John C. Calhoun (in the early part of his career) and Henry Clay and the Missouri Compromise. In 1824 Macon received the electoral vote of Virginia for the vice-presidency, and in 1826–28 was president pro tempore of the senate. He died at Buck Springs, N.C., on June 29, 1837.

See William E. Dodd, *The Life* of *Nathaniel Macon* (1903); E. M. Wilson, *The Congressional Career of Nathaniel Macon* (1900).

MÂCON, a town of east central France, capital of the *département* of Saône-et-Loire, 45 mi. N. of Lyons on the Paris-Lyon railway. Pop. (1954) 20.226. Mâcon *(Matisco)* was an important town of the Aedui, but under the Romans it was supplanted by Autun and Lyons. It suffered at the hands of the Germans, Burgundians, Vandals, Huns, Hungarians and even of the Carolingian kings.

In the feudal period it was an important countship sold in 1228 to the king of France, but at times in the possession of the dukes of Burgundy until the ownership of the French crown was established in the time of Louis XI.

In the 16th century Mâcon became a stronghold of the Huguenots, but afterward fell to the league, and only yielded to Henry IV in 1594. The bishopric, created by King Childebert, was suppressed in 1790.

Mâcon is situated on the Saône facing the plain of the Bresse; a bridge of 12 arches connects it with the suburb of St. Laurent on the opposite bank. The modern Romanesque church of St. Pierre is a large three-naved basilica. Of the old cathedral of St. Vincent (12th and 13th centuries), destroyed at the Revolution, nothing remains but the Romanesque narthex, now used as a chapel, the façade and its two flanking towers. The hôtel de ville contains a library, a theatre and picture gallery. Mâcon is the seat of a prefecture, and has tribunals of first instance and of commerce, and a chamber of commerce.

Copper-founding is an important industry, also printing; manufactures include casks, mats, esparto articles, powders, rope and utensils for the wine trade.

The town has a large trade in wine produced in the district, known as Mâcon. The railways from Paris to Marseilles and from Mont Cenis to Geneva, with a branch from Moulins are joined there.

MACON, a city of central Georgia, U.S., and the seat of Bibb county, is located about 75 mi. S.E. of Atlanta, on the Ocmulgee river, on the fall line. North Carolinians were the first settlers to build their homes on the east side of the river at Ft. Hawkins, a frontier trading post. The original settlement was called Newtown (1821), but after the Creek Indians ceded land west of the river, a site along its bank was platted in 1823 and named for Nathaniel Macon (*q.v.*). Newtown was annexed in 1829, and the city was chartered in 1832.

In the 1840s Macon became a market centre for cotton which was shipped downstream to Darien, and by the 1860s, with the coming of the railroads, its position as a trade and transportation centre had become established. During the American Civil War, Macon was a Confederate gold depository, and its factories produced munitions and supplies until Gen. Howell Cobb surrendered to the Union cavalry commander, Gen. James H. Wilson, on April 20, 1865.

Macon slowly rebuilt its economy during the Reconstruction period, and railroad shops, foundries, brickworks and textile mills were developed. The turn of the century saw civic improvements, which included the construction of a levee as a protection against river floods, and an extension of city limits. Economic stimulus was given during World War I with increased industrial employment and the influx of thousands of soldiers to camps Harris and Wheeler. The United States naval ordnance olant and Warner Robins air matériel area (now Robins air force base) became permanent installations after World War II.

In the 1960s the inhabitants in the metropolitan area were principally engaged in processing and distributing agricultural products from the surrounding fertile farm lands. which include cotton, grain. pulpwood, peaches. peanuts and pecans.

There are also industries based on nearby mineral resources, such as kaolin, granite, clays, limestone and lime. Scores of newer industries established in the area in the late 1940s and 1950s, include the manufacture of car accessories, candy, aircraft parts, drugs, clothing and chemicals.

The original settlers laid out exceptionally wide streets, nhich contain floral parkways. Macon's public parks are noted for their azaleas, camellias and glossy-leaved magnolias. The cultural atmosphere is enhanced by: Wesleyan college, a pioneer in higher education for women, established by the hlethodists in 1536; Mercer university, founded by the Baptists at Penfield in 1833 and moved to Macon in 1871; and Georgia Academy for the Blind (1851). Amid the splendour of ante-bellum Greek Revival houses with their majestic white columns adding old south charm to the city, there is a modest cottage on High street, the birthplace of Sidney Lanier (*q.v.*), Georgia's most renowned poet. These homes plus Indian mounds and relics. notably the Lamar mounds and village site, at Ocmulgee National monument are major tourist attractions.

The population of Macon city was 69,764 in 1960; the standard metropolitan statistical area comprising Bibb and Houston counties had a population of 180,403. (S. B. K.)

McPHERSON, AIMEE SEMPLE (1890–1944), U.S. evangelist and founder of the International Church of the Foursquare Gospel, was born near Ingersoll, Ont., Oct. 9. 1890. Her public career began as a missionary in China with her first husband, Robert Semple, a Pentecostal evangelist. She returned to the United States with her daughter after her husband's death, and a second marriage to Harold McPherson was ended by her turning to full-time itinerant evangelism and healing. In this she became an outstanding success, settling finally in Los Angeles, Calif., nhere for almost 20 years she preached to large congregations. Besides organizing (1926) and administering the International Church of the Foursquare Gospel. Mrs. McPherson built a radio station, founded and headed a Bible school, edited a magazine, wrote books and phamphlets and carried on extensive social service work. An attractive woman, she used her charms to the full. Her dynamic personality, prodigious energy and bizarre methods won for her countless friends and a number of enemies. Theologically she was fundamentalist and in her emphasis Pentecostal. The loyalty of her followers — in the face of her third marriage, which ended in a divorce, and various grave charges (unproved) against her — was constant.

Mrs. McPherson died on Sept. 27, 1944, from an overdose of sleeping ponders. Her son Rolf McPherson succeeded her, and the movement continued to grow, reporting in the late 1950s more than 700 churches.

Mrs. McPherson's published works include *This Is That* (1923); *In the Service of the King* (1927); and *Give Me My Own God* (1936). *The Story of My Life* was edited and published in her memory in 1951.

See Nancy B. Mavity, *Sister Aimee* (1931). (C. S. B.)

MACPHERSON, SIR DAVID LEWIS (1818–1896), Canadian financier and politician, mas born at Castle Leathers, near Inverness, Scot, on Sept. 12, 1818. In 1835 he emigrated to Canada, settling in Montreal, Que., where he built up a large fortune by "forwarding" merchandise. In 1853 he moved to Toronto, Ont., and obtained the contract for building a line of railway from Toronto to Sarnia, Ont., a project from which sprang the Grand Trunk railway. In 1864 he was elected to the Canadian parliament as member of the legislative council for Saugeen, Ont , and on the formation of the dominion, in 1867, was nominated to the senate. He published a number of pamphlets on economic subjects, of which the best-known is *Banking and Currency* (1869). In 1880 he was appointed speaker of the senate, and from Oct. 1883 till 1885 was minister of the interior in the Conservative cabinet.

In 1884 Macpherson mas knighted. He died on Aug. 6, 1896.

MACPHERSON, JAMES (1736–1796), Scottish "translator" of the Ossianic poems, was born at Ruthven. Inverness, on Oct. 27, 1736. He studied at King's college, Aberdeen (1753), at Marischal college and in Edinburgh. He is said to have written more than 4,000 lines of verse while a student, but though some of this was published, notably *The Highlander* (1758), he afterward tried to suppress it. On leaving college he taught in the school of his native place. At Moffat he met John Home, the author of *Douglas,* who encouraged him to publish translations from the Gaelic, as *Fragments* of *Ancient Poetry coliected in the Highlands of Scotland* (Edinburgh, 1760). Hugh Blair, who was a firm believer in the authenticity of the poems, got up a subscription to allow Macpherson to pursue his Gaelic researches. In the autumn he set out to visit western Inverness, the islands of Skye, North and South Uist and Benbecula. He obtained mss. which he translated with the assistance of Captain Morrison and the Rev. 4. Gallie. Later in the year he made an expedition to Mull. when he obtained other mss. In 1761 he announced the discovery of an epic on the subject of Fingal, and the next year published *Fingal, an Ancient Epic Poem in Six Books, together with Several Other* Poems *composed by Ossian, the Son of Fingal, translated from the Gaelic Language,* written in the musical measured prose of which he had made use in his earlier volume. *Temora* followed in 1763, and a collected edition, *The Works of Ossian,* in 1765.

The genuineness of these so-called translations from the works of a 3rd-century bard was immediately challenged in England, and Samuel Johnson, after some local investigation, asserted (*Journey to the Western Islands of Scotland,* 1775) that Macpherson had only found fragments of ancient poems and stories, which he had woven into a romance of his own composition. Macpherson never produced his originals, which he refused to publish on the ground of the expense. In 1764 he was made secretary to General Johnstone at Pensacola, West Florida, and when he returned, two years later, to England, after a quarrel with Johnstone, he was allowed to retain his salary as a pension. He wrote several historical works, the most important. of which was *Original Papers, containing the Secret History of Great Britain from the Restoration to the Accession of the House of Hanover; to which are prefixed Extracts from the Life of James II., as written by himself* (1775). He enjoyed a salary for defending Lord North's government, and held the lucrative post of London agent to Mohammed Ali, nabob of Arcot. He entered parliament in 1780, and at his estate, Belville, Inverness, he died, Feb. 17, 1796.

After Macpherson's death, Malcolm Laing, in an appendix to his *History of Scotland* (1800), propounded the view that the so-called Ossianic poems were altogether modern in origin, and that Macpherson's authorities were practically non-existent. For a discussion of this question *see* SCOTTISH LITERATURE : *In Gaelic.* Apart from the doubtful morality of Macpherson's transactions he was a great writer. He did not transcribe actual Celtic poems, but he appreciated natural beauty and his art, with its tenderness, did more than any single work to bring about the romantic movement in European, and especially in German, literature. It was translated into many European languages, and Herder and Goethe (in his earlier period) were among its admirers. Cesarotti's Italian translation was one of Napoleon's favourite books.

BIBLIOGRAPHY.—For Macpherson's life, see *The Life and Letters of James Macpherson . . .* (1894, new ed., 1906), by T. Bailey Saunders who has laboured to redeem his character from the suspicions generally current with English readers. The antiquity of the Ossianic poems was defended in the introduction by Archibald Clerk to his edition of the *Poems of Ossian* (1870). Materials for arriving at a decision by comparison with undoubtedly genuine fragments of the Ossianic legend are available in *The Book of the Dean of Lismore,* Gaelic verses, collected by J. McGregor, dean of Lismore, in the early 16th century (ed. T. McLauchlan, 1862); the *Leablzar na Feinne* (1871) of F. J. Campbell, who also discusses the subject in *Popular Tales of the Western Highlands,* iv. (1893). *See* also L. C. Stern, "Die ossianische Heldenlieder" in *Zeitschrift fur vergleichende Litteratur-geschichte* (1895; Eng. trans. by J. L. Robertson in *Trans. Gael. Soc. of Inverness,* xxii., 1897–1898); Sir J. Sinclair, *A Dissertation on the Authenticity of the Poems of Ossian* (1806); *Transactions of the Ossianic Society* (Dublin, 1854–61); *Cours de littérature celtique,* by Arbois de Jubainville, editor of the *Revue celtique* (1883, etc.); A. Nutt, *Ossian and the Ossianic Literature* (1899), with *a* valuable bibliographical appendix; J. S. Smart, *James Macpherson: an Episode in Literature* (1905), *Fragments of Ancient Poetry* was reprinted *in* 1917.

McPHERSON, JAMES BIRDSEYE (1828–1864), American soldier, was born at Sandusky, O., on Nov. 14, 1828. He entered West Point at the age of 21, and graduated (1853) at the head of his class, which included Sheridan. Schofield and Hood. He was employed at the military academy as instructor of practical military engineering (1853). A year later he was sent to engineer duty at New York, and in 1857 he was sent as superintending engineer to San Francisco, becoming first lieutenant in 1858. He was promoted captain during the first year of the Civil War, and towards the close of 1861 became lieutenant-colonel and aide-de-camp to Gen. Halleck, who in the spring of 1862 sent him to Gen. Grant as chief engineer. He remained with Grant during the Shiloh campaign, and acted as engineer adviser to Halleck during the siege operations against Corinth in the summer of 1862. In October he distinguished himself in command of an infantry brigade at the battle of Corinth, and on the 8th of this month was made major-general of volunteers and commander of a division. In the second advance on Vicksburg (1863) McPherson commanded the XVII. corps, fought at Port Gibson, Raymond and Jackson, and after the fall of Vicksburg was strongly recommended by Grant for the rank of brigadier-general in the regular army, to which he was promoted on Aug. 1, 1863. He commanded at Vicksburg until the following spring. He was about to go on leave of absence when he received his nomination to the command of the Army of the Tennessee, Grant's and Sherman's old army, which was to take part under Sherman's supreme command in the campaign against Atlanta (1864). This nomination was made by Sherman and entirely approved by Grant. McPherson commanded his army at the actions of Resaca, Dallas, Kenesaw Mountain and the battles about Atlanta. On July 22, when the Confederates under his old classmate Hood made a sudden and violent attack on the lines held by the Army of the Tennessee, McPherson rode up, in the woods, to the enemy's firing line and was killed. Grant is reported to have said "The country has lost one of its best soldiers and I have lost my best friend."

MACQUARIE, an island group in the Pacific ocean in long. 158° 54′ E. and lat. 54° 37′ S, The largest island is 21 mi. by 3 mi. The group is at the convergence of two submarine ridges, from Tasmania and through Auckland and Stenart Island to New Zealand. It is a scientific base and nature reserve. Australia has maintained a weather station there since 1948. This succeeded the temporary station of the Mawson Antarctic expedition. 1911–13.

MACREADY, WILLIAM CHARLES (1793–1873), English actor. manager and diarist, the greatest figure of the 19th-century stage in the development of techniques of acting and production. was born in London on March 3, 1793, the son of a minor Irish actor. who shortly afterward undertook a career as manager of provincial acting companies. Macready was entered at Rugby to prepare for the bar. but his father's financial difficulties and his own highly developed sense of personal responsibility caused him to abandon his formal education and take up temporarily, he thought. the theatre, a profession to which he was to make an outstanding contribution but for which he always felt an intense dislike. On June 7, 1810. he made his debut as Romeo at Birmingham and rapidly acquired fame in other Shakespearean and romantic roles in the provincial theatres. On Sept. 16, 1816, he appeared at Covent Garden. London. as Orestes in *The Distressed Mother,* a dull and outmoded tragedy by Ambrose Philips. Theatrical rivalry forced upon him a series of romantic and melodramatic villains, which he performed with such earnestness and truth that he became firmly established. though they did nothing to increase his affection for the stage. On Oct. 25, 1819, he was permitted to appear as Richard III in a text that he partially purged of the "improvements" of Colley Cibber, the first of his many important efforts to restore the original work of Shakespeare to the theatre. In 1820 he created the leading role in *Virginius,* the first produced play by James Sheridan Knowles, and from that time was recognized as belonging in the front rank of English actors, contested for the first place only by Edmund Kean.

Throughout his acting career at Covent Garden and at Drury Lane. Macready devoted himself wholeheartedly to his art. His method of long study and detailed rehearsal. at a time when the general practice was casual, conventional and inspirational, anticipated much of the naturalistic method of acting developed by Constantin Stanislavsky. In 1837 he undertook the management of Covent Garden, where he was able to extend his theory of acting to all the elements involved in production. He was thus the first to impose upon the theatre of realistic illusion the principle of unity: that the actors, from star to spear carrier, the designer, the costumer and all others connected with a performance be guided and controlled by the central ideas and concepts oi the playwright. Macready gave impressive demonstrations of his theory in notable revivals of *As You Like It, Macbeth, King Lear, Henry V* and *The Tempest,* as well as Handel's *Acis and Galatea.* The historical research that went into these productions was to have a strong influence on English stagecraft; the principle of theatrical unity was adopted and developed by the German predecessors of the duke of Saxe-Meiningen and anticipated the *régisseur* of the 20th century.

In addition to reviving standard plays, Macready also made industrious efforts to improve the repertory of modern drama. He worked closely with such professional playwrights as Sheridan Knowles and Bulwer-Lytton and worked tirelessly to persuade the leading literary figures of the day to turn to playwriting. For him. Robert Browning created *Strafford* and Sir Thomas Talfourd, *Ion*, Charles Dickens, his intimate friend for many years. assisted him in the search for plays, supported him in his managerial efforts and endeavoured without success to write a stageworthy comedy. After 1825 Macready moved freely in the highest literary and artistic circles of London: and the pages of his voluminous diary (twice edited, 1875, 1912) are a happy hunting ground for literary and historical scholars.

Macready made several professional tours outside England. In 1828 he joined a group of English players in Paris. where his distinctive style, a combination of domestic sensibility and emotional power. was eagerly welcomed by the new romantic school. particularly by Victor Hugo and Alfred de Musset. He visited America three times) in 1826, 1843 and 1848. He was much impressed by the political and social achievements of democracy, particularly in the field of public education, and seriously entertained thoughts of settling in New England. However, during his last visit, he was made the scapegoat of the Nativist political movement; their attacks on him as a foreigner and an aristocrat culminated in a public riot outside the Astor Place "opera house" in New York, during which more than 20 persons were killed by the militia and from which he narro ly escaped with his life (*see* FORREST! EDWIN). He abandoned all thoughts of emigrating, returned to England for his farewell performances and retired from the stage in his favourite role of Macbeth on Feb. 26, 1851.

Freed of his distasteful profession, he settled in Sherborne, Dorset, where he intended to devote himself to the education of his own large family and of the farm workers and labourers of the community. In 1823 he had married Catherine Atkins, an actress, who retired to motherhood and produced nine children. The family was cursed with ill health, the mother dying in 1852 and only one son and one daughter surviving Macready. In 1860 he married Cecile Louise Spencer. by whom he had a son. His lost years were spent in increasing gloom and unhappiness in Sherborne and later in Cheltenham, where he died on April 27, 1873.

Macready was an intellectual rather than an inspirational actor, at his best in such philosophical roles as Richelieu and Hamlet. He was capable of great emotional intensity! however, and in such parts as Lear or Byron's Werner. involving paternal or domestic feelings, he was unequaled. A lesser actor than Garrick and perhaps Kean when the latter was at his best, Macready was more important than either in his influence on the acting style and production techniques that made possible the art of the modern theatre.

(1912); Lady Pollock, *Macready as I Knew Him* (1895); W. Archer, *William Charles Macready* (1890); J. C. Trewin, *Mr. Macready* (1955). (A. S. DR.)

MACROBIUS, AMBROSIUS THEODOSIUS (fl. *c.* A.D. 400), Latin grammarian and philosopher, whose most important work is the *Saturnalia,* the last-known example of the long series of symposiums headed by the *Symposium* of Plato. He may be the Macrobius who was praetorian prefect in Spain (399), proconsul in Africa (410) and grand chamberlain (422). He was not Italian by birth. The *Saturnalia,* which is dedicated to Macrobius' son Eustachius, purports to give an account of discussions in private houses on the day before the *Saturnalia* and on three days of that festival. There is little attempt to give dramatic character to the dialogue. It is in seven books, parts of which are not extant, and contains countless quotations from earlier writers. It is also interesting for the light it throws on the educated society of the day. Its sources include Seneca: Gellius and Plutarch. The first book discusses, among other topics, the *Saturnalia,* the Roman calendar, the sun and other divinities. The second book. of which part is lost, is chiefly devoted to witticisms. The third book is partly concerned with the luxury of the ancients. The miscellaneous seventh book is partly concerned with scientific matters. The subject of part of the third book and of the fourth, fifth and sixth books is Virgil. who is treated with great reverence. His rhetoric and learning, or rather omniscience, is everywhere insisted upon.

Macrobius also wrote a commentary on Cicero's "Somnium Scipionis" ("The Dream of Scipio") from the *De Republica.* This is a neoplatonic work in two books. Plato's *Timaeus* is often mentioned. Macrobius may have used Porphyry's commentary on it, and he may also have used a neoplatonic commentary on Virgil. Of a third work by Macrobius entitled *De differentiis et societatibus Graeci Latinique verbi* ("On the differences and similarities of the Greek and Latin verb") only fragments remain.

Richard, with text, of the *Saturnalia* (1937); *Comnzentary on the Dream of Scipio,* Eng. trans. by W. H. Stahl (1952). For fragments of the *De differentiis . . . see* H. Keil, *Grammatici Latini,* vol. v, p. 555 ff. (1868). *See* also T. Whittaker, *Macrobius* (1923). (G. B. A. F.)

MACROZAMIA: see GYMNOSPERMS.

MACTAN, a low-lying coral island in the Philippines protecting the port of Cebu city (*q.v.*) and separated from Cebu island by a mile wide channel. Area 24 sq.mi. Pop. (1959 est.) 54,388. On April 27, 1521, Ferdinand Magellan invaded Mactan with a force of 49 Spaniards while 1,000 Cebuan allies and 11 Spanish guards watched from boats.

In the ensuing battle Magellan was killed by the Mactans under the leadership of Lapu-Lapu, the first Filipino to defeat a western conqueror. The island is a part of the province of Cebu (*q.v.*). Coconut growing and fishing are important in the economy. (R. E. HE.)

MACTARIS, 22 mi. S.E. of Le Sers, which is 103 mi. S.W. of Tunis by rail. an ancient town of North Africa, in which the influence of Punic civilization lasted until A.D. 200, when it became a Roman colony.

Mactaris has a fine arch of triumph of Trajan (A.D. 116), another triumphal arch; a temple of Apollo and Diana; an aqueduct. of nhich 12 arches are still standing, and (perhaps) the thermae which it supplied. and the remains of two mausolea.

MacVEAGH, (ISAAC) WAYNE (1833–1917), U.S. lawyer, diplomat and political reformer, was born near Phoenixville, Pa., on April 19, 1833. He graduated from Yale in 1853. Admitted to the bar in 1856, he was district attorney of Chester county, Pa., 1859–64. He held commands in militia forces raised to meet threatened Confederate invasions of Pennsylvania (1862–63). He became a leader in the Republican party, and from 1871 was a prominent opponent of his father-in-law, Simon Cameron, the Republican political boss in Pennsylvania.

MacVeagh was minister to Turkey, 1870–71, a member of the state constitutional convention of 1872–73, and chairman of the "MacVeagh commission," sent in 1877 by Pres. Rutherford B. Hayes to Louisiana; it secured the settlement of the contest between the two existing state governments and thus made possible the withdrawal of federal troops from the state. He was also attorney general of the Cnited States in 1881 under Pres. James Garfield, but resigned after Garfield's death.

An advocate of civil service reform and tariff reduction, he supported (1892) Grover Cleveland, the Democratic nominee for the presidency, and was later ambassador to Italy. He returned to the Republican party in 1896. In 1903 he was chief counsel of the United States before The Hague tribunal in the case of Germany, Great Britain and Italy against Venezuela. MacVeagh died at Washington, Jan. 11, 1917.

MACWHIRTER, JOHN (1839–1911), British landscape painter, was born near Edinburgh on March 27, 1839. He was elected member of the Koyal Scottish Academy in 1867, A.R.A. in 1879 and R.A. in 1893. His "June on the Austrian Tyrol" was bought in 1892 out of the Chantrey bequest. He died in London on Jan. 28, 1911.

MADÁCH, IMRE (1823–1864), Hungarian poet, author of a poetic drama which has won fame in Hungary and, in translation, in other European countries for its lofty philosophical thought and its effectiveness on the stage. He was born on Jan. 21, 1823, at Alsósztregova, and died there on Oct. 4, 1864. A nobleman by birth, he spent his life in farming and public service.

Intelligent, with keen and catholic interests, Madách indulged in poetry and wrote several dramas, all rather weak. He secured himself a place of honour in Hungarian literature by his *Az ember tragédiája* (1861; Eng. trans. The Tragedy of *Man*, 1933), a breath-taking drama in 15 acts covering the past and future of mankind, from the Creation to an ice age caused by the cooling of the sun. The central figures are Adam (who in some of the scenes assumes the personality of a well-known figure, e g. Miltiades, Tancred, Repler, Danton), Eve and Lucifer (dramatically a most rewarding role) who, in a spirit of negation and out of spite, wishes to demonstrate the failure of God's work and the futility of man's endeavour to improve. Though his demonstration —in Madách's presentation — seems to carry conviction, he is vanquished through his inability to take into account God's infinite mercy to which Adam should pin his hopes. (Ds. Sr.)

MADAGASCAR (Malagasy Republic), an island in the Indian ocean about 250 mi. off the east coast of Africa. It was a French colony from 1896 to 1946, a territory of the French Cnion until 1958 and since then it has formed part of the French Community as the Malagasy Republic.

After Greenland, New Guinea and Borneo, Madagascar is one of the largest islands in the world. Its area is 227.760 sq.mi. with a maximum length of 995 mi. and a maximum width of 360 mi. It lies in the southern hemisphere between 11° 57' and 25° 38' lat. S. and 43° 12' and 50° 17' long. E. and is thus almost entirely within the tropics; the Tropic of Capricorn crosses the southern end of it. The Mozambique channel separating it from Africa is only 248 mi. wide at its narrowest part.

Madagascar is surrounded, at a distance of 185 mi. to 560 mi. by small groups of volcanic islets: the Comoro Islands, the Mascarene Islands and the Seychelles.

This article is divided into the following sections and subsections:

I. PHYSICAL GEOGRAPHY

1. Geology and Paleontology. — The former hypothesis that the island was at one time part of Gondwanaland (*q.v.*), an immense continent joining southern Africa to India, is now disputed. It seems probable that a gulf corresponding to the southern part of the Mozambique channel existed from the end of the Paleozoic era and that the subsidences or slow driftings which have brought the island to its present position took place at the beginning of the Mesozoic era. Very ancient Pre-Cambrian foldings have affected an assemblage of paragneissic formations with granitic intrusions. On these formations rest three more recent series, also traversed by granitic intrusions of which the youngest, schists and quartzites, are of the Devonian period; they have been distorted by movements of the Hercynian orogenesis, as is shown by the faults and subsidences which divide up the central massif. The interior of the island has the appearance of a horst to which are opposed the western plateaus with their regular sedimentary layers. From the foot of the hills to the Mozambique channel the strata run from Carboniferous to Middle Jurassic; these formations are called Karroo by analogy with the similar African ones. At the end of the Cretaceous, the sea invaded the east coast for the first time: the advances and withdrawals of the sea occurred from then on in regular succession and different layers accumulated: Upper Jurassic marls, Cretaceous marl-sandstone deposits, Eocene and Miocene limestones which seem to mark the end of marine sedimentation. The Neogene is continental everywhere, yellow sands on the west coast, southern clay sheets passing into the Androy sands laterally, lacustrine deposits in the interior. Tertiary movements have only slightly modified the sedimentary layers of the coastal regions, but have on the other hand violently affected the old shelf. Ancient fractures have come together again and new ones have appeared, accompanied by volcanic manifestations everywhere. Cretaceous eruptions showed in basaltic flows, Miocene eruptions in the extreme north, pro-Quaternary eruptions represented by basaltic flows and the recent systems of the Montagne d'Ambre, of the Ankaratra and of the Itasy. Violent earthquakes have often shaken the island and bear witness even today to the strength of orogenic forces.

Numerous fossil remains have shown the existence of a whole giant fauna, giant land tortoises and Lemuridae (*Megaladapis, Archoeoindris*) much bigger than the modern species. A giant bird, *Aepyornis*, was perhaps contemporary with the first inhabitants of the island. It was about the size of an ostrich, but it was completely wingless and had enormous feet. Its eggs, whose fossils have been found until recently, were bigger than ostrich eggs. Reptiles also seem to have been very large, *e.g.*, the Bothriospondylus, related to the Diplodocus, which measured more than 66 ft. Finally, traces of fossil fishes whose species have disappeared are very often found in the lacustrine deposits.

2. Relief and Drainage. — The island consists of three large parallel longitudinal zones. the central plateau formed from ancient systems; a narrow littoral strip to the east; and a zone of sedimentary formations comprising low plateaus and vast plains to the west.

The Plateau.—Between 2.500 and 4,500 ft. the plateau is composed of ancient crystalline and eruptive rocks. It has been several times folded and worn down and is tilted to the west where the slope is less sheer than it is to the east. The whole is covered with a red soil, a lateritic clay resulting from the breakdown of the rocks by rain and heat and which owes its colour to the iron oxide it contains. Where this red soil is covered with humus it bears forests and crops, but where it has been leached it forms a sterile lateritic covering.

Three massifs of the plateau are over 6,500 ft. in height: the Tsaratanana in the north, separated from the rest of the plateau by the swell of Androna, nhose volcanic summit (9,468 ft.) is the highest point on the island; the Ankaratra in the centre, an enormous volcanic mass whose summit, Tsiafajavona, is 8,674 ft. high. The Ankaratra is a watershed separating three basins: the Imerina in the centre of the island where Tananarive stands on the Betsimitatra plain; the Itasy with its famous lake of volcanic origin; the Vakinankaratra, full of extinct volcanoes and hot springs. Farther south. the Andringitra, a vast granitic massif. dominates the Betsileo district. The plateau slopes more regularly toward the extreme southern plain but its boundaries to east and west are more abrupt. To the east it descends in a sharp fault by steps of 1 to 200 ft. This cliff, called the Great cliff or Cliff of Angavo is often impassable and is itself tordered by an escarpment (Betsimisaraka) which overhangs the coastal plain. Behind the scarp face are the remains of ancient lakes (Alaotra). To the south the two steep gradients meet forming the plateaus of the Mahafaly and the Androy, which in most places overhang the sea in precipitous cliffs. Toward the west, on the other hand, the descent is made in a series of steps, like the Tampoketsa which leads to the plains of Majunga or the plateaus of the Isalo. Sometimes, however, the plateau is bordered by an escarpment, less high than that of the east but still impassable (cliff of Bongolava). Finally, to the extreme north, the plateau is separated by the low sedimentary belt of the Ambre massif, which includes a series of volcanic craters.

The Eastern Coastal Zone. — This zone has an average width of 30 mi., and is a narrow alluvial plain terminating at the sea in a low coastline bordered with extensive lagoons linked together by the Canal des Pangalanes. To the south of Farafangana, the coast becomes rocky but still inhospitable, and it is only in the southeastern tip of the island that there are little bays. There, at Sainte-Luce and Fort-Dauphin were the first French settlements.

The Western Zone.—This is everywhere broader, being from 62 mi. to 124 mi. wide. Its sedimentary layers slope toward the Mozambique channel and produce a succession of hills, especially in the Sakalava country. One side of these steep hills dominates the hollows formed in the soft sediments, while the other descends to the sea in rocky slopes (Borna-Bamaraha). The coast itself is straight, bordered by small dunes and fringed with mangroves.

The currents in the Mozambique channel have favoured the deposit of alluvium and the growth of deltas. On the northwestern coast there are estuaries and bays (Diégo-Suarez). This coast is bordered by coral 'reefs and volcanic islands like that of Nossi-Bé (Nosy BC) which protects the bay of Ampasindava.

The hydrography of the island is also to be explained by' the asymmetry of its relief. The rivers of the east are short, turbulent, and have an abundant flow. They discharge either into the lagoons, through sandy mouths which are constantly shifting, or directly on to the coast with rapids and waterfalls.

These are the rivers Maningory (whose source is Lake Alaotra), Loky, Bemarivo and the northern Mananara in the northeast; the Ivondrona, Mananjary, Faraony, Mananysatra rivers in the east. The most important rivers are those which have captured plateau streams: the Mangoro, in the centre, which drains part of the intermediate slope and receives the Onive from the plateau; and the southern Mananara, nhich receives two tributaries from the slope and one from the plateau. The western rivers are much longer, regular and often navigable over long stretches. But they carry masses of alluvium which block their estuaries. The chief are the Sofia, the Betsiboka, which is in Tananarive province and navigable for over 150 mi., the Tsiribihina, formed by three rivers of which two come from the plateau, the Mangoky which ends in a huge delta, and the Onilahy, which flows through arid country and has a less abundant flow (it has a well-sheltered estuary to the south of Tulear).

All these rivers are very important, not only for navigation but because, intersected by dams, they can provide power and water for irrigation of crops. There are numerous lakes of volcanic origin (Itasy, to the west of the Ankaratra, Titriva near Antsirabé). Lake Alaotra is the last survivor of the immense lakes which once occupied the eastern slope. To the southwest Lake Tsimanampetsotsa is a huge salt lake covering $7\frac{3}{4}$ sq mi. without outlet.

3. Climate.—The individuality of the island's climate is explained essentially by two phenomena: the asymmetry of the relief and the winds. The plateau forms a permanent obstacle to the winds, and is the major factor in the differentiation of the climatic regions.

The winds are of three kinds: sea breezes, trade winds and monsoons. The sea breezes have only a local effect in cooling the shores, and their influence is hardly felt inland. The trade is the dominant mind. Caused by the anticyclone situated over the Indian ocean between Madagascar and Australia, it blows from the southeast almost continuously, but is particularly violent during the southern winter (May to September). The east coast is thus to windward and has a high rainfall (139 in. per year at Maroantsétra in Antongil bay). But once past the cliff of Angavo and over the plateau, the trade wind loses its humidity and behaves like a foehn; it does not bring rain to the Sakalava country, which receives its rainfall from the monsoon. The latter is most noticeable during the southern summer (October–April) when the sun is near its zenith. It comes from the north as a continuation of the Indian monsoon but produces northwesterly winds because of deviation (Majunga has a rainfall of 64 in. from November to April, and an annual total of 65 in.). The southwest receives scarcely any rainfall, except from occasional storms, and so is a semidesert region. The central plateau enjoys a tropical mountain climate with well differentiated thermal seasons (at Tananarive the hot season lasts five months, the cool season seven and there are 53.5 in. of rainfall, of which only 4 in. occurs during the six winter months. Lastly, the influence of the cyclones must be noted as they devastate the island periodically. Madagascar lies in the path of the southwestern cyclones of the Indian ocean, and Tamatave is one of the most exposed places (cyclone of 1927).

4. Vegetation.—The vegetation zones are likewise longitudinal. The screw pines and palms of the east coast dunes are succeeded inland by the reeds of the lagoons and by the viha, a kind of wide-leaved arum which grows in the marshes, and, on the low hills, by scrub. Most of the swamps have been turned into rice fields and the slopes have been planted. Toward the escarpment the vegetation becomes more dense: the savoka is sometimes formed by scrub (Longozo, *Haronga, Citrus*) and sometimes by a denser brushwood (Ravenala, the traveler's tree, with giant leaves at the top of a smooth trunk; sevabe and dingadinga, varieties of bamboo), but it is never suitable for timber. The true forest (ala) is higher up though it now covers only a small area (about 7% of the island). It consists of small thin trees 65–80 ft. high and of varied kinds. At their base grow ferns, dwarf palms and grasses; there are also numerous lianas and epiphytes. The plateau is an area of grassland, and there are no trees except round the villages. The grasses are mostly burned by the cattle raisers and gradually disappear allowing the red earth to be seen. In the plains of the west the grassland gives place to savanna: the grasses, which are taller, are scattered with fire resisting trees like the satrana, a large variety of palm. The savanna, which produces a very monotonous countryside, is tending to spread into the Sakalava country and into the forest of deciduous' trees which formerly wooded the whole west of the island. On the western plateaus, however, there remain the baobab trees and in the lower parts, the raffia palm.

In the north and northeast (Montagne d'Ambre, Tsaratanana, Nossi-Bé) the vegetation is the same as in the east. savoka tending to replace the forest. By contrast, the Androy region in the extreme south is characteristic. It is the region of Karroo scrub, with spiny succulents. A great number of the plants in the island are unique and many are in danger of becoming extinct through constant burning.

5. Animal Life.—The unique form of Madagascar animal life is equally remarkable. At first, the island had no monkeys, deer or snakes. It has, nevertheless, three quarters of the known Lemuridae of the world; about 40 species are found there, including the *Indris,* 39 in. high (eastern forests, around Tamatave and Antonpil bay) and the Microcebus the size of a fist. *Propithecus* is found in the south and east and it has been possible to tame other species of lemur like the maki and the varika.

The nocturnal aye-aye (*Daubentonia madagascariensis*) is a species peculiar to Madagascar. Other vertebrates include many kinds of hedgehogs, bats, civet cats and rodents. Birds are very numerous: guinea fowl (akanga), partridge, pigeons, herons, ibis, flamingoes, egrets, owls, birds of prey (papango, voromahery). Crocodiles are found in all waters, except in the coldest parts of the plateaus.

Various land and sea tortoises are found, chameleons of all sizes, geckos, lizards, snakes, including the do which is 10–13 ft. long, but is harmless. There are few fresh-water fish, but sea water fish and crustaceans abound on the coasts and in the lagoons. Certain species are peculiar to the island, like the globefish, bristling with spines, and the cofferfish. Finally, insects abound: grasshoppers, termites, cockroaches, all sorts of mosquitoes, of which some very dangerous ones attack cattle, but also the Madagascar Bombyx (moth) which gives a valuable silk, and more than 800 species of butterfly. Man has imported domestic animals: the zebu, which has great importance in Madagascan life, the fat-tailed sheep, dogs, poultry and pigs, these last being mostly raised by Europeans. (J. D.)

11. THE PEOPLE

The people of Madagascar. collectively known as Malagasy (in French *malgache*), appear to be a mixture from very ancient times of Indonesians and Africans who arrived there by sea at various periods. The majority exhibit a blend of Indonesian and African characteristics. In general one can distinguish 18 peoples who correspond to geographical regions or to kingdoms no longer existent. The principal peoples are as follows: (1) In the east: the

Betsimisaraka ("the inseparable multitude"); the Antemoro, of whom the noble orders claim Arab descent and who use Arab script; the Tanala ("people of the forest"); the Antesaka; and the Antanosy. These peoples are in general of medium stature and dark. (2) On the plateau: the Merina, around Tananarive, of whom the higher castes, the nobles (Andriana) and the bourgeois class (Hova) are often of an almost pure Indonesian type; the Betsileo (around Fianarantsoa); the Sihanaka around Lake Alaotra; to the north the Tsimihety; to the south the Bara who are tall and of African type. (3) In the west: the Sakalava; the Vezo, who are fishermen; the Mahafaly and the Antandroy ("people of the brambles"), who inhabit the dry southern region; and some Makoa, who came from Africa, often as slaves, and are distributed amongst the Sakalava.

1. Language. — The Malagasy language belongs to an Indonesian group, with some peculiarities of its own such as the vocalization of final letters, the existence of a definite article, and the "relative" mood of verbs. It contains some words of Bantu, Swahili, Arab, English and French origin. The existence of dialects, involving changes in certain consonants and final letters and some differences in vocabulary, does not affect the basic unity of the language.

From 1820 the Merina dialect, written in Latin characters, has become the official language, In this the letter o is pronounced as French ou (English *oo*); final a and y are almost silent. Malagasy literature includes proverbs, orations, stories, folk tales and poems. The soft and musical quality of the language has earned it the title of "the Italian of the east."

2. Religion. — The traditional religion is founded on ancestor worship. The dead are mostly buried in stone tombs, by family or clan, and are believed to keep watch over the living and to reward or punish them according to their deserts. They are invoked, either on special occasions of illness or disaster, or in special ceremonies such as the festival of the dead in the southeast and the Famadihana, "festival of returning," when the dead are moved from one tomb to another, on the plateau. The supreme being, called Zanahary, "the Creator," or Andriamanitra, "the Fragrant One," stands above the dead in the divine hierarchy and is associated with them in the ceremonies. There is also a belief in invisible beings who inhabit trees and stones, in water spirits and in certain animals as ancestors or kin. Divination is employed, based mainly on *sikidy,* akin to Arab geomancy. The mass of taboos (*fady*), imposed either by custom, by the date of birth or by sorcerors, fill the life of the Malagasy with inhibitions, and there is also the fear of spellbinders.

Formerly various kinds of trial by ordeal were practised in order to discover spellbinders and criminals. Notable among these was the tanghin poison ordeal. Today almost half of the people, especially among the Merina and the Betsileo and in the towns, have been converted to Christianity about equally divided between Protestant and Catholic. In the northwest there are about 70,000 Moslems.

3. Social Customs. — The traditional Malagasy family is patrilineal and includes collateral branches. The title of father and mother is given to all the elders, and that of children to all the younger generation. The clan (*foko*) includes families of the same origin The fokon'olona is that part of a clan which lives in the same village and whose decisions are taken by the heads of its families. This patriarchal system is on the decline in the Christian areas and in the towns, but respect for elders persists. The artificial relationship of blood brotherhood between two persons can be created by a special ceremony.

Malagasy society is divided into castes, which are in most cases limited to three: nobles, freemen and former slaves. Intermarriage betneen the castes is prohibited in principle. Polygamy has disappeared in the Christian areas. Marriage involves various ceremonies: a delegation to the prospective bride's family, sacrifices, the carrying off of the bride, etc. Children are always desired and the chief fear of women is sterility. Adoption is easy and is frequently undertaken.

The Malagasy house is always rectangular with the long sides running from north to south, the door on the west and an acutely angled roof. The materials vary with the region: clay is used in the central area, wood and branches on the coasts. On the east coast the houses are built on piles, or stilts. Clothing consisted formerly of the loincloth (of bark or cotton), the sheath dress (of rush matting or raffia) and the lamba, a kind of toga made of cotton or silk. These are giving way increasingly to imported clothing and materials. Traditional art, which is much less rich than that of Africa, comprises wooden statues, rush matting and coloured baskets, and decorated plates and spoons. Musical instruments betray especially African or Indonesian ancestry; notable is the *valiha,* a kind of zither made from bamboo. The same is true of the traditional dances which still accompany certain festivals. A love of music and poetry is a characteristic of the Malagasy.

III. HISTORY

The island was certainly inhabited during the Iron Age by Indonesian and African navigators. For many centuries the Malagasy have been divided into a number of peoples, separated from one another by a wide extent of uninhabited country.

"Arab" *Influence.*—The Indian ocean was frequented during the early middle ages by Indonesians and the Indians, who left traces in the population of Madagascar. From the 9th century the "Arabs" (correctly, Moslems of diverse origins), already established on the east coast of Africa and on the Comoro Islands, formed settlements on both the northwest and southeast coasts of the island. In the southeast they became merged in the general mass of the people, especially among the Antemoro.

In the northwest were several large "Arab" colonies, which occupied the ports of Anorotsangana, Mojanga (Majunga) and several others, retaining their distinct nationality.

Early European Connections. — The Alexandrian geographer Ptolemy speaks of an island called Menuthias, which might be Madagascar. Marco Polo has a chapter upon "Madeigascar," but his accounts of it are confused with those of the mainland of Africa, even the name later adopted for the island being a misunderstanding of that of the mainland port of Mogadishu.

The first European voyager to see the island was a Portuguese named Diogo Dias, captain of one of the ships of a fleet bound for India. Separated from his companions by a storm near the Cape of Good Hope, he sighted the eastern coast of the island on Aug. 10, 1500. That day being the feast of St. Lawrence, Madagascar was named the "Isle of St. Lawrence." Portuguese missionaries between 1600 and 1619 made unsuccessful efforts to convert the tribes on the southeast and western coasts. In the time of Charles I unsuccessful attempts were made to form English settlements in the southwest and on the island of Nossi-Bé. From 1642 the French held the extreme southeast point of the island at Fort-Dauphin, and the governor, Etienne de Flacourt, gave the first substantial description of the island. But in 1674 the garrison was partly massacred and partly evacuated. The king of France, however, maintained his claims to the sovereignty of the whole island.

In the late 17th and early 18th centuries Madagascar was the haunt of many pirates, including John Avery, Captain Misson and William Kidd. Between 1768 and 1786 two fresh attempts at settlement were made by the French, one by the comte de Modave at Fort-Dauphin and the other by D'Aladar de Benyowski at Antongil bay. In 1750 the island of Saint-Marie became French. In 1803 Sylvain Roux set up a French agency at Tamatave, which was occupied by the English in 1811.

The First *Kingdoms.*—Trade in arms and slaves allowed the development of Malagasy kingdoms. At the beginning of the 17th century the most important, those of the Antemoro, Antesaka, Betsileo and Merina (Hova), were still confined to small areas, the last named to the neighbourhood of Tananarive. In that century a southern Sakalava chief, Andriandahifotsi, conquered all the western plains, and his son conquered the northwest (Boina) and the extreme north. The Sakalava dominions, held by descendants of the founder, occupied half the island, but they disintegrated in the 18th century. In this century the half-caste Ratsimilaho (son of an English pirate) set up the kingdom of Betsimisaraka, which very soon disappeared.

At the end of the 18th century the disunited hlerina kingdom was unified by the great king Andrianampojnimerina (1787–1810). Imerina was soundly organized and the Sakalava incursions checked. Turning his attention to expansion, the king brought the Betsileo into subjection. At his death he bequeathed to his son Radama a single political ambition: "The sea will be the boundary of my ricefield" (*i.e.*, of his kingdom).

Merina Rule.—Radama I (1810–28) was a shrewd and enterprising man. He was helped by the English governor of hlauritius, Sir Robert Farquhar, who, failing to obtain the backing of the home government to replace the French in Madagascar, adopted a policy of supporting the Merina. Radama saw that it was necessary for his people to be educated and civilized, and, making a treaty with Farquhar to abolish the export of slaves, he received in compensation an annual subsidy of arms, ammunition and uniforms, as well as English training for his troops. He was thus enabled to establish his authority over a large part of the island. For some years a British agent, James Hastie, resided at Radama's court. During the same period (1820) Christian teaching was begun in the capital by the London Missionary society. The language was reduced to a systematic written form: and the art of printing introduced; the Scriptures were translated and many schools were formed.

The bright prospects thus opening up were clouded by the death of Radama at the age of 36 and the seizure of the royal authority by his first wife, Queen Ranavalona. She looked with much suspicion upon the European ideas then gaining ground. In 1835 the Christian religion was declared illegal. Of the Christian Malagasy about 200 suffered death, while many hundreds were punished by fine, degradation, imprisonment and slavery.

A few Europeans remained in Madagascar, notably the Frenchman Jean Laborde, who introduced many industries. During the queen's rule there were frequent rebellions and distant provinces were desolated by barbarous wars; for some years all Europeans were excluded, and foreign commerce almost ceased. An ill-managed attack upon Tamatave in 1846 by a combined British and French force ended in failure.

This reign of terror was brought to an end in 1861 by the death of the queen and the accession of her son, the good Radama II. But a concession he signed, giving great powers to a French company, combined with his weakness soon brought an end to his reign and his life. He was put to death in his palace (1863) and his wife Rasoherina was placed on the throne. The new sovereign refused to ratify the agreement with the French company, but treaties were concluded with the British, French and United States governments. Beside the London Missionary society, other Christian agencies were permitted to work, including the Jesuits and the Anglicans: the Society of Friends and the Norwegian Lutherans. The French explorer Alfred Grandidier explored the island and brought back much scientific information.

At the death of Rasoherina in 1868, she was succeeded by her cousin, Ranavalona II. One of the first acts of the new queen was the public recognition of Christianity; and soon afterward she and her husband, the prime minister, mere baptized, the Merina in general soon putting themselves under Christian instruction. Ranavalona II, her predecessor and her successor mere in turn married to the prime minister, Rainilaiarivony, who became virtual ruler of the country. Many measures tending to improve the administration were introduced. The hlerina now ruled the central part of the plateau directly; the kingdoms of the east and northeast were vassals; but the south and west were independent. The Merina army, well organized under Radama I, had since declined and Merina expansion had consequently ceased. Revenue was derived from customs, duties, fines and from a money offering, called *hasina,* presented on a great variety of occasions to the sovereign. The government also claimed the unpaid services of the community for public work. Consuls appointed by the British, French and U.S. governments were accredited to the Malagasy sovereign.

Relations With the *French.*—While Merina rule would have satisfied British interests in the island, it was otherwise with the French. The tradition of their former settlements and influence was strong; in 1840 they had taken under their protection the Sakalava ruler of the northwest coast. But a treaty concluded in 1868, while establishing French consular jurisdiction in Madagascar, recognized Ranavalona II as queen of Madagascar. A change came under the third republic. The French government revived its claim to a protectorate over the Sakalava of the northwest coast, and in 1883, following Malagasy rejection of French demands, Tamatave was bombarded and occupied by marines. By a treaty signed on Dec. 17, 1885, it was agreed that the foreign relations of Madagascar should be directed by France; that a resident should live at the capital; and that the Diégo-Suarez bay, together with surrounding territory, should be ceded to France. Queen Ranavalona II had died on July 13, 1883, and had been succeeded by her cousin Ranavalona III. In 1890 the British government, in return for concessions in Zanzibar, consented to recognize a French protectorate over Madagascar, but the Malagasy prime minister, Rainilaiarivony, continued to arm and train, with the help of British officers, a large body of native troops. Toward the close of 1894, the French government sent an ultimatum and war followed. An expeditionary force under Gen. J. C. Duchesne landed at Majunga and met with no effectual resistance. On Sept. 30, 1895, the French forces reached Tananarive, and on the evening of the same day the French entered the capital. The protectorate a-as established. Early in 1896, however, a serious rebellion broke out in several parts of Imerina. This movement was not only anti-French but also anti-Christian. Gen. J. S. Gallieni was sent out to relieve the then resident general.

French Rule.—Gallieni abolished royalty; Madagascar had already been declared a colony of France. Queen Ranavalona III was exiled to Réunion and subsequently to Algeria, where she died in 1917. Meanwhile, by 1898, the authority of France was established throughout the island. Gen. Gallieni, whose firm and vigorous administration and desire to treat the Malagasy justly made him liked, retired in 1905. In accordance with the usual French colonial system the tribes were all placed under the direct control of French officials, but large numbers of natives were employed in the French administration, and the few Malagasy who became thoroughly assimilated were given French citizenship.

Notwithstanding these measures the growth of a sense of Malagasy nationality could be discerned among the Merina. During World War I an anti-French secret society, the V.V.S., mas discovered. Madagascar enjoyed considerable economic development during the governorships general of Marcel Olivier (1924–30) and Léon Cayla (1930–40). But World War II brought economic crisis with the cessation of exports. The island declared for the Vichy government in 1940, and to prevent its invasion by the Japanese it was occupied in 1942 by the British. who handed it over to the Free French authorities in 1943. But it had been considerably disturbed by these events. In 1946, all the Malagasy had been granted French citizenship; but in 1947 a nationalist rising took place on the east coast. Subsequently new political institutions (in particular, local assemblies) were established without difficulty. On Oct. 14, 1958, the congress of the elected assemblies proclaimed an autonomous republic within the French Community and Philibert Tsiraana, a Tsimihety, was elected president. In 1960 the Malagasy Republic gained complete independence while remaining a member of the Community.

IV. POPULATION

The population of Madagascar which, at the first census in 1900, was 2,500,000, in 1956 4,934,375, and by 1960 exceeded 5 000,000. Increase is now at the rate of more than 100,000 a year. The average density is 20.7 to the sq.mi.; in the rice-growing regions of the east coast and the alluvial valleys and lake basins of the plateau it exceeds 77.7 but is less than 12.9 in the pastoral west and the forest-covered cliff regions. The most numerous peoples are the Merina (1,200,000), the Betsimisaraka (800,000) and the Betsileo (600,000). The population other than Malagasy is less than 100,000, including 70,000 French, 13,000 Indians and 7,000 Chinese. The number of Comoro is rapidly increasing on the northwest coast.

The people are essentially peasants. The capital is Tananarive or

Antananarivo (*q.v.*), pop., (1956) 193,476, which stands on a steep hill jutting into the surrounding rice fields. There are four towns with a population of 30,000 to 50,000; Tamatave (*q.v.*), Majunga, Diégo-Suarez and Fianarantsoa. The other principal centres, each with 10,000 to 30.000 inhabitants, are Antsirabe, Tulear, Manakara, Mananjary and Fort-Dauphin. Internal migrations brought the rice cultivators of the southeast (Antesaka) and those of the plateau (Merina and Betsileo) to the almost empty plains of the west, which they put under cultivation. This Malagasy "Far West" already has an immigrant population greater than the Sakalava. The Tsimihety, who increase rapidly, expand in all directions. Some Antandroy, to escape from the famines of the extreme south, find paid employment all over the island. There is a large proportion of Merina in the towns, where they are merchants or officials.

V. ADMINISTRATION

The constitution of the Malagasy republic, which became law on April 29, 1959, establishes a presidential regime. The president of the republic, who is elected for seven years, is also the head of the government. The parliament comprises two assemblies: a national assembly elected for five years by universal suffrage (male and female) and a senate representing national organizations; two-thirds of the senators are nominated by the provincial councils general. The Malagasy Republic is represented in France by a haut *représentant* and in certain other countries by ambassadors.

Madagascar is divided into six provinces: Diégo-Suarez, Majunga, Tamatave, Tananarive, Fianarantsoa and Tulear. The provinces, which have a large measure of financial autonomy, are themselves divided into districts and communes (formerly cantons) varying in number, which are administrative units. Large towns have elected municipal councils. Rural communes constitute centres of economic advancement. The president of the French community is represented by a high commissioner general. Many French officials are employed in the central and provincial services. Medical services include 60 hospitals and 300 medical stations. The fight against endemic diseases has succeeded in removing the plague and reducing malaria.

About half the children of school age attend public or private schools (200,000 boys and 150,000 girls). There are eight *lycées,* an institute of higher education and a Madagascar Institute of Scientific Research (I.R.S.M.). Education is conducted in Malagasy and French.

VI. THE ECONOMY

The traditional economy of Madagascar is based principally on the cultivation of rice and the raising of oxen. The rice fields are of Asiatic type with water levels and embankments. The grazing of oxen often takes the place of cultivation. Food consists of millet (in the south), cassava; potatoes, taro or coco, beans and some fruits (bananas, guavas and mangoes), together with fish from the streams, and berries and wild roots. The zebu (humped ox) is used both for tillage and for sacrifice, the beef being eaten during the ceremonies, and it provides visible capital. Poultry is abundant in all the villages. This subsistence economy has been changing during the 20th century through the opening up of the island to world commerce. The traditional products have been improved and new products created in the following ways.

Rubber is no longer cultivated but wax from wild bees is gathered. Scientific study has been devoted to fishery, especially that of tunny, prawns, mullet and whales. The forests have had to be protected and replanting has altered the denuded appearance of the plateau. Raffia fibre is a product peculiar to Madagascar.

Agriculture. — The rice-growing area has been doubled. Rice is grown mostly for local requirements but some special varieties of high quality (such as the long vary lava) have been developed for export. The American rices of Carolina had their origin in Madagascar. Cassava meal and tapioca are prepared from manioc (Manihot). "Cape pea," a kind of large haricot grown in the southwest, is exported to England.

"Robusta" coffee is the chief product of the east coast and the most important item of exported produce (60,000 tons). Madagascar is the world's chief producer of vanilla and ranks second for cloves (east coast). Perfume plants, peanuts (Lake Alaotra), "Maryland" tobacco (west and plateau), sugar (northwest), sisal (extreme south), potatoes (plateau) are substantial items.

Stockbreeding. — There are more than 6,000,000 head of zebu cattle on the natural pastures of the west and the plateau. Pigs are reared in the centre, sheep and Angora goats in the south.

Minerals. — The main resources are graphite and mica. A seam of coal in the southwest (Sakoa) has not been worked. There is some uranium, and precious stones (beryl, amethyst and garnet) are found.

Industry. — The only active industries are agricultural and chief among these are rice husking, the manufacture of starch from manioc, sugar refining, tobacco curing, meat preserving and tanning. There is abundant water power, but the two main barrages supply electricity chiefly to Tananarive. Nine-tenths of the inhabitants live by agriculture and the variety of products avoids serious shortages. Most of the peasants are owner-farmers. Europeans own some plantations (sugar, tobacco and sisal), sawmills and mines.

