MUSHROOM TO OZONOLYSIS

MUSHROOM. The well known, edible, umbrella-shaped fungus which is grown for the market and commonly served as a delicacy is called by many people "the mushroom." Botanically it is known as *Agaricus* campestris, or by some authors as *Psalliota* campestris. In the temperate regions of the earth it is often found growing wild, in pastures, lawns, golf courses, etc., where the grass is kept short and the ground is enriched by manure. Restriction of the name mushroom to this fungus alone is not in accordance with the terminology accepted by botanists, nor in most regions does it correspond with popular usage. Hundreds of other umbrella-shaped fungi occur in nature and are to be found in numbers unbelievable to those who have not made a deliberate search for them. These differ from *Agaricus* campestris in minor characters of form, structure, and colour. Many of them are edible, a few are deadly poisonous, others are too tough or unpalatable to serve as food. The botanist calls all of these mushrooms. Such umbrella-shaped fungi in most cases bear on the under side of the expanded upper portion or cap (*pileus*) a number of flat, knife-blade shaped parts (gills) which radiate like the spokes of a wheel from the handle or stalk (stipe) to the margin of the cap. Possession of these radiating gills marks a fungus as a member of the family Agaricaceae, these fungi being commonly called "agarics." Other closely related umbrella-shaped fungi outside this family lack gills. In the Boleti, for example, there may be seen on the under side of the umbrella. myriads of tiny pores which are the mouths of cylindrical tubes, while in members of the family Hydnaceae pendent spines occur instead. Still other related fungi lack the typical umbrella-shape, and show wide variation in form. The coral fungi (Clavariaceae) have the aspect of delicately coloured coral, and may be much branched like a deciduous tree. Others occurring on the sides of stumps, fallen logs, or trees are known as the bracket fungi and have the aspect of little shelves overlapping one above the other. The hundreds of species of all these various sorts of fungi possess, for the most part, a soft texture or flesh and the whole aggregation are commonly termed the "fleshy fungi." The application of the name mushroom to all of them accords with professional and popular usage for the most part. Some people use the term mushroom only for the edible members of this great group, and call those which are not edible toadstools. Although botanists recognize the word toadstool they regard it as synonymous with mushroom and write at times "edible toadstool" or "poisonous mushroom." In general they avoid the term toadstool.

The Agaricaceae, characterized as noted above, by the possession of gills on the under side of the pileus, embrace more than fifty different genera. These constitute five groups differing in the colour of the dust or powder which falls from the gills at maturity. This dust, composed of many thousands of tiny, unicellular spores, which float downward in such quantity as to form a noticeable deposit on the grass or earth beneath the fungus, may be easily caught for examination if a sheet of paper be placed directly beneath the cap. The colour of this spore dust in some genera is white. In others it is pink, purple-brown, rusty brown or black. The group characterized by possession of purple-brown spores contains about ten genera, one of which is Agaricus. The well known mushroom of commerce, *A. campestris*, is only one of a dozen or more species composing this genus. Some genera contain many dozens of species. In any given genus the species all possess in common certain prominent features of form, colour or structure which serve to distinguish them from those of other genera. Within a genus the species differ from one another in more minor characters of the same sort, it being necessary in many cases to take note of microscopic points of dissimilarity. Consideration of the genus Agaricus in this connection will serve to illustrate this situation concretely. All the species of the genus have purple to purple-brown spores, and the gills, which are white when young, change gradually through pink and successive shades of deepening brown as the spores reach maturity over their surface. The ends of the gills nearest the stipe are not attached to it and are not disturbed when the stipe is torn from the pileus. On the under side of the pileus of the young opening umbrella there is a chamois-skinlike membrane stretching from the stipe to the margin of the pileus and hiding the gills from view. A little later this membrane *(veil)* detaches itself from the margin of the pileus and falls to form a ring *(annulus)* around the stipe. In the other genera having purple-brown spores the gills are attached to the stipe and an annulus is lacking. The characters which serve for the identification of the genus Agaricus are thus seen to be few and readily recognized.

In the group of white-spored forms the genus Amanita is very important, because to it belong all the deadly poisonous mushrooms. Though a few of its species are regarded as edible, most of them are definitely dangerous, and some are capable of causing death. It is necessary, therefore, that the characters which separate this genus from others be clearly understood. As an annulus is present and as the gills are free from the stipe, there is a pronounced resemblance in form to Agaricus. However, the spore powder is white, and the gills are never brown. In most species they are white, and remain so even in old specimens. Though a young individual of Agaricus in which the gills are still white may be easily confused with one of Amanita, there is present in the latter an additional structure which, if not overlooked, will serve as a danger signal. While yet in the young more or less globose stage the plant in Amanita is completely enveloped in a definite sheath similar in character to the membrane which forms the annulus. This outer layer of enveloping tissue is called the volva. As the young plant grows and enlarges it bursts this membrane, emerges from it, elongates upward, and opens out into the umbrella shape. In some species of Amanita the entire volva persists thereafter at the base of the plant as a bag or cup surrounding the base of the stipe. This "death-cup" is not well formed in all cases, and even when present may be overlooked by careless individuals who fail to pick the entire plant including its base. Furthermore, in other species of the genus the rupture of the volva occurs equatorially in such a fashion that approximately the whole upper half of it remains attached over the upper surface of the pileus and is carried upward, the portion left at the base being insufficient to form a definite cup. In these cases the part carried up on the surface of the pileus is later broken up there into loosely adherent, flake-like scales by the expansion of the tissue beneath as the pileus opens into the umbrella form and increases in lateral diameter. The presence of such loosely attached, flake-like scales on the pileus should hold a fungus under suspicion until study of its other features proves it to be in fact not an Amanita. Though in many edible species in other genera scales occur on the pileus they are more firmly attached in character, and can be seen to have resulted from cracking or fraying of the tissue of the pileus itself. Specimens suspected of being Amanita should be examined carefully in the young state if possible, for the presence of the volva is then more readily noted. Questionable plants should be discarded.

There have been many well authenticated cases of illness and death from mushroom poisoning. In most of these instances poisonous species of Amanita were undoubtedly involved. However, records of symptoms of poisoning, and even death, exist in cases in which the plants consumed were apparently recognized as edible forms. Such cases have probably arisen from the eating of specimens already in a state of decay. Collectors Should avoid all fungi which are not in a wholly fresh and wholesome condition. Old, wormy or semiputrid ones may well contain poisons similar to those present in rotting vegetables and meats. When poisoning by mushrooms is suspected it can not be too strongly urged that a competent physician be summoned with the least possible delay. The poisonous element is not the same in all species of Amanita. In *A. muscaria,* the fly agaric, it has been considered to be chiefly because of the alkaloid muscarine, but more recent work indicates that it may actually be one of the derivatives of muscarine. Symptoms of poisoning with muscarine usually appear in from one-half to two hours. Vomiting and diarrhoea, pronounced flow of saliva, suppression of the urine, dizziness, derangement of vision and loss of confidence in ability to make ordinary movements are succeeded by drowsiness, stupor, cold sweating and marked weakening of the heart's action. In fatal cases stupor persists for two or three days, and death follows the gradual weakening of the pulse. Treatment for this poison consists chiefly in the prompt removal of the unabsorbed mushroom material from the alimentary canal and the giving of subcutaneous injections of some powerful heart stimulant such as atropine. The poison phallin, present in *A. phalloides* and related species, is albuminous in nature and more deadly than muscarine. Preliminary symptoms of poisoning do not appear, unfortunately, until about ten hours after the mushrooms are eaten. Then severe abdominal pains are associated with cramps in the limbs and convulsions. Weakening of the pulse, vomiting, and extreme diarrhoea are followed by death in two to four days. The fundamental injury to the body is due to direct attack on and rapid dissolution of the blood corpuscles. The undigested mushroom material in the stomach and intestines should be removed as promptly as possible. Though it is usually stated that there is no known antidote for phallin, a report from the Pasteur Institute in Paris records preparation there of an antiphallinic serum which has proved so effective that the French Government requires a supply of it to be kept available for use by physicians.

In picking wild mushrooms for the table it is necessary to avoid not only the extremely poisonous Amanitas, but also the more or less poisonous and distasteful species of other genera. Such forms exist in genera whose other members are in all respects wholesome. Consequently, it is necessary to know the specific identity of every plant eaten. There is no royal road to this knowledge. Careful observation of the details in which one species differs from another, combined with the study of pictures and descriptions in some standard book on mushrooms will enable the amateur student to recognize with certainty at least a few desirable forms. All others should be avoided. One species often differs from another in various minor features of form or colour, and only critical observation will enable the collector to recognize a given species with certainty and assure him that it is not a somewhat similar, perhaps poisonous one.

The tiny spores which fall in countless thousands from the gills of mushrooms, float about in the air currents and are disseminated over a wide area. They are analogous to the seeds of higher plants and function in propagating the species. Each spore is a microscopic, more or less globose or ovoidal, cell, composed of a bit of protoplasm surrounded by a thin wall. Though capable of remaining quiescent for a time, it finally undergoes renewed growth, and if it finds adequate moisture and food in the spot where it has fallen it germinates. The side of the spore bulges outward and forms a cylindrical tube-like outgrowth which gradually lengthens and develops into a system of branching threads. These permeate the elements of the substratum, and are readily visible to the unaided eye as a network of delicate strands, usually white, though in some species of other colours. Strands arising from different spores may merge, and threads as heavy as ordinary twine may result. The tips of these heavy cords at the surface of the substratum in time enlarge into more or less globose bodies, commonly termed buttons. Each button is in fact a young mushroom, and by increase in size and internal differentiation of tissues, the umbrella-like mature plant gradually comes into being. It will be understood then that this umbrella is not the whole plant but merely the above ground fruiting portion of it. The mycelium below ground is the vegetative or feeding portion. In some wild species it occurs in the soil, in others in leaf mould, in rotting wood. or in any other material from which the fungus may obtain its food. The mushrocm of commerce, *Agaricus campestris,* is grown in beds of specially prepared manure to which soil, straw, or other materials are sometimes added. In this mixture the mycelium grows luxuriantly. The grower calls manure in which the mycelium is abundantly present spawn. Old spawn is mixed into the manure in the preparation of new beds, and flakes of spawn or bricks of it are sold. Horse manure has been preferred to other sorts, and the coming of the automobile era has reduced the amount available while increasing its price. Efforts have been made to make use of other materials. Research has shown that the application of urea to mixtures of straw and other composting elements gives satisfactory results. Much more investigation is desirable.

Not uncommonly, commercial mushroom beds are invaded by the mycelium of other species of fungi. In these cases the reduction in the crop necessitates the removal of the infested material, sterilization of the beds, and the use of new spawn.

Like all widely spread and much-cultivated plants, the mushroom of commerce has developed a number of recognized varie-

PHOTOGRAPHED ESPECIALLY FOR ENCYCLOPÆDIA BRITANNICA BY ALEXANDER H. SMITH

EDIBLE AND INEDIBLE MUSHROOMS

Top row, left to right: Coprinus ***micaceus*** **(Mica** or Inky, cap), edlble. Found around the stumps of shade **trees** in spring and fall. *Cantharellus* ***cibarius*** (Chanterelle) **,** edible, **choice.** Found in areas of open hardwoods in summer. *Pholiota squarrosa,* **edible.** Found on hardwoods and conifers

Second row, left to right: ***Boletinus pictus,*** edlble. Found under white pines, summer and **fall.** *Coprinus* ***comatus*** **(Shaggymane),** edlble, choice. Found **in** waste places. *Armillaria* ***mellea*** (Honey **agaric),** edible. Found on wood or around stumps in the late summer and fall

Third row, Ieft to right: ***Lactarius*** *deliciosus,* edible. Found under conifers in summer and fall. *Lepiota clypeolaria,* not recommended. Found In woods, summer and fall. ***Amanita muscaria*** (Fly **agaric),** poisonous. Found in aspen, pine and spruoe woods in spring and fall

Fourth row, left to right: ***Agaricus silvaticus,*** not **recommended.** Found in conifer woods in the fall. ***Hydnum*** *repandurn,* edible, choice. Found under conifers and hardwoods **in** summer and fall. ***Morchella esculenta*** (Morel), edible, choice. Found **in** orchards and near open hardwoods **in** the spring

Fifth row, left to right: Fistulina hepatica (Beefsteak fungus), edible. Found on hardwood stumps in the fall. ***Clavaria*** *subbotrytis,* edible. Found under conifers. ***Hypomyces lactifluorum,*** edible. Found under hardwoods. **late** summer

ties, and in different regions and under different modes of culture it shows differences as do the various garden plants. There is always the desire to obtain even more attractive or productive varieties. Toward this end research work in various laboratories has been carried on, and pure cultures obtained from single germinating spores have been prepared and tested. Such pure cultures are in some cases maintained under laboratory conditions and made available to the grower on request.

Mushrooms are grown in caves, in abandoned coal mines, in dark cellars, and in specially built mushroom houses. They are not allowed to reach the fully expanded condition, but are harvested in the large button stage while still very firm, and before the discolouring spore dust begins to fall from the gills. They are usually packed neatly in attractive containers. Though they are being grown in increasingly large quantities, they are still expensive and constitute a delicacy rather than a staple article of food. Though nutritious, their food value is not as great as their extremely high protein content would indicate. See **FUNGI**; MOREL; PUFF-BALL; TRUFFLE.

Atkinson, *Mushrooms, Edible, Poisonous, etc.* (1900, 1901, 1903); N. L. Marshall, *The Mushroom Book* (1905, 1923); Louis C. Krieger, *The Mushroom Handbook* (1936). (H. M. F.)

MUSHROOMS, COOKERY OF. Edible mushrooms contain some nitrogenous food and about 90% water. Eaten with other foods they are of great service in the diet on account of their flavouring properties. It is dangerous to eat mushrooms which have been gathered by anyone who has not studied the different kinds.

Among the most familiar kinds are the common meadow mushroom (*Agaricus* campestris); button (immature) mushrooms employed chiefly for garnishing purposes and as an addition in high-class dishes; and truffles (underground fungi).

To prepare ordinary mushrooms for cooking, pick over and wipe with a flannel dipped in salt. Peel and remove stalks where necessary. The latter may be used for flavouring stews, soups, sauces, etc.

Mushrooms may be grilled (broiled) and served with maître d'hôtel or plain butter, etc.; baked in the oven under glass (or in a shallow dish); stewed in a casserole with other foods, *e.g.*, Italian pastes, rice, or in a well-flavoured sauce; or, they may be used in stuffings for turkey, poultry and game; they are also employed for garnishes in making galantines, etc.

Stewed Mushrooms. — Place the mushrooms in a stewpan with 2 oz. of butter, salt, a squeeze of lemon juice and a blade of mace. When cooked, stir in a white liaison of flour and butter blended together. Stir well and serve either as an entrée, or on toast as a savoury. This dish may be varied by adding other ingredients and may be served as a cream by adding a sauce of cream and beaten-up eggs.

Fried Mushrooms. — These are frequently added as an addition to a mixed grill. Frying should be done in a frying pan and not in a deep pan of fat. It is best to use good margarine or butter.

Grilled Mushrooms. — Large mushrooms should be chosen for grilling. Grease the gridiron before cooking. Place flesh side uppermost on the gridiron.

Stuffed Mushrooms. — Good-sized mushrooms are needed for stuffing. Any well-flavoured forcemeat can be used though certain flavours blend better with mushrooms than others, *e.g.*, game. To stuff, remove the stalks and pile the forcemeat in the centre of each mushroom. Squeeze lemon juice over and cover with buttered paper or place under glass. Bake in the oven for half an hour.

Mushroom Ketchup. — Sprinkle salt freely over large meadow mushrooms and leave them to stand for a few hours, then mash them in a mortar and set aside for 48 hours. Stir from time to time. Press through a colander and place in a pan. Boil up, skim carefully and simmer for an hour. Strain into a pan and leave until the next day. Then strain again leaving the sediment at the bottom of the basin and add one ounce of black peppercorns, a blade of mace, half an ounce of allspice, one quarter of an ounce of ginger and half an eggspoonful of grated lemon rind to each quart of liquor. Boil up and reduce to half the quantity Bottle and store in a dry place.

MUSIC. The Greek *μουσική* (*sc.* *τέχνη*) from which this word is derived was used comprehensively for all the arts of the Nine Muses. Contrasted with *γυμναστική* (gymnastic) it included the culture of the mind as distinguished from that of the body. Thus the singing and setting of lyric poetry formed but a small, if a central, part of a "musical" education which ranged from reading and writing to the sciences of mathematics and astronomy besides all the arts of literature. The philosophers valued music both in the ancient general sense and in our restricted sense, chiefly as an educational element in the formation of character; so that we obtain little light from them on the pure aesthetics of the Greek art of musical sounds.

1 INTRODUCTION

The present article deals mainly with the musical art-forms matured by European civilization since the 14th century. More ancient music is discussed frankly as beyond our power of appreciation except in the light of prehistoric origins. Our Western art of music stands in the unique position that its language has been wholly created by art.

Music owes but little to nature in the form of acoustic science, and still less to the sounds that occur outside works of art. It is already a mature musical art that selects the acoustic facts, just as in painting it is art that determines the selection of optical facts. Wise critics have, since Ruskin's day, abandoned the attempt to settle *a priori* how much of nature an aesthetic system ought to digest; and music differs only in degree from literature and the plastic arts as to independence of nature.

Yet the difference is often important. Perspective existed as a science before it was taken up by painters, and as a human experience before it became a science. The naïve Western spectator has seen enough of it in pictures to make him resent its neglect, whether in modern art or in the masterpieces of China and Japan. In music the nearest analogy to perspective is the system of tonality developed by the great composers from Alessandro Scarlatti to Wagner. (See HARMONY.) Every step in its evolution has been fiercely contested; and even twenty years after the end of Wagner's long career not every responsible musician was ready to admit Wagnerian tonality as a legitimate enlargement of the classical system.

If we set aside language and the organized art of music, the power of distinguishing sensations of sound is no more complex than the power of distinguishing colours. On the other hand sound is the principal medium by which most of the higher animals both express and excite emotion; and hence, though until codified into human speech it does not give any raw material for elaborate human art, it suffices for bird-songs that are as long prior to language as the brilliant colours of skins, feathers and flowers are prior to painting. Again, sound as a warning or a menace is an important means of self-preservation; and it is produced instantly and instinctively.

All this makes musical expression a pre-human phenomenon in the history of life, but is unfavourable to the early development of musical art. Primitive music could mysteriously re-awaken instincts more elemental than any that could ever have been appealed t~ by the deliberate process of drawing on a flat surface a series of lines calculated to remind the eye of the appearance of solid objects in space. But the powers of music remained magical and unintelligible even in the hands of the supreme artists of classical Greece. We may be perfectly sure that if the Greeks had produced a music equivalent to the art of Palestrina, Bach or Beethoven, no difficulty of deciphering would have long prevented us from recovering as much of it as we have recovered of Greek literature. Some enthusiasts for Oriental lore assure us that long ago the Chinese knew all about our harmonic system but abandoned it after they had exhausted it. This need not worry us. The Oriental aristocrat conceals in his politeness a profound contempt for our efforts to patronise his culture; and that contempt is justified when we show such ignorance of our own music as to suppose that a music of similar calibre could have utterly disappeared from a living nation whose most ancient plastic art and literature commands our respect and rewards our study. When we trace the slow and difficult evolution of our harmonic system we cease to wonder that it was not evolved sooner and elsewhere, and we learn to revere the miracle that it was evolved at all.

2. NON-HARMONIC AND GREEK MUSIC

Music before the rise of a harmonic system is of two kinds, the unwritten or extemporaneous, and the recorded or scientific. At the present day the music of races that have not acquired Western harmony often pleases us best when it seems most extemporaneous. Tradition can go far to fix the forms and even the details of a performance that may, without the aid of words or dance, last for hours. With words or dance, music becomes more capable of being fixed by writing; but the first musical problems are as far beyond conscious reasoning as the origins of language. Birds solved them before human beings; and folk-music can show real beauty when the systematic music of its day is arbitrary and uncouth. Moreover, folk-music, together with the present music of barbarous races and Oriental civilization, can give us materials such as anthropology uses in reconstructing the past from its vestiges in the present.

For us the music of ancient Greece is by far the most important branch of musical archaeology. Unfortunately the approach to this most difficult subject has been blocked by lack of co-ordination between scholarship and musicianship; and the ascertained truth is less instructive to the general reader than the history of opinions about it. These opinions begin to be interesting when they are expressed by musicians whose music we can understand. The natural tendency of such musicians was to suppose that Greek music was like their own; and each advance in knowledge is marked by disillusion. The first difficulty presented by ancient Greek writers was sufficiently disconcerting. The Greek terms for "high" and "low" were found to be reversed. Our own meaning seems founded in nature; and science confirms it. Our "high" or "acute" notes demand tense vocal cords and correspond to vibrations of "high" frequency. A great 16th century composer, Costanzo Porta, inferred a mystery here, and argued that the Greeks had mastered the art of a totally invertible polyphony, such as Bach afterwards displayed in two fugues in *Die Kunst der Fuge.* Porta accordingly wrote a 4-part motet *(Vobis datum est cognoscere mysterium)* which could be sung upside down: and his contemporary Vincentino composed 4-part motets in each of the three Greek *genera,* diatonic, chromatic and enharmonic. *(See* Hawkins's *History of Music,* i. 112, *seq.)* They are as good as any other music written on a *priori* principles, and the enharmonic motet may be commended to some of our modern experimenters in quarter-tones. But they represent as much knowledge of Greek music as we possess of the inhabitants of Mars.

The truth must be sought by other methods and by far the most promising is the study and comparison of the present scale of nations, whether barbarous or cultured, who have not come into contact with the classical harmony of the West.

A readable account of musical origins may be found in Parry's *Evolution of the Art of Music.* Following the researches of A. J. Hipkins and A. J. Ellis, Parry illustrates the fact that most of the primitive scales, notably the pentatonic scales prominent in Scottish and Chinese music, are built around the interval of a downward 4th (as from C to G) which was probably the first melodic interval to become fixed in the human mind as being simple enough but not too wide. A scale would begin to form by the accretion of other notes near the bottom of this interval. Now take another 4th with similar accretions below the former, either conjunctly (as G to D below the C–G) or disjunctly (as F–C). The resulting scale will either fill or include an octave, it does not matter which; for the filled octave of the conjunct tetrachord contains in another position the notes of the included octave of the disjunct tetrachords, as can be seen in the combined series C, A, G, E, D, C, A, G. And the octave was recognized from the outset as a limit after which a musical series repeats itself.

The Greeks had three ***genera*** of scale: the diatonic, the chromatic and the enharmonic. Of these the diatonic divides the tetrachord most evenly, as E, D, C, B:A, G, F, E. This gives us our diatonic scale in what Palestrina would call the Phrygian mode. The Greeks found that all its notes could be traversed (as a knight's move can traverse our chessboard) in a series of intervals which they called concords. (They thought of them only as successions, not combinations of sound.) These were the 4th (in the ratio 4:3); the 5th (3:2); and the octave (2:1). (Our own "perfect concords" are in these ratios.) Scales with chromatic tetrachords (E, C♯, C♮, B:A, F♯, F♮, E) could also be traversed by the concordant intervals, but not so easily. The enharmonic tetrachords, which only the most accomplished singers could sing, were beyond the reach of perfect concords; and for us they would need a special notation, as E, C, B′, B ; A, F, E′, E♮; where B′ and E′ signify something like quarter-tones above the B♮ and E♮. Yet this difficult scale was said to be the oldest of all; which seems not unlikely when we observe that it gathers three notes closely to the bottom of the tetrachord, leaving a gap of a major 3rd from the top. Eliminate the quarter-tones, and there remains a pentatonic scale E, C, B:A, F, E, which is more likely to be the earliest filling out of the downward 4th than the scales in which the auxiliary note is a whole tone away. And if this nucleus had the prestige of a mystic antiquity musicians would feel a pious pride in mastering the difficulty of filling it up like the other genera.

If authorities on Greek music would abandon their habit of writing scales and reckoning intervals upwards, their results, whether correct or not, would become much more lucid. For, as Parry points out, it is only our harmonic system which makes us think of scales as normally rising; and when a musician applies the term "cadence" to chords that rise from dominant to tonic he contradicts the literal meaning of the word.

Until the most recent times classical scholars have ruthlessly closed the door upon all hope of further light from the comparison of Greek data with the phenomena of extant non-harmonic folk-song and Oriental scales. If such a comparison is to have any meaning we must assume that the now universal phenomena of modes existed in ancient Greece. Modes, as far as non-harmonic melody is concerned, are various cross-sections of a standard scale. Thus, Scottish music shows very clearly five pentatonic modes. Adding the 8ve to complete the scale, these are, 1. C, A, G, F, D, C; 2. D, C, A, G, F, D; 3. F, D, C, A, G, F; 4. G, F, D, C, A, G; 5. A, G, F, D, C, A. In the article HARMONY the ecclesiastical modes of pure polyphony are given with their fondly-imagined Greek names. Pre-harmonic music without modes is contrary not only to our Western prejudices but to the whole trend of anthropological research. In these circumstances classical scholars, under the guidance of D. B. Monro, crushed all hopes by deciding that the Greeks had no modes at all, but that either their ʽαρμονίαι or their *τονόι* (the terms, whatever they mean, are not synonymous) were mere transpositions of the three genera into various pitches, just as our "keys" are transpositions of our pair of major and minor modes.

When Monro published his *Modes of Ancient Greek Music* in 1894, musicians had learnt too well the lesson that Greek music must not be expected to make sense. They would never dispute a point of classical scholarship; and it did not occur to them that Monro might be just so innocently familiar with modern music as not to realize that he might as well impute high-church tendencies to Alcibiades because of "the splendour of his liturgies" as impute to the ancient Greeks a system of keys related by mere transposition. But musicians only thought that even the most unprejudiced anthropological comparison of extant scales could prevail no more than Macfarren's Victorian assumptions could do in a dispute with Monro. Fortunately in 1916 Mr. G H. Mountford, in a degree thesis, satisfied classical scholars that Monro was in error and that the Greek modes were modes in the universal and proper sense of the term.

Miss Kathleen Schlesinger has found, by experiments with a monochord, a means of producing modes on mathematical principles. Certainly the Greeks did measure musical intervals mathematically on a string; certainly Miss Schlesinger's system is among the very first things that could have happened in that way; and its results produce many phenomena that ought to have occurred in ancient Greek music. There is, for instance, a remarkable passage in Plato's *Republic* (VII., 531) where Socrates gibes at the pedantries of the merely practical musicians who spend hours in arguing whether this and that note are too near to allow another note between them. And Miss Schlesinger's various scales comprise between them notes quite close enough to explain how the practical musician could get into difficulties about what was obvious to the philosopher. Miss Schlesinger has, moreover, tuned a pianoforte on the basis of her theory, and the result is acoustically very interesting. So much then, for a *priori* theory and practical experience. If Miss Schlesinger's results are not Greek they ought to have been.

The other line of approach is through the experience of setting the choruses of Greek tragedy to a modern music which confines itself to a strict representation of the metre and sets strophe and antistrophe to the same melody. The composer should not attempt Greek modes, on whatever theory, or he will achieve nothing better than an effect of singing "We won't go home till morning" on the supertonic of a minor key and with a beat missing. Instead of thus warping his imagination the composer should translate all that modern culture enjoys in Greek poetry into a music that he can enjoy; restricting himself mainly to one note to a syllable and, while making his instrumental accompaniment as beautiful as he likes, straying into no by-paths of musical tone-painting other than the most natural symbolisms. The Greek rhythmic forms prove musically fascinating, and there is full scope for fine melody within them. The strict correspondence of strophe and antistrophe causes difficulties which reveal much. Even a unisonous accompaniment, such as the Greeks had, can glide over a difference of punctuation or indeed a running on of the sense between strophe and antistrophe, as at the end of the enormous first chorus of *Agamemnon;* and the technique of such compromises closely resembles that of Schubert and Brahms in strophic songs, and has the subtlety of Greek simplicity. Aristophanes, in the Frogs, laughs at the interlinear *θραττο θραττο θραττ* (or "plunketyplunk") of the Aeschylean lyre. The passage seems to indicate something more extensive than a merely connective tissue; but exaggeration is not unknown in comedy.

More difficult and therefore still more instructive are the occasional contrasts of sentiment between strophe and antistrophe. In another chorus in *Agamemnon* the pretty ways of a lion-cub are to be sung to the same music as the tale of disaster that befell the man who adopted it when, on growing up, it behaved as might be expected. The highest point of pathos in the first chorus, one of the supreme things in poetry, is the moment where the description of the sacrifice of Iphigeneia turns into a reminiscence of her singing in her father's halls and then runs on into the antistrophe, with the words "The rest I saw not, nor will I tell." After which the same music has to express the pious hope that the queen who now approaches shares the wishes of the chorus for the welfare of the land she holds in trust.

From Plato we learn that musicians degraded themselves by imitating the roaring of lions and the whistling of winds. But what was the Greek criterion for the singing voice? Certainly very different from ours; for Aristotle says that certain high-pitched modes (but what is "high" in this context?) are suited to the voices of old men. An age-limit is the only criterion the heartless modern critic has for the voices of old men. Be this as it may, the safest inference from it is that every educated Greek was expected to sing well as an integral part of the art of speaking well. Perhaps our modern contrast between the singing and the speaking voice did not exist. Nowadays it is not uncommon to find a high soprano speaking normally around the A or G below the treble staff.

(See also ARISTOXENUS; EUCLID; PYTHAGORAS.)

3. HARMONIC ORIGINS

The latent harmonic sense of the Greeks is shown in the fact that their diatonic scale was amenable to the Pythagorean science of harmonic ratios. And we cannot suppose that no notice was taken of the combined sounds resulting from reverberation in halls and caverns, or from striking several strings of the lyre at once. Yet the fact remains that outside the orbit of our own Western music of the last six centuries we know of no harmonic system that has advanced beyond drones below the melody and cymbals (our Authorized Version is right in reading "tinkling cymbal") or bells above it.

Music, as we now understand it, consists in the interaction of three elements as inseparable (but not as interchangeable) as the three dimensions of Newtonian space. The Greeks knew two, rhythm and melody, which are as ancient as human consciousness and evidently have their meaning for some other animals. But non-harmonic melody is a very different thing from melody that implies harmony. (See MELODY exs. 1 and 2 with their discussion.) When we hear an unaccompanied folk-song we involuntarily think of it as the top line of a series of harmonies. If it is really pre-harmonic it will prove unamenable to that interpretation, and then we shall think it quaint. Neither the quaintness nor the harmonic interpretation ever entered into its intention. Life is too short for Western musicians to devote much of it to the violent mental gymnastics of thinking away the harmonic ideas that have made Western music enjoyable throughout five centuries. We may perhaps widen our experience by going back another two centuries; for it was agreed by all the musicians in Vienna that a concert of "Gothic" music was their most interesting musical experience of the year 1928.

In the article HARMONY the main steps are indicated by which mediaeval musicians advanced from doubling melodies in 4ths and 5ths (as the unoccidentalised Japanese are said to be doing now) to an aesthetic system of polyphony that demands complete independence in its melodic threads and forbids consecutive 5ths and 8ves as barbarous. The details of this evolution are abstruse; but two main issues may be mentioned here. Polyphony could not have been established without fixed scales and a repository of known melody for composers to work upon.

The scale was set in order in Graeco-Roman times by Ptolemy the astronomer, who flourished A.D. 130 and from whose time the history of the "ecclesiastical modes" becomes continuously traceable until the records of music are secured by the art of printing,

The necessary repository of melody was supplied by the ancient plain-songs of the church, many of which claimed to have come uncorrupted from the music of Solomon's temple and certainly had a continuous history reaching back to early Christian services in the catacombs of Rome. In A.D. 384 a large body of these "tones" was set in order by St. Ambrose. According to a tradition accepted, after some "historic doubts," by good authorities, St, Gregory revised and enlarged the Ambrosian collection; and the whole corpus of Gregorian music undoubtedly familiarizes Roman Catholics of to-day with a music enormously more ancient in its origin than any harmony. This music forms the principal melodic foundation of Palestrina's polyphony; but by his time it had become corrupted, and we must look to the Solesmes edition of 1904 for the text and method of singing plain-song in the perfection it is held to have attained shortly after the death of St. Gregory. The essential difference between the Ratisbon tradition (which we may loosely call Palestrinian) and that of Solesmes is that the Palestrinians impatiently curtailed the flourishes of the plain-song much as Palestrina did with the Gregorian themes he used in polyphony; whereas the Solesmes method restores the free speech-rhythm which makes the flourishes (or melismata) possible in a rapid delivery. Some of these melismata are very extensive, and the Palestrinians (who gradually developed the modem organist's habit of providing each note of a Gregorian melody with a separate chord) had some excuse for mistaking them for corruptions of style.

The Gregorian tradition did not stand alone. There was an ancient Visigoth (or "Spanish") tradition; and there are the traditions of the Eastern Church. Professor J. J. W. Tillyard has shed much light on Byzantine music (*q.v.*), including a promising opening in the deciphering of the earliest *Neumae,* diacritical signs above the words, supposed to indicate musical notes.

He uses the method of interpreting the past from vestiges of primitive usage in the present. Controversies as to the number of modes, whether 8 or 12, raged till late in the 16th century. The *Dodecachordon* of Glareanus settled the question in favour of twelve, as its name implies. Meanwhile composers developed polyphony by ear and got no help whatever from the theorist. Quite independent of modes and entirely practical was the hexachord scheme (*see* HEXACHORD) developed in the 11th century by Guido of Arezzo (*q.v.*).

The general reader may learn something of the hexachord system very pleasantly from the music-lesson in *The Taming of the Shrew.* Hortensio's gamut says "Gamut am I, the ground of all accord . . . D sol re, one clef [*i.e.,* sign, or key], two notes have I: E la mi: show pity or I die." "Gamut" is a survival of Greek tradition; for the bottom note of the Greek scale was identified with the bass G, and this "ground of all accord" is an octave below the Ut of the hard hexachord. Hence it is Gammaut. D is Sol in the hard hexachord $\left\{\begin{matrix}\text{G}, & \text{A}, & \text{B}, & \text{C}, & \text{D}, & \text{E}\\ \text{Ut} & \text{Re} & \text{Mi} & \text{Fa} & \text{Sol} & \text{La}\end{matrix}\right\}$ and Re in the natural hexachord $\left\{\begin{matrix}\text{C}, & \text{D}, & \text{E}, & \text{F}, & \text{G}, & \text{A}\\ \text{Ut} & \text{Re} & \text{Mi} & \text{Fa} & \text{Sol} & \text{La}\end{matrix}\right\}$. It has two names but only one position or "clef," unlike B which has to be flattened in the soft hexachord (F to D). (Morley writing in 1597, calls A flat the B clef.) E is La in the hard hexachord and Mi in the natural hexachord.

Between Fa of the natural hexachord and Mi of the hard hexachord a dissonant tritone 4th exists. It gave great trouble to mediaeval musicians, who assigned it to the devil. *Mi contra Fa est Diabolus in Musica.*

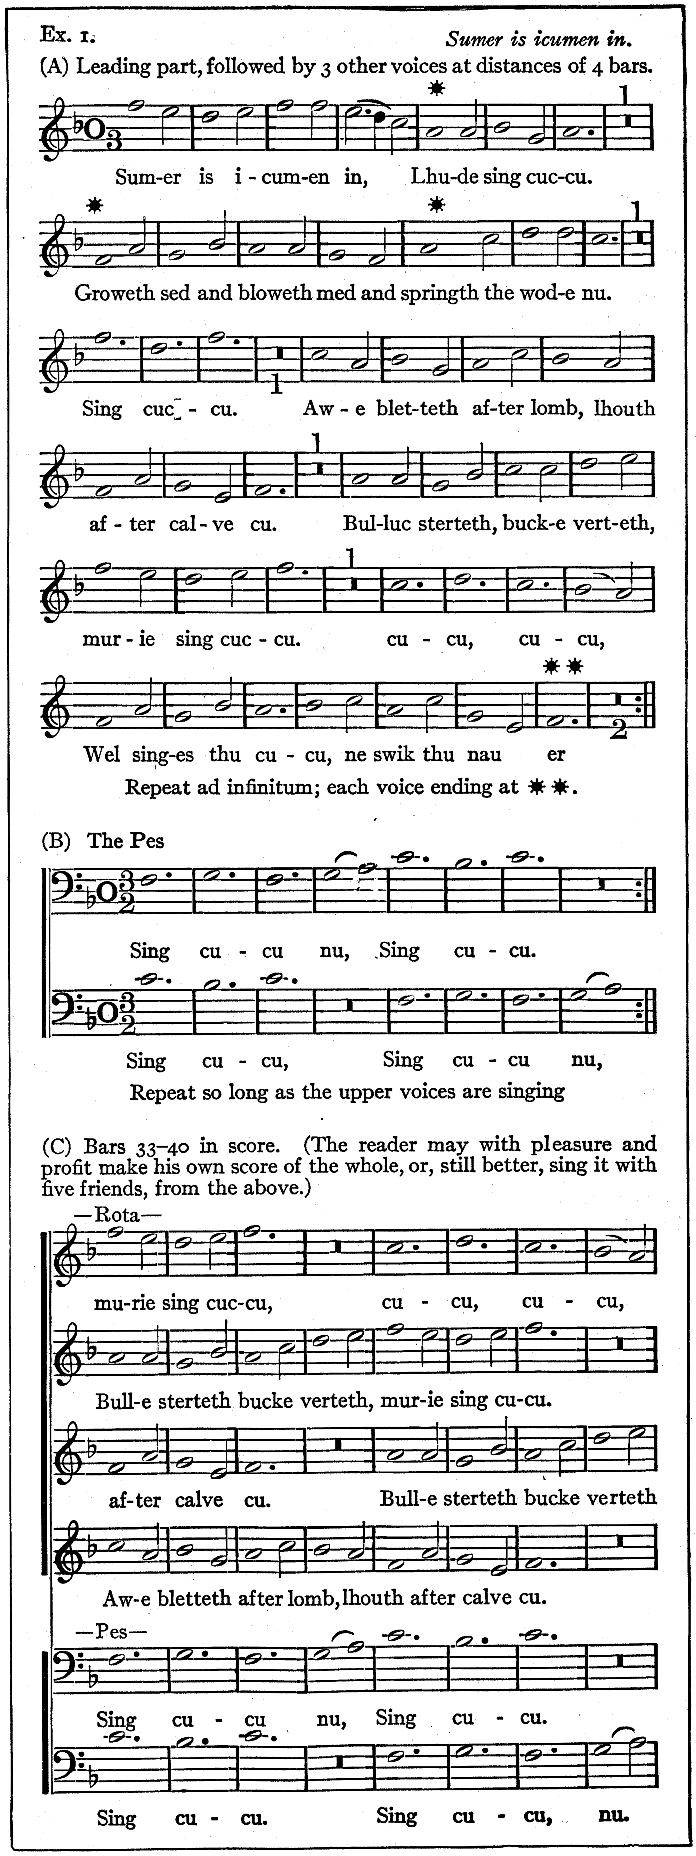
To the early harmonic and contrapuntal processes alluded to in the article HARMONY some details must be added. The famous unwritten songs of the aristocratic troubadours or *trouvères* of the 12th and 13th centuries undoubtedly set the fashion in melody, and probably set it in the direction of *Sumer is icumen in;* that is to say, in the Ionian mode (that *modus lascivus* that is identical with our major scale) and in a lilting trochaic rhythm

𝅗𝅥 ♩ | ♩ 𝅗𝅥

Sumer is icumen in contains no technical feature that has not been found in other compositions of its period, but nothing within two centuries of it achieves either its euphony or its easy handling of canon in four parts on a canonic bass in two. Its consecutive 5ths which sound licentious to us were in its own day the sole justification of the scheme.

It confirms other evidence that the imperfect concords (3rds and 6ths) must have obtained squatter's right in music in spite of theorists; for a very early practice known as ghimel or gymel consisted in singing in 3rds. This is not merely doubling, for the 3rd must oscillate between major and minor according to its position in the scale; and this adjustment requires an advanced harmonic system. When scholars tell us that singing in 3rds was traditional in Britain before the Roman Conquest, we must demur, especially when they tell us (in *Grove's Dictionary of Music and Musicians,* 3rd edition) that we must not expect to find written records of "so simple a process." Similarly we must not expect to find ancient Greek written records of so simple a process as steam locomotion. Still, let us not be unduly sceptical as to the extent to which popular licence and unrecorded extemporisation could advance beyond all the theoretic lore that scribes will record.

The troubadours disdained both the practice of accompaniment (which they left to their servants) and the art of scientific or written music. Not until the time and work of Adam de la Hale, surnamed the Hunchback of Arras (*c.* 1230–1288) can we trace the development of the troubadour into the learned musician. Nearly a century later, when literature is unbending from its universal Latin and becoming truly universal by becoming vernacular, we find the poet Machault, who stands with Petrarca among Chaucer's masters in the technique of verse, producing music that marks a technical advance discoverable by grim toil of expert analysis. But so far we may pardonably dismiss all such



archaic work (except *Sumer is icumen in)* with Burney's sly comment on the earliest piece of recorded music known to him: "It is not of such excellence as to make us greatly regret the loss of such music; though the disposition of those who were pleased by it may have been a great blessing to them." When music is too archaic or inaccessible to give us aesthetic data more may be learned from the disposition of those who were pleased by it than from its recorded technical data.

Before the middle of the 15th century music had passed forever out of the stage at which anything need be known about a composer other than his music. As early as 1437 an Englishman, John Dunstable. had acquired a European reputation. The golden age of the 16th century had no use for archaic music, and Morley in his *Plaine* and *Easie Introduction to Practickall Musicke* quotes Dunstable much as we might now quote Bach if all Bach's works were lost except for traces of contemporary hostile criticisms and awe-inspired laudations. To call Dunstable the "inventor of counterpoint" is no better than to call Cadmus the inventor of the alphabet. But he is the earliest composer whose polyphony is in direct line with that of the golden age; for Dufay, the first important master of the Netherlands, where the true polyphonic tradition was for long thought to have originated, is known to have died in 1474, 21 years after Dunstable. And when Walker, in his *History of English Music,* praises a motet by Dunstable for its distinction of style, he is describing permanently intelligible aesthetic values. By the end of the 1jth century counterpoint was substantially fixed. Practice was still imperfect and aims were uncertain, but skill was increasing, and in the 16th century we leave archaic music behind.

4. THE GOLDEN AGE

From this point onward the history of music is best studied in the masterpieces of the art. Each period has its own art forms. Articles relevant to the golden age are COUNTERPOINT; INSTRUMENTATION; MADRIGAL; MASS; MOTET; with biographies on ANIMUCCIA, GIOVANNI; ARCADELT, JAKOB; BATESON, THOMAS; BENNET, JOHN; BULL, JOHN; BYRD, WILLIAM; DESPRÈS, JOSQUIN; ECCARD, JOHANN ; FARRANT, RICHARD; FESTA, CONSTANZO ; GABRIELI; GIBBONS, ORLANDO; GUERRERO, FRANCISCO; HANDL, JAKOB; HASLER, HANS; ISAAC, HEINRICH; LASSO (LASSUS), ORLANDO; MARENZIO, LUCA; MORLEY, THOMAS; OBRECHT, JAKOB; OKEGHEM, JOANNES; PALESTRINA, GIOVANNI PIERLUIGI DA; SWEELINCK, JAN PIETER; TALLIS, THOMAS; TAVERNER. JOHN; VICTORIA, TOMAS LUIS DE; WEELKES, THOMAS; WILBYE, JOHN.

The external history of music is not so easily brought into true relation with the art as popular legends would have it. Everybody is familiar with the story of the drying up of polyphony in the foolish ingenuities of Flemish contrapuntists until, at the behest of the Council of Trent, Palestrina wrote the *Missa Papae Marcelli* in a pure and simple style which convinced the authorities that polyphonic music could be devout. Undoubtedly there was a great deal of barren ingenuity in the work of the lesser Flemish masters, and Obrecht himself had written masses in which the liturgical text is drowned beneath five other texts which each voice sings to other plain chants and themes of old songs.

The secular tunes thus freely introduced were not always sung as *canti fermi* too slow to be recognized. Recognition sometimes even led to the singing of the original words.

One old song, *L'homme armé,* became the string round which every possible ingenuity crystallized in the composition of the Mass. There is no reason to doubt that the state of church music both deserved and received the serious attention of the Council of Trent.

On the other hand, not all Flemish music was silly, and many of the quaintest "canonic" devices were really nothing but harmless cryptography applied to music that was composed on purely artistic lines. Burney discovered this when, with his usual flair for good illustrations, he quoted some dry ingenuities from Okeghem (or Okenheim) and followed them by the wonderful *Deploration de Jehan Okenheim* by that master's great pupil Josquin Desprès, who is the first unmistakably great composer and who has been well named "the Chaucer of music." No listener can fail to recognize, from anything like a competent performance, the spontaneous beauty and poetic depth of this music, throughout which, while the other voices sing an elegy in French, the tenor intones in Latin the plain chant of the Requiem beginning on a note a semitone lower than the liturgical pitch, and continuing in the wailing melodic mode thus produced. Burney had the wit to see that the "canon" *ung demiton plus bas* did not mean that some other part was to answer the tenor in canon, but was merely the "rule" for reading the cryptogram, the tenor being written at the normal pitch.

Many Flemish devices are well calculated to give coherence or climax to a large composition. One voice may wander up and down the scale with a single figure and a single motto text while the other voices tell their whole story in polyphony. For instance, declaim the words *Miserere mei Deus* in monotone rising one step just for the first syllable of *Deus.* Start on the fundamental note of the scale, and at intervals repeat the phrase a step higher each time. After reaching the fifth degree go down again. Josquin's *Miserere* is a setting of the whole 51st Psalm, woven round a tenor part entitled *Vagans* and constructed on this plan. It is one of the first mature masterpieces in the history of music. Palestrina's art is too subtle for rigid Flemish devices; but once, in one of his finest motets, *Tribularer si nescirem,* he uses Josquin's *Miserere* burden in exactly Josquin's way. Lasso is thoroughly Flemish in both sacred and secular music, and in a motet on the resurrection of Lazarus he makes a soprano *Vagans* cry *Lazare, veni foras* from the beginning of the narrative until the chorus reaches these words and joins in with them in triumphant polyphony.

One must not, then, be misled by the ecclesiastical tradition that condemns Flemish music wholesale. In any case the concern of the church authorities was liturgical rather than artistic. The bishops would have been for the most part glad enough to see church music restricted to the note-against-note style of Palestrina's litanies, *Stabat Mater, Improperia* and last book of *Lamentations.* A very sublime style it is, and Tallis's responses, in their authentic form, are a noble illustration of it. But, as Jeppesen *(The Style of Palestrina and the Dissonance)* has clearly shown, Palestrina's *Missa Papae Marcelli* shows special signs of being a deliberate demonstration that a high degree of polyphony can be reconciled with clear choral delivery of the words. Certainly the ecclesiastical authorities did not long succeed in preventing the use of secular themes in church music.

Many great musicians of today have a musical culture which ignores the golden age; and a knowledge of Palestrina is still considered, as it was in the days of Bach and of Beethoven, rather an out-of-the-way specialty. This is like a culture based on Latin and sceptical of Greek; good as far as it goes, but limited and cocksure like an 18th-century gentleman's artistic impressions of the grand tour. An illustration of the most perfect style of the golden age is appended to the article MOTET.

5. THE MONODIC REVOLUTION AND ITS RESULTS

Until Palestrina's art attained its height, the path of progress in music for the best part of two centuries was that of purity. It was not the free and bold spirits but the idlers and dullards who broke rules and disliked contrapuntal forms. The Hispano-Roman style of Victoria and Palestrina was not everything. It was not secular (though Palestrina's madrigals make him as supreme in that form as in church music), and it was not, like the glorious English polyphony, experimental or racy of the soil. But it was metropolitan, and the boldest of the Tudor composers would have been no such fool as not to hold it supreme. But even before the death of Palestrina a new music was groping toward the light; the path of progress for this music was no more that of purity than the path of omelette making is that of the conservation of eggshells.

Eve's apple was not more fatal to man's earthly paradise than the rise of instrumental music and dramatic solo declamation was to the hope of continuing the golden age of music into the 17th century. The revolution did not consist in this detail or that. To

(Barred according to the main rhythms.)
Phrygian mode transposed.

by JOSQUIN DES PRÉS

*The distribution of the words is uncertain. Perhaps these repeated notes are a realistic sob.

say that Monteverdi '(invented" the dominant 7th, or that anyone else invented it, or that any such invention could revolutionize music, is like saying that Shakespeare revolutionized drama by inventing strange oaths. The important point is not the technical names of the details but their meaning. When Lasso was young some experiments in chromatic music had been made by Cipriano de Rore, and were eagerly imitated by Lasso. But what is Lasso's object in being the first person to write such an out-of-the-way note as A♯? Simply to express the words *"novum melos."* Very different from such intellectual playthings is the purpose of the powerful discords of Monteverdi's madrigal *Cruda Amarilli* and of the monodic lament of Ariadne which drew tears from the spectators of his opera *Arianna.*

The article MONTEVERDI contains further remarks on his importance and on his coincidence in place and time with the creators of the violin. *(See* also OPERA.) The Palestrina style henceforth became the rightful privilege only of those composers who, either having mastered it before monody arose, or, like Orlando Gibbons (1583–1625), living in regions too remote for it to penetrate, could still compose polyphonically from impulse and not from asceticism. Orlando Gibbons did, in fact, try some monodic experiments which are poor enough.

An impulsively eclectic composer is another matter; and in uncouth, illogical Germany a giant such as Schiitz could almost fill the century before the birth of Bach and Handel, with a life's work ranging from the pure polyphony of his Venetian master Gabrieli to the exploitation of all his "astute friend" *(scharfsinniger Frezmd)* Monteverdi's new principles in most gigantic efforts in mixed vocal and instrumental polyphony. From Schiitz we can extract no such system as that which makes Monteverdi a favourite subject in musical history; but in Schutz's chaos the elements may at any moment come together in some strange work of art that fits into no historical or technical scheme but speaks clearly to us through its o n coherence. Schutz's "astute friend" always knows what he is doing and whither his work is leading; but, except in a madrigal here and there, which was not his proper business, he does not produce a convincing work of art so often as Schiitz who seems to have no proper business at all. It is to the astute, logical Italians that we must look for the progress and consolidation of musical art in general during the 17th century; but we must not let the enthusiasm of historians make us think that such a century of progress was a period of great music. The historians themselves are apt to neglect the intrinsic values of the 17th century compositions and to estimate them merely for their tendency towards something that was to take convincing shape later. The early 17th century was, in fact, musically not unlike what we have so far experienced of the 20th; the eyes of musicians and music-lovers were at the ends of the earth prophesying Wagner, when all that the whole century could finally achieve was the *da capo* form of aria.

Monteverdi and his fellow monodists had, in no mood of caprice, moved in the one direction that was universally important for music; yet their formless declamation soon palled, and its method survived only by becoming codified into the formulas of recitative, which are happy idealizations of Italian speech-cadence, and which survive as dramatic idioms in all music even at the present day. The "invention" of recitative has been ascribed to this or that monodist, with as little room for dispute as when we ascribe the invention of clothes to Adam and Eve. Any vocal music which, whether from inability or from disinclination, avoids organizing symmetrical melody, will be called recitative. When Wagner was still a subject of controversy, critics on both sides used to say that *Das Rheingold* was all recitative.

Two tendencies converged to make music become formal after the '(first fine careless rapture" of monody was spent. First, the dramatic stage, with baroque scenery in magnificent development as early as 1667, in Cesti's *Porno d'Oro,* greatly encouraged the ballet; so that when serious musicians cultivated the stage they also cultivated dance-music. This, however, was less important than the rise of the violin Monteverdi had alreadv understood its importance; and one symptom of the decadence of polyphony had been the growing habit of solo-singers to sing the top parts of madrigals with all manner of ridiculous flourishes. Persons less legendary than King Cole felt the fascination of the "tweedle-dee" of the fiddle; the great Dutch polyphonist Sweelinck (q *v.)* used to adorn his organ works with passages of *imitatio violinistica;* and the last quarter of the 17th century saw the brilliant work of Biber with his queer abnormal violin-tunings, and the sober classical *sonate da chiesa* and *sonate da camera* of Corelli *(q v.).* Artistically as well as morally this development of the violin was healthier than that of the voice, wherein coloratura singing tended to become an acrobatic monstrosity though it had first been regarded as a means of emotional expression. A talent for the violin was no danger to a boy; but a beautiful voice put a boy in deadly peril in an age when all the great opera-singers were *castrati.* Even Haydn had a narrow escape in his youth.

And yet there is, on the whole, more beauty than decadence in the vast mass of solo vocal music produced between 1630 and 1760. That period takes us from the advent of mature instruments and instrumentalized music to a time beyond the death of Handei. Except for the device of the ground-bass *(see* VARIATIONS) the first form that emerged from chaos organized itself on a method of balance between a solo voice and a group of instruments, together with a development of melodic form by means of a firmly-estabhshed classical key-system. The result was the classical aria, one of the most effective art-forms ever reduced to the capacity of normal musicians It entirely destroyed the dramatic character of opera for a whole century; but this has been lamented with unnecessary vehemence. With the exception of the early monodic works and of Purcell's *Dido and Aeneas,* opera before Gluck is not an art-form at all; it is merely a name for the spectacular conditions under which the 18th century public could he induced to listen to a string of thirty arias by one compoier uho could either handle no other forms or find no listeners for them *(See* ARIA.) Other art-forms developed in the 17th century for use in the 18th are discussed under CANTATA, CONCERTO, OPERA, ORATORIO. SONATA, SONATA FORMS. and SUITE. Matters of style and texture are discussed in CHAMBER MUSIC, HARMONY and INSTRUMENTATION. The articles on monodic composers include CACCINI, CAVALIERI, CESTI, PERI and MONTEVERDI, besides BANCHIERI who wrote against Monteverdi's earlier works with well-grounded demonstrations of their subversive effect on pure polyphony. The survival of polyphony in grimy and pompous decadence is represented by Pitoni, and later and more as a renascence by LOTTI. Early violin music is represented by BIBER and CORELLI.

The short career of PURCELL (*q.v.*) ends twenty years after the death of Schütz and ten years after the birth of Bach and Handel. Almost any random quotation from Purcell might be by a composer of the calibre of Bach or Handel. Purcell is one of the greatest contrapuntists that ever lived; one of the greatest inventors of themes; one of the greatest masters of declamation; and a completely mature master of early orchestration. And his fellows in the English music of the Restoration. Pelham Humfrey, Child and Blow were no mean spirits. Burney devotes an entire plate in his *History of Music* to examples of "Dr. Blow's crudities"; and later historians need look no farther afield for examples of intelligent prophesy. But the Restoration music lacks one thing; and that is power of composition. Purcell, in small dance-forms and short lyrics, is unsurpassable. But his only chance of getting through a sustained movement is when he writes on a ground-bass. In this fascinating forlorn hope of English music we see the fruit of nearly a century of bold endeavour ripening a generation too soon. Parry ascribes the patchiness of Purcell to the subtle humour of Charles II. in sending his best chorister to learn from Lully, the master of the French ballet-opera, how to write English church music. But Lully is not patchy, and Purcell's music is a crazy-quilt, purple with foreshadowing~of the music of the future.

6. BACH, HANDEL AND THE NEAPOLITAN SCHOOL

If all music between 1685 and 1759 were annihilated except the work of Bach and Handel, the ordinary music-lover would miss nothing but a large collection of decorative and decorous violin music and a still larger collection of arias; and to most of these favourite *gemme d'antichità* the mid-19th century editor has contributed much of their lusciousness. For us the age of Bach and Handel is the age of nobody else in music. But the contemporaries of Bach and Handel thought of Handel as a fashionable opera-writer who with advancing years developed choral music as a pious fad; while nobody thought of Bach except people within coaching-range of Saxony where Bach was known as a wonderful organist and an impracticably deep scholar. The polyphony of Bach and Handel stands almost alone in an age when polyphony was utterly unfashionable. It was inculcated as a staple subject in musical education; but to carry it into mature art was to discuss Latin grammar in the drawing-room. The opportunities and the difficulties of early symphonic orchestration alike arose from the neglect of polyphony after 1750. Apart from Bach and Handel, that neglect can be traced much further back; and it characterized musical connoisseurship much later; so that Burney could say of Philipp Emanuel Bach that wherever he got his beautiful and natural style from it was not from his father, for that eminent organist, though profoundly versed in all devices of canon and fugue, was so fond of crowding all the harmony he could into both hands that he must inevitably have lost melodic grace.

The vast and accurately-perfected aesthetic system of Bach and the improvisatorial opportunist eclecticism of Handel are discussed in the articles on those masters, and also under the headings of CANTATA. CONCERTO, COUNTERPOINT, FUGUE, HARMONY, INSTRUMENTATION, ORATORIO, SONATA FORMS and SUITE. But, while this information covers the aesthetic values of the period, it tells us little of its historic trend. We must not look for light from the "spirit of the age" as shown in its politics or even in its religious history. Palestrina writes, from habit and preference, a devout music which neither Luther nor the Council of Trent could blame as representing the spirit of the age; and Bach achieves the ideal Lutheran music while Voltaire is at the court of Frederick the Great.

The music that pleased the contemporaries of Bach and Handel was that which continued. not too elaborately, the Neapolitan tradition founded by Alessandro Scarlatti. Lully (an Italian by birth) took his tradition to France, and transformed Italian opera by encouraging the French taste for the ballet. Rameau, greatest of classical French composers and epoch-making theorist, carried on the Lully tradition in opera, and joined forces with the exquisite school of clavecinistes, whose leader, Couperin, was admired and imitated by Bach in his suite-forms. Italian violin music and concertos in the Neapolitan style were produced by composers who were also great players. The enormous industry of Bach and Handel was nothing unusual. Arias could be written as easily as letters, and distributed by thirties in operas. Oratorios and church music, though less fashionable, were more highly organized, mainly because they kept choral music in being.

And thus the Neapolitan tradition of choral music passes straight into the polyphony of Mozart, quite independently of Handel and wholly ignoring Sebastian Bach, of whom Mozart knew not a note until he was grown up. Meanwhile cultured Europe was unvexed by doubts as to who were the immortals. The Handel-Bononcini rivalry had been little more than a nine-days' wonder. Six years after Handel's death, the seven-year old Mozart in London dedicated his violin-sonatas to Queen Charlotte in the hope that under Her Majesty's protection "je deviendrai immortel comme Haendel et Hasse." Graun would probably have been the third name of European repute; and Telemann, the most voluminous composer of his voluminous day, was a great figure in his own country. As for Bach—everybody in London knew Mr J. C. Bach, of the Bach and Abel concerts, and report said that his father had been a great musical scholar.

Behind the dignified musical history, but not (like Sebastian Bach) aloof from it, vital forces were at work in comic music-drama. This was admitted by way of *intermezzi* between the acts of serious operas. One of these intermezzi, La *Serva Padrona* by Pergolesi (known in the 19th century by his conventional *Stabat Mater* for two-part female chorus) not only broke from its moorings, like many other intermezzi, but found its way to Paris where it created a furore of popular success and precious disputation dividing musical Paris into *Buffonnistes* and *Anti-buffonnistes.* Except for the untimely blossom of English opera in the hands of Purcell in the previous century this is the only moment at which opera after Monteverdi and before Gluck (with all respect to Rameau) becomes a genuine art-form instead of a concert on the stage.

Biographical articles dealing with the following named composers who belong to this period: the violin writers CORELLI, GEMINIANI and TARTINI: the clavier writers COUPERIN and D. SCARLATTI (the Paganini of the harpsichord and a most unclassical son of the founder of classical tonality) ; the opera writers (which meant the all-round musicians) DURANTE (Francesco), GALUPPI (who certainly never wrote Browning's "sixths diminished, sigh on sigh"!), LEO (Leonardo), PERGOLESI and SCARLATTI (Alessandro). RAMEAU is equally important in three capacities as a master of French opera, a livelier master of instrumental music, and an epoch-making theorist. German beginnings of serious and comic music-drama were sumptuously inaugurated at Hamburg by KEISER (*q.v.*) whose influence is traceable in Handel's first opera *Almira.*

7. THE RISE OF DRAMATIC MUSIC AND THE SONATA STYLE

The fashionable distaste for polyphony was a mere negative force in the early 18th century. The positive force was, as in the monodic revolution a hundred and fifty years earlier, an impulse towards drama. Unlike the monodists who, when they rejected polyphony had no power of composition beyond the single musical sentence, the 18th century musicians could easily cover ten minutes with a well-balanced form; and the problem of making such forms dramatic was no longer confined to the monodist's problem of making them rhetorical. On the contrary, the rhetoric had to be demolished; for the action of drama is not the action of rhetoric.

The distaste for polyphony was no unfavourable condition for the rise of dramatic music; it was the inverse aspect of a growing sense of contrast in various textures cheap and valueless in themselves. The rest of the story is told in the articles, INSTRUMENTATION, HARMONY, OPERA, SONATA FORMS, and GLUCK, BEETHOVEN, HAYDN, MOZART.

It is inadequate to call Gluck a "reformer" of opera. Music itself was not dramatic before Gluck made it so. Hence it is a mistake to separate Gluck's "reform" from the whole process of the development of the sonata style. Lastly, we miss the whole meaning of that style unless we realize that as soon as it arose the purely instrumental music became more dramatic than any drama. At the same time it also became more powerfully architectural than any earlier music. The art comprised in the works of Haydn, Mozart, and Beethoven constitutes one unbroken aesthetic system, more universal in emotional range than any art since Shakespeare, and as perfectly balanced as the arts of ancient Greece. Until the end of the 19th century it would have seemed a paradox to maintain that Beethoven's work belonged to the same aesthetic system as Haydn's and Mozart's; for critics were slow to escape from the habit of estimating works of art by the face-value of their subjects and the dignity of their language And the language of Haydn and Mozart corresponds with that of the comedy of manners, while Beethoven is the most tragic composer that ever lived. Nevertheless the huge expansion which music underwent at Beethoven's hands was no revolution, and the popular idea of Beethoven as a revolutionary artist is based on two errors; first, the commonplace habit of seeking parallels between the works of genius and the personal eccentricities of their authors; and, secondly, the inadequacy of orthodox doctrine on musical forms. This inadequacy results from the fact that the doctrines are contemporaneous with the compositions and are accordingly hostile to all but the easiest conventions. A proper grammar of a classical art requires something of the attitude of the unjustly-despised Byzantine scholars who sacrificed aesthetic pleasures in humble devotion to the task of securing the texts. It is when the languages are dead that they live for ever and suffer no corruption.

We need not expect scholarship in the orthodoxies that were current as to musical forms used in the lifetime of the classics themselves. (See FUGUE for a demonstration of the irrelevance of traditional doctrine on that art-form.) Still more impertinent is our orthodoxy on sonata-forms. It ignores the differences between Haydn and Mozart which are as radical as any innovation Beethoven introduced; and, having thus cut away all ground for appreciating Beethoven, treats him as the central symphonic classic, and also as a stupendous revolutionary. This result is correct as far as it goes: central classics can be stupendous revolutionaries. But correct pious opinions are the healthier for facts that can give us a right to them; and the beginning of the 19th century was unfortunately the beginning of an age of humbug in musical education. (See CHERUBINI, who, however, has other claims to our respect.) One consequence is that many a musical revolt purports to revolt against the classics when its nearest contact with classical forms has been the perky generalizations of textbooks by writers who regarded the great masters as dangerous, and who deduced their rules from the uniform procedures of lesser composers. Now these procedures were often derived from one or two popular works by the greatest men: thus Beethoven himself produced one model sonata (op. 22)—if its "first subject" had only been long enough. And if Mozart's great C major quartet had not such a subversive introduction it might (and did) serve as a jelly-mould for all the quartets of Spohr. Take another jelly-mould from Spohr, and you have classical tradition.

But now comes the fundamental difficulty in all attempts to distinguish the classical from the pseudo-classical. Every individual work must be judged on its own merits. No generalizations are trustworthy. Many movements by Mozart are as alike as peas. But, being alive, they are not as alike as buttons. With Mozart and Haydn the individuality of each work is all-important for the critic, and if he neglects this all that he says about the common form is superficial. On the other hand, the materials of Beethoven's work developed so rapidly that he seems to be driven to invent a new technique for almost each composition. Hence the external differences become obvious; and unless the critic penetrates to the common form he is lost.

With the symphonic classics we enter the period when these considerations become important; for there is no gulf between that period and our own. No musical art known to Haydn has suffered, like the art of Bach, a period of total eclipse; nor, on the other hand has it had preserved a character that Haydn could have understood. Not much light is shed on Haydn and Mozart by calling them court composers, and little more on Beethoven by calling him a child of the French Revolution. In an age of court patronage Bach the theologian had been inspired to write warlike music not more by ancestral memories than by scriptural texts of war in Heaven. Mozart and Haydn were restive in the service of courts and their musical language was that of the comedy of manners when it was not racy of the soil. In Paris, where musicians might be expected to know most about the French Revolution, the modest, lovable Etienne Méhul (famous for the biblical opera Joseph) produced his prettiest comic operetta Le *Jeune* Sage et le Vieux Fou in the year of the Terror; and on French music the immediate effect of these tremendous days was the rise of a new type of sentimental opera concerning the hair-breadth escapes and sufferings of the political prisoner rescued by the heroic wife. Hence Cherubini's Les Deux Journkes (The Water-Carrier) and Beethoven's Fidelio. Genius is the wind that bloweth where it listeth. In Bach's day Beethoven would have been musical interpreter of the Apocalypse; and in this 20th century Bach would be something like Dr. Schweitzer.

When we contemplate the impassable gulf that separates Bach's art not only from Haydn's and Mozart's but from the apparently more kindred spirit of Beethoven, we find it hard to realize that contemporaries were unaware of any catastrophic development. In the case of choral music a little study shows us that its forms and language remained Neapolitan. Haydn's and Mozart's masses are flamboyant Neapolitan music; and Michael Haydn, who was merely decorative as an instrumental composer, was rightly thought by his brother to be the better man at church music Again we regard Philipp Emanuel Bach as bridging the gulf between his father's and the new art; but Philipp Emanuel was writing quite mature sonatas in the year of his father's B minor Mass and his last set of sonatas was produced in the year of Mozart's Don Giovanni. Clementi, born in the year after Bach's death, was an infant prodigy of eight when Handel died; he had developed an extraordinarily massive and genuine pianoforte technique (more powerful than beautiful) when he encountered Mozart in a musical tournament, and he survived Weber, Beethoven and Schubert. Nothing can be gained by a further attempt to summarize this "Viennese" period. We may call it the period of the sonata and of Mozartean comic and French romantic opera. More particular information is given in the following technical and categorical articles: HARMONY (on Key-relations); INSTRUMENTATION; MELODY; OPERA; ORATORIO; OVERTURE; RONDO; SCHERZO; SONATA FORMS; SYMPHONY; VARIATIONS, and the biographies ABEL (K. F.); BACH (K. P. E.); BEETHOVEN; BENDA; BOCCHERINI; CHERUBINI; CLEMENTI; DITTERSDORF: DUSSEK; GLUCK; HAYDN (F. J.); MOZART; PICCINNI; SCHUBERT; SPOHR; WEBER (C. M. F. E. VON).

8. THE ROMANTIC PERIOD

With the romantic period comes the development of lyric music in the forms of songs and short pianoforte pieces. Schubert, Weber, Spohr, Mendelssohn and Schumann would be the romantic composers in this sense, and many contemporaries would have added Cherubini to the list, for they thought of him not as the martinet who directed the Paris Conservatoire but as the composer of Les Deux *Journées*. Romanticism was thrilling and classicism was cold.

But this list traverses another sense of the term which opposes the romantic to the classical. The classical is in this connection identified with both formalism and mastery. Mendelssohn and Spohr chose romantic subjects to no purpose; their mastery was unromantically slick (there is no other word for it) and Spohr's forms were more thoroughly ascertained than anybody else's except those of Mozart's brilliant pupil, J. N. Hummel. Mendelssohn's forms were free; but he never got into difficulties, so how could anybody recognise his freedom? Philipp Emanuel Bach's vein of sentimental rhetoric was not only typically romantic but enabled him to write some genuinely lyrical songs. J. Schobert is another romantic writer who influenced Mozart at an impressionable time of his boyhood. Every thrilling modulation in Beethoven's music was romantic, and so were the double-bass passages at the beginning of Cherubini's overture to Les Deux Journkes.

But the facts are more interesting than this generalization. Mastery is not the line of cleavage that ranges Spohr and Mendelssohn on the one side and Schubert, Schumann and Chopin on the other. Beethoven's later tonality and polyphony had made music ready for lyric forms which he himself adumbrated in a few of his bagatelles for pianoforte and some sporadic good things in his songs. Mendelssohn and Spohr took up song-writing and produced in that line masterpieces for the drawing-room. We ought not to despise the drawing-room. Schubert became the supreme master of song, and Schumann achieved greatness there as in his pianoforte lyrics; but you might as well think of Keats and Shelley as writers for the drawing-room.

Another line of cleavage separates Schubert from Schumann and Chopin as fundamentally as it separates him from Mendelssohn and Spohr. When Schumann and Chopin handle the large classical forms they show obvious weaknesses. Schumann makes an effective new artificial sonata form out of his stiff antithetic epigrammatic style, as a man might construct a landscape in mosaic. Chopin merely shows that he has taken the sonata forms uncritically from Hummel, though the first two movements of the B flat minor sonata are almost as happy in their classical form as the Ballades are in Chopin's unique way. But Schubert's large forms have only the weaknesses of youth, and their positive qualities and tendencies set him above all schools and indicate that if he had lived we should not so readily have closed a historic chapter with Beethoven. The mastery that Schubert lacks is not anything that Spohr could have supplied. Younger composers with new worlds to conquer could with some truth accuse Spohr of playing with classical forms as one might play chess; but they could never have so accused the Schubert that died young or the Schubert that might have reached old age.

We do not know what Mendelssohn might have achieved if he had lived longer. His influence on the musicians he knew personally was wholly stimulating and good. But he too, seemed able to play chess with symphonies, oratorios and songs with and without words, while other composers were grappling in their music with real life, perhaps confined to one narrow art-medium like Chopin, or, like Schumann, deserting lyrics for larger forms or some artificial hypothesis, or, like young Berlioz, kicking right and left against all teaching and all criticism while dreaming new wonders of orchestral sound, and correctly dreaming the practical means to them also.

Meanwhile a greater than Berlioz was arising, a dreamer of new sense as well as of sound. Mendelssohn and Schumann saw only the beginning of Wagner's development, and could not feel very sure that this voluble and stormy reformer of music-drama was really likely to achieve anything better than the tinsel of the astute Meyerbeer who dominated the world of cosmopolitan opera. The early style of Wagner is inaeed an alloy of many metals besides iron and potter's clay; but even in the 'forties his work marks the eclipse of the first romantic period and the dawn of another and greater epoch.

The art-forms peculiar to the Romantic period have no definite names, though composers began to use many literary titles, such as Ballade, Romance (already used by Mozart for slow movements in sonata-form), Nocturne and the like. Dance-rhythms, especially those of Poland, were brought into prominence in the pianoforte music of Chopin. Mendelssohn's invention of the song without words was very successful, but the notion is too facile to lead far, or always, even in Mendelssohn's hands, to justify its existence. Fantastic titles, used in the 18th century by the French clavecinistes, assumed great prominence in the pianoforte works of Schumann who created a new type of long connected cycles of epigrammatic little pieces. The articles PROGRAMME MUSIC and SONG concern this period vitally. Relevant biographical articles are CHOPIN, MENDELSSOHN, SCHUBERT, SCHUMANN, SPOHR, WEBER; while the crowd of pianoforte composers whose brilliance on that instrument obstructed all wider musical prospects, include the respectable HUMMEL, the less respectable STEIBELT and the Irish writer of beautiful pre-Chopin nocturnes, FIELD (John).

9. THE WAGNERIAN DEVELOPMENT AND THE RENASCENCE OF CLASSICAL FORM

Wagner formulated his principles of music-drama long before he matured his musical style. It is impossible to understand the musical history of the second half of the 19th century until we frankly admit that the composers of instrumental music saw in Wagner not only the subversive operatic theorist and erotic dramatist but the composer who was popular because of the salvation-army religiosity of the end of the Tannhauser overture and the downright vulgarity of the entr'acte before Act III in *Lohengrin.* His theories and methods might be controversial, but these lapses never were.

Strange to say, Wagner received something like recognition from the doyen of classical champions, Spohr, whose attitude to Beethoven had been merely condescending, but who saw in Der Fliegende Hollander and *Tannhäuser* interesting, if faulty, works which well deserved painstaking production at his theatre at Cassel. Schumann too, after joining in the general hostility towards *Tannhäuser,* frankly recanted and praised its many noble features. Personally he and Wagner did not get on so well; he found Wagner too talkative and Wagner found that Schumann had nothing to say. Later on when Wagner was in exile, *Lohengrin* found a powerful champion in Liszt at Weimar.

Liszt presented another problem to sober musicians. Wagner himself at first saw nothing in Liszt but the virtuoso who, when asked for music, would give you a fantasia on Robert *le* Diable. On the other hand, persons who became bitterly hostile to all the musical tendencies that Liszt fostered went out of their way to declare that no such wonderful interpretations and technique as Liszt's pianoforte playing had ever before been heard on any instrument or orchestra. All Liszt's gestures were superb, from his monumental immobility at the pianoforte to his princely and often really self-sacrificing generosity to other musicians. And at the age of 37 he made the most superb of all his gestures in giving up playing in public. And so the one incontrovertible power of his art became a legend and his actual activity became the championship of unorthodox artists. He took to composing on a more. ambitious scale than that of the marvellous pianoforte virtuoso; and became himself the leader of a new development of romantic music. Although he took little pleasure in counterpoint he had none of Berlioz's clumsiness in harmonic texture; and his orchestration, in which his first efforts had the secret assistance of Raff, was always brilliant and novel, though it never caught the Berliozian fire or plumbed the Wagnerian deeps. Liszt realised no more than Berlioz the true musical purport of the new ideas which his symphonic poems and Berlioz's symphonic-dramatic phantasmagorias were putticg forward under all kinds of literary and pictorial names. While the new romantic composers purported to be devoting instrumental music to the illustration of literature (see PROGRAMME MUSIC) they were really struggling with a new musical time-scale.

As we have already seen in the present article and in the discussion of HARMONY, musical history may be traced in terms of the time-limit over which the listener's memory is brought into play. In the 16th century that limit is from accent to accent; by the end of the 17th century it ran from phrase to phrase. The great architectural forms of Bach could stretch it easily to six minutes, and, in extreme cases to ten. The rise of the dramatic sonata style did not greatly enlarge the time-scale; for there are few well-constructed sonata-movements that exceed a quarter of an hour, though on no smaller scale could Beethoven have prepared the famous harmonic collision that gave such offence in the first movement of the Eroica symphony. Now this ten-minute time-scale obviously compelled musicians to handle the action of an opera by means of conventions. (*See* OPERA.) It is less obvious that it also produced a similarly conventional artifice in the relation of sonata-forms to their emotional content. A design may complete itself in ten minutes while raising emotional issues that cannot be dealt with in less than forty. And so the sonata-forms are grouped in from two to four (rarely more) movements as artificially as the musical sections of classical operas. Wagner's enormous achievement in music-drama consisted essentially in giving music the same time-scale as that of the drama. As with all first solutions of an art-problem he achieved an extreme case, for his drama became cosmically slow. But from *Das Rheingold* onwards every Wagnerian opening instantly, and without any introductory gestures, lays down the lines of its vast time-scale, to the utter bewilderment of his contemporaries who continued to expect Das *Rheingold* to show its pattern on Beethoven's time-scale, just as Beethoven's contemporaries had heard seven pianissimo bars on the chord of E flat, not as that vaulted vacancy appears in the middle of the andante of the C minor symphony, but as it would have sounded if it were intruded into an andante by Mozart.

Nobody else before Richard Strauss achieved Wagner's mastery of his new time-scale; and few, if any, of his contemporaries, whether hostile or friendly to him, realized its existence. Liszt was trying, in his symphonic poems, to make a music that filled its half-hour or forty minutes continuously; but his first effort of the kind, *Ce qu'on entend sur la montagne,* spends the first twenty of its forty minutes in a series of introductions, and the remaining twenty in retracing the series backwards. And his more successful efforts, such as *Orpheus* and *Les Préludes,* are either essentially lyric or not on the new time-scale at all. He never achieved so effective a symphonic poem as Schubert had already long ago unwittingly produced in the "Wanderer" fantasia. Musicians who might not have been repelled by new doctrines of musical form found Liszt's style even more demi-mondaine than that of the early works of Wagner; nor did Liszt show any tendency to purify it. Moreover he rivalled Meyerbeer in the efficiency of his press-bureau by which he made propaganda, often in his own fluent French, more generously for others than for himself

Meanwhile another musical development was arising, conscious of its continuity with the past, and, like Judaism as defined by Matthew Arnold. tinged with emotion in the morality of its aesthetic principles. Joachim, as great an interpreter on the violin as Liszt on the pianoforte, at first found in Liszt a congenial friend, until he saw his compositions. These horrified him, and the horror completed an estrangement already begun by his dislike of the atmosphere of Liszt's press-bureau. He and his younger friend Brahms were united not only in general musical taste but in personal devotion to the heroic widow of Schumann, who, after her husband's tragic and lingering death, was bringing up a large family on the proceeds of her concerts. These three artists soon came to regard the musical atmosphere of Weimar, where the *Lisztianer* gathered around their master, as unhealthy. In the correspondence and mutual criticism of Brahms and Joachim the word *Lisztisch* became synonymous with "devilish"; and indeed it is true that any characteristic Lisztian and many Wagnerian idioms would have a disgusting effect if intruded into Brahms's music. To-day we can be wise after the event and find matter for regret in the drastic out-spokenness of Joachim and Brahms which elevated matters of taste into questions of artistic honour. If Liszt could have been contented with *sachlich* criticism on definable issues of technique without requiring attestations of sympathy and enjoyment, and if Joachim could have resolved matters of taste into questions of artistic proportion, the neo-classical and neo-romantic musicians would have joined forces instead of condemning each other. Similar economies might be effected in nature if lions could be converted to vegetarianism.

The controversy was unequal, in two compensating ways. Wagner had a tremendous, if acrid, fluency in prose and did not care where his vitriol might alight. Moreover, Wagnerian and Lisztian music was much easier to write about, whether in attack ordefence, than music which had no literary aspect. Brahms, like Wagner, needed and found friends who adored his music, but he hated the idea of a press-bureau and snubbed anybody whose compliments aroused the least suspicion of flattery. These drawbacks had their own compensation. It might be difficult to write as interestingly about Brahms as about Wagner; but Wagner, whether in exile or enthroned at Bayreuth, had Wagnerian music-drama as his whole province, while Brahms reigned over the whole of the rest of music, instrumental, choral and lyric. If criticism came to persecution, on the whole the neo-classics had the worst of it; for Brahms had no equals since Joachim gave up composition, and the position of a champion of classical forms was easily confused with that of a persecutor of the prophets of progress. As a matter of fact, Brahms was no anti-Wagnerian and was annoyed when his friends bracketed Wagner with Liszt.

But, apart from the clash of flying inkpots, the recognition of Brahms was assured by two facts; first the propaganda of his work not by words but by consummate and authoritative performance, and second, the very fact that his music required an experienced love of music for its understanding A man might become an enthusiastic Wagnerian or even a well-equipped conductor of Wagner's music and be as the brutes that perish about symphonic orchestration, choral music, chamber-music, songs and all pianoforte music except Chopin. But it was long before any musician could venture to tackle Brahms's music on any basis except that of the most comprehensive musical culture and technique. Brahms lived long enough to become worshipped unintelligently; and after his death (in 1897) the reaction was more evident than the fashionable worship had been. There are signs that the reaction is over by now.

The Wagnerians felt deeply that their propaganda was incomplete for lack of a master of purely symphonic music. This they found in Bruckner (*q.v.*). Brahms was appalled by the clumsiness of Bruckner's forms, and the most official Wagnerians admitted the frequent lapses of their symphonic master. On the other hand Bruckner's Nibelungen-tetralogy openings to his symphonies obviously dwarfed the terse themes of Brahms. By the time Brahms and Bruckner had come into their own, the public had long lost all sense of form in its appetite for bleeding gobbets of musical butcher's-meat hacked from the living body of Wagnerian music-drama and served up in concert rooms as *Waldweben, Karfreitagszauber* and *Walkürenritt* After this it was pedantry to quarrel with any symphonic composer's form so long as his openings were vast enough. Brahms was no pedant; obvious weakness of form and style did not deter him from being the first to recognize Dvořák (*q.v.*); and he was drastic in his rebuff of anybody who thought to flatter him by talking against Wagner.

The song-writer Hugo Wolf (1860–1903) became recognized too late to be made use of as a lyric-pawn in the Wagner-Bruckner party politics of music As far as his theory of song can be summarized, it consists in the application of Wagnerian declamation to lyric poetry. If his practice were not better than this essentially prose theory of verse-rhythm (*see* RHYTHM) and the perky censorship of classical musical declamation that goes with it, Hugo Wolf's art would not have survived his short and ailing life. But it is deeper than the theories on which it is supposed to rest and its apparent revolt from lyric melody only partly conceals a powerfully organized lyric form, and does not at all conceal a great gift of characterisation.

10. NON-GERMAN MUSIC OF THE 19TH CENTURY

While these great issues were being debated in Germany, the music of other countries was awakening from long sleep or outgrowing infancy and provinciality. France had, since Rameau, been remarkably content to have its music dominated by foreigners Before Rameau, French opera was established by the Italian Lully. After Rameau it was reformed by the German Gluck. Early 19th century French classicism was dominated by the Italian Cherubini. Another Italian, Rossini, was in the prime of his life absorbed by Paris; and the result was *Guillaume Tell*, with its rich orchestration and grandiose forms. But the crown of French opera was imposed on it by the German Jew Meyerbeer. The pretensions of the native French composers were more modest, except for the volcanic eruptions of that typical Gascon Berlioz. The popularity of Gounod (1818–1893) rested on the same misunderstanding of the meaning of art as the vogue of Doré in the capacity of an illustrator of the Bible. *Faust* was a success. Another development, more improvisatorial, uncertain of its style, but fundamentally sincere, was initiated by the Belgian, César Franck (1822–1890) (*q.v.*). From him, and not from the more prolific and facile Saint-Saens, originated the main stream of modern French music. His style had too much affinity with Liszt to please the musicians who continued to regard Liszt as the author of all modern musical evil; but he achieved mastery in a wide range of forms all his own and he never wrote for effect.

In Italy music after Rossini aas long contented to imitate the things in which Rossini was imitable. These were the mechanical cultivation of *bel canto* and the use of a full orchestra to support the voice in a thick unison of the melodic instruments, with a brassy dance-rhythm in the rest, and the big drum and cymbals to mark the rhythm. The genuine melodic inventiveness of Bellini and Donizetti did little to improve the other categories of the art; but in Verdi (1813–1901) a new genius was arising together with the Risorgimento. In *Rigoletto*, *Il Trovatore* and *La Traviata* Verdi's dramatic sincerity triumphs over the defects of a musical texture which still clung to traditional squalor, though strokes of genius occurred unpredictably in the orchestration of many passages. In *Aïda* the style silences all cavil; and in *Otello* (written at the age of 74) and *Falstaff* (written at the age of 80) Verdi created a new kind of opera, Wagnerian in its perfect continuity and dramatic movement, but utterly independent of Wagner's style and method.

Bold prophets in Beethoven's time had been heard to say that a great musical future was in store for Russia. The fulfilment of this prophecy was long delayed, for when Rubinstein averred that Michael Glinka (1803–1857) was the equal or the superior of Haydn and Mozart he expressed an opinion which could have occurred only to a Russian, and then only as a patriotic paradox. Rubinstein himself achieved only a weak cosmopolitanism in his voluminous compositions, though his pianoforte playing remained, for all its waywardness, till near the end of the century, as the most monumental power of interpretation on that instrument since Liszt. The first composer to make a genuinely Russian music recognized over the whole civilized world was Tschaikovsky (1840–1893) whose symphonies were held by some critics to have eclipsed those of Brahms. This was the eclipse of drama by melodrama. The true merits of Tschaikovsky were eclipsed by the rising reputation of his less immediately successful contemporaries. Moussorgsky (1835–1881) had the posthumous fortune to have his two great operas *Boris Godunov* and *Khovantschina* revised by Rimsky-Korsakov (1844–1908) the most brilliant contemporary master of pure orchestral colour and texture. This was unquestionably good fortune in so far as it speeded these unconventional works on their way into the wide world; but something like indignation accompanied the later study of Moussorgsky's original scores, with the discovery that besides altering clumsinesses Rimsky-Korsakov constantly meddled with features in his friend's style that were far beyond his comprehension.

The 19th century was over before any musician on the continent could be persuaded that there were composers in England. Schumann had repeated St. Gregory's pun about Angles and angels when he hailed Sterndale Bennett as "ein englischer Componist"; but the trials of English musical life dried Bennett up. All who knew and loved him denied hotly that his music reflected Mendelssohn's; and perhaps, to-day, a leisurely study of it might vindicate his independence. Macfarren (1813–1887), who succeeded Bennett in his educational offices, was a widely-cultured musician whose influence for good was frustrated by his violent conservatism which co-existed with a fatal readiness to be led by faddists. The renascence of English music began in the work of Parry (1848–1918) and Stanford (1852–1924). They put an end to the provincial absurdities of British oratorio tradition, and consistently set great literature in a way that revealed to contemporary poets that the antithesis between musical and general culture was false.

They also had wide and deep influence as teachers of composition.

Still, recognition of English music on the continent was rare and capricious. Englishmen wrote church music for the stage, stage music for the church, organ music for the orchestra, and, as far as they had any orchestral ideas at all, orchestral music for the organ. The one famous English composer who could be understood on the continent as saying intelligible things in fit terms, was Sullivan, with his Savoy operas. And his serious colleagues and critics urged him with owlish solemnity to produce no more light masterpieces but to go on with his serious and luscious Golden Legends and Martyrs of Antioch and generally to consummate the final merging of English music into "The Lost Chord." We may thankfully hope that that chord is now lost for ever; but the Savoy operas live, and might, without delay to their popularity, have risen to the position of great music if Sullivan had had enough steadfast love of music to finish those parts of his work to which the public did not listen; if for example, he had provided his operas with better orchestral introductions than the perfunctory pot-pourris of their favourite tunes which he calls overtures and which are quite as long as artistically-decent overtures would have been.

It is customary to explain the failure of all but the most recent British music by saying that the native art was crushed by the ponderous genius of Handel. It is a great pity that the united ponderosity of Handel and the middle-weight Mendelssohn could not avail to dam the output of oratorios by composers who might have become good song-writers or even acquired some knowledge of orchestration beyond that of choral accompaniment. The complaint of foreign domination is nonsense. No nation has had its music so long and so completely dominated by foreigners as France; and French music has always remained exclusively French and has made thoroughly French artists of the foreigners who dominated it. The traces of foreign influence on English music have always been the echoes of individual phrases or mannerisms.

While Englishmen echoed, as fashions changed, Mendelssohn, Brahms and Debussy, they learned no technical lessons from them. Such mechanical echoes show no foreign domination, but are the best proof of an inveterate provincialism and the kind of ignorant and irritable independence that goes with it. Since music ceased to be an integral part of an Englishman's culture (about the time of William and Mary) their musicians, as a rule, began its serious study far too late. The language of music cannot be begun at the age of 19 like courses in law or medicine. Their universities have played a considerable part in shaping British musical destinies; but a mighty Oxford treads on the tongue of the encyclopaedist who would pursue this topic.

11. MUSIC OF THE 20th CENTURY

It has often been said that the 20th century witnessed as drastic a musical revolution as that of any period in history. The attitude of the public as well as the internal evidence of the music clearly showed a definite rupture with the immediate past. At first the radical new departures aroused indignant audiences just beginning to enjoy the colourful richness of the late romantic composers like Richard Strauss and Nicolas Rimsky-Korsakov and resulted in many violent demonstrations. Critics raved; composers explained; sides were taken; and societies were formed to propagate what was then called "ultramodern" music.

But even if this were not sufficient proof, a comparison of any brief portion of Arnold Schonberg's *Pierrot Lunaire* (1912) or of Igor Stravinsky's *Le Sacre du printemps* (1913) with any previous music would reveal at once how extreme the break with the past was. Yet these and other radical new works could not be easily dismissed as the misguided experiments of a few isolated eccentrics, because their novel methods soon attracted more and more followers among musicians and the public. When the nazi and soviet states in the 1930s and 1940s began to legislate against those using the newer styles, it became clear that the modernists were to be reckoned with. By mid-century, the importance of the revolution had to be admitted by almost every musician; for not a single composer had appeared since about 1920 who could write convincingly enough in the older style to win recognition. The only important late romanticists still greatly respected during this time were those like Richard Strauss (1864–1949), Sergei Rachmaninoff (1873–1943) and Johan Julius Sibelius (1865–1957), who had become known earlier.

There were many attempts to summarize the distinguishing marks of the new music. Most of these efforts were made by adherents of one or the other of two main factions that began to take shape around 1930: the neoclassicists, who followed the lead indicated by the later works of Igor Stravinsky (1882–), and the atonalists, who followed Arnold Schonberg (1874–1951). Since many intelligent articles were written by the composers and their followers discussing these two points of view, both were very influential; but besides these two schools, there were a great number of independents harder to deal with in critical estimates because of their avoidance of doctrinaire attitudes. The case of Béla Bartók (1881–1945), whose music did not receive the recognition accorded his more discussed contemporaries until after his death, is a rather typical example of the fate of a composer not belonging to a pressure group who preferred to let his music alone speak for him. Five years after his death, Bartok was generally regarded as superior in many ways to almost every other composer of his time.

In spite of their doctrinaire tendencies, the neoclassicists and the atonalists represented the opposite poles between which much music of the first half of the century lay; and the undeniable mastery of Stravinsky and Schonberg lent their points of view considerable weight. Because both dwelt so much on the importance of musical technique, they had often been dismissed as "formalists" concerned only with pure form devoid of musical expression. Indeed, the neoclassicists were particularly condemned for their insistence on "objectivity," but this objectivity was really a way of achieving artistic dignity and distinction by maintaining an aesthetic distance from the emotions portrayed. It was similar to the type of representation of feelings used in the baroque era, and this attitude distinguished modern neoclassicism from that of Brahms, which was truly romantic in its direct expression of dynamic emotions. True to classical precepts, the new group adhered to the representation of centrally important human feelings seen through the restless rhythmic and harmonic tension of modern technique. This double exposure of past and present inevitably suggested a commentary of one period on the other with comic or, more often, with nostalgic overtones. This school began to decline in influence around 1945.

The atonalists, on the other hand, were concerned with intensifying and compressing direct expression to the utmost. They continued the romantic psychology of dynamic emotions but focused it on the most subjective and unusual states of mind, related to the tormented, neurotic violence of the German expressionist theatre and painting. Their weird, fantastic and personal realm found its expression in a strict musical technique that was claimed to be a summation of all the devices of previous music, combining the formal methods of preromantic styles and the psychology of romantic music with the new techniques of the 20th century.

Most of the independents reflected a concern with elaborate musical techniques and with the avoidance of large-scale, opulent, romantic rhetoric. There was also a group of followers of the "populist" composers of soviet Russia who were under official pressure to avoid these "formalist" methods. These used a kind of romantic style drastically simplified, yet with certain contrapuntal and harmonic devices similar to the neoclassicists. Their works, particularly those by Sergei Prokofiev (1891–1953) after he returned to soviet Russia in 1934 and Dmitri Shostakovich (1906–), often met with great acclaim for their very real musical values, but few of them outlasted their first flush of success.

Technically, composers of the first half of the 20th century seemed to have been mainly occupied in breaking up the relationships between the various elements of musical discourse and in reintegrating them on a level of greater freedom. The rhythmic aspect of a work often had a comparatively independent life of its own, not emphasizing the harmonic changes or the melodic flow. Harmonies were often used for their sonorous and expressive qualities and not to underline the melody. This freedom was usually ordered by new kinds of self-imposed formal and stylistic restrictions. The neoclassicists favoured strict mechanical regularity of pulse while employing great liberty in the irregular distribution of accents and in all the other elements; the atonalists adhered to a strict system of ordering the tones of a composition, allowing the greatest licence in other directions.

Each element within its own domain was freed from previous limitations in order to bring out its particular expressive qualities. Rhythm became highly irregular, using either assymetrical groupings of rather rapid regular pulsations or sought the other extreme of expressive rubato. Two main ideas were current about melody. One, accepting the classical use of a pronounced and definite melodic line, emphasized its rhythmic aspect by reiterations or escaped into the free development of motives like that of Gregorian chant. The other idea, derived from Claude Debussy's melodies of harmonies and Schonberg's "melodies of tone-colour," renounced the clear definition of melodic outline, treating the total sound effect of any moment as a unit to be connected to other units as single tones are in a melodic line.

In harmony, any simultaneous grouping of tones was considered acceptable provided it gave the desired qualities of tension and expression. The movement from one chord to the next usually obscured or negated classical usages, dissonances not being prepared or resolved. When music had a tonal feeling, this was more a result of melodic emphasis on tonal centres than of functional harmonic activity.

Whether new music invented new "open" forms or adapted old "closed" ones to new needs, it was permeated by the principle of continual variation replacing the classical devices of literal or sequential repetition. The older symmetry of balancing sections was eliminated in favour of drastic shortenings and lengthenings to preserve the greater tension of the assymetrical rhythmic basis. Texture became predominantly contrapuntal with a freedom of relation between voices that sometimes recalled the heterophonic practices of primitive or Balinese music and more often the linear counterpoint of the middle ages. The orchestra was dissociated into sharply defined groups of colours in order to bring out the contrapuntal and linear nature of the music; the individual instruments mere often treated as soloists as in chamber music.

Perhaps the most striking general aesthetic and technical feature of the period was a new attitude toward stylization. Obviously works of music had been stylized in every period, but previous composers usually drew upon the general practices of their time for the devices used to give each work its special stamp. From 1860 on, the commonly accepted methods of the immediate past began to disintegrate rapidly. Wilhelm Richard Wagner, Hugo Wolf, Modest Petrovich Mussorgsky and others added many novel features, and by the end of the century the impressionist composers Claude Debussy (1862–1918) and Maurice Ravel (1875–1937) had stretched the use of older harmonies to the point where they no longer fulfilled their former functional capacities of pushing toward cadences and employed them as separate sonorities much as blotches of colour were used in impressionist paintings. Debussy in his later works consciously strove for a more fluid style that dispensed with classical rhythmic and melodic procedures achieving a technique that resembles the "stream of consciousness" of contemporary literature. At about the same time. Alexander Scriabin (1871–1915) invented new chords to express his sensual mysticism, and Erik Satie (1866–1925) and Ferruccio Busoni (1866–1924) were demonstrating in very different ways the "objective" attitude in their works.

Around 1908 there was an outburst of musical primitivism and expressionism that paralleled the postimpressionist reaction in painting against the tenuous world of the impressionists. From this time until about 192 j, each new composer strove to invent his oan vocabulary of melodies, harmonies and rhythms, as well as his own grammatical rules. Each went in search of new materials and new ways of joining them, and each work provided an opportunity of carrying some technical, stylistic or aesthetic idea to its extreme limit. For a while such stylistic relativism seemed to point toward complete anarchy. It looked as if there were going to be almost as many styles as there were works written. In Stravinsky's works, for instance, the vehement barbaric ritualism of *Le Sacre du printemps* (1913) gave way to the dryly humorous pathos of *L'Histoire du soldat* (1917) with its deliberate distortions of café music. This in turn led to a whole series of works related to styles ranging from Bach to Tschaikovsky and, in 1948, to an austere setting of the Mass using bits of musical Gothic. All of these works were done with such imagination, fantasy and authority that they furnished cues for one group of followers after another.

Similar but not so drastic changes went on within the very individual styles of Bartók and Schonberg, as each passed in his own way through a period of classicism.

This desire for total stylization can be seen as shaping the background of the entire first half of the 20th century, often with sensational results as in the works of Edgar Varèse (1885–) or of Anton Webern (1883–1945), which extended stylization to the limits of unusualness, or in the later works of Erik Satie and in those of Virgil Thomson (1896–), which carried it to the opposite extreme of simplification.

Against this experimental background, however, several marked trends began to form which gave the years between 1925 and 1940 a certain unity. Around the time when Schonberg wrote his first works using the 12-tone technique in 1924, when Stravinsky had gone back to Bach in his *Piano Concerto* (1923–24) and when Bartók had finished his most experimental works, the *Piano Sonata* (1926) and the *Third String Quartet* (1927), the directions became defined. Composers felt that the previous inventions needed to be explored. At this time a number of excellent neoclassicists appeared: Sergei Prokofiev before he returned to soviet Russia, Darius Milhaud (1892–), Francis Poulenc (1899–), George Auric (1899–), who followed the new aesthetic using elements of their native French popular, folk and art music, while Arthur Honegger (1892–1955) combined this idea with a dramatic violence that brought him close to the romantic style. In Germany, where Busoni had prepared the way, Paul Hindemith (1895–) turned from romanticism in his clear-sounding, objective, contrapuntal style and treated chromatic elements in a new motoristic, vigorously rhythmic way derived from the neoclassic approach. His series of outstanding works revealed a growing preoccupation with the styles of the Renaissance and middle ages. In the United States, Walter Piston (1894–) and Roger Sessions (1896–) produced important and skilful uorks in this style. Shunning romantic attitudes, they regarded themselves as returning to the ideals of craftsmanship of earlier times. Many wrote teaching pieces and music for amateurs and other kinds of *gebrauchsmusik* (music for use) in their own idioms.

The other important rallying point, atonalism, for a time eclipsed by the success of the neoclassicists, was also related to the earlier techniques, particularly of the Renaissance. Schönberg and his followers, Alban Berg (1885–1935) and Anton Webern, developed a rigorous system usually called the 12-tone or dodecaphonic technique which they applied to their subsequent works. By this an entire composition is organized around a chosen order of the 12 tones of the chromatic scale, sometimes transposed, inverted or read in retrograde motion (backward). No tone can return unless separated by the other intermediate 11 tones, thus ensuring an equal distribution of emphasis on all 12. This was intended to obviate the classical feeling of tonality. The chosen "row" of 12 tones forms the basis of all melodies, counterpoints and harmonies in a given work, and its application immediately gives stylistic and motivic unity. Alban Berg's amazing feat of composing a full-length opera, *Lulu,* on one tone row revealed the enormous possibility of variety within the system, borne out by the numerous and varied works of Schonberg and Webern. Berg's music, surprisingly enough, is also quite clearly romantic in its feeling, while Schonberg's is more austere and Webern's fancifully aphoristic. Around 1940, many composers like the former neoclassicist, Ernst Křenek (1900–), and the young Italian, Luigi Dallapiccola (1904–), began to use this system as did many others in most important musical centres. It also had an indirect influence on Bartók and on the Americans, Sessions and Wallingford Riegger (1885–1961).

A mature form of nationalism that aimed at expressing the national spirit of a country in music abstracted from its folk origins emerged in almost every country during these years. The outstanding exponents of this trend were: Bartók and Zoltán Kodály (1882–) in Hungary; Manuel de Falla (1876–1946) in Spain; Ralph Vaughan Williams (1872–1958) and Gustav Holst (1874–1934) in England; Bohuslav Martinu (1890–1959) in Czechoslovakia; Gian Francesco Malipiero (1882–) in Italy; Heitor Villa-Lobos (1887–1959) in Brazil; Carlos Chávez (1899–) and Silvestre Revueltas (1899–1940) in Mexico; and Roy Harris (1898–), Aaron Copland (1900–), Douglas Moore (1893–) and the independent experimenter, Charles Ives (1874–1954), in the United States. Since all of these and many more applied in some measure the principles of stylization mentioned above, their works present a most varied character.

For sensitivity to stylistic difference~had been very strongly developed as musicians came to know recordings of folk, primitive and oriental music, as well as pre-18th century music as it was occasionally performed under the supervision of musicologists intent on reviving the original music with its original style of interpretation. This expanded cultural and historical horizon, as was seen above, contributed new stylistic and aesthetic ideas to many 20th-century composers, some of whom, such as Bartók, Hindemith and Křenek, were musicologists themselves.

It is beyond the scope of this article to discuss in detail the psychological and sociological background of modern music. One characteristic feature deserves mention, however—the role of the societies which were formed in almost every occidental country to encourage and propagate the new music. Many composers took a determined stand against the banalities of the contemporary popular mass culture and relied on the understanding and support of such intelligent and progressive groups of musicians and music lovers to serve as intermediaries between them and the broad musical public. This reaction against the widespread public trend toward cultural uniformity (which in the musical world showed itself in the standardization of the repertoire) led many musicians to the cultivation of pronounced individuality of style. It also led them to uphold the integrity and dignity of modern art by assuming more meaningful attitudes toward artistic expression and toward contemporary life than were possible in popular entertainments or in the general run of concerts devoted to the repetition of familiar masterpieces. Hence modern music was often misunderstood by the general musical public, while the societies which supported modern music were able to distinguish its importance. The faith of these societies over the years was amply justified by the remarkable works which they brought to light and championed.

MUSIC, TEACHING OF. Music is concerned with three types of individuals—composers. performers and listeners. The basic training of all three is related, since none can function fully without an understanding of musical structure. Hence the teaching of music is essentially the development of musicianship—that is. the sum of individual aptitudes. insights and skills in respect to music. Musicianship consists of both intuitive and rational responses, and the teacher's responsibility is to develop the latter through all available means according to the student's individual needs and capabilities. Musicianship is based primarily upon a grasp of how composers use their materials, and hence the greatest teacher of music. either technically or aesthetically, is music itself. But, as Franz Joseph Hapdn said, "The educated ear is the sole authority," and this simple fact is the basis of the teaching of music in terms of musicianship.

Listening, as the primary type of musical activity, is transmuted into specific skills through singing, playing, analyzing, writing and creating music. These avenues of learning all have a common goal—musical insight, which is promoted by their integration. Specifically, this means that the student learns the structure of music through the simultaneous study of written and keyboard harmony, music reading. ear training, analysis and creative writing. All are of equal importance, and all contribute to "the educated ear." These, then, are the basic principles of the teaching of music: the development of musicianship through the study of music literature based upon aural perception and promoted through related and integrated skills. The teaching of these skills may be summarized thus:

Listening is a mental activity dependent only in a general sense on physical hearing. Hence "ear training" should be regarded as directed listening for all rather than as a separate skill for the select few. It may be either oral or written, and its precision will depend upon the maturity of the student and the end in view. The first aural reactions will be general in character: the recognition of register, tones of the tonic chord, consonance and dissonance. These generalities will gradually be refined to specific reactions: chord quality, inversions, form and rhythmic, melodic and harmonic complexities, paralleling the development of other skills. In general, the musical passages used should be presented as a unit, not as separate rhythmic, melodic or harmonic drills, even though each of these factors may be recognized individually. Three specialized types of dictation should be noted: (1) corrective listening—the recognition of differences between the music as printed and as performed when the instructor deliberately introduces alterations; (2) contrapuntal listening—notation of simple two-voice counterpoint; and (3) analytic listening—recognition and notation of formal design, using letters for various parts and arbitrary symbols for cadences.

Writing is one aspect of musical literacy and as such is an essential skill. In the beginning. notation is best learned directly from the analysis of familiar melodies, not as an isolated body of facts unrelated to musical experience. When the elements of notation are learned: the study of harmony is begun, and scale structure, key signatures, intervals and chords are explained as the need arises from the music examined. Four-part harmony is approached gradually through one-, two-, and three-voice writing and simple piano accompaniments. Chords are best taught in the order of their use in music literature rather than in the order of their structure; *i.e.,* triads! their inversions, seventh chords, etc. Musical usage implies the early introduction of nonchord tones and modulations. Figured bass assumes less importance, though its principles should be clearly understood. Counterpoint is studied stylistically through the vocal and instrumental idioms of Giovanni Pierluigi da Palestrina and Johann Sebastian Bach respectively. The traditional approach, strict or academic counterpoint, is less desirable, as its musical values occur unrestricted in Palestrina's style.

Keyboard Harmony makes abstract knowledge concrete. It includes melody harmonization, transposition, improvisation, modulation, score reading, harmonic reductions, keyboard dictation and playing by ear. From the beginning all students should have some keyboard experience, limited only by their technical facility. Two advanced specialized types of keyboard instruction should be noted: (1) the teaching of transposition through the use of movable clefs and (2) keyboard analysis of piano literature for interpretive purposes.

Music Reading, as the other aspect of musical literacy, is equally important. The immediate purpose of music reading or "sight singing" is dual: to read music silently and to reproduce it vocally. The training of the inner ear takes precedence, because vocal reproduction is the echo of the sound conceived mentally. Hearing precedes singing. All systems for developing a sense of pitch relationship are only means to that end and should be abandoned when it is achieved. The oldest system, solfeggio and its modification, tonic sol-fa, associated the first syllable of each line of a medieval hymn to John the Baptist with one of the six degrees of the Guidonian hexachord (*q.v.*). Its long use is due as much to tradition as to the success of the system. However, it is open to criticism on both psychological and pedagogical grounds. In America, three other systems are found: (1) the use of numbers or letters, or both, for scale pitches, (2) the development through rote singing and melodic analysis of a strong sense of tonality without the use of specific pitch names and (3) the supplementary use of a simple flutelike instrument to solve physical or psychological problems. Without evaluating these various methods, it is clear that they all are only teaching devices to aid in vocal discrimination. The whole problem of music reading is complex and includes many psychological and musical factors. The solution requires a thorough study similar to that done in the field of language. Certainly it is known that one of the essential principles is phrase-wise rather than note-wise reading, and, in general, emphasis on the musical rather than the technical elements involved.

Analysis is an understanding of the total organization of music. Its objective is the explanation of musical structure in such a way that insight results. It includes awareness of all harmonic, contrapuntal, formal and stylistic elements. In a sense, all musical activity is dependent upon either conscious or intuitive analysis, and for this reason it should permeate all levels of instruction. Even a child can understand, in his own terms, the organization of music that he performs. In harmonic analysis it is desirable to stress essential progressions rather than details; *e.g.*, chromatic embellishing chords or diatonic extensions, which can be fitted later into the general pattern. Contrapuntal analysis, especially of the baroque period, is of particular value to pianists, organists or choirmasters.

The analysis of form, or the sequence of musical ideas, is also essential for musicianship and yet is frequently neglected. The first principle of teaching form is to explain the structure in simple language understood by the student. Second, analysis must be applicable to the student's needs and relative to his experience. Third, it should be both aural and visual, though analysis by ear is a much more musical and realistic approach. Both can be combined by reading the music while listening to its performance.

Creative Writing is one of the best means for the promotion of musical insights. Creativity is universal and should be used from the outset according to individual capacity. Begin by setting short poems to music without accompaniment, or by writing free instrumental melodies, and parallel later study by composition in the small-song forms. Students, even with a meagre background, can express themselves acceptably when musical rather than technical problems are stressed. The objective is musical growth through doing, and this can be achieved on all levels.

These six skills, then, as the basis of musicianship, should be so taught as to meet the individual needs of composers, performers and listeners.

Trends.—At mid-20th century, some specific trends in music teaching were: (1) emphasis on musicianship as the goal, achieved through the study of musical literature. This implied a consideration of style as a factor of structure and consequently as a basis of judgment; *e.g.*, the different attitude toward parallel fifths in various periods. Another implication was the stress on musical rather than technical values, the recognition of general principles rather than of specific rules. Thus, if the trained ear was to be the only arbiter, a passage could not be poor musically but correct theoretically. This involved the question of taste—also an essential element of musicianship. (2) Use and integration of all avenues of learning discussed above, rather than the traditional emphasis on reading and writing. This meant that ear training, keyboard harmony, analysis and creative writing were also treated as integral and integrative factors in the development of musicianship.

General trends in the teaching of music were: (1) belief in the social and democratic values of music, and of its vital role in the well-rounded curriculum at all levels of instruction, as shown by the expanding instrumental and vocal programs in primary and secondary schools, and colleges. (2) Use of audiovisual aids enlarged and improved tremendously the techniques of both group and individual study through the use of radio, records and scores for the exploration of musical literature in accordance with the principles outlined above. (3) Growth of the adult education movement increased both the number and type of music students. Instruction of these amateur groups emphasized the cultural rather than the technical aspects of music, unless the latter were required for individual needs. (4) Remarkable development of musicology, especially in America, where outstanding European authorities had settled from 1914 onward, thereby stimulating its study.

UNITED STATES

Music received slight attention in the days of the American colonists. For the improvement of church music, manuals of instruction in singing were prepared early in the 18th century by two Massachusetts ministers, the Rev. John Tufts and the Rev. Thomas Walter. These books and their successors provided the text material for the "singing schools" and "musical conventions" which for years represented the chief activity in music study.

The first well-organized effort to provide a more complete musical education was the Boston Academy of Music founded by Lowell Mason in 1833. The first college recognition of music was the engagement of an instructor of music at Oberlin college, Oberlin, O., in 1838. From about 1840 a considerable number of Americans went abroad to study music, chiefly in Germany. These pioneers, home again and reinforced by many foreigners, were leaders in the marked advance of their profession, especially after the Civil War. The first comprehensive music schools were the Oberlin conservatory (1865), which in 1867 became the first college music department, and the New England conservatory (Boston, Mass., 1867). Then followed the Cincinnati conservatory (Cincinnati, O., 1867), Chicago Musical college (Chicago, Ill., 1867), Peabody conservatory (Baltimore, Md., 1868), College of Music in Cincinnati (1878), American conservatory (Chicago, Ill., 1886) and many others.

Reporting in 1908 on a study of such schools and departments of music, the bureau of education declared that their widely varying curricula in many instances were so much given to the vocational aspects of music that music was separated from general educational thought. Data in Randall Thompson's College *Music* (1935) were indicative, however, of academically well-based curricula, though varied in extent and other respects, at Oberlin by 1865, Harvard by 1870, and Smith, Vassar, Wellesley, Yale, Columbia and the Universities of Michigan and Oregon between then and the turn of the century. The Music Teachers National association (1876), comprised of teachers and, later, composers, conductors, musicologists, editors, critics, music librarians and publishers, became increasingly a disseminator of broadly educational ideas as to music teaching. Also directly effective in the improvement of many music schools and departments was the National Association of Schools of Music, founded in 1924 to develop uniform standards for granting degrees and other credentials. Efforts were made in some states to set standards for the work of private music teachers, but with only partial success.

Four music schools with large endowments became especially competent to give the highest professional training, often through scholarships. The oldest, the Institute of Musical Art of New York, was founded in 1904 and in 1926 became affiliated with the Juilliard School of Music as its undergraduate school. The large bequest of Augustus D. Juilliard (1919) for musical education led to founding in 1924 of the above-named graduate school for students of unusual talent. The Eastman School of Music (1919), a department of the University of Rochester (N.Y.), was endowed with $12,000,000 by George Eastman, and the Curtis Institute of Music in Philadelphia (Pa., 1924) with more than $12,000,000 by Mrs. Edward W. Bok. Sharing the Boston Symphony orchestra's ideal setting at Tanglewood was the Berkshire Music centre, established by Serge Koussevitzky in 1940 in connection with the Berkshire festivals. Two classes of students were admitted to this great summer centre: those capable of profiting by the best professional training for careers as orchestra or solo players, singers, conductors or composers; and "students, teachers and others . . . seeking to enrich their capacities for lifelong enjoyment." Tanglewood was given to the orchestra in 1936 by Mrs. Andrew H. Hepburn and Mary A. Tappan. A bounty of another kind was the settling in the United States of many more of the world's finest musicians and teachers shortly before and during the period of World War II.

Public school music education in the United States began with Lowell Mason's work in the Boston public schools in 1837, an example followed promptly in Buffalo, N.Y., Pittsburgh, Pa., Louisville, Ky., Cincinnati, O., San Francisco, Calif., and other communities. The Music Educators National conference was founded in 1907 by school music supervisors. Largely through that organization, with its affiliated regional, state and local associations, research council, active committees on every phase of the work, and its journal and other publications, the teaching of music in schools had by the mid-century become almost everywhere a cherished indispensable. The brief summer schools for music teachers of the early days were succeeded by special four-year curricula and graduate courses at state and other universities and some conservatories. There were still many school systems with very little or poor music instruction, some with none, but many high schools had developed excellent performing groups and music courses, while guided listening, rhythmics, class instrumental instruction and playing groups as well as singing had become common in elementary schools. Two of the greatest events for music teachers in the first half of the 20th century were the amazingly good performance of the *Eroica* symphony by a large national high school orchestra at the Music Educators National conference in Detroit, Mich., in 1926 and the superb performance of great music by a Flint (Mich.) high school *a cappella* choir at the Chicago meeting of that conference in 1928. The challenge of these revelations was felt throughout the nation.

The first music textbooks, by Lowell Mason (1841) and Charles Aiken (about 1850), were for grammar grades and high school and were derived from those of the "singing schools." The *National Music Course* (Luther W. Mason, 1870) was the first to provide distinctively for all grades. It was used widely in the U.S., and a translation published in Leipzig was used in German schools; but by 1880 its abundance of songs and the teaching of music reading mainly through them came under suspicion of not helping directly enough toward mastery of the printed page. Moreover, where accepted as a regular part of school work, music had now to prove not its appeal and human value, but that it could be taught efficiently by the grade teacher. The *Normal Music Course* (1883) gave answer in a relentlessly logical succession of exercises and songs. This won many adherents, but its use gradually revealed that mastery of details of scale and rhythm, won apart from music, was of little use in reading music. By mid-20th century 16 other complete music courses had been published and widely adopted, all using the song approach to musical learning, but many with large quantities of inane songs. The trend, however, was toward using many folk songs and other vital music and toward greater dependence, as to method, on the musicalness, judgment and skill of the teacher.

MUSICAL-BOX. The modern musical-box is an elaboration of the elegant toy musical snuffbox in vogue during the 18th century. The notes or musical sounds are produced by the vibration of steel teeth or springs cut in a comb or flat plate of steel, reinforced by the harmonics generated in the solid steel back of the comb. The teeth are acted upon and musical vibrations produced by the revolution of a brass cylinder studded with projecting pins, which, as they move round, raise and release the proper teeth at due intervals according to the nature of the music. The revolving motion of the cylinder is effected by a spring and clockwork, and the rate is governed by a fly regulator.

MUSICAL COMEDY. Until the end of the 19th century, the term musical comedy was one of many used to describe any stage piece of a comic nature to which music was either integral or incidental. By the second part of the 20th century, the term defined a particular form of dramatic and musical entertainment which had virtually taken the lead in modern theatre forms. Within the loose usage of the previous century, an *opera buffa* such as Mozart's *Le Nozze di Figaro* could be called a musical comedy; at the opposite extreme, the term was also applied to the popular U.S. farces staged by Edward Harrigan and Tony Hart in the late 19th and early 20th century, on the strength of their interpolated songs and ballads. A specific application of the term to a genre of stage piece in which popular songs. dances and production ensembles are festooned upon a farcical plot was first made in the early 1890s by George Edwardes, manager of the Gaiety theatre in London, who called his production of *A Gaiety Girl* musical comedy to distinguish it from his previous burlesques. These musical comedies were brought from the Gaiety to the United States. where they formed the basis for the entertainment that has since persisted.

Musical comedy, as it bad been known in 20th-century U.S. and English theatres, differs from comic opera and operettas in that it adheres to a more vernacular style in its music, dances, lyrics and dialogues. It differs from variety or vaudeville—to which it is indebted for many of its elements of song, dance and humour—in its possession of a plot, however minimal, and also as a rule in the elaborateness of its physical production. It differs from the revue largely in its use of a plot; the mainstays of that medium—satire. parody and topical thrusts—are also used in musical comedy. U.S. musical comedy, as it came into being just before the beginning of the 20th century, developed through a fusion of the elements of six earlier types of musical entertainment—extravaganza, pantomime, variety. burlesque, farce-comedy (in the special sense the term acquired in the 1870s) and European comic opera. The extravaganza (in France, the *féerie*) was originally an imaginative spectacle leaning upon the devices of ballet; *The Black Crook* by Charles M. Barres (1866) was a celebrated example in the United States.

After French romantic ballet dropped out of favour, almost any spectacular piece using elaborate machinery for the production of illusions was called extravaganza. Pantomime, still popular in England, was a short-lived importation in the U.S., disappearing in the 1870s. Variety served as a proving ground for performers who later graduated into musical comedy; many songs and dance routines (including those from blackface minstrel shows) became the stock in trade of musical comedy.

Burlesque, still true to its name, was taken to the United States in 1868 by Lydia Thompson of London and was given a homely U.S. showing by Edward E. Rice in *Evangeline* (1874). Among the distinguishing marks of burlesque in the 19th century were its girls in tights, playing so-called male roles, its comedians with baggy pants and red noses and its coarse humour. Farce-comedy derived from the work of the Roman comic dramatist Plautus, with its metric recitations accompanied by the flute (*tibia*), became in the middle of the 1870s, a vernacular form of entertainment popular in England. The Vokes family of England and an American troupe called Salsbury's Troubadours introduced the notion of hanging variety specialties upon a slender thread of plot. These shows stood in contrast to English and Viennese comic opera and Offenbach's French *opéra bouffe*, which at best constituted a more aristocratic form produced by better craftsmen.

Borrowing from all these sources and adding a native drive and ingenuity, U.S. musical comedy began to develop. In the second decade of the 20th century, ballroom dancing and the ragtime of Irving Berlin moved musical comedy out of the world of imaginary Balkan principalities into the present. As the impact of the new continental inventions in staging, led by Max Reinhardt and Josef Urban, invaded the theatre, the artistic level of musical comedy rose considerably.