Trade. — The distance of the main markets of the world is a handicap to Madagascar's exports owing to the high cost of freight. The lack of domestic industry necessitates the importation of most manufactured goods. Wholesale trade is principally the care of French companies and retail trade is, to a large extent, in the hands of Indians and Chinese. The chief exports are coffee, rice, cloves, tobacco, vanilla, sugar, dried vegetables, raffia and preserves. Of secondary importance are graphite, perfumed oils, sisal, manioc starch and hides. Coffee represents about half the total value. About two-thirds-of the exports are bought by France and one-sixth by the United States. Principal imports include materials and clothing, motor vehicles, petroleum products, machinery, iron, tools and cement; approximately two-thirds of these come from France.

Communications. — In former times all transport was on foot; important personages were carried by *filanzane* (palanquin) and goods were slung at the two ends of a pole across the shoulders. Roads have now been constructed all over the country; they are mostly simple, tracks suitable for motor traffic but subject to seasonal interruptions. The principal centres are linked by asphalt roads. The total mileage of roads is about 18,650. Two railways cross the cliffs to link the plateau with the east coast: the Tananarive-Côte Est (T.C.E.) to Tamatave, about 230 mi.: and the Fianarantsoa-Cbte Est (F.C.E.) to Manakara, about 102 mi. The former has two branches, to Lake Alaotra and to Antsirabe.

The chief port is Tamatave (*q.v.*), which has equipment and quay berths. Diégo-Suarez, which has one of the finest roadsteads in the world, is unfortunately too remote from the centre. Majunga has only a lighterage port. Minor ports are Manakara, Fort-Dauphin, Tulear, Morondava, Analalava and Vohemar. The principal airport is Arivonimamo, 27 mi. west of Tananarive. Secondary airfields are numerous and local airlines provide daily services.

MADAN, MARTIN (1726–1790), English preacher and writer of the Methodist revival. Educated at Westminster school and Christ Church, Oxford: he was called to the bar in 1748 but abandoned his career and the pleasures of society after hearing John Wesley preach. He was ordained in 1750 and appointed chaplain to the Lock hospital, London. A powerful itinerant preacher, he became known as "Counsellor Madan." His acutely argued *Thelyphthora . . . A Treatise on Female Ruin* (1780), advocating polygamy to check the evils of adultery, seduction and prostitution, was bitterly attacked, but he maintained that his views were strictly in accordance with Holy Scripture. He died at Epsom on May 2, 1790.

MADAUROS, an ancient city of Numidia (near the modern Mdaourouch, 55 mi. N. of Tebessa by rail), which became a Roman colony at the end of the 1st century after Christ. It was the birthplace of Apuleius, and its schools were celebrated. Among its ruins are some large thermae, a fine Roman mausoleum, a large Christian basilica of the Byzantine period, with a nave and two aisles, and a Byzantine fortress built about A.D. 535.

See Joly, *Mdaourouch.*

MADDALONI, a town of Campania, Italy, in the province of Caserta, about 3½ mi. S.E. of Caserta, with stations on the railways from Caserta to Benevento and from Caserta to Avellino, zoo ft. above sea level. Pop. (1951) 22,174. It is prettily situated at the base of one of the Tifata hills, the towers of its medieval castle and the church of San Michele crowning the heights above. The fine old palace of the Caraffa family, once dukes of Maddaloni, the old college now named after Giordano Bruno, and the institute for the sons of soldiers are the chief points of interest. About 2½ mi. east of Valle di Maddaloni, the Ponti della Valle, an aqueduct built by the orders of Charles III of Naples and his son to convey the water of the Tiburno to Caserta (19 mi.), is carried across the valley between Monte Longano and Monte Gargano by a threefold series of noble arches rising to a height of 210 ft. The work was designed by Lodovico Vanvitelli and constructed 1753–59.

MADDEN, SIR FREDERIC (1801–1873), English palaeographer, of Irish extraction, was born at Portsmouth on Feb. 16, 1801. In 1826 he entered the British Museum, and in 1828 he became assistant keeper of manuscripts. In 1833 he was knighted, and in 1837 became keeper of manuscripts, retiring in 1866. He edited for the Roxburghe club *Havelok the Dane* (1828), discovered by himself among the Laudian manuscripts in the Bodleian, *William and the Werwolf* (1832) and the old English versions of the *Gesta Romanorum* (1838). The edition (1850) in parallel columns, of what are known as the "Wycliffite" versions of the Bible, from the original manuscripts, upon which he and Forshall had been engaged for 20 years, was published by the University of Oxford. In 1866–69 he edited the *Historia Minor* of Matthew Paris for the Rolls Series. In 1833 he wrote the text of Henry Shaw's *Illuminated Ornaments of the Middle Ages;* and in 1850 edited the English translation of Silvestre's *Paléographie universelle.* He died on March 8, 1873, bequeathing his journals and other private papers to the Bodleian library.

MADDER or DYER'S MADDER, the root of *Rubia tinctorum* and perhaps also of R. *peregrina,* both native European plants, and of *R. cordifolio,* a native of the hilly districts of India and of northeastern Asia and Java; the last supplies Indian madder, or *manjit. Rubia* is a genus of about 40 species of the madder family, Rubiaceae. It much resembles the familiar lady's or yellow bedstraw *(Galium verum)* and the cleavers or catchweed bedstraw (G. *aparine)* of hedges and woodlands, having similarly whorled leaves, but the parts of the flowers are in fives and not fours, while the fruit is somewhat fleshy *(see* BEDSTRAW).

The red colouring principle of madder, alizarin, is now made synthetically, and the once extensive use of madder as a dye has nearly disappeared. The dye properties appear to have been known from the earliest times; cloth dyed with madder has been found on the Egyptian mummies, and it was used for dyeing the cloaks of the Libyan women in the days of Herodotus. Madder also mas employed medicinally, especially in the treatment of amenorrhea, by the ancients and in the middle ages. A remarkable physiological effect of alizarin is that of colouring red the bones of animals and the claws and beaks of birds that feed upon madder. This property was utilized by physiologists in ascertaining the manner in which bones develop and the functions of the various types of cells found in growing bones. The only British species of *Rubia* is *R. peregrina,* found in Wales, southern and western England and eastern and southern Ireland. *R. tinctorum,* a native of western Europe, was once extensively cultivated in southern Europe, France and the Netherlands. *Rubia* is neither naturalized nor cultivated in the United States. *See* also ALIZARIN.

MADEC, RENÉ-MARIE (1736–1784)—called Medoc in Anglo-Indian writings—French adventurer in India, was born at Quimper in Brittany on Feb. 7, 1736, of poor parents. He went out to India and served under Dupleix and Lally, but being taken prisoner by the British he enlisted in the Bengal army. Deserting with some of his companions shortly before the battle of Buxar (1764), he became military instructor to various native princes, organizing successively the forces of Shuja-ud-Dowlah, namab of Oudh, and of the Jats and Rohillas. He took service under the emperor Shah Alam in 1772, and when that prince was defeated at Delhi by the Mahrattas, Madec rejoined his own countrymen in Pondicherry, where he took an active part in the defense of the town (1778). After the capitulation of Pondicherry he returned to France with a considerable fortune, and died there in 1784. At one time he worked for a French alliance with the Mogul emperor against the British, but the project came to nothing.

See Émile Barbé, *Le Nabob René Madec* (1894).

MADEIRA or FUNCHAL, a group of islands in the North Atlantic ocean, which belong to Portugal, and consist of two inhabited islands named Madeira and Porto Santo and two groups of uninhabited rocks named the Desertas and Selvagens. Pop. (1930) 211,601; (1950) 266,990; area, 308 sq.mi. Funchal, the capital, is on the south coast of Madeira island, in 32° 37′ 4j" N. and 16° 54′ W. It is about 360 mi. from the coast of Africa, 53j from Lisbon. 1,215 from Plymouth, 240 from Teneriffe, and 480 from Santa Maria, the nearest of the Azores.

Madeira (pop. in 1950, 264,002), the largest island of the group, has a length of 36 mi., an extreme breadth of 14 mi., and a coast line of 95 mi. Pico Ruivo, the highest summit, stands in the centre of the island, and has a height of 6,106 ft., while some of the adjacent summits are very little lower. The depth of the ravines, the rugged peaks, often snow-covered, the bold precipices of the coast and the proximity of the sea afford many scenes of picturesque beauty or striking grandeur. The greater part of the interior is uninhabited, though cultivated, for the towns, villages and scattered huts are usually built either at the mouths of ravines or upon the lower slopes that extend from the mountains to the coast. The ridges between the ravines usually terminate in lofty headlands, one of which, called Cabo Girão, has the height of 1.920 ft., and much of the seaboard is bound by precipices of dark basalt. The north coast, having been more exposed to the erosion of the sea, is more precipitous than the south, and presents everywhere a wilder aspect. On the south there is left very little of the indigenous forest which once clothed the whole island. A long, narrow and comparatively low rocky promontory forms the eastern extremity of the island; and there is a tract of calcareous sand, known as the fossil bed, containing land shells and numerous bodies resembling the roots of trees, probably produced by infiltration.

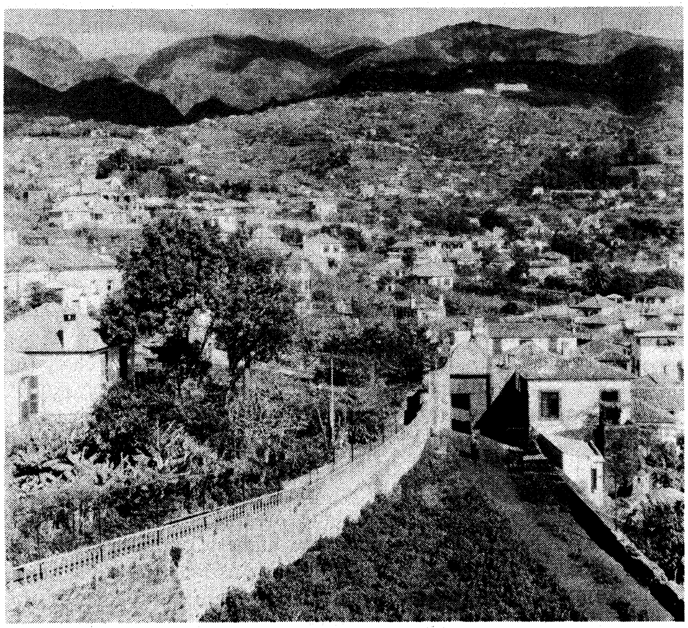
Porto Santo is about 25 mi. S.E. of Madeira. Pop. (1950) 2,888. It has a length of 7 mi. and a width of 4 mi. The capital is Porto Santo, called locally the *villa* or town. At each end of the island are hills. of which Pico do Facho. the highest, reaches the altitude of 2,139 ft. Little but barley is grown, the limited requirements of the inhabitants being supplied from Funchal.

The Desertas lie about 11 mi. S.E. of Madeira, and consist of three islands. Ilheo Chão, Bugio and Deserta Grande, together with Sail Rock off the north end of Ilheo Chão. They present lofty precipices to the sea on all sides. Rabbits and goats abound on them. The archil weed grows on the rocks and is gathered fbr exportation. The largest islet (Deserta Grande) is 7 mi. long and attains the height of 1,450 ft.

The Selvagens or *Salvages* are a group of three islands, 156 mi. from Madeira, and between Madeira and the Canary Islands. The largest island is the Great Piton, 1.6 mi. long. and 1.4 mi. broad.

Geology.—All the islands of the group are of volcanic origin. They are the summits of very lofty mountains which have their bases in an abyssal ocean. The greater part of what is now visible in Madeira is of subaerial formation, consisting of basaltic and trachytic lavas, beds of tuff and other ejectamenta, the result of a long and complicated series of eruptions from innumerable vents.

There are no data for determining when volcanic action began in this locality, but looking at the enormous depth of the surrounding sea it is clear that a vast period of time must have elapsed to allow of a great mountain reaching the surface and then rising several thousand feet, as well as to excavate the deep and wide ravines that everywhere intersect the island. At the present day there are no live craters or smoking crevices, as in the Canaries and Cape Verdes, nor any hot springs, as in the Azores.



JAMES SAWDERS

A VIEW OF FUNCHAL, ADMINISTRATIVE CENTRE FOR THE MADEIRAS

The rarity of crateriform cavities in Madeira is remarkable. There exists, however, to the east of Funchal, on a tract 2,000 ft. high, the Lagoa, a small but perfect crater 500 ft. in diameter and with a depth of 150 ft.; and there is another, which is a double one, in the district known as Fanal, in the northwest of Madeira, nearly 5,000 ft. above the sea. The basalt, of which much of the outer part of the island is composed, is of a dark colour and a tough texture, with small disseminated crystals of olivine and augite, and often forms a rude columnar structure. The basalt yields good building stone, some of which is quarried.

Climate. — Observations taken at Funchal observatory (80 ft. above sea level) in the last 20 years of the 19th century showed that the mean annual temperature is about 6j° F. The mean minimum for the coldest part of the year (October to May inclusive) does not fall below 55°, and the average daily variation of temperature in the same period does not exceed 10°. The mean humidity of the air is about 75 (saturation= 100). The prevalent winds are from the north or from a fe points east or west of north, but these winds are much mitigated on the south coast by the central range of mountains. A hot and dry wind, the leste of the natives, occasionally blows from the east-southeast, the direction of the Sahara, and causes the hill region to be hotter than below; but even on the coast the thermometer under its influence sometimes indicates 93°. As the thermometer has never been known to fall as low as 46" at Funchal, frost and snow are there wholly unknown; snow falls on the mountains once or twice during the winter, but seldom below the altitude of 2,000 ft. Madeira has a high reputation as a health resort for persons suffering from chest diseases and is well known as a winter resort.

Animal **Life.**—No species of land mammal is indigenous to the Madeiras. The rabbit, black rat, brown rat and mouse have been introduced. The first comers encountered seals, and this amphibious mammal (*Monachus albiventer*) still lingers at the Desertas. Among the many species of birds which breed in these islands only one, a wren (Regulus madeirensis), is endemic, but five other species are known elsewhere only at the Canaries. These are the green canary (Fringilla butyracea, the parent of the domesticated yellow variety), a chaffinch (Fringilla tintillon), a swift (Cypselus unicolor), a wood pigeon (Columba trocaz) and a petrel (*Thalassidroma* bulwerii). There is also a local variety of the blackcap, distinguishable from the common kind by the extension in the male of the cap to the shoulder.

The only land reptile is a small lizard (Lacerta *dugesii*), which is destructive to the grape crop. The loggerhead turtle (*Caouana* caretta, Gray) is frequently captured and cooked. but the soup is inferior to that made from the green turtle of the West Indies.

Many kinds of fish, such as the mackerel, horse mackerel, groper, mullet, braise, etc., are caught in abundance and afford a cheap article of diet. Several species of tunny are taken plentifully in spring and summer, one of them sometimes attaining the weight of 300 lb. The only fresh-water fish is the common eel, which is found in one or two of the streams.

A large majority of the land shells are considered to be peculiar. Many of the species are variable in form or colour, and some have an extraordinary number of varieties. About 43 species are found both living and fossil in superficial deposits of calcareous sand in Madeira or Porto Santo. These deposits were assigned by Lyell to the Newer Pliocene period. Some species have not been discovered alive elsewhere.

By the persevering researches of T. V. Wollaston the astonishing number of 695 species of beetles at the Madeiras was brought to light as early as 1870. The proportion of endemic kinds is large, and it is remarkable that 200 are either wingless or their wings are so poorly developed that they cannot fly, while of 23 of the endemic genera all the species are in this condition. Upward of 100 moths have been collected, the majority being of a European stamp, but probably a fourth are peculiar to the Madeiran group. Among Neuroptera a certain number are peculiar.

The bristle-footed worms of the coast were studied by P. Langerhans, a large number being found new to science. There is a white stony coral allied to the red coral of the Mediterranean which would be valuable as an article of trade if it could be obtained in sufficient quantity. Specimens of a rare and handsome red Paragorgia are in the British Museum and Liverpool museum.

Vegetation. — The vegetation is strongly impressed with a south-European character. Many of the plants in the lower region undoubtedly were introduced and naturalized after the Portuguese colonization. A large number of the remainder are found at the Canaries and the Azores, or in one of these groups, but nowhere else. Lastly, there are about 100 plants which are peculiarly Madeiran, either as distinct species or as strongly marked varieties. Among the large number of ferns three are endemic species and six others belong to the peculiar flora of the North Atlantic islands. A connection between the flora of Madeira and that of the West Indies and tropical America has been inferred from the presence of six ferns found nowhere in Europe or North Africa but existing on the islands of the east coast of America or on the Isthmus of Panama. A further relationship to that continent is to be traced by the presence in Madeira of the beautiful ericaceous tree Clethra arborea, belonging to a genus which is otherwise wholly American, and of a *Persea,* a tree laurel, also an American genus. The dragon tree (Dracaena draco) is almost extinct. Among the trees most worthy of note are four of the laurel order belonging to separate genera, an Ardisia, *Pittosporum, Sideroxylon,* Notelaea, Rhamnus and Myrica — a strange mixture of genera to be found on a small Atlantic island. Two heaths of arborescent growth and a whortleberry cover large tracts on the mountains. In some parts there is a belt of the Spanish chestnut about the height of 1,500 ft. There is no indigenous pine tree as in the Canaries, but large tracts on the hills have been planted with *Pinus* pinaster, from which the fuel of the inhabitants is mainly derived. Several of the native trees and shrubs now grow only in situations which are nearly inaccessible, and some of the indigenous plants are of the greatest rarity. But some plants of foreign origin have spread in a remarkable manner. Among these is the common cactus or prickly pear (Opuntia tuna), which in many spots on the coast is sufficiently abundant to give a character to the landscape. The coast being rocky and the sea unquiet, the species of Algae are few and poor.

Agriculture. — A large portion of the land was formerly entailed in the families of the landlords (morgados), but entails have been abolished by the legislature, and the land is now absolutely free. An incredible amount of labour has been expended upon the soil, partly in the erection of walls intended to prevent its being washed away by the rains, and to build up the plots of ground in the form of terraces. Watercourses have been constructed for purposes of irrigation, without which at regular intervals the island would not produce a hundredth part of its present yield. These watercourses originate high up in the ravines, are built of masonry or driven through the rock, and wind about for miles until they reach the cultivated land. Some of them are brought by tunnels from the north side of the island through the central crest of hill. Each occupier takes his turn at the running stream for so many hours, day or night, at a time notified to him.

The system of cultivation is primitive. Few of the occupiers own the land they cultivate; but they almost invariably own the walls, cottages and trees, the land alone belonging to the landlord. The tenant practically enjoys fixity of tenure, for the landlord is seldom in a position to pay the price at which the tenant's share is valued. The métayer system regulates almost universally the relations between landlord and tenant, the tenant paying a certain portion of the produce, usually one half or one third. There are few meadows and pastures, the cattle being stall-fed when not feeding on the mountains. Draught labour is performed by oxen.

The two staple products are wine and sugar. The vine was introduced from Cyprus or Crete soon after the discovery of the island by the Portuguese (1420), but it was not actively cultivated until the early part of the 16th century. The wine usually termed Madeira is made from a mixture of black and white grapes, which are also made separately into wines called Tinto and Verdelho, after the names of the grapes. Other wines, known as Bual. Sercial and Malmsey, are made from varieties of grapes bearing the same names. (See MADEIRA WINE.) The sugar cane is said to have been brought from Sicily about 1452. A considerable quantity of spirit, consumed on the island, is made by the distillation of the juice or of the molasses left after extracting the sugar.

The common potato, sweet potato and gourds of various kinds are extensively grown, as well as the *Colocasia* esculenta, the *kalo* of the Pacific islanders, the root of which yields an insipid food. Most of the common table vegetables of Europe are plentiful. Besides apples, pears and peaches, all of poor quality, oranges, lemons, guavas, mangoes, loquats, custard apples, figs, bananas and pineapples are produced. The last two are articles of export.

Population and Administration. — The inhabitants are of Portuguese descent, with probably some intermixture of Moorish and negro blood. Both men and women in the outlying country districts wear the *carapuça,* a small cap made of blue cloth in shape something like a funnel, with the pipe standing upward. The men have trousers of linen, drawn tight, and terminating at the knees; a coarse shirt covered by a short jacket completes their attire. The population increased 20% in the years 1900–20. Many of the able-bodied males emigrate to Brazil or the United States. The density of population (866.8 per sq.mi. in 1950) is great for an agricultural district containing no large town.

Funchal (pop., 1950, 37,035), headquarters of Madeiran commerce and shipping, is described in a separate article. The other chief towns are Camara de Lobos (3,257), Machico (4,734), Santa Cruz, Ponta do Sol and Calheta. Each of these is the capital of a commune (concelho), to which it gives its name. Madeira is connected by regular lines of steamships with Great Britain, Germany, Portugal, Cape Colony, Brazil and the United States.

The archipelago is officially styled the district of Funchal; it returns members to the Portuguese Cortes, and is regarded as an integral part of the kingdom. The district is subdivided into the eight communes already enumerated. Funchal is a Roman Catholic bishopric in the archiepiscopal province of Lisbon.

History. — It has been conjectured, but on insufficient evidence, that the Phoenicians discovered Madeira at an early period. Pliny mentions certain Purple or Mauretanian Islands, the position of which with reference to the Fortunate Islands or Canaries might seem to indicate the Madeiras. There is a romantic story to the effect that two lovers, Robert Machim, a Machin, or Macham, and Anna d'Arfet, fleeing from England to France (c. 1370) were driven out of their course by a violent storm and cast on the coast of Madeira at the place subsequently named Machico, in memory of one of them. João Gonçalvez Zarco first sighted Porto Santo in 1418, having been driven thither by a storm while he was exploring the coast of West Africa. Madeira itself was discovered in 1420. It is probable that the whole archipelago had been explored at an earlier date by Genoese adventurers; for an Italian map dated 1351 (the Laurentian portolano) shows the Madeiras quite clearly, and there is some reason to believe that they were known to the Genoese before 1339. When Zarco visited Madeira in 1420 the islands were uninhabited, but Prince Henry the Navigator at once began their colonization, aided by the knights of the Order of Christ. Sanctioned by the pope and by two charters which the king of Portugal granted in 1430 and 1433, the work proceeded apace; much land was deforested and brought into cultivation, and the Madeiran sugar trade soon became important. Slavery was abolished in Madeira in 1775, by order of Pombal. In 1801 British troops, commanded by Gen. W. C. Beresford, occupied the island for a few months, and it was again under the British flag from 1807 to 1814. It shared in the civil disturbances at the accession of Dom Miguel, but after 1833 was peaceful.

Vahl, *Madeira's* Vegetation (1904); A. S. Brown, Madeira, The Canary Islands, and the Azores (13th ed., 1926).

MADEIRA RIVER in Brazil, is the main affluent of the Amazon (*q.v.*), formed in the northeast corner of Bolivia by the junction of the Mamoré and the Beni (*qq.v.*). The Madeira, which flows north, is the focal point of a riverine complex made up of the Beni, the Mamoré and the Guaporé. These rivers and their tributaries connect eastern Bolivia, part of eastern Peru and western Mato Grosso with the Amazon and the Atlantic. The Beni is navigable from Reyes to the Esperanza rapids near its confluence with the Mamoré. From Riberalta, after passing the rapids, the Beni joins the Mamoré near the town of L'illa Bella. From there they flow northward as the Madeira, constituting the Bolivia-Brazil frontier until uniting with the Abunb. The Mamoré and its tributaries flow across the eastern plains of Bolivia. The Guaporé, or Itenéz, the largest affluent of the Mamoré, rises in Mato Grosso and flows northwest until its confluence with the Mamoré near Puerto Sucre.

The Madeira is 2,012 mi. long from the upper sources of the Mamoré, and the general width is from ½ mi. to 1,000 yd. When the river is at half flood the current flows at about four miles per hour. It is navigable by seagoing vessels most of the year from its mouth near Manaus to the San Antonio falls 807 mi. upstream. This is the first of 19 falls or rapids (cachoeiras) blocking further passage. The Madeira-Mamoré railway, extending for 227 mi. between Pôrto Velho and Guajarb Mirim, provides a link with the upper sources of the Madeira. The rainy season generally commences at the end of October and ends in March. In the dry season its diminution is great and navigation is adversely affected, particularly on the upper reaches of the Madeira's affluents.

The exploration of the Madeira valley began in the 16th century and parts of the region are still unexplored. Notable Portuguese expeditions which ascended the Madeira into Bolivia were those of Francisco de Melo Palheta (1723), and José Gonçalves da Fonseca (1749), who reached Mato Grosso in western Brazil. In the 19th century the Madeira region was explored by José Augustín Palacios (1884), Lardner Gibbon (1853), a U.S. naval officer, Gen. Quintín Quevedo (1861) and José and Francisco Keller (1867–68). Rio da Duvida (River of Doubt), a tributary of the Madeira, was named Río Roosevelt following its exploration by the Roosevelt-Rondon expedition in 1914.

The heavily forested, rainy tropical region through which the Madeira flows is almost uninhabited except for occasional settlements of Indians and *mestizos* who dwell along the banks and gather forest products such as Brazil nuts and rubber.

(J. L. Tr.)

MADEIRA WINE. The Portuguese planted vines in Madeira within a few years of its colonization in 1420, and ordinary unfortified beverage wines were already being exported to Europe by the beginning of the 16th century. The Navigation act of 1663 (which prohibited all exports from France, Spain, Italy and Portugal to any British colony except in a British ship). by exempting Madeira and the Azores, stimulated trade in Madeira. Sugar canes were uprooted and replaced by vines, and sales of wine to British ships and to India, and especially to the West Indies and America, became considerable. In the middle of the 18th century the Madeira merchants discovered that by following the principles used in the making of port wine and adding up to 3% grape brandy both during and after fermentation they produced a wine that pleased the rich settlers of New England and Virginia. (It is such a fortified wine that is produced today.) But in 1852 a vine fungus, oïdium. swept the island and killed almost every plant; the dissolution of the East India company (an important customer) and the opening of the Suez canal, which meant that eastbound ships no longer called at Funchal, also hit the wine trade. Sherry and Marsala captured the market and Madeira never recovered its former prosperity.

However, a small and slowly increasing quantity of high-quality Madeira is still exported, the wines usually being called after the vine that produced them. The most popular are malmsey (*q.v.*), verdelho, bual and sercial. Sercial is a full-bodied but true wine, and the others are richer dessert wines. All are dark brown in colour, with an unmistakable tang or burnt bittersweet flavour. This derives from the process whereby, after the juice has been fermented and partly fortified, it is placed in ovens called *estufas*, the cheaper wines being left for three months at 140° F. and the most expensive ones for six months at 110° F.

Madeira takes several years to mature, and blending of old and young wine is practised to keep the period of maturation to the minimum. It is a very long-lived wine and bottles over 100 years old have been known. "Rainwater" Madeira was light in colour and body and was very popular in Charleston and the southern states, but is now infrequently seen.

See H. Vizetelly, *Facts About Port and Madeira* (1880); A. L. Simon and E. J. Craig, *Madeira* (1933). (C. C. H. F.)

MADERNO (Maderna), **CARLO** (1556–1629), leading Roman architect of the early 17th century, was born at Capolago, near Lugano. From 1603 until his death in 1629 he was chief architect of St. Peter's in Rome.

Maderno built the nave and façade of the church (1607–17). Consonant with the spirit of the Counter-Reformation, Maderno reverted to the scheme of early Christian and medieval cathedrals; by adding the nave he transformed Michelangelo's Greek-cross plan into a longitudinal one. His façade has been both criticized for impairing the effect of Michelangelo's dome and admired for its forceful grouping of huge engaged columns. Besides the façade of Sta. Susanna (1596 ff.) Maderno designed the Palazzo Barberini for the family of Pope Urban VIII (1625). His buildings determined the style of early baroque architecture. The Palazzo Barberini was completed by Francesco Borromini and Giovanni Lorenzo Bernini, whose works were influenced by Maderno.

See Nina Caflisch, *Carlo Maderno* (1934). (W. Lz.)

MADERO, FRANCISCO INDALECIO (1873–1913), Mexican revolutionary leader and president from 1911 to 1913, was born in Parras, Coahuila, on Oct. 30, 1873, the scion of a wealthy landowning family. His education, received in Paris and California, was intended to train him for a career in business and agricultural management. He became a believer in the efficacy of democracy and a devotee of spiritism with its emphasis on human progress.

After five years in Europe, he returned to Mexico in 1893 and for a time devoted himself to agricultural activities; he merits recognition as a leading pioneer in the development of the Laguna cotton region. As a landowner, Madero was known for his disinterested promotion of the well-being of his tenants. Influenced by his democratic ideology, Madero chose politics as his means of serving his countrymen. Prior to the 1905 gubernatorial election in Coahuila he helped organize the Benito Juárez Democratic club and served his apprenticeship as a political writer on its weekly, El *Demdcrata*. Undiscouraged by this unsuccessful effort, hfadero learned that efforts against the dictatorship of Porfirio Diaz (*q.v.*) in individual states would inevitably fail; while awaiting an opportunity for a national democratic movement, he supported and encouraged independent journalists and carried on an extensive correspondence regarding political organization.

It was Diaz himself who inadvertently brought on a renewal of political activity when he stated to the U.S. journalist James Creelman that Mexico was ready for democracy. This declaration prompted a flood of political literature and a flurry of political activity. Madero contributed to the political reawakening by the publication, early in 1909, of his book La *sucesidn presidencial en 1910*, in which he emphasized the problem of militarism and viewed the immediate political situation. Madero helped to organize the Antire-electionist party and became its presidential candidate. His correspondence, organization of political clubs and tireless and courageous campaign travels earned for him the designation of "apostle of democracy." On the eve of the farcical election, Madero was' arrested on charges of fomenting a rebellion and insulting the authorities. Released on bond, he escaped across the border. From San Antonio, Tex., he issued the "Plan of San Luis Potosi," a political document which had as its principal planks effective suffrage and no re-election and which called for the revolution to begin on Nov. 20, 1910. While the initial response was sporadic, Pascual Orozco kept the rebellion alive in Chihuahua. The Diaz government, unsuccessful in the suppression of the movement by military means, undertook successively political reforms and negotiations with the rebels. However, the conflagration continued to spread and after the surrender of Ciudad Juarez a compromise peace was arranged.

For five months the conservative Francisco de la Barra directed an interim government whose mission was to restore order and conduct new elections. Friction occurred between revolutionaries and old regime elements and divisions appeared among the revolutionaries themselves. The presidential election resulted in a sweeping triumph for Madero, who assumed office Nov. 6, 1911. His administration was brief and difficult. He suffered from lack of political experience and was handicapped by his own overly optimistic idealism. Preoccupied with giving the people democratic conditions under which the needed reforms could be effected, Madero was attacked by the entrenched advocates of the old regime who opposed any change and by revolutionary elements nho were insistent on far-reaching social and economic changes. He also had to contend with a hostile press, the harassment of U.S. Ambassador Henry Lane Wilson and a series of armed rebellions. Conservative-inspired movements were led by Bernardo Reyes and Pascual Orozco in the north and by Félix Diaz in Veracruz while Emiliano Zapata led land-hungry peasants in hforelos.

In the light of these overwhelming difficulties, the accomplishments of Madero's administration were not inconsiderable. The press and labour enjoyed freedom; agrarian reform was studied and humble beginnings of change were initiated; education was promoted; and democratic principles were applied. Many believe that Madero was moving or would have moved in the direction that the revolution demanded when, in Feb. 1913, a military revolt broke out in Mexico City. The betrayal of Gen. Victoriano Huerta caused Madero's overthrow. On Feb. 22, 1913, while being transferred to prison, Madero was assassinated by the escort.

In death Madero provided a symbol for revolutionary unity in the continuing struggle against the Huerta regime. His career and martyrdom served as an inspiration and exemplar for the establishment of a democratic polity in Mexico.

MADHAVA ACHARYA (fl. *c.* 1380), Hindu statesman and philosopher, lived at the court of Vijayanagar, the vigorous south Indian kingdom that so long withstood Moslem influence. He had his education under three masters: Vidyatirtha was the most iniportant of them! looked upon as an incarnation of Mahesvara and worshiped by the pupil at Sringeri under the name Vidyasankara; the other teachers were Bharatitirtha and Srikanthanatha. His younger brother Sayana (d. 1387), also a statesman and the minister of four successive Vijayanagar kings, is best known as the commentator of the Vedas; Sayana's commentaries were influenced by Madhava, who patronized the scholars collaborating in his brother's great work. Madhava turned ascetic about 1377 and was thereafter known as Vidyaranya. According to tradition he died in Sringeri in 1386, at the age of 90. He was part author of *Jivanmuktiviveka* and Panchadasi, works of Vedanta philosophy; *Dhatuvritti,* a treatise of Sanskrit grammar; and *Nyayamalavistara,* on the Mimamsa system; as well as the *Parasarasmritivyakhya,* an elaborate comment on the *Parasarasmriti,* adding a chapter on law to those on custom and penance in the original. Madhava Acharya should not be confused with his contemporary Madhavamantrin, statesman, warrior and author, or with a later Madhava, the author of Sarvadarsana *Samgraha* ("Compendium of Speculations"). (K. A. N. S.)

MADHVA (ANASDATIRTHA; PURNAPRAJNA) (*c.* 1199–*c.* 1278). a prominent Hindu philosopher, was born at Rajatapitha near Udipi in south Kanara. Little is known of his life, but 37 Sanskrit works are attributed to him, dealing chiefly with the interpretation of Hindu sacred writings and the explanation of his own theological system.

According to Madhva, Vishnu (Krishna) is the one eternal God who rules the world and grants salvation to his devotees. Both souls (jiva) and matter (prakriti) coexist eternally with Vishnu. The individual souls are spiritual beings of atomic size, blissful by nature. As they are from eternity connected with matter and subject to the law of retribution for their deeds (karma), they wander about in bodies of angels (deva), men, animals and infernal beings, subject to pain and suffering. The inanimate world originates from primordial matter, out of which all elements and the organs and bodies of the souls are produced by evolution. The aim of man must therefore be to become free from impurities, ignorance, passion, karma and matter. The means of salvation is the grace of Vishnu, who predestines the souls to deliverance, permanent transmigration or eternal damnation in hell.

Madhva's teaching differs in two points from that of other Vedantins who like him base their doctrines on the Upanishads, the Bhagavad-Gita and the Brahma sutras: believing in the metaphysical reality of souls and matter, he repudiates all theories which attempt to reduce them to an illusion (maya), and he rejects all pantheistic ideas, as God is only the efficient, not the material, cause of the universe.

Madhva's philosophy is called dvaita ("dualism"), because it acknowledges a difference in kind between God and souls. Salvation therefore consists not in the absorption of the soul into the absolute but in the independent existence of the released in Vishnu's supernatural world.

MADHYA BHARAT, a former state of India, was formed by the union of 25 former princely states of the old Central India agency, with whose western tract (with the exclusion of Bhopal and the addition of Gwalior) it virtually coincides. The states incorporated were Alirajpur, Barwani, Dewas Senior, Dewas Junior, Dhar, Gwalior, Indore, Jaora, Jhabua, Khilchipur, Narsingarh, Rajgarh and Ratlam; and Sailana, Situmau, Jobat, Kathiawara, Khaniadana, Kurwai, Mathwar, Piploda, Muhammadgarh, Pathari and the Bhumia estates of Nimkhera, Jamnia and Rajgarh. The former state was bounded on the north by Rajasthan, on the east by Uttar Pradesh and Madhya Pradesh, on the south by Bhopal and on the west by Bombay. Area 46,478 sq.mi.; pop. (1951) 7,954,154. On Nov. 1, 1956, the state was incorporated as a part of Madhya Pradesh (*q.v.*) by the Reorganization of States act.

The Vindhya and Satpura ranges intersect the region, and the Narbada and the Chambal are the most important rivers flowing through it. Gwalior (pop.. 1951 census, 241,577) was the winter and Indore the summer capital.

Wheat and cotton are produced in great quantity in the black cotton soil of the southern plateau, where the rainfall is heavier and the climate more temperate than in the northern lowlands. Maize, rice, oilseeds, peanuts, sugar cane and fruit are important products Textiles, oil, matches, sugar, cement and engineering are the chief industries, and the potteries of Gwalior are well known. Manganese, iron ore and asbestos are found in large quantities.

The union was inaugurated on May 28, 1948. The maharaja of Gwalior was appointed *rajpramukh* for life; the *rajpramukh* governed on the advice of a ministry, and there was a state assembly of 99 members. The administration of the merged states was integrated, and an agreement was reached with the government of India in Sept. 1949 gradually to abolish internal customs duties either within five years or when the sales tax yielded Rs. 20,000,000, whichever was earlier. In Oct. 1951 the ownership of all landed estates was vested in the government, and compensation, equal to eight times the net annual income payable over a period of ten years, was promised to the expropriated landowners.

The region is served by 1,100 mi. of railway, 4,500 mi. of roads and 1.000 mi. of irrigation canals. There are more than 500 hospitals and dispensaries. (S. GL.)

MADHYA PRADESH, the largest state in India, where it occupies part of the central zone. Until the reorganization of the states on Nov. 1, 1956, it was the largest, but it then lost 8 of its 22 districts to Bombay (Akola, Amravati, Bhandara, Buldana, Chanda, Nagpur, Wardha and Yeotmal) and received the former states of Madhya Bharat (except Sunil Tappa of Bhanpura tehsil of Mandsaur district), Bhopal and Vindhya Pradesh, as well as the Sironj subdivision of Kotah district of Rajasthan which was included in the Bhilsa district of Madhya Pradesh. With the dissolution of Bombay in 1960 it regained the rank of largest. The area is 171.210 sq.mi. (formerly 130,272 sq.mi.). Madhya Pradesh is bounded on the north by Uttar Pradesh, on the west by Rajasthan and Bombay, on the south by Andhra Pradesh and on the east by Orissa and Bihar.

PHYSICAL FEATURES

The state comprises a large portion of the broad belt of hills and plateau country which separates the northern plains from the Deccan. From the Chambal river, a stretch of which forms the northwestern boundary with Rajasthan, it rises to the Vindhya mountains and then slopes down to the Narbada valley and rises again in the Satpura range in the south. In the east are to be found some hilly tracts, but that area is in the main composed of open country forming the upper basin of the Mahanadi river. The Narbada, the chief river of Madhya Pradesh, rises in the Maikala hills in the east and flows west along a narro valley between the Vindhya and Satpura ranges. The Son also rises in the Maikala range and flows northwest to the foothills of the Kaimur range where it turns and flows northeast and is joined by parallel tributaries from the south. The Ken river rises in the Bhaurer range north of Jabalpur and flows north to join the Jumna in Uttar Pradesh. Also draining the northern plateau are the Dhasan, Betwa and Sind, all flowing into the Jumna. To the south of the Narbada, the Tapti flows west in a parallel course, after rising in the Mahadeo hills, a continuation of the Satpura range.

Climate. — In climate the Vindhyan and Satpura districts are comparatively temperate; the Narbada valley is hot. The northern tracts enjoy a very pleasant cold season. Except in the tracts nearest Bengal, where the "rains" produce an exceedingly steamy atmosphere, the state has the advantage of a reasonably cool, rainy season, since both the cyclonic storms from the Bay of Bengal and the steady current of the southwest monsoon from the Arabian sea bring it moisture-laden clouds. The annual rainfall varies from 25 in. to 30 in. in the west, from 30 in. to 50 in. in the centre round Bhopal, and from 50 in. to 60 in. in the east. The monsoon period is divided between early rains, often deficient; middle rains, seldom failing completely; and late rains, premature cessation of which frequently causes severe losses.

Jungle Flora and Fauna.—The most outstanding feature of the physiographical aspect of Madhya Pradesh is the vast extent of jungle. Of the great trees of these forests the sal *(Shorea robusta)* is among the most important.

Mammals in the jungle include wild buffalo, gaur (bison), tiger, nilgai, red dog. panther, hyena, sambar, black buck and many other larger kinds of deer, wild pig, wild cat and innumerable monkeys. There are peacocks, jungle fowl, sand grouse, partridges and green pigeon, and many varieties of duck and other waterfowl on the big tanks. Snipe abound in the paddy fields. Crocodiles are to be found in the rivers, and there are cobra and the deadly Russell's viper and krait and many other types of snakes in the forests and plains.

There is an immense variety of insects.

In 1955 the Kanha wildlife sanctuary. 180 mi. N.E of Nagpur, was declared a national park. The park covers 99 sq.mi and is known chiefly for the Indian swamp deer (barasingha), but it also has tiger, leopard, gaur, chital, black buck, sambar and barking deer.

POPULATION

The population in 1959 was estimated at 27,940,000 (pop. [1951] 26,071,637). The capital is Bhopal (pop., 1951, 102,333).

A large proportion of the people are of aboriginal and old Dravidian races, Gonds being the most numerous. *(See* GONDWANA.) The total population of the Adivasis (aboriginals) was 4,015,232 in 1957. This includes the Maria. Muria. Parja and Bhathra tribes in Bastar district, the Pandos and Korwas in Surguja district, the Oraons in Jashpur, the Munda and Korkus in Betul, the Gonds and Baigas in Mandla, and Bhils in Jashpur, Bhopal, Jhabua, Dhar and Nimar. Most of the rest are Hindus.

In Madhya Pradesh as it was at the time of the 1951 census, as many as 377 languages and dialects were mother tongues. The new state boundary lines of 1956 were drawn partly on a basis of language and race.

ECONOMICS

Agriculture.—The large majority of the population is dependent on agriculture, and almost every crop groan in India is to be found in Madhya Pradesh. A line drawn from Satna in the north to Balaghat in the south roughly divides the agriculture of the country. East of that lihe. where the rainfall is heavy, the principal crop is rice; west of it wheat, grain, maize, oilseeds, sugar cane, fruit, tobacco. cotton and jowar (sorghum) are chiefly grown. The Narbada valley and the Vindhyan districts are the great wheat-producing areas; Khargone and Khandwa districts (south of the Narbada) are the great cotton and jowar tracts. But while cotton and jowar are quite insignificant in the rice country, and rice is insignificant west of the Satna-Balaghat line, practically every district in the state contains some heavy black soil areas that produce wheat and cold-weather crops. This variety of soil and cropping affords a certain degree of insurance against capricious rainfall. Rice is the most important cereal; the others are wheat, jowar, maize, barley and pulses and peas of many kinds. There are considerable sugar cane and banana plantations, and oranges and citrus fruits are grown in large quantities. The state as a whole is a surplus area, and production has been increased by long-term planning. Minor irrigation and tank projects were nearing completion in 1956, and a major scheme in Hoshangabad district on the Tawa river was soon to be begun. The latter would irrigate 590,000 ac. and enable an additional annual production of 200.000 tons of food grain. The main cash crops are cotton and sunn hemp; there are also large areas under oilseeds, peanuts, linseed and sesame.

Vast tracts (about 51% of the total area of the state) are under forest, and the state is the largest producer of timber, firewood and minor forest produce in India. Animal husbandry is receiving increasing attention.

Mining and Heavy **Industry.**—Madhya Pradesh is very rich in minerals. and the eastern region is believed to be the most highly mineralized area in the whole country. Systematic geological mapping and surveying had been begun by 1956. The manganese deposits, chiefly in Balaghat district and in the districts of Nagpur and Bhandara now in Bombay state, are among the best in the world. Iron ore is to be found in Durg, Jagdalpur and Saugor districts and in the former Madhya Bharat region (that in Jagdalpur is believed to be of high-grade quality), but mining was not far developed by 1956. The chief coal mines are in Chhindwara and Ambikapur districts; development of those at Korpa had been undertaken by 1956. Limestone is found in large quantities in the Vindhyan ranges and there are bauxite deposits, asbestos and alluvial gold in the state.

The extent and variety of mineral deposits makes Madhya Pradesh an obvious centre of heavy industry. and in 1956 work was begun on the construction of a steel plant at Bhilai in Durg district. Limestone and manganese are to be found in the neighbourhood, and there are large iron deposits at Dalli-Rajara. 50 mi. to the south, and blending coal is available 140 mi. away at Korpa. The U.S.S.R. agreed in 1955 to furnish all the equipment (to be paid for over a period of 12 years) and technical assistance needed for the construction and operation of the steel works. The other major industry in the state is newsprint manufacture. The Nepa mills at Nepanagar in Khandwa district, the first of their kind in India, began production in 1955 using salai wood, which is grown in large quantity in the state.

Other industries include textiles, oil and sugar refining, cement and match manufacturing and engineering. There are old-established potteries at Gwalior.

ADMINISTRATION

The state is divided into seven administrative divisions—Bhopal, Bilaspur. Gwalior. Indore, Jabalpur, Raipur and Rewa. By 1957 it had been decided that a bicameral legislature should take the place of the unicameral administration. (S. GL.)

MADI, a tribe of Negroes who live in the Nile valley along the Bahr el-Jebel south of the Bari. The Madi proper live in Uganda just beyond the Sudan frontier; the Sudan Madi live east of the river. The Madi speak a language belonging to the Madi-Moro group.

The Moro. who live in the Amadi district of the Sudan, speak a dialect of Madi and are called Madi by their neighbours; they erect remarkable megalithic monuments over their dead.

(A. J. AL.)

MADISON, JAMES (1751–1836), 4th president of the United States, often called "the father of the constitution," was born at Port Conway, in King George county, Va., on March 16, 1751. His great-great-grandfather, John hladdison (so spelled), a ship carpenter. came from England to take up 600 ac. in 1653. His father, also named James illadison, was the owner of large estates in Orange county. Va.

In 1769, Madison entered the College of New Jersey (now Princeton university). Graduating in 1771, he remained for another half year pursuing studies under the direction of the college president. John Witherspoon (1723–94). In 1772 he returned to Virginia. where he continued his reading and studies in religion and law. In Dec. 1774, as friction between the colonies and England increased. he was chosen a member of the Orange county committee of public safety of which his father was elected chairman. In the spring of 1776 he was chosen a delegate to the Virginia constitutional convention, where he was on the committee which drafted the declaration of rights and the Virginia constitution; he played a major role in the formulation of the article on religious freedom in the declaration of rights. As the constitution provided that the members of the convention should constitute the house of delegates, Madison became a member of the first Virginia state legislature. But in 1777, largely, it seems, because he refused to treat the electors with rum and punch after the custom of the time) he was not re-elected. In November of the same year he was chosen a member of the privy council or council of state, in which capacity he took a prominent part from Jan. 14, 1778, until the end of 1779, when he was elected a delegate to the continental congress.

As a member of the continental congress during the final stages of the Revolutionary War, he drafted instructions in 1780 to John

Jay, then representing the United States at Madrid, that in negotiations with Spain he should insist upon the free navigation of the Mississippi and upon the principle that the United States succeeded to British rights affirmed by the treaty of Paris of 1763. When the government under the articles of confederation faced collapse because of the failure of the states to respond to requisitions of congress for supplies for the Federal treasury, Madison was among the first to advocate the granting of additional powers to congress, and urged that congress should forbid the states to issue more paper money. In 1781 he favoured an amendment to the articles of confederation giving congress power to enforce its requisitions; and in 1783, in spite of the open opposition of the Virginia legislature, he advocated that the states should grant to congress for 25 years authority to levy an import duty. In the same year he was a member of the committee which reported a skillful compromise on the Virginia proposal as to the terms of cession to the confederation of the unoccupied western territory, held by several states.

When his term in congress expired, in Nov. 1783, Madison returned to Virginia to study law. In the following year he was elected to the house of delegates. As a member of its committee on religion, he opposed giving special privileges to the Episcopal (or any other) Church, and spoke against a general assessment for the support of the churches of the state. His petition of remonstrance against the proposed assessment, drawn up at the suggestion of George Nicholas (c. 1755–99). was widely circulated and procured its defeat. On Dec. 26, 1785. Thomas Jefferson's bill for establishing religious freedom in Virginia, which had been introduced by Madison, was passed. In the Virginia house of delegates, as in the continental congress, he opposed the further issuance of paper money; and he tried to induce the legislature to repeal the law confiscating British debts.

Meanwhile he did not lose sight of the interests of the confederation. His proposal for a conference between Maryland and Virginia relating to the navigation and commerce of the Potomac river led to a meeting of commissioners from the two states in March 1785. When the Maryland legislature proposed to invite Pennsylvania and Delaware to join in an arrangement, Madison. seeing an opportunity for more general agreement, proposed that all the states should be invited to send commissioners to consider commercial questions. 4 resolution to that effect was adopted (Jan. 21, 1786) by the Virginia legislature. This led to the Annapolis convention of 1786, and that in turn led to the Philadelphia convention of 1787.

In April 1787, Madison wrote a paper based on his study of confederacies, ancient and modern, in which he declared that no confederacy could long endure if it acted upon states only and not directly upon individuals. As the time for the convention of 1787 approached, he drew up an outline of a new system of government, the basis of the "Virginia plan," sometimes called the "Randolph plan" because it was presented in the convention by Edmund Randolph.

Madison's scheme, as expressed in a letter to George Washington, April 16, 1787, was that individual sovereignty of states was irreconcilable nith aggregate sovereignty, but that the "consolidation of the whole into one simple republic would be as inexpedient as it is unattainable." He considered as a practical middle ground changing the basis of representation in congress from states to population, thus giving the large states a greater voice. He favoured giving the national government "positive and complete authority in all cases which require uniformity" and a negative authority on all state laws, a power he felt might best be vested in the senate, a comparatively permanent body. He also favoured electing the lower house for a short term; providing for a national executive and national judiciary chosen by the legislature; creating a council to revise all laws, and including an express statement of the right of coercion; and finally, obtaining the ratification of a new constitutional instrument from the people, and not merely from the legislatures.

The "Virginia plan" was the basis of the convention's deliberations which resulted in the constitution favourably voted on by the convention on Sept. 17, 1787. Madison, always an opponent of slavery, disapproved of the compromise (in Art. I, sec. 9 and Art. V) postponing to 1808 (or later) the prohibition of the importation of slaves. He took a leading part in the debates of the convention, of which he kept careful notes, afterwards published by order of congress (3 vol., 1843). He spoke before the convention more frequently than any delegate except James Wilson and Gouverneur Morris.

In spite of the opposition of the Virginia leaders, George Mason and Edmund Randolph, Madison induced the state's delegation to stand by the constitution in the convention. To meet the objections brought against it throughout the country, he joined Alexander Hamilton and John Jay in writing The Federalist, a series of 85 papers, of which 29 (numbers 10, 14, 18. 19, 20, 37 through 58, 62, 63) were written by him. In the Virginia convention for ratifying the constitution (June 1788), when eight states had ratified and it seemed that Virginia's vote would be needed to make the necessary nine, Madison appeared at his best against such opponents of ratification as Patrick Henry, George Mason, James Monroe, Benjamin Harrison, William Grayson and John Tyler. Against an originally adverse public opinion and against the eloquence of the opponents of the constitution, Madison and his associates, Edmund Pendleton, John Marshall, George Nicholas, James Innes and Henry Lee, won a significant victory. At the same time, Madison's labours in behalf of the constitution alienated from him valuable political support in Virginia. He mas defeated by Richard Henry Lee and William Grayson for the U.S. senate, but in his own district he was chosen a representative to congress, defeating James Monroe.

Madison took his seat in the house of representatives in April 1789, and assumed a leading part in the legislation necessary to the organization of the new government. He drafted a tariff bill giving certain notable advantages to nations with which the United States had commercial treaties. hoping to force Great Britain into a similar treaty; but his policy of discrimination against England mas rejected by congress. It was his belief that such a system of retaliation would remove the possibility of war arising from commercial quarrels. He introduced resolutions calling for the establishment of three executive departments — foreign affairs, treasury and war — the head of each to be removable by the president.

Most important of all, Madison proposed nine amendments to the constitution, which were the basis of the Bill of Rights embodied in the first ten amendments. A staunch friend of the constitution. Madison believed that the instrument should not be interpreted loosely. He opposed Hamilton's measures for the funding of the debt, the assumption of state debts and the establishment of a national bank and on other questions. He bided more and more with the opposition, gradually assuming its leadership in the house of representatives and playing a leading role in the formation of the Jeffersonian Republican party. Madison objected to carrying out the recommendations in Hamilton's famous report on manufactures (Dec. 5, 1791), which favoured a protective tariff.

In 1793–96 he strongly criticized the administration for maintaining a neutral position between Great Britain and France. He wrote for the public press five papers (signed "Helvidius"), attacking the "monarchical prerogative of the executive" as exercised in the proclamation of neutrality in 1793 and denying the president's right to recognize foreign states. He found in Washington's attitude an "Anglified complexion," in direct opposition to the popular sympathy with France and French republicanism. In 1794 he again tried his commercial weapons, introducing in the house of representatives resolutions based on Jefferson's report on commerce, advising retaliation against Great Britain and discrimination in commercial and navigation laws in favour of France; and he declared that the friends of Jay's treaty were "a British party systematically aiming at an exclusive connection with the British Government."

In 1797 Madison retired from congress, but not to a life of inactivity. In 1798 he joined Jefferson in opposing the Alien and Sedition laws, and Madison himself wrote the resolutions of the Virginia legislature declaring that the powers of the federal government were limited by the compact to which the states were parties, and affirming that, in case of a "deliberate, palpable and dangerous" exercise of powers, not granted by the constitution, the states had the right and the duty to interpose their power. The Virginia resolutions and the Kentucky resolutions (the latter having been drafted by Jefferson) were met by dissenting resolutions from the New England states, from New York and from Delaware. In answer to these, Madison, who had become a member of the Virginia legislature in the autumn of 1799, wrote for the committee to which they were referred a report elaborating and sustaining in every point the Virginia resolutions.

Madison became secretary of-state upon Jefferson's accession to the presidency in 1801. Because of their close relationship it is difficult to separate their roles in the diplomacy of 1801–09. The great achievement was the purchase of Louisiana, and following it, the success with the Barbary pirates. Their failures were their inability to acquire Florida and the hopelessness of the relationship with England and France.

During eight years as secretary of state, Madison had continually to defend the neutral rights of the United States against the encroachments of European belligerents; in 1806 he published *An Examination of the British Doctrine which subjects to Capture a Neutral Trade not open in Time of Peace*, a careful argument against the doctrine set forth by Great Britain in 1756 and extended in 1793 and 1803.

In 1808 Madison was elected president by 122 electoral votes over his Federalist opponent. Charles C. Pinckney, who received 47 votes. Taking office at a moment of crisis in relations between the United States and Great Britain, the first years of his administration were dominated by problems of foreign affairs. For two years the president did the work of his incapable secretary of state, Robert Smith, who was replaced in 1811 by James Monroe.

While many historians have viewed President Madison as a weak and indecisive executive, pushed hesitantly into war by congress, Madison's most exhaustive and critical biographer, Irving Brant, rejects this verdict. Brant depicts a president who led congress and the nation. When his peace policy of economic coercion failed, he aroused public opinion both to change the complexion of congress in the elections of 1810 and to support the War of 1812. The country, however, was not adequately prepared for war, nor was it united in support of what many called "Mr. Madison's War." Re-elected in 1812 in spite of formidable opposition, Madison grew increasingly unpopular as disaster followed the armies (*see* WAR OF 1812); the New England Federalists called for his resignation and even talked secession. In general, congress was more to blame than either the president or his official family, or the army officers. With the declaration of peace the president again gained a momentary popularity. In the postwar period, Madison assented to a new nationalistic program which included the creation of the Second Bank of the United States and a protective tariff.

Retiring from the presidency in 1817, Madison returned to his home, Montpelier, Orange county, Va., which he was to leave in no official capacity except in 1829, when he was a delegate to the state constitutional convention and served on several of its committees. Madison took an interest in education, in emancipation of slaves, and in agricultural questions, to the last. He died at Montpelier on June 28, 1836.

Madison was married in 1794 to Dolley (or Dolly) Payne Todd (1768–1849), a widow of great social charm. Her plump beauty was often remarked, notably by Washington Irving, in contrast to Madison's delicate figure and wizened face. He was! as Henry Adams wrote, "a small man, quiet, somewhat precise in manner, pleasant, fond of conversation, with a certain mixture of ease and dignity in his address."

Henry Clay, contrasting him with Jefferson, said that Jefferson had more genius, Madison more judgment and common sense; that Jefferson was a visionary and a theorist, Madison, cool, dispassionate, practical and safe. The broadest and most accurate scholar among the "founding fathers," he was particularly an expert in constitutional history and theory.

See also UNITED STATES OF AMERICA: *History*.

BIBLIOGRAPHY.—Madison's life is most competently and exhaustively treated in Irving Brant, *James Madison* (5 vol., 1941–56). Older biographies were written by J. Q. Adams (1850), W. C. Rives (3 vol., 1859–69) covering the period before 1797, S. H. Gay (1884), and Gaillard Hunt (1902). Madison's *Writings* (9 vol., 1900–10) were edited by Hunt, who also edited *The Journal of the Debates in the Convention which framed the Constitution of the United States, as Recorded by James Madison* (1908). *See* also Henry Adams, *History of the United States, 1801–1817* (9 vol., 1889–91); S. F. Bemis, ed., *American Secretaries of State and Their Diplomacy*, iii (1927); N. E. Cunningham, Jr., *The Jeffersonian Republicans* (1958); Adrienne Koch, *Jefferson and Madison: the Great Collaboration* (1950). (N. E. CU.)

MADISON, the capital of Wisconsin, G.S., the seat of Dane county and the University of Wisconsin; lies in the south central part of the state in a rich agricultural region of gently rolling wooded hills. Four lakes linked together by the Yahara river furnish a picturesque site for the city, located on an isthmus between the two largest, Lake Mendota (15.2 sq.mi. in area), and Lake Monona (5.5 sq.mi.). Pop. (1960) city 126.706; standard metropolitan statistical area (Dane county) 221,095. (For comparative population figures *see* table in WISCONSIN: *Population.)* Surrounded by a number of populous communities Madison began a program of annexation about 1940 which by 1958 had trebled its area and accounts in part for the population increase. Two independent residential villages, Maple Bluff and Shorewood Hills, lie within Madison's boundaries. Middleton borders it on the northwest.

History.—Madison was founded in 1836, a year of frenzied speculation in public lands and tomnsites in the newly created Territory of Wisconsin. The pleasant wooded knoll between the lakes caught the eye of one of Wisconsin's most far-sighted and inveterate speculators, James Duane Doty, who laid out a townsite for a company of investors which included Gov. Stevens T. Mason of Michigan. It was named for Pres. James Madison, who had recently died. That fall Doty lobbied a bill through the legislature, which was then meeting at the temporary capital of old Belmont, making Madison the permanent capital. The place was uninhabited but construction was quickly begun on a capitol and late in 1838 the legislature held its first session in the unfinished building. Controversies over the legal title to the townsite and financial stagnation following the panic of 1837 retarded settlement.

In 1846, when a village government was established, the lonely inland community still numbered only 626 inhabitants. Due in large measure to the efforts of Leonard J. Farwell, the "second father of Madison," small industries soon began to move in. The state university opened its doors in 1849, a railroad reached Madison in 1854, and in 1856 the city was incorporated. Its growth thereafter was unspectacular but steady, following the pattern laid down in early years.

The Economy.— Government operations, federal, state, county and city, account for much of the city's prosperity. Federal agencies include the G.S. forest products laboratory, the first of its kind in the world, and the world headquarters for the U.S. Armed Forces institute. The white granite capitol (the third on the site, constructed 1906–17) stands in the centre of the city in a 14-ac. wooded park. Nearby is the county and city building (completed in 1957), and a mile away is the University of Wisconsin, occupying 320 ac. within the city limits and an additional 1,654 ac. in Dane county. (For further discussion of the university *see* WISCONSIN: *Education.)*

Institutional agencies occupy more than a quarter of the land area of the city. This is divided almost equally among three groups: the city, for schools, parks, government buildings; the state and the university; and semi-public organizations such as churches, hospitals and lodges. The number employed by government agencies in Madison exclusive of educational staffs was estimated at 14,000 in the 1960s.

Industries developed substantially after World War I. In the early 1960s the city had more than 150 industrial plants employing more than 12,000 persons. Because of its central location and good transportation facilities, Madison became a jobbing and distributing centre for the wholesale trade. Truax field, used jointly by the city and the U.S. air force, serves as the commercial airport.

Other Facilities. — ?*ladison is noted for its numerous public and parochial schools, its libraries and its hospitals. There are numerous parks and playgrounds, golf courses. bathing beaches, picnic grounds and other forms of recreational areas in the city. The city has a high proportion of professional. managerial and technical personnel. Its people are a middle-income population. (AL. E. SM.)

MADIUN, a regency and town of the province of East Java, Indon. The regency has an area of 443 sq.mi. and a population (19j6 est.) of 468,690. Rice, corn (maize), sugar cane, cassava. coffee, coca, chinchona, coconuts and peanuts are grown. Teak is obtained from the forests. Madiun became a Dutch residency (area, 2,512 sq.mi.) after the rebellion of 1825–30. Occupied by the Japanese during World War II, the residency became part of the Republic of Indonesia after the war. Thereafter it was broken up and the regency of Xladiun created.

Madiun. the capital city, is located on the banks of the Madiun river and has large railway shops and irrigation works. Pop. (1956 est.) 86,713.

MADRAS, a state of India, in the south of the Indian peninsula. It is bounded on the northeast by Andhra Pradesh state, on the northwest by Mysore state and on the southwest by Kerala state. Its area is 50.132 sq.mi. and population (1951 census for post-Nov. 1956 area) 29.974.936. The 1961 census was 33,650,-917. The capital is Madras (*q.v.*). Madras came to enjoy provincial autonomy in 1937 and became a state of the republic of India in 1950. In 1948–49 the area of the state was enlarged by the inclusion into existing districts of three former Madras states. viz., Banganapalle, Pudukkottai and Sandur, but in 1953 it ceded to the newly constituted state of Xndhra 10 of its 25 districts, and at the same time part of the Bellary district was transferred to Mysore state. This reduced the area of Madras state by 67,428 sq.mi. and its population by 21,281.513. A further revision of the state's boundaries was recommended in the report of the States Reorganization commission. 1955. The reorganized state came into existence on Nov. 1. 1956. and according to this arrangement the district of Malabar and the district of South Kanara were transferred to the states of Kerala and Mysore respectively. A part of Coimbatore district was also transferred to Mysore state.

In turn. Madras got a few taluks. south of the former Travancore-Cochin state. These are now constituted into a district by name Kanyakumari. At present, the state has 13 districts, further divided into 101 taluks. The total number of villages is 17,285.

Physical Features. — The state is bounded on the western side by the Western Ghats, on the east by the Bay of Bengal and on the south by the Gulf of Mannar. The vast plain covering the whole of the south and extending up to the eastern coast line comprises the major part of the state; the mountainous region is in the centre and north. The Eastern Ghats enter Madras state from Andhra state in the north and run across the state in a southwesterly direction until they merge with the Nilgiri hills which are connected with the Western Ghats. The highest peak in the Nilgiris is Mt. Dodabetta (8,640 ft.).

The Western Ghats, a steep and rugged range of mountains rise to 8,841 ft. (Amai Mudi peak) and more at certain places, run along the whole length of the western boundary of the state at a distance varying from 50 to 100 mi. from the sea. There is only one gap in the range. the Palghat gap, about 20 mi. wide, 1.000 ft. high, which facilitates communication between the west coast and Madras state.

The most important river in the state is the Cauvery which rises in Coorg in the Western Ghats and after flowing across the Mysore plateau drops into the plains of Madras at the falls at Sivasamudram. With a large tributary system it crosses the peninsula and reaches the Bay of Bengal through an alluvial delta. Other rivers of importance are the Ponnaiyar (or Penner), the Palar, the Vaigai, the Tambraparni and the Netravati. Marine cretaceous deposits are found in three detached areas, near Tiruchirapalli (Trichinopoly), Viruddachalam and Pondicherry.

Climate. — The climate of Madras varies in accordance with the height of the mountain chain on the western coast. Where this chain is lofty, as between Malabar and Coimbatore. the rain clouds are checked and give a rainfall of 150 in. on the side of the sea and only 20 in. on the landward side. Where the range is lower. the rain clouds pass over the hills and carry their moisture to the interior districts. The Nilgiri hills enjoy the climate of a temperate zone, with a moderate rainfall. The clouds on the Western Ghats sometimes obscure the sun for months at a time. Along the eastern coast and central tablelands the rainfall is low and the heat excessive. At Madras, the average rainfall of 50 in. is above the mean.

Flora.—Madras. which can be roughly divided into five main vegetational regions, contains over 4,500 species of flowering plants. In the west and south is dense evergreen forest. The characteristic plant of the sal region, in the north, is the sal tree (*Shorea robusta*) which does not occur south of the Godavari river. In the Deccan region. from the Godavari west and south to Coimbatore, the forest is mainly deciduous with teak (*Tectona grandis*), *Terminalia tomentosa* and *T. coriacea*, etc. In the semi-desert region. stretching roughly from the southern part of Coimbatore to the coastal strip. the vegetation consists of small-leaved thorny trees and shrubs such as *Dalbergia spinosa*, *D. coromandeliana*, *Acacia planifrons*. Characteristic plants of the rich flora of the wet region—the coastal strips. the Western Ghats and the western plain up to about 6.000 ft.—are *Hopea parviflora* and the Indian copal tree (*Vateria indica*); *Xylia xylocarpa* occurs near the coast; teak, rosewood (*Dalbergia latifolia*), *Pterocarpus marsupium*, which provides wood for building and furniture and a medicinal gum-resin called kino. *Terminalia crenulata* and the ornamental *Lagerstroemia lanceolata* are found in the deciduous forest inland; species of Guttiferae. Myrtaceae, Euphorbiaceae. Orchidaceae, etc., grow in the wet forests higher up. and in the dense forest tracts are reedlike bamboos, a profusion of mosses. tree and other ferns, the only indigenous conifer (*Podocarpus latifolius*) and the two tree composites (*Vernonia monosis* and *V. travancorica*). The alpine region in the higher Nilgiris and other ranges, above 6,000 ft.. consists of open grasslands with alpines and small bushes; *e.g.*, the small blue *Parochetus communis* and the big yellow *Hypericum mysorense*. Belts of mangroves and of halophytic chenopods occur in the deltas of both coasts, while on the dry foreshores, where the beefwood tree (*Casuarina equisetifolia*) has been planted, creeping sand-binders include *Hydrophylax maritima*, *Ipomoea biloba*, *Sesamum prostratum* and *Spinifex squarrosus*.

Fauna.—Wild animals include the elephant, bison, sambar and ibex of the Western Ghats and Nilgiris. The elephant is protected by law from indiscriminate destruction. The cattle are small but along the Mysore frontier a superior variety is carefully bred by the wealthier farmers.

HISTORY

Until the British conquest the nhole of southern India had never acknowledged a single ruler. The Tamil country in the extreme south mas traditionally divided between the three kingdoms of Pandya. Chola and Kerala. The nest coast supplied the nucleus of a monarchy which afterward extended over the highlands of Mysore and took its name from the Carnatic. On the northeast the kings of Kalinga at one time ruled over the entire line of seaboard from the Kistna to the Ganges. (*See* INDIA.) The Mohammedan invader first established himself in the south in the beginning of the 14th century.

Ala ud-Din, the second monarch of the Khilji dynasty at Delhi, and his general Malik Kafur conquered the Deccan and overthrew the kingdoms of Karnataka and Telingana. which were then the most powerful in southern India. But after the withdrawal of the Moslem armies the native monarchy of Vijayanagar (*q.v.*), arose out of the ruins.

In 1565 this monarchy was overuhelmed by a combination of the four Mohammedan principalities of the Deccan. At the close of the reign of Aurangzeb, although that emperor nominally extended his sovereignty as far as Cape Comorin. in reality southern

India had again fallen under a number of rulers who owed no regular allegiance. The nizam of the Deccan, virtually an independent sovereign, represented the distant court of Delhi. The most powerful of his subordinates was the nawab of the Carnatic, with his capital at Arcot.

Vasco da Gama cast anchor off Calicut on May 20. 1498, and for a century the Portuguese retained the commerce of India. The Dutch, superseding the Portuguese at the beginning of the 17th century, were quickly followed by the English, who concluded a treaty with the zamorin of Calicut; but no settlement was established until 1664. The Portuguese eventually retired to Goa and the Dutch to the Spice Islands. The first English settlement on the east coast was in 1611, at Masulipatam, even then celebrated for its fabrics. Farther south Fort St. George, the nucleus of Madras city, was erected in 1640. Pondicherry became a French settlement in 1674. The War of the Austrian Succession in Europe lit the first flame of hostility on the Coromandel coast. In 1746 Madras was forced to surrender to Mahé de la Bourdonnais, and Fort St. David remained the only English possession in southern India. By the peace of Aix-la-Chapelle Madras was restored to the English, and English influence was generally able to secure the favour of the rulers of the Carnatic and Tanjore, while the French succeeded in placing their own nominee on the throne at Hyderabad. Robert Clive, whose defense of Arcot in 1751 forms the turning point in Indian history, defeated Joseph Dupleix, and in 1760 the crowning victory of Wandewash was won by Colonel (afterward Sir Eyre) Coote, over the comte de Lally. A year later, despite help from Mysore, Pondicherry was captured.

In 1763 the tract encircling Madras city, then known as the Jagir and now as the Chingleput district, was ceded to the British by the nawab of Xrcot.

In 1765 the Northern Circars, out of which the French had recently been driven. were granted to the East India company by the Mogul emperor. but at the price of an annual payment of £90,000 to the nizam of Hyderabad. Full rights of doininion were not acquired until 1823.

In 1792 Tipu was compelled to cede the Baramahal (now part of Salem district), Malabar and the Dindigul subdivision of Madura. In 1799, on the reconstruction of Mysore state after Tipu's death, Coimbatore and Kanara were appropriated as the British share; and in the same year the Maratha raja of Tanjore resigned the administration of his territory, though his descendant retained titular rank till 185j. In 1800 Bellary and Cuddapah were made over by the nizam of Hyderabad to defray the expense of an increased subsidiary force. In the following year the dominions of the nawab of the Carnatic, extending along the east coast almost continuously from Nellore to Tinnevelly, were resigned into the hands of the British by a puppet who had been put upon the throne for the purpose. The last titular nawab of the Carnatic died in 1885. (See also HYDER ALI.)

After the beginning of the 19th century Madras experienced no regular war, but occasional disturbances called for measures of repression. In 1836 the zamindari of Gumsur in that remote tract was attached by the government for the rebellious conduct of its chief.

In 1879 the country round Rampa on the northern frontier was the scene of riots necessitating calling out the troops. More serious were the "Anti-Shanar riots" of 1899, when the Maravans of Tinnevelly and parts of Madura, resenting the pretensions of the Shanans, a toddy-drawing caste, to a higher social and religious status, organized attacks on Shanan villages. In Aug. 1921, as a result of Rhilafatist agitation, the fanatical Moplahs of Malabar (Moslems of Arab descent) broke out into rebellion; thousands of innocent Hindus were either massacred or forcibly converted to Islam before order was restored (Feb. 1922).

SOCIAL AND ECONOMIC CONDITIONS

Population. — Of the population in 1951 30,558,981 were Hindus. 3,248,608 Mohammedans, 1,432,761 Christians, 32,353 Jains and 461.786 were of other religions. The average death rate was 21.9 and birth rate 32.4j per 1,000. The best-known aboriginal tribe, the Toda (*q.v.*), is found in the Nilgiris. The chief Mohammedan tribes are Labbai, Moplah, Sheikh, Sayad, Pathan and Dudecula.

Broadly speaking, the entire population of Madras belongs to the five linguistic offshoots of the great Dravidian stock dominant throughout southern India. At an early period these races appear to have accepted some form of the Brahmanical or Buddhist faiths. Many storms of conquest later swept over the land, and colonies of Mogul and Maratha origin are to be found here and there. But the evidence of language proves that the ethnical character has remained stable under all these influences and that the Madras Hindu, Mohammedan, Jain and Christian are of the same stock.

Of the five Dravidian languages Tamil is spoken by 24,075,196 persons, Telugu by 3,323,142, Kannada by 1,217,146 and Malayalam by 5,208,587.

Administration. — Formerly a presidency of British India, officially styled the Presidency of Fort St. George, Madras is now a state of the Indian republic, with a local ministry and legislature. For purposes of administration, the state is divided into 13 districts, each under the charge of a collector, with subcollectors and assistants. Local government is organized through panchayats (village committees) and district boards.

The superior court of justice is the high court at Madras, with a chief justice and 8 puisne judges; there are also 19 district and sessions judges for criminal and civil law cases.

The chief educational institutions are the Madras and Annamalai universities founded in 1857 and 1928 respectivcly. In 1957 there were 23,268 recognized public educational institutions with 3,285,-023 pupils.

Agriculture and Forestry. — Over the greater part of Madras artificial irrigation is impossible and cultivation depends upon the local rainfall. The main sources of irrigation are channels, tanks (small man-made lakes) and wells.

Out of the net area cultivated (14,030,000 ac.), 4,500,000 ac. were irrigated in 1956–57. A number of major and minor irrigation schemes have been drawn up.

The principal food staples are rice and cholum, cambu, ragi and varagu (four kinds of millet). The most common oilseed is peanut. Sugar is derived from cane and the sap of palms. The principal fruit trees are coconut. areca nut. jack, tamarind and mango, and other crops include coffee, rubber, tobacco and tea. Cotton is grown mostly in the districts of Coimbatore, Tirunelveli, Ramanathapuram and Madurai, and the greater part of the coffee-growing area is in the Nilgiri hills. The tea plant has also been introduced into the Nilgiri hills. The greater part of the soil is held by the cultivators direct from the government under the tenure known as ryotwari. (See RYOT.)

Of the total population 61.54% were engaged in agriculture according to the 1951 census.

Forests cover a total area of 6,564 sq.mi. Experimental afforestation has received much attention. It has been estimated that in the year 1956–57 forests in Madras state yielded more than 47,400 tons of timber, 146,900 tons of firewood and 1,566 tons of sandalwood. The forests contain teak, ebony, rosewood, sandalwood and redwood trees. There were Iarge-scale plantations of teak, wattle, eucalyptus and cashew in 1957.

Mining and Manufactures. — The mineral wealth of the state is largely undeveloped, though excellent iron has been smelted by local smiths from time immemorial. The principal minerals are mica, barites, gypsum, bauxite, limestone, china clay, magnesite, etc., and a scheme for mining lignite in Neyveli, South Arcot district, was begun in the mid-1950s.

The chief industries in Madras are cotton ginning, spinning and manufacturing, coffee curing, oil pressing, rice curing, ropemaking, sugar refining, tanning, tile and brickmaking, and the manufacture of cement, glass, matches, salt and soap. The railway works are also considerable. A number of new industrial establishments arose in different parts about the middle of the 20th century, including plants for the manufacture of automobiles, bicycles, etc. The Integral Coach factory of the Indian railways is located near Madras city.

Trade and Communications. — The continuous seaboard of

Madras, without any natural harbours of the first rank, has tended to create a widely diffused trade. Madras city conducts nearly one-half of the total sea-borne commerce; then Tirunelveli. with the harbour at Tuticorin, Tanjore and South Arcot. Madras has most of the coastal trade. The chief staples of the export trade are cotton and cotton piece goods, peanuts, hides and skins, tea and coffee, coir manufactures. rice and oil.

The state is well supplied with railways, which naturally have their centre in Madras city, the chief seaport. The broad-gauge line of the Southern railway connects with Bombay and Bangalore and also crosses the peninsula to Kozhikode (Calicut) and Mangalore on the west coast. The total length of railways is over 6,000 mi.. of cement and concrete roads 239 mi., of black-top-surface roads 4,431 mi., of metalled roads 10,274 mi. and of unmetalled roads 8.20; mi.

Love, *Vestiges of Old Madras, 4* vol. (London, 1913); J. S. Gamble, *Flora of the Presidency of Madras, 3* vol. (London, 1915–36).

MADRAS, the capital and the chief port of Madras state, India: is situated on the eastern coast of India. in lat. 13° 4 N., long. 80° 17 E. Nearly 50 sq.mi. in area, it is the largest town in extent in the Indian republic. The population in 1951 was 1,416,056, as compared with 777,481 in 1941.

The city can be reached by sea, air, rail and road. Ships of all countries call at the port, and there is an airport at Minambakkam, on the southern trunk road, a few miles away from the city. Madras is the southern terminus and headquarters of the Indian railways and from it railway lines branch out to all parts of the country. Many important trunk roads also converge on the city. The principal waterways of the city are the Cooum river, which cuts the city into two almost equal halves, the Adyar three miles to the south of the Cooum and the Buckingham canal, which connects the Cooum with the Adyar.

Fort St. George is the centre from which the city has expanded toward the north. south and west. To the north of the fort is George Town, a densely populated block about a mile square, comprising the principal business part of the city with the banks, customshouse and high court. On the sea front are the mercantile offices, the pier and the harbour, and to the south of the fort are the densely populated, centuries-old hamlets of Triplicane and Mylapore, which contain many ancient Hindu temples. To the east of Mylapore is San Thomé. the cathedral which is reputed to contain the tomb of Thomas the apostle. To the south of San Thomé and beyond the Adyar river, is the international headquarters of the Theosophical society. Along the sea front for more than 2 mi.. from San Thomé to Fort St. George, runs the broad Marina, one of the most beautiful promenades in the world. Facing the Marina, are the library, colleges, and offices of the University of Madras, and the government offices. The southern trunk road area beyond the Cooum river and the northern trunk road area are rapidly becoming industrialized and in the former area are situated the offices of several important newspapers, the state legislature buildings and the legislators' hostel. Though the centre of the city and the area around it are congested, its outskirts and suburbs! especially the new housing colonies such as Ayanavaram. Shenoy Nagar, Thyagarayanagar and Gandhi Nagar have a pleasant rural appearance. Viewed from the air, the city looks quite green, since, even in the most congested parts, there are fine trees, gardens and parks. The Madras municipal corporation, the oldest in the east, consists of 81 members, under an elected mayor and deputy mayor, with a paid commissioner as its chief executive. The University of Madras, constituted in 1857 as an examining body, was reorganized in 1923 as a teaching and residential university with a large number of constituent, affiliated and approved colleges throughout the state.

Madras possesses some special industries, the most important of which are the film and textile industries, engineering—structural and mechanical—and automobile and railway coach building. Though entirely artificial, the harbour is thoroughly equipped and has accommodation for 18 vessels, 9 at moorings and 9 at the quays. The depth at the moorings ranges from 28 ft. to 31 ft. 6 in. and at the quays from 26 ft. to 30 ft. The chief exports are seeds, nuts, hides, skins, condiments, textiles, ores, tobacco and vegetable oils.

The chief imports are coal, coke. food grains, mineral oils, metals, timber, textiles, building materials, machinery, hardware, paper, stationery, tanning substances and chemical fertilizers. The chief places of interest are the Marina, the museum. the municipal stadium, the zoo, the agri-horticultural gardens and the Adyar gardens.

History.—The foundation of Madras dates from Feb. 20, 1640, when the English actually settled on land granted to them in 1639 by the local Hindu chief. The building of Fort St. George was started in 1640 and completed in 1653, and a gradually increasing population settled around its walls. From these small beginnings, the city has extended and expanded through three centuries, into a modern city of 50 sq.mi. (J. V. S. R.)

MADRAZO, a family of Spanish artists.

JOSÉ DE MADRAZO Y AGUDO (1781–1859), portrait and history painter and etcher, was born at Santander. April 22. 1781, and died in Madrid, May 8, 1859. A supporter of Charles IV, he followed the king to France after his abdication in 1808 and became a pupil of J. L. David, whose influence shows clearly in his portraits. He went to Rome, and in 1819 returned to Madrid. where he was appointed keeper of the Prado and director of the Academia de San Fernando.

FEDERICO DE MADRAZO Y KUNTZ (1815–1894), portrait and history painter, José's eldest son, was born in Rome. Feb. 9, 1815, and died in Madrid, June 10, 1894. He was a pupil of his father. of the Academia de San Fernando and of F. Winterhalter in Paris (where J. A. D. Ingres was among his portrait subjects). His "Godefroy proclamé roi de Jérusalem" was commissioned for Versailles in 1837. After a long stay in Rome he returned to Madrid as a fashionable portraitist. becoming painter-in-ordinary to the court and in 1859 succeeding his father in the direction of the Prado and the Academia. He was the founder of *El Artista, El Renacimiento, El Sevnanario pintoresco* and other journals.

José's second son, LUIS DE MADRAZO Y KUNTZ (1825–1897), was a successful history painter, and his youngest son, JUAN DE MADRAZO Y KUNTZ (1827–1880), was architect of the English church and other buildings in Madrid. RAIMUNDO DE MADRAZO Y GARRETA (1841–1920), Federico's eldest son and pupil. was a portrait. subject and genre painter who eventually settled in France. Federico's youngest son and pupil. RICARDO DE MADRAZO Y GARRETA (1852–1917), also a pupil of Mariano Fortuny, was a genre painter and sculptor.

MADRE DE DIOS, a montaña department of southeastern Peru, bounded north by Brazil and Loreto, east by Bolivia, west by Cuzco and south by Puno. Area 30,271 sq.mi. Pop. (1955 est.) 33,289. The department, created in 1902, is an isolated region of dense forests subject to periodic inundation. The climate is generally hot and humid with heavy rainfall; however, there is a fairly well-marked dry season from April through September. Economic resources of the department comprise rubber of the high-quality Beni-Acre type, Brazil nuts, medicinal plants and hardwoods. Crops cultivated include rice, cassava, bananas, sugar cane and other tropical commodities.

Puerto Maldonado, pop. (1958 est.) 1,910, capital of the department, is situated at the confluence of the Madre de Dios and Tambopata rivers. It may be reached by air but otherwise transport is by river craft. The population is largely Indian and mestizo with a small colony of Japanese. (J. L. TR.)

MADRE DE DIOS RIVER rises in the Cordillera de Carabaya near Paucartambo in southern Peru and flows 615 mi. north and northeast past Manú in Peru and Puerto Heath on the Peru-Bolivia border to meet the Beni river at Riberalta, Bol. The Beni and bfamore unite northeast of Riberalta to form the Madeira river, one of the major tributaries of the Amazon. In Peru the Madre de Dios flows through the sparsely settled department of Madre de Dios, which has less than 0.4% of the total Peruvian population. The Madre de Dios river is generally navigable for small craft on the upper course but its efficiency, like that of most rivers in eastern Bolivia, is much reduced by rapids and tree trunks. Traffic on the river is interrupted just below Puerto Heath.

During the days of the rubber boom in the Amazon basin there were numerous rubber stations on the Madre de Dios, but after 1912 production ceased to be commercially important. The climate is hot and humid and the entire region is largely covered with virgin forest. There is still some gathering of rubber, balata, chicle and other products along the river's course. In a few small areas there is some unimpressive production of cacao, coffee! cotton, fruits, sugar cane and cassava. Development of this isolated area through which the Madre de Dios flows does not appear likely, but the river is the main communication line with the outside world. (L. WE.)

MADRID, a province of central Spain, formed in 1833 of districts previously included in New Castile, and bounded on the west and north by Ávila and Segovia, east by Guadalajara, southeast by Cuenca and south by Toledo. Pop. (1950) 1,823,410, of whom 1,571,939 inhabited the city of Madrid; area, 3,090 sq.mi. Madrid belongs to the basin of the Tagus, being separated from that of the Douro by the Sierra de Guadarrama on the northwest and north, and by the Sierra de Gredos on the southu-est. Like the rest of Castile, Madrid is chiefly of Tertiary formation; the soil is mostly clayey, but in part sandy. The southeastern districts are the best watered: and produce in abundance fruit, vegetables, wheat, olives, esparto grass and excellent wine. To the north there is timber for fuel and building. The royal domains of the Escorial, Aranjuez and El Prado, and the preserves of the nobility, are wooded and supplied with game. The Sierra de Guadarrama has quarries of granite, lime and gypsum, and is known to contain iron, copper and argentiferous lead. Other industries are chiefly confined to the capital. All the great railways converge in this province, and it contains 221 mi. of line. Besides Madrid! the towns (1950 pop.) of Aranjuez (21,910, mun.), Alcalá de Henares (15,004, mun.) and the Escorial are described in separate articles. Other towns with more than 10,000 inhabitants are Puente de Vallecas, Chamartin, Carabanchel Bajo, Vistalegre-Ventas and Pueblo-Nuevo-Ventas. The population of these towns has been included in the aggregate municipal population of Madrid.

MADRID, the capital of Spain, lies almost in the centre of the Iberian peninsula. Pop. (1897) 397,816; (1950) 1,571,939; (1957 municipal census) 1,910,000.

The highest capital city of Europe, it is situated on the Meseta, an undulating plateau of sand and clay. On the northwest, beyond the Manzanares river (a 50-mi.-long tributary of the Jarama, which flows into the Tagus), the city is bounded by heath and parkland, the former comprising the royal hunting preserves (Casa de Campo); farther north is the Sierra de Guadarrama (7,972 ft.), the inner valleys of which, still fairly well wooded, are much frequented by the *Madrileños*. On the other sides Madrid is surrounded by agricultural land, mostly treeless and bare in appearance, but well cultivated. The highest point in Madrid is 2,373 ft. above sea level. This altitude and the open situation of the town makes it liable to sudden variations of temperature. On the other hand, to these same circumstances Madrid owes its clear, pure atmosphere which makes its climate healthful and reasonably pleasant except in July and August, when the heat becomes oppressive.

The Moorish name of the town (Majrit), first historical evidence of its existence, appears to have been mentioned in 932 when Ramiro II razed its walls but left it in Moorish hands. Traces have been found of a Roman settlement and even some indications of human habitation in prehistoric times. Nevertheless, Madrid must be considered a modern town by Spanish standards, and only gained some claim to fame when Alfonso VII granted it certain privileges. The parliament (*Cortes*) was twice summoned in Madrid (1309 and 1478). Henry III, John IV of Portugal and Henry IV of Castille all spent considerable periods of time in the town. where the latter king died. Philip II, taking into account its central position and healthful surroundings, established his capital there in 1561, a decision generally thought to be transitory. In fact, it mas only in 1607, under Philip III, that Madrid finally attained its present status. It has never become a city. During the War of the Spanish Succession, Madrid took the Bourbon side against the Habsburgs. In 1808 it gave the signal for a mass uprising against the troops of Napoleon, remaining afterward obdurately hostile to his brother Joseph, whom he had placed on the Spanish throne. Ferdinand VII, on his return from imprisonment by Napoleon in 1814, bestowed upon the town the title of "heroic." As a consequence of the political vicissitudes of the 19th and 20th centuries the life of the capital was disturbed more than once. The disturbances remained sporadic until the Spanish civil war of 1936–39, when. as seat of the government, Madrid became the scene of the two-and-a-half years' siege, which ended on March 28, 1939, with the entry of the nationalist troops. All traces of the damage suffered were completely obliterated.

Madrid is the see of a bishopric, the headquarters of an army corps and residence of the captain general of the 1st military region, the focus of the main roads and railways, a banking centre, the seat of a university, of the supreme court and of all branches of the central administration. The head of the state lives in the former royal palace of El Pardo, 9 mi. from the city proper. Economically the importance of Madrid considerably increased. In the 1960s it was the second Spanish industrial town after Barcelona.

Development and General Description.—Madrid has known four well-defined periods of development: the first, under the house of Austria, shortly after having been chosen capital; the second, under Charles III (1759–88), one of the so-called enlightened despots; the third stretching from the end of the reign of Isabella II (1868) to the regency of Maria Cristina of Habsburg (1885–1902); and the last, which includes World Wars I and II, interrupted by the Spanish civil war of 1936–39.

From the first period dates the Plaza Mayor, built in 1619, rectangular in shape and 430 ft. long, ornamented by an equestrian statue of Philip III and two small fountains. It has witnessed many a solemnity, from tournaments to bullfights and autos-da-fé. To the same period also belong the building housing the foreign office. the remnants of the royal palace of El Buen Retiro (an artillery museum) and the town hall. To Charles III are due the Puerta de Alcalá, one of the two city gates worthy of mention (the other being the Puerta de Toledo), the finance ministry and the observatory. He also completed the royal palace, constructed in 1735–64 by Filippo Iuvara and G. B. Sachetti. The middle of the 19th century saw the opening of a new opera house (Teatro Real, 1850), the installation of water mains (1858) and the construction of the square knomn as Puerta del Sol.

José de Salamanca, a prominent banker, gave a new impetus to the extension of Madrid, by planning and financing the fashionable district bearing his name. From 1900 progress continued at a steady but leisurely pace. In 1910 the opening. through a maze of old streets, of the commercial thoroughfare popularly called Gran Vía took place. Roughly one mile long, it became a smart shopping and amusement centre and altogether changed both the face and the tempo of life of central Madrid. Flanked by tall modern buildings including the 14-story telephone exchange, the Gran Via ends at the Plaza de Espaiia, where stand the Cervantes monument and the Espaiia skyscraper, reputed to be the tallest in Europe.

In 1919 the first subway was built. From that time the town's growth has been swift and constant. Between 1947 and 1951 nearly all the outlying suburbs were annexed to the capital and the municipal territory increased tenfold. A planning organization, the Comisaria Superior de Ordenación Urbana, was created. Developments after 1939 included reconstruction of the university city, destroyed during the civil war; new canalization of the Manzanares, thereby reclaiming further land along its banks, where a vast scheme of working-class dwellings, green spaces and artificial beaches has been carried out; the erection of the group of buildings housing the Higher Council for Scientific Research; and the construction of the Barajas international airport, linked with the capital by a magnificent highway. The Castellana avenue was prolonged for nearly a mile, the main roads leading into the town nidened and embellished, a new ring road constructed and several important housing schemes, comprising blocks of flats

(Barrios de la Concepción de la Quintana, del Niño Jesús, etc.) and suburban garden cities (Puerta de Hierro. la Florida). completed. Other municipal developments included an extension of the subway, replacement of streetcars by buses and trolley buses, improvements in sanitation and lighting. and new athletic fields, including the gigantic Chamartín stadium.

In the course of its somewhat haphazard growth Madrid has become the common modern type of sprawling city and has therefore no definite form. the only feature retained of its previous shape being that it still measures rather more from north to south than from east to west.

The Puerta del Sol (reputedly named after a gate, which stood there until 1510 and had on its front a representation of the sun) used to be the centre of Madrid and the busiest spot. Devoid of all architectural interest, it has become peripheral, and several other centres have sprung up in different parts of the town. On the north side of the Puerta stands a square red brick building erected in 1768 as a post office. later the police headquarters. The three-mile-long Calle de Alcalá starts in the Puerta del Sol. It contains the finance and education ministries, a theatre, two churches, nine of Spain's main banks and the Real Academia de Bellas Artes. founded in 1752 as an academy of art and music. Its collection of Spanish masters includes some of the best works of Murillo and Goya.

The Bank of Spain stands where the Calle de Alcalá intersects the Prado, an avenue laid out with gardens and adorned on the right side by the fountain of Apollo and on the left by an obelisk commemorating the rising against Napoleon. The Prado connects two oval plazas in each of which is a fountain one representing Neptune and the other Cybele. At one end of the avenue stand the Prado museum and the Church of St. Jerome (founded by the "Catholic Sovereigns" Ferdinand and Isabella and the scene of royal weddings and ceremonies); at the other the general post office (1916) and the ministry of marine; in the middle the exchange (1894). The Paseo del Prado has great architectural distinction. bounded on one side by a residential quarter including the Retiro gardens, a park with ponds, fountains, monuments and a zoo. A royal palace, built for Philip IV and destroyed during the French occupation. once stood there.

Northward the Prado is continued by the Calvo Sotelo (formerly the Paseo de Recoletos) and the Castellana, in which are the national library, the mint, the Columbus monument, foreign embassies and residences of the aristocracy and the well-to-do.

Near the Puerta del Sol lies the Plaza de Oriente. A statue of Philip IV on horseback, designed by Velázquez, presides over its gardens, the whole dominated by the royal palace. built on an eminence overlooking the Manzanares. It replaces the old Alcizar, nhich burned down on Dec. 28, 1734, and contains richly decorated rooms, a priceless library, collections of tapestries and a famous armoury. Southeast of the plaza and down to the Manzanares stretch the *barrios bajos*, Madrid's most typical and poorest section.

Among the churches the following deserve mention: San Francisco el Grande (18th century, designed by Francesco Sabattini); San Andrés (17th century), one of the finest, which was set on fire by the mob and gutted in 1936; Capilla del Obispo (Gothic and Renaissance. 1520); San Pedro (Hispano-Moorish), built on the site of a mosque; Montserrat (baroque); Comendadoras and San Placido (both 18th century); and, lastly, San Isidro, used as a cathedral since 1885 (built from 1623 to 1665).

Of secular buildings, the following are notable: the Casa de Cisneros (plateresque); the Casa de los Lujanes, where Francis I of France, captured at Pavía. was kept prisoner; and above all the Prado museum, originally planned as a museum of natural science and formally opened in 1819. The building was designed by Juan de Villanueva, as were the entrance to the adjoining botanic gardens and the nearby observatory. In the Prado are exhibited the paintings collected by the Spanish monarchs from the 15th century. representing almost the entire range of western painting, mainly Spanish, Flemish and Italian, up to the 19th century. A new wing was added in 1956. There are 20 other museums in Madrid, some of them first class: archaeological, artillery, naval and decorative arts museums among them. Of the private collections three are outstanding, nameiy the Lázaro Galdiano. Cerralbo and Valencia de Don Juan. The Toledo and Segovia bridges (1735 and 1584) spanning the Manzanares are worthy of note.

'Education and Culture. — Until 1836, when the university founded in Alcalá by Francisco Cardinal Jiménez de Cisneros was transferred to the capital, Madrid had no university of its own. Older existing institutions, such as the Medical College of San Carlos (1786) and the Royal Institute of San Isidro, were merged with it, and the University of Madrid became the foremost university in Spain. Among the buildings in the reconstructed university city are several newly created *colegios mayores* or students' residences. Madrid also contains teachers' training colleges, schools of arts and crafts, a conservatory of music, colleges of agriculture, architecture and engineering, etc. The principal learned societies are the royal academies for the cultivation of the Spanish language, of history, moral science, jurisprudence, medicine and pharmacy, mostly created in the 18th century and later incorporated into a body called the Institute of Spain.

From the time it was made a capital Madrid has had a vigorous and lively cultural life. The atmosphere of the town. its light and colour, the temperament of its people, generous, quick-witted, easygoing, even if perhaps superficial, form the background of the literary trend known as *Madrileñismo*, which extols the capital's charms and explores its past and present; the writers Ramón de Mesonero Romanos, in the 19th century, and later Ramón Gómez de la Serna being its main exponents. The so-called *zarzuela* ("musical comedy") and *saiaete* ("light prose comedy") based on Madrid lore are the outcome of the same feeling.

Industries. — In 1900 Madrid was almost exclusively an administrative and commercial centre. Industries making luxury and fancy goods, pharmaceutical products, leather articles, furniture: etc.. began to develop. After 1940, however, Madrid took its place among Spain's chief industrial cities and there are important factories manufacturing aircraft, radio and electrical equipment of all kinds (including domestic appliances), rubber, plastics, optical equipment, trucks and motor engines.

MADRIGAL is the name given to a form of concerted vocal music, Italian in origin. The earliest school of madrigal writing flourished in northern Italy in the 14th century and is quite distinct from the later one that began about 1530. The early madrigal is a poetical form as well as a musical one, similar to the ballade or ballata, in which two or three strophes of three lines each (iambic pentameters) are followed by a final ritornello of two lines; in each strophe two lines rhyme with one another. For this type of madrigal the suggested derivation from *mandra* ("flock") may nell be correct, since early writers associate it with the *pastourelle* of the troubadours and its subject matter is generally idyllic and contemplative, if not exactly pastoral.

The principal composers to write in this form were Jacopo da Bologna and Giovanni da Cascia (or da Firenze); their settings are for two or three voices, of which the topmost is usually very ornate.

The madrigal was already becoming obsolete by the time of Francesco Landino (c. 1325–97) and it fell into complete oblivion during the 1jth century. When it was revived by the humanistic circle which gathered about Cardinal Pietro Bembo in the early years of the 16th century it is probable that. whatever its original derivation had been, *madrigale* was thought of simply as equivalent to *matricale*, meaning "in the mother tongue"; *i.e.*, Italian and not Latin, for it is applied to poems without any fixed form. The madrigals of this period were intended as a literary return to the more elevated style of antiquity, in contrast to such current forms as the *frottola* and the *strambotto*. The music to which they were set was likewise intentionally dignified, and it drew upon the style of the contemporary sacred motet and upon Josquin des Prés's sonorous chansons; nevertheless the break was not a sudden one, and the first of these madrigals (published in 1533) are still similar to *frottole*.

The earliest group of 16th-century madrigal composers includes Philippe Verdelot, Jacob Arcadelt, Adrian Willaert and Costanzo Festa. It will be noted that northern (French and Flemish) composers preponderate, and it was not until the middle of the century that native Italian composers began to play a large part in the composition of madrigals. Whereas the earlier madrigalists had aimed at a placid, almost abstract, musical accompaniment to the words, Cipriano de Rore, Andrea Gabrieli, Philippe de Monte and Orlando di Lasso cultivated a new and detailed expressiveness, with words such as *acerbo* ("bitter"), *ira* ("anger"), *pianti* ("weepings") underlined by dissonances, and *gioia* ("joy") or *riso* ("laugh") set to swiftly running figures. Although the application of these expressive symbols at times appears naïve, the result was the rapid development of a new musical language, one which had repercussions on the setting of words to music throughout Europe.

The final stage of the Italian madrigal, although it produced much superb music, can be seen as a decline from this intimate fusion of music and poetry. In the hands of composers such as Luca Marenzio, Don Carlos Gesualdo and Claudio Monteverdi the musical language of the madrigal became ever richer and more varied, but with this went a tendency to set stilted and epigrammatic poems of negligible literary value. The increasing independence of the separate voice parts eventually resulted in the complete breakup of the old polyphonic texture; in the later madrigals of Monteverdi, for example, passages for one or more solo voices are punctuated with sonorous passages for the full group, and unity is achieved not by continuity of texture but by the use of an accompanying *basso continuo*. From this type of accompanied madrigal it was a comparatively short step to the cantata, which in the 17th century was to take its place as the most elevated form of secular vocal music.

In France, Germany and Spain, the Italian madrigal made its influence felt on the native forms of secular part song, but nowhere was it so enthusiastically imitated or so completely naturalized as in England. Madrigals had been known in court since the later years of Henry VIII, but it was not until the 1580s that they achieved real popularity. In 1588 Nicholas Yonge was able successfully to publish a large collection of Italian madrigals in English translation under the title *Musica Transalpina,* and similar collections followed it. William Byrd (1542 or 1543–1623) was already a mature artist and was little influenced in his secular music by the Italian style, but his pupil Thomas Morley embraced it wholeheartedly, and even had two of his sets published in an Italian version as well as in the original English. Morley excelled in the lighter and more cheerful types of madrigal, such as canzonets ("little short songs" as he calls them) and ballets: the latter he modeled on the *balletti* of Giovanni Giacomo Gastoldi, but achieved a more elaborate musical development and a stronger sense of harmonic direction. John Wilbye (1574–1638) and Thomas Weelkes (1577?–1623) brought to the English madrigal a new depth of feeling and on occasion a profound melancholy that is not characteristic of the Italian school; Wilbye is the purer stylist, but Weelkes the bolder and more individual.

Of the later English madrigal publications those of Orlando Gibbons and Thomas Tomkins, published in 1612 and 1622 respectively, are the best, but although the fashion for madrigals lasted only about 40 years in England it had in that comparatively short space of time produced a remarkable quantity of fine music.

Uniquely in Europe, it seems, the tradition of madrigal singing was revived in England in the early 18th century. The Madrigal society (founded by John Immyns in 1741, and still in existence) and, less specifically, John C. Pepusch's Academy of Ancient Music kept the practice alive in London, and it also flourished among the lay clerks of cathedral and collegiate churches throughout the country. At these meetings both English and foreign madrigals were sung, together with later compositions written in imitation of their style. In the 19th century there appeared two studies of the madrigal repertory—T. Oliphant's *La Musa Madrigalesca* (London. 1837) and E. F. Rimbault's *Bibliotheca Madrigaliana* (London, 1847), and G. E. P. Arkwright provided both historical studies of the composers and editions of their music in a more scientific way at the beginning of the 20th century. However, it was the work of E. H. Fellowes, above all, that made this repertory available for study and performance; his complete edition of *The English Mudrigal School,* 36 vol. (London, 1913–24) is among the monuments of British musicology; and his book *The English Madrigal Composers,* 2nd ed. (London, 1948), and his edition of the poetic texts in *English Madrigal Verse* (Oxford, 1920) form a worthy complement to it. Fellowes' work led to a widespread revival of madrigal singing in England and the United States.

Studies and editions of the two Italian schools of madrigalists are too scattered and extensive to be listed here, but details of the earlier may be found in any bibliography of the Italian Ars Nova, while an indispensable guide to the later is A. Einstein's *The Italian Madrigal,* 3 vol. (Princeton, Oxford, 1949). Einstein left the vast collection of manuscript scores on which he had based his comprehensive survey to Smith college, Northampton, Mass., where they form a unique library for any student of the subject. A general survey and detailed bibliography may be found in G. Reese, *Music in the Renaissance* (New York and London, 1954). (J. J. N.)

MADRÍZ, a small department in the northwestern part of the Central Highlands in Nicaragua. Area 531 sq.mi. Pop. (1950) 33,178, of which 89% was rural. Somoto, pop. (1950) 2,313, is the largest town and departmental capital. Despite its rugged relief, and because of rather fertile valley soils and 60 or more inches of rain per year, the department is significant in the production of swine, cattle, horses, mules, coffee, brown sugar (panela), cotton, vegetables and subtropical fruits. Until the construction of the Inter-American highway across the department, giving it access to Managua, 136 mi. away, Madriz depended chiefly upon pack and air transportation. (C. F. J.)

MADROÑA *(Arbutus menziesii)*, a handsome North American tree of the heath family *(Ericaceae),* called also madrone, madroño and laurelwood, native to the coast region from British Columbia to southern California. It is a widely branched tree, growing to a height of 125 ft., with a trunk diameter exceeding 4 ft.; polished crimson to dark-brown bark; large, lustrous, dark-green leaves, nearly white beneath; small, heathlike, white flowers in dense clusters; and bright orange-red, berrylike fruit.

MADURA, an island of Indonesia (Dutch MADOERA), lying off the northeast coast of Java, from which it is separated by a shallow strait of less than $1\frac{1}{2}$ mi. It is over 100 mi. long and 24 mi. wide and has an area of 2,113 sq.mi. Pop. 2,000,000. It has an undulating surface, but no mountains, 700 ft. being the greatest elevation in the west and 1,565 ft. that of the east. In the north the hills run down nearly to the sea; in the northwest and south there are extensive alluvial plains, while the south coast is fringed with islets, shoals and mudbanks. The geological formation reveals the relation of Madura to northern Java, since it consists largely of the same limestone rocks, of Tertiary formation, with low alluvial tracts. There are hot springs. Off the eastern coast are several islands—Sapudi, and the Kangean group, Kangean Island being 25 mi. long and from 3 to 15 mi. wide, with hills reaching 1,500 ft.

The climate, flora and fauna of Madura resemble those of east Java. Vegetation is luxuriant, but the soil is not as fertile as the average soil in Java, and one indication of this is that rice has to be imported to meet the needs of the population. Maize and cassava are the main crops, but rice, coconuts, coffee, coca, kapok and most of the usual Malayan fruits and vegetables are grown, and kapok, copra and coconut oil figure largely in exports, also teak, from the extensive forests in the northwest. The island is well adapted for cattle-breeding, which is engaged in extensively, and the wide expanse of coast, well sheltered on the southern side, gives opportunity for a great deal of fishing; the Kangean Islands and Sapudi yield timber, trepang and tortoise shell. The principal industry is salt panning, which is a government monopoly. The salt is obtained from saline springs and from sea water; the largest pans are situated at Kalianget. Manufacture is according to European method and employs many. Production after World War II fluctuated between 130,000 and 320.000 tons. Petroleum has been found and is worked on a small scale. The Madurese (Moslems). who are keen traders, fishermen and sailors but not very good craftsmen, are shorter, but more sturdily built than the Javanese ; they are also more independent. and quick-tempered, but thrifty and hard-working. and their moral standard is high: they have their own peculiar amusements of bullracing and bull-fighting; the races. usually held in the month of September, attract huge crowds. The capital and seat of the resident is Pamekasan, in the central southern part of the island. not far from the coast (pop. 23,121), which has modern buildings, including a hotel. Other towns are Sumenep (pop. 33,628), near which are the tombs of the princes of Sumenep; Bangkalan (pop. 19,8j1), with the old palace of the sultan of Bangkalan, or Madura, and an interesting mosque; Sampang (pop. 15,000); Kamal; and Kalianget. Dutch influence was established in Madura late in the 17th century. and the power of the ambitious prince of Madura was circumscribed by the division of the island into three regencies. bladura (or Bangkalan), Pamekasan. and Sumenep, each having its own prince, or sultan. After much native misrule, the regencies were, in 1885, united under a residency attached to Java. In 1950 Madura became part of the Republic of Indonesia. (E. E. L.)

MADURA (Anglicization of MADURAI), a city and district in Madras state. Republic of India. The city is situated on the right bank of the Vaigai river, and has a station on the Southern railway 345 mi. S.E. of Madras. Pop. (1961) 424.975. In Madura city are a government industrial school and the American college, affiliated to Madras university. Cotton and silk weaving are special industries, with brass work and wood carving.

The city was the capital of the Pandpan dynasty, which ruled over this part of India from the jth century B.C. to the end of the 11th century A.D. The immense rectangular precincts of the Great temple are dominated by ten elaborately carved and coloured gopuras, or gate towers, of which the largest is 152 ft. high. The temple, which contains a "hall of a thousand pillars," is said to have been built in the reign of Viswanath, first ruler of the Nayak dynasty. The splendid palace of Tirumala Nayak, which covers a large area, has been restored and is used for public offices. Also, there are Vasanta, a hall 33 ft. long, and the Tamakam, a pleasure palace.

In 1310 Madura was plundered by a Moslem army under Malik Kafur. It formed part of the empire of Mohammed ibn Tughlak until 1334 when Sayyid Ahsan, the governor of Mabar, revolted and established the independent sultanate of Lladura which after 1378 was absorbed by the Hindu empire of Vijayanagar. In the middle of the 16th century the governor Viswanath established the Nayak dynasty. which lasted for a century. The greatest of the line was Tirumala Nayak (reigned 1623–59), who adorned Madura with many public buildings. and extended his empire over adjoining districts. Later Mohammedans again invaded Lladura and compelled him to pay them tribute, After his death the kingdom of Madura gradually fell to pieces, being invaded by both Mohammedans and Marathas. About 1736 the district fell into the hands of the nawab of the Carnatic, and the line of the Nayaks was extinguished. About 1764 British officers took charge of Lladura in trust for the last independent nawab of the Carnatic, whose son finally ceded his rights of sovereignty to the East India company in 1801.

THE DISTRICT OF MADURA has an area of 4,910 sq.mi. Pop. (1961) 3,204,866. It consists of a section of the plain stretching from the mountains east to the sea, coinciding with the basin of the Vaigai river, and gradually sloping to the southeast. The plain is broken by the outlying spurs of the ghats, rising 8,000 ft. above sea level. They enclose a plateau of about 100 sq.mi. On it is situated the sanatorium of Kodaikanal, and fruit is grown and coffee planting carried on. Other crops are millets, rice, other food grains. oilseeds and cotton. Tobacco is grown chiefly near Dindigul. The Periyar tunnel through the Travancore hills conveys the rainfall across the watershed for irrigation.

MADURESE LANGUAGE, like most languages of Indonesia, is one of the Malayo-Polynesian languages (*q.v.*). It is most closely related to the languages of western Indonesia such as Javanese and Malay. It is the native language of about 8,000,000 Indonesians and thus shares with Malay third position among the languages of the country. Its speakers are distributed mainly over Madura and nearby islands, the Kangean and Sapudi Islands and the section of the eastern peninsula of Java which faces Madura. There are two main dialects: Western Madurese. which has two subdialects with centres respectively at Pamekasan and Bangkalan. and Eastern hladurese with its centre at Sumenep. Madurese has different status styles: the *alos* (literally "fine") for deferential address, the *kasar* (literally "coarse") for familiar address and the *tengngaqan* (literally "middle") for othernise undefined address. The difference between the styles is not as great as that of the Javanese and Sundanese styles.

Madurese is traditionally written in an adapted form of the Javanese alphabet. Madurese formerly was rarely used in writings because of the domination by Javanese princes and then by the Netherlands Indies government. The chief original Madurese writings are some historical norks. the remainder being mainly translations from the Javanese. (I. DN.)

MADVIG, JOHAN NICOLAI (1804–1886), Danish philologist. whose chief work was the study and teaching of Latin and Greek and the improvement of the classical schools, was born on the island of Bornholm on Aug. 7, 1804. He was educated at Frederiksborg and at the University of Copenhagen, where in 1829 he became professor of Latin language and literature. In 1848 Madvig entered parliament and became minister of education and later (1852) director of public instruction. From 1856 to 1863 he was president of the council and leader of the National Liberal party.

Madvig died at Copenhagen on Dec. 12, 1886.

Besides his unsurpassed edition of Cicero's *De finibus* (1839; 3rd ed.. 1876), Madvig published *Der römische Stats Forfatning og Forvaltning,* 2 vol. (1881–82); *Livseringringer* (1887); and many works on Latin grammar and Greek syntax.

See J. E Sandys, *History of Classical Scholarship,* 2nd ed , iii (1908).

MAEBASHI, industrial city and communications centre. is the capital of Gumma prefecture. Japan. The city grew rapidly in size and population after World War II. Pop. (1947) 90,432; (1960) 181,937. Maebashi remains a centre of sericulture and silk-yarn production in spite of the general decline of the silk industry.

An old castle town, in the Muramachi period it was called Umayabashi and in the Tokugawa period it was the seat of the hlatsudaira family. (C. A. MR.)

MAECENAS, GAIUS (CILNIUS), Roman patron of letters. was probably born betneen 74 and 64 B.C., perhaps at Arretium. Expressions in Propertius (ii, 1, 25–30) seem to imply that he had taken some part in the campaigns of Mutina, Philippi and Perusia. He prided himself on his Etruscan lineage and claimed descent from the princely Cilnii of Arretium. His great wealth may have been in part hereditary, but he owed his position and influence to his close connection nith the emperor Augustus He first appears in history in 40 B.C., when he was employed by Octavian in arranging his marriage with Scribonia, and afterward in assisting to negotiate the peace of Brundusium and the reconciliation with Antony. It was in 39 B C. that Horace mas introduced to Maecenas, who had before this received Varius and Virgil into his intimacy. In the "Journey to Brundusium" (Horace. *Satires,* i. 5) in 37, Llaecenas and Cocceius Nerva are described as having been sent on an important mission, and they were successful in patching up, by the treaty of Tarentum, a reconciliation between the two claimants for supreme power. During the Sicilian war against Sextus Pompeius in 36, Maecenas was sent back to Rome and was entrusted with supreme administrative control in the city and in Italy. He was vice-gerent of Octavian during the campaign of Actium, when. with great promptness and secrecy, he crushed the conspiracy of the younger Lepidus; and during the subsequent absences of his chief in the provinces he again held the same position. During the latter years of his life he fell somewhat out of favour with his master.

Maecenas died in 8 B.C., leaving the emperor heir to his wealth.