In the depression years of the 1930s, political satire *per se* appeared; *Of Thee I Sing* by George S. Kaufman, Morrie Ryskind and Ira and George Gershwin, became the first piece of this kind to win the Pulitzer prize (1931). In the late 1930s and early 1940s such choreographers as George Balanchine and Agnes De Mille won for the dance a serious participation in the story telling of the musical comedy form. Music and the lyric theatre took on more importance; the combined efforts of score, scenery, ballet, costumes and play were taken seriously.

From a series of "intimate" musical comedies initiated by Jerome Kern, Guy Bolton and P. G. Wodehouse with *Very Good, Eddie* (at the Princess theatre in New York in 1915), the musical theatre gradually took on believable plot construction and characterization which grew into such dramatically superior works as *Lady in the Dark* by Moss Hart and Kurt Weill (1941) and *South Pacific* by Richard Rodgers and Oscar Hammerstein II (1949). As the musical field was enriched by such serious and even tragic "musical plays" as Gian-Carlo Menotti's *The Consul* (1950) and *The Saint of Bleecker Street* (1954), a change took place in more popular entertainment. The use of plays by such dramatic authors as Eugene O'Neill, Sidney Howard and George Bernard Shaw became great popular successes in musical comedy form, as *New Girl in Town* by George Abbott and Bob Merrill (1954), *Most Happy Fella* by Frank Loesser (1955) and My *Fair Lady* by Alan Jay Lerner and Frederick Loewe (1955). (R. N. LE.)

MUSICAL INSTRUMENTS, a general term used to designate instruments used for producing sound. The sound produced is generally that of musical notes with definite pitch. Each note (though there are exceptions, such as the pure tone of single frequency produced by a tuning fork and the primary tones of electronic musical instruments) normally consists of a complex of harmonic frequencies or overtones, varying in their number and relative strength according to the type of instrument and the intensity with which it is sounded. The sound is analyzed by the ear and so recognized as a musical note having the tone-quality characteristic of the instrument in question. By attentive listening it is often possible to distinguish several of the overtones individually—especially in notes of deep pitch—while scientific examination, *e.g.*, by oscilloscope and mathematical analysis of the wave-form shown thereon, makes possible a precise graphic demonstration of the "tonal spectra" of different notes throughout an instrument's range. With some musical instruments, such as bells and tuned drums, in which the sound-producing vibration is complex compared with that of the stretched string of stringed instruments and the air column of wind instruments, the pitch of a note may be less easy to perceive owing to the presence in it of inharmonic or dissonant frequencies. With others no definite pitch is perceived, the sound being that of a clash, knock or rustle of wholly dissonant constitution and employed to mark rhythms or points of musical structure. Occasionally the primary purpose of such an instrument may be nonmusical; *e.g.*, a pair of spoons, which exemplifies an improvised musical instrument. Also, the purpose of the sound of an instrument may be nonmusical in the strict sense, as when it is employed for signaling, *e g.*, many whistles, or in ritual without musical context. Sound-producing instruments with such nonmusical purposes are so closely linked both typologically and genealogically with those used in music-making that all are included under the one conventional term, musical instruments. Their historical and ethnological study is called organology.

Chronological Evolution of Instruments.— The chronology of Curt Sachs *(Geist und Werden der Musikinstrumente,* 1929) is the foundation of modern study. The earliest instruments were used for marking rhythm. Initially a dancer beat his body, stamped and clapped; then a piece of wood, sometimes placed over a hollow in the ground, was used to amplify the sound of stamping, while sticks, spears or boomerangs were clashed, and strings of rattles were worn on the body to give sound to otherwise silent rhythmic movements. Familiar survivors of this stage of development in the western world include the jingle bells worn on the legs of morris dancers and the rumba claves (rhythm sticks). In the next stage, still a very early one, appeared many primitive instruments which show magic connotations, by which the sounds produced from natural substances by the hand or breath of man are used for communication with the spirit world in rites of every kind. These include seed-gourd rattles; scrapers, in which the sound is produced from a serrated or corrugated surface; the bull-roarer, a piece of wood whirled on a cord to spin and thereby produce a roaring vibration of the free air; and whistles made from bones. Excavations of Magdalenian sites in Europe (representing a final stage of Upper Paleolithic culture) have yielded archaeological examples of all the last three. Many simple instruments still keep their ritual use in European folklore, as, for example, willow whistles, horns, pottery flutes, and rattles and knockers sounded at various feasts of the year; the ratchet rattle swung at football matches may be placed on the fringe of these. Others have lost such associations and may be regarded as purely rhythmic instruments, as, for instance. the rumba maracas (gourd rattle) and guiro (scraper), or have degenerated into signaling instruments or toys.

A little later than the early rattles and flutes are the first "trumpets," as, for instance, conch shells, and hollow branches, such as the Australian dijeridoo. Their most primitive use is simply as voice disguisers in the utterance of spells and commands; the trumpet at this stage is not actually a true sound producer but a "pseudo musical instrument," like a kazoo or a megaphone. The first drums are placed by Sachs among the early Neolithic strata (though "friction drums," from which a roaring sound is produced by rubbing a stick or cord attached to the centre of the drum-skin, are later; the Spanish *zambomba* is a well-known surviving European species). At this stage, too, appear various instruments on which two or more contrasted pitches are deliberately obtained, like the "slit drum." a log partially hollowed out through a slit-like incision, the two edges of which give different pitches when struck (whereby in West Africa speech-tone patterns are reproduced and messages transmitted); kindred forms include the orchestral wood block. which gives but one sound, and the "temple blocks" (Chinese "wooden fish"), each sounding a different pitch. "Stamping tubes" are large bamboos pounded on a log and often tuned to chosen notes. Neolithic flutes, generally of cane, may give several notes. either as natural harmonics, or through finger-holes, or by being combined as Panpipes.

By this stage primitive stringed instruments had appeared, notably the widespread "musical bow." which may be either an ordinary hunting bow or one specially constructed; among its playing techniques, one is to hold one end of the bow to the mouth and, by altering the mouth cavity so that it acts as a selective resonator, to make melodies from the string's natural harmonics, tapping the string with a stick. The same acoustic principle is employed in playing the Jew's harp, widely distributed as a primitive instrument with a vibrating tongue of bamboo, though in Europe of metal; the melody of the mouth-resonated harmonics has to be listened for above the noisier droning of the deep-pitched fundamental frequency. In another instrument of Neolithic cultures, a slither of bark is separated from a bamboo stem except at the ends, and raised from the stem by bridges to provide a "string"; several such canes may be placed beside each other. or several "strings" may be cut in one thick bamboo, *e.g.*, the *valiha* of Madagascar, making various types of primitive zither. Generally, the greater the tuneful and tunable possibilities of a primitive instrument, the smaller are its ritualistic connotations, and primitive stringed instruments, also xylophones (which occur first among higher Neolithic cultures) and the African metal-tongued *sansa,* are played mainly for their music in recreation and entertainment rather than at rituals.

The native civilizations of America developed no stringed instruments, relying upon rattles, drums, flutes and trumpets (notably conches). In the ancient civilizations of the middle east, on the other hand, stringed instruments had risen very early to that leading position in music which they have since maintained in high civilization. Most modern authorities postulate the musical bow as progenitor of the arcuate (bow-shaped) harp (c. 3000 B.C.) and long-necked lute (*c.* 2000 B.C.). The middle east also knew clappers, sistra (metal rattles), drums, flutes (mainly pastoral), aulos (reed pipe) and cymbals and metal trumpets. Many of these are mentioned in the Old Testament, though some of their names in the Authorized (King James) Version are misleading: the "harp" was actually a lyre and the "psaltery" was a harp. Just before the Christian era, the organ, the first keyboard instrument, was invented, it is believed, in Alexandria. At the other end of the old world, ancient China, provided with drums, many other percussion instruments and flutes, developed its first stringed instruments from the primitive zither; the Japanese koto is their best-known modern descendant. Among wind instruments, China evolved the free-reed mouth organ, a parent of the harmonica (*q.v.*). In early medieval Europe a notable development, possibly from central Asia, was the fiddle, allowing the production of a sustained sound on a stringed instrument by bowing.

For details of ancient and modern western instruments, *see* ORCHESTRA; PERCUSSION INSTRUMENTS; STRINGED MUSICAL INSTRUMENTS; WIND INSTRUMENTS; ELECTRONIC MUSICAL INSTRUMENTS; and articles on individual instruments. *See* also AFRICAN MUSIC; CHINESE MUSIC; JAPANESE MUSIC.

Classification of Instruments.— Musical instruments do not fall naturally into any single comprehensive taxonomic scheme, and their many physical cross-relationships make it very difficult to devise a useful classification consistently based upon straightforward criteria. Yet some scheme is required, and for the broad study of instruments (from over the entire world and back into prehistory) the familiar grouping of strings, wind and percussion has been superseded by a scheme introduced by V. C. Mahillon in 1888 (though Indian music had long observed its essence) by which instruments are grouped primarily according to the nature of the material which is regarded as producing the sound in the first instance. Hence percussion instruments are divided into (I) idiophones, in which sound is produced from hard substances not previously stretched in any way (bells, cymbals, xylophones, etc.); and (II) membranophones, producing sound from a stretched skin (drums). Stringed instruments are termed (III) chordophones. Wind instruments come under (IV) aerophones, and it will be noted that the definition does not specify blowing; it requires that the sound be regarded as being produced in the first place from a vibrating mass of air. (A fifth group, electrophones, may be appended to include instruments in which sound is produced electronically.) In the main groups, the acoustic chain of events, as seen by the scheme, may be illustrated by a few examples, as is shown in Table I.

TABLE I.—*Stages in the Acoustic Chain of Events*

Instrument	A	B	C	D
Gong	Arm movement	Impact of stick	Vibration of *metal*	—
Violin	Arm movement	Impulses from resined horse-hair bow	Vibration of *string*	Resonation by air contained in body of instrument
Clarinet	Breath stream	Impulses from pressure changes at vibrating reed	Vibration of *air column*	—

It must be stressed that the only object in thus equating the events which take place in such entirely different acoustical systems as these is to establish a basis for classification. Even so, there are a number of "borderline" cases, especially between idiophones and aerophones, *e.g.,* the free-reed instruments, and the plucked reeds (Jew's harp, musical box, sansa), and authorities still disagree about where these should be placed in the scheme. A. Schaefiner's discussion of such cases is of special value (see *Bibliography*). For defining subdivisions within the main groups, the sound-generating actions are referred to (*see* columns A, B, Table I), except that with stringed instruments this leads to so distorted a picture in terms of musical practice and history, that arrangement according to structure is preferable. The examples cited in the following table are chosen from past and present western music, except for certain primitive types and unique oriental types.

TABLE II.—*Classification of Certain Instruments*

I. Idiophones

Method	Wood or other organic material	Metal or other inorganic material
Struck	Percussion boards, xylophone	Triangle, glockenspiel, vibraphone, celesta
	Stamping tubes, slit drum	Tubular bells, gongs, steel drums, bells
Struck together	Rhythm sticks, castanets	Cymbals
Shaken	Rattles	Jingle bells, sistrum
Scraped	Guiro, ratchet rattle	Washboard
Rubbed	New Ireland "rubbed wood"	Glass harmonica
Plucked	Primitive versions of the Jew's harp	Jew's harp, African sansa, musical box

II. Membranophones

Struck	Drums: bowl drums—pottery drums, timpani; *tubular drums*—side bass, tabor, bongos; *frame drums*—tambourine;
	"Roller" (a leather cylinder, China)
Shaken	Rattle-drum (Tibet)
Rubbed	Friction drums
Plucked	Indian gobi-yantra drone

III. Chordophones

Ground harps (rattan rope)	Beaten
Musical bows	Plucked, beaten, or, in Hottentot *gura,* blown
Zithers (strings run from end to end of resonator)	Open-string: plucked—psaltery, harpsichord; beaten—dulcimer, pianoforte; wind-blown—aeolian harp
	Stopped-string: plucked—Austrian zither, mountain dulcimer; bowed—bowed zither.
Lyres (strings run over resonator to crossbar)	Plucked—ancient and African lyres; bowed—Welsh crowd
Lutes (strings run over resonator and along "neck" where they may be stopped)	Plucked—lute, guitar, cittern; bowed—violin, viol, tromba marina; bowed by wheel—hurdy-gurdy
Harps (strings leave resonator at angle in plane vertical to soundboard)	Plucked—arcuate or angular *frame:* ancient and non-western harps; triangular *frame:* western harps; with neck and bridge: African harp-lute

IV. Aerophones

Flutes (no mechanical vibrator)	*Artificial air-slit:* (tubular) whistles flageolets, recorder; (globular) bird whistles, ocarina
	Lip-formed air-slit: (tubular) side-blown—transverse flutes; end-blown—*kaval,* Panpipes, notched flute; (globular) gourd flutes
Trumpets (vibrating lips, coupled to air column)	Conch, animal horn, tusk, wood (alpenhorn): end-blown or side-blown; with finger holes—cornet, serpent
	Metal: mainly cylindrical bore—trumpet (natural, keyed, valved), trombone (slide, valved); *narrow-taper* bore—French horn, posthorn, cornet; *wide-taper* bore—bugle, ophicleide (keyed), Flugelhorn, alto and tenor horns. tubas (valved)
Reed instruments (vibrating reed coupled to air column)	Cylindrical bore: (single reed) reed pipes, clarinet; (double reed) anlos, crumhorn, rackett; (free reed) free-reed pipe of southeast Asia
	Taper bore: (single reed) saxophone, tarogato; (double reed) shawm, oboe, bassoon
Free aerophones	Without reed—bull-roarer, siren; band-reed—grass squeakers; free *reed*—bark or fish scale placed in mouth, mouth organs, accordion, toy trumpets

Concerning classification *see* E. von Hornbostel and C. Sachs, "Systematik der Musik instrumente," in Z. *Ethn.,* xlvi, p. 553 (a full expansion of Mahillon's scheme) (1914); André Schaeffner, *Origine des instruments de musique,* p. 371, also especially p. 225 ff. (1936); Jaap Kunst, *Ethnomusicology,* 3rd ed., p. 55 (a review of the whole subject) (1959). (A. C. BA.)

MUSICAL NOTATION, a graphic method of representing sounds to the ear through the medium of the eye. It is probable that the earliest attempts at notation were made by the Hindus and Chinese, from whom the principle was transferred to Greece. The exact nature of the Greek notation is a subject of dispute, different explanations assigning 1680, 1620, 990, or 138 signs to their alphabetical method of delineation. To Anicus Manlius Severinus Boethius we owe the certainty that the Greek notation was not adopted by the Latins, although it is not certain whether he was the first to apply the 15 letters of the Roman alphabet to the scale of sounds included within the two octaves, or whether he was only the first to make record of that application.

Indications of a scheme of notation based, not on the alphabet, but on the use of dashes, hooks, curves, dots and strokes are found to exist as early as the 6th century, while specimens in illustration of this different method do not appear until the 8th. The origin of these signs, known as neumes (*q.v.*) (*νεύματα*, or nods) is the full stop (*punctus*), the comma (virga), and the mound or undulating line (*clivus*), the first indicating a short sound, the second a long sound, and the third a group of two notes. The musical intervals were suggested by the distance of these signs from the words of the text. The variety of neumes employed at different times, and the fluctuations due to handwriting, have made them extremely difficult to decipher. In the 10th century a marked advance is shown by the use of a red line traced horizontally above the text to give the singer a fixed note (F = fa), thus helping him to approximate the intervals. To this was added a second line in yellow (for C = ut), and finally a staff arose from the further addition of two black lines over these.

A variety of experiments resulted in the assignment of the four-lined staff to sacred music and of the five-lined staff to secular music. The yellow and red colours were replaced by the use of the letters F and C (fa and ut) on the lines. This use of letters to indicate clef is forestalled in a manuscript of Guido of Arezzo's Micrologus, dating from the 12th century, in which is the famous hymn to St. John, printed with neumes on a staff of three lines (see GUIDO OF AREZZO and HEXACHORD). The use of letters for indicating clefs has survived to the present day, our clef signatures being modified forms of the letters C, F and G, which have passed through a multitude of shapes.

Before the 12th century there is no trace of a measured notation; *i.e.*, of a numerical time division separating the component parts of a piece of music. It was at the time of Franco of Cologne that measured music took its rise, together with the black notation in place of neumes, which disappeared altogether by the end of the 14th century. In the black notation, which led to the modern system, the square note with a tail (▜) is the long sound; the square note without a tail (■) is the breve; and the lozenge shape (♦) is the semibreve. In a later development there were added the double long ▀▌ and the minim (♦). The breve, according to Franco of Cologne, was the unit of measure.

The development of a fixed time division was further continued by Philippe de Vitry. It has been noted with well-founded astonishment that at this period double time (*i.e.*, two to the bar) was unknown, but only triple time which was regarded as "perfect"— "because it hath its name from the Blessed Trinity which is pure and true perfection." Vitry championed the rights of imperfect time and invented signs to distinguish the two. The perfect circle O represented the perfect or triple time; the half circle C the imperfect or double-time. This C has survived in modern notation to indicate four-time, which is twice double-time; when crossed ¢ it means double-time. The method of dividing into perfect and imperfect was described as prolation. The addition of a point to the circle or semicircle (⊙ ⋶) indicated major prolation; its absence, minor prolation. The substitution of white for black notation began with the first year of the 14th century and was fully established in the 15th century.

It has already been shown how the earlier form of alphabetical notation was gradually superseded by one based on the attempt to represent the relative height and depth of sounds graphically. The alphabetical nomenclature, however, became inextricably associated with the graphic system. The two conceptions reinforced each other; and from the hexachordal scale, endowed with the solmization of ut, re, mi, fa, sol, la—which was a device for identifying notes by their names when talked of, rather than by their positions when seen on a page of music—arose the use of what are now known as accidentals (*q.v.*).

Of these it may here be said that the flat had originated from the necessity of sinking the B of the scale in order to form a hexachord on the note F in such a way as to cause the semitone to fall in the right place—which in the case of all hexachords was between the third and fourth notes. This softened B was written in a rounded form thus: ♭ (rotundurn), while the original B remained square thus: ♮ (*quadrum*). The original conception of the sharp was to cross or lattice the square B, by which it was shown that it was neither to be softened nor to remain unchanged. The flat, which originated in the 10th century, appears to have been of far earlier date than the sharp, the invention of which has been ascribed to Josquin Des Près (1450–1521). The B-sharp was called B cancellaturn, the cross being formed thus ✕.

The use of key signatures constructed out of these signs of sharp and flat was of comparatively late introduction. The key signature states at the beginning of a piece of music the sharps and flats which it contains within the scale in which it is written. It is a device to avoid repeating the sign of sharp and flat with every fresh occasion of their occurring. The double ♭♭ and the double sharp χ are conventions of a much later date, called into existence by the demands of modern music, while the sign of the natural (♮) is the outcome of the original B quadration or square B♮. See TONIC SOL-FA; see also references under "Musical Notation" in the Index volume.

MUSICAL SOCIETIES AND INSTITUTIONS. Medieval and Renaissance Societies.—Societies in Europe formed to promote the performance of music consisted originally of performers with common secular or religious ideals. Among the most ancient associations for the performance of secular music were the Welsh Eisteddfod (*q.v.*), the French guilds of troubadours of about the 11th century (which organized competitions called the Puy) and the German guilds of Meistersinger (*q.v.*) which flourished from the 14th to the 16th centuries. Medieval associations for the performance of sacred music were the Compagnia de Gonfalone (Rome, 1264) and the Confrérie de la Passion (Paris, 1402). In the Renaissance, academies were founded in Italy and later in France for the encouragement of music and poetry. The principal Italian academies associated with music were in Florence, founded by Lorenzo the Magnificent in 1480, Venice (Accademia Pellegrina, 1550) and Bologna (Accademia dei Filomusi, 1615).

The Camerata (Florence, 1594) led to the production in 1597 of O. Rinuccini's Dafne, a music-drama on the lines of Greek tragedy with music by J. Peri and J. Corsi, and to the establishment in Italy of opera (*q.v.*). The chief French institutions of this kind were the Académie de poésie et de musique, founded by J. A. Baïf in 1570, associated with secular music, and the Académie de Musique (1671) associated with opera. In London opera was promoted by the Royal Academy of Music (1720), not to be confused with the institution of this name founded in 1822.

Early Concert Societies.—In the 17th and 18th centuries the institution of the Collegium Musicum, deriving from an earlier institution, the Convivia Musica, was associated with universities in Germany and Switzerland. Its purpose was to organize public concerts (see CONCERT). The Collegium Musicum at Prague dates from before 1616, and the Gesellschaft auf dem Musiksaal was founded at Ziirich in 1613. G. P. Telemann was associated with the Collegium Musicum at Hamburg at the beginning of the 18th century, and other towns where there were such institutions were Halle, Berlin and Leipzig. Early concert societies in London were the Academy of Ancient Music (1710), the Castle society (1724), the Catch club (1761), the Anacreontic society (1766), the Concerts of Ancient Music (1776, later known as the King's concerts), the Professional concerts (1783) and the Caecilia society (1785). The Edinburgh Musical society was founded about 1725.

In Paris the most important 18th-century concert-giving society was Le Concert Spirituel founded by A. D. Philidor in 1725 for the performance of sacred works, later enlarging its scope to include secular works. Its rival, the Concerts des amateurs, was founded in 1770. In Vienna the Tonkiinstler-Societat (1771, renamed in 1862 the Haydn-Verein) was the main concert organization. Developing the activities of the Collegium Musicum, the Gemandhauskonzerte were founded at Leipzig in 1781. Choral music was fostered at Berlin by the foundation of the Singakademie (1791). Other concert societies were founded at Copenhagen (1744), Bergen (1765), Stockholm (1771) and at Åbo, Finland (1790). In the United States the St. Cecilia society was founded at Charleston, S.C. (1762) and the Musical society at Stoughton, Mass. (1786).

19th-Century Concert Societies — The Museums-Gesellschaft was founded at Frankfurt in 1808, the Musikakademie in Munich (1811) and the Philharmonische-Gesellschaft in Berlin (1826). The Gesellschaft der Musikfreunde was founded in Vienna in 1812 and led to the establishment there of the conservatory in 1821. The Singakademie was founded in Vienna in 1858.

In Paris the main concert organizations were the Société des Concerts du Conservatoire (1828), the Société Sainte-Cécile (1849), the Société Philharmonique founded by Berlioz (1850) and the Société des jeunes artistes du Conservatoire (1851). In London the Philharmonic society (1813, from 1912 the Royal Philharmonic society) was the principal concert organization, followed by the New Philharmonic society (1852) and the Halle society in Manchester (1857). The amateur choirs that sprang up in England brought the formation of the Sacred Harmonic society (1832), the Choral Harmonists' society (1833), the Royal Choral society (1871) and the Bach choir (1875). In Italy the Società Musicale Romana and the Societi Orchestrale Romana (both 1874) were followed by the Societi dei Concerti (Turin, 1877).

In the United States the Handel and Haydn society (Boston, 1815) gave early performances of choral music. In instrumental music the Philharmonic Society of New York (1842) was the leading institution. The Oratorio Society of New York was founded in 1873, and the New York Symphony society in 1878. Other concert societies were formed at Stockholm (1820), Amsterdam (1829), Copenhagen (1836), Prague (1862), Brussels (1865), Oslo (1871) and St. Petersburg (1873). In Australia the Royal Sydney Philharmonic society was founded in 1850. Many of these societies, which greatly developed with the wider interest in instrumental music, flourished into the 20th century, and similar societies were established in provincial towns.

Schools and Academies. — With the growth of concert music, schools, hitherto private or ecclesiastical institutions, were established for the public in the principal centres. In London the Royal Academy of Music was founded in 1822, the Trinity College of Music in 1872, the National Training School of Music in 1873 (becoming in 1883 the Royal College of Music) and the Guildhall School of Music in 1880. The Royal Irish Academy of Music was founded in 1848 and the Royal Scottish Academy of Music in 1885. The Metropolitan College of Music was founded in New York (1887, becoming in 1900 the American Institute of Applied Music). The Canadian Academy of Music was founded in Toronto in 1911. Taking the name, conservatory (*q.v.*) from the French school founded in Paris (1795), the Boston Conservatory of Music was founded in 1867 and the Elder Conservatory in Adelaide, Aust., in 1898.

Historical Societies. — About the middle of the 19th century scholars began to publish editions of earlier composers and societies were formed to study and perform the work of particular composers. In England the Handel society was formed in 1843, the Bach society in 1849, and the Purcell society in 1876. In Germany the Mozartstiftung was founded at Frankfurt in 1838, becoming in 1951 the Deutsche Mozart-Gesellschaft. The Bach-Gesellschaft was founded in 1850, the Handel-Gesellschaft in 1856, and other societies in Germany and Austria were formed to study the works of Wagner (1883), Beethoven (1889) and Brahms (1904). The Société Frederic Chopin was formed in Paris (1911) and the Beethoven association in New York (1918).

National and International Societies. — The rise of musical nationalism about the middle of the 19th century led to societies that promoted the performance of national music such as the Russian Music society (St. Petersburg, 1859), the Société Nationale de Musique (Paris, 1871), followed by the Société Independante (1909), the British Music society (1918) and the Society for the Publication of American Music (1919). Later, international societies were formed to deal with scientific, economic, social and religious problems connected with music. The main international societies devoted to musicological research were the Internationale Musikgesellschaft (Leipzig, 1899) and the Internationale Gesellschaft für Musikwissenschaft (Basel, 1927). In 1926 The Confédération Internationale d'auteurs et compositeurs was established in Paris to protect authors' and composers' copyrights. The Performing Rights society in England and the American Society of Composers, Authors and Publishers (ASCAP) in the U.S. are among the many national organizations affiliated to it. The International Society for Contemporary Music was founded in 1922, the Société Internationale des amis de la musique française (1928), the International Folk Music council in 1947 and the International Council for Music, organized by UNESCO, in 1949. The Fédération Internationale des Jeunesses Musicales (1947) co-ordinated the activities of educational concerts, and an international society for music education was founded in Brussels (1953). The Association internationale des Bibliothèques musicales (1951) began the publication of an international index of source materials. An international society for the promotion of Catholic church music was founded at Frankfurt in 1929.

20th-Century Societies. — The mechanical reproduction of music by phonograph and radio, as well as educational and aesthetic matters, were among the main concerns in the first half of the 20th century of both amateur and professional bodies. Among 20th-century societies devoted to the wider diffusion of music in England were the National Federation of Gramophone societies (1936), the Committee for the Promotion of New Music (1943), the Exploratory Concert society (1947) and the National Federation of Music societies (1935), founded with the support of the professional musicians' organization, the Incorporated Society of Musicians (1882). Interest in older music was encouraged by the Plainsong and Medieval Music society (1888), the Chamber Music association (1934), the Society of Recorder Players (1937), the Renaissance society (1944) and the Viola da Gamba society (1948). The English Folk Dance society (1911, becoming in 1932 the English Folk Dance and Song society), the Society for the Advancement of Musical Education (1935), the Workers' Music association (1936) and the Society of Young Musicians (1936) were devoted to the broad popularization of music. Musicological research was published by the Royal Musical association (1874) and research on old instruments was promoted by the Galpin society (1946).

In the U.S. the Society of Friends of Music (1913) sponsored performances of lesser-knomn works, and the League of Composers (1923) the interests of contemporary music. Chamber music was encouraged by the American Society of Ancient Instruments (1927), the Chamber Music Society of America (1933), the New Friends of Music (1936) and the Haydn society (1949). The National Music council (1940) was concerned with both professional and cultural aspects of musical life. The Music Library association was founded in 1931 and the American Musicological society in 1934.

In the Argentine, 20th-century music was encouraged by the Grupo Renovación (1929) and chamber music by the Sociedad Argentina de Musica da Camera. Cultural movements were promoted in Brazil by the Academia Brasileira de Musica (1945) and U.S. and Latin-American musical interests by the Instituto Interamericano de Musica (Montevideo. 1932).

In Canada the Federation of Canadian Music festivals organized widespread activities, and the Composers. Authors and Publishers

Association of Canada gave awards and scholarships to composers. The Canadian Music council (1949) promoted a broad interest in musical affairs. In Australia contemporary music was fostered by the Guild of Australian Composers (1935), chamber music by the Musica Viva society (1946) and professional interests by the National Council of Music associations (1932). The Elizabethan Theatre trust (1954) promoted opera throughout Australia.

(E. LR.)

MUSIC HALL AND VARIETY are related forms of popular entertainment which stem from the taproom concerts given in city taverns in England during the 18th and 19th centuries. Sadler's Wells was typical of the many refreshment houses enlivened by song and dance. Gradually a stage was provided for paid singers, the most popular being comic, and the audience was seated at tables; liquor sales paid the expenses.

To discourage these entertainments. parliament passed an act (1751) which required every such pleasure haunt to obtain a magistrate's licence, but the measure had the contrary effect: the larger taverns lived up to their new dignity by employing musicians and scenery and the smaller did without the licence by forming harmonic clubs. Profits from the licensed premises led to the building of variety theatres of increasing size and glitter with elaborate scenic effects. In the early 19th century the unlicensed "musick" houses evaded the licensing laws by changing into "burletta" houses; *i.e.,* theatres where plays had to include by law a certain number of songs (see BURLESQUE). "Saloon" then became the name for any place of popular entertainment, while "music hall" meant a concert hall and "variety" was an evening of mixed plays.

In Victorian times the rapid increase of urban populations intensified the demand for song. Publicans adapted the adjoining building to their premises as the music hall, thus giving it the significance it has had ever since. The first was reputedly at the Canterbury arms. Lambeth, where Charles Morton, the publican known as the "father of the halls," liked the music to be operatic and the comedians to wear smart clothes; the doorway survived a bomb of World War II and displayed its date of 1852 with an inscription referring to the act of 1751. At the same time Sam Collins, a chimney sweep who appeared as an Irish singer, founded Collins's music hall by Islington green. The humour of the halls concentrated on the hardships of life and caricatured weddings, funerals, seaside holidays, large families, wash day and other trials; yet, space was found in the protracted programs for ballads of domestic tragedy and patriotic heroism. Some outstanding performers were Marie Lloyd, Dan Leno, Vesta Tilley, Harry Champion, G. H. Chirgwin, Eugene Stratton, "Little Tich" (Harry Relph) and George Robey.

There was a change in 1891 when Albert Chevalier, an actor from a fashionable theatre, broke away from taproom humour to express a side of street life at the Pavilion which gave him the name of the "costers' laureate," in his songs of courtship and one of old age, "My Old Dutch." The idyllic strain persisted until Harry Lauder sang as a Highland lover with a hint of poetry. Will Fyffe, apart from his famous "Glasgow belongs tae me," sang of the sea, moors and mountains.

When the sale of liquor during performances was no longer permitted, the comedians still dominated the halls but had a diminishing place among the many amusements which kept variety true to its name. As the 20th century advanced, the music halls were dwarfed by palaces of variety on an even larger scale than the Empire and the Alhambra. Just as Sadler's Wells had advertised, 100 years earlier, the spectacle of real water and pony races, so the Hippodrome now displayed aquatic dramas and the Coliseum representations of the Derby and chariot races in ancient Rome. None of these lasted long, but other ambitious plans kept variety prosperous after the real music hall had been killed by the competition of the cheap cinema.

Such celebrities as Sarah Bernhardt, Sir George Alexander and Sir Herbert Tree put on one-act plays or the last acts of plays; eminent musicians such as Mascagni and Henry Wood gave performances with their orchestras; Diaghilev and his ballet, at the height of its fame, appeared in 1918 at the Coliseum in a bill which included comedians and jugglers.

Yet the excitement caused by actors or dancers never exceeded the enthusiasm aroused by the popular singers of the 1920s who showed how this fame had been intensified by the phonograph. Nora Bayes, who was the first to make this trend noticeable, received a welcome when she appeared at the Palladium such as a diva of grand opera might have envied. Sophie Tucker was her successor, but Gracie Fields, fresh from a touring revue called "Mr. Tower of London," proved that Lancashire could produce a favourite equal to those of New York. Also in the 1920s the craze for dance music was started by Paul Whiteman's band; it was continued by more than 12 others, headed by those of Jack Hylton and Jack Payne.

The advent of "talking films" caused variety theatres throughout. the United Kingdom to be turned into cinemas. Among the schemes invented to keep comedians employed were a mixture of films and songs called cine-variety and attempts to keep theatres open from noon to midnight with nonstop variety. These were short-lived, with the exception of the Windmill theatre near Piccadilly Circus, London, which remained open throughout World War II and afterwards. The most remarkable experiment in entertainment during the 1930s and 1940s was the creation of the Crazy Gang (Bud Flanagan, Nervo and Knox, Naughton and Gold) who, at the Palladium and later at the Victoria Palace, restored elementary humour to favour.

The influence of radio was of fluctuating importance to music hall and variety: broadcast programs of "turns" were difficult because few comedians could survive the continual strain of composing new material. Audiences once preferred old favourites in song; television set the pace for frequent change.

Oddities of the licensing laws in Great Britain permit cabaret to be performed before an audience who are seated at tables and who consume food and strong drink which cannot be served in the auditorium of a theatre. Consequently the old music hall of Gatti's-under-the-Arches, at Charing Cross, London, run on Victorian music hall lines, became a club and the Hippodrome, while retaining its stage for revue, became a restaurant. In Europe cabaret often means a music hall while "music hall" usually means variety. See also VAUDEVILLE.

MUSIC PRINTING. Printed music originated soon after the invention of typography and 1465 is given as the earliest date of any record of its existence. At first the method was only used for printing the staves in red ink from a woodcut, the notes being written in by hand. Later the staves and notes were engraved separately on wood blocks and printed respectively in red and black. Then followed the practice of cutting both the staves and notes on one block for printing in black. There are no records of music being printed from separate characters before 1473 when a theological work by a German printer named Gerson mas issued containing five notes of music evidently so printed. This may be regarded as the foundation of music printing.

In 1482 William Caxton, the first English printer, published a work entitled *Polychronicon,* in which there are a few notes of music, though apparently filled in to the printed stave lines by hand. Wynkyn de Worde, who succeeded Caxton, reprinted this work in 1495, introducing both the notes and stave lines by type characters, so that he must be given the credit of being the first English printer of music from movable type. The *Mainz Psalter* of 1490 contained typeprinted music. In 1500 Ottaviano Petrucci, in Venice, produced music with the staves and notes printed from type by separate operations.

Thenceforward the system of printing the stave lines separately fell into disuse. Pierre Attaignant, in Paris (1529), was the first to print the words of songs under the notes. In 1530 music began to be printed in England with type similar to that used by Petrucci, and it was done in two printings, but in 1539 a London printer named Gough issued music from type characters with the staves and notes printed at one impression. In 1550 Richard Grafton printed in London the *Booke of Common Praier noted*, the musical part being executed in type with red stave lines. Printing from type then became general and by 1700 it had assumed the appearance of present day music.

Music printed from plates dates from 1525, when Pierre Hautin, a French engraver, cut punches for the notes and stamped them into metal plates, which were finished by engraving. This style of work became general in England and continued to hold the field until about 1710, when music printed from punched plates began to appear.

Lithographic music printing dates from 1799, being first applied by Alois Senefelder, the inventor of lithography, who drew the music direct on stone, or on transfer paper.

Typographical music printing recovered its position with the production of better music type by the English letter founders and came largely into use for hymnals, song books, and other musical works for which large editions in a cheap form are required. (W. Gam.; X.)

MUSIL, ROBERT, Edler von (1880–1942), German writer renowned for his unfinished *Der Mann ohne Eigenschaften*, one of the most significant novels of the 20th century. Born at Klagenfurt, Nov. 6, 1880, he studied engineering and philosophy and obtained a doctorate degree for his work on Ernst Mach (1908). After working in the Austrian war office he went to Berlin in 1922 where he lived as an independent writer. From 1933 to 1938 he lived in Vienna, then in Geneva, where he died April 15, 1942.

Der Mann ohne Eigenschaften was published in three volumes (1930, 1933, 1943); a more complete version came out in 1952, the last part, however, was an unscholarly compilation from unpublished papers. There is an English translation, *The Man Without Qualities* (1953–60). This monumental novel is an ironic analysis of the ills of the age, an unmasking of false attitudes of mind and an attempt to apply scientific precision of thought to social and spiritual experiences; Musil also explores a way of life for his hero who seeks to live without pretense. His style is translucent and often resembles a scientific mode of writing, but leaves room for expression of emotion. His method of presentation shows the influence of Marcel Proust and James Joyce.

Other works include *Die Verirrungen des Zögling Törless* (1906; Eng. trans. *Young Törless,* 1955), a novel; *Der Schwärmer* (1921) and *Vinzenz oder die Freundin bedeutender Männer* (1924), dramas; and *Drei Frauen* (1924), prose tales. (H. S. R.)

MUSK, the name originally given to a perfume obtained from the strong-smelling substance secreted in a gland by the musk deer (*q.v.*), and hence applied to other animals, and also to plants, possessing a similar odour. The variety which appears in commerce is a secretion of the musk deer; but the odour is also emitted by the musk ox and muskrat of India and Europe, by the musk duck (*Biziura lobata*) of West Australia, the musk shrew, the musk beetle (*Calichroma moschata*), the alligator of Central America, and others.

To obtain the perfume from the musk deer the animal is killed and the gland completely removed, and dried, either in the sun, on a hot stone, or by immersion in hot oil. It appears in commerce as "musk in pod," *i.e.,* the glands are entire, or as "musk in grain," in which the perfume has been extracted from its receptacle. Three kinds are recognized: (1) Tongking, Chinese or Tibetan, imported from China, the most valued; (2) Assam or Nepal, less valuable; and (3) Karbardin or Russian (Siberian), imported from central Asia by way of Russia, the least valuable and hardly admitting of adulteration. The Tongking musk is exported in small, gaudily decorated caddies with tin or lead linings, wherein the perfume is sealed down.

Good musk is of a dark purplish colour, dry, smooth and unctuous to the touch, and bitter in taste. It dissolves in boiling water to the extent of about one-half; alcohol takes up one-third of the substance, and ether and chloroform dissolve still less. A grain of musk will distinctly scent millions of cubic feet of air without any appreciable loss of weight, and its scent is not only more penetrating but more persistent than that of any other known substance. In addition to its odoriferous principle, it contains ammonia, cholesterin, fatty matter, a bitter resinous substance, and other animal principles. As a material in perfumery it is of the first importance, its powerful and enduring odour giving strength and permanency to the vegetable essences.

Artificial musk is a synthetic product, having a similar odour to natural musk. It was obtained by Baur in 1888 by condensing toluene with isobutyl bromide in the presence of aluminum chloride, and nitrating the product. It is a symtrinitro- Ψ-butyl toluene. Many preparations have been made, and the odour seems to depend upon the symmetry of the three nitro groups.

Musk in botany is *Mimulus moschatus.* (*See* Mimulus.) The musk orchis is *Herminium monorchis;* musk mallow, *Malva moschata;* muskmelon, *Cucumis melo;* musk thistle, *Carduus nutans.*

MUSK DEER (*Moschus moschiferus*), an aberrant deer, presenting many peculiar characteristics (*see* Deer). There are no antlers, but in lieu of such weapons, the upper canine teeth of the male form projecting tusks. About 20 in. high at the shoulder, the musk deer possesses long limbs, and there is a great development of the lateral pair of hoofs. The ears are large and the tail rudimentary. The grayish-brown hair is long, coarse, and brittle. This animal inhabits the forests of the Himalayas as far west as Gilgit, always at great elevations and preferring thickets of birch, juniper, and rhododendrons. It extends into Tibet, Siberia and northwestern China. In habits the musk deer is solitary! shy and nocturnal, but very active; it feeds on moss, grass and leaves. The deer takes its name from the secretion of a sac, about the size of an orange, beneath the skin of the abdomen, opening in front of the preputial aperture. This contains a dark brown substance of the consistency of "moist gingerbread." It is only present in the male (*see* Musk). A race, the southern musk deer (*M.* m. *sifanicus*), inhabits eastern China, distinguished by its longer. black ears.

MUSKEGON, a city of western Michigan, U.S., a port of entry and seat of Muskegon county, is on Muskegon lake and Lake Michigan. 38 mi. N.W. of Grand Rapids. The largest port on the eastern shore of Lake Michigan, with an excellent landlocked harbour protected by a breakwater. it is served by all-year car-ferry and steamship lines to Milwaukee. In 1960 the population of the city was 46,485 and of the Muskegon-Muskegon Heights standard metropolitan statistical area (Muskegon county) 149,-943. (For comparative population figures for the two cities. which adjoin each other, *see* table in Michigan: *Population.)*

The city benefited greatly from gifts of Charles H. Hackley (1837–1905), lumberman–philanthropist. totaling about $8,500,-000 and consisting of a $2,000,000 endowment to the public schools: buildings. equipment and endowments of a manual training school, public library. art gallery. stadium and hospital; and a public square with numerous statues. The city also has a public junior commercial college opened in 1926 and a historical museum.

A trading-post was established on the site of the city in 1812 by Jean Francois Recollet and the first sawmill was erected in 1837. The town was laid out in 1849. incorporated as a village in 1861 and as a city in 1869; the name is derived from the Ottawa *Mus-Kee-Go* and the Chippewa *Mas-Ki-Ki-Gon,* both of which mean "river-with-marshes." The lumber industry reached its peak in 1887. with a cut of 700,000.000 bd.ft. The population then was about 24.000 but with the depletion of the forests it dwindled. Renewed prosperity began about 1900 when the city's wealthy citizens financed new manufacturing. With more than 200 manufacturing establishments. Muskegon's principal products are automotive! military and aircraft engines, piston rings and other automobile parts, office furniture and equipment. refrigerators, bowling and billiard equipment, gray iron. steel, brass and aluminum castings. boats, electric cranes and hoists. and wire products. Points of interest include an old Indian burial ground and the grave of the abolitionist Jonathan Walker, immortalized in Whittier's poem "The Branded Hand." (E. K. W.)

MUSKELLUNGE (Muskie): *see* Pike.

MUSKET, a term generally applied to all smoothbore infantry small arms before the universal adoption of rifled firearms about the middle of the 19th century. The original musket evolved during the third yuarter of the 16th century in the Spanish army, then the foremost military system of Europe. Following the wars betneen Spain and France in Italy, the trend toward solidarity in infantry tactics led to the demand for a heavier firearm than the arquebus (*q.v.*). A solution was found in a weapon that was in effect an enlarged arquebus, since the matchlock firing principle remained unchanged.

The musket, like the arquebus, was loaded by pouring coarse powder donn the barrel, then ramming home a lead ball and a wad of rag. A pull of the trigger brought the serpentine, with its length of burning slow-match. into contact with the fine powder in a pan that the musketeer uncovered by hand. The resulting flash of the powder in the pan passed through the touchhole and discharged the piece. Not much accuracy could be expected of the musket. Reloading was such a complicated process that two soldiers were assigned to the clumsy weapon. The adoption of a portable iron fork, serving as a rest, made it possible to bring into the field a firearm 5½ ft. in length, weighing 15 lb. and firing a ball as heavy as 2 oz. with an effective range from 150 to 200 yd.

Musketeers and pikemen—the "shot and pike" of the 16th century—were drawn up in a phalangial formation, many ranks in depth. for the purpose of mutual protection. Reloading was such a slow process that the musketeers of the front rank retired to the rear for that function and gradually moved forward until their turn came to fire again.

Improvements in the musket during the Thirty Years' War made it possible to reduce the weight and discard the iron fork. Late in the 17th century the matchlock mas replaced by the flintlock, known in France as the fusil. But the term musketry survived into the 20th century on occasion to denote infantry fire with rifles. See also SMALL ARMS, MILITARY. (LN. MS.)

MUSKMELON, a frost-tender annual trailing vine of the family Cucurbitaceae, grown for its edible fruits. The botanical name is *Cucumis melo.* The leaves are three to five inches across, coarse, hairy to rough, nearly round to slightly heart shaped, three to seven angled with angles rounded, and with margins wavy. Its flowers are yellow, five-lobed, wheel shaped, about one inch across; they occur at the nodes, usually singly, on short peduncles. Generally the plant bears male flowers and female flowers; some plants bear male and perfect flowers. The male flowers, which appear first, are easily distinguished by the absence of tne small undeveloped fruit subtending the corolla. Fruits are very diverse. ranging in neight from two to nine pounds; in shape they vary from slightly oblate through globular to oval and long tapered; in surface features they are regular to broadly sutured to wrinkled, and from smooth to heavily netted; in flesh colour they are from pale green to orange; in odour and flavour from very slight to strongly "musky"; harvest time is from 85 to 125 days after planting.

Cantaloupe is sometimes loosely used in referring to the fruit of any variety of muskmelon; it properly applies, in the United States, only to small (two to four pound), round to oval, heavily-netted, highly perishable varieties. All varieties of muskmelon belong to the same species and intercross freely. When grown for production of seed for planting, varieties must be separated by a quarter of a mile or more; they are insect pollinated. Muskmelons will not cross with cucumber, squash, pumpkin or watermelon. As muskmelons of the highly perishable type approach maturity a separation layer develops where the stem joins the fruit. When a crack is visible completely around the stem at this point the fruit has its maximum sugar content and is ready for harvest. At this "full slip" stage slight pressure will remove the stem cleanly. leaving no broken tissue of stem or fruit. Muskmelons of the "winter" or long-keeping type such as honeydew, Persian and casaba do not develop this separation layer until after they are ripe, so are harvested by cutting the stems. Proper harvest stage of the ninter type is detected by rind colour, which must be judged according to variety. After harvest muskmelons will become softer but not noticeably sweeter.

The muskmelon originated in Iran and the Transcaucasia. Northern Pakistan. Kashmir and Afghanistan constitute a secondary centre of development. The ancient Egyptians probably grew it and the ancient Greeks and Romans definitely did. It was introduced into China about the beginning of the Christian era. It is now grown in the warmer parts of the temperate zones and less humid parts of the tropics the worldwaround. In the cooler parts of the temperate zones it can be gro n only under glass.

Muskmelons grow well on many kinds of soil but they need high fertility and ample soil moisture. Usually seeds are planted directly in the field or garden; sometimes plants are started under protection and transplanted to the field after danger of frost is past. Early field plantings may be protected by paper covers over the plants, and by windbreaks of brush and paper. Plants usually are spaced about two feet apart in rows five to six feet apart or in "hills" five by five feet apart.

J. HORACE MCFARLAND CO.

MUSKMELON (CUCUMIS MELO)

In the U.S. muskmelons are grown commercially in more than 25 states; California, Arizona, Texas and Colorado account for about two-thirds of the acreage and three-fourths of the production of the country. (V. R. B.)

MUSKOGEE, a city of northeast Oklahoma, U.S., 50 mi. S.E. of Tulsa is situated near the confluence of the Verdigris, Grand and Arkansas rivers; the seat of Muskogee county. Incorporated in 1898, the city adopted a council-manager form of government in 1920. In Muskogee are located the U.S Indian agency for the Five Civilized Tribes, regional offices and a hospital of the U.S. veterans administration, the Oklahoma School for the Blind, Bacone College for Indians and the Oklahoma Free State fair.

Founded in 1872 as a townsite on the first railroad built into Indian territory and named for the Muskogee (Creek) Indians, Muskogee soon became the administrative centre for the Five Civilized Tribes. The Commission to the Five Civilized Tribes, which dissolved tribal landholdings in preparation for Oklahoma statehood, maintained headquarters there. Originally the city served an agricultural and oil region but in modern times the economy was diversified including processing and manufacturing of rocket and missile fuel, rare metals, glass products, clothing, steel and iron, boxes, canned goods, meat and milk products and tire repair materials.

For comparative population figures see table in OKLAHOMA: *Population.* (J. D. MO.)

MUSKOGIAN INDIANS. This group constituted one of the larger speech stocks of native North America, and was typical of and dominant in the southeastern area of aboriginal culture, comprising the region from the Gulf of Mexico to Tennessee, and from the Carolinas to Louisiana. The Muskogian family comprised a series of divisions: (1) Apalachee; (2) Hitchiti, Apalachicola, etc ; (3) Alabama, Koasati, etc.; (4) Choctaw, Chickasaw, Mobile, Pensacola, etc.; (5) Tuskegee; (6) Cusabo, Yamasee and other tribes of the Georgia coast; (7) Miskogi proper. The latter formed the bulk of what was later the Creek confederacy, in nhich the Hitchiti and other groups were included. The Natchez and Taensa of the loner Mississippi seem to be a remote Muskogian offshoot; the Calusa and other south Floridian tribes may be.

Since the middle of the 18th century the historically important tribes have been the Choctaw, Chickasaw and Creek, plus a branch of the latter, the Seminole. With the non-Muskogian Cherokee, these make up the "five civilized tribes," which for three-quarters of a century, until 1906, maintained quasi-autonomous governments in Indian territory (Oklahoma), where they had removed under the pressure of American settlement.

Ethnographically the Muskogian or Southeastern culture province included, besides the groups listed, the Chitimacha and Tunica of the lower Mississippi, the Iroquoian Cherokee, the Timucua of central Florida and, in the lower region of Georgia and Carolina, the Yuchi, the Algonkin Shawnee and various eastern Siouan tribes. All these groups were agricultural, planting maize, pumpkins, beans, cane-millet, tobacco, sometimes Jerusalem artichokes, and sunflowers. They gathered hickory nuts and wild fruits, hunted deer and, in the west, bison, and stored nut oil and bear fat. The settlements were straggling; the "town" contained a square, on which were public and religious buildings; "villages" were often outlying. The towns were autonomous and essentially constituted tribes. They united into confederacies, directed by councils; such confederacies might break up and recombine. The most successful, like those of the Creek and Choctaw, grew in population during the colonial period, largely through absorption of smaller or scattered groups. The tribes were divided into matrilineal, totemic clans; chieftainship and office were hereditary, probably in the lineage within the clan. The Natchez and some other groups had superimposed a peculiar class or caste system. Chieis in these cases were carried in litters, enthroned on raised seats or in arbours, and accompanied in death by sacrificial followers. All the tribes were warlike and in chronic but shifting embroilment with others. They took scalps and slowly tortured prisoners to death in a frame or tied to a post in the town square. Often there was a distinction between civil and military chiefs; the towns entitled to offices of one or the other kind in a confederacy were known as peace and war, that is, white or red.

Economic life was undeveloped as compared with the fairly well organized socio-political institutions. Houses were of logs or poles, wattled, chinked or plastered with mud, the roof of thatch. Bark or thatch houses were also built. Exposed settlements were palisaded, or log forts erected. Pottery was unpainted, basketry of cane splints; simple weaving was done in bark fibres and bison hair, but the principal clothing besides mantles was breech clouts for men and apron skirts for women. Many tribes deformed their heads. There was little property, almost no treasure: and limited trade before the corning of the whites. Ritual was also simple. The most important ceremony was the busk or green-corn festival, a first-fruits and new-fire rite. Purification by emetics was a common religious observance. There was little that could be called art. Most tribes had a migration legend.

The Muskogian-Southeastern culture extended with variations north into the Ohio valley to the prehistoric moundbuilders, and northeast to the tribes of Iroquois lineage; it was represented in pallid form among many of the Xlgonkian groups as far as New England and the Great Lakes. The total Muskogian population was about 50,000. At the time of discovery, there may have been 7,000 Creeks (increased to 20,000 by 1832), 3.500 Chickasaw, 15,000 Choctaw, 5,000 Xpalachee, perhaps 5,000 Mobile. The first three of these tribes survive in increased numbers, but much mixed with whites and Negroes.

See also Indian, North Americas; Central and North American Languages; and the articles on individual tribes: Apalachee; Choctaw; Chickasaw; Creek; Natchez; etc.

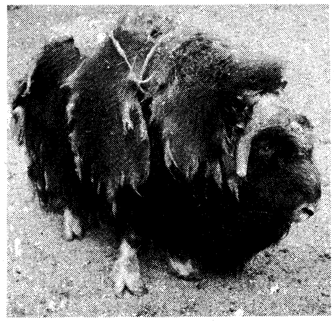
MUSK OX, a shaggy-haired arctic American ruminant (*Ovibos moschatus*) of the cattle family (Rovidae: *q.v.*). it is not a true ox (subfamily Bovinae) but belongs rather to the goat-sheep subfamily (Caprinae), and in general appearance resembles somewhat a very hairy domestic bull. It is closely related to the takin of Asia. The musky odour from which it takes its name does not come from a special gland as in so many other musk-producing mammals.

The bull musk ox stands about 5 ft. at the shoulder; the cow is somewhat smaller. Horns, present in both sexes, are borne on a large almost "neckless" head. In old males the sometimes two-foot-long horns meet by broad bases at the mid-line of the brow and proceed laterally, dip downward at the sides of the head and then curve upward. Females and young have smaller horns with a space between the bases. The striking external fezture of this animal is the coat of long, dark bronn hair, reaching nearly to the feet, concealing the short tail and nearly covering the small ears. Shorter hair covers the face, and is shortest on the space between the nostrils and upper lip. Underneath the shaggy coat is a thick wool, shed in summer. The legs are stout and short with hoofs that are rounded in varying degrees, depending on the subspecies.



W. SUSCHITZKY

MUSK OX (OVIBOS MOSCHATUS)

Musk oxen often travel in herds numbering 20 to 30 individuals. They are not aggressive animals, but when attacked the band forms a circle, the larger oxen presenting a formidable front of horns on the outer rim. This defense is very effective against arctic wolves and dogs. Musk oxen feed chiefly on grass, but also eat other low-growing vegetation including lichens, willows, etc. Some authorities, considering musk oxen as arctic cattle—with excellent milk production, valuable wool and good meat—are urging their domestication in suitable places. After a gestation period of 9 months the female gives birth to one young in late May or early June.

In the Pleistocene epoch (about 1,000,000 years ago) musk oxen were circumpolar in distribution, inhabiting Siberia, Germany, France, England and even parts of the southeastern Cnited States. Today they are confined to arctic America, from about latitude 64 to the Arctic ocean and from a short distance east oi the Mackenzie river delta to Greenland, including some of the arctic islands of Canada. Since the advent of firearms in the Arctic; the range of musk oxen is thought to be even further restricted. In 1929 a group of musk oxen was shipped from Greenland to Fairbanks, Alaska; this herd, now living on Nunivak Island in the Bering sea, was intended to be used to restock arctic Alaska. (O. J. M.)

MUSKRAT (Musquash), a large ratlike semiaquatic rodent (*Ondatra zibethicus*) of the family Cricetidae, subfamily Microtinae. The subfamily also includes the voles, meadow mice and lemmings. Muskrats occur over almost all of North America excluding the treeless tundra. They have been introduced in Europe and are becoming widespread there. The muskrat measures about 12 in. long and has an almost naked, scaly, laterally compressed tail somewhat shorter than the compact and heavy body. The eyes are small and the rounded ears project barely beyond the fur. The five-toed hind feet, partially webbed and fringed with stiff bristles, are an aid in swimming. The body is dark brown or somewhat paler; the feet, usually black. A dense, soft underfur is heavily overlaid with long, glossy, stiff guard hairs. Because of their availability, beauty and durability, muskrat pelts are a basic commodity of the fur industry. The yield in North America exceeds in value that of any other fur. The musky secretion that gives the animal its name issues from musk sacs. Muskrats live in poorly constructed reed and rush mounds, or lodges, in

JOHN H. GERARD

MUSKRAT (ONDATRA ZIBETHICUS)

marshes, shallow lakes and streams. The lodge, in a bank or on a reed and mud island. is entered through an underwater opening. Food consists of a wide variety of sedges. reeds, roots — mostly of aquatic plants — and occasional fresh-water mussels. crayfish, salamanders and fish. Feeding customarily takes place at special feeding sites, usually a flat rock or island of cut reeds. One to 11 young are produced once or twice a year, depending on the locality.

(K. R KN.)

MUSK SHREW, the common name for small insectivores (*q.v.*) of the genus *Crocidura,* characterized by a powerful. musky odour. Because they frequent human habitations — in Africa and the warmer parts of Europe and Asia — they are often called house shrews. Their habits are like those of other shrews; they are voracious, sometimes vicious, alternately extremely active and completely inactive in frequent and swift succession. *See* also SHREW.

MUSLIM: *see* ISLAM.

MUSLIM-IBN AL-HAJJAJ (full name, MUSLIM IBN AL-HAJJAJ ABU'L HUSAIN AL-QUSHAIRI AL-NAISABURI) (*c.* A.D. 820–875), Arabian scholar, was one of the chief authorities on the apostolic tradition, the *Hadith* (*q.v.*), in which accounts of the sayings and deeds of the prophet Mohammed were collected. He was born *c.* 820 at Naisabur, northeast Persia, and died in 8i5 at Nasrabad near Naisabur. He traveled widely! and his great work, the *Sahih* ("The Genuine")? is said to have been compiled from about 300,000 traditions collected throughout the middle east. It has been unanimously acclaimed as authoritative and is generally ranked next to al-Bukhari's work. He was careful to give a full account of the *isnads* (links in the chain of transmission) for each tradition and to record textual variations. Muslim defended al-Bukhari's contention that the words of the Koran were the creation of an inspired prophet and not a transcript of eternal divine law. (F'U. R.)

MUSLIN, a plain-woven cotton fabric made in various weights from very sheer to coarse, heavy sheetings.

The better qualities are fine and smooth in texture, woven from evenly spun warps and wefts. They are given a soft finish, bleached or piece dyed and sometimes patterned in the loom or printed. The coarser varieties are often of irregular yarns and textures, bleached, unbleached or piece-dyed and generally sized in the finishing. Varieties of muslin are known under such names as book, mull, swiss, sheeting, etc.

The name is derived from the city of Mosul in Mesopotamia (Iraq), where the material was first made. Early Indian muslins were handwoven of extremely fine handspun yarns and were very costly. They were imported into Europe in the 17th century and later manufactured in Paisley and Glasgow in Scotland and in many of the English factories. (M. DA.)

MUSSEL, the name given to certain aquatic bivalve mollusks of the class Lamellibranchia. In its most regular usage, it is applied to the marine Mytilidae, of which the edible mussel. *Mytilus edulis,* is the most familiar example, and to the fresh-water genus *Anodonta*. The marine mussels (*Mytilus, Modiolaria, Modiolus*) belong to the suborder Mytilacea of the order Filibranchia. The edible mussel, *Mytilus edulis,* has a wide distribution. It is found on both sides of the Atlantic and in the Mediterranean, and on the eastern Atlantic seaboard its range extends as far south as Rio de Oro, in Morocco. Its habitat is toward low-tide mark, where it lives attached to rocks or on consolidated shingle or sandbanks. It is usually found in large numbers. mussel beds sometimes covering several acres and containing millions of individuals.

The Mytilidae have an inequilateral shell. the apex or umbo appearing to be displaced to one end when compared with that of a cockle. for example. This is due to the imperfect development of the anterior end of the shell. The foot is provided with a byssus, a bunch of hairs secreted in a glandular cavity of the foot. From this cavity the hairs are extruded and harden on contact with the sea water, forming a means of attaching the mussel to a rock or stone. This fixation is not, however, permanent; the animal can discard the byssus and anchor itself afresh in a new situation, Such a means of anchorage and the faculty of occasionally changing position are highly important in animals which live, as the Mytilidae do, in the tidal zone, where gales tend to shift the sand or shingle on which they live, and where the animal is liable to be swept away from its feeding ground or buried beneath the debris of the shore.

The edible mussel, *Mytilus edulis,* is of considerable economic importance as human food (though it is not eaten to any great extent in the United States) and as bait for edible fishes. It is considered of fair size for eating when it is two inches long, a size attained three years after the young mussel settles down. Under favourable conditions it will attain a much greater size. The degree of salinity of the water has a considerable effect on the size of the shell. For example, those mussels which live in the comparatively fresh water of the Baltic sea are often a quarter or one-fifth the size of the North sea forms. Nevertheless, it seems to thrive best in water having a salinity lower than that of normal sea water. In Great Britain the chief mussel beds are in Morecambe bay (Lancashire) and in the Wash.

There are many genera in the family Mytilidae, which has a wide distribution. They include *Modiolaria, Lithophapa* (the date mussel), which bores into rock, *Modiolus* and *Crenella.*

The fresh-water mussels, or clams, are members of the family Unionidae (order Eulamellibranchia) and include the genera *Anodonta, Unio, Quadrula, Lampsilis, Margaritana,* etc. They are mainly found in ponds, lakes and quiet rivers and streams. They burrow in the soft mud of the bottom and, living thus in more tranquil conditions than the sea mussels, have a byssus only in the juvenile stage.

The developmental history of these mussels is unique among mollusks. In the female the ripe eggs are emitted from the ovaries and pass to the gills, where they are fertilized by sperm brought in water currents. The fertilized eggs attach to gill elements and begin their development. In a short time the eggs become minute larvae (glochidia), which are equipped with two valves. After the larvae are shed into the water they sink to the bottom or are distributed by water currents. The next stage is parasitic on fish. Hooked glochidia attach to the soft parts of a fish, and hookless types clamp onto the gill filaments of a fish. The parasitic larvae feed and grow by absorbing nourishment from the host fish. In time the young mollusk releases its hold and drops to the bottom to take up its free-living existence.

The members of the genus *Unio* and its near allies are of considerable economic importance in the United States, where they are cultivated for the pearly shell used in button making. At one time the pearls obtained from mussels were widely sought in Europe, but this industry declined after the introduction of the oriental pearls of Ceylon, etc. At times the glochidial stage causes considerable losses of young fish in fish hatcheries.

More detailed information on habits, structure and function will be found in specific articles BIVALVE and MOLLUSCA; *see* also references under "Lamellibranchia," "Bivalve" and "Mussel" in the Index volume. (G. C. R.; X.)

MUSSELBURGH, a small burgh of illidlothian, Scot., 6 mi. E. of Edinburgh. Pop. (1961) 17,273. The burgh, which lies on the south shore of the Firth of Forth, is intersected by the Esk and embraces the village of Fisherrow on the left bank of the river. The "burgh" in Musselburgh means "bank." While preserving most of the ancient features of its High street, the town, with its fine beach and golf course, has become a suburb of Edinburgh. Loretto school occupies the site of the chapel of Our Lady of Loretto, which was founded in 1534 by Thomas Duthie, a hermit from Mt. Sinai: and was the favourite shrine of Mary of Guise. The 1st earl of Hertford destroyed it in 1544, and after it was rebuilt the Reformers demolished it again, some of its stones being used in erecting the tolbooth. The school also owns Pinkie house, a Jacobean mansion with a fine fountain, formerly a seat of the abbot of Dunfermline, but transformed in 1613 by Lord Seton. The painted gallery, with an elaborate ceiling, was used as a hospital after the battle of Pinkie (1 mi. southeast) in 1547, and Prince Charles Edward slept in it after the battle of Prestonpans (1745). Near the tolbooth stands the market cross. A 16th-century stone bridge crosses the Esk. and Roman remains have been found near it. Foundations of a 2nd-century Roman fort, similar to those along the Antonine wall, as well as other Roman remains have been found at Inveresk. The chief bridge. which carries the high road from Edinburgh to Berwick, was built by John Rennie in 1807.

The principal industries include the making of wire ropes, paper. twine and nets; there is also brewing and market gardening. Fishery is confined to Fisherrow where there is a harbour. Race meetings are held on the links. At Carberry hill hlary surrendered to the lords of the congregation in 1567, the spot being still known as Queen Mary's mount The burgh has a famous July festival. "The Riding of the Marches of the Commonty," celebrated every 21 years. A celebration of this ceremony took place in 1935. In September is an annual event called the "Fisherman's walk."

MUSSET, ALFRED DE [Louis Charles Alfred] (1810–1857), French poet, playwright and novelist, was born on Dec. 11. 1810 in a house in the middle of old Paris, near the Hôtel Cluny. In the summer of 1827 he won the second prize (at the Collège Henri IV.) by an essay on "The Origin of our Feelings." He took up law and medicine but could endure no profession. He was taken by Paul Foucher to Victor Hugo's house, where he met Alfred de Vigny, Prosper Mérimée, Charles Nodier, Sainte-Beuve, and others. His first original volume, *Contes d'Espagne et d'Italie* (1829), had an immediate success, provoked bitter opposition, and produced many unworthy imitations. This volume contained a fantastic parody in verse on certain productions of the romantic school. This was the famous "Ballade à la lune" with its recurring comparison of the moon shining above a steeple to the dot over an i. It was, to Musset's delight, taken seriously.

In December 1830 Musset was just twenty years old, and was already conscious of that curious double existence within him so frequently symbolized in his plays—in Octave and Célio for instance (in *Les Caprices de Marianne*), who also stand for the two camps, the men of matter and the men of feeling—which he has elsewhere described as characteristic of his generation. At this date his *Nuit vénitienne* was produced by Harel, manager of the Odiron. It failed and Musset was disgusted with the theatre.

Musset now belonged, in a not very whole-hearted fashion, to the "Cirnacle," but the connection came to an end in 1832. In 1833 he published the volume called *Un Spectacle dans un fauteuil,* and was asked to contribute to the *Revue des deux mondes.* In this he published, in April 1833, *André del Sarto,* and he followed this six weeks later with *Les Caprices de Marianne.* The latter play has perhaps more of the Shakespearian quality—the quality of artfully mingling the terrible, the grotesque, and the high comedy tones—which exists more or less in all Musset's long and more serious plays, than is found in any other of these. Its brilliant dialogue and swiftness of action give it superficially the character of comedy, but throughout there runs the sense of fate.

In 1833 the *Revue* published *Rolla,* a symptom of the *maladie du siècle.* Rolla, for all the strain which is not to be denied of Wertherism, has yet a decided individuality. The poem was written at the beginning of Musset's *liaison* with George Sand. and in December 1833 Musset started on the unfortunate journey to Italy. It is well known that the rupture of what was for a time a most passionate attachment had a disastrous effect upon Musset, who was absolutely and completely struck down by the blow. But it was not so well known until Paul de Musset pointed it out that the passion expressed in the *Nuit de dkcembre,* written about twelve months after the journey to Italy, referred not to George Sand but to another and quite a different woman. As fiction, the story is told in the two volumes called respectively *Elle et lui* by George Sand, and *Lui et elle* by Paul de Musset.

During Musset's absence in Italy *Fantasio* was published in the *Revue, Lorenzaccio* is said to have been written at Venice, and not long after his return On *ne badine pas avec l'amour* was written and published in the *Revue.* In 1835 he produced *Lucie, La Nuit de mai, La Quenouille de Barberine, Le Chandelier, La Loi sur la presse, La Nuit de dkcembre,* and *La Confession d'un enfant du siècle,* wherein is contained what is probably a true account of Musset's relations with George Sand. To 1836 belong the *Nuit d'août,* the *Lettre à Lamartine,* the *Stances à la Malibran,* the comedy *Il ne faut jurer de rien,* and the beginning of the brilliant letters of Dupuis and Cotonet on romanticism. *Il ne faut jurer de rien* is as typical of Musset's comedy work as is *Les Caprices de Marianne* of the work in which a terrible fatality underlies the brilliant dialogue and keen polished characterization. In 1837 was published *Un Caprice,* which afterwards found its way to the Paris stage by a curious road. Mme. Allan-Despréaux, the actress, heard of it in St. Petersburg as a Russian piece. On asking for a French translation of the play she received the volume *Comédies et proverbes* reprinted from the *Revue des deux mondes.* In 1837 appeared also some of the *Nouvelles.* In 1839 Musset began a romance called *Le Poète déchu,* of which the existing fragments are full of passion and insight.

In 1840 Musset passed through a period of feeling that the public did not recognize his genius—as, indeed, they did not—and wrote a very short but very striking series of reflections headed with the words "A trente ans," which Paul de Musset published in his *Life.* In 1841 there came out in the *Revue de Paris* Musset's "Le Rhin allemand," an answer to Becker's poem which appeared in the *Revue des deux mondes.* This fine war-song made a great deal of noise, and brought to the poet quantities of challenges from German officers. Between this date and 1845 he wrote comparatively little. In the last named year the charming "proverbe" *Il feut q'une porte soit ouverte ou fermée* appeared. In 1847 *Un Caprice* was produced at the *Théâtre Français.* The word "rebonsoir" shocked some of the old school. But the success of the piece was immediate. In 1848 *Il ne faut jurer de rien* was played at the Théâtre Français and the *Chandelier* at the Théâtre Historique. Between this date and 1851 *Bettine* was produced and *Carmosine* written. The poet died on May 2, 1857

Alfred de Musset now holds the place which Sainte-Beuve first accorded, then denied, and then again accorded to him—as a poet of the first rank. He had genius, though not genius of that strongest kind which its possessor can always keep in check. His own character worked both for and against his success as a writer. He inspired a strong personal affection in his contemporaries. His very weakness and his own consciousness of it produced such beautiful work as, to take one instance, the *Nuit d'octobre.* His *Nouvelles* are extraordinarily brilliant; his poems are charged with passion, fancy and fine satiric power; in his plays he hit upon a method of his own, in which no one has dared or availed to follow him with any closeness. He was one of the first, most original, and in the end most successful of the first-rate writers included in the phrase "the 1830 period." The wilder side of his life has probably been exaggerated; and his brother Paul de Musset has given in his *Biographie* a striking testimony to the finer side of his character. In the later years of his life Musset was elected, not without opposition, a member of the French Academy. Besides the works above referred to, the *Nouvelles et contes* and the *Oeuvres posthumes,* in which there is much of interest concerning the great tragic actress Rachel, should be specially mentioned. (W. H. Po.; X.)

The biography of Alfred de Musset by his brother Paul, partial as it naturally is, is of great value. Alfred de Musset has afforded matter for many appreciations, and among these in English may be mentioned the sketch (1890) of C. F. Oliphant and the essay (1855) of F. T. Palgrave. *See* also the monograph by Arvède Barine (Madame Vincens) in the "Grands écrivains francais" series. Musset's correspondence with George Sand was published intact for the first time in 1904.

See M. Donnay, *Alfred de Musset* (1914); C. Maurras, *Les Amants de Venise: George Sand et Musset* (1916), pp. 316; E. Moroncini, *A. de Musset e l'Italia* (Milan, 1921), pp. 228.

MUSSOLINI, BENITO (1883–1945), Italian politician and journalist, was born July 29, 1883, at Dovia, in the commune of Predappio (province of Forli). His father, Alessandro Mussolini, was a blacksmith of antireligious and vaguely socialist opinions. His mother, Rosa Maltoni, was a school tezcher of strong character. Young Mussolini was named Benito after Benito Juarez, the Mexican revolutionary leader. Benito Mussolini was sent by his mother to the Salesian school of Faenza. The boy showed there a vivid intelligence and an insubordinate temper. Later he went to the normal school at Forlimpopoli and qualified as a school teacher at 18, obtaining an appointment at Gualtieri (province of Reggio Emilia).

The Leftist Period—As a youth Mussolini was interested in the Italian revolutionary movement which was then a mixture of socialist, republican, syndicalist and anarchist tendencies. Looking for a better career than teaching in elementary schools, he went to Switzerland, where he earned a precarious livelihood, sometimes by manual work of various kinds, while engaging in revolutionary and atheistic propaganda. After having been expelled from various cantons, he was finally expelled from the confederation. On returning to Italy he performed his military service in the Bersaglieri (light infantry). Back in his native Romagna, Mussolini became an active member of the socialist movement. On one occasion he was arrested, condemned to ten days' imprisonment and placed under police surveillance.

At the end of 1908 Mussolini went to Trento (then belonging to the Austrian empire) to join the staff of local Italian socialist newspapers. At first he worked with *L'Avvenire,* then with the Popolo. The latter was edited by Cesare Battisti, an Italian irredentist patriot, always ready to fight the Vienna government. (Rattisti was hanged by the Austrians in 1916.) The association with Battisti inspired Mussolini with nationalistic ideas and after publishing an irredentist article, he was arrested and expelled from Austria. In Trento hfussolini became acquainted with the newest German irrationalistic and pessimistic philosophy, particularly that of Friedrich Wilhelm Nietzsche, which strengthened his conviction that violence is the fundamental element of social .transformation.

On his experiences Mussolini published an essay "The Trentino Seen by a Socialist" in La *Voce.* While in Trento Mussolini had published an anticlerical novel Claudia Particella, *the* Mistress of the Cardinal.

In 1910 Mussolini was appointed secretary of the section in Forli of the Italian Socialist party and edited La Lotta di Classe, a small paper in which he developed the idea that "Socialism is war and in war woe to those who have humanitarian feelings." More than with orthodox hlarxism, he sympathized with the revolutionary theories of two Frenchmen: the insurrectionist Louis Auguste Blanqui and the syndicalist George Sorel.

When Giovanni Giolitti's government decided upon the military occupation of the then Turkish province in Africa, Tripolitania, Mussolini was among the more vehement opponents. He said that class war was wanted and not imperialistic wars, that the aim of the Socialists could not be a vast Italy, but should be an Italy "cultivated, rich and free." On Sept. 25–27, 1911, having led the workers of Forli in a movement of resistance to war, he was arrested and condemned to five months' imprisonment. At the next congress of the Socialist party in Reggio nell' Emilia (1912), the left wing obtained the majority, the reformist leaders Leonida Bissolati and Ivanoe Bonomi were expelled and Mussolini's position as a leader of the leftist majority was recognized. On Dec. 1, 1912 he was made editor of the *Avanti,* the official organ of the party. His closest collaborator was then the famous Russian revolutionary, Angelica Balabanoff. Under Mussolini's editorship the circulation rose considerably. His vigorous editorials, written in a synthetic, hammering style, and his support of the "Red week" of June 1914 in the Marches and in Romagna gave him considerable popularity. In the *Avanti* and in the review Utopia—founded by him in 1913—Mussolini stated that the Italian nation needed a "bath of blood," after which the revolutionaries would be able to take power. Mussolini then published another anticlerical book: Jan *Huss, the Truthful* (Rome, 1913). In that period Mussolini met Rachele Guidi who later became his wife. Of humble origin and possessing a good deal of common sense, Rachele Mussolini led a retired life. She bore her husband six children, of whom the best known was Edda, the eldest daughter, who married Galeazzo Ciano.

World War I.—When World War I broke out, Mussolini advocated at first a policy of absolute neutrality. In the *Avanti* he threatened the government with a proletarian uprising in case Italy intervened on the side of Austria and Germany, the powers to which the Italian government was bound by an alliance. After seeing many of his syndicalist friends (among them Filippo Corridoni) take the democratic interventionist side, he began to hesitate. The able diplomacy of the French ambassador Camille Barrère, who gave considerable help to many Italian interventionist groups, and the intermediary activity of his French Socialist friend Marcel Cachin (later a leader of the French Communist party) decided Mussolini to range himself on the side of the Allies.

Mussolini was obliged to leave the editorship of the *Avanti.* On Oct. 25, 1914 the Socialist congress at Milan refused to accept his justification that war would promote social revolution in Italy, and Mussolini left the Socialist party. On Nov. 15, 1914 first appeared the new daily paper of Mussolini, *Il* Popolo d'ltalia, a Socialist daily. (The paper bore two watchwords: "Who has iron, has bread" of Blanqui and "The revolution is an idea plus bayonets" of Napoleon.) Mussolini openly advocated Italy's entry into the war. He explained that if Italy would help the western democratic powers win the war, "more liberty would exist in Europe and the proletariat would have better opportunities to develop its class capacities; on the contrary, if the Prussian reaction triumphs over Europe the level of human civilization would be lowered."

A small number of Socialists followed Mussolini to the Popolo *d'Italia.* The most valuable of them were Sandro Giuliani and Cesare Sarfatti. Together with them and several young republican interventionists, young Mussolini founded the Fasci *d'* Azione *Rivoluzionaria,* which made strong war propaganda. At a great meeting of the Fasci in Milan, on Jan. 25, 1915, Mussolini advocated war not only against Austria, but principally against Germany. For his violent speaking, Mussolini was arrested in April 1915. A few days later he was slightly wounded in a duel with the pacifist Socialist leader Claudio Treves. Summarizing his policy, Mussolini stated on May 15 that either the king would take Italy into the war or there would be a republican revolution. War was declared on May 24. In Sept. 1915 Mussolini was called up and served as a private in the Bersaglieri. On Feb. 23, 1917, while exercising, he was wounded by the explosion of a hand grenade. He spent many months in the hospital and on recovery returned to the editorship of the Popolo *d'Italia.* He wrote a graphic account of his experiences in his *Diario* di Guerra. In the last years of the war he changed the subtitle of his Popolo *d'Italia* to "Organ of the Combatants and of the Producers" and engaged in an active campaign against the Socialist party, which continued to advocate a pacifist policy.

Fascism.—Thanks to the help of wealthy people who feared a bolshevik revolution, and of ex-service men dissatisfied with peace conditions, Mussolini was able to found on March 23, 1919, at Milan. a new political movement under the name of Fasci di Combattimento. The program, adopted on Llussolini's suggestion, asked for a constituent assembly, the abolition of the senate and the recognition of workers' and technicians' control in the factories. Concerning foreign policy, hlussolini said that the League of Nations could be accepted only on condition that the claims of poor nations (like Italy) against the wealthy ones would be taken into consideration.

At first Mussolini tried to acquire the sympathies of the trade unions and to remove them from the influence of the Socialist party. He was not successful. At the elections of 1919 he stood as a fascist candidate for Milan and secured only a few votes. A few days later Francesco Saverio Nitti had him arrested on a charge of "plotting against the security of the state," but he was soon liberated. Meanwhile, Gabriele d'Annunzio had occupied Fiume. Mussolini supported him in the Popolo *d'Italia* and in public meetings. "D'Annunzio," he said on August 5, 1920. "is the only man who has dared to revolt against the plutocracy of Versailles." But when, in Dec. 1920, Giovanni Giolitti settled *manu militari* the question of Fiume, hfussolini refused to give armed support to d'Annunzio. He maintained that the moment had not yet arrived for a direct attack against Italy's liberal regime.

The Conquest of Power.—The social upheaval caused by the war and by the problems of the post-war period reached its climax in Italy in autumn 1920 with the seizure of some factories in northern Italy by metallurgical workers. Mussolini at first supported the movement. He tried to get in touch uith its leaders and offered a common front of direct action against the industrialists, the government and the extremist or bolshevik wing of the workers' movement. Mussolini's offer was rejected. Largely as a result of the wise policy of the government and in exchange of small concessions, the workers surrendered the control of the factories to the owners. The public interpreted this move as a failure of the revolutionary socialist movement. But the panic caused by the revolutionary threat remained and Mussolini decided to exploit the fear and desire for revenge then prevalent in large sections of the Italian nation, in order to achieve the destruction of the liberal parliamentarian regime of Italy. The Fasci received ample funds from many people, chiefly industrialists and landowners. Armed squads (*Squadre d'Azione*) were organized to destroy the political and economic organizations of the Socialists, whose capacity to resist was greatly hampered by their own divisions. The premier, Giolitti, ignored the fundamental principle that in no case can the state surrender to private organizations the obligation of maintaining order. He tolerated the actions of Mussolini's followers believing that it was good policy to let the fascists quell the Socialist revolutionary threat. His successor, Bonomi, actually ordered the armed forces to support the fascists. Blinded by hatred and fear of socialism, various Italian liberal groups and the Catholic democratic party (together with the Socialists. the most important political element in Italy at that time) observed a neutrality favourable to the fascists.

From the end of 1920 on. the fascist squads attacked and destroyed the organizations of the Socialists, the communists, the republicans, etc. Hundreds of people were killed. New fascist groups mere formed everywhere. In May 1921 Mussolini and 35 other fascists mere elected. In Nov. 1921 at the congress of Rome, fascism was organized into a political party. Mussolini was already known to his follouers as I1 Duce (the leader). During 1922 the Trade Union council, the Socialist party and the Railwaymen's union tried to stem the tide by declaring a general strike. The strike was broken by the fascist armed squads. To secure support of the army and important conservative groups, at a fascist gathering at Udine on Sept. 29, Mussolini renounced his former republican convictions. A fascist convention at Naples, on Oct 24, 1922. provided the pretext for the concentration of armed squads from all over the country for a march on the capital *(see* ITALY: *History)*. Mussolini went from Naples to Milan, near the Swiss border, and left the direction of the "march" to a quadrumvirate of his closest friends (Italo Balbo, Michele Bianchi. De Bono and C. M De Vecchi). Practically no opposition was met from the civilian and military state authorities.

The Facta cabinet decided unwillingly to proclaim a state of emergency but the king refused to give his approval. Facta resigned and after a futile attempt on the part of the liberal-nationalist Antonio Salandra to form a coalition government. the king entrusted to Mussolini the task of forming the new cabinet.

The Fascist Government. — The first cabinet formed by Mussolini (Oct. 31, 1922) included several non-fascists, but Mussolini kept for himself every decision on vital questions. Later all non-fascists were eliminated.

There was a period when seven portfolios were in the hands of Mussolini himself. As years went by the quality of Mussolini's cabinet deteriorated. He eliminated all those who showed inclination for independence or had acquired a popular personal following and surrounded himself with more or less insignificant "yes men."

A convinced enemy of all democratic forms of government and particularly of the parliamentarian one, Mussolini devised a number of measures with the aim of concentrating all power in his hands. On Jan. 12, 1923 he created the Grand Council of Fascism, whose members he appointed and which was transformed later into one of the most important organs of the state. On Feb. 1, 1923 the fascist armed squads were officially militarized in the *Milizia Volontaria Fascista per la Sicurezza Nazionale,* and provided Mussolini with a large personal army. The murder of a leading member of the Socialist party, Giacomo Matteotti (June 10, 1924), made Mussolini's position extremely difficult for a while, but the opposition parties confined themselves to passive resistance only (the Aventino) and the king, after some hesitation. decided to support Mussolini, who was able once more to take the political initiative.

In 1925 (Dec. 24) and 1926 (July 31) Mussolini introduced laws which gave him a special position as prime minister. and the right to exercise — as head of the executive — legislative and judicial prerogatives. This meant the end in Italy of the classical "division of powers." In 1926 (Nov. 6) all opposition activity (parties, press. meetings) was definitely prohibited. After 25 years of a varied political career and seven years as the leader of fascism. Mussolini realized his dream of becoming the absolute ruler of his country. In 1928 (May 17 and Sept. 2) a new electoral law was also approved. The fascist political, syndical and cultural associations — through their leaders who were all appointed by Mussolini—were asked to present candidates among whom the Great council (also appointed by the Duce) chose those who were to be nominated. The electors had only the right to accept or reject the whole list. New elections took place on this basis in 1929 and 1934.

For the purpose of bringing Italian economic life under the control of the executive, according to the leitmotiv "for the fascist all is in the state, nothing exists outside the state." Mussolini created the so-called *Corporazioni* in 1930 (March 20) and definitely organized them in 1934 (Feb. 5). The 22 *Corporazioni* were all presided over by Mussolini. In 1938 (Oct. 8) even the fascist parliament was abolished and replaced with the assembly of the *Corporazioni,* which met for the first time on March 23. 1939, The members of the assembly were all appointed by the government and even the formality of popular approval, maintained in the reform of 1928, was dispensed with.

Important reforms concerned Italy's judicial organization. The old codes were abolished and new ones, inspired by fascist principles, enforced. The judicial power was deprived of its autonomy. Also the structure of the fascist party was transformed At first it included important groups more loyal to other fascist leaders than to Mussolini. Under the secretaryship of Augusto Turati and of Achille Starace, the influence of various leaders was eliminated and their clienteles dissolved. The Duce emerged as the only man in control of the party. Mussolini granted special powers to the police which became the most important organ of the Italian fascist state. The chief of police was probably the only man who could see Mussolini whenever he wished. For many years the police was probably the most efficient of all fascist organizations. Its task was not an easy one because the opposition went underground but never surrendered. To the opposition were due numerous attempts against Mussolini's life, the organization of secret political parties, the publication of clandestine newspapers, acts of sabotage, etc.

Foreign Policy.——Violently opposed to ideas of human solidarity and of lasting peace, Mussolini's aim, after he seized power. in the international field was to take advantage of every possible situation to achieve Italy's territorial expansion. He first tried his hand as a conqueror in 1923, when he sent an expedition against the Greek island of Corfu. Pressure from the western democracies obliged him to retreat. Mussolini played for a long time on the differences among the principal European powers, in order to obtain concessions for Italy in Europe and in Africa. From France, Italy had obtained a rectification of colonial boundaries in 1919. Further territories were given up as a result of an agreement between Laval and Mussolini in Jan. 1935. In 1925 England surrendered Jubaland in East Africa and a few oases on the Libyan-Egyptian border. By helping the Albanian Ahmed Zog to seize power in Albania, Mussolini was able to establish an Italian protectorate over that region in 1927. (Albania was definitely occupied in April 1939.)

The Duce's imperial aspirations took definite shape at the time of the world depression of 1929–32. Mussolini was convinced that, as a result of economic crisis and social upheavals, the democratic powers were bound to collapse, that they were not in a position to defend the independence of the small states and would put up little fight for their colonial empires. Three regions exercised a particular fascination over Mussolini's imperial dreams: the Mediterranean, the Balkan-Danubian countries and the northeastern section of Africa. To acquire the control of the Mediterranean, Mussolini strengthened the Italian navy. intervened in Spain (1936–39) and subsidized all kinds of anti-French and anti-British movements in the Mediterranean countries controlled by these powers. But when the crucial moment arrived in World War II to achieve his ambitions, Mussolini found himself obliged to ask Germany's help and to open the Mediterranean to German influence.

As a result of internal divisions and fear of Germany. the Austrian republic under Engelbert Dollfuss and Kurt von Schuschnigg accepted an Italian protectorate. Hungary and Bulgaria drew close to Italy as Mussolini had decided to support their revisionist claims The Croat separatists were supported by Mussolini, who wanted to weaken Yugoslavia as much as possible. But Germany's rise in power under Hitler soon destroyed nhat Mussolini had been able to achieve. Austria was annexed to the *Reich*, Hungary and Bulgaria fell under German control. From the dismemberment of Yugoslavia in *1941*, Mussolini received one-third of Slovenia, Dalmatia and a precarious protectorate over Croatia.

To acquire new territories in Africa, Mussolini began war preparations in the autumn of *1934* against Abyssinia and attacked, with overnhelming military forces, on Oct. *3, 1935*. The League of Nations decided on economic sanctions against the fascist war (they lasted from Kov. *18, 1935* to July *15, 1936*). hlussolini carried on, counting on the divisions between the powers belonging to the League and on the unwillingness of the democratic nations to go to war The Italian army occupied Addis Ababa, Abyssinia's capital, on hlay *5. 1936*. On May *9, 1936* Mussolini nominated the Italian king emperor of Ethiopia. Hatred against western liberalism and territorial ambitions brought him close to the nazis. In *1936* he opened negotiations with Germany and when Count Ciano visited Berlin (Sept.–Oct. *1936*) a secret agreement was reached. In the following years hlussolini went to Berlin. Hitler visited him in Rome and they met several times at the German-Italian frontier. In March *1938* he accepted Austria's annexation by Germany. In September of the same year—at the Munich conference—he helped Hitler to achieve a diplomatic success and the practical annexation of Czechoslovakia. On May *22, 1939* an Italian-German military alliance was concluded. At the beginning of World War II Mussolini proclaimed a policy of non-belligerency but on June *10, 1940*, declared war on France and Great Britain at the moment he thought Germany had certainly won the war. Italy's subsequent military debacles are described in WORLD WAR II; they led finally to his downfall on July *25, 1943*, after the Fascist Grand council, led by Count Dino Grandi, had repudiated his leadership by a vote of *19* to *7*. The king "accepted" Mussolini's resignation and appointed Marshal Pietro Badoglio to succeed him. Il Duce was placed in protective custody, but on Sept. *12, 1943*. the Germans announced he had been rescued by nazi paratroopers at a place later identified as a hotel on Gran Sasso mountain in the Abruzzi. The Germans then set up a "republican fascist party" with Mussolini as its titular head. In April *1945*. when the war in Europe was nearing an end. he and his party were apprehended by Italian Partisans outside the Italian village of Dongo, near Como, where, after "trial" they nere executed on the 28th.

MUSSOORIE (properly MASURI), a health resort in Dehra Dun district, Uttar Pradesh, India, about *6,600* ft. above sea level. Population *(1951) 7,133*, rising to *20.000* in the hot season. The town. which is *18* mi, by road north of the railhead at Dehra Dun, stands on a ridge of one of the lower Himalayas, amid beautiful mountain scenery. It is one of the chief summer resorts for residents in the plains of Cttar Prsdesh. Mussoorie practically forms one station with Landaur, *7,362* ft. above sea level. Northwestward *(22* mi.) on the road to Simla, is the cantonment of Chakrata, *7.300* ft. The climate makes hlussoorie suitable for numerous schools, including St. George's college, the Oak Grove school of the Northern railway, and several Anglican and Roman Catholic institutions. together with a cathedral of the latter faith. The first brewery in India was established there in 1850. The town has botanical gardens, and is the summer headquarters of the Indian government trigonometrical survey

MUSSORGSKY, MODEST PETROVICH (1839–1881), Russian composer, was born at Karevo, Pskov government. March *21, 1839* The son of a landowner. he was sent to the army cadet school in St. Petersburg at *13*, and at *17* entered the Preobrazhensky regiment. He became seriously interested in music in 1857, when he met Aleksandr Dargomyzhski, César Cui and Mili Balakirev (*qq.v.*). The following year he began to study systematically under Balakirev. who mas only three years older. From the age of *19* Mussorgsky suffered intermittently from a nervous disorder, and before entering the civil service in *1863* led the life of a dilettante, playing the piano in society and beginning various compositions, an opera based on Gustave Flaubert's *Salammbô* and others remaining unfinished. What drove him to earn his living was the liberation of the serfs in *1861*, with which he was politically in sympathy, but which impoverished him as a member of a landed family. His first mature songs date from 1864. He was artistically influenced by Michael Glinka, who had died in *1857*, but whose sister he met in *1866*, and Nicolas Rimsky-Korsakov (*q.v.*), whom he had first known in *1861*. Although Rimsky-Korsakov was five years younger and at first as amateurish as any of the circle, he acquired a more solid technical equipment than hlussorgsky ever achieved and. far less of a spontaneous and natural genius though he was, gained a kind of artistic ascendancy over him. The two shared lodgings from 1871 until Rimsky-Korsakov's marriage. This association mas to bear questionable fruit after hlussorgsky's death, when his friend undertook to edit the finished and unfinished works left by the composer who, though faultily trained, was by far the most important figure among the five who formed the group known as *moguchaya kuchka* (the mighty handful) including these two, Balakirev, Xleksandr Borodin and Cui.

In *1868* Mussorgsky, who by that time had written more than half of his many songs, began an opera based on Nikolai Gogol's *The Marriage*, but abandoned it in favour of another, *Boris Godunov*, based on Aleksandr Pushkin's drama and N. M. Karamzin's Russian history. The first version was finished in 1869, but was at least twice revised by the composer, the second time at the behest of the Imperial opera, which refused to produce the work without a love episode, but at last performed it on Feb. *8, 1874*. Yet another version appeared after Mussorgsky's death, drastically altered and "corrected" by Rimsky-Korsakov, and this held the stage until the earlier versions were tried during the 20th century and judged superior by many authorities. They certainly far better represent Mussorgsky's art, which includes some characteristic crudities more interesting and attractive than any editorial polish. The next two operas, *Khovanshchina* (1872–80) and *Sorochintsy Fair* (1874–80), both remained unfinished. Drunkenness laid hold of Mussorgsky more and more disastrously and made him incapable of sustained work. He still wrote many remarkable songs, however, including the cycles *Sunless* (1874) and *Songs and Dances of Death* (1875–77), as well as the vivid piano suite *Pictures From an Exhibition (1874)*. He died in misery at a military hospital in St. Petersburg, March *28. 1881*.

Mussorgsky survives as a great composer on few works *Boris Godunov* is recognized as an opera nonetheless great for being in some ways defective. and many of the songs. which shon his great gift of outlining human character, are among the most striking and memorable ever written. Mussorgsky had neither the copiousness nor the assured craftsmanship of Tschaikovsky. but ranks with him as a great composer, representing at its best the national side of music in Russia as Tschaikovsky stands for its cosmopolitan aspect.

See M. D. Calvocoressi, "Mussorgsky," *Master Musicians .Series* (1946). (E. W. BM.)

MUSTAFA KEMAL ATATÜRK (1881–1938), Turkish soldier and statesman, was born in Salonika, Greece; his father, a customs officer who afterward entered the timber trade, died when Mustafa was a small child. At the military preparatory school he proved to be an exceptional student, especially in mathematics. His teacher in mathematics, who was also named Mustafa, gave him the distinctive surname of Kemal (Arabic, perfection), as a tribute to his ability. He did not receive the name Atatiirk till 1934, when family names were introduced in Turkey by law.

In 1904 he was gazetted lieutenant, but arrested on the same day and. after examination, banished to Damascus, Syr. There. after observing the deplorable condition into which the civil and military organization of the empire had fallen, he founded in 1905 the secret political society Vatan (Fatherland). From Damascus he was transferred to Jaffa. whence he made his way secretly to Salonika to organize a similar political movement in the European provinces. The association which he founded at Salonika was afterward affiliated with the Union and Progress society. The Constantinople government again ordered his arrest; but he escaped and the government presently forgot him. In 1907 he was promoted and sent to Salonika, where he resumed his revolutionary activities.

When the revolution of 1908 re-established the constitution of 1876, Mustafa Kemal found himself in serious disagreement with the leaders of the victorious Union and Progress party. In consequence he abandoned politics for the time and turned his whole energy into his military career, in which he advanced rapidly. In 1911 he went to Tripoli incognito to take part in the war against Italy. There he was promoted to major. The first Balkan War was over before he could return; but in July 1913, during the second Balkan War, he was appointed chief of staff to the newly organized army corps on the Gallipoli peninsula, where he made a detailed firsthand study of the problem of defending the Dardanelles. After the restoration of peace he was appointed military attaché at Sofia and held this post until the autumn of 1914.

Mustafa Kemal believed that Turkey had entered the war prematurely and that Germany was doomed to eventual defeat. Possibly for this reason his desire to return to active service was not encouraged; but on his insistence he was appointed commander of the forces at Rodosto, Turk., and afterward (in 1915) at the Dardanelles. He inspired the defense of the straits against the British attack—this, when the Turkish high command had lost hope. Mustafa Kemal was then sent to the Caucasus. where he was promoted to the rank of pasha and recovered Bitlis and Mush from the Russians. In 1917 he was posted to the Hejaz.

At this time Germany's intervention in the internal affairs of Turkey had reached its height, and Mustafa Kemal Pasha put himself at the head of the opposition to it. He sent in a succession of reports adverse to the Baghdad expedition, which he thought would end in another disaster, and when his advice was ignored he resigned. In 1918 he yielded to Sultan Mehmed and accepted command of the 7th army corps in Palestine but all chance of taking the offensive, or even averting disaster, had then disappeared.

When the Turkish government negotiated the armistice of Mudros (Oct. 30, 1918), Mustafa Kemal was opposed to the policy of complete surrender and, after the signature of the armistice, retired to Constantinople. The Greek landing at Smyrna on May 16, 1919, which reawakened the Turkish nation, and his appointment by the Ottoman government in Constantinople as inspector of the 9th army corps in northeastern Anatolia gave him his chance. Mustafa Kemal meant to create a nucleus of national resistance against the partition of the country and therefore accepted with alacrity the position oifered him by the unsuspecting government. As soon as he landed at Samsun he began to organize his new movement locally at Amasia, Tokat and Sivas and to correspond secretly with other parts of the country. The sultan's government, too late, recalled him to Constantinople, but he went on instead to Erzerum and sent in his resignation. He next convened two congresses. one at Erzerum in July, the other at Sivas in Sept. 1919. Both congresses endorsed his program of fighting for national existence to the bitter end, and relations betueen the capital and the interior of Anatolia were broken. All the efforts of the Constantinople government and the Allied powers to frustrate Mustafa Kemal's activities simply strengthened his conviction. On April 23, 1920, he gathered at Angora the nationalist members of the late parliament who had escaped from Constantinople and was unanimously elected president of this new national assembly.

During the two and one-half years which followed Mustafa Kemal's military ability, intellect and oratory carried his countrymen through their ordeal. During the summer campaign of 1921, which was the supreme crisis of the Graeco-Turkish War, the Angora assembly appointed him generalissimo of the Turkish forces, with unlimited power; and he took personal charge at the front during the 22 days' and nights' fighting of the battle of the Sakaria, which brought him the rank of field marshal and the traditional title of Ghazi (the victorious). The destruction of the Greek army, the peace settlement at Lausanne, Switz., the abolition of the sultanate, the declaration of the republic and the abolition of the caliphate were the direct work of Mustafa Kemal. On Oct. 29, 1923, when the republic was proclaimed, the national assembly unanimously elected him president, an office to which he was re-elected on Nov. 1, 1927, on May 4, 1931 and finally on March 2, 1935. He died on Nov. 10, 1938, and was succeeded as president by Ismet Inonii (*q.v.*).

Atatürk was the builder of a modern Turkish nation, the reformer of all Turkish life. Under his strong guidance the legacy of the mediaeval and oriental Ottoman empire was discarded and the country turned into a modern progressive secularized republic which could keep abreast of all human progress and take a constructive place at the side of other nations. Though Atatürk, in view of the general backwardness of the country, could accomplish his aim only by dictatorial methods, he remained faithful to the progressive and liberal ideas of his youth. He emancipated the Turkish women, established complete equality of all citizens, introduced universal education and became an educator to democratic forms of life. The democratic constitution of the republic was jealously guarded; Atatürk regarded his dictatorship as a temporary institution for strengthening the foundations of liberal democracy in a population not prepared for it.

In foreign affairs Atatürk resolutely abandoned all dreams of expansion or of military glory, so dear to other nationalist dictatorships. He taught the Turks the virtue of moderation in their aspirations and even succeeded in making a lasting peace with the Greeks, with whom the Turks had fought bitterly for many centuries and whom he had defeated shortly before.

The firm friendship with Greece allowed Turkey to become the leader in an effort to secure a lasting peace by collective agreements with its neighbours: the Balkan pact which united Turkey with Greece, Yugoslavia and Rumania; and the Near Eastern pact which united it with Iran, Afghanistan and Iraq. Atatürk also maintained close and friendly relations with the U.S.S.R., which had helped Turkey throw off the conditions of the peace of Sèvres. He also led Turkey to join the League of Nations and to make peace with the former enemy nations, Great Britain and France.

BIBLIOGRAPHY.—Mustafa Kemal Atatürk delivered a long justification of his activities before the members of his party in Angora (Oct. 15–20, 1927), official tran. *Die Neue Türkei*, 2 vol. (1928). (A. J. T.; H. Ko.; X.)

MUSTANG, the wild or semiwild horse of the prairies of North America, the descendant of the horses imported by the Spaniards after the conquest in the 16th century (see HORSE).

MUSTARD is a name applied to a family of plants (Cruciferae) in which each flower has four petals forming a cross if viewed from above: to various species in several genera of the family; to the leaves of these species when used as greens; and to the pulverized seeds of several species. Both white mustard (*Sinapis alba*) and black mustard (Brassica *nigra*) originated in the Mediterranean region or Middle East, have been cultivated for 2,000 years or more, and have spread almost throughout the temperate regions of the world. Mustard plants were mentioned frequently in biblical. Greek. and Roman writings. Mustard seed was used medicinaily by Hippocrates and probably earlier. Indian mustard (*Brassica juncea*) possibly originated in Africa, but if so, it reached Asia at an early date, where it is extensively cultivated. Wild mustard plants were biennial, but selection has developed annual strains: the only types cultivated.

Mustard is raised for the leaves, to be used as greens, and for the seeds which yield oils and are used as a condiment. To produce greens the plants are grown during the spring or fall, for only basal leaves from fast-growing plants are suitable as pot herbs. Seeds are sown at two- to five-inch intervals in rows two feet apart, or broadcast. Seed-producing plants are grown in summer when flowering occurs early and few leaves appear. Both types of culture are practised in Asia, Europe and North America, and California, Montana and Kentucky lead in production in the United States. Black mustard is a weed in parts of Britain. in California and in some other areas. The plants may attain heights of 10 to 16 ft. Other species of *Brassica* and Sinapis are less aggressive weeds than the black mustard and are troublesome locally only. Mustard is used occasionally as a cover crop. for stock feed, as a green manure in orchards or prior to planting crops that grow best in mid-summer.

WHITE MUSTARD (B. HIRTA), SHOWING FLOWERS AND FRUITS (SILIQUAE)

Mustard seeds contain a fixed oil that is present in amounts of 30% to 35% and is extracted by the cold press method. This oil is edible, but is used mainly as an illuminant, for making soap and rubber substitutes, in the manufacture of leather and woolen goods, for quenching steel plates and for other technical purposes. A second. very different oil, is obtained by grinding the seeds and treating the flour with water to cause a chemical action between an enzyme and a glucoside, producing an oil not present, as such, in the tissues of the plant. In black mustard the enzyme myrosin acts on a glucoside, sinigrin, to produce a volatile, very irritating oil which was the mustard gas of World War I. In white mustard the same enzyme acts on a different glucoside, sinalbin, to produce a nonvolatile oil that is a powerful rubefacient, but less irritating than the oil from black mustard, and is used in mustard plasters. Such plasters (*Emplastrum sinapis* in the U.S. Pharmacopoeia) contain mustard mixed with one .to four parts of flour to control the irritating qualities.

Many species of Cruciferae have similar systems of enzymes and glucosides in the seeds, and to a lesser degree, in the leaves. The enzyme is destroyed by boiling. so greens made from B. juncea are boiled twice, the first water being discarded to reduce the "bite."

Table mustard made from the seeds of black mustard is preferred on the continent of Europe, while that made from white mustard in England. In the Cnited States the condiment is usually made with a mixture of these two seeds, with a small quantity of B. juncea seed blended with the others in some grades. The sharpness of the condiment may be toned down by adding starch or flour: vinegar or wine, and certain other spices. Mustard. either dry or moist. soon loses its potency owing to oxidation unless it is hermetically sealed. When eaten it stimulates salivary secretions and peristaltic action in the stomach.

See I. H. Burkill, A Dictionary of the Economic *Products* of the Malay Peninsula (1935); A. F. Hill, Economic Botany, 2nd ed. (1952).

(I. L. W.)

MUSTARD GAS, the name given to β, β'-dichlorodiethyl sulphide, one of the most effective toxic agents used during World War I. This substance is not easily destroyed by weathering; at ordinary temperatures, it is a liquid which evaporates only slowly. It therefore tends to persist for days or weeks in any area where it has been released. This property largely governs its tactical use. Inhalation of a sufficient quantity of mustard-gas vapour causes pulmonary inflammation. When the vapour or (more particularly) droplets of the liquid come in contact with the skin, severe blisters and burns are produced (vesicant effect). Of these two methods, the second is more important for military purposes. In World War I mustard gas caused many temporary casualties but few permanent injuries and still fewer deaths. See CHEMICAL WARFARE.

MUSTARD OILS, a general term applied to the esters (q v.) of isothiocyanic acid. The name arises from the fact that allyl isothiocyanate occurs in. and forms the principal component of, the oil obtained by distilling black mustard seeds (Sinapis nigra). These seeds contain a glucoside (see GLYCOSIDES, NATURAL) termed potassium myronate which undergoes a fermentative change due to an enzyme (*q.v.*), myrosin, also present in the seeds. Allyl mustard oil (allyl isothiocyanate). $C_3H_5.N:C:S$, is a colourless liquid sparingly soluble in water and boiling at 151° C.; it has a sharp pungent odour and produces blisters on the skin, whence the efficacy of the mustard poultice as a counterirritant. It can be prepared synthetically by heating allyl bromide, $CH_2:CH.-CH_2Br$, with potassium thiocyanate. The odour and taste of mustard (*q.v.*) are due to this substance. The analogues of allyl isothiocyanate are readily prepared by the action of carbon bisulfide on primary amines, when alkyl dithiocarbamates are formed which on distillation with mercuric chloride yield the corresponding mustard oils. These compounds are colourless liquids with pungent irritating odours. This general reaction proceeds so smoothly that it is employed as a distinctive test for primary amines. See AMINES.

MUTANABBI, AL- (ABU AL-TAYYIB AHMAD IBN HUSAYN) (915–965), regarded by many Arab critics as the greatest Arab poet of Islamic times, was born at Kufah of poor and obscure parentage. He gave early signs of poetic talent and became a professional poet. This meant that he had to attach himself to a succession of rich patrons willing to support him in return for poems extolling their merits. His debut was made among the bourgeoisie and minor officials of Syria and Palestine. His career was interrupted by a curious incident of which little is known in detail: in 932 he joined a heretical revolutionary movement staged by a section of the nomad tribes of the Syrian desert and is alleged to have declared himself as the "prophet" of the movement. It was from this that he gained the cognomen of al-bfutanabbi. "the claimant to prophethood." The revolt failed, and he spent two years in prison, thereafter resuming his profession. The peak of his career was reached when, in 948, he attached himself to the brilliant and versatile Hamdanid prince of northern Syria. Sayf-al-Dawlah. For the first time, al-Mutanabbi had a patron whom he could admire. But the association lasted only nine years, and the latter part of it was clouded nith intrigues and jealousies. which culminated in al-Mutanabbi's leaving Syria for Egypt, then under the rule of a rival princely family, the Ikhshidids. The ruler, however. was a puppet and actual power rested in the hands of the Negro eunuch Kafur, to whom al-Mutanabbi attached himself. Such patronage was wounding to his pride, and he soon transferred himself to the protection of Abu Shuja' Fatik, another prominent member of the Ikhshidid court. The latter died in 961. and the poet's position was then one of extreme danger; he had bitterly offended Kafur, both by deserting his patronage and by writing scurrilous satirical poems against him, and was forced to flee secretly. He returned to Iraq and after four years of wandering in an unsuccessful search for another patron was killed by bandits during a journey.

Ancient Arabic poetry had been characterized both by a rich and varied vocabulary and by a freshness and spontaneity resulting from an intimate acquaintance with the Bedouin environment with which the poems dealt. In the urban civilization which grew up in the 8th century, poets who clung to the ancient models were forced either to replace this freshness by literary artifice or to retain spontaneity by writing on intimate and personal themes in a simple, everyday language. Abu Tammam and Buhturi (*qq.v*), belonged to the former school and al-Mutanabbi followed them. Hence his poetry is ornately rhetorical; yet he handles this "Augustan" style with consummate skill and artistry, and greatly influenced Arabic poetry until the 19th century. His collected poems (edited by 'Abd-al-Wahhab with introduction and notes, 1944) are mainly panegyric. but contain some occasional odes (*e.g.,* laments and satires) of high quality.

See R. Blachère, *Un podte arabe du IV^e siècle de l'Hégire, Abou-Tayyib al-Motannabi* (1935). (A. F. L. B.)

MUTATION: see VARIATION: Experimental; HEREDITY; EVOLUTION, ORGANIC.

MUTILATIONS AND DEFORMATIONS. In every part of the world, both in civilized as well as uncivilized communities some form of mutilation of the human body is found; but the widest variety of mutilations as well as the most severe occur among the more primitive peoples.

Early historians and writers, long before the Christian era, show that in those days such mutilations as tattooing and circumcision, as well as skull deformation, were well known. Some form of mutilation was probably practised from earliest prehistoric times. On the cave walls of France and Spain, where Aurignacian and Magdalenian man painted the mammoth, elephant and woolly rhinoceros during the closing phases of the last Ice Age, are painted hands which indicate the removal of one or more finger joints, a practice still common in South Africa, India and elsewhere. The reason for this mutilation on the part of prehistoric man can only be conjectured by analogy with these modern primitive peoples. The Wellcome Historical Medical museum in London has a skeleton of an early man from a prehistoric grave at Gebel Moya in the Sudan. Found close to the jaw is a stone stud exactly similar to the lip studs worn by modern Nilotic peoples. Other evidence may be found in folk tales, early paintings and carvings and by a careful interpretation of objects found in the graves. The motives behind mutilation may be classified as. tribal convention; adornment; initiation ceremonial; religion; punishment; and health.

Skin. — Tattooing consists of puncturing the skin in the pattern desired and rubbing in colouring material so that the pattern is indelibly fixed. In New Zealand the Maoris brought tattooing to a very high art, and the intricate patterns with which they adorned their faces were executed with exquisite workmanship and taste. In China, Borneo. India and other parts of the Far East tattooing is prevalent, and it was introduced into Europe chiefly by sailors. Arms, legs, body and face are all considered suitable surfaces for decoration. Modern tattooing saloons exist in London and in many of the bigger seaports. True tattooing, but of a less lasting nature, is occasionally found in parts of Africa, and must not be confused with scarification.

Scarification. — This consists of cutting deep marks into the skin and rubbing in charcoal and other irritant material to keep open the wound which eventually is allowed to heal but which leaves a deep scar. Sometimes the wound is so treated that a shiny keloid instead of a flat scar results. Scarification occurs all over Africa for reasons as numerous as they are different. Very frequently small scars are made on the face which serve as tribal and clan marks. Often elaborate patterns are worked out on the chest for purely personal adornment; these are especially good on the West Coast. Sometimes the object of the operation is semimagical, women of many African tribes being scarified on the abdomen during pregnancy. At other times, scarification is merely the result of surgical treatment and is the consequence of rather crude cupping methods followed by the application of an irritant powder. In Australia the aborigines scarify their arms and chests, which often show great black keloids representing many years of patient work, the wound being opened up from time to time and fresh irritants applied.

Hair. — Depilation by some means or other has been practised by primitive peoples for hundreds of years, while all modern civilized peoples still continue to remove unwanted hair by various methods. One of the widely accepted modern methods employs electrolysis as a means for removal of adventitious growth of hair. One of the commonest primitive methods of hair removal is by plucking out each individual hair by its root, every time it grows. By starting at an early age the time comes when the hair on the parts so treated could be grown only sparsely even if desired. Depilation by plucking is common all over Africa and in many parts of the east and Oceania. The areas so treated are more especially the face and pubic regions, and chest and under the arms. Some individuals even go to the length of removing all body hair.

Shaving of the face, as well as of the scalp, is a common practice among primitive people, and may be carried out with such instruments as a piece of broken glass, or a special iron blade. It is usually done dry, without the use of water or lather. Depilation by singeing, as well as by the use of ointments occasionally occurs.

Removal of the hair is usually a tribal custom, as hairy people are despised and often unable to find a mate.

Head. — There are few if any parts of the world where some portions of the head and face entirely escape mutilation, but the most commonly maltreated are the ears, nose, lips and teeth. Skull deformation may be the result of deliberate intention, or of chance. In some tribes, especially in America every individual was intentionally treated as a child with the direct view of reducing the skull to a certain shape. In other cases, as in parts of Africa, deformation is the unintentional result of the local methods of carrying water pots or loads on the head. Young children, especially girls, start such work long before the skull is properly developed and the result is a definite and fairly uniform deformation. Skull deformation occurs in nearly every part of the world, though commonest in the Americas and least common, if at all existent, in Australia. Intentional deformation is carried out from various motives, sometimes a long pointed head, sometimes a flat depressed head being the shape required. Various methods are employed, commonest of which are by bandaging, and by tying the child's head to a flat board fixed to the occipital region.

Ears. — These are pierced to carry earrings all the world over, indeed very few, primitive or civilised peoples, leave the ears totally unmutilated, though the Andamanese, Bushmen and true Baganda are reported as doing so. Both the ear lobes, as well as the cartilage round the top of the ear, are commonly pierced. This is usually done during childhood and a small piece of wood is inserted into the wound which is then left to heal. Later this plug is removed and a larger one inserted, the process being continued until the required size of hole is obtained by reason of this continual stretching. In many countries both sexes treat their ears in this way, while in others it is confined to one or other sex. The greatest distensions are to be found in Borneo and East Africa. In both these places lobes are often seen so stretched that they hang down to the shoulder, with holes so large that it would be possible to pass a closed fist through them. In all these ear mutilations adornment is the end in view. Large carved wooden plugs, carved stone ornaments, metal rings and fibre and paper rolls, all are used as earrings, while to-day even earthenware jam pots and circular cigarette tins are popular in some parts of Africa.

In some tribes such as the Kikuyu, a husband if displeased with his wife breaks the lobe of her ear with his hands.

Nose. — The nose is often mutilated for purposes of personal adornment especially in India, and the East, as well as in New Guinea and Polynesia, S. America, Australia and in parts of Africa. Nose ornaments also signify social rank. Sometimes it is the alae, and sometimes the septum which is perforated. Often only a small hole is made through the septum from which a gold ring or other jewel is suspended; at other times the hole in the septum is big enough for a finger to be passed through. Elsewhere one, and occasionally both, nostrils are pierced and distended to carry coloured studs, sometimes of unbelievable size, as among the Makonde of Portuguese East Africa. Nose ornaments are more common with women than men, but in New Guinea and especially among the Tugeri and the Solomon Islanders, the men wear great pointed sticks, or sometimes the tusks of wild pig through holes in the nose.

Lips. — In several parts of Africa, especially in the Congo, the south east Tanganyika Territory, and the upper reaches of the Nile, and among the Botocudo of S. America enormous plates and plugs are inserted in hugely distended holes, cut in the upper and lower lips. The lip studs and pins of the Nilotic peoples of Uganda, Kenya Colony and the Sudan are usually small and made of ivory, rock crystal or stone, and are inserted through the upper and lower lips or both. Other lip mutilations include pricking and rubbing with irritant to cause them to swell. This is done in parts of West Africa.

Teeth. — Over the greater part of Africa, as well as in Australia, New Guinea and elsewhere, it is a common practice to remove one or more front teeth in the upper or lower or both jaws Sometimes the ceremonial knocking out of the teeth accompanies initiation and is a test of ability to bear excruciating pain unflinching; sometimes it is simply a matter of custom; sometimes it serves as a tribal mark, while yet another reason given is the fear of lock-jaw. The removal of the teeth is in this case a precaution which would enable the patient to be fed if the disease were contracted.

Another common practice in Africa, found also in Southern India, is the filing or chipping of teeth to serve either as a tribal mark or as an initiation step, or for both purposes. The Akamba and certain Congo peoples file their incisors to sharp points, and for some unknown reason this was considered by early travellers as a sign of cannibalism — a most erroneous view. The Eskimo file the teeth to make them shorter and less like those of dogs and in south and central Africa the incisors are filed to all sorts of shapes and patterns as described by Dr. G. Turner in the *Transvaal Medical Journal* for 1911

The Dyaks of Borneo and other people in the East, occasionally drilled holes in the teeth, into which plugs of gold were driven to serve as ornament. This method of adornment was also used in ancient Mexico, precious stones being inlaid in the teeth.

Tongue, Cheeks **and** Neck. — Among the Bateso of East Africa a hole is sometimes bored through the tongue and a brass ring bearing one or two beads is inserted. The cutting out of the tongue was once a legal penalty in Europe, and has only recently been forbidden in some parts of Africa.

The Aleutian Islanders bored a hole through each cheek through which seal's whiskers were stuck. Feathers are put through holes in the cheek in parts of S. America.

The *Padang* of the South Shan States deform the necks of their womenfolk by making them wear — from early childhood onwards —high metal collars whose length is gradually increased; this eventually produces such elongation and dislocation of the neck that if the collars were removed the wearers would not be able to hold up their heads.

Eyes **and** Body. — Putting out eyes as a punishment for various crimes has existed at different times all over the world — Europe included. Priests and worshippers of certain eastern cults still gash and cut themselves with knives as did the priests of Baal in olden times. In parts of Africa it was once a practice to cut off the breasts of an unfaithful wife.

Limbs. — In former times both in England, and Europe generally, amputation of one or more limbs was a common punishment for crime *(see* Pike's *History of Crime in England,* 1893), and this method has also been suppressed in parts of Africa.

For purposes other than punishment and medical necessity, amputation consists chiefly of cutting off the finger joints. especially the little finger. In south Africa this was either done as mourning or as a magical preventive measure in the case of a child born to a mother whose last baby aas stillborn. In southern India grandmothers used (in some castes) to have to cut off one joint for each grandson born to them.

There is too the former Chinese bandaging of girl children's feet to prevent their development.

MUTIS, JOSÉ CELESTINO (1732–1808), Spanish naturalist noted for his studies of the plants of Colombia and for his part in the early history of quinine, was born at Cadiz on April 6, 1732. He took his degree at Seville university and afterward studied medicine at Madrid, where for a time he lectured in anatomy. His preference, however, was for the study of mathematics and natural science. especially botany. He became one of the first Spanish disciples of Linnaeus. Attracted by the wide and fruitful fields of study which South America then afforded, Mutis sailed in 1760 for New Granada (Colombia).

There he occupied himself collecting and describing plants from the lowlands and from the higher Andean regions. but that he did not neglect medicine is shown by his appointment as king's physician in the viceroyship. He spent much time on sanitary problems, including the establishment of proper cemeteries, the prevention of smallpox and the reduction of malaria. He put into general use many South American herbs, the properties of which he had studied, among them ipecacuanha (ipecac), guaco and Peruvian balsam. Some of these, such as the cinnamon laurel of the Andes, he made known in Europe.

Mutis' favourite study, however, was quinine, which he investigated from every angle from the distribution of the different species of cinchona down to experiments in the curative properties of the drug. Having been presented with some samples of bark and a drawing of the tree, he sent them to Linnaeus (1764). His *El Arcano de la quina* was published in 1793. Later studies were published in the *Papel periodico* and, after his death, by his nephew Sinforoso Mutis, who completed and arranged his notes on the subject (1828).

His work probably had much to do with making possible the colonization of malaria-infested regions. It attracted the attention of the king, who created the Royal Botanical expedition of New Granada and placed Mutis at its head. With 18 of his best students, Mutis carried out a systematic survey in which material was collected for the monumental *Flora de Bogotá ó de Nueva Granada* which he planned in 13 folio volumes.

Only the first volumes of this intended work were arranged at his death. For the remainder he left manuscripts, notes, illustrations and sketches in such profusion that only someone knowing his schemes of arrangement could have finished the work. Among these botanical riches were 6,480 illustrations, admirable in precision and colour, which were intended for an atlas volume. This material, amounting to more than 4,000 folios of loose manuscripts, and his collection of more than 20,000 plants were sent after his death to the botanical garden at Madrid, where they are preserved.