He seems to have been of great use to Augustus in the establishment of the empire, and was credited with having influenced him towards a humane policy. The best summary of his character as a man and a statesman is that of Velleius Paterculus (ii. 88), who describes him as "of sleepless vigilance in critical emergencies, far-seeing and knowing how to act, but in his relaxation from business more luxurious and effeminate than a woman." His character as a munificent patron of literature has made his name a household word. His patronage was exercised with a political object, and he sought to use the genius of the poets of the day to glorify the new régime. The diversion of Virgil and Horace towards themes of public interest may be ascribed to him, and he endeavoured less successfully to do the same thing with Propertius. The great charm of Maecenas in his relation to the men of genius who formed his circle was his simplicity, cordiality and sincerity. He admitted none but men of worth to his intimacy, and when once admitted they were treated like equals. Much of the wisdom of Maecenas probably lives in the Satires and Epistles of Horace. It has fallen to the lot of no other patron of literature to have his name associated with works of such lasting interest as the Georgics of Virgil, the first three books of Horace's Odes, and the first book of his *Epistles.*

Maecenas himself wrote in both prose and verse. His prose works on various subjects—Prometheus, Symposium (a banquet at which Virgil, Horace and Messalla were present), De *cultu* suo (on his manner of life)—were ridiculed by Augustus, Seneca and Quintilian for their awkward style. Dio Cassius states that Maecenas was the inventor of a system of shorthand.

There is no good modern biography of Maecenas. The best known is that by P. S. Frandsen (1843). See "Horace et Mecène" by J. Girard, in La *Révue politique* et *littéraire* (Dec. 27, 1873); V. Gardthausen, *Augustus* und seine *Zeit,* i. 762 seq.; ii. 432 *seq.* The chief ancient authorities for his life are Horace (Odes with Scholia), Dio Cassius, Tacitus (Annals), Suetonius (*Augustus*). The fragments have been collected and edited by F. Harder (1889).

MAELDUIN or **MAELDUNE, VOYAGE OF,** an early Irish romance. The text exists in an 11th-century redaction, by a certain Aed the Fair, the "chief sage of Ireland," but dates back to the 8th century. It belongs to the group of Irish romance, the Navigations (Imrama), resembling the classical tales of the wanderings of Jason, of Ulysses and of Aeneas. Maelduin, the foster-son of an Irish queen, learnt on reaching manhood that he was the son of a nun, and that his father, Ailill of the edge of battle, had been slain by a marauder from Leix. He set sail to seek his father's murderer, taking with him, in accordance with the instructions of a sorcerer, 17 men. His three foster-brothers swam after him, and were taken on board. This increase of the fateful number caused Maelduin's vengeance to be deferred for three years and seven months, until the last of the intruders had perished. The travellers visited many strange islands, and met with a long series of adventures, some of which are familiar from other sources. The Voyage of St. Brendan (*q.v.*) has very close similarities with the Maelduin, of which it is possibly a clerical imitation, with the important addition of the whale-island episode, which it has in common with "Sindbad the Sailor."

Imram Curaig Mailduin, is preserved, in each case imperfectly, in the Lebor *na* h Uidre, a ms. in the Royal Irish academy, Dublin; and in the Yellow Book of Lecan, ms. H. a16 in the Trinity college library, Dublin; fragments are in Harleian ms. 5,280 and Egerton ms. 1,782 in the British Museum. There are translations by Patrick Joyce, Old Celtic Romances (1879), by Whitley Stokes (a more critical version, printed together with the text) in Revue celtique, vols. ix. and x. (1888–89). See H. Zimmer, "Brendan's Meerfahrt" in Zeitschrift fur deutsch. Altertum., vol. xxxiii. (1889). Tennyson's Voyage of *Maeldune* includes the framework of the romance.

MAELIUS, SPURIUS (d. 439 B.C.), a wealthy Roman plebeian, who during a severe famine bought up a large amount of corn and sold it at a low price to the people. Lucius (or Gaius) Minucius, the patrician praefectus annonae (president of the market), thereupon accused him of courting popularity with a view to making himself king. The cry was taken up. Maelius, summoned before the aged Cincinnatus (specially appointed dictator), refused to appear, and was slain by Gaius Servilius Ahala; his house was razed to the ground, his corn distributed amongst the people, and his property confiscated. The open space called Aequimaelium, on which his house had stood, preserved the memory of his death.

See Livy, iv. 13; Cicero, De senectute 16, De amicitia 8, De *republica,* ii. 27; Florus, i. 26; Dion. Halic. xii. 1.

MAELSTROM, a term originally applied to the Moskenstrom, a strong current running between the islands of Moskenaes and Mosken in the Lofoten Islands off the west coast of Norway. Its power has been much exaggerated though it is dangerous in certain states of wind and tide. The original name occurs on Mercator's Atlas of 1595; the term has been used generically for large whirlpools elsewhere and figuratively for any turmoil of wide-reaching influence. It is probably from Dutch *malen,* "to grind," and *stroom,* "a stream."

MAENAD, one of the female attendants of Dionysus (*q.v.*); they also are called Bacchae, Lenae, Thyiades, Clodones and Mimallones.

MAERLANT, JACOB VAN (c. 1225–*c.* 1291), the pioneer of the didactic poetry which flourished in the Netherlands in the 14th century. A Fleming by birth, he was born in Vrije van Brugge (Damme?). The details of his life are disputed, but he was probably sexton at Maerlant near Brielle on Voorne between 1255 and 1265(?) and was employed by Albrecht van Voorne, Nicholas Cats, lord of North Beveland, and Floris V, count of Holland. About 1266 he became clerk to the court at Damme, where he died shortly after 1291. Maerlant reveals careful education by his intimate knowledge of both Latin and French. His early works were versions of medieval romances—Alexanders *Geesten* (*c.* 1225), based on Gautier de Châtillon's Latin *Alexandreis; Historie* van den *Grale* Merlyn (c. 1260), freely translated from Robert de Borron's early contributions to the Arthurian cycle; *Torec* (c. 1262); and, most important, the *Historie* van Troyen (c. 1264), from the Roman de Troie ascribed to Benoît de Sainte-Maure. These chivalric epic romances belong to the period of Maerlant's contact with the world of nobility, but it is interesting that even in them he shows a tendency to treat his subjects historically and to correct and amplify his sources by reference to Latin texts.

When Maerlant began to write with the definite aim of providing instruction, he turned entirely to Latin sources, writing a scientific compilation, Der Naturen Bloeme (1266–69?), after Thomas of Cantimpré's De natura *rerum;* a life of St. Francis (before 1273), based on Bonaventura; the Rijmbijbel (1271), after Petrus Comestor's *Historia Scolastica;* and, finally, his most important work, *Spieghel* Historiael, an adaptation with additions of his own of Vincent of Beauvais's Speculum *historiale,* begun c. 1282 and completed after his death by Philippe Utenbroeke and Lodewijk van Velthem.

These moralizing rhymed encyclopaedic works were written to satisfy the rising class of commoners who wished for instructive reading in their own language. Among Maerlant's many followers in this kind the most notable were Jan van Boendale, Lodewijk van Velthem and Jan de Weert. His own considerable gifts as a religious poet are also more fully shown in his strophic poems—especially *Wapene* Martijn, a dialogue poem in which he discusses the decadence of the period and treats moral problems with great earnestness—and in his fervent Disputacie van Onser Vrouwen ende *vanden Heilighen Cruce* and Van den *Lande* van Oversee which scourges the laxity of the church and calls for a new crusade.

MAES (MAAS), **NICOLAES** (NICOLAS) (1632–1693), Dutch painter, a follower of Rembrandt, was born at Dordrecht. About 1650 he went to Amsterdam, where he entered Rembrandt's studio. Before his return to Dordrecht in 1654 Maes painted a few Rembrandtesque genre pictures, with life-size figures and in a deep glowing scheme of colour, as in the "Reverie" at the Ryks museum in Amsterdam, the "Card Players" at the National Gallery, London, and the "Children with a Goat Carriage," in the collection of the late J. P. Morgan, New York. In his best period, from 1655 to 1665, Maes devoted himself to domestic genre on a smaller scale, retaining to a great extent the magic of colour he had learned from Rembrandt.

His favourite subjects were women spinning, or reading the Bible, or preparing a meal. He visited Antwerp between 1660 and 1670, and his Antwerp period coincides with a complete change in style and subject. He devoted himself almost exclusively to portraiture, and abandoned the intimacy and glowing colour harmonies of his earlier work for a careless elegance which suggests the influence of Van Dyck. The change gave rise to the theory of the existence of another Maes, of Brussels. Maes is well represented at the National Gallery by five paintings: "The Cradle," "The Dutch Housewife," "The Idle Servant," "The Card Players," and a man's portrait. At Amsterdam, besides the splendid examples to be found at the Ryks museum, is the "Inquisitive Servant" of the Six collection. At Buckingham Palace is "The Idle Servant," and at Apsley House "Selling Milk" and "The Listener." There are examples in New York, Boston, Philadelphia, San Francisco and other American cities.

MAESTRO: *see* WINDS, MOUNTAIN AND LOCAL.

MAETERLINCK, MAURICE (1862–1949), Belgian-French dramatist and poet, of Flemish extraction, was born at Ghent on Aug. 29, 1862. He was educated at the Collège Sainte-Barbe, and then at the university of Ghent. In 1887 he settled in Paris, where he immediately became acquainted with Villiers de l'Isle-Adam and the leaders of the symbolist school of French poetry. At the death of his father, Maeterlinck returned to Belgium, where he thenceforth mainly resided: in the winter at Ghent, in the summer on an estate at Oostacker. His career as an author began in 1889, when he published a volume of verse, *Serres chaudes*, and a play, *La Princesse Maleine*, the latter originally composed in metre, but afterwards rewritten in prose. In 1890 he published, in Brussels, two more plays, *L'Intruse* and *Les Aveugles;* followed in 1891 by *Les Sept princesses.* His strong leaning to mysticism was now explained, or defined, by a translation of the *Adornment of the Spiritual Marriage* of Ruysbroeck (*q.v.*) which Maeterlinck brought out in 1891. In 1892 appeared *Pelléas et Mélisande,* followed in 1894 by those very curious and powerful little dramas written to be performed by marionettes: *Alladine et Palomides, Intérieur* and *La Morte de Tintagiles.* In 1895 Maeterlinck brought out, under the title of *Annabella*, a translation of Ford's *'Tis Pity She's a Whore,* with a preface. Two philosophical works followed. a study on Novalis (1895) and *Le Trésor des humbles* (1896). In 1896 he returned to drama with *Aglavaine et Se'lysette* and to lyric verse with *Douze chansons.* 4 monograph on the ethics of mysticism, entitled *La Sagesse et la destine'e,* was issued, as a kind of commentary on his own dramas, in 1898; and in 1901 Maeterlinck produced a volume of prose, in which philosophy, fancy and natural history were mingled—La *Vie des abeilles.*

The nature of Maeterlinck's early writings, whether in prose or verse, was strictly homogeneous. Whether in philosophy. or drama, or lyric, Maeterlinck was exclusively occupied in revealing, or indicating, the mystery which lies only just out of sight, beneath the surface of ordinary life. In order to produce this effect of the mysterious he aimed at an extreme simplicity of diction, and a symbolism so realistic as to be almost bare. His plays are occupied with the spiritual adventures of souls, and the ordinary facts of time and space have no influence upon the movements of the characters. We know not who these orphan princesses, these blind persons. these pale Arthurian knights, these aged guardians of desolate castles, may be; we are not informed whence they come, nor whither they go; there is nothing concrete or circumstantial about them. Their life is intense and consistent, but it is wholly of a spiritual character; they are mysterious with the mystery of the movements of a soul. In spite of the shadowy action of Maeterlinck's plays, which indeed require some special conditions and contrivances for their performance, they are produced with remarkable success before audiences who cannot be suspected of mysticism, in most of the countries of Europe. His later work, published after he settled in France, presents a marked

Several of his prewar essays, collected in *The Buried Temple* (1902), *The Double Garden* (1909), *Life and Flowers* (1907), and more particularly his book on *Death* (1912). were inspired by a reaction against his early mystic and fatalistic tendencies. The same contrast applies to the spirit of such plays as *Monna Vanna* (1909) and *Mary Magdalene* (1909), in which the action is concentrated in a few important scenes, more according to the Racinian than to the Shakespearian method.

His interest in Shakespeare is nevertheless shown in his essay on King Lear, *Life and Flowers,* and in the translation of *Macbeth* (1910). *The Blue Bird* (1910), produced in 1911, still increased the popularity of the Belgian writer in English-speaking countries. It was followed by *The Betrothal* (1919), produced in London in 1921. Maeterlinck wrote a war play dealing with the German occupation of Belgium, *The Burgomaster of Stilemonde* (1920), produced in London by Sir J. Martin Harvey. *The Miracle of St. Anthony* and *Mountain Paths* appeared in 1919, and *The Cloud that Lifted* and *The Power of the Dead* in 1923. Most of the works of Maurice Maeterlinck have been translated into English.

Maeterlinck was awarded the Nobel prize for literature in 1911. He died May 6. 1949, near Nice, France.

See J Bithell, *Life and Writings of Maurice Maeterlinck,* "Great Writers" (1913); G. F Sturgis, *The Psychology of Maeterlinck as Shown in his dramas* (1914); *M.* Clark, *Maurice Maeterlinck, poet and philosopher* (1915); *H* Meyer-Benfey, *Das Maeterlinck-Buch* (1923).

MAFEKING, a town in the Cape Province, near the frontier of the Bechuanaland Protectorate; 25° 52′ S., 25° 41′ E.; altitude 4,194 ft. Its pop. (1951) of 6,965 makes it the trade centre for the protectorate and the western Transvaal. It is also the headquarters of the railway system between Kimberley and Bulawayo, and is the chief seat of the administration of the Bechuanaland Protectorate. The native town. a separate entity, situated about a mile away. is the chief place of the Barolong tribe, and has a population of about 3.000. The town was besieged by the Boers from Oct. 12, 1899, to May 17, 1900. *(See* SOUTH AFRICAN WAR, 1899–1902.) In memory of those who died in its defense, the English church was erected and also a memorial before the town hall.

MAFFEI, FRANCESCO SCIPIONE, MARCHESE DI (1675–1755), Italian dramatist and scholar, who in his verse tragedy *Merope* (1713) attempted to introduce French classical simplicity into Italian drama, was born at Verona, June 1. 1675. After studying at Parma, he fought in the War of the Spanish Succession. Becoming interested in the archaeology of his native town, he wrote a valuable account of its history and antiquities, *Verona illustrata* (1731–32). He died in Verona, Feb. 11, 1755.

Besides *Merope,* his works include *Teatro italiano,* a collection of 12 plays (1723), translations of the *Iliad* and the *Aenead,* and many scholarly studies.

A modern edition of Maffei's works by A. Avena appeared in 1928.

See G. Gasperoni, *Scipione Maffei e Verona Settecentesca* (1955).

MAFIA (MAFFIA). A word of uncertain origin. anglicized as mafia, used to designate a specific form of criminality which arose on the great landed estates *(latifundia)* of Sicily as a result of bad government during a long period of the island's history, and more especially during the disorders consequent on the Napoleonic invasion of south Italy. Lawless conditions led the owners of large estates to place their lands in the charge of energetic ruffians who exercised almost despotic powers over a terrorized peasantry. The contiguity of the estates enabled these men to form an organization which gradually became very extensive and powerful, so much so that in time it turned against the landowners themselves. The members of the organization were not very numerous. but, bound by close ties of fellowship and capable of any crime, they compelled the landowners to employ persons of their choice, fixed the compensation they claimed for their services, and the rents and price of the lands and of the crops entrusted to their protection. Their activities sometimes extended to neighbouring towns; they made it practically impossible for lands or crops to be sold at open auction, and effectively hindered efforts likely to interfere with their interests.

On the other hand, fierce quarrels of all kinds arose among them leading to terrible acts of revenge, whence the formation of bands of outlaws, at feud among themselves, and all the crimes consequent on outlawry.

A complicated code of traditions regulated the *mafia,* based on so-called *omertà* (from Sicilian omu, man), the obligation never, under any circumstances. to apply for justice to the legally constituted authorities, and never to assist in any way in the detection of crime committed against oneself or others. Absolute silence was required and enforced by ruthless reprisals, the right to avenge injuries being reserved to the victims or their families. Like the Camorra (*q.v.*), the Mafia was soon powerful in various social classes.

After the fall of the local Bourbon monarchy in 1860, the Italian government endeavoured with varying success to rid Sicily of the Mafia; but in the various Sicilian provinces the police authorities continued to tolerate it. When the fascist regime came into power, after 1922, it used its exceptional powers to capture and bring to trial the leaders of the Mafia. In a series of trials at Palermo and neighbouring Termini Imerese, in 1927, the accused, in batches of as many as 150, were brought before the courts; and their victims gave evidence against them. The leaders received life sentences and heavy punishment was meted out to their accomplices. Unfortunately, the fascist government used this occasion to get rid, at the same time, of honest Sicilians strongly opposed to it. And this fact became an advantage for the legend of the Mafia which, although composed of criminals, did not lack in its distant origins a certain chivalrous element, since it had once appeared to many as a force fighting Spanish misrule and feudal abuses.

In spite of all repressive efforts the Mafia persisted. Following World War II the land reforms weakened its power in the rural areas of central and western Sicily. Its strongholds, and its extortionary and other activities were then directed more to industrial, business and construction enterprises.

Organized crime in the Cnited States, some observers have pointed out, bears many resemblances to the Mafia in its philosophy, methods of operation and local organization. In 1950–51, the U.S. senate special crime investigating committee reported that U.S. gangster syndicates had close business relations with the Mafia. Similar allegations were made in 1958 by witnesses before the U.S. senate select committee on improper activities in the labour management field.

Mori, *The Last Struggle with the Mafia* (1933); Frederic Sondern, Jr., *Brotherhood of Evil: the Mafia* (1959). (O. R. A.; T. SN.)

MAFRA, a town of Portugal, 20 mi. N.W. of Lisbon. Pop. (1950) 3,116. Mafra is remarkable for its monastery, church and palace, built by John V in 1717–32 in consequence of a vow to build a convent for the poorest friary of the kingdom—which proved to be a small Franciscan settlement there. The building is in the form of a parallelogram and it is said to be lighted by no fewer than 5,200 windows. The church is sumptuously built of marble and richly adorned with statues and other objects of art. In each of the twin towers there is a chime of 57 bells.

MAGADHA, an ancient kingdom of India. mentioned in the Ramayana and the Mahabharata. It comprised that portion of Behar lying south of the Ganges, with its capital at Pataliputra or Patna. The scene of many incidents in the life of Gautama Buddha. it was a holy land and was also the seat of the Maurya empire founded by Chandragupta Maurya and, later, of the Gupta dynasty. See INDIA: History.

MAGALLANES (Spanish form of Magellan), the southernmost province of Chile, extending from 48° 40' S. to Cape Horn and including the mainland west of the Argentine frontier, the numerous islands fronting the Pacific, the Fuegian archipelago and the western half of Tierra del Fuego (*q.v.*). Pop. (1960) 73,037. Area 52,285 sq.mi. The area to the west of the Andes is one of the most inhospitable regions of the world, with cool rainy conditions prevailing throughout the year. Many of the islands are barren and where forests occur the terrain prevents their commercial exploitation. The channels, fiords, mountains and glaciers make it a region of great scenic beauty. The area east of the Andes, both on the mainland and on Tierra del Fuego, consists of extensive glacial plains covered with tussock grass. Rainfall on these plains nowhere exceeds 40 in. annually.

For three centuries after its discovery by Magellan in 1520 the region was inhabited only by nomadic tribes; of which the chief survivors are the Alacaluf (*q.v.*) in the western channels. In 1843 the settlement of Fuerte Bulnes on the Strait of Magellan established Chile's claim to the area. Six years later Punta Arenas was founded as a penal settlement. The discovery of gold and of the region's pastoral possibilities in the 1880s speeded the occupation of the province. The principal settlements are Punta Arenas (*q.v.*), the provincial capital and chief distributing and administrative centre on the Strait of Magellan, Puerto Natales, serving Ultima Esperanza, and Porvenir, the port of Tierra del Fuego. There are large estancias in the region east of the Andes where an estimated 2,500,000 sheep produce 80% of Chile's wool. Some frozen mutton is exported from four freezing plants to the United Kingdom but central Chile is the major market. The discovery of petroleum in northern Tierra del Fuego at Manantiales widened the economy of the province. (G. J. B.)

MAGAZINE: see PERIODICAL.

MAGDALENA, a department in Colombia. lies on the northern coast between the Magdalena river on the west and the Sierra de Perija and the Guajira peninsula, on the east. Area 18.071 sq.mi. Pop. (1961 est.) 500,640. Much of the terrain is swamp, flood plain or high mountains including the Sierra Nevada de Santa Marta. The department is the oldest government jurisdiction in Colombia; its capital city, Santa Marta (*q.v.;* pop., 1961 est., 62,650), was founded in 1525. In the second half of the 20th century the excellent natural harbour at Santa Marta experienced a boom as the construction of the Atlantic railway neared completion. The new railroad was planned to link Santa Marta with Bogotá via the Magdalena valley. It would connect with existing railroads to other major inland industrial centres. In 1955 the department had 160 small industrial enterprises, but the major economic activity is banana raising in the vicinity of Santa Marta. Very poor transportation facilities within the department limit development outside the Santa Marta area. (R. L. GE.)

MAGDALENA RIVER, rises at the bifurcation of the central and eastern ranges of the Colombian Andes and flows north for 956 mi. to the Caribbean. The major tributaries of the river are the San Jorge, the César and the Cauca (*q.v.*), all of which enter at the northern lowlands and make that area a flood plain with many swamps. The mouth of the Magdalena must be dredged to enable ocean-going vessels to have access to the port of Barranquilla (*q.v.*) near its mouth. Other major river towns from south to north are Neiva, Girardot and Honda. The smaller ports of Puerto Berrio. Puerto M'ilches and Barrancabermeja service adjacent highland areas. The river is navigable by shallow-draft steamboats between Neiva and the sea, interrupted only by the rapids at Honda. The course of the river is quite straight, the current is fast and the depth is subject to sharp variations. November is the month in which steamboat traffic is most liable to interruption.

The Magdalena has been a major commercial artery since the Spanish conquest. From colonial times to mid-19th century, goods were carried in keelboats manned by rivermen (*bogas*) who were as tough and dissolute as those of the Mississippi. Steamboats, first introduced in 1822, were profitably operated only after 18jo when the tobacco boom provided sufficient bulk cargo. The steamboat in the 20th century was subject to competition by air freight and highway, and the end of major steamboat cargo service seemed probable upon completion of the Atlantic railway. See also COLOMBIA: Physical *Geography*. (R. L. GE.)

MAGDALENIAN, in archaeology. the term given the last great major cultural tradition of the Upper (late) Paleolithic stage in Europe, named after a site at La Madeleine, in lower Vézère, France. In England it is found at Cheddar and Kent's cavern. See ARCHAEOLOGY: *Culture* History of the Pleistocene.

MAGDEBURG, a city of Germany, in the district of the same name, capital of the former Prussian province of Saxony. It lies mainly on the left bank of the Elbe. 88 mi. S.W. of Berlin, 177 ft. above sea level. Pop. (1950) 206,305.

Magdeburg. which at the beginning of the 9th century was a small trading settlement on the frontier of Slavonic lands. owes its early importance to Otto I who established the Benedictine monastery of Bergen there about 937. In 962 it became the seat of an archbishop, but the boundaries of the new archbishopric were fixed six years later. It comprised the bishoprics of Havelberg, Brandenbusg, Merseburg, Meissen and Zeitz-Naumburg. The archbishopric played a great part in the germanization of Slavonic lands east of the Elbe-Saale line.

Although burned down in 1188, Magdeburg became a flourishing commercial town during the 13th century, and was an important member of the Hanseatic league. It became celebrated for establishing in the 13th century an autonomous municipal administration, a model of which, known as the "Magdeburg law" (*Magdeburger Recht*), was later widely adopted not only in Germany but also in many countries of eastern Europe.

From the 13th century the citizens were almost constantly at variance with the archbishops, and by the end of the 1jth century had become nearly independent of them but failed to achieve the status of a *Reichsstadt*. Under Archbishop Albrecht, a member of the house of Hohenzollern, Magdeburg embraced the Reformation in 1524 and was thenceforth governed by Prdtestant titular archbishops. During the Thirty Years' War Magdeburg successfully resisted Wallenstein for seven months in 1629, but was taken by storm by Tilly on May 20. 1631. The city was sacked and almost entirely burned, and the great part of its 40,000 inhabitants were butchered. By the peace of Westphalia (1648) the archbishopric was converted into a secular duchy, to fall to the Hohenzollern electorate of Brandenburg on the death of the last administrator (August, of the Saxon house of Wettin), which happened in 1680.

On Nov. 11, 1806, the fortress of Magdeburg surrendered to Napoleon without fighting and until 1813 was part of the kingdom of Westphalia. The fortress, established in the 17th century on an island in the Elbe between the old town and the Friedrichstadt on the right bank of the river. was dismantled in 1912.

The most important building in Magdeburg is the cathedral, dedicated to St. Maurice and St. Catherine. This structure. with two 344-it.-high towers, begun in the 13th and completed in the 16th century, exhibits an interesting blending of Romanesque and Gothic architecture. The Liebfrauenkirche, the oldest church in Magdeburg, is a Romanesque edifice of the 11th century, completed in the 13th century and restored in 1890–91. The Renaissance town hall (*Rathaus*) was built in 1691 and enlarged in 1866. In front of the town hall stood an equestrian statue of Otto I, erected about 1290. With the exception of the Breite Weg and the Otto von Guericke street running from north to south, the streets of the old town are narrow and crooked. Kloster Berge garden, in the south of the city, is situated on the site of the convent of Berge, which was founded in 968 and suppressed in 1809.

Toward the end of World War II Magdeburg suffered heavily from British and C.S. air bombing. Especially devastating was the R.A.F. attack on the night of April 1j–16, 1945, followed by a daylight bombing by the U.S.A.F. On that day 65% of the city was destroyed. Captured on April 18, 1945, by the U.S. army, Magdeburg was later evacuated and included in the Soviet zone. With the exception of the industries little reconstruction was undertaken.

hfagdeburg was before World War II an important industrial centre with ironworks producing armour and varied machinery. Of equal importance were a synthetic oil plant, chemical factories! textile mills and sugar refineries. By the 1960s these and other industries were working again at capacity level.

Six railway lines join in Magdeburg linking the city with Berlin. Dessau. Leipzig. Halberstadt. Helmstedt (Brunswick) and Stendal. Seven arterial highways radiate from the city. The *Autobahn* Berlin-Ruhr crosses the Elbe north of Magdeburg. The city is also a river port, the importance of which greatly increased when the Mittelland canal. linking the Rhine with the Elbe (slightly northnard from Magdeburg), was inaugurated on Oct. 30. 1938. Another system of canals links Magdeburg with Berlin and the lower Oder. This makes Magdeburg the most important inland port of the German Democratic Republic.

MAGEE, WILLIAM (1766–1831), archbishop of Dublin, was born at Enniskillen, County Fermanagh, and educated at Trinity college. Dublin, nhere he was elected fellow in 1788. He was ordained in 1790. His *Discourses on the Scriptural Doctrines of Atonement and Sacrifice* (1801), a polemic against Unitarian theology, was answered by Lant Carpenter. Magee was appointed professor of mathematics and senior fellow of Trinity in 1800, but in 1812 he resigned and in 1813 became dean of Cork. In 1819 he was consecrated bishop of Raphoe. In 1822 the archbishop of Dublin was translated to Armagh, and Magee succeeded him at Dublin. Though generally tolerant. he opposed the movement for Catholic emancipation. He died on Aug. 18, 1831.

See *Works of the Most Reverend William Magee, D D. (1842).*

MAGEE, WILLIAM CONNOR (1821–1891), British divine. vas born at Cork and educated at Trinity college, Dublin. In 1864 he became dean of Cork and chaplain to the lord lieutenant. His remarkable powers were shown in the defense of the Irish church at the time of the disestablishment proposals of 1868, when his brilliant speeches induced Disraeli to offer him the bishopric of Peterborough. He justified his appointment by his magnificent speech when the Disestablishment bill reached the house of lords in 1869. He took up the temperance question, and declared in the house of lords that he would rather see "England free than England compulsorily sober," an utterance nhich the extreme advocates of total abstinence misquoted and attacked. He supported the movement for abolishing the recitation of the Xthanasian creed in the public services of the Church of England Magee took a prominent part in the ritualist controversy, opposing what he conceived to be romanizing excess in ritual, as well as the endeavour of the opposite party to "put donn ritualism." as Disraeli expressed it, by the operation of the civil law. His incisive nay of putting things earned for him the title of the "Militant Bishop." He died on May 5, 1891, about four months after his appointment to the see of York.

See Canon J C MacDonnell, *Life* and *Letters,* 2 vol. *(1896).*

MAGELLAN, FERDINAND (*c.* 1480–1521), the first to undertake a voyage around the globe, was born at Sabrosa in the Villa Real district of the Traz-os-Montes province of Portugal. He was a son of Pedro de Magalhães, and belonged to the fourth order of Portuguese nobility (*fidalgos de cota de armas*). He was brought up as a page of Queen Leonor, consort of King John II the Perfect.

Service in the Indies.—In 1495 he entered the service of Manuel the Fortunate. John's successor, and in 1504 enlisted as a volunteer for the Indian voyage of the first Portuguese viceroy in the east. Francisco de Almeida. He sailed on March 25, 1505; was nounded at Cannanore on March 16, 1506; was then sent with Nuno Vaz Pereira to Sofala to build a Portuguese fortress at that place. He returned to India early in 1508 and was again wounded at the battle of Diu on Feb. 3, 1509. At Cochin (Xug. 19, 1509) he joined Diogo Lopes de Sequeira on his famous voyage intended for the Spice Islands, when the Portuguese almost fell victims to Malay treachery at Malacca. Before Oct. 10, 1510, he had been renarded for his many services with the rank of captain. He again distinguished himself at the taking of Malacca by Albuquerque (July–August 1511), and was then sent on by the viceroy with Antonio d'Abreu to explore the Spice Islands (Moluccas). Leaving Malacca at the end of Dec. 1511, this squadron sailed along the north of Java. passed betneen Java and Madura, left Celebes on their left, coasted by the Gunong Api volcano, touched at Bura and so reached Amboina and Banda. At the last-named they found such abundance of spices that they came straight back to Malacca nithout visiting Ternate. as had been intended.

Fitting Out the Expedition.—Magellan returned to Portugal in 1512. On July 14 of that year he was raised to the rank of *fidalgo escudeiro,* and in 1j13 he accompanied a Portuguese expedition against Azamor in Morocco. The city was taken on Aug. 28–29, 1513, but Magellan was subsequently wounded, and lamed for life. in a sortie; he was also accused of trading with the Moors. The accusation was subsequently dropped, but Magellan fell into disfavour with King Manuel, who let him understand that he mould have no further employment in his country's service (after May 15, 1514). Magellan formally renounced his nationality and went to offer his services to the court of Spain. He reached Seville on Oct. 20, 1517, and thence went to Valladolid to see Charles V. With the help of Juan de Aranda, one of the three chief officials of the India house at Seville, and of other friends, especially Diogo Barbosa, a Portuguese like himself, naturalized as a Spaniard, who had acquired great influence in Seville and whose daughter Magellan now married, he gained the ear of Charles and of the powerful minister Juan Rodriguez de Fonseca, bishop of Burgos, the persistent enemy of Columbus, the steady supporter of his great successor.

Magellan proposed to reach the Spice Islands of the East Indies by the west; for that purpose he hoped to discover a strait at the extreme south of South America, and is said to have declared himself ready to sail southward to 75° to realize his project. Ruy Faleiro the astronomer, another Portuguese exile, aided him in the working out of his plan, and he found an invaluable financial ally in Christopher de Haro, a member of a great Antwerp firm, who owed a grudge to the king of Portugal. On March 22, 1518, Magellan and Faleiro, as joint captains-general, signed an agreement with Charles V., by which one-twentieth of the clear profits were to fall to them; further, the government of any lands discovered was vested in them and their heirs, with the title of *Adelantados*. On Xug. 10, 1519, the fleet of five vessels, under Magellan's command, left Seville and dropped down the Guadalquivir to S. Lucar de Barrameda, at the mouth of the river, where they remained more than five weeks. On Sept. zo, the armada put to sea. Of the vessels which composed it, the "Trinidad" was the flagship, and the "Vittoria" the only one which accomplished the circumnavigation. Antonio Pigafetta of Vicenza, an Italian gentleman who has left the best history of the voyage, went as a volunteer in Magellan's suite. Faleiro stayed behind, having cast his horoscope and found that the venture would be fatal to him. Before starting, Magellan made his will and addressed a memorandum to Charles V., assigning geographical positions connected with the controversy he was intending to settle: viz., the proper drawing of a demarcation-line between the spheres of Spain and Portugal in the East Indies, and the inclusion of the Moluccas within the Spanish sphere.

Passing the Straits.—Steering south-west and calling at Teneriffe (Sept. 26–Oct. 3), Magellan sighted South America at Cape St. Augustine, near Pernambuco on Nov. 29; thence he followed the east coast of the New World down to the La Plata estuary, which he examined in the hope of finding a passage at this point (Jan. 11–Feb. 6, 1520). On March 31, following, he arrived at Port St. Julian (in 49° 20′ S.) where he wintered. Here he crushed a formidable mutiny (April 1–2), and made acquaintance with the natives, whom he called *Patagonians* ("Big Feet"), whose great size and lofty stature are magnified by Pigafetta to gigantic proportions. Leaving Port St. Julian on Aug. 24, 1520, he discovered on Oct. 21, the cape of the Eleven Thousand Virgins, the eastern entrance of the long-sought passage. Through this strait, 360 m. long, often narrow and very tortuous, fringed by snow-clad mountains, he guided his armada for thirty-eight days, weakened by the desertion of one vessel (the "S. Antonio"). On Nov. 21, a council of pilots and captains was held to consider the continuation of the voyage, and on Nov. 28, the fleet rounded Cabo Deseado, the "desired" western terminus of the strait of Magellan. To the south of the passage lay the forbidding land "stark with eternal cold," which from the many fires here observed Magellan named "Tierra del Fuego." The expedition now entered the "Great South Sea," first sighted by Vasco Nuñez de Balboa (*q.v.*), which, from the steady and gentle winds that drove the fleet across the immeasurable expanse, was by Magellan called "Pacific." For ninety-eight days Magellan crossed this sea from Cabo Deseado to the Ladrones. On the whole transit he discovered only two islands, sterile and uninhabited, which he called "St. Paul's" (Jan. 24, 1521) and "Shark Island" (Feb. 3). The explorers had no fresh provisions, little water (and that bad), and putrid biscuit; the ravages of scurvy became terrible. The worst fears of Magellan were realized; ox-hides, sawdust, and rats had to be eaten.

Magellan's Death.—At last, on March 6, 1521, the Ladrones (so named by Magellan from the thievish habits of the natives) came in sight, Guam being probably the first port of call. Here the fleet rested, watered, revictualled and refitted; on March 9 they started again westward; and on March 16 sighted the southern point of Samar Island in the archipelago, since 1542 called the Philippines, but named by Magellan, its first discoverer, after St. Lazarus. On April 7, the squadron arrived at Cebu, south-west of Samar, in the heart of the Philippines; here Magellan contracted a close friendship and alliance with the treacherous native sovereign, who professed Christianity the better to please and utilize his Catholic friends. Undertaking an expedition to conquer, for the Catholic faith and the king of Cebu, the neighbouring island of Mactan, Magellan was killed there in a fight with the islanders (April 27, 1521). The king of Cebu after this got into his power several leaders of the squadron, including Juan Serrano, one of the two admirals elected to replace Magellan, and then murdered them.

The survivors, burning one of the three remaining vessels, left the Philippines, and made their way to the Moluccas (Nov. 6), visiting Borneo on the way (July 9–Sept. 27, 1521). At Tidor a heavy cargo of cloves was taken in; the "Trinidad," becoming leaky, stayed behind with her crew; and the "Vittoria," under Juan Sebastian del Cano, proceeded to Europe alone (Dec. 21, 1521). To double the Cape of Good Hope the "Vittoria" reached between 40° and 41° S. (April 7–16, 1522) and suffered from contrary winds, heavy seas, scurvy and starvation. In the Cape Verde Islands (July 9–15, 1522) 13 of the crew were detained prisoners for a time by the Portuguese. Only 18 men returned with del Cano to Seville in the first vessel that had ever made the tour of the earth. Though Magellan had not quite reached the Spice Islands when he fell at Mactan, his task had then been accomplished. He had already reached and passed the longitude of the Moluccas, where he had already been; the way home from the Philippines by the Indian Ocean and the Cape of Good Hope was perfectly known to the Portuguese, himself included. Magellan's name has never received its due recognition in general history. It ranks with those of Columbus, Marco Polo, and Henry the Navigator. The circumnavigation of the globe is as great an event as the discovery of America. Magellan achieved what Columbus planned—the linking of west Europe with east Asia by direct transit over the western ocean.

Magellan's Straits, the Magellanic clouds (not first observed by him), and Magellan's Land—a name long given to Patagonia and that hypothetical southern continent of which Tierra del Fuego was considered only a portion, and now again bestowed by Chile on her territory in the extreme south—preserve the memory of the first circumnavigator. The largest of the oceans has also kept the flattering name given to it by the man who first crossed it.

Bibliography.—No record of his exploits was left by Magellan himself; and contemporary accounts are less detailed and consistent than could be wished. The best is that of Antonio Pigafetta. a volunteer in the fleet. It is printed in Ramusio, and exists in four early MS. copies. one in Italian and three in French.

Other authorities are: (1) The narrative of an unknown Portuguese in Ramusio's *Navigationi et viaggi;* (2) the *Derrotero* or Log-Book in the Seville Archives, supposed to be the work of Francisco Albo, *contramaestre* of Magellan's flagship, the "Trinidad": this consists mainly of nautical observations; (3) the narrative of the so-called Genoese pilot, written in excellent Portuguese, and printed in vol. iv. of the *Collecão de noticias* of the Lisbon Academy; (4) various *informaciones* and other papers in the Seville Archives, especially bearing on the mutiny; (5) the letter of Maximilian of Transylvania, under-secretary to Charles V, to the cardinal of Salzburg; (6) the references in Correa and Herrera, often based on good information, and adding points of interest to other records. Of these (1)-(3), (5), and an instance of (6) are translated in the Hakluyt Society's volume. Magellan's two wills (i.) executed at Belem on Dec. 17, 1504, on the eve of his departure with Almeida, (ii) executed at Seville on Aug. 24, 1519, just before starting on his voyage round the world, are both of some value for his life

de Magalhães, a trans. of the Spanish life by Fernando de Magalhães Villas Boas (Lisbon, 1881); F. H. H. Guillemard, *Life of Magellan* (London, 1890); *Magellan . . . the original text of the Ambrosian MS.* (of Pigafetta), with English translation, notes, bibliography, etc., by J. A. Robertson (Cleveland, U.S.A., 1906). Before the appearance of this indispensable work, the best edition of Pigafetta had been in vol. iii. part 5 of the *Raccolta di documenti e studi pubblicati nella r. commissione colombiana,* edited by Andrea da Mosto (Rome, Ministry of Public Instruction, 1894). *See* also O. Koelliker, *Die Umsegelung der Erde durch Magellan* (1908); E. Oberhummer, *F. Maghalães, und die Bedeutung der ersten Erdumsegelung* (1921); A. S. Hildebrand, *Magellan* (1925); Plischke, *F. de Maghalães* (1926).

MAGELLAN, STRAIT OF (Spanish ESTRECHO DE MAGALLANES), a channel, named for its discoverer. Ferdinand Magellan (*q.v.*), at the southern extremity of South America between the mainland (Magallanes; *q.v.*) and Tierra del Fuego (*q.v.*). It connects the South Atlantic and Pacific oceans and follows a winding course of about 360 mi. with widths varying from 2 to 20 mi.

MAGELLANIC CLOUDS (named after Ferdinand Magellan), two cloudlike condensations of stars in the southern sky. The Large Cloud is in the constellation Dorado at right ascension 5 hr. 26 min., declination $-69°$; the Small Cloud in Tucana at right ascension 0 hr. 56 min., declination $-73°$. They are two companion galactic systems to the Milky Way, consisting of myriads of stars and many gaseous clouds; they are located at a distance of about 140,000 light-years from the sun, and are visible to the unaided eye for observers located in the southern hemisphere.

MAGENDIE, FRANÇOIS (1783–1855), French physiologist and father of experimental pharmacology, was born at Bordeaux on Oct. 6, 1783. He graduated M.D. at Paris in 1808 and, while prosector of anatomy, demonstrated in 1813 the passive role of the stomach in vomiting and investigated the action of emetics. His pioneer work on the localization of the site of drug action laid the scientific foundation for the introduction into medical practice of such drugs as strychnine and morphine. With P. J. Pelletier he discovered emetine in 1817. His announcement in 1822 that the anterior roots of the spinal nerves are motor in function and the posterior roots sensory led to prolonged controversy with Sir Charles Bell (*q.v.*), who claimed to have made the same discovery in 1811. From 1813 to 1831 Magendie taught experimental physiology privately, being appointed in the latter year professor of medicine at the Collège de France. Elected to membership of the Academy of Sciences in 1821, he was its president in 1837. A superb experimenter and a bold vivisectionist, Magendie founded the *Journal de physiologie expérimentale* (1821–31) and wrote *Précis élémentaire de physiologie* (2 vol., 1816–17) and *Formulaire pour la préparation et l'emploi de plusieurs nouveaux médicaments* (1821). Magendie is commemorated by the "foramen of Magendie" in the brain (1828). He died at Sannois, near Paris, on Oct. 6, 1855.

See J. M. D. Olmsted, *François Magendie* (1945). (WR. R. B.)

MAGENTA, a town of Milano province in Lombardy, Italy. lies 364 ft. above sea level and 16 mi. W. of Milan by rail in an industrial and agricultural region. Pop. (1951) 12,453. The town increased greatly after World War II. Its chief buildings are the cathedral, with a façade of Carrara marble, the commercial high school, the stadium, and the ossuary containing the remains of 9,000 killed at the battle of Magenta (June 4, 1859). There is a public park with a zoological garden. Magenta is a communications centre between Milan and Turin and its chief industry is the making of matches while other factories produce artificial silk and door locks.

Magenta derives its name from Marcus Maxentius, a Roman. general and emperor (306–312), who had his headquarters there, at Castra Maxentia. Historically the battle of Magenta, which resulted in a victory for the Franco-Sardinians under Napoleon III over the Austrians, represented an important step toward Italian national independence. (G. CI.)

MAGGIORE, LAGO, the largest lake in Lombardy, north Italy (Verbanus Lacus of the Romans), area 82 sq.mi., length 41 mi., greatest width 7 mi.. greatest depth 1.220 ft., surface 636 ft. above sea level. The Ticino flows through, north to south. on its way to the Po; the Tosa or Toce comes in on the west from the Val d'Ossola below the Simplon pass, the Tresa enters from the lake of Lugano on the east. The upper end of the lake (16 sq.mi.) is in the Swiss canton of Ticino. Locarno, at the northern or Sniss end. is 14 mi. S.W. of Bellinzona by rail on the St. Gotthard line. On the east shore are Luino and Laveno. On the west shore are (reckoning from north to south) Cannobio, Pallanza. Baveno, Stresa and Arona. Opposite (southeast) Baveno are the famous Borromean Islands (*q.v.*), while southwest of Baveno rises the glorious viewpoint of the Monte Mottarone (4,892 ft.) between Lago Maggiore and the Lake of Orta.

MAGH, a term applied to immigrants from Burma long settled in the southeast districts of Bengal. Apparently of Tai origin, they entered Bengal from Arakan toward the end of the 18th century. Most of them came under Bengali influence, but in the south of the Chittagong Hill tracts, where their culture is comparatively pure, the script and dress are Burmese and the language an Arakanese dialect. Elsewhere the Bengali dress and language prevail The religion of the Arakanese-speaking Maghs is animistic Buddhism. The race is divided into endogamous clans and in modern times there were still strong traces of a political organization under clan chiefs, the most powerful of whom are known as the Bohmong and the Mong Raoja, the former being a lineal descendant of the Mon kings of Pegu. In the hills shifting was still preferred to plow cultivation in modern times, but the villages, containing from 10 to 50 houses, were invariably built on the banks of streams.

The houses were flimsy structures on bamboo piles and a relic of the communal house for men was sometimes found in the form of a roofed platform built at the end of the village street.

See Hutchinson, *Account of the Chittagong Hill Tracts* (1906). (J. P. M.)

MAGIC. The magic art is of ancient lineage and wide distribution. Civilization even yet is not entirely devoid of all elements of magical belief and ritual. But in primitive cultures magic is still a living reality. a serious practical means of commanding success in any critical human undertaking.

PRIMITIVE

The importance of the magic art in primitive culture provoked an extensive theoretical discussion in which such authoritative writers as Tylor. Frazer, Westermarck. Preuss. Hubert and Mauss, Marett, Lehmann. Lowie and Malinowski, took a prominent part. Sir James Frazer, in particular, in his great classical treatise The *Golden Bough*, formulated a distinct and coherent theory of magic on which all subsequent studies were largely built. These various contributions were reviewed by H. Hubert and Marcel Mauss and by R. R. Marett. As a preliminary. the useful distinction drawn by Frazer between magic and religion may be noted, its essence being that magic consists in the direct control by man of the forces of nature, while religion relies upon the propitiation of these and other higher powers.

(1.) **The** Sociology of **Magic.**—Magic, as Frazer so fully showed, is not merely a type of belief or a piece of man's intellectual apparatus, but an art in which theory and dogma at every step are translated into action. It is always a very practical affair. It has to bring rain to crops or game to the nets, to give stability to a house or lightness to a canoe. to inflict or ward off misfortune, disease or death, to win a loved one, to give skill in war, speed in travelling, beauty at the feast or the dance. It is distinctively a human art, in that it is practised only through man's agency and for his benefit. At the same time it involves a recognition of the supernatural, a belief in the power of magic, wielded by man, to turn aside the normal operation of the forces of the external world. Its roots lie in the diversity of human activities; it is a way of handling the forces of nature, of bending them to man's will, of safeguarding his welfare and shaping his destiny.

Magic invests its practitioners with social power. In nearly all communities the magician is the one person who can be compared with the chief in point of influence, prestige and authority. Magic thus acts as a force of social control. The important practices of the craft tend to be carried on largely by special experts, often constituting a distinct class in the community, and these, desiring to ensure the continuity of their knowledge, and prizing it as a thing of great value, transmit it only to their descendants. So magic is appropriated, forms the subject of well defined claims and privileges, and is handed down through families and clans in exclusive possession. The magic art is also of economic interest, since its practitioners are usually remunerated by those who seek their services, while even the transmission of the lore is often a matter for compensation by a substantial payment. Magic on its traditional side is linked by mythology with the dim past of gods and heroes, with the origins of man, and the beginnings of the tribal culture. Legends of the miraculous deeds of ancestors bear witness to the power of the ritual, while their names are frequently cited in charm and spell. (See also FOLK DANCE.)

(2.) Elements of the Magical Art.—As Dr. Bronislaw Malinowski clearly shows, every act of magic is characterized by things said, things done, and a person officiating. Hence the spell, the rite and the condition of the performer are fundamentals.

(i.) The Spell. The spell, the uttering of words according to a formula, *i.e.,* in a set order, is everywhere regarded as the outstanding part of the magical act. In fact by some peoples the word for spell, as the Maori karakia or the Kiriwinian megwa, is used also to mean magic as a whole. The virtue of the magic lies primarily in the formula, which is believed to have been handed down from immemorial antiquity. Hence the insistence upon the correct recital of it, lest variation in the text render the magic of no avail. The customary rigidity of the formula does vary in different communities. Thus among the Polynesians any slip, any omission, any alteration of wording deprived the magic of its efficiency, and in the most important sacred ritual was thought to involve the death of the practitioner from supernatural causes. But elsewhere individual changes of wording within the main frame of the formula are permissible. Nevertheless, it is always well defined by tradition, variations are minor and of a customary kind, and no major extemporization is possible. Since the spell is in fact the backbone of magic, its language is naturally correlated with the aim of the ritual. There are constant references to objects or actions, the mention of which is supposed to influence the desired end. A Maori spell to give speed and grace to a canoe, for instance, speaks of the swiftness of a bird on the wing, the lightness of a sea-gull floating on the water, and gives the names of a number of woods noted for their buoyancy. Metaphor and simile are freely used, while onomatopoeic effect is introduced, as speed-noises or the wailing of the sea. References to traditional and mythological events are frequent, ancestral names are recited, and, coupled with the cryptic and archaic language in which the spell is often couched, are apt to render it obscure to any but those trained in this type of magical lore. Thus magic maintains its bond with tradition.

(ii.) The *Rite.* Accompanying the magical formula is a set of actions, the rite, the primary function of which is to convey the spell to the object which it is desired to affect. Thus when a Maori dart-thrower wished to make a good cast he would spit upon the implement and repeat a charm beginning "Fly forward, my dart, like a meteor in the heavens." Like the spell, the rite is definitely prescribed in form and is often in distinct correspondence with the words uttered. Thus movement described in the spell is carried out or imitated by the performer, substances which produce effects analogous to those desired are handled and mentioned. The sprinkling of water on the ground, for instance, is often part of the magic of rain-making, the destruction of an image by fire accompanies a charm to bewitch an enemy with burning pains. Attractive scents are used in love magic, powdered lime is released by Melanesian sailors in danger from flying witches, to make a magic fog which will blind their pursuit. The rite is thus the vehicle of the spell and its equivalent, the translation of the word into action.

(iii.) Condition of the Performer. Since magic is of such importance the performer must handle it with care. In all communities he is hedged around by taboos; he must refrain from eating certain foods, from casual sexual indulgence, and from other contaminating things. If he fails to conform, then he nullifies the power of his art; breach of taboo, in fact, is the cause most frequently assigned for failure of magic. The emotional attitude of the magician is also of interest. In the rite of black magic which consists in pointing a bone or dart at a victim, the wizard twists and turns the instrument in the air and assumes a state of excitement and fury as if he actually were performing the deed of stabbing his enemy. Dr. Malinowski stresses the importance to the theory of magic of this simulation of the real act; he sees in fact in the sympathetic emotional condition of the performer, the fundamental basis of the art. Magic, for him, is a ritualized expression of an emotional state of desire, which, baulked of its object, nevertheless is constrained to find outlet in speech and gesture. In the spontaneous outburst of word and act lies the germ of spell and rite, in the illusion of subjective experience—the conviction that such actions have really had their effect—rests the foundation of the belief in magical efficiency.

(3.) The Essence of Magical Power.—Dr. Marett ascribes the basic idea of magic to the belief of the native in a vague mysterious power, supernatural and immaterial, animating all things. Hubert and Mauss and Prof. K. Th. Preuss have independently arrived at somewhat the same conclusion. *"Mana,"* it is said, "is the mother-idea of magic." This notion of a mystic impersonal force is held by many primitive peoples, being termed *mana* in parts of the Pacific, hasinu by the Malagasy, and *wakan,* orenda, *pokunt* and *manitou* by various American Indian tribes. But examination of its content shows that it is a concept of an extremely general order. The essence of magical power, on the other hand, is very restricted; it is fixed in man, it is bound by human tradition, it is even localized at times in the body of the wizard. It is not, like *mana,* a universal force latent in all things, which man has taken and utilized for his own ends. The real virtue of magic is embodied in the spell, and to a less extent in the rite. Magic is born of the emotional tension of specific situations; it is not the concrete use of a general abstract concept. The idea of *mana* is certainly closely intertwined with the practice of magic, but they are interlacing stems which spring from a different root.

The value of Marett's contribution to the theory of magic lies in his stress on the emotional aspect of the performance, analysing the state of mind of the savage in his magical experiences. By his psychological treatment he counteracted the tendency to an over-intellectualistic study of primitive beliefs. (See MANA.)

(4.) Magic and Primitive Science.—By Edward Tylor, the great pioneer in anthropology, magic was regarded as developing from the thought-processes of primitive man by mistaken association of ideas, and becoming organized into "an elaborate and systematic pseudo-science." This position has been more explicitly formulated by Sir James Frazer. He advances the view that magic really represents the attempt of man to formulate a body of principles by which the sequence of events throughout the world may be determined. "Magic is a spurious system of natural law as well as a fallacious guide of conduct; it is a false science as well as an abortive art."

The label of "bastard science" affixed by Frazer has not remained unchallenged. Hubert and Mauss, in their study of magic, and Dr. Marett from the psychological side, point out that there are radical differences between the magical and the scientific attitude of man towards his environment. By his analysis of garden magic in Melanesia in conjunction with the actual agricultural operations, Dr. Malinowski shows that the native outlook upon the two is essentially different. Empirical knowledge of soils and plant growth, of wind and weather, is utilized to cope with the known and calculable requirements of the industry; the native is well aware that careful tillage, weeding, repairing of fences and replacement of damaged seed are essential for a good harvest. On the other hand, to secure the right amount of rain and sun, avoid insect pests, or unaccountable failure of the crop, to ward off the ill-luck which sometimes dogs his steps he has recourse to magical aid. So also in canoe-building, fishing, warfare, love-making, the birth of children and matters of health and death, primitive man recognizes both a natural and a supernatural set of conditions, facing the first with rational technique and empirical knowledge, embodied even in rudimentary theoretical laws, the second with the arts of magic. The same duality is to be found in the economic life of the Maori (Raymond Firth) and evidence is accumulating to show that this must be a phenomenon of universal occurrence. Primitive man has his real science, running side by side with his magic. The two are closely bound together in the practical activity, the body of rational knowledge being utilized to deal with the mechanical efficiency of the undertaking, while the ritual of magic deals with the incalculable elements therein, the luck and chance upon which so much of success depends.

It is permissible, then, with Sir James Frazer, to call magic a pseudo-science if the limitations of the term be borne in mind. Magic is akin to primitive science in that it exists to serve very definite, often similar ends, and is possessed of a theory, a system of principles which dictates the manner in which the ritual must be performed. Like science, it has developed a special technique which is handed down from one generation to another. But these resemblances are little more than superficial; the difference is fundamental. Science, even as represented by the rudimentary equipment of the savage, is based on experience, is open to correction by observation and experiment, is ever marked by the thirst for further knowledge and the attempt at a more exact classification and description, a more careful elucidation of the general principles governing the behaviour of the material world. Magic, on the other hand, is governed by tradition, is largely impervious to the lessons of observation, and shows no desire to make profit by experiment. The underlying mental attitude is one of implicit faith, based upon emotional rather than upon rational experience. It is clear, then, that the real roots of science are to be found, not in the magic art of primitive man, but in his rudimentary store of knowledge and his attempts at rational enquiry, stimulated by the practical needs of his technology, into the nature of his physical environment.

(5.) The Continuity of Belief.—It is not difficult to see the hollowness of the pretensions on which magic bases its claim to power. The sky will not really give forth thunder and rain in reply to sympathetic rites, animals do not obligingly come to the hunter through a muttered spell, nor can that *more coy game, woman,* be ensnared by the waving of a wand. Why, then, is not the fallacy of this hocus-pocus exposed, and "the whole monstrous farrago," as Tylor called it, discarded as futile? The answer usually advanced is that the faise ritual of magic does not exist entirely in its own strength, but associated with it are elements of medical skill or political craft of the practitioner, which sustain its reputation when in need. Again, success is bound to come in a large proportion of cases by the mere laws of chance, aided by the shrewdness of the magician in selecting the opportune moment for the exercise of his art. This is helped by the general inability of the human mind to appreciate negative evidence when strong forces of belief are entrenched on the side of an established institution. One success counts more in retrospect than a dozen failures. More important still is what Dr. Malinowski has termed "the current mythology of magic," that is, the stories of prowess which tend to circulate round every magician of influence, exaggerated tales of wonderful cures, of game attracted, of lovers united, of enemies slain by the craft of his spells. These stories reach back into the mists of antiquity, forming a body of instances which can be drawn upon at any moment to vouch for the efficacy of the art. This halo of myth, of magical miracle, is the strength of the belief in magic, its buckler against the assaults of rational experience. The real basis for the continuity of magic, however, lies even deeper in the sphere of its cultural utility.

(6.) The Value of Magic to Man.—Magic is not merely a vain replica of science. Despite the fallacy of its premises and the illusory nature of its claims it possesses a real validity in human life. The magical rites performed in agriculture, for instance, are of undoubted efficacy to the native. By proceeding step by step in close contact with the actual stages of the work, of which it regulates the times and seasons, by imposing taboos, by investing the task with serious import and a supercatural sanction, the magic reinforces order and punctuality within the industry, and acts as a very valuable factor of organization, wielded as it usually is by the expert who has charge of the practical arrangements. Again, the magical ritual enters at the point where man's knowledge and foresight begin to fail, where chance, luck and the incalculable elements of nature begin, where reliance on rational technique can no longer avail. By providing him with a firm belief in his own powers, by promising him control, illusory though it may be, over these all important factors of success, it gives man that much needed psychological backing of confidence and assurance which is so essential to the accomplishment of his desire.

Egyptian.—The processes of Egyptian magic, or *hike* were a spoken formula, which must be exactly as prescribed in order to be efficacious, and an act or gesture, often to be performed at a particular time and under special conditions of place and position. The choice of word and act is based on the doctrine of sympathy and homoeopathy, *i.e.,* the belief that two things which have once been connected may continue to react on each other even when separated, and that like has power to affect like. Thus a burn may be cured by the recitation of the words used by Isis over her son Horus when he was once burnt, and one may cause one's enemy pain by maltreating a wax image of him, indeed the mere knowledge of the Sun-god's name was sufficient to give Isis magical power over him. From similar conceptions arose the belief in protective amulets which assumed such vast importance both for the living and for the dead.

There was no class of professional magicians in Egypt—there is not even a general word for magician. It is not surprising, however, to find that those who exercise the art on a large scale are often priests, and more particularly lector-priests, *i.e.,* those whose business consisted especially in the study and reading of sacred books. At the same time it would seem that magic on a small scale was within the reach of everybody who was prepared to observe the conditions, and to judge from the papyri which have come down to us it must have played a very large part in every day life.

It was used not only to escape death, to drive out disease, to avert the evil eye, to cure a snake bite, but also to drive rats from a barn. and to prevent the approach of a storm: there is even a spell to secure the various advantages summed up in the phrase "to be blessed every day."

diagonals, add up alike, this sum being called the *constant.* Strictly speaking the numbers used should be consecutive from 1 up to n^2, where n is the number of cells (or squares) in any side. Such an arrangement of n^2 numbers is called a square of the nth order. Thus fig. 1 complies with all the conditions and is a magic square of the 3rd order. These squares are of very great antiquity and appear to have been known from very ancient times in China and India, where, as at the present time, magic squares were worn engraved on metal or stone as amulets or talismans.

They appear to have been introduced into Europe early in the Christian era though the first known writer on the subject was Emanuel Moschopoulus, a Greek of uncertain date who lived in Constantinople, probably about 1300. His work in manuscript is in the National Library in Paris (ms. No. 2,428). Cornelius Agrippa (1486–1535) constructed squares of the orders 3, 4, 5, 6, 7, 8, 9, which were associated with the seven astrological

"planets," Saturn, Jupiter, Mars, the Sun, Venus, Mercury and the Moon. The magic square of the 4th order shown in fig. 2 is to be seen in Albrecht Durer's picture of "Melancholy." The date of the work (1514) is indicated in the two central cells of the bottom row, but whether this was intentional or a mere coincidence is not known (see Notes and Queries, Feb.–March 1918). In later times the subject has been investigated as a mathematical curiosity and has a large though scattered literature of its own. The three main lines of enquiry are construction, enumeration and classification.

Construction. — It is convenient to deal with these squares in three classes. Those of an odd order, those of a doubly-even order (that is where n is of the form $4m$) and those of a singly-even order (where n is of the form $2[2m+1]$). These vary in difficulty in their order. The smallest possible square of an odd order is, of course, that of the 3rd order shown in fig. 1, to which there is that one fundamental solution only. Eight different arrangements may be obtained by merely turning the page round and also turning it round in front of a mirror. These so-called reversals and reflections are not usually counted as different. A square of the odd order may immediately be written down in the manner shown in fig. 3, described first by De la Loubère. Here we start at the central cell in the top row and proceed diagonally upwards to the right. As the 2 is outside the square we bring it to the bottom of the column, thus giving it the position it occupies on the outside square. Having written the 3, the 4 falls outside the square, so we insert it at the opposite end of the row and write in the 5. As the next square is occupied by the 1 we write the 6 beneath the 5 and proceed until the 10 falls outside the square and so on. It will be noted that 16 falling outside the square at a corner is written beneath the 15 as in the case of an occupied square. This can be a p plied to any square of an odd order, but, like so many methods that have been adopted, it only produces one type of square, though it may be modified to form a limited number of other squares. Thus we may start with the 1 in any cell and always get a square that

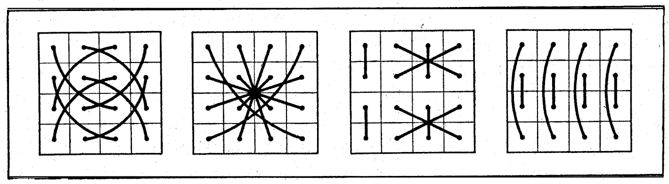
FIGS 7, 8, 9 AND 10.— TYPES OF MAGIC SQUARES OF THE 4TH ORDER

is magic in rows and columns, but not necessarily in the diagonals. Bachet (1612) used a somewhat similar method. Another method devised by De la Hire, may be used for the construction of squares of any order. He employed three subsidiary squares though one of these has been dispensed with by later writers. In fig. 4, the numbers 1, 2, 3, 4, 5, are arranged so that every number appears once and once only in every row and column, and in one diagonal, the other diagonal having repetitions of 3. In fig. 5, the numbers 0, 5, 10, 15, 20, are similarly treated only the repeated 10's are in the other diagonal. These squares superimposed and added produce fig. 6, which is a perfect magic square. Similar methods have been devised for the construction of magic squares and some of these will be found in the books named at the end of this article. But most of the writers on the subject develope their own favourite schemes. It is not difficult to construct squares of particular types but the ideal solution is, of course, a method completely general for squares of every order, that will include every possible arrangement of the order dealt with. Such a solution is probably not discoverable. Magic squares of singly-even orders (such as those where $n=6$, 10, 14, 18, etc.) are generally the most difficult of all to construct and their treatment is largely empirical. Large



FIGS. 11, 12, 13 AND 14.— GRAPHIC SOLUTIONS OF TYPES OF FOURTH ORDER

collections of squares of the higher orders have been compiled by Violle and others, so that examples are easily obtainable.

Classification. — This is a matter of individual taste and may be called the elegant branch of the subject. Taking the case of the 4th order the solutions can all be classified under the four types shown in figs. 7 to 10.

The Nasik square (so named by the Rev. A. H. Frost after the town in India where he lived) is the most perfect type conceivable. Here all the broken diagonals sum to the constant 34. Thus, for example, $15+14+2+3$ and $10+4+7+13$ and $15+5+2+12$. As a consequence its properties are such that if you repeat the square in all directions you may mark off a square 4×4 wherever you please and it will be magic. It should be noted that Nasik squares can be constructed for any doubly-even orders and for any odd orders. But a Nasik square of a singly-even order is impossible. The number of fundamentally different Nasik squares of the 5th order is sixteen.

In the case of the associated squares every number if added to the number that is equidistant in a straight line from the centre gives 17. Thus 1+16, 2+15, 3+14, etc. Durer's square (fig. 2) is also associated The simple square is one that fulfils the simple conditions and no more. The semi-Nasik has the property that the opposite short diagonals of two cells together sum to 34. Thus $14+4+11+5=34$. $12+6+13+3=34$. And in this order there are 48 Nasiks, 384 semi-Nasik (which include 48 associated) and 448 simple, making a total of 880. The Nasik square is also sometimes called diabolique and pandiagonal and the semi-Nasik semi-diabolique.

A graphic illustration of each type is shown in figs. 11 to 14, if placed beneath the squares to which they apply. Every Nasik square takes the form of fig. 11 and every associated that of fig. 12, but the graphic forms for the simple and semi-Nasik squares are considerably varied. There are 12 such graphic forms in all of the 4th order, and these are shown in Amusements in Mathematics. (See bibliography.)

FIG. 15.—A BORDERED SQUARE

Another type of magic square is the bordered, an example of which is shown in fig. 15 where it will be seen that a square of the 3rd order is surrounded by a border so as to form a square of the 5th order. In fig. 16 we have an example of an extension first considered by Frénicle (c. 1602–75). Here the borders may be successively stripped off to produce magics of the 9th, 7th, 5th and 3rd orders, and these concentric or progressive squares for odd and even orders respectively may be constructed without any limit whatever.

Composite squares also may be formed in certain cases. If we know how to construct a square of the mth and nth orders we can directly make one of the mnth order as in fig. 17 where m and n are each 3. It will be noted that each subsidiary square is successively constructed in the same order as the smallest one and each successive square is placed in the larger square, again in the same order. A more difficult but very elegant type of square is that of two degrees, as in fig. 18. Here we have a magic square of the 8th order with the constant 260 and every square of four cells summing to 130. If for every number we substitute in its allotted place its square then it will also be entirely magic with the constant 11180. A Nasik square of this kind and order has been constructed.

FIG. 17.—COMPOSITE SQUARE

No square of two degrees is possible for any order smaller than the 8th.

Enumeration. — The very difficult question of enumerating the squares of the different orders has attracted the attention of many mathematicians but very little progress has been made during the last 200 years. Of the 3rd order there is only one fundamental arrangement as stated above. Of the 4th order there are 880 different fundamentals. These were all given by Frénicle in a posthumous work of 1693 and this has been frequently confirmed by later writers. It was shown in the *Queen,* Jan. 15, 1910, how the complete set might be so written out if desired (*see* also Frolow's *Carrés Magiques*).

All told there are 549,504 fourth order magic squares in rows and columns.

45	31	3	49	44	26	6	56
34	20	16	62	39	21	9	59

FIG 18.—A SQUARE OF TWO DEGREES

No enumeration for larger squares has been completed. Particular types of squares, however, have been counted. Thus there are 28,800 Nasik and 174,240 bordered squares of order 5, and 567,705,600 bordered squares of order 6.

Actual formulas counting the so-called uniform step squares of J. Willis of any odd order n have been given by D. N Lehmer.

The number of magic squares of order n increases very rapidly with n, as does also the difficulty of enumeration.

Extensions and Variations. — Though strictly speaking the magic square should be composed of a natural sequence of numbers from 1 to n^2 this condition is sometimes dispensed with. Any arithmetical progression will serve, as in fig. 19, where the numbers in the series used have a common difference of 2. But squares of the 3rd order may be formed with any nine numbers if we can write them thus:

1	2	3
7	8	9
13	14	15

where the horizontal differences are all alike and the vertical differences also all alike but not necessarily the same as the horizontal. The arrangement is shown in fig. 20. This applies equally to the higher orders. Thus fig. 21 is constructed from the numbers

1	2	3	4
6	7	8	9
11	12	13	14
16	17	18	19

and is a Nasik square.

A general solution for squares of the 4th order in which any numbers (all different but not necessarily consecutive) are used was given by Ernest Bergholt in *Nature* for March 26, 1910. Then the question of the construction of magic squares with prime numbers only, and with the smallest possible constants, has been investigated. A summary of results will be found in *The Monist* (Chicago) for Oct. 1913. The formation of squares composed of consecutive composite numbers has also been considered. These can be formed for any order without the use of tables of primes though the method will not always give the smallest possible constant. First write down any consecutive numbers, the smallest being greater than 1, say, for the 3rd order, 2, 3, 4, 5, 6, 7, 8, 9, 10. The only prime factors of these numbers are 2, 3, 5 and 7. Add

the product of these four numbers, 210, to each of the nine numbers. The result is the nine consecutive composite numbers 212 to 220 inclusive with which we can form a magic square. Yet a square with a smaller constant may be formed, as in fig. 22, with the numbers 114 to 122 inclusive. But it would be difficult to find empirically (if possible) a lower solution for the 4th order than we get by the rule, using the numbers 510512 to 510527 inclusive.

Subtracting, multiplying and dividing magic squares have also of late been investigated, and examples of the 3rd order are given in figs. 23, 24 and 25. In fig. 23, a subtracting square, you get a constant 5 by subtracting the first figure in a line from the second and the result from the third. The operation may, of course, be

performed in either direction but in order to avoid negative numbers it is more convenient simply to deduct the middle number from the sum of the two extreme numbers. In fig. 24, which is a multiplying square, the constant 216 is obtained by multiplying together the three numbers in any line. In the dividing square (fig. 25) the constant 6 is obtained by dividing the second number in a line by the first in either direction and the third number by the quotient. But again the process is simplified by dividing the product of the two extreme numbers by the middle number. This question has been dealt with in *Amusements in Mathematics.*

Other extensions of the problem such as magic polygons, magic cubes, magic circles and magic stars have also attracted the attention of mathematicians. Attempts have also been made to construct a magic knight's tour. The knight has to be played once to every square of the chessboard in a complete tour, or non-re-entrant path, numbering the squares visited in order, so that when completed the square shall be magic with the constant 260. The nearest approach to a solution is shown in fig. 26 given by C. F. Jaenisch in *Applications de l'Analyse Mathématique au Jeu des Echecs* (St. Petersburg, 1862). Unfortunately it is not a perfect magic square because the diagonals are incorrect, one adding 264 and the other 256—requiring only the transfer of 4 from one diagonal to the other. Probably a perfect solution is impossible but no rigid proof of this has been obtained. Magic squares have been devised for construction with dominoes and playing cards;

FIG. 26.—ATTEMPT AT THE KNIGHT'S-MOVE SQUARE

also with coins and postage stamps, where one is restricted, of course, by the limitations of issue, coins and stamps of certain convenient values not being in existence. These interesting questions are of a puzzle character and often call for considerable mathematical analysis, though, as a man said of Paradise Lost, they "prove nothing" and lead nowhere. They are therefore strictly speaking of no direct mathematical importance.

MAGINN, WILLIAM (1793–1842), Irish poet and journalist, was born at Cork on July 10, 1793. The son of a schoolmaster, he graduated at Trinity college, Dublin, and after his father's death in 1813 succeeded him in the school. He first made his mark as a parodist and a writer of humorous Latin verse in *Blackwood's*. In 1821 he visited Edinburgh, where he made acquaintance with the Blackwood circle. He is credited with having originated the idea of the Noctes arnbrosianae, of which some of the most brilliant chapters were his. His connection with Blackwood lasted, with a short interval, almost to the end of his life. His best story was "Bob Burke's Duel with Ensign Brady." In 1823 he moved to London. He was employed by John Murray on the short-lived Representative, and was for a short time joint editor of the Standard. Maginn was the original of Captain Shandon in Thackeray's Pendennis.

MAGINOT, ANDRÉ (1877–1932), French statesman and one of the sponsors of the Maginot line, was born at Paris on Feb. 17, 1877. After studying political science and law, he entered the civil service and rose to be assistant to the governor general of Algeria in 1907.

In 1910 Maginot abandoned government service for politics, being elected to the chamber of deputies and, in 1913, becoming undersecretary of state for war. He was inducted into the army as a private at the outbreak of World War I, and was seriously wounded, being crippled for life. On his recovery. in 1916, he resumed his political career as a deputy and served as minister of colonies, pensions or war in six successive cabinets. During his last term as minister of war (Nov. 1929–Jan. 1931), he reorganized the army and directed the construction, on the French northeast frontier, of the system of fortifications named after him (see FORTIFICATION).

Maginot died at Paris on Jan. 7, 1932.

Maginot's name became a symbol of the belief in elaborate fixed defenses that dominated French military thought before World War II and stood in sharp contrast to German tactics that stressed rapid movement of tanks, planes and motorized infantry. (M. V.)

MAGISTRATE, in general, one vested with authority to administer the law or one possessing large judicial or executive authority. In this broad sense the word is used in such phrases as "the first magistrate" of a king in a monarchy or "the chief magistrate" of the president of the United States. In countries deriving their legal systems substantially from the Roman law, it signifies more particularly the holder of a judicial office, whereas in England it is annually applied to minor or subordinate judicial officers, whether unpaid, as justices of the peace, or paid, as stipendiary magistrates. (See POLICE COURTS and JUSTICE OF THE PEACE. See also ROMAN LAW; CONSUL, etc.)

The term magistratus in ancient Rome originally implied the office of magister (master) of the Roman people, but was subsequently applied also to the holder of the office, thus becoming identical in sense with magister, and supplanting it in reference to any kind of public office. The fundamental conception of Roman magistracy is tenure of the imperium, the sovereignty which resides with the Roman people, but is by it conferred either upon a single ruler for life, as in the later monarchy, or upon a college of magistrates for a fixed term, as in the Republican period. The Roman theory of magistracy underwent little change when two consuls were substituted for the king; but the subdivision of magisterial powers which characterized the first centuries of the Republic, and resulted in the establishment of 20 annually elected magistrates of the people, implied some modification of this principle of the investiture of magistrates with supreme authority. For when the magistracies were multiplied a distinction was drawn between the magistrates with imperium, namely consuls, praetors and occasionally dictators, and the remaining magistrates, who, although exercising independent magisterial authority and in no sense agents of the higher magistrates, were invested merely with an authority (potestas) to assist in the administration of the state. At the same time the actual authority of every magistrate was weakened not only by his colleagues' power of veto, but by the power possessed by any magistrate of quashing the act of an inferior, and by the tribune's right of putting his veto on the act of any magistrate except a dictator; and the subdivision of authority, which placed a great deal of business in the hands of young and inexperienced magistrates, further tended to increase the actual power as well as the influence of the senate at the expense of the magistracy.

In the developed Republic magistracies were divided into two classes: (a) magistrates of the whole people (*populi* Romani) and (b) magistrates of the plebs. The former class is again divided into two sections: (1) curule and (2) noncurule, a distinction which rests mainly on dignity rather than on actual power, for it cuts across the division of magistrates according to their tenure or nontenure of imperium.

The powers possessed by all magistrates alike were two: that of enforcing their enactments (coercitio) by the exercise of any punishment short of capital, and that of veto (intercessio) of any act of a colleague or minor magistrate. The right of summoning and presiding over an assembly of that body of citizens with whose powers the magistrate was invested lay with the higher magistrates only in each class, with the consuls and praetors, and with the tribunes of the plebs. Civil jurisdiction was always a magisterial prerogative at Rome, and criminal jurisdiction also, except in capital cases, the decision of which was vested in the people at least as early as the first year of the Republic, was wielded by magistrates until the establishment of the various quaestiones *perpetuae* during the last century of the Republic. But in civil cases the magistrate, though controlling the trial and deciding matters of law, was quite distinct from the judge or body of judges who decided the question of fact; and the *quaestiones* perpetuae, which reduced the magistrate in criminal cases to a mere president of the court, gave him a position inferior to that of the praetor only in so far as the praetor controlled the trial in some degree by his *formula*, under which the judges decided the question of fact.

Tenure of magistracy was always held to depend upon election by the body whose powers the magistrate wielded. Thus the magistrates of the plebs were elected by the plebeian council, those of the people in the Comitia (*q.v.*). In every case the outgoing magistrate, as presiding officer of the elective assembly, exercised the important right of nominating his successor for election.

MAGNA CARTA was issued by King John in June 1215, under compulsion from his barons. From the time of its issue it became a symbol to barons and people alike, and king after king, throughout the middle ages, was expected to confirm it. Its clauses were regarded with veneration long after they were out of date, and men read into them meanings which would have surprised their original drafters. Seventeenth century lawyers, ignorant of the law of the early 13th century, knowing nothing of the conditions of the time, saw in the charter a solemn grant to the people of England of rights which the Stuart kings were withholding. Trial by jury, the principle of habeas corpus, the right of parliament to control taxation, all these were thought to have been secured by Magna Carta. Even the great historians of the 19th century wrote of the charter with more enthusiasm than judgment. Modern criticism has done much to put it in its rightful per-

REPRODUCTION OF MAGNA CARTA FROM THE ORIGINAL IN LINCOLN CATHEDRAL

Transliteration of the first three-and-a-third lines: Johannes Dei gratia, rex Anglie, dominus Hybernie, dux Normannie et Aquitannie, comes Andegavie, archiepiscopis, episcopis, abbatibus, comitibus, baronibus, justiciariis forestariis, vicecomitibus, prepositis, ministris, et omnibus ballivis, et fidelibus suis, salutem. Sciatis nos, intuitu Dei, et pro salute anime nostre, et omnium antecessorum, et heredum nostrorum, ad honorem Dei, et exaltationem sancte ecclesie, et emendationem regni nostri, per consilium venerabilium patrum nostrorum Stephani Cantuariensis archiepiscopi, totius Anglie primatis et sancte Romane ecclesie cardinalis; Henrici Dublinensis archiepiscopi, Willelmi Londoniensis, Petri Wintoniensis, Joscelini Bathoniensis et Giastoniensis, Hugonis Lincolniensis, Walteri Wygornensis, Willelmi Coventrensis, et Benedicti Roffensis, episcoporum; magistri Pandulfi domini pape subdiaconi et familiaris, fratris Eymerici, *magistri militie templi* in *Anglia,* et *nobilium* virorum Willelmi Mariscalli comitis Penbrok, Willelmi comitis Saresberie, Willelmi comitis Warennie, Willelmi comitis Arundellie, Alani de Galweya constabularii Scottie. Warini filii Geroldi, Petri filii Hereberti, Huberti de Burgo senescalli Pictavie, Hugonis de Nevilla, Mathei filii Hereberti, Thome Basset, Alani Basset, Philippi de Albiniaco, Roberti *de Roppelay*, Johannis *Mariscalli, Johannis filii Hugonis*, et aliorum *fidelium* nostrorum; Imprimis concessise Deo et hac presenti carta nostra confirmasse pro nobis et heredibus nostris in perpetuum:

Translation should read: John, by the grace of God, king of England, lord of Ireland, duke of Normandy and Aquitaine, and Count of Anjou: to the archbishops, bishops, abbots, earls, barons, justices, sheriffs, reeves, ministers, and to all bailiffs, and faithful subjects, greeting. Know that we, by divine impulse, and for the salvation of Our soul, and of the souls of Our ancestors and of Our heirs, and for the honour of God, and the exaltation of Holy Church, and the amendment of Our kingdom, by advice of Our venerable fathers, Stephen, archbishop of Canterbury, primate of all England, and cardinal of the holy Roman Church: Henry, archbishop of Dublin; the bishops William of London; Peter of Winchester; Jocelin of Bath and Glastonbury; Hugh of Lincoln; Walter of Worcester; William of Coventry; Benedict of *Rochester;* and Master *Pandulph,* sub-deacon and Counsellor; Brother *Eymeric,* master of the Temple in England, and the noble William Marescall, earl of Pembroke; William earl of Salisbury; William earl de Warenne; William earl of Arundel; Alan of Galloway, constable of Scotland; Warin Fitzgerald, Peter Fitzherbert; Hubert de Burgh, seneschal of Poitou; Hugh de Neville, Matthew Fitzherbert; Thomas Basset; *Allan* Basset; Phillip *d'Aubigny,* Robert of Ropsley, John Marshal!, John *Fitzhugh,* and others *Our* liegemen; have in the first place granted to God, and by this Our Present charter, confirmed on behalf of Ourselves and Our heirs for ever:

spective, but many writers have gone too far in their destructive criticism. It has often been suggested that the charter was drawn up in the interests of the barons alone, and that other clauses were inserted merely to attract support. There is an element of truth in the charge. The barons were naturally more interested in defining their own position than in securing advantages for the boroughs, or freedom of election for the church. That the king himself, that contemporary chroniclers, that foreign observers, should describe the charter as an agreement between king and baronage was almost inevitable, for the barons supplied the motive force by which the king was brought to terms. Their relations with the king were the shifting sand on which feudal society was built, and the charter of necessity dealt at greater length with them. But an examination of the history of John's reign, of the circumstances leading to the issue of the charter, of the charter itself and the other documents which belong to the period of negotiation, show that those who drafted the charter took pains to secure through it, not only baronial demands, but administrative reforms.

The relations between king and baronage had never been precisely defined. The charter issued by Henry I at his coronation covered only a small part of the field, and did not name the amount of the relief nor deal with the military service due from the king's tenants. The legal changes of the 12th century meant that the king's court had more power than ever before, while the baronial courts were losing business to it. On the whole the barons favoured the new methods of procedure. They were willing to submit to the firm rule of a king who should keep the understandings that governed their relations with him. So long as their reliefs were reasonable, so long as the king behaved with reason with regard to his rights of marriage, did not take excessive scutages, or insist on too much military service, they would not rebel. They might and did complain of acts of oppression, of the rigidity of the forest laws, but there had been no general antagonism between Henry II and any class of his subjects. Richard I prepared the way for the charter by his continual demands for money. His crusade meant a heavy drain at the moment of his accession; his ransom meant another extortion, four years afterward; and then his war with Philip of France began. But the country was well governed by the civil service created by Henry II.

The Grievances Against John.—John inherited the fruits of his brother's policy. The possessions of his house in France were lost to Philip Augustus. Continual and increasingly heavy scutages, accompanied by fines ne *transfretet* taken from barons who did not accompany the king on his campaigns, irritated the baronial and knightly class, particularly as Normandy seemed permanently lost. The great inquest of service of 1212 increased their unrest by suggesting that the king intended to exact all that was his due, and a scutage at three marks on the knight's fee for the expedition which ended in disaster, in 1214, determined their opposition. The church was alienated by its treatment during the Interdict, when its property was taken into lay hands and its revenues went to the royal treasury. The quarrel with the church reacted on the general administration. The last eyre of John's reign was that of 1208; the exactions of local officers, therefore, went uncorrected, and the pleas which should have come before the judges went unheard. This collapse of the judicial administration must have done more than anything else to bring the masses of men over to the baronial side. Royal rights with regard to purveyance (*q.v.*), bridge and castle building had been stretched to the utmost by John's servants, and there existed no machinery to enforce upon royal officials payment for the food, carts, or timber which they took for the king's service. Distrusting his barons, John relied on mercenaries, and rewarded them with positions in the local government of England. They cared only for the king's interests and nothing for the welfare of their shires. Against John many men desired vengeance for personal reasons. William de Braiose was driven into exile. his wife and son starved to death because they knew that John himself had murdered his nephew, Arthur. It was unsafe for contemporary chroniclers to tell too much of the scandals of John's private life. But there seems no doubt that the baronial leader. Robert Fitzwalter, wished to avenge his daughter, possibly the daughter that another rebel, Geoffrey, earl of Essex. had married. Many barons had been forced to pay far higher reliefs than had been customary. John had tried to forestall active measures against him by demanding hostages from all prominent barons. The appointment, on the eve of John's departure for his last foreign expedition, of Peter des Roches, bishop of Winchester, to the justiciarship vacated by the death of Geoffrey Fitz Peter was a further grievance, for Peter was, before everything, the king's man.

The first sign of revolt had come more than a year earlier. In Sept. 1212, on his way to a Welsh expedition, John mas warned both by his daughter, Joan, wife of Llewylyn of Wales, and by the king of Scots, that his barons were planning to betray him to the Welsh. He abandoned the expedition and Robert Fitzwalter and Eustace de Vesci, a prominent northern baron, left the country. They persuaded the pope that they were suffering for righteousness' sake, and came back with other exiles when John and Innocent were reconciled in 1213. The reconciliation brought to England the new archbishop, Stephen Langton, who returned to his native land with the intention of using his position as chief adviser of the king to compel him to restore good government to the land. John was absolved after swearing on the Gospel that he would love, defend and maintain the church, restore the good laws of his predecessors, particularly Edward the Confessor, do away with bad laws, judge all men according to the just judgments of his court, and give to every man his rights. The king then prepared to sail to Poitou, leaving the archbishop and justiciar in control of the administration to give effect to his promises. At St. Albans, early in August, they took the first steps toward the restoration of good government. Later in the month, at St. Paul's, the first suggestion that a charter should be demanded seems to have been made by the archbishop, who apparently did not know of the existence of Henry I's coronation charter. Langton realized at once that a formal charter was the best way of securing reforms in the administration, and John's observance of them. He took a few of the leading barons aside, read them Henry I's charter and suggested that it should be the basis of their program. He must also have discussed the needs of the country with the justiciar and the other judges. In all probability the actual drafting of some of the clauses of the charter was begun by such men in private talk at this time.

John, in the meantime, had forgotten his promises in his just rage against the northern barons, who should have been awaiting him on the south coast, ready to embark to France. He found all in confusion there and, obliged to put off his expedition, turned north determined on vengeance. The archbishop pursued him, catching him up at Northampton and pointing out that the occasion demanded that the northern barons should be tried in the king's court and not punished till they had been found guilty. Though he resented the archbishop's interference, John gave way. It was this crisis combined with the new idea of a charter that probably gave occasion for a compilation known as "the unknown charter of liberties." Not mentioned by any contemporary, the document was unknown until the 19th century. There is no evidence that it was anything more than a basis for discussion or an attempt to draft the baronial demands. It contains none of those clauses characteristic of the later charter, which attempt administrative reforms and link Magna Carta rather with the Statutes of Edward I than with the charters of Henry I and Stephen.

The Crisis.—By whatever means it was secured, some compromise must have been made, for the king departed on Feb. 2, 1214, on his last expedition to Poitou, and during his absence no active steps were taken against him, although a demand for a scutage of three marks, issued from abroad, roused bitter resentment. When John returned defeated, all parties felt that the time had come to insist on definite guarantees for the future. John met the barons at Bury St. Edmunds on Nov. 4, 1214, and received a definite refusal to pay the scutage. After the king had departed they solemnly swore to withdraw their allegiance from him unless he would confirm their liberties by charter. They agreed to present their demands soon after Christmas, and in the meantime to prepare for war. John tried to win over his ecclesiastical opponents by issuing, on Nov. 21, a charter to the church, in which he granted freedom of election. On Jan. 6 the barons put before the king at the Tower general demands that a charter should be issued on the lines of Henry I's charter, but incorporating administrative reforms which some at least of the barons desired. The archbishop and William Marshall, earl of Pembroke, were anxious for reform without war. Through their mediation John secured a truce till Easter. On Jan. 15, he reissued the charter to the church, and ordered the sheriffs in every county to take oaths of allegiance to the king. Both sides appealed to the pope and the king took the cross. The pope had a double reason for protecting him; he was both a vassal and a crusader.

In Easter week the barons met at Stamford to force a charter from the king. Contemporary chroniclers emphasize the fact that the backbone of the resistance was a group of northern barons; but to label the baronial resistance as northern is inaccurate, as the contemporary chroniclers themselves imply. In Lincolnshire, Norfolk, Suffolk and Essex it was particularly strong; the great men of Essex and Hertfordshire, the earl of Essex, the earl of Oxford, Robert Fitzwalter, were almost to a man against the king, and with them were joined many barons of the second rank and men of rich knightly families from the other three eastern counties. The midland counties supplied such great names as William d'Albigny and John, the constable of Chester and the west, the Fitz Alans, and Fulk Fitz Warin. From the southwest came William Malet and William de Montecute. That fewer supporters for the baronial party should come from the southwest, the northern midlands, and the honour of Lancaster was natural, since these were John's own lands. That the opposition should be stronger in the southeast is again to be expected. The men of Essex were more nearly in touch with modern thought, and modern thought was much occupied with the duties of the king. But John's enemies were everywhere. John had, however, certain supporters among the greatest barons in the land. The earl of Chester, almost a sovereign prince himself, could do no other than take the king's side, though one may suspect that he approved the charter, since he issued a comprehensive charter to his own men at some phase in the struggle, a document known as the Magna Carta of Chester. The earl of Pembroke, a man grown old in the service of the royal house, the earl of Salisbury, half brother to the king, the earl of Warenne, the earl of Arundel, and earl Ferrars were all on the royal side, but Ralf of Coggeshall tells us that even when a baron supported John his knights were generally on the other side.

The archbishop had created a situation which he could not control. The barons were eager for war. The king was determined not to give way unless he were forced, and scornfully refused to consider the schedule that the barons at Stamford sent for his seal by the hands of the archbishop and the marshal. On May 5 the barons renounced their allegiance and chose Robert Fitzwalter as leader. The title he took, "Marshal of the army of God and Holy Church," emphasized the righteousness of the cause. Four days later John issued a charter to London, granting the privilege of an annually elected mayor, but it came too late to win support for him. Robert Fitzwalter, lord of Baynard's castle, on the outskirts of the city, dominated city politics. The king's offer, next day, to submit his quarrel with the barons to arbitration was in vain. When the barons entered London, easily quelling any opposition, the king realized that he must come to terms, and on June 15 met them at Runnimede, between Staines and Windsor. The barons came prepared with a document, which survives, as the Articles of the Barons. It was sealed on the first day of the conference and became the basis for discussion. The more elaborate charter contained amendments on both sides.

THE CONTENTS OF THE CHARTER

The charter is drawn up in the ordinary form of a contemporary grant of land or privileges. The convenience of modern commentators has necessitated the adoption of a traditional division into clauses, a division often unfortunate in that it suggests a separation where the originators of the charter were clearly following out a line of thought. In summarizing the contents it is impossible to follow the order of the clauses and at the same time give a coherent impression of the contents of the document. The intention of the men who drew up the charter was to state the law as it should be. It is the first detailed statement of feudal law, the first clear agreement between the king and his barons as to the exact demands which the king can make on them and which they can make on their men. Its emphasis on the use of the feudal council inaugurates no new policy, but simply reiterates the recognized, though not always followed, feudal practice. The statements about debt were a serious attempt to deal with one of the most pressing problems of administration and, indeed, of social intercourse, the chronic need of money, felt by all alike, and the consequent impossibility to get anyone to pay his debts. The judicial clauses were drafted with the obvious aim of restoring judicial eyres and improving the efficiency of the royal courts. The much quoted clause about the writ Precipe was a natural attempt to curb what was, to the barons, unfair competition with the feudal courts, competition which Ranulf Glanville himself, though a royal justiciar, had hardly approved. It does not express a desire to go back upon the judicial changes of the last 50 years, but merely a feeling that the baron who had been bearing the burden of the day in the matter of judicial labour ought not to be deprived of the cases which would still be settled in his court unless he failed to do justice. A serious attempt was made in the charter to eliminate the abuses of local government, abuses which had existed in the earliest days of Norman rule, and which successive kings had fought against in vain. During his quarrel with the church John made no effort to deal with them, and, indeed he had aggravated them by the appointments he had made to local offices. John had been interested in the development of his towns, and the charter confirmed to towns the privileges they had won. All classes of the community expected something from the charter, and the drafters did their best to satisfy the general desire. The charter therefore ranges widely over the whole field of society and administration. But it also contains clauses which reflect the bitterness of the time, clauses that must have irritated the king almost beyond endurance. Since all mercenaries were to leave the land it was but to insult the king to name a few. The determination of the barons to be rid of old grievances, particularly those connected with the forests, to right old wrongs, even those of another generation, almost destroyed the charter itself. But without the spur that the bitterness of personal hatred gave, the charter would never have been won. If the famous clause promising that no freeman shall be taken or imprisoned or disseised or outlawed or exiled . . . without the judgment of his peers or by the law of the land, was the outcome of the memory of John's attack on the northern barons in 1213, it was a guarantee of security against arbitrary rule to all men, whether barons or simple free men.

The Clauses.—The charter may be summarized as follows, the numbers in brackets being the traditional numbers of the clauses:

I. The clause reiterating the grant of free election to the church (1).

II. Clauses which chiefly concerned the barons: (a) Inheritance.—Military tenants are to have their inheritances on payment of the ancient relief, £100 for an earl or baron, 100*s.* for a knight. (b) Wardship.—Heirs who have been in wardship are to have their inheritances without relief. The heir in wardship is to be safeguarded from the rapacious guardian, who is to hand over the land well stocked (2–5). The king will not claim prerogative wardship, *i.e.*, if a man holds of the king by other than military tenure and of some other lord by military tenure, the king will not claim the wardship of his heir by reason of the land that is held of him (37). Barons who have founded abbeys are to have the custody of them when they are vacant (46). (c) Marriage.—Heirs are to be married without disparagement, the kinsfolk of the heir being consulted. A widow is to have her marriage portion and her inheritance at once on her husband's death, and shall give nothing for it or for her dower. The latter shall be assigned to her within 40 days during which she can stay in her husband's house. No widow shall be forced to remarry provided that she gives security not to remarry without her lord's consent (6–8). (d) Debt.—Lands or rents are not to be seized for the payment of debt while the debtor has sufficient chattels to pay the debt. The debtor's sureties are not to be distrained so long as the debtor himself can pay. If the sureties are called on they are to hold the debtor's lands till their payment has been made up to them. No interest is to be paid on debts to the Jews while the heir of the debtor is under age. The king will only take the principal if the debt comes into his hands. When anyone dies in debt to the Jews or to other people his wife and children are to be first provided for, and the debt is to be paid out of the residue of his estate (9–11). Debts to the king are to be the first charge on the estate of crown tenants, the residue is to be left to the disposal of his executors in accordance with the will of the dead man. If no debt is owing to the crown the estate may be disposed of according to his will reserving to his wife and children their reasonable shares. If a free man dies intestate, his kin and friends under the direction of the church shall divide his chattels, after the dead man's debts have been paid (26–27). (e) Service and rules for holding the *feudal* council.—No scutage or aid is to be taken without the common council of the kingdom, that is, without the matter being brought before the feudal council of tenants in chief, except for the ransoming of the king's body, the knighting of his eldest son and the first marriage of his eldest daughter. In these cases the aid is to be a reasonable one (12). The archbishops, bishops, abbots, earls and greater barons are to be summoned to the council individually by letter stating the cause of the summons; all those who hold of the king in chief are to be summoned generally through the sheriffs or royal bailiffs. Forty days' notice is to be given and on the appointed day the business is to proceed even if all those summoned are not present (14).

III. Clauses which principally affect subtenants and freemen as well as barons: All the customs granted to his dependents by the king all men in the kingdom shall observe towards theirs (60). The king will not allow anyone to take an aid from his free men except on the three aforesaid occasions, and the aid then is to be a reasonable one (15). No one is to be forced to do more service for a knight's fee or other free tenement than he ought to do (16). No constable shall compel a knight to give money in lieu of castle guard if the knight wishes to do it in person or through a competent deputy. Service on an expedition shall free a knight from a proportionate amount of castle guard (29). "No freeman shall be taken, or imprisoned, or disseised, or outlawed, or exiled, or in any way destroyed, nor will we go upon him, nor will we send upon him, except by the legal judgment of his peers or by the law of the land" (39). "To no one will we sell, deny, or delay right or justice" (40). All persons are to be free to come and go in time of peace, except outlaws and prisoners (42).

IV. Clauses referring to towns, trade and merchants: The aids of the city of London are to be governed by the same rule as the baronial aids, and the city is to have its ancient liberties and free customs. All other cities, boroughs, towns and harbours, are to have their liberties and free customs (12–13). There is to be one measure of wine and ale and corn within the realm, namely the London quarter, and one breadth of cloth, and it is to be the same with weights (35). All merchants are to be free to come and go, to stay in the land and to buy and sell, except in time of war. In time of war merchants of enemy countries in England are to be treated as English merchants are treated in the enemy countries (41). All kydells are to be removed from the Thames and the Medway and throughout all England except the sea coasts (33).

V. Clauses reforming judicial and legal matters: Common pleas are not to follow the court but to be held in some certain place (17). For the taking of inquisitions of novel disseisin, mort d'ancestor, and darrein presentment two justices are to be sent through the realm four times a year and with four knights of each county chosen by the county are to hold the assizes on the day and in the meeting place of the shire court. If all cannot be taken on the one day, enough knights and freeholders are to remain to conduct the business (18, 19). Amercements are to be in accordance with the measure of the offence. They are not to be so heavy, in the case of grievous crimes, as to deprive any man of his means of livelihood. They are to be assessed by the honest men of the neighbourhood (20). Earls and barons are to be amerced by their peers according to the measure of their offence (21). Clerks shall only be amerced according to the measure of their offence and only the lands which they hold by lay tenure shall be answerable for the amercement (22). The lands of those convicted of felony shall only be held by the king for a year and a day and then shall return to the lord of the fee (32). The writ called *Precipe* shall not in future be issued to anyone touching any tenement whereby a free man may lose his court (34). Nothing shall henceforth be given for a writ of enquiry touching life or limb, but it shall be granted freely and not denied (36). No one is to be taken or imprisoned upon the appeal of a woman for the death of any other than her husband (54).

VI. Clauses intended to check the abuses of local officers: No town or individual shall be forced to make bridges or maintain river banks except such as ought to be so maintained by ancient custom and right (23). No sheriff, constable or bailiff is to hold the pleas of the crown (24). All counties, hundreds, wapentakes and ridings are to be at their old farm without any increment, except the king's demesne manors (25). No constable or bailiff is to take a man's corn or other chattels without immediate payment unless the owner allows a respite (28). No sheriff, bailiff or any other person shall take a freeman's horses or carts for carriage duty except with the owner's consent (30). Neither the king nor his bailiffs are to take a man's timber for castle-building or any other royal work without the consent of the owner of the wood (31). No justice, constable, sheriff or bailiff is to be appointed but such as knows the law and is willing to observe it (45). No bailiff upon his own bare word without credible witnesses is to send a man to the ordeal (38).

VII. Forest Clauses: Men who dwell without the forest are not to come before the justices of the forests on a general summons but only when they are concerned in special cases (44). All forests made by John are to be disafforested and all evil customs of the forests abolished. Justice is to be done with regard to the forests made by Henry II and Richard I (47, 48).

VIII. Clauses of temporary interest, to correct temporary abuses: All hostages and charters taken from the English barons are to be returned (49). Welsh grievances are to be considered and Welsh hostages are to be returned (56–68). Scottish hostages are to be returned and justice is to be shown to Alexander, king of Scotland (59). Certain named mercenaries and their followers are to be sent away. All mercenaries are to be dismissed (50, 51). Justice is to be done in the case of wrongful dispossessions by John himself, Henry II or Richard I (52). In all cases the king is to have the crusader's respite. Illegal fines and amercements are to be remitted. The 25 barons who were to be responsible for the maintenance were to judge any disputed matters, together with Stephen Langton, archbishop of Canterbury.

IX. The form of security for the maintenance of the provisions of the charter: The barons were to choose 25 of their number to be the guardians of the charter. If the king or one of his officers did anything contrary to its terms the offence was to be notified at once to 4 of the 25 who were to go to the king or the justiciar and ask that the matter might be corrected. If it were not corrected within 40 days the 4 barons were to refer the matter to the rest of the 25, who together with the community of the whole land "shall distrain and trouble us in all possible ways by taking our castles, lands and possessions." When redress has been forced upon the king, former relations with him were to be resumed. Anyone who wished could swear to obey the 25. The king would enforce the oath on anyone who refused to take it. On the death of one of the 25 the survivors were to appoint his successor. A majority of them were to decide questions in dispute. The king promised that he would not directly or indirectly do anything by which the concessions might be revoked or diminished.

War Again.—In this last clause lies the weakness of the charter and of the whole baronial position. The legalization of temporary rebellion inevitably affected the tempers of both sides. At the same time, in the opinion of the archbishop and the moderate party, it was likely to secure not peace and good government but prolongation of the time of disorder. The baronial choice fell on some of the worst malcontents. The mayor of London was the only member of the 25 who was of less than baronial rank, no bishops were among them, and the only one of them who had any sympathy with the king's point of view was the count of Aumâle, a thoroughly untrustworthy person. The moderate men secured the appointment of a second committee of 38 men, chosen from all parties, and containing some of the wisest of the king's supporters. The work of this body was to hold the balance between the king and the 25. But despite this arrangement war broke out. The charter as it was issued can have satisfied no one. Some of the northern barons had even withdrawn before agreement was reached; other barons evidently cared only for those clauses which secured to themselves either general promises or the redress of 'individual grievances. Stephen Langton, the wiser earls and the judges saw the clauses by which they hoped to secure a well run administration wrecked by such insistence on personal questions. For the moment the king seemed willing to keep his part of the bargain. The charter was sent into every shire for publication by the sheriff and orders were sent to sheriffs and bailiffs that men should swear allegiance to the 25, and that enquiries should be set on foot as to the evil customs to be abolished. Peter des Roches ceased to be justiciar, and Hubert de Burgh was appointed. Some of the foreign mercenaries were dismissed, and some of the offending sheriffs removed. Enquiries were also set on foot as to claims of individuals against the king. This compliance did not last long. The tyranny of the a j was not to be borne by one so impatient of control as John. He made ready for war, sending to Aquitaine and Flanders for mercenaries, and to the pope for spiritual help.

While the king made ready for war the baronial leaders remained in London, making no other preparations than negotiations with the French king for help against John. The northern barons who had withdrawn from the negotiations for the charter fortified their castles. All over the country the king's lands were attacked and his deer stolen. The administration was disorganized; the business of the exchequer at a standstill. Stephen Langton and the bishops could do nothing. The pope annulled the charter and excommunicated the baronial leaders. The archbishop refused to publish the excommunication, little as he approved of the baronial attitude, and left the country with his office in abeyance.

In October a party of barons seized Rochester castle, but John laid siege to it and it fell on St. Andrew's day. No substantial help came from France till January 1216, and Louis, son of Philip Augustus, whom the barons wished to make king, only landed in May. Meanwhile John was isolating the baronial stronghold of London by the fortification of Windsor, Hertford, Berkhampstead and Bedford castles. One company of the royal army occupied itself in reducing East Anglia and Essex. The king in person quelled resistance in the north, and appointed trustworthy men to keep the northern barons in subjection. Had it not been for French help the rebellion would have been over before the summer of 1216. The coming of Louis meant the desertion of many of John's French mercenaries. Louis' momentary success drew to his side some of the greater barons who had hitherto supported John, the earls of Warenne, Arundel and Salisbury and the count of Aumble. War was renewed all over the country. Alexander of Scotland raided the north. Lincoln castle was besieged by barons acting in the name of Louis. In Yorkshire the rebel barons rose again, and in Nottinghamshire the castles of Nottingham and Newark were taken by them. But the king's cause was by no means lost. In the north the men appointed by John had little difficulty in upholding his authority. Even in the south Louis made little headway. Although he took Winchester, he could not take the castles of Windsor or Dover. Meanwhile, resentment against French domination began to be felt among the barons. John reorganized his forces in the southwest, drew off the besiegers of Windsor castle and passed into the eastern counties, where he intended to crush resistance as he had done in the north in the previous winter. At Kings Lynn he was seized with dysentery. He crossed the Wash and managed to struggle to Newark, where he died on Oct. 19, 1216. With his death the need for further opposition to royal authority was gone, for the moderate party took control of affairs in the name of the young Henry.

The Reissues of the Charter.—The charter was at once reissued with certain significant changes. All clauses of a purely temporary nature were omitted, as well as those dealing with mercenaries and the redress of grievances. With them went the promise that only justices, constables, sheriffs and bailiffs who know the law and are willing to observe it shall be appointed (45). Clauses which might affect the royal power to raise money were omitted, together with those relating to the Jews, the feudal aids, and the farms of the shires. The clause laying down the way in which the barons should be consulted in the feudal council was omitted. These omissions were all matters of policy. It was not the time to haggle over personal grievances, nor could Henry's advisers rightly bind the young king in matters of general policy. The mercenaries were needed to fight Louis. Money was needed from whatever source. The necessity of the moment, too, added a provision that payment for goods for royal castles might be postponed for three weeks. Other changes, slight though they were, showed that those who reissued the charter had sufficient time and interest to consider the advantage of authoritative statements on difficult legal points. The position of the heir in his lord's wardship and the position of a widow with regard to her dower are more precisely defined. The form of security for the maintenance of the charter was omitted, but a clause was inserted promising full consideration of everything that needed correction.

In the reissue of the following year, 1217, the clauses omitted in 1216 were not replaced. The regency council might be using the charter as a political weapon to win men to their side, but they regarded it as above all an administrative measure, a guide to and a check on judges and local officers in the difficult years of reconstruction. The rights of the widow are still more carefully defined. The rules for the taking of assizes are modified. There are three fresh clauses forbidding a freeman to give or sell so much of his land as may hinder the proper performance of his services to his lord; regulating the conduct of the sheriff with regard to the holding of the shire court; and forbidding the practice of giving land to a religious house and receiving it back as its tenant. The delay of 3 weeks in the payment of goods taken for the use of a royal castle in 1216 is extended in 1217 to 40 days, but in 1217 the carts of ladies, knights and parsons are exempt from cartage duties. The provision in the 1215 issue that service with the army exempts from castle guard is limited by the statement that the exemption only applies to fiefs from which service with the army is due. If the clause which declares that the promises made by the king to his tenants shall be observed by his men to theirs is weakened by the saving clause reserving* to "all archbishops, bishops, abbots, priors, templars, hospitalers, earls, barons and all other as well ecclesiastical as secular persons their liberties and free customs which they had before," it is, at any rate! made clear that all villeins, not only the king's, are protected from excessive amercements. The forest clauses were omitted and issued later in a separate charter. It is to this issue that the name Magna Carta became attached in contrast with the charter of the forest. The edition of 1225 contained nothing new, except the statement that the charter is issued of the king's free and spontaneous will and in return for an aid. That later issues of the charter were no more than confirmations of this edition is not surprising. The administrative system was yearly becoming more complicated, the law more intricate. A carefully drawn statute was needed at the end of the century to deal with a matter for which a short clause would have sufficed in 1217.

There still exist four originals of the charter of 1215, two of them in the cathedral churches in which they were originally deposited, Lincoln and Salisbury, the other two in the British Museum. The Lincoln Charter was considered the most perfect and was reproduced in the Statutes of the Realm in 1810. The charter was commented on by Sir Edward Coke in his *Second Institute* published by order of the Long Parliament in 1642, but modern criticism was begun by William Blackstone in *The Great Charter and the Charter of the Forest* (1759). Richard Thornson's *Essay on the Magna Carta of King John* (1829) was a serious attempt to collect all the information on the circumstances and people connected with the charter. It also contains a useful section on the existing manuscripts, copies and printed editions of the charter. Modern authorities to be consulted are C. Bémont, *Chartes des libertés anglaises* (1892); W. S. McKechnie, *Magna Carta* (1905); Petit-Dutaillis, *Studies Supplementary* *to Stubbs' Constitutional History* ii (1908); R. L. Poole, "The Publication of Great Charters by the English Kings," *Eng. Hist. Review* (1913); *Magna Carta Commemoration Essays* (1915); F. M. Powicke, *Stephen Langton* (1928). (D. M. S.)

MAGNA GRAECIA, the name given (first, apparently, in the 6th century B.C.) to the group of Greek cities (*e megale Hellas*), along the coast of the "toe" of south Italy (or more strictly those only from Tarentum to Locri, along the east coast), while the people were called Italiotes (*Italiotai*). The interior continued in the hands of the Bruttii, the native mountaineers, from whom the district was named in Roman times (*Brettia* also in Greek writers). The Greek colonies, at first trading stations, grew into independent cities. An early trade in copper was carried on between Greece and Temesa (Homer, Odyssey, i, 181), chiefly by Euboeans; and Cyme (Cumae) in Campania was founded in the 8th century B.C., when the Euboean Cyme was still a great city. After this the energy of Chalcis went onward to Sicily. and the states of the Corinthian gulf carried out the colonization of Italy, Rhegium having been founded, it is true, by Chalcis, but after Messana (Zancle), and at the request of the inhabitants of the latter.

Sybaris (721) and Crotona (703) were Achaean settlements; Locri Epizephyrii (about 710) was settled by Ozolian Locrians, so that. had it not been for the Dorian colony of Tarentum, the southern coast of Italy would have been entirely Achaean. Tarentum, whatever its origins, early became the only foreign settlement of the Spartans. Ionian Greeks fleeing from foreign invasion founded Siris about 650 B.C., and, much later, Elea (540).

The Italian colonies, planted among friendly peoples. grew much more rapidly than the Sicilian Greek states, which had to contend against Carthage. After the Achaean cities had combined to destroy the Ionic Siris, and had founded Metapontum as a counterpoise to the Dorian Tarentum, there was little strife among the Italiotes. An amphictyonic league, meeting at the temple of Hera on the Lacinian promontory. fostered a feeling of unity. The Pythagorean and Eleatic systems of philosophy had their chief seat in Magna Graecia. They sent competitors to the Olympic games (among them the famous Milo of Croton); and the physicians of Croton early in the 6th century (especially in the person of Democedes) were reputed the best in Greece. In 510 Croton. having defeated the Sybarites in a great battle, totally destroyed their city.

In the war between Athens and Syracuse, Magna Graecia took comparatively little part; Locri was strongly anti-Athenian, but Rhegium, though the headquarters of the Athenians in 427, remained neutral in 415. Foreign enemies pressed heavily on it. The Lucanians and Bruttians on the north captured one town after another. Dionysius of Syracuse attacked from the south; and after he defeated the Crotoniate league and destroyed Caulonia (389 B.C.), Tarentum (*q.v.*) remained the only powerful city. Repeated expeditions from Sparta and Epirus tried in vain to prop up the decaying Greek states against the Lucanians and Bruttians; and when in 282 the Romans appeared in the Tarentine gulf the end was close at hand. The aid which Pyrrhus brought did little good to the Tarentines, and his final departure in 274 left them defenseless. Malaria increased as population diminished. Many of the cities disappeared, and hardly any were of great importance under the Roman empire; some, like Tarentum, maintained their existence into modern times. Archaeological investigations of great importance have been made. (T. A.)

MAGNASCO, ALESSANDRO (LISSANDRINO) (1667–1749), Italian painter distinguished for his genre painting with small figures, was born at Genoa, where he studied under his father, Stefano. He afterward worked in Milan with an obscure Venetian painter, Filippo Abbiati. He began as a portrait painter, but only one self-portrait is known. His later scenes were from the lives of monks, nuns, gypsies or bandits, frequently set in romantic landscapes. These are extremely loosely painted in a dramatic, almost ecstatic manner, influenced by P. Morazzone and reminiscent of Salvator Rosa, Jacques Callot and M. Cerquozzi. Very few are dated or datable.

Some time between 1693 and 1698 he met Sebastiano Ricci, through whom he exercised a marked influence on Venetian 18th-century painting. Later he moved to Florence, where he found employment at the court of the grand duke, and after traveling about Tuscany and Emilia he returned to Milan, where he remained from 1711 until 1735. He then returned to Genoa, where he died on March 12, 1749.

Magnasco was exceedingly prolific both as a painter and a draftsman and occasionally collaborated with C. Spera, C. Tavella, M. Ricci and Perugrini, inserting figures in their landscapes. Though he had no pupils, he had several imitators, notably the Neapolitan Ciccio and the Milanese Coppa.

See B. Geiger, *Saggio d'un Catalogo delle Pitture di Alessandro Magnasco* (1945) and A. Morassi, Catalogue of the *Mostra di Magnasco* (1949), both have full bibliographies. (F. J. B. W.)

MAGNATE, a noble, a man in high position, by birth, wealth or other qualities. The term which is derived from Late Lat. magnas, a great man, was specifically applied to the members of the upper house in Hungary, the Forendihaz or house of magnates.

Its popular application to a wealthy man is usually satirical.

MAGNESIA, in ancient geography the name of two cities in Asia Minor and of a district in eastern Thessaly, lying between the Vale of Tempe and the Pagasaean gulf.