For 18 years Mutis carried on a correspondence with Linnaeus, much of which was published in *A Selection of the Correspondence of Linnaeus* (1821). He furnished many specimens of plants which the Swedish naturalist described, including additional material from which Linnaeus' son perfected the generic description of cinchona. Linnaeus the younger named in Mutis' honour the beautiful genus *Mutisia,* of the family Compositae, comprising about 50 species of plants found in South America. Mutis died at Bogotá on Sept. 11. 1808.

MUTTON: *see* LAMB AND MUTTON.

MUTTONBIRD: *see* SHEARWATER.

MUTTRA (officially, and anciently, MATHURA), a city and district in the Agra division of Uttar Pradesh, India. The city is on the right bank of the Jumna, 30 mi. above Agra; pop. (1961) 125,808. In the 6th century B.C. it was the capital of the Saurasenas. Fa Hien *(c.* A.D. 400) refers to it as a centre of Buddhism; but his successor Hsuan Tsang *(c.* 650) is forced to record a Brahmanical revival. It was sacked by Mahmud of Ghazni in 1017–18; about 1500 Sultan Sikandar Lodi destroyed all the Hindu shrines, temples and images; and in 1636 Shah Jahan appointed a governor expressly to "stamp out idolatry." In 1669–70 Aurangzeb visited the city and continued the work of destruction. Muttra was again captured and plundered by Ahmad Shah with 25.000 Afghan cavalry in 1757.

The town is still a great centre of Hindu devotion, and temples and bathing stairs line the river bank. The majority are modern, but the mosque of Aurangzeb, on a lofty site, dates from 1669. Most of the public buildings are of white stone, handsomely carved. The city is the seat of two colleges of Agra university and of the Curzon museum of antiquities. Cotton, paper and pilgrims' charms are the chief manufactures.

MUTTRA DISTRICT (area 1,467 sq.mi.; pop., 1961, 1,070,572) consists of an irregular strip of territory on both sides of the Jumna. The eastern half consists of a rich upland plain, abundantly irrigated by wells, rivers and canals, while the western part, though rich in mythological association and antiquarian remains, is comparatively unfavoured by nature. The principal crops are millet, pulse, cotton, wheat, barley and sugar cane. The eastern half is watered by the navigable Agra canal and the western half by branches of the Ganges canal. The central part of Muttra district is one of the most sacred spots in Hindu mythology. The district within a circuit measuring about 170 mi. around Gokul and Brindaban nas called Braj-Mandal and had many associations of earliest Aryan times. There Krishna and his brother Balarama fed their cattle: and numerous relics of antiquity in the tonns of Muttra, Gobardhan. Gokul. Mahaban and Brindaban attest the sanctity of this holy tract. After the invasion of Mahmud of Ghazni the city fell into insignificance until the reign of Akbar; thenceforward its history merges in that of the Jats of Bharatpur, until it again acquired separate identity under Suraj Mal in the mid-18th century. The whole of Muttra passed to British rule in 1804.

BIBLIOGRAPHY.—F. S. Growse, *Mathura: A District Memoir* (1883); J. P. Vogel, *Catalogue of the Archaeological Museum at Mathura* (1910) and "La Sculpture de Mathura," *Ars Asiatica* (1930).

MUTUAL ECONOMIC ASSISTANCE, COUNCIL OF, an organization established in Moscow, U.S.S.R. in Jan. 1949 to centralize arrangements for trade, credit and technical assistance between the Soviet Union and the other members of the Sino-Soviet bloc. Before its establishment, foreign trade, apart from reparation payments to the Soviet Union from the defeated countries of eastern Europe, mas conducted under one-year agreements on a bilateral basis that specified fixed quantities of goods to be imported and exported. Prices were expressed in the United States dollars at existing prices. No credits were provided. and the accounts nere expected to be balanced each three months. This system was regarded as inadequate since there was no assurance that necessary imports would in fact be supplied or surplus exports bought.

After Jan. 1949 and especially after the ruble revaluation of Feb. 1950 this system was altered The new Council of Economic Mutual Assistance (CEMA) permitted longer-run national planning through the exchange of lists of minimum import needs and export availabilities; the conclusion of long-term trade agreements for periods up to five years; and the conclusion of bilateral investment agreements and technical-assistance contracts. Particular co-operation was effected in transportation where agreements provided for the exchange of rolling stock.

Credits from the Soviet Union under the CEMA arrangements nere arranged to finance trade imbalances and specific investment projects. such as factories to be built with Soviet equipment and possibly by Soviet technicians. The standard credit arrangement was said to run for 12 years. bear $2\frac{1}{2}\%$ interest and call for repayment in commodities (possibly those produced by the factory) or in the money of the borroner. The amounts of such credits were difficult to determine. A totaling of specific announced credits amounted in 19j6 to $850,000,000 for eastern Europe and at least $430,000,000 for Communist China. A statement by N. Khrushchev in 1956 set the total at $5,500,000,000. A 1958 estimate by the west German finance ministry was $7,000,000,000. These last tno figures may have included some considerable volume of military credits. All figures were derived by converting rubles into dollars at the official exchange rate fixed in 1950—four rubles to the dollar. This rate could substantially overstate the purchasing power of the ruble outside the Soviet bloc.

No estimate was possible of the extent to which this unknown amount of credits represented net assistance by the Soviet Union to the other members of the bloc, because of the unknown amount of reparations from the satellites to the Soviet Union, especially from Germany. After the disturbances in 1956, however, it was clear that the rate of Soviet assistance increased.

The nest German finance ministry indicated that aid by Communist China increased sharply after the middle of the 1950s. Credits, loans and gifts were said to have amounted to $190 000,000 in 1955, $170,000,000 in 1956 and $215,000,000 in 1957. The last figure consisted of $85,000,000 each for North Korea and North Vietnam. nith smaller amounts for Outer Mongolia, Sepal and Hungary.

For a discussion of Soviet aid to countries outside the Sino-Soviet bloc. *see* FOREIGN AID PROGRAMS

The volume of trade among the countries of the Sino-Soviet bloc conducted under CEMA was difficult to estimate. Including east Germany and Communist China. total trade of the bloc may have amounted to $12.500,000,000 in 1952. Of this sum. $9,400,000,000, or 75%, was believed to represent intra-bloc trade. Bloc trade with the outside world mas more readily approximated. and was believed to have declined from $2,000,000,000 (of "free world" exports) in 1947 to $1,388,000,000 in 1953, under the impact of the strategic trade control system. After 1953 it expanded again, as the system was relaxed, and reached $3,086,000,000 in 1957.

See Nicolas Spulber, *The Economics of Communist Eastern Europe* (1957), especially ch. 11. For a discussion of the trade of the Soviet bloc with nonbloc countries including underdeveloped nations, *see* the reports to the congress under the Mutual Defense Assistance Control act of 1951 (Battle bill), especially the eighth report for the last half of 1955 (*C.* P. K.)

MUTUAL SECURITY PROGRAM, the name by which U.S. foreign aid programs became officially known in 1951. The concept of U.S. economic aid to Europe exemplified by the Marshall plan (European Recovery program) was applied to non-Euroocan areas. as well as to Eurooe. and combined with U.S.-aided technical assistance programs and programs of mutual military defense and defense support in the Mutual Security act of Oct. 10, 1951 and succeeding mutual security acts. A Mutual Security agency (MSA) was established as the successor of the Economic Cooperation administration (ECA). which had administered the Marshall plan. In 1953 MSA was superseded by the Foreign Operations adininistration (FOA) and in 19jj by the International Cooperation administration (ICA). See FOREIGN AID PROGRAMS.

MUWASHSHAH, an Arabic poetical genre in strophic form (in contrast to classical Arabic poetry in which a poem has one single rhyme recurring at the end of each line); it is said to have been invented in Spain by a poet from Cabra who lived *c.* 900. The fundamental scheme is seen in the following example, and its translation:

Nasimu'l-rawdi fah (A) fa-qumu nashrahu (B)

A-la qum ya ghulam (c)
Adir ka'sa'l-mudam (c)
Mada sirfu'l-zulam (c)
Wa-kafuru'l-sabah (A) ilayna yujlabu (B)

Silu mazja'l-khumur (d)
Bi-salsali'l-thughur (d)
Fa-ma sirru'l-surur (d)
Sima ka'sati rah (A) wa-riqin ya'dhubu (B)

The garden scents the air; (A) Awake and drink, my friend; (B)

Awaken boy, I say, (c)
And pass the cup this way; (c)
Darkness is gone, and day, (c)
Shining and camphor-fair, (A) To us doth perfume send. (B)

Come, mix the ruby sips (d)
With nectar of the lips. (d)
While time for ever slips (d)
Away, what joys are there (A) But these, before the end? (B)

The usual number of strophes is five. The rhyme scheme can be complicated by introducing internal rhymes (*e.g.,* ABCABC defdefdefABCABC, etc.). The poems are written in classical Arabic and their subjects are those of classical Arabic poetry, such as panegyric, love. wine. The second part of the last strophe (called *kharja* or *markaz*) is usually written in vernacular Arabic or in the Spanish "Mozarabic" dialect; it is normally put into the mouth of a girl and expresses her longing for her absent lover. These verses—the earliest examples of lyric poetry in a Romance language—make it probable that the inventors of the *muwashshah* were partly inspired by some kind of oral Romance poetry. Most of the Arabic *muwashshahs* from Spain are from the 11th and 12th centuries. From the 12th century onward the genre also spread to north Africa and the east. Jewish poets of Spain also wrote *muwashshahs* in Hebrew, with *kharjas* in Arabic and Spanish.

See M. Hartmann, *Das arabische Strophengedicht. I: Das Muwassah* (1897); S. M. Stern, *Les chansons mozarabes* (1953). (*S.* M. SN.)

MUYBRIDGE, EADWEARD (EDWARD JAMES MUGGERIDGE) (1830–1904), British photographer and pioneer in motion photography, was born at Kingston-on-Thames, April 9, 1830. He emigrated to the U.S. in 1852 and was engaged in business until 1860. when he joined the U.S. coast and geodetic survey as a photographer. In 1872 he made a series of photographs which proved that at one point in its stride a galloping horse has all four feet off the ground. His major work, published in 1887, was *Animal Locomotion: an Electro-photographic Investigation of Consecutive Phases of Animal Movements, 1872–1885,* 11 vol., containing 781 photoengravings.

Muybridge also developed the zoopraxiscope. a forerunner of the modern motion-picture projector. Photographs were mounted on a disk which when rapidly rotated recaptured the original motion of the subjectsand cast the enlarged images upon a screen.

Muybridge returned to Kingston-on-Thames in 1900 and died there May 8, 1904.

MUZAFFARGARH, a municipality, *tehsil* and district of Bahawalpur division, West Pakistan. The town (pop.. 1951, 11,271) is near the right bank of the Chenab, 20 mi. S.W. of Multan. Its fort and mosque were built by Nawab Muzaffar Khan in 1794–96.

MUZAFFARGARH TEHSIL had a population in 1951 of 234.856.

MUZAFFARGARH DISTRICT (area 5.601 sq.mi.; pop.! 1951, 751,-250) occupies the dagger-shaped southern end of the Sind-Sagar *doob* between the Indus and Chenab rivers. The northern half of the district is an arid plateau. the *thal,* in the cold months the grazing ground of the camel herds belonging to Afghan *povindah* merchants. Elsewhere in the district wheat. pulse, rice and indigo are cultivated. Irrigation is effected from the two rivers.

MUZAFFARPUR, a town and district in the Tirhut division of Bihar, India. The town, which is the divisional headquarters, is on the right bank of the Little Gandak river, about 36 mi. N.N.E. of Patna. Pop. (1951) 73,594. The town is well laid out along tn-o lakes and is an important trade centre. being on the Patna-Nepal route. Four colleges in the town are connected with Patna and Bihar universities. Muzaffarpur is the headquarters of the Behar Light Horse.

MUZAFFARPUR DISTRICT (area 3,018 sq.mi.; pop., 1951, 3,520,-739) is a plain watered by the Great Gandak, Baghmati and Little Gandak rivers and their tributaries; it is dotted with mango groves and clumps of bamboo. It is closely cultivated, rice being the main crop. The indigo industry, almost extinguished by the coming of the synthetic dye, was largely replaced by sugar.

Excavations revealed the remains of buildings of *c.* A.D. 300; hundreds of seals of the 4th or 5th century A.D. also have been found. At Kolhua, 3 mi. N.W. of Muzaffarpur, is a pillar crowned by a lion, set up by the emperor Asoka to mark a stage of his journey to Nepal in 249 B.C.

MWERU (or MOERU), a large lake of eastern central Africa. It lies 3,010 ft. above the sea, in a western branch of the great Tanganyika rift valley. The lake is about 75 mi. long by about 27 mi. in breadth, and is roughly rectangular. It is cut a little south of its centre by 9° S. Mweru, first visited in 1798 by F. de Lacerda. was reached by Livingstone in 1867, but its western shore was first explored in 1890 by Sir Alfred Sharpe, who two years later circumnavigated the lake. The eastern shores belong to Northern Rhodesia, the western to the Belgian Congo. There is one large island! Kilwa, in the southern part of the lake.

MYCENAE, one of the most ancient cities of Greece. The citadel on the summit is triangular with sides facing north, south-east and south-west. Part of the south-eastern wall and the palace within have been undermined by the torrent which bounds the lower town on the east. For the artistic significance of the various graves and building remains scattered among the groups of houses forming the lower town, *see* AEGEAN CIVILIZATION. Mycenae is a natural rock citadel standing in the north corner of the Argive plain flanked to north and south by deep ravines. It watched the hills, controlled the plain, and was the key to the road from the Gulf of Argos to the Gulf of Corinth which afforded the shortest route from Crete to central Greece.

The hill is roughly triangular with the apex pointing south and is defended by massive cyclopean walls. At the northwest angle is the Lion Gate surmounted by the famous limestone relief of two confronted lions ten feet high. The gate itself is about ten feet square and with its approaches is built of ashlar masonry in hard conglomerate. In the north wall is a smaller but similar gate and near it lies a secret underground cistern fed by the Perseian spring and approached by a subterranean passage from inside the walls. The extreme northeast angle is a later addition to strengthen this important point and to provide a sally port. Within the Lion Gate lies the Grave Circle enclosing the Royal Graves found by Schliemann and by it are ruined houses and storehouses. From the gate an inclined roadway leads to the summit crowned by the palace. This was built at different periods, but the ruins now visible belong in the main to the last great age of Mycenae. At the northwest angle was a columned entrance porch, and a throne room, a shrine, a bathroom, and a room with store jars have been found. On the south a wide staircase with two flights ascends to a spacious court. To the east a porch and vestibule open into the great hall *(megaron)* in the centre of which is a large circular hearth covered with painted stucco and surrounded by four column bases. The walls and floors of the *megaron,* court and vestibule were covered with painted stucco and there are plentiful remains of frescoes which adorned other rooms at different periods. West of the court a staircase led to the upper stories and to its north ran two parallel corridors giving access to other rooms at higher levels.

From the citadel a narrow ridge runs westwards so that its backbone forms the natural approach to the Lion Gate. Here are three of the beehive tombs (the Tomb of Aegisthus, the Lion Tomb, and the Tomb of Clytaemestra) and also the north wall of the Hellenistic lower town and the ruins of its gymnasium and theatre. At its west end a wider and longer ridge runs due south. Its northern end was included in the Hellenistic lower town and somewhere along it must have run the prehistoric road. On its east side stands the Treasury of Atreus, the largest beehive tomb, and on its west another, and all about are rock cut chamber tombs. Below its southern extremity the ravine which runs from the south side of the citadel was spanned by a prehistoric bridge on the road leading southeast towards the Argive Heraeum and Tiryns. Sub. sidiary ridges running westwards to the plain are also honeycombed with tombs among which are four more beehive tombs. On one ridge, Kalkani, traces of early Bronze Age occupation have come to light, and in the hollows are two ancient wells. On the peak of Hagios Elias which overlooks Mycenae to the north stands a small fort of the later part of the Third Bronze Age which clearly served as a signal station, for thence the whole plain can be surveyed from Asine to Argos with the passes towards Arcadia, Nemea and Cleonae and the Acrocorinthus itself can be seen. A system of built roads radiates through the hills from Mycenae and they and the signal station emphasize its strategic and political importance.

Argolis was inhabited in the Neolithic age by a branch of the race that occupied central and northern Greece. No settlement of this period has yet been found at Mycenae, whose history begins with the Bronze Age. Then the citadel was occupied by the bronze using folk of the Early Aegean period who seem to have come into Greece from the islands and southwest Asia Minor. There is no clue to the language of the neolithic race, but the Bronze Age people probably spoke a non-Hellenic tongue and brought into Greece the place names which end in -nthos, -assos, or -ene. Among these is Mykene, a heroine mentioned by Homer whose name is to Mykenai as Athene is to Athenai. It is hard to estimate either the date of the Bronze Age settlement, which probably existed before the third millennium *B.c.,* or its size, for ceramic remains, though frequent, are much disturbed by later buildings. With the beginning of the Middle Aegean period soon after 2200 *B.C.* a new racial element of unknown origin entered Greece. Its presence is marked by a class of pottery called Minyan Ware which has several varieties. The plentifulness of this and of a matt painted fabric, developed from the Early Bronze Age pottery at Mycenae, shows that the city prospered under this new impulse. As Minyan ware is practically unknown in Crete, though common in the islands, relations between Crete and Mycenae cannot have been intimate, and so the latter's expansion would have been mainly independent of Crete. Throughout the Middle Bronze Age, on the hillside where the Grave Circle and Lion Gate were afterwards built, a cemetery had been in use, as this was the nearest spot where the rock was soft enough for simple cist graves of the type usual at the period. Among them in one special area larger and deeper graves were hewn out to contain the remains of the princes, the famous Shaft Graves, the treasures of which, excavated by Schliemann, first revealed the great prehistoric civilisation of Greece. The earliest, the Sixth, contains some objects from Crete, but the bulk of its pottery is unmistakably indigenous.

This Shaft Grave Dynasty rose to power about 1600 B.C. almost coinciding with the establishment of the 18th Dynasty in Egypt and the renaissance of Knossos after its destruction towards the end of the Middle Bronze Age. Slight signs of Cretan influence appear shortly before, but now at the beginning of the Late Bronze Age Cretan fashions and art were largely adopted at Mycenae. Three explanations are possible: (1) that Cretans now conquered the mainland and displacing the native population colonized a large portion; (2) that Mycenaean kings, strong on land and sea, successfully raided Crete, bringing home rich treasures and craftsmen as slaves; (3) that the kings of Mycenae grew powerful and rich, entered into relations with Crete and absorbed its culture. The first view seems least probable because for one reason Cretan pottery of the date of the alleged conquest is extremely rare at Mycenae where local fabrics still continued. Which of the other two is more correct time alone can show. The "Crétoiserie" of the Shaft Grave kings can be compared to the European *Chinoiserie* of the early 18th century, which was not the result of a Chinese conquest of Europe. These kings undoubtedly resided on the summit of the citadel where there are traces of a "palace" underlying the later palace. No signs of a circuit wall have yet been found and in any case it would not have had the area of the later enceinte. Still the richness of the royal graves and of private tombs of the period shows that a high standard of civilisation had been reached. This was not due entirely to the adoption of the Cretan culture, but to the fact that the newcomers of the Middle Bronze Age, who may well have spoken Greek, were themselves keen, energetic, and well advanced in things material, and needed only the contact with Crete to develop artistically as well.

Towards the close of the 16th century B.C. a change in royal burials indicates a new dynasty, which laid its princes in stone built beehive tombs from 25 to 50 feet in height and diameter. Nine such tombs exist at Mycenae. Their architecture displays gradual advance in technical matters, the use and cutting of materials and the handling of the problems of stresses and weights, so that they fall by progressive development into three groups of three tombs each. The first group belongs to the later 16th and to the early 15th century B.C. and the second group to the later 15th century. The earlier tombs were smaller, the construction primitive, the material inferior, the stone unshaped, and stresses not understood. The second group is larger and better built, the stone was hewn but not sawn, and a relieving triangle over the lintel was employed. In the two first groups the finest are the Tomb of Aegisthus and the Lion Tomb which last was closed with a door and threshold instead of rude stone walling. The first Beehive Tomb kings must have lived in the citadel but, apart from signs of their activity in the palace area, no other building can be definitely assigned to this date. The standard of culture was the same and there was intercourse with the islands, Crete and Egypt. The private tombs show that comfort was extending and the rather simple rock cut tombs of the 16th century now developed into spacious chambers with wide entrances.

After 1400 B.C. when Knossos fell and Egypt decayed under the last Amenhoteps, Mycenae, which had been rapidly developing since the end of the Middle Bronze Age, now took first place. Greek traditions, Homer's picture of Agamemnon as suzerain of the princes who sailed against Troy, and its mighty ruins, all bear witness to its greatness. Under the aegis of Mycenae ruled by the later kings of the Beehive Tomb Dynasty the Minoan-Mycenaean culture spread throughout the Eastern Mediterranean, and echoes of this are found in Homer. To this great age the majority of the amazing buildings at Mycenae belong. The palace was reconstructed on a large and sumptuous scale, the cyclopean walls of the citadel were built with the Lion Gate. Within the walls rose storehouses and residences for the civil and military officers of the court, and for their guards and servants. The royal Shaft Graves with part of the old cemetery were enclosed within the enceinte and the space round them was levelled, ringed with standing slabs, and made into a sacred area for the worship of the dead princes.

These later kings of the Beehive Tomb Dynasty to whose energy and ability the greatness of Mycenae seems so largely due, were buried in the last group of Beehive Tombs, the Treasury of Atreus, the Tomb of Clytaemestra, and the Tomb of Genii. These are naturally the best in construction, plan and size, and are built throughout of hard stone, mainly sawn. Each had a door, and a threshold constructed on a wedge principle. The understanding of stresses and of the means to counteract them shows that their architects profiting by earlier experiments perfected their methods and materials, so that two of these tombs still stand almost intact. The Treasury of Atreus is structurally so like the Lion Gate and the palace that it is possible that the royal builder of the two latter prepared the former as his tomb. The same style occurs in the walls and palace at Tiryns which are contemporary. The civilian population of Mycenae must have lived in undefended settlements on the neighbouring hills and the many cemeteries of this date divide into local groups suggesting separate communities. The tombs are carefully hewn in the rock with long narrow entrance passages and were furnished with objects in pottery, bronze, glass, ivory and gold, which show that the culture of Mycenae at its zenith even if less artistic displays wonderful technical ability. During the 14th and 13th centuries B.C. at Mycenae not only were crafts such as the potter's intensively and skilfully practised, but also professions such as those of engineers and architects, for the cyclopean walls and great domes like the Treasury of Atreus imply structural genius.

Troy according to tradition was taken early in the 12th century. Then, as the use of iron spread, the Iron Age began and as the contemporary Egyptian records say "the Isles were restless." This was the age of the Dorian Migration. Then Mycenae fell and the palace and houses were burnt. The walls, however, were not destroyed and as such a stronghold could not be left untenanted Mycenae was inhabited during the early Iron Age, but was of small importance as Dorian Argos usurped her place. As a small city state it preserved its independence and a Doric temple of Athena who ousted the local heroine Mykene arose early in the sixth century upon the ruins of the palace of the Bronze Age kings. Some sculptures from this temple survive. The débris among the ruins proves Mycenae's continuous existence, through the geometric, orientalising and archaic periods of Greek art down to the Persian Wars. Then Mycenae sent her small contingent to join in resisting Xerxes' invasion. Her men fought at Plataea in 479 B.C. and the name Μυκανῆς can still be read on the serpent column from Delphi now in the Hippodrome at Constantinople. Argive jealousy, however, could not forgive and in 470 B.C. when Sparta was in difficulties an Argive army besieged Mycenae. The citadel was starved out, its walls and buildings were overthrown and the site laid waste.

In 235 B.C. the Argive tyrant Aristippos was murdered at Mycenae which like other small towns dependent on Argos was probably reoccupied by the Argive tyrants of the third century B.C. during their struggles with the Achaean League. The walls of the citadel were repaired and part of the hillside on the south was walled in to make a lower town. In this lay a small theatre directly above the Tomb of Clytaemestra and by it was a gymnasium. The Doric temple, which the Argives had perhaps spared in 470 B.C., still stood on the summit of the citadel. Inscriptions dating probably from 194 B.C. and referring to Mycenae's relations with Argos and Nabis of Sparta give some details of its government. After Argos was freed from Nabis Mycenae vanishes from history and Pausanias in the second century A.D. makes no mention of inhabitation. A few remains of the Roman period have been found so it cannot have been entirely deserted, but the depopulation of Greece must have affecred Mycenae and a few inhabitants among ruins so famous would give every impression of desolation. Soon after it must have been completely deserted, for there are no traces of Byzantine or later occupation.

The site of Mycenae was never forgotten as Pausanias who saw the Lion gate shows and when Greece began to be revisited by travellers from western Europe it became a place of pilgrimage. Excavations were begun by Schliemann who made soundings in 1873. but conducted his epoch-making campaign in 1876 when he found the royal Shaft graves. Stamatakes followed from 1877 to 1879 when he found the sixth Shaft grave and cleared the Treasury of Atreus. From 1886 to 1902 Tsountas in a fruitful series of excavations cleared several houses, and found the palace, three beehive tombs and a large number of private tombs. Rodenwaldt did valuable work on the frescoes in the palace between 1912 and 1914. From 1920 to 1923 Wace excavated here for the British school at Athens, when many tombs were found and new and important results were obtained from the Grave circle, the Beehive tombs and the palace.

P. Nilsson, *The Mycenaean Origin of Greek Mythology* (1932); A. W. Persson, *The Religion of Greece in Prehistoric Times* (1942); A. J. Wace, *Chamber Tombs at Mycenae* (Oxford, 1932).

MYCETOZOA or **MYXOMYCETES.** The lower members of the plant and animal kingdoms approach each other so closely that it is often difficult to decide to which they belong. Among such organisms are the remarkable Mycetozoa. Literally the term means "fungus-animals," and rhe synonym preferred by botanists is Myxomycetes or "slime moulds," the latter being a common designation for the assemblage. While students have disagreed as to the types embraced by the name Mycetozoa, all are agreed that the rather homogenous assemblage known as the Myxogastres must be included. Indeed, since the beginning of the 20th century the tendency has been to limit the definition of the Mycetozoa to the point where it is customary to use, as does this article, either Mycetozoa, Myxomycetes, or slime moulds as synonyms for the stricter designation, Myxogastres.

The Plasmodium. — The stage in the life cycle of the Mycetozoa which has commanded most attention begins by the sexual fusion of microscopic gametes. Nuclear division commences in the amoebalike zygote, but unlike true amoebae the zygote does not split following nuclear division. Thus, with repeated nuclear divisions there is formed a creeping, jellylike plasmodium of no fixed shape, containing many nuclei. As the plasmodium grows, the amoeboid creeping is no longer feasible by the extension of a pseudopod into which the mass of protoplasm flows or which pulls the rest after it; the diffusion of oxygen to the interior, the excretion of waste and the intake of nutrients impose conditions which a rather compact amoeba can no longer meet.

Therefore. the plasmodium becomes thin and sheetlike, broken into interconnecting strands of protoplasm, and assumes a fanlike shape. The plasmodium, by the time it is easily visible to the unaided eye, has already achieved the characteristic fanlike appearance; and the fan both grossly and microscopically has distinguishable regions. The front comprises a broadly curved sheet of protoplasm, usually with a raised anterior border. Just posterior the sheet is thinner, and microscopic examination shows that it is formed of gelled protoplasm crossed by anastomosing strands of liquid protoplasm in active streaming motion. Toward the rear the sheet begins to break up into strands until the trailing end of the plasmodium is fdrmed of a few strands, or frequently a single strand, of protoplasm.

The vivid protoplasmic streaming shown by the Mycetozoa has excited the curiosity of naturalists since it was first observed. In the strand5 of the plasmodium it is somewhat rhythmic, the flow being first in the general direction of the front, then slowing, coming to a full stop and reversing. The forward creeping of the plasmodium is at least in part because of the accumulation of protoplasm at the front by forward streaming. The reverse streaming does not last for so long a period as the forward flow and presumably has the function of depositing waste to the rear.

While because of its mass a large plasmodium may not change shape as rapidly as an amoeba, the shape is by no means constant. A plasmodium may reverse its direction of creeping either by turning around or by simple reversal of the main protoplasmic flow, in which case the former rear now becomes a broadly fan-shaped front. At times small secondary fans are formed which may be later resorbed, or not infrequently may finally separate from the parent. The fan shape is typical only of plasmodia on a smooth substrate in the laboratory or on the surfaces of logs, leaves and other vegetable debris. For these plasmodia which live within decsyiag wood the fan shape is obviously impossible, and the plasmodium is a loosely flung network through fissures, within vessels and along the tunnels of boring insects.

If a strand of a vigorous plasmodium is severed, there is an immediate welling out of the fluid endoplasm which may continue until a drop the size of a pea or larger is formed. Almost immediately there is gelation of the endoplasm at the surface which continues toward the interior, and in a few minutes the entire drop becomes a soft but firm mass. If placed on a new substrate, -it forms a small plasmodium; if left in place, it is resorbed in a matter of hours.

Simultaneously with the injury, the strand usually gels for some distance on either side of the cut, so that further flow does not occur until the interior reverts to its former fluid state. The fluid-gel reversal also occurs naturally. The flowing protoplasm of a channel may come to rest and gel, while adjacent protoplasm will become fluid and begin to flow, thus creating a new channel.

Although mycetozoan plasmodia, because of their often great size, have been used frequently for studies on the physiology of undifferentiated and primitive protoplasm, the protoplasm is neither particularly primitive, undifferentiated nor more resistant to abuse than the protoplasm of more conventional cells. Rough mechanical treatment may kill part or all of the plasmodium; it may be overwhelmed by bacterial contamination; and the protoplasm of some forms is sensitive to lack of oxygen and to excessive wetting.

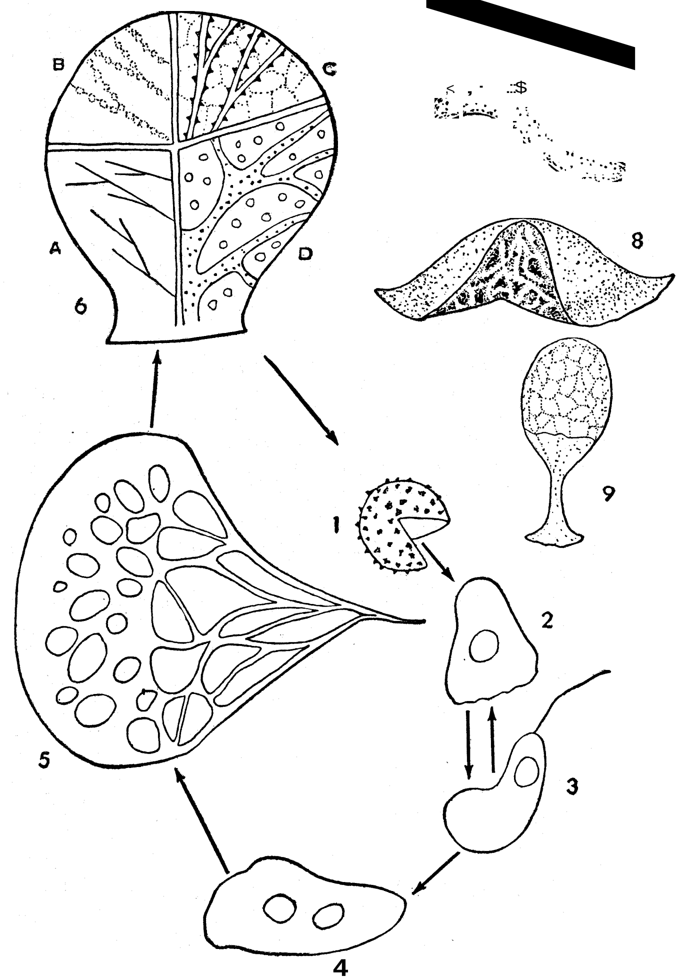
Most of the Mycetozoa are terrestrial forms which spend their vegetative existence creeping in and among damp, decaying leaves, twigs and logs. Nutrition and safety are aided by tactic behaviour — the oriented response to external conditions, such as light, moisture and food.

Negative chemotaxis is exhibited in the laboratory by movement away from stale to fresh substrates and by the avoidance of certain bacterial colonies. Positive chemotaxis is often dramatically shown toward other bacteria or fungi, as when the plasmodium of *Physarum polycephalum* envelops and digests a large mushroom down to an unrecognizable slimy mass within a day after first contact has been established.

Plasmodia from the field are often seen to be crowded with fungus spores, woody particles and other debris indicating an animal-like ingestion of particles, some of which might have nutritive value. But other data indicated that the chief mode of nutrition was saprophytic, the absorption of the dissolved products of decaying organic matter.

In 1939 it was shown that plasmodia could partially digest vegetable substrates but could not grow indefinitely upon them alone. Micro-organisms were also necessary, and indeed plasmodia could grow indefinitely solely by ingesting various killed or living bacteria or yeasts, thus making it probable that the chief mode of nutrition is animal-like.

Life History. — The plasmodium does not always remain in a fluid state of differentiation, but under ill-defined conditions it generally seeks an elevated place for fruit formation. The details of fruiting body formation differ from group to group, but usually the plasmodium breaks up into small globules which become invested with pellicles which dry into the peridium. The globules may remain sessile on the substrate or be elevated on stalks while within the sporangium the protoplasm forms tubular vacuoles, the walls of which become lined with secreted material forming a branched or network system which hardens into the capillitium. Further successive division of the protoplasm results in separa-



FIGS. 1—9.— LIFE CYCLE AND TYPES OF FRUITING BODIES IN MYCETOZOA

All figures highly diagrammatic; figs. 1–4, magnified approximately 1,000 ×; 6, 7 and 9, approximately 12 ×; 5 and 8, approximately life size. Fig. 1. — Emptied spore case from which myxameba (fig. 2) has escaped. Fig. 3.— Swimming stage (gamete) which may revert back to myxameba or fuse in pairs. Fig. 4.—Fused gametes, flagellae retracted, nuclei unfused. Fusion of nuclei and growth of zygote produces plasmodium, fig. 5. Fig. 6.—Sessile fruiting body showing stages of development: A, formation of strain lines in protoplasm which develop into chains of vacuoles; B, C, coalescence of vacuoles to form system of hollow tubes; protoplasm is cleaving into blocks from which spores are formed; D, mature fruit, granule-filled capillitium with a few spores in the meshes. Fig. 7.—Plasmodiocarp. Fig. 8.— Aethalium as in *Fuligo septica*, cut open to show black spore masses and interlacing walls of the separate, imperfect sporangia. Fig. 9.—Stiped fruiting body of *Arcyria*, showing the expanded capillitial network

tion of each nucleus with its surrounding protoplasm as a spore. Investment of the spore with a firm wall and drying of the sporangium releases the dry, microscopic spore for dissemination by wind. In some genera such as *Arcyvia* and *Trichia* the capillitium plays an active role in spore dispersal. With the drying of the fructification, the peridium is burst by the elastic capillitium, spores being scattered by the sudden expansion of the capillitium and by the constant twisting of its threads with changes in the moisture content of the surrounding air.

On attaining a suitable wet environment, the spore absorbs water, nuclear division occurs and the spore wall is either ruptured or partly dissolved to release two or more swarm cells or, more frequently, an amoeboid mass which soon divides into uninucleate swarm-cells. The swarm cell of the Mycetozoa has two interchangeable phases, an amoeboid, creeping stage, in which it crawls over the substrate ingesting bacteria and other particles, and a swimming stage, in which it is comma-shaped with a flagellum projecting from the anterior, tapering end.

Since 1911 there is agreement that the swarm cells are sexual cells or gametes; prior to that time it was thought that the plasmodium was formed either by nonsexual fusion of swarmers or that nuclear fusion took place before germination of the spore. It is probable that such early concepts and some later disagree-

ments may be because of the difference in plasmodial behaviour de-
pendent either on species or on conditions of formation.
The coalescence of groups of swarm cells probably results in nuclear pairing and fusion within the young plasmodium at a later period, while pairing of gametes may result either in immediate or delayed nuclear fusion. With fusion of the gametes, retraction of flagella and nuclear fusion, the plasmodium is initiated as previously described.

There are alternative resting conditions which, unlike spore formation, do not result in propagation. The swarm cell—on fouling of the medium, starvation or desiccation—may surround itself with a smooth cyst wall to await the return of favourable circumstances. Under similar circumstances the plasmodium may form a sclerotium. Microscopic examination shows that the plasmodium has divided into numerous cells, which may contain from 1 to more than 20 nuclei each. These sclerotia retain their viability when dry, viability having been recorded up to 20 years, though 3 years is the usual limit. On being moistened, the cyst walls are dissolved, the contents of the cysts coalesce and the plasmodium resumes vegetative activity.

Extent of the Group.—Approximately 500 species of Mycetozoa are known. Identification of genus and species is based on the fruit, for the plasmodia are usually very similar in appearance and of inconstant colour, the prevailing colours being yellow, orange and buff to watery white. In all genera except *Ceratiomyxa* the spores are obviously borne within fruiting bodies. In *Ceratiomyxa* the fructifications are apparently composed of pillars or ridges, with the spores borne individually on minute stalks. The researches of H. C. Gilbert, however, indicate that the so-called spores are sporangia reduced to the extreme degree where each contains one spore.

Diagnosis of family, genus and species is made, in order of importance, on the colour of the spores, the existence of a capillitium, the presence or absence of calcium carbonate granules in the sporangium wall and in the capillitium, the type of fruit and the often beautiful sculpturing of the capillitium and of the spore walls. The fruits are of several types. The individual sporangia may be sessile on the substrate or on a thin horny sheet, the hypothallus, or raised on a stalk. Some species fruit without breaking up into individual sporangia, the fructifications, called plasmodiocarps, resembling more or less completely the strands of the plasmodium. The aethalium is a type of fructification consisting of fused individual sporangia or of plasmodiocarps. In some cases the walls of the separate sporangia comprising the aethalium may be reduced to threadlike remnants resembling the capillitium and known as a pseudocapillitium.

Field observations and laboratory cultivation indicate that fructifications derived from a single plasmodium may vary greatly in type, depending on external conditions at the time of sporangium formation. Thus, the author has found the well-known *Physarum polycephalum* fruiting as plasmodiocarps and as sessile sporangia as well as the typically stalked forms with convoluted sporangia.

Other Groups Sometimes Included with the Mycetozoa.—The Acrasieae (or Sorophoreae) constitute a remarkable group of organisms which engage in communal encystment. The vegetative stage is passed as small individual amoebae indistinguishable from the many other small amoebae which inhabit the soil and decaying vegetable matter. The vegetative period is also the period of reproduction by fission, a sexual cycle not being established for the group. At the completion of the vegetative period the amoebae creep toward a common centre, the converging streams of their closely packed cells recalling the strands of a plasmodium; and therefore this stage is known as a pseudoplasmodium. The pseudoplasmodium becomes more compact, and in the lower forms all the individual amoebae encyst, to be scattered by wind or rain as a prelude to excystment and commencement of the vegetative stage. In the higher forms, such as *Polysphondylium* and *Dictyostelium*, the cells comprising the pseudoplasmodium become differentiated, some of them being sacrificed to form the vacuolated, polygonal cells of the stalk and branches (sorophores), on which are borne the heads of cysts (sori). In the highly developed *Dictyostelium discoideum* the entire pseudoplasmodium migrates as a unit before fructification. For an account of this remarkable group the reader is referred to the papers of Kenneth Raper.

The Labyrinthulae is a group very imperfectly known and with certainty containing only the type genus, *Labyrinthula,* whose species are all parasites of aquatic plants, one being the cause of an economically important disease of eel grass *(Zostera marina).* The characteristic structure of *Labyrinthula* is the net-plasmodium, which unlike the true plasmodium of the Myxomycetes, shows only partial fusion of the individual cells. The spindle-shaped bodies are connected to each other by a network of slender extensions along which they move with relation to each other. Prior to 1929 it was generally believed that these strands were pseudopodial extensions, but work since that date indicates that they may be nonliving tubes or threads along which the spindles glide. The life cycle is still very obscure, only vegetative division and cyst-formation having been observed.

The Plasmodiophoreae in some respects approach most closely the Mycetozoa in life cycle and in morphology. The vegetative state is a plasmodium, parasitic in higher plants, which eventually breaks up into spores. On being freed from the host, and on germination, these spores produce anteriorly flagellate swarm cells which gain access to the host through the root hairs.. There is little agreement on the details of the life cycle, but there is reasonable agreement that these swarm cells are gametes, and on fusion initiate the plasmodium either immediately or after an intermediate stage.

Relationships. — Forming, as they do, small fruiting bodies resembling those of the higher fungi, it is understandable that for a very long time the Mycetozoa were supposed to be a division of the Gasteromycetes, hence the name Myxogastres. Not until the classical work of Heinrich Anton de Bary was it made clear that these forms were not to be grouped with the highly specialized puff balls, but instead were related to very primitive forms resembling both plants and animals.

In some respects the Mycetozoa resemble the lowest fungi— the chytrids, some of which may spend a large part of the life cycle without a firm cell wall. In other respects, they recall strongly the amoeboid-flagellate line with its borderline members such as the flagellate amoeba, *Mastigamoeba.* A. Pascher has described the chlorophyll-bearing counterparts of the Mycetozoa, Labyrinthulae and of *Mastigamoeba,* and it is well recognized that any line drawn across the flagellates to separate plants from animals is an arbitrary one. While close relationship with the amoeboid-flagellate line is very likely, the Mycetozoa probably form an evolutionary blind alley of their own.

As to the relationships between the Mycetozoa as defined here, and the Plasmodiophorae, Acrasieae, Labyrinthulae and other curious forms such as *Vampyrella* and Proteomyxa, too little is known of the life history to group these forms together with any certainty, or else increased knowledge has widened the gulf between the Mycetozoa and some divisions formerly included with them, such as the Acrasieae.

Bibliography.—General and Systematic Accounts *(See* article Protozoa).—Several of the following reviews, and general and systematic accounts, have extensive bibliographies. H. Raper, "The Communal Nature of the Fruiting Process in the Acrasieae," *Amer. Journ. Bot.,* vol. 27, p. 436 (1940). (A. L. Cn.)

MYCOLOGY is the science of fungi (Greek *myco,* "a mushroam." *logy,* "discourse"), and is dealt with in the article Fungi.

MYCORHIZA (Mycorrhiza), a word used to describe several types of partnership between a fungus and the roots of a higher plant. The term mycorhiza, derived as a compound of the Greek terms for "fungus" and "root." also designates the composite organs formed by the fungus and the host plant. and has been extended to include organs in which the component of the higher plant is a rhizome (underground stem) or thallus (undifferentiated plant body) rather than a root. Such growths are common on the roots of trees and many other plants. Since the organs of the host plant are unharmed, although modified in structure, and root growth may be stimulated. these associations are considered symbiotic or mutually helpful.

The roots of land plants live in soil. competing therein for water and nutrients with a crowded population of microorganisms. This population varies greatly in density depending on the various components of which the soil is composed, and great densities of colonization occur in the immediate environs of living roots. The soil surrounding the roots is called the rhizosphere and in this region, and on the surfaces of roots themselves, populations of fungi. differing in number and kind from the general soil population, are present. Many of the organisms of the root region are specialized in nutritional requirements and have important effects on their hosts in respect to their potential to cause or inhibit disease or to affect the availability of nutrients.

Many species of land plants enter into an even closer association with certain fungi in which they form composite organs of root and fungal tissues. This phenomenon was comparatiyely well known, especially to foresters, when in 1885 the German botanist A. B. Frank coined the name mycorhiza for the fungus root organs of forest trees, especially oak, beech, hornbeam and other members of the Cupuliferae and certain conifers, to register his view that these constituted an organ of importance in nutrition. He put forward the hypothesis, based on observations and experiment. that in woodland conditions certain trees normally were infected by fungi that formed mycorhizae with their roots. Later he and others described analogous associations of fungi with roots and absorbing organs of many other plants and distinguished various other kinds of mycorhiza. Robert Hartig and other botanists took the view that these fungal infections were of a parasitic nature and it was not until the end of the 19th century that mycorhizal associations were accepted as a natural and healthy condition of many plants.

Distribution. — Mycorhizae are formed by liverworts, ferns. club mosses and conifers and by flowering plants of most families. Analogous associations, the lichens, are formed between algae and fungi. Mycorhizae are constantly formed in certain groups of seed plants (*e.g.,* Orchidaceae. Ericales) and are invariably developed by saprophytic species lacking chlorophyll. Fungal infections, similar histologically to living examples of certain mycorhizae. have been observed in fossils such as the Psilophytales from the Devonian period and the Cordaitales from the Carboniferous period. The widespread occurrence of mycorhizae in living and fossil plants and their universal presence in diverse saprophytes are arguments supporting the view that infections of this kind are of selective value to the host plants.

Structure of **Mycorhizae.**—It is still convenient to recognize two main types of mycorhizal structure and to use the descriptive names given to these by Frank. The ectotrophic types are specially characteristic of many forest trees in which the fungal mycelium completely invests the tips and younger portions of the root with a sheath of compact fungal tissue. From the sheath. hyphal branches penetrate between the cortical cells to form a network but rarely penetrate into the cells themselves. The endotrophic types of infection are more variable than the ectotrophic types and are characterized by the absence of a fungal sheath although there may be in some a profuse development of extraradical mycelium. The hyphae or branching threads penetrate the cortex of the root, usually entering the cells where they form coils or branched haustoria. In the majority of endotrophic infections the hyphae at some stage disintegrate or are digested within the host cells, liberating soluble products that presumably become available to the host.

Ectotrophic mycorhizae are to a great degree uniform in structure regardless of the species of host plant. Their main variability lies in the extent of penetration of the cells of the host and in the thickness of development of the sheath. Some, in which the cells are heavily penetrated, have been called ectendotrophic mycorhizae; others. in which the fungus appears to give rise to slight parasitic symptoms, have been called pseudomycorhizae. These variations seem to be due to the species of fungus involved and to conditions of growth.

By contrast, endotrophic mycorhizae do not comprise a single natural kind of mycorhiza. That found in the Orchidaceae, some Gentianaceae and in certain liverworts, for instance, differs markedly from that of Ericaceae, although in both the fungal hyphae are septate and form coils within the cells. Again, plants belonging to many other Angiosperm families such as Gramineae, Leguminosae and Rosaceae, to conifers such as cypress and yew and to certain groups of liverworts and ferns form mycorhiza with fungi lacking septa (walls) in their hyphae which form large branched haustoria and swollen vesicules in their cells. In the ensuing paragraphs a few important kinds of mycorhiza will be described.

Mycorhiza of Trees.—The ectotrophic mycorhiza of forest trees is easily recognized. Each rootlet is enveloped in a sheath of fungal tissue, branches from which penetrate on the one hand into the cortex and on the other into the soil. In most species the infected roots are aggregated into racemose systems of short rootlets borne upon long mother roots of more normal appearance. These mother roots are, however, normally infected in some way, either by a network of hyphae in the cortical cells or by a superficial fungal sheath. The young short branches consequently become infected as they grow out through the cortical tissues of the mother root. The mycorhizal rootlets of pines differ from those of other trees in being forked rather than racemosely branched.

Many of the characteristic fungi of forests have been isolated into pure culture and some have been shown experimentally to form mycorhizae with trees. These belong mainly to Hymenomycetes or toadstool fungi, of which genera like Boletus, *Russula,* Tricholoma and Lactarius include many mycorhizal species. Some Gasteromycetes (puffball fungi) such as *Rhizopogon* are mycorhizal, as are a few Ascomycetes. By cultural experiments 50–100 species have been shown to be capable of forming mycorhizae with forest trees and these show variable specificity. For instance, Boletus *elegans* is known to form mycorhizae only with larch, whereas Cenococcum graniforme forms them with numerous and varied tree species.

Elias Melin and his colleagues in Sweden demonstrated that most of these mycorhizal fungi have characteristic nutritional requirements. They usually are dependent upon a supply of simple carbohydrates, vitamins and growth factors. Although in this respect there is considerable variation among them, their development on root surfaces is to some degree explicable by their nutritional characteristics. Some produce as end products of their metabolism substances with auxinlike properties that can affect the pattern of root growth and this affords a partial explanation of the characteristic form and structure of mycorhizal rootlets.

Although totally uninfected individuals of mycotrophic trees are probably never found in nature, the intensity of mycorhizal infection varies, especially in seedlings. Such variation has its explanation in the nutritional status of the host plant. Adequate or excessive supply of nutrients in the soil tends to confer resistance on the host, whereas deficiency or lack of balance in one or more nutrients predisposes the host to infection. At the same time infection occurs abundantly only on plants with excess of carbohydrates in their root systems. Hence plants grown in low light intensity or in normal light intensity with high nutrient supplies are deficient in mycorhizal development. This complex interaction of carbohydrate status and mineral nutrient status upon susceptibility of hosts to infection, which was first shown by E. Björkman, has not been fully explained. Reasons have been sought in the change in nature or quantity of substances secreted by the roots of host plants. Similarly, the effects of auxinlike secretion of mycorhizal fungi have been shown to give a partial explanation of the change of histological pattern in the cells of the host roots. Both these problems are being actively investigated by research workers.

By contrast with those on natural sites, it has been observed that plantations of exotic trees, especially conifers, in areas far removed from their normal habitat sometimes fail to produce mycorhizae when first planted. Such plantations often fail to develop normally but sometimes recover after inoculation with suitable mycorhizal fungi. In controlled experiments, where inoculation has been done with pure cultures, it was shown that mycorhizal plants grow faster and absorb nitrogen, phosphorus, potassium and other nutrients at a faster rate from poor soils than do uninfected control plants. It was concluded that mycorhizal root systems are able to extract nutrients more rapidly from deficient soil than uninfected systems and that they pass these nutrients on to the host plant.

In some degree the explanation of these results is to be found in the effect of mycorhizal infection upon the form of the root system, for the fungus appears to stimulate root growth and to prolong the life of the feeding roots. In addition it was shown, using isotopically labeled nutrients, that the hyphae connecting mycorhizae with the soil may absorb and pass substances to the host and that the sheath tissues themselves are capable of a greater rate of absorption of some nutrients than are uninfected roots. Mycorhizal roots accumulate rapidly great quantities of some nutrients into their sheath tissues and this may be translocated to the host under suitable conditions.

Root systems equipped with ectotrophic mycorhizal rootlets are nutrient-absorbing organs of great efficiency that can compete with other soil inhabitants and confer a selective advantage on their host plants.

The ectotrophic mycorhizal habit, characteristic of forest dominants in the temperate regions of the northern hemisphere, is also found in southern hemisphere trees such as renantheroid Eucalypts.

Mycorhiza in Ericaceae and Related Families.—In the northern hemisphere certain members of the family Ericaceae, *e.g.,* heaths (Erica *spp.*), ling or heather (Calluna) and cranberry and bilberry (Vaccinium) and Empetraceae, *e.g.,* crowberry (*Empetrum*), are constant features of the vegetation of acid humus soils—moorland and woodland—on which they often dominate large areas almost to the exclusion of other plants. In the southern hemisphere, Epacridaceae have a somewhat similar habit.

The mycorhiza of these plants is of the endotrophic type with certain characteristic features, in some respects showing points of resemblance with that of trees. The young roots are of small diameter and the outermost layer of cells forms a definite mycorhizal zone. In favourable soil conditions practically every cell in this layer is filled with a densely branched complex of fungal hyphae from which strands of mycelium extend outward into the soil. The growth of the mycelium on the outside of the roots is usually profuse and in some species, *e.g.,* arbutus, may resemble the sheath of ectotrophic mycorhizae. In the cells the hyphal complexes are subject to digestion and the resulting products appear to be absorbed by the host cells.

There has been some disagreement between research workers who have investigated the mycorhiza in Ericaceae. Some described a cyclic symbiosis in which all the organs of the host plant were infected by fungal hyphae so that the seed coat became infected before seed dispersal and the seedlings became infected early in germination. Normal germination and growth failed if infection did not take place. But the evidence against this view of mycorhiza in the Ericaceae is stronger than that for it, since asymbiotic germination of many species has been brought about in sterile natural substrates and great difficulty is experienced in obtaining evidence for fungal infection of stems, leaves and floral parts.

At one time the mycorhizal fungi of Ericaceae were believed to belong to the imperfect genus *Phoma,* which may be capable of fixing atmospheric nitrogen. This is questionable since several fungi other than *Phoma* produce typical mycorhizae with many ericaceous species. Many commonly held opinions concerning the functioning of this mycorhiza probably are of doubtful validity.

Work after 1955 on the *Pernettya* genus of evergreen shrubs further emphasized the similarity of the mycorhizae of Ericaceae with that of forest trees. In respect to both the factors affecting intensity of infection and the rate of salt absorption from deficient soils, similarities with ectotrophic mycorhizae are apparent.

Mycorhiza of Orchids.—The mycorhiza of orchids is endotrophic and the mycelium is widely distributed throughout the cortex of the root. or in rootless forms: in the chlorophyll-free tissues of the absorbing organs. Two contrasted types of cell usually are observable: "host" cells containing active hyphae and "digestion" cells in which hyphal digestion or disintegration occurs. In the former the mycelium fills the cells with skeins or "pelotons" of characteristic appearance and is believed to extract nutrients from the host. In the digestion cells the contents of the hyphae are released to the cells.

The French botanist Noel Bernard and the German botanist Hans Burgeff were responsible for important researches on orchid mycorhiza. Fungi mere isolated into pure culture from the roots and shomn, by back inoculation into sterile seedlings, to be capable of mycorhiza formation. Many of these fungi belong to the imperfect genus *Rhizoctonia,* of which some species are known to be dangerous parasites and others weak root-inhabiting parasites. *Rhizoctonia solani* is a parasite of many plants but also forms mycorhiza with at least one orchid. Certain mycorhizal *Rhizoctonia* species, including *R. solani,* are capable of forming basidiomycete fructifications in some conditions and may be referred to the genus *Corticium.* Basidiomycetes in perfect state such as species of *Fontes, Xerotus* and *Armillaria* form mycorhiza with saprophytic orchids. The majority of these fungi have the ability to utilize as carbon sources many resistant substances of soil and plant material; many utilize cellulose and some lignin also. In this respect the fungi of orchid mycorhiza are contrasted with those of ectotrophic mycorhiza.

The minute seeds of *Orchidaceae* usually do not germinate in natural substrates unless they become infected by appropriate fungi. They may. as L. Knudson first showed, be stimulated to germination in aseptic culture if given appropriate conditions. Research upon the conditions required for aseptic germination indicates that the provision of soluble carbohydrate is all that is needed in some cases. but more often the seed is unable to synthesize some essentials. For instance, many orchid seeds require nicotinic acid or nicotinamide (precursor of the enzyme cocarboxylase) before germination proceeds.

After germination the tiny orchid seedling grows saprophytically, usually for a period of years, before producing organs above ground. Hence, even those species that become self-supporting in respect to carbon compounds as adults are saprophytic and dependent on fungal activity in youth The mechanism whereby the fungi of orchids improve the supply of carbon compounds to their hosts is not fully understood It is however, probable that the hyphae in the substrate absorb carbonaceous substances and conduct them into the host where they are released by both direct secretion and digestion

Mycorhizal infection similar to that of orchids is found in many other plants. including some of the *Gentianaceae* (gentian family) and some liverworts. including Cryptothallus, the only saprophytic member of the group

Mycorhiza of Common Crop Plants.—By far the commonest type of inycorhiza is that in which the fungi concerned are of the class Phycomycetes with aseptate hyphae. In these endotrophic mycorhizae the main hyphae may either grow betaeen the cells of the cortex of the host or be completely intercellular. In both cases specialized lateral branches of small diameter are formed that ramify dichotomously in the cells to form complex haustorial organs called arbuscules. In addition the main hyphae may also form large swellings or vesicules in or between the cells. In many cases the fungal hyphae are also present in the soil on or around the roots and the extraradical vesicules may be formed. In spite of the presence of profuse mycelium in the soil around many of these mycorhizae great difficulty has been experienced in culturing the fungi and so in learning anything of their physiological properties.

The roots of plants infected with vesicular-arbuscular mycorhiza are often little modified in form or structure. Indeed the majority of common angiosperm crop plants, *e* g., Gramineae (grasses and cereals) and Leguminosae (clover, peas. beans, etc.) are infected in this way as also are Rosaceae (roses, apples, pears. peaches, strawberry. etc.). Among the conifers this form of mycorhiza is common in all families except Pinaceae. so that many forest dominants, *e.g.,* cypresses. redwoods, yew. etc.. are infected. Many ferns, club mosses and liverworts also have this mycorhiza. w

As yet there is no conclusive evidence that mycorhizal infection of this type has any marked effect on the growth of the host plant. Experiments have been impeded because of the difficulty of isolating the fungi into pure culture. After 1950 two lines of research gave promise of providing results. On the one hand it was sho n that a species of *Endogone* can produce mycorhizae of this type with many Rosaceae. On the other hand the phycomycetous parasite *Pythium ultimum* was isolated from mycorhizae of wild garlic and is said to be capable of forming mycorhizae with various plants when back inoculated. These lines of investigation may lead to fuller understanding of the commonest type of mycorhiza.

MYELITIS, from the Greek word meaning marrow. is used in medicine in accordance with the significance of the root and ending to mean an inflammation of the marrow of the bone as osteomyelitis or of the spinal cord as in poliomyelitis. A large number of descriptive adjectives are used to describe more accurately the various types of disorders involving the spinal cord. *See* BONE, DISEASES AND INJURIES OF; NERVOUS SYSTEM; SPINAL CORD, etc. (F. L. X.)

MYERS, FREDERIC WILLIAM HENRY (1843–1901), English poet and essayist. son of Frederic Myers. was born at Keswick. Cumberland, on Feb. 6. 1843, and educated at Cheltenham and Trinity college. Cambridge; where he was appointed classical lecturer in 1865. He had no love for teaching, which he soon discontinued, but he took up his permanent abode at Cambridge in 1872, when he became a school inspector under the education department. He published poems, for instance *St. Paul,* but is more likely to be remembered by his *Essays, Classical and Modern* (2 vol., 1883). The essay on Vergil, by far the best thing he ever wrote. represents the matured enthusiasm of a student and a disciple to whom the exquisite artificiality and refined culture of Vergil's method were profoundly congenial. In 1882 Myers led a small band of explorers (including Henry Sidgwick and Richard Hodgson. Edmund Gurney and F. Podmore), who founded the Society for Psychical Research. He was the mouthpiece of the society, and steered a middle course between extremes. He helped to revise the cumbrous mass of *Proceedings,* the chief concrete results being the two volumes of *Phantasms of the Living* (1886). His *Human Personality and Its Survival of Bodily Death* (2 vol.. 1903) was described by William James as "the first attempt to consider the phenomena of hallucination, hypnotism, automatism. double personality and mediumship. as connected parts of one whole subject." Also there was *Science and a Future Life* (1893). Myers died at Rome on Jan. 17, 1901, but was buried in his native soil at Keswick.

MYLIUS-ERICHSEN, LUDWIG (1872–1907), Danish explorer, was born at Viborg, Jutland, on Jan. 15, 1872 He made two notable expeditions to Greenland in 1902–04 and 1906–08. The first of these yielded much valuable ethnographical information; the second provided increased geographical knowledge of the eastern coast. He died in Nov. 1907, with two companions, on a sledge journey during his second expedition.

MYLODON, type of family of large ground sloths characteristic of the new world. *Paramylodon,* from the Pleistocene of North America, was the size of a rhinoceros. It had short stout limbs, terminated by feet with five digits. The inner digits bore strong clams, but the outer were clawless. The head was long: with a blunt muzzle. Front teeth were lacking. but the jaws were set with large prismatic cheek teeth, five above and four below on each side. The teeth became progressively large posteriorly and the last molar was two or three lobed. *Mylodon,* as shown by specimens from a cave off the Straits of Magellan, possessed a skin studded with bony ossicles and covered with a heavy coarse brown hair.

Sloths of the family Mylodontidae ranged from Patagonia to Canada. Several genera are known from the Pleistocene of South America. Lestodon has the front pair of teeth enlarged as tusks and a flaring, bell-shaped muzzle. *Scelidotherium* is characterized by an elongate skull and narrow body. The toes are reduced and specialized. The ancestry of the family can be traced back into the Miocene, and possibly the Oligocene, in Patagonia. Early genera are less specialized than their descendants and more clearly point to relationships with tree sloths, armadillos and anteaters.

(W. D. M.; E. C. O.)

MYLONITE, in petrology, a rock which has been crushed and ground down by earth movement and at the same time rendered compact by pressure. Mylonites are fine grained, sometimes even flinty in appearance, and often banded in parallel fashion with stripes of varying composition. The great majority are quartzose rocks, such as quartzite and quartz-schist; but in almost any type of rock mylonitic structure may be developed. Gneisses of various kinds, hornblende-schists, chlorite-schists and limestones are not infrequently found in belts of mylonitic rock. The process of crushing by which mylonites are formed is known also as "granulitization" and "cataclasis," and mylonites are often described as granulites, though the two terms are not strictly equivalent in all their applications.

Mylonites occur in regions where there have been intense earth movements. Thrust planes and great reversed faults are often bounded by rocks which have all been crushed to fine slabby mylonites that split readily along planes parallel to the direction in which movement has taken place. These "crush belts" may be only a few feet or several hundred yards broad. The movements have probably taken place slowly without great rise of temperature, and hence the rocks have not recrystallized to any extent.

MYMENSINGH, a municipality and district in the Dacca division of East Pakistan. The town (formerly known as Nasirabad) is on an old channel of the Brahmaputra, 70 mi. N. of Dacca, with which it is connected by a line of the isolated metre-gauge system of the Eastern Bengal railway. Pop. (1951) 44,527; of the surrounding administrative subdivision 1.522,48j. It has been noted for the manufacture of glass bangles.

MYMENSINGH DISTRICT occupies a part of the alluvial valley of the Brahmaputra east of the main channel (called there the Jamuna). Area 6.230 sq.mi.; pop. (1951) 5,797,521. For the most part level and open, it is covered with cultivated fields. The Madhupur jungle, partly covered with red ferruginous clay, extends from the north of Dacca district into the heart of Mymensingh; its average height is about 60 ft. above the level of the surrounding country, and nowhere exceeds 100 ft. On the west is an alluvial plain watered by the Jamuna; the eastern area of the district is fertilized by the Surma and Meghna. the old Brahmaputra and other streams, and contains extensive marshes. which are under water for eight months of the year and are grazing grounds for cattle for the other four months. On the southern border the Susang hills rise. The Jamuna forms the western boundary for 94 mi.; during the rainy season it expands in many places to 5 or 6 mi. in breadth. The Brahmaputra formerly flowed through Mymensingh till it joined the Meghna a little below Bhairab Bazar, but in the late 18th and early 19th centuries the formation of sand bars in the upper course diverted it into the Jamuna. The rainfall is heavy, the mean annual at Mymensingh being 91.48 in.

The staple crop is rice, followed by jute, which is an important cash crop. Cottage industries such as hand weaving and brassworking are carried on in the district. The two colleges of Dacca university concerned with training primary teachers and women teachers are in Mymensingh town; the university has also affiliated two other colleges in the town and nine elsewhere in the district.

MYNAH, the name given to several birds of the starling family (Sturnidae). The Indian house mynah (Acridotheres *tristis*) is a well-known bird in the east and has been introduced into Australia and New Zealand. Somewhat larger than a thrush, with brown plumage, except for a black head and white on the wings and tail, the house mynah is easily domesticated and will learn to talk.

The true talking mynah (Grecula religiose) is, however, a very different bird. See GRACKLE.

MYRA (mod. DEMBRE), an ancient town of Lycia situated a short distance inland between the Myrus and Andracus rivers. Its early history is obscure. St. Paul touched Myra on his last journey westward, and changed into "a ship of Alexandria sailing into Italy." In the 3rd century St. Nicholas, of Patara, was its bishop. Theodosius II made Myra the Byzantine capital of Lycia, and as such it was besieged and taken by Harun al-Rashid in 808. The town seems shortly afterward to have decayed. A small Turkish village occupied the plain at the foot of the acropolis, and a little Greek monastery lay about a mile westward by the church of St. Nicholas. The latter formed the nucleus of modern Dembre. The western scarp of the acropolis has been sculptured into a number of sepulchres imitating wooden houses with pillared façades, some of which have pediment reliefs and inscriptions in Lycian. The theatre lies at the foot of this cliff and is partly excavated out of it, partly built. The church of St. Nicholas lies out in the plain, at the western end of Dernbre. Its floor is far below the present level of the plain, and for some time the church was half filled with earth. There are also extensive ruins of Andriaca, the port of Myra, about 3 mi. W., containing churches, baths and a great grain store: inscribed with Hadrian's name. They lie along the course of the Xndraki river; whose navigable estuary is still fringed with ruined quays.

MYRIAPODA. A group of terrestrial Arthropoda. comprising the Chilopoda (centipedes, *q.v.*), Diplopoda (millipedes, *q.v.*), Pauropoda and Symphyla (*qq.v.*). The name was originally used by Pierre Latreille (1796) to embrace the centipedes and millipedes. which, with certain Crustacea, he ranked as an order under the Insecta. Subsequently William Leach (1814) restricted the term to the centipedes and millipedes, raising the group to the rank of a class, of equal status with insects and Crustacea, the Pauropoda and Symphyla being incorporated much later.

After 1893 a classification of Myriapoda into Progoneata and Opisthogoneata was widely adopted among zoologists. the Progoneata (comprising Diplopoda, Pauropoda and Symphyla) having the reproductive opening near the anterior end of the trunk, while in the Opisthogoneata (comprising the Chilopoda) it is located at its hinder end.

The classification is held to imply the independent descent of the two groups from a common ancestor with multiple reproductive openings, any resemblance being therefore of a fortuitous and superficial character. The remarkable anatomical characters of the Symphyla seem, however, altogether to invalidate this classification, for, as shown by A. D. Imms (1936) and O. W. Tiegs (1940), they are surely closely related to the Insecta, even though the latter are opisthogoneate.

The Myriapoda are, indeed. by no means an unnatural assemblage of animals. A. Sedgwick, who shared this view, defined them as follows: "Tracheates with numerous and similar pedigerous segments, with one pair of antennae followed by a pair of palpless mandibles, with regularly and segmentally arranged tracheal stigmata, and with malpighian tubules. The young are. with a few exceptions. not provided with the full complement of segments at hatching" (from A. Sedgwick, *Student's Teat-Book of Zoology,* by permission of The Macmillan Company. publishers). Many of these characters. he points out, are also found in Onychophora (*q.v.*) and insects. and he is led to conclude that "the classes Insecta, Onychophora and Myriapoda are the survival of a once great and continuous group of land Arthropods, a large number of which have become extinct, leaving two groups. Insecta and Onychophora. each fairly compact and showing little variety of organization. and one, the Myriapoda, loose and heterogeneous, and with considerable gaps between the orders."

MYRICA is considered by many authors as the only genus of the Myricaceae family. while some others accord generic rank to the three subgenera (*Myrica, Gale* and *Comptonia*) as distinct from *Myrica.* About 40 species. with only one under *Comptonia,* are widely distributed throughout the world. Well-known representatives are the sweet fern (*C. perigrina*), sweet gale (*M. gale*) and wax myrtle (*M. cevijera*). *See* SWEET GALE; WAX MYRTLE. (J. M. BL.)

MYRISTICACEAE, the nutmeg (*q.v.*) family, comprising 18 genera and 300 species. all tropical and especially numerous in Asia. They are trees or shrubs with evergreen leaves.

MYRIVELES. STRATES (STRATIS MIRIVILIS) (1892–), Greek novelist. whose best-known work is his "war trilogy": the *Zoe en Tapho* ("Life in the Tomb"; 1930); the *Daskala me ta Chrysa Matia* ("The Teacher With the Golden Eyes": 1932); and the *Panagia Gorgona* ("The Mermaid Virgin": 1955). Born in Lesbos in 1892. he firrt appeared as a writer in 191j with a book of short stories. *To Kokkino Biblio* ("The Scarlet Book"), but it was in 1932 that he captured the public imagination. with his *Zoe en Tapho.* This is a series of war impressions from the Macedonian front. where the author fought in World War I. It was followed by the *Daskala ntc ta Chrysa Matia,* in many respects a maturer novel. which starts with the Asia Minor campaign of 1921–22 and continues in the island of Lesbos. The *Panagia Gorgona* tells of the life of a group of Greek refugees from Asia Minor who settled in Lesbos. Myriveles also wrote several shorter novels and short stories; a lively travel book on Greece. *Apo ten Hellada* (1954); and a few poems and prose poems. His style is forceful and he has a fine mastery of language. Occasionally. however. the dialect and the lyrical elements in his prose are excessive. He is at his best in descriptions of natural scenery. (CE. A. T.)

MYRMIDON. in Homer. one of the inhabitants of Phthiotis in Thessaly of 'ancient Greece. According to post-Homeric legends their original home was Aegina, from which they crossed over to Thessaly with Peleus, but the converse view is now more generally accepted. Their name is derived from a supposed ancestor. son of Zeus and Eurymedusa. who n-as wooed by the god in the form of an ant: or from the repeopling or' Aegina (when all its inhabitants had died of the plague) n-ith ants changed into men by Zeus at the prayer of Aeacus, king of the island. As the fierce and devoted followers of Xchilles. their name came to be used in modern times to mean subordinates who carry out orders implacably.

MYROBAEANS, the name given to the astringent iruits of several species of *Terminalia*, largely used in India for dyeing and tanning and exported for the same purpose. They are large deciduous trees of the family Combretaceae. The chief kinds are the chebulic or black myrohalnn. from *Terminalia chebula*, which is smooth. and the belleric. from *T. bellerica,* n-hich is five angled and covered with grayish don-n. There is also *Prunus cerasifera,* known as myrobalan and widely employed as stock for cherries.

MYRRH, a gum resin (*see* RESINS), highly esteemed by the ancients as an unguent and perfume, used for incense in temples and also in embalming: it was one of the gifts offered by the Magi. True myrrh is the product of *Commiphora myrrha,* a small tree of the family Burseraceae that gron-s in eastern Africa and Arabia, but the name is also applied to gum resins obtained from other species of *Commiphora.* Bisabol or bissabol. from *Commiphora kataf,* resembles true myrrh in appearance. but has a disagreeable taste and is scarcely bitter. It is used in China. mixed with food. and given to cows to improve the quality and increase the quantity of milk. When mixed with lime as a size it imparts a gloss to walls. Opaque bdellium. produced by C. *playfairii,* when shaken with water forms a slight hut permanent lather. It is known as *meena harma* in Bombay, and was formerly used there for the expulsion of the guinea worm. African bdellium is from *C. africana,* and like opaque bdellium lacks the white streaks which are characteristic of myrrh and bisabol: both are acrid. but have little bitterness or aroma. Indian bdellium. probably identical with the Indian drug gugal obtained from *C. mukul* and *C. pubescens,* is of a dark reddish colour, has an acrid taste and an odour like cedarwood and softens in the hand.

As met in commerce true myrrh occurs in pieces of irregular size and shape. from one-half inch to two or three inches in diameter. and of a reddish-brown colour. The transverse fracture has a resinous appearance with white streaks: the flavour is bitter and aromatic and the odour characteristic. It consists of a mixture of resin. gum and essential oil. the resin being present to the extent of 25% to 40%, with $2\frac{1}{2}$% to 8% of the oil. myrrhol. to which the odour is due.

MYRTACEAE, the myrtle or eucalyptus family. dicotyledonous trees and shrubs found in all the warmer parts of the world. especially in Australia and tropical America. There are

COURTESY AUSTRALIAN NEWS AND INFORMATION BUREAU

SCARLET FLOWERING GUM (EUCALYPTUS FICIFOLIA)

about 90 genera and approximately 2.800 species. all with oil glands in the evergreen leaves. Several species yield useful timber. and *Eucalyptus* also gives oil: *Eugenia,* cloves; etc. Some have edible fruits. as *Pisidium* (guava'). *Rhodomyrtus* (hill gooseberry). various species of *Syzygium* and *Eugenia,* and *Feijoa* (pineapple guava). *Pimenta officinalis* yields allspice (*q.v.*) and P. *acris,* bay oil. *See* EUCALYPTUS: FEIJOA; GUAVA.

MYRTLE, the *Myrtus communis* of botanists, as now found growing wild in many parts of the Mediterranean region. It is a low-growing, evergreen shrub. with opposite leaves, varying in size. but always small, simple. dark-green. thick in texture. and studded with numerous receptacles for oil. When the leaf is held up to the light it appears as if perforated n-ith pinholes owing to the translucency of these oil cysts, The fragrance of the plant depends upon the presence of this oil. .Another peculiarity of the myrtle is the existence of a prominent vein running round the leaf within the margin. The flowers are borne on short stalks in the axils of the leal-es. The fruit is a purplish berry. enclosing very numerous minute seeds. Many varieties are in cultivation. The typical species is quite hardy in the south of England. The Chilean guava (*M. ugni*), a shrub with ovate. dark-green leaves and white flowers succeeded by globular red or black glossy fruit with a pleasant smell and taste. is a greenhouse shrub, hardy in southwest Britain. The common myrtle is the sole representative in Europe of a large genus (100 species) which has its headquarters in extra-tropical South America, while other members are found in Australia and New Zealand. The genus *Myrtus* also gives its name to a very large family. Myrtaceae (*q.v.*). Myrtle is also used for the bog myrtle (see SWEET-GALE), the crape myrtle (*Lagerstroemia indica*). the sand myrtle (*Leiophyllum buxifolium*), the creeping myrtle (*Vinca* minor) and many others.

MYRTLE (MYRTUS COMMUNIS), SHOWING FLOWERING BRANCH AND VERTICAL SECTION OF FLOWER

MYSIA, a district of northwestern Asia hlinor, hounded by Lydia and Phrygia on the south. by Bithynia on the northeast and by the Propontis and Aegean sea on the north and west. Its precise limits are difficult to assign, the Phrygian frontier being vague and fluctuating. while in the northwest the Troad was sometimes included in Mysia, sometimes not.

The most important cities were Pergamum (*q.v.*) in the valley of the Caicus and Cyzicus (*q.v.*) on the Propontis. But the whole seacoast was studded with Greek towns, several of which were places of considerable importance; thus the northern portion included Parium, Lampsacus and Abydos, and the southern Assus, Adramyttium and, farther south, on the Elaitic gulf. Elaea, Myrina and Cyme.

Ancient writers agree in describing the Mysians as a distinct people. like the Lydians and Phrygians. though they never appear in history as an independent nation. That they mere kindred with the Lydians and Carians, is attested by their common participation in the sacred rites at the great temple of Zeus at Labranda. as well as by the statement of the historian Xanthus of Lydia that their language was a mixture of Lydian and Phrygian. Strabo was of the opinion that they came originally from Thrace (see BITHYNIA) and were a branch of the same people as the Mysians or Moesians (see MOESIA) who dwelt on the Danube. The Mysians appear in the list of the Trojan allies in Homer. The first historical fact learned is their subjugation, together with all the surrounding nations. by Croesus of Lydia. After the fall of the Lydian monarchy they remained under the Persian empire until its overthrow by Alexander. They continued to form a part of the Syrian monarchy until the defeat of Antiochus the Great (190–189 B.C.), after which they were transferred by the Romans to the dominion of Eumenes of Pergarnum. After the defeat of the Pergamene pretender Aristonicus (130 B.C.) Mysia became a part of the Roman province of Asia.

See A. H. M. Jones, *The Cities of the Eastern Roman Provinces* (Oxford, 1937); David Magie, *Roman Rule in Asia Minor* (Princeton, 1950)

MYSLOWICE (Ger. *Myslowitz*), a town of Katomice, Poland, on the Przemsa river. It is 120 mi. S.E. of Breslau by rail and an important railway junction. Pop. (1960) 40,000. It became a town in 1857 and is in an industrial area with coal mines: flax spinning and brick making. Taken by Germany in 1939, it was returned to Poland in 1915.

MYSORE, a constituent state of India, in the southern part of the peninsula. bounded north and northwest by Bombay. east by Andhra Pradesh, southeast by Madras, and with the state of Kerala lying against its southtz-estern border. Rlysore is divided naturally into two regions: the hill country called the malnad on the west; and the more open country known as the maidan, comprising the greater part of the state, where the wide-spreading valleys and plains are covered with villages and populous towns.

The drainage of the country is mostly into the Bay of Bengal, and is divisible into three great river systems—the Kistna on the north, the Cauvery on the south, and the northern Pennar, the Palar, and the southern Pennar (Pannaiyar) on the east. Because of either rocky or shallow beds none of the Mysore rivers is navigable. The main streams! especially the Cauvery and its tributaries. support an extensive system of irrigation by means of channels drawn from immense dams (anicuts).

Mysore is a prosperous state. Situated on a healthful plateau, it receives the benefit of both the southwest and northeast monsoons. which, in conjunction with its irrigation system, has brought it a large degree of immunity from famine. Iron and steel, cement, paper, sugar and sandalmood oil are the important industries. An aircraft factory and a telephone factory, the only ones of their kind in India, are located in Bangalore. Manganese, mica and steatite are worked. Kolar district (*q.v.*) contains famous gold fields. The University of Mysore (1916) has most of its component institutions either at Mysore or at Bangalore.

The total area of the state in 1951 was 29,489 sq.mi., subdivided into ten districts. Population (1951) 9,074,972. In 1961 the area of Mysore was increased to 74,122 sq.mi. The state then comprised 19 districts. Seven talukas of Bellary district were transferred from Madras to Mysore in Oct. 1933. The 1961 population, within the boundaries as delimited in 1961, was 23,547,081. Kannada (Kanarese) is spoken by the majority of the people, three-quarters of whom are engaged in agriculture. Of the Christians over two-thirds are Roman Catholics. The state government is as laid down in part B of schedule 1 of the Indian constitution. 1950. The maharaja, in his capacity of *rajpramukh* (*q.v.*), is constitutional head of state., There is an elected legislative assembly of 208 members, a legislative council (mainly elective) and a ministry composed of the chief minister and five other ministers and formed by the majority party in the legislature. Bangalore is the state administrative capital, Mysore city the dynastic capital.

History.—In the earliest historical times the north of Mysore was held by the Kadamba dynasty. whose capital. Banawasi, is mentioned by Ptolemy: they reigned during 14 centuries, though later they became feudatories of the Chalukyas (*q.v.*). The Cheras were contemporary with the Kadambas. and governed the southern part of Mysore till they were subverted by the Cholas in the 8th century. Another ancient race. the Pallavas, held a small part of the eastern side of Mysore, but were overcome by the Chalukyas in the 7th century. These were overthronn in the 12th century by the Ballalas (Hoysalas), an enterprising and warlike race professing the Jain faith. They ruled over most of Mysore, and parts of the modern districts of Coimbatore. Salem and Dharwar. nith their capital at Dwarasamudra (the modern Halebid); but in 1310 the Ballala king was captured by Malik Kafur. the general of Ala ud-Din; and 17 years later the town was entirely destroyed by another force sent by Jlohammed Tughlak. After the subversion of the Ballala dynasty, a new and powerful Hindu sovereignty arose at Vijayanagar.

In 1565 a confederation of the Mohammedan kingdoms defeated the Vijayanagar sovereign at the battle of Talikota. The most important of the petty local chiefs was the *wodeyar* of Mysore, who in 1610 seized the fort of Seringapatam. and so laid the foundation of the present state. His fourth successor. Chikka Deva Raja. during a reign of 34 years, made his kingdom one of the most powerful in southern India. In the middle of the 18th century the famous Mohammedan adventurer Hyder Ali (*q.v.*), usurped the throne. His dynasty. however. was as brief as it was brilliant, and ended with the defeat and death of his son Tippoo at Seringapatam in 1799. Krishnarajah Wodeyar, only five years old. was placed on the throne. and until he came of age in 1811 the state was under the administration of Purnaiya, the Brahman minister of Hyder and Tippoo. When Krishnarajah took over the management of his state he received .an orderly and contented principality with a surplus of two crores of rupees. Within 20 years he had driven his subjects into rebellion and involved himself and his state in heavy debt. The British government therefore assumed the administration in 1831, and placed it in the hands of commissioners. In 1867 it was determined to secure the continuance of native rule in Mysore and on March 25, 1881, Chamarajendra, Krishnarajah's successor, having attained the age of 18 years, was publicly entrusted with the administration of the state. He made over to the British a small tract at Bangalore (*q.v.*), forming the "civil and military station," and received in return the island of Seringapatam. By the signing of the "instrument of transfer." the young maharajah, for himself and his successors. undertook to perform the conditions imposed upon him. The maharajah died at Calcutta on Dec. 28. 1894. In 1913 the instrument of transfer was replaced by a treaty. Following the state's accession, without incident, to independent India on hug. 9, 1947, the maharajah was created *rajpramukh* on June 2, 1949.

MYSORE, the dynastic capital of the state of Mysore, India. 76 mi. S.W. of Bangalore on the Bangalore-Chamrajnagar branch of the Southern railway. Pop. (1961) 253,524. The city, which is spread over 14 sq.mi., has its nucleus in a valley at the foot of Chamundi hill. The palace of the maharaja within the large European-type quadrangular fort contains the ivory and gold throne said to have been presented to Chikka Deva Raj by the emperor Aurangzeb. The former residency, or government house, was built in 1805. The building later used for the district offices was originally built by Col. Arthur Wellesley (duke of Wellington) for his own occupation. The domed building for the public offices in Gordon park. the Maharaja's college and Maharani's College for Women in the university, the Mary Holdsworth hospital, the fine palace offices and the law courts are conspicuous. A teaching and residential university established in 1916 has five colleges in Mysore and six in Bangalore, as well as 22 intermediate and affiliated colleges in the two cities and elsewhere in the state. Mysore was superseded by Seringapatam as the seat of the court from 1610 to 1799, and in 1831, on the British occupation, the seat of administration was moved to Bangalore.

MYSORE TALUKA, which excludes the city, has an area of 303 sq.mi.; pop. (1951) 95,039.

MYSORE DISTRICT (4,622 sq.mi. excluding Mysore city; pop. [1961] 1,669,874) has only two municipalities with more than 15,000 inhabitants—Nanjangud ([1951] 16,737) and Chamrajnagar ([1951] 16.040). At Seringapatam, 10 mi. N. of Mysore city, are the mausoleums of Tippoo and Hyder Ali. The hilly "malnad" runs down the southwest side of the district, the rest being the more open "maidan" at a general elevation of 2,000–3,000 ft. The district is drained by the upper Cauvery and the Kabbani and the Nugu, tributary to it.

MYSTERY. It is necessary to differentiate mystery, Gr. *μυστήριον,* from its homophone, properly written mistery, late Lat. *ministerium,* a trade or craft; hence mystery plays (see DRAMA), those performed by trade-gilds. We must also set aside the Hellenistic meaning, common in modern languages, of "secret," "puzzling occurrence."

Properly, then, a mystery is a Greek rite which is kept secret (*μύειν,* to shut the mouth or eyes) from all save the initiated (oi *μύσται, οἱ μεμυημένοι*). These are specially prepared to have the secret revealed to them, under the guidance of a hierophant (*ἱεροφάντης,* "revealer of holy things"). According to Theon Smyrnaeus (de util. math., p. 15, Hercher) there were four stages: (1) preliminary purification (*καθαρμός*); (2) communication of mystic knowledge, *τελετῆς παράδοσις,* presumably including a sort of sermon of instruction or exhortation; (3) *ἐποπτεία,* or revelation of the holy things, the central point of the rite; (4) the crowning or garlanding of the mystic, who was thus, as it were, badged as a privileged person. We know that the central revelation was something done (*δρώμενον*), not spoken, or not merely spoken; Lucian says (de *saltat.,* 15) that all mysteries included dancing. Hence it is usually, and reasonably, concluded that some sort of pageant or rudimentary sacred drama was shown.

We may now ask why the rites should be secret at all. A plausible but mistaken explanation has recently been revived by O. Kern (Die *Religion* der *Griechen,* i. 1926): the invading Hellenes oppressed, perhaps actually used religious persecution against, the earlier inhabitants of Greece, hence driving their cults into secrecy.

It might be urged in favour of this view that in Crete, according to Diodorus Siculus (v. 77, 3), rites similar to the Greek mysteries lay open to all and had nothing "mysterious" about them, and also that the telesterion or hall of initiation at Eleusis originates in Minoan-Mycenaean constructions, and Eleusis itself has a name probably pre-Greek (*cp.* A. W. Persson in *Archiv* f. *Religionswissenschaft,* xxi., p. 291 ff.; M. P. Nilsson, *Minoan-Mycenaean* Religion, 1927, p. 402, ff.); furthermore, that several survivals of things pre-Hellenic have been more or less certainly traced in the ritual of the mysteries, Eleusinian and other. But these considerations can hardly avail against the facts that the mystic deities include many undoubtedly Greek, as Demeter, *Kore,* Ge, *Aglauros,* the Charites, Hecate, and others; that the ritual is in the hands of noble and distinguished families, not of slaves or other remnants of a conquered population; and that a good magico-religious reason for secrecy can be given. The deities of these cults are one and all chthonian; these, however benevolent, are in their nature dangerous to approach; therefore, to avoid all possibility of disturbance at a critical time, it is but prudent to shroud the whole performance in secrecy, and keep the impure and unprepared at a safe distance.

For the student of Hellenism, the Eleusinian and Orphic ceremonies are of paramount importance; the Samothracian, which vied with these in attractiveness for the later Hellenic world, were not Hellenic in origin; nor wholly hellenized in character, and cannot be considered in an article of this compass.

As regards the Eleusinia, we are in a better position for the investigation of them than our predecessors were; for the modern methods of comparative religion and anthropology have at least taught us to ask the right questions and to apply relevant hypotheses; archaeology, the study of vases, excavations on the site, yielding an ever-increasing hoard of inscriptions, have taught us much concerning the external organization of the mysteries, and have shown us the beautiful figures of the deities as they appeared to the eye or to the mental vision of the initiated.

In seeking to guess what the secret of the mysteries was, we must first rid ourselves of the notion that it was any esoteric philosophy, or elaborate theology kept hidden from the world at large. Negatively, we have no jot of evidence that the initiates were more intelligent than the rest of Greece, or that their belief or practice differed from those of their fellow-countrymen to any marked degree, although there need be no doubt that a certain amount of verbal instruction was given by the hierophant (see below). Positively, we have the repeated insistence, from the Homeric hymn down (*hymn. Homer,* ii., 480) that the initiates saw something which greatly comforted their souls, not that they learned anything of great importance. What they saw was doubtless the sacred *dromenon.* We can realize what effect this might have on excited and believing minds, if we consider the importance, for a pious Catholic, of such impressive ceremonies as the elevation of the Host at mass.[1]

Our evidence is of two kinds. Firstly, a number of works of art show us scenes probably or certainly taken from the ritual of the Eleusinian or other mysteries. But here we may be certain that the artists, even if they themselves had no scruples, would not risk violating the deepest religious sentiments of thousands of their fellow-countrymen. Secondly, we have literary evidence. But this, if pagan, is restrained by the same reasons as the artists' from saying too much; if Christian, the writers seldom, if ever, can be shown to have been initiates themselves; some indeed cannot have been, for they were never pagans, Their

[1]This is well and sympathetically discussed by O. Kern, *Die griechischen* Mysterien der *klassischen* Zeit [1927], especially p. 23 ff. Aristotle [frag. 45, Rose] declares that the mystae learned nothing, but underwent "an experience and an influence" [*παθεῖν καὶ διατεθῆναι;*] an important testimony.

statements are generally uncritical and do not clearly differentiate between the Eleusinian mysteries and others, such as the Orphic, Sabazian, and those of Cybele and Attis.

The questions that the critical analysis of all the evidence may hope to solve are mainly these: (a) What do u e know or what ran we infer concerning the personality of the deities to whom the Eleusinian mysteries were originally consecrated, and were new figures admitted at a later period? (b) When was the mystery taken over by Athens and opened to all Hellas, and what waa the state-organization provided? (c) What was the inner significance, essential content or purport of the Eleusinia, and what was the source of their great influence on Hellas? (d) Can we attribute any ethical value to them, and did they strongly impress the popular belief in immortality? Limits of space allow us only to adumbrate the results that research on the lines of these questions has hitherto yielded.

The paramount divine personalities of the mystery were, in the earliest period of which we have literary record, the mother and the daughter, Demeter and Kore, the latter being never styled Persephone in the official language of Eleusis; while the third figure, the god of the lower world known by the euphemistic names of Pluto (Plouton) and at one time Eubouleus, the ravisher and the husband, is an accessory personage, comparatively in the background. This is the conclusion naturally drawn from the Homeric hymn to Demeter, a composition of great ritualistic value, probably of the 7th century B.C., which describes the abduction of the daughter, the sorrow and search of the mother, her sitting by the sacred well, the drinking of the *κυκεών* or sacred cup, and the legend of the pomegranate. An ancient hymn of Pamphos, from which Pausanias freely quotes and which he regards as genuine[1], appears to have told much the same story in much the same way. As far as we can say, then, the mother and daughter were there in possession at the very beginning. The other pair of divinities known as *ὁ θεός, ἡ θεά* that appear in a jth century inscription and on two dedicatory reliefs found at Eleusis, have been supposed to descend from an aboriginal period of Eleusinian religion when deities were nameless[2]. But for various reasons the contrary view is more probable, that *ὁ θεός* and *ἡ θεά* are later cult-titles of the married pair Pluto-Cora (Plouton-Kore), the personal names being omitted from that feeling of reverential shyness which was specially timid in regard to the sacred names of the deities of the underworld. And it is a fairly familiar phenomenon in Greek religion that two separate titles of the same divinity engender two distinct cults.

The question as to the part played by Dionysus in the Eleusinia is important. Some scholars, like M. Foucart, have supposed that he belonged from the beginning to the inner circle of the mystery; others that he forced his way in at a somewhat later period owing to the great influence of the Orphic sects who captured the stronghold of Attic religion and engrafted the Orphic-Sabazian *ἱερός λόγος*, the story of the incestuous union of Dionysus-Sabazius with Demeter-Kore, and of the death and rending of Zagreus, upon the primitive Eleusinian faith. A saner and more careful criticism rejects this view. There is no genuine trace discovered as yet in the inner circle of the mysteries of any characteristically Orphic doctrine; the names of Zagreus and Phanes are nowhere heard, the legend of Zagreus and the death of Dionysus are not known to have been mentioned there. Nor is there any print within or in the precincts of the *τελεστήριον*, the hall of the *Μύσται*, of the footsteps of the Phrygian deities, Cybele, Attis, Sabazius.

The exact relation of Dionysus to the mysteries involves the question as to the divine personage called Iacchus: who and what was Iacchus? Strabo (p. 468), who is a poor authority on such matters, describes him as "the daemon of Demeter, the founder of the leader of the mysteries." More important is it to note that "Iacchus" is unknown to the author of the Homeric hymn, and that the first literary notice of him occurs in the well-known passage of Herodotus (viii. 65), who describes the procession of the mystae as moving along the sacred way from Athens to Eleusis and as raising the cry *Ἴακχε*. We find Iacchus the theme of a glowing invocation in an Aristophanic Ode (Frogs, 324–398), and described as a beautiful "young god"; but he is first explicitly identified with Dionysus in the beautiful ode of Sophocles *Antigone* (1119); and that this was in accord with the popular ritualistic lore is proved by the statement of the scholiast on Aristophanes (Frogs, 482) that the people at the Lenaea, the winter-festival of Dionysus, responded to the command of "Invoke the god!" with the invocation "Hail, Iacchus, son of Semele, thou giver of wealth!" We are sure, then, that in the high tide of the Attic religious history Iacchus was the youthful Dionysus, a name of the great god peculiar to Attic cult, and this is all that here concerns us to know.

We thus see that Iacchus was an Athenian, not an Eleusinian, god; his abiding-place was Athens, and he merely visited Eleusis for the mysteries. We may indeed conjecture that his votaries read Dionysiac interpretations into Eleusinian dromena. But all this is conjecture. The interpretation of what was shown would naturally change somewhat with the changing sentiment of the ages; but Demeter and Kore, *τὼ θεώ*, and no one else, are the paramount figures at Eleusis from the "Homeric" hymn to Xlaric's invasion. Triptolemus the apostle of corn-culture, Eubouleus—originally a euphemistic name of the god of the under-world, "the giver of good counsel," conveying a hint of his oracular functions—these are accessory figures of Eleusinian cult and mythology that may have played some part in the great mystic drama that was enacted in the hall.

As to the history of the Eleusinian mysteries[1], the legends concerning the initiation of Heracles and the Dioscuri imply that originally they were closed to strangers, which, as they probably were in origin local rites in honour of local deities, is exactly what we should expect. But the "Homeric" hymn implies that they are open to all; with this we may connect the sagas of the conquest of Eleusis by Athens (see EUMOLPUS) and the early unification of Attica under Theseus (see CONSTITUTION OF ATHENS). By what steps the mysteries grew in importance and fame we do not know, but certainly Peisistratus paid attention to them, while Pericles found them highly important and made them more so. Decrees of his time[2] proclaim a holy truce for pilgrims to the festival and invite the subject-allies of Athens to send first-fruits of corn, a part of his imperial policy. The *μυστικός σηκός* at Eleusis is of his date.

At least from the 5th century onwards, Athens was in charge of the organization and external control of the mysteries, the management being in the hands of the archon basileus and a committee of four *epimeletai* (overseers) and a *paredros* (assessor). The State, as elsewhere in Greece, controlled the Church. But the priesthood was Eleusinian. Two ancient clans, the *Eumolpidai* (see EUMOLPUS) and the *Kerukes* (see HERALD) performed the whole ceremony between them; it appears that in the 4th century the *Kerukes* died out and the *Lukomidai* of Phlye took their place, perhaps bringing with them a tendency to Orphism. From the Eumolpidae was chosen the hierophant, who was so holy that his personal name was no longer used when once he was appointed, and he alone might enter the innermost shrine,—or perhaps, for the details are obscure, he and a priestess. Demeter and Kore had also each a *hierophantis* or female hierophant; considering that the Thesmophoria (*q.v.*) was entirely in the hands of women, it is not surprising that they took part in the mysteries also. The *Kerukes,* afterwards the *Lukomidai,* chose the *δᾳδοῦχος* or torch-bearer, who ranked next after the hierophant, from their number.

Turning now to the celebration itself, we can only sketch the more salient features here. On the 13th of Boedromion, the Attic month corresponding roughly to our September, the Ephebi (*q.v.*) marched out to Eleusis, and returned to Athens the next

day, bringing with them the "holy things" (ἱερά) to the "Eleusinion" in the city; these ἱερά probably included small images of the goddesses. The 16th was the day of the ἀγυρμός, the gathering of the catechumens, when they met to hear the address of the hierophant, called the πρόρρησις. This was no sermon but a proclamation bidding those who were disqualified or for some reason unworthy of initiation to depart. The legally qualified were all Hellenes and subsequently all Romans above a certain — very youthful — limit of age, women and. as it appears, even slaves; barbarians, and those uncleansed of some notorious guilt, such as homicide, were disqualified. It is certain that there was no dogmatic test, nor would time allow of any searching moral scrutiny, and only the Samothracian rites, in this respect unique in the world of classical religion, possessed a system of confessional. The hierophant appealed to the conscience of the multitude, but the terms of his proclamation, which can only be approximately restored from late pagan and early Christian writers, are not altogether sure. It is known that he demanded of each candidate that he should be "of intelligible speech [*i.e.*, Hellene] and pure of hand"; and he catechized him as to his condition of ritualistic purity — the food he had eaten or abstained from. It appears also from Libanius that in the later period at least he solemnly proclaimed that the catechumen should be "pure of soul" (Or. *Corinth,* iv, 356), and this spiritual conception of holiness had arisen already in the earlier periods of Greek religious thought. On the other hand must be borne in mind the criticism that Diogenes is said to have passed upon the Eleusinia, that many bad characters were admitted to communion, thereby securing a promise of higher happiness than an uninitiated Epameinondas could aspire to.

An essential preliminary was purification and lustration, and after the assembly the "mystae" went to the seashore (ἅλαδε μύσται) and purified themselves with sea water, and probably with sprinkling of pigs' blood, a common cathartic medium. After their return from the sea, a sacrifice of some kind was offered as an essential condition of μύησις, but whether as a sacrament or gift offering to the goddesses it is impossible to determine. On the 19th of Boedromion the great procession started along the sacred way bearing the "fair young god" Iacchus; and as they visited many shrines by the way the march must have continued long after sunset! so that the 20th is sometimes spoken of as the day of the exodus of Iacchus. On the way each wore a saffron band as an amulet: and the ceremonious reviling to which the μύσται were subjected as they crossed the bridge of the Cephissus answered the same purpose of averting the evil eye. Upon the arrival at Eleusis, on the same night or on the following, they celebrated a midnight revel under the stars with Iacchus, which Aristophanes glowingly describes.

The question of supreme interest now arises: What was the mystic ceremony in the hall; what was said and what was done? Two grades in the celebration can be distinguished: the greater was the τέλεα and ἐποπτικά, the full and satisfying celebration, to which only those were admitted who had passed the lesser stage at least a year before. As regards the actual ritual in the hall of the mystae, much is still uncertain. That there was some kind of holy pageant or play, the accusations against Aeschylus and Alcibiades would suffice to prove, and Porphyry speaks of the hierophant and the δᾳδοῦχος acting divine parts. What the subject of this drama was may be gathered partly from the words of Clement — "Deo (Demeter) and Rore became the personages of a mystic drama, and Eleusis with its δᾳδοῦχος celebrates the wandering, the abduction and the sorrow" (Protrept., p. 12, Potter), supported by Apuleius (Met. vi, 2). We may believe then that the great myth of the mother's sorrow, the loss and the partial recovery of her beloved was part of the Eleusinian passion play. Did it also include a ἱερος γάμος? We should naturally expect that the sacred story acted in the mystic pageant would close with the scene of reconciliation, such as a holy marriage of the god and the goddess. But the evidence that this was so is mainly indirect, apart from a doubtful passage in Asterius, a writer of questionable authority in the 4th century A.D. (Econom. *martyr.*, p. 194, Combe). At any rate, if a holy marriage formed part of the passion play, it may well have been acted with solemnity and delicacy. We have no reason to believe that even to a modern taste any part of the ritual would appear coarse or obscene; even Clement. who brings a vague charge of obscenity against all mysteries in general, does not try to substantiate it in regard to the Eleusinia, and another Christian writer noted the scrupulous purity of the hierophant.

It would be interesting to know if the birth of a holy child, a babe Iacchus, for example. was a motive of the mystic drama. The question seems at first sight to be decided by a definite statement of Hippolytus (*Philosoph.*, 5, 8) that at a certain moment in the mysteries the hierophant cried aloud: "The lady-goddess Brimo has borne Brimos the holy child." But a careful consideration of the context almost destroys the value of his authority. For he does not pretend to be a first-hand witness. but admits that he is draning from Gnostic sources, and he goes on at once to speak of Attis and his self-mutilation. The formula may then refer to the Sabazian-Phrygian mystery, which the Gnostics would have no scruple in identifying with the Eleusinian. And the archaeological evidence that has been supposed to support the statement of Hippolytus is deceptive.

The simple structure of the building and the absence of any reference. in the many inscriptions, to expenses for scenery or the like forbid us to suppose that there was any elaborate staging. The pageant-play produced its effect by means oi gorgeous raiment, torches and stately figures.

But the mystic action included more than the pageant-play. The hierophant revealed certain holy objects to the eyes of the assembly. There is reason to suppose that these included certain primitive idols of the goddesses of immemorial sanctity; and, if we accept a statement of Hippolytus (*loc. cit.*), we must believe that the *epoptai* were also shown "that great and marvellous mystery of perfect revelation, a cut corn-stalk." The value of this definite assertion. which appears to be an explicit revelation of the secret, would be very great, if it could be trusted; but unfortunately it occurs in the same suspicious context as the Brimo-Brimos formula, and the same uncritical confusion of Eleusinian with Phrygian ritual is again suspected. for it is known that Attis himself was identified in his mysteries with the "reaped corn," the στάχυς ἄμητος, almost the very phrase used by Hippolytus. Only, it is in the highest degree probable, whether Hippolytus knew anything or not, that a corn token was shown among the sacred things of a mystery uhich possessed an original agrarian significance and was intended partly to consecrate and to foster the agricultural life. But to say this is by no means the same as to admit the view of F. Lenormant[1] and F. B. Jevons[2] that the Eleusinians worshipped the actual corn, or revered it as a clan totem. For of direct corn worship or of totemism there is no trace either at Eleusis or elsewhere in Greece.

Among the δρώμενα or "things done" may we also include a solemn sacrament, the celebration of a holy communion, in which the votary was united to the divinity by partaking of some holy food or drink? To Clement of Alexandria (Protrept., p. 18, Potter) is owed an exact transcription of the password of the Eleusinian mystae; it ran as follows (if Lobeck's emendation of ἐγγευσάμενος for ἐργασάμενος is accepted) : "I have fasted, I have drunk the barley-drink, I have taken (the things) from the sacred chest, having tasted thereof I have placed them' into the basket and again from the basket into the chest." It may be gathered from this that some kind of sacrament was at least a preliminary condition of initiation; the mystae drank of the same cup as the goddess drank in her sorrow, partly — as we say — "in memory of her." partly to unite themselves more closely with her. It is known also from an inscription that the priest of the Samothracian mysteries broke sacred bread and poured out drink for the mystae (Arch, *epigr. Mitth.*, p. 8. no. 14 [1882]). But neither in these nor in the Eleusinian is there any trace of the more mystic sacramental conception, any indication that the votaries believed themselves to be partaking of the actual body of their

[2] *Introduction* to the Study *of Comparative* Religion (1908).

divinity[1], for there Is no evidence that Demeter was identified with the corn, still less with the barley-meal of which the *κυκεὼν* was compounded. Nor is it likely that the sacrament was the pivot of the whole mystery or was part of the essential act of the *μύησις* itself. In the first place we have an almost certain representation of the Eleusinian sacrament on an archaic vase in Naples[2], probably of Attic *provenance,* and the artistic reproduction of a holy act would have been impious and dangerous, if this had belonged to the inner circle of the mystery. Again, there is no mention of sacrament or sacrifice among the five essential parts of *μύησις* given by Theo Smyrnaeus, nor in the imaginary narrative of the late rhetorician Sopatros (*Rhet. Graec.* viii., 121) who supposes the strange case of a man being initiated by the goddesses in a dream: they admit him to their full communion merely by telling him something and showing him something.

Besides the *δρώμενα,* then, there were also certain things said in the hall, or in the earlier stages of initiation, which we would gladly discover. Part of these were mystic formulae, one of which has been discussed already, the pass-word of the votaries. We gather also from Proclus and Hippolytus *(in* **Tim.** 293[c]; *Ref. Omn. Haer.* 5, 7, p. 146) that in the Eleusinian rites they gazed up to heaven and cried aloud "rain"—%--and gazed down upon the earth and cried "conceive"—*κύε.* This ritual charm—we cannot call it prayer—descends from the old agrarian magic which underlay the primitive mystery. What else the votaries may have uttered, whether by way of thanksgiving or solemn litany, we do not know[3]. But there was also a certain *ἱερὸς λόγος* some exposition accompanying the unfolding of the mysteries; for it was part of the prestige of the hierophant that he was chief spokesman, "who poured forth winning utterance and whose voice the catechumen ardently desired to hear" *(Anth. Pal.,* app. 246); and Galen speaks of the rapt attention paid by the initiated "to the things done and said in the Eleusinian and Samothracian mysteries" *(De usu part. 7.* 14). But we have no trustworthy evidence as to the real content of the *λόγος* of the hierophant. We need not believe that the whole of his discourse was taken up with corn-symbolism, as Varro seems to imply (Aug. *de civit. Dei.* 20), or that he taught natural philosophy rather than theology, or again, the special doctrine of Euhemerus, as two passages in Cicero *(De natur. deor.* i. 42; *Tusc.* i. 13) might prompt us to suppose. His chief theme was probably an exposition of the meaning and value of the *ἱερά* as in an Australian initiation rite it is the privilege of the elders to explain the nature of the "churinga" to the youths. And his discourse on these may have been coloured to some extent by the theories current in the philosophic speculation of the day. But though in the time of Julian he appears to have been a philosopher of Neo-platonic tendencies, we ought not to suppose that the hierophant as a rule would be able or inclined to rise above the anthropomorphic religion of the times. Whatever symbolism attached to the *ἱερά,* the sacred objects shown, was probably simple and natural; for instance, in the Eleusinian, as in Egyptian eschatology, the token of the growing corn may have served as an emblem—though not a proof—of man's resurrection. The doctrine of the continuance of the soul after death was already accepted by the popular belief, and the hierophant had no need to preach it as a dogma; the votaries came to Eleusis to ensure themselves a happy immortality. And in our earliest record, the Homeric hymn, we find that the mysteries already hold out this higher promise. How, we may ask, were the votaries assured? The Egyptianizing theory of Foucart, that they were given directions and spells to take them past the terrors of the underworld, after the manner of the *Book of the Dead,* is wholly improbable. The terror of hell is not normal Greek, although something of the kind existed in Orphism; nor have we any evidence that spells of any kind were taught or that the *λόγος* was regarded as particularly important. If we could be sure that the Minoans had a developed eschatology *(see* Evans in *Journ.* Hell. *Stud.,* xlv. p. 43 ff., but *cf.* Nilsson, *Minoan-Myc. Rel.,* p. 549 ff.), we might suppose some of it to survive; but the matter is very doubtful.

The assurance of the hope of the Eleusinian votary was obtained by the feeling of friendship and mystic sympathy, established by mystic contact, with the mother and the daughter, the powers of life after death. Those who won their friendship by initiation in this life would by the simple logic of faith regard themselves as certain to win blessing at their hands in the next.

That the mysteries preached a higher morality than that of the current standard is not proved. That they exercised a direct and elevating influence on the individual character is nowhere explicitly maintained, as Diodorus (v. 49) maintains concerning the Samothracian. But on general grounds it is reasonable to believe that such powerful religious experience as they afforded would produce moral fruit in many minds. The genial Aristophanes *(Frogs,* 455) intimates as much, and Andocides *(De myster.* p. 36, § 31; p. 44, § 125) assumes that those who had been initiated would take a juster and sterner view of moral innocence and guilt.

Besides the greater mysteries at Eleusis, we hear of the lesser mysteries of Agrae on the banks of the Ilissus. Established. perhaps, originally by Athens herself at a time when Eleusis was independent and closed her rites to strangers, they became wholly subordinated to the greater, and were put under the same management and served merely as a necessary preliminary to the higher initiation into them. Sacrifice was offered to the same great goddesses at both; but we have the authority of Duris *(Athenae,* 253*d*), the Samian historian, and the evidence of an Attic painting, called the ***pinax*** of Nannion[1], that the predominant goddess in the mysteries at Agrae was Kore. And this agrees with the time of their celebration, in the middle of Anthesterion, when Kore was supposed to return in the young corn. Stephanus (*s.v.* "Aypa), drawing from an unknown source, declares that the Dionysiac story was the theme of their mystic drama; an isolated statement with nothing to confirm or interpret it.

The influence of Eleusis in early times must have been great, for we find offshoots of its cult, whether mystic or not, in other parts of Greece. In Boeotia, Laconia, Arcadia, Crete and Thera, Demeter was called Eleusinia, meaning in all probability "goddess of Eleusis." The initiation rites of Demeter at Celeae near Phlius, at Lerna in Argolis, and at Naples, were organized after the pattern of the Eleusinian. But of these and the other Demeter mysteries in the Greek world, there is little to record that is certain and at the same time of primary importance for the history of religion. The Arcadian city of Pheneus possessed a mystery that boasted an Eleusinian character and origin, yet in the record of it there is no mention of Kore, and we may suspect that, like other Demeter-worships in the Peloponnese, it belonged to a period when the goddess was revered as a single personality and Kore had not yet emanated from her. We know much more of the details of the great Andanian mysteries in Messenia, owing to the discovery of the important and much-discussed Andanian inscription of 91 B.C.[2]. But what we know are facts of secondary importance only. We gather from Pausanias (4. 33. 4; *cf.* 4. I. 5. and 4. 26. 8; 4. 27. 6) that the rites, which he regards as second in solemnity and prestige to the Eleusinian alone, were consecrated to the **Μεγάλαι θεαί** (the great goddesses) and that Kore enjoyed the mystic title of Hagnē, "the holy one." The inscription has been supposed to correct and to refute Pausanias, but it does not really controvert his statements, which are attested by other evidence; it proves only that other divinities came at

[1]This is Dr. Jevons's supposition—*op. cit.*—on which he bases an important theory of the whole Eleusinian mysteries and their intrinsic attraction.

[2](Farnell, *Cults,* vol. iii. pl. xv.[b]).

[3]The other formula which the scholiast on Plato *(Gorg. 407 c.)* assigns to the Eleusinian rite: "I have eaten from the timbrel, I have drunk from the cymbal, I have carried the sacred vessel, I have crept under the bridal-chamber," belongs, not to Eleusis, but, as Clement and Firmicus Maternus themselves attest. to Phrygia and to Attis.

[1]Farnell, *Cults of the Greek States,* vol. iii. p. 242, Pl. xvi.

[2]*See* Sauppe, *Mysterieninschrift von* Andania; cf. Foucart's commentary in Le Bas, *Voyage archéol.* 2, No. 326[a]; H. Collitz, ***Dialect-inschriften,*** 4689.

a later time to have a share in the mysteries, such as the Μεγάλοι θεοί who were probably the Cabeiri (*q.v.*). It is clear that the Andanian mysteries included a sacred drama, in which women personated the goddesses. The priestesses were married women, and were required to take an oath that they had lived "in relation to their husbands a just and holy life." We hear also of grades of initiation, purification-ceremonies, but of no sacrament or eschatologic promise; yet it is probable that these mysteries, like the Eleusinian, maintained and secured the hope of future happiness.

The Eleusinian faith is not wholly unattested by the grave-inscriptions of Hellas, though it speaks but rarely on these. The most interesting example is the epitaph of a hierophant who proclaims that he has found that "death was not an evil, but a blessing[1]."

Of equal importance for the private religion of Greece were the Orphic mystic societies, bearing a Thraco-Phrygian tradition into Greece, and associated originally with the name of Dionysus. and afterwards with Sabazius also and the later cult-ideas of Phrygia[2]. The full account of the Dionysiac mysteries would demand a critical study of the Dionysiac religion as a whole, as well as of the private sects that sprang up under its shadow. It is only possible here to indicate the salient characteristics of those which are of primary value for the history of religion.

Originally a great nature-god of the Thraco-Phrygian stock, powerful over all vegetation and especially revealing his power in the vine, Dionysus was forcing his way into Greece at least as early as the Homeric period, and by the 6th century was received into the public cults of most of the Greek communities. We can gather with some certainty or probability his aboriginal characteristics and the form of his worship. Being a god of the life of the earth, he was also a nether divinity, the lord of the world of souls, with whom the dead votary entered into privileged communion; his rites were mystic, and nightly celebrations were frequent, marked by wild ecstasy and orgiastic self-abandonment, in which the votary became at one with the divinity and temporarily possessed his powers; women played a prominent part in the ritual; a savage form of sacramental communion was in vogue, and the animal victim of whose flesh and blood the votaries partook was at times regarded as the incarnation of the divinity, so that the god himself might be supposed to die and to rise again; finally we may regard certain cathartic ideas as part of the primeval tradition of this religion. Admitted among the soberer cults of the Greek communities, it lost most of its wildness and savagery, while still retaining a more emotional ecstatic character than the rest. But this cooling process was arrested by a new wave of Dionysiac fervour that spread over Greece from the 7th century onwards, bringing with it the name of Orpheus, and engendering at some later date the Orphic brotherhoods (thiasoi). This religious movement may have started like the earlier one from the lands north of Greece; but Crete and even Egypt are supposed to have contributed much to the Orphic doctrine and ritual. Plato's contemptuous mention (Rep. 364A) of wandering Orphic initiators brings to our notice a phenomenon unknown elsewhere in Greek religion; the missionary spirit, the impulse to preach to all who would hear, which foreshadows the breaking down of the gentile religious barriers of the ancient world. And it is probable that some kind of "Orphic" propagandism, whether through books or itinerant mystery-priests, or both, had been in vogue some time before Plato. Orphism was known to Pindar (*Olym.* ii. and frags. 129-133 v. Christ) and Euripides, see *Hipp.* 952–4 and, yet more important, frag. 472 (Nauck) which attests the antiquity of these mystic Dionysiac associations in Crete. The initiated votary proclaims himself as sanctified to Zeus of Ida, to Zagreus and to the mountain-goddess Rhea-Cybele; he has fulfilled "the solemn rite of the banquet of raw flesh," and henceforth he "robes himself in pure white and avoids the taint of childbirth and funerals and abstains from meat" And—what is most significant—he calls himself by the very name of his god—he is himself Βάκχος. In spirit and in most of its details the passage accords well with the Bacchae of Euripides, which reflects not so much the public worship of Greece, but rather the mystic Dionysiac brotherhoods. Throughout this inspired drdma the votary rejoices to be one with his divinity and to call himself by his name, and this mystic union is brought about partly, though Euripides may not have known it, through "the meal of raw flesh" or the drinking of the blood of the goat. or the kid or the bull. The sacramental intention of this is confirmed by abundant proof; even in the state-cult of Tenedos they dressed up a bull-calf as Dionysus and reverentially sacrificed it (Ael. *Nat.* an. 12. 34); those who partook of the flesh were partaking of what was temporarily the body of their god. The Christian fathers at once express their abhorrence of this savage ὠμοφαγία and reveal its true significance (Arnob. *Adv. nat.* 5. 119); and Firmicus Maternus (De error., p. 84) attests that the Cretans of his own day celebrated a funeral festival in honour of Dionysus in which they enacted the life and the death of the god in a passion-play and "rent a living bull with their teeth."

But the most speaking record of the aspirations and ideas of the Orphic mystic is preserved in the famous gold tablets found in tombs near Sybaris, one near Rome, and one in Crete. These have been frequently published and discussed; and here it is only possible to allude to the salient features that concern the general history of religion. They contain fragments of a sacred hymn that must have been in vogue at least as early as the 3rd century B.C., and which was inscribed in order to be buried with the defunct, as an amulet that might protect him from the dangers of his journey through the under-world and open to him the gates of Paradise. The verses have the power of an incantation. The initiated soul proclaims its divine descent: "I am the son of Earth and Heaven." "I am perishing with thirst, give me to drink of the waters of memory." "I come from the pure": "I have paid the penalty of unrighteousness": "I have flown out of the weary, sorrowful circle of life." His reward is assured him: "O blessed and happy one, thou hast put off thy mortality and shalt become divine." The strange formula ἔριφος ἐς γάλ' ἔπετον "I a kid fell into the milk," has been interpreted by Dieterich (Eine Mithras-Liturgie, p. 174) with great probability as alluding to a conception of Dionysus himself as ἔριφος, the divine kid, and to a ritual of milk-baptism in which the initiated was born again[1].

We discern, then, in these mystic brotherhoods, the germs of a high religion and the prevalence of conceptions that have played a great part in the religious history of Europe. And as late as the days of Plutarch they retained their power of consoling the afflicted (*Consol. ad. uxor.*, c. 10).

The Oriental mysteries, associated with Attis, Cybele, Isis and Sabazius, which invaded later Greece and early imperial Rome, were originally akin to these and contained many concepts in common with them. But their orgiastic ecstasy was more violent, and the psychical aberrations to which the votaries were prone through their passionate desire for divine communion were more dangerous. Emasculation was practised by the devotees of Attis, whatever the reason may have been[2], and the high priest himself bore the god's name. Or communion with the deity might be attained by the priest through the bath of blood in the taurobolium (*q.v.*), or by the gashing of the arm over the altar. A more questionable method which lent itself to obvious abuses, or at least to the imputation of indecency, was the simulation of a sacred marriage, in which the catechumen was corporeally united with the great goddess in her bridal chamber (Dieterich, *op. cit.* pp. 121–134). Prominent also in these Phrygian mysteries were the conception of rebirth and the belief, vividly impressed by solemn pageant and religious drama, in the death and resurrec-

tion of the beloved Attis. The Hilaria in which these were represented fell about the time of our Easter; and Firmicus Maternus reluctantly confesses its resemblance to the Christian celebration (Farnell. Cults, iii, 299).

The Eleusinian mysteries are far more characteristic of the older Hellenic mind. These later rites breathe an oriental spirit, and though their forms appear strange and distorted they have more in common with the subsequent religious phenomena of Christendom. And the Orphic doctrine may have even contributed something to the later European ideals of private and personal morality. (See *Archiv* fur Religionswiss. (1906), article by Salomon Reinach.)

Bibliography.—C. A. Lobeck, *Aglaophamus* (1829) is still very useful for material. General discussion of the subject in M. P. Foucart, *Les grands mystères d'Eleusis* (1900); Goblet d'Alviella, *Eleusinia* (1903); L. R. Farnell, *Cults of the Greek States*, vol. iii (1906), mith collection of relevant passages. Frazer, *Golden Bough*, 3rd *ed.*, especially vols. ii (1911) and vii (1912) (bibl.). *See* also Dionysus; Demeter; Great Mother of the Gods; Mithraism; Orpheus, and literature cited in text. (L. R. F.; H. J. R.)

MYSTERY AND DETECTIVE STORIES. Although the mystery story as a minor literary genre, a convenient category for book reviewers, is not old, its origins are lost in the blackout of antiquity. Its seeds are found in the folklore of the oldest nations: little tales, hints. anecdotes, superstitions. that are as old as recorded time. They are part of ethnology, philosophy. religion; and their long growth into a department of literary art or artifice parallels the history of man's mind.