(1) MAGNESIA AD MAEANDRUM, a city of Ionia, situated on a small stream flowing into the Maeander, 15 Roman miles from Miletus and rather less from Ephesus. According to tradition it was founded by colonists from the Thessalian tribe of the Magnetes, with whom were associated, according to Strabo, some Cretan settlers. It was thus not properly an Ionic city, and for this reason, apparently, was not included in the Ionian league, though superior in wealth and prosperity to most of the members except Ephesus and Miletus. It was destroyed by the Cimmerii in their irruption into Asia Minor, but was soon after rebuilt, and gradually recovered its former prosperity. It was one of the towns assigned by Artaxerxes to Themistocles for support in his exile. His statue stood in its market place. Thibron, the Spartan, persuaded the Magnesians to leave their indefensible and mutinous city in 399 B.C. and build afresh at Leucophrys, an hour distant, noted for its temple of Artemis Leucophryne, which, according to Strabo, surpassed that at Ephesus in the beauty of its architecture, though inferior in size and wealth. Its ruins were excavated by Dr. K. Humann for the Constantinople museum in 1891–93; but most of the frieze of the temple of Artemis Leucophryne, representing an Amazon battle, had already been carried off by Texier (1843) to the Louvre. It was an octostyle, pseudodipteral temple of highly ornate Ionic order, built on older foundations by Hermogenes of Alabanda at the end of the 3rd century B.C. In front of the west facade stood a great altar. An immense *peribolus* wall is still standing (20 ft. high), but its Doric colonnade has vanished. The railway runs right through the precinct, and much of Magnesia has gone into its bridges and embankments. South and west of the temple are many other remains of the Roman city, including a fairly perfect theatre excavated by Hiller von Gaertringen, and the shell of a large gymnasium. Part of the Agora was laid open to Humann, but his trenches have fallen in. The site is so unhealthful that even the Circassians who settled there in the 19th century almost all died off or emigrated.

Magnesia continued under the kings of Pergamum to be one of the most flourishing cities in this part of Asia; it resisted Mithradates in 87 B.C., and was rewarded with civic freedom by Sulla; but it appears to have greatly declined under the Roman empire, and its name disappears from history, though on coins of the time of Gordian it still claimed to be the seventh city of Asia.

See K. Humann, *Magnesia am Maeander* (1904).

(2) MAGNESIA AD SIPYLUM, a city of Lydia, about 40 mi. N.E. of Smyrna, was unknown before the battle of 190 B.C. In 197 B.C. the Romans, after being freed of all danger from Carthage, had forced the submission of Philip V of Nacedon (see CYNOSCEPHALAE), while Antiochus, overrunning Asia Minor, had penetrated into Thrace. The Mediterranean world could not hold two such powerful rivals, and the inevitable clash was hastened by Antiochus's subsequent invasion of Greece. If by his dilatory and

limited strategy he lost his opportunity, he roused the Romans, reviving from the war weariness that followed the struggle with Hannibal, to a sense of danger, and, not content with his repulse, they prepared a counterinvasion—all the more because Hannibal was now at the side of Antiochus. The expedition was placed under the consul Lucius Scipio, whose election was due to the promise of his famous brother, Publius Scipio Africanus, to accompany him as his lieutenant. The latter's combination of strategy and diplomacy ensured the expedition's secure and unchecked passage from Greece and across the Dardanelles into Asia Minor. But illness prevented him reaping the tactical fruits, and the decisive battle was fought while he was still on his sickbed. Antiochus with an army computed at 62,000 foot and over 12,000 horse had fallen back behind the Hermus river and there at Magnesia—the modern Minissa—fortified a strong camp. Though the Romans counted only two legions and proportionate allied contingents—about 30,000 in all—an attack was decided upon. "The Romans never despised an enemy so much." However, Antiochus saved them the trouble and came out to offer battle. Even so, they evidently missed the master-hand of Scipio Africanus, and were even in jeopardy for a time. For while they were driving in the enemy's centre, and their cavalry were attacking his left flank, Antiochus himself with his right wing cavalry crossed the river—left almost unguarded—and fell upon the Romans' left flank. The troops there were dispersed and took refuge in the camp, where only the resolution of the tribune left in charge rallied them and staved off the danger until reinforcements arrived. Foiled here and seeing a heavy concentration developing against him, Antiochus fled from the battlefield, and the remnants of his demoralized army followed him to Sardis. Antiochus, with his subject states making their peace with Rome, was forced, more through Africanus's strategy than his brother's tactics, to sue for a peace which removed him to the eastern side of the Taurus range and left Asia Minor free for Roman exploitation.

MAGNESITE, one of the calcite group of rhombohedral carbonate minerals, consisting of magnesium carbonate, is a principal source of magnesium. It is mined in Austria, Czechoslovakia, Yugoslavia. Greece, the Ural mountains, Madras (India), Manchuria, California, Washington and Nevada. It is used for making refractory firebricks for lining steel furnaces; for magnesium oxychloride (Sorel) cement (*q.v.*), used mainly in flooring; for preparing magnesium chemicals, including those used as a component of fertilizer; and as a catalyst and filler in making synthetic rubber. The formula of magnesite is $MgCO_3$. Extensive substitution of iron, as well as lesser amounts of calcium and manganese, may occur in place of magnesium. It is rarely found in good single crystals, occurring either as crystalline aggregates or as earthy to compact masses. When pure it is white, with a hardness of 3.75 to 4.25 depending on direction, and a specific gravity of 3.0. Although found in some beds deposited from saline lakes, it more commonly occurs either as a replacement of limestones and dolomites or as a breakdown product of serpentine attacked by hot carbonate solutions. In the latter, it usually contains admixed opaline silica and magnesium silicates. (D. L. G.)

MAGNESIUM is a metallic chemical element of silvery white appearance with a specific gravity of 1.74. The sulfate, or Epsom salt, was isolated in 1695 by N. Grew, while in 1707 M. B. valentine prepared magnesia alba from the mother liquors obtained in the manufacture of nitre. Magnesia was confused with lime until 1755, when J. Black showed that the two substances were entirely different. Sir Humphry Davy in 1808 produced the amalgams of magnesium and isolated the metal by distilling off the mercury. In 1828 the metal was prepared (in a state approximating to purity) by A. Bussy who fused the anhydrous chloride with potassium. Michael Faraday in 1833 was the first to succeed in producing metallic magnesium by electrolysis of molten magnesium chloride, using a voltaic cell. Robert Bunsen achieved the same result in 1852, his electrolytic cell corresponding in construction to the principle of the modern cell. In France, H. Sainte Claire Deville and H. Caron in 1857 accomplished the reduction of anhydrous magnesium chloride with sodium. In 1886 the electrolytic process was further developed by F. Fischer and R. Graetzel in Germany. Electrolytic methods entirely superseded the older ones until about 1941 when the carbothermic and ferrosilicon techniques, employing a thermal process, came into use for a small proportion of magnesium production.

Occurrence.—It is estimated that magnesium forms about 2.1% of the earth's crust, being the third most abundant of the engineering metals. It is found widely distributed in nature in a variety of forms. The carbonate, oxide and chloride are the ones most widely used and occur as dolomite, magnesite, brucite and carnallite. Magnesium also occurs in silicate minerals of which the most important are olivine, serpentine and asbestos. Although the silicate minerals are of world-wide occurrence, they are not suitable raw materials for magnesium metal manufacture because of the difficulties in separation.

Magnesium is found as chloride in sea water and in certain deep brines, such as those of Michigan, these being important commercial sources, especially in the U.S. Magnesite, $MgCO_3$, is the most important solid source of magnesium and is widely distributed throughout the world, the largest deposits being in Austria, the U.S.S.R., Greece, Czechoslovakia, Manchuria and the Pacific coast of North America. Dolomite, $MgCO_3.CaCO_3$, is also widely distributed, there being abundant deposits in the United Kingdom, Austria, Hungary, Germany, Switzerland, Italy, Spain and the United States. Carnallite, $MgCl_2.KCl.6H_2O$, forms a layer of the great salt beds at Stassfurt, Germany, and provided the raw material for the first electrolytic production of magnesium on a commercial basis, although it is not now an important raw material. Large deposits of the hydroxide, brucite, $Mg(OH)_2$, are found in Quebec and in Nevada. Although brucite is richer in magnesium than any other ore, it is extremely local in occurrence.

Magnesium Minerals

Name	Nominal formula	% Mg contained
Magnesite	$MgCO_3$	28.7
Dolomite	$MgCO_3.CaCO_3$	13.8
Brucite	$Mg(OH)_2$	41.6
Serpentine	$3MgO.2SiO_2.2H_2O$	25.9
Olivine	$(MgFe)_2\ SiO_4$	28.4
Talc	$3MgO.4SiO_2.H_2O$	20.7–26.9

Other magnesium minerals found in salt deposits from evaporation of ancient seas, include:

Carnallite	$MgCl_2.KCl.6H_2O$
Schoenite	$MgSO_4.K_2SO_4.6H_2O$
Polyhalite	$MgSO_4.2CaSO_4.K_2SO_4.2H_2O$
Kieserite	$MgSO_4.H_2O$
Epsomite	$MgSO_4.7H_2O$
Kainite	$MgSO_4.KCl.3H_2O$
Langbeinite	$2MgSO_4.K_2SO_4$

Extraction and Production.—Two chief methods were in use by mid-20th century for the commercial production of magnesium, one electrolytic, the other thermal, the former accounting for the bulk of industrial production. In Germany, where the magnesium industry was first developed on a large scale, the process is based on the electrolysis of molten magnesium chloride. a by-product from the potash and carnallite operations at Stassfurt, or the chlorination of magnesite. Magnesium chloride may be produced from brines, sea water, processed dolomite or by chlorinating magnesite. The electrolytic method accounted for approximately 85% of the magnesium output of the U.S. during World War II. The sea water electrolytic process was then the newest method (1941) of producing magnesium, and the bulk of production in the U.S. was derived in this manner. A brief description of the process follows.

Sea water, which contains about 0.13% magnesium, is pumped into huge settling tanks where it is mixed with lime. The calcium from the lime is exchanged with the magnesium in the sea water which precipitates as insoluble magnesium hydroxide, settles to the bottom of the tank and is filtered off. The magnesium hydroxide is then converted to magnesium chloride by reaction with hydrochloric acid prepared from natural gas and chlorine, $Mg(OH)_2+2HCl=MgCl_2+2H_2O$.

After thorough drying, which may be accomplished by means of spray or shelf driers or a combination of the two, the magnesium chloride or cell feed is fed to the electrolytic cells where electricity breaks it down into magnesium metal and chlorine gas, $MgCl_2 = Mg + Cl_2$. A typical cell is a large rectangular steel pot about 6 ft. deep. 5 ft. wide and 11 ft. long which holds the fused salt bath, conducts the current to the internal cathodes and contains approximately 10 tons of molten salts. This stands in a gas-fired refractory brick furnace. The pot and its internal parts act as the cathode while graphite anodes, 8 in. in diameter and 9 ft. long, are suspended in the top of the cell. Granular $MgCl_2$ cell feed is continuously fed into the top of the cell except when dipping metal or servicing the cell. The cell bath is a mixture of molten salts held at 700° C. During electrolysis the magnesium metal is liberated at the cathode and rises to the surface of the bath where it is guided by inverted troughs to the metal wells in the front of the cell. Metal of 99.9% purity is dipped out of the cell at 4-hr. intervals and poured into ingot moulds. Each pot produces approximately 1,100 lb. of metal per day.

The thermal process may also be employed, obtaining magnesium by the direct reduction of its compounds with suitable reducing agents. In this process the reaction takes place above the boiling point of magnesium, permitting the metal to be separated from the residue by distillation and to be condensed in solid or liquid form.

The Pidgeon ferrosilicon process, an example of the thermal technique, was developed in Canada during 1941. It makes use of ferrosilicon and calcined dolomite which is fed into red-hot retorts, yielding a magnesium vapour which condenses in crystals on a water-cooled sleeve. $2(MgO.CaO) + Si = 2Mg\uparrow + 2CaO.SiO_2$ (the iron does not react). The crystals are melted and poured into ingots.

Another thermal method, the carbothermic process, was invented in 1928 in Austria. The process centres around the reduction of magnesium oxide obtained by crushing and calcining magnesite. In the original process, the oxide after being mixed with anthracite was pressed into pellets and charged into electric-arc furnaces where the magnesium vapourized, $MgO + C = Mg\uparrow + CO$. A chilling blast of hydrogen turned the vapour into a highly inflammable magnesium dust. The dust was tableted in a press, fed into retorts and vapourized again, yielding magnesium crystals which in turn were melted and poured into ingots. The process was modified in various ways after it was first designed, including the substitution of natural gas for hydrogen and petroleum coke for anthracite. As a safety measure, the dust is mixed with oil before being loaded into the retorts.

Physical Properties. — The principal physical properties of magnesium (99.9% pure) are as follows:

Symbol	Mg
Atomic number	12
Atomic weight	24.32
Atomic volume—cu.cm./gram atom	14.0
Crystal structure	Close-packed hexagonal
Lattice parameters	$a_0 = 3.203$Å
	$c_0 = 5.199$Å
Axial ratio (c/a)	1.624
Electron arrangement in free atoms	$1s^2, 2s^2, 2p^6, 3s^2$
Mass numbers of the stable isotopes	24 25 26
Relative frequency of the isotopes—%	78.8 10.1 11.1
Mass numbers of radioactive isotopes	23, 27
Melting point	650° C. (1,202° F.)
Boiling point	1103° C. (2,017° F.)
Modulus of elasticity—	
Kg /mm.²	4,570
lb./sq in.	6.5 x 10^6
Modulus of rigidity—	
Kg /mm.²	1,700
lb./sq in.	a.42 x 10^6
Poisson's ratio	0.35

Chemical Properties and Compounds. — Magnesium is a member of group II of the periodic system and has a valence of 2, forming magnesium ion (Mg^{++}). In a finely divided form, it may be ignited in air and burns with an intense white light which is rich in the ultra-violet rays. The products are magnesium oxide (MgO) and the nitride (Mg_3N_2). Larger pieces must be heated above the melting point of the metal before they ignite.

Magnesium is a very strong reducing agent and reacts with most acids liberating hydrogen, $Mg + 2H^+ = Mg^{++} + H_2$. With nitric acid it reduces both the nitrogen and the hydrogen, $4Mg + 10HNO_3 = 4Mg(NO_3)_2 + NH_4NO_3 + 3H_2O$ and, $Mg + 2HNO_3 = Mg(NO_3)_2 + H_2$. It displaces hydrogen from boiling water but is not attacked by alkalies.

The important magnesium compounds, their properties and uses are:

Magnesium oxide, MgO, prepared by calcining magnesite

$$MgCO_3 = MgO + CO_2\uparrow$$

or by calcining magnesium hydroxide

$$Mg(OH)_2 = MgO + H_2O\uparrow.$$

MgO is a white powder and is sold in various grades: light (caustic burned) magnesia, calcined at about 6j0° C., and heavy (dead burned) magnesia, calcined at 1,650 ° C.

Uses: refractory brick, oxychloride cement, fertilizer, in rubber and plastics.

Magnesium hydroxide, $Mg(OH)_2$, a white powder. This compound is the key to recovery of magnesium from sea water. It is precipitated from sea water and Mg-containing brines by the simple addition of milk of lime:

$$Mg^{++} + Ca(OH)_2 = Mg(OH)_2\downarrow + Ca^{++}$$

It is used in medicine as an antiacid and laxative and in the manufacture of other magnesium compounds.

Magnesium carbonate: The commercial product is a basic magnesium carbonate $4MgCO_3.Mg(OH)_2.4H_2O$ and is made by heating the normal carbonate, obtained by carbonating $Mg(OH)_2$:

$$Mg(OH)_2 + CO_2 + 2H_2O = MgCO_3.3H_2O$$

$$5[MgCo_3.3H_2O] = 4MgCO_3.Mg(OH)_2.4H_2O + CO_2 + 10H_2O$$

It is also made from dolomite by the Pattinson process. The rock is calcined, hydrated and then treated with carbon dioxide or kiln gas at several atmospheres' pressure. Magnesium bicarbonate goes into solution. After filtration the pressure is released and on boiling, basic magnesium carbonate is precipitated.

It is used as an insulator for boilers and pipes, in table salt to prevent caking, in rubber and ink industries and in pharmaceutical and cosmetic preparations.

Magnesium sulphate, colourless crystals, is sold as Epsom salt, $MgSO_4.7H_2O$ and Kieserite, $MgSO_4.H_2O$. Kieserite comes from the Stassfurt deposits and from British Columbia, Canada. while Epsom salt is made by treating olivine with sulphuric acid or by the reaction of magnesium hydroxide, sulphur dioxide and air:

$$Mg(OH)_2 + SO_2 + \tfrac{1}{2}O_2 \text{ (air)} = MgSO_4 + H_2O.$$

It is a constituent of cements and is used in the leather industry, flotation, medicine, fertiliser and in the textile industry.

Magnesium chloride, colourless deliquescent crystals, prepared by crystallization from brines and bitterns decomposition of carnallite and by the action of HCl on $Mg(OH)_2$

$$Mg(OH)_2 + 2HCl = MgCl_2 + 2H_2O.$$

It is used in magnesium metal production, in oxychloride cements and in textiles. Magnesium oxychloride cements are made by adding a strong solution of magnesium chloride to light (caustic', magnesium oxide. The resulting paste is magnesium oxychloride (approx. $3MgO.MgCl_2 11H_2O$). Fillers such as sand and limestone fines are added. The cement, which can be coloured, takes a high wax polish It is used for heavy-duty flooring. An increasing use for magnesium oxide and magnesium sulphate is as a fertilizer in Mg-deficient soils. giving increased yields especially with citrus fruits and potatoes.

Medicine. — The salts of magnesium may be regarded as typical saline purgatives. Their aperient action is dependent upon the minimum of irritation of the bowel. and is exercised by their abstraction from the blood of water, which passes into the bowel to act as a diluent of the salt. Magnesium salts have a powerful depressant action, especially on nervous tissue. They have been useful in controlling the epileptiform seizures nhich occur in children folloning the hypertensive encephalopathies which are secondary to nephritis. Hypertonic solutions of magnesium sulphnte (6%–10%) have proved their value over a long period of time for net dressings on open wounds.

Organic Compounds. — Important organic compounds of magnesium are knonn as Grignard reagents (*q.v.*). They are of the composition RMgX (where R=an alkyl or aryl group and

X = a halogen). One large-scale use is in the production of silicones:

$$SiCl_4 + CH_3MgCl \rightarrow \begin{array}{c} CH_3 \\ | \\ ClSiCl \\ | \\ CH_3 \end{array} + \begin{array}{c} CH_3 \\ | \\ ClSiCl \\ | \\ Cl \end{array} \xrightarrow{H_2O}$$

$$\left[\begin{array}{ccc} CH_3 & & CH_3 \\ | & & | \\ -\,Si - O - & & Si - O \\ | & & | \\ CH_3 & & O \end{array} \right]_n \quad \text{Silicone Resin.}$$

Magnesium is a constituent of chlorophyll, $C_{55}H_{70}MgN_4O_6$, and apparently plays a role similar to that of iron in haemoglobin.

Detection. — Magnesium salts can be detected by precipitating magnesium hydroxide with a solution of sodium hydroxide. It is not soluble in an excess of sodium hydroxide, but readily soluble upon addition of a saturated ammonium chloride solution.

Magnesium is determined quantitatively by precipitation as magnesium ammonium phosphate by means of dibasic ammonium phosphate from an ammonical solution from which interfering elements have been removed. It is ignited and weighed as magnesium pyrophosphate.

MAGNESIUM AS A STRUCTURAL METAL

Magnesium (specific gravity 1.74) is the lightest of the commercially used structural metals. Its basic crystal structure is different from those of iron, copper, or aluminum but similar to those of zinc and cadmium. The modulus of elasticity of magnesium and its alloys is relatively low, resulting in a comparatively high capacity for elastic energy absorption

Distortion or slipping in a magnesium crystal can take place on only one series of atomic planes at temperatures up to about 400° F. The material therefore tends to harden when worked at room temperature. More atomic planes become available for slipping above 400° F. and the metal can be readily worked without hardening. Magnesium is thus well adapted to hot forming methods. It is quite stable in ordinary inland atmospheres Brightly polished metal will gradually assume a thin gray film after about one month's exposure. Magnesium is resistant to most alkalies, many organic chemicals, chromic and concentrated hydrofluoric acids, alkali metal fluorides, arsenates, chromates and dichromates. It is attacked to varying degrees by other acids and water solutions of salts. Being high in the electromotive series, magnesium is somewhat more susceptible to galvanic corrosion than other structural metals. Protective atmospheres and fluxes are employed during melting, heat treating and casting of the alloys in order to reduce oxidation and provide clean metal.

Alloys. — Pure magnesium has low structural strength; however alloys have been developed to meet increased property demands, to improve corrosion resistance and to facilitate production and fabrication, the first commercial ones having been placed on the market by the Germans in 1909. The principal constituents of the majority of the commercial alloys of magnesium are aluminum, zinc and manganese. The proportions in which they are used vary from 3% to 10% for aluminum, 0.1% to 1.5% for manganese, and 0 5% to 3% for zinc. The use of aluminum, the most important alloying constituent of magnesium, imparts hardness and also increases the tensile strength.

Zinc, the second most important alloying element, is usually combined with aluminum to form a ternary alloy and is used chiefly to give a general improvement in properties and to facilitate foundry work. It also improves elongation, especially in the wrought alloys, and is useful for nullifying the detrimental effects of such impurities as iron and nickel, which tend to increase the salt water corrosion rate of magnesium and its alloys.

Manganese, in small proportions, is used in practically all commercial alloys of magnesium because it greatly improves the resistance to salt water corrosion without materially affecting the other properties. Seldom used in a greater proportion than 2.5%, it has a small effect on the mechanical properties in the cast state. In the rolled condition, however, manganese increases strength. Improved tensile properties particularly at elevated temperatures can be obtained with magnesium-manganese wrought alloys, especially if small amounts of cerium or calcium have been added to produce fine grain. Magnesium-manganese alloys are of value also because of their good welding properties.

Cerium, calcium, zirconium, cadmium, silver, silicon, beryllium, thorium and tin are sometimes used as alloying ingredients for special purposes. Table I gives the chemical composition of the most frequently used magnesium alloys.

Mechanical Properties. — Pure magnesium in the sand cast state has a tensile strength of 14,000 p.s.i. (7 tons/in.^{2}) and in the extruded condition about 26,000 p.s.i. (13 tons/in.^{2}). The addition of suitable alloying elements doubles these values for cast and wrought alloys. When aluminum is used as an alloying constituent, casting alloys attaih their maximum value for tensile strength and elongation in the cast state at approximately 6% aluminum. A substantial further increase in strength is possible by heat treating cast alloys containing 6% to 12% aluminum. Wrought alloys attain maximum strength with approximately 10% aluminum, although alloys with aluminum content as high as this are limited to simple shapes. Those with the lower aluminum contents of 3% to 7% are in more common use.

The typical mechanical properties of common magnesium alloys appear in Table II.

USES OF MAGNESIUM

Magnesium was formerly associated in the minds of many people almost exclusively with pyrotechnics, and for many years the chief production was used for this purpose, as well as for ribbon and powder in photography. But the increasing emphasis upon weight reduction, both in industrial applications and in consumer goods, gave magnesium as a structural material an importance far beyond these earlier uses. Since alloys, rather than pure magnesium, are used for structural purposes, mention of magnesium in this section will refer to the alloys.

Aircraft. — Because of their low specific gravity, magnesium alloys are widely used in the aircraft industry, this being especially true during World War II. Typical applications included: housings for camshafts, timing gears, superchargers, oil filters and pumps; landing wheels; forged radial engine crankcases; propeller blades; floor beams; frames for seats and many small parts such as die-cast instrument housings. Increased use has been made of magnesium sheet in the monocoque or stressed skin type of wing construction and it has been used on a considerable scale for fairings, cowlings and tanks About zoo to 400 lb. of magnesium castings were used in many aircraft engines during World War II, and it has been estimated that approximately 95% of all military planes were equipped with cast-magnesium landing wheels. As much as 1,000 lb. of magnesium were used in many combat planes, while more than a ton was used on some of the large bombers.

Transportation. — Although in this field magnesium has found its greatest use in aircraft, there is a growing interest in applying its advantages to other types of transportation. This trend has found greatest practical expression thus far in Europe, and especially in Germany, where magnesium alloys are used in such applications as superstructures for motor buses and trucks, cast wheels for tramways and buses and in a variety of small parts. In the U.S , magnesium has also been used in the construction of truck bodies and auto-transport trailers. Its projected use in railroad equipment includes frames for seating, partitions in Pullman cars and instrument panels and housings.

Portable Equipment. — Magnesium is increasingly used for various types of portable goods such as tools, being employed in the housings and handles. Portable conveyor systems, dockboards, hand trucks, milk crates and similar items are examples of other uses in this field. It is also utilized for office equipment, such as typewriter and adding machine frames, and various types of instrument housings.

Industrial Equipment. — Both because of their light weight and their ability to absorb dynamic energy, magnesium alloys are being used in parts of high-speed and reciprocating machinery. Examples are warp beams, bobbins, spools and knitting bars used in textile machinery. Cast magnesium foundry flasks and moulding and core boxes are used in foundries.

Consumer Goods. — Because of the distinct trend toward streamlining and weight reduction, the use of magnesium in consumer goods of many different types is constantly expanding. This field includes such items as domestic vacuum cleaners, griddles, wheel toys, lawn mowers and photographic and motion picture cameras. It has also been successfully used in ski, baseball catcher's masks and rowboats.

Miscellaneous. — Magnesium is used as an important alloying element in aluminum alloys, its chief function being to increase the mechanical and corrosion-resisting properties. It also facilitates heat

treatment. A new and promising use of magnesium is as an expendable galvanic anode for the cathodic protection of buried metal structures such as pipe lines, as well as for ship hulls and tanker compartments. Its high position in the electromotive series of metals enables it to perform this function.

Because of its high affinity for oxygen, magnesium is used as a deoxidizer in the manuiacture of metals lower in the electromotive force series of metals, such as nickel and nickel alloys.

Economic Importance of Magnesium.— After World War *I*, intensive research and development work produced strong, light alloys which have established magnesium as the world's lightest structural metal. The world-wide and rapid development of the aircraft industry played an important part in advancing the use of magnesium alloys for structural purposes, where their unusual advantages were quickly utilized. Perfection of allovs which could be fabricated successfullv by casting, extruding, rolling and forging opened up many new fields of use to magnesium. It possesses special properties which make it particularly desirable for certain types of applications which include exceptional machining qualities and good fatigue resistance and damping capacity under impact stress. The attainment of high standards in pressure die casting technique has presented new spheres of application in the instrument, tool, optical and other industries where designers are often able to substitute a single casting for parts formerly built up from sheet and sections, the die casting being stronger and more rigid but not heavier. Sand castings are being made which weigh as much as 1,000 lb. Even forgings of considerable size have been fabricated from magnesium.

MAGNETIC INSPECTION. Magnetic inspection is the use of magnetism to detect surface and subsurface defects in magnetizable materials. In 1905 the magazine Revue de Met on page 421 mentioned for the first time the possibility of detecting defects such as cracks, lamination~,etc., in ferromagnetic materials by means of magnetic fields. In 1919 E. W. Hoke applied for the first patent in the U.S. on a magnetic inspection method, which was granted in 1922 under 1426384.

The material to be inspected is subjected to the action of a magnetic field. When the magnetic flux lines encounter a surface break or internal discontinuities they are deflected and create a distortion of the magnetic field. Not only minute cracks invisible even to the microscope, but changes in the crystal structure because of heat treating, welding or other physical operations can be detected by the experienced metallurgist.

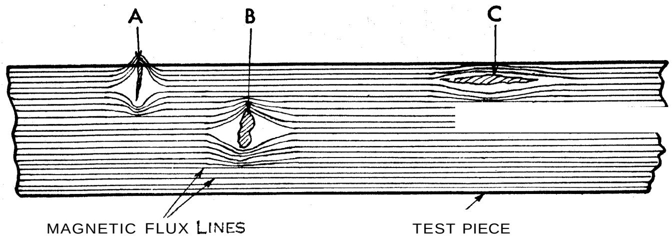

FIG. 1.— DISTRIBUTION OF MAGNETIC FLUX LINES

Fig. 1 demonstrates various kinds of defects and their effect in creating leakage flux lines. Defect *A* is a fine surface crack or lamination and causes a maximum magnetic deflection. Defect *B* is a subsurface discontinuity, which creates only a slight surface distortion of the magnetic path, the indication of which decreases with increasing depths of the defect. *C* is a flaw parallel to the magnetic flux lines which causes a minimum of magnetic deflection and in most cases can not be detected. From this last phenomenon, it is evident that the sensitivity of this testing method depends not only upon the depth of the discontinuity, but upon the necessity that at least one dimension of the flaw is approximately at a go° angle to the direction of the magnetic force lines. In order to detect flaw C, a magnetic field at right angles to C has to be produced in the test piece. To increase the sensitivity, the test piece should be magnetized near, but not above, the saturation point whenever possible. For example, to examine satisfactorily the crankshaft of an aeroplane engine, a longitudinal magnetic field has to be created to detect circumferential defects like fatigue cracks, injurious tool marks, etc. Then the part is magnetized with a circular field and longitudinal flaws like laminations, forging laps, etc., are found. Fig. 2 shows a machine for longitudinal and circular magnetization.

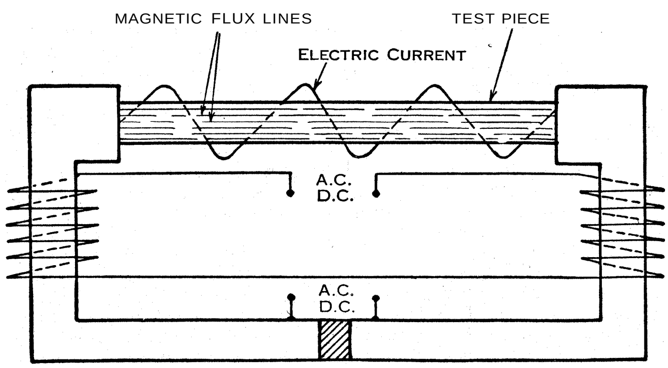

FIG. 2.— PRINCIPLE OF LONGITUDINAL AND CIRCULAR MAGNETIZATION WITH A.C. OR D.C.

To induce a magnetic field in the test piece, various methods are employed. Alternating current as well as direct current can be used; however, direct current is favoured and specified by army and navy agencies. Circular magnetism can be produced: (1) by passing a heavy current through the test piece; (2) if hollow, by inserting a rod through the test piece to carry the current; (3) by induction. Longitudinal magnetism is created: (1) by inserting the test piece in a coil carrying a heavy current; (2) by placing the test piece between the yokes of electromagnets.

Many ingenious methods have been devised to observe and record these distortions of the magnetic field, termed stray fields or leakage fields. In 1932 the Electrotechnical institute in Moscow developed a detector coil consisting of a small horseshoe magnet and compensating coil. This instrument recorded stray fields graphically. A similar method, the Sperry rail test, uses a search coil to measure current density variations in railroad tracks. Materials for highly stressed parts are tested by passing between the yokes of strong D.C. magnets on which search coils are mounted, to measure variations of the magnetic reluctance. The most simple and general application of magnetic testing uses the magnetic stray field to attract paramagnetic particles and collects these around the defective area, thus making microscopic flaws visible. These particles are brought to the piece to be tested through the medium of air or liquid. The paramagnetic substance can be iron filing, or powder, iron dust or iron oxides such as Fe_2O_3 and Fe_3O_4. The use of iron powder is called the dry process, while the wet process employs a solution of iron dust or Fe_3O_4 suspended in a light petroleum distillate.

The dry process is generally applied on large castings, forgings and welded structures, which are magnetized whole or in sections of about 5-in. diameter. or in the case of welded seams. in 6-in. to 8-in. lengths. A standard 500-amp. welding generator or a hand electromagnet with approximately 15,000-amp. turns furnishes a sufficiently strong magnetic field. These tests, if made on U.S. army ordnance matériels such as welded gun mounts, are subject to the army procedure specifications WXS-158 dated Feb. 17, 1942, if made on army and navy aeronautical materials, specifications AN-1-30/31/32 as of Jan. 1945 apply.

Small parts, as used in the automotive and the aeroplane industry, are tested by the wet process. The solution consists of paramagnetic particles suspended in kerosene of such concentration as to provide a mixture of approximately one ounce of solid to one gallon of liquid. The continuous wet method applies the magnetic substance while the material is being magnetized. The residual method immerses the test piece in the paramagnetic liquid after magnetization. The continuous wet method is most frequently used.

Any material conducting electricity can be tested magnetically, provided the magnetic stray fields are observed while the electric current is flowing. The characteristic of surface concentration when using A.C. magnetization decreases its sensitivity for revealing internal flaws, as compared to D.C. magnetization. It should be borne in mind that maximum indications are obtained by magnetization nearly to the saturation point. Most magnetic inspection machines use low voltage of approximately 6 volts, and high currents up to 6,000 amp. The maximum current used for a part under inspection is usually restricted by the heating effect in the part itself. To avoid burning the contact points of test pieces when conducting heavy currents, it is advisable to use metal braiding, steel wool or lead contact plates to increase the contact area. (W. W. O.)

MAGNETIC RECORDING: see TAPE RECORDING, MAGNETIC; PHONOGRAPH.

MAGNETISM. This article is divided into the following sections:

- I. History
  1. Magnetostatics and the Nature of Magnetism
  2. Electromagnetism
  3. Modern Theory
- II. General Description of Magnetism
  1. Magnetic Field
  2. Intensity of Magnetization and Magnetic Induction
  3. Magnetization and Permeability Curves

This subject may be divided into three parts: (1) ferromagnetism, a property possessed by iron and a few other metals and compounds and characterized by strong attraction of one magnetized body to another; (2) paramagnetism, a quality of many substances which causes them to be attracted less strongly by the poles of an electromagnet or magnetized body; and (3) diamagnetism, by virtue of which materials possessing this property are repelled by an electromagnet. Ferromagnetism is sometimes considered to be a branch of paramagnetism, and then ferromagnetic bodies are differentiatedfrom other paramagnetic bodies by the magnitude of their reaction with a magnetic field and in other ways described in detail in the following paragraphs.

For practical purposes, ferromagnetism is much the most important kind of magnetism.

After a historical introduction, ferromagnetic phenomena and materials will be described, and the effect of various factors on magnetic properties discussed. Following this, diamagnetism and paramagnetism and the theory of ferromagnetism will be considered, and finally an account of methods used for measuring magnetic quantities will be given.

I. HISTORY

Centuries before the Christian era the Greeks knew that the mineral lodestone, a magnetic oxide of iron (magnetite, Fe_3O_4), had the ability to attract iron and other pieces of the same mineral. This natural magnet was mentioned by Thales of Miletus (640–546 B.C.); and according to Plato in the *Ion,* Socrates states that it will support a chain of iron rings, each held to the one above it by magnetic attraction.

The Roman Lucretius Carus states in his De *rerum natura,* in the 1st century B.C., that ". . . iron can be drawn by that stone which the Greeks call Magnet by its native name, because it has its origin in the hereditary bounds of the Magnetes," the inhabitants of Magnesia, in Thessaly. The Romans knew also of the repulsive action of magnetism, as shown by a quotation from the same passage: "Sometimes, too, iron draws back from this stone; for it is wont to flee from and follow it in turn." No reference to the directive property of the magnet, as used in the compass, is found in old Greek and Roman literature. To account for magnetic attraction some in this period believed that there were hooks on the surface of the magnet and little rings on the surface of the iron to catch them; others that particles were emitted by the magnet and created an empty space toward which the iron would move.

Beginning in the period A.D. 1000–1200 the history of magnetism is closely connected with the compass and its use in navigation. According to G. Sarton, the first clear mention in any literature of a magnetic needle for indicating direction appears to have been made by Shen Kua (1030–93), a Chinese mathematician and instrument maker, who, however, mentions only its use on land.

Soon after 1100, the Chinese Chu Yu reported that in the period 1086–99 the compass was used for navigation by "foreign" sailors going between Canton and Sumatra. Since the trade in this region was practically a Moslem monopoly it is concluded that they were the first to use the compass for directing ships.

The earliest known European reference to the compass is by Alexander Neckam (1157–1217), an English cyclopaedist. In 1269 Petrus Peregrinus de Maricourt, a French crusader, gave the first detailed description as an instrument of navigation. He wrote of the floating compass as an instrument in common use and described a new pivoted compass in some detail. He fashioned a sphere of lodestone and explored its surface with bits of iron, and applied the term pole to the places in which the magnetic power appeared to be concentrated. He believed that the magnet derived its power from the sky.

After his time little progress was made for almost 300 years. In 1600 William Gilbert of Colchester, Eng., published his *De magnete* which summarizes the knoll-ledge of magnetism at the time of Queen Elizabeth, whose court physician he was, and reports some of his own experiments. He mentions the dip and declination of the compass and propounds his own great contribution. the discovery that the earth itself is a magnet. He showed that magnetized iron lost its magnetism when heated to a bright red heat and regained it when cooled again to room temperature. His chapter xii of book v is entitled "Magnetick force is animate, or imitates life; and in many things surpasses human life, while this is bound up in the organick body."

After the time of Gilbert, during the period when Isaac Newton was formulating the law of gravitation and Robert Boyle was investigating the laws of gases, little of importance for magnetism was recorded.

1. Magnetostatics and the Nature of Magnetism. — In 1785 Charles Augustin Coulomb established with some precision the inverse square law of attraction (and repulsion) between unlike (and like) magnetic poles, a proposition that had been favoured or opposed by many before him. This was made the basis of Poisson's mathematical theory giving the forces between magnetized bodies in terms of their intensities of magnetization. Simeon Denis Poisson (1781–1840) assumed magnetization to be a molecular phenomenon, but believed that a molecule became magnetic when the two fluids which it contained became separated. In 1852 Wilhelm Weber proposed that each molecule is a permanent magnet, subject to a frictional force that tends to maintain it in its established orientation. This explained the limit of magnetization (saturation) and gave a rather unsatisfactory explanation of residual magnetization; the magnetization remaining after the removal of the magnetizing field. Later James Clerk Maxwell (1831–79) improved upon Weber's explanation of residual magnetization by suggesting that the molecular magnet had no friction but had more than one fixed position of equilibrium.

Before the time of Weber, Hans Christian Oersted made the important discovery (1820) that an electric current would affect a magnetic needle. Quickly following up this lead. André Marie Ampère investigated experimentally and mathematically the mutual forces between currents and showed (182 j) that a current in a circuit is equivalent to a "magnetic sheli" of calculable strength. He considered a magnet to be due primarily to electric currents circulating within the molecules, and this concept, though not accepted immediately because there was no way either to prove or to disprove it, stood the test of time and was elaborated only by the advent of electron theory and the modern era.

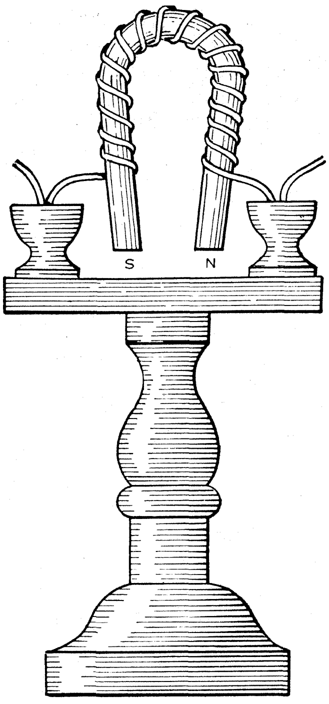

FIG. I. — THE FIRST TRUE ELECTROMAGNET

Constructed by William Sturgeon in 1825, the soft iron horseshoe is five inches high and is magnetized by the copper wire connected to a battery not shown in the drawing

2. Electromagnetism. — Using Oersted's discovery, both Ampére and Dominique Arago (1786–1853) magnetized steel needles by placing them in a helix of wire carrying an electric current. This was the prelude to the construction in 1825 of the first electromagnet which could be so called. by William Sturgeon (1 783–1850) of Lancashire (fig. 1). This was made of soft iron bent in the form of a horseshoe and mound with a loose helix of 18 turns of wire. When excited by a wet battery it could lift 20 times its own weight.

Several years later Joseph Henry in the United States built a much improved electromagnet with many turns of wire efficiently applied. While experimenting with this in 1829 he noticed the spark that occurred when the circuit was broken and he was led to the discovery of self-induction. a treatise on which he published in 18.32. The same phenomenon was independently discovered and published several years later by Michael Faraday (1791–1867). This great English experimentalist also shared with Henry the important discoverv of electromagnetic induction, the "conversion" of magnetism into electricity. Although Henry is believed to have performed the experiment first and understood its significance, his results were unknown to Faraday who likewise made the crucial experiment and was the first to publish the results. Faraday and Henry made the first transformers (fig. 2) and prepared the way for the construction of the dynamo and motor and the age of electricity.

The laws of electricity and magnetism were formulated systematically in mathematical language by Maxwell: and his famous treatise was published in 1873. (See ELECTRICITY: *Electromagnetic Waves.*)

3. Modern Theory. — One difficulty with Weber's theory was that it gave no satisfactory explanation of residual induction and hysteresis. Maxwell's suggestion of multiple fixed positions for the molecular magnet left unexplained the fact that hysteresis (*see* below) is found when a magnetizing force. after being once applied. is removed and reapplied. J. A. Ewing proposed (1890) that the constraints on the orientations of the molecular magnets were imposed by the magnetic forces of the surrounding molecules, and showed by means of calculations and models that such forces can account qualitatively for the shape of the magnetization curve and the major and minor hysteresis loops. He first used the word hysteresis. J. Swinburne predicted on the basis of Ewing's theory that in a rotating magnetic field the hysteresis should disappear, and F. G. Baily's experiment (1896) confirmed this in a striking way (see fig. 25 below).

The first important influence of modern concepts on the theory of magnetism came when P Langevin (1905) used statistical theory to explain the variation of paramagnetic susceptibility with temperature. He assumed each molecule to have a definite magnetic moment that tended to be oriented by the applied field and at the same time disturbed by thermal agitation. In 1907 this was seized upon by P. Weiss who postulated that the molecules are exposed both to the applied field and to a so-called molecular field proportional to the intensity of magnetizstion: thus he developed the first important quantitative theory of ferromagnetism. This molecular field is co-operative in nature, in that it depends on the mutual action of many atoms. and is now attributed to the "exchange forces" derived from quantum theory by W. Heisenberg.

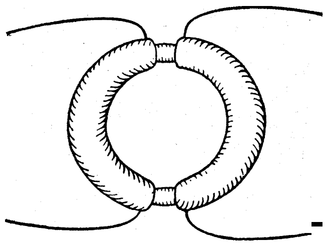

FIG 2 — FARADAY'S FIRST TRANSFORMER

This transformer has two windings of copper wire on an iron core. Connection of one winding to a battery causes mornentarv flow of electricitv in the other winbing connected to 'a galvanometer

It is a consequence of the Weiss theory that ferromagnetic materials must be spontaneously magnetized, that is. small regions or "domains" of the material are magnetized to saturation even when the specimen as a whole has zero intensity of magnetization; in this latter condition the magnetic moments of the regions are oriented at random. Previously such regions were considered identical with the molecules or atoms of the substance, but Weiss's deduction was later supported by many experiments (*e.g.,* those on the Barkhausen effect) and is the basis of the domain theory now used in the interpretation of many magnetic phenomena.

The quantum theory by its clarification of atomic structure has had a great influence of magnetic theories. W. Pauli in 1920 showed that there is a natural unit of magnetic moment, the Bohr magneton, and in 1926 S. Goudsmit and G. E. Uhlenbeck proposed the spinning electron as the fundamental magnetic particle having a moment of one Bohr magneton. The quantum theory of paramagnetism and ferromagnetism was developed rapidly by the contributions of Heisenberg. J. H. Van Vleck, E. C. Stoner. H. Bethe, F. Bloch, J. C. Slater and others. The temperature dependence of saturation magnetization, as calculated by P. Debye (1912), was a notable success of the quantum theory of ferromagnetism. Advances in the theory of diamagnetism were also made after Langevin's pioneering work of 1905. The advances in useful materials, and in methods of measurement of magnetic quantities, are mentioned in appropriate places in the body of the article.

II. GENERAL DESCRIPTION OF MAGNETISM

The quality of magnetism first apparent to the ancients. and to us today. is the attractive force that exists between a natural magnet (lodestone) or an artificial magnet (a "permanent magnet") and a piece of soft iron. When a magnet is dipped into iron filings they cling to it, especially in certain places called poles that are usually near the ends of the magnet (fig. 3). Such poles always occur in pairs. and in a magnet used as a compass needle the pole that points to the north is the north-seeking pole. or simply the north pole, and the other the south pole. When a magnet is broken new poles appear near the break so that each piece contains the same number of poles of each kind.

1. Magnetic Field. — A magnet will attract a piece of iron even though the two are not in contact. and this action at a distance is said to be due to the magnetic field, or field of force around the magnet. This field may be explored by sprinkling iron filings around a magnet, whereupon they form in lines that converge on the poles and indicate also the direction a small compass needle would take if placed at any point (fig. 4).

Poles exert forces on each other, north and south poles attract each other and like poles repel with a force that varies inversely as the square of the distance between them. A unit pole is a convenient concept defined so that two unit poles of like kind, one

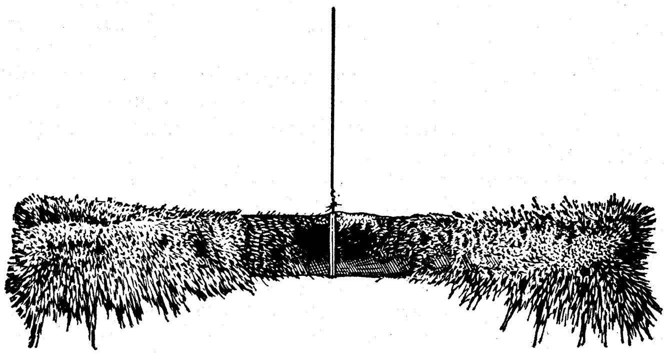

FIG. 3.— A MAGNETIZED BAR ATTRACTS IRON FILINGS THAT CLING MOST STRONGLY NEAR THE POLES OF THE BAR

centimetre apart, repel each other with a force of one dyne. The strength of the field of force, or simply the magnetic field strength or magnetizing force, may be defined in terms of magnetic poles: at one centimetre from a unit pole the field strength is one oersted. A magnetic field may be produced by a current of electricity as well as by a magnet and the unit of field strength can also be defined in terms of current. A magnetic field has direction as well as strength; the direction is that in which a north pole. subjected to it, tends to move. or that indicated by a small compass placed at the point. The field strength is represented by the symbol H, and the unit defined above is the oersted.

2. Intensity of Magnetization and Magnetic Induction.— In order to describe the magnetic properties of materials, one must have a quantitative measure of magnetization. Such a measure is the intensity of magnetization, defined in terms of the number of unit poles in a piece of given cross-sectional area. Suppose that a uniformly magnetized bar, of length l and cross-sectional area a, has m unit north poles at one end and m unit south poles at the other (fig. 5). The intensity of magnetization is then m/a, and is represented by the symbol I. It may easily be shown that I is also the magnetic moment per unit volume; for the magnetic moment is pole strength times interpolar distance ($M=ml$), and $I=M/v$, if v is the volume al.

Maxwell showed that some of the properties of magnetism may be likened to a flow, and conceived endless lines of induction that represent the direction and, by their concentration, the flow at any point. The lines pass from a magnetized material

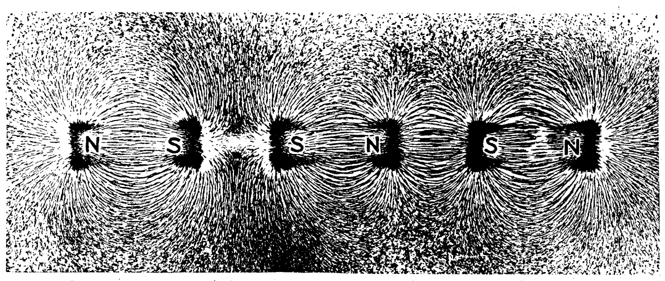

FIG. 4.— IRON FILINGS INDICATE THE DIRECTION OF THE MAGNETIC FIELD NEAR A GROUP OF BAR MAGNETS AND SHOW THE LINES OF FORCE EMANATING FROM SOUTH POLES AND CONVERGING ON NORTH POLES

into the air at the north pole, and enter again at a south pole, and pass through the material from the south pole back to the north to form a closed loop.

The total number of lines crossing a given area at right angles is the flux in that area. The flux per unit area is called the flux density or magnetic induction, and is represented by the symbol B. The lines of induction are due to both H and I, but in magnetic materials they are due mainly to the magnetization, **I**. The magnetic induction is defined by the relation

$$B=H+4\pi I,$$

the unit of induction being the gauss. The occurrence of the factor 4π is due to the fact that a unit pole gives rise to a unit field everywhere on the surface of a sphere of unit radius enclosing the pole, and this sphere has an area of 4π. The lines of induction may be visualized with the aid of fig. 4 showing the pattern obtained with iron filings.

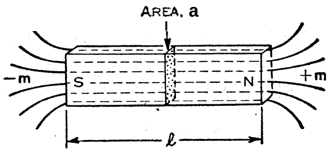

FIG. 5.— UNIFORMLY MAGNETIZED BAR

A pole of strength m and area a corresponds to an intensity of magnetization I=m/a, equal also to magnetic moment per unit volume ml/v. Lines of induction are endless, pass into the magnet at the south pole and leave at the north pole

3. Magnetization and Permeability Curves.— When a piece of iron is brought near a magnet, or subjected to the magnetic field of an electric current, the magnetization induced in the iron by the field is described by a magnetization curve obtained by plotting the intensity of magnetization, I, or the magnetic induction, B, against the field strength, H. Such curves are of fundamental importance for describing the magnetic properties of materials, and many of them are shown on the following pages. A magnetization curve for iron is shown as the solid line of fig. 6 (left).

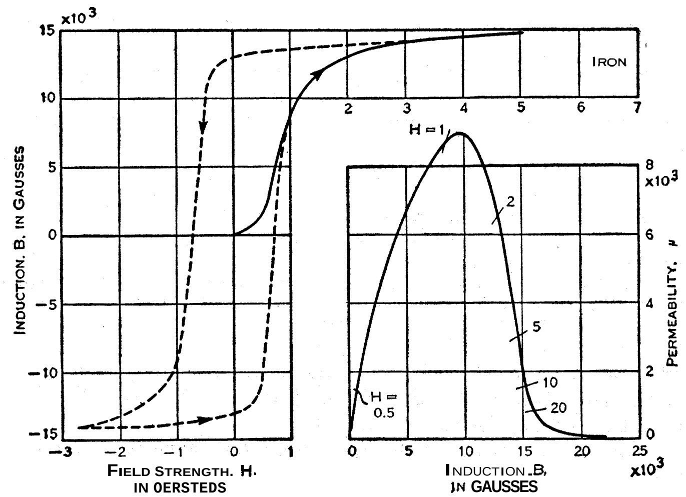

FIG. 6.— PROPERTIES OF MATERIALS ARE DESCRIBED BY MAGNETIZATION CURVES (SOLID LINE) AND HYSTERESIS LOOPS (BROKEN LINE) OBTAINED BY PLOTTING I OR B AGAINST H; THEY MAY ALSO BE DESCRIBED BY PERMEABILITY CURVES (μ v. B)

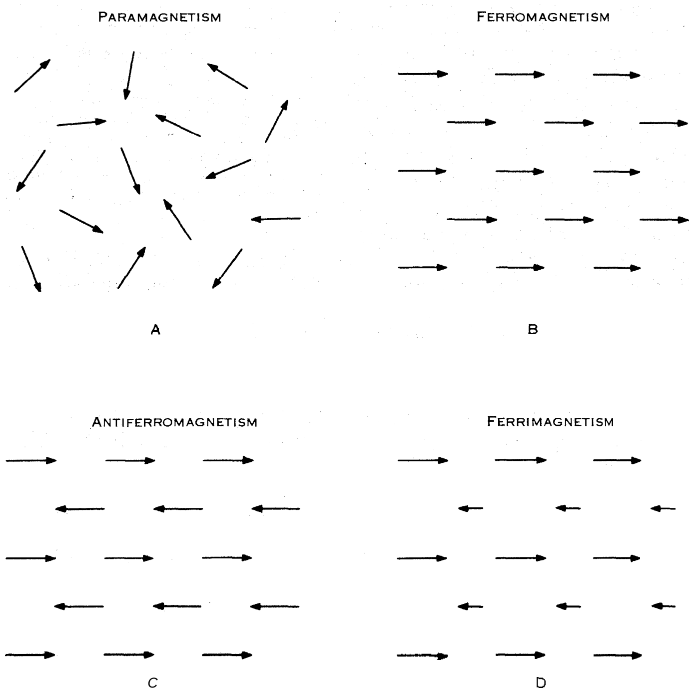
The behaviour of a material is also described by its permeability curve and hysteresis loop. The ratio B/H is called the permeability. μ, and this represents the relative increase in flux due to the presence of the magnetic material. The permeability curve is obtained by plotting the permeability, μ, against either **I**, B, B-H or H. In any case the curve rises from a point on the μ axis above the origin (the "initial permeability") to a maximum (the "maximum permeability") and falls off rapidly and then more slowly toward a value of one (not zero). When plotted against B-H the curve ends at a definite point; *i.e.,* when B-H reaches its highest possible value, the saturation (fig. 6).

If the field strength is first increased from zero to a high value and then decreased again, as indicated by the arrows of fig. 6, it is observed that the original curve is not retraced; the change of induction "lags behind" the change in field and follows the characteristic curve shown by the broken line. This phenomenon was named hysteresis by Ewing, and the characteristic curve is called a hysteresis loop. On this loop, the value of H for which $B=0$ is called the coercive force, H_c, and this is often used as a measure of quality of the material. Sometimes it is desirable to have H_c large, sometimes small; for different materials H, may be higher than 1,000 or lower than 0.01 oersted. The value of B for which $H=0$ is called the residual induction, B_r.

4. Kinds of Magnetism. — Materials which have magnetic properties similar to iron are ferromagnetic. They have permeabilities of considerable magnitude that vary with the field, they exhibit hysteresis and they lose these properties rather abruptly when heated to a temperature called the Curie point of the material. They usually contain iron, cobalt or other elements of the



BY COURTESY OF "ELECTRICAL ENGINEERING"

FIG. 7.— KINDS OF MAGNETISM ASSOCIATED WITH VARIOUS KINDS OF INTERATOMIC INTERACTION
(A) Paramagnetism, weak interaction; (B) ferromagnetism, "positive" interaction; (C) antiferromagnetism, negative interaction; (D) ferrimagnetisrn, negative interaction between unequal moments

first transition series of the elements (titanium through nickel) or of the later transition series (rare earths). They are all solids. *(See* ELEMENTS, CHEMICAL.)

Another class of materials, more numerous, have permeabilities only slightly greater than one, usually between one and 1.001. These do not show hysteresis. The permeability is generally independent of field strength, except at the lowest temperatures, and as a rule is either independent of temperature or decreases with increasing temperature. These materials are paramagnetic. Among them are many of the salts of the iron and the rare earth families and the palladium and platinum metals, the elements sodium, potassium and oxygen and the ferromagnetic materials when heated above their Curie points. The substances may be solids, liquids or gases.

In diamagnetic substances the magnetization is directed oppositely to the field; *i.e.,* they have permeabilities somewhat less than one. They are, therefore, repelled from the poles of an electromagnet, and move toward a weaker field. Many of the metals and most of the nonmetals are diamagnetic.

Paramagnetic and diamagnetic substances are described more conveniently by their susceptibilities than by their permeabilities. The susceptibility is a measure of the increase in magnetic moment caused by the application of a field and is defined as

$$\kappa = I/H,$$

or the equivalent,

$$\kappa = \frac{\mu - 1}{4\pi}.$$

For diamagnetic materials the susceptibility is negative, and for bismuth has a relatively large value of -0.000013. For substances like iron the susceptibility may be as high as 500, or higher.

The kinds of magnetism denoted antiferromagnetism and ferrimagnetism are defined in terms of the arrangement of magnetic dipoles in the material. A simple paramagnetic material can be represented by fig. 7(A), the magnetism of the separate atoms being represented by arrows arranged in random directions with little or no correlation between the directions of the arrows in neighbouring atoms. In ferromagnetic materials neighbouring atoms are arranged so that neighbouring atomic moments are parallel (fig. 7[B]). In antiferromagnetic materials neighbouring atoms are antiparallel (fig. 7[C]) and the moments are equal; the material then has the low permeability of a paramagnetic substance.

If neighbouring moments are antiparallel but unequal (fig. 7[D]) there will be a net moment in a group of atoms, and the substance is ferrimagnetic; this is both antiferromagnetic in nature and ferromagnetic in properties (large permeability).

5. Spontaneous Magnetization. — A ferromagnetic substance has long been regarded as an assemblage of small magnets, each magnet a group of atoms—when the material is unmagnetized the groups are arranged with haphazard orientations; when it is magnetized they are lined up with their axes approximately parallel. The nature of this small magnet, or domain, has been the subject of much consideration over a period of years, and now it is known that all ferromagnetic materials are composed of such domains, each of which consists of many atoms. Within a domain all of the atoms are aligned parallel, even when no field is applied, and they are therefore said to be "spontaneously magnetized." When the magnetization of the material is changed, the atoms turn together in groups, or the sizes of the groups change (the atoms in each group remaining parallel to each other), so that they are aligned more nearly with the magnetic field applied to the material. The domain theory is discussed in more detail later.

The magnetic properties of materials depend mainly on the chemical composition and on the heat treatment they receive after fabrication, and sometimes these properties are influenced in an important way by the kind of fabrication used. Some ferromagnetic properties, such as saturation induction and Curie point, change but slowly with chemical composition, and are usually quite insensitive to methods of fabrication and heat treatment. On the other hand properties like permeability and hysteresis are highly sensitive to small amounts of impurities and to heat treatment—they are extremely "structure sensitive." In some cases the permeability (*e.g.,* of iron) will increase a thousandfold when 0.1% of an impurity is removed by heat treatment, and an equal change in the reverse direction will be caused by bending the material or stretching it so that its form is permanently changed or strained. The susceptibilities of paramagnetic and diamagnetic substances are not usually affected to any considerable extent by fabrication and heat treatment.

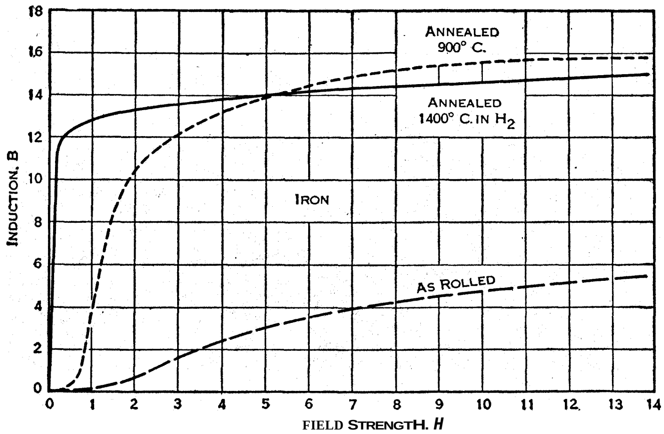


FIG. 8.— MAGNETIZATION CURVES OF IRON IN VARIOUS CONDITIONS (P. P. CIOFFI). B IS EXPRESSED IN KILOGAUSSES

III. PERMEABLE MATERIALS

Magnetic materials are essential for the operation of many of the devices and machines used in modern industry. Without them the production, distribution and use of electricity, and also communication by wire and radio, would be seriously limited or even impossible. After the use of iron in the compass became commonplace, the important new uses of magnetic materials were first in the transformer and electric motor and generator, and later in electromagnetic devices such as relays, telephone receivers, loading coils, loud-speakers, indicating instruments and many other devices upon which all of our industries depend. It is estimated that several million tons of metal are produced annually for use as magnetic material.

Most useful magnetic materials either have high permeability and are magnetized and demagnetized easily, or are permanent

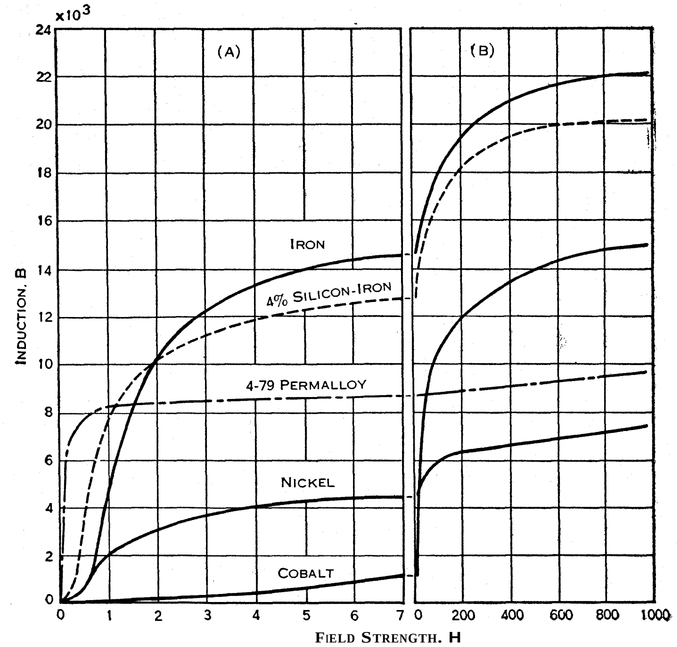

FIG. 9.— MAGNETIZATION CURVES OF SOME COMMON MATERIALS IN THE ANNEALED CONDITION IN LOW (A) AND HIGH (B) FIELDS

magnets and magnetize with difficulty but retain their magnetism tenaciously. The latter will be discussed in the next section headed *IV*. Permanent Magnets.

As stated above. the magnetic properties depend mainly on the chemical composition and heat treatment. Permeable materials are usually processed, or annealed, by heating to some temperature between 800° and 1,400° C., often about 1,000° C., and cooling at any specified rate to room temperature. Because the permeability will be lowered if they are deformed beyond the elastic limit. materials are made in final size and shape and are then heat treated and assembled directly in apparatus for use or for test. without bending. For each material there is a specific heat treatment that must be used to develop the desired property to the greatest extent. Magnetization curves of iron as rolled, after a conventional anneal. and after a special anneal in which harmful impurities are removed, are shown in fig. 8.

1. Elements. Iron-Silicon Alloys. — Iron, cobalt and nickel are the common ferromagnetic elements and were the only ones known until 193j when gadolinium was also shown to be ferromagnetic. The magnetism of iron. as well as steel and lodestone, was known to antiquity, while cobalt and nickel were first investigated about the middle of the 18th century. Most of the ferromagnetic substances are alloys containing one or more of the elements iron, cobalt and nickel; some are nonmetallic compounds of iron, cobait, nickel or (rarely) manganese or chromium; and some are alloys containing no iron, cobalt or nickel but composed of manganese and certain other elements such as aluminum and copper (Heusler alloys).

Magnetization curves for iron, cobalt and nickel are shown in fig. 9. In iron one observes the highest magnetization and also the highest permeability. Cobalt has a lower magnetization and the lowest value of maximum permeability. Of these materials iron is by far the most important and is the only one used to any considerable extent in industry as a magnetic material in elementary form. The most used material of all, however, is an alloy of iron and silicon, sometimes called silicon steel or electrical sheet steel, even though it is not a steel in the strict sense of the word because it contains no essential carbon. The iron-nickel alloys are used for many purposes when very high permeability is desired and cost is not too important.

Iron-silicon alloys containing a few per cent of silicon were invented by Sir Robert Hadfield, and came into use in the period 1900–10, mainly through the efforts of E. Gumlich in Germany. These alloys usually contain 3% to 4% silicon, but any amounts up to 6% silicon are occasionally used. They are made from pig iron and ferrosilicon melted and refined in the basic open hearth (see IRON AND STEEL), or from ingot iron remelted with ferrosilicon in the electric furnace. Ingots are poured and rolled to slabs and the latter rolled either hot or cold to sheets of the required thickness, usually 0.014 in. These are then cut to the appropriate size for use in transformers or other apparatus and are preferably annealed by heating to some temperature lying between 800° and 1,200° C., usually nearer 800° C.; or they may be annealed before cutting. A later development is the production of grain-oriented silicon iron in which a direction of easy magnetization is obtained in material by orienting the crystals of which the material is composed. This orientation is obtained in the purified alloy by cold reduction of the sheet and subsequent annealing to produce the desired recrystallization texture. The material then has an especially high permeability when magnetized in one direction — that in which the material passed through the rolls during fabrication.

Some magnetic and physical characteristics of commercial silicon-iron alloys are given in Table I. The watt loss there referred to is the power dissipated in the alloy when it is magnetized to a maximum induction of $B=15{,}000$ by an alternating field of frequency 60 cycles per second. Such losses dissipate power and objectionably raise the temperature of a transformer core in operation (see TRANSFORMER). They are due partly to hysteresis and partly to eddy currents, the nature of which latter will be discussed below under X. Magnetization in Alternating Fields.

2. Iron-Nickel Alloys **(Permalloys)**.—These alloys have properties that are unusual and interesting from both a scientific and a commercial point of view. It became generally recognized about 1920, as a result of the work of G. W. Elmen, that the alloys containing from 35% to 90% nickel have permeabilities very much greater than those of iron. These alloys were named permalloys. A magnetization curve and hysteresis loop for 78 permalloy are shown in fig. 10, and curves for iron are given for comparison.

An iron-nickel alloy containing 50% nickel was investigated by T. D. Yensen and named hipernik. As distinguished from 78 permalloy, which is suitable for transformers transmitting the weak signals of communication apparatus, hipernik has high permeabilities and low losses in the higher magnetic fields used in the transmission of power.

These commercial alloys, 78 permalloy and hipernik, have the compositions that are scientifically the most interesting of the binary iron-nickel series. This is illustrated in part (a) of fig. 11 showing the induction of the alloys at low, intermediate and high field strengths.

The induction in high fields has a minimum at 30% nickel and a

maximum at 45% to 50% nickel. The maximum occurs not only when the field strengths are large but persists and is even more marked in low fields. A second maximum appears for low fields

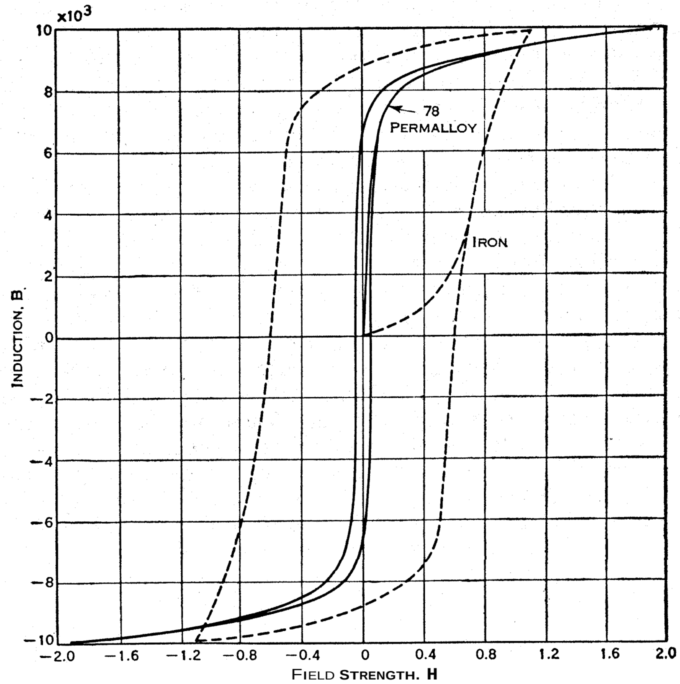

FIG. 10.— COMPARISON OF PROPERTIES OF PERMALLOY AND IRON

when the nickel content is about 80%, and this corresponds to the commercially useful alloy, 78 permalloy. The high initial permeability (permeability for very low values of B) of 78 permalloy (fig. 11[b]) is associated with its very low magnetostriction (see *VI. Stress and Magnetostriction* below).

Molybdenum, chromium and copper have been added to permalloy to advantage. The most used alloys of this kind are 4-79 permalloy, containing 4% molybdenum. 79% nickel and 17% iron! and mumetal. containing usually 5% copper, 2% chromium, 75% nickel and 18% iron. These are both used in transformers operating at high frequencies and are meritorious primarily on account of their high initial permeabilities. but also because they have higher resistivities and can be prepared with a simple heat treatment. Their permeabilities at various inductions are indicated by the curves of fig. 12. Initial permeabilities of 10,000 to 30,000 are usually attained.

During World War II a great improvement was made in the permalloys by heat treating them in pure hydrogen at 1,200° to 1,300° C. The most useful of these alloys, called supermalloy, contains 5% molybdenum and 79% nickel, the balance mainly iron. Initial permeabilities as high as 125,000 and maximum permeabilities of more than 1,000,000 can be attained commercially even in thin sheet (fig. 12). The technical progress in magnetic materials may be measured by comparing these magnitudes with the permeabilities of the best materials available in the first decade of the 20th century—silicon steel made at that time had initial and maximum permeabilities about ·,-& those of supermalloy.

Remarkable magnetic properties are exhibited by iron-nickel alloys given a still different kind of heat treatment. After heating at a higher temperature the material is maintained for a short time at 400° to 600° C. in the presence of a magnetic field of several oersteds. After cooling to room temperature the maximum permeability is found to be greatly increased and the coercive force diminished. This effect. often called magnetic anneal. depends on the composition and is most pronounced when the nickel content is 65% to 70%, as illustrated in fig. 11(c). The hysteresis loops of material given the magnetic anneal have the characteristic rectangular shape illustrated in fig. 13. The sides are vertical and the corners often perfectly square, and the coercive force much smaller than that of the same material heat treated in the absence of a field. Such "square-loop" materials of various compositions are useful as elements for the storage of information in electronic computers.

3. Iron-Cobalt Alloys.—It is a fact for which there is no satisfactory explanation that some alloys of iron and cobalt can attain greater intensities of magnetization than either of these elements alone. The saturation magnetization is highest for the alloys containing 35% to 40% cobalt, and then is 10% to 15% higher than for pure iron. When the field strength is 1,000 or below. the highest inductions are attained in the alloy containing equal proportions of the two elements, except that in fields weaker than two oersteds pure iron has the highest permeability

As a material the 50% alloy, under the name of permendur, is a useful component of the magnetic circuits of electromagnets and permanent magnets, where it is used for yokes and pole pieces. Since it is rather brittle and cannot be rolled to thin sheets, 2% vanadium is sometimes added and this permits the fabrication of sheets a few thousandths of an inch thick. The latter material is used in quantity in the thin diaphragms of telephone receivers. Some alloys contain 35% cobalt and other elements added to increase ductility.

Some alloys containing iron, cobalt and nickel are interesting because they have permeabilities that are independent of field strength over a relatively large range. The same alloys have

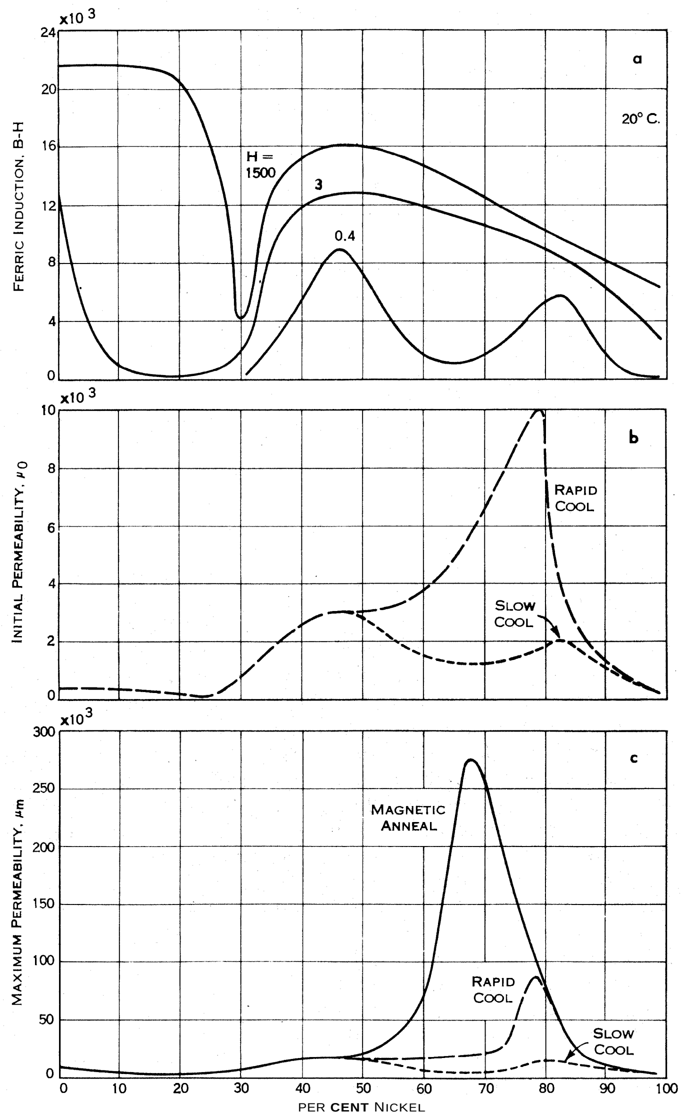

FIG 11 — SOME MAGNETIC PROPERTIES OF IRON-NICKEL ALLOYS

hysteresis loops of peculiar shape with low residual induction and a constricted middle portion.

A representative alloy, called perminvar, contains 30% iron, 25% cobalt and 45% nickel. The constancy of permeability uith field strength at low fields is brought out by annealing in the usual nay at about 1,000° C. and then heat treating for several

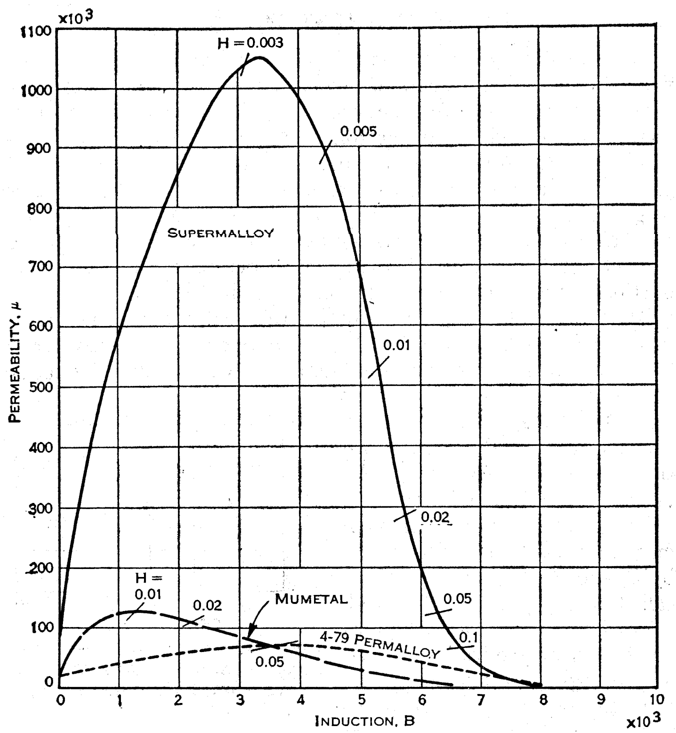

FIG. 12.— COMPARISON OF SUPERMALLOY WITH OTHER HIGH-PERMEABILITY ALLOYS (O. L. BOOTHBY AND R. M. BOZORTH)

hours at a relatively low temperature, 350° to 500° C. The hysteresis loss is then extremely small. A μ v. H curve and a hysteresis loop for an alloy of the above composition, heat treated for 24 hours at 400° C., are shown in fig. 14. This material responds

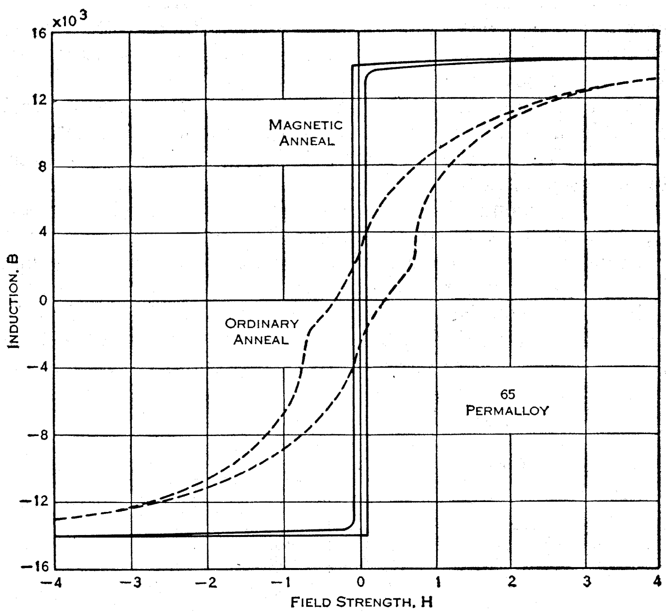

FIG. 13.—EFFECT OF ANNEALING IN PRESENCE OF MAGNETIC FIELD (J. F. DILLINGER AND R. M. BOZORTH)

to heat treatment in a magnetic field, and a loop for a specimen so treated is also shown in the figure.

4. Ferrites.—After World War II a number of nonmetallic substances were investigated and subsequently found many applications in industry. The most important among these are the ferrites. which were developed largely as the result of the work of J. L. Snoek. Examples of important ferrites are nickel ferrite ($NiFe_2O_4$), manganese ferrite ($MnFe_2O_4$) and their combinations with zinc ferrite ($ZnFe_2O_4$).

The ferrites are nonmetallic refractory materials composed of the oxides of iron-and other metals, usually manganese. cobalt, nickel. copper, zinc or magnesium. The proper proportions of the oxides are pressed in powder form to the required shape and fired at temperatures of 1,000° to 1,300° C. During the firing, chemical reaction occurs, and when the materials are cooled to room temperature they are hard, strong and brittle.

The maximum induction attainable in the ferrites is generally lower than in metallic materials, as shown by the hysteresis loops of fig. Ij. The permeability is also below that of the best alloys.

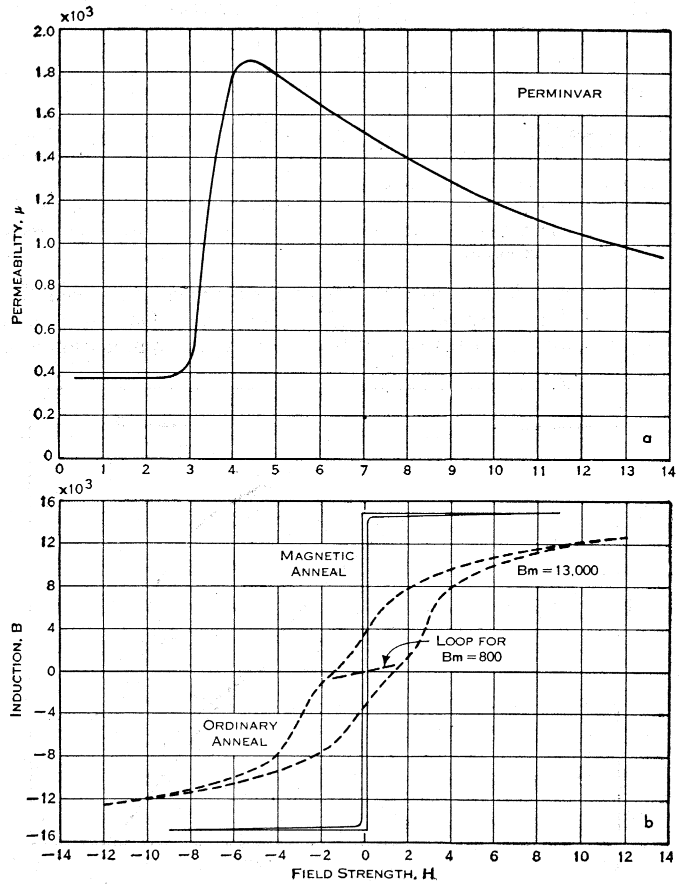

FIG. 14.— PROPERTIES OF PERMINVAR

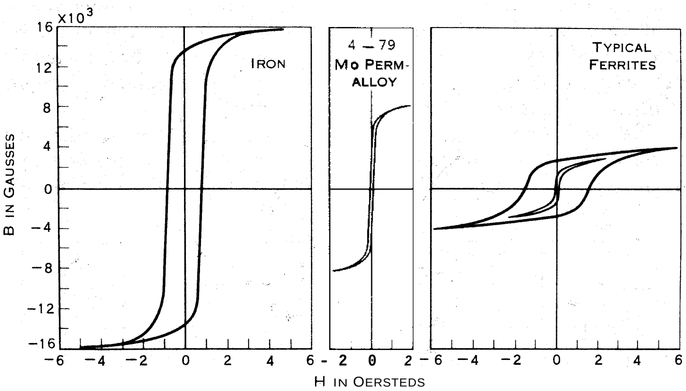
Perminvar (45% Ni, 25% Co, 30% Fe) has remarkably constant permeability in low fields (a). It has extremely low hysteresis at low induction (b) and a characteristic wasp-waisted hysteresis loop at high inductions, and is affected strongly by magnetic anneal (G. W. Elmen and G. A. Kelsall)

However, the resistivities of the ferrites are a million (10^6) to a billion (10^9) times higher than for metallic materials, and this quality brings about a great reduction in the losses associated with changes in magnetization at high frequencies. For many applications especially in communications engineering. the merit of a magnetic material is measured by the product μQ, μ being the permeability in weak fields and Q inversely proportional to the energy loss per cycle. The variation of μ and μQ with frequency is shown in fig. 16, nhere it is noted that the μQ of manganese-zinc ferrite becomes increasingly valuable at frequencies up to one megacycle.

A number of materials of high permeability are described in Table II. The fabrication and heat treatment are given in outline only; in practice well-controlled procedures must be used.

5. Magnetic Compounds. — There are a large number of other compounds and alloys that are ferromagnetic. As early as 1903, C. Heusler discovered that alloys near in composition to the compound Cu_2MnAl mere ferromagnetic, with a saturation (B_s) of about 5,500, nearly as high as for nickel. Similar alloys are known in which the aluminum (Al) is replaced by samarium, arsenic, antimony. bismuth, indium or gallium, or copper may be replaced by a larger amount of silver. Later many intermetallic and nonmetallic compounds of iron, cobalt, nickel, manganese and chromium were discovered.



BY COURTESY OF ELECTRICAL ENGINEERING'

FIG 15.— HYSTERESIS LOOPS OF NICKEL FERRITE AND ZINC MANGANESE FERRITE (SMALLEST LOOP) AS COMPARED WITH LOOPS OF METALLIC IRON AND MOLYBDENUM PERMALLOY

Ferrites in addition to those mentioned above have been the subject of increasing research and development. One such class of ferrites (orthoferrite) is typified by $GdFeO_3$, a combination of a

rare earth oxide and an iron-group oxide. Different structure (garnet type) and properties are obtained if the component oxides are combined in the ratio $3Gd_2O_3.5Fe_2O_3$. Also, many cyanides, of which $Fe(FeC_6N_6)$ is an example, are found to be strongly magnetic at very low temperatures.

IV. PERMANENT MAGNETS

Permanent magnets, like electromagnets, are used to produce magnetic fields of considerable strength and constancy. Many devices depend on them for operation; *e.g.*, loud-speakers, magnetos, meters of many kinds, magnetrons, telephone receivers and a host of others. In all of these the magnet necessarily contains an air gap; consequently it always operates under the influence of a demagnetizing field (see *XIV.* Measurement of Magnetic Quantities below), such as that existing at the middle of a short bar of magnetized material. Thus the magnet operates not at residual induction but at some lower value of the induction, *B*.

The important curve for evaluating the quality and behaviour of material for permanent magnets is that portion of the hysteresis loop that lies in the second quadrant, between residual induction, B,, and coercive force, H_c, and is called the demagnetization curve. Magnetization and demagnetization curves for Alnico 5 (Alcomax) are shown in fig. 17.

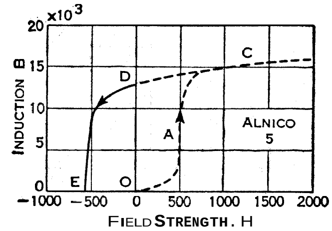

FIG. 17.— MAGNETIZATION CURVE (OAC) AND DEMAGNETIZATION CURVE (DE) O, ALNICO 5 (ALCOMAX)

The quality of a permanent magnet is characterized not only by B_r and H,, but also by the so-called energy product, the product of *B* and *H* for various points on the demagnetization curve. The energy product curve (fig. 18), showing this product as dependent on *B*, has a characteristic shape, and its greatest product, the maximum energy product, is the best single criterion of magnetic quality for these materials. The reason for this, and its importance in the design of permanent magnets. will be discussed after the most-used materials have been described.

1. Alloy Magnets.—From ancient times until about 1930 materials used as magnets were carbon steels. After 1855 alloying elements were added, especially tungsten. to improve the quality. In 1916–17 chromium began to displace tungsten, and cobalt was added up to 40% with very beneficial effect.

From the standpoint of magnetic quality the best materials available in the late 1950s for permanent magnets were not steels but dispersion-hardened (precipitation-hardened) alloys containing no essential carbon (see ALLOYS). The first materials of this kind to find commercial use were the iron-cobalt-molybdenum and iron-nickel-aluminum alloys (Table III). Their high coercivities are caused by the presence of very small particles of one kind highly dispersed in a matrix of another composition.

Important materials for magnets are listed in Table III, which indicates in outline the mechanical operations required in preparation and the heat treatment used to bring out the best magnetic

properties. Demagnetization curves for some of these alloys are reproduced in bg. 19. Special attention is called to the alloy called Alnico 5 in the United States and Alcomax in England. In order to develop its remarkable properties it must be cooled at a definite rate in a strong magnetic field (about 1,000 oersteds) so directed in the specimen that it is parallel to the field required in use. At right angles to the direction of the field applied during treatment the properties are not so good, the energy product being then only about one-tenth as high. Although Alnico j is not forgeable and must be cast and ground to final form, its magnetic properties are outstanding and its uses numerous.

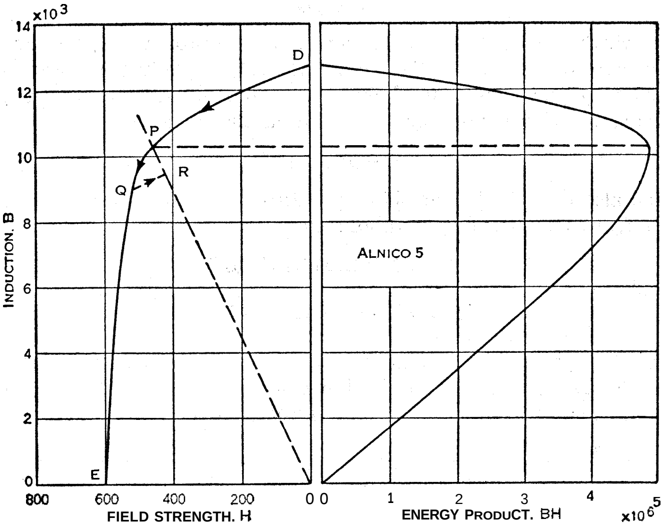

FIG. 18.— DEMAGNETIZATION CURVE (DE) AND CORRESPONDING ENERGY PRODUCT CURVE (BH v. B), SHOWING DESIRABLE POINT OF OPERATION. P, WHERE ENERGY PRODUCT IS MAXIMUM

2. Fine-Particle Magnets.—Among the other materials used or contemplated for use in permanent magnets the most interesting are in the class of fine-particle magnets. Theory indicates that

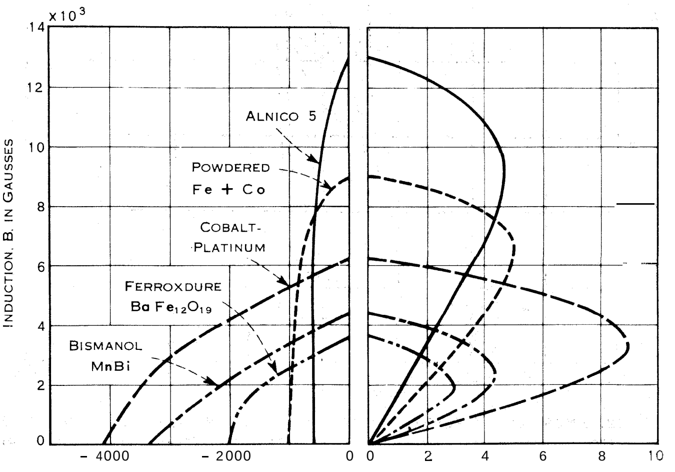

FIG. 19.— DEMAGNETIZATION AND ENERGY PRODUCT CURVES FOR SEVERAL MATERIALS IMPORTANT FOR PERMANENT MAGNETS

when particles are small enough, of the order of one micron (10^{-4} cm.) or less in diameter, they are comprised of single domains (see I'. *The Magnetization Curve: j. Domain Theory of Magnetization* below). This means that it is more difiicult to reverse the magnetization in them than in larger particles of the same material and that therefore they will make good permanent magnets.

Permanent magnets have been made of finely divided powder of barium ferrite ($BaFe_{12}O_{19}$, Ferroxdure). of iron, of manganese bismuthide (MnBi) and of iron-cobalt ferrite ($CoFe_5O_8$). In 1956 magnets of a finely powdered iron-cobalt alloy were prepared by T. O. Paine and his associates with an energy product of $j \times 10^6$ (*see* fig. 19). In this material the shape of the particle is important (the length is several times the diameter) and the long directions of the particles are all aligned parallel to the direction in which the material is to be magnetized.

It has been proposed that materials like Alnico j, although cast, fall into the category of fine-particle magnets because they are composed of particles of the requisite fineness embedded in a matrix of different magnetic quality.

3. Design of Permanent Magnets.— In the design of permanent magnets it is important to use the appropriate material and to shape it so that the minimum amount is used to produce the desired field strength in a given gap. As already pointed out. this result is accomplished when the product of B and H everywhere in the material has its maximum product, (BH),. The magnet of fig. 20 is designed with that in mind. The material is Alnico 5. The length of the material along the curved path, in relation to the length of the gap, determines the position of the line OP of fig. 18, and this should be placed so that it cuts the demagnetization curve at $B = 10{,}000$, corresponding to (BH),. The cross-sectional area of the magnet is adjusted to take account of leakage; a heavier section is necessary at the lower part because all of the leakage flux must pass through this, and B must at the same time be maintained at its proper value.

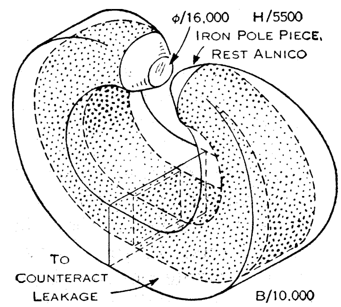

FIG. 2.0.— PRACTICAL DESIGN OF A PERMANENT MAGNET

The magnet operates at H=5,500, with B_0=10,000 almost everywhere in material. Unshaded portion is part of magnet necessary to carry "leakage flux" (P. P. Cioffi)

After a permanent magnet is designed and constructed it is magnetized with a high field. After removal of this magnetizing field it is usually desirable to apply momentarily a relatively weak field in the opposite direction. whereupon the magnetic state of the material changes as indicated by the points PQR of fig. 18. This stabilizes the magnet against the effect of stray fields or mechanical shocks or changes in temperature, so that the field in the gap is less likely to change.

V. THE MAGNETIZATION CURVE

1. Three Portions of Curve.— A typical magnetization curve, showing the relation between B and H in a specimen initially unmagnetized! may be divided into three main parts separated from each other by the "knee" and the "instep" (fig. 21). These three regions are identified with different physical mechanisms of change of magnetization; and also with different engineering uses of the materials. The initial portion of the curve; the "toe," is not horizontal at the origin but has a definite slope called the initial permeability. μ_0, equal to B/H for $H = 0$. For low inductions Lord Rayleigh found that the relation

$$B=\mu_0 H+aH^2$$

was obeyed, and when the permeability μ is plotted against the field strength H the points usually lie on a straight line corresponding to the equation

$$\mu=\mu_0+aH\ .$$

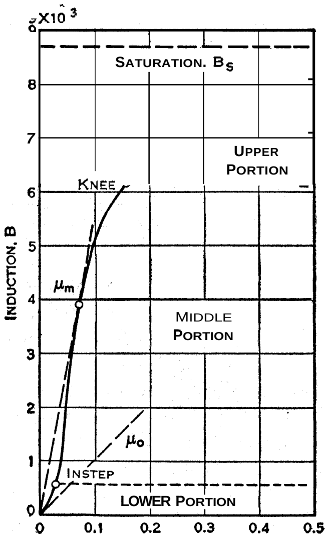

FIG. 21.—THREE SECTIONS OF NORMAL MAGNETIZATION CURVE
The sections are separated by "knee" and "instep." μ_m is largest value of B/H, μ_0 initial slope of curve

Curves of this kind are used to determine the value of μ_0 by extrapolation.

The upper portion of the magnetization curve (fig. 21) bends over and approaches the horizontal line marked B_s. In high fields, however, it is found that B approaches no definite limit but B-H does approach a limit, called the saturation induction or simply saturation. designated B_s. Since $B-H=4\pi I$, I approaches the limit I_s, the saturation magnetization.

The upper part of the curve may be represented fairly well by O. Frohlich's equation:

$$B-H=H/(a+bH)$$

in which $b=1/B_s$ and a is a constant which measures the magnetic hardness and is larger the stronger the field necessary to attain any given fraction of saturation. When H is small enough to be neglected in comparison with B, this equation may be expressed in the equivalent form used by A. E. Kennelly:

$$1/\mu=a+bH$$

and so a linear relation is found when $1/\mu$ is plotted against H. From a graph of this kind one can easily determine the constants a and b, and interpolate to find the value of μ for intermediate values of H. The slope of the line, b, may be used to estimate the saturation induction ($b=1/B_s$), but this method cannot be depended on for accuracy for in some materials such as iron the slope changes markedly at inductions close to saturation. The ratio $1/\mu$ is termed the reluctivity.

In its middle portion the magnetization curve is the steepest, and the permeability has its greatest value. It is here that irreversible changes in magnetization are a maximum, as indicated by the fact that curves for increasing and decreasing field strength differ markedly. These irreversible changes and the consequent losses in energy will now be discussed.

2. Hysteresis Loops.—A set of normal hysteresis loops is shown in fig. 22. In forming one of these the field strength is first increased from zero and the induction follows the magnetization curve OAC. H is then decreased, and the induction decreases slowly so that the hysteresis loop passes successively through the points D, E and F; then the field is reversed and the loop passes through G and back to C. At D the induction is called residual induction (B_r) and at E, when $B=0$, the field strength is the coercive force (H_c). The induction at the tip of a loop, as at C, is commonly designated B_m.

When the tip of the hysteresis loop lies on the first portion of the magnetization curve (OP in fig. 22), the loop is relatively narrow and the slope of the upper part of the loop, after it has just receded from the tip, is not greatly different from the slope of the magnetization curve at that point. If the tip lies in the middle portion of the magnetization curve, however. the slope of the loop (*e.g.*, at C, going toward D) is markedly different from the slope of the magnetization curve. These loops are relatively wide and the energy losses large. In the upper portion of the curve, above the knee, the losses are again small and the process of magnetization reversible.

The area enclosed by a hysteresis loop is proportional to the energy liberated as heat during traversal of the loop. When the area is in the units gausses × oersteds the energy loss due to hysteresis (Warburg's law) is

$$W_h=\frac{\text{area}}{4\pi}=\frac{1}{4\pi}\oint HdB$$

ergs/cm.³ for each traversal of the loop, or cycle. In high fields the hysteresis loss in iron, about 10,000 ergs/cm.³/cycle, is sufficient to raise its temperature about 0.0003° C. for each cycle, and therefore if the field is alternated 50 or 60 times a second, about one minute is required for the iron to heat one degree.

The hysteresis loss rises rapidly as the maximum induction of the loop, B_m, increases. The curve of fig. 23 shows the relation between W_h and B_m for ordinary iron having a maximum permeability of 4,500. When B_m is very small W_h varies as B^3, and in the range $B_m=1{,}000$ to $15{,}000$, of special interest for work on power transformers, it varies approximately as the 1.6 power of B_m in accordance with the empirical law of Steinmetz:

$$W_h=\eta B_m^{1.6}$$

in which the Steinmetz coefficient, η, is approximately constant for any one material. The B3 relation at low inductions was derived by Rayleigh. He showed, as noted above, that the magnetization curve near the toe followed the equation

$$B=\mu_0 H+aH^2$$

and also that the hysteresis loop with tips at B_m, H_m and $-B_m$, $-H_m$ was described by parabolic equations

$$B=\mu H+(a/2)(H_m^2-H^2)$$

and

$$B=\mu H-(a/2)(H_m^2-H^2)$$

for the upper and lower halves of the loop, respectively. (Here $\mu=B_m/H_m$). Such a loop is shown with the corresponding magnetization curve in fig. 24. Measurements have been made for

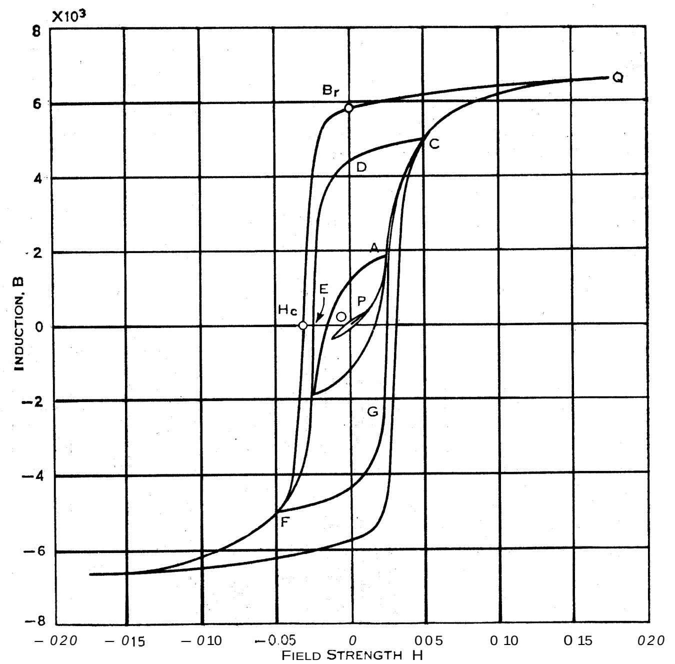

FIG 22 — NORMAL HYSTERESIS LOOPS FOR LOW, INTERMEDIATE AND HIGH INDUCTIONS. RESIDUAL INDUCTION, B_r, AND COERCIVE FORCE, H_c, ARE VALUES OF B AND H WHERE CURVES CROSS AXES

values of B_m as low as two gausses, and only slight deviations from the Rayleigh form observed. The area of a Rayleigh loop may be calculated from the above equations, and the corresponding hysteresis loss, expressed in ergs/cm.³/cycle, is

$$W_h=\frac{aH_m^3}{3\pi}=\frac{aB_m^3}{3\pi\mu^3}.$$

This equation corresponds to the lower part of the long curve of fig. 23, and is valid in iron when B_m is below about 500 gausses.

The hysteresis losses of various materials vary over a wide range. Losses of some of the common permeable materials are indicated by curves in fig. 23, and one of these has about $\frac{1}{200}$ the loss of iron at the same value of B_m. Materials used for permanent magnets, on the other hand, have hysteresis losses enormously larger than iron, sometimes by a factor of 500. Thus the over-all range in loss in various materials is approximately 100,000 times; *i.e.*, the coefficient η of Steinmetz' equation varies from 0.6×10^{-5} to 0.6.

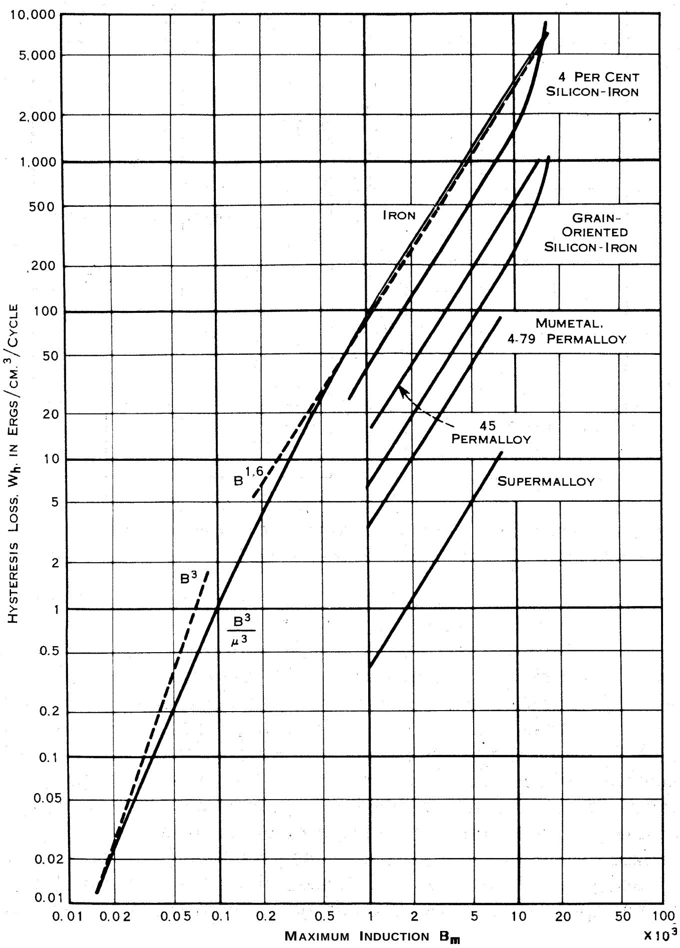

FIG. 23.— HYSTERESIS LOSS AS DEPENDENT ON MAXIMUM INDUCTION FOR SOME IMPORTANT MATERIALS

3. Distribution of Hysteresis Loss Over Cycle.—The energy loss and the attendant rise in temperature can be calculated satisfactorily as described above for a complete hysteresis loop. But in what part of the loop does most of the rise in temperature take place? This question has been answered by direct experiment, measurements having been made of the very small rise in temperature that occurs when the induction is changed by only a small fraction of the total. Changes of about $\frac{1}{1,000,000}°$ C. have been measured in these experiments. The results of such investigations show that the energy losses are largest where the hysteresis loop is steepest. In addition to this irreversible loss, there is a heating of the specimen in strong fields as the field is increased, and an equal cooling as the field is decreased. This reversible heat does not, therefore, contribute to the hysteresis loss over a complete cycle.

4. Hysteresis in Rotating Fields.—The hysteresis loops mentioned so far have been measured with B and H either parallel or antiparallel to each other. A different result is obtained if the field acting on a specimen is maintained constant in strength and varied continually in direction. This is usually called simply rotational hysteresis as compared with the usual alternating hysteresis. Measurement of rotational hysteresis is accomplished by placing a disk of the material to be examined between the poles of an electromagnet and rotating the disk so that H always lies in its plane. The force necessary to turn the disk is then a measure of the rotational hysteresis loss.

As the field strength increases from zero the rotational hysteresis first increases rapidly (fig. 25), more rapidly than the alternating hysteresis, but when the induction is half to three-quarters of saturation the alternating hysteresis goes through a maximum and decreases rapidly, approaching zero at saturation. The disappearance of hysteresis in a high rotating field was predicted as a result of Ewing's theory, and its confirmation in 1896 indicated the fundamental soundness of the theory. Rotational hysteresis is of practical importance in the magnetic material forming the segments or teeth of rotating dynamo-electric machinery.

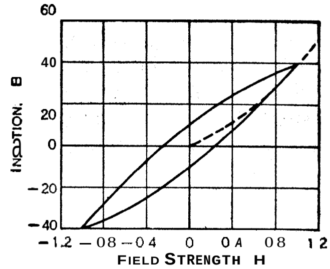

FIG. 24.—FORM OF HYSTERESIS LOOP FOR LOW INDUCTIONS (LORD RAYLEIGH)

5. Domain Theory of Magnetization.— Many of the phenomena of the magnetization curve and hysteresis loop can be described to advantage in terms of the domain theory. The theory that a ferromagnetic material is composed of many small regions, each magnetized to saturation in some direction, was first stated by Weiss in 1907, and the description he gave at that time is accepted with but slight modification. The existence of such domains is evident from H. Barkhausen's experiments and even more definitely from the study of powder patterns (see below). In the unmagnetized state the directions in which the domains are saturated (the directions of easy magnetization) are distributed either at random or in some other way such that the resultant magnetization of the specimen as a whole is zero. Application of a field changes only the direction of magnetization in a given volume. The three main parts of the magnetization curve are distinguished from each other by the nature of this change in direction, which may take place in any of several ways.

The magnetic moment of any one domain is specified by the magnitude and direction of its magnetization and by its volume. Ordinarily at constant temperature the moment of a domain, and therefore the magnetization of the ferromagnetic body of which it is a part, is changed by: (1) a change in the direction of magnetization of the domain ("rotation"); or (2) a change in the volume of the domain ("moving boundary"). These processes are indicated graphically in fig. 26. It has been shown by R. Becker that the moving boundary is particularly important for changes occurring in low and medium fields. Processes may be classified also as reversible or irreversible accordingly as the energy dissipated in heat is a relatively small or large fraction of the potential energy.

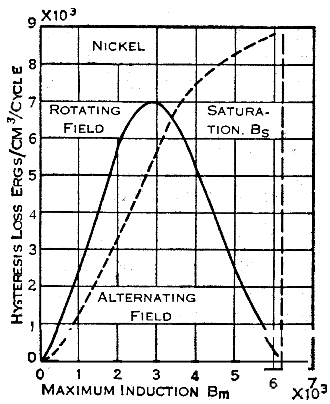

FIG. 25.— ROTATIONAL HYSTERESIS LOSS GOES THROUGH MAXIMUM, APPROACHES ZERO AT SATURATION (A. PERRIER)

In each of these portions of the magnetization curve, one type of process preponderates as indicated here: (1) initial portion—reversible boundary displacement; (2) middle portion—irreversible boundary displacement; (3) upper portion—reversible rotation. Fig. 27 shows the three important processes in relation to the magnetization curve and hysteresis loops, and the corresponding energy losses due to hysteresis, for a specimen of a high-permeability alloy.

The domain boundaries are not sharp on an atomic scale; as shown in fig. 28 the orientations of the atoms change progressively across the "wall." In iron the wall is about 1,000 atoms thick instead of the four indicated in the schematic drawing.

If the dimensions of a magnetic particle are about the same as the wall thickness it is apparent that there can be no change in magnetization by wall displacement. Change in magnetization must then occur by domain rotation, and higher fields are necessary to produce a given change in magnetization, provided the particles are magnetically anisotropic. Consequently an agglomerate of fine particles will make a good permanent magnet.

The factors which determine the direction of magnetization in a single domain of a specimen are the crystal structure, the state of strain and, of course, the direction and strength of the magnetic field. The effect of crystal structure and of strain will be

FIG. 26.— MECHANISM OF CHANGE OF MAGNETIZATION. DOMAIN WALL MOTION IN WEAK FIELDS (A, B), DOMAIN ROTATION IN STRONG FIELDS (C, D)

discussed in some detail in later sections of this article. It may be mentioned here in a preliminary way that the nature of the crystal structure affects mainly the upper part of the magnetization curve of a permeable material. In iron, for example, the crystal structure is such that the magnetic properties of a single crystal vary considerably with direction, and as a result of this variation exceptionally high fields are necessary to approach saturation in ordinary polycrystalline iron. The rotation of the domain by the field must be made against relatively powerful forces. and so the magnetization curve above the knee rises slowly over a considerable distance. This behaviour may be contrasted with that of permalloy containing 60% to 80% nickel and 40% to 20% iron —here the magnetic properties vary but little with the direction in the crystal, the domains therefore rotate easily and the magnetization curve flattens out quickly above the knee, attaining saturation in relatively weak fields (fig. 9).

Just as strain affects magnetic properties, so magnetization changes the dimensions of a ferromagnetic body, or the body is said to exhibit magnetostriction. If the length of a material changes by a relatively large amount when magnetized to saturation, this material will be relatively sensitive to strain; *i.e.*, magnetostriction and strain sensitivity are reciprocal properties. Strain affects mainly the lower and middle portions of the magnetization curve, and the strain and magnetostriction together determine the ease with which the interdomain boundary is moved by a change in the magnetic field. Thus the highest initial perme-

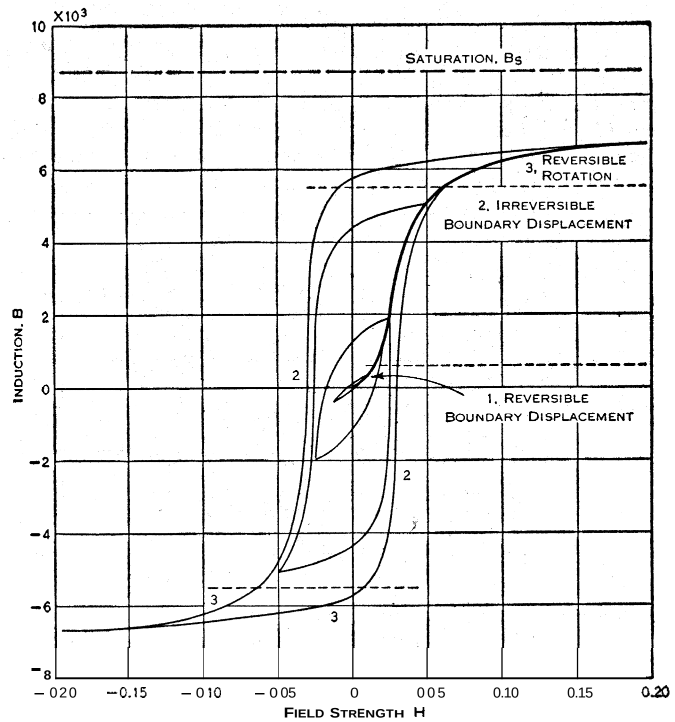

FIG. 27.— NATUREOF CHANGE IN MAGNETIZATION IN RELATION TO POSITION ON MAGNETIZATION CURVE AND HYSTERESIS LOOP

abilities are found in materials having very small magnetostriction; *e.g.*, permalloy containing about 80% nickel.

6. Powder Patterns. — For many decades iron filings have been used to portray the directions of lines of magnetic force in air and to detect flaws or inhomogeneities in magnetic materials. (See MAGNETIC INSPECTION.) In 1931 it occurred to L. von Hàmos and P. A. Thiessen to use fine magnetic powder to detect the local inhomogeneities in magnetization that the domain theory predicts. Independently F. Bitter applied a suspension of siderac (Fe_2O_3), having particles about 10^{-4} cm. in diameter, to a polished magnetized surface and observed under the microscope that the powder formed parallel lines regularly spaced about 0.1 mm. apart and aligned approximately perpendicularly to the direction of magnetization. The technique and interpretation of such patterns were then the subjects of study by a number of workers. A notable advance was made by H. J. Williams, R. M. Bozorth and W. Shockley, who used carefully prepared surfaces of single crystals of silicon

iron and other substances. Many of the processes predicted by domain theory were confirmed by them and other experimenters. Fig. 29 shows a domain pattern on a single cobalt crystal; one sees here the motion of the boundaries with change in direction of applied field. In fig. 30, a domain pattern near the edge of a crystal of iron, both 180° and 90° walls (between domains magnetized in opposite directions and at right angles) are observed. The small domains at the bottom are "domains of closure" and permit the flux to flow easily in the directions of easy magnetization indicated by the arrows. A discussion of the easy directions of magnetization is given in *VII. Properties of Single Crystals* below.