MYSTERY STORIES

In that history the emotion of fear always has bulked large, and the oldest and strongest of man's fears is fear of the unknown. Mystery. by definition, is that which is unknown. But tied in with fear of the unknown is the emotion of curiosity concerning it; and out of that fear and curiosity perhaps mas born the mystery story. At first a tale of wonder and terror concerned largely mith supernatural matters, it later became a subsidiary of romance; and in still later times, notably our own, it came to be a sort of game invented and played for intellectual relaxation and artificial excitement.

Today a mystery story is, loosely, any story containing a mystery. It may be, and frequently is, a tale of horror and terror; but it may also be a pseudoscientific fantasy (*see* Science Fiction). a tale of diplomatic intrigue. an affair of codes and ciphers and secret societies, a crime story or a dozen other things involving an enigma. In the beginning. however, it was a tale of spectres and the supernatural.

It will be noted that the detective story per se is omitted from the above list. By recent arbitrary definition, the detective story, lustiest offspring of the mystery story, is a separate and distinct division oi literature, a pure form that demands individual consideration. However, it is obviously a mystery story; the separation is largely one of convenience.

Early **History.**—While mystery stories cannot always be classified nith exactness—since mystery is everywhere present—they may be divided, for easy understanding, into three groups: ghost stories, riddle stories and detective stories.

Ghost Stories, the Gothic and Beyond.—The literature of ghosts, as already stated, is time old. The middle ages took over the dark heritage of antiquity and amplified it with academically formulated magic and cabalism. Perhaps the ghostly angle—complicated by devils, ghouls, ruined castles, subterranean passages and suchlike medieval claptrap—began to emerge most clearly as a department of romance in the 18th century, with what is called the Gothic tale.

It was invented by a worldly Englishman. Horace Walpole, whose Castle *of* Otranto (1764) may be said to have founded the horror story as a permanent form. Among his outstanding successors were Ann Radcliffe (*The Mysteries of Udolpho,* 1794), Matthew Gregory Lenis (The *Monk,* 1796). Charles Robert Maturin (*Melmoth the Wanderer,* 1820) and the early American novelist Charles Brockden Brown (*Wieland,* 1798). Mary Godwin Shelley, the wife of the poet, took a hand in the game, with her famous novel Frankenstein (1818), still a classic horror story, and nith it introduced the pseudoscientific note—the creation out of charnel fragments of a monster that ultimately destroyed its creator.

The influence of the Gothic tale persisted well into the 19th century in the work of such writers as J. Sheridan Le Fanu and Wilkie Collins; indeed, it is obvious in Bram Stoker's gruesome vampire tale *Dracula,* published as late as the year 1891. And pseudoscientific nightmares have not ended with H. G. Wells. Greatest of all names in the field, however, is that of Edgar Allan Poe (1809–49), who first forced the tale of mystery and horror into the artistic regions of pure literature and invented the modern short story form.

Poe's most relevant successors perhaps have been Le Fanu, a strangely neglected Irish genius, Robert Louis Stevenson, Arthur Conan Doyle. Ambrose Bierce. Arthur Machen, Algernon Blackwood, Lord Dunsany and the American *fantaisiste* H. P. Lovecraft. But any such list of masters is inevitably and unfairly incomplete—such isolated masterpieces as W. W. Jacobs' "The Monkey's Paw" have not infrequently lifted writers of a more miscellaneous genius into the front rank of mystery masters.

Riddle Stories.—Riddle stories too began in time out of mind, for the enjoyment of puzzles is as old as humanity itself. But there is a practical utility in puzzle solving, also, that no doubt was recognized by the ancients; regular exercise is as necessary for the brain as for the body. The riddle of Samson, propounded in the Bible (Judg. xiv. 12–18), is the most famous early example; but, although Samson has been called the father of riddles. it may be that older and better ones were even then buried in antiquity.

Among the Egyptians, puzzling was a religious rite. and the Sphinx was their goddess. Such was the esoteric religion of the Egyptians that all the priests were riddlers and their religion one vast enigma. The classic riddle of the Sphinx, however. belongs to Grecian mythology. Its date is not authenticated, but it is of antiquity, for Sophocles wrote about it in the 4th century B C.

So much for antiquity. The riddle story came down the years as did the ghost story, and not infrequently the two overlapped. Its distinguishing feature, at the moment, is that the reader be confronted with a number of mysterious facts and situations, explanation of which is reserved until the end of the story. Unlike the pure detective story—which also, of course. is a riddle story—there may be no clues, either leading or misleading, to assist or to trick the reader. The nhole operation of reading may be one of sustained wonder and abiding curiosity.

A good example of the riddle story may be one describing a search for lost treasure. in which mysterious conditions are encountered. In many such. a cipher or cryptogram is added to the tale to complicate the over-all mystery with an interior riddle that most readers find irresistibly attractive.

Poe's great short story "The Gold Bug" is a classic example of this ingenious and popular story plot. Of another kind is Kipling's short mystery "The Sending of Dana Da," a tale involving a plethora of cats visited upon a hater of cats. In the more sinister field of murder are innumerable tales of roguery involving mystery and crime but without the familiar detective interludes. Two notable—almost notorious—riddle stories of modern times offered no solution to the riddle posed and gained wide attention by their novelty—"The Lady or the Tiger" by Frank R. Stockton, and "The Mysterious Card" by Cleveland Moffett.

More nearly kin to the detective story than any of these are the spy stories. the secret service stories, the tales of international intrigue and adventure that, in our own day, have been entertainingly written and prolifically produced by such men as E. Phillips Oppenheim, John Buchan, Francis Beeding (joint pseud, of J. L. Palmer and H. A. St. G. Saunders), Valentine Williams, H. C. McNeile and William Le Queux to name only half a dozen out of many nho are typical.

These stories are on the border line between adventure and bona fide detection; in certain instances—*Bulldog Drummond, Clubfoot, et al*—they overlap the pure detective story and almost force an entrance into the more select field.

BIBLIOGRAPHY.—Dorothy L. Sayers (ed.), *The Omnibus of Crime* (1929); Carolyn Wells, *The Technique of the Mystery Story*, rev. ed. (1929); H. P. Lovecraft, "Tne Supernatural in Fiction," *The Outsider, and Others* (1939).

DETECTIVE STORIES

The detective story, as a literary form, celebrated its 100th anniversary in April 1941. Pedantry asserts that its seeds are to be found in the earliest folklores. and it is true that the antecedents of the various motifs combined in the genre are as old as man's mental habits. of which they are in part the history. The puzzle motif is as old as the Prophets, and the Erinyes theme—revenge relentlessly tracking down the wicked—is anterior to literature. Alleged examples of the detective story, in this prenatal sense: have been dug from the pages of Aesop, Herodotus. Cicero, Vergil and the authors of the Apocryphal Scriptures; specimens have been found in all the literatures of the east. Best of these. perhaps, is the Apocryphal account of Daniel's superb sleuthing in the story of "Bel and the Dragon." in which the prophet is shown to have anticipated Sherlock Holmes by many centuries.

Medieval literature also yields relevant tales and legends from the writings of Boccaccio, Chaucer and others. revealing detective habits of thinking in certain fictive characters; and more pertinent examples are outstanding in the *Arabian Nights*. Most striking of modern prototypes is a famous chapter in Voltaire's *Zadig*, an 18th-century romance in which the philosopher-hero accurately describes a lost horse and dog, although he has seen neither, by pure Holmesian deduction.

Nevertheless. the detective story as we know it was born in the pages of *Graham's Magazine*, a Philadelphia journal, in April 1841, with the publication of a short story, "The Murders in the Rue Morgue." by Edgar Allan Poe. Of this story. Dorothy L. Sayers has observed that "it constitutes in itself almost a complete manual of detective theory and practice." A sequel. "The Mystery of Marie Rogêt," appeared in *Snowden's Ladies' Companion*, of New York, in the issues of Nov. and Dec. 1842 and Feb. 1843. Poe's third and last pure detective story, "The Purloined Letter," was published in a Philadelphia annual. *The Gift*, for the year 1845, in which year all three stories; with others, were brought together in a book called simply *Tales*, the most important volume in the history of the detective story. Each of the three tales celebrated an exploit of the chevalier C. Auguste Dupin. who must be called the first fictional detective, and this for a good reason: the profession of detective had only recently been invented. and until there were detectives in the world to write about, no stories about them were possible.

If anybody preceded Poe, it was François Eugbne Vidocq, the reformed French thief, who established the world's first official detective bureau, at Paris in 1817. and published his *Mémoires* in 1828–29. There is no doubt that Poe read this book and was influenced by it; but presumably—and ostensibly—Vidocq's volume was a factual record of his own experience, not a fictional detective story. And if Poe drew some of his inspiration from the French book—the background of his tales was the Paris of Vidocq's brigade de sûreté—Dupin was no Vidocq: he was Poe himself in a new role invented for the occasion, that of the perfect reasoner: the divine amateur, later to find world popularity in the epic figure of Sherlock Holmes. It may be noted, however, that Poe did not use the word detective in any of his stories: that was to come later.

With Poe's three tales of ratiocination, almost miraculously the detective story sprang into flower full blown. "The extraordinary thing," says H. Douglas Thomson, in *Masters of Mystery*, "is that at its very inception the principles and canons of detective fiction writing were brilliantly conceived, even with a touch of finality." It is not known why Poe stopped at the third story: he may have tired of his creation or, as is more likely, the public response may have been lukewarm. Two other mysteries by this author, "The Gold Bug" and "Thou Art the Man," are sometimes called detective stories, but strictly speaking they are outside the canon.

Poe was ahead of his public. Twenty years were to elapse before the infant he had laboured and then deserted was adopted; and then it was a parent from another land. The year was 1866 when Emile Gaboriau, who had been contributing stories of military and fashionable life to the Parisian newspapers, began to publish his *L'Affaire Lerouge* in *Le Pays* and woke up one morning to find himself famous. Thereafter until his death in 1873 he was a busy man, for he had invented the long detective story. and it was a spectacular success. Other detective novels flowed from his pen —*Le Dossier 113, Le Crime d'Orcival, Monsieur* Lecoq—and his detective creations. Père Tabaret and Lecoq, now stand with Dupin on the shelf of illustrious practitioners. Less clever than Dupin, they were more humorously alive and more recognizably human—Tabaret, the bibliomaniac amateur; Lecoq, the brilliant professional. With Dupin they are the forerunners, the immediate ancestry, of Sherlock Holmes.

It is possible that Gaboriau was familiar with Poe's *Tales*, in the translation of Baudelaire (1856–57), but more likely that he was directly influenced by Vidocq, whose *Mémoires* were looted by scores of French writers of the period, among them Balzac, Hugo and Dumas. These masters, however, never wrote a detective story. Gaboriau's only relevant contemporary was his successor and imitator Fortuné du Boisgobey, author of a line of sensational police romances, of which the first, *Le Forçat Colonel*, was published in 1872.

But before Gaboriau had ceased to write, the movement had crossed the channel; the next landmark in detective fiction was English. In 1868, within a year of the appearance of *L'Affaire Lerouge*, a famous book was published in London—The *Moonstone*, by Wilkie Collins.

An earlier masterpiece by Collins, *The Woman in White*, had appeared in 1860. but, although an excellent mystery, it was not a detective story. In *The Moonstone*, Collins wrote what many critics have called the greatest detective story of them all. However that may be—and the detection in the book is not exhibitional. but a device to catalyze the elaborate ingredients—it was the first full-length detective novel in English and is properly a classic. With Sergeant Cuff, the professional detective who raised roses in his unprofessional moments, says Thomson. "the paradox was born, the detective with a sensibility greater than his sense." With Sergeant Cuff also, it has been said, "character began to raise its head."

Throughout all these years Charles Dickens had been writing voluminously in England without producing a detective novel. He was, however. interested in police work and had watched the growth of England's protective system with alert appreciation of its possibilities for literature. In 1829 Sir Robert Peel had established the London metropolitan police force: with a backdoor opening on a spot called Scotland Yard; and in 1842 a detective branch had been added, with headquarters in the Yard itself. Thus the scene was set; and it may be said that Dickens in a sense inaugurated the long literature that followed those momentous events when, in 1853, he made his friend Inspector Field a character in *Bleak House*. However, *Bleak House* is not a detective novel. Suddenly, in the last year of his life, and probably under the influence of Collins. he began to write *The Mystery of Edwin Drood* but died with the novel half finished on his desk. The fragment was published in 1870 and remains to this day the most exasperating detective story in the world. Hundreds of literary detectives have tried to penetrate its mystery and none has succeeded. There can be little doubt. though, that the book is another landmark in the history of detective fiction.

In America. meanwhile, a young woman named Anna Katharine Green was getting ready to write The *Leavenworth Case*, first of a long line of melodramatic novels of crime and detection from the same hand. The book appeared in 1878 and is still its author's most famous story. although possibly not her best. It is an American classic, however. the first detective novel by an American and the first by a woman in any language. Stilted and old-fashioned as Miss Green's books now seem, her plots, says Howard Haycraft, in *Murder for Pleasure*, are "models of careful construction that can still hold their own against today's competition."

Two remarkable events occurred in 188; to make that year memorable in the history of the detective story. Out of Australia came a sensational thriller, *The Mystery of a Hansom Cab*, by

Ferpus Hume, to become the greatest commercial success in the annals of literary crime. When Hume died. in 1932, more than joo ooo copies had gone over the counter. This famous tale is scarcely readable today but historically it is important.

That nas the first event. The second was the appearance of Sherlock Holmes, still the greatest name in detective literature. His creator, Arthur Conan Doyle, was a young Scotch-Irish physician. who had been inspired by an insufficiency of patients to try his hand at writing. *A Study in Scarlet,* first of the Holmes stories, nas a potboiler that brought him only £2 j. It appeared just before Christmas 1887, and there was no sequel until 1890, when *The Sign of Four* nas written for an American magazine. Neither story set England on fire. but both mere widely pirated in America, in the absence of an international copyright act. The widespread popularity of the detective dates from July 1891, when "A Scandal in Bohemia." first of the shorter *Adventures of Sherlock Holmes,* was published in the *Strand Magazine,* to be followed by 23 others over the next two years. The last 12 became the *Memoirs of Sherlock Holmes,* and in the final story Holmes was killed off by his creator, a deed of violence that shocked the world. By that time, however, the doctor's future had been assured; he had given up medicine and was—as he confessed—heartily tired of his famous puppet, who was obscuring his more important work in the historical field.

But public indignation harassed him until he was forced to bring Holmes back to life. In 1902 he yielded to supplication and published *The Hound of the Baskervilles,* a reminiscence of Sherlock Holmes; in 1905 he surrendered unconditionally in *The Return of Sherlock Holmes,* in which he resurrected the detective with great ingenuity. Three other volumes folloned: *The Valley of Fear,* in 191j; *His Last Bow,* in 1917; and *The Case-Book of Sherlock Holmes,* in 1927

Sir Arthur Conan Doyle died in 1930, leaving behind him the greatest reputation in the history of detective fiction and a detective whose name bids fair to remain a permanent part of the English language.

For the inspiration that led Conan Doyle to write the tales of Sherlock Holmes we have to thank, first, his unemployment; second, his admiration for the work of Poe and Gaboriau; and, last, his happy recollection of the methods and mannerisms of his old teacher, Joseph Bell of Edinburgh. who was the living prototype of the detective. Most of the stories are told by the amiable and obtuse Doctor Watson, a fictional character almost as famous and well loved as Holmes himself. In Watson, it is fair to assume, we have a self-portrait of Conan Doyle, the impecunious Portsmouth physician, who contributed them both to the gallery of immortals.

Thus. says Dorothy L. Sayers, "the ball—the original nucleus deposited by Edgar Allan Poe nearly 40 years earlier—was at last set rolling. As it went, it swelled into a vast mass—it set off others—it became a spate—a torrent—an avalanche of mystery fiction."

In England and America writers were quick to try their talents at the popular game, and for the most part the Sherlock model prevailed. Best of immediate imitations was *Martin Hewitt, Investigator* (1894), by Arthur Morrison, and its several sequels. Simultaneously, pseudoscientific detection made its appearance in the tales of L. T. Meade and her collaborators. Clifford Halifax and Robert Eustace, a series that began with *Stories From the Diary of a Doctor* in 1894.

The aestheticism of the 1890s was reflected in the genre, to some extent, in M. P. Shiel's *Prince Zaleski* (1895); and Grant Allen closed the decade with three excellent volumes, of which the best was *Hilda Wade,* (1900).

The 20th century opened with the Baroness Orczy's anonymous detective, *The Old Man in the Corner,* functioning brilliantly in the magazines (book publication was delayed), and between the years 1907 and 1911 three detectives of the first water appeared in book form: Dr. John Thorndyke, in R. Austin Freeman's *The Red Thumb Mark* (1907), A. E. W. Mason's Hanaud, in *At the Villa Rose* (1910), and G. K. Chesterton's Father Brown, in *The Innocence of Father Brown* (1911). Father Brown, the little English Roman Catholic priest, has been called one of the immortals, and Thorndyke is indubitably great, a scientific investigator whose science is as sound as it is fascinating. In 1913 *Trent's Last Case,* by E C Bentley, was hailed by critics as one of the great masterpieces of the genre The Sherlock Holmes period may be said to have ended, in England. with Ernest Bramah's *Max Carrados* (1914), a volume of notable short stories introducing the first blind detective.

The American scene in the early years of the century produced detective stories in number but only a few that were important. Still remembered is the work of Jacques Futrelle, best viewed in *The Thinking Machine* (1907), and Arthur B. Reeve. whose stories in *The Silent Bullet* (1912) introduced the long series about Craig Kennedy.

More important are Mary Roberts Rinehart and, perhaps, Carolyn Wells. Mrs. Rinehart's *The Circular Sfaircase* (1908) was the first of several books—on the border line between detection and mystery—that helped to make her for a time the most popular of American storytellers. Miss Wells, with less talent, wrote more than 70 detective novels. most of them starring her Sherlockian creation Fleming Stone

High spots of the period were *In the Fog* (1901), by Richard Harding Davis; *Tlzrough the Wall* (1909), by Cleveland Moffett; *The Mystery of the Boule Cabinet* (1912), by Burton E. Stevenson; and *The Achievements of Luther Trant* (1910), by William MacHarg and Edwin Balmer.

In the last book the methods of the psychological laboratory mere used for the first time in fictional crime detection.

America's outstanding contribution to detecti e fiction. after Poe's Dupin stories. was *Uncle Abner: Master of Mysteries,* by Melville Davisson Post, which was not published until 1918; but as early as 1896 Post had begun his career in crime literature. His first attempts were stories of legal chicanery, but by 1909 his tricksy lawyers had gone over to the side of law and order, and this superlative technician was moving into the field of pure detection. In the Uncle Abner stories. tales of early Virginia, he produced an American classic and added the first great American investigator to the gallery of illustrious detectives Post's only comparable contemporary was Frederick Irving Anderson, who published just three books between 1914 and 1930 and was, in consequence, forgotten between volumes. His best-known work is *The Book of Murder* (1930).

Of the years between World Wars I and II it is difficult to write briefly. For a time the most popular writer of detective fiction in the norld probably was J. S. Fletcher. whose excellent novels were given a tremendous impetus by President Wilson's publicized pleasure in *The Middle Temple Murder* (1918). Then, in 1920, another great landmark made its appearance in England: this was *The Cask,* by Freeman Wills Crofts, a book of remarkable quality that has influenced profoundly the modern detective story as a whole "Mr. Crofts." says John Carter "combined the elaboration of Gaboriau nith an integrity of method nhich set an altogether new standard for the many police detectives who have followed [his] Inspector French."

And the years from 1920 onward introduce, one after another, names that today are household words among readers of detective fiction: Poirot, in Agatha Christie's *Mysterious Affair at Styles* (1920); Reggie Fortune, in H. C. Bailey's *Call Mr. Fortune* (1920); Lord Peter Wimsey, in Dorothy L. Sayers' *Whose Body?* (1923); Anthony Gethryn, in Philip MacDonald's *The Rasp* (1924); Dr. Priestly, in John Rhode s *Paddington Mystery* (1925); Roger Sheringham, in Anthony Berkeley's *Layton Court Mystery* (192j); J. G. Reeder, in Edgar Wallace's *The Mind of Mr. J. G. Reeder* (1926).

Others who contributed notable volumes of detection in this period were Eden Phillpotts and A. A. Milne, authors more widely known in other fields. In *Enter Sir John* (1928) Clemence Dane and Helen Simpson created a popular actor-detective, Albert Campion, languid hero of a dozen distinguished books by Margery Allingham, although he made his first appearance in 1928, did not reach his peak until 1934.

All in all, the third decade of the century was memorable—a golden age of the detective story.

In America also, in this decade, important deeds mere accomplished. at least four fictional detectives of stature were added to the records. Chronologically. Charlie Chan was first: a new and appealing figure in the world of fantasy, he made his bow in *The House Without a Key* (1925), by Earl Derr Biggers. Five other novels now celebrate his exploits and, aided by the motion pictures, the aphoristic little Chinese-American lives in the affection of readers more surely than many better detectives.

Philo Vance, his immediate successor, became the best American detective in the English tradition. With Vance. according to Howard Haycraft, "overnight, American crime fiction came of age." Introduced in *The Benson Murder Care* (1926), by S S. Van Dine, his later appearances broke records for detective fiction and made him for some years the most famous fictional sleuth in the world.

Van Dine, his reputed creator, was in reality Willard Huntington Wright. a well-known critic of the arts—and, like his hero, a dilettante—who brought all his imposing erudition in several fields to the task of making Vance one of the immortals of detective fiction. In spite of considerable pretentiousness and some lack of humour, it may be admitted that he succeeded.

Ellery Queen, as writer and detective, entered the field in 1929. The name is a pseudonym concealing the identities of Frederic Dannay and Manfred B. Lee; but Queen also is the central figure in the stories written under that name. Since his appearance in *The Roman Hat Mystery,* his adventures have been increasingly popular; his name is the trade-mark of a reliable brand of entertainment.

Last and most important of the four leading American writers of the period is Dashiell Hammett, ex-Pinkertonian and graduate of the pulp magazines, whose unsentimental narratives established new standards of realism in the detective story field In five novels of startling originality, backgrounded largely by the underworld of American gangsterdom, Hammett invented what has been called the hard-boiled school of crime fiction; but he did more than that—he created a definitely American style, separate and distinct from the English pattern which had been slavishly followed by American writers for generations. As character studies alone, it is claimed, his stories approximate capitalized "Literature."

His influence, however, while enormous, was not altogether good: it has been the more meretricious of Hammett's spectacular bag of tricks that have been exploited by his less talented imitators, in particular his not infrequent salaciousness. First of the Hammett novels was *Red Harvest* (1929). His masterpiece is generally believed to be *The Maltese Falcon* (1930), one of the all-time high points in its field. His most sensationally successful story, *The Thin Man* (1934), was the last of an extraordinary quintette. Summing up his short and brilliant career. critical opinion finds that no other writer of modern times has so basically changed and influenced the detective story form.

Most popular of American writers after Hammett were Erle Stanley Gardner, author of the persistent Perry Mason novels and, under the pseudonym A. A. Fair, of the deeds of Donald Lam and Bertha Cool; Rex Stout, whose fat, orchid-raising Nero Wolfe with his assistant, Archie Goodwin, seems to have become a permanent part of the new mythology; and Raymond Chandler. Hammett's most relevant successor. In England the best traditions of Holmes, Thorndyke, *et al.*, were carried on in the literate entertainments of such writers as Nicholas Blake, Michael Innes. Ngaio Marsh and Cyril Hare. A topflight practitioner hailed on both sides of the Atlantic is the Anglo-American writer John Dickson Carr (Carter Dickson).

On the continent of Europe. except in France, few detective stories of distinction were published at any time. Germany's efforts along the years have been abortive and ponderous; and examples of Scandinavian detective literature, although readable, are unexceptional and not strictly canonical. In France two writers of high importance must be noted in Gaston Leroux and Maurice Leblanc. Leroux's *Le Mystère de la chambre jaune* (1908) has been called the masterpiece of French detective fiction. In Arsène Lupin, in the same period, Leblanc created a romantic rogue. half detective, who ranks with E. W. Hornung's Raffles in popular esteem.

It was not until 1930 that a writer came to stand with Gaboriau, Leroux and Leblanc: then there appeared a figure of international interest, Georges Simenon. His masterful and masterly Inspector Maigret became popular in 17 languages. Introduced to the English-speaking world in *The Crime of Inspector Maigret* (1932), he joined the immortals; in the opinion of a critic, "the greatest character in detective fiction since Sherlock Holmes."

(V. STA.)

The Boom.—Quantitatively speaking, the detective story's climb to the world popularity it enjoys in the second half of the 20th century was slow until comparatively recent times. From its beginnings with Poe in 1841 up to and including 1920, an estimated 1,300 new titles mere published in English-speaking countries; whereas from 1921 to 1940, inclusive, more than 8,000 new titles were published. It is also estimated that about 1,700 new writers of detective stories appeared in the years 1921–40, as against only 300 in the preceding 80 years. World War II brought an inevitable hiatus, which makes continued comparison difficult. Following its conclusion. however. production quickly regained prewar levels. More importantly, the postwar years witnessed two developments which increased the readership of detective stories astronomically: (1) the phenomenal rise of paper-bound books published in huge editions; and (2) the growth of book clubs. While exact statistics are unavailable, it may be safely asserted that if the prewar readership of detective stories could be numbered in the hundreds of thousands, the postwar audience might be counted in the millions.

Coincident with this broadening of its audience, the arbitrary and rather doctrinaire separation of the detective story from other forms of mystery fiction *(see* above) tended to disappear. By the 1950s most recognized authorities were treating detective-mystery-crime fiction as a single if multibranched genre. An interesting subspecies to emerge in the postwar years was the psychological or suspense novel, with its emphasis primarily on the why of crime as distinguished from the traditional who and how. Like the hard-boiled detective novel before it, the suspense novel. after a brief crest of popularity, tended to be absorbed back into the mainstream of mystery fiction, while influencing the more orthodox mystery novel healthily in the direction of imaginativeness and heightened awareness of human values. More generally, critics on both sides of the water noted a trend away from the story of pure detection, or so-called chess puzzle, and toward the novel of character, with a crime or detection motif.

Although the postwar years were marked by a high level of competence in mystery writing, they produced fewer recognizable titans than the preceding decades: a development not unusual in a maturing literary form.

Nevertheless a few writers may be mentioned whose fame seems secure for more than the moment. In England, Josephine Tey *(The Franchise Affair, The Daughter of Time)*, Raymond Postgate *(Verdict of Twelve)* and Edgar Lustgarten *(One More Unfortunate)* upheld the dignity of the British detective novel, though departing frequently from the classical formula; while Eric Ambler and Manning Coles gave new stature to the tale of intrigue and espionage.

In America the period produced a number of writers whose importance rests less on scintillating solo performances than on a highly competent, continuing body of work; of these, Frances and Richard Lockridge, with their Mr. and Mrs. North narratives, may be cited as representative.

In the field of the suspense story Dorothy B. Hughes and Cornell Woolrich (pseudonym, William Irish) won high standing, among many.

Two timely events considerably influenced the production of mystery fiction. especially in the C.S. In 1941 *Ellery Queen's Mystery Magazine* was established, the first quality periodical in the field; its American success was followed, after World War II, by editions published in France, Great Britain, Italy, Brazil, Australia, Japan and Mexico. Founded in 1945, Mystery Writers of

America, Inc., is a professional organization dedicated to elevating the standards of mystery fiction and the economic status of its members. Boasting a membership of more than 400 active writers, and with flourishing chapters in New York, Chicago, Los Angeles and San Francisco, its annual "Edgar" awards (named, of course, for Edgar Allan Poe) are as eagerly awaited in the mystery field as the Academy of Motion Picture Arts and Sciences' "Oscars" in the motion-picture industry.

MYSTICISM, a phase of thought, or rather perhaps of feeling. which from its very nature is hardly susceptible of exact definition. It appears in connection with the endeavour of the human mind to grasp the divine essence or the ultimate reality of things, and to enjoy the blessedness of actual communion with the Highest. The first is the philosophic side of mysticism; the second, its religious side. The first effort is theoretical or speculative; the second, practical. The thought that is most intensely present with the mystic is that of a supreme, all-pervading, and indwelling power, in whom all things are one. Hence the speculative utterances of mysticism are always more or less pantheistic in character. On the practical side, mysticism maintains the possibility of direct intercourse with this Being of beings—intercourse, not through any external media such as an historical revelation, oracles, answers to prayer, and the like, but by a species of transfusion or identification, in which the individual becomes in very truth "partaker of the divine nature." God ceases to be an object to him, and becomes an experience.

Universality.—In the writings of the mystics, ingenuity exhausts itself in the invention of phrases to express the closeness of this union. hlysticism differs, therefore, from ordinary pantheism in that its inmost motive is religious; but, whereas religion is ordinarily occupied by a practical problem and develops its theory in an ethical reference, mysticism displays a predominatingly speculative bent, starting from the divine nature rather than from man and his surroundings, taking the symbolism of religious feeling as literally or metaphysically true, and straining after the present realization of an ineffable union. The union which sound religious teaching represents as realized in the submission of the will and the ethical harmony of the whole life is then reduced to a passive experience, to something which comes and goes in time, and which may be of only momentary duration. Mysticism, it will be seen, is not a name applicable to any particular system. It may be the outgrowth of many differing modes of thought and feeling. Most frequently it appears historically, in relation to some definite system of belief, as a reaction of the spirit against the letter. When a religion begins to ossify into a system of formulas and observances, those who protest in the name of heart-religion are not unfrequently known by the name of mystics. At times they merely bring into prominence again the ever-fresh fact of personal religious experience; at other times mysticism develops itself as a powerful solvent of definite dogmas. Mysticism appears in various phases in all the higher religions known to history. Its distinctive characteristics emerge in the religions of India and Persia as well as in the faith of Islam These subjects are dealt with elsewhere; but its relation to Judaism and the religions of Greece requires special mention here. For opposite reasons, neither the Greek nor the Jewish mind lent itself readily to mysticism: the Greek, because of its clear and sunny naturalism; the Jewish, because of its rigid monotheism and its turn towards worldly realism and statutory observance. It is only with the exhaustion of Greek and Jewish civilization that mysticism becomes a prominent factor in Western thought. It appears, therefore, contemporaneously with Christianity, and is a sign of the world-weariness and deep religious need that mark the decay of the old world. Whereas Plato's main problem had been the organization of the perfect state, and Aristotle's intellect had ranged with fresh interest over all departments of the knowable, political speculation had become a mockery with the extinction of free political life, and knowledge as such had lost its freshness for the Greeks of the Roman Empire. Knowledge is nothing to these men if it does not show them the infinite reality which is able to fill the aching void within. Accordingly, the last age of Greek philosophy is theosophical in character, and its ultimate end is a practical satisfaction. Neoplatonism seeks this in the ecstatic intuition of the ineffable One. The systematic theosophy of Plotinus and his successors does not belong to the present article, except so far as it is the presupposition of their mysticism; but, inasmuch as the mysticism of the mediaeval Church is directly derived from Neoplatonism through the speculations of the pseudo-Dionysius, Neoplatonic mysticism fills an important section in any historical review of the subject.

Neoplatonism.—Neoplatonism appears in the first half of the 3rd century, and has its greatest representative in Plotinus. He develops the Platonic philosophy into an elaborate system by means of the doctrine of emanation. The One, the Good, and the Idea of the Good were identical in Plato's mind, and the Good was therefore not deprived of intelligible essence. It was not separated from the world of ideas, of which it was represented as either the crown or the sum. By Plotinus, on the contrary, the One is explicitly exalted above the νοῦς and the "ideas"; it transcends existence altogether (ἐπέκεινα τῆς οὐσίας), and is not cognizable by reason. Remaining itself in repose, it rays out, as it were, from its own fullness an image of itself, which is called νοῦς, and which constitutes the system of ideas of the intelligible world. The soul is in turn the image or product of the νοῦς, and the soul by its motion begets corporeal matter. The soul thus faces two ways—towards the νοῦς, from which it springs, and towards the material life, which is its own product. Ethical endeavour consists in the repudiation of the sensible; material existence is itself estrangement from God. (Porphyry tells us that Plotinus was unwilling to name his parents or his birthplace, and seemed ashamed of being in the body.) Beyond the καθάρσεις, or virtues which purify from sin, lies the further stage of complete identification with God (οὐκ ἔξω ἁμαρτίας εἶναι, ἀλλὰ θεὸν εἶναι). To reach the ultimate goal, thought itself must be left behind; for thought is a form of motion, and the desire of the soul is for the motionless rest which belongs to the One. The union with transcendent deity is not so much knowledge or vision as ecstasy, coalescence, *contact* (ἔκστασις, ἅπλωσις, ἁφή, Ennead., vi. 9. 8–9). But in our present state of existence the moments of this ecstatic union must be few and short.

It will be seen from the above that Neoplatonism is not mystical as regards the faculty by which it claims to apprehend philosophic truth. It is first of all a system of complete rationalism; it is assumed, in other words, that reason is capable of mapping out the whole system of things. But, inasmuch as a God is affirmed beyond reason, the mysticism becomes in a sense the necessary complement of the would-be all-embracing rationalism. The system culminates in a mystical act, and in the sequel, especially with Iamblichus and the Syrian Neoplatonists, mystical practice tended more and more to overshadow the theoretical groundwork.

Dionysius **Areopagiticus.**—It was probably about the end of the jth century, just as ancient philosophy was dying out in the schools of Athens: that the speculative mysticism of Neoplatonism made a definite lodgment in Christian thought through the literary forgeries of the pseudo-Dionysius (*see* DIONYSIUS AREOPAGITICUS). The doctrines of Christianity were by that time so firmly established that the Church could look upon a symbolical or mystical interpretation of them without anxiety. The author of the *Theologia mystica* and the other works ascribed to the Areopagite proceeds, therefore, to develop the doctrines of Proclus with very little modification into a system of esoteric Christianity. God is the nameless and supra-essential One, elevated above goodness itself. Hence "negative theology," which ascends from the creature to God by dropping one after another every determinate predicate, leads us nearest to the truth. The return to God (ἕνωσις, θέωσις) is the consummation of all things and the goal indicated by Christian teaching. The same doctrines were preached with more of churchly fervour by Maximus the Confessor (580–622).

The West.—St. Maximus represents almost the last speculative activity of the Greek Church, but the influence of the pseudo-Dionysian writings were transmitted to the West in the 9th century by Erigena, in whose speculative spirit both the scholasticism and the mysticism of the middle ages have their rise. Erigena translated Dionysius into Latin along with the commentaries of Maximus, and his system is essentially based upon theirs. In Erigena mysticism has not yet separated itself in any way from the dogma of the Church. There is no revulsion, as later, from dogma as such, nor is more stress laid upon one dogma than upon another; all are treated upon the same footing, and the whole dogmatic system is held, as it were, in solution by the philosophic medium in which it is presented. No distinction is drawn, indeed, between what is reached by reason and what is given by authority; the two are immediately identical for Erigena. In this he agrees with the speculative mystics everywhere, and differentiates himself from the scholastics who followed him. The chief representatives of scholasticism aim at demonstrating that the content of revelation and the teaching of reason are identical, but this is only an equation of two things which have been dealt with on the supposition that they are separate. Mysticism, on the other hand, is marked on its speculative side by even an overweening confidence in human reason; and this is pre-eminently visible in the work of Erigena. Nor need this be wondered at if we consider that the unity of the human mind with the divine is its underlying presupposition. Hence where reason is discarded by the mystic it is merely reason overleaping itself; it occurs at the end and not at the beginning of his speculations. Even then there is no appeal to authority; nothing is accepted from without. The appeal is still to the individual, who, if not by reason then by some higher faculty, claims to realize absolute truth and to taste absolute blessedness.

Anti-dialectical.—Mysticism first appears in the mediaeval Church as the protest of practical religion against the predominance of the dialectical spirit. It is so with Bernard of Clairvaux (1090–1153), who condemns Abelard's distinctions and reasonings as externalizing and degrading the faith. St. Bernard's mysticism is of a practical cast, dealing mainly with the means by which man may attain to the knowledge and enjoyment of God. Reason has three stages, in the highest of which the mind is able, by abstraction from earthly things, to rise to *contemplatio* or the vision of the divine. More exalted still, however, is the sudden ecstatic vision, such as was granted, for example, to Paul. This is the reward of those who are dead to the body and the world. Asceticism is thus the counterpart of medieval mysticism; and, by his example as well as by his teaching in such passages, St. Bernard unhappily encouraged practices which necessarily resulted in self-delusion. Love grows with the knowledge of its object, he proceeds, and at the highest stage self-love is so merged in love to God that we love ourselves only for God's sake or because God has loved us. "As the little water-drop poured into a large measure of wine seems to lose its own nature entirely and to take on both the taste and the colour of the wine; or as iron heated red-hot loses its own appearance and glows like fire; or as air filled with sunlight is transformed into the same brightness so that it does not so much appear to be illuminated as to be itself light—so must all human feeling towards the Holy One be self-dissolved in unspeakable wise, and wholly transfused into the will of God. For how shall God be all in all if anything of man remains in man? The substance will indeed remain, but in another form, another glory, another power" (De diligendo *Deo*, c. 10).

Mysticism was more systematically developed by Bernard's contemporary Hugh of St. Victor (1096–1141). The Augustinian monastery of St. Victor near Paris became the headquarters of mysticism during the 12th century. It had a wide influence in awakening popular piety, and the works that issued from it formed the textbooks of mystical and pietistic minds in the centuries that followed. Hugh's pupil, Richard of St. Victor, declares, in opposition to dialectic scholasticism, that the objects of mystic contemplation are partly above reason, and partly, as in the intuition of the Trinity, contrary to reason. He enters at length into the conditions of ecstasy and the yearnings that precede it. Bonaventura (1221–1274) was a diligent student of the Victorines, and in his *Itinerarium* mentis ad Deum maps out the human faculties in a similar fashion. He introduces the terms "apex mentis" and "scintilla" (also "synderesis" or συντήρησις) to describe the faculty of mystic intuition. Bonaventura runs riot in phrases to describe the union with God, and his devotional works were much drawn upon by mystical preachers.

Theology of the Heart.—From the 12th and 13th centuries onward there is observable in the different countries of Europe a widespread reaction against the growing formalism and worldliness of the Church and the scandalous lives of many of the clergy. Men began to feel a desire for a theology of the heart and an unworldly simplicity of life. In the beginning of the 13th century the foundation of the Dominican and Franciscan orders furnished an ecclesiastical and regular means of supplying the same wants, and numerous convents sprang up at once throughout Germany. The German mind was a peculiarly fruitful soil for mysticism, and a number of women appear about this time, combining a spirit of mystical piety and asceticism with sturdy reformatory zeal directed against the abuses of the time. Even before this we hear of the prophetic visions of Hildegard of Bingen (a contemporary of St. Bernard) and Elizabeth of Schonau. In the 13th century Elizabeth of Hungary, the pious landgravine of Thuringia, assisted in the foundation of many convents in the north of Germany. (For an account of the chief of these female saints see the first volume of W. Preger's *Geschichte* der *deutschen* Mystik.) Mechthild of Magdeburg appears to have been the most influential, and her book *Das fliessende* Licht der *Gottheit* is important as the oldest work of its kind in German. It proves that much of the terminology of German mysticism was current before Eckhart's time. Mechthild's clerico-political utterances show that she was acquainted with the "eternal gospel" of Joachim of Floris. Joachim had proclaimed the doctrine of three world-ages—the kingdom of the Father, of the Son, and of the Spirit. The reign of the Spirit was to begin with the year 1260, when the abuses of the world and the Church were to be effectually cured by the general adoption of the monastic life of contemplation.

Very similar to this in appearance is the teaching of Amalric of Bena (d. 1207); but, while the movements just mentioned were reformatory without being heretical, this is very far from being the case with the mystical pantheism derived by Amalric from the writings of Erigena. His followers held a progressive revelation of God in the ages of the Father, Son and Holy Spirit. Just as the Mosaic dispensation came to an end with the appearance of Christ, so the sacraments of the new dispensation have lost their meaning and efficacy since the incarnation of God as Holy Spirit in the Amalricans. With this opposition to the Church they combine a complete antinomianism, through the identification of all their desires with the impulses of the divine Spirit. Amalric's teaching was condemned by the Church, and his heresies led to the public burning of Erigena's De *divisione naturae* in 1225.

Eckhart.—In Meister Eckhart (?1260–1327) the German mind definitively asserts its pre-eminence in the sphere of speculative mysticism. Eckhart was a distinguished son of the Church; but in reading his works we feel at once that we have passed into quite a different sphere of thought from that of the churchly mystics; we seem to leave the cloister behind and to breathe a freer atmosphere. The scholastic mysticism was, for the most part, practical and psychological in character. It was largely a devotional aid to the realization of present union with God; and, so far as it was theoretical, it was a theory of the faculties by which such a union is attainable. But in Eckhart the attitude of the churchman and traditionalist is entirely abandoned. His system enables him to give a profound significance to the doctrines of the Church; but, instead of the system being accommodated to the doctrines, the doctrines—and especially the historical facts—acquire a new sense in the system, and often become only a mythical representation of speculative truth.

The political circumstances of Germany in the first half of the 14th century were in the last degree disastrous. The war between the rival emperors, Frederick of Austria and Louis of Bavaria, and the interdict under which the latter was placed in 1324 inflicted extreme misery upon the unhappy people. From some places the interdict was not removed for twenty-six years. Men's minds were pained and disquieted by the conflict of duties and the absence of spiritual consolation. The country was also visited by a succession of famines and floods, and in 1348 the Black Death swept over Europe like a terrible scourge. In the midst of these unhappy surroundings religion became more inward in men of real piety and the desire grew among them to draw closer the bonds that united them to one another. Thus arose the society of the Friends of God (Gottesfreunde) in the south and west of Germany, spreading as far as Switzerland on the one side and the Netherlands on the other. They formed no exclusive sect. They often took opposite sides in politics and they also differedin the type of their religious life; but they uniformly desired to strengthen one another in living intercourse with God. Among them chiefly the followers of Eckhart were to be found. Such were Heinrich Suso of Constance (1295–1366) and Johann Tauler of Strasbourg (1300–1361), the two most celebrated of his immediate disciples. It was doubtless one of the Friends who sent forth anonymously from the house of the Teutonic Order in Frankfort the famous handbook of mystical devotion called Eine deutsche Theologie, first published in 1j16 by Luther.

Jan van **Ruysbroeck (1294–1381)**, the father of mysticism in the Netherlands, stood in connection with the Friends of God, and Tauler is said to have visited him in his seclusion at Groenendal near Brussels. He was decisively influenced by Eckhart, though there is noticeable occasionally a shrinking back from some of Eckhart's phraseology. Ruysbroeck's mysticism is more of a practical than a speculative cast. He is chiefly occupied with the means whereby the unio *mystica* is to be attained, whereas Eckhart dwells on the union as an ever-present fact, and dilates on its metaphysical implications. Towards the end of Ruysbroeck's life, in 1378, he was visited by the fervid lay-preacher Gerhard Groot (1340–1384), who was so impressed by the life of the community at Groenendal that he conceived the idea of founding a Christian brotherhood, bound by no monastic vows, but living together in simplicity and piety with all things in common, after the apostolic pattern. This was the origin of the Brethren of the Common Lot (or Common Life). The first house of the Brethren was founded at Deventer by Gerhard Groot and his youthful friend Florentius Radewyn; and here Thomas à Kempis (*q.v.*) received his training. Similar brother-houses soon sprang up in different places throughout the Low Countries and Westphalia, and even Saxony.

Mystics and the Reformation.—It has been customary for Protestant writers to represent the mystics of Germany and Holland as precursors of the Reformation. In a sense this is true. But it would be false to say that these men protested against the doctrines of the Church in the way the Reformers felt themselves called upon to do. There is no sign that Tauler, for example, or Ruysbroeck, or Thomas à Kempis had felt the dogmatic teaching of the Church jar in any single point upon their religious consciousness Nevertheless, mysticism did prepare men in a very real way for a break with the traditional system. Mysticism instinctively recedes from formulas that have become stereotyped and mechanical. On the other hand its claim for spiritual freedom was soon to be found in opposition also to the Reformers. The wild doctrines of Thomas Munzer and the Zwickau prophets, merging eventually into the excesses of the Peasants' War and the doings of the Anabaptists in Munster, first roused Luther to the dangerous possibilities of mysticism as a disintegrating force. He was also called upon to do battle for his principle against men like Caspar Schwenkfeld (1490–1561) and Sebastian Franck (*c.* 1499–*c.* 1543), the latter of whom developed a system of pantheistic mysticism, and went so far in his opposition to the letter as to declare the whole of the historical element in Scripture to be but a mythical representation of eternal truth. Valentin Weigel (1533–1588), who stands under manifold obligations to Franck, represents also the influence of the semi-mystical speculation that marked the transition from scholasticism to modern times. The final breakdown of scholasticism as a rationalized system of dogma may be seen in Nicolas (or Nicolaus) of Cusa (1401–1464), who insists that all real apprehension of God is by way of a "knowledge above knowledge." The influence of later mediaeval mysticism is seen in Jacob Boehme (1575–1624).

Other Forms of Mysticism.—Mysticism did not cease within the Catholic Church at the Reformation. In St. Theresa (1515–1582) and John of the Cross the counter-reformation can boast of saints second to none in the calendar for the austerity of their mortifications and the rapture of the visions to which they were admitted. But, as was to be expected, their mysticism moves in that comparatively narrow round, and consists simply in the heaping up of these sensuous experiences. The speculative character has entirely faded out of it, or rather has been crushed out by the tightness with which the directors of the Roman Church now held the reins of discipline. The gloom and harshness of these Spanish mystics are absent from the tender, contemplative spirit of François de Sales (1567–1622); and in the quietism of Mme. Guyon (1648–1717) and Miguel de Molinos (1627–1696) there is again a sufficient implication of mystical doctrine to rouse the suspicion of the ecclesiastical authorities.

In the 17th century mysticism is represented in the philosophical field by the so-called Cambridge Platonists, and especially by Henry More (1614–1687), in whom the influence of the Kabbalah is combined with a species of Christianized Neoplatonism. Pierre Poiret (1646–1719), an ardent student of Tauler and Thomas à Kempis, exhibits a violent reaction against the mechanical philosophy of Descartes, and especially against its consequences in Spinoza. The first influence of Boehme was in the direction of an obscure religious mysticism. J. G. Gichtel (1638–1710), the first editor of his complete works, became the founder of a sect called the Angel-Brethren. All Boehme's works were translated into English in the time of the Commonwealth, and regular societies of Boehmenists were formed in England and Holland. Later in the century he was much studied by the members of the Philadelphian Society, John Pordage, Thomas Bromley, Jane Lead, and others. The mysticism of William Law (1686–1761) and of Louis Claude de Saint Martin in France (1743–1803), who were also students of Boehme, is of a much more elevated and spiritual type. The "Cherubic Wanderer," and other poems, of Johann Scheffler (1624–1677), known as Angelus Silesius, are more closely related in style and thought to Eckhart than to Boehrne.

The religiosity of the Quakers, with their doctrines of the "inner light" and the influence of the Spirit, has decided affinities with mysticism; and the autobiography of George Fox (1624–1691), the founder of the sect, proceeds throughout on the assumption of supernatural guidance. Stripped of its definitely miraculous character, the doctrine of the inner light may be regarded as the familiar mystical protest against formalism, liberalism, and scripture-worship. Swedenborg, though selected by Emerson in his Representative Men as the typical mystic, belongs rather to the history of spiritualism than to that of mysticism as understood in this article. He possesses the cool temperament of the man of science rather than the fervid Godward aspiration of the mystic proper; and the speculative impulse which lies at the root of this form of thought is almost entirely absent from his writings. Accordingly, his supernatural revelations resemble a course of lessons in celestial geography more than a description of the beatific vision.

Analysis.—The term mysticism is often extended by popular usage and philosophical partisanship to the whole activity of the German idealistic thinkers who followed Kant; but this looseness of phraseology only serves to blur important distinctions. However absolute a philosopher's idealism may be, he is erroneously styled a mystic if he moves towards his conclusions only by the patient labour of the reason. Hegel therefore, to take an instance, can no more fitly be classed as a mystic than Spinoza can. It would be much nearer the truth to take both as types of a thoroughgoing rationalism. In either case it is of course open to anyone to maintain that the apparent completeness of synthesis really rests on the subtle intrusion of elements of feeling into the rational process. But in that case it might be difficult to find a systematic philosopher who would escape the charge of mysticism; and it is better to remain by long-established and serviceable distinctions.

So, again, when Récéjac defines mysticism as "the tendency to draw near to the Absolute in moral union by symbolic means," the definition, as developed by him, is one which would apply to the philosophy of Kant. Récéjac's interesting work, *Les Fondements de la connaissance mystique* (Eng. trans. 1899), though it touches mysticism at various points, and quotes from mystic writers, is in fact a protest against the limitations of experience to the data of the senses and the pure reason to the exclusion of the moral consciousness and the deliverances of "the heart." But such a position is not describable as mysticism in any recognized sense. On the other hand, the term is in place where the movement of revulsion from a mechanical philosophy takes the form rather of immediate assertion than of reasoned demonstration, and where the writers, after insisting generally on the spiritual basis of phenomena, either leave the position without further definition or expressly declare that the ultimate problems of philosophy cannot be reduced to articulate formulas. Examples of this are men like Novalis, Carlyle and Emerson, in whom philosophy may be said to be impatient of its own task.

Modern Studies. — Study of the subject may be said to begin with Dean Inge's Bampton Lectures on Christian Mysticism (1899). It has since been pursued along the parallel routes of psychology, history and philosophy of religion, with the result that the claim of mysticism to be regarded as a genuine form of human experience is justified. These aspects of mysticism cannot rigidly be separated, or indeed understood in isolation, each being of vital importance to the rest.

William James, in his epoch-making Gifford Lectures on *The Varieties of Religious Experience* (1902), originated the serious study of mysticism, especially from the psychological point of view, and attempted to discover its relation to other forms of consciousness. Although based on material chosen from too restricted a field, the publication of this book revolutionised the attitude of students towards religious psychology. The conception of the subconscious was now first used to provide an explanation and sanction for the ecstatic and other abnormal phenomena found in connection with mysticism, and an attempt was made to distinguish the accompaniments of genuine religious apprehension from their pathological imitations.

These researches have continued vigorously, especially in America and France. Pratt's *Religious Consciousness* (1921) represents the matured result of the movement started by James. Considerable advance has been made towards the correlation and better understanding of such types as the prophet, visionary and religious revivalist, in all of whom a strong mystical impulse is commonly at work. The hostile study of mysticism from the psychological standpoint has its chief exponent in J. H. Leuba, and to some extent in the work of experimental psychologists such as P. Janet, whilst an approach midway between the philosophical and psychological is provided by Bucke's *Cosmic Consciousness*, a curious work which has exercised considerable influence. Delacroix's sympathetic but penetrating analyses of the evolution of the great mystics have shed much light on the psychological characteristics of religious genius. Valuable studies of the nature of mystical contemplation, and restatement in modern terms of its processes, have been produced by Roman Catholic scholars, the best being those of Père Poulain, S.J.

Influence of Psychology. — The psychological study of mystical phenomena has illuminated many historical problems, especially those connected with prophecy and the origins of religious movements. The treatment of the subject in such works as Heiler's *Das Gebet* and *Der Katholizismus* or Brémond's monumental *Histoire du Sentiment religieux en France,* is symptomatic of the changed outlook. Material available for students of historical mysticism has been much enriched. Good texts and translations of many masterpieces of European mysticism have appeared, with valuable studies such as those of Abbot Butler and Rufus Jones, based on the historical method.

The changed outlook of physical science, the new understanding of its limitations and the marked revolt from 19th-century materialism, have brought about a *rapprochement* between mysticism and philosophy. Inge's *Philosophy of Plotinus* (1918) and Otto's widely discussed essay *Das Heilige* (The Idea of the Holy, 1924) show different aspects of the reaction of philosophy to mysticism. But this is also felt in the pure metaphysics of Wittgenstein, and in the inimical attitude of Croce and his school. The greatest and ultimately most influential expositions of the place of mysticism in theistic philosophy, and its limitations and rightful relation with other aspects of knowledge, are Von Hiigel's *Mystical Element of Religion* and *Eternal Life*. These books have affected all modern religious thinkers, and may provide the starting-point of a critical realism harmonising the mystical, moral and intellectual approaches to reality. In America, Hocking's *Meaning of God in Human Experience* is probably the most important philosophic contribution to this subject.

Modern Practical Mysticism. — The first quarter of the 20th century saw, especially in France, a revival of genuine Christian mysticism; possibly the beginning of what later historians may recognise as a "mystical epoch." Its most impressive document is the *Spiritual Journal* of the lady known as Lucie-Christine (1844–1908), a record which bears comparison with the historical classics of mysticism. Its most striking product is the career of the hermit saint of the Sahara, Charles de Foucauld (1858–1916). These stand out among a number of more obscure personalities, such as Elizabeth de la Trinité (1880–1906) and Madeleine Sémer (1874–1921), all of whom claim and describe with a conviction and sobriety compelling respect the characteristic mystical experience and certitude. From India, the autobiography of the saintly Hindu theist Maharshi Devendranath Tagore (1817–1905), and the experiences of the Christian convert Sadhu Sundar Singh (born 1889), whose career and personality have made a widespread impression, provide unspoilt examples of first-hand mysticism, and deepen the sense of unity in the spiritual intuitions.

The revived interest in mysticism has had popular results in several directions. It has seemed to endorse the shallow eclecticism in which many escape the difficulties of belief. Its superficial peculiarities have been exploited by theosophists and other apostles of eccentric religiosity. It has produced numerous bastard cults, mostly hailing from America though often wearing Oriental disguise; cults mainly compounded of pantheism, quietism and crude autosuggestion, and offering a "mystical religion" to those seeking a spiritual home full of modern conveniences and devoid of discipline. On the other hand, its spirit has affected for good the literature and activity of the organised Churches; shifting the emphasis from tradition to experience, and bringing back into focus those mysterious realities which religious symbols and institutions seek to express.

(A. S. P.-P.; E. Un.; X.)

MYTHOLOGY (Greek *mythos,* "story"; *logos,* "discussion" or "account" of anything) is the study of the traditional tales of any people or of mankind in general (for example, of Greek, Indian or Chinese stories). The term is used, more loosely, to describe the collectivity of such tales (as, the mythology of Zeus, Thor, etc.). Most peoples, though not all, have a number of these traditions, sometimes embodied in written works such as epic and other poems, sometimes oral, as in the case of illiterate or preliterate peoples whose beliefs have been collected and studied by modern scholars. It is often found that oral stories passed on from generation to generation of narrators, who are frequently professionals, have a fixed form, whether in verse or not. Tales current in Ireland and parts of the Scottish Highlands are of this kind. Such stories may be classed as unwritten literature.

Classification. — Traditional tales fall into three classes, myth proper, saga (or legend) and *Märchen,* or folk tales. Of these, the myths deal with customs, especially religious customs; with natural phenomena of the most varied kind, from the creation of the world to the shape of a rock; and with the supposed character and activities of whatever gods or other supernatural beings are worshiped. A saga, however, is popular history, regularly having behind it some real event which has impressed the general imagination, such as a battle or a raid. It is therefore founded upon fact, however much fanciful embroidery may have been added. A *Märchen,* or folk tale, has no such foundation and no serious purpose, but is told simply to amuse or to interest, being thus a forerunner of the novel or short story. Prolonged study of folk tales from all over the world has shown that they have a great number of themes in common (*e.g.,* the youngest child or other inferior person turns out to be brilliantly successful). It is disputed whether this is due to independent origin, the human imagination being apt to work along much the same lines everywhere, or to distribution from one or more centres. The truth probably is that both factors are involved. A good story often spreads across linguistic and cultural frontiers in a remarkable fashion (thus, Homer's tale of Odysseus and the Cyclops is found in substance among the Lapps, who certainly did not get it direct from the *Odyssey).* Such motifs as the grateful rewarding of a kind action or the finding of some magical or other wonderful means of achieving one's desires seem to arise simply from universal human sentiments and wishes.

Origins. — While saga and folk tales are easily accounted for, the rise of the myth is a matter much discussed from various points of view. Examination of the abundant material shows that among many peoples myth is so closely connected with magico-religious ritual as to form part of it. "Myth is a true story because it is a sacred story, not only by virtue of its content but because of the concrete sacral forces which it sets to work. The recital of myths of the beginnings of things is part and parcel of cult, because it is cult itself and helps to gain the ends for which cult is carried on, namely, the preservation and increase of life" (R. Pettazzoni, *Miti e Leggende,* vol. i, p. x). Thus, the recital of a myth of creation (which often must be done only at certain times of the year and at certain hours of the day) not only has the effect of informing the younger members of the community how, in the opinion of their people. the world came to be, but actively helps to preserve it as it is and to prevent it from relapsing into some kind of primeval chaos. But it has yet to be proved that this type of custom was observed by all peoples. Thus, there is no proof that the stylized Hebrew account of creation was ever formally recited as part of a religious ceremony, and the numerous Greek myths concerning the early days of the universe (Greece had, apparently, no creation myths proper) were never, so far as is known, part of any rite. Their telling was not restricted to any particular date or to any particular time of day or night, and they had no fixed, unalterable form, but varied in their phrasing, even in many of their details, from one narrator to another. This is not to say that there was no connection between Greek myths and Greek ritual, however. There is the myth of the rape of Kore, the young corn goddess, by Hades, the god of the underworld, and of her subsequent reunion with her mother Demeter, in the "Homeric" hymn to Demeter (about 7th century B.C.) ; and it is to be supposed that something of the kind was represented, by mimetic dancing or otherwise, at the Eleusinian mysteries *(see* H. J. Rose, *Modern Methods* in *Classical Mythology,* pp. 9–12). But in general Greek myths are etiological—*i.e.,* purporting to explain such things as the details of a particular cult — and are not part of the cult itself. Rome too had abundant ritual, but apparently no native myths at all. The explanation for this seems to be that, once satisfied that their gods possessed power (described by the term *numen* in Latin from at least the 2nd century B.C.), and that they could be induced to exercise it for the benefit of their worshipers, the Romans were incurious as to what kind of beings the gods were and as to what they did besides using *numen.* The Greeks, like numerous other peoples, were more inquisitive.

Several instances exist of far-traveled myths. That of Heaven and Earth, husband and wife who used to be closely embraced until their children separated them by force, is to be found in Greece and in New Zealand. Intervening forms are being discovered. but its origin is at present unknown.

It should be noticed that myth has its part also in magical ritual. Narrative forms an important element in many charms employed by all manner of peoples. Thus in the Finnish *Kalevala,* Väinämoinen, wounded with an iron weapon, recites the story of the origin of iron as part of his cure. Often the story is of a miraculous healing, and the moral is pointed somewhat thus: "As the disease of So-and-so was healed, so may his ailment be who uses this charm."

Development. — Once existent, myths form the material of imaginative works, often long and elaborate, among those peoples who are sufficiently advanced to produce anything of the kind. This involves a more or less complete severance between myth and ritual, for although the general outlines of the story are usually unchanged (thus, in Greek tradition, Zeus must always be represented as overthrowing his father Kronos), the author, generally a poet, has a free hand in describing how the events came about. His attitude may vary from deep and sincere reverence to the most frivolous handling of the matter, and accordingly he may be anything from a devout worshiper of the gods involved in the story to a complete unbeliever, using them simply as ornaments for his narrative or as "epic machinery." The possession of poetic powers, again, may be regarded as anything from direct inspiration by supernatural beings such as the Greek Muses to simple literary training and ability. .(The Muses are repeatedly invoked in Homer to tell the story which they know exactly, whereas mortals hear only a vague rumour of it.) Furthermore, myth need not be the author's only material; he is generally at liberty to add saga and folk tales as he sees fit. A good example of the result of this procedure is the story of the Argonauts (*q.v.*) as it has survived. This may well have originated as a record of some actual voyage of traders or pirates, but many of the details are of pure folk tale type, using well-known themes, while the mythical element is present in several forms.

Criticism. — Clearly, works such as the tale of the Argonauts cannot reveal the ultimate origin of myths, or even of folk tales; this belongs to the remote past of human history. Ever since naïve belief in myths ceased, a number of theories have been put forward in both ancient and modern times to explain their existence. The most vulgar and in some ways the most persistent of these theories is the so-called rationalistic method. This consists simply in accepting the ancient tales as true, once those parts in which the theorist does not believe have been got rid of. The presence of these in the narrative is explained in various ways. It may be held to be due to a misunderstanding of ambiguous wording or of figurative speech, or to be the sheer fancy or some poet who gave the tale its present form, or the like. This interpretation is well illustrated by the "rationalization" of the Attic legend of the abduction of the princess Oreithyia by Boreas, god of the north wind. Some explained this by saying that a strong blast of wind from the north blew her off high ground so that she was killed. (Plato, in the *Phaedrus,* criticizes the fabrication of such explanations as time ill-spent.)

What might be regarded as a special form of this method is that known as Euhemerism. from its originator. Euhemerus (*q.v.*) of Messene (late 4th and early 3rd centuries B.C.). In his day two tendencies were prominent. One was literary: when poets used the great figures of mythology, they tended to humanize them to such an extent that little of their divinity was left. The other tendency was political: the rulers of the great kingdoms of that time were often given divine honours after death. or even in life. Hence, Euhemerus found some to believe his alleged discovery that the traditional gods were really kings and other prominent persons of early days, who had been deified out of gratitude or flattery. The myths concerning them were to be interpreted as noteworthy but still perfectly natural exploits in peace or war. This theory had a grain of truth in it. for several divine figures in various parts of the world can be traced, certainly or plausibly, to human origins. but as a general explanation it is absurd. It had, however. a considerable success long after its author's death. when Christian controversialists adopted it, or what they knew and understood of it, to reinforce their attacks on the pagan gods.

Another hypothesis concerning myths originated early and continued late. This was that the wise ancients had embodied certain philosophic truths in mythical form—in other words, that the myths were allegories, and that their incredible or shocking features were nothing but spurs to the curiosity of those who heard them and were intended to lead to discovery of the underlying verities. Such allegorizations were of two principal kinds. The earlier (which continued to be popular, perhaps especially with the Stoics) was physical, the divine characters in the myths being personified natural forces. Thus Hera, in Greek tradition, was the air (Greek *aër*, almost an anagram of the goddess' name). Granted this. the tales of her shrewish temper and of her quarrels with her husband Zeus and with sundry other figures. human and divine, ceased to be objectionable; for, however unworthy of a deity such behaviour might be. it is a plain fact that atmospheric disturbances often take place. The details, of course, varied with the current scientific and other theories. For instance, the persistent identification in late Roman times of all manner of gods with the sun accorded with the religious and political conditions of the age, in which solar cult was very prominent. Corresponding to it was the undisguised despotism of the imperial government, with all power concentrated in the hands of one man, who thus was to the civilized world what the sun is to the visible heavens.

The second kind of allegorization mas metaphysical or theological. The latter term is used by the writer Sallustius (4th century A.D.), who illustrates it by an elaborate interpretation of the Greco-oriental myth of the Great Mother of the Gods (*q.v.*) and her relations with her favourite Attis. Every detail is pressed into service to signify some doctrine concerning the divine nature or to justify the ceremonies used in the worship of the goddess (De *dis et mundo,* 4, pp. 6–11 of the edition of A. D. Nock. 1926). Although this fantastic method of interpretation lingered on into modern times, notably in the work of Georg Friedrich Creuzer (1771–1858), it is obviously quite without foundation in its classical form, since the original myth-makers lived long before there were any theories. physical or other. for them to allegorize. Creuzer, indeed, saw this and credited the storytellers merely with vague, if grandiose, conceptions of religious matters, mhich he supposed that they had embodied in symbols at first uniform for all peoples and later mildly misunderstood.

Even with this modification, there is little or nothing to commend this idea. Any fragment of truth that is to be found in it resides in the fact that the oldest myths seem to have been the creation of some of the best minds among early peoples. These minds, untrained in reasoning and with very little factual knowledge to guide them. had yet a certain creative power, comparable to that of a poet or other artist—a point rightly insisted on by E. Jensen (*Mythos und Kult bei Naturvölkern,* p. 88). By virtue of this they shaped a kind of vision. crude indeed, and often absurd or even revolting, of the reality which they dimly guessed to lie behind the bewildering phenomena surrounding them. This vision was as yet far from being scientific or philosophical thought, but it was in some sense the forerunner of both. Because these minds had as yet no approach to a scientific or philosophical vocabulary, it necessarily expressed itself in a kind of imagery which may perhaps justifiably be called symbolic.

Modern **Investigations.**—An early and very necessary stage in modern studies. based on common sense. on the collection of evidence and on an assessment of the credibility of the authorities, was the denial of the more fanciful explanations of myths. A pioneer in this regard was C. A. Lobeck (1781–1860), who swept away a vast amount of cloudy speculation. For the most part, this speculation was founded on absurd misunderstandings of what classical writers had said, or mere supposed to have hinted, concerning both myths and the less well-known kinds of ritual, such as the Eleusinian mysteries and the so-called Orphic writings. But Lobeck and his contemporaries knew little of any but the Greek material and its Roman adaptations. The nature-myth school of Max Müller (*q.v.*), whose principal works were published at various dates from 1856 to 1897. represented an advance in this respect. Starting from the rich mythology of Sanskrit, Müller interpreted much classical and other material in the light of etymological equations. on the basis of a theory concerning primitive language, mhich he thought to have had an inaccurate vocabulary apt to lead to all manner of misunderstandings. Myth was thus largely a "disease of language," and its contents were chiefly metaphorical descriptions of celestial phenomena, such as sunrise. Although his theories mere based on premisses largely false, his investigations and those of his followers led to more examination of comparative material from all parts of the world. In consequence, there developed a clearer understanding of what myths are and of the ways in which they may be supposed to originate; as also of their relations, which are far from simple, to religious beliefs and customs.

Another very necessary process was the critical examination of documentary material. where such existed. This was done for Greece. especially, by K. O. Müller (*q.v.*), and after him the work was continued by many scholars. In order to judge whether a myth is the product of a comparatively primitive mind or of some more sophisticated imagination, it is above all useful to know at least its approximate date. It is often also desirable to know its place of origin; *i.e.,* whether it began among the more advanced or the more backward sections of the people concerned. Thanks to such researches the myths of the Vedas. for example, are no longer imagined to be in any proper sense primitive, although they are certainly old; and a fantastic tale from Ovid is not placed on a level with one of Homer's, nor equated with a local legend of some obscure place in Arcadia, the home of much that is early in origin.

Another productive source of information on myths is the comparative method of research. Myths or customs, especially religious or social customs, are often inexplicable if research is confined to one nation or even to one race. They become intelligible, however. if similar tales or rites belonging to other sections of humanity are examined, especially if the second group of people is connected geographically or historically with the first; thus, for Indian material. Persian rather than Egyptian or Hebrew tradition should be looked to. But it sometimes happens that a distant people. unconnected so far as is knonn with the object of examination. will furnish a welcome clue. The assembling of such material commonly involves investigation and recording of the traditions of illiterate peoples and therefore goes hand in hand with the collection of folk tales. Folk tales, however, are often, perhaps most commonly, obtained from people of the European peasant type. These stories are characteristic. that is. of the less literate classes of nations well above savagery or barbarism. and especially of country people. Many of the most famous collections of folk tales, such as that of the brothers J and W. Grimm, have drawn wholly or chiefly on this source.

By the late 1950s the newest method of seeking for the ultimate meaning of myths was the psychoanalytic. This line of research, however, though held to be promising, mas not very far advanced. As Jung puts it: "In view of the enormous complexity of psychic phenomena. a purely phenomenological point of view is, and will be for a long time, the only possible one and the only one with any prospect of success." (C. G. Jung and C. Kerényi, *Introduction to a Science of Mythology,* p. 218, Eng. trans. by R. F. C. Hull, Routledge & Kegan Paul Ltd., 1951). Up to that time, indeed, research had often been hampered by the strained application to mythological material, not seldom uncritically gathered and ill-understood, of premature theories concerning the activities of the human mind, generally the subconscious or unconscious mind. Little that was likely to be of permanent value had yet been achieved; but it was fairly clear that typical situations and figures prominent in dreams and other fantasies bore a resemblance to the content of some myths. Certain scholars believed that careful and critical investigation of this complex material by suitably qualified researchers would in time throw much-needed light on the problems involved. It was certain at least that these traditional tales, whether connected or not with religious or magical rites, are the offspring of imagination and not of formal reasoning; and it was thought, therefore, that a better understanding of the nature of imagination ought to help investigators to perceive the genesis of these its products.

(H. J. R.)

MYXEDEMA, the medical term for a constitutional disease caused by a deficiency or hypofunction of the thyroid gland, and occurring in adults; cretinism is essentially the same condition appearing in early childhood.

There are two forms, myxedema proper and operative myxedema *(cachexia strumipriva).* Myxedema was termed Gull's Disease from Sir William Gull's observations in 1873. Women are more often the victims than men, in a ratio of six to one. It frequently affects members of the same family and may be transmitted through the mother; it has been observed sometimes to follow exophthalmic goitre. The symptoms are a marked increase in bulk and weight of the body, puffy appearance of skin which does not pit on pressure, the line of the features becoming obliterated and getting coarse and broad, the lips thick and nostrils enlarged, with loss of hair, subnormal temperature and marked mental changes. There is striking slowness of thought and action, the memory becomes defective, and the patient becomes irritable arid suspicious. In some instances the condition progresses to that of dementia. The basal metabolic rate is very low. The thyroid gland itself is diminished in size, and may become completely atrophied and converted into a fibrous mass. The untreated disease is progressive, but the course is slow and the symptoms may extend over 12 to 1j years, death from asthenia or tuberculosis being the most frequent ending.

Symptoms similar to the above may follo complete removal of the thyroid gland. Kocher of Berne found that, in the total removal of the gland by operation, out of 408 cases operative myxedema occurred in 69, but it is thought that if a small portion of the gland is left, or if accessory glands are present, these symptoms will not develop. The treatment of myxedema, like that of cretinism, is by administration of thyroid extract.

MYXINE, a genus of cyclostome fishes known as slime eels. They are closely related to the hagfish, differing in having a single external gill opening. They have similar parasitic habits. See HAGFISH; CYCLOSTOMATA.

N IN all known alphabets the letter N has stood in close connection with M, the particular form of one being generally reflected in the other. Semitic (*nun,* originally probably meaning "fish") and Greek (*nu*) are its predecessors. In the inscriptions from Thera the form was consistently . Other forms were from Corinth and in the Ionic alphabet of Abu-Simbel. In the Lydian alphabet the form was ; Etruscan had sometimes the curious form corresponding to its five-stroked (M). The Latin forms were N and N.

The minuscule cursive form of the 6th century was , probably accounted for by the writing of the letter without taking the pen from the paper commencing at the top of the left-hand vertical stroke. This would cause the oblique stroke to rise from left to right instead of being downward in direction. The Carolingian

hand developed the rounded minuscule form n. From this derives the modern minuscule. The sound that the letter has represented throughout its history is the dental nasal, the nasals being of all sounds the least liable to change. Before the velar consonants *k,* hard *c,* hard *g, q,* and *x,* however, *n* has the velar sound heard in "long" as distinguished from the dental sound heard in "lawn" (*e.g.,* in "ink," "angle," "relinquish"); but not so in "unkempt," "ingrate," where *n* ends the prior member of a compound. *See* also ALPHABET. (B. F. C. A.; J. W. P.)

NABATAEANS, a people of ancient Arabia, whose settlements gave the name of Nabatene to the borderland between Syria and Arabia from the Euphrates to the Red sea. The history of the Nabataeans cannot be carried back beyond 312 B.C., at which date they were attacked without success by Antigonus I (*Cyclops*) in their mountain fortress of Petra.

The Nabataeans were Arabs—as their proper names show—who came under Aramaic influence. They wrote a letter to Antigonus "in Syriac letters," and Aramaic continued to be the language of their coins and inscriptions when the tribe grew into a kingdom, and profited by the decay of the Seleucids to extend its borders northward over the more fertile country east of the Jordan.

They occupied Hauran, and about 85 B.C. their king Aretas (Harithath) became lord of Damascus and Coele-Syria. Allies of the first Hasmonaeans in their struggles against the Greeks (I Macc. v, 25, ix, 35; II Macc. v, 8), they became the rivals of the Judean dynasty in the period of its splendour and a chief element in the disorders which invited Pompey's intervention in Palestine.

The Roman arms were not very successful, and King Aretas retained his whole possessions, including Damascus, as a Roman vassal. (*cf.* II Cor. xi, 32). As "allies" of the Romans the Nabataeans continued to flourish throughout the first Christian century. Their power extended far into Arabia, particularly along the Red sea; and Petra was a meeting place of many nations, though its commerce was diminished by the rise of the eastern trade route from Myoshormus to Coptos on the Nile. A sober, acquisitive, orderly people, wholly intent on trade and agriculture (Strabo, xvi, 4), they might have long been a bulwark between Rome and the wild hordes of the desert but for the short-sighted cupidity of Trajan, who reduced Petra and broke up the Nabataean nationality (A.D. 105). *See* SEMITIC LANGUAGES.

(W. R. S.; S. A. C.)

NABHA, a municipality and tehsil (subdivision) in Patiala district, Punjab state, India. The town, founded in 1755, is on the Northern railway, 37 mi. W. of Ambala. Population (1951) 25,676.

NABHA TEHSIL (240 sq.mi.; pop. [1951] 92,587) includes part of the former princely state of the same name (area 947 sq.mi.; pop. [1941] 340,044). Its territories were scattered; one section with 12 separate tracts lay in the territories of Patiala and Jind states, in the east and south of the Punjab; the other was in the extreme southeast. Nabha, founded by a member of the Sikh Phulkian family, established its independence about 1763. In 1807–08, the raja obtained British protection against threatened encroachments of Ranjit Singh. During the Mutiny in 1857 the raja was loyal to the British and was rewarded by grants of territory.

In April 1948, after India became independent, Nabha joined a union of five Phulkian states, which, on Aug. 20, 1948, merged with the Patiala and East Punjab States union (PEPSU). On Nov. 1, 1956, PEPSU was merged into Punjab state.

NABIGHAH, AL- (AL-NABIGHAH AL-DHUBYANI) (fl. *c.* A.D. 600), one of the six pre-Islamic Arab poets whose works were collected before the middle of the 2nd century of Islam; his poetry is represented in the anthologies *al-Sumut* (*see* MU'ALLA-

QAT) and *Hamasah* (*q.v.*). After living much of his life at the court of the kings of Hira he fled for a time to the court of Ghassan because, according to legend, his poem praising the beauty of Queen Mutajarida, wife of Ring Nu'man of Hira, was inspired by an accidental view of her unveiled charms. Later he was pardoned and returned to Hira but after Nu'man's death withdrew to live with his own tribe, the Dhubyan. He wrote mainly eulogies and satires concerned with the strife between Arab tribes. His vivid, sensitive verse shows a fine poetic imagination.

BIBLIOGRAPHY.—There are editions of his poems by W. Ahlwardt in *Diwanr of the Six Ancient Arabic Poets* (1870); *H.* Derenboure, Le *Diwan de Nabiga Dhobyani* (1869); and by 'Abd-al-Rahman Sallam and Mohammed Jamal (1934).

NABIS, tyrant of Sparta, seized the throne after Sparta's heavy defeat by the Achaean League in 207 B.C. He seems to have put into practice the "four points" of the revolutionary program of the day, abolition of debt, division of land, confiscation of personal property and liberation of slaves, though he does not appear to have tackled the Helot problem very completely. Whether he was the monster of cruelty represented by Polybius it is difficult to say. No revolutionary leader gets fair play from contemporary historians as a rule, and few revolutionary leaders can afford very gentle measures. In any case, he carried out more thoroughly the aims of Xgis and Cleomenes and extended his system to Argos, which was put into his hands by Philip V in 198. The Achaeans under Philopoemen first attacked him in 201, and defeated him at Scotitas. Later in 195 B C. after the conclusion of the war with Philip the Romans under Flamininus turned their attention to the affairs of Greece. The league was unanimous for war against Nabis, and Flamininus duly undertook it. Nabis organized a vigorous defense and raised an army of 10,000 from Sparta with the help of the enfranchised Helots. After some desultory fighting and a good deal of negotiation, Nabis obtained peace at the price of losing Argos and some harbours, and the internal affairs of Sparta were left undisturbed. As soon as the Romans had gone Nabis was embroiled with the Achaeans again. He uas eventually murdered by some Aetolian auxiliaries, and Philopoemen ruthlessly suppressed one of the few whole-hearted attempts at social revolution in Greek history.

See Plutarch, *Philopoemen;* Polyb., xiii–xx; Paus., iv–viii; Liv , 31–35; W. W. Tarn, in *The Hellenistic Age* (1923), and *Hellenistic Civilization* (1927).

NABOB, a corruption of the word nawab, a native Indian ruler. In the 18th century it nas sarcastically applied to Englishmen who returned with fortunes from the east.

NACHTIGAL, GUSTAV (1834–1885), German explorer of the Sahara, was born at Eichstedt in Brandenburg on Feb. 23, 1834. He studied medicine at the universities of Halle, Wurzburg and Greifswald and practised for several years as a military surgeon. He then went to Tunis as physician to the bey and took part in several expeditions into the interior. In 1868 he was sent on a mission to the sultan of Bornu by the king of Prussia and traveled there via Tibesti and Borku, parts of the central Sahara then unknown to Europeans. From Bornu he went on to Baguirmi and then via Wadai and Kordofan to arrive in Cairo in Nov. 1874. This journey was described in Sahara *und Sudan,* 3 vol. (1879–81); he was awarded the gold medals of the Royal and Paris Geographical societies and became president of the Berlin Geographical society. Nachtigal was German consul-general at Tunis, 1882–84, and was then sent by Bismarck to west Africa, ostensibly to inquire into trade, but really to annex territory for Germany. As a result Togoland and the Cameroons were added to the German empire. Nachtigal died on the homeward voyage, at sea off Cape Palmas, on April 19, 1885.

See Heinrich Schiffers, *The Quest for Africa,* pp. 303–310 (1957). (R. M. P.)

NACOGDOCHES, Texas, U.S., and county seat of Nacogdoches county, is located near the Angelina river about 130 mi. N.E. of Houston. It was named for the Nacogdoche Indians. The site was first visited by the La Salle expedition in 1687; Mission Nuestra Senora de Guadalupe was founded by the Spaniards in 1716. Fears of the French resulted in abandonment in 1718. The Spaniard Antonio Gil Ybarbo reoccupied it in 1779, when it was chartered, and rebuilt the Old Stone Fort, which was restored in the 1920s. Nacogdoches was the gateway from the east to Spanish territory and was a place of unrest and violence. It was the scene of smuggling and freebooting activities, such as those of A. Leal and Philip Nolan; revolutionary movements, related first to Mexican independence, and later to that of Texas; and Indian unrest culminating in the expulsion of the Indians after the rebellion promoted by Vicente Cordova in 1838.

Stephen F. Austin State college (see TEXAS: Education) is located there. A diversified economy based on agriculture and lumbering has characterized its history after the coming of the railroad in 1882. The council-manager form of government was adopted in 1936.

For comparative population figures see table in TEXAS: *Population.* (J. L. WR.)

NADELMAN, ELIE (1885–1946), Polish-American sculptor, was born in Warsaw. Pol., on Oct. 6, 1885, the son of a master jeweler. He left home at 19 and first saw Greek sculpture, the dominant influence in his art, in Munich. In 1903 he went to Paris, where he studied Rodin's work, whose analyses of plastic forms as intersecting curves anticipated Cubism and had wide effects on contemporary art. His first one-man shows in Paris (1909), London (1911) and New York (1915) were sensational successes. He emigrated to the U.S. in 1917 and became a citizen in 1927. A sensitive portraitist and masterful architectural sculptor, in his last decade Nadelman worked on small-scaled grand-style sculpture fitted to modern domestic living. He died in New York city, Dec. 28. 1946.

BIBLIOGRAPHY.—Elie Nadelman, *Vers la beauté plastique* (Drawings) (1921); Lincoln Kirstein, *Elie Nadelman* (1948); Lincoln Kirstein, *Elie Nadelman Drawings* (1949). (L. E. K.)

NADIA, a district in West Bengal, India. Area, 1,527 sq.mi.; pop. (1951) 1,144,924; the former British-Indian district of Nadia (2,879 sq.mi.) was divided at the 1947 partition, the territory northeast of the Bhairab river going to form Kushtia district in East Pakistan. Standing at the head of the Gangetic delta, Nadia is an alluvia! plain, the level of which has been raised by deposits of silt, so that it is subject to inundation only in years of high flood. Along the northeastern boundary flows the main stream of the Ganges (Padma channel), of which the remaining rivers of the district are offshoots. The Bhagirathi on the southwestern border and the Jalangi meandering through the centre of the district are the chief of those offshoots, called distinctively the Nadia rivers. In former times the Nadia rivers afforded a regular means of communication between the Ganges and the seaboard; but the levels of the river beds have risen and, except in the rains, the rivers have diminished to shallow streams. The land no longer receiving a fertilizing deposit of silt, the productivity of the sandy soil has been reduced. Rice is the staple crop.

Industries include cotton weaving, brass and pottery works, processing of sugar and oil.

The headquarters of the district are at Krishnagar (pop. 1951 50,042), 55 mi. N. of Calcutta: which contains the residence of the maharaja of Nadia. The town of Nabadwip or Nadia. 7 mi. W. of Krishnagar, was formerly on the east bank of the Bhagirathi, which has since changed its coarse. Pop. (1951) 56,298. It is celebrated for its capture by the Moslems in the 12th century; for the sanctity and learning of its pundits; and as the birthplace of Chaitanya, the Vaishnava reformer. Krishnagar and Nabadwip each contain an undergraduate college of Calcutta university.

NADIR, a term used in astronomy for the point in the heavens exactly opposite to the zenith, the zenith and nadir being the two poles of the horizon; that is, the zenith is directly overhead, the nadir directly unclerfoot.

NADIR SHAH **GHAZI, MOHAMMED** (1883?–1933), king of Afghanistan. born April 10, 1883?, at Dehra Dun, India. After the abdication of Amanullah (*q.v.*) in 1929, Nadir Shah defeated Habibullah, known as *Bacha-i-Sakao* ("the son of the water carrier"), who had seized the throne, and became king on Oct. 16. He was assassinated at Kabul, Nov. 8, 1933, by an Amanullah supporter.

His son Mohammed Zahir Shah succeeded him.

NAEVIUS, GNAEUS (*c.* 270–201 B.C.), the second in the triad of early Latin epic poets and dramatists, between Livius Andronicus and Ennius. A native of Capua, he seems nevertheless to have been a Roman citizen. He served in the First Punic War. His career as a dramatist, which began in 235, only five years after the first play ever produced in Rome, continued for 30 years. An attack in one of his plays on the noble family of the Metelli, making fate rather than merit responsible for their consulships (*fato* Metelli *Romae fiunt consules;* the reference is to L. Caecilius Metellus, consul 206) provoked the threatening reply that the Metelli would punish the poet Naevius (*malum* dabunt *Metelli Naevio* poetae) and led to imprisonment, followed by residence (perhaps exile), at Utica, where he died.

He is reported to have spent his time in prison writing two plays, in which he apologized for his rudeness. An epitaph, attributed to the poet himself, but probably written nearly 100 years after his death, recalls his epic poetry by the Saturnian verse in which it is cast, and his drama by the fine tribute that, since he died, "they have forgotten at Rome how to speak the Latin tongue."

Like Livius, Naevius translated Greek tragedies and comedies. Six such tragedies are known by title, among them two (*Danae* and *Equos Troianus*) which were produced also by Livius and suggest that Naevius deliberately challenged comparison with the older poet. Of his comedies more than 30 titles are known, many of them of the Latin type (*Corollaria, Nervolaria, Tunicularia*) familiar from Plautine plays. Fragments are scant) but sufficient to show that, far surpassing Livius, Naevius may be regarded as the creator of that apt, forcible and colourful language which is the constant delight of readers of Plautus. His attitude to his originals was more independent than that of Livius: he transferred elements from one play into another. added song where the originals lacked it, and increased the variety of metre. He also added contemporary references and political comment, such as that which proved his undoing. But he broke entirely new ground in writing at least two plays on national subjects (praetextae): Romulus (perhaps the same as Lupus), on the birth of Romulus and Remus, and *Clastidium,* celebrating the victory there of M. Claudius Marcellus over the Celts in 222 B.C., and probably produced at Marcellus' funeral games in 208.

While Rome was fighting the Second Punic War, Naevius chronicled the events of the first in his Carmen Belli Poenici. For his facts he may have relied, apart from his own observation, on oral tradition at Rome; it is uncertain whether the history of Rome by Fabius Pictor, which became a source for the history of the wars, was already available. Force of diction. enhanced rather than impeded by the harsh staccato rhythm of the Saturnian metre, and an over-all plan, which comprised the wanderings of Aeneas (including apparently his sojourn with Dido at Carthage as a cause of the war between Rome and that city), make good the claim of this chronicle to the rank of an epic poem. Naevius undoubtedly had Hellenistic models for the epic treatment of contemporary history, but when it is measured against the *Odusia* of Livius, this poem shows in its conception the same originality as does the creation of the praetextae. The *Bellum Punicum* seems to have exercised considerable influence on the Annals of Ennius and on Virgil's *Aeneid,* but this cannot be closely defined, since only about 60 lines of the poem remain.

Remarkable ancient judgments on Naevius are those of Volcacius Sedigitus (*c.* 100 B.C.), who placed him third, after Caecilius and Plautus, in a somewhat arbitrary canon of Roman writers of comedy, and Cicero, who likened his epic, as pleasing despite some lack of polish, to a work of the sculptor Myron.

Morel in *Fragmenta poetarum Latinorum,* "Teubner Series," 2nd ed. (1927) and, with critical commentary, by S. Mariotti in *Il bellum poenicum,* etc. (1955). Edition with Eng. trans. by E. H Warmington, "Loeb Series" (1936). See also W. Beare, The Roman Stage, 2nd ed., pp. 23 ff. (1955); Schanz-Hosius, Ronzische Literatur-Geschichte, vol. i, 4th ed. (1927); and for a critical assessment E. Fraenkel in Pauly-Wissowa, Real-Encyclopadie der classischen *Altertumswissenschaft,* suppl. vol. 6 pp. 622 ff. (1935). (OT. S.)

NAEVUS. A naevus is a nonmalignant. growth which is usually present at birth or shortly thereafter. The growth may consist of any tissue present in the skin such as blood vessels, pigment-forming cells, hair follicle cells and connective tissue. The most common naevi are those of blood vessels ired birth marks), and pigment forming cells (brown birth marks or moles).

The blood vessel naevi are of three types: (1) superficial (port wine stain) (2) elevated (strawberry markj and (3) deep (cavernous). The superficial type remains throughout life and is exceedingly difficult to treat without leaving a bad scar or obvious defect in the skin. The elevated type almost always disappears spontaneously by puberty or before, and the deep type should be treated very early in life (X-ray or radium) to obtain the best results.

The pigmented spot or mole may turn into a malignant tumour but the incidence of such malignant change in this naevus is about one in a million. It is estimated that every individual has about 14 moles and it is apparent that removing all pigmented naevi from everyone as a preventive measure would be highly impractical. If a mole increases in size, changes in colour or begins to bleed or form a crust it should be removed and examined to be sure it has not become malignant. (RD. B. S.)

NAGA HILLS, a mountainous and forested region on the India-Burma frontier. betneen the Brahmaputra and Chindwin river valleys. The region includes the Patkai range to the northeast of the Nagas proper. is continued southwestward by the Barail range and forms part of the Arakan Yoma system. The Barail-Naga-Patkai chain forms a 250-mi. barrier shutting off Manipur and Upper Burma from Xssam. Japvo (9,826 ft.), in the Barail range south of Kohima. is the highest mountain in Assam; and on the Burmese side a range detached from the main Nagas by the intrusion of the Tuzu-Dilli tributary of the Chindwin begins in the southwest with Sampurre (12,622 ft.).

NAGA HILLS DISTRICT (INDIA) has an area of 4.259 sq.mi.; pop. (1951) 205,950. The raids of the head-hunting Nagas led to punitive expeditions and the gradual British occupation of the hills. A frontier district was formed in 1866; in 1880 it was decided that the Naga hills should be administered as British territory. During the operations of 1917–19 against the Kukis of Manipur the boundary was brought to Burma north of Manipur, embracing the territory designated as the NAGA TRIBAL AREA and renamed Tuensuang Frontier division (2,091 sq.mi.; pop. [1951] 7,025 [excluding the part B tribal areas where no census was taken]). The district headquarters, Kohima (pop. [1951] 4,125), was occupied by the Japanese in March–June 1944.

NAGA HILLS SUBDIVISION (BURMA) is an unadministered part of Upper Chindwin district, Sagaing division. Area 3,785 sq.mi.

NAGANO, OSAMI (1880–1947), Japanese admiral. planned and ordered the attack on Pearl Harbor, Dec. 7. 1941. Born in Kochi, he was educated at the naval academy and staff college. In 1913 as a language officer in the U.S., he studied law at Harvard university and took courses at the War college. As naval attach6 in Washington (1920–23), he attended the Washington Naval conference (1921–22); the Geneva Naval Limitations conference (1935); and the London Naval conference (1935–36). Naval minister in 1936–37, he became naval chief of staff in April 1941. His reputation rose after Pearl Harbor, but later reverses caused his dismissal in Feb. 1944. Having admitted personal responsibility for the Pearl Harbor attack. he died on Jan. 5, 1947, while on trial before the International War Crimes tribunal.

NAGANO is the name of both a landlocked prefecture in central Honshu, Japan, and its capital city. Most of the prefecture is over 2,600 ft. in elevation and 15 peaks, mostly volcanic! are over 9.800 ft. The harnessing of such large rivers as the Tenryu, Kiso, Chikuma and Shinano made it a leading hydroelectric producer. Most activity centres in small mountain basins (Suwa, Matsumoto, Ina, Iida, Zenkoji basins) over 1,600 ft. elevation, where sericulture and apple raising are agricultural specialties. Rich forest land, one-third in national forests, is an important resource. Limited industry is based on sericulture. Area j.262

sq.mi.; pop. (1960) 1,981,433.

Nagano, in the Zenkoji basin, is the capital and largest city (pop. [1960] 160,522) of Nagano prefecture. Formerly known by the name of Zenkoji, it dates from the 7th century A.D. and grew as a great shrine and post town. Besides administration and education (two universities), Nagano has a commercial function.. (J. D. EE.)

NAGAS, a group of tribes inhabiting the northern part of the hills dividing Assam from Burma. Within the group are tribes of mixed origin, varying cultures and very different physique and appearance, but having enough in common to make it generally possible to say. within the area indicated, whether a given tribe is Naga (as distinct from Kachin, Kuki. Kachari, etc.) or not.

Every sort of political organization is found from the autocracy of tabooed chiefs (Konyak tribes) through gerontocracy (Ao tribe) to purest democracy (Angami tribe). Patrilineal exogamy is everywhere the social rule, but there are indications of the pre-existence of matrilineal and perhaps totemistic systems and of leviritical polyandry. Dual organization (*q.v.*) is found and communal houses for the unmarried. Some tribes (*e.g.*, Sema. Chang) practise polygyny: monogamy is more common, divorce being easy and frequent. Inheritance of land always passes in the male line.

Agriculture is practised by all tribes, some growing rice on elaborately built-up and irrigated terraces (Angami, Tangkhul), others growing it dry, and others using millet, Coix *lachryma* or taro as the staple crop, with rice, maize, sorghum, yams and sago as subsidiary. Millet is often grown on dry terraces among pollarded alders: cotton is grown. cattle are kept and numbers of mithun (*bos frontalis*), which has generally, but not everywhere, displaced the buffalo. Dogs are reared for food as well as for hunting. Fishing is carried on, particularly with the use of intoxicants which kill or incapacitate the fish.

hlanufactures and the arts include weaving (on simple tension looms): dyeing, pottery. blacksmith's work and rough wood carving. Material culture shows many links with Indonesia and Melanesia. and the northern tribes make huge wooden xylophones, membraneless drums often suggestive of dugout canoes with carved figureheads. which are beaten to raise an alarm or celebrate important events. The prevailing weapon is the throwing-spear, but crossbows are used by some tribes. also guns. Music and dancing are most highly developed in the southern tribes, but are everywhere popular. The numerous tribal languages are tonal and agglutinative, belonging to the Tibeto-Burmese family; within each language area almost every village has its own dialect.

See J. P. Mills, ***The** Ao Nagas,* with bibliography (1926). (J. **H.** H.)

NAGASAKI, a Japanese prefecture. includes the islands of Tsushima, Iki. Hirado-shima and the Goto-retto. It has a very irregular shape, with rounded Shimabara peninsula in the southeast and Nomo and Nishisonogi peninsulas (which enclose Omura bay) in the southwest. Dominated by mountains. it has limited agricultural land that is worked intensively (rice. sweet potatoes and mandarin oranges). Its thriving fisheries support a seafood processing industry. Although coal is mined. there is little industry except in the capital city of Nagasaki (shipbuilding) and the naval base of Sasebo. The city of Nagasaki has one of Japan's largest Christian communities. Area of the prefecture 1,578 sq.mi.; pop. (1960) 1,760,421. (J. D. EE.)

NAGASAKI, capital and largest city of Nagasaki prefecture, western Kyushu, Japan, is the administrative, commercial and cultural nucleus of the prefecture. A port city, it is located at the head of a narrow, deep-cut bay at the meeting point of the Nomo and Nishisonogi peninsulas. The city is like an amphitheatre in form. the crooked streets and tiered houses clinging to the hillsides that enclose the inner bay. Reclaimed land at bayside and the Urakami basin at the head of the bay provide a little level land.

Nagasaki's early growth was based on its overseas contacts. Subsequent to the arrival of the first Portuguese ships in 1571, it became the principal port for calls by foreign ships. Christianity, introduced by Roman Catholic priests. established a firm foothold in Nagasaki in spite of grievous persecutions. With the enforcement of foreigner exclusion measures, it became the sole remaining point of contact with foreigners after 1636. Only the Dutch were permitted to remain in residence on small Deshima (an island on the eastern coast of the bay, now a reclaimed part of the mainland). Through that modest station passed a trickle of books and information that acquainted Japanese authorities with main developments in the west. Scholars also went there to learn Dutch and foreign science and culture. When Japan was emerging from its feudal past in the last half of the 19th century, Nagasaki benefited from nearby coal deposits to become one of the leading east Asian coaling stations. It was the winter port for the Russian Asiatic fleet prior to 1903. The development of oil-burning ships, competition from northern Kyushu coal fields and ports, a limited hinterland and distance from main Kyushu industrial areas later reduced its importance. Nagasaki's limited industrial growth stems mostly from the large Mitsubishi shipyards and supplier industries, which are grouped along the western and inner parts of the bay. The innermost portion of the city was destroyed on Aug. 9, 1945, by the second atomic bomb dropped on Japan by U.S. forces in World War II (estimated 64,000 casualties, including 39,000 dead). Pop. (1960) 344.153. (J. D. EE.)

NAGAUR, a city, tehsil and district of Rajasthan, India; before April 7, 1949, part of the principality of Jodhpur. The town, 75 mi. N.E. of Jodhpur city, has a wall more than 4 mi. in circuit. Populations (1951): town 19,588; tehsil (2,608 sq.mi.) 206,572; district (6.883 sq.mi.) (1961) 932.707.

The district is in general a sandy plain 1,000–1,500 ft. above sea level. Marble is quarried. The largest town is Ladnun (20,914), 48 mi. N.E. of Nagaur.

NÄGELI (NAEGELI), **KARL WILHELM VON** (1817–1891). Swiss botanist famous for his investigations on the origin of cells and for his versatility in research, was born on March 26, 1817, at Kilchberg, near Zurich. He studied botany under A. P. de Candolle at Geneva, graduated at Zurich in 1840. then devoted himself to the microscopical study of plants. He became professor in the University of Zurich and of botany in the universities of Freiburg, Ger. (1852) and Munich (1858), where he died on May 10, 1891. Nägeli extended Robert Brown's discovery of the nucleus to the principal families of cryptogams and asserted that it is present in all plants. He investigated the "mucous layer" (Schleimschicht) in cells and showed this to be the living matter of the cell. This discovery was made independently and at the same time by Hugo von Mohl, who called the living substance "protoplasm." Nageli also investigated the mode of growth in a large number of plants belonging to the algae, mosses. liverworts and angiosperms. He discovered the spermatozoids and antheridia of ferns. He also wrote papers on the anatomy of vascular plants, and introduced the concept of "meristem" as opposed to permanent tissue. In addition he studied the structure, development and various forms of starch grains. In his last book Nageli introduced the idea of a substance which he called "idioplasm" as the definite material basis of heredity. He corresponded with Gregor Mendel (*q.v.*) but does not seem to have grasped the essentials of Mendel's discoveries.

Among his more important contributions to science were a series of papers in the Zeitschrift fur *wissenschaftliche* Botanik (1844–46); Die *neuern* Algensysteme (1847); Gattungen *einzelliger* Algen (1849); *Pflanzenphysiologische* Untersuchungen (1855–58), with C. E. Cramer; Beitriige *zur wissenschaftlichen Botanik* (1858–68); and finally. *Mechanisch-physiologische Theorie* der Abstammungslehre (1884).

See C. E. Cramer, *Leben und Wirken von Carl von Naegeli* (1896).

NAGOYA, a city and capital of Aichi prefecture. Japan. is one of the country's leading industrial centres. It has a deltaic location on the Nobi plain facing deep-cut Ise bay. Nagoya's modern rise dates from 1610, when a great castle was erected by the Owari branch of the powerful Tokugawa family. Subsequently, political and economic power became centred there. After the collapse of the feudal order, Nagoya continued as the commercial hub of a broad central Honshu area between the spheres of Tokyo and Osaka, earning the title, "central capital."

Its industry is predominantly light because of the long distance from coal sources and the late development (1907) of its port facilities. Among its assets are a central location and abundant hydroelectric power from the rivers of central Honshu. Historically strong in cotton textile production, Nagoya is the economic nerve centre for a nest of industrial satellite cities in Aichi, Gifu and Mie prefectures. Lumber and wood products, vehicles (automobiles and airplanes). machinery and machine tools. ceramics. electric steel, synthetic fibres and electrochemicals are among the products of its diversified industry.

The city is laid out on a rectangular plan with exceptionally broad main avenues for traffic and fire control. Burned badly in World War II, it put an impressive city reconstruction plan into effect and built many new public and private buildings in the main commercial and residential districts. Several railways, including the main Tokaido line. converge on Nagoya. Its harbour (30 ft. deep) has berthing facilities for 30 ships totaling 135,000 tons and excellent cargo handling and storage installations. Canals link the port and industrial areas. With a population of 1,591,935 (1960). it was the third largest city of Japan. (J. D. Ee.)

NAGPUR, a city, with *tehsil* (administrative subdivision), and a district of Maharashtra state, India. The city formerly was the capital of the state of Madhya Pradesh. The old capital of the Gond dynasty expanded beyond all recognition between 1852, when it came under British rule, and mid-20th century. Its population, 84,000 in 1872, had expanded to 643,186 by the 1961 census.

Once the terminus of a branch line Xagpur became an important railway centre of the Eastern and Central lines, being halfway between Bombay and Calcutta and between Madras and Delhi. It is connected by a narrow-gauge railway with Chindwara and Chanda. It is also an important junction for internal air services. It is the commercial as well as the administrative capital of the state and its centre of education. being the seat of Nagpur university (1923), with its law, technological and teachers training colleges. and of 10 of its 16 affiliated undergraduate colleges. It is the see town of both Anglican and Roman Catholic dioceses.

The whole area is dominated by the hill and fort of Sitahaldi. overlooking the civil station on the west, the city proper on the east and north, and the suburbs of Sitabaldi and Craddock Town to the south. This hill was the scene of the famous battle of Nov. 1817 where a small British force of less than 1.500 repulsed the Maratha army of 20.000. The only regular troops in Nagpur in the 19jos were those stationed in this fort, but it is the headquarters of the auxiliary force. Besides cotton textile mills, there is canning of fruits and vegetables. Handloom weaving is carried on by Koshtis, who produce fine fabrics and silk-bordered cloths. At one time there was also a large community of Momins or Mohammedan weavers. Ten miles northeast of Nagpur is the once-important cantonment and trade centre of Kamptee (36.165). founded in 1821.

Nagpur District has an area of 3,842 sq.mi. and in 1961 had a population of 1,511,187. It is on an extension of the Berar plain eastward of the Wardha river. In the western part Deccan trap overlies sandstone formation. In the eastern part the sandstone is broken up by granite and the juxtaposition of these formations, which meet at Sitabaldi, makes the geology of the district interesting.

In the north and northeast valuable deposits of manganese ore are norked. These are among the best in the world. but by the mid-1950s reserves were reported to be running low and were not expected to last more than 30 years.

The sacred hill of Ramtek in the northeast, with its gleaming white temples, is a landmark for miles around. The drainage of the east is to the Wainganga, and of the west to the Wunna and Wardha rivers. The plain is broken up in the west by ranges of flat-topped hills, but there are many plains, fertile valleys and pockets of rich land.

Agriculture is varied; it was developed by the Kunbis, the great cultivating Maratha caste, and by Raghvis and Kirars, immigrants from upper India. To the west the cropping is mainly cotton and *jowar;* in the centre and south wheat, linseed. and pulses are the chief staples. On the northeast and southeast there is a considerable area of rice. There are fine betel leaf plantations and the district is famous for its orange groves. Government forests cover 500 sq.mi., mostly concentrated in the reserves along the Pench river in the north, but isolated blocks of not much value are scattered over the nhole district.

NAGYKANIZSA, a town of west Hungary, Zala megye, a railway junction and agricultural market town. It has large flour mills. distilleries, breweries and vegetable-preserving works, manufactures bricks and trades in cereals and cattle. It was once a powerful fortress, important during the attacks of the Turks who held it in 1600–90. Pop. (1960) 34.222 mun.

NAHA, largest city of Okinawa Island, Ryukyu Islands, on the island's southwestern coast, was the capital of Japan's pre-World War II Okinawa prefecture and became the seat of both U.S. military and Okinawan governments after the war. Its port, which can handle ships of 10,000 tons, makes it the commercial centre for the Ryukyu chain. Destroyed during World War II, it was revived with U.S. support. Pop. (1960) 222,799.

(J. D. Ee.)

NAHUM (Hebrew for "rich in comfort [is God]"), an Old Testament prophet. Of the prophet himself: all that is known is the statement of the title that he was an Elkoshite. But the locality denoted by the designation is quite uncertain. The original heading of Nahum's prophecy is contained in the second part of the superscription: "(the book of) the vision of Nahum the Elkoshite." The first part ("Oracle concerning Nineveh") is a late editorial insertion. but correctly describes the main contents of the little book.

Contents. — Chapters i and ii. The prophecy against Nineveh in its present form really begins with chapter ii, 1, followed immediately by v. 3, and readily falls into three parts, viz. (1) ii, 1, 3–10; (2) ii. 11–13; and (3) iii. Here (1) describes the assault on Xineveh. The city is mentioned by name in ii. 8 (9 Heb. text). its capture and sack; (2) contains an oracle of Yahweh directed against the king of Assyria; (3) again gives a vivid picture of war and desolation which are to overtake and humiliate Nineveh, as they have already overtaken No-Amon (*i.e*, Egyptian Thebes, vv. 8–10). The absence of distinctly religious motive is remarkable.

Chapter i forms the exordium of the prophecy of doom against Nineveh. Its tone is exalted, and a fine picture is given of Yahweh appearing in judgment. The effects of the divine anger on the physical universe are forcibly described (vv. 3–6); on the other hand, God cares for those "who take refuge in Him" (v. 7), but overwhelms His enemies (w. 8–12*a*). In the following verses (12*b*–1j) the joyful news is conveyed to Judah of the fall of the oppressor.

Regarding chapter i and ii, 2 (=i and ii, 1, 3, Heb. text) there has been much discussion in recent years. It was long ago noticed that traces of an alphabetic acrostic survive in this section of the book. In vv. 12*b*, 13 and (certainly) 15 (=ii, 1 Heb,) Judah appears to be addressed. The text of i, 1–15, ii, 1–2 has been reconstructed by H. Gunkel and G. Bickell so as to form a complete alphabetic psalm with contents of an eschatological character, and is regarded by them as a later addition to the book. It is generally held by scholars that i, 1–8, 13, 1j and ii, 2 certainly do not proceed from Nahum (i, 9–12 may, however, belong to the prophet). No satisfactory solution has been reached.

Date. — The date of the composition of Nahum's prophecy must lie between 612, when Nineveh was captured and destroyed by the Babylonians and Medes, and the capture of Thebes (No-Amon), uhich is alluded to in iii, 8–10, in 663 B.C. On the whole a date somewhat near 612 is more prbbable. The poetry of the book is of a high order.

Bibliography.—The *Commentaries* on the minor prophets, especially those of J Wellhausen, D. W. Nowack and K. Marti (all German); G. A. Smith, *The Book of the* Twelve *Prophets,* 2 vol., rev ed. (1929); A. B. Davidson (ed), *Nahum, Habakkuk and Zephaniah* (1896). (G. H. B.)

NAIAD, in Greek mythology a nymph of flowing water (*naiein,* "to flow"). See Nymph (myth.).

NAIDU, SAROJINI (1879–1949), Indian poetess, orator in languages and nationalist, eldest child of Aghorenath Chattopadhyaya. principal of the Nizam's college, Hyderabad, Deccan, was born in that city on Feb 13,1879. She matriculated at the Madras university when only 12, and began soon after to write English verse.

Sent to Britain in 1895, she studied at King's college in London. and Girton college, Cambridge. Her volumes of verse were sponsored by such discerning critics as Arthur Symons and Edmund Gosse. and included *The Golden Threshold, The Bird of Time* and *The Broken Wing.* They were translated into the chief Indian vernaculars and European languages, and her verse was frequently set to music. Her marriage to M. G. Naidu. a rajput who became head of the medical service in Hyderabad state, was resented in orthodox Hindu circles on grounds of caste. Mme. Naidu soon deserted the poetic muse to promote social and political reform and the feminist movement—fields nhich gave scope for fiery oratory and telling nit—and increasingly identified herself nith the advanced wing of the Indian National Congress party. At Kanpur in 1925 she nas the first Indian woman to preside at an annual session. She threw herself into Mohandas Gandhi's civil disobedience movement in 1930, and underwent the first of several imprisonments.

She accompanied the mahatma to London when he was the sole representative of the National Congress party at the second session of the Indian round table conference. Though inclined to realism, she supported the attitude of aloofness from, and then of avoned hindrance of. India's great part in the war effort of the United Nations. Following on the decision in Xug. 1942 to embark on mass civil disobedience, she was arrested nith other members of the working committee of the Congress party. being released in March 1943 on grounds of health. In 1947 she became governor of the United Provinces.

Mme. Naidu died in Lucknow, India. on March 2, 1949.

(F. H. BR ; X.)

NAIL. Iron nails were in common use during the Roman occupation of Britain, large numbers having been found in places where they were manufactured by the Romans There is a striking similarity between the forged Roman nail (fig. 1N) and the type of nail manufactured in modern times.

The forging of nails was an industry of some importance in Great Britain up to the end of the 17th century, giving way only before the advent of machinery and the cut and machine-headed nail.

Wire Nails.—The use of wire for nail making completely revolutionized the method of manufacture Nails made from drann wire are produced so cheaply that they can be purchased at almost the same price as the wire from which they are made. Cut nails, sheared from plates or flat stock. are produced, but the quantities in which these nails are used are so small that they are negligible items of trade.

Nail manufacturers' catalogues show about 100 different types of nails or fasteners made of round wire, but the number of items. by gauges and sizes, runs over 400. Fig. 1 shows many common types of nire nails.

Screw-type nails are used to some extent. principally as roofing nails. This type of nail tends to drive more easily, rotates as it enters the wood and retains greater holding power than does a similar nail of round wire. One method in common use for the manufacture of this type of nail is to produce it as a round wire nail and then pass the nail between two rolls and roll four or five spiral flutes into the shank. Another type of nail developed to increase holding power has annular serrations or saw-tooth ridges around the shank that are designed to bite into the grain of the wood when forces tend to aithdran the nail. This particular type of nail is used to some extent for fastening composition-type shingles and siding.

Forming wire nails is a typical cold heading operation. Stresses and pressures in various parts of the nail machine are great. and nail machines are relatively massive. There are principally four component parts in a nail machine: (1) a hammer mounted in a crosshead to which is imparted reciprocating motion through a connecting rod and a crankshaft; 12) a set of cam-actuated slides which hold case-hardened tools that form the point and cut the nail after it is headed; (3) another set of cam-actuated slides that hold the dies that grip the round wire and act as an anvil for the hammer forming the head; and (4) a reciprocating feed

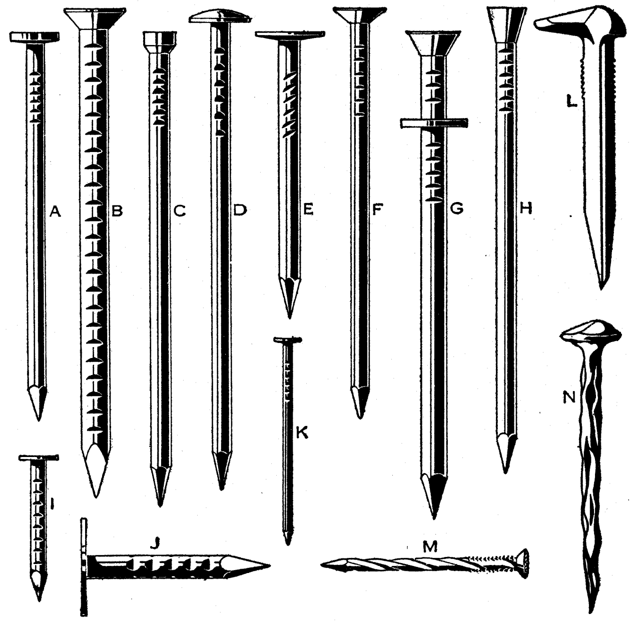

FIG. 1.— VARIOUS KINDS OF NAILS

(A) Common, (B) barbed car, (C) finishing, (D) clinch, (E) slating, (F) countersunk, (G) double-head form, (H) flooring brad, (I) broom, (J) roofing, (K) fine nail, (L) dog spike, (M) screw nail, (N) Roman

table that straightens the wire as it unwinds from the coil and feeds through the heading dies the proper amount of wire stock for the nail.

In machine operation, the feed table straightens and forces wire through the header dies in sufficient amounts to provide stock for the head; the header dies then grip the wire and the hammer moves forward to form the head. During the forward travel of the hammer, the feed table is retracted. ready to feed material into the machine for the next nail. After the head is formed, the hammer is withdrawn and the feed table moves forward with wire for another nail. After the feed table has completed its forward travel and the header dies have gripped the wire. the cutting and pointing tools move together, form the point and cut off the nail. The cycle is repeated for each nail; at every revolution of the crankshaft.

Nail machines operate at varying speeds to turn out 150, 12-in. spikes to over 600 cigar-box nails per minute. After nails are cut. they are placed in rumblers, with a small amount of sawdust, and rumbled for Ij or 20 min. to remove "ahiskers" and to be polished. They are then dumped into kegs for shipment.

Staples.—As staples are a form of nail. their manufacture is usually carried on nith that of nails. They are made in all sizes from both bright and galvanized wire. The three different forms of points on staples are illustrated in fig 2; the names themselves indicate the difierence in the style of point. The term presser point simply means that the point is so sharp and fine that the staple can be stuck into the wood by simple pressure previous to being hammered down.

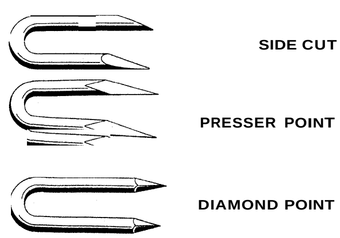

FIG. 2 — FENCING STAPLES

Points are selected according to the hardness of wood used

The several types of machines used in making staples follow the same principle as those for straight nails, the wire being automatically fed forward from the swift. and the operation of cutting and pointing being immediately followed by the bending of the wire into its required shape to form the staple. (R. M. Hu.)

NAIL VIOLIN, a musical curiosity invented by Johann Wilde, a musician in the imperial orchestra at St. Petersburg. It consisted of a wooden soundboard about 1) ft. long and 1 ft. wide, bent into a semicircle. In this soundboard were fixed a number of iron or brass nails of different lengths, tuned to give a chromatic scale. and the sound was produced by friction with a strong bow, strung with black horsehair.

NAIMA, MUSTAFA (16jj–1716), Turkish historian, wrote a history. *Tarih,* of the period 1591–1659. Born in Aleppo, he went at an early age to Istanbul where he entered palace service and held various offices. Protected and encouraged by Hiiseyin Pasha. the grand vizier. he was appointed official chronicler (1709). He died during a campaign in the Morea in 1716. His history is a compilation from the work of his predecessors (Sharihülmen-arzadc whose work is lost. Kâtib Chelebi, Hasanbeyzade and others), together with his own comments. In the introduction he states that the aims of a historian should be objective criticism of sources, avoidance of flattery and a straightforward and unadorned style. This advice he himself followed.

The *Tarih* was published in two volumes (1730) and in six volumes (1884).

See C. Fraser's partial Eng. trans., *Annals* of *the Turkish Empire from 1591 to 1659 of the Christian era* (1832). (F. I.)

NAINI TAL, a town and district in the Kumaon division of Uttar Pradesh, republic of India. The town (which is the divisional headquarters) is 6,400 ft. above sea level. Pop. (1951) 12,350. Naini Tal is a popular sanatorium for the residents in the plains. It is situated on a lake, surrounded by high mountains. and is subject to landslides; a serious catastrophe of this kind occurred in Sept. 1880. There are several European schools and a college of Agra university, besides military barracks.

Naini Tai. District comprises the lower hills of Rumaon and the adjoining Tarai or submontane strip. Area, 2,635 sq.mi. Pop. (1951) 335,414. The district includes the Gagar and other foothills oi the Himalayas, which reach an extreme height of nearly 9,000 ft. The Bhabar tract at their base consists of boulders from the mountains, among which the hill streams are swallowed up. Forests cover vast areas of the hill country and the Bhabar. Beyond this is the Tarai, moist and extremely unhealthy. There the principal crops are rice and wheat. In the hills a small amount of tea is grown, and a considerable quantity of fruit.

NAINSOOK, a light and fine cotton fabric of the plain calico weave, and of texture similar to that of lawn and cambric. It is usually bleached and sometimes striped and checked and finished with a very soft feel for use as lingerie and underwear.

NAIRN, a royal and small burgh and the county town of Nairnshire, Scot.. on the Moray Firth, at the mouth of the Nairn, 16 mi. E.N.E. of Inverness by road. Pop. (1951) 4,700. The town attracts many summer visitors by its mild and dry climate, good sea bathing and golf courses. Salmon, herring and white fishing are carried on. There is a good harbour. constructed by Thomas Telford in 1820 and enlarged by the building of a dock in 1932. Nairn (originally Invernairn) was made a royal burgh by Alexander I (d. 1124); but his charter, having been lost, was confirmed by James VI in 1589.

NAIRNE, CAROLINA, Baroness (1766–184j), Scottish song writer, was born in the "auld hoose" of Gask. Perthshire. on Aug. 16, 1766. She was descended from an old family settled in Perthshire in the 13th century, and could boast of kinship with the royal race of Scotland. Her father, Laurence Oliphant, was one of the foremost supporters of the Jacobite cause, and she was named Carolina in memory of Prince Charles Edward. In 1806 she married W. M. Nairne, who became Baron Nairne in the year 1824. She brought out a collection of national airs set to appropriate words. To this collection, *The* Scottish *Minstrel* (1821–24), she contributed a large number of original songs, adopting the signature "B. B."—"Mrs. Bogan of Bogan." The music was edited by R. A. Smith. She died at Gask on Oct. 26. 1845. Among her most famous songs are: "The Laird o' Cockpen," "The Fife Laird," "John Tod." "Charlie is my darling." "Caller Herrin'" and the "Land o' the Leal." For vivacity, genuine pathos and bright wit her songs are surpassed only by those of Burns.

For Lady Nairne's songs, see *Lays from Strathearn, arranged with Symphonies and Accompaniments for the Pianoforte by Finlay Dun* (1846); vol. i of the *Modern Scottish Minstrel* (1857); *Life and Songs of the Baroness Nairne, with a Memoir and Poems of Caroline Oliphant the Younger,* edited by Charles Rogers (1869, new ed. 1886). *See* also T. L. Kington-Oliphant, *Jacobite Lairds* of *Gask* (1870).

NAIRNSHIRE, a northeastern county of Scotland, bounded west and south by Inverness-shire, east by Moray and north by the Moray firth, Pop. (1951) 8,719. The area is 162.9 sq.mi. There are 9 mi. of coast. It is the fourth smallest county in Scotland. The seaboard, skirted by sand banks dangerous to navigation. is lined by low dunes extending into Moray. Traces of old marine terraces are seen at elevations of 100, 50 and 25 ft. above present sea level. Parallel with the coast is a deposit of blown sand and gravel about 90 ft. high stretching inland for 4 or j mi. This and the undulating plain behind are a continuation westward of the fertile Laigh of Moray. The lowland rocks are Old Red Sandstone, widely covered with glacial deposits consisting of lower and upper boulder clays. with later gravels forming ridges on the moorland between the Findhorn and Nairn rivers. From this region southward the land rises rapidly to the confines of Inverness-shire. where the chief heights occur. This higher land consists of the eastern, Dalradian, or younger Highland schists. with associated granite masses. Several border hills exceed 2,000 ft. in elevation.

The only rivers of importance are the Findhorn and the Nairn, both rising in Inverness-shire. The Findhorn after it leaves that county takes a northeasterly direction down Strathdearn for 17 mi. and enters the sea to the north of Forres in Moray after a total course of 72 mi. At Dulsie bridge (18th centuryj it flows through a narrow rocky gorge where its course is very picturesque. The Nairn, shortly after issuing from Strathnairn, flows to the northeast for 12 mi. out of its complete course of 38 mi. and falls into the Moray firth at the county town. There are eight lochs. all small; that of Clans contains crannogs, or ancient lake dwellings.

The country was originally peopled by the Gaelic or northern Picts. Stone circles believed to have been raised by them are found at several places, particularly in the Nairn valley. To the north of Dulsie bridge is a monolith called the Princess stone. Mote hills and stones with cup markings are also common. Beyond the occasional finding of Roman coins. there is little evidence of effective Roman occupation. St. Columba and his successors made valiant efforts to Christianize the Picts, but it was long before their labours began to tell. although the saint's name was preserved late in the 19th century in the annual fair at Auldearn called St. Colm's market, while to his biographer Adamnan (corrupted into Evan or Wean) was dedicated the church at Cawdor, where an old Celtic bell also bears this name. By the 10th century the Picts had been subdued with the help of the Norsemen. and Nairn, which was one of the districts colonized by the Scandinavians as part of the ancient province of Moray, soon became an integral portion of the kingdom of Scotland. Hardmuir. between Brodie and Kairn, is the heath where Macbeth is reputed to have met the witches.

Territorially Moray was greatly contracted in the reign of David I. and thenceforward the history of Kairn merges in the main in that of the bishopric and earldom of Moray. The thane of Cawdor was constable of the king's castle at Nairn, and when the heritable sheriffdom was established toward the close of the 14th century this office was also filled by the thane of the time. Cawdor castle dates from the 15th century and is still inhabited. At Auldearn. where once stood a royal castle, the marquess of Montrose defeated the Convenanters in 1645.

The soil of the alluvial plain, or Laigh, is light and porous and careful cultivation has rendered it very fertile. and there is some rich land on the Findhorn. Oats, barley and potatoes are grown and sheep and cattle are reared. There are many dairy farms. The poorer arable land at a higher level is used chiefly for producing winter keep for breeding stock. Other industries include whisky distilling. granite quarrying. brickmaking and processing seaweed for fertilizers and feeding stuffs. There is also a small salmon fishing Industry, but sea fishenes have much declined.

The railway from Forres to Inverness crosses the north of the shire.

The population was 8.719 in 1951, Gaelic and English being spoken by 140 persons, as compared uith 410 in 1931. Nairn (pop, 1951, 4,700), the county town, is the only royal burgh and only small burgh. Nairn and Moray shires combine to return one member to parliament. There are no county districts. The shire forms a sheriffdom with Inverness, Moray and Ross and Comarty and a sheriff-substitute from Elgin sits also at Nairn.

NAIROBI, the capital of Kenya colony. British East Africa, is inland about 300 mi. N.W. from Mombasa and is 5,453 ft. above sea level. It is situated on a gentle slope at the head of the Athi plains and from it can he seen Mt. Kenya and Mt. Kilimanjaro and the Aberdare mountains. The climate is pleasantly warm. Once just a water hole. Nairobi has grown rapidly since its first settlement at the end of the 19th century. In 1899 the railway from the coast to Uganda reached Nairobi and a principal depot was established there. In 1905 the government was moved there. In 1919 Nairobi was granted the status of a municipality and in 1950 it became a city. Its local authority consists of a city council. aldermen and a mayor.

The 1948 census of its population was 118.976, (10,830 Europeans). Although the racial groups tend to live in their own areas, public facilities are generally available to all. There are good hotels, parks and playing fields and some fine modern public and private buildings, the most interesting of which are Parliament building, Church House and the Royal Technical College of East Africa. There are schools for all children of European and Asian descent and for some of the African children. Those who are able receive secondary education (Africans at schools outside Nairobi), and for higher education the Royal Technical college takes pupils of all races in sciences and arts. The African population is mostly not settled permanently in Nairobi and many men who work there maintain their families on small-holdings in the African reserves in other parts of Kenya.

Nairobi is the most important urban centre in East Africa; besides being the capital of Kenya it is also the headquarters of the East African railways. the East Africa high commission and many other interterritorial services. In banking and business, many firms including a number from overseas, have their East African headquarters in the concentrated commercial centre of the city, which is also the shopping area. Shops vary from large modern European ones to the old Indian bazaar type. Near by, and well supplied with railway sidings, is the industrial area The main industries are building materials. food and tobacco products, railway and light engineering. The Coryndon museum, Kenya National theatre, the East Africa conservatoire of music and broadcasting stations are in the city, and Nairobi National (game) park is in the vicinity.

Nairobi is reasonably well served by roads and rail lines. The main routes are south to Mombasa and Tanganyika and, via the highlands and Lake Victoria, to Uganda, with regularly scheduled buses and trains. There are two airports, one international and the other for local services. (D. Hs)

NAISMITH, JAMES (1861–1939), U.S. physical education director and inventor of the game of basketball, was born at Almonte. Ont.. Canada, on h'ov. 6, 1861. He was educated at McGill university, Presbyterian theological college at Montreal and the Young Men's Christian Association training college, Springfield, Mass. (now Springfield college) where he also taught physical education. Later he was director of physical education at the Young Men's Christian Association college in Denver (1895–98), obtained an M.D. from the University of Colorado in 1898, and headed the physical education department at the University of Kansas (1898–1937). He died at Lawrence, Kan., Nov. 28, 1939.

With Luther Gulick, his fellow physical education instructor at Springfield, h'aismith began experimenting with winter indoor games and originated basketball in 1891. See BASKETBALL: *Origin.* (J. D. McC.)

NAIVASHA, the name of a lake and town in the Rift Valley province of Kenya. The lake, which is roughly circular with a length of 10 miles, lies 6,150 ft. high on the crest of the highest ridge in the eastern Great Rift valley between the Kikuyu escarpment (east) and the Mau escarpment (west). It is fed by the Gilgil and Morendat rivers, which run in deep gullies, but it has no known outlet. The water of the lake is fresh but slightly alkaline; the shore in many places is lined with papyrus. North and northwest the lake is closed in by the volcanic Eburru hills; to the south towers the extinct volcano of Longonot. The former Crescent Island has now joined with the southern shore of the lake. The lake is famous for its bird life, including many kinds of geese and duck. Naivasha was discovered in 1883 by Gustav Adolf Fischer (1848–1886), and visited in the same year by Joseph Thomson, the Scottish explorer. The main railway from Mombasa to Lake Victoria and Uganda skirts the eastern side of the lake, and on the railway close to the lake is built the town of Naivasha, 6,230 ft. above the sea, 395 mi. north by rail from Mombasa. Nonnative population (1948) 422. The country around Naivasha is especially suitable for cattle and sheep raising.

NAJARA, ISRAEL BEN MOSES, Hebrew poet, was born in Damascus and wrote in the latter part of the 16th century (1587–1599). .He was inspired by the mystical school, and his poems are marked by their bold, sensuous images, as well as by a depth of feeling unequalled among the Jewish writers of his age. He often adapted his verses to Arabic and Turkish melodies. To tunes which had been associated with light and even ribald themes, Najara wedded words which reveal an intensity of religious emotion which often takes a form indistinguishable from love poetry. Some pietist contemporaries condemned his work for this reason; but this did not prevent many of his poems from attaining wide popularity and from winning their way into the prayer-book.

He published during his lifetime a collection oi his poems, Songs of Israel (*Zemiroth Israel*), in Saied in 1587; an enlarged edition appeared in Venice (1599–1600). Others of his poems were published at various times, and W. Bacher has described some previously unknown poems of Najara (Revue des *études* juives, no. 116 et seq)

NAKHICHEVAN, an Autonomous Soviet Socialist Republic of U.S.S.R.. created in 1921, and linked administratively with the Azerbaijan S S.R.. from which it is, however, separated by a strip of Armenian territory. It is bordered on the south and southwest by Iran and on the north and east by the Armenian S.S R. Area 2,085 sq mi. Pop. (1956 est.) 129,000. Though the republic is small, its relief is varied. In the southwest it consists of the valley on the left bank of the Araxes river, which there forms the boundary between Russia and Iran, and along the left bank of which goes the railway loop from Tiflis on the Black sea–Caspian line, which links Armenia and the south of Azerbaijan with Baku, and from which a branch line goes to Tabriz from Dzhulpha in the Nakhichevan republic. The republic thus forms a centre for trade between Russia and Iran. From the valley of the Araxes the Armenian or Transcaucasian plateau rises to a height of about 10,000 ft.

The industries of the region are mainly silk weaving, cotton cleaning and wine production. The numerous small cotton-cleaning enterprises were reorganized after the revolution into two large government factories.

Of the mineral wealth in the republic, salt, lead, sulphur. arsenic, copper, sulphur pyrites and coal, only salt is exploited. Curative arsenical and sulphur springs have been known to the native shepherds for centuries.

The population consists chiefly of Armenians and Azerbaijan Turks, with some Russians in the towns of Nakhichevan (pop. 11,700) and Ordubat (pop. 3,665). The number of schools and teachers has markedly increased, and there are Turkish, Armenian and Russian schools, but many children still receive no education. Grants from the central government of the U.S.S.R. provided for the building of a school, hospital and electric station in the town of Nakhichevan, and a grant was also made for the repair and rebuilding of the small factories. and the irrigation canals, and the development of cotton, silk and salt production. The region was important at an early date because it lay on the route from Teheran and Tabriz to Caucasia. It was laid waste by the Persians in the 4th century, by the Seljuk Turks in the 11th century and by the Mongols in the 13th century. From that time until 1828.

when by the peace of Turkman-chai it passed under Russian rule. it was a khanate vassal to Persia and was frequently devastated during the wars between Persia. Armenia, Turkey and Russia. Its importance for trade and its great fertility helped it to recover after each of these disasters and after the more recent 1917–20 period of disorder and struggle.

NAKHICHEVAN, a town of the U.S.S.R., the administrative centre of the Nakhichevan Autonomous Soviet Socialist Republic in 39° 14′ N., 45° 24′ E., on the Kishchai river and at the terminus of a short line linking it with the railway that runs north of the Araxes river and which is connected with Baku. The town is on a spur of the Karabagh mountains at an altitude of 2,940 ft. Pop (1959) 25,000, mainly Tatars and Armenians. It has an electric plant, motor-driven flour mills and a leather factory. A little to the southeast of it, a branch railway goes to Tabriz.

An ancient site on the Tiflis to Tabriz and Teheran road, the town had much transit trade, especially in salt. between Persia and the north in prerailway days. Armenian tradition claims Noah as its founder, and a mound of earth as his grave. Ptolemy mentions it as Naxuana.

The Persians sacked the town in the 4th century and it did not revive until the 10th century. Alp Arslan. Sultan of the Seljuk Turks, captured it in 1064 and the Mongols raided it in the 13th century. From this period onward it was a bone of contention between Persians. Armenians and Turks. By the peace of Turkmanchai in 1828 it became Russian. The present houses have for the most part been quarried from ancient ruins. A gateway with a Persian inscription and the 12th-century tower of the khans remain.

NAKHON NAYOK is the name of both a *changwat* and its capital in Thailand northeast of Bangkok on the central plain and adjacent to the zone of hills which separates northeast Thailand from the central plain. Located on the windward side of these hills. the *changwat* receives 89 in. of rainfall annually, about double the average of the central plain. It is not a rich agricultural area. partly due to its acid soil and to poor transportation. In 1960 the *changwat* had an estimated population of 153.683. and the city 8.048. The capital is on the Nakhon Nayok river, and is linked to the Pa Sak river canal system. (T. F. B.)

NAKHON PATHOM is the name of both a *changwat* and its capital in Thailand west of Bangkok on the Chao Phraya river delta plain. With an area of 841 sq.mi., the *changwat* in 1960 had an estimated population of 354,324, and a heavy population density of 421 per square mile. Alluvial soils, 49 in. of rain annually, supplementary irrigation from the Nakhon Chai Si river. a Chao Phraya distributary, nearness to the Bangkok market. well-developed transportation facilities and industrious people all contribute to making this one of the most productive and richest *changwats* in Thailand. The chief products are rice, hogs, coconuts, pomelo and other fruits.

The city of Nakhon Pathom (pop. [1957 est.] 26,357) is 29 mi. W. of Bangkok on the railroad line connecting Bangkok with Singapore. It is on a hard-surfaced highway extending from Bangkok to peninsular Thailand. At the head of a canal constructed from the Nakhon Chai Si river, it has access to the delta waterways. In addition to being the transportation and commercial centre of the *changwat,* it is a religious and military centre for the entire kingdom. The largest stupa (Phra Pathom) of Thailand, on which construction started in 1860, is there. The new stupa mas built on top of an Indian stupa dating from A.D. 500. (T. F. B.)

NAKHON RATCHASIMA (formerly known as KORAT) is the name of a *changwat* in Thailand and its capital. The *changwat* holds a strategic location in the southwest corner of the northeast geographic region because it is closer and more accessible to Bangkok than any of the other *changwats*. Northeast Thailand is in the Mekong river watershed and contains about one-third of the land and a little less than two-thirds of the country's population. The *changwat* population (1,094,774) in 1960 averaged 145 persons per square mile (area 7.564 sq.mi.). The population is a mixture of Thai, Laotian and Cambodian. Most of the area is in forest and grazing land. The rural population is concentrated chiefly on the flood plains and tributaries of the Moon river where rice can be grown under irrigation on the alluvial soils. Most of the 45 in. of rain falls during the wet season from May to November. The farms produce rice, corn, tobacco, cattle and hogs. The biggest farm problem is the more efficient use of water resources.

The city of Nakhon Ratchasima (pop. [1957 est.] 41,037) is the transportation. commercial, financial and governmental centre of the northeast. From the city, which is 192 mi. N.E. of Bangkok, a trunk railway line bifurcates toward the north 110 mi. to the Mekong river at Nong Khai, and west 165 mi. to Muang Ubon. Chief commodities shipped to Bangkok by rail are rice and livestock. A net of all-weather roads connects all the *changwats* and their principal cities in the northeast with this centre. A modern asphalt trunk highway 150 mi. long and air transport connect this capital nith Bangkok. One of Thailand's gunnysack factories is in Nakhon Ratchasima. Ruins indicate that settlement on the Moon river is very old and except for a few short-lived conquests by Cambodia the area has been a part of Thailand since the 14th century. (T. F. B)

NAKHON SAWAN, a province *(changwat)* in central Thailand. Area, 3,736 sq.mi.; pop. (1960) 580 504. The capital, Nakhon Sawan (Paknampho) (1957 est., 30,252) and chief upcountry river port, is situated at the point where the Nan and Ping rivers join to form the Menam Chao Phraya. Chumsaeng, the second town of importance, is 19 mi northeast by railroad, at the confluence of the Yom river with the Nan. Roth towns are collection points for teak logs floated downriver. Nakhon Sawan produces rice, beans, maize, cotton. jute and sesame. (G. W. SK.)

NAKHON SI THAMMARAT, a city and capital of the *changwat* of the same name, near the east coast of peninsular Thailand. on a railroad spur, 370 mi. S. of Bangkok by rail, is one of the oldest cities in Thailand. It was founded more than 1 000 years ago. Sometimes called Ligor until the 13th century, it was the capital of a powerful kingdom which dominated the middle of the Malay peninsula. The manufacture of nielloware for which Thailand is known around the world originated there. Pop. (1960) 25.919.

The *changwat* of Nakhon Si Thammarat had an area of 3,926 sq.mi. and population (1960) of 730,402. Abundant rainfall (110 in.), areas of fertile young soils and industrious people make it one of the best agricultural centres in peninsular Thailand. Rice, fruit, and coconuts are the chief farm products. Its outport on the Gulf of Thailand is Pak Phanang, where Wat Mahathadu, over 1,000 years old. is a famous temple. (T. F. B.)

NAMAQUALAND, a region of southwestern Africa, extending along the west coast more than 600 mi. from Damaraland (22° 43′ S.) on the north to 31° S., and stretching inland 80 to 350 mi. It is divided by the lower course of the Orange river into two portions — Little Namaqualand to the south and Great Namaqualand to the north.

Little Namaqualand forms part of Cape Colony (see CAPE OF GOOD HOPE; Great Namaqualand is the southern portion of South-West Africa. The people of Namaqualand are the purest surviving type of Hottentots. and number about 20,000 to 30,000.

NAME (IN LINGUISTICS). A name may be defined, broadly. as a word or small group of words indicating a particular entity in its entirety without necessarily or essentially indicating any special quality of the entity. The term "common name" is sometimes used roughly as the equivalent of "noun"; the present article is concerned with what are more specifically "proper names," although a wholly logical distinction has never been established between the two classes. (See also NAME [IN LOGIC].)

To illustrate something about the nature and manner of origin of names, a situation may be assumed in which two English-speaking persons are wrecked on an island with several other persons of whose language and individual names they are ignorant. At first they are also ignorant of any individual qualities of the others except for gross external ones. and so they will be likely to speak in such terms as "that fellow with the limp." This may be called a description, serving to distinguish the individual by means of a special quality. In a few days, however, the two will undoubtedly be referring to the other by some handier expression. such as Limpy, and he will at the same time have assumed individuality. so that the word will bring to mind many physical and mental characteristics, that is to say, a whole person. It continues to indicate a special quality, but does not essentially do so, since it calls to mind the complete individual, and has in fact come to be a handy formula for that very purpose. After a while Limpy's foot may heal so that he walks perfectly. His name, however, can remain unchanged. since it has ceased to be primarily a description and refers to him as a whole.

Similarly a place name may be taken. such as Dartmouth. an often-used example. The town was named originally because it stood at the mouth of Dart river. as it still does. But now the word is norinally used to name the town without particular reference to its site, and may readily be used for other towns, not so located.

In the effort to escape from this all-inclusive but often no longer descriptive quality of a name. poets and orators often coin epithets. Thus "The Eternal City." though indicating the same entity that Rome does. is purposefully used to direct the mind to a certain aspect. If the name Rome should go out of use and the other become the regular appellation. it would then most likely lose its specific, evocative force as bringing to mind the "eternity" of the city and would become a label to refer to the city in all its aspects, contemporary and ancient, just as Rome now does.

The fact that under proper circumstances Rome will call to mind something other than the Italian city can be taken as demonstrating that a name, like a common noun, may have different applications or meanings. Similarly, it must be recognized that the same entity, by common practice, may have a different name on different occasions: The saine man may now be called Jack; now. John; now, Evans; now. Shorty. Even numbers can lose their natural quality of distinguishing a particular aspect. Fifth avenue has come to be just as much a name as Park avenue, evoking all the qualities of the entity. Who thinks of 10 Downing street with any reference to 9 Downing street?

Of concern to theorists. and also a practical matter as regards capitalization in English, is the problem of collective names; plural names, and names derived from collectives and plurals. The problem is usually considered in connection with names for people, but exists with other classes of names; *e.g.,* the Canary Islands. There is much to be granted to the view that no name should exist in the plural (Eskimos) or should he preceded by the indefinite article (an Eskimo). On the contrary, the ordinary practice of linguistic process easily, even if inconsistently, sets up entities composed of what might then be called "subentities," just as a mathematician distinguishes between $a + b$ and $(a + b)$. Present usage in English accepts as names the appellations of legally recognized: well-organized and sharply defined groups, and those of their members. The line of distinction, however, is vague. Differences in the conception of what is to be considered a name (as shown by capitalization) can be readily observed; inconsistencies can be found in the work of a single author and even within a single chapter.

At this point the impossibility of a distinction between names (proper names) and ordinary nouns (common names) becomes evident. If "Englishman" is to be considered a proper name, why should not "man" have the same status? Each specifies! equally, a representative of a class. In fact. "man" indicates a clear and basic biological entity. whereas "Englishman" rests upon the vague and comparatively superficial entity of nationality. The German practice of capitalizing all nouns seems to recognize this impossibility of distinction. and works for consistency and ease in writing; on the other hand, the principles of capitalization, and thus the conception of names, in English and many other languages permit more subtle effects, and seem to reflect a conception that is in harmony with some basic human principle of classification, even if it is not satisfactorily defined by logicians.

A11 naming thus rests upon the recognition of entities, but in practice a particular entity will be named only if it is important enough to make a name for it useful. Thus, in a large flock the rams and bellwethers may have names but not the ordinary sheep. A (proper) name. as opposed to a (common) noun. may therefore be said, finally, to be assigned to individual entities of sufficient interest and importance. This, in human society, includes all human beings (no completely nameless humans exist) and a vast number of items in their environment (rivers, towns, mountains, houses, etc.).

Classes of Names.—Since the individual person is probably the most easily recognizable of all entities and since it is useful to have names for people, personal names are generally conceded to have been the first to be applied. Their tremendous number and great importance make them still of outstanding interest, and most people think of them first when "name" is mentioned. The ramifications of naming are, however, vastly complicated, and it represents a much larger segment of human activity than is usually recognized. as the following rough classification of names may demonstrate.

1. Personal names (see below).
2. Quasi-personal names. Here are to be included names for individual animals, for personified objects (*e.g.,* dolls. weapons, ships) and for personified abstractions (*e.g.,* Hope). Also individual wild animals are sometimes named, and primitive peoples often conceive personality as existing in inanimate objects.
3. Names for things not definitely personified but sufficiently important to be individualized. A stone may be usefully named because it marks a boundary, or a tree because it is a good bearer of nuts.
4. Place names (see below). These are an obvious extension of (3): they have assumed an importance secondary only to (1).
5. Kames of tribes (gentiles, or ethnics), groups, etc. These are an extension of (1), and arise with the recognition of a kind of communal personality. The problem of collectives arises chiefly in connection with this class.
6. Names of institutions (including religions and sects) and corporations. These are an outgrowth of (5), arising with the development of civilization and legal systems.
7. Titles; *i.e.,* the names of books and other works of art. These. developing at comparatively late date, have become of great importance. They may be considered a development of (3) in the direction of the abstract, but what is actually named, even in the case of a statue or painting, is not so much the physical thing as what might be called the artistic or abstract entity.
8. Brand names; *e.g.,* Coca Cola, Vaseline. These are an important modern phenomenon. As with titles, what is named is a kind of exemplar; one buys "a bottle of Coca Cola," or. by compression, "a Coca Cola," much as one buys "a copy of *Hamlet.*"
9. Kames of events in history; *e.g.,* the Sicilian Vespers, the Renaissance.
10. Names of abstractions not personified; *e.g.,* Stoicism.

With nearly all of these groups the proviso "including legendary, mythological and fictional examples" must be inserted.

PERSONAL NAMES

The statement by Herodotus (iv. 184), echoed by many later writers. to the effect that the members of a certain African tribe possessed no personal names was based upon hearsay and need be given no credence. Historical and anthropological research has failed to discover any people lacking names. The theory has even been advanced that the first words were the names based upon cries by nhich individuals "trade-marked" themselves for the practical purpose of identification. Scholars agree that the use of personal names arose at an extremely early period in human development.

Personal names are derived regularly from ordinary words or from other names. Much less commonly they are derived from the synthesis of essentially meaningless units, such as parts of words single syllables or mere sounds or letters. This last method is comparatively unimportant, but is of much theoretical interest.

In general every human being receives some name shortly after birth whether in a matter of minutes or days or neeks, and nhether or not this name is considered permanent or temporary. This name is necessarily given by others than the individual receiving it. and these others are generally a parent or both parents. or at least some member or members of the family or group. Since these are well-wishers of the child, the name in any society will ordinarily be a "good" one, whether chosen because of religious feeling. family pride, fashion or mere practicality. Apparent exceptions can be noted, as when a child in some demon-fearing tribe may be given a name such as Filth to deceive the evil spirits into thinking he is not worth troubling. Occasionally (much more rarely than is commonly supposed) the Puritans gave names such as Humility and Tremble; though these names may appear sadistically inspired, we must remember that they must have seemed excellent to parents of particular religious convictions.

Since a name is generally considered important, its bestowal is often a solemn occasion and a ritual, even, or perhaps especially, among primitive peoples. Such bestowal of a name, however. does not usually prevent the use of a pet name, and this may later displace the "real" name for practical purposes, and sometimes even officially.

Because a newly born child possesses only minimal individuality, few even of its physical traits being determined, fitting descriptive names can rarely be applied, although parental pride may indulge in such a name as the Greek Callias "beautiful." Some peoples have resorted to numbering their children (*e.g.,* the Roman *praenomina,* Quintus, Sextus, etc.), although in such cases the original name is sometimes (though not among the Romans) considered to be only temporary. In contrast to the rarity of truly descriptive names, incident names are common. These are suggested by the time or circumstances of birth, or sometimes of pregnancy. Ben-oni "son of my sorrow" (Genesis xxxv. 18) was the name of an infant whose mother died in childbirth; it is another example of an "unpleasant" name, and mas also used by the Puritans, perhaps being given on similar occasions. Even among modern peoples incident-naming, particularly with reference to the occasion of birth. is far from uncommon. and many a child is thus called June, or Noël. or even Christmas. Incident-names, but mingling a strong euphemistic quality, are the very numerous saints' names (including even the French Toussaint; "all saints") given, partly at least. because of the day of birth.

As already pointed out, the desire to give a child a "good" name regularly imparts a euphemistic flavour, but many namings are even more definitely so intended and consciously try to start the child out under proper auspices. A baby may be put into what is conceived to be a proper relationship with the tribal totem by being called Wolf, or Son-of-the-Wolf. Even among the Puritans such auspicious names mere much commoner than their opposites, *e.g.,* Hope. Constant. Increase! Comfort, Satisfaction. Names that dedicate a child to some god, or in some way connect him with the god, are extremely common (especially in Semitic languages). and many modern names are thus derived; *e.g.,* John from the Hebrew "Jah is gracious," Theodore from the Greek "gift of God," various names beginning in Os- from a Germanic deity.

Coinparatively uncommon, but increasing in importance, is the actual manufacture of a personal name from sounds, letters or syllables. Though the practice, or something similar to it. is probably of ancient date, its great development is to be found in the 20th century, especially in the United States for girls' names. Thus have been coined Kathetta, Marilla, Elizene, ClarEtta, D'an, Johnny-D. D-Etta and a host of others.

Inevitably, after the passage of a few generations, names lose touch with their origins, tend to be repeated, and to become "just names." The common practice of naming a child "after" someone, usually some member of the family, is chiefly responsible, along with the power of tradition which makes the use of an established name seem safer and more suitable. With the continuation of this practice, a name. which is by nature and purpose conservative and less subject to linguistic change, which is the inevitable fate of all linguistic forms, may therefore become meaningless to later generations and degenerate into a mere label or tag. This loss of lexical meaning. afflicts especially names borrowed from one language into another (cf. John, above). In compensation the name acquires a new richness of suggestion as the result of remembered people who have borne it. Thus, today. few know that Thomas means "twin" and was originally applied to one of twins; on the contrary, a boy is so named "after" his father. or someone else. or because "Tom is a good name for a boy." Often the name will he given with both ideas in mind. and perhaps even with the additional thought of Thomas Jefferson and/or all the St. Thomases.

The original name, however given, may be replaced, and such is the regular practice among some peoples. The name may be changed at some definite time, as at puberty, or it may be changed on the occasion of some exploit. Again, a "good" name is sought. The person to be named may now have attained sufficient maturity to choose his own name. or aid in doing so. Since he will by now have attained individuality, the name can often be descriptive, either of appearance or of character, or it may spring from an exploit Since there is often a close association of names nith magic and religion, the new name may have to be "good" in these connections also.

Such full-fledged change of names has not been a noteworthy feature in the tradition from nhich modern European and American naming has sprung, but the giving of additional names has been of great importance, since the use of family names has developed from it Such additional names were once known as surnames or nicknames, but modern usage confines the former to mean family names and the latter to mean names of informal or derogatory character The older term *to-name* has therefore been revived as a technical term, and will be so used here.

In their nature and manner of giving, to-names differ profoundly from names bestowed at birth and names that wholly replace previous ones. They may be bestowed by the person himself or his well-wishers, but more commonly are bestowed by the community. They are often bestowed by people who are good-naturedly making fun of the individual. or even who dislike him. As a result to-names may be "good" as when the Roman general Scipio is called Africanus because of his victories in Africa. More frequently they are commonplace or mildly derogatory. A few express actual disgust or hatred.

Since the development of multiple and family names, to-names have had little practical function and are not much used, except insofar as individuals. often temporarily as children, may be called by pet names. Even most of the so-called nicknames are only conventionally altered forms of real names, *e.g.,* Bill and Jack, and are scarcely to be considered to-names.

In earlier periods, however. to-names were very widely applied and used, and served much the same purpose that family names now serve. As nould be suggested by their generally being commonplace and lacking the "good" quality, to-names seem to have originated for reasons that were primarily practical in the worldly sense. In particular they afforded a good means of distinguishing identically named persons. of whom there are many in most communities. To-names may be actually bestoued or may begin as descriptions (the big John; John who lives at the wood; John. the tanner) Like other descriptions. these pass into names. in English, by shortening. by sloughing off their grammatical apparatus and by being capitalized in writing (Big John, John Atwood. John Tanner). Many such double names look exactly like the modern combination of given and family names, and once really functioned as such, but they differ by not being hereditary. John Atwood's son John. even if he lived in the same place, was not called John Atwood; he might have been called John Priest because of real or imagined piety.

Nearly all to-names, and therefore the family names which develop from them. can be conveniently classified into five groups, according to their manner or origin. (1) They are descriptive of the person's appearance or character; (2) they record an incident or exploit; (3) they identify him by his connection with some other person. usually his father; (4) they give his residence or former residence; (5) they specify his occupation.

Among many peoples and over long periods of time the combination of given name and to-name has functioned satisfactorily and efficiently to identify individuals.

The inherited family name is a comparatively recent development in the European tradition.

Although a few families among the Greeks identified themselves by the patronymic of a real or reputed ancestor, the Etruscans and, learning the custom from them, the Romans are the first Europeans to make regular use of family names. The Roman three-name system was awkward and not highly efficient, but endured until the end of the empire. It then died out, largely because of the opposition of Christianity, under which only the single baptismal name was recognized, though to-names were used for practical distinction.

A modern development of hereditary names began in the middle ages, with royal and noble families. One dynasty of England. for instance, bore the name Plantagenet from a nickname of Geoffrey IV, count of Anjou. Noble families often identified their head by suffixing the name of the estate. This last was in the nature of a to-name as long as it applied only to the titleholder, but it eventually began to be taken by the younger sons and to be considered hereditary. The modern revolution in naming thus seems to stem from feudalism and the family pride associated with it.

Once started, the growth of the use of hereditary names proceeded steadily. The *bourgeoisie* aped the nobility; the lower orders aped both. This desire to be in style was probably an important factor. In addition, the growth in the size of population units and the necessity for more careful keeping of written records presumably aided the process.

The nen system was more efficient than the old one. A family name identifies the children before they can achieve any kind of surname except a patronymic. It remains fixed and certain through a man's (but not a woman's) life, whereas he may have one to-name as a young man and have that one forgotten and another put upon him later, or may even bear two to-names at once, perhaps being called one thing by his family and friends and another by people uho dislike him. Though to-names are more individualistic and colourful. a family name is correspondingly unlikely to be embarrassing, because everyone realizes that it does not describe the hearer. Moreover. as with all names, the original meaning is generally forgotten. Anyone may be embarrassed because someone bearing the same family name is involved in a scandal, but he is rarely concerned about the actual meaning. The modern triumph of the family name system can thus be adequately explained, both on socio-cultural and practical grounds.

British and American Naming. — Since names are a matter of language and tradition, the practices of naming among the English-speaking peoples can be considered together, with certain specification of diiferences developing since the beginnings of an American tradition.

The Anglo-Saxons, both before and after their Christianization, used a naming system that was also employed by other Indo-European-speaking groups; it is the best attested Indo-European practice, but probably neither the oldest nor the only one. This was a system by which each personal name was formed of two ordinary words; *e.g.*, Hrothgar (Roger), "fame-spear."

As commonly happens with naming, literal significance was not greatly considered, and names were produced, such as Wigfriih, "war-peace." which makes no sense and may be compared to such a modern coinage as Luanda. This system was efficient for the small population groups of the time; if it is assumed that only 100 elements were in use, approximately 10,000 different names were available. To-names were therefore scarcely required, though no doubt they existed. In practice many names were shortened, and nicknames could be used. The only approach to family names seems to have been the practice, at least among royal families, of alliterative naming, or of employing a common initial name-element for all of the sons. Since the Danes and Anglo-Saxons used the same methods of formation, and spoke related languages, the name-pattern of Britain was not greatly affected by the Danish invasion. The chief effect of the Norman conquest was to introduce the use of a few favourite names, themselves of Scandinavian origin but modified by Latin and French influence, and still further modified by transference into English. Thus we may account for the forms and the continuing popularity of' William especially, and also of Robert, Richard and Henry (Harry).

Toward the end of the 12th century the church protested against the use of the old heathen names. But even though these objections could not make head against the popularity of the Norman names among the upper classes, the insistence upon the use of biblical and saintly names worked nothing less than a revolution. From this period dates the popularity (and, in some instances, the first recorded English use) of such names as John, James, Michael, Mary, Anne, Elizabeth, Agnes, Catherine and Margaret. Although the number of names in the Christian tradition was considerable, only a few came to be popular. Since at the same time the coinage of new names became almost impossible, the period of the later middle ages threatened to become nomenclaturally poverty-stricken. Only the almost universal use of to-names (and soon, of family names) saved the situation. At the same time there was a great flourishing of variants, so that anyone named Richard might be distinguished from other Richards by being called Dick, Rich, Rick, Hitch, Hitchcock, Dickon or Hud, to mention only a few. Many family names are based on such nicknames.

During the same period of the later middle ages to-names stiffened into family names by becoming hereditary. In the process, however, what might be called the centre of the name-pattern moved considerably in the direction of the commonplace, because to-names mere usually given by other people but a man had a good chance of determining what to-name became his family name, or at least of avoiding one he did not want. Thus such persona; descriptive~as Little, and Reed ("Red"), are preserved, probably because the bearers had no great objection to passing those names on to their children, but such a common derogatory nickname as Fatty, if preserved at all as a family name, is very rare. Names seeming to be derogatory can usually be found to have some other origin, as with Coward, which is from cow-herd or cow-ward.

Geographically, the use of family names began in London and other more developed districts and worked outward. The process was scarcely complete by 1500, even for England, and in the outlying parts of Wales, Scotland and Ireland the use of family names was not universal even in the 18th century.

The chief later British development in family names has been the tendency, basically because of family pride, toward hyphenization (Burne-Jones, Sackville-West).

In modern times the most notable tendency in given (Christian, baptismal, etc.) names has also been toward multiplicity. In English-speaking countries a second given name (middle name) was uncommon before 1700, but by 1850 was ordinary. The use of three given names is fairly common in Great Britain.

Given names, as in any country, are partly controlled by conservative forces (*e.g.*, established religion, family pride), and partly by forces working for change (*e.g.*, fashion, desire for novelty). As important postmedieval influences on naming may be mentioned Puritanism (rejection of the names of nonbiblical saints, emphasis on the Old Testament) and Romanticism (great fondness for Charles, revival of old names such as Alfred, Guy, Guenevere). Any name becoming well known is likely to be more widely used, especially if it carries with it some "good" suggestion, such as piety or patriotism or stylishness. Thus George really became an English name after St. George came to be considered the patron saint of England (about 1360); it grew more popular with the accession of the Hanoverian kings, and in the United States with the emergence of George Washington. Similarly, the Anglo-Saxon name Edward became important because of its use by English kings. Thomas, also, became a characteristically English name because, it would seem, of the popularity of St. Thomas à Becket.

In modern times any popular hero or heroine, even a character in a novel, is likeiy to give vogue to a name. Such influence, however, is easily overemphasized. It must be remembered that an actor or actress may well assume as a stage name some name that is already becoming fashionable. In that same way, the popularity of Charles may have been aided by the novel Sir Charles *Grandison* (1753), but since the name had already begun to rise in popularity before that time, it may be argued that Richardson actually chose his hero's name for this reason.

Special American Developments. — In the United States the chief special developments in the use of family names are (1) the transformation of old names under the influence of frontier illiteracy; (2) the adoption of family names, generally English, by Negroes and Indians; and (3) the adoption of English names or the anglicization of foreign names by non-English-speaking immigrants.

In given names American usage is notable for the strong Puritan use of Old Testament names in early New England (Joseph, Samuel. Benjamin, David. Joel. Ezra, Adlai). Another development is the xidespread coinage of women's names (see above).

Particularly American also is the use of Jr., as a kind of to-name. and the writing of the signature in the form John Q. Public, as opposed to the British use of J. Q. Public or J. Quincy Public. Hyphenated family names and the use of more than two given names are generally held to be British practices and viewed with little favour.

The second quarter of the 20th century was marked by a considerable change in naming habits in the United States. The proportion of children called by such traditionally common names as John and Mary had declined and many new given names, especially original family names, had become popular. The use of the mother's family name as the child's second given (middle) name has gained considerably.

Scholarship and Relationships. — Most scholarship upon personal names has concentrated upon their etymology, manners of origin and method of development. Statistical and historical study of naming as a social phenomenon is little advanced. Although as yet failing to be as useful a tool as the study of place names (see below), the study of personal names has been of aid to genealogists and linguists, and occasionally to historians.

Fucilla, *Our Italian Surnames* (1949).

PLACE NAMES

The giving of local names depends, much like that of personal names, upon (1) a sense that a place is an entity which possesses an individuality differentiating it from other places. and (2) a sense that a place is useful and therefore worth naming. The recognition of these requirements necessitates no high degree of intelligence and onomastic reaction is easy. Hence place names arose at a very early period, and occur in all recorded languages.

Originally place names need not have been fully differentiated from common nouns. Just as people now living near a large river say ordinarily "the river," so a primitive tribe thus located, and perhaps knowing no other river, must have spoken. Place naming in a fuller sense would have begun when the people recognized two examples of the same class, and distinguished "the red river" from "the black river," whence eventually Red river and Black river. The original quasi-place name thus became what is now called, by biological analogy, the generic (river), and the element used to distinguish between examples of the same class became the specific (red, black). This principle, in fact, is not limited to toponomy, or to nomenclature in general — father may be any father or Father (Jones). In many instances, however, the development proceeded conversely, so that the original common noun became a specific; *e.g.*, from Anglo-Saxon words meaning "the river" several English streams now bear the name Ray or Rea.

The specific-generic principle of place naming. which is highly efficient and so widespread as to be considered universal, rests upon the basic linguistic principle of classification. Ordinary practice in most languages permits the combination of generic and specific into one "word," *e.g.*, Charlestown. and also the omission of either half under the proper circumstances. so that people may say or write either "the Ohio," or "the river," at the same time knowing the full name to be "the Ohio river." In English the specific generally precedes, but it may follow (Lake Mead) or be appended in a phrase (the Bay of Islands).

In spite of the widespread use of the specific-generic principle, different languages naturally differ in their methods of forming place names. Those possessing locative endings are likely to use them liberally. French and Greek employ the article more freely than English does. but Latin lacks an article and so cannot omit it as a mark of a name. The fully developed place name in English generally omits the article; *e.g.*, France, Long Island. The article, however, is used with plurals (the British Isles), and commonly with certain generics. *e.g.*, desert, sea.

This complicated subject of the omission of the article is involved in English with the distinction between evolved and bestowed names. The former begin as mere makeshift identifications; *e.g.*, "the river where the pine trees grow." This can become "the river of the pines," and then "the pine river," and finally "Pine river," or the evolution may be somewhere arrested. At a point sometimes difficult to sense the identification assumes the quality of a name. Bestowed names, on the contrary, arise when a place is consciously labeled by some definite act of naming. Since such a name is likely to be a fully developed one, evolution does not commonly occur, although it may take over to simplify an overcomplicated name, as when El Pueblo de la Reina de los Angeles de la Porciúncula is shortened to Los Angeles.

The giving of place names, as already stated, depends upon entity and use. Primitive peoples, lacking large geographical conceptions, have names for small and obviously useful natural features such as springs, but are not likely to have a sense of the entity of a long river or to have any sense of its usefulness as a whole. Therefore they may not have a single name for it, but may have names for particular pools, reaches and rapids. A mountain is likely to be even harder to conceive as an entity; a range of mountains, still more so. As knowledge increases, larger features are named, often by the process of extending a name in its application; for instance, Italy, Africa and Siberia were originally but small parts of the areas later so denominated. With the development of civilization and geographical knowledge names must be applied to larger and more abstract entities, such as oceans, continents and archipelagos, and eventually to features such as submarine basins, of which earlier peoples were necessarily ignorant.

At the same time a developing civilization gives rise to numerous man-created entities, such as villages. towns. fortresses, provinces and streets. and these also are named. A significant distinction, however, exists between such names and those of natural features. The man-created entities are somewhat less definitely "places" than are natural features, being less surely connected with an actual spot. Towns have changed location, moving the name with them. Primitive villages may bear merely the tribal name, and shift location with the tribal migrations. Even a modern city is often conceived as consisting not of the place, but of the people; its name, then, approaches the status of a collective personal name. In addition, any sovereign or corporate entity such as a city or state possesses a name much as a corporation does. Nevertheless these "habitation-names" are usually considered to be place names, partly because they have a geographically definable location and partly because many of them, such as Liverpool, go back to evolved names of natural features. More doubtful, but sometimes considered to be place names. are the names of such things as bridges, tunnels and individual buildings.

Types of Specifics. — The number of specifics is very large, but their usage may be considered under nine heads, and a useful classification of place names thus results, even though the existence of many borderline examples must be recognized. It must also be emphasized that this classification is of kinds of usage, not of the specifics themselves. Thus a specific such as Lincoln might give rise, according to circumstances, to an incident name, a possessive name. a commemorative name or even to something else.

Descriptive *names* employ a specific indicating a long-enduring quality of the generic (Clear brook, Roaring river, Stinking spring, Pliocene ridge). Less purely descriptive, but generally so classified. are names that identify by means of a possibly impermanent association (Boundary mountain, Mill river, Lone Pine creek). Similar to these latter are the relative descriptive names which identify by indicating a relation to something else (North sea, Ten Mile creek, Fourth crossing). Many counterpart names thus arise, *e.g.*, Big river may not actually be very large, but may be named because it is larger than a neighbouring Little river.

Incident names arise from an incident occurring at the place and making it memorable (Massacre lake, Hungry Moose creek). Names of persons are often applied to natural features for this reason. as are also the names of animals. Thus, Crocodile river need not indicate that those beasts were especially numerous there, but merely that a single crocodile happened to impress himself upon early explorers. Nearly all names used by primitive peoples are either descriptive or incident names.

Possessive *names* spring from the idea of ownership, whether legal or informal (Culp's hill, Bakersfield)! though the possessive form of the noun need not be maintained. Under this heading may be included most ethnic names (Zululand, Cheyenne river) and many mythological names derived from the names of gods and spirits. These two subclasses, however, are also closely connected with associative-descriptives and with commemorative names. Possessive names appear at an early stage of culture, but probably arise subsequently to the first two classes.

Commemorative names are those given consciously "in honour of" someone or something (many religious and patriotic namings); here are to be included most transfer names (Megara from Greece to Sicily; Boston from England to the United States).

Euphemistic names are those bestowed a-ith the idea of making a good impression or establishing favourable auspices (Euxine sea. Beneventum, Greenland, Cape of Good Hope). Commemorative and euphemistic names may be considered to arise somewhat later in cultural development than the above-mentioned classes.

Manufactured names are those constructed from recombined sounds or letters, out of fragments of old words, from initials, by backward spellings, etc. (Tesnus, from Sunset; Tonolo, from an arrangement of selected letters). Such names are probably of comparatively late origin; no certain example seems to be known before 1600.

Shift names result from the mere shift of the specific from one generic to another in the vicinity (White lake, though it may not be white, takes that name because it is near White mountain). The resulting group is called a name-cluster.

Folk-etymologies, though they may be said merely to transform old names, really produce what are essentially new names! through the mishearing and misinterpretation of an obsolete or foreign word (Picketwire from Purgatoire). Backformation (River Cam from Cambridge) may be considered a phase of folk-etymology

Mistake names arise from failure in transmission. either oral or written (Oregon, from an error on a map). These last three classes differ from the others in that they arise secondarily from other names, and seldom by a conscious process of naming.

The number of names in a given area will be greater because of any factor that increases the number of places easily to be conceived as having entity (*e.g.*, more variegated topography), and also because of any factor leading to more intensive use of land (*e.g.*, denser population). Longer continuous linguistic and cultural tradition is also an important factor, since names established for any reason tend to persist. From such factors. and doubtless from others less easily appraised, spring varying local habits of name giving: thus in some countries every farm and even every field bears a name, but else here such units do not. The density of names thus differs greatly in different areas (according to estimates, South Dakota, .2 to the sq.mi.; U.S., 1; Keos, Greek island, 17; Norway, 40; Bohuslan, Swedish province, 150). Such differences, however, result partly from differences in judgment as to what is to be considered a place name.

Notable periods of naming occur when an uninhabited country is being explored or developed. or when the speakers of a new language are imposing themselves upon a country. In such periods not only are names established for the most important natural features but also for many of the habitation sites that will later become the cities. Because of the general turmoil associated with such a situation, the names are likely to be impermanent. Thus, during the period of the settling of the United States, thousands of names appeared, only to disappear; five once-current European names are recorded for Hudson river, in addition to North river, still in limited use.

Once established firmly: however, place names cling with great pertinacity, and frequently survive, though suffering great change of form, even through periods of shift in population and language. This tenacity renders place names valuable to the study of history and prehistory. and necessitates careful study of the alterations to which they are subject. In general, being a part of language. place names change pronunciation along with the rest of the language. Thus, when the pronunciation of English vowels shifted in the later middle ages, this change occurred in place names as in other words. Certain special iactors, however, must be noted. (1) Place names, consisting of specific-generic, are on the average at least twice as long as ordinary words, and so are especially subject to the linguistic forces applicable to long words. (2) Many place names, whether because originally from foreign words or because long-enduring and therefore affected by the obsolescence of native words, are or become meaningless to the ordinary speaker, and thus are peculiarly subject to the processes of folk-etymology. (3) The usage of most place names is highly local, and they are thus susceptible to dialectal variation and even to personal whim. Place names thus tend to depart from the rest of the language and to become unintelligible to the ordinary person, except insofar as they are "re-interpreted" by folk-etymology. By means of earlier recorded forms and by the methods of comparative philology, however, the trained linguist is able to penetrate most of the disguises, and even the most cryptic are not beyond his attempts. As a result the study of place names has proved highly rewarding, and has been assiduously pursued during the 20th century, particularly in western Europe.

Place Names of Western Europe. — In this area the "place-name pattern" indicates what is sometimes called a "prehistoric base," *i.e.*, a scattering of names that defy explanation by means of any otherwise recorded language, and are therefore held to represent one that existed at some very remote period. Attempts have been made to elucidate some of these names. Thus to a basic root **kal-* (Calahorra), also supposed to exist in numerous variants, such as **kar* (Carcasonnej and possibly even in **al-* (Alps), has been assigned a large number of names, and the meaning "rock" has been postulated, extended in one direction to mean "mountain," and in another to include "fortress," and even "house" and "village." Such conclusions must still, however. be viewed as highly hypothetical. Iberian and Ligurian were previously coupled with the basic "stratum." The modern tendency, however, is to connect the former with Basque and to restrict it to the Iberian peninsula with some extension into France, and possibly into Britain. Ligurian is now generally considered to represent an early extension of Indo-European, importact only in the region of northwestern Italy and southwestern France. After about 1945 much attention was directed toward another possibly early Indo-European stratum to which the term "Illyrian" has been attached.

In contrast to these uncertain early influences is the clear Celtic imprint. As a result of shorter or longer Celtic occupation a recognizable stratum of names extends all the way from central Europe to Ireland and Portugal. As such many names may be noted of rivers (Rhine, Avon). strongholds and sites (Verdun, Vienna. Madrid) and districts (Kent, le Maine). Noteworthy is the derivation from the names of Celtic tribes of about 40 French cities, including Paris.

As comparatively unimportant in the western European name-pattern may be considered the few names left by Greeks, *e.g.*, Nice, Antibes, Ampurias; and by Semites, *e.g.*, Cadiz, Cartagena. The Romans, however, exercised a tremendous influence, and not merely in Italy. Thus arose not only the names of innumerable villages, but also of many important cities; *e.g.*, Saragossa. Aix, Coblenz, Cologne. Direct Roman influence upon names in Britain seems to have been negligible, but indirectly, from Latin words adopted by the natives. *e.g.*, *castra* and *colonia*, have sprung names such as Lancaster. Chester and Lincoln.

The Germanic migrations affected the pattern strikingly. The appellations of tribes were fixed upon whole regions (Lombardy, Burgundy, Wessex), and even produced the names England and France. In England, where the speech of the invaders supplanted the Celtic speech, the place names became predominatingly Anglo-Saxon. and this Germanic domination was enhanced by the later Scandinavian invasions. In France, Spain and Italy, however, the Germanic influence on names varies, regionally, from moderate to negligible. Naming was active during the period of the revival after the dark ages; the modern languages had then emerged, and most of the new nanies sprang from them, though a certain Latin influence was still exercised through the Church. Because of the Church influence many religious names appeared; especially noteworthy are the numerous names of towns and villages commemorating saints.

By 1500 the basic European name-pattern was well established, and even most of the smaller names were fixed. Still. naming is a continuous process. Thus, in France, though most cities bear names of medieval or more ancient origin, Le Havre dates only from 1517 and Lorient from 1664. In the British Isles the continuing process is observed \\-ith Londonderry, Fort William and Port Sunlight, as well as with the naming of innumerable streets and estates.

Wars and revolutions continue to affect the names, as in the shifts from St. Petersburg to Petrograd to Leningrad. Revivals of nationalism also have strikingly influenced the pattern in Greece and the Republic of Ireland. In Italy the attempts to recall past glories produced such shifts as that from Girgenti to Xgrigento.

Place Names of the United States.—The place-name pattern of the United States is typical for countries whose development lies mainly in the historical period. The discoverers found a situation such as is to be expected in a region thinly inhabited by primitive tribes. Names were rather sparse; they were descriptive or incident names; according to the principles of entity and use only such features were named as were of interest to a primitive people and were recognizable by them. Europeans adopted some of these names, but since these were generally unintelligible, they were used as mere counters and often misapplied. Thus Connecticut, "at the long estuary," applying only to the river near its mouth, was extended to the whole stream. and then to the colony. At a later period Indian names that had acquired sentimental value were transferred to new sites; a striking example is Wyoming, originally applied to a small valley in Pennsylvania.

Much more commonly the Europeans, of whatever nationality, gave names in their own languages. These were often descriptive (Colorado river. Marblehead, Detroit), or sprang from incidents (Cape Fear, Rancheria de la Espada). Many were commemoratives (Virginia, numerous saints' names in French and Spanish territory), and many of these were transferred from "the old country" (Thames river, Harlem). During more than three centuries, while the country was being explored and settled, thousands of names. and eventually millions, arose by bestowal and evolution. All possible methods of naming were represented; all phases of the history and social development of the American people were enshrined in the names. Enlarged geographical conceptions and an increasing density of population resulted in more and more naming. The necessity of establishing so many names in such a short time, because of the rapidity of settlement, resulted in much repetition and in a great use of transfer names taken in seemingly haphazard fashion from various parts of the world; *e.g.*, Toledo, Athens. Odessa. Nevertheless not a little ingenuity was also displayed, and occasionally some sense of poetry. as in John Frémont's naming of the Golden Gate.

The typically American use of the manufactured name seems to have arisen in an attempt to gain more variety. Although beginning as early as Saybrook (1635), it was a special development of the last half of the 19th century and subsequently. Many manufactured names are *boundary names,* such as Calexico and Mexicali (both from California and Mexico), and Texarkana (from Texas, Arkansas and Louisiana).

Toward the end of the 19th century the "big names" had all been fixed, and the process became one of filling in. Significant dates are the fixing of the last state-name (Wyoming, 1868) and the establishment of the Board on Geographic Names (1890), a federal agency to regulate governmental naming. Place-naming in the United States! however, is still in a comparatively active period because of the constant naming of towns, districts and streets, and the filling-in by the naming of lesser natural features.

Place-Name **Scholarship.**—As a result of the differences in the nature of the problems in Europe and in the United States. the methods and interest of onomatologists have differed greatly. European scholars, lacking historical information, have generally worked by linguistic methods, drawing what help they could from geography. history and anthropology. They have been essentially etymologists. The usual European scholar has little interest in names that have arisen since the middle ages, and are therefore of no etymological interest. Many European scholars have been intensely concerned with the ancillary use of place-name study as a tool for the investigation of prehistory.

American scholars rely mainly on the methodology of history. Not primarily etymologists, they are likely to consider the establishment of the etymology as a mere primary step, of not much significance unless the reason for the application can be established. They are more likely than European scholars to be informed as to the processes of place-naming and more likely to be interested in recent and current naming.

Since the study of place names deals with an important human activity. it is justified in its own right. but it is also of ancillary value to many other studies, such as linguistics. history, geography, archaeology, anthropology and folklore. A zoologist may study place names to establish the former habitat of an animal. Probably the greatest "external" triumphs of the study have been in connection with the establishment of the locations. and something of the social organizations, of various peoples when historical records are lacking. Thus place names make certain a Saxon occupation of the Calais region in France at some time during the period of Germanic migrations. Similarly such study, almost without historical aid, has established that many Norwegians settled in northwestern England (about goo), and is even able to support the assertion that these came in small groups, not in an invading army, had an Irish element mingled with them, and lived on comparatively peaceable terms with the English.

Nevertheless, evidence derived from the study of place names must be used with caution, and is seldom conclusive except when a whole "pattern" can be demonstrated. Individual names may show close resemblance or even be identical as the result of coincidence. as with Georgia in the Caucasus and Georgia. U.S., or Miami (Ohioj and Miami (Fla.), and many others. In the newer countries, such as those of both the Americas, there has been constant transfer of names at a sophisticated level and for what may be called somewhat extraneous reasons. Thus California has been shown to be derived from a Spanish romance. Corinto in Nicaragua resembles the Greek Corinth only by being a port. Odessa in the U.S. may indicate not a settlement of Ukrainians but a nheat-growing district.

Without historical evidence coincidences are often baffling, as with the three widely-separated tribes known to the ancient Greeks as Enetoi. Such cruxes can only be approached by a meticulous combination of linguistic: historical, archaeological, geographical and anthropological techniques.

NAME (IN LOGIC). A name is a word, symbol or expression having the kind of meaning which can be explained only by saying that a sentence in which the name is used is intended to be about something which the name denotes. (See DENOTATION.)

By some logicians the term *name* is restricted to the narrow category of what are sometimes called logically proper names; *i.e*, names which denote uniquely, which are simple, in the sense of having no analysis into meaningful parts, and which supposedly have denotation without connotation. But by others the word name is used rather in a broader sense than is customary in everyday usage and in linguistics; and it is this broader sense which will be treated in the present article.

Historical changes in the meaning of names (see the discussion of particular examples in NAME [IN LINGUISTICS] above). and variabilities and uncertainties of meaning which occur in the natural languages are the concern of the linguist rather than the logician. And many complicating features of the meaning and usage of names in the natural languages, however unavoidable in the actual use and development of a language, are best regarded for purposes of logical analysis as irregularities that have to be removed. This leads ultimately to a formalized language (see LOGIC). But we here use for illustration a natural language, English, abstracting from uncertainties of meaning which might be urged as doubts against some of the examples.

Traditionally, names have been classified according to their denotation, as *concrete* names. denoting physically concrete things, collective names, denoting collections or classes of concrete things, and abstract names denoting abstract entities, or according to the connotation (*q.v.*), as negative (if they connote the not having of a specific property) or positive (in the contrary case), as relative (if, like "father," "friend," "cause," they connote the bearing of a specific relation) or nonrelative.

More fundamental, however, is the distinction between *singular* names, or constants, which have as a part of their meaning that there is one unique thing denoted, and *common* names. or general names, which do not have uniqueness as part of their meaning. (Proper name is convenient as a synonym of *singular* name, in view of other meanings of the word *singular;* but by many the term proper name is used rather for some more restricted class of names.)

Examples of singular names are the place name "Dartmouth," which denotes the town Dartmouth; the personal name "James Mill," which denotes the man James Mill; the phrase, "the father of John Stuart Mill," which (as would be said even by those logicians who do not class such descriptive phrases as names) denotes the same man James Mill; the personal name "Chiron." which purports to denote a certain centaur; the collective name "mankind," which denotes the class of men; the abstract name "courage," which denotes the property or quality of being courageous. The fact that more than one town has the name of "Dartmouth" and more than one man that of "James Mill" constitutes an equivocacy of these names, but does not prevent them from being singular names, as each one purports to denote uniquely. On the other hand, "Englishman" is a common name since, without equivocacy, it denotes James Mill, and also denotes John Stuart Mill, and Guy Fawkes, and Alexander Pope, etc. "Son of Henry VIII" is a common name, as it is no part of the meaning of the name that there is only one; but "the son of Henry VIII" is a singular name. "Bachelor" is a concrete common name; "centaur" is a concrete common name, though denoting nothing; "throng" is a collective common name; "virtue" is an abstract common name (as both courage and honesty, *e.g.,* are virtues).

In the construction of formalized languages both common names and names denoting nothing have generally been avoided, in the interest of simplicity—except so far as the variables which occur in most formalized languages (see LOGIC) may be regarded as partial analogues of the common names. It is an interesting question whether these familiar features of natural language can be reproduced in a formalized language, or whether they have some inherent inconsistency or unsuitability that prevents it. But statements containing either common names or denotationless names can always be reformulated so as to use instead only the constants and variables of the usual formalized languages (an example is the reformulation of "All bachelors are red-haired" as $(x)\,[B(x) \supset R(x)]$ in the language L described in SEMANTICS IN LOGIC). (Ao. C.)

NAMPA, a city in the centre of the Boise valley in southwestern Idaho, U.S., 20 mi. W. of the city of Boise. Founded Sept. 8, 1886, on the main line of the Union Pacific at the junction of a branch to Boise, Nampa was a hamlet in the desert until irrigation transformed the area into farms in 1891. The town gained importance through the efforts of W. H. Dewey, an early Idaho settler who made Nampa the hub of two more branch railways and in 1902 undertook a major development of the townsite. His Dewey Palace hotel was a landmark for a generation. A sugar factory, milk condensery, several major vegetable seed producers and the Pacific Fruit Express shops are the major industries. Nampa is the home of Northwest Nazarene college, a denominational college founded in 1913. The community sponsors the annual Snake River Stampede, one of the leading rodeos in the northwest. The name Nampa is from the name of a leader of the western Shoshone Indians. For comparative population figures see table in IDAHO: Population. (M. D. B.)

NAMUR, one of the nine provinces of Belgium, between Hainaut on one side and Liège and Luxembourg on the other, extends from Brabant up the Meuse to the French frontier. Area, 1,413 sq.mi.; pop. (1955 est.) 364,125 or 258 per sq.mi. It is fertile north of the Meuse and forested in the south. There are a few iron and coal mines between the Sambre and Meuse, and the quarries are important. Arboriculture, especially fruit-tree plantation, is increasing. There are three administrative arrondissements, Namur, Dinant and Philippeville, 14 cantons and 366 communes.

NAMUR (Flemish NAMEN), a town of Belgium, capital of the province of Namur. Pop. (1955 est.) 32.078. The town lies on the left bank at the junction of the Sambre and Meuse rivers, while the rocky promontory forming the fork between them is crowned with the old citadel, which occupies the site of the old castle of the counts of Namur. This citadel was abandoned for military purposes, and its hill was converted into a park, while the crest was occupied by a hotel reached by a cogwheel railway. Namur is connected with the citadel by two bridges across the Sambre, and from the east side of the promontory there is a fine stone bridge to the suburb of Jambes. This bridge was constructed in the 11th century and rebuilt in the reign of Charles V. It is the only old bridge in existence over the Belgian Meuse. The cathedral of St. Aubain or Albin was built in the middle of the 18th century. The church of St. Loup is a century older and is noticeable for its columns of red marble from the quarry at St. Rémy near Rochefort. There is a considerable local industry in cutlery, and there are tanneries and glassmaking factories.

In the feudal period Namur formed a marquisate in the Courtenay family. Jousts on stilts were a medieval custom that lasted into recent times there. Don John of Austria made Namur his headquarters in the Netherlands, and died here in 1578. Louis XIV took it in 1692 and Vauban renewed the defenses but William III retook it in 1695, though the French held it again from

1702 to 1712 In 1893. under the new scheme of Belgian defense, the citadel and its detached works were abandoned, and in their place nine outlying forts were constructed at a distance of from 3 to 5 mi Namur was the scene of intense fighting in both World Wars I and II.

NAN, a province (*changwat*) in northern Thailand, formerly an autonomous principality. Its area (4,515 sq mi.) comprises the upper Nan river basin and the surrounding mountains, which isolate it from Laos to the north and east and from Chiangrai and Phrae provinces to the west. A single road connects the capital. Nan (1957 est.. 12,785), with the nearest railroad station, Denchai, 84 mi to the southnest.

Major products are teak logs, floated downriver to Bangkok mills, and tobacco. The population, 239 037 in 1960, is predominantly Thai-Lao. but includes a variety of tribal peoples, most notably Lu, Tin, Khamu and Yao. (G W. SK.)

NANA SAHIB, the common designation of Dandu Panth, an adopted son of the former peshma of the Marathas. Baji Rao, who took a leading part in the great Indian mutiny (q v.) and was proclaimed peshwa by the mutineers. Nana Sahib had a grievance against the British government because it refused to continue to him the pension of 800,000 rupees (£80,000), which was promised to Baji Rao by Sir John Malcolm on his surrender in 1818. This pension, however, was intended only to be a life grant to Baji Rao himself. For this refusal the Nana bore the British a lifelong grudge, which he satisfied in the massacres at Cawnpore (Kanpur; *q.v.*). In 1859, when the last rebels disappeared into Nepal, he was among the fugitives. His death was reported some time afterward, but his real fate is obscure.

See G. O. Trevelyan, *Cawnpore* (London and Cambridge, 1865).

NAN-CH'ANG, the capital of the province of Kiangsi, China, on the Kan Chiang near the lake Po-yang Hu, 160 mi. S.E. of Wuhan. Pop. (1957 est.) 508,000. Nan-ch'ang is situated on the east-nest railroad connecting Hangchow in Chekiang province with Chu-chou (Chuchow) in Hunan province. A second railroad station in Nan-ch'ang's left-bank industrial suburb is the terminus for a line going northnard to the Yangtze river port of Chiu-chiang (Kiukiang). Nan-ch'ang is the largest city of the Po-yang lake basin one of China's chief rice-growing areas. In addition to rice, the city also trades in tea, grown on near-by hillsides, and in cotton. tobacco and hemp. Industries that have developed in the left-bank suburb include factories for the processing of vegetable oils and fats. paper, textiles, machinery and agricultural implements. Kiangsi Agricultural institute and Medical college are located in Nan-ch'ang.

An old walled town. it was formerly situated on Po-yang Hu. Over the years the sediments carried by the Kan Chiang built up a delta that pushed the lake shore as far as 20 mi. from the city The city mall was razed in modern times. The two banks of the city are linked across the Kan Chiang by a bridge and ferries. During the Chinese-Japanese War, the Japanese occupied Nan-ch'ang from 1939 to 1945. (T. SD.)

NANCY, a town of northeastern France, the capital formerly of the province of Lorraine, and now of the dkpartement of Meurthe-et-Moselle, 219 mi. E. of Paris on the railway to Strasbourg. Pop. (1954) 120,484.

At the close of the 11th century Odelric of Nancy, brother of Gérard of Xlsace, possessed at Nancy a castle which enabled him to defy the united assaults of the bishops of Metz and Trèves and the count of Bar. In the 12th century the town was surrounded with walls, and became the capital of the dukes of Lorraine; and in 1477 Charles the Bold was defeated here by René II. (See SWITZERLAND: *History.*) Refortified by Charles III, it was taken by the French in 1633. After the peace of Ryswick in 169; it was restored to Duke Leopold. He founded academies. established manufactures and set about the construction of the new town. But it was reserved for Stanislas Leczinski, the last of the dukes of Lorraine, to make Nancy one of the palatial cities of Europe. The city, which became French in 1766, was occupied by the allies in 1814 and 1815 and put to ransom by the Prussians in 1870. After the Franco-German War the population was greatly increased by the immigration of Alsatians and of people from Metz and its district.

Although Nancy remained outside the area of actual fighting during World War I it was bombarded by German aeroplanes and long-range guns, but the damage was not very serious.

Nancy stands on the left bank of the Meurthe 6 mi. above its junction with the Moselle and on the Marne-Rhine canal. The railway from Paris to Strasbourg skirts the city on the southwest side; other railways — to Metz, to Épinal by Mirecourt, to Château Salins — join the main line near Nancy and make it an important junction. The town consists of two portions — the Ville-Vieille in the northwest, with narrow and winding streets, and the *Ville-Neuve* (16th–18th centuries) in the southeast, with wide straight streets. Between the two lies the Place Stanislas, and on all sides rise imposing buildings of the 18th century — the town hall, episcopal palace, etc. A fine triumphal arch erected by Stanislas in honour of Louis XV leads from the Place Stanislas to the Place Carrière, which forms a beautiful tree-planted promenade, containing at its further end the government palace (1760) now the residence of the general commanding the XX army corps, and adjoins the so-called Pépinière (nursery) established by Stanislas.

The cathedral in the Ville-Neuve, built in the 18th century, has a wide façade flanked by two dome-surmounted towers. Of particular interest is the church of the Cordeliers, in the old town, built by René II. about 1482 to commemorate his victory over Charles the Bold. Pillaged during the Revolution period, but restored to religious uses in 1825, it contains the tombs of the counts of Vaudémont. Here also is a chapel built at the beginning of the 17th century to receive the tombs of the princes of the house of Lorraine. The church of St. Epvre, rebuilt between 1864 and 1874 on the site of an old church of the 13th, 14th and 15th centuries, has a fine spire and belfry and good stained glass windows. Of the old ducal palace, begun in the 15th century by Duke Raoul and completed by René II., there remains but a single wing, partly rebuilt after a fire in 1871. The entrance to this wing, which contains the archaeological museum of Lorraine, is Gothic of the early 16th century. One of the greatest treasures of the collection is the tapestry found in the tent of Charles the Bold after the battle of Nancy. Of the old gates of Nancy the most ancient and remarkable is the Porte de la Craffe (1463). The town hall contains *a* museum of painting and sculpture.

Nancy is the seat of a bishop, a prefect, a court of appeal and a court of assizes, headquarters of the XX. army corps, and centre of an *académie* (educational division) with a university comprising faculties of law, medicine, science and letters, and a higher school of pharmacy. There are also tribunals of first instance and of commerce, a board of trade-arbitrators, and a national school of forestry. The industries of Nancy include printing, brewing, cotton- and wool-spinning and the weaving of cotton and woollen goods, and the manufacture of tobacco (by the State), of boots and shoes, straw hats, pottery, casks, embroider~machinery, motor cars and spare parts, engineering material, farm implements and iron goods.

NANDI (CEMUAL), an East African people of the so-called "Nilo-Hamitic" group who inhabit the eastern part of the Kenya highlands. The name is used in the narrow sense for a group numbering about 100,000 who live southeast of Mount Elgon and also, in a wider sense. to include the following related peoples: Kipsigis (Kipsikis, Lumbma); Terik (Nyangori); Elgeyo (Keyo); Kamasiya (Tuken); Elgonyi (Kony) and Sebei (Sapei), who number, taken together, between 200.000 and 300,000. Except for the Sebei, who live on the Uganda side of Mount Elgon, all are in Kenya.

Nandi cultivate millet, maize, sweet potatoes and other crops with iron hoes. but their principal interest is their cattle, which. besides providing food and bridewealth payments, are of great ritual importance. Cattle supply both milk and blood, the latter being taken by puncturing a vein in the beast's neck without killing it. A man's cattle are distributed among his kinsmen as a precaution against epidemic diseases and raids, which, before the establishment of British administration in 1896, were a popular activity among the Nandi and related peoples.

The people are divided among 17 exogamous, totemic patrilineal clans, which are dispersed throughout Nandiland. The most important traditional social groups, however, are the age sets formed by youths upon circumcision and initiation. Each set remains in power during some 15 years of warriorhood, after which it ceremonially hands over to the succeeding set.

Prior to British administration, political and jural authority resided in local councils of elders. Ritual experts of Masai origin —*orkoiyot*—are in charge of divining and rain making.

NANDU, the Brazilian name for the rhea (*q.v.*).

NANKANA, a people resembling the Bura and the Mampursi, living in the Navoro district of the Northern Territories, Ghana, and across the Upper Volta border in the Leo district. They speak a Mossi dialect.

See Cardinal, *The Natives of the Gold Coast.*

NANKEEN, a cotton cloth originally made in China and now imitated in various countries. The name is derived from Nanking, the city in which the cloth is said to have been originally manufactured. The characteristic yellowish colour of nankeen is attributed to the peculiar colour of the cotton from which it was originally made.

NANKING (NAN-CHING), capital of Kiangsu province, China, on the south bank of the Yangtze river, 160 mi. W.N.W. of Shanghai. Pop. (1953 census) 1,091,600. The city of Nanking dates from the beginning of the Ming dynasty (1368), although it is built on the site of a city which for more than 2,000 years appeared under various names in the history of the empire. The more ancient city was originally known as Kin-ling; under the Han dynasty (202 B.C. to A.D. 23) its name was converted into Tan-yang; by the T'ang emperors (A.D. 618–906) it was styled Kiang-nan and Sheng Chow; by the first sovereign of the Ming dynasty (A.D. 1368–1644) it was created the "southern capital" (Nanking) and was given the distinctive name of Ying-t'ien; and with the accession to power of the Manchu rulers it was officially known as Kiang-ning, though still popularly called Nanking. It was the seat of the imperial court only during the reigns of the first two emperors of the Ming dynasty, and was deserted for Shun-t'ien (Peking) by Yung Lo (Ch'eng Tsu), the third sovereign of that line, who in 1403 captured the town and usurped the crown of his nephew, the reigning emperor.

The T'aip'ing rebels, who carried the town by assault in 1853, swept away all the national monuments and most of the public buildings it contained, and destroyed the greater part of the magnificent wall which surrounded it. The wall, of which only small portions remain, was about 70 ft. in height, measured 30 ft. in thickness at the base, and was probably 20 mi. in circumference and pierced by 13 gates. Encircling the north, east and south sides of the city proper was a second wall which enclosed about double the space of the inner enclosure. In the northeast corner of the town stood the imperial palace built by Hung Wu (Chu Yüan-chang), the imperial founder of the modern city. After suffering mutilation at the overthrow of the Ming dynasty, this building was burned to the ground on the recapture of the city from the T'aip'ing rebels in 1864.

The most conspicuous public building at Nanking was the famous porcelain tower, which was designed by the emperor Yung Lo (1403–28) on a previously sacred site to commemorate the virtues of his mother. The building was begun in 1413. In shape the pagoda was an octagon and was about 260 ft. in height. The outer walls were cased with bricks of the finest white porcelain, and each of the nine stories was marked by overhanging eaves of green glazed tiles.

Nanking was formerly one of the chief literary centres of the empire. It was taken by the British in 1842 and made a treaty port by the French treaty of 1858, but was not formally opened. Its proximity to Chen-chiang (Chinkiang), where trade had established itself while Nanking was still in the hands of the rebels, made its opening of little advantage. In 1899 it was voluntarily thrown open to foreign trade by the Chinese government, and in 1909 it was connected by railway with Shanghai, and became the southern terminus of the Tientsin-P'u-k'ou railway.

The nationalist government moved the capital of China to Nanking in 1928 and Nanking remained the legal capital when the government moved to the wartime capital of Chungking after the Japanese invasion. After 1928 Nanking developed rapidly and a number of new buildings such as a modern railway station and several ministries were built by the government and broad boulevards were constructed. Modern airfields and shipping facilities increased the importance of Nanking as a communication centre. Outside the city the famous Sun Yat-sen mausoleum was erected in memory of the founder of the Chinese republic. In Nov. 1937 Nanking fell to the Japanese troops. The "rape of Nanking" which followed was fully authenticated by many neutral witnesses. From 1940 to 1945 Nanking was the seat of the puppet government of Wang Ching-mei. Following the defeat of Japan, the Nationalist government officially returned to Nanking, May 5, 1946, after an absence of eight years.

The Communists seized Nanking in April 1949, and on Oct. 1, 1949, they proclaimed the People's Republic of China with its capital at Peking. Although Nanking ceased to be the national capital, it became the administrative seat of Kiangsu in 1952, when the provincial capital was moved from Chen-chiang to Nanking.

Traditional industries of Nanking included satin, cotton (nankeen cloth), porcelain, paper and ink. Modern industries are concentrated in the riverside suburb of Hsia-kuan (Siakwan) and especially in the left-bank suburb of P'u-k'ou (Pukow), terminus of the trunk railroad to Tientsin. P'u-k'ou has a chemical fertilizer plant and a tractor factory. (T. SD.)

NAN-NING, capital city of the Kwangsi Chuang Autonomous Region, south China and 330 mi. west of Canton. Pop. (1953) 194,600. Nan-ning is situated about 30 mi. below the junction of the Li Chiang or Tso Chiang and the Yu Chiang, which form the Yü Chiang, the main southern branch of the Hsi Chiang. The city is served by the Hunan-Kwangsi railroad, which connects the Chinese rail system with North Vietnam.

Nan-ning was opened voluntarily to foreign trade by China in 1907 to offset French influence at Lung-ching (Lungtsin), the former Lungchow, a treaty port near the North Vietnam frontier. Nan-ning is the highest accessible point for steam junks on the Hsi Chiang, except during the low-water season in winter when navigation is seriously affected above Wuchow (Wu-chou). Nanning consists of an old walled city on the left bank of the Yü Chiang and the former foreign commercial settlement just south of the walled town. During the Chinese-Japanese War, the city was temporarily occupied in 1940 by the Japanese.

After the Communist take over in 1949, the city regained the status of provincial capital, which had been briefly shifted to Kuei-lin (Kweilin), and resumed its historic name of Nan-ning, after having been known officially as Yung-ning from 1913 to the end of World War II.

Nan-ning's traditional orientation toward Canton by the natural route of the Hsi Chiang was sharply altered in 1951 with the coming of the railroad. This line connected Nan-ning with central China and with North Vietnam. During the Indochina hostilities, ending in 1954, Nan-ning was a base of support for the Communist forces of North Vietnam against the French. Nanning's trade was further reoriented in 1955, when a newly completed railroad opened a direct outlet from Kwangsi to the South China sea at the port of Chan-chiang (Tsamkong).

Nan-ning is the centre of a fertile subtropical agricultural area, whose principal products are aniseed, sugar cane and fruits. It has a flour mill and a meat-packing plant. With the recognition of the cultural identity of the Chuang-language minority (of the Thai ethnic group), Nan-ning became the cultural centre of the Chuang people and, in 1958, the capital of the Kwangsi Chuang Autonomous Region, which replaced Kwangsi province.

(T. SD.)

NANNYBERRY (*Viburnum* lentago), a handsome North American shrub or small tree of the honeysuckle family (Caprifoliaceae), called also black haw, sheepberry, wild raisin and sweet viburnum, sometimes planted for ornament. It is native to rich soil from Quebec to Hudson bay and southward to New Jersey, Georgia and Colorado. The nannyberry, though usually a shrub, sometimes grows 30 ft. high, with a trunk diameter of 10 inches. It has slender branches, ovate: long-pointed, finely-toothed leaves and bears small white flowers in showy clusters, two to five inches broad. The oval, bluish-black, sweet, edible fruit ripens in late autumn.

NANSEN, FRIDTJOF (1861–1930), Norwegian explorer, scientist, artist, statesman and humanitarian, awarded the 1922 Nobel peace prize, was born at Frøen on the outskirts of Christiania on Oct. 10, 1861. He went to school in Christiania where, in 1880, he passed his entrance examination to the university without particular distinction. He chose to study zoology, because field work would give him the chance of living an outdoor life, and also enable him to make use of his artistic talents. Although his scientific work was always closest to his heart, he first attained fame as an explorer. His activities were interwoven, but a picture of his life is best given by describing them separately.

As Explorer.— As a young man Nansen was a great outdoor athlete, an accomplished skater and skier, and a keen hunter and fisherman. He thus developed an excellent physique which gave him the stamina and endurance he needed on his later arctic journeys. He first encountered arctic conditions in 1882 when he joined the sealing ship "Viking" for a voyage to the Greenland waters. On this voyage he saw at a distance Greenland's mighty icecap which fired his imagination. It occurred to him that it ought to be possible to cross it, and gradually he developed a plan which he announced in 1887. The plan was characteristic of Nansen. Instead of starting from the inhabited west coast he would start from the east coast, and by cutting off his means of retreat would force himself to go forward. The expedition of six left Norway in May 1888. In Iceland the group joined a sealing ship bound for east Greenland waters, and after various difficulties the crossing started on Aug. 16. Facing storms and enduring intense cold and other hardships they reached the highest point of the journey (8,920 ft.) on Sept. 5, and on the 26th struck the west coast at Ameralik fiord. They were forced to winter at the settlement of Godthaab, where Kansen took the opportunity to study the Eskimos and gather material for his book on *Eskimo Life* (Eng. trans., London. 1893). The party returned home in triumph in May 1889.

In 1890 Nansen presented a plan for an even more hazardous expedition before the Norwegian Geographic society, and in 1892 he laid it before the Royal Geographical society in London. He had collected evidence showing that the ice of the Polar sea drifted from Siberia toward Spitsbergen, and proposed to build a ship of such a shape that it should be lifted but not crushed when caught by the ice. He would let the ship freeze in off eastern Siberia, in order to be carried from there by the currents. His plan was severely criticized by contemporary arctic explorers; however, the Norwegian parliament granted two-thirds of the estimated expenses, and the rest was raised by subscriptions from King Oscar II and private individuals. His ship "Fram" (*i.e.,* "Forward"; now preserved outside Oslo) was built according to his ideas. With a complement of 13 men, the "Fram" sailed from Christiania on June 24, 1893. On Sept. 22 she was enclosed by the ice in 78° 50′ N., 133° 37′ E.; she froze in, and the long drift began. She bore the pressure of the ice perfectly. On March 14, 1895. Nansen, being satisfied that the "Fram" would continue to drift safely, left her in 84° 4' N., 102° E.. and started northward with dog sleds and kayaks. accompacied by Hjalmar Johansen. On April 8 they turned back from 86° 14′ N., the highest latitude then reached by man, and headed toward Franz Josef Land. When approaching the northern islands progress was hampered by open water and, because of the advanced season, they wintered on Frederick Jackson Land (named by Nansen after the British arctic explorer) where they stayed from Aug. 26, 1895, to May 19, 1896. They built a hut of stone, and covered it with a roof of walrus hides, and lived during the winter mainly on polar bear and walrus meat, using the blubber as fuel. In spring, when traveling to Spitsbergen. they encountered Frederick Jackson and his party of the Jackson-Harmsworth expedition, on June 17, and returned to Norway in his ship "Windward," reaching Vardo on Aug. 13. The "Fram" also reached Norway safely, having drifted north to 85° 55'. Nansen and his companions on board the "Fram" were given a rousing welcome which culminated on arrival in Christiania on Sept. 9.

As **Scientist.**—Nansen's success as an explorer was mainly due to his careful evaluation of the difficulties that might be encountered, his clear reasoning, which was never influenced by the opinions of others, his willingness to accept a calculated risk. his thorough planning and his meticulous attention to detail. Many of these traits can be recognized in his scientific writings. In 1882 he was appointed curator of zoology at the Bergen museum. He wrote papers on zoological and histological subjects, illustrated by excellent drawings. For one of his papers. "The Structure and Combination of Histological Elements of the Central Nervous System" (Bergen, 1887), the Christiania university conferred upon him the degree of doctor of philosophy. This paper contained so many novel interpretations that the committee which had to examine it accepted it with doubt, but it is now considered a classical paper in its field. On his return from the "Fram" expedition in 1896 a professorship in zoology was established for him at the Christiania university, but his interests shifted from zoology to physical oceanography, and in 1908 his status was changed to professor of oceanography. During 1896–1917 he devoted most of his time and energy to scientific work. He edited the report of the scientific results of his expedition and himself worked up some of the most important parts. He participated in the establishment of the International Council for the Exploration of the Sea and directed for some time the council's central laboratory in Christiania. In 1900 he joined the "Michael Sars" on a cruise in the Korwegian sea. In 1910 he made a cruise in the "Fridtjof" through the northeastern North Atlantic; in 1912 he visited the Spitsbergen waters on board his own yacht "Veslemoy," and in 1914 he joined B. Helland-Hansen on an oceanographic cruise to the Azores in the "Xrmauer Hansen." In 1913 Nansen traveled through the Barents sea and the Kara sea to the mouth of the Yenisei river and back through Siberia. He published the results of his cruises in numerous papers. partly in co-operation with Helland-Hansen. His lasting contributions to the science of oceanographp comprise improvement and design of instruments, some of which were still in use after half a century, explanation of the wind-driven currents of the seas, discussions of the waters of the Arctic and explanation of the manner in which deep- and bottom-water is formed. He also dealt with other subjects, and published in 1911 *In Northern Mists* (2 vol.), giving a critical review of the exploration of the northern regions from early times up to the beginning of the 16th century. Nansen's papers are ail stimulating, but they are not easy reading. He wrote so fluently that he was likely to be verbose and his great attention to detai! made his presentation cumbersome. His great literary talent is, on the other hand, evident in his popular accounts of his journeys, many of which he himself illustrated.

As Statesman and **Humanitarian.**—As Nansen grew older, he became more and more interested in the relations between individuals and nations. In 1905 he took a lively part in the discussion about the dissolution of the union between Norway and Sweden. His attitude may be summarized by his words: "Any union in which the one people is restrained in exercising its freedom is and will remain a danger." On 'the establishment of the Norwegian monarchy. Nansen was appointed its first minister in London (1906–08) and was in the same year created knight of the Grand Cross of the Victorian Order. In 1917 he was appointed head of a Norwegian commission to the United States, and secured a satisfactory agreement with the U.S. government about the import into Norway of essential supplies.

At the first assembly of the League of Nations in 1920 the Norwegian delegation was headed by Nansen who remained one of the outstanding members of the assembly until his death. With his tall and bony frame, his snow-white hair, his flowing mustache, and his broad-brimmed hat at a rakish angle, he made a striking figure in Geneva.

In 1920 the League of Nations gave Nansen his first great task, appointing him high commissioner, responsible for the repatriation of about 500,000 prisoners of war. However, the Soviet leaders would not recognize the League of Nations, but were willing to co-operate with an organization headed by Nansen as a private person. As a result the Nansen Relief organization was created, financed mainly by the International Red Cross and the national Red Cross organizations. In Sept. 1921 Nansen was able to inform the League that 447,604 prisoners of war from 26 countries had been repatriated, and less than a year later he reported that the task was completed. About that time the identification card for displaced persons, the "Nansen passport," was introduced.

In Aug. 1921 he was asked by the International Red Cross to direct an effort to bring relief to famine-stricken Russia. He accepted, and on Aug. 15 a conference at which 13 governments and 48 Red Cross organizations were represented appointed him high commissioner of this new venture. His request to the League for financial assistance was turned down, but by appealing to private organizations, and himself addressing large public meetings, he succeeded in raising the necessary funds. This effort was followed by similar ones for Greece and Armenia, and Nansen never tired in his struggle to reduce suffering and misery.

In 1922 Nansen was awarded the Nobel peace prize, which he gave to the furtherance of international relief work. Another distinction which he cherished equally came to him when the student body of St. Andrews university elected him rector in 1926. In his address at his installation in 1927 he spoke on "Adventure," explaining to the students some of his own philosophy of life.

Between his numerous journeys he found recreation by returning to his scientific problems, by perfecting his technique when preparing etchings, and on short hunting or fishing trips. He died at his home near Oslo on May 13, 1930, and was buried on May 17, Norway's national holiday.

NANSEN INTERNATIONAL OFFICE FOR REFUGEES. The Office International Nansen pour les Réfugiés was founded in 1931 as an autonomous body under the League of Nations to carry on the work started in 1921 by Fritdjof Nansen (*q.v.*). At the end of World War I there were more than 2,000,000 refugees in Europe and Asia Minor. Of these, approximately 1,250,000 were political refugees from Russia, several hundred thousand were Armenians expelled from Asia Minor and another substantial number was composed of Greeks who fled into Greece as a result of political circumstances in Asia Minor and the Balkans, where their ancestors had been living for several centuries. The remainder were Assyrians, Assyrian Chaldeans, Bulgars and Turks.

The League of Nations accepted responsibility for the legal protection of these refugees, and in 1921 Nansen. well-known polar explorer, became the hrst League of Nations high commissioner for refugees. Nansen's work resulted in the development of the international identity certificate known as the "Nansen passport" and he did much of the pioneer work in civil rights and employment and social security rights for refugees.

In 1935 the League brought under the protection of the office the 7,000 refugees who leit the Saar as a result of the 1935 plebiscite. Administrative funds were voted by the assembly of the League on a diminishing scale until Dec. 31, 1938, the date set for final liquidation of the office. The League had always considered its interest in refugees to be of a temporary nature and, although it accepted responsibility for their legal protection, it wished to avoid responsibility for their relief.

Nansen's objective had been to make refugees self-supporting. However, the depression of the 1930s made the task of finding employment opportunities for refugees unusually difficult. National governments also wished to avoid relief grants to refugees unable to work, and the depression reduced the funds of private charitable organizations.

Despite these handicaps the Kansen office carried forward its work. In order that the legal protection of refugees might be assured after the closing of the office, the League provided, through the medium of the convention of Oct. 28, 1933, for the issuance of Nansen identity certificates by the governments signing the convention and for rights of residence, employment, social security and relief for Russians, Armenians and assimilated refugees then under the protection of the Nansen office.

Unfortunately this 1933 convention was ratified by only eight states and in some cases with important reservations. It served as a model, however, in drawing up the 1938 convention concerning the status of refugees coming from Germany, and became important after World War II when once again the world was faced with the problem of stateless persons.

The 1938 Nobel peace prize was awarded to the Nansen office. At the close of the office in Dec. 1938, M. Michael Hansson of Norway, president of the Nansen office, reported 600.000 refugees of the foregoing groups still unsettled and without secure civil status. Their situation was worsened as they became part of the larger numbers of refugees displaced by World War II. (*See* also REFUGEES.)

(G. L. W.)

NANTERRE, a suburb 8 mi. northwest of Notre Dame de Paris, with a port on the Seine, in the *département* of Seine, at the foot of Mount Valérien, 8 mi. N.W. of Paris on the railway to St. Germain. Pop. (1954) 52.832. The principal manufactures are chemicals, tallow and aluminum; stone is quarried in the vicinity; the town is noted also for its cakes. Nanterre (the ancient *Nemptodurum* or *Nemetodurum*) owes its origin to the shrine of Ste. Geneviève (420–512), the patron saint of Paris.

NANTES, a city of western France, capital of the *département* of Loire-Atlantique, on the Loire, 35 mi. above its mouth, at the junction of the Orléans, Ouest-état and State railways, 55 mi. W.S.W. of Angers by rail. In population (1954, 197,915), Nantes is the first city of Brittany. The Loire there divides into several west branches forming islands over portions of which the city has spread.

History.— Before the Roman occupation Nantes was the chief town of the Namnetes and consisted of *Condovicnum,* lying on the hills away from the river, and of *Portus Namnetum,* on the river. Under the Romans it became a great commercial and administrative centre, though its two parts did not coalesce till the 3rd or 4th century. In the middle of the 3rd century Christianity was introduced by St. Clair. Clotaire I got possession of the city in 560, and placed it under the government of St. Félix, the bishop who caused the Loire to flow under the walls of the castle, After being several times subdued by Charlemagne. Brittany revolted under his successors, and Nominoé, proclaimed king in 842, razed the fortifications of Nantes because it had sided with Charles the Bald. The Normans held the town from 843 to 936. About this time began the rivalry between Nantes and Rennes, whose counts disputed the sovereignty of Brittany. Pierre de Dreux. declared duke of Brittany by Philip Augustus, made Nantes his capital, surrounded it with fortifications and deiended it against John of England. During the Breton wars of succession Nantes took part first with Jean de Montfort, but afterward with Charles of Blois, and did not open its gates to Montfort till his success was assured and his English allies had retired. In 1560 Francis II granted Kantes a communal constitution. Averse to Protestantism. it joined the league along with the duke of Mercoeur, governor of Brittany. who helped to raise the country into an independent duchy; and it was not till 1598 that it opened its gates to Henry IV, who there signed on May 2 the Edict of Nantes which until its revocation by Louis XIV in 1685 was the charter of Huguenot liberties in France. The city was in 1793 the scene of the *noyades* of J. B. Carrier, envoy of the Committee of Public Safety.

The Port.— The maritime port of Kantes is reached by way of the Loire and the ship canal between the island of Carnet and La Martinière ($9\frac{1}{2}$ mi.). Vessels drawing as much as 20 ft. 8 in., and at spring tides, 22 ft., can reach the port. The outer port stretches ½ mi. to Chantenay. The principal quays extend along the right bank of the branch which flows past the town and on the western shore of the island of Gloriette. A slipway facilitates the repairing of ships.

The river port occupies the St. Félix and Madeleine branches and on the Erdre is a third port for inland navigation. The older quarter of Nantes is situated to the east of the Erdre.

Buildings. — The cathedral, built above a 12th-century crypt. was unfinished till the 19th century. There are two interesting monuments in the transept: Michel Colomb's tomb of Francis II, duke of Brittany, and his second wife Marguerite de Foix (1507), and that of Gen. Juchault de Lamoricière, a native of Nantes, by Paul Duhois (1879). Between the cathedral and the Loire stands the castle of Nantes, founded in the 9th or 10th century. Rebuilt by Francis II and the Duchess Anne, it is flanked by huge towers and by a bastion erected by Philip Emmanuel, duke of Mercoeur, in the time of the league. A fine Gothic façade looks into the courtyard. From being the residence of the dukes of Brittany, the castle became a state prison and is now occupied as the artillery headquarters. The chapel in which the marriage of Louis XII with Anne of Brittany was celebrated was destroyed in 1800.

Nantes has an archaeological collection in the Dobrée museum. and in the museum of fine arts a splendid collection of paintings, modern French masters being well represented.

Industries. — Among the more important industries of Nantes are sugar-refining. rice-husking. the manufacture of oil, soap, flour pastes and biscuits, chocolate and the preparation of tinned provisions (sardines. vegetables. etc.) ; the manufacture of tin boxes, tiles, chemical manures, acid, leather, paper. rope. boots and shoes, brushes, porcelain and glass; shipbuilding. metal founding and the construction of engineering material; and wool and cotton-spinning and the manufacture of cotton and other fabrics. rubber goods, hosiery and knitted goods. Coal and petroleum. sugar, coffee, cottonseed, copra, hemp, grain. phosphates and pyrites, timber and pulpwood are imported. Principal exports are machinery, pit props. iron ore, slate, hoops and provisions.

NANTES, EDICT OF, the law promulgated in April 1598 by the French king, Henry IV, which secured a large measure of religious liberty to his Protestant subjects, the Huguenots. Its main provisions may be summarized as follows: (1) It gave liberty of conscience to the Protestants throughout the whole of France. (2) It gave them the right of holding public worship in those places where they had held it in 1576 and the earlier part of 1577; also in places nhere this freedom had been granted by the edict of Poitiers (1577) and the treaties of Nerac (1579) and of Fleix (1580). The Protestants could also worship in two towns in each *bailliage* and *sénéchaussée*. The greater nobles could hold Protestant services in their houses: the lesser nobles could do the same, but only for gatherings of not more than 30 people. In regard to Paris. the Protestants could conduct worship within five leagues of the city instead of ten leagues as previously. (3) Full civil rights mere granted them. They could trade freely, inherit property and enter the universities, colleges and schools. All official positions were open to them. (4) To deal with disputes arising out of the edict, a chamber was established in the parliament of Paris *(le chambre de l'e'dit).* This group was to be composed of ten Roman Catholic and six Protestant members. Chambers for the same purpose, but consisting of Protestants and Roman Catholics in equal numbers, were established in connection with the provincial parliaments. (5) The Protestant pastors were to be paid by the state and to be freed from certain burdens, their position being made practically equal to that of the Roman Catholic clergy. (6) A hundred places of safety were given to the Protestants for eight years, the expenses of garrisoning them being undertaken by the king.

The edict was greatly disliked by the Roman Catholic clergy, and a few changes were made to conciliate them. The parliament of Paris shared this dislike, but was forced by the king to register the edict on Feb. 25, 1599. After similar trouble it was also registered by the provincial parliaments, the last being the parliament of Rouen, which delayed the registration until 1609.

That the strong political position thus secured to the French Protestants was a danger to the state was proved by the troubles which arose during the minority of Louis XIII. After Richelieu had succeeded in crushing th'e quasi-independent power of the Huguenot lords and cities, however, the French Protestants ceased to be a political danger.

With the revocation of the Edict of Nantes, on Oct. 18, 1685, the French Protestants were deprived of all civil and religious liberty.

NANTEUIL, ROBERT (1623/30–1678), French line engraver, was born in Reims. the son of a merchant. Having received an excellent classical education, he studied engraving under his brother-in-law, Nicholas Regnesson. He became known by his crayon portraits, and was pensioned by Louis XIV and appointed designer and engraver of the cabinet to that monarch. It was mainly because of his influence that the king granted the edict of 1660, by which engraving was pronounced free and distinct from the mechanical arts, and its practitioners were declared entitled to the privileges of other artists. Nanteuil died at Paris on Dec. 9, 1678.

The plates of Nanteuil, several of them almost life-size, number about 300. In his early practice he imitated the technique of his predecessors, working with straight lines, strengthened, but not crossed. in the shadows, in the style of Claude Mellan, and in other prints crosshatching like Regnesson, or stippling in the manner of Jean Boulanger. He then gradually acquired an individual style, modeling the faces of his portraits with the utmost precision and completeness, and employing various methods of touch for the draperies and other parts of his plates. Among the finest of his mature works are the portraits of Pomponne de Bellièvre, Gilles Ménage, Jean Loret, the duc de la Meilleraye and the duchess of Nemours.

NANTICOKE, a city of Pennsylvania, U.S., on the Susquehanna river 7 mi S.W. of Wilkes-Barre in Luzerne county. Main industries are coal mining and the manufacture of cigars, clothing silk and rayon yarn and thread and sportswear.

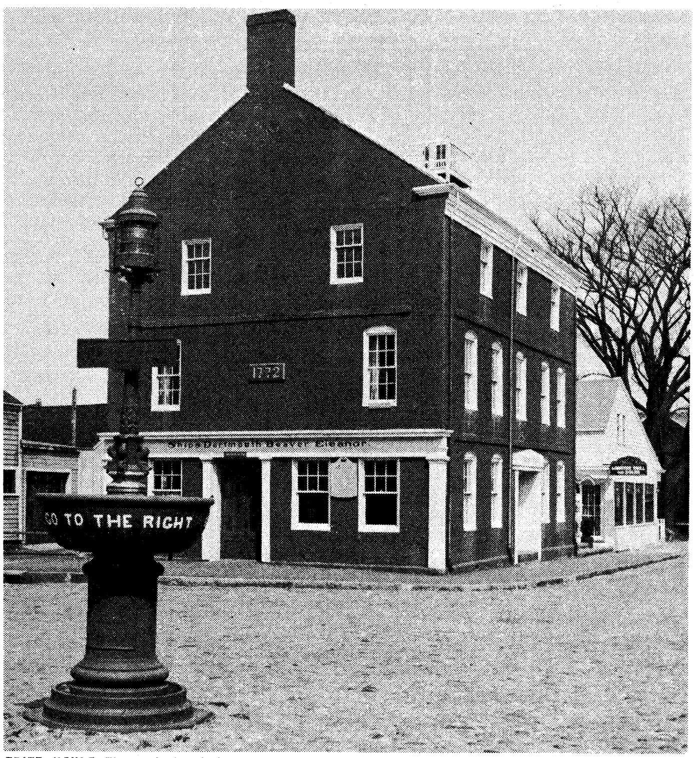
Anthracite coal mining was long the economic mainstay and is still important, but the steady decline of the industry caused serious dislocations, chronic unemployment, and a steady loss in population. For comparative population figures see table in Pennsylvania: *Population.*

The city is named after a shad-fishing Indian village on the uest side of Nanticoke creek. The town nas laid out in 1793 and the first anthracite coal was mined by Col. Washington Lee in 1825. The North Branch canal and the Susquehanna river were important for the transportation of coal before the building of the railroads.

Nanticoke was incorporated as a borough in 1874 and secured a charter as a city in 1926. (L. A. Gr.)

NANTUCKET, a large island off the coast of Massachusetts U.S., about 25 mi. S.E. of Cape Cod. Once the centre of the whaling industry, Nantucket has turned to the tourist and recreation industries for support. The island is nearly 1 j mi. long and averages 3 mi. in width. The land is quite level nith a few low hills, the whole being a terminal moraine of a continental ice sheet The ever-eroding sea has created 88 mi. of sandy beaches around the island. The encircling ocean also modifies the climate markedly, with warmer winters and cooler summers than the adjacent mainland

Nantucket was discovered by Bartholomew Gosnold in 1602, granted to the Plymouth company in 1621. and purchased by Thomas Mayhew in 1641. Agriculture mas never too successful and the settlers quickly turned to fishing, shipbuilding and trading. Whaling began in earnest in the early 18th century and reached its peak just before the American Revolution, when 125 whalers sailed out of Santucket's commodious harbour. British raids during the Revolution, the blockade of the War of 1812 and the general attrition of Nantucket's vessels at sea sapped the commercial strength of the island. although by as late as 1830 it was the third commercial port of Massachusetts. New Bedford had surpassed Nantucket as a whaling centre by 1820 and the development of



FRITZ HENLE FROM MONKMEYER

THE PACIFIC CLUB. NANTUCKET ISLAND. MASS. THE BUILDING WAS THE HOME OFFICE OF THE OWNER OF THE "DARTMOUTH," "BEAVER" AND "ELEANOR." SHIPS THAT WERE RAIDED IN THE BOSTON TEA PARTY (1773). IN 1861 IT BECAME A CLUB FOR WHALING MASTERS. THE UPPER FLOORS NOW SERVE AS COURTROOMS

kerosene destroyed the sperm oil industry by 1860. The population of the island shrank from 6.094 in 1860 to a low of 2,797 in 1920. Attempts were made to introduce some manufacturing after the Civil War but none of them prospered. Gradually, as transportation with the mainland improved, first by boat and later by airplane, the island developed a lively tourist industry nhich brought many visitors and considerable revenue. The population is about 3.000.

The village of Nantucket itself is one of the main attractions with its quaint colonial houses, cobblestoned streets. museums (including a well-known whaling museum) and art galleries. Summer finds the island and its many beaches crowded with vacationers from all over the United States. Santucket is also the name of the county. coextensive with the island; it comes from an Indian word meaning "the faraway land." (G. K. L.)

NANTWICH, a market tonn and urban district in the Nantwich parliamentary division of Cheshire, Eng., 20 mi. S.E. of Chester. Pop. (1951) 8.843. Area 1.8 sq mi. It lies on the Weaver river and is a centre for dairy farming and hunting. The Church of St. Mary is a cruciform building in red sandstone, of the Decorated and Perpendicular periods, with a central octagonal tower. The fine old carved stalls are said to have belonged to Vale Royal abbey, near Winsford. The town is modern in appearance, but 128 older buildings (16th- and 17th-century, many of them half-timbered) have been scheduled for preservation. Churche's mansion. a fine Elizabethan building, has been excellently restored. The grammar school (*c.* 1560) is now coeducational. The salt industry, important in the time of Henry VIII, has lapsed, but there are now brine baths. Nantwich manufacturers clothing, boots and shoes; there is also a tannery and a corn mill.

Remains found in the district indicate a Roman settlement probably because of the salt. The Domesday Book contains a long account of the laws, customs and values of the saltworks. The salting houses were divided betneen the king, the earl of Chester and certain resident freemen. The name of the town appears variously as *Wich* or "town" in Domesday Book and as *Nametwihc* "named" or famous "wich" in 1194. The only town charter was granted by Elizabeth I (1568).

NAOMI (Hebrew, "pleasant"; also NOEMI in Douay version), mother-in-law of Ruth in the Old Testament Book of Ruth. She was the nife of Elimelech of Bethlehem and the mother of Mahlon and Chilion. During a famine in Bethlehem, the family went to the country of Moab. After the death of both her husband and her two sons, Naomi returned with her daughter-in-law, Ruth, to Bethlehem in Judah. Ruth was a native of Moab, but she was devoted to her mother-in-law and insisted on remaining with her. As a result of her misfortunes. Naomi was not recognized readily when she returned to Bethlehem. Whereupon she said, "Call me not Naomi. call me Mara [bitterness] ; for the Almighty hath dealt very bitterly with me." During the harvest, Ruth went to work in the fields of Boaz, a wealthy kinsman of Saomi. After Ruth and Boaz met, Naomi advised and encouraged Ruth to remarry, nhich she soon did. Naomi later became the nurse for Obed, the son who was born to Ruth and Boaz. See RUTH, BOOK OF.

NAOROJI, DADABHAI (1825–1917), Indian politician, was born at Kasik on Sept. 4, 1825, the son of a Parsi priest. During a long and active life, he was prominent in various fields: professor of mathematics at the Elphinstone college (1854); founder of the *Rast* Goftar newspaper; partner in a Parsi business firm in London (1855) ; prime minister of Baroda (1874) ; member of the Bombay legislative council (1885) ; M.P. for Central Finsbury (1892–95), being the first Indian to be elected to the house of commons; and three times president of the Indian National congress. Many of his numerous nritings mere collected in Poverty *and Un-British* Rule *in* India (1901).

NAPALM, the aluminum soap of naphthenic and palmitic acids. When mixed with gasoline it forms a sticky sirup ranging in colour from light tan to brown.

In World War I both Germany and the Allies used raw gasoline in flame throwers (*q.v.*), but it burned too quickly to be fully effective. What was needed was a thickener that would slow donn the rate of burning and increase the range of the weapon. Napalm did this, and it also greatly raised the temperature at which the fuel burned. Harvard university scientists. in cooperation with the U.S. army chemical warfare service, developed the substance in 1942. *See* also CHEMICAL WARFARE.

In World War II. allied forces used great quantities of napalm-thickened gasoline in flame throners and fire bombs. After the U.S. marines had employed the flame thrower effectively against Japanese bunkers on Guadalcanal, the meapon became popular with army troops.

Napalm was also used in incendiary bombs that the air forces rained on Japanese industrial cities. By the end of the war these bombs had burned out 40% of the area of the target cities. During the Korean war (1950–53) napalm was again fired from flame throners, and was poured into 165-gal. fire bombs that were dropped with devastating effect on enemy troops.

See E. W. Hollingsworth, "The Use of Thickened Gasoline in Warfare," *Armed Forces Chemical Journal,* June *1951.* (L. P. B.)

NAPATA, the capital of the ancient kingdom of Cush in Nubia (*q.v.*) from about 750 B.C. to 590 B.C., was situated just donnstream of the fourth cataract of the Sile, near the modern Karima in Sorthern province in the Republic of the Sudan. It was an area rather than a single tonn. extending east and south of Karima from Nuri to Kurru. Its main feature is the hill of Barkal, under which lie the ruins of several temples; for it mas regarded as a holy mountain, the throne of the god Amon, possibly from as early as the New Kingdom (see EGYPT: History). A stele of Thutmose III (1504–1450 B.C.) mentioning a fort was found there, and Amenhotep II (1450–1425 B.C.) sent an Asian prisoner to be hanged on its walls. When about 950 B.C. the Libyans seized power in Egypt, a body of the priests of Amon at Thebes went into voluntary exile at Napata. They appear to have egyptianized the native princes of Cush and to have inspired them to enter a degenerate Egypt about 750 B.C. as reformers. Thus Kashta and his descendants came to constitute the 25th dynasty of Egypt, restoring to a great extent the ancient customs and beliefs which had been abandoned under the New Kingdom. This led to their introducing into Cush the custom of royal burial under pyramids. All their pyramids are at Kurru except the largest, that of King Taharka (688–663 B.C.) which is at Nuri. Taharka also built several Egyptian-style temples at Napata and elsewhere, including perhaps a large copy at Barkal of the temple of Rameses II at Abu Simbel in Nubia. He clashed, however, with the Assyrians in Judaea and was expelled from Egypt. For some time the rulers of Cush thought of reconquering Egypt, but the 26th (Saitej dynasty, originally protégés of the Assyrians, sent an expedition with Greek and Carian mercenaries which sacked Napata in 590 B.C. and caused the transfer of the capital to Meroë (*q.v.*) on the opposite bank; until 315 B.C., however, kings were buried at Nuri, Napata being the religious capital. Royal burials at Barkal on two different occasions even after that have given rise to the hypothesis that Napata may have twice made itself independent of Meroë.

Reisner, articles in *Journal of Egyptian Archaeology,* vol. iv, v, vi (1917–20); Dows Dunham, *Royal Cemeteries of Kush,* 3 vol. (1950–57); A. J. Arkell, *A History of the Sudan* (1955). (A. J. AL.)

NAPHTALI was, according to Gen. xxx, 8, a son of Jacob by Rachel's handmaid Bilhah, and full brother of Dan. This may be no more than a reflection of the fact that geographically the tribes of Dan and Naphtali are closely associated. Not only did the land of Naphtali in northern Palestine border on that of Dan. but there is in Deut. xxxiii, 23, an indication that Naphtali dwelled near to Dan in the older seat of the latter tribe in the southwest. The story of the conflict against Sisera, Judg. iv, *et* seq., associates Zebulon closely with Naphtali, and informs us that from Kadesh, the old Amorite city which was the chief place in Naphtali's territory, came the hero Barak.

Naphtali, because of its exposed situation, suffered at the hands of Syria (I Kings xv, 20); it was depopulated by Tiglath-Pileser (II Kings xv, 29). The reference to Naphtali in the blessing of Jacob, Gen. xlix, 21, is obscure and of uncertain interpretation. (W. L. W.)

NAPHTHA, a word originally applied to the more volatile kinds of petroleum, issuing from the ground in the Baku district of the U.S.S.R. and in Iran.

It is mentioned by Dioscorides, and is the naphtha, or bitumen *liquidum candidum,* of Pliny the Elder in the 1st century A.D. By the alchemists, the word was used principally to distinguish various mobile liquids of low boiling point including certain ethers and esters.

The term is now seldom used, either in commerce or in science, without a distinctive prefix, as in the following:

1. Coal-tar naphtha, a volatile commercial product, is obtained by the distillation of coal tar. (See COAL TAR.)
2. Shale naphtha is obtained by distillation from the oil produced by the destructive distillation of bituminous shale.
3. Petroleum naphtha is a name sometimes given in the United States to a portion of the more volatile hydrocarbons distilled from petroleum.

See PETROLEUM: SHALE. OIL.

NAPHTHALENE, a hydrocarbon formed when many organic compounds are passed as vapours through a red-hot tube. This accounts for its presence in coal tar (*q.v.*), from the distillates of which it was first isolated by A. Garden in 1819, and also for its formation in modern processes for the high temperature catalytic cracking of petroleum.

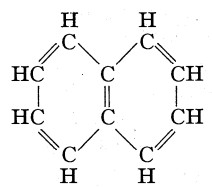
Naphthalene is the most abundant single constituent of coal tar. being present to the extent of about 5%. The amount depends on the type of coal used and increases with rising temperature of carbonization. Naphthalene may be carried with the coal gas through the various purifying chambers and deposited in the service pipes to such an extent as to cause partial blockage. For the technical production of naphthalene the appropriate coal tar distillate, boiling point 170° C. to 230° C., known as middle oil or carbolic oil, is strongly cooled, whereupon the naphthalene crystallizes and may be pressed free from most of the adhering oil. For purification, it is treated with hot caustic soda to remove acidic phenols and then, in the molten state, with a little concentrated sulfuric acid to remove bases and other impurities; it is finally distilled or sublimed.

Properties and Uses.—Pure naphthalene crystallizes in lustrous white plates, melting at 80.1° C. and boiling at 218° C. It is almost insoluble in water, sparingly soluble in cold alcohol and in petroleum spirit, but is readily soluble in ether and in hot alcohol. It is characterized by its volatility, and it readily sublimes. It forms with picric acid a stable crystalline molecular compound, melting point 151° C., the formation of which may be used for the characterization and quantitative estimation of naphthalene. The hydrocarbon has a characteristic odour; as "carbon balls" or moth balls, it was formerly used as a moth repellent but was replaced for this purpose by more efficient insecticides such as paradichlorobenzene, DDT and Gammexane (benzene hexachloride). Naphthalene has toxic properties, and when administered to rabbits produces a form of cataract, or opalescence of the lenses of the eye.

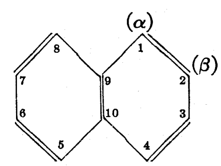
The products obtained by chemical oxidation of naphthalene vary considerably with the conditions and type of oxidizing agent. Chromic acid in acetic acid gives mainly 1:4-naphthoquinone, whereas potassium permanganate in alkaline solution gives phthalonic acid. In acid solution phthalic acid is the chief product, and this is also formed by oxidation with potassium dichromate and sulfuric acid. Phthalic acid was formerly manufactured by oxidizing naphthalene with hot concentrated sulfuric acid in the presence of mercuric sulfate. This process has been superseded by vapour-phase catalytic oxidation with air, using a vanadium pentoxide catalyst; the phthalic acid which is formed is dehydrated to phthalic anhydride, which sublimes into a condenser.

Naphthalene is extensively used as a raw material for the manufacture of dyestuffs and synthetic resins. Phthalic anhydride may be converted into anthranilic acid, an intermediate in the manufacture of indigo; into triphenylmethane dyes; and into anthraquinone and its derivatives. which form the starting material for the preparation of fast vat dyes such as Indanthrene and Flavanthrene. Phthalic anhydride is also much used for the production of alkyd resins and glyptals in which it is combined with polyhydric alcohols such as glycerol (see RESINS). Naphthalene gives rise to a host of substitution products which are important components in the manufacture of azo dyes. These intermediates are principally naphthalene derivatives which contain hydroxyl, amino and sulfonic acid groups in various combinations.

Constitution.—The composition of naphthalene was determined by Michael Faraday in 1826. Its molecular formula, $C_{10}H_8$, shows that at least two carbon atoms have no hydrogen atoms attached to them and in 1866 E. Erlenmeyer, Sr., proposed the structural formula I, based on F. A. Kekulé's structure for benzene. It is usually written in the contracted form II.

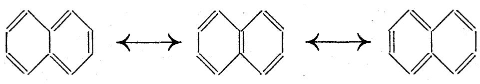


I



II

The oxidation of naphthalene to phthalic acid indicates the presence of one benzene ring. C. Graebe, in 1868–69, obtained from naphthalene a series of degradation products which showed conclusively the presence of two distinct benzene rings. All subsequent work has confirmed the carbon skeleton shown in Erlenmeyer's formula (I). Corresponding with the two Kekulé structures for benzene there are three possible arrangements of the double bonds in naphthalene:



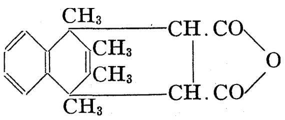
IIa II IIb

The modern view regards naphthalene as a resonance hybrid of which these three are the unexcited forms. L. Pauling and G W. Wheland recognized 42 canonical structures. Positions 1,4,5 and 8 are equivalent to one another (α), and positions 2,3,6 and 7 form a second set of equivalent positions (β), so that if a single substituent is introduced into the molecule there are two possible isomers.

The equivalence of the four α positions was proved experimentally by A. Atterberg. Positions 9 and 10 are devoid of hydrogen and cannot be substituted, although this becomes a possibility in fully reduced naphthalene (decahydronaphthalene).

In their chemical reactions some naphthalene derivatives behave as if they had exclusively the Erlenmeyer structure (II) 2-Naphthol, for example. couples with diazo compounds always in position 1, even with displacement of another substituent. and never in the second *ortho* position, 3. But the specificity of such reactions does not necessarily imply bond fixation and can be interpreted on the basis of quantum mechanical calculations which give a figure of 1.725 for the bond order of the 1:2-bond and 1.603 for the 2:3-bond in naphthalene. These differences are reflected in the small but definite differences in bond length shown in the exact X-ray crystallographic measurements by J. M. Robertson and his collaborators.

By contrast with benzene, which has six π electrons for its ring. naphthalene has only ten π electrons for two rings. Hence if one ring assumes the stable electronic configuration of a fully aromatic structure, the other has the character of an unsaturated side chain linked in two contiguous positions. In this way one can interpret the fact that naphthalene forms addition compounds with much greater facility than benzene. It readily forms a tetrahydride and a tetrachloride and also reacts by addition with alkali metals. It even gives an adduct with maleic anhydride in a Diels-Alder reaction, albeit in small yield. This reaction is much facilitated by alkyl substitution. and 1:2:3:4-tetramethylnaphthalene reacts smoothly to give the anhydride (III) in high yield. Substitution reactions also take place more readily with naphthalene than with benzene.



III

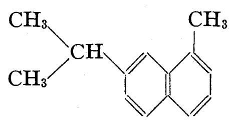
For disubstituted naphthalenes there are 10 possible isomers if the substituents are the same and 14 if they are different. With 3 identical substituents the number of isomers is again 14. but if they are all different 84 isomers are possible.

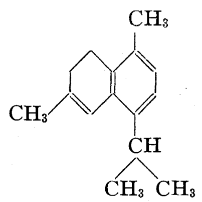
Chemical Reactions.— In its chemical behaviour naphthalene shows the aromatic character associated with benzene and its simple derivatives. Its reactions are mainly reactions of substitution, and naphthalene may be readily chlorinated, brominated, nitrated and sulfonated, and it will undergo the Friedel-Crafts reaction. In reactions such as nitration and halogenation, the substituent mainly enters the more reactive α-positions, although chlorination and bromination lead to a certain extent to β-substitution. Reversible reactions subject to steric hindrance lead to substitution in the less hindered β-positions to an extent which increases with increase in reaction temperature, but varies with the nature of the reagent and sometimes with the solvent. In the sulfonation of naphthalene the α-sulfonic acid is formed at low temperatures (below the melting point of naphthalene) whereas the β-sulfonic acid is formed at high temperatures (optimum temperature, 160° C. to 170° C.). By heating with sulfuric acid, the α-acid is converted into the β-acid.

NAPHTHALENE DERIVATIVES

Homologues.—Many of the alkyl derivatives of naphthalene have played an important part in the elucidation of the molecular structures of naturally occurring sesquiterpenes, triterpenes and related compounds. They are also present in coal tar. The simplest two are α- and β-methylnaphthalenes, both of which are coal tar constituents. E. A. Coulson described a process by which they may be isolated by fractional distillation of a suitable tar oil fraction, using a column having a rectifying efficiency corresponding with about 100 theoretical plates. α-Methylnaphthalene is a liquid, boiling point 240° C., and β-methylnaphthalene is a low-melting crystalline solid. Eight of the ten possible dimethylnaphthalenes have been isolated from coal tar and two of them (1:6 and 2:6) from Rumanian petroleum. The best known of these are the 1:6-, 2:3-, 2:6- and 2:7-dimethylnaphthalenes. The 1:6-compound is a liquid; the other three are solids which crystallize in colourless glistening plates. Of the trimethylnaphthalenes, the 2:3:6-, 1:3:7-and 2:3:5- compounds have been isolated from coal tar, and the 1:2:5-, 1:2:7- and 2:3:6- compounds from a Trinidad petroleum distillate. From the high-boiling fractions of aromatic hydrocarbons obtained by high temperature catalytic cracking of petroleum there have been isolated α- and β-methylnaphthalenes; 1:2-, 1:6-, 1:7-, and 2:6-dimethylnaphthalenes; and 1:2:5- and 1:2:6-trimethylnaphthalenes.

The sesquiterpenes are hydrocarbons of the formula $C_{15}H_{24}$, which occur in the essential oils of certain plants. Some of them are hydronaphthalene derivatives; among these are cadinene, which is present in oil of cubebs, and selinene. present in celery seed oil. Closely related to the latter is eudesmol, $C_{15}H_{26}O$, an alcohol which occurs in eucalyptus oil, and cyperone, an unsaturated ketone which is a constituent of oil of *Cyperus rotundus*. Selinene, eudesmol and cyperone (after reduction) may be converted by dehydrogenation with sulfur or selenium into eudalene, or 1-methyl-7-isopropylnaphthalene (IV). Cadinene under similar conditions gives cadalene or 1:6-dimethyl-4-isopropylnaphthalene (V). The structures of these two naphthalene hydrocarbons have been established by synthesis.



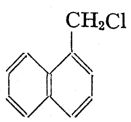


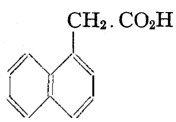
IV V

The pentacyclic triterpenes undergo extensive degradation under the conditions of selenium dehydrogenation. Typical naphthalene derivatives which are formed by this procedure are 2:7-dimethylnaphthalene, 1:2:5-trimethylnaphthalene (agathalene), 1:2:7-trimethylnaphthalene (sapotalene), 6-hydroxy-1:2:5-trimethylnaphthalene and 1:2:5.6-tetramethylnaphthalene. (See also TERPENES.)

To assist the identification of the naphthalene hydrocarbons formed by the dehydrogenation of terpenes, all of the 14 theoretically possible trimethylnaphthalenes have been synthesized as well as all 10 possible dimethylnaphthalenes. Naphthalene homologues may be synthesized either by introducing alkyl groups into simpler naphthalene derivatives or by building up the second ring from a side chain attached to a suitable benzene derivative.