FIG. 29.— POWDER PATTERN OF DOMAIN WALL MOTION IN COBALT (H. J. WILLIAMS)

The effect of imperfections on wall movement is illustrated by the two parts of fig. 31. In (A) the imperfection is near a principal wall which moves under the influence of a field, and from the imperfection there are subordinate walls stretching from the principal wall. But when this wall moves too far from the imperfection the subordinate walls are stretched too far and ultimately break, thus releasing the energy stored in the subordinate walls and causing the principal wall to move forward suddenly.

The structures of some powder patterns are simple and well understood. It is believed that the more complicated patterns are controlled by the same factors, illustrated in fig. 32.

The energies involved are: (1) magnetostatic energy, associated with magnetic charge or poles; (2) magnetostrictive energy, associated with the spontaneous change in dimensions of a domain when it is formed as a magnetic unit; and (3) the energy associated with the domain wall. In the various configurations of fig. 32, (A) shows a single isolated domain with a large amount of magnetostatic energy; in (B) this is reduced but some wall energy is added; in (C) the magnetostatic energy is further reduced but magnetostrictive energy, associated with nonparallel domains, is added; and in (D) the latter is reduced and some domain wall energy is added. The stable configuration is that for which the total energy is a minimum. The amounts of energy can be evaluated for simple configurations such as the one shown, and quantitative agreement with experiment is found. The resemblance between fig. 32(D) and fig. 30 is easy to see. Complex structures presumably are subject to the same principles.

7. Barkhausen Effect.—In 1919 Barkhausen discovered the effect known by his name, and interpreted it as demonstrating that the magnetization of iron proceeds by steps and not in a continuous manner. This effect may be demonstrated simply with the aid of amplifier and phones. As the field is changed slowly the succession of clicks heard in the phones, or in a loud-speaker, persists only when the magnetization is changing along the steep part of the magnetization curve or hysteresis loop. The clicks are identified with irreversible changes in magnetization (process [2] above) and are direct evidence of the existence of domains.

It is now known that the discontinuities of the Barkhausen effect are caused by the sudden movement of a portion of a domain wall from one stable position to another. the positions of stability being determined by the location of crystal imperfections of one kind or another. During one discontinuity in magnetization the volume of the material swept over by the wall is on the average about 10^{-6} mm.^{3}, whereas the volume of a single domain is of the order of 10^{-3} mm.^{3}

VI. STRESS AND MAGNETOSTRICTION

The magnetic properties of many ferromagnetic materials are sensitive to the application of stress, to such an extent that stress may be ranked with field strength and temperature as one of the primary factors affecting magnetic change. Stresses of two kinds should be distinguished: large stresses, that cause a permanent deformation of the material. almost invariably cause a decrease in permeability; stresses within the elastic limit may cause either an increase or a decrease in the permeability, depending on the nature of the material.

When a moderate tension is applied to a specimen of nickel, its permeability is decreased. The magnetization curve taken with tension applied always lies below that-for the unstrained material (fig. 33), and the curve is always lower the greater the tension. The effect of stress on the magnetization curve is greatest in the middle portion of the curve, and approaches zero when the specimen is either unmagnetized or saturated.

With some materials, on the other hand, the effect of tension is to increase the permeability. For example, in permalloy containing **68%** nickel and 32% iron the maximum permeability is higher by a factor of 8 when the tension is 2 kg./mm.^{2} and by a factor of about 30 when the tension is 11 kg./mm.^{2} (15,600 lb./in.^{2}), the elastic limit of this material. As the stress exceeds the elastic limit the permeability of permalloy, and indeed that of any material. decreases rapidly.

FIG. 80.— DOMAIN STRUCTURE IN [100] PLANE OF IRON, SHOWING TRIANGULAR DOMAINS OF CLOSURE AT EDGE OF CRYSTAL. UNMAGNETIZED (H. J. WILLIAMS)

The effect of stress on magnetization is closely related to the change of dimensions that occurs when a magnetic body is magnetized (magnetostriction); that is, the effect of strain on magnetization and the effect of magnetization on strain are interdependent. When nickel is magnetized it contracts a small fraction of its original length, at most 40 parts per 1,000,000. The fractional change of length, $\Delta l/l$, with field strength, H (fig. 34), is first slow, then rapid, then again slow as it approaches a finite limit called "saturation magnetostriction" $(\Delta l/l)_s$. When 68 permalloy is magnetized it increases in length as shown.

FIG. 31.— SECONDARY WALLS FROM SUBSURFACE CRYSTAL IMPERFECTION RESTRICT PRIMARY WALL AS IT MOVES DOWNWARD UNDER INFLUENCE OF APPLIED FIELD (R. C. SHERWOOD)

Nickel and 68 permalloy are representative of materials with negative and positive magnetostriction. respectively. Tension increases the magnetization of a body having positive magnetostriction, decreases the magnetization if it has negative magnetostriction. The effect of compression is opposite to that of tension, consequently the magnetization of magnetostrictively positive materials is decreased by pressure. In referring to tension and compression it has been assumed that they are applied along a line parallel to the direction of the magnetic field; if pressure is applied in a direction at right angles to the field the effect on magnetization is opposite to the effect of compression applied parallel to the field; *i.e.,* compression applied to nickel at right angles to the field will decrease the magnetization measured parallel to the field.

Iron and some other materials have magnetostriction that is sometimes positive and sometimes negative. The magnetostriction of iron is positive in weak fields, negative in strong fields; and the effect of tension is, as expected, to increase magnetization in low fields, decrease it in high fields.

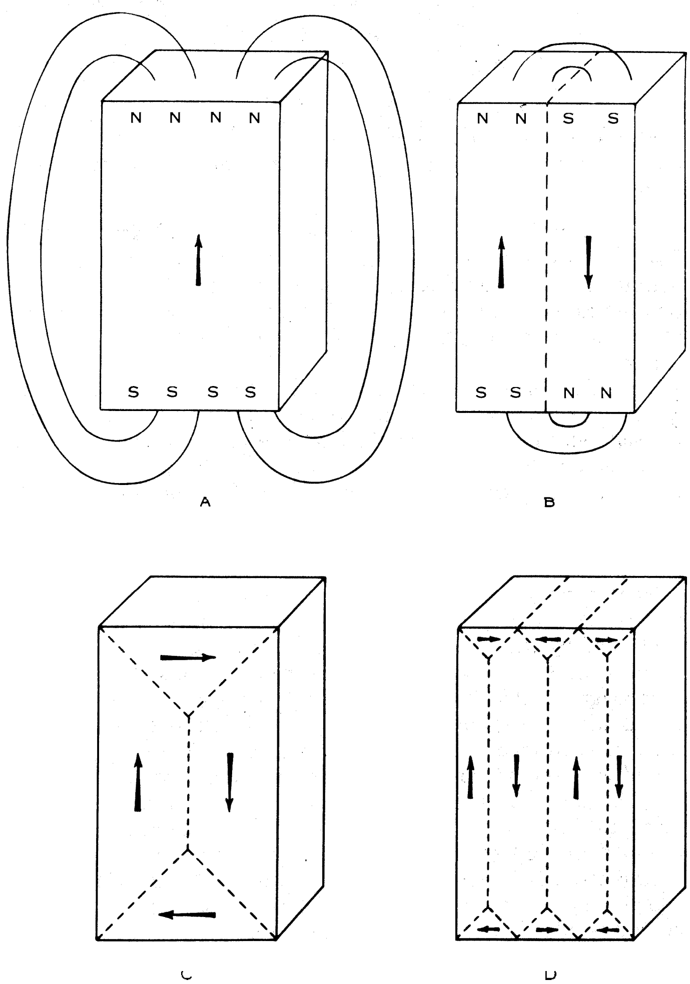
Generally the magnetostriction begins to increase rapidly with field strength at about the knee of the magnetization curve. The magnetization attains one-half to two-thirds of its saturation value while the magnetostriction is still only one-fourth to one-third of its final value $(\Delta l/l)_s$.

Both the strain sensitivity and magnetostriction of the iron-nickel alloys are of special interest. The saturation magnetostriction (the greatest change in length) goes through zero at about 81% nickel, a composition close to that of the permalloys having the highest permeability, and L. W. McKeehan pointed out the close theoretical connection between the low magnetostriction and high permeability of these alloys. The strain sensitivity of the permalloys is also zero at about 81% nickel, as would be expected.

The magnetostriction of iron-cobalt ferrite ($CoFe_2O_4.Fe_3O_4$) is the largest so far reported—about 750×10^{-6}. High magnetostriction has also been reported for cobalt, for manganese bismuthide (MnBi) and for some iron-cobalt alloys.

Measurements of magnetostriction are commonly made with strain gauges, as proposed by J. E. Goldman. These consist of fine wires cemented firmly to the surface of the body to be measured. When the body expands or contracts, the wire expands or contracts with it and the resistance of the wire changes accordingly. The resistance can be measured with high accuracy so that the change in dimensions can be determined to 1 part in 10,000,000 to 100,000,000 (10^{-8}).

1. Changes in Volume.—When iron is magnetized in not too strong a field its length increases and its cross-sectional area decreases in about the same proportion, so that the volume remains approximately constant. However, there is a small change in vol-



BY COURTESY OF "ELECTRICAL ENGINEERING"

FIG. 32.— POSSIBLEDOMAIN STRUCTURES

Diagrams show large magnetostatic energy in (A), and successively lower energy in other structures in which there is wall energy (B) and magnetostrictive energy (C); (D) represents the kind of structure actually observed (fig. 30)

ume, usually an expansion, that can be detected with sensitive apparatus. When a field of about 2,000 oersteds is applied. the fractional change in volume in iron is about 10^{-6}, and in nickel about one-third of this amount. It is especially large in the iron-nickel alloys containing about 30% nickel, and here amounts to about 40×10^{-6}.

Closely connected with the change in volume with field strength is the change of magnetization with hydrostatic pressure. As indicated by the magnitude of the volume magnetostriction, this change is small.

2. Domain Interpretation of Stress.—According to the domain theory, when tension is applied to a material with positive magnetostriction, the magnetization of a single domain will tend to be aligned parallel to the direction of the tension. In an unmagnetized material with domains oriented initially at random the domains are rotated by a sufficiently large tension, as shown in fig. 35(A) and (B), because the directions of easy magnetization in the various domains have been changed by the stress. If a field is then applied, half of the domains reverse in direction and the material is saturated. (No magnetostrictive change in length accompanies such domain reversals.)

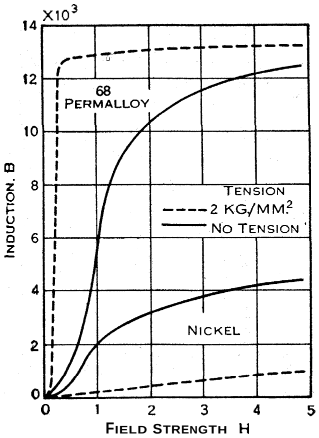


FIG. 33.—EFFECT OF TENSION ON MAGNETIZATION

The effect on 68 permalloy and nickel is opposite in direction. Tension is held constant while field is increased from zero

Compression causes the domains to orient transversely (fig. 35[D]). If a material has negative magnetostriction, tension will effect the same result, and a field subsequently applied will rotate the domains toward saturation.

The domain theory has been successful in predicting the highest value of the initial permeability that can be attained when impurities have been reduced to a minimum and internal strains relieved as much as possible by annealing. The small strain then remaining is due to the magnetostriction of the separate domains and is proportional to the saturation magnetostrictions; and the smaller the magnetostriction the larger the initial permeability according to the relation derived by M. Kersten:

$$\mu_o = \frac{4I_s^2}{(\Delta l/l)_s^2 E}$$

in which E is Young's modulus of elasticity and **I,** the saturation magnetization. This equation, although by no means exact, is in agreement with the fact that μ_o is large when $(\Delta l/l)_s$ is small. as it is in the iron-nickel alloys containing about 80% nickel; and the equation holds with fair accuracy for a series of iron-nickel alloys. For $(\Delta l/l)_s$ one can usually use the magnetostriction for polycrystalline material, but more accurately it is the magnetostriction measured in the direction of easy magnetization in a single crystal.

VII. PROPERTIES OF SINGLE CRYSTALS

Improvements in the technique of growing large metallic crystals have opened to investigation the magnetic properties of single crystals of iron. cobalt. nickel and many alloys of these elements, and the nonmetallic ferrites. Crystals of some metals. such as nickel and nickel-iron alloys, are grown by slow freezing of a melt of pure material. This method is not adapted to iron. because of its phase transformation at about 900° C.; single crystals of this element are grown by stretching a pure specimen a definite amount and then heating it for a long time just below the transformation temperature.

In the cubic crystals of iron and nickel the magnetic properties depend on the direction, with respect to the crystal axes. in which these properties are measured. Fig. 36 shows the magnetization curves for iron and for nickel, taken nith B and H measured in the three principal directions, namely: (1) parallel to an edge of the cube—the [100] direction; (2) parallel to a diagonal of a cube face—the [110] direction; and (3) parallel to the space diagonal—the [111] direction. The direction for nhich the magnetization curve lies highest is the direction in which magnetization is most easily acquired, and is called the direction of easy magnetization. In iron this directipn is parallel to a cube edge; in nickel it is parallel to a cube diagonal.

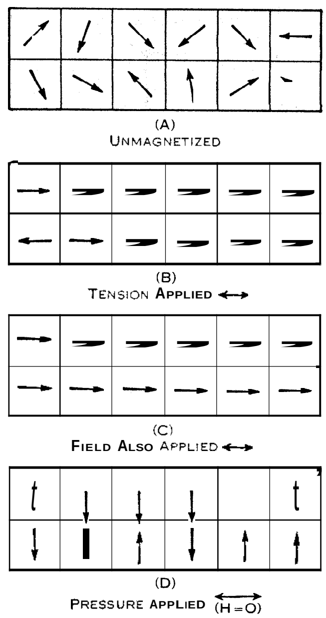

FIG. 35.—EFFECT OF STRESS AND MAGNETIC FIELD

Schematic domain interoretation of the effect of stress and magnetic field applied to material with positive magnetostriction

According to the domain theory the direction of easy magnetization in a crystal determines the actual direction of magnetization in a single domain not subjected to magnetic field or strain. and in unmagnetized iron the domains are oriented in each of the six directions parallel to a cube edge so that the net magnetization is zero. In nickel there are eight such easy directions.

Magnetization curves of single crystals of a silicon-iron alloy (3.8% silicon) have a special interest because this is the first case in which measurements mere extended to very low inductions, and because the high permeabilities obtained in these crystals are enormous compared with the permeabilities found in commercial silicon-iron sheet having the same silicon content These data nere made available by cutting a single crystal in the form of a hollow parallelogram so that all sides were parallel to equivalent directions in the crystal. *e.g.,* parallel to diagonals of cube faces and so forming a closed magnetic circuit and measuring in the usual way. The highest permeability observed is about 100 times that of commercial transformer sheet.

1. Calculation of **Magnetization Curves.**—A theoretical study of the properties of crystals has made it possible to calculate the magnetization curve for any direction in a single cubic crystal like iron or nickel, provided a single constant of the crystal, the anisotropy constant. K, is knonn. This constant is a measure of the difference between the magnetization curves in different directions, and is numerically equal to four times the area between the **I** v. H curves for the [100] and [110] directions. The constant is positive for iron and negative for nickel, and is approximately zero for iron-nickel alloys containing 65% to 80% nickel.

Comparison of theory and experiment is made in fig. 37 using Williams' data for a single crystal containing 3.8% silicon, for which $K = 280\ 000$ ergs/cm.^{3}; the theory does not take account of the energy associated with the lower and middle portions of the magnetization curve; therefore, the calculated curves do not correspond to the true magnetization curve below its knee. In a polycrystalline material the magnetization curve is a combination of the separate curves for the many small single crystals of which it is composed. The calculation of such a composite curve has been made to show in what manner the magnetization curve approaches saturation, and fair agreement with observation has been found.

In iron and nickel the anisotropy constants decrease as the temperature increases, so that these metals are isotropic over a considerable range of temperature before they become nonmagnetic at

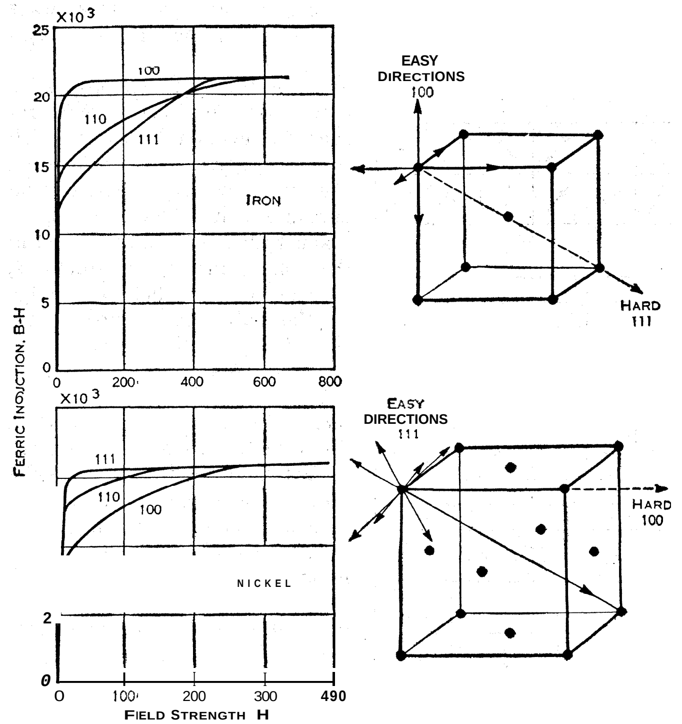

FIG. 36.— MAGNETIC PROPERTIES AND CRYSTAL STRUCTURES OF SINGLE CRYSTALS OF IRON AND NICKEL

The groups of arrows at the corners of the cubes—six for iron and eight for nickel — indicate the directions of easy magnetization (K. Honda and S. Kaya, W. L. Webster)

the Curie point. At very low temperature, 20° K., the constant for nickel is 10 to 15 times that it is at room temperature, while for iron the corresponding ratio is only 1.5.

2. Anisotropy.—Unusual magnetic properties are found in alloys having small values of the anisotropy constant. Such alloys are the permalloys having nickel contents between 60% and 80%, in which range of composition the constant goes from positive to negative (fig. 38). When the anisotropy is small, and the orientation of the domain therefore controlled only weakly by the crystal structure, the material responds easily to either magnetic field or to mechanical stress and therefore saturates in relatively low fields and is unusually strain sensitive.

The small anisotropy of the permalloys containing 60% to 80% nickel is associated with the fact that these alloys show unusual properties when heat treated in a magnetic field. A hysteresis loop of material so treated, and the high values of maximum permeability associated with the permalloys (fig. 12), have already been mentioned.

Cobalt differs from the other ferromagnetic elements, iron and nickel, by having a hexagonal crystal structure instead of a cubic one. At room temperature the direction of easy magnetization is parallel to the hexagonal axis of the crystal, and when unmagnetized the domains therefore lie in one of the two orientations parallel to this axis.

This small number of easy directions, compared with the six or eight in a cubic crystal, means that the domains are needlelike and that the whole magnetic structure may be regarded as a bundle of needles magnetized initially in either direction at random. This picture is supported by powder patterns (see fig. 29) and by the measurements made by L. H. Germer of magnetic fields close to the surfaces of a single crystal of cobalt.

The crystal anisotropy of cobalt is large, and consequently a

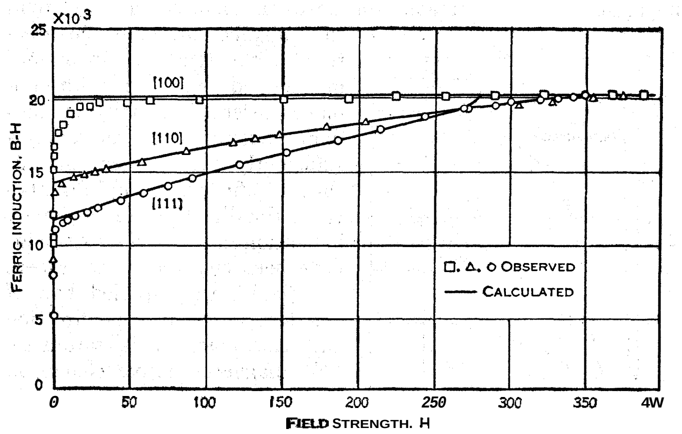

FIG. 37.— COMPARISON OF THEORY AND EXPERIMENT FOR MAGNETIZATION OF IRON-SILICON CRYSTAL IN THREE PRINCIPAL DIRECTIONS (H. J. WILLIAMS)

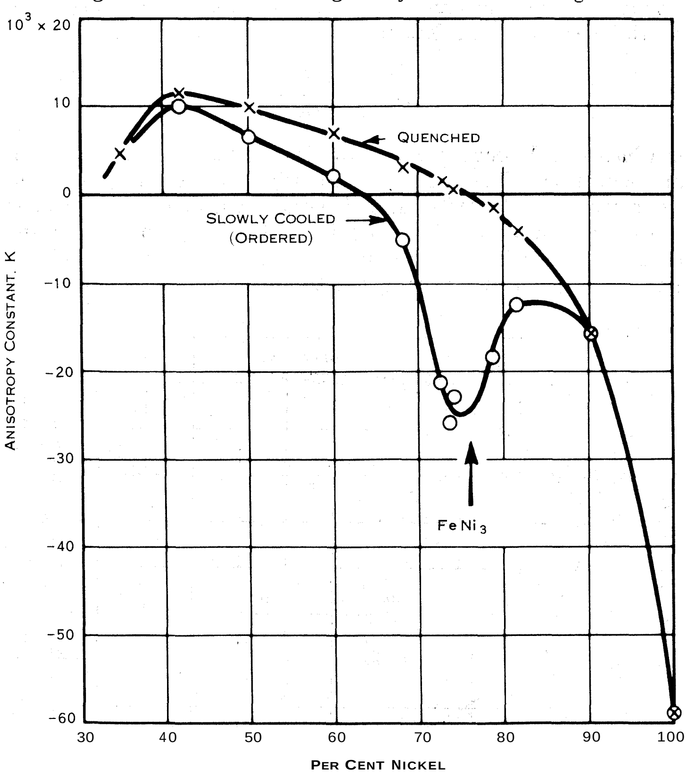
strong field is necessary to saturate a crystal in the direction of most difficult magnetization. More than 10,000 oersteds are required for this purpose at room temperature (fig. 39), compared with 600 oersteds for iron and 300 for nickel.

At higher temperatures cobalt becomes isotropic, and above 300° C. the hexagonal axis is the direction of most difficult magnetization. all directions at right angles to the axis being equally easy. Magnetization curves for the principal directions at room temperature and at 390° C. are shown in fig. 39.

3. Magnetostriction in Single Crystals.— The magnetostric-



FROM "THE PHYSICAL REVIEW," BY COURTESY OF THE AMERICAN PHYSICAL SOCIETY

FIG. 38.— CRYSTAL ANISOTROPY CONSTANTS OF IRON-NICKEL ALLOYS AFTER QUENCHING OR SLOWLY COOLING (R. M. BOZORTH AND J. G. WALKER)

tive change in length of a single crystal is not the same in all crystallographic directions. Especially is this true in iron which expands when the field is applied parallel to a crystal axis [100], contracts when it is applied parallel to a cube diagonal [111] (fig. 40). In the direction of the face diagonal [110] the crystal expands in low fields and contracts in high fields. Nickel contracts in all field strengths in all directions.

VIII. TEMPERATURE AND THE CURIE POINT

It bas been known for many years that when iron is heated to a high temperature it loses its ferromagnetism and is no longer

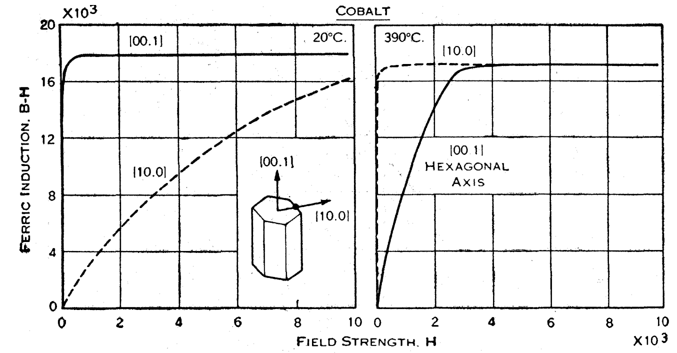


FIG. 39.— CRYSTAL ANISOTROPY OF COBALT REVERSES SIGN AT ABOUT 270" C., DIRECTION OF EASY MAGNETIZATION CHANGING FROM HEXAGONAL AXIS [00.1] BY 90" TO [10.0] (K. HONDA AND H. MASUMOTO)

strongly attracted by a magnet. The temperature at which any ferromagnetic material loses its magnetism is known as the Curie point; it is 770° C. for iron and 358" C. for nickel. The highest knonn Curie point is 1,120° C., for cobalt. For some materials the Curie point lies near the absolute zero of temperature.

When a magnetic material is subjected to a high constant field, an increase in temperature brings about a continuously accelerating decrease in induction. The induction comes down abruptly, almost to zero, at the Curie point (fig. 41), and the curve is retraced when the temperature is lowered again. On the other hand when the iron is subjected to a weak field the induction will first increase with increase in temperature and after passing through a maximum will drop to a low value at the Curie point as before.

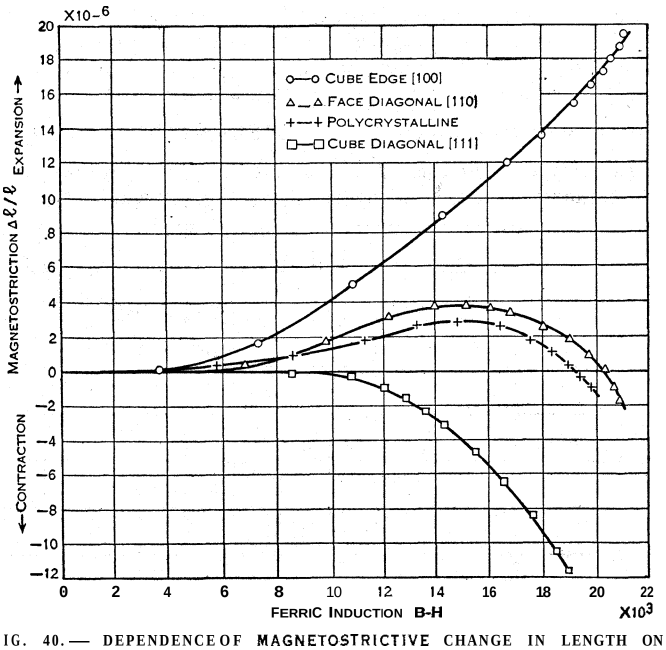

FIG. 40.— DEPENDENCE OF MAGNETOSTRICTIVE CHANGE IN LENGTH ON CRYSTAL DIRECTION IN IRON (W. L. WEBSTER)

In iron and in other materials which may be called "normal," the initial and maximum permeabilities first increase and then decrease with increasing temperature, and the coercive force and hysteresis loss continually decrease. The characteristic maximum in the initial and maximum permeabilities, just below the Curie point. is associated with the low magnetic anisotropy at this temperature. The way in which the size and shape of the hysteresis loop of iron change as the temperature approaches the Curie point is shown in fig. 42.

Iron and nickel are normal as to their magnetic behaviour with change of temperature. No changes in their crystal structures occur between room temperature and the Curie point. On the other hand such changes in structure do occur in many alloys, among which the so-called irreversible alloys of iron and nickel (5% to 30% nickel), investigated by J. Hopkinson. and some of the iron-cobalt alloys may be considered as examples. In the 60% cobalt-iron alloy a change in phase, due to a rearrangement of the atoms in the crystal. from a body-centred cubic (a) to a face-centred cubic (γ) form, occurs when the alloy is heated above 980° C. The α phase is ferromagnetic, the γ phase is nonmagnetic (*i.e.*, paramagnetic), consequently the material loses its ferromagnetism when heated through the temperature of change of phase, 980° C., and the magnetization (measured in a high field) drops toward zero precipitously (fig. 43) instead of in the normal fashion as it does for iron (fig. 41).

IX. EFFECT OF MAGNETIZATION ON OTHER PROPERTIES

Preceding paragraphs have described the magnetostriction that occurs during magnetization. Magnetization also effects changes in many other physical properties; and a ferromagnetic material, even though unmagnetized, possesses certain physical properties that are characteristic of its ferromagnetism. The more important of these properties are the following: (1) electrical resistance; (2) thermal expansion; (3) Young's modulus and other elastic constants; (4) magnetocaloric effect; (5) specific heat. The resistivity of magnetic materials is affected also by stress— tension may either increase or decrease the resistivity, depending on whether the material has positive or negative magnetostriction.

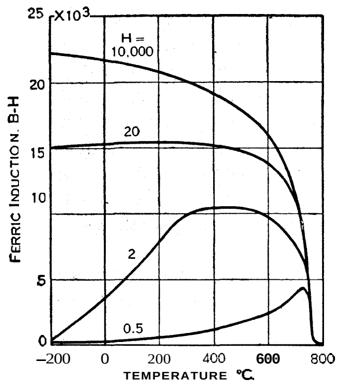

FIG. 41.— EFFECT OF TEMPERATURE

Effect of temperature on magnetization of iron subjected to fields of various strength. Magnetization drops to low value at Curie temperature, 770° C. (E. M. Terry)

1. Magnetism and **Resistivity.**—When nickel is magnetized in a high field. its electrical resistivity is increased by about 2%, and a similar but smaller effect is found in iron. Such changes were first reported by W. Thomson (Lord Kelvin) in 1851. A larger change in resistivity, as high as 4% to 5%, is shown by the iron-nickel alloys having 70% to 85% nickel. The increase in resistivity with field strength for the 84% permalloy (fig. 44) illustrates the general rule that most of the change occurs when the magnetization is well beyond the knee of the magnetization curve. and suggests that the change in resistivity, like the magnetostrictive change in length. is associated with domain rotations and not with domain reversals. There is a close relation between changes in length and changes in resistivity, and these quantities usually have a constant ratio.

The resistivity of a ferromagnetic material is abnormally low by virtue of the fact that it is ferromagnetic. This may be illustrated by comparison of the resistivities of nickel and palladium, elements occupying similar positions in the periodic table. The resistivity-temperature curves (fig. 45) are drawn so that they coincide at a temperature just above the Curie point of nickel, when both metals are nonmagnetic, and the separation of the curves below this temperature indicates the lowering of the resistivity due to the ferromagnetism. The ferromagnetism becomes progressively weaker as the Curie point is approached, and the separation of the curves in the figure correspondingly less.

2. Magnetism and Thermal Expansion.— The thermal expansion of magnetic materials is abnormal to such an extent that occasionally such a material will contract instead of expand as the temperature is raised in the vicinity of the Curie point. In some alloys, such as invar, the expansion is very small over a range of temperatures that includes room temperature, and this property is of great technical importance.

The origin of the abnormal expansion lies in the change in the forces between atoms that occurs when the material becomes ferro-

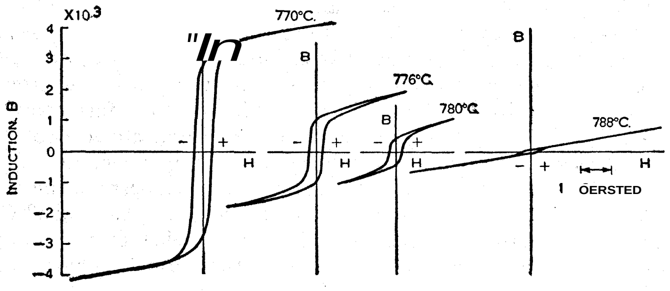

FIG. 42.—CHANGE IN FORM OF HYSTERESIS LOOP OF IRON NEAR THE CURIE POINT (H. KÜHLEWEIN)

magnetic. The iron-nickel alloys show these changes in a striking way (fig. 46). As nickel and the alloys containing more than 70% nickel cool through the Curie point, the expansion coefficients first increase and then decrease rapidly. In contrary fashion. the coefficients of alloys with 30% to 70% nickel first decrease sharply and then increase. These changes may be regarded as the result of the superposition of a "magnetic" expansion or contraction on the normal; in invar, containing about 36% nickel, the anomalous and normal expansion neutralize each other at room temperature. When the nickel content is about 70%, there is no anomalous magnetic expansion or contraction at any temperature; this is associated with the fact that at this composition the Curie point of these iron-nickel alloys is a maximum and independent of composition.

3. Abnormal Stress-Strain Relation.—In almost all substances a small mechanical stress, σ (tension), will produce a strain, ϵ (expansion), that is proportional to the stress, as required by Hooke's law

$$\epsilon=\sigma/E$$

in which Young's modulus, E, is constant. In an unmagnetized magnetic material, however, a tension will change the direction of local magnetization (fig. 35), and with such changes is bound a change in length equal to the magnetostriction of the material. Therefore, when tension is applied to a magnetic material, the whole expansion will be the sum of the normal expansion and the magnetostrictive expansion, consequently Young's modulus will vary with stress and deviations from Hooke's law occur.

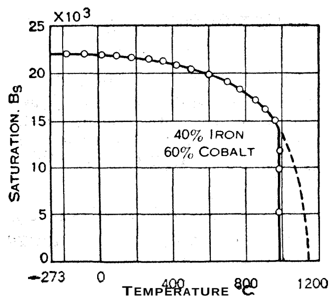

FIG. 43.—CURIE POINT DETERMINED BY CHANGE IN PHASE, AT 980° C., OF IRON-COBALT ALLOY (60% COBALT) (A. PREUSS)

In a magnetic material Young's modulus will therefore vary both with the amount of strain and with the intensity of magnetization. The change of E with magnetization has been studied in a variety of materials and may be 10% or larger.

4. Specific Heat and Magnetocaloric Effect.—In comparing the specific heats of nickel and copper at various temperatures (fig. 47) it is apparent that there is an unusual effect in nickel in the neighbourhood of the Curie point. Such a rapid rise and still more rapid drop in the curve, occurring aith rising temperature, is characteristic of a ferromagnetic material and is accounted for qualitatively and to a considerable extent quantitatively by theory. The heat necessary to raise the temperature of a magnetic material like nickel is equal to that necessary for a similar but nonmagnetic material (*e.g.*, copper), plus the heat necessary to overcome the mutual interatomic forces that hold the magnetic moments of neighbouring atoms parallel.

This characteristic specific heat of ferromagnetic bodies occurs whether or not the substance under examination is magnetized in the usual sense of the word. The existence of this phenomenon is strong evidence in favour of the existence of spontaneous

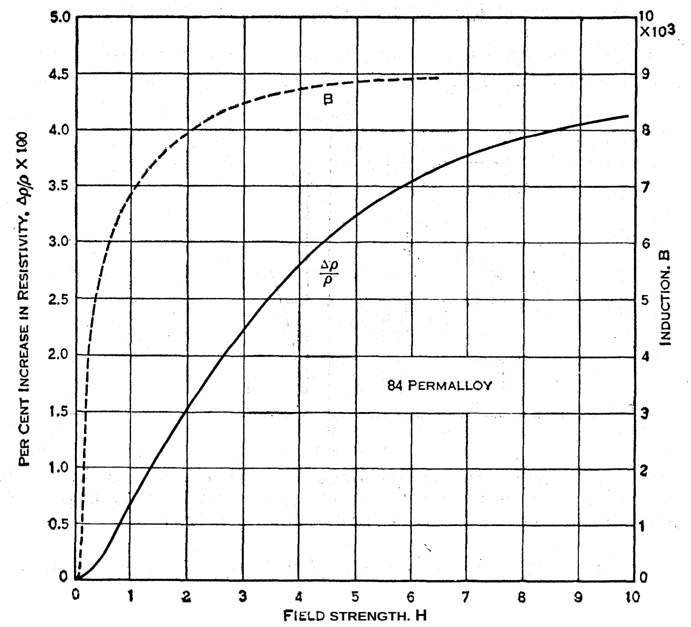

FIG. 44.— RESISTIVITY (ρ) OF MAGNETIC MATERIAL (PERMALLOY) INCREASES SLIGHTLY WITH MAGNETIZATION. MOST OF INCREASE OCCURS AFTER MAGNETIZATION IS WELL BEYOND KNEE OF MAGNETIZATION CURVE (L. W. MC KEEHAN)

magnetization in certain regions or domains in ferromagnetic materials.

Similar evidence for spontaneous magnetization is supplied by the magnetocaloric effect. According to theory, at temperatures near the Curie point high fields should increase the spontaneous magnetization, and with this increase there should be a rise in temperature of the material. Experimentally. Weiss and R. Forrer observed increases in temperature of more than 1° C. when a field of 18.000 oersteds was applied to nickel just below its Curie point. The change of spontaneous magnetization with temperature, derived from the data, is in good accord with the theory.

X. MAGNETIZATION IN ALTERNATING FIELDS

In many of their uses magnetic materials are subjected to an alternating field, produced by an alternating current in the mire

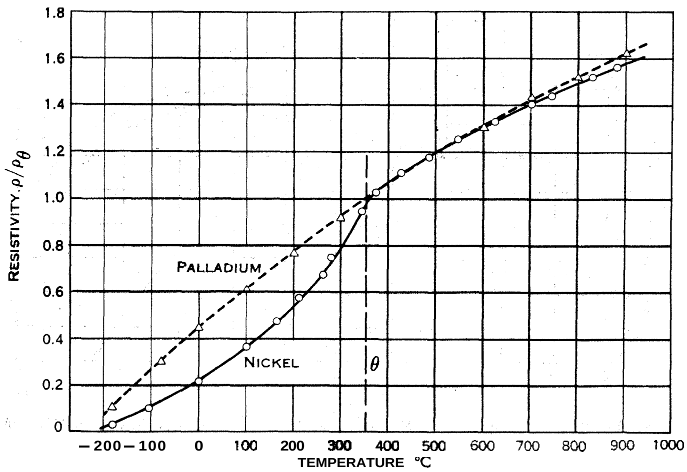

FIG. 45.— RESISTIVITY OF MAGNETIC MATERIAL IS ABNORMALLY LOW AS LONG AS IT IS FERROMAGNETIC (H. H. POTTER AND J. G. G. CONYBEARE)

associated with the material. The effects of the frequency of alternation on the magnetic properties of the material are primarily of four kinds: (1) the effective permeability of the material is reduced; (2) the energy loss in the material is increased; (3) there is a time lag between the field strength and the corresponding induction; and (4) at ultrahigh frequencies true permeability is less than at low frequencies. The distinction between effective and true permeability is discussed below.

1. Effect of Eddy Currents.—When the magnetic flux in a conducting medium changes with time, an electromotive force is generated, and there is a resulting flow of currents within the material. These Foucault currents, or eddy currents, depend on the geometry of the material specimen and on its resistivity and permeability; their direction is always such as to counteract the change in field that produced them (fig 48). The effect of eddy currents is to prevent the field from penetrating immediately to the interior of the material, and when the applied field is varying continually, as it is in much of the apparatus in which magnetic material is used, the field strength in the interior of the material may never be more than a small fraction of the field strength at the surface. The magnetic induction, therefore, decreases from the surface toward the interior.

To avoid this reduction in field strength, and resultant decrease in alternating flux, the magnetic cores of transformers and other apparatus are laminated, each lamination being insulated electrically from its neighbour. The flux-carrying capacity of such a lamination depends on the thickness (t in cm.), permeability (ρ) and resistivity (ρ in ohm-cm.$\times 10^9$) of the material and on the frequency (f in cycles/sec.) of alternation of the magnetic field. It can be calculated accurately provided the permeability does not vary with field strength, and can be expressed in terms of the effective permeability, $\bar{\mu}$, defined as the ratio of the amplitude of the induction, $\overline{B}$ (averaged over the section of the lamination), to the amplitude of the applied field strength, H_a. When H_a varies sinusoidally with time, $\bar{\mu}/\mu$ varies with frequency as is shown graphically in fig. 49.

In laminations as commonly used in power transformers, the reduction in permeability is only a fraction of 1%, and therefore negligible. When the frequency is high, $\bar{\mu}/\mu$ is inversely proportional to $\sqrt{f}$, or

$$\bar{\mu}=\frac{\sqrt{\mu\rho}}{2\pi t}\cdot\frac{1}{\sqrt{f}}.$$

In a transformer working at radio frequencies the constants of the materials used are such that 95% of the true permeability

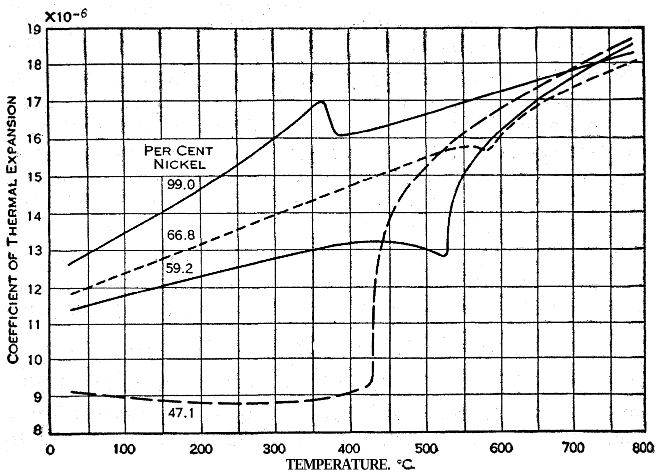

FIG. 46.— THERMAL EXPANSION CURVES OF MAGNETIC MATERIALS SHOW ANOMALIES NEAR AND BELOW CURIE POINTS (P. CHÉVENARD)

is lost. At these high frequencies the flux-carrying power or value of a material of given resistivity and thickness is directly proportional to the square root of its permeability.

2. Energy Losses in Alternating Fields.—Eddy currents in a magnetic material consume power and raise the temperature of the material. The power loss, W_e, may be calculated with some precision provided μ does not vary with B. At low frequencies it is proportional to f^2. At high frequencies it is proportional to $f^{3/2}$, if the material is always magnetized to the same value of $\overline{B}$:

$$W_e=\frac{\pi t\overline{B}^2}{\sqrt{\mu\rho}}\cdot f^{3/2}.$$

If the amplitude of the magnetizing current is held constant, the loss is proportional to $f^{1/2}$. The hysteresis loss of a magnetic

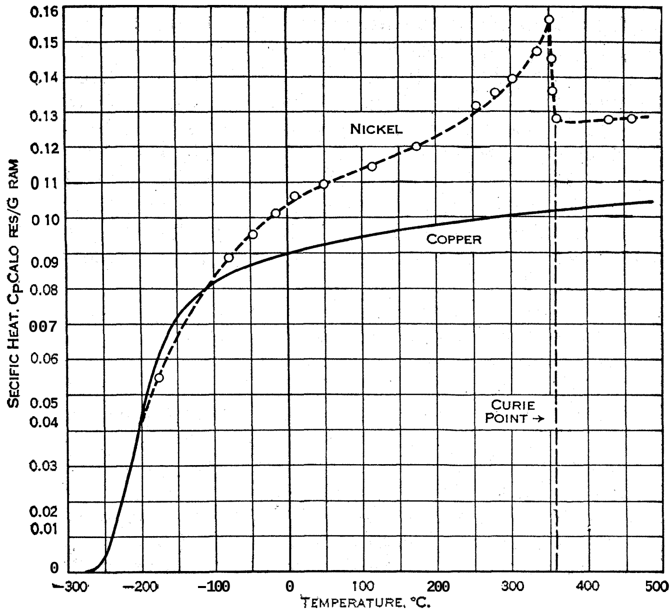

FIG. 47.— SPECIFIC HEAT OF A MAGNETIC SUBSTANCE IS UNUSUALLY HIGH. CURVES FOR NICKEL (E. LAPP) AND COPPER (H. KLINKHART) ARE COMPARED

material at intermediate and high inductions is given approximately by Steinmetz' relation (*see* above)

$$W_h=\eta B^{1.6}f.$$

The total loss due to hysteresis and eddy currents at low frequencies may then be written

$$W=W_h+W_e=\eta B^{1.6}f+AB^2f^2$$

where A can be calculated theoretically under certain conditions, as shown above. This relation is sometimes used for the separation of the total loss (as measured with a wattmeter at a given value of B) into its hysteresis and eddy components.

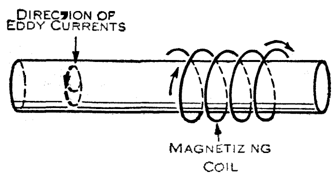

FIG. 48.—DIRECTION OF EDDY CURRENTS IN SOLID BAR

The direction is opposite to that of applied magnetizing current giving rise to them

When apparatus operates at low inductions, as it often does for transmission of the feeble signals used in communication, the energy losses incurred are usually measured with a Maxwell bridge, as described below under *XIV. Measurement of Magnetic Quantities.* The data obtained are the A.C. resistance. R, in ohms, and the inductance, L, in henries, of a coil surrounding the material under test. The ratio R/L is characteristic of the magnetic material and is related to the energy losses in ergs/cm.^{3} by the equation

$$\frac{R}{2\pi fL}=\frac{8\pi\bar{\mu}W}{B^2}.$$

The reciprocal of $R/(2\pi fL)$ is often called the quality factor, Q. When the frequency is low, the losses due to eddy currents and hysteresis may now be separated by plotting $R/(2\pi fL)$ or $R/(\mu Lf)$ against frequency. W_h varies as B^3f (see V. *The Magnetization Curve: 2. Hysteresis Loops* above) and W_e as B^2f^2, and

$$\frac{R}{\mu Lf}=aB+c+ef,$$

a relation in which a and e are called the hysteresis and eddy current constants, respectively, and c is a constant representing an energy loss of unknown origin, important only at very low inductions.

At moderately high frequencies and low inductions the losses in a material of high permeability are usually due predominantly to eddy currents. These can be calculated as described above and for them $R/(2\pi fL)$, or Q, is shown by the curve of fig. 49.

3. Effects at High Frequencies. — In considering the effect of frequency on permeability it has been assumed that the permeability, ~is independent of frequency and that only the effective permeability, $\bar{\mu}$, diminishes as the frequency increases. However, at very high frequencies, of the order of 10^9 to 10^{10} cycles/sec., the permeability decreases to a small fraction of its value at low frequency. This decrease is due primarily to the energy losses associated with rapid changes in magnetization. The losses are due to various inherent properties of the material other than eddy currents, and may be associated, for example, with the bending of domain walls.

Experiments on ferromagnetic resonance at high frequencies have yielded much information about the nature of the magnetic carriers and the forces between them, and have led to important applications of magnetic materials, especially the ferrites. The principle of the experiments and the experimental arrangements are as follows:

Imagine an electron travelling in an orbit and suspended in space as shown in fig. 50. The magnetic moment caused by the orbital motion of the electron and also by its spin can be represented by the vector M. Antiparallel to M is the vector J, which represents the angular momentum of the electron. If a magnetic field, H, is applied as indicated, the vectors M and J will precess with the frequency $MHI(2\pi J)$.

Now let us apply a small-amplitude alternating field. H_{rf}, having a direction perpendicular to H and a frequency equal to or near the precession frequency. The amplitude of the precessing magnetic moment will become larger and larger, because it is continually pulled by the alternating field, until a final amplitude is reached which depends on the internal damping or energy loss as-

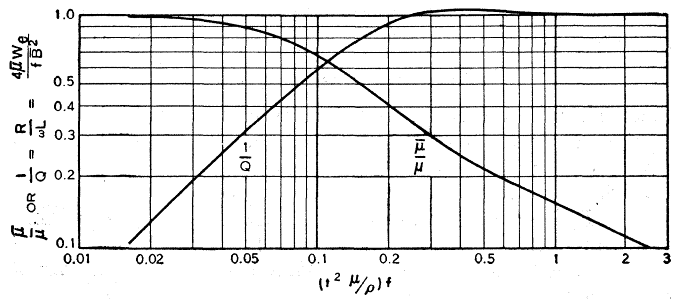

FIG. 49.— THEORETICAL CHANGE OF APPARENT PERMEABILITY. $\bar{\mu}$, AND ENERGY LOSS, W_e, DUE TO EDDY CURRENTS. WITH FREQUENCY, F, FOR SHEETS OF GIVEN THICKNESS. T(CM.), PERMEABILITY, μ, AND RESISTIVITY. ρ (OHM-CM. X 10^9)

sociated with the precession. The amplitude of the magnetic moment obtained with a given alternating field is measured, and by varying the frequency of H_{rf} until the amplitude is a maximum (at resonance) we can determine the natural frequency of precession and so the ratio M/J. The results of the experiments give fundamental information concerning the nature of the magnetic dipoles and the forces acting on them in the solid state.

In an actual material, one way of observing resonance at microwave frequencies is indicated in fig. 51. A wave guide is terminated at one end by a cavity one wave length long, and a small spherical specimen is supported at the centre of the cavity by a polystyrene rod, as shown. Under these conditions the alternating field, obtained by excitation of the wave guide, is perpendicular to the constant field, H, of several thousands of oersteds, which is supplied by an electromagnet. By measurement of the standing wave pattern in the wave guide the effective permeability of the specimen, and in particular the maximum permeability at resonance, can be determined. The results of an experiment in which the material supermalloy was excited at 24,000 mc./sec. is shown in fig. 52. The position and sharpness of the peak give basic information about the gyromagnetic properties of the atoms and the interaction between them.

F. F. Roberts observed that if a piece of magnetized magnesium ferrite is placed in a microwave transmission line the plane of polarization of the electromagnetic wave is rotated through a large angle, *e.g.*, 90° or 180°, the amount of rotation ("Faraday rotation") being governed by the intensity of magnetization of the ferrite. In manganese ferrite rotations of 90° to 180° can readily be observed. A device constructed on this principle by C. L. Hogan permits microwave transmission in one direction without appreciable loss but prevents to a high degree the transmission in the opposite direction. Such a device can be used to prevent unwanted reflections in a transmission line, and similar devices can be adapted for many kinds of microwave switching.

4. Time Lag in **Magnetization.**—As already mentioned, eddy currents cause a delay in magnetization so that after a sudden change in H from one value to another, a perceptible time elapses before B acquires its final corresponding value. There are other reasons, too, why B continues to change with time after H has become constant. One well-known cause of such change is metallurgical aging. This is usually observed in permanent magnets, the induction in h can be l l t change over a period of years, and this change is attributed to the slow precipitation of metallic phases from supersaturated solution at room temperature. Similar changes occur also in ordinary annealed iron to such an extent that the coercive force may eventually be doubled even though the material has not been heated above 100° C. Materials that have been severely cold worked sometimes become magnetically softer on account of the slow relief of the internal strains caused by the working.

FIG. 50.— SPINNING ELECTRON IN ORBIT

Magnetic moment M, and angular momentum J, precess under influence of applied field H. Radio-frequency field H_{rf} is applied perpendicular to H for resonance

A more rapid change of induction with time has been observed repeatedly since Ewing's experiments of **1885**. One method of experimenting is to change H suddenly, then observe the change in B as dependent on time. A second way of observing a change of magnetic state with time is to measure the permeability at very low inductions, at various times after demagnetizing and after the measuring current has been applied. Such changes are associated in some way with the impurities present, for they disappear when these are removed by heat treatment at a high temperature in hydrogen. It has been suggested that the diffusion of small traces of nitrogen or oxygen in iron will impede the movement of domain boundaries in such a way as to account for the observed changes of permeability with time.

XI. DIAMAGNETISM

Faraday showed in **1845** that all substances may be classified as diamagnetic and paramagnetic (he considered ferromagnetism to be one kind of paramagnetism). He distinguished between the paramagnetism and diamagnetism of feebly magnetic substances by suspending them in a strong inhomogeneous field and noting whether they were drawn into or repelled from the strongest part of the field.

The force with which a diamagnetic material is repelled by a field is proportional to the strength H and gradient dH/dx of the field and to the susceptibility, κ, and volume, v, of the material:

$$f=\kappa vHdH/dx.$$

The susceptibilities of solid diamagnetic substances are usually about -1×10^{-6} or -2×10^{-6}, and are normally independent of field strength. Bismuth has the exceptionally large value of -13×10^{-6}, but even in this substance the numerical value of the susceptibility is millions of times less than that of the ferromagnetic metals. Bismuth is also exceptional in that its suscep-

FIG. 51.— ELECTROMAGNET WITH SECTION OF WAVE GUIDE SHOWING CAVITY USED FOR FERROMAGNETIC RESONANCE

tibility varies somewhat with the field at low temperatures (jo° K.).

While diamagnetic and paramagnetic materials are not often of technical use, as such, a study of their behaviour is very important for our scientific knowledge of the nature of matter. Diamagnetism is an atomic property, and usually occurs when the atom has a symmetrical electronic structure and no permanent magnetic moment. In discussing diamagnetism it is appropriate to use the term atomic susceptibility defined as $\chi_A=\kappa A/d$, A being the atomic weight and d the density. Then $\chi_A H$ is the magnetic moment of one gram atomic weight: and when divided by Avogadro's number is the average magnetic moment per atom resolved parallel to the magnetic field. Similarly $\chi_M=\kappa M/d$ is the molecular susceptibility. M being the molecular weight.

As P. Curie shoved in his classical researches (1895), diamagnetism is usually independent of temperature. and so is not disturbed markedly by atomic collisions or the positions of nearby atoms. However. some change in the diamagnetic susceptibility is generally noted when a substance changes from the solid to the liquid state.

Following the work of Curie, in 1910 and 1912 K. Honda and M. Owen reported measurements of the susceptibilities of many elements. Fig. 53 shows the atomic susceptibilities as dependent on atomic number according to more recent data summarized by P. W. Selwood. Here it is apparent that the rare earth metals are strongly paramagnetic, that the metals of the transition groups containing palladium and platinum are rather strongly paramagnetic and that most good metallic conductors of electricity are weakly paramagnetic. This implies what is in fact the case. that in a metal the conducting electrons are paramagnetic. The other metals and the nonmetals are usually weakly paramagnetic or diamagnetic.

Most ionic and molecular compounds are also diamagnetic because their electrons are paired and their permanent moments tend to cancel each other; however. gaseous oxygen, 0,. is paramagnetic. Fig. 54 shows the atomic or molecular susceptibilities of some typical materials and the way they change with temperature.

1. Theory.— Our understanding of the origin of diamagnetism is due largely to Langevin, who published his celebrated paper on magnetism and electron theory in 1905. He considered an atom nith a single electron of charge, e, and mass. m, travelling with velocity, v, in a circular orbit of radius, r (fig 55). This "current" gives rise to a magnetic moment, M, proportional to the current and the area of the orbit:

$$M=\frac{ve/c}{2\pi r}\cdot\pi r^2=\frac{ver}{2c},$$

where c is the velocity of light. As pointed out by Sir Joseph Larmor. application of a magnetic field H will create an electromagnetic force in the orbit, as a result of the flux threading it, and this will cause the electron to change its velocity by an amount

$$\Delta v=-\frac{eHr}{2mc}$$

in such a direction as to change the moment, M, by the amount

$$\Delta M=\frac{er\Delta v}{2}=\frac{e^2Hr^2}{4mc^2}.$$

The susceptibility of this "atom" is then $-\delta M/H$, and the susceptibility of one gram atomic weight is

$$\chi_A=-\frac{Ne^2\,r^2}{4mc^2},$$

where N is the number of molecules in a gram molecular weight. If an atom contains many electron orbits, oriented in all directions with respect to the field, the expression for atomic susceptibility becomes

$$\chi_A=\frac{Ne^2\Sigma\overline{r^2}}{6mc^2}=-2.83\times10^{10}\,\Sigma\overline{r^2}$$

in which the mean square orbital radius is summed over all the orbits in the atom.