The chloromethylation reaction may be used for the preparation of other types of naphthalene derivatives. Thus, naphthalene itself gives the 1-chloromethyl compound (VI), which may be reduced to α-methylnaphthalene or reacted with potassium cyanide to give a nitrile; this is hydrolyzed to α-naphthylacetic acid (VII), a substance which has found extensive use as a plant-growth sub-





VI VII

stance. It stimulates root formation in a manner similar to the natural plant growth hormone, heteroauxin, or indolyl-3-acetic acid.

Naphthylamines and **Naphthols.**—A very wide range of naphthalene derivatives of these two types with their sulfonic acids is manufactured for use in the dyestuffs industry, being used mainly as components for azo dyes (see DYES). When their potentialities for this purpose were first recognized, their chemistry was very imperfectly understood. hlanufacturing processes in many cases gave rise to mixtures which were difficult to separate, and of which the constituents were poorly characterized and the orientation of their substituents only partly determined. In establishing the chemistry of these derivatives of naphthalene on a firm basis, inestimable service was rendered by the classical researches of H. E. Xrmstrong and W. P. Wynne, who prepared all of the theoretically possible mono-, di- and trichloronaphthalenes (26 in all), established their orientations with absolute certainty and provided a series of reference compounds to which the many naphthalene-, naphthylamine- and naphtholsulfonic acids could be related. P. T. Cleve observed, in 1876, that when a naphthalenesulfonyl chloride was distilled with phosphorus pentachloride it was converted into the corresponding chloronaphthalene, and that β-naphthol when treated in the same way gave β-chloronaphthalene. Xrmstrong and Wynne used this as a diagnostic method and showed that bromo- and nitro- substituents were also displaced by chlorine when the compounds containing them were distilled with phosphorus pentachloride.

Amino groups could be displaced by chlorine by T. Sandmeyer's method, or replaced by hydrogen through the diazo reaction. By such reactions a naphthalene derivative of unknown structure could be converted into a chlorinated naphthalene of known orientation, from which the positions of substituents in the original compound could be deduced.

The preparation of naphthalene derivatives for use as dyestuffs intermediates involves either nitration or sulfonation of naphthalene as the first stage. Nitration leads to a-nitronaphthalene, which crystallizes in yellow needles: melting point 57.8° C.

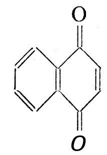
α-Naphthylamine is obtained from α-nitronaphthalene by reduction with iron turnings and water acidulated with hydrochloric acid. After complete reduction, the acid is neutralized and the basic or-naphthylamine is obtained by distillation with superheated steam. It may also be purified by distillation under reduced pressure. It crystallizes in colourless leaflets, melting point 49.2° C. On exposure to air it rapidly acquires a grayish-violet colour and has a somewhat disagreeable odour.

As stated earlier: the position of entry of a sulfonic acid group into the naphthalene molecule is determined by the conditions used. It is very difficult to obtain the pure sulfonic acid by direct sulfonation of naphthalene with sulfuric acid on account of the ease with which it is converted into naphthalene-β-sulfonic acid. The latter acid is, however, readily obtained by sulfonation at high temperatures and is an important intermediate. By fusion of the sodium salt with caustic soda, β-naphthol is formed. and this operation is one of the most important processes in the organic chemical industry. β-Xaphthol crystailizes in colourless plates which melt at 122° C. Its methyl ether, nerolin, has a fragrant odour and is used in perfumery.

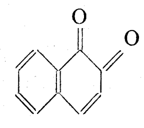
β-Xaphthylamine is another important naphthalene derivative prepared from β-naphthol. The hydroxyl group is replaced by an amino group by means of the Bucherer reaction. whereby β-naphthol is heated in an autoclave at 150° C. and 6 atm. pressure with an ammonium sulfite solution prepared by saturating concentrated ammonia solution with sulfur dioxide and then adding an equal volume of concentrated ammonia solution. β-Xaphthylamine crystallizes from alcohol in colourless lustrous scales of melting point 110° C. Unlike the α-isomeride it is odourless when pure. β-Xaphthylamine is probably the agent responsible for causing the bladder cancers to which workers in the dyestuffs industry are sometimes liable. Because of this its manufacture has been largely discontinued in Great Britain. It has been shown experimentally that such bladder tumours can be produced in dogs by administration of β-naphthylamine.

Carboxylic Acids.—Many naphthalenecarboxylic acids have been described, but with few exceptions are of little importance. They have the usual properties of acids of the aromatic series. Naphthalene-1:8-dicarboxylic acid: naphthalic acid, is obtained by oxidation of the coal tar hydrocarbon, acenaphthene. In a similar manner, naphthalene-1:4:5:8-tetracarboxylic acid is formed by oxidative degradation of two of the rings of the tetracyclic hydrocarbon, pyrene (*q.v.*).

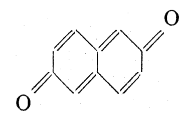
Naphthoquinones.—Six different naphthoquinones, $C_{10}H_6O_2$, are theoretically possible, but the only ones which have been prc pared are the 1:4- or α- (1'111), the 1:2- or β- (IX) and the 2:(or *amphi* (X) naphthoquinones. 1:4-Naphthoquinone (VII may be obtained by oxidation of naphthalene with chromic acid acetic acid. but is better prepared by oxidation of 4-amino-1- naphthol. It crystallizes in yellow tablets, melting point 125° C., is volatile in steam and has a characteristic pungent smell. 1:2-



VIII



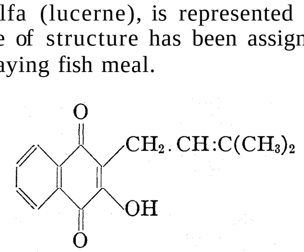
IX



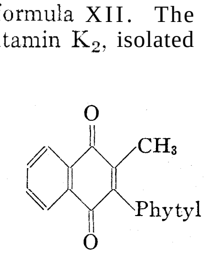
X

Naphthoquinone, formed by oxidation of 1-amino-2-naphthol, forms golden-yellow needles which decompose at 145° C. to 147° C., and is odourless and nonvolatile. It is somewhat unstable, although more stable derivatives are known; *e.g.*, 3:7-dimethyl-1:2-naphthoquinone. 2:6-Naphthoquinone, also nonvolatile and odourless, forms reddish-yellow crystals. These quinones have the high reactivity associated with quinones of the benzene series, and undergo many reactions of addition. An important example, in the case of the 1:4-quinone. is the Diels-Alder addition of dienes, which furnishes a simple route from the naphthalene series to the anthracene series.

Many derivatives of 1:4-naphthoquinone have been found to occur in nature as pigments. An early known example is juglone, 5-hydroxy-1:4-naphthoquinone, which occurs as the colourless leuco compound in unripe walnut shells. Closely related to this is plumbagin, or 5-hydroxy-2-methyl-1:4-naphthoquinone, a yellow pigment found in roots of *Plumbago* species. It has long been known as the active principle of the medicinal drug, Chita, obtained from this source. Lawsone, extracted from the leaves of henna (*Lawsonia inermis*), is 2-hydroxy-1:4-naphthoquinone. Phthiocol, or 2-hydroxy-3-methyl-1:4-naphthoquinone, has been isolated from human tubercle bacilli, but it has been suggested that it may be formed during isolation by degradation of vitamin K. Structurally related to phthiocol is lapachol, a pigment occurring in the grain of a number of African woods (*Bignoniaceae*). Lapachol has been shown to have the structure shown in XI. Introduction of a hydroxyl group into one of the methyl groups of XI gives the structure of lomatiol, the yellow pigment surrounding the nucleus in seeds of Australian *Lomatia*. Vitamin K_1, the antihemorrhagic factor isolated from hexane extracts of dried alfalfa (lucerne), is represented by the formula XII. The same type of structure has been assigned to vitamin K_2, isolated from decaying fish meal.



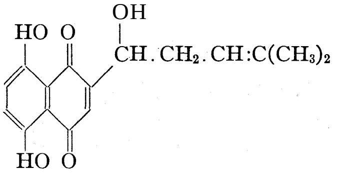
XI



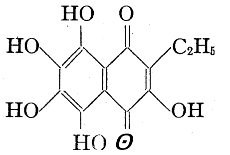
XII

Another group of natural naphthoquinone pigments is derived from naphthazarin (5:8-dihydroxy-1:4-naphthoquinone), long known as a synthetic dyestuff. To this group belongs alkannin, a brown-red pigment occurring as the angelic ester in the root of *Alkanna tinctoria*. It is optically active (laevorotatory), and its enantiomorph is shikonin, isolated from *Lithospermum erythror-*

hizon. These two pigments have the structure XIII. Hydroxydroaerone, which occurs with droserone in *Drosera whittakeri,* a plant growing in the Adelaide district of Australia, is also a naphthazarin derivative (3:5:8-trihydroxy-2-methyl-1:4-naphthoquinone).



XIII



XIV

In many ways the most remarkable of all these substances is echinochrome A, one of several related pigments which have been isolated from sea urchin eggs. It functions as a chemotactic principle and is secreted by the egg to the surrounding sea water to induce motility in spermatozoa with which it comes in contact. It still shows biological activity in dilutions of 1.2×10^9. It is a completely substituted naphthalene derivative of the structure XIV, or a tautomer. *See* also Index references under "Naphthalene" in the Index volume.

NAPIER, SIR CHARLES (1786–1860), British admiral, second son of the Hon. Charles Napier. R.N., and grandson of the 5th Lord Napier, was born at Merchiston hall, near Falkirk, on March 6, 1786. He became a midshipman in 1800 and lieutenant in 1805. He was appointed to the "Courageux" (74). serving with her in the West Indies, and later was appointed commander of the "Pultusk" brig (Nov. 30, 1807). In Aug. 1808 he was moved into the "Recruit," and in April 1809 took part in the capture of the "Hautpoult" and was promoted acting post captain. Coming home with a convoy. he was put on half pay and spent some time at the University of Edinburgh, and later visited Portugal. He served in 1811 in the Mediterranean and in 1813 on the coast of America. He spent his leisure in Italy and Paris, but was ruined by speculation in a steamboat company. In 1827 he was appointed to the "Galatea," was at the Azores when they were held by the count de Villa Flor for the queen of Portugal, and accepted the offer of the constitutional leaders to take command of the fleet (Feb. 1833). With it he destroyed the Miguelite fleet on July 5, and was struck off the English navy list. He commanded the Portuguese land forces in the defense of Lisbon (1834) and was made Count Cape St. Vincent in the peerage of Portugal.

Napier then returned to England, was restored to his former rank in 1836, and received the command of the "Powerful" in 1838.

In 1840 he was made knight commander of the Bath for his services as second in command in Syria. He was member of parliament for Marylebone from 1842 to 1846. He was promoted rear-admiral in 1846 and commanded the channel fleet from 1846 to 1848.

In the Crimean War he received the command of the Baltic fleet, and hoisted his flag in February 1854. He refused to attack Cronstadt, and a great outcry was raised against him for not obeying the orders of the Admiralty. He was not again offered a command.

He was member of parliament for Southwark from Feb. 1855 until his death on Nov. 6, 1860.

See Major-General E. Napier's *Life and Correspoadence of Admiral Sir Charles Napier, K.C.B.,* 2 vol. (1862); Napier's own *War in Syria,* 2 vol. (1842); *The Navy: its past and present state in a series of letters,* edited by Sir W. F. P. Napier (1851); and *The History of the Baltic Campaign of 1854, from documents and other materials furnished by Vice-Admiral Sir C. Napier, K.C.B.* (1857). *See* also *The Life and Exploits of Comwzodore Napier* (1841); and *Life of Vice-Admiral Sir C. Napier* (1854).

NAPIER, SIR CHARLES JAMES (1782–1853), British soldier and statesman, was born in London, the eldest son of Col. George Napier (a son of the jth Lord Napier) and Lady Sarah Lennox, on Aug. 10, 1782. He was lieutenant in 1800 and captain in the staff corps under Sir John Moore. He became major in 1806 and served in the Danish campaign (1807) and in Portugal, but was badly wounded at Coa and Busaco. He took part in the pursuit of Masséna and became lieutenant colonel (1811) of the 102nd regiment, which he thoroughly reorganized. At Bermuda in 1813 he served against the Cnited States, but returned in 1815 and was made companion of the Bath. From 1822 to 1830 he was military resident of Cephalonia, where he met Lord Byron, and was recommended as commander in chief of the Greek forces. Napier declined, and, after trouble with Sir Frederick Xdams, the high commissioner, he became commanding officer in the north of England during the Chartist riots (1839), although his sympathies were on the popular side.

He accepted an Indian commission in 1841, and in Sept. 1842 was ordered to Sind.

His command in Sind lasted until Aug. 1847. He at once determined to seek the first opportunity of conquering the amirs. He was to be accompanied by James Outram (*q.v.*) who had been British resident in Sind during the Afghan War. On Feb. 1j, 1843, Outram was treacherously assailed at Hyderabad, and on the 17th Napier attacked the Baluch army 30,000 strong, with but 2,800 men. With these 2,800 men, including the 22nd regiment, he won the brilliant and decisive victory of Miani, one of the most amazing in the history of the British army, in which generals had to fight like privates. In March he finally destroyed the army of the amirs at the battle of Hyderabad, and for this service received the knight commander of the Bath. Sind, when it came under British rule, was in a state of anarchy, for the Baluchis had formed a tyrannical military government. The native population was protected by Sir Charles Napier. The difficulties of administration were increased by the necessity of repressing the hill tribes, encouraged to lawless acts by the licence which followed the Afghan War; the later years were made very stormy by attacks in England on the policy of the conquest. Napier left Sind in Aug. 1847 after quarreling with nearly every authority in India.

His short stay in England was occupied with incessant struggles with the directors of the East India company, but the panic in England which followed the news of the indecisive victory of Chillianwalla obliged the company to summon the greatest general of the day to command its armies.

Napier left for India at once, only to find that the victory of Gujrat had been won and the Sikh War was over. He was on good terms with the governor general, Lord Dalhousie, until, in Dalhousie's absence at sea, Napier took upon himself. in face of a threat of mutiny, to alter the regulations regarding allowances to native troops. On Dalhousie's return he reprimanded the commander in chief, and reversed his decision. Napier immediately resigned, and, when Wellington repeated the reprimand. he returned to England.

He died at Portsmouth on Aug. 29, 1853. A bronze statue of him by G. G. Adams was erected in Trafalgar square, London, by public subscription.

Napier also wrote several books on Indian government and the colonial administration of India. These works include *Memoir on the Roads of Cephalonia* (1825); *The Colonies, tveating of their value generally and of the Ionian Islands in particular; Strictures on the Administration of Sir F. Adam* (1833); *Colonization, particularly in Southern Australia* (1835); *Remarks on Military Law and the Punishment of Flogging* (1837); *A Dialogue on the Poor Laws* (1838?); *A Letter on the Defence of England by Corps of Volunteers and Militia* (1852); *Lights and Shadows of Military Life* (trans. from the French, 1840); and *A Letter to the Right Honourable Sir J. C. Hobhouse on the Baggage of the Indian Army* (1849); *Defects, Civil and Military, of the Indian Government* (18j3); *William the Conqueror, a Historical Romance,* edited by Sir W. Napier (1858).

The chief authority for Sir Charles Napier's life is his *Life and Opinions by* his brother (1857); consult also MacColl, *Career and Character of C. J. Napier* (1857); M'Dougall, *General Sir C. J. Napier, Conqueror and Governor of Scinde* (1860); *W.* N. Bruce, *Sir Charles Napier* (1855); and T. R. E. Holmes, *Four Famous Soldiers* (1889). On Sind, consult primarily Sir W. Napier, *The Conquest of Scinde*

(1845); *The Administration of Scinde* (1851); *Compilation of General Orders issued by Sir C. Napier* (1850); and Outram, *The Conquest of Scinde, a Commentary* (1846). For his command-in-chief, and the controversy about his resignation, consult J. Mawson, *Records of the Indian Command of General Sir C. J. Napier* (1851); *Minutes on the Resignation of the late General Sir C. Napier, by Field-Marshal the Duke of Wellington*, etc. (1854); *Comments by Sir W. Napier on a Memorandum of the Duke of Wellington* (1854); Sir William Napicr, *General Sir C. Napier and the Directors of the East India Company* (1857); Sir W Lee Warner, *Life of Lord Dalhousie* (1904).

NAPIER (NEPER), **JOHN** (1550–1617), eighth laird of Merchiston, and a distinguished Scottish mathematician who was the inventor of logarithms, was born at Merchiston castle, near Edinburgh, in 1550. At the age of 13, he entered the University of St. Andrews, where he came under the care of the remarkable John Rutherford. His stay at St. Andrews appears to have been short, for he left without taking a degree.

Little is known of his early life, but it is thought that he traveled abroad, as was the custom with the sons of the Scottish nobility. What is certain is that he was back home in 1571, and he stayed either at Merchiston or at Gartness for the rest of his life. The following year, he married Elizabeth, daughter of Sir James Stirling. She died in 1579, leaving him a son and a daughter.

A few years later, he married Agnes, daughter of Sir James Chisholm, and she survived him. From this second marriage there were five sons and five daughters. Napier died at Merchiston on April 4, 1617.

Napier's life was spent amid bitter religious dissensions. He was a passionate and uncompromising Protestant, and in his dealings with the Church of Rome he sought no quarter and gave none. It was well known that James VI of Scotland hoped to succeed Elizabeth I to the English throne, and it was suspected that the help of Philip II of Spain had been sought to achieve this end. Panic-stricken at the peril which seemed to be impending, the general assembly of the Scottish Church, a body with which Napier was closely associated, begged the king to deal effectively with the enemies of the church, and on three occasions Napier was a member of a committee appointed to make representations to the king concerning its well-being, and to urge him to see that "justice be done against the enemies of God's Church."

In Jan. 1594, Napier addressed to the king a letter that forms the dedication of his great work: *A Plaine Discouery of the Whole Reuelation of Saint John.* "Let it be your Majesty's continuall study" he there declared, "to reforme the universall enormities of your country, and first to begin at your Majesty's owne house, familie and Court. and purge the same of all suspicion of Papists and Atheists and Newtrals, whereof the Revelation foretelleth that the number shall greatly increase in these latter daies." This work occupies a prominent place in Scottish ecclesiastical history, for it is the earliest Scottish work on the interpretation of the scriptures.

Follo ing the publication of this work, Napier seems to have occupied himself with the invention of secret instruments of war, for in the Bacon collection at Lambeth palace, London, there is a document bearing his signature, enumerating various inventions "designed by the Grace of God, and the worke of expert craftsmen" for the defense of his country. These inventions included two kinds of burning mirrors, a piece of artillery and a metal chariot from which shot could be discharged through small holes.

Napier devoted most of his leisure to the study of mathematics, particularly to devising methods of facilitating computation, and it is with the greatest of these, namely logarithms, that his name is associated

His contributions to this powerful mathematical invention are contained in two treatises: *Mirifici Logarithmorum Canonis Descriptio*, which nas published in 1614 (Eng. trans., 1857), and *Mirifici Logarzthmorum Canonis Constructio*, which did not appear until 1620, three years after his death (Eng. trans, 1889). In the former. he outlined the steps which led to his invention, these being briefly as follows:

Consider two particles P and Q, the former of which moves along a line segment AZ of finite length, the latter along a line A'Z' whose length is indefinite. Both particles start with the same velocity. but while Q retains this velocity unchanged. that of P alters in such a way that at any point in its path, say B, the velocity is proportional to the distance it still has to go; *i.e.*, BZ. If, when P is at B, Q is at B', then A'B' is defined as the logarithm of BZ. Thus, Napier was able to establish a correspondence between an arithmetical and a geometrical progression, which, it should be noted, is at the root of the modern conception of logarithms. It is clear, however, that the modern conception of logarithms as exponents was quite unknown to Napier. For the development of common logarithms from those of Napier and the part played by Henry Briggs (*q.v.*) in this development, *see* LOGARITHMS: *Invention of Common Logarithms.*

In trying to simplify computation, Napier may well have been led to his invention by a consideration of such a relation as $2\sin A \sin B = \cos(A-B) - \cos(A+B)$, in which the product of two trigonometrical functions can be expressed as the sum (or difference) of two others. The *Descriptio*, besides giving an account of the nature of logarithms, contains a table of natural sines and their logarithms for every minute of the quadrant, to seven figures. These are not what are now called Naperian, *i.e.*, hyperbolic, logarithms, though they are related to them. In this work, Napier confined himself to an account of the use to which logarithms might be put. He promised to explain the method of their construction in a later work. This was the *Constructio*, which also claims attention because of the systematic use in its pages of the decimal point to separate the fractional from the integral part of a number. Decimal fractions had already been introduced by Simon Stevin (*q.v.*) in 1585, but his notation was clumsy. The use of a point as separatrix occurs frequently in the *Constructio.*

Although Napier's invention of logarithms overshadows all his other mathematical work, he has other mathematical contributions to his credit. In 1617, he published his *Rabdologiae, seu Numerationis per Virgulas Libri duo* (Eng. trans., 1667); in this he described ingenious methods of performing the fundamental operations of multiplication and division by means of "rods" or "bones." He also made important contributions to spherical trigonometry, and by his rules of circular parts he was able to resolve all cases of right-angled spherical triangles.

He is also credited with certain trigonometrical relations—Napier's analogies—but it seems likely that Briggs had a share in these.

See C. G. Knott (ed.), *Napier Tercentenary Memorial Volume* (1915). (J. F. ST.)

NAPIER, SIR WILLIAM FRANCIS PATRICK (1785–1860), British soldier and one of his country's most celebrated military historians, was born at Celbridge, near Dublin, on Dec. 17, 1785, a younger brother of Sir Charles James Napier (*q.v.*). He became an ensign in the Royal Irish artillery in 1800, but transferred to the 62nd regiment, and in 1802 was put on half pay. He later became a cornet in the Blues, but soon transferred to the 52nd. Through Sir John Moore he secured a company in the 43rd and joined that regiment at Shorncliffe. He served in Denmark and later in Spain, distinguishing himself during the Corunna campaign.

In 1809 he became aide-de-camp to the duke of Richmond. lord lieutenant of Ireland, but joined the 43rd in the summer when that regiment was ordered to Portugal. (*See* PENINSULAR WAR.) At the skirmish on the Coa river (1810) he was wounded; and in 1811 at Casal Novo, he was shot near the spine. After he left the lines of Torres Vedras he became brigade major, was present at Fuentes de Ofioro, but illness forced his return to England. He later returned to Spain and was present at the storming of Badajoz (1812). He took command of the 43rd regiment (he was now a substantive major) and commanded it at the battle of Salamanca (July 23, 1812). At the battle of the Nivelle (Nov. 10, 1813) he secured the most strongly fortified part of Marshal Soult's position, practically without orders, He served with his regiment at the battle of the Nive, where he was wounded, and at the battles of Orthez and Toulouse. For his services he mas made brevet lieutenant colonel and one of the first companions of the Bath. He then entered the military college at Farnham. He commanded his regiment in the invasion of France after the battle of Waterloo, and remained in France with the army of occupation until 1819, when he retired on half pay.

He studied art but later his major contribution was to be in literature. In 1823 Henry Bickersteth (afterward Lord Langdale) suggested his writing a history of the Peninsular War. The duke of Wellington gave him the whole of Joseph Bonaparte's correspondence which had been taken at the battle of Vittoria. In 1828 the first volume of the *History of the War in the Peninsula and in the South of France* appeared. The publisher, John Murray, was disappointed in the sale of the first volume and Napier published the remainder himself. But the excitement which followed the appearance of each volume is proved by the innumerable pamphlets issued by those who believed themselves to be attacked, and by personal altercations between Napier and many distinguished officers. When in 1840 the sixth and last volume of the *History* was published, his fame was safely established.

In 1830 he had been promoted to colonel, and in 1842 he was made a major general and given the lieutenant governorship of Guernsey. There he managed the relations between the soldiers and the inhabitants, and worked out proposals for a compiete scheme of reform in the government of the island.

In 1845 he published *The Conquest of Scinde,* and in 1851 the corresponding *History of Sir Charles Napier's Administration of Scinde.* In 1847 he resigned his governorship. and in 1848 was made a knight commander of the Bath, and settled at Scinde house, Clapham park. In 1851 he was promoted lieutenant general. His time was occupied in defending his brother Charles and in revising the numerous editions of his *History of the War in the Peninsula.* His energy is the more astonishing when it is remembered that he never recovered from the effects of the wound he received at Casal Novo, and that he often had to lie on his back for months. His life of Charles appeared in 1857. Sir William died on Feb. 12, 1860. Four months earlier he had been promoted to the full rank of general.

See H. A. Bruce (Lord Aberdare), *Life of Sir William Napier,* 2 vol. (London, 1864).

NAPIER AND ETTRICK, FRANCIS NAPIER, Baron (1819–1898), British diplomatist, descended from the ancient Scottish family of Napier of Merchistoun, was born on Sept. 15, 1819, the son of William John, ninth Lord Napier. He entered the diplomatic service in 1840, and held successive posts at Vienna, Constantinople, Naples, Washington and The Hague. In 1860 he became ambassador at St. Petersburg, and in 1864 at Berlin. In 1866 he was appointed governor of Madras, and was at once confronted with a serious famine in the northern districts. In dealing with this and other problems he showed great activity and practical sense, and he encouraged public works, particularly irrigation. In 1872 he acted for a few months as Viceroy, after Lord Mayo's assassination; and on Lord Northbrook's appointment to the office he returned to England, being created a baron of the United Kingdom (Baron Ettrick of Ettrick) for his services. He was for a time a member of the London School Board, and was chairman of the Crofters' Commission in 1883, the result of which was the appointment of a permanent body to deal with questions affecting the Scottish crofters and cottars. He died at Florence on Dec. 19, 1898.

NAPIER OF MAGDAEA, ROBERT CORNELIS NAPIER, 1st Baron (1810–1890), British field-marshal, son of Major Charles Frederick Napier, was born at Colombo, Ceylon, on Dec. 6, 1810. He entered the Bengal Engineers from Addiscombe College in 1826, and after the usual course of instruction at Chatham, arrived in India in November 1828. For some years he was employed in the irrigation branch of the public works department, and in 1838 he laid out the new hill station at Darjeeling. Promoted captain in January 1841, he was appointed to Sirhind, where he laid out cantonments on a new principle—known as the Napier system—for the troops returning from Afghanistan. In December 1845 he joined the army of the Sutlej, and commanded the Engineers at the battle of Mudki, where he had a horse shot under him. At the battle of Ferozeshah on Dec. 21 he again had his horse shot under him and, joining the 31st regiment on foot, was severely wounded in storming the entrenched Sikh camp. He was present at the battle of Sobraon on Feb. 10, 1846, and in the advance to Lahore. He was chief engineer at the reduction of Kote-Kangra by Brigadier General Wheeler in May 1846 and received the thanks of the government. He was then appointed consulting engineer to the Punjab resident and council of regency, but was again called to the field to direct the siege of Multan. He was wounded in the attack on the entrenched position in Sept. 1848, but was present at the action of Surjkund, the capture of the suburbs, the successful storm of Multan on Jan. 23, 1849, and the surrender of the fort of Chiniot. He then joined Lord Gough, took part, as commanding engineer of the right wing, in the battle of Gujrat in Feb. 1849, accompanied Sir W. R. Gilbert in his pursuit of the Sikhs and Afghans and was present at the passage of the Jhelum, the surrender of the Sikh army and the surprise of Attock. At the close of the war Napier was appointed civil engineer to the board of administration of the annexed Punjab province and carried out many important public works. He commanded a column in the first Hazara expedition in Dec. 1852 and against the Boris in the following year. He was appointed military secretary and adjutant general to Sir James Outram's force for the relief of Lucknow in the Indian mutiny in 1857 and was engaged in the actions which culminated in the first relief of Lucknow. He directed the defense of Lucknow until the second relief, when he was severely wounded in crossing an open space with Outram and Havelock to meet Colin Campbell. He was chief of the staff to Outram in the defense of the Alambagh position and drew up the plan of operations for the attack on Lucknow, which was approved by Campbell and carried out by Napier. as brigadier general commanding the engineers, in March 1858. On the fall of Lucknow Napier was appointed C.B. He joined Sir Hugh Rose as second-in-command in his march on Gwalior, and commanded the 2nd brigade at the action of Morar on June 16. On the fall of Gwalior he was entrusted with the task of pursuing the enemy. With only 700 men he came up with Tantia Topi and 12,000 men on the plains of Jaora Alipur and completely defeated him, capturing all his guns (25), ammunition and baggage. On Rose's departure he took command of the Gwalior division, captured Paori in August, routed Ferozeshah, a prince of the house of Delhi, at Ranode in December, and in January 1859, succeeded in securing the surrender of Man Singh and Tantia Topi, which ended the war. For his services Napier received the thanks of parliament and of the Indian government, and was made K.C.B.

In January 1860 Napier was appointed to the command of the 2nd division of the expedition to China under Sir Hope Grant, and took part in the action of Sinho, the storm of the Peiho forts, and the entry to Peking. For the next four years Napier was military member of the council of the governor-general of India and, on the sudden death of Lord Elgin, for a short time acted as governor-general, until the arrival of Sir W. T. Denison from Madras. In January 1865 he was given the command of the Bombay army; in March 1867 he was promoted lieutenant-general, and, later in that year, appointed to command the expedition to Abyssinia, selecting his own troops and making all the preparations for the campaign. He arrived at Annesley Bay in the Red Sea in January 1868, reached Magdala, 420 m. from the coast, in April; stormed the stronghold, freed the captives, razed the place to the ground, returned to the coast, and on the 18th June the last man of the expedition had left Africa. He received for his services the thanks of parliament, a pension, a peerage, the G.C.B., the G.C.S.I., and many academic honors. He held the command-in-chief in India for six years from 1870, during which he did much to benefit the army. He was promoted general in 1874, and appointed a colonel-commandant of the royal engineers. In 1876 he was the guest of the German cronn prince at the military manoeuvres; and from that year until 1883 he held the government and command of Gibraltar. In the critical state of affairs in 1877 he was nominated commander in chief of the force which it was proposed to send to Constantinople. On Jan. 1, 1883, he was promoted to be field marshal. In Dec. 1886 he was appointed constable of the Tower of London. He died in London on Jan. 14, 1890.

See H. D. Sapier, *Field Marshal Lord Napier of Magdala* (London, 1927)

NAPIER, third largest exporting port in New Zealand, on the east coast of North Island, capital of the province of Hawke's Bay, 200 mi. N.E. of Wellington. Pop. (1956) 21.270 (27,507 urban). The town is situated on a peninsula known as Scinde Island

and by virtue of its sunny climate is a popular resort. It is the largest wool centre in New Zealand; the district is agricultural and is renowned for crossbred wools, frozen meats, fruit and canned products which are exported chiefly to Great Britain. The harbour caters for overseas and coastal vessels and is sheltered by a breakwater. The business area was rebuilt after its destruction by fire following a severe earthquake in 1931.

NAPLES (Ital. NAPOLI. Latin. *Neapolis*), the former capital of the kingdom of the Two Sicilies. and since 1860 the chief town of the province which bears its name. lies on the northern shore of the Bay of Naples, It. In 1901, with 547,503 inhabitants. it was the largest city in the country, but was later superseded by Milan. Pop. (1957 est.) 1,115,798 (commune).

The city of Naples is built at the base and on the slopes of a range of volcanic hills, and. rising from the shore like an amphitheatre, is best seen from the sea. To the west of Naples the coastline is broken and irregular and this part of the bay is divided by the promontory of Posilipo. which extends due south, into two small bays—the eastern. with the city of Naples. and the western, the sheltered Bay of Baiae. Silhouetted against the sky to the south of the plain is the cone of Mount Vesuvius. Naples is divided into two natural crescents by a transverse ridge running south from the summit of Vomero hill. which is occupied by the castle of Sant' Elmo, to the promontory of Pizzofalcone. The western crescent. though merely a long narrow strip between the sea and Vomero hill. is the fashionable quarter of Naples. A fine broad street, the Riviera di Chiaja. runs parallel with the coast for 1½ mi. to the foot of the hill of Posillipo. Begun at the close of the 16th century by Count d'Olivares, it was completed between 169j and 1 joo by the duke de Medina Celi. Between it and the sea lie the public gardens of the Villa Comunale. the chief promenade of the city; these gardens. which were first laid out in 1780, have been extended at various times since. The whole edge of the bay from the Castel dell' Ovo. on the island at the tip of the Pizzofalcone promontory. westward to the small port of Mergellina is lined by a massive embankment and carriageway, the Via Caracciolo, constructed in 187j–81. On the hill of Posillipo above Mergellina there are three grottoes, one of which is said to be the tomb of Virgil.

The oldest and by far the largest part of the city, however, lies in the crescent to the east of Pizzofalcone. The character of this shore has been much altered by nevi harbour works, which, with wharves and warehouses, have absorbed the Villa del Popolo ("people's park") originally laid out on land reclaimed from the bay. The western and eastern crescents, and with them the two halves of the city, have now been united by a connecting thoroughfare, on the seaward side of the Castelnuovo and the hill of Pizzofalcone, and also by a tunnel (the Galleria della Vittoria) cut under this hill.

During the middle ages the area of Naples was bounded by the walls built by the emperor Valentinianus (450–455) and the configuration of the ancient town has been preserved in the modern city with its network of roads, though little remains of the buildings of Greek and Roman times. The best-known thoroughfare is the historic Toledo (officially Via Roma). which runs almost due north from the Piazza del Plebiscito in front of the Palazzo Reale as far as the Museo Nazionale ("national museum"). North of Santa Teresa street the Toledo changes its name to Via Nuova di Capodimonte which runs through the Ponte della Sanità (built by the French) to the gates of the Capodimonte palace. This long street divides the city into two parts. Winding from west to east below the hills, the Corso Vittorio Emanuele (opened 1893) runs from the Mergellina railway station to the museum near which it becomes the Via Salvator Rosa.

On the small island of Isola del Salvatore (the Megaris of Pliny), now joined to the shore at the foot of the Pizzofalcone hill by a causeway, stands the Castel dell' Ovo ("egg castle"). In Roman times this castle was owned by Lucullus and was part of his famous villa. On the mainland to the east, by the breakwater guarding the harbour, stands the Castelnuovo ("new castle"). the royal palace originally built (1279–82) in the reign of Charles I. king of Naples and Sicily and count of Anjou, by French architects who also opened up new roads and built other castles and churches. It was the royal residence of the kings of the houses of Anjou and Aragon and was called Castelnuovo to distinguish it from the other royal castles. Castel Capuano and Castel dell' Ovo. It stands on the southeastern side of the Piazza del Municipio. It was rebuilt in 1442 by a Catalonian architect and on the northern side are three of its five massive circular towers between two of which is a triumphal arch (1470) commemorating the entry of Alphonso I into Naples (1442) after expelling the Xngevins. This arch is one of the best examples of medieval architecture in Naples.

On the waterfront south of the Castelnuovo and facing westward on to the Piazza del Plebiscito is the Palazzo Reale, which was built about 1600 by the architect Domenico Fontana on the orders of the Spanish viceroy. The palace was completely restored and enlarged after a serious fire in 1837. The national library, founded in 1734 by Charles de Bourbon, is housed in the palace and possesses over 1,300,000 volumes and many valuable incunabula and manuscripts.

Away from the harbour to the northeast is the Castel Capuano which was founded in the 12th century by William I of Sicily and completed by the emperor Frederick II in 1231. The castle was for a time a royal residence but now houses the courts of justice transferred there in 1540 by Don Pedro of Toledo. Because of its lofty position on the hill of Vomero, the rectangular mass of the Castel Sant' Elmo is perhaps the most impressive of Naples' castles. Standing on the site of an earlier fortress built by Robert the Wise: Sant' Elmo was erected early in the 14th century and enlarged during the 16th century.

A city of palaces and castles, Naples is also famous for its many churches. most of which lie between the Toledo and the Via del Duomo to the east. From this street a flight of steps leads up to the Cathedral of San Gennaro. Dating from the reign of Charles I, the cathedral was rebuilt by Alphonso I after an earthquake. and altered and restored as late as the 18th century. The three naves have Angevin Gothic vaulting but much of the cathedral's beauty is in its chapels. which are adorned with frescoes by Domenichino and others. In a silver tabernacle on the high altar of the chapel of San Gennaro (St. Januarius) are two phials partially filled n-ith the saint's blood. The liquefaction of the blood which takes place annually on the first Saturday of May and on Sept. 19 is the greatest of the city's religious festivals. The cathedral was built beside the ancient basilica of Santa Restituta, said to be on the site of a temple of Apollo, and containing the 5th-century baptistry of San Giovanni in Fonte. The dome is adorned with beautiful mosaics of Christ and the Virgin from the 7th century. North of the cathedral is San Giovanni a Carbonara. noted for its monument to Ring Ladislaus (1428) by Andrea Firenze.

To the east of the Toledo are many churches of medieval foundation. Santa Chiara was founded by King Robert the Wise, count of Anjou, and built between 1310 and 1328. The rococo decoration was completely destroyed and many of the beautifully sculpted Angevin tombs were damaged during World War II. San Domenico Maggiore (1 289) with its many chapels and altars, sculptures and frescoes, is one of the most impressive churches in Naples. St. Thomas Xquinas lived in the monastery adjoining the church when he was professor at the University of Naples (1272). Other churches in this quarter include: San Pietro a Majella, founded early in the 14th century by Giovanni Pipino di Barletta; San Lorenzo (13th century), a fine example of Gothic French architecture; San Filippo Neri (16th–17th century) with paintings by Guido Reni. Domenichino and Andrea da Salerno; the church of Sant' Angelo a Nilo with the tomb of Cardinal Brancaccio by Donatello and Michelozzo; Sant' Anna dei Lombardi, or Monte Oliveto, which contains some of the finest sculpture in the city by such artists as Antonio Rossellino, Benedetto da Maiano and Guido Mazzoni (especially fine is the Chapel of the Holy Sepulchre with the group of life-sized terra-cotta figures by hfazzoni standing in grief-stricken postures about the tomb of Christ). In the Incoronata church to the south, near the Castelnuovo. there are frescoes by an unknown artist, believed to be one of Giotto's pupils.

Naples is renowned for its museums. The most finely situated is San Martino on Vomero hill in the precincts of the fortifications of the castle of Sant' Elmo. Built originally as a Carthusian monastery, San Martino was begun in 1325 but was entirely rebuilt in the 17th century; its church has many fine paintings by Guido Reni, Caravaggio and others. The museum contains examples of Venetian glass, porcelain. silver and marble.

The chief museum, however, is the Museo Nazionale. It was built in 1586 as a barracks and in 1615 was ceded to the university; not until the late 18th century did it become a museum, when the art collections belonging to Charles III of Bourbon, which he inherited from his mother Elizabeth Farnese, were deposited there. It is now one of the finest museums in the world with its great collection of works of art from the ancient world, including masterpieces from the excavations at Herculaneum, Pompeii, Stabiae and Pozzuoli. These include bronzes, Pompeian frescoes and mosaic, terra cottas, ancient glass and gems and a large and valuable collection of Italo-Greek vases. The carved reliefs and marble statuary, which are spaciously exhibited. form perhaps the most impressive of the collections.

On a hill to the far north of the city is the palace of Capodimonte, the building of which was begun in the 18th century during the reign of Charles III, who also opened tapestry and porcelain works in the city. It was made into a museum in 1957 and a collection of delicate porcelain, in particular the Portici porcelain "cabinet," can be seen there, but its chief glory is the collection of pictures transferred from the Museo Nazionale. Among paintings of the Flemish and Italian schools are canvases by Brueghel, Giovanni Bellini, Correggio, Andrea del Sarto and Titian. The little-known 17th century Neapolitan school is well represented by paintings by Bernardo Cavallino and Mattia Preti.

The state archives, including those of the former kingdom of Naples, are kept in the Benedictine monastery in Vico San Severino e Sossio not far from the university; the notarial archives in Via San Paolo, a little to the north, contain all (about 800,000) the original notarial acts from 1450 onward. The Società di Storia Patria, established in 1875 to record and compile the history of the locality, has a good library also.

The San Carlo Opera house, capable of seating about 2,000 spectators, is one of the largest in Europe. It stands near the Palazzo Reale and was originally built in 1737 under Charles III, but was destroyed by fire in 1816 and completely rebuilt in 1876.

Charitable institutions are numerous in Naples. The Reclusorio or poorhouse, founded in the 18th century, besides offering shelter to the poor has a series of industrial schools attached, at which foundling boys are educated and taught trades. There are also several hospitals: the Incurabili, founded in 1510, the Istituto Principi di Piemonte, Cardarelli, Fondazione Pascale, Loreto, Ascalesi and the Ospedale della Pace.

Education and Learning. — The University of Naples. which was founded by the emperor Frederick II in 1224, is well equipped with zoological, mineralogical and geological museums, botanical gardens, a physiological institute and a department of anthropology. The buildings were originally erected in 1557 for the use of the Jesuits. The new building, completed in 1906, stands in the Corso Umberto I (Rettifilo), the street running northeastward, a little way behind the harbour, to the central railway station. The aquarium of the famous marine biological station at Naples, one of the most important in the world, founded by Anton Dohrn in 1872, is situated in the gardens of the Villa Comunale; the marine flora and fauna of the neighbourhood are more varied than those of any district in Europe. There is an observatory on the hill of Capodimonte.

The Royal Society of Naples, dating from 1756, is divided into three academies, namely, moral and political; physical and mathematical; letters, archaeology and fine arts. The Accademia Pontaniana, founded by Antonio Becardella and J. J. Pontanus in 1442, was restored in 1808 and is still extant. The Istituto Universitario Orientale, where foreign languages are taught, owes its existence to Matteo Ripa, who in 1732 established a school for Chinese missionaries. The Conservatory of Music in the monastery adjacent to San Pietro a Majella has been in existence since 1760, and has had many famous pupils, among them Vincenzo Bellini.

The Port. — At an early date the original harbour at Naples, now known in its greatly reduced state as Porto Piccolo and fit only for little boats and lighters, became too small In 1302 Charles II began the construction of the Porto Grande by forming the Molo Grande, which stretched eastward into the bay and was terminated by a lighthouse in the 15th century. By the addition of a pier running northeast from the lighthouse protected by a heavily armed battery, Charles III, in 1740, added greatly to the safety of the harbour. In 1826 the open area to the south of the Porto Grande was formed into the Porto Militare by the construction of the Molo San Vincenzo, 1,200 ft. long. The lengthening of the Molo San Vincenzo to a total of more than 5,000 ft. and the construction of curving moles on the east to meet it, have formed a large outer basin, the *avamporto,* and an inner harbour (Porto Mercantile). New quays ha e been made from the old Immacolatella landing place to the Capitaneria di Porto, close to which is the marine railway station, with piers long enough for the largest liners to lie alongside. The depth of this new harbour is from 25 to 30 ft. To the east are dock basins, silos for grain and other warehouses. A modern station for handling passenger traffic was opened in 1936. In 1956, 9,656 vessels of 15,303,717 tons and with 974,493 passengers arrived, bringing 6,132,605 tons of merchandise; 9,626 ships left with 2,123,012 tons of merchandise and 946,084 passengers. The new drydock is 1,140 ft. long and 132 ft. wide. Large sections of the harbour were utterly ruined by British and U.S. air raids during World War II, but all of them have been built again. The port of Naples is second only to that of Genoa.

The specialities of Naples are the manufacture of coral and tortoise-shell articles, kid gloves and macaroni, but it has been growing also as an industrial centre.

Recent Development. — Naples has grown in modern times at an enormous rate. On the large areas reclaimed from the sea, hotels and great blocks of flats have been erected. The Vomero is now an important suburb. The area of the commune has been built over in every direction, especially toward the east where a special zone has been set aside for the purpose of industrial development. This zone now contains a large number of mills for spinning silk, cotton, jute and wool; factories for making locomotives and automobiles; shipbuilding yards; an oil refinery; iron and steelworks; a huge cement mill; and silos.

After the cholera epidemic of 1884, Agostino Depretis, then premier, visited Naples, and uttered the famous dictum *Bisogna sventrare Napoli*" ("Naples must be disembowelled.") The worst slums, which lay between the centre of the town and the railway station, were pulled down and a wide street was constructed from the centre of the town to the eastward; a water supply was brought to the town from the hills near Avellino; and a large working-class quarter was erected to the north and beyond the railway station, known as the Rione Vasto. In the late 1950s another business and shopping quarter was being constructed in the centre of the city, replacing an older working-class quarter which had been demolished. There were also new middle-class quarters at Santa Lucia, Vomero Nuovo and Sant' Efremo, Poggioreale, Fuorigrotta, Arenella and Camaldoli, and better houses on the Riviera di Chiaja, Viale Elena and Via Caracciolo at Mergellina, and Via Partenope near the Chiatamone, and an aristocratic quarter in the large extensions made in the Rione Amedeo and Posillipo Alto. The narrow alleys of Porto, Pendino and Mercato were gradually disappearing, and old Naples was vanishing day by day; Via Marittima, one of the largest streets, in which stands the great new Loreto hospital, was opened in 1958.

History. — According to some ancient writers, there were two towns in the 7th century B.C.: Parthenope and Neapolis, which was later called Palaeopolis. According to others, Naples mas founded in the 6th century B.C. by Greek immigrants who settled at Cumae. Although the origin of the city is obscure, it is certain that the Romans conquered it in 328 B C.

As a Roman settlement under the empire, it was enriched with temples, gymnasiums, baths, aqueducts, hippodromes and arenas, and in that period many of the Romans of the upper classes, from a love of Greek manners and literature, were attracted to Neapolis

by its schools and gymnasiums or for enjoyment of music and of a soft climate. It was the favourite residence of many of the emperors: Nero made his first appearance on the stage in one of its theatres; Titus assumed the office of its archon and Hadrian became its demarch. Marcus Aurelius lived in Neapolis and frequented its schools. It was also the favourite residence of the poets Statius (*c.* A.D. 45–96) and Silius Italicus (A.D. 25 or 26–101), the former of whom was a Neapolitan by birth. It was chiefly at Naples that Virgil composed his *Georgics* and he desired to be buried on the hill of Pausilypon. the modern Posillipo, in its neighbourhood, though his traditional tomb is really a columbarium.

After the fall of the Western Roman empire, the town declined. It was conquered by Odoacer and by a Byzantine army under Belisarius in 536; Totila, the Gothic leader, drove the Byzantines from Naples in 542; ten years later, however, it reverted to Byzantine rule. Naples became a dukedom in the 8th century and preserved its independence against Lombard incursions In 1139 it capitulated and was annexed to the kingdom of Roger II of Sicily. Under the Hohenstaufen emperor Frederick II (Frederick I of Sicily) the city became a centre of learning; in 1224 he built the university where many famous men of letters were numbered among its teachers: Pier delle Vigne, Andrea d'Isernia, Bartolomeo Prignano (Urban VI) and Cino da Pistoia. Charles of Anjou, whd overthrew the Hohenstaufen in southern Italy in 1266, made Naples the capital of his kingdom; during his reign and those of his Angevin and Aragonese successors, the city was enlarged and developed. Many palaces, castles and churches were built. Trade and commerce grew under the influence of Italian settlers from Florence, Pisa and Lombardy. During the 14th century the wool industry flourished.

Through the Aragonese succession Naples became a possession of the Spanish Habsburgs. Despite much unrest (*see* MASANIELLO for the revolt of 1647), epidemics and heavy taxation, the city continued to grow under this regime; development was especially rapid during Don Pedro de Toledo's viceroyalty (1532–59) and the famous Via Toledo was constructed. In 1707, during the War of the Spanish Succession, Naples fell to the Austrians, who retained it under the treaties of 1713–14.

In 1734 the Spanish prince Charles of Bourbon (the future Charles III of Spain) captured Naples, which he made the capital of his independent kingdom of the Two Sicilies. During his reign in this kingdom the royal palaces of Caserta and Portici, the Reclusorio and other famous buildings were built. On becoming king of Spain in 1759, Charles was succeeded by his third son, Ferdinand IV, who in 1799 was expelled by a French Revolutionary army. A republic was then proclaimed. In 1806 Joseph Bonaparte, Napoleon's brother, became king of Naples. Joachim Murat took his place in 1808.

On Ferdinand's restoration (1815), the barrier which already divided the Bourbons from the leading Neapolitan class became unsurmountable and the rising of this minority, who were aiming at the unity of Italy, culminated in the revolution of 1848.

On Sept. 6, 1860, Francis II, the last king of Naples, left the capital, which had fallen to Garibaldi's army. Naples ceased to be governed as a separate entity and came under the national government of Italy with Victor Emmanuel as king. The subsequent history of the city is concerned with attempts to raise the standard of living by increased public services and amenities, to build new districts for the working classes, to encourage industry and to improve the port.

After World War II many new roads and streets were constructed to take in districts which had hitherto been outside the city proper on Vomero, Arenella and Posillipo Alto hills. Great care has been taken in this modernization to preserve the ancient and famous buildings of the city. (*See* also NAPLES, KINGDOM OF.)

NAPLES, KINGDOM OF, the name conventionally given to the kingdom of Sicily on the Italian mainland (Sicily beyond the Faro), to distinguish it from that of Sicily proper (Sicily on this side of the Faro, *i.e.,* Messina).

The leaders of the Norman house of Hauteville, Robert Guiscard and Richard of Aversa, in 1059 did homage to Pope Nicholas II. (*q.v.*) for all the conquests they made both in the island and upon the mainland. In 1130 Roger de Hauteville (Roger II. as "great count" of Sicily) assumed the style of king as Roger I. In this way the south of Italy, together with the island of Sicily, was converted into one political body.

The **Hohenstaufen.**—After the death of Tancred, son of William II., the emperor Henry VI., of the house of Hohenstaufen, who by his marriage with Constance or Costanza d'Altavilla, daughter of Roger I. (d. 1154), laid claims to the lungdoms of Naples and Sicily, descended into Italy in 1194. He easily conquered both the mainland and the island, but died in 1197. Costanza then had her son, Frederick (b. 1194) proclaimed king, and obtained the support of the Holy See on condition that the kingdom should be once more recognized as a fief of the Church. The Hohenstaufen kings afterwards refused to admit this claim; thus provoking the persistent hostility of the popes and many foreign invasions. Costanza died in 1198, leaving Pope Innocent III. regent and tutor to her son. In 1209 Frederick married Costanza, daughter of the king of Aragon, with whose help he succeeded in reducing a large part of Sicily to obedience. Two years later he was elected king of the Romans, and in 1220 he was crowned emperor in Rome by Pope Honorius III., but continued to reside in Sicily. In 1227 Gregory IX. excommunicated him because he delayed the crusade which he had promised to undertake. Frederick sailed for Palestine the following year and on his return defeated the army which the pope had sent into Neapolitan territory, peace being made at San Germano in 1230 and the excommunication withdrawn. In 1231 he issued the celebrated Constitutions of the Sicilian kingdom at the parliament of Melfi. He died in 1250.

His son Conrad IV. succeeded to the empire, while to his illegitimate son Manfred he left the principality of Taranto and the regency of the southern kingdom. Conrad died in 1254, leaving an infant son, Conradin (b. 1252), and Manfred was appointed vicar-general during the latter's minority. In 1258, on a rumour of Conradin's death, Manfred was offered and accepted the crown of Naples and Sicily. The rumour was false, but he retained the crown, promising to leave the kingdom to Conradin at his death and to defend his rights.

Angevin **and Aragonese.**—In 1265 Clement IV., wishing to rid himself of the Hohenstaufen, induced Charles of Anjou, brother of Louis IX. of France, to come to Italy. Agreeing to accept the kingdom of the Two Sicilies as a fief of the Church, Charles, in 1266, marched southward with the privileges of a crusader (*see* CHARLES I., king of Naples and Sicily). Manfred was defeated and killed at Benevento, and Charles was soon master of almost the whole kingdom.

In Sicily, however, Charles's government soon made itself odious by its exactions and the insolence and cruelty of the king's French officials and favourites. The malcontents were led by the Salernitan noble Giovanni da Procida, who had induced Peter III. of Aragon, husband of Manfred's daughter Costanza, to make good his shadowy claims to the crown of Sicily. On Easter day 1282, just as Charles was preparing an expedition to the East, the popular rising known as the Sicilian Vespers broke out at Palermo and resulted in the massacre of nearly all the French in the island. Peter reached Palermo in September. Pope Martin IV. proclaimed a crusade against the Aragonese, and the war continued for many years. The Sicilian fleet under Ruggiero di Lauria defeated that of the Angevins at Malta in 1283, and in 1284 in the Bay of Naples. Charles I. died in 1286; his heir, Charles the Lame, being a prisoner, was not crowned until two years later. (*See* CHARLES II., king of Naples and Sicily, and FREDERICK III., king of Sicily.).

Charles II. died in 1309 and was succeeded by his second son Robert, who became leader of the Guelphs in Italy. War between

Naples and Sicily broke out once more, when Erederick allied himself with the emperor Henry VII. on his descent into Italy and proclaimed his own son Peter heir to the throne. Robert died in 1342; he had been a capable ruler, a scholar, and a friend of Petrarch, but his authority was limited by the rights-of a turbulent and rebellious baronage (see ROBERT, king of Naples). He was succeeded by his granddaughter Joanna, wife of Andrew of Hungary, who was assassinated in 1345, not without suspicion of Joanna's complicity. Andrew's brother Louis, king of Hungary, attempted to make good his claims on Naples and avenge the murder of Andrew; but as Pope Clement refused to recognize his claims he went back to Hungary in 1348 and Joanna and her second husband Louis of Taranto were crowned at Naples by the pope's legate in 1352, but Niccolb Acciaiuoli, the seneschal, became the real master of the kingdom. Joanna nominated Louis of Anjou her heir, but while the latter was recognized by the anti-pope Clement VII., Pope Urban VI. declared Charles of Durazzo (great-grandson of Charles II.) king of Sicily *al di quà* del Faro (*i.e.* of Naples). Charles conquered the kingdom and took Joanna prisoner in 1381, and had her murdered the following year. Louis failed to drive out Charles, and died in 1384. A period of anarchy followed during the reigns of Charles III. and his son Ladislas, and on the latter's death in 1414 he was succeeded by his sister Joanna II. (*q.v.*), during whose reign the kingdom sank to the lowest depths of degradation. Louis died in 1434 and Joanna in 1435. Alphonso was recognized as king of Naples by Pope Eugene IV. in 1443.

Under Alphonso, surnamed "the Magnanimous," Sicily was once more united to Naples and a new era was inaugurated, for the king was at once a brilliant ruler, a scholar, and a patron of letters. He died in 1458, leaving Naples to his illegitimate son Ferdinand I (*q.v.*) (Don Ferrante), and Sicily, Sardinia, and Aragon to his brother John. Ferdinand died in Jan. 1494, and he was succeeded by Alphonso. In the following September Charles VIII. of France entered Italy and conquered the Neapolitan kingdom without much difficulty. Alphonso abdicated, and his son Ferrandino and his brother Frederick withdrew to Ischia. But Ferrandino. with the help of Ferdinand II. of Spain, was able later to reoccupy his dominions. He died much regretted in 1496 and was succeeded by Frederick. The country was torn by civil war and brigandage, and the French continued to press their claims; until, with Gonzalo de Cordoba's victory on the Garigliano in Dec. 1502, the whole kingdom was in Spanish hands.

Spanish Rule.--On Ferdinand's death in 1516, the Habsburg Charles became king of Spain, and three years later was elected emperor as Charles V.; in 1522 he appointed John de Lannoy viceroy of Naples, which became henceforth an integral part of the Spanish dominions. Spanish rule presently provoked several rebellions. On July 7, 1647, tumults occurred at Naples in consequence of a new fruit tax, and the viceroy, Count d'Arcos, was forced to take refuge in the Castelnuovo. The populace, led by an Amalfi fisherman, known as Masaniello (*q.v.*), obtained arms, erected barricades, and, while professing loyalty to the king of Spain, demanded the removal of the oppressive taxes and murdered many of the nobles. D'Arcos came to terms with Masaniello; but in spite of this, and of the subsequent assassination of Masaniello, the disturbances continued.

In 1670 disorders broke out at Messina, which developed into an anti-Spanish movement; and while the inhabitants called in the French, the Spaniards, who could not crush the rising, called in the Dutch. In 1707 an Austrian army conquered the kingdom and Spanish rule came to an end.

The Bourbons.—In Sicily the Spaniards held their own till the peace of Utrecht, in 1713, when the island was given over to Duke Victor Amadeus of Savoy, who assumed the title of king. In 1718 he had to hand back his new possession to Spain, which, in 1720, surrendered it to Austria and gave Sardinia to Victor Amadeus. In 1733 the treaty of the Escurial between France, Spain, and Savoy against Austria was signed. Don Carlos of Bourbon, son of Philip V. of Spain, easily conquered both Naples and Sicily, and in 1738 he was recognized as king of the Two Sicilies, Spain renouncing all her claims. Charles was well received and, with the Tuscan Bernardo Tanucci as his minister, introduced many useful reforms. In 1759 Charles III., having succeeded to the Spanish crown, abdicated that of the Two Sicilies in favour of his 8-year-old son Ferdinand, who became Ferdinand IV. of Naples and III. of Sicily, with a regency under Tanucci. The regency ended in 1767, and the following year Ferdinand married the masterful and ambitious Maria Carolina, daughter of the empress Maria Theresa. With the help of John Acton, an Englishman whom she made minister in the place of Tanucci, she secured a *rapprochement* with England and Austria.

On the outbreak of the French Revolution the king and queen were not at first hostile to the new movement; but in 1793 they joined the first coalition against France, instituting severe persecutions against all who were remotely suspected of French sympathies. Republicanism, however, gained ground, especially among the aristocracy. In 1798, during Napoleon's absence in Egypt and after Nelson's victory at Aboukir, Maria Carolina induced Ferdinand to go to war with France. The French marched on Naples, but not until Jan. 20, 1799, were the invaders masters of the city. On the 23rd the Parthenopaean republic was proclaimed. The Republicans were men of culture and high character, but doctrinaire and unpractical, and they knew very little of the lower classes of their own country. Meanwhile the court at Palermo sent Cardinal Fabrizio Ruffo to Calabria, to organize a counter-revolution. He succeeded beyond expectation, and with his "Christian army of the Holy Faith" (*Esercito Cristiano della* Santa Fede), consisting of brigands, convicts, peasants and some soldiers, advanced on the capital, whence the French, save for a small force under Méjean, withdrew. On June 13 Ruffo and his hordes reached Naples and, after a desperate battle at the Ponte della Maddalena, entered the city. The French in Castel Sant' Elmo and the Republicans in Castelnuovo and Castel dell' Uovo still held out and finally an armistice was concluded and a capitulation agreed upon, whereby the castles were to be evacuated and the garrisons free to remain in Naples unmolested or to sail for Toulon.

Nelson at Naples.—On June 24 Nelson arrived with his fleet, and on hearing of the capitulation refused to recognize it save in so far as it concerned the French. Ruffo indignantly declared that the treaty had been signed, not only by himself but by the Russian and Turkish commandants and by the British captain, Foote. On the 26th Nelson changed his attitude and informed the cardinal that he would do nothing to break the armistice; while Captains Bell and Troubridge wrote that they had Nelson's authority to state that the latter would not oppose the embarcation of the Republicans, who thereupon embarked on the vessels prepared for them. But on the 28th Nelson, acting on despatches from the court (in reply to his own), held up the vessels and many of the Republicans were arrested. Caracciolo, who commanded the Republican Fleet, was tried by court-martial on board Nelson's flagship, condemned to death, and hanged at the yard arm (*see* CARACCIOLO, FRANCESCO and NELSON, HORATIO NELSON).

On July 8 King Ferdinand arrived from Palermo and the State trials resulted in hundreds of persons being executed, including some of the best men in the country, such as the philosopher Mario Pagano, the scientist Cirillo, Massa, the defender of Castel dell' Uovo, and Ettore Caraffa, the defender of Pescara. After the peace of Amiens in 1802 the court returned to Naples, where it was well received. But when the European war broke out again in the following year King Ferdinand played a double game, appearing to accede to Napoleon's demands while negotiating with Britain. After Austerlitz, Napoleon declared that "the Bourbon dynasty had ceased to reign" and sent an army under his brother Joseph to occupy the kingdom.

Joseph Bonaparte and Murat.—Ferdinand and Maria Carolina fled to Palermo in 1805; in Feb. 1806 Joseph Bonaparte entered Naples as king. A cultivated, well-meaning, not very intelligent man, he introduced many useful reforms and abolished feudalism, but the taxes and forced contributions proved very burdensome. Joseph's authority did not exist throughout a large part of the kingdom, where royalist risings, led by brigand chiefs, maintained a state of anarchy, and a British force, under Sir John

Stuart, defeated the French at Maida in Calabria (July 6, 1806).

In 1808 Napoleon conferred the crown of Spain on Joseph and appointed Joachim Murat king of Naples. Murat continued Joseph's reforms and reorganized the army; and although he introduced the French codes and conferred many appointments and estates on Frenchmen, his administration was more or less native and favoured the abler Neapolitans. The king gained many sympathies; he gradually became estranged from Napoleon and secretly opened negotiations with Austria and Great Britain. In Jan. 1814 he signed a treaty with Austria, and the following month proclaimed his separation from Napoleon. But when Napoleon escaped from Elba, Murat suddenly returned to the allegiance of his old chief, marched into northern Italy, and from Rimini issued his famous proclamation in favour of Italian independence (March 30, 1815). He was subsequently defeated by the Austrians several times and on May 18 sailed from Naples for France (see MURAT, JOACHIM). On the 23rd the Austrians entered Naples to restore Bourbon rule.

The Restoration.—Ferdinand and Maria Carolina had continued to reign in Sicily, where the court's extravagance and the odious Neapolitan system of police espionage rendered their presence a burden instead of a blessing to the island. A bitter conflict broke out between the court and the parliament, and the British minister, Lord William Bentinck, forced Ferdinand to resign his authority and appoint his son regent and introduced many valuable reforms. In 1812 a constitution on British lines was introduced, and the queen, who was perpetually intriguing against Bentinck, was exiled. Bentinck, whose memory is still cherished in the island, departed in 1814. Ferdinand dissolved parliament in May 1815, after concluding a treaty with Austria for the recovery of his mainland dominions by means of an Austrian army. On June 9 Ferdinand re-entered Naples and bound himself in a second treaty with Austria not to introduce a constitutional government. At first he abstained from persecution and received many of Murat's old officers into his army. In Oct. 1815 Murat, believing that he still had a strong party in the kingdom, landed with a few companions at Pizzo di Calabria, but was immediately captured by the police and the peasantry, court-martialled, and shot.

Ferdinand proclaimed himself king of the Two Sicilies at the congress of Vienna. incorporating Naples and Sicily into one state, and abolished the Sicilian constitution (Dec. 1816). In 1818 he concluded a Concordat with the Church, by which the latter renounced its suzerainty over the kingdom, but was given control over education, the censorship, and many other privileges. But there was much disaffection throughout the country, and the Carbonarist lodges had made much progress, especially in the army (see CARBONARI). In July 1820 a military mutiny broke out at Caserta, the mutineers demanding a Spanish constitution although professing loyalty to the king. Ferdinand, feeling himself helpless to resist, acceded to the demand. The new government's first difficulty was Sicily, where the people had risen in rebellion demanding their own charter of 1812, and although the Neapolitan troops quelled the outbreak with much bloodshed the division proved fatal to the prospects of liberty.

This outbreak seriously alarmed the Powers responsible for the preservation of the peace in Europe. At the congress of Troppau (Oct. 1820) the famous protocol was issued affirming the right of collective "Europe" to interfere to crush dangerous internal revolutions. Both France and Great Britain protested against this dangerous principle; but by general consent King Ferdinand was invited to attend the adjourned congress, fixed to meet at Laibach in the spring of the following year. Under the new constitution the permission of parliament was necessary before the king could leave Neapolitan territory. This was weakly granted, after Ferdinand had sworn the most solemn oaths to maintain the constitution. He was scarcely beyond the frontiers, however, before he repudiated his engagements, as exacted by force. The powers authorized Austria to march an army into Naples to restore the autocratic monarchy. General Pepe commander of the Constitutional forces, was sent to the frontier at the head of 8,000 men, but was completely defeated by the Austrians at Rieti on March 7. On the 23rd the Austrians entered Naples, followed soon afterwards by the king. Every vestige of freedom was suppressed, and the inevitable State trials instituted with the usual harvest of executions and imprisonment. Pepe saved himself by flight. (See FERDINAND IV., king of Naples.)

Ferdinand died in 1825 and was succeeded by his son Francis I., an unbridled libertine, under whom the corruption of the administration assumed unheard-of proportions. (See FRANCIS I., king of the Two Sicilies.) He died in 1830 and was succeeded by his son, Ferdinand II., who at first awoke hopes that the conditions of the country would be improved; but on the death of his first wife, Cristina of Savoy, he married Maria Theresa of Austria, who encouraged him in his reactionary tendencies and brought him closer to Austria. The desire for a constitution was by no means dead, and the survivors of the old Carbonari gathered round Carlo Poerio, while the Giovane *Italia* society (independent of Mazzini) promoted a few sporadic outbreaks easily crushed. The following year the Venetian brothers Bandiera, acting in concert with Mazzini, landed in Calabria, believing the whole country to be in a state of revolt; they met with little local support and were quickly captured and shot, but their deaths aroused much sympathy, and the whole episode was highly significant as being the first attempt made by Italians from other parts of the country to promote revolution in the south.

Revolution of 1848.--On Jan. 12, 1848, a revolution under the leadership of Ruggiero Settimo broke out in Sicily. These events were followed by demonstrations at Naples, and on Jan. 28 the king granted the constitution. The popular demand was now that Naples should assist the Lombards in their revolt against Austria, for a feeling of Italian solidarity was growing up. Ferdinand declared war against Austria (April 7, 1848); and a Neapolitan army under General Pepe marched towards Lombardy in May, while the fleet sailed for Venice. But a dispute between the king and the parliament concerning the form of the royal oath having arisen, a group of demagogues with criminal folly provoked disturbances and erected barricades (May 14). The king refused to open parliament unless the barricades were removed. A few shots were fired on the 15th, the Swiss regiments stormed the barricades and street fighting lasted all day. By the evening the Swiss and the royalists were masters of the situation. A new ministry under Prince Cariati was appointed. Parliament was dissolved, the National Guard disbanded and the army recalled from the Po.

In Sicily the revolutionists were bitterly hostile to the Neapolitans. The Sicilian assembly met in March 1848, and Settimo in his inaugural speech declared that the Bourbon dynasty had ceased to reign and that Sicily united her destinies to those of Italy; Settimo was elected president of the Government. After the Austrian victories Ferdinand sent a Neapolitan army under Carlo Filangieri (*q.v.*) to subjugate the island. The troops landed at Messina, whose citadel had been held by the royalists throughout, and after three days' desperate fighting the city itself was captured and sacked. Filangieri marched forward, committing many atrocities. In April he reached Palermo while the fleet appeared in the bay, and tumults having broken out within the city the Government surrendered on terms which granted amnesty for all except Settimo and 42 others.

For a few months after the dissolution of the Neapolitan parliament the Government abstained from persecution, but with the crushing of the Sicilian revolution its hands were free; and when the commission on the affair of May 15 had completed its labours thousands of respectable citizens were thrown into prison, such as L. Settembrini, Carlo Poerio, and Silvio Spaventa. The abominable conditions of the prisons in which the best men of the kingdom were immured were made known to the world by the famous letters of W. E. Gladstone, which branded the Bourbon regime as "the negation of God erected into a system of government." In 1857 Carlo Pisacane, an ex-Neapolitan officer who had taken part in the defence of Rome, fitted out an expedition, with Mazzini's approval, from Genoa, and landed at Sapri in Calabria; but the local police assisted by the peasantry attacked the band, killing many, including Pisacane himself, and capturing most of the rest. The following year, at the instance of Great Britain and France, Ferdinand commuted the sentences of some of the political prisoners to exile. (See FERDINAND II., king of the Two Sicilies.)

In May 1859 Ferdinand died and was succeeded by his son, Francis II. (*q.v.*). Victor Emmanuel, king of Sardinia, wrote to him proposing an alliance for the division of Italy, but Francis refused. In June part of the Swiss Guard mutinied and were shot down; and this affair resulted in the disbanding of the whole force—the last support of the autocracy. Various proposals were made for an alliance with Sardinia, but Francis rejected them and indeed began to negotiate with Austria.

Garibaldi.—In the meantime events in Sicily were reaching a crisis destined to subvert the Bourbon dynasty. Mazzini's emissaries, F. Crispi (*q.v.*) and R. Pilo, had been trying to organize a rising in favour of Italian unity and, although they merely succeeded in raising a few armed bands, they persuaded Garibaldi (*q.v.*) that the revolution, which he knew to be imminent, had broken out. Garibaldi, whose hesitation had been overcome, embarked on May 5, 1860, at Quarto, near Genoa, with 1,000 picked followers on board two steamers, and sailed for Sicily. On the 11th the expedition reached Marsala and landed without opposition. Garibaldi was somewhat coldly received by the astonished population; but he set forth at once for Salemi, where he issued a proclamation assuming the dictatorship of Sicily in the name of Victor Emmanuel, with Crispi as secretary of state. On the 15th he attacked and defeated 3,000 of the enemy under General Landi at Calatafimi; the news of this brilliant victory revived the revolutionary agitation throughout the island, and Garibald was joined by Pilo and his bands. By a cleverly devised ruse he avoided General Colonna's force, which expected him on the Monreale road, and entering Palermo from Misilmeri received an enthusiastic welcome. After three days' street fighting the Bourbonist commander, General Lanza, not knowing that the Garibaldians had scarcely a cartridge left, asked for and obtained a 24 hours' armistice (May 30). Garibaldi went on board the British flagship to confer with the Neapolitan generals Letizia and Chrétien; then he informed the citizens by means of a proclamation of what he had done, and declared that he would renew hostilities on the expiration of the armistice. Although unarmed, the people rallied to him as one man, and Lanza became so alarmed that he asked for an unconditional extension of the armistice, which Garibaldi granted; 15,000 Bourbon troops embarked for Naples on June 7, leaving the revolutionists masters of the situation. The Sardinian Admiral Persano's salute of 19 guns on the occasion of Garibaldi's official call constituted a practical recognition of his dictatorship by the Sardinian (Piedmontese) Government. In July further reinforcements of volunteers under Cosenz and Medici, assisted by Cavour, arrived at Palermo with a good supply of arms furnished by subscription in northern Italy. Garibaldi's forces were now raised to 12,000 men, besides the Sicilian *squadre*. Cavour's attempt to bring about the annexation of Sicily to Sardinia failed, for Garibaldi wished to use the island as a basis for an invasion of the mainland. When the Garibaldians advanced eastward they encountered a force of 4,000 of the enemy under Colonel Bosco at Milazzo; on July 20 a desperate battle took place, resulting in a hard-won Garibaldian victory. The Neapolitan Government then decided on the evacuation of the whole of Sicily except the citadel of Messina, which did not surrender until the next year.

The news of Garibaldi's astonishing successes entirely changed the situation in the capital, and on June 25, 1860, the king granted a constitution, and appointed A. Spinelli prime minister. Disorders having taken place between Liberals and reactionaries, Liborio Romano was made minister of police in the place of Aiossa. The king appealed to Great Britain and France to prevent Garibaldi crossing the Straits of Messina, and only just failed (for this episode see under LACAITA, SIR JAMES). On Aug. 19 Garibaldi crossed with 4,500 men and took Reggio by storm. He was soon joined by the rest of his troops, 15,000 in all, the Neapolitan army collapsed before Garibaldi's advance, and the people rose in his favour almost everywhere. On Sept. 6 the king and queen sailed for Gaeta; on the 7th Garibaldi entered Naples alone, although the city was still full of soldiers, and was received with delirious enthusiasm; on the 11th a part of the royalists capitulated and the rest retired on Capua. Cavour now decided that Sardinia must take part in the liberation of southern Italy, for he feared that Garibaldi's followers might induce him to proclaim the republic and attack Rome, which would have provoked French intervention; consequently a Piedinontese army occupied the Marche and Umbria and entered Neapolitan territory with Victor Emmanuel at its head. On Oct. 1 and 2, 1860, a battle was fought on the Volturno and the Garibaldians, although inferior in numbers, were victorious. On the 26th he met Victor Emmanuel at Teano and hailed him king of Italy and subsequently handed over his conquests to him. On Nov. 3 a plebiscite was taken, which resulted in an overwhelming majority in favour of union with Sardinia under Victor Emmanuel. Garibaldi departed for his island home at Caprera, while L. C. Farini was appointed viceroy of Naples and M. Cordero viceroy of Sicily. The last remnant of the Bourbon army was concentrated at Gaeta, the siege of which was begun by Cialdini on Nov. 5; on Jan. 10, 1861, the French fleet, which Napoleon III. had sent to Gaeta to delay the inevitable fall of the dynasty, was withdrawn at the instance of Great Britain; the fortress surrendered on Feb. 13 and the royal family departed by sea. The citadel of Messina capitulated a month later and Civitella del Tronto on March 21. On Feb. 18 the first Italian parliament met at Turin and proclaimed Victor Emmanuel king of Italy. Thus Naples and Sicily ceased to be a separate political entity and were absorbed into the united Italian kingdom.

NAPOLEON I. (1769–1821), emperor of the French. Napoleon Bonaparte was born at Ajaccio on Aug. 15, 1769, the year following the reunion of Corsica with France. His father, Charles Buonaparte—it was not until after 1796 that the spelling Bonaparte was adopted—came of a good family which had been established in the island since the 16th century. The family origins may perhaps be traced to Tuscany, an Italian province, the relations of which with Corsica had always been close. Napoleon himself, in later years, scoffed at the exaggerated tales invented by flatterers and courtiers, of the lordly status formerly held by the family at Treviso and Bologna. Yet his father was undoubtedly of noble birth, and was the delegate of the Corsican nobility at Paris. Charles Buonaparte married Laetitia Ramolino, a woman of strong character and great personal beauty. He was a lawyer by profession and brought up a large family in difficult times. After the Corsicans had, several times, revolted against their Genoese masters, the republic of Genoa, despairing of ever bringing the rebels to submission, ceded its rights to France, against which the Corsicans, led by Paoli (*q.v.*) at first attempted resistance. Charles Buonaparte joined Paoli's party. He even joined him in his campaign, taking with him his wife and children.

lest they should be seized as hostages by the French. When Paoli was beaten and had to fly Charles Buonaparte became reconciled to French rule and benefited by the protection of M. de Marbeuf, the governor, to whom he was able to make himself useful. In 1779, sent on a mission to Versailles, he took with him his second son, Napoleon, for whom M. de Marbeuf had obtained a bursary at the military academy at Brienne.

EARLY LIFE

These facts enable us to understand the character of Napoleon. He was born a Frenchman, of a family which, unwilling at first to become French, afterwards unreservedly accepted the *fait accompli*. From the age of ten he was educated with other boys of his own class by French people according to French ideas. Though we must make due allowance for heredity, family influence, and the impressions of early childhood, it is an exaggeration to explain Napoleon, as historians since Stendhal have been too much inclined to do, entirely in the light of his Corsican and Tuscan origin, and to see in him the incarnation of a condottiere, or of a 14th century Italian city despot, a modem Castruccio Castracani. It is more important to bear in mind that young Bonaparte, born in an island which had only just become part of France, shared neither the traditions nor the prejudices of his new country.

In 1789, at the age of 20, he came into the Revolution with an open mind, feeling neither like nor dislike for many things which other Frenchmen either regretted or frankly detested. If he remained Corsican in temperament he was, by virtue of the instruction he had received, and the books he had read, pre-eminently a man of the 18th century. His occasional early philosophical writings leave no doubt as to this side of his character, which is also illustrated by the life-long habit of epigrammatic, well-turned, often paradoxical expression, a trait which he had in common with Chamfort and Rivarol; witness his celebrated definition of love as "*une* sottise faite *à deux*." Further, having lost his father in 1785, and having been designated by him as the head of the family, although he was the second and Joseph the eldest son, he had known poverty and the responsibility of helping to provide for his mother, brothers and sisters. Success was more necessary to him than to others, and the upheaval of 1789 favoured the ambitious.

We must realize therefore that he entered the Revolution in rather an unusual frame of mind, occasionally ardent, joining the Jacobins without hesitation, but also capable of coolly judging events as when on June 20, at the capture of the Tuileries, he was moved to scorn by the weakness of Louis XVI. We must also remember that, having begun his studies at the cadet school at Brienne, he completed them at the Ecole Militaire in Paris, where (1784–5) he received a solid grounding in the work of an artilleryman and an officer. It would be wrong to look on him as a kind of self-taught genius, a god of war, who might be said to have discovered, taught, and even created strategy and tactics.

The Artillery Officer.—He himself acknowledged, modestly and loyally, his debt to his teachers. He had studied the treatises of Bourcet and of Guibert, who had evolved from modern armaments new principles and methods of warfare. As a sub-lieutenant at Auxonne, after leaving the Ecole Militaire, he received at first hand instruction from baron du Teil, brother of the author of a remarkably advanced work on the use of modern artillery. He profited by the instruction, and always spoke of it with appreciation. However gifted a man may be, he still needs inspiration and counsel, and learns more from his predecessors than he himself passes on to his contemporaries and to posterity. The genius of Napoleon was not least evident in the way in which he made use of the instruction which he received. Curiously enough, Guibert in his *Système* de *guerre moderne* had predicted that a great man would arise to put into practice the military theories which were then taking shape. These facts, which place Napoleon in his proper intellectual environment, seem to the writer to throw more light on his mind and his character than would countless anecdotes of his childhood and schooldays, such as that at Brienne he was nicknamed *Paille au nez* by his companions because of the way in which he pronounced *Napolione*.

Between his spells of garrison duty at Valence and at Auxonne as a young artillery officer, a part of his early career of which little is known was passed in the leave which he spent on more than one occasion in Corsica, where the somewhat complicated affairs of his family demanded his presence. At Ajaccio in Sept. 1789, he found his elder brother Joseph deep in the affairs of the democratic party which had inevitably, with the progress of the Revolution, become the party of France. Paoli, who had at first thought that events in France would bring about Corsican independence, had soon been disillusioned, Jacobinism being essentially a unifying and centralising force. He inclined therefore to the counter-revolution and entered the opposite camp.

Napoleon, promoted lieutenant in 1791 on the reorganization of the artillery, was stationed for another three months at Valence, where he continued his studies, and even wrote an essay on a subject set for competition by the academy of Lyons: "What are the principles and institutions most likely to bring about the greatest happiness of mankind?" He treated the subject in the style and according to the principles of Jean Jacques Rousseau. When, years afterwards, Talleyrand showed him the essay, he threw it into the fire.

He was again in Corsica from Sept. 1791 to May 1792. Feeling ran high in the island, as a result of the disestablishment of the Catholic Church. He plunged into political intrigue, outstayed his leave, and became liable to the penalties in force against deserters and émigrés. On April 20, 1792, however, the legislative assembly had declared war on Austria. Officers were needed. Instead of undergoing any penalty, Bonaparte, whose zeal for the Revolution was well known, was made a captain. In this capacity he remained in Paris for several months, and witnessed the great events of the Revolution. After the September massacres, he went to Ajaccio to take home his sister Elisa from the convent of Saint Cyr which had just been closed. This was his last visit to his native country. The break with Paoli was now complete. Bonaparte was on the side of the "*patriotes*," while the old champion of independence was appealing to the English against the Republic, One and Indivisible. Paoli was victorious. Bonaparte and his family, now entirely ruined, had to fly from the island and take refuge in France. This was the termination of what we may call his "insular" period. As he himself said afterwards, once he had left Ajaccio, more important affairs left him little time to think of Corsica and Paoli.

Early Military Opportunities.—In Sept. 1793, Napoleon Bonaparte was still unknown to the world whirh was to ring with his name. Amazed himself at his extraordinary career, and the incredible swiftness of his rise to power, he said in Saint Helena to Las Cases, "Centuries will pass before the unique combination of events which led to my career recur in the case of another." Favourable circumstances were also required to bring the young artillery officer to the front, and these were not lacking. The republic, which had challenged half Europe, had to face foreign and civil war, under conditions of anarchy. Bonaparte was a Jacobin, with a great reputation as an artillery officer. At Beaucaire, on his way to Paris, he had written a pamphlet, the *Souper* de *Beaucaire*, in which he had refuted the arguments of three Southern federalists or counter-revolutionaries. It is probable that it reflects a conversation which actually took place in an inn of the little town beside the Rhone. Its publication attested the patriotism of its author. The good word of Robespierre's brother and of Napoleon's compatriot, the deputy Salicetti, were also of assistance. At this juncture it was necessary to recapture Toulon, the inhabitants of which had rebelled against the Convention and called in the assistance of an English squadron. An able officer of artillery was required to direct the siege operations. Bonaparte was chosen.

There has since grown up the legend of "the great Napoleon at the siege of Toulon," though the part which he really played was essentially that of a technical expert. He found in command General Carteaux, formerly an artist, who was too ignorant even to understand that to take Toulon he must capture the position which commanded the roadstead. Things were no better under his successor, Doppet, and until the arrival of General Dugommier, a soldier of greater experience, who, together with Gasparin, the people's commissary, recognized the knowledge and good sense of the young artillery officer.

On the fall of Toulon in Dec. 1793, Napoleon was promoted general of brigade, and in Feb. 1794 he was given the command of the artillery of the army of Italy. These were still subordinate positions, offering little opportunity for prominence. He spent the next few months — the period of the Terror — in inspecting fortifications and was even for a time "suspect" for having reconstructed an old fort at Marseilles, a town which had also risen against the Convention. He had rejoined the army of Italy, when fresh disaster seemed imminent. After the 9th Thermidor, his relations with the Jacobins became compromising. Accused of having disclosed certain plans to the younger Robespierre, he was arrested, but, in default of evidence, was released on Carnot's instructions. Nevertheless his position at this juncture was extremely precarious. Under the nerveless leadership of Schérer, he had no opportunity of distinguishing himself in the Italian campaign except at Saorgio and on the Roja. He was marking time, in fact. Like a true soldier he detested the campaign in la Vendée, and he refused the command of an infantry brigade which was to be sent against the Western royalists. Aubry, the minister of war, removed him from the active list in consequence.

Reverses. — He now experienced real poverty, and had to sell his books and his watch. He thought of taking service with the sultan to re-organize the Turkish army. Madame Tallien, wife of the member of the Convention, whom he met at this time, interested herself in him and made his peace with the authorities. When Kellermann lost the lines of the Apennines it was remembered that Bonaparte knew Italy, he was taken into consultation, and joined the topographical service of the army.

At this time, in the autumn of 1795, Hoche, Marceau and Joubert were already famous; Bonaparte was still unknown. It looked almost as if fortune were definitely against him. The only thing which he had brought back from his campaigns was the itch and, probably, the malaria, which made him very ill. He was obliged to shave his head, which was later on to bring him the nickname of *"le petit tondu."* Small in stature, thin, yellow-faced, badly dressed, his person was unimposing and no one would have seen in him the future emperor of the French.

The Insurrection of 1795. — It needed a day of revolution and of civil war to bring him into prominence, by giving him the chance to do the Republican Government a service, the vital service of saving the Republic. In the autumn of 1795 the majority of the people of Paris were chafing against dear food, *assignats* and never-ending war. The Convention, by declaring for a constitution designed to keep its own members in power, provoked an insurrection, which, owing to the weakness of General Menou, very nearly succeeded. The Convention then placed the deputy Barras in command of the home forces. He, having known and learnt to value Bonaparte at the siege of Toulon, asked for, and obtained, his appointment as second in command. The young general at once assumed complete control, issued rapid orders, forestalled the insurgents who were about to capture the artillery parked at Les Sablons, and shot them down in the rue Saint-Honoré, on the steps of the church of Saint-Roch. In less than a day he had subdued a serious royalist rising (*13 Vendémiaire* — Oct. 4, 1795). He had saved the republic and earned the nickname *Général Vendémiaire.*

ITALIAN AND EGYPTIAN CAMPAIGNS

Italy. — His first reward was the hand of Josephine, a beautiful Creole, widow of the viscount de Beauharnais, who had been guillotined during the Terror. Josephine, whose morals were none too strict, was living at this time mainly by her wits. The general was six years younger than she, but he seemed to be on the threshold of a brilliant career, and the marriage freed her from poverty. He had, in fact, as his second reward been appointed commander in chief of the Army of Italy. Like Josephine, the government of the Republic was at the end of its financial resources. At this moment, indeed, there was difficulty enough in feeding the troops; it was hoped they would live on the conquered territory. At the beginning of March 1796 Bonaparte married Josephine. At the end of the month he arrived at his headquarters at Nice.

His army consisted of thirty thousand starving soldiers, in want of everything. He issued to them the famous proclamation: — "You are badly fed and all but naked. . . . I am about to lead you into the most fertile plains in the world. Before you are great cities and rich provinces; there we shall find honour, glory, and riches." He entered Italy on April 10. His plan of campaign — the separation of the Piedmontese from the Austrians — was very simple; he executed it successfully after severe actions at Montenotte, Millesimo and Dego.

While he was conducting the campaign, he did not forget that he was a general of the Revolution, and issued to the Italian people proclamations which, while treating the Catholic religion with respect, spoke the language of liberty. The king of Sardinia took fright, and, on the advice of the Archbishop of Turin, sued for peace to an army "with neither artillery, cavalry, nor shoes to its feet." The pope and the dukes of Parma, Modena and Tuscany were not long in following the example of Victor Amadeus. Great political schemes were taking shape in Bonaparte's mind, but first he had to beat the Austrians. This was, indeed, his first experience of large-scale operations. The crossing of the bridge of Lodi was a bold achievement which made his name known in a day all over France and indeed all over Europe. That day, by an old camp custom, his soldiers dubbed him corporal, and another nick-name, the *"petit caporal,"* stuck to him.

New Republics. — In May, some weeks after the setting out of his ragged army, he entered Milan in triumph. He could write to the directory: "The republic holds all Lombardy." At that same moment he received from Paris orders which upset all his plans. Sure that his resignation would not be accepted, he sent it in, and, while waiting for the answer, harried the Austrians, whose generals "faithful to the old system of warfare. scattered their troops in small detachments before a man who practised mass-movement." The further Bonaparte advanced with so small an army, the greater was the need for skill and boldness. At Arcola he suffered in his own person, by falling into a swamp. These "miracles of genius and courage" were crowned by the victory of Rivoli, followed by the preliminary negotiations of Leoben (April 18, 1797). "No other general could show such fourteen months." He had forced Austria to sue for peace. He had founded the Cispadane, the Cisalpine, and the Ligurian republics, which brought a large part of Italy under the same *régime* as France, and preparations were begun for its annexation. He had been able to provide for his army by requisitioning; to conquer without costing the treasury anything, and had even sent money to Paris. Finally when the Republicans, having lost their majority in the Councils, were in need of help, Bonaparte, though he had cause for complaint against the directory, sent them his subordinate Augereau, for the *coup de force* of Fructidor (Sept. 1797) directed against the royalists and the moderates. True, the royalists and moderates wanted peace, while Bonaparte agreed with the Jacobins, and aspired to secure France's "natural frontiers."

He was able to congratulate himself on fulfilling both desires by the Treaty of Campo-Formio (Oct. 17, 1797). By it the emperor ceded to France both Belgium and the left bank of the Rhine. Glorious as it was, however, and in keeping with Revolutionary foreign policy, the treaty, far from ending the war, perpetuated it. To assure the permanence of these conquests the goodwill of England was necessary, and England was not in a position to give it; compulsion was therefore necessary. The whole story of Napoleon up to Waterloo turns on this. Henceforth he was to struggle against England, and in that struggle he was in the end to be vanquished.

England and Egypt. — The brusqueness of his manner, and still more his popularity with the masses made him an object of suspicion, in spite of the services which he had rendered the Republic. He, on his side, despised the corrupt government of the directory, "a government of lawyers," whether Jacobin or moderate. He soon realised that their plans for an invasion of England had no chance whatever of success. In any case he thought it prudent to quit France for a time. The East had always fascinated him. "Only in the East can one do great things," he said. Reading and reflection had convinced him that Egypt was one of the keys of the world. This idea had already emerged in the days of Louis XIV., and was taken up again during the 18th century wars between France and England; there too Napoleon had his forerunners. He planned to strike at the power of England through Egypt and the route to India, and to stir the imagination of his own country-men. The directory accepted the scheme.

The Egyptian expedition was thus indirectly to be the means of forcing the British government to recognise the territorial acquisitions of the Revolution. The weakness of this plan, a weakness inherent in the whole struggle with England, was that France had no navy. Though Bonaparte, by a fortunate combination of circumstances, was able to land his army near Alexandria (July 1, 1798), Nelson, a month later (Aug. 1), destroyed the French fleet at Aboukir. From that moment the Egyptian expedition, instead of being *"le* commencement *d'une* grande chose" was merely an adventure. In vain Bonaparte executed a brilliant campaign, capturing Cairo, and subduing the country in three weeks. Of the great expedition nothing has endured but famous sayings, such as "Soldiers, from these pyramids forty centuries look down on you"; the Institute of Egyptology; the diffusion of the French language in the valley of the Nile; and, in Bonaparte's own case, a romantic touch of orientalism, symbolised by his faithful mameluke Roustan. Nevertheless, to carry through his great scheme, he undertook the conquest of Syria. Acre, under Admiral Sidney Smith, held out. "That man made me miss my destiny," he said later.

18th BRUMAIRE AND THE CONSULATE

The Coup **d'État.**—The expedition was, in fact, a failure. Bonaparte realized that there was nothing to be done in Egypt. At the same time came news which told him that there was work for him in France. The directory was in difficulties both at home and abroad. Disorder was rampant, finance and currency desperate, discontent everywhere. The Government, not knowing which way to turn, swayed one day to the Jacobins, the next to the moderates. In Germany the war continued, and in Italy the Republican armies suffered a series of reverses, and invasion was only checked with difficulty by Brune at Bergen, and by Masséna at Zurich. The restoration of the monarchy seemed inevitable. The republic could be saved only by a military leader.

"I seek a sword," said Sieyès, nne of the five directors, racking his brains for a general to whom he could confide the defence of the Republic. At that crucial moment Bonaparte decided to return. He went boldly on board a frigate, slipped through the English cruisers in the Mediterranean, and landed at Fréjus on Oct. 8, 1799. He was greeted with shouts of "Long live the republic." He was the man of the hour for all those who desired an end of anarchy but were opposed to the return of the Bourbons. Without him the Revolution was a lost cause. This consideration is essential to the understanding of the famous coup d'e'tat of the *18* Brumaire (Nov. 9, 1799).

The *coup* d'e'tat was organized, indeed, from within. Not only had Bonaparte accomplices among those in power, he had not even to offer or to impose himself; he was sought out. Baudin, a deputy from the Ardennes, and a staunch Republican, died of joy when he heard of the return of *"Général* Vende'miaire," who was once more to save the Republic. Of the five directors, Sieyks, though a regicide, had given up hope of saving the country except by a dictatorship, of which he hoped to be the head, with Bonaparte as his strong right hand. Roger-Ducos was of the same opinion. The third, Barras, was corrupt, and would do anything for money. Only the remaining two, Moulin and Gohier, were immovable in their Jacobinism, and had to be silenced. Resistance could come only from political circles, the assemblies, or perhaps from part of the army, where Jacobinism was still strong. The conspirators were assured in advance of the support of public opinion It is, therefore, essential to note that the coup d'e'tat was conceived and organized by Sieyès, who took charge of the parliamentary side, while Bonaparte was an executive agent charged with assuring the support of the army. We must not forget that from its origin to the days of *Fructidor* and *Prairial,* the Revolution had undergone many forcible changes and had violated its different constitutions over and over again.

The pretext for the transference of the two legislative assemblies from Paris to Saint Cloud on the *18 Brumaire* was *a* terrorist plot invented for the occasion. The plan, though well laid, all but miscarried. On the first day, that of *18* Brumaire, all went well, and, as the Convention had done in Vende'miaire, the assemblies placed Bonaparte in command of their forces. On the morrow at Saint Cloud, affairs took a dangerous turn. The Upper Chamber or Council of the "Ancients" had been won over, but the lower or Council of the Five Hundred, whose Jacobin members had had time to summon their forces, greeted the general with shouts of "Down with the dictator! Outlaw him!" Bonaparte lost the thread of his speech, lost countenance, and for a moment was surrounded by a threatening crowd of deputies. Soldiers came to his assistance; however, the day would have been lost but for his brother Lucien, who had made his way in politics and was president of the assembly. Declaring that the right of free speech had been outraged, he dramatically threw off his insignia and rushed into the court of the Orangery to harangue the still hesitating soldiers. Bonaparte, having recovered from a fainting condition, appeared, his face bleeding where, in his agitation, he had scratched it. This made the soldiers think that he had been wounded. General Eeclerc, his brother-in-law, thus charged at the head of his grenadiers and cleared the hall of the refractory deputies. That very evening Bonaparte, Sieyks and Roger-Ducos were elected "consuls" by the Council of the Ancients.

The Revolution was not over. Bonaparte was to continue it under monarchical forms, and to give it at last a government. Sieyks dreamed of giving a constitution to France, but France had worn out so many constitutions during the last ten years! Bonaparte, who had used the "ideologues" as stepping stones to power, now made it clear to them that they had a master; and of Sieyks' constitution, only such portions as suited him remained. Authority was narrowing its limits. Five directors had given place to three consuls.

First Consul. — Immediately after, Napoleon became the first, the only one, elected for ten years. Public opinion gave him what was practically unlimited power. Disillusion and anxiety made him master of France. Some were tired of violence and disorder. Others, who had profited by the Revolution to possess themselves of national property, feared the return of the Bourbons and its restoration to its former owners. The mass of the people therefore, desired the consolidation of the new re'gime. Had it not been for the *18* Brumaire, it is probable that the restoration of the legitimate branch would have taken place much sooner, before the Napoleonic empire had consolidated the results of the revolution by permanent institutions. The great mistake of the royalists was to look upon Bonaparte as another General Monk. He replied with disdain to the overtures of the comte de Provence—the future Louis XVIII. The royalists in their turn hastened to resume the struggle against him, thus definitely marking him as the representative of the "revolution in arms."

The Revolution was further indissolubly bound to its idea of "natural frontiers," and could not surrender the conquests which the rest of Europe refused to recognise. The war had to go on, whether they liked it or not—a fact which entailed government by a soldier. With the rest of his heritage, Bonaparte had to accept the necessity which had made the weak directory as warlike as the Convention. His term of power served merely to postpone the inevitable catastrophe.

Reforms. — His first work was to restore order and to regulate the administration of government. Here his lack of prejudice helped the first consul. As has already been said, being of French education, but not of French origin, he neither disliked nor regretted the old *régime.* He was thus able to adopt the strong points of the old monarchical system and reject the weaknesses of revolutionary democracy. The Revolution had made the system of election universal, in the civil service, in the magistracy, and in the police: a fault which killed successive governments. Bonaparte replaced the elected committees by prefects and sub-prefects, thus re-establishing and multiplying the old *intendants*. Unwilling to restore completely the independence of the magistracy, of which the parlements had availed themselves against the crown, he gave the government the right to nominate magistrates, while making them, in the interests of justice, irremovable. Thus, making use of the experience both of the monarchy and of the revolution, Bonaparte framed the system known as the constitution of the year VIII. based on administrative centralization which subordinated the nation to the State, and which has been so convenient for governments that it has been kept in being by all the succeeding régimes. Altered only in detail, it subsists today.

At the outset Bonaparte justified the hopes aroused by his *coup d'état*. The mass of the people longed for peace at home and abroad. He appeared to fill the rôle of peacemaker. Having rid himself of Sieyès, he associated with himself, for form's sake, two other consuls, Cambacérès and Lebrun, men of ripe age and moderate views, the latter of whom had been secretary to Chancellor Maupeou under Louis XV. When a plebiscite was taken, the First Consul was approved by three million votes. He immediately reassured both the solid middle class. and the revolutionaries who had enriched themselves during the Revolution. He wiped out the last relics of Jacobinism, by suppressing the progressive forced loans, and the law of hostages. He re-opened the churches and pacified the Vendée by putting an end to religious persecution and thus indicating a forthcoming *concordat* with the Pope. With the help of a former official of the monarchy, Gaudin, who became duke of Gaeta, he reorganised the finances, and prepared the way for a return to a stable currency.

Marengo and Elohenlinden. — Abroad his task was more difficult. There is no reason to think that Bonaparte was not sincere in trying to put an end to hostilities, though he may have wished to prove to the peace party that peace was unobtainable. The proof, in any case, was quickly forthcoming. The emperor of Russia having retired from the coalition, it remained to deal with England and Austria. The first consul offered a cessation of hostilities. It was a mistake to think that England, so long as she remained mistress of the seas, would ever allow France to retain possession of the mouths of the Scheldt. Pitt refused. Then Bonaparte made another miscalculation. **A** smashing victory on the Continent would, he thought, compel England to yield. He persisted in this erroneous idea until Waterloo. His history henceforth is a striving for the impossible, *i.e.*, the capitulation of Great Britain on a point she had never admitted — the annexation of Belgium — by a France, which was powerless at sea.

Seven months after the 18 *Brumaire*, he boldly crossed the Alps by the Great Saint Bernard to compel Austria to make peace. On June 14, 1800, the hardly won victory of Marengo made him once more master of Italy. Together with Moreau's victory at Hohenlinden in December, it forced the Emperor Francis to sign the treaty of Lunéville, by which Austria recognized all the conquests of the Revolution. The left bank of the Rhine became part of France, and was divided into departments. This was the triumph of Bonaparte and of the revolution. For the first time in history France had regained her "natural frontiers," those of Gaul as known to Caesar.

By the treaty of Lunéville, the British government lost her last Continental ally. The war was costing dear, and many people were weary of it. Trade was severely affected. The first consul, who knew this, resumed in appearance the preparations for invasion, which had been begun in 1797. When, after the fail of Pitt, negotiations were begun with the London cabinet, he strove to drive a bargain, renouncing all claims on Egypt. In March 1802, the treaty of Amiens was signed. It was. and could only be a truce, but the French saw in it definitive peace, and the prestige of the first consul was increased.

Extensions of Power. — In the midst of his success there was one seed of anxiety. He was in power only for ten years. Three had already passed, and opposition was beginning to make itself felt. A Jacobin conspiracy was discovered. Soon after he narrowly escaped being killed by an infernal machine. Former terrorists were thought to be responsible, but Fouché, the minister of police, found that the criminals were royalists instigated by the irreconcilable Cadoudal. Then the Tribunate instituted by Sieybs, opposed Bonaparte's favourite ideas; the Concordat with the Pope, the Order of the Legion of Honour, the Civil Code. Their opposition would become more formidable as the ten year period drew to a close. Definitely to establish the Consulate, and to make it safe from attack, permanence was desired. Thus by a natural progression opinion tended towards the revival of the monarchy in favour of the first consul. He himself was silent, asked for nothing, and let his friends work for him This they did most effectively.

After the triumph of the peace of Amiens, they proposed a national token of gratitude. The Senate accorded only a prolongation of power for a further ten years. This was a discomfiture. Then Cambacérès thought of consulting the people whether Napoleon Bonaparte (his Christian name was beginning to be used officially) should be made consul for life. It was carried by three and a half million to less than ten thousand votes. The first consul also received the right to choose his successor (Aug. 1802). Although he then had no children, there was nothing to prevent him from choosing his son, if he should have one.

Hereditary monarchy was thus on the point of being re-established, after so many solemn protestations to the contrary. From that time the sovereigns of Europe began to regard Bonaparte as one of themselves. They matched him "climbing step by step towards the throne," though there were to be further happenings before he reached it. It would be an error to accuse him of having sought to gain the crown by means of a new war. The establishment of the empire was an indirect consequence of the renewal of hostilities in May 1803, the immediate cause of which was a dispute over Malta and the interpretation of the treaty of Amiens, though for reasons easily understood, and beyond the control of statesmen, peace could never have been more than a truce. Could England allow France to remain in permanent, possession of the finest coast line and most valuable ports of the Continent from Rotterdam to Genoa? To put the question is to answer it. And we must remember that Napoleon had received Belgium and Holland in trust for the Revolution.

Counterplots. — France and England slowly prepared for a struggle which this time must be carried to the bitter end. The twice abandoned plan of invading Great Britain was again resumed, and a camp was formed at Boulogne. Meanwhile the irreconcilable royalists, encouraged by the first consul's new difficulties, conspired with General Pichegru to assassinate him. Georges Cadoudal, who had landed in France, succeeded in implicating the celebrated Moreau, jealous of the first consul. The discovery of this plot infuriated Bonaparte. He accused the *émigrés* of ingratitude, publicly affirmed his republican sympathies, and declared that the intention was to destroy the revolution in his person. He determined to strike.

A young prince of the house of Condé, the duke of Enghien, one of the Bourbons, was forcibly seized on the territory of the duchy of Baden, summarily tried and shot. Bonaparte has been universally condemned for this judicial murder, which set "a ditch filled with royal blood" between the older dynasty and the throne upon whose steps he stood. His regicide monarchy was no longer suspect even to the fiercest republicans. Just as the infernal machine had contributed to the success of the first plebiscite, the conspiracy of Cadoudal and Pichegru facilitated the proclamation of the empire. The first consul had escaped the conspirators, and the danger helped his cause.

THE FIRST EMPIRE

The consulate for life seemed too precarious; a Napoleonic dynasty would survive its founder. Since his enemies, who were the enemies of the revolution, wished to destroy him "he must be made king or emperor, so that heredity should reinforce his power by ensuring him of natural and unquestioned successors and, by rendering useless crimes against his person, should remove the temptation to commit them." (Thiers.)

Thus France returned to hereditarv monarchy, approved by a unanimous vote of the Senate, and by a plebiscite. The empire was proclaimed on May 18th, 1804, the title of emperor being chosen because the word king was inseparably connected with the Bourbons, and because it sounded more impressive, more military. It evoked, moreover, memories of Rome and of Charlemagne And, like Charlemagne, Napoleon wished to be crowned by the Pope, not in Rome but in Paris. After some hesitation Pius VII. granted his request. On Dec. 2, at Notre Dame the amazing ceremony took place, and the soldier of the revolution became the anointed of the Lord. Moreover he took the crown from the hands of the Pope, and placed it on his own head. And Josephine the Creole adventuress, became empress. But Napoleon could dare all. He built up a new nobility, he gathered together a court France approved of everything. When the wife of Marshal Lefebvre (the celebrated *Madame Sans-Gêne,* who had been a washer-woman) became the duchess of Dantzig he dared even ridicule.

Boulogne, Ulm and **Cadiz.**—The empire united the old France with the new; in it revolutionary and monarchical ideas were combined. There was general satisfaction. Prosperity had returned with ordered government. No one troubled about the one weak point. The empire could not be really established, nor the conquests of the revolution assured, without the defeat of the British power. Napoleon did not forget it, and in the midst of his re-organization of home affairs, his thoughts were on the camp at Boulogne. He knew that to settle finally with England he must overcome her on her own ground, and must have therefore, were it only for one day, free passage across the Channel. A third coalition was forming. He could, he was sure, defeat its forces by land, but this new victory would be no more effective than earlier ones, so long as the British navy, was undefeated. With the help of Admiral Decriis, Napoleon had laboured since the days of the consulate to re-establish the French navy, ruined by the Revolution. But a navy is not built in a day. Failure at Boulogne was to change the fortunes of the empire.

Yet the plan was bold and simple. France had two squadrons. The destruction of one mattered little if, while it fought, the other could slip into the Channel and for 24 hours assure the transport of the troops gathered at Boulogne. On this strategy everything turned; it failed. Villeneuve failed Napoleon, as Grouchy was to fail him at Waterloo. The admiral was uneasy about his equipment, his officers, and his raw and untrained crews. His anxiety was shared by Decriis, the minister of marine. Napoleon spent the month of Aug. 1805 in cruel suspense. Villeneuve, he learnt at last, had not dared to enter the Channel and instead of bearing towards Brest, was making sail to the south. Once more the invasion of England must be abandoned, or at least postponed. Austria was openly threatening, Russia was arming, Prussia could not be depended upon. Austria must be brought to the knees without delay. Napoleon broke up the camp at Boulogne, marched into Germany with amazing rapidity ("The emperor makes war with our legs," said his soldiers) and forced General Mack to surrender at Ulm on Oct. 19.

Two days later this magnificent victory, with all those which were to follow it, was nullified. Villeneuve, blockaded by Nelson in Cadiz, had tried to escape. The British fleet, though smaller in numbers, had destroyed the Franco-Spanish off Cape Trafalgar. From that day the French empire was doomed. Napoleon was faced with the hopeless task of subduing England, absolute mistress of the seas. All his future was governed by that impossibility.

Austerlitz and **Jena.**—Because he had not crossed the Straits of Dover, he was to go in vain even to Moscow. In vain he sought to triumph first over the Continental powers, hoping then to find the British government discouraged and in a mood for compromise. The Russians having offered battle, he defeated them, and also a fresh Austrian army, in the most brilliant of his victories, that of Austerlitz (Dec. 2, 1805), exactly a year after his coronation. In a few weeks the third coalition was wiped out.

The armies of France, under the single command of a man who was a military genius and an absolute sovereign, seemed invincible. Napoleon. and perhaps he alone, knew that no decision had been reached. He rejected Talleyrand's plan for a reconciliation with Austria, and, returning to the idea which had inspired his Egyptian expedition, planned to strike at England through the East. By the peace of Pressburg he made of a subjugated and diminished Austria a means of communication with Constantinople. The vision was taking shape. To realize it, however, he must dominate all Europe. Within a few years he exhausted the Empire in the attempt. With the conquest of Belgium as a starting point, the revolution urged its successor to vast enterprises, for which neither the military genius of Napoleon nor his political ability would suffice. It was not mania for conquest but the logical development of these schemes which led him to annexations and dangerous territorial adjustments which disquieted all Europe. His brother Joseph became king of Naples, his brother Louis king of Holland. He formed the states of Southern Germany into the Confederation of the Rhine, with himself as president. Prussia, charged with closing the Baltic to the English, was promised Hanover, and the Bourbons, dethroned in Naples, were to have the Balearic isles. After the death of Pitt, he tried to conciliate England by offering secretly to restore Hanover. These diplomatic moves served only to make him two enemies, Prussia, which he had humoured for so long, and Spain, a former ally.

The Prussian campaign saw another of the lightning strokes which he understood so well. The Prussian Army, which had lived on the reputation gained under the great Frederick, was routed at Jena (Oct. 1806). In a few weeks the defence had collapsed, and Napoleon was master of the greater part of Prussia.

The Subjugation of Europe — Since Prussia had refused to lend herself to his schemes, he would make northern Germany another annex to his empire, himself closing the Baltic and eventually all Europe, to English commerce. From Berlin he promulgated the Continental blockade, an idea arising naturally out of the situation, simple, easy to set out on paper, but entailing the suppression of the independence of all the nations of Europe, since the prohibition of trade with England to be effective must be general. The Continental blockade was the consequence of and the counter-strike to Trafalgar.

But Napoleon was caught in a net from which there was no escape. He had set himself an endless task. After Ulm had to come Austerlitz, after Austerlitz, Jena. After Jena he had to complete the conquest of Prussia, and to complete it, to defeat Russia, penetrate further into the East, cross the Vistula. At Eylau (Feb. 8, 1807), three hundred leagues away from France, he fought in the snow a bloody and inconclusive battle. A new effort, the calling up of next year's conscripts was demanded of Frenchmen "that peace might be won." In June at Friedland, the *grande armée* was again victorious.

Once more Napoleon had the illusion that the goal was reached, that he was master of Europe and could hold England to ransom. The tzar Alexander, highly strung and impressionable, was now won over to the idea of an agreement with the emperor of the French for a policy of partition on 18th century lines. This time Turkey was to be divided instead of Poland. Napoleon was convinced that, allied with Russia against England, able to close the Mediterranean against her, threatening her even in India, he would force her to her knees. The meeting at Tilsit, and the conclusion of the pact of friendship between the emperor of the East and the emperor of the West, seemed to justify the costly victories which had led the French army as far as the Niemen.

Spain, Prussia and Austria. — The first disappointment was that the Franco-Russian alliance determined England to fight more fiercely than ever; her answer was a declaration of war against Russia, and the bombardment of Copenhagen. The Continental blockade everywhere led to increasing difficulties. Portugal showed no eagerness to shut out English trade. Junot had to be sent there with an army. Spain was also giving trouble, and Napoleon determined to drive the Bourbons from Madrid. As if he were transferring prefects, he placed his brother Joseph on the throne of Charles IV., and succeeded him at Naples by Murat, who had married Caroline Bonaparte. At the same time the occupation of the Papal States by General Miollis, charged with enforcing the blockade, embroiled him with the Pope. The system drove Napoleon to increasing severity. To hold Germany and Italy, together with the Adriatic coasts, and the Spanish peninsula, would soon require a standing army of a million men, while the patience with which his conquests and his violence were endured would decrease in proportion to the dispersion of his troops.

Spain gave the signal for resistance. The Spanish people refused to recognise Joseph, and a wide spread insurrection broke out. When, in July 1808 General Dupont surrendered at Baylen, the Napoleonic empire suffered its first military reverse. The news resounded all over Europe. At the same time an English army landed in Portugal and Junot succumbed to superior numbers. Napoleon's desire to direct and control Spanish affairs had not only caused the English to be received as liberators, but had committed himself to an endless struggle against a people in arms. The uprising of the Spanish nation was infectious. In Prussia, in Tirol, in Dalmatia, patriotism was extolled, and the idea of a holy war for national independence took root and grew. In later days the emperor realized that Spain had been his first check, and that the limit of his power had been attained. In spite of a fresh interview at Erfurt, at which the two emperors paraded their friendship before an audience of kings, the Franco-Russian alliance languished. The partition of Turkey was hindered by the question of Constantinople, which neither emperor wished to see in the power of the other. Alexander was beginning to doubt the power of his new friend. Napoleon, feeling that the ill-success of his policy in Spain was injuring his prestige, determined himself to cross the Pyrenees, and re-establish Joseph in Madrid.

Incited by England and lavishly supplied with English money, Austria took advantage of his absence to re-enter the struggle. Napoleon had to return in haste from the Ebro to the Danube. The Austrian plans were carefully laid, and their opposition was far from negligible. Essling was a difficult, and Wagram (July 1809) a costly victory, but in both he carried the day.

Russia. — From these very successes, however, there arose a further complication. Napoleon had made use of Poniatowski and his Poles against the Austrians. Alexander, who, in any case, had remained neutral, feared that Napoleon was planning the reconstitution of Poland. Abandoning his former ally, he denounced the Continental blockade, and had in his turn to be encountered. The idea of conquering England by Europe and Asia, the sea by the land, had brought about a result which, though it seems at first absurd, was yet the logical conclusion.

It was with no light heart that Napoleon decided to carry the war into Russia. He still hoped that it might not be necessary, if Spain were subdued and if the United States, to whom he had ceded Louisiana and promised Florida, declared war on England, which, attacked in its vital interests by the Continental blockade, would at last sue for peace. There was no doubt that the blockade was having a disastrous effect on British trade; its results on the commerce of other nations were no less serious. Holland refused to enforce it, and Napoleon was obliged to resume control from his brother Louis, who had espoused the cause of his new subjects. He annexed the country, and divided it into departments, thus giving England a fresh reason for remaining under arms. In this way the Continental blockade led either to fresh wars or to expansions of territory which the English inevitably refused to recognise, since they had never recognised those revolutionary conquests which the new ones consolidated.

France was growing uneasy. Common sense made it clear that this extension of territory and of war could not go on indefinitely, and yet no end was in sight. Far-seeing members of the emperor's own circle, such as Talleyrand and Fouché, began to fear that affairs were going wrong. "If it only lasts," said Laetitia Ramolino, *Madame Mère*. Yet the empire never seemed so great, nor the future so secure as in 1810.

Marie-Louise. — Already on a level with kings, Napoleon in his second marriage equalled the proudest dynasties. The head of the house of Habsburg gave him the hand of his daughter. Josephine, though she was loved by the people and her dethronement regretted, was growing old and she had given him no heir. He was tired of her, and anxious to ensure the succession. The emperor of Austria must have shared his confidence in the future, since he was willing to accept the "Corsican ogre" as his son-in-law. The marriage contract with the archduchess was modelled on that of Louis XVI. and Marie-Antoinette, into whose family he was now admitted, in one of the most extraordinary episodes of even his life. The following year Marie-Louise bore him a son; the empire had an heir, who was given the title king of Rome, as the heir to the Holy Roman Empire had been named king of the Romans. But in 1811 Rome was but the capital of the department of the Tiber. The pope had been deported to Savona and was about to be imprisoned at Fontainebleau. By the Continental blockade the restorer of Catholicism in France had been led to alienate Catholics all over the world. Nevertheless, excommunicated, having driven the Bourbons from Naples and from Madrid, the man who 20 years before had been an insignificant officer with neither name nor fortune, married a daughter of the Habsburgs. Confident in his star, he carried all before him.

Though his marriage gratified his ambition, Napoleon had decided upon it only after the failure of negotiations for an alliance with a sister of Alexander. He would have preferred a Russian princess, for more than one old veteran of the Revolution, remembering Marie-Antoinette, asked why the "little corporal" should marry another "Austrian." But the Russian emperor was gradually disengaging himself from the alliance, on which Napoleon was ceasing to rely.

Moscow.—Realising that the Russians would never consent to the extension of the French empire, which under the necessity of the Continental blockade had ended by annexing the Hansa towns of Bremen and Hamburg, and making them the principal cities of two of its hundred and thirty departments, he saw that war was inevitable. French territory now stretched to the Baltic, and the nearer its boundaries approached those of Russia, the greater was the danger of conflict. Difficulties arose continually over Oldenburg, Poland, the East, and the reluctance of Russia to abandon trade with England. The two allied emperors were arming against each other. These preparations were themselves a further offence. Convinced that this new struggle had been decreed by fate, and that his work would not be accomplished till he had vanquished Russia as he had vanquished Prussia and Austria, Napoleon now assembled for the campaign of 1812 the greatest army which the world had yet seen, an army of "twenty nations" made up of contingents from all the peoples allied to or dependent on France, a sort of Western crusade against Asiatic Russia. By natural inclination, as much as by policy, Napoleon raised again for this crusade the battle cry of the Revolution, the liberation of nationalities, of which the reconstitution of Poland was to be the token. He forgot that the Spaniards were already fighting for their independence, and that the nationalism, awakened by principles of the Revolution, was stirring the people of Germany. Alexander, who could play many parts, also spoke the language of liberalism, invoked justice, enlisted on his side the countries defeated and subjugated by France or in rebellion against her, and prepared for peace with Prussia and Austria by complicity in the partition of the Polish provinces. Napoleon was thus to stake everything on the inevitable Russian campaign. Victorious, he would be master of the East, of Constantinople, of all Europe, and would at last force the English to capitulate. Defeated, he himself would have given the signal for the debacle. The war which began in 1792, having carried the French to the gates of Moscow was to return by a swift and violent revulsion to the gates of Paris.

In June 1812 the grande *armée* crossed the Niemen. According to their custom, the Russians declined battle. Alexander had said that he would retire if necessary beyond Tobolsk, while Napoleon imagined himself dictating peace from Moscow. The Russians set fire to the city, and made no peace. Then began a retreat which after the passage of the Beresina became a disaster. In the month of December, Ney and Gérard arrived at Konigsberg almost alone. The *grande armée* had melted away. Realising the extent of the catastrophe, and its probable effects in Europe and in France itself, the emperor had secretly left the army, which was kept in ignorance of his departure. The news of General Malet's conspiracy, which had reached him in Russia, had shown him how precarious was his position and how much weakened his prestige.

The Loss of Germany. — The subsequent history of the Empire is the story of a rapid return to the conditions under which Napoleon had assumed the dictatorship in 1799. The Republicans themselves on the *18th Brumaire* had entrusted him with the task of saving the Revolution and its conquests. To this end France had allowed him to take the crown, to found a dynasty, to overrun three-quarters of Europe and to raise countless armies. All in vain. In a few months he was back at his starting point.

The Spanish insurrection of 1809 had encouraged England to persevere, and had revived the resistance of the conquered peoples. The disasters of the Grand Army in 1813 spurred on his enemies still more. "A few more sacrifices," said the English, "and our end is accomplished." Not even the long hoped for declaration of war by the United States, due not to French diplomacy but to the doctrine of the freedom of the seas as opposed to the English "tyranny at sea," could affect the determination of the British government. Everything pointed to a vast change of fortune in favour of the cause of which England, at one moment, had remained the sole champion. Nationalist propaganda was bearing fruit in Germany. Prussia, while still protesting fidelity to Napoleon, had shifted her allegiance, and secretly reconstituted her army. A Prussian corps in French service, commanded by General York, went over to the Russians. Its defection made a great sensation in Germany and hastened the continued retreat to the Elbe of the remnants of the French army. The Prussian government then unmasked and, obedient to popular opinion, proclaimed a war of liberation and independence.

Napoleon chose to consider his Russian defeat as an accident. In Germany it would always be easy for him, he thought, to beat the Prussians and the Russians; having raised and trained a fresh army he did, in fact, beat them at Lutzen and at Bautzen. The campaign of 1813 opened well. He was, however, justly apprehensive of Austria, and instead of following up these fresh successes he agreed to an armistice, so as to be ready for the third adversary. A coalition of Austria, Prussia and Russia had no terrors for him. He wished to settle with it as quickly as possible, thinking that he held enough cards to secure even from England a favourable peace. The victory of Dresden (Aug. 27) seemed to justify this. But, one after the other, his generals, badly served by their contingents from the Germanic Confederation, were beaten in the field. and his plans were delayed. At Leipzig, where he had returned to prevent the junction of his three opponents, Napoleon fought a three days' battle (Oct. 16–19), during which his Saxon troops went over to the enemy. Having lost this immense battle, and all Germany with it, he had to fall back to the Rhine. In November what had been the *grande armée* entered Mainz, after fighting its way through the Bavarians who in their turn had betrayed him.

Was it possible, on the banks of the Rhine, to secure peace on the basis of "natural frontiers"? The question had been identical under the Revolution. Prussia showed herself at last as the German power most fiercely opposed to France, and England insisted on the renunciation of Antwerp. This was, as it had been during twenty years of war, the question at stake.

Disintegration. — Holland had risen against French rule. Belgium was tired of conscription and of taxes, and there also was awaking an old, invincible consciousness of nationality. The British government, well informed on the condition of' France, was aware of her exhaustion. Everything, they knew, had been organized for conquest, nothing for defence. The Allies were much superior in numbers. Even within its own boundaries the Napoleonic empire was tottering. Their determination to finish the business once and for all carried even more weight than Prussia's hatred, and the negotiations which took place before the Allied entry into Paris were for that reason insincere. It had been clear since 1798 that, with England undefeated, France could make peace only on returning to her former frontiers.

No one knew better than Napoleon himself that he was, as the Convention and the directory had been, bound hand and foot by the war and its conquests. He must defend those conquests to the end, or perish with them, as the Revolution had perished. The very nature of his power and the conditions on which he had received it, forbade him that honourable and prudent peace which he has been vainly reproached for failing to achieve. First the allies would have none of it, though their unwillingness was veiled to give the impression in France that only the insensate ambition of the emperor stood in the way; secondly. no government of revolutionary origin could accept the former boundaries. The situation was the same as in 1799. "As things are," said Napoleon, "no one but a Bourbon can succeed me."

The Bourbons, however, succeeded him for another reason. When the Allies invaded France in 1814, they were not in agreement on the form of government. They had not made war for the re-establishment of the monarchy before or now. The Austrian emperor preferred the regency of his daughter Marie-Louise, which would have given him control of French policy. The emperor of Russia dreamed of a king of his making, such as Bernadotte, one of the luckiest adventurers of the Revolution, who by an unprecedented combination of circumstances had become crown prince of Sweden and had betrayed Napoleon. Prussia, concerned only with her own aggrandisement, cared little who ruled in France provided that she obtained her share of the spoils.

Thus Castlereagh, who wished to see France smaller, but free and in subjection neither to Austria nor to Russia, became convinced that a Bourbon monarchy alone would fulfil England's conditions, since, according to Albert Sorel, "this government of principles and not of expedients would be neither the debtor nor the client of any of the Allies." Unknown to, or uncomprehended by the French, this was the reason for the restoration, which to them seemed to be arbitrarily imposed by the enemy, though, in accordance with the English theory of the balance of power, it was intended to preserve their national independence.

Napoleon's campaign in France, the most brilliant of them all, was a barren masterpiece. Albert Sorel has compared his victories, Brienne, Champaubert, Monttnirail, Montereau, to that of Valmy. The Allies hesitated and wondered whether to negotiate. But just as the Revolution had demanded that the enemy should quit French territory, so Napoleon insisted on the guarantee of "natural frontiers." He could do no less, but the object of the coalition was to deprive France of them. "We must reassume the uniform and the courage of '93." he said in Feb. 1814. He clung instinctively to the Revolution, and welcomed the proffered assistance of Carnot, former comrade of Robespierre, and one of the few revolutionaries who had held aloof from the empire. The allies on their side remembered that when, after Valmy, the invaders had retired behind the Rhine, Revolutionary France had decided to pursue them. This recollection stiffened their determination, and strengthened their alliance. The four powers bound themselves afresh by the pact of Chaumont, and resumed the offensive, determined to dictate terms of peace.

Everything was crumbling around Napoleon. With the last levies which France could give him, scarcely more than children, he again tried to hold back the enemy, then to outflank and defeat them. His plans failed for want of men. On March 30 the Allies were masters of Paris, and a German wrote from Montmartre, "Nine and a half centuries ago our emperor Otto planted his eagles on these hills."

Abdication. — On April 11, 1814, at Fontainebleau, Napoleon abdicated. Not only had his Senate, the child of the *Corps Législatif* of *Brumaire,* itself the child of the Convention, deserted him and declared for the Bourbons, but his marshals fiercely urged him to renounce his sovereignty and leave the country. They had returned to the position before the 18 *Brumaire*, from which the Directory had sought to escape. It is again Albert Sorel who notes that the empire ended, as the consulate began, by one of those "days" which had overthrown so many revolutionary governments. On May S, Louis XVIII. entered Paris, while the fallen emperor landed on the island of Elba where his sovereignty was recognized. The former master of Europe now reigned over a few square miles. But he was only forty-five and in the full force of his powers. A man of such immense energy and such ardent imagination could not resign himself so easily to defeat.

Only 25 years separated the beginning of the revolutionary era from his fall. A quarter of a century, however crowded with events, is a short space of time. What had happened? In the part of its programme which included republican government, and "natural frontiers," the Revolution had doubly failed: first, when to save itself it had had recourse after the 18th *Brumaire* to a dictatorship, to absolute sovereignty, to the empire; and again when after incessant fighting for "natural frontiers," the empire had ended by laying France itself open to invasion. Conditions which the Revolution would never accept even though the refusal involved a military despotism, were now imposed. France was obliged to return to her former boundaries, and this involved the restoration of the Bourbons. It was the only possible solution, and there were few in 1814 who did not accept it. Talleyrand, who was far from being a legitimist, played a principal part in the restoration, simply because he realized that it was the only solution. Any government, whether republican or imperial, which sprang from the revolution, was doomed to war, and France had already waged war to the limit of her strength. The monarchy alone could assume the heavy responsibility of concluding peace on the terms offered. Hence when the French had forgotten the disasters and the despotism of the empire arose the reproach that the Bourbons had "returned in the baggage waggons of the enemy."

The return of Louis XVIII. was accompanied by the grant of the "Charter," and representative government. He did not restore the institutions of pre-revolutionary France, but on the contrary, retained those of Napoleon, of the year VIII., even confirming the greater number of his prefects in their office. It remained to make peace in Europe. Louis XVIII. and Talleyrand, making use of the jealousies which had arisen among the allies, sought to make the general settlement as favourable as possible to France. The Congress of Vienna was still sitting when, early in March 1815, the news came "like a bombshell" that "Bonaparte" had escaped from Elba. It had all to be done over again.

There are few examples in history of such sentimental and passionate episodes as the return from Elba. Though the good sense of the French protested against the adventure, it caught at their hearts. Napoleon brought with him so many memories, and with them the tricolor. The daring of his landing in France recalled the return from Egypt. He had only to appear, and almost all France rushed to support him. Yet moderate men realized that the emperor's new adventure was all but hopeless, and would end in a catastrophe even worse than that of 1814. Liberals regretted the loss of the "Charter." France was sick of war, and the abolition of conscription had been the most insistent demand made on the Bourbons. Napoleon maintained that he had been recalled by the people, universally dissatisfied with the restored monarchy. There was, of course, unavoidable friction between the old émigré 'society and the new. There were in particular soldiers who had held out alone in Germany, Holland and Italy, and had not returned to France till after the convention of April 23. These had not witnessed the invasion, and felt that the fall of the emperor had been undeserved. There was also to be reckoned with, the discontent of the officers who had been placed on half pay.

None of this was really serious, however. Only the presence of Napoleon himself, escaped from his island prison, could have brought about the flood of popular feeling by which he re-conquered France in three weeks. He had only to appear and all was forgotten, the disasters of yesterday and those which his return implied, the slaughter which had brought curses on his name, the detested conscription. Officers and men rallied round him. He had not lost his power of appealing to them, and he stirred their hearts by memories of past glory. After the first moments of hesitation the detachments first sent against him declared for him. Grenoble, then Lyons opened its gates. Marshal Ney, who had undertaken to apprehend him and to bring him back if necessary in a cage, wavered, was carried away, and fell into his arms.

The Hundred Days.—Having landed in the gulf of Juan with a handful of men on March 1, 1815, he was at the Tuileries on the 20th, and Louis XVIII. had fled to Ghent.

A hundred days: the adventure lasted no longer, and was doomed from the outset. Three months' madness. To understand why Napoleon, who, ten months before, had been deserted and denied by all, became the master of France in three weeks in a rush of passionate enthusiasm, we must take into account the change in himself, and the new rôle which he played in opposition to the Bourbons. He was not only a military genius. He was a supremely able politician, and his talents had been perfected during the revolution. He now awoke its memory, talking to the soldiers of glory and to the people of peace and liberty. The former despotic emperor returned a demagogue. Two things menaced him. There was first the fear that the allies would again take up arms, but that he assured the people would be prevented by his father-in-law, the emperor of Austria. Then there was his own despotism. But he told the peasants that they were threatened with the revival of tithes, seigniorial privileges and rights. "I come," he said, "to free you from bondage and serfdom." He who had restored the rights of the Church, and founded a new nobility now incited the mob against the nobles and the priests. To the Liberals he promised representative government, the freedom of the press, everything which Louis XVIII. had already granted, but with a new revolutionary tinge. The idea of a liberal Napoleon conformable with the principles of the Revolution, remained in men's minds. From it dates that alliance of the Bonapartists with the Liberals which disturbed the restoration and the reign of Louis Philippe, and paved the way to the era of Napoleon III.

Abroad the consequences of the return from Elba were no less grave. The allies at Vienna learned the news on March 13. They immediately declared the emperor an outlaw. The pact of Chaumont was renewed. Resumption of the war was certain, and new disasters probable for France. Talleyrand, the French representative at the Congress, was in a cruel position. Foreseeing the event, he associated himself with the allies in order at least to keep the conditions of the Treaty of Paris, and to prevent the next treaty from being made even more severe. It was easy afterwards to pillory this prudent decision, and to assert that the Bourbons had joined with the enemies of the French people. When those who had compromised themselves in the Hundred Days sought for an excuse, they used this treacherous argument.

DOWNFALL AND CAPTIVITY

Waterloo.—Napoleon had never held the illusion that the allies would permit him to reign, nor that he could reign, over a France reduced to its former boundaries. He was still subject to the law which had in the past driven him incessantly to battle. Outlawed by Europe, he prepared to fight. He could still command his followers, but the enthusiasm of the early days had evaporated and there were sinister forebodings. There were many abstentions from the plebiscite held, as before, to approve the supplementary Act to the constitution. The assembly of the *Champ de Mai* resuscitated as the festival of Federation, was gloomy. The spirit of the people was exhausted, their minds disturbed, and Napoleon's supporters uneasy. To prevent a new invasion, the Emperor left for Belgium on June 12 with the intention of separating Wellington and Bliicher, who had a hundred thousand men more than he, and defeating them successively. In spite of a success at Ligny, he failed to prevent the junction of the English and the Prussians. This was partly due to what is usually called ill-fortune, but is really the resultant of many forces. Grouchy, a second-rate general to whom Napoleon had given a command in reward for political services, blundered, and remained inactive during the great battle which took place on June 18 at Waterloo—the name of a disaster unparalleled since Trafalgar. On his return to Paris on June 20 no other course but a second abdication was open to Napoleon. All was over. The Napoleonic drama culminated in disaster,

It would appear that in order to strike the imagination of mankind a hero's life should end with a great misfortune. If he had died a natural death in his palace, or fallen on the field of battle, Napoleon would never have become to posterity the figure we know. Lives like his must end in martyrdom, which crowns them with the pity caused by human suffering and the respect due

to misfortune. Saint Helena idealised the emperor's memory, and his gaolers unwittingly prepared for him a sort of poetic immortality. Though his imprisonment in a distant island was a punishment relatively slight as compared with the torture of Joan of Arc, and though the man who placed the imperial crown upon his own head had little in common with the young girl who led her king to his crowning at Reims, there is some similarity in the moral effect and the historical renown of their death. The last phase of Napoleon's life may be regarded as his transfiguration.

After Waterloo, the energy which his presence had re-awakened relaxed. On his return to Paris he felt himself abandoned, The Chamber declared itself against him, and appointed an executive commission to govern with the ministers. He must either forcibly dissolve it, or abdicate. He decided to abdicate in favour of his son, the king of Rome, and made known his intention of going to the United States. The executive commission replied that two frigates, then in waiting at Rochefort, were at his disposal, and requested him to hasten his departure. He remained a week longer at Malmaison, then, as a last despairing throw of the dice, offered his sword against the invaders as a simple general. He then undertook to leave for America. His offer was refused. He left Malmaison on June 29 and arrived at Rochefort on July 3.

The two frigates were there, but the "Bellerophon" and other English ships were cruising before the harbour and blocked the outlet. One hope was left, to slip past and get out to sea. Napoleon would not run the risk of arrest as a fugitive. Thanking all those who offered to help him to escape, he decided on a plan he had had in mind several days, which seemed to him to be the most worthy of him as having an element of greatness, namely to demand asylum from the British government. Maitland, the commander of the "Bellerophon," had let him know that the request would be well received. Thus Napoleon wrote his famous letter to the prince regent:—

"Your Royal Highness, Exposed to the factions which distract my country and to the enmity of the greatest powers of Europe, I have ended my political career, and I come, like Themistocles, to appeal to the hospitality of the British people. I put myself under the protection of their laws, and beg your royal highness, as the most powerful, the most determined and the most generous of my enemies, to grant me this protection."

The allies at this moment were in agreement on only one point of their treatment of Napoleon. There must be no new return from Elba, and it would be perhaps even easier to return from America. The victors, to tell the truth, did not know what to do with him, and every solution presented difficulties. Their secret hope was that he would commit suicide, or perish on his way, the victim of a "White Terror." Or they would have liked Louis XVIII. on his return to Paris to have him summarily tried, condemned and executed. "We wish," wrote Lord Liverpool to Castlereagh, "that the king of France would have Bonaparte shot or hanged. It would be the best end to the business." But no one wished to take the responsibility, and Louis XVIII, less than anyone else. And Alexander I. and Wellington were working to save Napoleon's life. So the fate of the man regarded as an outlaw, "outside human society," *hostis generis humani*, had still to be decided. By his surrender to England the "Corsican ogre" laid on her the task of custody which Lord Liverpool would willingly have left to others.

Louis XVIII., who had returned to Paris on July 9, was anxious for the matter to be settled as quickly as possible, without taking the odium on himself. He ordered the prefect of Rochefort to keep the ex-emperor on the frigate La Saale, and to give him up to Commander Maitland, on the latter's requisition. Napoleon thought it more dignified to surrender without waiting for summons or arrest. On July 15 wearing the green coat of the *chasseurs* de la garde, and the small hat, his favourite uniform, and that in which he is always popularly represented he went on board the "Bellerophon."

One wonders if he deceived himself as to his fate and believed that the British government would allow him to go to America, or to remain at liberty in England, which had always welcomed exiles and was looked on as a political asylum. He may have remembered Paoli and Theodore, king of Corsica for a brief period, who had come to London, to die. Strangely enough there has been found among his papers a short literary exercise, an imaginary letter from Theodore asking Walpole for protection. In his school exercise books is also the phrase "Saint Helena, a little island."

The Voyage.—If Napoleon had hoped to remain at liberty he was undeceived when the "Bellerophon" arrived at Plymouth. Admiral Keith delivered to him, in the name of the British government a letter which informed "General Bonaparte" that in order to deprive him of further opportunities of disturbing the peace of Europe, it was necessary to restrain his personal liberty, and that to this end Saint Helena had been chosen as his future residence. He might take with him three companions, from among those who had accompanied him to England, and a surgeon. The emperor, on receipt of the letter, protested that he was the guest and not the prisoner of the British government, and that the rights of hospitality were being violated in his person. He then resigned himself, and set an example of stoicism to his followers. He did no more than put into writing the verbal protest which he had made to Admiral Keith.

Napoleon took with him into his captivity General Bertrand, a former grand marshal of the palace, Count Montholon, aide de camp, and General Gourgaud, and a civilian, the count de Las Cases. Countess Bertrand and Countess Montholon were of the party, as well as Las Cases the younger, and several servants. On Aug. 7 they embarked on the "Northumberland," commanded by Admiral Cockburn, and almost immediately set sail. The voyage lasted more than two months. Napoleon preserved his impassibility, even though the officers and crew had been ordered to refrain from paying him marks of respect, and he was addressed merely as "General." On arriving at Saint Helena Cockburn even said to General Bertrand, "I know of no emperor living in this island, nor of any person with a right to that position, having, as you say, travelled with me on the Northumberland."

Reading was Napoleon's chief distraction, during this long and monotonous voyage which was bearing him for ever from France and from his family. He had read to him from the Encyclopedia *Britannica* everything concerning Saint Helena and the countries near which the ship was passing. After a turn on deck he would lean against a gun, which the midshipmen soon called "the emperor's gun," and talk at length of his past life, telling stories of his career. Las Cases, who kept a journal was thus led to begin his Memorial of Saint Helena. Soon Napoleon himself decided to dictate his recollections, beginning with his Italian campaign.

Saint Helena.—On Sunday, Oct. 15 the "Northumberland" dropped anchor before Saint Helena. Napoleon looked through his glasses at the island which was to be his tomb, without, says Las Cases, showing the slightest emotion, and then worked as usual. They landed the next day. The dwelling intended for the prisoner was called Longwood, and, as it was in bad repair and not ready for his reception he stayed temporarily at the small house "The Briars," of which Las Cases says: "The Emperor Napoleon, who was once so powerful, and master of so many crowns, found himself reduced to a little hovel a few square feet in dimensions, with neither curtains, shutters, nor furniture. He had to sleep, dress, eat, work, live there, and if there was cleaning to be done he had to go out of doors." Napoleon protested more than once against this "infamous treatment," against the fact that he was treated as a prisoner of war, though he had himself taken refuge under the English flag, and against the prohibition of news of his wife and son. In December, Longwood was ready at last, and the little company moved there, together with Doctor O'Meara of the Northumberland who had asked to share Napoleon's exile, since no other doctor was available. He also has written an interesting account of the captivity.

Longwood, which had been a farm. was larger and a little more comfortable than "The Briars." Napoleon remained there till his death, spending his time in talking over his past career, dictating his reminiscences, reading, doing a little gardening, riding in the narrow limits permitted him, and even in learning English, which he read fairly fluently, but would never speak. His chief troubles were the prohibition of correspondence with his family, and the badness of the food. His imprisonment became still more rigorous when, in April 1816, Admiral Cockburn was replaced by Hudson Lowe. The new Governor, obsessed with the fear of losing his prisoner, and, seeing nothing but espionage and plans of escape, made himself detested. Under his petty persecution Napoleon remembered with regret the régime of Admiral Cockburn. First Las Cases, accused of having organised a correspondence with the outer world, was deported to the Cape; O'Meara, the next to go, was replaced by the Corsican doctor, Antommarchi. In 1818 Gourgaud, who could not agree with his companions, left Saint Helena. Only Bertrand and Montholon stayed till the end.

Napoleon's health was suffering. It is possible that the climate, the food and mental anguish assisted the tendency towards cancer which he inherited from his father. His strength rapidly declined. In March 1821, he took to his bed. In April he dictated his will. "It is my wish," he said "that my ashes shall be laid to rest on the banks of the Seine among the French people whom I have loved so well." He added "I am dying before my time, murdered by the English oligarchy and its hired assassin" (Hudson Lowe). He died on the morning of May 5 in his 52nd year. His body was dressed in his favourite uniform, that of the *chasseurs de la garde,* and covered with the cloak he had worn at Marengo. He was buried in a lonely spot near a spring shaded by two weeping willows. He had often walked there. "Here lies" was on the stone. No name.

The Napoleonic Legend.—He had said one day, "What a romance my life has been." Napoleon knew mankind too well, he was in fact too great an artist not to realise that his captivity and his martyrdom gave him a magnificent opportunity of impressing himself upon posterity. On that lonely rock he was seized by an idea as great as were his plans of campaign or the *Code civil.* He would prepare, if not for himself, at least for someone of his race, something better than a return from Elba. He foresaw the nineteenth century, and would catch its imagination. Two thousand leagues away from France he divined the medley of sentiment and emotion forming there:—Austerlitz and Waterloo, the triumph and humiliation of the tricolor, the Revolution of 1789 ending in the return of the Bourbons, all the longings for liberty and for glory which would torture the people of France. Buried desires would rise again, resuscitated by regret and the magic of remembrance. Napoleon had always known how to appeal to the French people. He had not lost the art.

So the *Memorial of Saint Helena* was to become the Gospel of Saint Helena. During the hundred days he had already allied himself with the Liberals and the Republicans. The great Carnot had wept on his shoulder after the second abdication. He spent his years of exile in reviving the Napoleonic legend, in confounding it with liberalism, in "changing the eagle's plumage." He dreamed sometimes that he was working for himself. and that the people aroused by his promises would drive out their Kings and come to deliver him. "We are martyrs to an immortal cause," he said. "We struggle against oppression and the voice of the nations is for us."

In the conversations which were published to the world by his companions in captivity, he made himself. the apostle of a new political doctrine, which, inspired by the principles of 1789, had the character and the fascination of a religion. It was a vast idealistic programme, a declaration of the rights and duties of the French people, a reshaping of Europe on the principles of liberty, equality, fraternity and justice. He identified his cause with that of universal freedom. The peoples must be set free, and a holy alliance of nations substituted for a holy alliance of Kings. "There are" he said "strivings for nationhood which must be satisfied sooner or later." No people should be left under the domination of another, and different sections of the same race, which wish to unite, ought not in the future to be separated. "Though they are scattered there are in Europe more than thirty million Frenchmen, fifteen million Spaniards, fifteen million Italians and thirty million Germans. I should like to have made each of these peoples a single united nation." He re-told his own story, giving it a humanitarian and idealistic bias. He represented his dictatorship as that of a liberal, or '.crowned Washington," a despot in spite of himself and for the world's good, waging war to found the United States of Europe. He called himself the Messiah of the Revolution whose name would be for the peoples "the emblem of their hopes."

This lofty incarnation triumphed. Popular imagination represented Napoleon at Saint Helena as on a sort of Mount Sinai. Béranger's songs, Victor Hugo's poems added to the glamour. In 1840 the government of Louis-Philippe obeyed the national will by sending the prince de Joinville to bring back the remains of the emperor. The "return of the ashes" was a historic day. Since then, Napoleon rests in the Invalides. Another poet. Lamartine, warned Louis-Philippe that this return foreshadowed another. And, indeed, thanks to the legend woven by his uncle. after the revolution of 1848, Louis Napoleon was elected president of the republic, and then restored the empire, accomplishing in foreign policy, by his support of Italian unity, the programme of nationalities, though the integration of Italy was not yet completed. Thus the Napoleon of Saint Helena survived.

THE NAPOLEONIC RECORD

The Soldier.—We must now briefly consider this man, whose personality was in every respect far above the mean, as a commander and as a legislator—as soldier and sovereign.

His master concepts may be gathered from his various sayings. "The art of war" he said "is simple and wholly executive. There is nothing ideological about it." And again "The whole art of war consists of a careful and nell-thought out defensive, together with a swift and bold offensive." Simplicity and rapidity are the dominating features both of his campaigns and his battles. "The art of war" he said at the beginning of his career "consists, with inferior forces, in always having larger forces than the enemy at the point of attack or defence" To do this rapidity of movement is required. "Energy, rapidity" was his constant admonition to subordinates. One must concentrate one's own forces, keep them together, lead the enemy to give battle in the most unfavourable conditions; then, when his last reserves are engaged, destroy him by a decisive attack and end the war as quickly as possible.

As Napoleon himself said, all these precepts could be compressed in a very small book. He had, in fact, a method. not a system. "One of the characteristic features of Napoleonic strategy," says Marshal Franchet d'Esperey, "is that, the goal once chosen and boldly chosen, the method does not vary, though, being supple, it adapts itself to circumstances." One might just as well say "the measure of the method is the commander's measure." Napoleon's power of rapidly summing up a situation and making his decision, explains his victories. As Clausewitz has well said: "On the field of battle everything depends on a decision made in a few minutes." Napoleon summed up everything, including himself, in the words: "No precise rules can be laid down. Everything depends on the character of the general, his abilities, his weakness, the quality of his troops, the range of their neapons, the weather and a thousand other circumstances which never repeat themselves." Hence before the battle his meticulous study of the position, of alternative suppositions, a keen examination of the psychology of his opponent, and the rigorous use of information, material and moral. The weak point was that everything depended on Napoleon. He saw everything, did everything, took account of the most insignificant details, himself directly gave all the orders. His lieutenants, having the habit of obedience, mere merely executants who took no initiative. Berthier. although he held the position of chief of staff,said that he counted for nothing with the army. Therefore, an indisposition of the emperor was sufficient to disorganize the machine.

Then, from 1812 onwards, the number of troops involved became too large, and the commander's vision no longer sufficiently sure. It was a war of armies, not of army corps. The Napoleonic system began to give less favourable results. An exaggerated belief in his "star" and his genius, and his heavy demands on an exhausted France, explain the final catastrophe. He had long profited from the concentration of power in his own person. He himself rejoiced in being almost the only great captain to hold absolute authority over a rich and populous country, and command its resources both of men and money. Yet in spite of his enormous intellectual energy he gave way in the end under the burden. He insisted on regulating the minutest details of his government. Thus the decree which still governs the *Theâtre Français* was signed at Moscow. Moreover his empire was precarious. Founded on victory and success, it could not survive defeat. Remembering after Waterloo Louis XIV. unshaken by misfortune, he said, "If I had been my own grandson, I could have retreated as far as the Pyrenees."

The Sovereign.—Yet he did more than win and lose battles. He gave to France laws which for the most part still endure. We have seen that when he became first consul, France had fallen practically into anarchy. The ancient laws, excessively complicated, because they differed from province to province and were customary and traditional, had been wiped out by the revolution. The new laws, so far as they existed at all, were too revolutionary in character and unadapted to normal society. The *code civil* united what in Roman law and in tradition was best suited to France under the conditions engendered by the Revolution. It may be said to be a systemization of good sense, at the same time logical and historical. Napoleon had no legal training, and his share in the work should not be exaggerated, but he intervened continually with the dominating idea that, though the work of the revolution must not be undone, order must be restored in France. Here again he profited by his lack of prejudice and his trained intelligence. He carried out the transition from old to new France. Probably he alone could have re-established the conditions necessary to settled government without being accused of relinquishing the "civil victories of the revolution." He was able to reimpose indirect taxation and in particular food taxes, the most unpopular of all, the abolition of which had made it impossible to place the finances of the Republic on a sound basis.

The council of state, the public accounts office, the courts of justice, the universities, the rights of the *Banque de France,* all these were established, counterbalancing the work of the revolutionary demagogues, and they serve to this day as restraining influences on the occasional over-violence of democracy. On the other side of the picture we see excessive centralization which stifled provincial life and local characteristics, cast the whole country in the same mould, and made the State supreme over the entire people—a system singularly favourable to "étatisme." Thus as a legislator, and as a legendary figure, Napoleon appeared as the restorer of order and authority and the embodiment of progress.

BIBLIOGRAPHY.—(I.) GENERAL. *(A) Sources.* The chief source is the *Correspondance* published by order of Napoleon III. (28 volumes, Paris 1857–59), followed by the *Oeuvres de Napoléon à Sainte Hélène* (1870, 4 vols). This is incomplete. There should also be consulted: Lecestre, *Lettres ine'dites de Napole'on Ier* (1897, 2 vol.); de Brotonne, *Idem* (1898) and *Dernières lettres ine'dites* (1903); A. Chuquet, *Ordres et apostilles* (1911–12, 4 vol.); Picard et Tuetey, *Correspondance ine'dite* (1912–13, 4 vols.). The most complete itinerary has been given by Schnermans: *Itinéraire général de Napole'on Ier* (1908). For legal documents, see *Bulletin des lois,* 3rd and 4th series; Duvergier, *Collection* (vols. 12 to 18); Dalloz, *Répertoire* (1st ed. 1865–70—48 vols.). (B) *History.* Histories of the Napoleonic period are innumerable. The oldest, such as that of Sir Walter Scott, have little more than antiquarian interest. This is not the case with: Thiers, *Histoire du Consulat et de l'Empire* (1845–1862), 20 volumes with tables and maps. Numerous editions in all languages); Lanfrey, *Histoire de Napoléon Ier* (1867–75, 5 volumes); Oncken, *Das Zeitalter der Revolution des Kaiserreiches und der Befreiungskriege* (1880, 2 vol.); Taine, *Les origines de la France contemporaine,* 3rd part, *le Régime moderne* (1891–94—unfinished); A. Fournier: *Napoleon I. Eine Biographie* (Wien und Leipzip. 1886–1893, 3 vols.); Lavisse et Rambaud: *Histoire générale* (Vol IX. 1893); Masson, *Napolton et sa famille* (10 vol. 1897–1913); J. Holland Rose, *The Life of Napoleon I.* (1905 2 vols); *The Cambridge Modern History* (vol. IX., *Napoleon,* 1906); W. M. Sloane, *Life of Napoleon Bonaparte* (1910, bibliog.); Lavisse: *Histoire de la France contemporaine* (Vols. II. and III. by G. Pariset, 1923); E. Ludwig: *Napoleon* (1927); Madelin, *Histoire politique* 1515 *to 1804* volume 4 of the *Histoire de la nation française,* by G. Hanotaux.

(II.) YOUTH AND TRAINING. (A) *Sources.* Napoleon's early works have been published by Masson and Biagi under the title *Napole'on inconnu* (1895, 2 vols.) but the editors have been charged with corredting the text improperly. (B) *History.* Gadobert, *La jeunesse de Napoléon Ier* (1897); A. Chuquet, *La jeunesse de Napole'on Ier* (3 vol. 1897–99); P. Cottin, *Toulon et les Anglais en 1793* (1898); C. J. Fox, *Napoleon Bonaparte and the Siege of Toulon* (Washington, 1902); J. Colin, *L'tducatzon mzlitaire de Napoléon Ier* (1902); O. Browning, *Napoleon, the First Phase* (1905); H. F. Hall, *Napoleon's Notes on English History* (1905); H. Zivy, *Le* 13 *vendémiaire* (1898).

(III.) FROM THE ITALIAN CAMPAIGN TO THE 18TH BRUMAIRE. (A) *Sources.* Here must be cited the memoirs of all the great figures of that time. There are in particular, those of the directors: the memoirs of Barras (ed. Duruy 1895–96 4 vols.); of Barthélemy, ed. Y. de Dampierre (1914); of Carnot, ed. his grandson; of Gohier (1824, 2 vols.); of La Revellière (1895, 3 vols.). *See* also the *Mtmoires* of Masséna, cd. Koch (1849–50, 7 volumes). For the expedition to Egypt: *Les Mtmoires de Bourrienne* (Vols. II. and III. 1829); the *Lettres de Geoffroy Saint Hilaire,* ed. Hamy (1901); Volume III. of Nelson's *Despatches and Letters.* Under the title: *Paris pendant la réaction thermidorienne et le Directoire* Aulard has publiihed many police reports and extracts from newspapers (5 vols. 1898–1902). (B) *History. A.* Sorel, *L'Europe et la Révolution française* (Vol. V. *Bonaparte et le Directoire,* 1903); Guyot, *Le Directoire et la paix de l'Europe* (1911); Clausewitz, *Der Feldzug von* 1796 *in Italien* (1883); Colin: *Etude sur la campagne de 1796–1797* (1818); Fabry, *Campagne d'Italie* (1900–01 3 vols.), followed by *Me'moires* (1905) and *Rapports* (1905), the whole edited by the historical section of the French General Staff; Gaffarel: *Bonaparte et les républiques italiennes, 1796–97* (1895); C. Tivaroni, *Storia critica del Rzsorgimento italiano* (first three vols., Turin 1888–97); Bianchi, *Storia della monarchia piemontese* (Turin 1885 4 vols. Vol. II). The most recent and much the most satisfactory work on Egypt is La Jonquière, *L'expédition d'Egypte* (1900–07, 5 vols., ed. historical section of the General Staff). For the *coup d'e'tat, see* Vandal, *L'avènement de Bonaparte* (Vol. I. 1903 with a critical indication as to its sources); J. Bainville, *Le* 18 *Brumaire* (1926); Rocquain, *L'Etat de la France au* 18 *Brumaire* (1874).

(IV.) THE PRIVATE LIFE OF NAPOLEON. *(A) Sources.* The principal memoirs are those of the Duchesse d' Abrantès (1831–37, 18 vols.); of Mme. de Remusat (1879–80, 3 vols.); the *Considérations* and *Dix anntes d'exil* of Mme. de Stael; the memoirs of various members of the staff of the palace, such as Beausset (1827–28, 4 vols.), Constant (1830–31, 6 vols.), Baron Fain (1908), General Durand (1819, 2 vols.) and Meneval (1894, 3 vols.) etc. The work entitled *Mémoires et Correspondance de l'imptratrice Joséphine* (1820) is apocryphal. *See* also Empress Marie-Louise, *Correspondance* 1799–1847 (Vienna, 1887); Jérôme, *Mtmoires et Correspondance,* ed. du Casse (1861–66. 7 vols.); Joseph, *Me'moires et Correspondance,* ed. du Casse (1853–54, 10 vols.); Queen Hortense, *Mémoires* (3 vols. 1927). (B) *History.* Frédéric Masson, *Napoléon et les femmes* (1893); *Napoleon chez lui* (1894); Bouchot, *La toilette à la cour de Napolton* (1895); A. Lévy, *Napole'on intime* (1893); de Lescure, *Napolton et sa famille* (1867); Larrey, *Madame Mère* (1892, 2 vols.); Masson: *Jose'phine de Beauharnais, Madame Bonaparte, Jose'phine impératrice, Joséphine répudiée* (1899–1919. 4 vols.); Rocquain, *Napole'on Ier et le Roi Louis* (1875); Welschinger, *Le divorce de Napole'on* (1899), *Le Mariage de Napoléon (Revue révolutionnaire,* 1888. II.); Masson, *Marie-Louise* (1903); Masson, *Napoléon et son fils* (1904). *See* also BONAPARTE *(Family).*

(V.) FOREIGN POLICY AND WARS. (4) *Sources.* Martens, *Recueil général des traités d'alliance et de paix,* with appendices and tables (Gottingen, 1817–76); Talleyrand, *Lettres inédites à Napolton,* ed. Pallain (1889), and *Mémoires,* ed. de Broglie (1891–92, 5 vols.); Metternich, *Mémoires* (8 vols., Vols. 1 and 2); Hardenberg, *Denkwürdigkeiten* (ed. Ranke, Leipzig, 1877, 5 vols.); Nesselrode, *Lettres et papiers* (Vols. III. to V. 1905–07); Castlereagh, *Memoirs and Correspondence* (1848–53, 12 vols.); Tratchevski, *Documents diplomatiques concernant les relations de la France et de la Russie* (St. Petersburg, 1890–91, 2 vols. in Russian and in French); Bailleul, *Preussen und Frankreich* Dipl. Corr. (Leipzig, 1881–87, 2 vols.). For the details of military events and the actual life of the armies we must have recourse to the memoirs of generals and soldiers, such as:—Bernadotte: *Correspondance* (1819); Davout, *Correspondance* (1887, 4 vols.) Gille, *Mtmoires d'un conscrit* (1892); Lavallette: *Me'moires* (1831. 2 vols.); Coignet, *Cahiers* (1883); Marbot, *Me'moires* (1891—3 vols.); Marmont, *Mémmoires* (1856–57, 9 vols.); Murat, *Correspondance, Lettres et documents* (1899 and 1908–14); Soult, *Mtmoires* (1854, 3 vols.) etc. These memoirs are of unequal value, and should be accepted with considerable reserve. (B) *History.* Bourgeois, *Manuel historique de politique étrangère,* vol. II. (1898); Sorel, *L'Europe et la Révolution française* vols. VI. VII. et VIII. with tables (1903–04); Tramond, *Manuel d'histoire maritime de la France* (1916); A. T. Mahan, *Influences of Sea Power on the French Revolution and Empire* (1892 2 vols.); Driault, *Napolton et l'Europe* (1910); Pingaud, *Bonaparte, pre'sident de la république italienne, La domination française dans l'Italie du Nord* (1914, 2 vols.); H. A. L. Fisher, *Napoleonic Statesmanship: Germany* (1903); Froidevaux, "La politique coloniale de Napoléon" *(Revue des questions historiques,* 1901); A. Lévy, *Napole'on et la paix* (1903); Driault, *La politique orientale de Napolton* (1904); Marshal Franchet d'Esperey and General Mangin, *Histoire militaire et navale* (Vol. *VIII.* of the *Histoire de* la *nation française* of Hanotaux).

For the details of military and diplomatic events:—Roberts: "The negotiations preceding the peace of Amiens" *(Transactions of the Royal Hist. Soc.* 1901 Vol. XX.); H. M. Bowman, *Preliminary Stages of the Peace of Amiens* (Toronto 1900); Philipson, "La Paix d'Amiens" *(Revue historique* 1901); O. Browning, *England and Napoleon in 1803* (1887); J. H. Rose, "Napoleon and English Commerce" *(Engl. Hist. Rev.* 1893); *Select Despatches . . . relating to the Formation of the Third Coalition* (1904); Coquelle, *Napole'on et l'Angleterre* (1904); O. Brandt, *England und die napoleonische Weltpolitik 1800–3* (Heidelberg 1916); Yorck von Wartenburg, *Napoleon als Feldherr* (1885–86 2 vols.); Camon: *La guerre napoléonienne: Précis des campagnes* (1903), *les Systèmes d'opérations* (1907), *les Batailles* (1910), *la Fortification* (1914); and, always interesting Jomini: *Vie politique et militaire de Napoléon Ier* (1827 4 vols. and maps). (J. Bai.)

NAPOLEON II.: *see* Reichstadt, Napoleon Francis Joseph Charles, Duke of.

NAPOLEON III. [Charles Louis Napoleon Bonaparte] (1808–1873), emperor of the French, was born on April 20, 1808, in Paris at 8 rue Cerutti (now rue Laffitte), and not at the Tuileries, as the official historians state. He was the third son of Louis Bonaparte *(see* Bonaparte), brother of Napoleon I., and king of Holland (1806–10), and of Hortense de Beauharnais (*q.v.*). Of the two other sons of Louis Bonaparte and Hortense, the elder, Napoleon Charles (1802–1807), died in infancy; the second, Napoleon Louis (1804–1831), died in the insurrection of the Romagna, leaving no children.

Exile of **Hortense.**—After Waterloo, Hortense, suspected by the Bourbons of having arranged the return from Elba, had to go into exile. The ex-king Louis, who now lived at Florence, had compelled her by a scandalous law-suit to give up to him the elder of her two children. With her remaining child she wandered, under the name of duchesse de Saint-Leu, from Geneva to Aix, Carlsruhe and Augsburg. In 1817 she bought the castle of Arenenberg, in the canton of Thurgau, on a wooded hill looking over the Lake of Constance. Hortense supervised her son's education in person. The young prince also studied at the gymnasium at Augsburg, and there he acquired his slight German accent.

In 1823 he accompanied his mother to Italy, visiting his father at Florence, and his grandmother Letitia at Rome, and dreaming with Le Bas on the banks of the Rubicon. He returned to Arenenberg to complete his military education under Colonel Armandi and Colonel Dufour, who instructed him in artillery and military engineering. At the age of twenty he was a "Liberal," an enemy of the Bourbons and of the treaties of 1815; but he was dominated by the cult of the emperor, and for him the liberal ideal was confused with the Napoleonic.

Revolution of 1830.—The July revolution of 1830, of which he heard in Italy, roused all his young hopes. He could not return to France, for the law of 1816 banishing all his family had not been abrogated. But the liberal revolution knew no frontiers. Italy shared in the agitation. He had already met some of the conspirators at Arenenberg, and it is practically established that he now joined the associations of the Carbonari. Following the advice of his friend the Count Arese and of Menotti, he and his brother were among the revolutionaries who in February 1831 attempted a rising in Romagna and the expulsion of the pope from Rome. They distinguished themselves at Civita Castellana, a little town which they took; but the Austrians arrived in force, and during the retreat Napoleon Louis, the elder son, took cold, followed by measles, of which he died. Hortense hurried to the spot and took steps which enabled her to save her second son from the Austrian prisons. He escaped into France, where his mother, on the plea of his illness, obtained permission from Louis Philippe for him to stay in Paris. But he intrigued with the republicans, and Casimir-Périer insisted on the departure of both mother and son. In May 1831 they went to London, and afterwards returned to Arenenberg.

For a time he thought of responding to the appeal of some of the Polish revolutionaries, but Warsaw succumbed (September 1831) before he could set out. Moreover the plans of this young and visionary *enfant du siècle* were becoming more definite. The duke of Reichstadt died in 1832. His uncle, Joseph, and his father, Louis, showing no desire to claim the inheritance promised them by the constitution of the year XII., Louis Napoleon henceforth considered himself as the accredited representative of the family. He endeavoured to define his ideas, and in 1832 published his *Rêveries politiques, suivies d'un projet de constitution,* and *Considérations politiques et militaires sur la Suisse;* in 1836, as a captain, in the Swiss service, he published a *Manuel d'artillerie,* in order to win popularity with the French army.

Strasbourg Conspiracy.—With the aid of his friend Fialin and of Eléonore Gordon, a singer, and of certain officers, such as Colonel Vaudrey, an old soldier of the Empire, commanding the 4th regiment of artillery, and Lieutenant Laity, he tried to bring about a revolt of the garrison of Strasbourg (Oct. 30, 1836). The conspiracy was a failure, and Louis Philippe, fearing lest he might make the pretender popular either by the glory of an acquittal or the aureole of martyrdom, had him taken to Lorient and put on board a ship bound for America, while his accomplices were brought before the court of assizes and acquitted (February 1837). The prince was set free in New York in April; by the aid of a false passport he returned to Switzerland in August, in time to see his mother before her death on Oct. 3, 1837.

At any other time this attempt would have covered its author with ridicule. Such, at least, was the opinion of the whole of the family of Bonaparte. But his confidence was unshaken, and in the woods of Arenenberg the romantic-minded friends who remained faithful to him still honoured him as emperor. And now the government of Louis Philippe, by an evil inspiration, began to act in such a way as to make him popular. In 1838 it caused his partisan Lieutenant Laity to be condemned by the Court of Peers to five years' imprisonment for a pamphlet which he had written to justify the Strasbourg affair; then it demanded the expulsion of the prince from Switzerland, and when the Swiss government resisted, threatened war. Having allowed the July monarch to commit himself, Louis-Napoleon at the last moment left Switzerland voluntarily. All this served to encourage the mystical adventurer. In London, where he had taken up his abode, together with Arese, Fialin (says Persigny), Doctor Conneau and Vaudrey, he was at first well received in society, being on friendly terms with Count d'Orsay and Disraeli, and frequenting the *salon* of Lady Blessington. He was evolving his programme of government, and in 1839 wrote and published his book: *Des Idées napoléoniennes,* a curious mixture of Bonapartism, socialism and pacificism, which he represented as the tradition of the First Empire. He also noted the fluctuations of French opinion.

Boulogne Conspiracy.—The pretender, again thinking that the moment had come, formed a fresh conspiracy in 1840. With a little band of fifty-six followers he attempted to provoke a rising of the 42nd regiment of the line at Boulogne, hoping afterwards to draw General Magnan to Lille and march upon Paris. The attempt was made on Aug. 6, but failed; he saw several of his supporters fall on the shore of Boulogne, and was arrested together with Montholon, Persigny and Conneau. This time he was brought before the Court of Peers with his accomplices; he entrusted his defence to Berryer and Marie, and took advantage of his trial to appeal to the supremacy of the people, which he alleged, had been disregarded, even after 1830. He was condemned to detention for life in a fortress, his friend Aladenize being deported, and Montholon Parquin, Lombard and Fialin being each condemned to detention ior twenty years. On Dec. 15, the very day that Napoleon's ashes were deposited at the Invalides, he was taken to the fortress of Ham. On the whole the régime imposed upon him was mild. He corresponded with Louis Blanc, George Sand and Proudhon, and collaborated with the journalists of the Left, Degorge, Peauger and Souplet. For six years he worked very hard ('at his University of Ham," as he said. He wrote some *Fragments historiques,* studies on the sugar-question, on the construction of a canal through Nicaragua, and on the recruiting of the army, and finally, in the *Progrès du Pas-de-Calais,* a series of articles on social questions which were later embodied in his *Extinction du paupérisme* (1844). But the same persistent idea underlay all his efforts. On May 25, 1846, he escaped to London, giving as the reason for his decision the dangerous illness of his father. On July 27 his father died.

Return to France.—He was again well received in London and he "made up for his six years of isolation by a furious pursuit of pleasure." The duke of Brunswick and the banker Ferrère interested themselves in his future, and gave him money, as did also Miss Howard, whom he later made comtesse de Beauregard, after restoring to her several millions. At the first symptoms of revolutionary disturbance he returned to France; on Feb. 25, he offered his services to the Provisional Government, but, on being requested by it to depart at once, resigned himself to this course. But Persigny, Mocquard and all his friends devoted themselves to an energetic propaganda in the press, by pictures and by songs. After May 15 had already shaken the strength of the young republic, he was elected in June 1848 by four departments, Seine, Yonne, Charente-Inférieure and Corsica. In spite of the opposition of the executive committee, the Assembly ratified his election. But he had learnt to wait. He sent in his resignation from London, merely hazarding this appeal: "If the people impose duties on me, I shall know how to fulfil them." This time events worked in his favour; the industrial insurrection of June made the middle classes and the mass of the rural population look for a saviour, while it turned the industrial population towards Bonapartism, out of hatred for the republican *bourgeois.*

Presidency of the Republic.—On Sept. 26 he was re-elected by the same departments; on Oct. 11 the law decreeing the banishment of the Bonapartes was abrogated; on the 26th he made a speech in the Assembly defending his position as a pretender, and cut such a sorry figure that Antony Thouret contemptuously withdrew the amendment by which he had intended to bar him from rising to the presidency. Thus he was able to be a candidate for this formidable power. The former rebel of the Romagna, the Liberal *Carbonaro,* was henceforth to be the tool of the priests. In his very triumph appeared the ultimate cause of his downfall. On Dec. 10 he was elected president of the Republic by 5,434,226 votes against 1,448,107 given to Cavaignac. On Dec. 20, he took the oath "to remain faithful to the democratic Republic . . . to regard as enemies of the nation all those who may attempt by illegal means to change the form of the established government." From this time onward his history is inseparable from that of France. But, having attained to power, he still endeavoured to realize his cherished project. All his efforts (Dec. 10, 1848 to Dec. 2, 1852) tended towards the acquisition of absolute authority, which he wished to obtain, ostensibly from the people.

It was with this end in view that he co-operated with the party of order in the expedition to Rome for the destruction of the Roman republic and the restoration of the pope (March 31, 1849), and afterwards in all the reactionary measures against the press and the clubs, and for the destruction of the Reds. But in opposition to the party of order, he defined his own personal policy. "The name of Napoleon," he said on this occasion, "is in itself a programme; it stands for order, authority, religion and the welfare of the people in internal affairs, and in foreign affairs for the national dignity."

In spite of this alarming assertion of his personal policy, he still remained in harmony with the Assembly (the Legislative Assembly, elected on May 28, 1849) in order to carry out "a Roman expedition at home," *i.e.,* to clear the administration of all republicans, put down the press, suspend the right of holding meetings and, above all, to hand over education to the Church. But he knew where to stop and how to keep up a show of democracy. When the Assembly, by the law of May 31, 1850, restricted universal suffrage and reduced the number of the electors from g to 6 millions, he was able to throw upon it the whole responsibility for this *coup d'état bourgeois.*

In fact, while trying to compass the destruction of the republican movement of the Left, he was taking careful steps to win classes. At his side were his accomplices, men ready for anything, whose only hopes were bound up with his fortunes, such as Morny and Rouher; his paid publicists, such as Romieu, the originator of the "red spectre"; his cudgel-bearers, the "Ratapoils" immortalized by Daumier, who terrorized the republicans.

Coup **d'État.**—He next entered upon that struggle with the Assembly, now discredited, which was to reveal to all the necessity for a change, and a change in his favour. In January 1851 he deprived Changarnier of his command of the garrison of Paris. "The Empire has come," said Thiers. The pretender would have preferred, however, that it should be brought about legally, the first step being his re-election in 1852. The Constitution forbade his re-election; therefore the Constitution must be revised. On the 19th of July the Assembly threw out the proposal for revision, thus signing its own death-warrant, and the *coup d'état* was resolved upon. He prepared for it systematically. The cabinet of Oct. 26, 1851 gave the ministry for war to his creature Saint-Arnaud. All the conspirators were at their posts—Maupas at the prefecture of police, Magnan at the head of the troops in Paris. At the Elysée, Morny, adulterine son of Hortense, a hero of the Bourse and successful gambler, supported his half-brother by his energy and counsels. The ministry proposed to abrogate the electoral law of 1850, and restore universal suffrage; the Assembly by refusing made itself still more unpopular. By proposing to allow the president of the Assembly to call in armed force, the questors revealed the Assembly's plans for defence, and gave the Elysée a weapon against it ("donnent barre contre elle à l'Elysée"). The proposition was rejected (November 17), but Louis-Napoleon saw that it was time to act. On Dec. 2 he carried out his *coup d'état.*

Proclamation as Emperor—But affairs developed in a way which disappointed him. By dismissing the Assembly, by offering the people "a strong government," and re-establishing "a France regenerated by the Revolution of '89 and organized by the emperor," he had hoped for universal applause. But both in Paris and the provinces he met with the resistance of the Republicans, who had reorganized in view of the elections of 1852. He struck at them by mixed commissions, deportations and the whole range of police measures. The *décrets-lois* of the year 1852 enabled him to prepare the way for the new institutions. On Dec. 2, 1852 he became in name what he was already in deed, and was proclaimed Emperor of the French.

The aim which the emperor had in view was, by a concentration of power which should make him "the beneficent motive force of the whole social order" (constitution of the 14th of January 1852; administrative centralization; subordination of the elected assemblies; control of the machinery of universal suffrage) to unite all classes in "one great national party" attached to the dynasty. His success, from 1852 to 1856, was almost complete. The nation was submissive, and a few scattered plots alone showed that republican ideas persisted among the masses. As "restorer of the overthrown altars," he won over the "men in black," among them Veuillot, editor-in-chief of *l'Univers,* and allowed them to get the University into their hands. By the aid of former Orleanists, such as Billault, Fould and Morny, and Saint-Simonians such as Talabot and the Pereires, he satisfied the industrial classes, extended credit, developed means of communication, and gave a strong impetus to the business of the nation. By various measures, such as subsidies, charitable gifts and foundations, he endeavoured to show that "the idea of improving the lot of those who suffer and struggle against the difficulties of life was constantly present in his mind." His was the government of cheap bread, great public works and holidays. The imperial court was brilliant. The emperor, having failed to obtain the hand of a Vasa or Hohenzollern, married, on Jan. 29, 1853, Eugénie de Montijo, comtesse de Teba, aged twenty-six and at the height of her beauty.

Foreign Policy. — France was "satisfied" in the midst of order, prosperity and peace. The foreign policy of the Catholic party, by the question of the Holy Places and the Crimean War (1853–1856), gave him the opportunity of winning the glory which he desired, and the British alliance enabled him to take advantage of it. In January 1856 he had the good fortune to win a diplomatic triumph over the new tsar, Alexander II. It was at Paris (February 25–March 30) that the conditions of peace were settled. The emperor was now at the height of his power. He appeared to the people as the avenger of 1840 and 1815, and the birth to him of a son, Eugène Louis Jean Joseph, on March 16, 1856, assured the future of the dynasty. It was then that, strong in "the esteem and admiration with which he was surrounded," and "foreseeing a future full of hope for France," he dreamed of realizing the Napoleonic ideal in its entirety. This disciple of the German philologists, this crowned *Carbonaro,* the friend of the archaeologists and historians who were to help him to write the *Histoire de César,* dreamed of developing the policy of nationalism, and of assisting the peoples of all countries to enfranchise themselves.

From 1856 to 1858 he devoted his attention to the Rumanian nationality, and supported Alexander Cuza. But it was above all the deliverance of Italy which haunted his imagination. But the Catholics feared that the Italian national movement, when once started, would entail the downfall of the papacy; and in opposition to the emperor's Italian advisers, Arese and Prince Jerome Napoleon, they pitted the empress, who was frivolous and capricious, but an ardent Catholic. Napoleon III. was under his wife's influence, and could not openly combat her resistance. It was the Italian Orsini who, by attempting to assassinate him as a traitor to the Italian nation on Jan. 14, 1858, gave him an opportunity to impose his will indirectly by convincing his wife that in the interests of his own security he must "do something for Italy." Events followed each other in quick succession, and now began the difficulties in which the Empire was to be irrevocably involved. Not only did the Italian enterprise lead to strained relations with Great Britain, the alliance with whom had been the emperor's chief support in Europe, and compromised its credit; but the claims of parties and classes again began to be heard at home.

The Italian war aroused the opposition of the Catholics. After Magenta (June 4, 1859), it was the fears of the Catholics and the messages of the empress which, even more than the threats of Prussia, checked him in his triumph and forced him into the armistice of Villafranca (July 11, 1859). But the spread of the Italian revolution and the movement for annexation forced him again to intervene. He appealed to the Left against the Catholics by the amnesty of April 17, 1859. His consent to the annexation of the Central Italian states, in exchange for Savoy and Nice (Treaty of Turin, March 24, 1860) exposed him to violent attacks on the part of the ultramontanes, whose slave he had practically been since 1848. At the same time, the free-trade treaty with Great Britain (January 5, 1860) aroused a movement against him among the industrial *bourgeoisie.*

From this time onward, in face of a growing opposition, anxiety for the future of his régime paralysed his initiative. Placed between his Italian counsellors and the empress, he was ever of two minds. His plans for remodelling Europe had a certain generosity and grandeur; but internal difficulties forced him into endless manoeuvre and temporization, which led to his ruin. Thus in October 1862, after Garibaldi's attack on Rome, the clerical coterie of the Tuileries triumphed. But the replacing of M. Thouvenel by M. Drouin de Lhuys did not satisfy the more violent Catholics, who in May 1863 joined the united opposition. Thirty-five opposers of the government were appointed, Republicans, Orleanists, Legitimists or Catholics. The emperor dismissed Persigny, and summoned moderate reformers such as Duruy and Béhic. But he was still possessed with the idea of settling his throne on a firm basis, and uniting all France in some glorious enterprise which should appeal to all parties equally, and "group them under the mantle of imperial glory." From January to June 1863 he sought this appearance of glory in Poland, but only succeeded in embroiling himself with Russia. Then, after Syria and China, it was the "great inspiration of his reign," the establishment of a Catholic and Latin empire in Mexico, enthusiasm for which he tried in vain from 1863 to 1867 to communicate to the French.

But while the strength of France was wasting away at Puebla in Mexico, Bismarck was founding German unity. In August 1864 the emperor, held back by French public opinion, which was favourable to Prussia, and by his idea of nationality, allowed Prussia and Austria to seize the duchies of Schleswig and Holstein. After his failure in Poland and Mexico and in face of the alarming presence of Germany, only one alliance remained possible for Napoleon III., namely with Italy. He obtained this by the convention of the 15th of September 1864 (involving the withdrawal of the French troops from Rome). But the Catholic party redoubled its violence, and the pope sent out the encyclical *Quanta Cura* and the *Syllabus,* especially directed against France. In vain the emperor sought in German affairs a definitive solution of the Italian question. At Biarrite he prepared with Bismarck the Franco-Prussian alliance of April 1866; and hoped to become arbiter in the tremendous conflict which was about to begin. But Koniggratz came as a bolt from the blue to ruin his hopes. French interests called for an immediate intervention. But he resigned himself to the annexation by Prussia of northern Germany. "Now," said M. Drouin de Lhuys, "we have nothing left but to weep."

The Third Party. — Henceforth the brilliant dream, a moment realized, the realization of which he had thought durable, was at an end. The Empire had still an uncertain and troubled brilliancy at the Exhibition of 1867. But Berezowski's pistol shot, which accentuated the estrangement from the tsar, and the news of the death of Maximilian at Queretaro, cast a gloom over the later fêtes. In the interior the industrial and socialist movement, born of the new industrial development, added fresh strength to the Republican and Liberal opposition. The moderate Imperialists felt that some concessions must be made to public opinion. In opposition to the absolutist "vice-emperor" Rouher, whose influence over Napoleon had become stronger and stronger since the death of Morny, Émile Ollivier grouped the Third Party, Anxious, changeable and distraught, the emperor made the Liberal concessions of Jan. 19, 1867 (right of interpellation), and then, when Ollivier thought that his triumph was near, he exalted Rouher (July) and did not grant the promised laws concerning the press and public meetings till 1868. The opposition gave him no credit for these tardy concessions. There was an epidemic of violent attacks on the emperor; the publication of the *Lanterne* and the Baudin trial, conducted by Gambetta, were so many death-blows to the régime. The *Internationale* developed its propaganda. The election of May 1869 resulted in 4,438,000 votes given for the government, and 3,355,000 for the opposition, who also gained 90 representatives. The emperor, disappointed and hesitating, was slow to return to a parliamentary régime. It was not till December that he instructed Ollivier to "form a homogeneous cabinet representing the majority of the Corps Législatif" (ministry of the 2nd of January 1870). But, embarrassed between the *Arcadiens*, the partisans of the absolute régime, and the republicans, Ollivier was unable to guide the Empire in a constitutional course. At the Tuileries Rouher's counsel still triumphed. It was he who inspired the ill and wearied emperor, now without confidence or energy, with the idea of resorting to the *plébiscite*.

"To do away with the risk of a revolution," "to place order and liberty upon a firm footing," "to ensure the transmission of the crown to his son," Napoleon III again sought the approbation of the nation. He obtained it with brilliant success, for the last time, by 7,358,786 votes against 1,571,939, and his work now seemed to be consolidated.

War With **Prussia.**—A few weeks later it crumbled irrevocably. Since 1866 he had been pursuing an elusive appearance of glory. Since 1866 France was calling for "revenge." He felt that he could only rally the people to him by procuring them the satisfaction of their national pride. Hence the mishaps and imprudences of which Bismarck made such an insulting use. Hence the negotiations of Nikolsburg, the "note d'aubergiste" (innkeeper's bill) claiming the left bank of the Rhine, which was so scornfully rejected; hence the plan for the invasion of Belgium (August 1866), the Luxemburg affair (March 1867), from which M. de Moustier's diplomacy effected such a skilful retreat; hence the final folly which led his government into the war with Prussia (July 1870).

The war was from the first doomed to disaster. It might perhaps have been averted if France had had any allies. But Austria, a possible ally, could only join France if satisfied as regards Italy; and since Garibaldi had threatened Rome (Mentana, 1867), Napoleon III, yielding to the anger of the Catholics, had again sent troops to Rome. Negotiations had taken place in 1869. The emperor, bound by the Catholics, had refused to withdraw his troops. It was as a distant but inevitable consequence of his agreement of December 1848 with the Catholic party that in 1870 the emperor found himself without an ally.

His energy was now completely exhausted. Successive attacks of stone in the bladder had ruined his physique; while his hesitation and timidity increased with age. The influence of the empress over him became supreme. On leaving the council in which the war was decided upon the emperor threw himself, weeping, into the arms of Princess Mathilde. The empress was delighted at this war, which she thought would secure her son's inheritance.

Deposition. — On July 28 father and son set out for the army. They found it in a state of utter disorder, and added to the difficulties by their presence. The emperor was suffering from stone and could hardly sit his horse. After the defeat of Reichshoffen, when Bazaine was thrown back upon Metz, he wished to retreat upon Paris. But the empress represented to him that if he retreated it would mean a revolution. An advance was decided upon which ended in Sedan. On Sept. 2 Napoleon III surrendered with 80,000 men, and on the 4th of September the Empire fell. He was taken as a prisoner to the castle of Wilhelmshohe, near Cassel, where he stayed till the end of the war. After the intrigues of Bazaine, of Bismarck, and of the empress, the Germans having held negotiations with the Republic, he was de facto deposed.

On March 1, the assembly of Bordeaux confirmed this deposition, and declared him "responsible for the ruin, invasion and dismemberment of France."

Restored to liberty, he retired with his wife and son to Chislehurst in England. Unwilling even now to despair of the future, he still sought to rally his friends for a fresh propaganda. He had at his service publicists such as Cassagnac, J. Amigues and Hugelmann. He himself also wrote unsigned pamphlets justifying the campaign of 1870. It may be noted that, true to his ideas, he did not attempt to throw upon others the responsibility which he had always claimed for himself. He dreamed of his son's future. But he no longer occupied himself with any definite plans. He interested himself in pensions for workmen and economical stoves.

At the end of 1872 his disease became more acute, and a surgical operation became necessary. He died on Jan. 9, 1873, leaving his son in the charge of the empress and of Rouher.

The young prince was educated at Woolwich from 1872 to 1875, and in 1879 took part in the English expedition against the Zulus in South Africa, in which he was killed. By his death vanished all hope of renewing the extraordinary fortune which for twenty years placed the nephew of the great emperor, the *Carbonaro* and dreamer, at once obstinate and yet hesitating, on the throne of France.

BIBLIOGRAPHY.—The *Oeuvres* of Napoleon III have been published in four volumes (1854–57) and his *Histoire de Jules César* in two volumes (1865–69); this latter work has been translated into English by T. Wright. *See* also Ebeling, *Napoleon III und sein Hof* (1891–94); H. Thirria, *Napoléon III avant l'Empire* (1895); Sylvain-Blot, *Napoléon III* (1899); Giraudeau, *Napoléon III intime* (1895); Sir W. A. Fraser, *Napoleon III* (London, 1895); A. NAPOLEON, a round game of cards (known colloquially as "nap"). Any number may play. The cards rank as at whist, and five are dealt to each player. The deal being completed, the player to the dealer's left looks at his hand and declares how many tricks he would play to win against all the rest, the usual rule being that more than one must be declared; in default of declaring he says "I pass." and the next player has a similar option of either declaring to make more tricks or passing, and so on all round. A declaration of five tricks is called "going nap."

The player who declares to make most has to try to make them, and the others. but without consultation, to prevent him. The declaring hand has the first lead, and the first card he leads makes the trump suit. The players, in rotation, must follow suit if able.

If the declarer succeeds in making at least the number of tricks he stood for he wins whatever stakes are played for; if not he loses. If the player declaring nap wins he receives double stakes all round; if he loses he only pays single stakes all round.

Sometimes, however, a player is allowed to go "Wellington" over "nap." and even "Blücher" over "Wellington." In these cases the caller of "Wellington" wins four times the stake and loses twice the stake, the caller of "Blücher" receives six times and loses three times the stake.

Sometimes a player is allowed to declare *misère, i.e.,* no tricks. This ranks, as a declaration, between three and four, but the player pays a double stake on three, if he wins a trick, and receives a single on three if he takes none.

NAPOLEONIC CAMPAIGNS. The era of the Revolutionary and Napoleonic Wars falls into two main divisions, the first of which (1792–1801) is dealt with under the heading FRENCH REVOLUTIONARY WARS. In the present article are described the campaigns in central and eastern Europe, directed by Napoleon — no longer one amongst many French generals. nor even a simple *primus inter pares,* but "Emperor" in the fullest sense — between the years 1805 and 1814. Napoleon's short

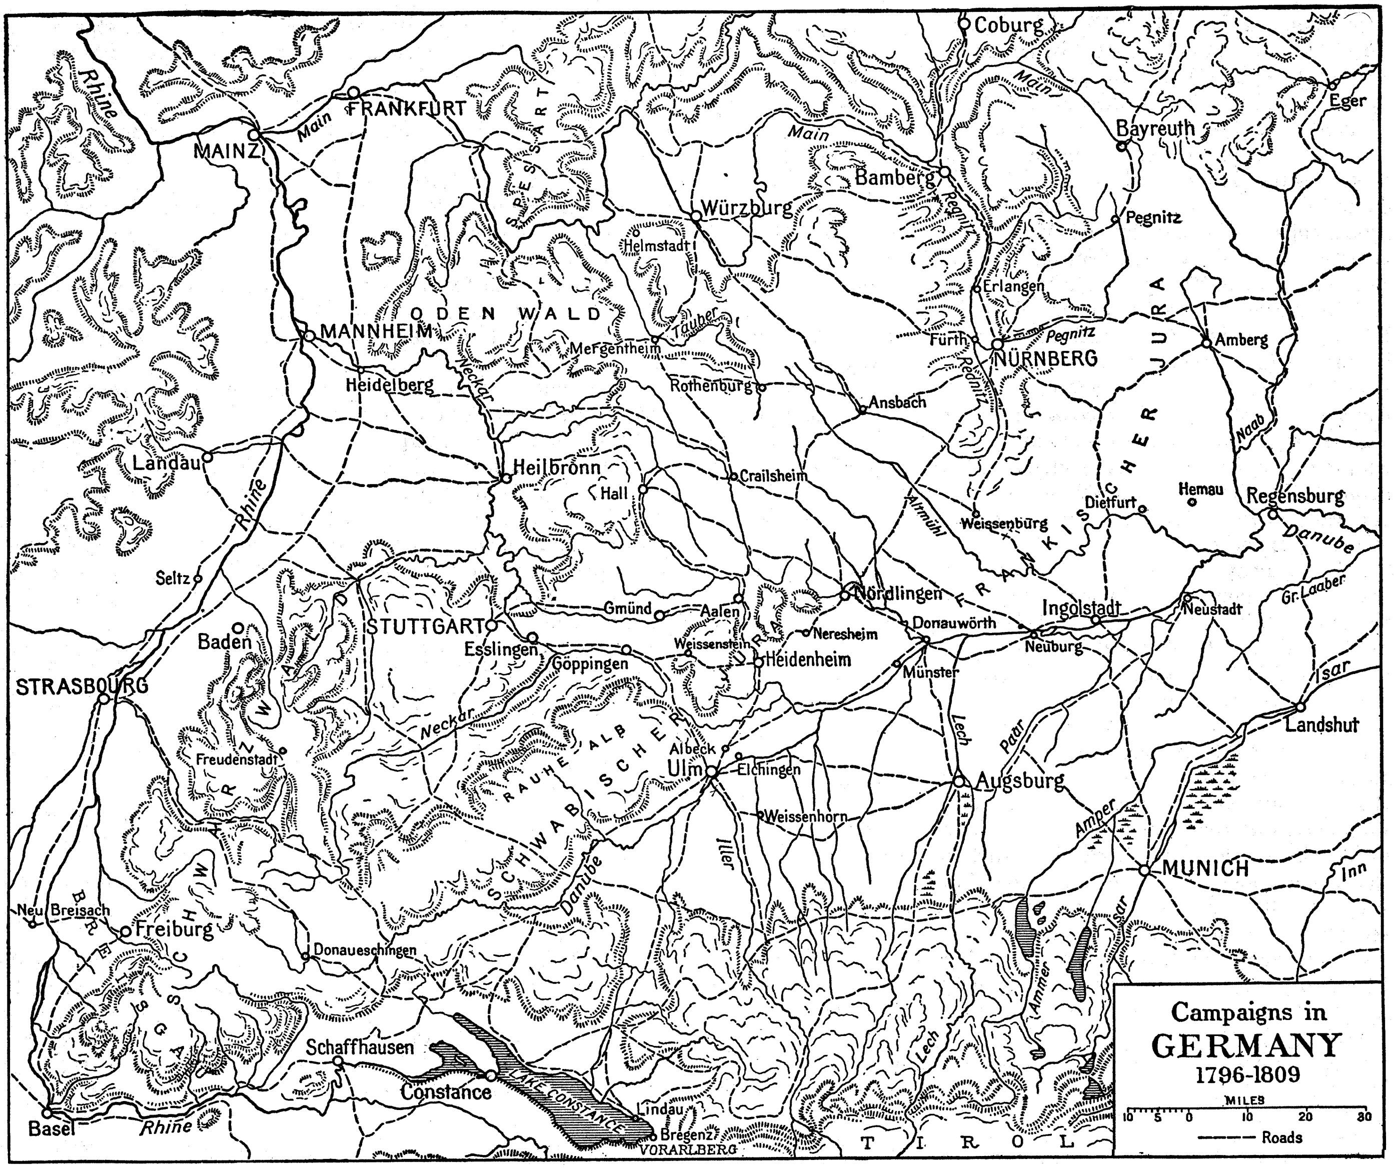

FIG. 1

Spanish Campaign of 1809 is dealt with under PENINSULAR WAR (this article covering the campaigns in Spain, Portugal and southern France 1808–1814), and for a discussion of the events that led to the final drama of Waterloo the reader is referred to WATERLOO CAMPAIGN, 1815.

The campaigns described below are therefore—

(a) The Austrian War of 1805 (Ulm and Austerlitz).

(*b*) The Conquest of Prussia and the Polish Campaign (Jena, Auerstadt, Eylau and Friedland).

(c) The Austrian war of 1809 (Eckmühl, Aspern and Wagram).

The Russian War of 1812 (Borodino and the retreat from Moscow).

(*e*) The German "War of Liberation," culminating in the Battle of the Nations around Leipzig.

(f) The last campaign in France, 1814.

The naval history of 1803–1815 includes the culmination and the sequel of the struggle for command of the sea which began in 1793 and continued for more than a decade with results increasingly disappointing to the ambitions of Napoleon, finally reaching a decisive climax on the day of Trafalgar.

THE CAMPAIGN OF 1805

This may be regarded as a measure of self-defence forced upon Napoleon by the alliance of Russia (April 11), Austria (August g) and other powers with Great Britain. The possibility had long been before the emperor, and his intention in that event to march straight on Vienna by the valley of the Danube is clearly indicated in his reply (November 27, 1803) to a Prussian proposal for the neutralization of the South German states. In this he says, "It is on the road from Strasbourg to Vienna that the French must force peace on Austria, and it is this road which you wish us to renounce." When, therefore, on Aug. 25, 1805, he learnt definitely that Villeneuve (see *Naval* Operations below) had failed in his purpose of securing the command of the Channel, which was the necessary preliminary to the invasion of England, it was but the affair of a few hours to dictate the dispositions necessary to transfer his whole army to the Rhine frontier as the first step in the march which he had determined to make to the Danube. On the date of this decision the army actually lay in the following positions:—

I.	Corps	Bernadotte	Hanover (Göttingen)
II.	"	Marmont	Holland
III.	"	Davout	Camp of Boulogne and other points on the English Channel
IV.	"	Soult	
V.	"	Lannes	
VI.	"	Ney	
VII.	"	Augereau	
Guard		Bessières	Paris

The corps were, however, by no means fit for immediate service. Bernadotte's corps in Hanover was almost in the position of a beleaguered garrison, and the marshal could only obtain his transport by giving out that he was ordered to withdraw to France. Marmont and Davout were deficient in horses for cavalry and artillery, and the troops in Boulogne, having been drawn together for the invasion of England, had hardly any transport at all, as it was considered this want could be readily supplied on landing. The composition of the army, however, was excellent, The generals were in the prime of life, had not yet learnt to distrust one another, and were accustomed to work under the emperor and with one another. The regimental officers had all acquired their rank before the enemy and knew how to manage their men, and of the men themselves nearly two-thirds had seen active service. The strength of the army lay in its infantry, for both cavalry and artillery were short of horses, and the latter had not yet acquired mobility and skill in manoeuvring. Napoleon's determination to undertake the invasion of England has often been disputed, but it is hard to imagine what other operation he contemplated, for the outbreak of hostilities with his continental enemies found him ill-supplied with intelligence as to the resources of the country he had then to traverse. To remedy this, Murat and other general officers as well as minor agents were sent ahead and instructed to travel through South Germany in plain clothes with a view to collecting information and mastering the topography. The emperor was, moreover, imperfectly acquainted with the degree of preparation of his adversaries' designs, and when he dictated his preliminary orders he was still unaware of the direction that the allies' advance would assume. On Aug. 26, however, he learnt that 100,000 Russians were about to enter Bohemia thence to unite with an Austrian army of 80,000 near the junction of the Inn and Danube, and this information drove him to alter the general direction of his advance so as to traverse the defiles of the Black Forest north of the Neckar, cavalry only observing the passes to the south.

Austrian Army.—The Austrians after the defeats of 1800 had endeavoured to reorganize their forces on the French model, but they were soon to learn that in matters of organization the spirit is everything, the letter very little. They had copied the organization of the French corps, but could find no corps commanders fit to assume the responsibility for these commands. As always in such conditions, the actual control of the smallest movements was still centralized in the hands of the army commanders, and thus the rate of marching was incredibly slow. They had decided that in future their troops in the field should live by requisition, and had handed over to the artillery, which needed them badly, a large number of horses thus set free from the transport service, but they had not realized that men accustomed to a regular distribution of rations cannot be transformed into successful marauders and pillagers by a stroke of the pen; and they had sent away the bulk of their army, 120,000 under their best general, the archduke Charles, into Italy, leaving Mack von Leiberich in Germany, nominally as chief of the staff to the young Prince Ferdinand, but virtually in command, to meet the onset of Napoleon at the head of his veterans. Mack had the distinction of having risen from the ranks in the most casteridden army in Europe.

The March on Ulm.—The outbreak of the campaign was hastened by the desire of the Austrian government to feed their own army and leave a bare country for Napoleon by securing the resources of Bavaria. It was also hoped that the Bavarians with their army of 25,000 men would join the allies. In the latter hope they were deceived, and the Bavarians under General Wrede slipped away to Bamberg in time. In the former, however, they were successful, and the destitution they left in their wake almost wrecked Napoleon's subsequent combinations. Mack's march to Ulm was therefore a necessity of the situation, and his continuance in this exposed position, if foolhardy against such an adversary, was at any rate the outcome of the high resolve that even if beaten he would inflict crippling losses upon the enemy. Mack knew that the Russians would be late at the rendezvous on the Inn. By constructing an entrenched camp at Ulm and concentrating all the available food within it, he expected to compel Napoleon to invest and besiege him. and he anticipated that in the devastated country his adversary would be compelled to separate and thus fall an easy prey to the Russians. For that blow he had determined to make his own army the anvil. But these views obviously could not be published in army orders, hence the discontent and opposition he was destined to encounter.

Movements of the French.—It was on Sept. 21 that Napoleon learnt of Mack's presence in Ulm. On that date his army had crossed the Rhine and was entering the defiles of the Black Forest. It was already beginning to suffer. Boots were worn out, greatcoats deficient, transport almost unattainable and, according to modern ideas, the army would have been considered incapable of action.

On Sept. 26 its deployment beyond the mountains was complete, and as Napoleon did not know of Mack's intention to stay at Ulm and had learned that the Russian advance had been delayed, he directed his columns by the following roads on the Danube, between Donauworth and Ingolstadt, so as to be in a position to intervene between the Austrians and the Russians and beat both in detail.

	Sept. 28	Oct. 6	Oct. 9	Oct. 16
Bernadotte	Würzburg	Anspach	Nürnberg	Regensburg
Marmont	Würzburg	Anspach	Nürnberg	Regensburg
Davout	Mannheim	Mergentheim	Anspach	Dietfurt
Ney	Selz	Crailsheim	Weissenburg	Ingolstadt
Lannes	Strassburg	Gmünd	Nordlingen	Neuburg
Soult	Landau	Aalen	Donauworth	

On Oct. 7 this movement was completed—the Austrians abandoned the Danube bridges after a show of resistance, retreating westward—and Napoleon, leaving Murat in command of the V. and VI. corps and cavalry to observe the Austrians, pressed on to Augsburg with the others so as to be ready to deal with the Russians. Learning, however, that these were still beyond striking radius, he determined to deal with Mack's army first, having formed the fixed conviction that a threat at the latter's communications would compel him to endeavour to retreat southwards towards Tirol. Bernadotte in his turn became an army of observation, and Napoleon joining Murat with the main body marched rapidly westward from the Lech towards the Iller.

Austrian Plans.—Mack's intentions were not what Napoleon supposed. He had meanwhile received (false) information of a British landing at Boulogne, and he was seriously deceived as to the numbers of Napoleon's forces. He was also aware that the exactions of the French had produced deep indignation throughout Germany and especially in Prussia whose neutrality had been violated. All this, and the almost mutinous discontent of his generals and his enemies of the court circle, shook his resolution of acting as anvil for the Russians, of whose delay also he was aware, and about Oct. 8 he determined to march out north-eastward across the French lines of communication and save his sovereign's army by taking refuge if necessary in Saxony. Believing implicitly in the rumours of a descent on Boulogne and of risings in France which also reached him, and knowing the destitution he had left behind him in his movement to Ulm, when he heard of the westward march of French columns from the Lech he told his army, apparently in all good faith, that the French were in full march for their own country.

Actually the French at this moment were suffering the most terrible distress—up to the Danube they had still found sufficient food for existence, but south of it, in the track of the Austrians, they found nothing. All march discipline disappeared, the men dissolved into hordes of marauders and even the sternest of the marshals wrote piteous appeals to the emperor for supplies, and for permission to shoot some of their stragglers. But to all these Berthier in the emperor's name sent the stereotyped reply—"The emperor has ordered you to carry four days' provisions, therefore you can expect nothing further—you know the emperor's method of conducting war."

Action of Albeck or Haslach.—Meanwhile Murat, before the emperor joined him, had given Mack the desired opening. The VI. corps (Ney) should have remained on the left bank of the

Danube to close the Austrian exit on that side, but by mistake only Dupont's division had been left at Albeck, the rest being brought over the river. Mack on the 8th had determined to commence his withdrawal, but fortune now favoured the French. The weather during the whole of October had been unusually wet, the swollen Danube overflowed the low ground and the roads had become quagmires. On the south bank, owing to better natural drainage and a drier subsoil, movement was fairly easy, but the Austrians found it almost impossible. On Oct. 11, when they began their march, the road along the Danube was swept into the river, carrying with it several guns and teams, and hours were consumed in passing the shortest distances. At length in the afternoon they suddenly fell upon Dupont's isolated division at Albeck, which was completely surprised and severely handled. The road now lay completely open, but the Austrian columns had so opened out owing to the state of the roads that the leading troops could not pursue their advantage — Dupont rallied and the Austrians had actually to fall back towards Ulm to procure food.

Elchingen.—For three more days Mack struggled with an unwilling staff and despondent men to arrange a further advance. During these very three days, through a succession of staff blunders, the French failed to close the gap, and on the morning of Oct. 14 the armies, each renewing its advance, came in contact at the bridge of Elchingen. This bridge, all but a few road-bearers, had been destroyed, but now the French gave an example of that individual gallantry which was characteristic of the old revolutionary armies. Running along the beams under a close fire a few gallant men forced their way across. The floor of the bridge was rapidly relaid, and presently the whole of the VI. corps was deploying with unexampled rapidity on the farther side. The Austrians, still in their quagmire, could not push up reinforcements fast enough, and though Mack subsequently alleged deliberate obstruction and disobedience on the part of his subordinates, the state of the roads alone suffices to explain their defeat. Only the right column of the Austrians was, however, involved; the left under General Werneck, to whom some cavalry and the archduke Ferdinand attached themselves, did indeed succeed in getting away, but without trains or supplies. They continued their march, famished but unmolested, until near Heidenheim they suddenly found themselves confronted by what from the diversity of uniforms they took to be an overwhelming force; at the same time the French cavalry sent in pursuit appeared in their rear. Utterly exhausted by fatigue, Werneck with his infantry, some 8,000 strong, surrendered to what was really a force of dismounted dragoons and foot-sore stragglers improvised by the commanding officer on the spot to protect the French treasure chests, which at that moment lay actually in the path of the Austrians. The young archduke with some cavalry escaped.

Mack Surrounded. — The defeat at Elchingen on Oct. 14 sealed the fate of the Austrians, though Mack was still determined to endure a siege. As the French columns coming up from the south and west gradually surrounded him, he drew in his troops under shelter of the fortress and its improvised entrenched camp, and on the 15th he found himself completely surrounded. On the 16th the French field-guns fired into the town, and Mack realized that his troops were no longer under sufficient control to endure a siege. When, therefore, next morning, negotiations were opened by the French, Mack, still feeling certain that the Russians were at hand, agreed to an armistice and undertook to lay down his arms if within the next twenty-one days no relief should arrive. To this Napoleon consented, but hardly had the agreement been signed when he succeeded in introducing a number of individual French soldiers into the fortress, who began rioting with the Austrian soldiery. Then, sending in armed parties to restore order and protect the inhabitants, he caused the guards at the gates to be overpowered, and Mack was thus forced into an unconditional surrender.

On Oct. 22, the day after Trafalgar, the remnant of the Austrian army, 23,000 strong, laid down its arms. About 5,000 men under Jellachich had escaped to Tirol, 2,000 cuirassiers with Prince Ferdinand to Eger in Bohemia, and about 10,000 men under Werneck had surrendered at Heidenheim. The losses in battle having been insignificant, there remain some 30,000 to account for — most of whom probably escaped individually by the help of the inhabitants, who were bitterly hostile to the French. Napoleon now hastened to rejoin the group of corps he had left under Bernadotte in observation towards the Russians, for the latter were nearer at hand than even Mack had assumed. But hearing of his misfortune they retreated before Napoleon's advance along the right bank of the Danube to Krems, where they crossed the river and withdrew to an entrenched camp near Olmiitz to pick up fresh Austrian reinforcements. The severe actions of Diirrenstein (near Krems) on Nov. 11, and of Hollabriinn on Nov. 16, in which Napoleon's marshals learned the tenacity of their new opponents, and the surprise of the Vienna bridge (November 14) by the French, were the chief incidents of this period in the campaign.

Campaign of **Austerlitz.**—Napoleon continued down the right bank to Vienna, where he was compelled by the condition of his troops to call a halt to refit his army. After this was done he continued his movement to Briinn. Thither he succeeded in bringing only 55,000 men. He was again forced to give his army rest and shelter, under cover of Murat's cavalry. The allies now confronted him with upwards of 86,000 men, including 16,000 cavalry. About Nov. 20 this force commenced its advance, and Napoleon concentrated in such a manner that within three days he could bring over 80,000 French troops into action around Brunn, besides 17,000 or more Bavarians under Wrede. On the 28th Murat was driven in by the allied columns. That night orders were despatched for a concentration on Brunn in expectation of a collision on the following day; but hearing that the whole allied force was moving towards him he decided to concentrate south-east of Briinn, covering his front by cavalry on the Pratzen heights. Meanwhile he had also prepared a fresh line of retreat towards Bohemia, and, certain now of having his men in hand far the coming battle, he quietly awaited events.

The allies were aware of his position, and still adhering to the old "linear" system, marched to turn his right flank *(see* AUSTERLITZ). As soon as their strategic purpose of cutting him off from Vienna became apparent, the emperor moved his troops into position, and in the afternoon issued his famous proclamation to his troops, pointing out the enemy's mistakes and his plan for defeating them. At the same time he issued his orders for his first great battle as a supreme commander. The battle of Austerlitz began early next morning and closed in the evening with the thorough and decisive defeat of the allies.

PRUSSIAN AND POLISH CAMPAIGNS

Around the Prussian army, and particularly the cavalry, the prestige of Frederick the Great's glory still lingered; but the younger generation had little experience of actual warfare, and the higher commanders were quite unable to grasp the changes in tactics and in the conduct of operations which had grown out of the necessities of the French Revolution. The individual officers of the executive staff were the most highly trained in Europe, but there was no great leader to co-ordinate their energies. The total number of men assigned to the field army was 110,000 Prussians and Saxons. They were organized in corps, but their leaders were corps commanders only in name, for none were allowed any latitude for individual initiative. Ill-judged economies had undermined the whole efficiency of the Prussian army. Two-thirds of the infantry and one-half of the cavalry were allowed furlough for from ten to eleven months in the year. The men were unprovided with greatcoats. Most of the muskets had actually seen service in the Seven Years' War, and their barrels had worn so thin with constant polishing that the use of full charges at target practice had been forbidden. Above all, the army had drifted entirely out of touch with the civil population. The latter, ground down by feudal tradition and law, and at the same time permeated by the political doctrines of the late 18th century, believed that war concerned the governments only, and formed no part of the business of the "honest citizen." In this idea they were supported by the law itself, which protected the civilian against the soldier, and forbade even in war-time the requisitioning of horses, provisions and transport, without payment. Up to the night of the battle of Jena itself, the Prussian troops lay starving in the midst of plenty, whilst the French everywhere took what they wanted. This alone was a sufficient cause for all the misfortunes which followed.

During the campaign of Austerlitz Prussia, furious at the violation of her territory of Anspach, had mobilized, and had sent Haugwitz as ambassador to Napoleon's headquarters. He arrived on Nov. 30, and Napoleon, pleading business, put off his official reception till after the battle of Austerlitz. Of course the ultimatum was never presented, as may be imagined; Haugwitz returned and the king of Prussia demobilized at once. But Napoleon, well knowing the man he had to deal with, had determined to force a quarrel upon Prussia at the earliest convenient opportunity. His troops therefore, when withdrawn from Austria, were cantoned in south Germany in such a way that, whilst suspicion was not aroused in minds unacquainted with Napoleonic methods, they could be concentrated by a few marches behind the Thuringian forest and the upper waters of the Main. Here the Grande Armée was left to itself to recuperate and assimilate its recruits, and it is characteristic of the man and his methods that he did not trouble his corps commanders with a single order during the whole of the spring and summer.

As the diplomatic crisis approached, spies were sent into Prussia, and simultaneously with the orders for preliminary concentration the marshals received private instructions, the pith of which cannot be better expressed than in the following two quotations from Napoleon's correspondence:—

"Man intention est de concentrer toutes mes forces sur l'extrémité de ma droite en laissant tout l'espace entre le Rhin et Bamberg entièrement dégarni, de manière à avoir près de 200.000 hommes réunis sur un même champ de bataille; mes premières march'es menacent le coeur de la monarchie prussienne" (No. 10,920). "Avec cette immense supériorité de forces réunis sur un espace si Ctroit, vous sentez que je suis dans la volonté de ne rien hasarder et d'attaquer l'ennemi partout oh il voudra tenir. Vous pensez bien que ce serait une belle affaire que de se porter sur cette place (Dresden) en *un bataillon carré de 200,000 hommes*" (Soult, No. 10,941).

Advance of the Grande Armée.—On Oct. 7 the Grande *Armée* lay in three parallel columns along the roads leading over the mountains to Hof, Schleiz and Kronach; on the right lay the IV. corps (Soult) about Bayreuth, with his cavalry in rear, and behind these the VI. corps (Ney) at Pegnitz; in the centre, Bernadotte's I. corps from Nordhalben, with the III. corps (Davout) Lichtenfels; Guard and headquarters, Bamberg. The left column was composed of the V. (Lannes) at Hemmendorf, with the VII. (Augereau) extending south to the Main at Burgebrach.

Napoleon's .object being surprise, all the cavalry except a few vedettes were kept back behind the leading infantry columns and these latter were ordered to advance, on the signal being given, in "masses of manoeuvre," so as to crush at once any outpost resistance which was calculated upon the time required for the deployment of ordinary marching columns. This order has never since found an imitator, but deserves attentive study as a masterpiece (see H. Bonnal, *Manoeuvre d'Iéna*).

To meet the impending blow the Prussians had been extended in a cordon along the great road leading from Mainz to Dresden, Blucher was at Erfurt, Rüchel at Gotha, Hohenlohe at Weimar, Saxons in Dresden. with outposts along the frontier. An offensive move into Franconia was under discussion, and for this purpose the Prussian staff had commenced a lateral concentration about Weimar, Jena and Naumburg when the storm burst upon them. The emperor gathered little from the confused reports of their purposeless manoeuvres, but, secure in the midst of his "battalion square" of 200.000 men, he remained quite indifferent, well knowing that an advance straight on Berlin must force his enemy to concentrate and fight, and as they would bring at most 127,000 men on to the battlefield the result could hardly be doubtful. On Oct. g the cloud burst. Out of the forests which clothe the northern slopes of the Thuringer Wald the French streamed forth, easily overpowering the resistance of the Prussian outposts on the upper Saale, and once the open country was reached the cavalry under Murat trotted to the front, closely followed by Bernadotte's corps as "general advance guard." The result of the cavalry scouting was, however, unsatisfactory. On the night of the 10th, the emperor was still unaware of the position of his principal foe, and Murat with Bernadotte behind him was directed on Gera for the 11th, the remainder of the army continuing along the roads previously assigned to them.

In the meanwhile, however, the Saxons had been moving from Naumburg through Gera on Jena, Hohenlohe was near Weimar, and all the other divisions of the Prussian army had closed in a march eastwards, the idea of an offensive to the southward which Napoleon had himself attributed to them having already disappeared.

Reaching Gera at 9 A.M. Murat reported the movement of the Saxons on the previous day, but omitted to send a strong detachment in pursuit. The traces of the Saxons were lost, and Napoleon, little satisfied with his cavalry, authorized Lasalle to offer up to 6,000 frs. reward for information of the Prussian point of concentration. At 1 A.M. of the 12th Napoleon issued his orders: Murat and Bernadotte via Zeitz to Naumburg; Davout (III. corps and a dragoon division) also to Naumburg; Lannes to Jena, Augereau following; Soult to Gera.

In the meantime the Prussians were effecting their concentration. Ruchel, who with 15,000 men had been sent into the mountains as an advance guard for the projected offensive, was recalled to Weimar, which he reached on the 13th. The main body were between Weimar and Apolda during the 12th, and the Saxons duly effected their junction with Hohenlohe in the vicinity of Vierzehnheiligen, whilst the latter had withdrawn his troops, all but some outposts from Jena, to the plateau about Capellendorf, some 4m. to the N.W. The whole army, of over 120,000 men, could therefore have been concentrated against Lannes and Augereau by the afternoon of the 13th, whilst Soult could

FIG. 2.—JENA CAMPAIGN

only have intervened very late in the day, and Davout and Bernadotte were still too distant to reach the battlefield before the 14th. All the French corps, moreover, were so exhausted by their rapid marches over bad roads that the emperor actually ordered (at 1 A.M. on the 13th) a day of rest for all except Davout, Bernadotte, Lannes and Murat.

The Prussian headquarters, however, spent the 12th and 13th in idle discussion, whilst the troop commanders exerted themselves to obtain some alleviation for the suffering of their starving men. The defeats undergone by their outpost detachment had profoundly affected the nerves of the troops, and on the afternoon of the 11th, on the false alarm of a French approach, a panic broke out in the streets of Jena, and it took all the energy of Hohenlohe and his staff to restore order. On the morning of the 12th the Saxon commanding officers approached Hohenlohe with a statement of the famishing condition of their men, and threatened to withdraw them again to Saxony. Hohenlohe pointed out that the Prussians were equally badly off, but promised to do his best to help his allies. Urgent messages were sent off to the Commissary von Goethe (the poet), at Weimar for permission to requisition food and firewood. These requests, however, remained unanswered, and the Prussians and Saxons spent the night before the battle shivering in their miserable bivouacs.

The 13th of October.—During the early morning of the 13th the reports brought to Napoleon at Gera partially cleared up the situation, though the real truth was very different from what he supposed. However, it was evident that the bulk of the Prussians lay to his left, and instructions were at once despatched to Davout to turn westward from Naumburg towards Kosen and to bring Bernadotte with him if the two were still together. The letter, however, ended with the words "but I hope he is already on his way to Dornburg." Now Bernadotte had neglected to keep the emperor informed as to his whereabouts. He was still with Davout, but, concluding that he had missed an order directing him to Dornburg, he thought to conceal his error by assuming the receipt of the order evidently alluded to in the last words, and as a result he marched towards Dornburg, and his whole corps was lost to the emperor at the crisis of the next day's battle.

On the road from Gera to Jena Napoleon was met by intelligence from Lannes announcing his occupation of Jena and the discovery of Prussian troops to the northward. Knowing the emperor's methods, he wisely restrained the ardour of his subordinates and asked for instructions whether to attack or wait. The emperor rode forward rapidly, reached Jena about 3 P.M., and with Lannes proceeded to the Landgrafenberg to reconnoitre. From this point his view was, however, restricted to the immediate foreground, and he only saw the camps of Hohenlohe's left wing. At this moment the Prussians were actually on parade and ready to move off to attack, but just then the "evil genius" of the Prussian army, Massenbach, an officer of the Headquarters Staff, rode up and claiming to speak with the authority of the king and commander-in-chief, induced Hohenlohe to order his troops back to camp. Of all this Napoleon saw nothing, but from all reports he came to the conclusion that the whole Prussian army was actually in front of him, and at once issued orders for his whole army to concentrate towards Jena, marching all night if need be. Six hours earlier his conclusion would have been correct, but early that morning the Prussian headquarters, alarmed for the safety of their line of retreat on Berlin by the presence of the French in Naumburg, decided to leave Hohenlohe and Rüchel to act as rear-guard, and with the main body to commence their retreat towards the river Unstrutt and the Eckhardtsberge where Massenbach had previously reconnoitred an "ideal" battlefield. This belief in positions was the cardinal principle of Prussian strategy in those days. The troops had accordingly commenced their march on the morning cf the 13th, and now at 3 P.M. were settling down into bivouac; they were still but a short march from the decisive field.

Battle of **Jena.**—On the French side, Lannes' men were working their hardest, under Napoleon's personal supervision, to make a practicable road up to the Landgrafenberg, and all night long the remaining corps struggled through darkness towards the rendezvous. By daybreak on the 14th, the anniversary of Elchingen, upwards of 60,000 men stood densely packed on the narrow plateau of the mountain, whilst, below in the ravines on either flank, Soult on the right, and Augereau on the left, were getting into position. Fortunately a dense fog hid the helpless masses on the Landgrafenberg from sight of the Prussian gunners. Hohenlohe had determined to drive the French into the ravine at daybreak, but had no idea as to the numbers in front of him. For want of room, only a few Prussian battalions were sent forward, and these, delaying their advance till the fog had sufficiently lifted, were met by French skirmishers, and small columns, who rapidly overlapped their flanks and drove them back in confusion. Hohenlohe now brought up the remainder of his command, but in the meanwhile the French had poured across the neck between the Landgrafenberg and the main plateau, and the troops of Soult and Augereau were working up the ravines on either hand. In view of these troops the Prussian line, which had advanced faultlessly as if on parade, halted to prepare its bayonet attack by fire, and, once halted, it was found impossible to get them to go on again. The French, who had thrown themselves into houses, copses, etc., picked off the officers, and the flanks of the long Prussian lines swayed and got into confusion. The rival artilleries held each other too thoroughly to be able to spare attention to the infantry, whilst the Prussian cavalry, which had forgotten how to charge in masses of eighty or more squadrons, frittered away their strength in isolated efforts. By 10 A.M. the fourteen battalions which had initiated this attack were outnumbered by three to one, and drifted away from the battlefield. Their places were taken by a fresh body, but this was soon outnumbered and ourflanked in its turn. By 2 P.M. the psychological moment had come, and Napoleon launched his guards and cavalry to complete the victory and initiate pursuit. Rüchel's division now arrived and made a most gallant effort to cover the retreat, but their order being broken by the torrent of fugitives, they were soon overwhelmed by the tide of the French victory and all organized resistance had ceased by 4 P.M.

Briefly summarized, the battle came to this—in four successive efforts the Prussians failed because they were locally outnumbered. This was the fault of their leaders solely, for, except for the last attack, local superiority was in each case attainable. Organization and tactics did not affect the issue directly, for the conduct of the men and their junior officers gave abundant proof that in the hands of a competent leader the "linear" principle of delivering one shattering blow would have proved superior to that of a gradual attrition of the enemy here, as on the battlefields of the Peninsula and at Waterloo, and this in spite of other defects in the training of the Prussian infantry which simultaneously caused its defeat on the neighbouring field of Auerstadt.

Battle of **Auerstädt.**—Here the superiority of French mobility showed its value most conclusively. Davout in obedience to his orders of the previous morning was marching over the Saale at Kosen, when his advanced guard and that of the Prussian main army came unexpectedly in contact. The latter with at least 50,000 men was marching in two columns, and ought therefore to have delivered its men into line of battle twice as fast as the French, who had to deploy from a single issue, and whose columns had opened out in the passage of the Kosen defile and the long ascent of the plateau above. But the Prussians attacked at the old regulation speed of seventy-five paces to the minute, and the French manoeuvred at the quick or double of 120 or 150. The consequence was that the French always succeeded in reinforcing their fighting line in time to avert disaster. Nevertheless by mid-day their strength was well-nigh exhausted, whilst the Prussian reserve, eighteen battalions of guards under Kalckreuth, stood intact and ready to engage. But at the critical moment the duke of Brunswick fell mortally wounded, and Scharnhorst, his chief of the staff, was at the time absent on another part of the field. Meanwhile rumours from the battlefield at Jena, magnified as usual, began to reach the staff, and these may possibly have influenced Kalckreuth, for when called upon to attack with his eighteen battalions and win the day, he declined to move without the direct order of the commander-in-chief to do so, alleging that it was the duty of a reserve to cover the retreat and he considered himself personally responsible to the king for the guards entrusted to his care. Even then the day might possibly have been saved had Bliicher been able to find even twenty squadrons accustomed to gallop together, but the Prussian cavalry had been dispersed amongst the infantry commands, and at the critical moment it proved impossible for them to deliver a united and decisive attack

Seeing further efforts hopeless, Scharnhorst in the duke's name initiated the retreat and the troops withdrew north-west towards Buttelstedt. almost unmolested by the French, who this day had put forth all that was in them, and withstood victoriously the highest average punishment any troops of the new age of warfare had as yet endured. So desperate had been their resistance that the Prussians unanimously stated Davout's strength at double the actual figure. Probably no man but Davout could have got so much out of his men, but why was he left unsupported?

Bernadotte, we have seen, had marched to Dornburg, or rather to a point overlooking the ford across the Saale at the village of

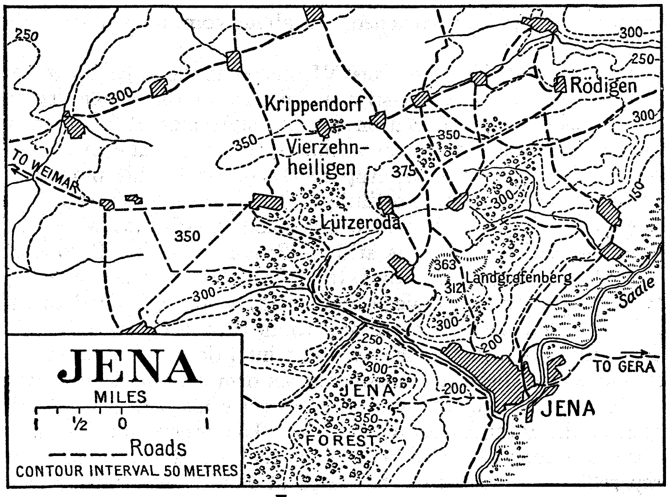

FIG. 3.—JENA

that name, and reached there in ample time to intervene on either field. But with the struggle raging before him he remained undecided, until at Jena the decision had clearly fallen, and then he crossed the river and arrived with fresh troops too late for their services to be required.

Prussian Retreat.—During the night the Prussians continued their retreat, the bulk of the main body to Sommerda, Hohenlohe's corps towards Nordhausen. The troops had got much mixed up, but as the French did not immediately press the pursuit home, order was soon re-established and a combined retreat was begun towards the mouth of the Elbe and Liibeck. Here help was expected to arrive from England, and the tide might ultimately have turned, for the Russian armies were gathering in the east. It was now that the results of a divorce of the army from the nation began to be felt. Instead of seizing all provisions and burning what they could not remove, the Prussian generals enforced on their men the utmost forbearance towards the inhabitants, and the fact that they were obeyed, in spite of the inhumanity the people showed to their sick and wounded countrymen, proves that discipline was by no means so far gone as has generally been believed. The French marching in pursuit were received with open arms, the people even turning their own wounded out of doors to make room for their French guests. Their servility awakened the bitterest contempt of their conquerors and forms the best excuse for the unparalleled severity of the French yoke. On Oct. 26 Davout reached Berlin, having marched 166m. in twelve days including two sharp rearguard actions, Bernadotte with his fresh troops having fallen behind. The inhabitants of Berlin, headed by their mayor, came out to meet him, and the newspapers lavished adulation on the victors and abuse-on the beaten army. On the 28th Murat's cavalry overtook the remnant of Prince Hohenlohe's army near Prenzlau (north of Berlin) and invited its capitulation. Unfortunately the prince sent Massenbach to discuss the situation, and the latter completely lost his head. Murat boasted that he had 100,000 men behind him, and on his return Massenbach implored his chief to submit to an unconditional surrender, advice which the prince accepted, though as a fact Murat's horses were completely exhausted and he had no infantry whatever within call. Only Bliicher now remained in the field, and he too was driven at length into Lubeck with his back to the sea where he capitulated Nov. 7.

Campaigns in Poland and East **Prussia.**—Hitherto the French had been operating in a rich country, untouched for half a century past by the ravages of war, but as the necessity for a campaign against the Russians confronted the emperor, he realized that his whole supply and transport service must be put on a different footing. After the wants of the cavalry and artillery had been provided for, there remained but little material for transport work. Exhaustive orders to organize the necessary trains were duly issued, but the emperor seems to have had little conception of the difficulties the tracks—there were no metalled roads—of Poland were about to present to him. Moreover, it was one thing to issue orders, but quite another to ensure that they were obeyed, for they entailed a complete transformation in the mental attitude of the French soldier towards all that he had been taught to consider his duties in the field. Experience only can teach the art of packing wagons and the care of draught animals, and throughout the campaign the small ponies of Poland and East Prussia broke down by thousands from over loading and unskilful packing.

The Russian Army formed the most complete contrast to the French that it is possible to imagine. Though clad, armed and organized in European fashion, the soldiers retained in a marked degree the traditions of their Mongolian forerunners, their transport wagons were in type the survival of ages of experience, and their care for their animals equally the result of hereditary habit. The intelligence of the men and regimental officers was very low, but on the other hand service was practically for life, and the regiment the only home the great majority had ever known. Hence obedience was instinctive and initiative almost undreamt of. Moreover, they were essentially a war-trained army, for even in peace time their long marches to and fro within the empire had most thoroughly inured them to hardship and privation. Napoleon might have remembered his own saying, "La misère est l'école du bon soldat." Their artillery was numerous and for the most part of heavy calibre—18- and 24-pounders were common—but the strength of the army lay in its infantry, with its incomparable tenacity in defence and its blind confidence in the bayonet in attack. The traditions of Suvarov and his victories in Italy (see FRENCH REVOLUTIONARY WARS) were still fresh, but there was no longer a Suvarov to lead them.

Advance **to the Vistula.**—Napoleon had from the first been aware of the secret alliance between Prussia and Russia, sworn

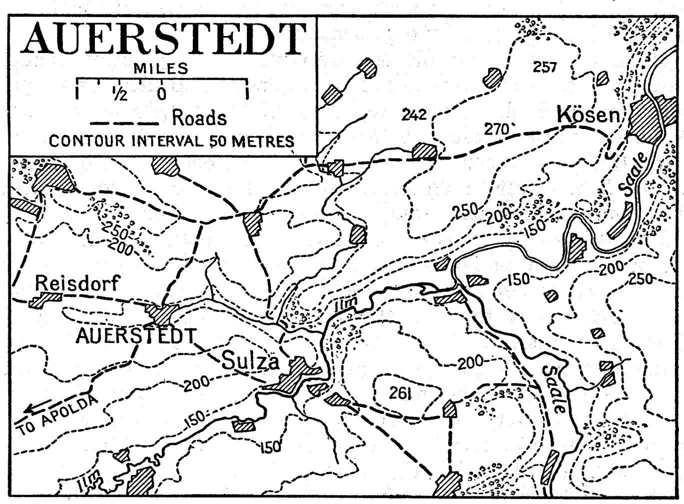

FIG. 4.—AUERSTEDT

by their respective sovereigns over the grave of Frederick the Great, and this knowledge had been his principal reason for precipitating hostilities with the former. He remained, however, in complete ignorance of the degree of preparation attained on the Russian side, and as the seizure of Warsaw together with the control of the resources of Poland in men and material its occupation would afford, was the chief factor in his calculation, he turned at once to the eastward as soon as all further organized resistance in Prussia was ended by the surrender of Prenzlau and Lübeck. Scarcely leaving his troops time to restore their worn-out foot gear, or for the cavalry to replace their jaded horses from captured Prussian resources, he set Davout in motion towards Warsaw on Nov. 2, and the remainder of the army followed in successive echelon's as rapidly as they could be despatched.

The cavalry, moving well in advance, dispersed the Prussian depots and captured their horses, as far as the line of the Vistula, where at last they encountered organized resistance from the

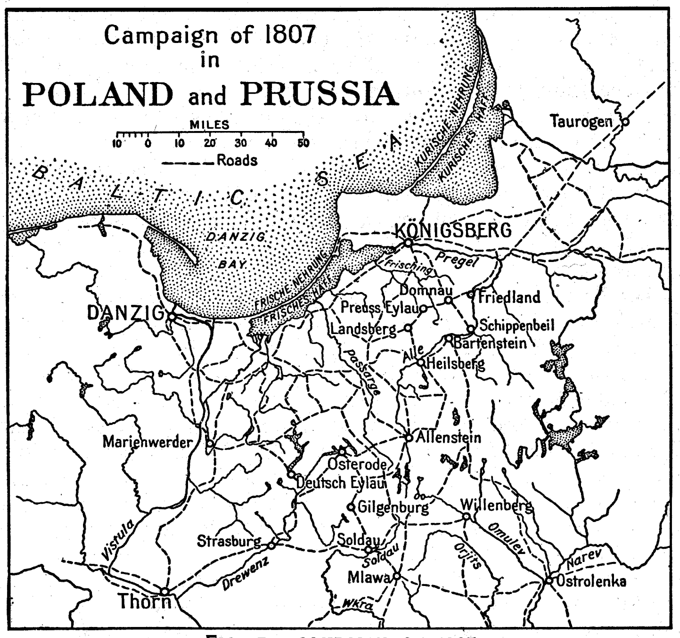

FIG. 5.—CAMPAIGN OF 1807

outposts of Lestocq's little corps of 15,000 men—all that was left of Frederick the Great's army. These, however, gave way before the threat of the advancing French and, after a few trifling skirmishes, Davout entered Warsaw on Nov. 30, being followed by the V., IV., and Guard corps during the succeeding fortnight, whilst the VI. and VII. were echeloned to their left, and the VIII. (Mortier) and IX. (Jerome Napoleon) and X. (Lefebvre), all new formations since the outbreak of the war, followed some marches in the rear. Jerome's corps was composed of the Bavarians, Wiirttembergers and Badensers.

Behind these all Prussia was overrun by newly formed units, (3rd and 4th battalions) raised from depot companies, conscripts for 1807, and old soldiers rejoining after sickness or wounds. Napoleon caused these to be despatched to the front immediately after their formation. He had much territory to occupy, and on the long march of on an average 85 days, he considered that they could be organized, equipped and drilled en route.

Pultusk.—The Russians meanwhile had been moving slowly forward in two bodies, one under Bennigsen (50,000), the other under Buxhowden (25,000), and the French being at this time in Warsaw, they took up threatening positions about Pultusk, Plock and Prassnitz. From this triangle they harried the French communications with Berlin, and to secure a winter's rest for his men Napoleon determined to bring them to action. On Dec. 23 operations were commenced, but the difficulties of securing information and maintaining communication between the respective columns, so unlike what any of the French had previously encountered, led to a very partial success. The idea had been to induce the Russians to concentrate about Pultusk and, turning their position from its left, ultimately to cut them off from Russia, and if possible to surround them. But in this new and difficult country the emperor found it impossible to time his marches. The troops arrived late at their appointed positions, and after a stubborn rearguard action at Pultusk itself and undecisive fighting elsewhere (Golymin and Soldau) the Russians succeeded in retreating beyond the jaws of the French attack, and Napoleon for the first time found that he had exceeded the limit of endurance of his men. Indeed, the rank and file bluntly told him as much as he rode with the marching columns. Yielding to the inevitable, but not forgetting to announce a brilliant victory in a bulletin, he sent his troops into winter quarters along the Passarge and down the Baltic, enjoining on his corps commanders most strictly to do nothing to disturb their adversary.

Campaign **of Eylau.**—Bennigsen, now commanding the whole Russian army which with Lestocq's Prussians amounted to 100,000, also moved into winter quarters in the area Deutsch Eylau-Osterode-Allenstein, and had every intention of remaining there, for a fresh army was already gathering in Russia, the first corps of which had reached Nur about 50m. distant from the French right.

Unfortunately, Ney with his VI. corps about Gilgenberg had received the most poverty-stricken district in the whole region, and to secure some alleviation for the sufferings of his men he incautiously extended his cantonments. till they came in contact with the Russian outposts. Apparently seeing in this movement a recommencement of hostilities, Bennigsen concentrated his troops towards his right and commenced an advance westwards towards Danzig, which was still in Prussian hands. Before his advance both Ney and Bernadotte (the latter, between Ney and the Baltic, covering the siege of Danzig) were compelled to fall back. It then became necessary to disturb the repose of the whole army to counter the enemy's intentions. The latter by this movement, however, uncovered his own communication with Russia, and the emperor was quick to seize his opportunity. He received the information on Jan. 28. His orders were at once issued and complied with so rapidly that by the 31st he stood prepared to advance with the corps of Soult, Ney, Davout and Augereau, the Guard and the reserve cavalry (80,000 men on a front of 60m.) from Myszienec through Willenberg to Gilgenberg; whilst Lannes on his right towards Ostrolenka and Lefebvre (X.) at Thorn covered his outer flanks.

Bernadotte, however, was missing, and this time through no fault of his own. His orders and the despatch conveying Napoleon's instructions fell into the hands of the Cossacks, and just in time Bennigsen's eyes were opened. Rapidly renouncing his previous intentions, he issued orders to concentrate on Allenstein; but this point was chosen too far in advance 'and he was anticipated by Murat and Soult at that place on Feb 2. He then determined to unite his forces at Joukendorf, but again he was too late. Soult and Murat attacked his rearguard on the 3rd, and Bennigsen, learning from his Cossacks that the French corps were designing to swing round and enclose him, he withdrew by a night march and ultimately succeeded in getting his whole army, with the exception of Lestocq's Prussians, together in the strong position along the Alle, the centre of which is marked by Preussisch-Eylau. The opportunity for this concentration Bennigsen owed to the time gained for him by his rearguard at Joukendorf, for this had stood just long enough to induce the French columns to swing in to surround it, and the next day was thus lost to the emperor as his corps had to extend again to their manoeuvring intervals. The truth is that the days were too short and the roads too bad for Napoleon to carry out the full purpose his "general advance guard" was intended to fulfil. It was designed to hold the enemy in position by the vigour of its attack, thus neutralizing his independent will power and compelling him to expend his reserves in the effort to rescue the troops engaged. But in forests and snowdrifts the French made such slow progress that no sufficient deployment could be made until darkness put a stop to the fighting. Thus, when late on Feb. 7, 1807 Murat and Soult found the enemy's rearguard near Eylau (*q.v.*) the fighting was severe but not prolonged. This time, however, Bennigsen, with over 60,000 men in position and 15,000 Prussians expected to arrive next morning, had no desire to avoid a battle, and deployed for action.

During the night Augereau and the Guards had arrived, and Ney and Davout were expected on either flank in the forenoon. This time the emperor was determined that his enemy should not escape him, and about 8 A.M. ordered Soult and Augereau on the left and right respectively to assail the enemy, Murat and the Guards remaining in the centre as reserve. Napoleon's own forces thus became the "general advance guard" for Ney and

Davout, who were to close in on either side and deliver the decisive stroke. But here too the weather and the state of the roads operated adversely, for Ney came up too late, while Davout, in the full tide of his victorious advance, was checked by the arrival of Lestocq, whose corps Ney had failed to intercept, and the attack of Augereau's corps (VII), made in a blinding snowstorm, failed with appalling loss. Bennigsen, however, drew off on Ney's arrival, and the French were too much exhausted to pursue him. Again the emperor had to admit that his troops could do no more, and, bowing to necessity, he distributed them into winter quarters, where, however, the enterprise of the Cossacks, who were no strangers to snow and to forests, left the outposts but little repose. A protracted period of rest followed, during which the emperor exerted himself unremittingly to re-equip, reinforce and supply his troops. Hitherto he had been based on the entrenched camp of Warsaw, but he had already taken steps to organize a new line of supply and retreat via Thorn, and this was now completed. At the same time Lefebvre was ordered to press the siege of Danzig with all vigour, and on May 5, after a most gallant resistance, Kalckreuth, who redeemed here his failure of Auerstadt, surrendered. English assistance came too late. By the beginning of June the French had more than made good their losses and 210,000 men were available for field service.

Heilsberg and Friedland.—Meanwhile Bennigsen had prepared for a fresh undertaking, and leaving Lestocq with 20,000 Prussians and Russians to contain Bernadotte, who lay between Braunsberg and Spandau on the Passarge, he moved southward on June 2, and on June 3 and 4 he fell upon Ney, driving him back toward Guttstadt, while with the bulk of his force he moved toward Heilsberg, where he threw up an entrenched position. It was not till June 5 that Napoleon received tidings of his advance, and for the moment these were so vague that he contented himself by warning the remainder of his forces to be prepared to move on June 6. Next day, however, all doubts were set at rest, and as the Russians advanced south of Heilsberg, he decided to wheel his whole force to the right, pivoting on the III corps, and cut Bennigsen off from Konigsberg and the sea. On June 8 the VI, III, VIII and Guard corps, together with a new cavalry reserve corps under Lannes, in all 147,000, stood ready for the operation, and with Murat and Soult as general advanced guard the whole moved forward, driving the Russian outposts before them. Bernadotte, who was to have attacked Lestocq, again failed to receive his orders and took no part in the following operations.

Murat attacked the Russians, who had halted in their entrenched position, on June 11 and drove in their outposts, but did not discover the entrenchments. Meanwhile, Soult had followed with his infantry in close support, and, the emperor himself arriving, ordered him to attack at once. Now the Russians uncovered their entrenchments, and in the absence of artillery preparation Soult's leading troops received most severe punishment. Fresh troops arriving were sent in to his support, but these also proved insufficient, and darkness alone put an end to the struggle. which cost the French 12,000 killed and wounded.

Bennigsen, however, learning that his right was threatened by the III corps, and not having as yet completed his concentration, retreated in the night to Bartenstein, and the following day turned sharp right toward Schippenbeil. The emperor now pressed on toward Friedland, where he would completely control the Russian communications with Konigsberg, their immediate base of supply, but for once the Russians outmarched him and covered their movement so successfully that for the next three days he seems to have completely lost all knowledge of his enemy's whereabouts. Lestocq in the meantime had been forced northward toward Konigsberg, and Soult with Murat was in hot pursuit. The III, VI, VIII and Guard corps followed the main road toward Konigsberg, and the former had reached Mühlhausen and the remainder were about Preussich-Eylau, when Latour Maubourg's dragoons sent in intelligence which pointed to the presence of Bennigsen about Friedland. This was indeed the case. The Russians after passing Schippenbeil had suddenly turned northward, and on the evening of June 13 were taking up a strong position on the river Alle with Friedland as a centre.

What followed presents perhaps the finest instance of the Napoleonic method. The enemy lay directly to his right, and Murat, the IV and III corps had well overshot the mark. Lannes's reserve corps (cavalry), to whom Latour Maubourg reported, lay at Domnau about 10 mi. to the right. The latter at once assumed the role of advanced guard cavalry and was ordered to observe the enemy at Friedland, Ney following in close support. Davout was turned about and directed on the enemy's right, and the VIII corps (Mortier), the Guards and the reserve cavalry followed as main body. On June 14 (the anniversary of Marengo) Lannes carried out his role of fighting advanced guard or screen, the emperor's main body gradually came up, and the battle of Friedland (*q.v.*), notable chiefly for the first display of the new artillery tactics of the French, ended with a general attack about 5 P.M. and the retreat of the Russians, after severe losses, over the Alle. Lestocq was, meanwhile, driven through Konigsberg (which surrendered on June 15) on Tilsit, and now that he was no longer supported by the Russians, the Prussian commander gave up the struggle.

THE AUSTRIAN WAR OF 1809

Ever since Austerlitz the Austrian officers had been labouring to reconstitute and reform their army. Much had been done to create an efficient staff, but though the idea of the army corps command was now no new thing, the senior generals entrusted with these commands were far from having acquired the independence and initiative of their French opponents. Hence the extraordinary slowness of their manoeuvres, not because the Austrian infantrymen were bad marchers, but because the preparation and circulation of orders were still far behind the French standard. The infantry adopted the highly manoeuvrable formations of the French—skirmishers and columns—but it was easier to adopt the formations than to acquire the initiative which gave these their vital energy. The light cavalry had been much improved and the heavy cavalry on the whole proved a fair match for their opponents.

After the peace of Tilsit the *Grande Armke* was gradually withdrawn behind the Rhine, leaving only three commands, totalling 63,000 men, under Davout in Prussia, Oudinot in west central Germany and Lefebvre in Bavaria, to assist the princes of the Confederation of the Rhine in the maintenance of order and the enforcement of the French law of conscription, which was rigorously insisted on in all the states comprised in this new federation. In exchange for the subsistence of the French troops of occupation, a corresponding number of these new levies were moved to the south of France, where they commenced to arrive at the moment when the situation in Spain became acute. The Peninsular War (*q.v.*) called for large forces of the old *Grande Armée* and for a brief period Napoleon directed operations in person; and the Austrians took advantage of the dissemination and weakness of the French forces in Germany to push forward their own preparations with renewed energy.

But they reckoned without the resourcefulness of Napoleon. The moment news of their activity reached him, while still in pursuit of Sir John Moore, he dispatched letters to all the members of the confederation warning them that their contingents might soon be required, and at the same time issued a series of decrees to General Clarke, his war minister, authorizing him to call up the contingent of 1810 in advance, and directing him in detail to proceed with the formation of 4th and 5th battalions for all the regiments across the Rhine. By these means Davout's, Oudinot's and Lefebvre's commands were augmented, while in February and March new corps were formed and rapidly pushed toward the front.

On his return from Spain, seeing war imminent, he issued a series of march orders (which deserve the closest study in detail) by which on April 15 his whole army was to be concentrated for manoeuvres between Regensburg, Landshut, Augsburg and Donauwörth, and sending on the Guard in wagons to Strasbourg, he despatched Berthier to act as commander in chief until his own arrival.

Austrian Offensive.—The position of assembly was excellently chosen, but unfortunately the Austrians took the initiative. On April g their main body of six corps crossed the Inn between Braunau and Passau and simultaneously two additional corps moved from Pilsen in Bohemia on Regensburg. At this moment Davout was entering Regensburg with his leading troops, the remainder still some marches in rear, and it was evident that the whole concentration could no longer be carried out before the Austrians would be in a position to intervene. Berthier received the news while still on his way to the front, and quite failed to grasp the situation. Reaching Donauworth at 8 P.M. on April 13, he ordered Davout and Oudinot to remain at Regensburg, whilst Lefebvre and Wrede (Bavarians) who had fallen back before the Austrians were directed to reoccupy Landshut. This was in direct contradiction to the instructions Napoleon had given on March 28 in view of this very emergency. Davout obeyed, but remonstrated. On the 16th Berthier went on to Augsburg, where he learned that Lefebvre's advanced troops had been driven out of Landshut, thus opening a great gap seventy-six miles wide between the two wings of the French army. Meanwhile Napoleon, who had left Paris at 4 A.M. on April 13, was hastening towards the front, but remained still in ignorance of Berthier's doings until on the 16th at Stuttgart he received a letter from the Marshal dated the 13th, which threw him into consternation. In reply he immediately wrote: "You do not inform me what has rendered necessary such an extraordinary measure which weakens and divides my troops"—and—"I cannot quite grasp the meaning of your letter yet, I should have preferred to see my army concentrated between Ingolstadt and Augsburg, the Bavarians in the first line, with the duke of Danzig in his old position, until we know what the enemy is going to do. Everything would be excellent if the duke of Auerstädt had been at Ingolstadt and the duke of Rivoli with the Wiirttembergers and Oudinot's corps at Augsburg, . . . so that just the opposite of what should have been done has been done" (C. N. to Berthier, Ludwigsburg, 16th April).

Napoleon Takes Command.—Having despatched this severe reprimand he hastened on to Donauworth, where he arrived at 4 A.M. on the 17th, hoping to find Berthier, but the latter was at Augsburg. Nevertheless, at 10 A.M. he ordered Davout and Oudinot to withdraw at once to Ingolstadt; and Lefebvre and Wrede on the right to support the movement. About noon Berthier returned and after hearing his explanation MassCna received orders to move from Augsburg toward Ingolstadt. "To-morrow will be a day of preparation spent in drawing closer together, and I expect to be able by Wednesday to manoeuvre against the enemy's columns according to circumstances."

Meanwhile the Austrians had approached so near that by a single day's march it would have been possible to fall upon and crush by superior numbers either wing of the French army, but though the Austrian light cavalry successfully covered the operations of the following troops they had not yet risen to a conception of their reconnoitring mission, and the archduke, in ignorance of his opportunity and possessed, moreover, with the preconceived idea of uniting at Regensburg with the two corps coming from Bohemia, moved the bulk of his forces in that direction, leaving only a covering body against Davout altogether insufficient to retain him. Davout, however, had left a garrison of 1,800 men in Regensburg, who delayed the junction of the Austrian wings until the 20th inst., and on the same day the emperor, having now reunited his whole right wing and centre, overwhelmed the covering detachments facing him in a long, series of disconnected engagements lasting forty-eight hours, and the archduke now found himself in danger of being forced back into the Danube. But with the Bohemian reinforcements he had still four corps in hand, and Napoleon, whose intelligence service in the difficult and intersected country had lamentably failed him, had weakened his army by detaching a portion of his force in pursuit of the beaten right wing, and against the archduke's communications.

Eckmühl.—When, therefore, the latter, on the 22nd, marched southward to reopen his communications by the defeat of the enemy's army, he actually reached the neighbourhood of Eckmiihl with a sufficient numerical superority had he only been prompt enough to seize his opportunity. But the French had been beforehand with him. Napoleon, who had personally taken part in the fighting of the previous day, and followed the pursuit as far as Landshut, whence he had despatched MassCna to follow the retreating Austrians along the Isar, seems to have realized about

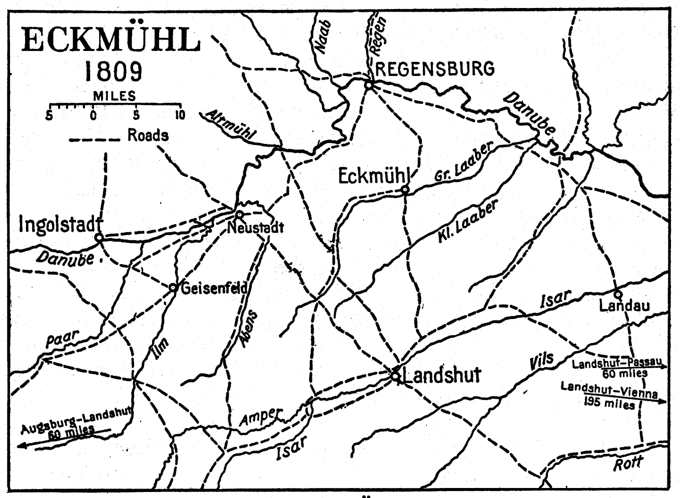

FIG. 6.—ECKMÜHL, 1809

3 A.M. in the morning that 'it was not the main body of the enemy he had had before him, but only its left wing, and that the main body itself must still be northward towards Regensburg. Issuing orders to Davout, Oudinot and his cavalry to concentrate with all speed towards Eckmiihl, he himself rode back along the Regensburg road and reached the battle-field just as the engagement between the advance troops had commenced. Had the Austrians possessed mobility equal to that of the French the latter should have been overwhelmed in detail, but whilst the French covered 17 and 19m. the Austrians only marched 10, and, owing to their defective assimilation of the new tactical training the troops actually on the ground could not hold out long enough for their reserves to arrive. The retreat of the front lines involved the following ones in confusion, and presently the whole mass was driven back in considerable disorder. It seemed as if nothing could save the Austrians from complete disaster, but at the critical moment the emperor, yielding to the protestations of his corps commanders, who represented the excessive fatigue of their troops, stopped the pursuit, and the archduke made the most of his opportunity to restore order amongst his demoralized men and crossed to the north bank of the Danube during the night.

On the following morning the French reached Regensburg and at once proceeded to assault its mediaeval walls, but the Austrian garrison bravely defended it till the last of the stragglers was safely across on the north bank. It was here that, for the only time in his career, Napoleon was slightly wounded. Then, leaving Davout to observe the archduke's retreat, the emperor himself rode after MassCna, who with the major portion of the French army was following the Austrian weaker wing under Hiller. The latter was not so shaken as Napoleon believed, and turning at bay at Ebelsberg inflicted a severe check on its pursuers. Thus covered by his rearguard Hiller gained space and time to pass his troops over to the north bank of the Danube and remove all boats on the river. This left the direct road to Vienna open, and Napoleon, hoping to find peace in the enemy's capital, pushed the whole of his army down the right bank, and with Murat's cavalry entered the city on May 12, after somewhat severe resistance lasting three days. Meanwhile the archduke and Hiller, both now unmolested, effected their junction in the vicinity of Wagram, picketing the whole line of the Danube with their outposts and collecting all the boats.

Aspern and Wagram.—The reconnaissance of the river was at once taken in hand by the French upon their arrival in Vienna, and a point opposite the island of Lobau selected for the crossing.

Thanks to the Austrian precautions it took four days to collect the necessary material to span the main branch of the river, here some 2,000yd. across, and though Napoleon personally spurred on all to activity nearly four days more were required for its construction. It was not till the night of May 19 that orders for the passage were finally issued, and during the night the troops commenced to occupy the island of Lobau. Surprise, of course, was out of the question, but the Austrians did not attempt to dispute the passage, their object being to allow as many French as they felt they could deal with to pass over and then to fall on them. Thus on May 21 the battle of Aspern (*q.v.*) or Essling began. It ended on the night of the 22nd with the defeat of Napoleon, the first ever inflicted upon him. The French retreated into the island of Lobau. By nightfall upwards of 100,000 men, encumbered with at least 20,000 wounded, were crowded together on the little island scarcely a mile square, short of provisions and entirely destitute of course of all hospital accessories. The question then arose whether the retreat was to be continued across the main stream or not, and for the second time in his career Napoleon assembled his generals to take their opinion. They counselled retreat, but having heard them all he replied, in substance: "If we leave here at all we may as well retire to Strassburg, for unless the enemy is held by the threat of further operations he will be free to strike at our communications and has a shorter distance to go. We must remain here and renew operations as soon as possible."

Immediate orders were despatched to summon every available body of troops to concentrate for the decisive stroke. Practically the lines of communication along the Danube were denuded of combatants, even Bernadotte being called up from Passau, and the viceroy of Italy, who driving the archduke Johann before him (action of Raab) had brought up 56,000 men through Tirol, was disposed towards Pressburg within easy call. The arsenal of Vienna was ransacked for guns, stores and appliances, and preparations in the island pushed on as fast as possible. By the end of June 200,000 troops were stationed within call, and on July 4 the French began to cross over to the left bank of the Danube. The events which followed are described under WAGRAM. The great battle at this place, fought on July 5 and 6, ended in the retirement of the Austrians. The only other event which occurred before peace was made was an unimportant action at Znaym on July 11.

THE RUSSIAN WAR OF 1812

Whilst the campaign of 1809 had shaken the faith of the marshals and the higher ranks in the infallibility of the emperor's judgment, and the slaughter of the troops at Aspern and Wagram had still further accentuated the opposition of the French people to conscription, the result on the fighting discipline of the army had, on the whole, been for good. The panics of Wagram had taught men and officers alike a salutary lesson. Aware of the growing feeling against war in France, Napoleon had determined to make his allies not only bear the expenses of the coming campaign, but find the men as well, and he was so far master of Europe that of the 363,000 who on June 24 crossed the Niemen no less than two-thirds were Germans, Austrians, Poles or Italians. But though the battlefield discipline of the men was better, the discipline in camp and on the march was worse, for the troops were no longer eager to reach the battlefield, and marched because they were compelled, not of their own goodwill. The result was apparent in a sudden diminution in mobility, and a general want of punctuality which seriously influenced the course of the campaign. On the other hand, the Russians, once their fatherland was invaded, became dominated by an ever-growing spirit of fanaticism, and they were by nature too obedient to their natural leaders, and too well inured to the hardships of campaigning, to lose their courage in a retreat.

By the middle of June 1812 the emperor had assembled his army along the line of the Niemen. On the extreme right stood the Austrian contingent under Schwarzenberg (34,000 men). Next, centring about Warsaw, a group of three corps (70,000 men) under the chief command of Napoleon's brother Jerome. Then the main army under Napoleon in person (220,000 men: with 80,000 more under the viceroy of Italy on his right rear); and on the extreme left at Tilsit a flanking corps, comprising the Prussian auxiliary corps and other Germans (in all 40,000 strong). The whole army was particularly strong in cavalry; out of the 450,000, 80,000 belonged to that arm, and Napoleon, mindful of the lessons of 1807, had issued the most minute and detailed orders for the supply service in all its branches, and the forwarding of reinforcements, no less than 100,000 men being destined for that purpose in due course of time.

Information about the Russians was very indifferent; it was only known that Prince Bagration (with 43,000 men) lay grouped about Wolkowysk; Barclay de Tolly (who had about 130,000) about Vilna; and on the Austrian frontier lay a small corps under Tormassov (40,000) in process of formation, while far away on the Turkish frontiers hostilities with the sultan retained Tschitschagov with 50,000 more. Of the enemy's plans Napoleon knew nothing, but, in accordance with his usual practice, the dispositions he had chosen met all immediate possible moves.

Opening of the Campaign.—On June 24 the passage of the Niemen began in torrid heat which lasted for a few days. The main army, with the emperor in person, covered by Murat and the cavalry, moved on Vilna, whilst Jerome on his right rear at once threatened Bagration and covered the emperor's outer flank. From the very first, however, the inherent weakness of the vast army, and the vicious choice of time for the beginning of the advance, began to make themselves felt. With crops still green, and nothing else available as forage for the horses, an epidemic of colic broke out amongst them, and in ten days the mounted arms had lost upwards of one-third of their strength; men died of sunstroke in numbers, and serious straggling began. Still everything pointed to the concentration of the Russians at Vilna, and Jerome, who on July 5 had reached Grodno, was ordered to push on. But Jerome proved quite inadequate to his position, listening to the complaints of his subordinates as to want of supplies and even of pay; he spent four whole days in absolute inertia, notwithstanding the emperor's reprimands. Meanwhile the Russians covered by stubborn rearguards made good their retreat—Barclay towards the entrenched camp of Drissa on the Dvina, Bagration towards Mohilev.

The emperor's first great coup thus failed. Jerome was replaced by Davout, and the army resumed its march, this time in the hope of surrounding and overwhelming Barclay, whilst Davout dealt with Bagration. The want of mobility, particularly in the cavalry,

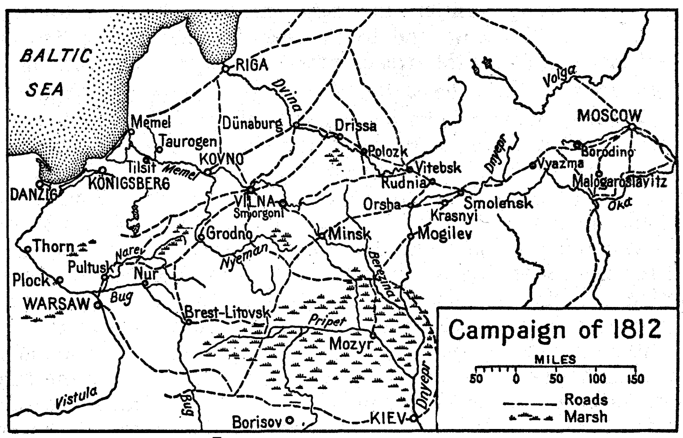

FIG. 7.—CAMPAIGN OF 1812

now began to tell against the French. With horses only just recovering from an epidemic, they proved quite unequal to the task of catching the Cossacks, who swarmed round them in every direction, never accepting an engagement but compelling a constant watchfulness for which nothing in their previous experience had sufficiently prepared the French.

Before their advance, however, the Russian armies steadily retired, Barclay from Vilna via Drissa to Vitebsk, Bagration—narrowly evading Davout—from Wolkowysk to Mohilev. Again arrangements were made for a Napoleonic battle; behind Murat's cavalry came the "general advanced guard" to attack and hold the enemy, whilst the main body and Davout were held available to swing in on his rear. Napoleon, however, failed to allow for the psychology of his opponents, who refused to be drawn into engagements and steadily withdrew from every position when the French gained touch with them. Thus the manoeuvre against Vitebsk again miscarried, and Napoleon found himself in a far worse position, numerically and mzterially, than at the outset of the campaign. Then he had stood with 420,000 men on a front of 160m., now he had only 229,000 men on a 135m. front; he had missed three great opportunities of destroying his enemy in detail, and in five weeks, during which time he had only traversed zoom., he had seen his troops reduced numerically at least one-third, and, worse still, his army was now far from being the fighting machine it had been at the outset.

Meanwhile the Russians had not lost a single gun and the *moral* of their men had been improved by the result of the many minor encounters with the enemy; further, the junction of Bagration and Barclay was now assured in the vicinity of Smolensk. Towards this place the French advance was now resumed, and the Russian generals at the head of a united force of 130,000 men marched forward towards Rudnia to meet them. Here, however, the inefficiency of the Russian staff actually saved them from the disaster which must certainly have overtaken them had they realized their intention of fighting the French. The Russians marched in two columns, which lost touch of one another, and as it was quite impossible for either to engage the French single-handed, they both retired again towards Smolensk, where with an advanced guard in the town itself—which possessed an old-fashioned brick *enceinte* not to be breached by field artillery alone—the two columns reunited and deployed for action behind the unfordable Dnieper.

Murat and Ney as "general advanced guard" attacked the town in the morning of Aug. 16, and the main body was swung round to place itself on the Russian rear astride the road to Moscow. The whole of the 17th was required to complete the movement, and as soon as its purpose was sufficiently revealed to the Russians the latter determined to retreat under cover of night. Their manoeuvre was carried out with complete success, and then began a series of rearguard actions and nocturnal retreats which completely accomplished their purpose of wearing down the French army. The Russian government, however, failed to see the matter in its true light, and Marshal Kutusov was sent to the front to assume the chief command. His intention was to occupy a strong position and fight one general action for the possession of Moscow, and to this end he selected the line of the Kalatscha where the stream intersects the great Moscow road.

Borodino.—Here he was overtaken by Murat and Ney, but the French columns had straggled so badly that four whole days elapsed before the emperor was able to concentrate his army for battle and then could only oppose 128,000 men to the Russians' 110,000. About 6 A.M. on Sept. 7 the battle *(see* BORODINO) began, but Napoleon was suffering from one of those attacks of illness and depression which henceforth became such an important factor in his fate. Till about midday he followed the course of the action with his usual alertness; then he appears to have been overcome by a kind of stupor and allowed his marshals to fight by themselves. There was no final decisive effort as at Wagram and the Guard was not even called on to move. Ultimately the sun went down on an undecided field on which 38,000 Russians and 25,000 French had fallen, but the moral reaction on the latter was far greater than on the former. Kutusov continued his retreat, and Murat with his now exhausted horsemen followed as best he might. Sebastiani, commanding the advanced guard, overtook the Russians in the act of evacuating Moscow, and agreed with the latter to observe a seven hours' armistice to allow the Russians to clear the town, for experience had shown the French that street fighting in wooden Russian townships always meant fire and the consequent destruction of much-needed shelter and provisions. Towards nightfall Napoleon reached the scene, and the Russians being now clear the troops began to enter, but already fires were observed in the farther part of the city. Napoleon passed the night in a house in the western suburb and next morning rode to the Kremlin, the troops moving to the quarters assigned to them, but in the afternoon a great fire began and, continuing for two days, drove the French out into the country again.

The emperor was now in the direst perplexity. Kutusov was hovering on the outskirts of the city, his main body at Kaluga, some marches to the south-west, where he was in full communication with the richest portion of the empire; and now news arrived that St. Cyr, who had relieved Macdonald on his extreme left, had only 17,000 men left under arms against upwards of 40,000 Russians under Witgenstein; and to the south Tschitschagov's army, being no longer detained on the Turkish frontier, where peace had been made, was marching to join Tormassov about Brest-Litovsk with forces which would bring the total of the two well over 100,000 men. Meanwhile Schwarzenberg's force opposing these had dwindled to a bare 30,000.

The disposition of the French forces was therefore untenable, and Napoleon's offers to treat for peace were ignored. Napoleon was considering a march on St. Petersburg with St. Cyr and Victor (the latter had about 30,000 men at Smolensk). Then, on Oct. 18, Murat, who had been sent to harass Kutusov, was attacked at Vinkovo, north of Tarutino, on the easterly road of the two roads leading south from Moscow to Kaluga.

Napoleon now resolved to retreat to Smolensk via Kaluga, hoping that, by taking the westerly road south from Moscow, he could bypass Kutusov and cut him off both from the provisions stored at Kaluga and from the Russian army facing Schwarzenberg at Brest. He left Moscow on Oct. 19, but Kutusov challenged him north of Kaluga, at Maloyaroslavets. The French after bitter fighting drove the Russians from the town (Oct. 24), but their strategy was frustrated and Napoleon turned to march for Smolensk without first taking Kaluga.

The Retreat from Moscow.—Then began the celebrated retreat. It has generally been forgotten that the utter want of march discipline in the French, and not the climatic conditions, was responsible for the appalling disasters which ensued. Actually the frost came later than usual that year, Oct. 27, and the weather was dry and bracing; not till Nov. 8 did the cold at night become sharp. Even when the Beresina was reached on Nov. 26, the cold was far from severe, for the slow and sluggish stream was not frozen over, as is proved by the fact that Eblé's pioneers worked in the water all through that terrible day. But the French army was already completely out of hand, and the degree to which the panic of a crowd can master even the strongest instinct of the individual is shown by the conduct of the fugitives who crowded over the bridges, treading hundreds under foot, whilst all the time the river was easily fordable and mounted men rode backwards and forwards across it.

To return to the actual sequence of events. Kutusov had been very slow in exploiting his success of the 24th and indeed had begun the pursuit in a false direction; but about Nov. 2, headquarters of the French being at Vyazma, the Cossacks became so threatening that the emperor ordered the army to march (as in Egypt) in hollow square. This order, however, appears only to have been obeyed by the Guards, with whom henceforward the emperor marched.

Kutusov had now overtaken the French, but fortunately for them he made no effort to close with them, but hung on their flank, molesting them with Cossacks and picking up stragglers. Thus the wreck of the *Grande Armée,* now not more than fifty thousand strong, reached Smolensk on the 9th and there rested till the 14th. The march was then resumed, the Guard leading and Ney commanding the rearguard. Near Krasnoi on the 16th the Russian advanced guard tried to head the column off. Napoleon halted a whole day to let the army close up; and then attacked with his old vigour and succeeded in clearing the road, but only at the cost of leaving Ney and the rearguard to its fate. By a night march of unexampled daring and difficulty Ney succeeded in breaking through the Russian cordon, but when he regained touch with the main body at Orcha only 800 of his 6,000 men were still with him (21st).

The **Beresina.**—From here Napoleon despatched orders to Victor to join him at Borisov on the Beresina. The cold now gave way and thaw set in, leaving the country a morass, and information came that Tschitschagov from the south had reached Borisov. He now selected Viesselovo as the point of passage and at 1 A.M. on the 23rd sert orders to Oudinot to march thither and construct bridges. In the execution of these orders Oudinot encountered the Russian advanced guard near Borisov and drove the latter back in confusion, though not before they had destroyed the existing bridge there. This sudden reassumption of the offensive threw Tschitschagov into confusion. Thus time was gained for Victor also to come up and for Oudinot to construct the bridges at Studienka near the above-mentioned place, but a spot in many respects better suited for the purpose. Thither therefore Napoleon sent his pontonniers under General Eblé, but on their arrival they found that no preparations had been made and much time was lost. Meanwhile Victor, in doubt as to the real point of passage, had left the road to Studienka open to Wittgenstein, who had followed hard on his heels.

By 4 P.M. on the 26th the bridges were finished and the passage began, but not without resistance by the Russians, who were gradually closing in. The crossing continued all night, though interrupted from time to time by failures of the bridges. All day during the 27th stragglers continued to cross, covered by such combatants as remained under sufficient discipline to be employed. At 8 A.M. on the 28th, however, Tschitschagov and Wittgenstein moved forward on both banks of the river to the attack, but were held off by the splendid self-sacrifice of the few remaining troops under Ney, Oudinot and Victor, until about 1 P.M. the last body of regular troops passed over the bridges, and only a few thousand stragglers remained beyond the river.

The number of troops engaged by the French that day cannot be given exactly. Oudinot's and Victor's men were relatively fresh and may have totalled 20,000, whilst Ney can hardly have had more than 6,000 of all corps fighting under him. How many were killed can never be known, but three days later the total number of men reported fit for duty had fallen to 8,800 only.

Final Operations.—Henceforward the retreat of the army became practically a headlong flight, and on Dec. 8, having reached Smorgoni and seeing that nothing further could be done by him at the front, the emperor handed over the command of what remained to Murat, and left for Paris to organize a fresh army for the following year. Travelling at the fullest speed, he reached the Tuileries on the 18th, after a journey of 312 hours. After the emperor's departure the cold set in with increased severity, the thermometer falling to 23°. On Dec. 8, Murat reached Vilna, whilst Ney with about 400 men and Wrede with 2,000 Bavarians still formed the rearguard; but it was quite impossible to carry out Napoleon's instructions to go into winter quarters about the town, so that the retreat was resumed on the 10th and ultimately Königsberg was attained on Dec. 19 by Murat with 400 Guards and 600 Guard cavalry dismounted. Meanwhile on the extreme French right Schwarzenberg and his Austrians had drifted away towards their own frontier, and the Prussian contingent, which under Yorck formed part of Macdonald's command about Riga, had entered into a convention with the Russians at Tauroggen (Dec. 30) which deprived the French of the last support upon their left. Konigsberg thus became untenable, and Murat fell back to Posen, where on Jan. 10 he handed over his command to Eugène Beauharnais and returned to Paris. The Russian pursuit practically ceased at the line of the Niemen, for the Russian troops also had suffered terrible hardships and a period of rest had become an absolute necessity.

The War of Liberation.—The Convention of Tauroggen became the starting-point of Prussia's regeneration. As the news of the destruction of the *Grande Armée* spread, and the appearance of countless stragglers convinced the Prussian people of the reality of the disaster, the spirit generated by years of French domination burst out. For the moment the king and his ministers were placed in a position of the greatest anxiety, for they knew the resources of France and the boundless versatility of their arch-enemy far too well to imagine that the end of their sufferings was yet in sight. To disavow the acts and desires of the army and of the secret societies for defence with which all north Germany was honeycombed would be to imperil the very existence of the monarchy, whilst an attack on the wreck of the *Grande Armée* meant the certainty of a terrible retribution from the new armies now rapidly forming on the Rhine.

But the Russians and the soldiers were resolved to continue the campaign, and working in collusion they put pressure on the not unwilling representatives of the civil power to facilitate the supply

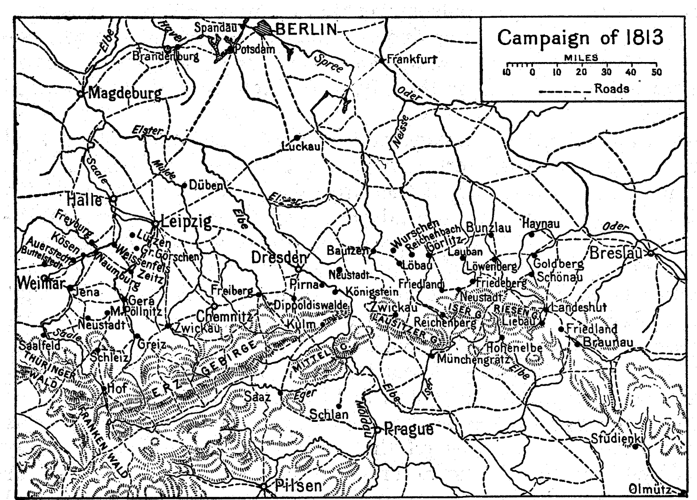

FIG. 8.—CAMPAIGN OF 1813

and equipment of such troops as were still in the field; they could not refuse food and shelter to their starving countrymen or their loyal allies, and thus by degrees the French garrisons scattered about the country either found themselves surrounded or were compelled to retire to avoid that fate. Thus it happened that the viceroy of Italy felt himself compelled to depart from the positive injunctions of the emperor to hold on at all costs to his advanced position at Posen, where about 14,000 men had gradually rallied around him, and to withdraw step by step to Magdeburg, where he met reinforcements and commanded the whole course of the lower Elbe.

Napoleon's Preparations.—Meanwhile the emperor in Paris had been organizing a fresh army for the reconquest of Prussia. Thanks to his having compelled his allies to fight his battles for him, he had not as yet drawn very heavily on the fighting resources of France, the actual percentage of men taken by the conscriptions during the years since 1806 being actually lower than that in force in continental armies of the early twentieth century. He had also created in 1811–12 a new National Guard, organized in "cohorts" to distinguish it from the regular army, and for home defence *only,* and these by a skilful appeal to their patriotism and judicious pressure applied through the prefects, became a useful reservoir of half-trained men for new battalions of the active army. Levies were also made with rigorous severity in the states of the Rhine Confederation, and even Italy was called on for fresh sacrifices. In this manner by the end of March upwards of 200,000 men were moving towards the Elbe,[1] and in the first fortnight of April they were duly concentrated in the angle formed by the Elbe and Saale, threatening on the one hand Berlin, on the other Dresden and the east.

The allies, aware of the gradual strengthening of their enemy's forces but themselves as yet unable to put more than 200,000 in the field, had left a small corps of observation opposite Madgeburg and along the Elbe to give timely notice of an advance towards Berlin; and with the bulk of their forces had taken up a position about Dresden, whence they had determined to march down the course of the Elbe and roll up the French from right to left. Both armies were very indifferently supplied with information, as both were without any reliable regular cavalry capable of piercing the screen of outposts with which each endeavoured to conceal his disposition, and Napoleon, operating in a most unfriendly cocntry, suffered more in this respect than his adversaries.

[1]Napoleon always gave their number as 300,000, but this was never attained.

On April 25 Napoleon reached Erfurt and assumed the chief command. On this day his troops stood in the following positions: Eugène, with Lauriston's, Macdonald's and Regnier's corps, on the lower Saale; Ney in front of Weimar, holding the defile of Kosen; the Guard at Erfurt, Marmont at Gotha, Bertrand at Saalfeld, and Oudinot at Coburg, and during the next few days the whole were set in motion towards Merseburg and Leipzig, in the now stereotyped Napoleonic order, a strong advanced guard of all arms leading, the remainder—about two-thirds of the whole—following as masse de manoeuvre, this time, owing to the cover afforded by the Elbe on the left, to the right rear of the advanced guard.

Meanwhile the Russians and Prussians had concentrated all available men and were moving on an almost parallel line, but somewhat to the south of the direction taken by the French. On May 1 Napoleon and the advance guard entered Liitzen. Wittgenstein, who now commanded the allies in place of Kutusov, hearing of his approach, had decided to attack the French advanced guard, which he took to be their whole force, on its right flank, and during the morning had drawn together the bulk of his forces on his right in the vicinity of Gross-Gorschen and Kaya.

Battle **of Lützen.**—About g A.M. on May 2 he began an attack on the French advance guard in Liitzen, whilst the remainder of his army was directed against Napoleon's right and rear. Just as the latter were moving off the heads of the French main body suddenly appeared, and at 11 A.M. Napoleon, then standing near the Gustavus Adolphus monument on the field of Liitzen, heard the roar of a heavy cannonade to his right rear. He realized the situation in a moment, galloped to the new scene of action, and at once grouped his forces for decisive action—the gift in which he was supreme. Leaving the leading troops to repulse as best they might the furious attack of both Russians and Prussians, and caring little whether they lost ground, he rapidly organized for his own control a battle-reserve. At length when both sides were exhausted by their efforts he sent forward nearly a hundred guns which tore asunder by their case-shot fire the enemy's line and marched his reserve right through the gap. Had he possessed an adequate cavalry force the victory would have been decisive. As it was, the allies made good their retreat and the French were too exhausted for infantry pursuit.

Perhaps no battle better exemplifies the inherent strength of the emperor's strategy, and in none was his grasp of the battlefield more brilliantly displayed, for, as he fully recognized, "These Prussians have at last learnt something—they are no longer the wooden toys of Frederick the Great," and, on the other hand, the relative inferiority of his own men as compared with his veterans of Austerlitz called for far more individual effort than on any previous day. He was everywhere, encouraging and compelling his men—it is a legend in the French army that the persuasion even of the imperial boot was used upon some of his reluctant conscripts, and in the result his system was fully justified, as it triumphed even against a great tactical surprise.

Bautzen.—As soon as possible the army pressed on in pursuit, Ney being sent across the Elbe to turn the position of the allies at Dresden. This threat forced the latter to evacuate the town and retire over the Elbe, before blowing up the stone bridge across the river. Napoleon entered the town hard on their heels, but the broken bridge caused a delay of four days, there being no pontoon trains with the army. Ultimately on May 18 the march was renewed, but the allies had continued their retreat in leisurely fashion, picking up reinforcements by the way. Arrived at the line of the Spree, they took up and fortified a very formidable position about Bautzen (*q.v.*). Here, on the 20th, they were attacked and fixed by Napoleon; but the intended decisive coup by which Ney was to arrive on their right rear on the 21st missed its mark owing to Ney's want of initiative and rigid adherence to the letter of his orders. As a result the allies were able to break off the action at their own time and retire in such good order that the emperor failed to capture a single trophy as proof of his victory. The enemy's escape annoyed him greatly, the absence of captured guns and prisoners reminded him too much of his Russian experiences, and he redoubled his demands on his corps commanders for greater vigour in the pursuit. This led the latter to push on without due regard to tactical precautions, and Bliicher took advantage of their carelessness when at Haynau (May 26), with some twenty squadrons of Landwehr cavalry, he surprised, rode over and almost destroyed Maison's division. The material loss inflicted on the French was not very great, but its effect in raising the moral of the raw Prussian cavalry and increasing their confidence in their old commander was enormous.

Still the allies continued their retreat and the French were unable to bring them to action. In view of the doubtful attitude of Austria, Napoleon became alarmed at the gradual lengthening of his lines of communication and opened negotiations. The enemy, having everything to gain and nothing to lose thereby, agreed finally to a six weeks' suspension of arms. This was perhaps the gravest military error of Napoleon's whole career, and his excuse for it, "want of adequate cavalry," was the strongest testimony as to the value of that arm.

As soon as a suspension of arms (to Aug. 15) had been agreed to, Napoleon hastened to withdraw his troops from the dangerous position they occupied with reference to the passes leading over the mountains from Bohemia, for he entertained no doubt now that Austria was also to be considered as an enemy. Finally he decided to group his corps round Görlitz and Bautzen whence they could either meet the enemy advancing from Breslau or fall on his flank over the mountains if he attempted to force his way into Saxony by the valley of the Elbe. This latter manoeuvre depended, however, on his maintenance of Dresden, and to this end he sent the I. Corps up the Elbe to Pirna and Konigstein to cover the fortifications of Dresden itself. His instructions on this point deserve the closest study, for he foresaw the inevitable attraction which a complete entrenched camp would exercise even upon himself, and, therefore, limited his engineers to the construction of a strong bridge head on the right bank and a continuous enceinte, broken only by gaps for counter attack, around the town itself.

Then he turned his attention to the plan for the coming campaign. Seeing clearly that his want of an efficient cavalry precluded all ideas of a resolute offensive in his old style, he determined to limit himself to a defence of the line of the Elbe, a position of waiting from which he could make a spring, of not more than a few days' duration, at any target the enemy might present.

Reinforcements had been coming up without ceasing and at the beginning of August he calculated that he would have 300,000 men available about Bautzen and 100,000 along the Elbe from Hamburg via Magdeburg to Torgau. With the latter he determined to strike the first blow, by a concentric advance on Berlin (which he calculated he would reach on the 4th or 5th day), the movement being continued thence to extricate the French garrisons in Kiistrin, Stettin and Danzig. The moral effect, he promised himself, would be prodigious, and there was neither room nor food for these 100,000 elsewhere. Towards the close of the armistice he learned the general situation of the allies. The crown prince of Sweden (Bernadotte), with his Swedes and various Prussian levies, 135,000 in all, lay in and around Berlin and Stettin; and knowing his former marshal well, Napoleon considered Oudinot a match for him. Bliicher with about 95,000 Russians and Prussians was about Breslau, and Schwarzenberg, with nearly 180,000 Austrians and Russians, lay in Bohemia. In his central position at Bautzen he felt himself equal to all his enemy's combinations.

Dresden.—The advance towards Berlin began punctually with the expiration of the armistice, but with the main army he himself waited to see more clearly his adversaries' plans. At length becoming impatient he advanced a portion of his army towards Bliicher, who fell back to draw him into a trap. Then the news reached him that Schwarzenberg was pressing down the valley of the Elbe, and, leaving Macdonald to observe Bliicher, he hurried back to Bautzen to dispose his troops to cross the Bohemian mountains in the general direction of Konigstein, a blow which would have had decisive results. But the news from Dresden, where the construction of the defences was still incomplete, was so alarming that at the last moment he changed his mind, and sending **Vandamme** alone over the mountains, he hurried with **his** whole army to the threatened point. This march remains one of the most extraordinary in history, for the bulk of his forces moved, mainly in mass and across country, gom. in 72 hours, entering Dresden on the morning of the 27th, only a few hours before the attack of the allies commenced. For the events which followed *see* DRESDEN: *Battle* of *Dresden.*

Dresden was the last great victory of the First Empire. By noon on Aug. 27 the Austrians and Russians were completely beaten and in full retreat, the French pressing hard behind them, but meanwhile Napoleon himself again succumbed to one of his unaccountable attacks of apparent intellectual paralysis. He seemed unaware of the vital importance of the moment, crouched shivering over a bivouac fire, and finally rode back to Dresden, leaving no specific orders for the further pursuit. The allies, however, continued to retreat, but unfortunately Vandamme, with his single corps and unsupported, issued out of the mountains on their iiank, threw himself across their line of retreat near Kulm, and was completely overwhelmed by sheer weight of numbers (29th). In spite of this misfortune, Napoleon could claim a brilliant success for himself, but almost at the same moment news reached him that Oudinot at Grossbeeren near Berlin, and Macdonald on the Katzbach opposed to Blucher, had both been severely defeated.

Napoleon's Movements.—During the next two days the emperor examined his situation and, after discussing on paper the respective hypotheses of a spring at Prague or at Berlin, summed up in favour of the second. But his consideration of this project was interrupted by news which indicated that the consequences of Macdonald's defeat had been far more serious to the moral of that command than he had imagined. He immediately rode over to establish order, and his manner and violence were so improper that Caulaincourt had the greatest difficulty in concealing the scandal. Blucher, however, hearing of his arrival, at once retreated and the emperor followed, thus uncovering the passes over the Bohemian mountains, a fact of which Schwarzenberg was quick to take advantage. Learning of his approach, Napoleon again withdrew to Bautzen. Then hearing that the Austrians had counter-marched and were again moving towards Dresden, he hastened back there, concentrated as many men as could conveniently be handled, and advanced beyond Pirna and Konigstein to meet him. But the Austrians had no intention of attacking him, for time was now working on their side and, leaving his men to starve in the exhausted district, the emperor again returned to Dresden, where for the rest of the month he remained in an extraordinary state of vacillation. On Oct. 4 he again drew up a review of the situation, in which he apparently contemplated giving up his communications with France and wintering in and around Dresden, though at the same time he was aware of the distress amongst his men for want of food.

Campaign of **Leipzig.**—In the meanwhile Blucher, Schwarzenberg and Bernadotte were working round his flanks. Ney, who had joined Oudinot after Grossbeeren, had been defeated at Dennewitz (Sept. 6), the victory, won by Prussian troops solely, giving the greatest encouragement to the enemy. Suddenly Napoleon's plans are again reviewed and completely changed. Calling up St. Cyr, whom he had already warned to remain at Dresden with his command, he decided to fall back towards Erfurt, and go into winter quarters between that place and Magdeburg, pointing out that Dresden was of no use to him as a base and that if he had a battle, he had much better have St. Cyr and his men with him than at Dresden. He then on Oct. 7 drew up a final plan, and this he immediately proceeded to put into execution, for he was now aware of the danger threatening his line of retreat from both Blucher and Schwarzenberg and the North Army; yet only a few hours afterwards the portion of the order relating to St. Cyr and Lobau was cancelled and the two were finally left behind at Dresden. From the 10th to the 13th Napoleon lay at Düben, again a prey to the most extraordinary irresolution, but on that day he thought he saw his opportunity. Blücher was reported near Wittenberg, and Schwarzenberg was moving slowly round to the south of Leipzig. The North Army under Bernadotte, unknown to Napoleon, lay on Blucher's left around Halle. The emperor decided to throw the bulk of his force on Bliicher, and, having routed him, turn south on Schwarzenberg and sever his communications with Bohemia. His concentration was effected with his usual sureness and celerity, but whilst the French moved on Wittenberg, Blucher was marching to his right, indifferent to his communications as all Prussia lay behind him. This move on the 14th brought him into touch with Bernadotte, and now a single march forward of all three armies would have absolutely isolated Napoleon from France; but Bernadotte's nerve failed him, for on hearing of Napoleon's threat against Wittenberg he decided to retreat northward, and not all the persuasions of Blucher and Gneisenau could move him. Thus if the French movement momentarily ended in a blow in the air, it was indirectly the cause of their ultimate salvation.

The "Battle of the Nations."—On the 15th Napoleon concentrated his forces to the east of Leipzig, with only a weak detachment to the west, and in the evening the allies were prepared to attack him. Schwarzenberg had 180,000 men available at once and 60,000 on the following day; Blucher had about 60,000, but Bernadotte now could not arrive before the 18th.

Napoleon prepared to throw the bulk of his force upon Schwarzenberg and massed his troops south-east of the town, whilst Schwarzenberg marched concentrically against him down the valleys of the Elster and Pleisse, the mass of his troops on the right bank of the latter and a strong column under Giulay on the left working round to join Blucher on the north. The fighting which followed was most obstinate, but the Austrians failed to make any impression on the French positions, and indeed Giulay felt himself compelled to withdraw to his former position. On the other hand, Blucher carried the village of Möckern and came within a mile of the gates of the town. During the 17th there was only indecisive skirmishing, Schwarzenberg waiting for his reinforcements coming up by the Dresden road, Blucher for Bernadotte to come in on his left, and by some extraordinary oversight Giulay was brought closer in to the Austrian centre, thus opening for the French their line of retreat towards Erfurt, and no information of this movement appears to have been conveyed to Blucher. The emperor when he became aware of the movement, sent the IV. corps to Lindenau to keep the road open. On the 18th the fighting was resumed and by about noon Bernadotte came up and closed the gap to the N.E. of the town between Blucher and the Austrians. At 2 P.M. the Saxons, who had remained faithful to Napoleon longer than his other German allies, went over to the enemy. All hope of saving the battle had now to be given up, but the French covered their retreat obstinately and by daybreak next morning one-half of the army was already filing out along the road to Erfurt which had so fortunately been left for them.

It took Bliicher time to extricate his troops from the confusion into which the battle had thrown them, and the garrison of Leipzig and the troops left on the right bank of the Elster still resisted obstinately—hence no direct pursuit could be initiated, and the French, still upwards of 100,000 strong, marching rapidly, soon gained distance enough to be reformed. Blucher followed by parallel and inferior roads on their northern flank, but Schwarzenberg knowing that the Bavarians also had forsaken the emperor and were marching under Wrede, 50,000 strong, to intercept his retreat, followed in a most leisurely fashion. Blucher did not succeed in overtaking the French, but the latter, near Hanau, found their way barred by Wrede with 50,000 men and over 100 guns in a strong position. To this fresh emergency Napoleon and his army responded in most brilliant fashion. As at Krasnoi in 1812, they went straight for their enemy and after one of the most brilliant series of artillery movements in history, directed by General Drouot, they marched right over their enemy, practically destroying his whole force. Henceforward their march was unmolested, and they reached Mainz on Nov. 5.

THE CAMPAIGN IN FRANCE IN 1814

When the last of the French troops had crossed to the western bank of the Rhine, divided counsels made their appearance at the headquarters of the allies. Everyone was weary of the war, **and** many felt that it would be unwise to push Napoleon and the French nation to extremes. Hence a prolonged halt arose, utilized by the troops in renewing their equipment and so forth, but ultimately the Young German party, led by Blucher and the principal fighting men of the army, triumphed, and on Jan. 1, 1814, the Silesian army (50,000) began its passage of the Rhine at Kaub. They were to be supported by Schwarzenberg with 200,000 men,

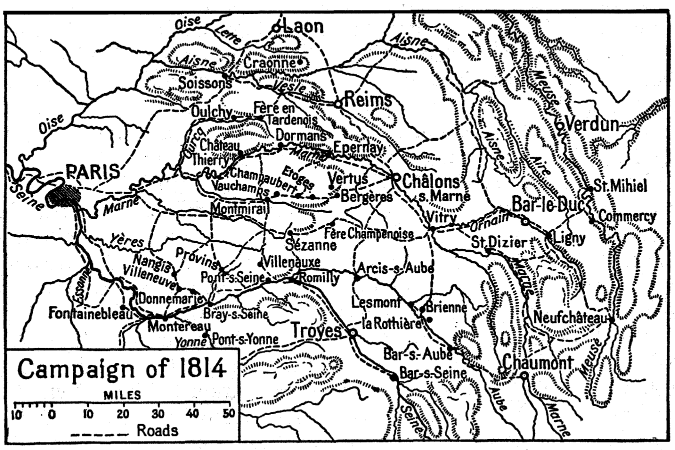

FIG. 9.—CAMPAIGN OF 1814

who was to advance by Basel and Neu Breisach to the south, and Bernadotte with the Northern army, about 120,000, was to move in support on the right flank through the Netherlands and Laon; this force was not yet ready and did not, in fact, reach the latter place till March. To meet these forces the emperor could not collect 200,000 men in all, of whom upwards of 100,000 were held by Wellington on the Spanish frontier, and 20,000 more were required to watch the debouches from the Alps. Hence less than 80,000 remained available for the east and north-eastern frontier. If, however, he was weak in numbers, he was now again operating in a friendly country, able to find food almost everywhere and practically indifferent as to his communications.

On Jan. 25 Blucher entered Nancy, and, moving rapidly up the valley of the Moselle, was in communication with the Austrian advanced guard near La Rothière on the afternoon of the 28th. Here his headquarters were surprised and he himself nearly captured by a sudden rush of French troops, and he learnt at the same time that the emperor in person was at hand. He accordingly fell back a few miles next morning to a strong position covering the exits from the Bar-sur-Aube defile. There he was joined by the Austrian advance guard, and together they decided to accept battle—indeed they had no alternative, as the roads in rear were so choked with traffic that retreat was out of the question. About noon Feb. 2 Napoleon attacked them, but the weather was terrible, and the ground so heavy that his favourite artillery, the mainstay of his whole system of warfare, was useless and in the drifts of snow which at intervals swept across the field, the columns lost their direction and many were severely handled by the Cossacks. At nightfall the fighting ceased and the emperor retired to Lesmont, and thence to Troyes, Marmont being left to observe the enemy.

Montmirail.—Owing to the state of the roads, more perhaps to the extraordinary lethargy which always characterized Schwarzenberg's headquarters, no pursuit was attempted. But on Feb. 4 Blucher, chafing at this inaction, obtained the permission of his own sovereign to transfer his line of operations to the valley of the Marne; Pahlen's corps of Cossacks were assigned to him to cover his left and maintain communication with the Austrians. Believing himself secure behind this screen, he advanced from Vitry along the roads leading down the valley of the Marne, with his columns widely separated for convenience of subsistence and shelter—the latter being almost essential in the terrible weather prevailing. Blucher himself on the night of the 7th was at Sézanne, on the exposed flank so as to be nearer to his sources of intelligence, and the rest of his army were distributed in four small corps at or near Épernay, Montrnirail and Étoges; reinforcements also were on their way to join him and were then about Vitry.

In the night his headquarters were again surprised, and he learnt that Napoleon himself with his main body was in full march to fall on his scattered detachments. At the same time he heard that Pahlen's Cossacks had been withdrawn forty-eight hours previously, thus completely exposing his flank. He himself retreated towards Étoges endeavouring to rally his scattered detachments, but Napoleon was too quick for him and in three successive days he defeated Sacken at Montmirail, Yorck at Champaubert and Blucher and his main body at Étoges, pursuing the latter towards Vertus. These disasters compelled the retreat of the whole Silesian army, and Napoleon, leaving Mortier and Marmont to deal with them, hurried back to Troyes with his main body to strike the flank of Schwarzenberg's army, which had meanwhile begun its leisurely advance, and again at Mormant on Feb. 17, Montereau the 18th and Méry the 21st, he inflicted such heavy punishment upon his adversaries that they fell back precipitately to Bar-sur-Aube.

In the meantime Blücher had rallied his scattered forces and was driving Marmont and Mortier before him. Napoleon, as soon as he had disembarrassed himself of Schwarzenberg, countermarched his main body and moving again by Sézanne, fell upon Blücher's left and drove him back upon Soissons. This place had been held by a French garrison, but had capitulated only twenty-four hours beforehand, a fact of which Napoleon was naturally unaware. The Silesian army was thus able to escape, and marching northwards combined with Bernadotte at Laon—this reinforcement bringing the forces at Bliicher's disposal up to over 100,000 men. On March 7 Napoleon fell upon the advance guard of this force at Craonne and drove it back upon Laon, where a battle took place on the 9th. Napoleon was here defeated, and with only 30,000 men at his back he was compelled to renounce all ideas of a further offensive, and he retired to rest his troops at Reims. Here he remained unmolested for a few days, for Blucher was struck down by sickness, and in his absence nothing was done. On March 14, however, Schwarzenberg, becoming aware of Napoleon's withdrawal to Reims, again began his advance and had reached Arcis-sur-Aube when the news of Napoleon's approach again induced him to retreat to Brienne.

The Allies March on Paris.—Thus after six weeks' fighting the allies were hardly more advanced than at the beginning. Now, however, they began to realize the weakness of their opponent, and, still more, the weakening of his political stability. Napoleon, coincidently, aware of the limitations of a strategy of continual parrying, was seized with the idea of a decisive coup against Schwarzenberg's communications. He determined to move eastward to St. Dizier, rally what garrisons he could find, and raise the whole country against the invaders, and had actually started on the execution of this plan when his instructions fell into the enemy's hands and his projects were exposed. The Czar Alexander called a council of war at which General Toll in opposition to his seniors, urged that instead of following Napoleon the allies should disregard the threat to their rear and advance by forced marches on Paris, whose people were reported to be "tired of the war and of Napoleon." His arguments for this moral objective won over the Czar and at his instigation the allies marched straight for the capital. Marmont and Mortier with what troops they could rally took up a position on Montmartre heights to oppose them, but seeing further resistance to be hopeless they gave way on March 31, just as Napoleon, with the wreck of the Guards and a mere handful of other detachments, was hurrying across the rear of the Austrians towards Fontainebleau to join them.

This was the end of the First Empire. The story of the WATERLOO CAMPAIGN, 1815, is told under its own heading.

BIBLIOGRAPHY.—Among the principal modern works on Napoleon's campaigns 1805–14 are the following: Yorck von Wartenberg, *Napoleon als Feldherr* (1866, English and French translations); H. Camon, *La Guerre napoléonienne* (Paris, 1903); H. Bonnal, *Esprit de la guerre moderne* (a series of works, of which those dealing with 1805–1812 are separately mentioned below.) For 1805 *see* Alombert and Colin (French Gen. Staff), *Campagne de 1805 en Allemagne* (Paris, 1898–1910); H. Bonnal, *De Rosbach à Ulm* (Paris, 1903); G. A. Furse, *Ulm, Trafalgar and Austerlitz* (London, 1905). For 1806–1807, Pr. Kraft zu Hohenlohe-Ingelfingen, *Letters on Strategy* (Eng. trans., vol.

i.); Freiherr v. d. Goltz, *Von Rossbach bis Jena und Auerstädt* (Berlin, 1906) and *Von Jena bis Preussisch-Eylau* (Berlin, 1908); H. Bonnal, La *Manoeuvre d'Iéna* (Paris, 1904); *Memoirs of Bennigsen* (trans. by E. Cazalas, French Gen. Staff, 1909); F. N. Maude, *The Jena Campaign* (London, 1909). For 1809, H. Bonnal, *La Manoeuvre de Landshut* (Paris, 1905); Saski, *Campagne de 1809* (Paris, 1899–1902); Ritter v. Angeli, *Ercherzog Karl* (Vienna, 1895–1897); Lieut. Field Marshal von Woinovich (ed.), *Das Kriegsjahr 1809;* Buat, *De Ratisbonne à Znadim* (Paris, 1910). For 1812, G. Fabry (French Gen. Staff), *Campagne de 1812* (Paris, 1904); *La Guerre nationale de 1812* (French translation from the Russian general staff work. Paris. 1904); H. NAVAL OPERATIONS

The Peace of Amiens in 1802 was productive of but a brief truce. Napoleon's ambitions and actions were such as quickly to re-awaken European suspicions, and his refusal to evacuate the Netherlands was alone enough to arouse England and cause her to declare war on him as early as May 18, 1803. From then onwards, for over two years, the war took the form of a gigantic scheme, on the part of Napoleon, for an invasion of England—a scheme which led to the movements known as the Trafalgar Campaign which, in its turn, led to the Battle of Tiafalgar. Boulogne was chosen as the base for the French operations; along the coast on either side an army of some 150,000 men was encamped, and specially-constructed flat-bottomed boats for their transport were brought from all parts of France. The army was given constant practice in embarkation and disembarkation, and, in the meantime, it proved impossible for the British ships to do much damage to this armament owing to the shallow water on the coastline. In order, however, to carry through his scheme successfully, Napoleon had got to obtain at least a temporary control of the Channel, and this meant either defeating the British fleet on equal terms in action, or, by some means, causing the various parts of it to scatter on some wild-goose chase, so giving hitnself the chance to bring every available ship to the Channel and overwhelm the British fleet there by sheer weight of numbers. French fleets were stationed at Brest, Rochefort, L'Orient and Toulon; all of them were watched by British blockading squadrons. From the end of 1804, when Spain entered the war on his side, Napoleon was able to add to this total Spanish squadrons at Corunna, Ferrol, Cadiz and Cartagena, all of which the British blockaded. The total number of ships at Napoleon's command was about 60, the English had an approximately equal number employed in blockading them. His plan, then, took the form of attempting to elude these blockading squadrons and make them scatter to various parts of the world in search of his escaped squadrons which would, after concentrating at a given rendez-vous, return to the Channel to crush Cornwallis and the English Channel Fleet, if indeed that had not scattered too, after the presumed escape of the Brest Fleet which it was blockading. In either case Napoleon might hope to achieve his object—control of the Channel for long enough to enable him to take his troops across, while the British squadrons returned from the various parts of the world to which he seemed to think they might sail. The scheme was an exceedingly weak one, and postulated a gross ignorance of naval strategy on the part of that country that had been its greatest exponent. The British Admiralty upset it by a single order. The various blockading squadrons, if they were eluded by the squadrons they were blockading, were to fall back on Cornwallis. Thus if all the French squadrons united at the appointed rendez-vous (which was Martinique) and sailed for the Channel, they would merely find Cornwallis with an equally concentrated fleet, and the extent of the British concentration would depend on, and be equal to, that of the French.

The first move occurred in January 1805 when the Rochefort squadron of five ships escaped and sailed for the West Indies, but it proved an isolated effort. On March 30, however, Admiral Villeneuve used a gale to elude Nelson who was watching him off Toulon, and got clear away with eleven ships which he increased to eighteen by picking up the Cadiz Squadron, reaching Martinique on May 14. He was joined on June 1, by two ships from Rochefort, but no others put in an appearance. He should have waited until nearly the end of the month before sailing back to Europe to try and pick up those squadrons which failed to join him, preliminary to making for Brest, whence Admiral Gantheaume was trying unsuccessfully to emerge from time to time. Only a week later, however, information reached Villeneuve that Nelson was already in the West Indies in search of him, and he decided to make for European waters immediately. Nelson, after having been evaded off Toulon should, according to his orders, have fallen back on Cornwallis, but he preferred, not for the first time, to follow his own course. It has often been said that Villeneuve induced Nelson to follow him and that, in doing so, the latter was playing into Napoleon's hands. The foolishness of this can be seen in the fact that the mere information that Nelson was in the neighbourhood caused Villeneuve to make for home a considerable time before he was due to depart, and any hope of a West Indian concentration was thus lost. When Napoleon hoped that the English blockading squadrons would scatter, he meant to places where the French had not gone. Foiled by false information of his hope of catching Villeneuve, Nelson sent a fast brig home to warn the Admiralty of the former's return, and himself sailed for Gibraltar. The Admiralty despatched Sir Robert Calder to intercept Villeneuve; this he did, off Finisterre, and, in a not very satisfactory action, fought in a fog, deprived him of two Spanish battleships, but let him make Ferrol. Here the French Admiral received reinforcements, and his next move, according to his programme, should have been to make for the Channel in an attempt to unite with the Brest fleet. But he conceived, rightly, that Napoleon's scheme had already been foiled and that his task would be impossible; thus when he left Ferrol he made, not for the Channel, but for Cadiz. Here he was blockaded by Nelson and Collingwood. The Trafalgar Campaign, as a campaign, was over, and the invasion scheme was a failure. Napoleon broke up his camp and marched his troops against Austria. A natural corollary of the Trafalgar Campaign was the battle of Trafalgar, but it must be realised that it was the former that saved England from invasion. In the autumn Napoleon needed a fleet in the Mediterranean and ordered Villeneuve to proceed there. The latter, after a protest, attempted to comply, and was beaten, as all the world knows, on Oct. 21, 1805 with a loss of twenty ships.

The victory of Trafalgar, while it did not end the war, conferred upon England the complete command of the sea. Thereafter naval activity was most pronounced, and the British Navy was employed in numerous undertakings in all parts of the world, but it becomes impossible to trace out any broad policy. It only remains to point out some of the more prominent incidents. Napoleon's operations with Russia produced some naval, activity. England attempted to assist that country when in 1807 Napoleon was preparing a final blow against her, by forcing the Dardanelles — Turkey being then allied with France. Admiral Duckworth was selected for the operation, and he actually silenced the batteries in the Straits and appeared off Constantinople. There he was helpless for lack of bombships, and had to retire under a damaging fire. Later in the same year the third coalition against France came to a final end when Napoleon and the Tsar of Russia signed the Treaty of Tilsit, by which they agreed to cease war and both plot for England's overthrow. One scheme they hatched was to seize all the neutral fleets in Europe and employ them against their common enemy. The largest neutral navy was Denmark's, and Canning, having providentially heard of this peculiar arrangement, anticipated a Franco-Russian breach of Danish neutrality by sending Admiral Gambier to "borrow" this fleet for the duration of the war. Gambier bombarded Copenhagen and returned with 70 out of 72 of the Danes' fighting ships.

Napoleon's Berlin and Milan Decrees, by which he hoped to break England's merchant marine, and England's reply with the Orders in Council, also gave the British navy opportunities to show its command of the sea. Napoleon forbade continental countries to import British goods either in British or foreign ships. England in turn seized neutral ships that called at a continental port without also calling at a British port. The struggle forced England to open new markets in the east and South America, but several countries rebelled against Napoleon's system and England was always ready to help. The revolt of Portugal began in 1808 and produced the Peninsular War, which ought to be thought of as partly a naval operation, for the fleet took off the army after Corunna, was always behind the duke of Wellington's lines at Torres Vedras and finally followed, as nearly as possible, his victorious advance.

The revolt of Austria in 1809 produced the combined expedition against Antwerp, commanded by Admiral Strachan and Lord Chatham, which hoped to find some sympathy among the Netherlanders for their Austrian former rulers. Walcheren and Flushing were captured, but the expedition had to retreat after the collapse of Austria. Finally, England's resistance to Napoleon's decrees involved it in 1812 in war with the United States, which considered itself ill-treated in the matter of the seizure of ships.

The British lost many single-ship actions with the Americans, their only success being that of the "Shannon" over the "Chesapeake," but the United States let its very natural jubilation rather blind it to the fact that its coasts were blockaded without serious challenge.

This is but a small selection from the numerous incidents that make up the naval side of the Napoleonic War after Trafalgar. The main point is that British sea supremacy was unchallenged after that battle, and the royal navy remained Napoleon's worst enemy to the end, for it was the British "Bellerophon" which intercepted him when, after Waterloo, he sought to escape to the United States to carve out an empire in a new world.

NAPOLEONITE, or CORSITE, a gabbro showing orbicular, or spherical, structure from Santa Lucia di Tallano, Corsica The rock when cut and polished makes a beautiful ornamental stone, examples of which are to be found in most petrographical museums. Although often referred to as a diorite, corsite in its mineral and chemical composition corresponds to a hornblende gabbro (*q.v.*). The orbicules, remarkable for their uniformity in structure, range from $\frac{3}{4}$ in. to 2 in. in diameter and are set in a matrix of variable grain size built up of green hornblende and cummingtonite ***(see*** AMPHIBOLE) and bytownite feldspar ***(see*** FELDSPAR: ***The*** *Plagioclases*).

The core of these structures consists of material mineralogically similar to the matrix but richer in feldspar; it is followed by a series of broad and narrow zones, respectively, of radiate plagioclase and green hornblende-cummingtonite intergrowths also radially arranged. Both the plagioclase of the core and of the broad zones is distinctly more calcic than that of the matrix. These relations are in accord with the concept that the orbicules developed in a crystallizing liquid and the structure itself has probably arisen by rhythmic crystallization.

Orbicular or spheroidal structures, though by no means common, have been found in the crystalline rocks of Sweden, Finland, the U.S.S.R. and America. They have been closely studied by the petrologists of Finland and are there known as esboites. The mutual relations in composition and structure of orbicule and matrix in some of these rocks, especially those of Finland, have led to the opinion that the structures are metamorphic in origin, the orbicules developing in a solid or quasi-solid matrix which has in part been converted into a migmatite by metasomatic replacement.

See P. Eskola, "*On* the Esboitic Crystallization of Orbicular Rocks," *J. Geol.*, vol. xlvi, pp. 448–485 (1938). (C. E. T.)

NAPRAPATHY is a system of manipulative drugless treatment founded in 1907 by Oakley Smith, based on a theory that connective tissue which has become shrunken as the result of injury is the basic cause of disease. A shrunken strand of connective tissue is called a ligatight and may occur in the spine, thorax, pelvis or elsewhere. It is claimed that such tissue can be corrected by naprapathic treatment, which aims at stretching the shrunken strands.

Study of a set of charts showing types of ligatights and manipulations to correct them are held to be an important part of the practitioner's training.

NÁPRAVNÍK, EDUARD (1839–1916), Czech conductor and composer, was born at Byšt in Bohemia on Aug. 24, 1839. In 1861 he went to St. Petersburg as conductor to Prince N. Yussipov. Through the influence of Anatol Liadov he obtained a post at the Maryinsky theatre and in 1869 succeeded him as first conductor there. He died Nov. 23, 1916.

Nápravník wrote several operas, including ***Francesca*** da ***Rimini*** (on Stephen Phillips's play); four symphonies; and orchestral, choral and piano pieces.

NAQUET. ALFRED JOSEPH (1834–1916), French chemist and politician, was born at Carpentras (Vaucluse) on Oct. 6, 1834. In 1863 he became professor of chemistry in Palermo and two years later of medicine in Paris. In 1867 he was imprisoned as a freemason and republican and in 1869 took refuge in Spain. Under the Third Republic he became an active politician. He was elected deputy for Vaucluse in 1871 and its senator in 1882, sitting on the extreme republican left. In 1888 he ardently supported Gen. Georges Boulanger and pressed for revision of the constitution. As a result of his efforts a law was passed facilitating divorce after three years of separation, on the demand of either party. He was prosecuted in the Panama affair but was acquitted in 1898. He thereafter retired into private life. He wrote several scientific works, including ***Principes de chimie*** *fondés sur les théories modernes* (1865), and such political works as La *République radicale* (1873) and ***Socialisme*** *collectiviste* et ***socialisme*** *libéral* (1890). (D. TN.)

NARA (sometimes called EAST NARA RIVER), an important water channel in West Pakistan, part of the bed of the "lost river of Sind," the Hakra ***(see*** INDIAN DESERT). It traverses the desert east of the lower Indus. A canal scheme utilizes the channel. (T. HER.)

NARA, a town of Japan, in the Nara prefecture, $25\frac{1}{2}$ mi. from Osaka by rail. Pop. (1955) 115,674 It lies on the slope of a range of picturesque hills, beautifully wooded with cryptomerias and evergreen oaks. Nara remained the metropolis during seven consecutive reigns (709 to 784), and its 75 years of favoured existence sufficed for the building and furnishing of several imposing shrines and temples, for the laying out of a noble park and for the casting of a colossal image of Buddha. In Nara and its environs there have been preserved important and beautiful remains of architecture dating back to the 7th and 8th centuries, such as parts of the Buddhist monasteries called Hōryūji, Yakushiji, Kōfukuji and Tōdaiji, together with remarkable examples of sculpture of similar age, notable among which are such celebrated Buddhist images as the Kudara Kwannon, the Chūgūji Kwannon, bronze Shaka trinity of A.D. 623 and many other distinguished works of art.

Many articles and ornaments used in the Nara palaces have been preserved for nearly 1,200 years in a storehouse. the Shōsō-in. They give a picture of the court life of those days and show evidence of cultural relations not only with China but with western Asia. The Shinto shrine of Kasuga, doubtless many times rebuilt, still preserves in its shape and decoration features of the primitive style of Japanese architecture. Nara has a fine park. and efforts are made to preserve the ancient characteristics of the town.

NARAYAN, JAYAPRAKASH (1902–), Indian political leader. founded and led the Socialist party (India) Born on Oct 11, 1902 in the province of Bihar, he was educated there and in the United States at the universities of California, Wisconsin, Iowa and Ohio State university, where he studied science and economics. During his stay in the United States he became a militant Marxist. A member of Mohandas K. Gandhi's civil disobedience movement, he was head of the Labour department of the Indian National congress in 1931, and was imprisoned with other congress leaders in 1932 for passive resistance to the setting up of special electorates for depressed classes. After his release Narayan organized and was founding secretary of a Socialist party within the congress in 1933. He also organized the All-India Railwaymen's federation, of which he was president from 1946 to 1952. He was imprisoned again in 1939 and 1942–43 in protest against the government's action of taking India into World War II without consulting congress leaders and against a new constitution offered by the British government. He left the congress in 1947 and later became active in the *Bhudan Yagna* (Land Gift) movement in Bihar; in 1954 he renounced political activity to work for *Bhudan Yagna.*

NARBADA (NERBUDDA), a river of central India. It is sometimes regarded as the boundary between Hindustan and the Deccan. It rises in the Maikala range in Madhya Pradesh and for the first 200 mi. of its course winds among the Mandla hills. Then at Jubbulpore, passing through the "Marble Rocks," it enters the structural trough between the Vindhya and Satpura ranges, and pursues a direct westerly course to the Gulf of Cambay. Its total course through Madhya Pradesh and northern Bombay state amounts to 801 mi., and it falls into the sea in the Bombay district of Broach. It receives the drainage of the northern slopes of the Satpuras, but not that of the Vindhya tableland, the streams from which flow into the Ganges and Jumna. After entering Bombay state, the river widens out in the fertile district of Broach, with an average breadth of ½ mi. to 1 mi. Below Broach city it forms an estuary which is 13 mi. broad where it enters the Gulf of Cambay.

The Narbada is nowhere utilized for irrigation, and navigation is confined to the lower section. In the rainy season boats of considerable size sail about 60 mi. above Broach city. In sanctity the Narbada ranks second to the Ganges among the rivers of India, and along its whole course are special places of pilgrimage. The most meritorious act that a pilgrim can perform is to walk from the sea to the source of the river and back along the opposite bank. The valley of the Narbada has always been an important routeway between the Arabian sea and the Ganges valley. Its middle section is followed by the main railway from Bombay to Jabalpur on its way to Allahabad.

NARBONNE, a city of France, capital of an *arrondissement* in the *département* of Aude, in a vine-growing plain 5 mi. from the Mediterranean, 37 mi. E. of Carcassonne. Pop. (1954) 27.896. Narbonne was the capital of the Volcae Tectosages. There the Romans in 118 B.C. founded their first colony in Gaul, named *Narbo Martius;* they built great works to protect the city from inundation and to improve its port, situated on a lake now filled up. The capital of Gallia Narbonensis, the seat of a proconsul and a station for the Roman fleet, Narbo Martius became the rival of Massilia. But the division of Gallia Narbonensis into two provinces lessened its importance. Alans, Suevi, Vandals, each held the city, and at last, in 413, it was occupied by the Visigoths, whose capital it afterward became. In 719, after a siege of two years, it was captured and extended by the Saracens Charles Martel, after the battle of Poitiers, and Pippin the Short. in 752, were both repulsed from its walls; but on a new attempt, after an investment of seven years, the Franks again forced their way into Narbonne. Charlemagne made the city the capital of the duchy of Gothia, and divided it into three lordships—one for the bishop, another for a Frankish lord and the third for the Jews. In the 13th century the archbishopric was seized by the pope's legate, Arnaud Amaury, who took the title of viscount of Narbonne. Simon de Montfort, however, deprived him of this dignity, receiving from Philip Augustus the duchy of Narbonne along with the county of Toulouse. By his expulsion of the Jews Philip the Fair hastened the decay of the city; and about the same period the Aude, which had formerly been diverted by the Romans, ceased to flow toward Narbonne and the harbour was silted up. United to the French crown in 1507, Narbonne was enclosed by a new line of walls under Francis I but had the last portions of its ramparts demolished in 1870. The archbishopric was founded about the middle of the 3rd century, its first holder being Sergius Paulus; it was suppressed in 1790. The Robine canal, a branch of the Canal du Midi, divides Narbonne into the *bourg* and the *cite'.* The former 13th-century cathedral (St. Just), consists only of a choir 130-ft. high and transept. The towers (194-ft. high) at each end of the transept date from 1480. The apse of the cathedral was formerly joined to the fortifications of the archiepiscopal palace, and the two buildings are still connected by a mutilated cloister of the 14th and 15th centuries. Part of the palace now serves as *hôtel de ville,* and the palace garden contains many fragments of Roman work; the Musée Lapidaire in the Lamourguier buildings has similar Roman remains. The church of St. Paul, though partly Romanesque, is for the south of France a rare example of a building of the early 13th century in the Gothic style of the north. It possesses some ancient Christian sarcophagi and fine Renaissance wood carving. It has a good trade in wine and spirituous liquors, salt, tartar, almonds and leather. The industries include cooperage, sulfur refining, brandy distilling and the manufacture of bricks and tiles.

NARCISSUS, in Greek mythology, son of the river-god Cephissus and the nymph Leiriope, distinguished for his beauty. The seer Teiresias told his mother that he would have a long life, provided he never looked upon his own features. His rejection of the love of the nymph Echo (*q.v.*) or of his lover Ameinias drew upon him the vengeance of the gods. Having fallen in love with his own reflection in the waters of a spring, he pined away (or killed himself), and the flower that bears his name sprang up where he died. According to Pausanias, Narcissus, to console himself for the death of a favourite twin sister, his exact counterpart, sat gazing into the spring to recall her features by his own.

It is a very plausible suggestion of Sir James Frazer in *The Golden Bough* that this story is to be connected with the widespread belief that it is unlucky, or even fatal, to see one's own reflection. This superstition existed in Greece.

Hence is derived the term narcissism, used in psychiatry, and especially psychoanalysis, for a morbid condition in which the subject is intensely interested in his own body.

NARCISSUS (d. A.D. 54) was a freedman of Claudius, and his secretary *ab epistulis.* Narcissus and Messallina between them exercised an unbounded influence over the emperor and arranged the execution or exile of their opponents almost at pleasure. Narcissus was sent to Britain to subdue the mutiny of the soldiers of A. Plautius. He was not well received, but the mutiny subsided. Narcissus was almost solely responsible for the ultimate downfall of Messallina in the Silius affair. It was he who made Claudius alarmed for his own safety, who succeeded in hardening him against Messallina's appeals and who finally gave the order for her execution when Claudius hesitated. For this he received the insignia of praetor. Eventually he made a false move over Claudius' second marriage, for which he supported Aetia Petina, and further antagonized Agrippina by backing the claims of Britannicus to the throne. As a result he was put to death on Nero's accession in A.D. 54. Narcissus' importance is an early example of the power of the freedmen-secretaries of the emperor's household and represented the first step toward the transformation of the emperor's personal staff into an imperial civil service.

See Sac. *Ann.* xi, xii, xiii, 1; Dio Cass. ix; Suet. *Claudius.*

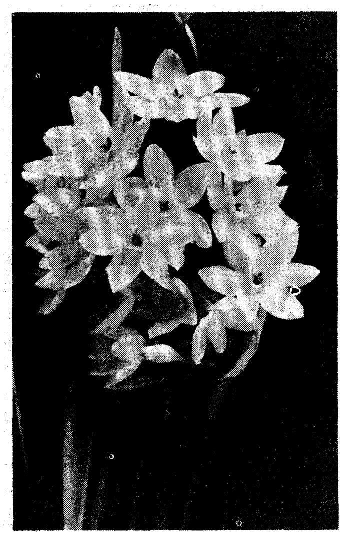
NARCISSUS, a genus of bulbous plants belonging to the amaryllis family (Amaryllidaceae), native of central Europe and the Mediterranean region; one species, *N. tazetta,* extends through Asia to Japan. From some of these, by cultivation and hybridization, have arisen the numerous modern varieties. The plants have long narrow leaves springing from the bulb and a central scape bearing one or more generally large, white or yellow, drooping or inclined flowers. The flowers are regular, with a perianth springing from above the ovary, tubular below, with spreading segments and a central corona; the six stamens are inserted within the tube. The most interesting feature botanically is the corona, or cup, which springs from the base of the flower segments and gives the special character to the flower. The classification of narcissuses adopted by the Royal Horticultural society in 1950 includes 11 groups or divisions; of these the following five are of chief interest to the gardener:

1. The hoop petticoat narcissuses are from 4 to 12 in. in height and have grassy foliage and yellow or white flowers. These have the corona in the centre of the flower—very large in proportion to the other parts and much expanded, like a hoop petticoat. They are all regarded as varieties or forms of the common hoop petticoat, *N. bulbocodium,* which has comparatively large bright-yellow flowers.

2. A second group is that of the pseudo narcissuses, of which the daffodil, N. *pseudo-narcissus,* is the type. The daffodil is common in woods and thickets in most parts of the north of Europe and is naturalized in the U.S. Its leaves are about 1 ft. in length and 1 in. in breadth and have a blunt central ridge and flat edges. The stem, which is 8 to 18 in. long, bears a single flower. The flowers are large, yellow, scented and a little drooping, with a corolla deeply cleft into six lobes, and a bell-shaped corona, which is crisped at the margin; they appear in early spring. In this species the corona is also very large and prominent. *(See* DAFFODIL.)

3. Another group, with coronas of medium size, includes the fine and numerous varieties of *N. incomparabilis,* one of which, with large, double flowers, is known as butter-and-eggs; N. *odorus,* known as the campernelle jonquil, has two to four uniform bright-yellow flowers and is considered a hybrid between N. *jonquilla* and *N. pseudo-narcissus* although it is found wild in France and Spain.

4. The polyanthus or bunch narcissuses form another well-marked group. whose peculiarity of producing many flowers on the stem is indicated by the name. In these the corona is small and shallow as compared with the perianth. *N. tazetta* is the type of this group. They are general favourites among spring flowers. The Chinese sacred lily, or joss flower, is a variety of N. *tazetta.* The jonquil, *N. jonquilla,* with yellow flowers, a native of south Europe and Algeria, is also grown in pots for early flowering but does well outside in a warm border.



J. HORACE MCFARLAND CO

PAPER-WHITE NARCISSUS (NARCISSUS TAZETTA ALBA), **ONE OF THE POLYANTHUS NARCISSUSES**

5. In the poet's or pheasant's-eye narcissuses *(N. poeticus)* the perianth is large, spreading and conspicuous and the corona very small and shallow. These pheasant's-eye narcissuses, of which there are several well-marked varieties, blossom in succession from earlv to midspring, and all do well in-the open borders as permanent hardy bulbs.

About 65 species of *Narcissus* are under cultivation. Narcissuses are best displayed in naturalized plantings but are effective in more formal arrangements. Bulbs, available in early fall, should be planted as soon as they are received, so that they may root before cold weather arrives. They should be covered by soil as deep as one and one-half times their height. Narcissuses will thrive in a loamy soil enriched with rotted manure or bone meal, which should not touch the bulbs. After the plants flower, the leaves should be allowed to wither naturally; the bulbs depend upon the foliage for the manufacture of food materials necessary for the resumption of growth next season.

BIBLIOGRAPHY.—For a scientific treatment of the genus, *see* J. G. Baker, *Handbook of Amaryllideae* (1888); E. A. Bowles, *Handbook of Narcissus* (1934); Royal Horticultural Society, *Dictionary of Gardening,* vol. iii (1951) and the *American Daffodil Yearbook* (1947 *et seq.*).

NARCOTICS, a general term for substances which produce lethargy or stupor and the relief of pain. In a restricted sense, the term applies to opium (*q.v.*) or coca leaves or any compound, manufacture, salt or preparation thereof, even though their action is not narcotic. Prescriptions for these substances in most countries require that the prescribing physician be registered with the proper governmental agency (department of internal revenue in the U.S.) and comply with the regulations furnished by that agency. *(See* DRUG ADDICTION.) (F. L. A.)

NARDI, JACOPO (1476–1563), Florentine statesman and historian, whose history of his native city throws light on contemporary events and personalities, was born in Florence in 1476. A republican and supporter of Savonorola, he occupied various official positions after the expulsion of the Medici in 1494. He continued in the public service after their return, but joined in the movement for their second expulsion in 1527 and was instrumental in defeating the Medicean troops under Cardinal Silvio Passerini. On the family's final reinstatement in 1530, Nardi was exiled. He lived most of the rest of his life in Venice. He died in March 1563.

Nardi's chief literary work was his *Istorie della Citta di Firenze,* published posthumously (1582). Based on the diary of Biagio Buonaccorsi, a companion of Macchiavelli, it covers the period 1498 to 1538. It reflects Nardi's republican zeal, and his admiration for the religious ideals of Savonorola, and its style is sometimes heightened by sincere feeling. He mas also the author of two comedies, and of a life of Antonio Giacomini (1567).

See L. Arbib's complete edition of Nardi's *Istorie* (1838–41); A. Pieralli, *La vita e le opere di Jacopo Nardi* (1901).

NARDINI, PIETRO (1722–1793), Italian violinist and composer, mas born at Fibiana in Tuscany in 1722. He studied violin and composition at Leghorn and later became a pupil of Giuseppe Tartini at Padua.

For 15 years he held an appointment at the court of Stuttgart as solo violinist. In 1767 he settled at Leghorn and was with Tartini in his last illness. He became music director to the duke of Tuscany in 1770 and enjoyed great fame as a performer and composer. He died at Florence on May 7, 1793. Nardini is remembered as Tartini's most famous pupil, and as the composer of many graceful compositions for the violin. His music is melodious and eminently playable, and has an educational value in respect of technique. Modem reprints of the sonatas are found in Alard's *Maîtres classiques,* in David's *Hohe Schule des Violinspiels* and in Jensen's *Classische Violinmusik.*

NARES, SIR GEORGE STRONG (1831–1915). English arctic explorer and commander of the "Challenger." mas educated at the Royal Naval college at New Cross and entered the navy in 1845 He served on the Australian station was mate of the "Resolute" in the arctic expedition of 1852 and then served in the Crimea. He was then employed in surveying work on the north-east coast of Australia and in the Mediterranean. While in command of the "Challenger" (1872–74), in the famous voyage of deep-sea exploration round the world, he was ordered home to take command of the arctic expedition which set sail in the spring of 1875 in the ships "Alert" and "Discovery." For his services he was made Knight Commander of the Bath (1876). Two years later he was sent in command of the "Alert" to survey Magellan strait. He retired from active service in 1886, and became a vice-admiral in 1892. He died at Surbiton, Surrey. on Jan. 15, 1915.

He published *Reports on Ocean Soundings and Temperature* (1874–75); and *Narrative of a Voyage to the Polar Sea during 1875–76,* 2 vol. (1878)

NARES, JAMES (1715–1783), English organist and composer, mas born at Stanwell, Middlesex, in 1715.

In 1734 Nares was appointed organist of York cathedral. Named organist and composer to the king in 1756, he became in 1757 master of the children at Chapel Royal. succeeding his former teacher, Bernard Gates. The Catch club, founded in London in 1761 to encourage the composition and performance of vocal music, awarded him a prize in 1770 for his glee "To all Lovers of Harmony." In July 1780 he resigned from his post at Chapel Royal, and on Feb. 10, 1783, he died in London.

Nares's works include three collections of harpsichord lessons (1748, 1758, 1759); two treatises on singing; *Il Principio, or, A Regular Introduction to Playing on the Harpsichord or Organ* (1759); *The Royal Pastoral* (1767), a dramatic ode; a collection of catches and glees (*c.* 1780); six organ fugues; 20 anthems (1778); and a number of services, canons. and rounds.

NARESUAN (PHRA NARET), popularly known as the Black Prince, was king of Siam from 1590 to 1605. In his youth, his country was invaded and conquered by Burma and was exposed to repeated invasions from Cambodia. In 1571, when only 16 years of age, Prince Naresuan was made governor of the northern province of P'itsanulok. His rule was a chronicle of constant fighting, during which he displayed reckless courage and extraordinary military skill. In 1584 he renounced allegiance to Burma. He successfully defended the capital city of Ayuthia, and defeated the besieging Burmese forces by a combination of scorched earth and daring guerrilla tactics. He also drove out the Cambodians and thus had reassured Siamese independence by the time he mounted the throne. As king he devoted more time to the improvement of internal affairs. He conducted peaceful relations with Portuguese from Malacca and Spanish from Manila. Then he expanded his power over much of Burma and Malaya, and reduced Cambodia to vassalage. He re-established the prestige of Siam in the region between the Indian ocean and the borders of China. More than anyone else, the celebrated warrior hero was responsible for the greatness of Siam which dazzled the first East India merchants from the Netherlands and Elizabethan England.

(C. A. B.)

NAREW, BATTLES OF THE. The battles on the river Narew, northeast of Warsaw, in July and Aug. 1915, were a part of the great offensive planned by Falkenhayn against Russia. During May and June, Mackensen had driven the Russian armies in Galicia from Tarnów on the Dunajec to the east of Lemberg (*see* LEMBERG, BATTLES *OF*). In July the group of armies under his command was directed northeast toward Brest-Litovsk against the communications of the Russian forces which still held the Warsaw salient.

Hindenburg, who commanded the group of armies on the northern part of the eastern front. was now ordered to strike a blow on the north side of the salient. Falkenhayn hoped thus by driving in the flanks of the salient to cut off large numbers of Russians in its apex about Warsaw. The realization of this hope depended, of course, on the rapidity with which the flanks could be forced.

Rival German Plans.—The operation against the Narew line provoked a controversy between the two men who had most influence on German strategy during the war, Falkenhayn and Ludendorff The former was at this time chief of the German Great General staff, and thus responsible for the supreme direction of the war; the latter was chief of staff to Hindenburg. Ludendorff had long cherished the idea of a Napoleonic maneuver against the Russian rear by Kovno and Wilno on Minsk, and considered the proposed Narew offensive as timid and ineffectual; Falkenhayn, with heavier responsibilities on his shoulders, mistrusted both the feasibility and the expedience of the Wilno adventure. He could not afford to become so deeply involved in the Eastern theatre as to be unable to withdraw troops to meet the coming offensive in the west. After a discussion of the alternative plans held in the presence of the kaiser, Falkenhayn's views were approved; and Hindenburg was ordered to carry out the Narew attack.

A formidable water barrier protected Russian Poland against invasion from East Prussia, formed by the Niemen. the Bobr, the Narew and the lower course of the Bug, and thence the Vistula to the frontier. The Russians had fortified this river line. Besides the fortresses of Kovno and Grodno. Osoweic, Lomza and Nowa-Georgiewsk, there were fortified bridgeheads on the Narew at Ostroleka. Rozan, Pultusk and Zegrze. Though the river was fordable in the summer at many points, marshes along its length increased its effectiveness as an obstacle.

The German **Attack.**—Gallwitz's army, which was to make the attack, comprised six corps (14 divisions). Opposite to it, on the lower Vistula, lay the Russian 1st army (Litvinov) with three corps and a cavalry corps.

The tactical details of the fighting are not of any special interest. On July 13 Gallwitz delivered his first attack on the approximate line Przasnysz-Ciechanbw, aiming at Pultusk. The Russians, overneighted both in numbers and heavy artillery, at once fell back more than halfway to the Narew line. They were attacked again on July 15, and during July 18 and 19 withdrew across the river, the Russian 12th army on their right conforming to the movement. Reinforcements had now arrived and resistance stiffened. Though the Germans stormed the bridgeheads of Pultusk and Rozan on July 23, and secured crossings over the river, their further progress was limited by violent Russian counterattacks, and they were unable to reach the line Wyszków-Ostrów (on the lower Bug), at which they were aiming. An attempt to force a passage further east at Ostroleka on July 30 failed, and it was not until Aug. 4 that this bridgehead fell. Losses were heavy on both sides; but the Russians had secured time and space sufficient to evacuate the Warsaw salient without danger.

Hindenburg and Ludendorff naturally claimed that the result of the battle vindicated their opinion on the mistaken strategy of the Supreme command. Falkenhayn retorted that the operations would have had the desired effect of intercepting the Russian retreat had Hindenburg used the full force available and given Gallwitz 20 divisions instead of 14. It seems doubtful, however, whether the communications would have allowed the effective employment of so large a force.

NARIÑO, southwesternmost department of the republic of Colombia, bounded by Ecuador on the south, the Pacific ocean on the west, and by the department of Cauca and the *comisaria* of Putumayo on the north and east. The *comisaria* of Putumayo was made a part of Nariño in 1953 and re-established as a *comisaria* in 1957. Area, 12,499 sq.mi. The population of Nariño (613,640 [1961 est.]) is principally concentrated in the volcanic Andean highlands above 5,000 ft. Indian physical and cultural characteristics predominate but Spanish is the universal language. The densely-settled *altiplano* of Túquerres-Ipiales on the Ecuador frontier is separated by the Patia river from that of Pasto, where Nariño's capital of that name is located. The economy of Nariiio is based almost entirely on agriculture. Wheat, barley, beans and potatoes are the principal highland crops. Bananas are exported from the port of Tumaco, which handles large ocean-going vessels. A railroad from Tumaco ascends the Patia valley for 70 mi. to El Diviso. (Js. J. P.)

NARNI (anc. Umbrian *Nequinum*, Rom. ***Narnia*),** a town and episcopal see of the province of Terni, region of Umbria, Italy, 65 mi. N. of Rome by rail. Pop. (1957 est.) 21,414 (commune). It is picturesquely situated on a lofty rock (787 ft.). The cathedral and the portico of S. Maria Impensole are Romanesque; the former has some good Renaissance sculptures. There are other interesting churches and some picturesque Gothic houses and palaces. There are factories of linoleum and calcium carbide.

The Umbrian Nequinum was taken by the Romans in 299 B.C., and a colony planted there against the Umbrians. It was situated on the Via Flaminia, and one of the finest bridges of antiquity crosses the river below the town. The original main road ran to Nuceria by Mevania; a branch by Interamna and Spoletium joined it at Forum Flaminii. According to some authors, the emperor Nerva was born at Narnia. The town played a considerable part in military history. In the middle ages Narni was under the papal power. It was the birthplace of the well-known condottiere Erasmo Gattamelata (d. 1443), whose statue by Donatello is at Padua.

See G. Eroli, *Miscellanea Storica Narnese* 2 vol. (1858–1862), and other works by the same author.

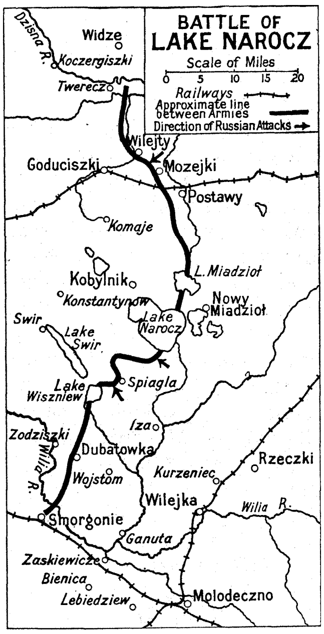
NAROCZ, BATTLE OF LAKE. Lake Narocz, in Belorussian S.S.R., U.S.S.R.. 62 mi. E.N.E. of Vilnius, gives its name to a great offensive by the Russian 2nd army in the spring of 1916. *(See* WORLD WAR *I: From Verdun to the Entry of America.)*

General Situation on the Eastern Front. — The river Pripet formed the dividing line between the German and Austrian commands. At the beginning of March there were 42 German and two Austrian divisions on the front north of the Pripet, the total length of which was about 250 miles. The Russians had organized their armies into three groups: the northern (12th and 5th armies) on the Dvina, the western (1st, 2nd, 10th, 4th and 3rd armies) extending to south of the Pinsk marshes and the southwestern (8th, 11th, 7th and 9th armies) up to the Rumanian border. Their main strength was concentrated on the northern and western fronts, where it had been decided that the principal efforts of the year should be made. The losses of 1915 in men and material had been made good; guns and munition were available on a larger scale than previously, though still insufficient for the requirements of trench warfare.

Plan of Operations. — The general idea of the battle was for the 2nd army to attack on either side of Lake Narocz, where the German line formed a slight salient; the two wings were eventually to join and to continue their advance westward to Panevežys (some 80 mi. N. of Wilno [Vilna] and 100 mi. W. of the original line), where the 5th army, which was to attack from the Jakobstadt bridgehead on the Dvina, was to join them. The operation seems to have been planned originally to take place later in the year, when all the Allies proposed to attack simultaneously. But on Feb. 21 the German assaults on Verdun began, and the Russians chivalrously hurried on their preparations and attacked to relieve the pressure on the French, at the worst possible time of the year—when the annual thaw, which renders all communications practically impossible for a period, might be expected at any moment.

Description of the Terrain. — Lake Narocz (8 mi. by 6 mi.) is the largest of a whole series of small lakes in which the tributaries of the Wilia and the Dzisna rise. It drains into the Narocz river, which flows south to join the Wilia east of Smorgonie. The greater part of the trench line between Dvinsk and Smorgonie (over 100 mi. in a straight line) was protected by lake, stream or marsh, and stretches of dry ground wide enough for a large scale offensive were few. On either side of Lake Narocz, however, mere gaps of four miles or so in the water line, where the terrain was comparatively favourable for attack, though communications were poor. The northern gap was ten miles to the north of Lake Narocz; the southern was between the lake itself and Lake Wiszniew.

Dispositions of the Opposing Forces. — The 2nd army was divided into three groups: the right group (under General Plyeshkov), opposite the northern gap, consisted of three corps and a cavalry corps; the centre group (under General Sirelius), of two corps; and the left group (under General Baluev), of three corps. Four corps were available behind these groups to exploit any success gained. The right and left groups were to attack the north and south faces of the salient respectively, while the centre group assisted by minor assaults and demonstrations. The army commander, Smirnov, fell sick just before the battle and his place was taken by General Ragoza



PLAN OF THE BATTLE OF LAKE NAROCZ, MARCH 18, 1916

The 2nd army was opposed by Von Eichhorn's 10th army on a front of some 85 mi.. comprising 11 divisions and two cavalry divisions. The Germans were aware of the Russian concentration.

The Russian Attacks. — A thaw set in on March 17, but the offensive was nevertheless begun on the 18th. After a bombardment of several hours, massed infantry attacks were made both by Plyeshkov's group north of Lake Narocz and by Baluev's group in the south. In the thickly wooded and enclosed terrain the insufficiently trained Russian infantry soon lost cohesion, and their assaults were ill-timed and disjointed. Though the German first-line trenches were in several cases occupied, they could not be held under the concentrated fire of the German artillery, which mas extremely skilfully handled. By nightfall the Russians were back in their original positions, having suffered very heavy casualties without result. After two days of further artillery preparation and minor attacks intended to mislead the enemy, renewed heavy assaults were made on the nights of March 19–20 and 20–21.

On Plyeshkov's front no ground was permanently gained in spite of terrible losses, but Baluev's group in the south made an advance of over a mile on a front of about 23 miles. The weather conditions were by now terrible; it thawed from the 17th to the 22nd. and the whole area of operations became a sea of mud. The battle was, however, continued till March, 27, when the Russians at last desisted from their fruitless and costly attacks. In April a German counterstroke retook all the ground gained by Baluev. Meanwhile the attacks of the 5th army from Jakobstadt, March 21–26, were equally unsuccessful and almost equally wasteful of life.

Results of the Operations. — The operations resulted in a complete and disastrous failure for the Russians. Their losses were over 100,000 and they accomplished nothing. The offensive did not cause the Germans to move a single man from the western front, and so brought no relief to the French. Both time and place were ill-chosen; the staff work was bad; and the artillery, in spite of a greater concentration of heavy guns on a narrow front and a more liberal expenditure of ammunition than ever before, failed to give proper support to the infantry, who, as usual, paid the price in terrible losses.

NARRA or ASANÁ, the local names (Philippine dialect) applied to some of the best timber trees, *Pterocarpus indicus*, P. *echinatus* and *P. blancoi* (family Leguminosae) in the Philippine archipelago. The wood is commonly known as "Philippine mahogany," and is in great demand for cabinet work; it is usually of a beautiful red or rose colour, often variegated with yellow, and is hard and heavy. The trunk is surrounded (or, occasionally, supported) by huge buttresses extending outward and upward for 10 to 20 ft.; these are sometimes made into table tops, the pattern of the grain and the colouring being hardly equalled by any other timber. The wood cells contaig a peculiar substance: a minute chip placed in a bottle of water soon gives an opalescent colour to the liquid. Narra is known as Burmese rosewood, Andaman redwood and Kiabooca wood.

NARSES *(c.* 478–573), an important officer of Justinian. in the 6th century. He was a eunuch of Persamenia, and apparently born about 478. If the statement that he died at the age of ninety-five be correct, he was probably brought young to Constantinople, and attained a footing in the *officium* of the grand chamberlain. He rose to be one of the three *chartularii,* a position involving the custody of the archives of the household. Hence, probably in middle life, he became *praepositus sacri cubiculi.*

In 532 the insurrection known as the Nika broke out in Constantinople, when for several hours the throne of Justinian seemed doomed to overthrow. It mas saved partly by the courage of his nife, Theodora, and partly by the timely prodigality of Narses, who with large sums of money bribed the leaders of the "blue" faction, which uas formerly loyal to the emperor. to shout as of old "Justiniane Auguste tu vincas." He defeated Totila in 552, with whom fell the last hopes of the Gothic kingdom of Italy.

NARSIMHAPUR (NARSINGHPUR), is a town and district in the Jabalpur division of Madhya Pradesh, India. The town, headquarters of the district, lies on the Central railway 50 mi. W. of Jabalpur. Pop. (1951) 14,316. Once called Chhota Gadarwara, it was renamed Narsinghpur when a temple of Narsingh (the "man lion," an incarnation of Vishnu) was erected about 150 years ago. The river Singri divides the town into two parts, Kandeli on the east and Narsimhapur on the west. The chief trade is in timber.

NARSIMHAPUR DISTRICT (area 1,979 sq.mi.; pop. 1961,412,387) is a narrow strip of fertile black alluvium between the Narmada (Narbada) river and the Satpura ranges. The Narmada, which marks its northern border, receives many tributaries from the south whose ravines are an ever-growing problem. Much of the district is forested and the remainder is under cultivation. the main crops being wheat. cotton, *jowar* millet and *sesamum*.

Narsimhapur once formed part of the territory of the Mandla Gond kings of Chauragarh, 20 mi. S.W. of Narsimhapur town. Later, the Bundelas of Orchha conquered Chauragarh and in 1781 the Gond dynasty was overthrown by the Marathas who were ousted by the British in 1818. (S. M. A.)

NARTHEX, in architecture, a long, narrow porch, usually colonnaded or arcaded. at the entrance of a church. sometimes alone, sometimes as the side of the atrium (*q.v.*) adjacent to the church façade. In the early days of Christianity it was the only portion of the church to which catechumens and penitents were admitted. Occasionally an additional vestibule exists within the church building proper. In this case, the inner vestibule is called the narthex and the outer porch an exonarthex. The narthex is common in basilican, Byzantine and some Romanesque churches. particularly in Italy; in the Gothic period its use had almost disappeared, but during the Renaissance it was again found, although its ritual usage had entirely died out and it had become a simple porch or vestibule. *See* BASILICA; RELIGIOUS ARCHITECTCRE.

NARVA, a seaport of Estonian S.S.R., U.S.S.R., on the Narva river, 8 mi. above the entry into Narva bay on the Gulf of Finland. Pop. (1956 est.) 21,000. With it is associated Narva-Joesuu (Hungerburg) in the Narva estuary; pop. (1939) 2,600.

Founded by the Danes in 1223, Narva became 15 years later a fortress of the Teutonic Knights. At the end of the 13th century it was conquered for a few years by the Russian Novgorod republic. but changed hands again and remained a Teutonic stronghold until 1558. In that year it returned to Russia, but in 1581 it was taken by Sweden. In 1700 it was besieged by the Russians who on Nov. 20 suffered a defeat at the hands of Charles XII. king of Sweden. Four years later Tsar Peter I had his revenge and on Aug. 9, 1704, captured Narva by storm. It remained under Russian rule until Estonia obtained independence in 1918: it returned to Russia in 1940 when Estonia was annexed by the U.S.S.R. During World War II it was occupied by the Germans from Aug. 1;, 1941, to July 26. 1944. The town suffered much from artillery fire when it was recaptured by the Russians.

Narva is a port and an industrial centre. Before 1939 vessels of $15\frac{1}{2}$ to 16 ft. draught could load in its harbour. There are important textile mills.

See H. J. Hansen, *Geschichte der Stadt Narva* (1858).

NARVÁEZ, PÁNFILO (*c.* 1480–1528), Spanish adventurer. was born at Talladolid. He helped Diego Velásquez in the reduction of Cuba and was put at the head of the force sent to the Aztec coast to compel Hernan Cortes to renounce his command. He was defeated by his compatriot and made prisoner (1520). On his return to Spain he obtained from Charles V a grant of Florida as far as the River of Palms. Landing near Pensacola bay in April 1528, he struck inland with 300 of his followers and reached "Apalache" on June 25. Disillusioned in their hopes of fabulous wealth, they made for the coast, arriving in July at the Bahia de los Caballos. at or near St. Mark's. Having built rude boats, the much-reduced company sailed on Sept. 22 for Mexico. but the vessel which carried Narváez perished in the storm. His lieutenant. Cabeza de Vaca, and three others ultimately reached the Gulf of California by way of Texas. *See* FLORIDA.

NARVÁEZ, RAMON MARÍA (1800–1868), Spanish soldier and statesman. was born at Loja. Granada, on Aug. 5, 1800. He served under Francisco Espoz y Mina (*q.v.*) in Catalonia in 1822. As one of the Conservative supporters of Isabella II he achieved great popularity by defeating Miguel Gómez, the Carlist general, near Arcos, in Nov 1836, and after clearing La Mancha of brigands in 1838 he mas appointed captain-general of Old Castile and commander in chief of the army of reserve. After taking part in the Seville insurrection (1840) against Baldomero Espartero and the Progresista party he fled to France and planned with Maria Cristina the expedition of 1843. which led to the overthrow of his adversary. Prime minister field marshal and duke of Valencia in 1844. his reactionary policy culminated in his having to quit office in Feb 1846 He became ambassador at Paris, but returned (1847) to govern Spain until 1851. despite misunderstandings with the court. His ministry succeeded Leopold O'Donnell's in 1856–57, Alejandro Mon's in 1864–65 and O'Donnell's in July 1866 He died in Madrid April 23, 1868.

NARVIK, an ice-free seaport on the Ofot fjord of the northnest coast of Norway in Nordland *fylke* (county), 68° 30' N. Pop. (1950) 11,023 (1959 est.) 12,842. The town dates from the construction, in 1903, of the Ofot railway, the most northerly in the world. Narvik is 167 mi. N.W. of Gallivare and 982 mi. N. of Stockholm by rail. From the Kiruna-Gallivare region of Sweden iron ore is transported across the mountains for shipment at Narvik. During World War II the Germans seized Narvik (April 9, 1940). Two naval battles were fought there on April 10 and 13, 1940. *See* WORLD WAR II.

NARWHAL, a cetacean (*Monodon monoceros*), characterized by the presence in the male of a long, hornlike tusk. In the adult of both sexes there are only two teeth, both in the upper jaw, which lie horizontally side by side, and in the female remain throughout life concealed in cavities of the bone. In the male the right tooth usually remains similarly concealed, but the left is immensely developed. attaining a length equal to nearly that of the entire animal. It projects forward from the head in the form of a cylindrical or slightly tapering, pointed tusk, composed of ivory nith a central cavity reaching almost to the apex. without enamel. and with the surface marked by grooves and ridges running in a left-handed spiral. Occasionally both left and right tusks are developed. In young animals several small additional teeth are present, but these generally disappear soon after birth

The head is short and rounded: the forelimbs or paddles are small and broad. and (as in the beluga) a dorsal fin is wanting. The general colour is dark gray, variously marbled and spotted with gray. The narwhal is an arctic whale rarely seen south of 65" N. Like most cetaceans it is gregarious and usually met nith in schools of 15 or 20. Its food appears to be cuttlefishes, small fishes and crustaceans. The purpose of the tusk is uncertain The narwhal is extremely playful, individuals frequently elevating their tusks and crossing them with each other as in fencing. They have never been known to charge and pierce the bottoms of ships with their weapons as the swordfish does The ivory of the tusk is of good quality but because of the central cavity is fitted only for the manufacture of objects of small size. The entire tusks are sometimes used for decorative purposes. *See* WHALE.

NASBY, PETROLEUM V., pen name of DAVID ROSS LOCKE (1833–1888), U S humorous satirist of the Civil War period He was born near Binghamton. N.Y., on Sept. 20, 1833. From an early age he worked for various newspapers in Nen York and Ohio. In 1861, as editor of the *Findlay* (Ohio) *Jeffersonian,* he published the first of many satirical letters purportedly written by one Petroleum Vesuvius Nasby. For over 20 years Locke contributed "Nasby Letters" to the *Toledo Blade,* which under his editorship gained national circulation. Many of the letters appeared also in book form

An ardent Unionist and foe of slavery. Locke vigorously supported the Northern cause. His chief weapon was a heavy irony. He let his character h'asby, a "Copperhead." argue in favour of the Southern position; but because Nasby is stupid, illiterate, coarse and vicious. he damns the cause he favours. His reasoning is absurd, his grammar and spelling atrocious. Used for a serious end, such verbal fooling delighted Northern readers, including President Lincoln. who occasionally read Xasby letters to his cabinet. But topical satire and humour date quickly. Among the many humourists who flourished during and immediately after the Civil War, Locke, perhaps the most influential of his time. is today one of the least readable. He died on Feb. 15, 1888.

See Cyril Clemens. *Petroleum V. Nasby* (1936) ; Walter Blair, *Horse Sense in American Humor* (1942). (L. T. D.)

NASCIMENTO, FRANCISCO MANOEL DO (pseudonym. FILINTO ELÍSIO) (1734–1819). the last of the Portuguese neoclassical poets. He was born in Lisbon on Dec. 23. 1734. of humble and probably adulterous origin. He was educated by the Jesuits and ordained in 1754. Sot long afterward he founded a literary society known as the *Grupo dn Ribriru das Naus.* In 1768 he became tutor to the daughters of the marquis of Alorna and fell in love with one of them, the "Maria" of his poems. Disapproving of the low-born poet's affection for his daughter. the marquis may have been ultimately responsible for Nascimento's being denounced to the Inquisition in June 1778. He succeeded in escaping to France, however. and there. except for some four years in The Hague during the revolutionary Terror. he remained. living by translations and by taking private pupils. But when he died, in Paris on Feb. 25, 1819, it was recognized that Portugal had lost its foremost poet.

The themes of Xascimento's poetry. which is usually in blank verse. polished. robust but often overladen with archaisms. range from denunciations of the tyranny of the aristocracy, the Inquisition and the hierarchy. coupled with praise of liberty and patriotism, to homely evocations of the joys of life in his native land and laments on the poverty and loneliness of exile. His demonstration of the flexibility and richness of the Portuguese language, his choice of themes and his translations of such works as Wieland's *Oberon* and Chateaubriand's *Les Martyrs* influenced the romantic writers.

NASEBY, a village of Northamptonshire, Eng., 7 mi. S.S.W. of Market Harborough, famous as the scene of the battle of June 14, 1645, which decided the issue of the first Civil War (*see* CIVIL WAR, ENGLISH). The army of King Charles I was less than 10,000 strong, while the New Model army of the parliament, commanded by Sir Thomas Fairfax. numbered about 13,000. Yet it was not without considerable hopes of victory that the royalists drew up for battle, although Lieutenant General Cromwell had made the New Model cavalry formidable indeed, the royalist foot had become professionalized in several years of war, whereas the parliamentarian foot was newly organized and in part at least only half trained. Fairfax and Cromwell, however. were still more confident, and with better reason. The battlefield lies between Naseby and Sibbertoft (3 mi. N. of Naseby) and is an undulating ridge which. near the centre of England, forms the divide between the Avon and the Welland rivers. Across this ridge the two armies were drawn up, the New Model facing north and the king's army south, the horse on the flanks and the foot in the centre of each army. At the first shock the royal foot asserted its superiority over the opposing infantry, four out of five regiments in the first line were broken and Philip Skippon, the major general of the foot, was wounded. But Fairfax' regiment held its ground until the second line of infantry advanced and re-established the front. Meantime the royalist right wing of horse, led by Prince Rupert, had completely routed the horse of Col. Henry Ireton which opposed them. But the victors as usual indulged in a disorderly pursuit, and attempted to overpower the baggage guard of the enemy near Naseby village. Their incoherent attack was repulsed, and when Rupert, gathering as many of his. men as he could, returned to the battlefield, the decisive stroke had been delivered by Cromwell and 'the right wing of parliamentary horse. In front of him, in somewhat broken ground, was Sir Marmaduke Langdale's cavalry, which the lieutenant general with his own well-trained regiments scattered after a short, fierce encounter. Cromwell's "godly" troopers did not scatter in pursuit. A few squadrons were ordered to keep the fugitives on the run, and with the rest, and such of Ireton's broken troops as he could gather. Cromwell attacked the royalist centre in rear while Fairfax and his foot pressed it in front. Gradually the royalist infantry, inferior in numbers, was disintegrated into small groups, which surrendered one after the other. But one brigade. called the "Bluecoats." held out to the last, and mas finally broken by a combined charge of Fairfax' regiment of foot, led by Cromwell. and the general's personal escort, led by Fairfax himself, who captured a colour with his own hand. The remnant of the king's army. reformed by Rupert, stood inactive and irresolute while its infantry was being destroyed and then fled. The spoils included 100 standards and colours and the king's private papers. But more important than trophies was the practical annihilation of the last field army of which the king disposed.. Half the royalists were captured, and about 1.000 fell in the battle and the pursuit. In addition all the artillery and the muskets (to the number of 8,000) and ammunition without which the king could scarcely create a new army were lost.

NASH, PAUL (1889–1946), English painter appointed an official war artist in both World Wars I and II, was born in London on May 11, 1889, and studied at the Slade school, London. In 1914 he enlisted in the artists! rifles and his 1918 exhibition of paintings portrayed with abstract detachment shattered war landscapes, such as "Menin Road" (Imperial War museum, London). There followed seascapes ("Wall Against the Sea," Carnegie institute: Pittsburgh) and landscapes ("Oxenbridge," Birmingham art gallery, Eng.) of distinguished design and cool, vibrating colours. and book illustrations and wood engravings. In the 1930s his paintings developed freer design and richer colour. together with a symbolic. "fourth-dimensional" vision influenced by surrealism. One of his best-known paintings of World War II was "Totes Meer" ("Dead Sea," Tate gallery, London). Later paintings reveal his imaginative poetic symbolism; *e.g.,* "November Moon" (Fitzwilliam museum! Cambridge, Eng.) and "Solstice of the Sunflower" (National gallery, Ottawa). Kash died at Boscombe. Hampshire, on July 11, 1946.

See Paul Kash, *Outline* (1949) ; M. Eates (ed.), *Paul Nash* (1948). (M. T. N.)

NASH, RICHARD (1674–1761), English dandy, better known as "Beau Kash," was born at Swansea on Oct. 18, 1674. He was educated at Carmarthen grammar school and at Jesus college, Oxford. He obtained a commission in the army, mhich however, he soon exchanged for the study of law at the Temple. There among "wits and men of pleasure" he came to be accepted as an authority on dress. manners and style. When the members of the lnns of Court entertained William III after his accession, Nash conducted the pageant at the hliddle Temple. He was offered knighthood, but he declined the honour, unless accompanied by a pension. The pension was not given and Nash turned gamester. In 1705 he succeeded Captain Webster as master of the ceremonies at Bath. Under his regime Bath became the leading fashionable watering place. He drew up a new code of rules for the regulation of balls and assemblies, abolished the wearing of swords in places of public amusement and brought duelling into disrepute, induced gentlemen to adopt shoes and stockings in parades and assemblies instead of boots, reduced refractory chairmen to submission and civility and introduced a tariff for lodgings. Through his exertions a handsome assembly room was also erected, and the streets and public buildings were greatly improved. Nash adopted an outward state corresponding to his nominal dignity. He wore an immense white hat as a sign of office, and a dress adorned with rich embroidery, and drove in a chariot with six grays, laced lackeys and French horns. When the act of parliament against gambling was passed in 1745, he was deprived of an easy though uncertain means of subsistence, but the corporation afterward granted him a pension of 120 guineas a year, which, with the sale of his snuffboxes and other trinkets, enabled him to support a certain faded splendour till his death on Feb. 3, 1761. He was honoured with a public funeral at the expense of the town. He was a man of strong personality, and considerably more able than Beau Brummell. whose prototype he was.

See Oliver Goldsmith, *Life of Richard Nash* (1762); Lewis Melville, *Bath Under Beau Nash* (1908), with full list of authorities.

NASHE (NASH), **THOMAS** (1567–1601?), English pamphleteer, poet and dramatist, was born in 1567 at Lowestoft. Suffolk, the son of a Herefordshire minister. In 1581 or 1582 he matriculated at St. John's college, Cambridge. About 1588 he left Cambridge and went to London, where he became associated with Robert Greene and other professional authors. His first appearance in print was his preface to Greene's *Menaphon* (1589), though he probably wrote *The anatomie of absurditie* (1589) earlier. Both works reveal the recent university graduate: a fervid but traditional espousal of literary standards. violent hostility to popular literature, a conventional misogynic attitude and a style tainted by euphuism. The learning is pretentious and the tone often arrogant and sometimes coarse: "I will persecute those idiots and their heires unto the third generation, that have made Art bankerout of her ornaments, and sent Poetry a begging up and downe the Countrey."

In 1589 and 1590 he evidently became a paid hack of the episcopacy in the Marprelate controversy (*q.v.*), and matched wits with the unidentified. but enormously clever, "Martin." Almost all the replies to Martin have variously been assigned to Nashe, but the only one that has been convincingly attributed is *An Almond for a Parrat* (1590). He wrote the preface to Thomas Newman's unauthorized edition of Sir Philip Sidney's *Astrophel and Stella* (1591). Though Nashe penned an extravagant, servile dedication to Sidney's sister, the countess of Pembroke, the book was withdrawn and reissued in the same year without Nashe's foreword.

Pierce Penilesse his supplication to the divell (1592) revealed Nashe's artistic strengths and weaknesses. Purged of euphuistic affectations, his prose had become a combination of colloquial diction and idiosyncratic coined compounds ideal for controversy and for his eccentric discussion of the seven deadly sins. But verbal facility was frequently an end in itself; Nashe rambled, inserting whatever came to mind, and failed to impose a consistent structure upon his material. In a digression he attacked Richard Harvey and thus added to Greene's diatribe against the Harveys in *A quip for an upstart courtier* (1592) a passage which Greene deleted before his death on Sept. 3, 1592. After Gabriel Harvey (*q.v.*) had assailed both Greene and Nashe in *Four Letters and certaine sonnets* (1592), in *Strange newes* (1592), Nashe defended, but not too strenuously, the memory of his friend and heaped further abuse upon the Harvey family. Then, in the foreword to *Christs teares over Jerusalem* (1593), he indicated willingness to end the dispute, but when Harvey, who was probably unaware of the proposal, printed *Pierces supererogation* (1593), Nashe withdrew the preface in the second edition, and wittily burlesqued his opponent in *Have with you to Saffron-Walden* (1596). Thomas Middleton, writing in 1604, was probably most accurate when he termed this controversy "but the running a tilt of wits in booksellers' shops on both sides of John of Paul's churchyard." For in 1592 and 1593 Harvey was in the employ of John Wolfe, who printed his pamphlets, and, if Harvey is to be credited, Nashe was as early as 1593 a hack in the printing establishment of John Danter. The flyting was officially terminated in 1599, when the archbishop of Canterbury ordered "that all Nasshes bookes and Doctor Harveyes bookes be taken wheresoever they maye be found and that none of theire books bee ever printed hereafter."

Apparently Nashe wrote *Strange newes* while he was living in late 1592 and early 1593 at the home of Sir George Carey, who dramatically relieved for the moment his oppressive poverty. *Christs teares over Jerusalem* and *The Terrors of the Night* (1593) were dedicated to members of the Carey family. In the former Nashe ominously warned his countrymen during one of the worst plagues that unless they reformed London would suffer the fate of Jerusalem, and so strenuously condemned the greed of London merchants that he was forced to cancel the offending passage. *The Terrors of the Night* was a discursive, sometimes bewildering, attack on demonology. Both works were medieval in their attitudes and almost puritanical in their moral indictments.

Pierce Penilesse excepted, Nashe's most successful works were his masque, *Summers last Will and Testament* (1592, publ. 1600), his novel *The unfortunate traveller, or, The life of Jacke Wilton* (1594) and *Nashes lenten stuffe* (1599). *The unfortunate traveller* has brilliant sections, including the romance of the earl of Surrey and Geraldine, but it is marred by Nashe's lack of artistic control and by his repellent fascination with cruelty and violence. *Lenten stuffe,* purportedly a panegyric of red herrings, contained a charming description of Yarmouth, Norfolk, and a serio-comic treatment of Hero and Leander.

By his share in a lost stage comedy entitled *The Isle of Dogs* (1597) and labeled seditious, Nashe offended the authorities. Exactly what punishment he received is unknown, but Ben Jonson and others were temporarily imprisoned. In the remaining years of his life Nashe apparently retired from London to Yarmouth. He died in 1600 or 1601. Nashe was the first of the English prose eccentrics, an extraordinary inventer of verbal hybrids, and, according to C. S. Lewis, "the supreme master of literary *sansculottisme.*" (C. S. Lewis, *English Literature in the Sixteenth Century,* Oxford University Press, London, 1954.) Unfortunately he neither had time because of financial need nor the temperament necessary to realize fully his undoubted talents.

The Works were ed. by R. B. McKerrow, 5 vol. (1904–10; rev. ed. by F. P. Wilson; 1958).

NASHUA, a city of New Hampshire, U.S., is located on the Merrimack and Nashua rivers 40 mi. N.W. of Boston, Mass.; the seat of Hillsboro county, It has extensive manufacturing. With the post-World War II withdrawal of textiles the city developed a diversified industrial base through the Nashua-New Hampshire foundation, which includes shoes, paper products, electronics, chemicals, office equipment, millwork, plastics, greeting cards, asbestos products and machinery for the manufacture of plastic and paper.

The site was originally part of Massachusetts province but the 1741 settlement of the Massachusetts-New Hampshire boundary led to local resentment and a five-year delay in applying for a charter as Dunstable, N H. In 1803 the village of Indian Head, across the Nashua river, took the name of Nashua (believed to have been derived from a local Indian tribe, the Nashuas). The two settlements joined in 1837 as Nashua. The northern section uithdrew, as Nashville. in 1842 over a dispute in locating the town hall. They were reunited under a city charter in 1853.

Nashua is the site of Rivier, a Roman Catholic college for women, founded in 1933. The city early attracted Irish immigrants to the textile mills, followed by large numbers of French Canadians. The latter still form the major ethnic group, although Lithuanian, Polish and Greek immigrants subsequently contributed to the cosmopolitan character of the community. For comparative population figures *see* table in NEW HAMPSHIRE: *Population.* (L. F. R.)

NASHVILLE, capital city of Tennessee, U.S., and seat of Davidson county, is situated on the Cumberland river in the north central portion of the middle Tennessee basin. Pop. (1960) city 170,874; standard metropolitan statistical area (Davidson county) 399,743. (For comparative population figures *see* table in TENNESSEE: *Population.)*

History. — The first English settlement in Tennessee west of the Allegheny mountains, the city was founded in 1779 by settlers from eastern Tennessee under the leadership of James Robertson and John Donelson. The site of the city had been occupied much earlier by French traders, who operated a trading post near the present downtown area, and before that by the Shawnee Indians. It was originally named Fort Nashborough, for Gen. Francis Nash of North Carolina, and in 1784 took its present name.

One of the prime movers behind the settlement of Fort Nashborough was Richard Henderson, a North Carolina jurist, who in 1775 acquired most of middle Tennessee and Kentucky in the famous Transylvania purchase from the Cherokee Indians. He also is credited with having written the Cumberland Compact, the articles of self-government adopted by the settlers, which contained the first known provision in the United States for recall of elected officials (see TENNESSEE: History). Henderson's settlement was under frequent Indian attack in its early years and for a while these attacks seemed likely to destroy the infant colony. But with the end of the American Revolution many new settlers arrived increasing the population and treaties of peace were soon signed with the formerly hostile Indians.

The city grew rapidly in the first half of the 19th century and soon became a thriving trade centre for the entire middle Tennessee area. Radiating from the city like the spokes of a wheel was an extensive system of turnpikes over which the produce of the surrounding area was brought to the city's Cumberland river docks. Nashville's commercial importance was further enhanced in the 1850s when it acquired railroad connections with major commercial cities to the north and south. The city also became a political centre of the state. In 1826, just two years before Andrew Jackson became president of the United States, Nashville was selected as temporary capital of the state; in 1843 it became the permanent capital.

Its transportation facilities and strategic location made Nashville an important city in the campaigns of the American Civil War. It was occupied by Federal troops in Feb. 1862, shortly after the capture of Ft. Donelson, the Confederacy's key defense position on the Cumberland river. Nashville was under Federal military control for the remainder of the war and from March 3, 1862, to April 1865 it was the seat of government for Military Governor Andrew Johnson. It also was a major supply base for Federal operations in the lower south. Its warehouses and railroads played an important part in Gen. William T. Sherman's 1864 campaign against Atlanta.

The last major battle of the Civil War took place at Nashville a few months after the fall of Atlanta. Confederate Gen. John B. Hood moved back into Tennessee in an effort to cut Sherman's supply lines and perhaps threaten Cincinnati and other northern cities. After suffering heavy losses in the battle of Franklin (Nov. 30, 1864), Hood advanced to the southern outskirts of Nashville, about 15 mi. N. of Franklin and there established defensive lines across the railroad tracks leading south. On Dec. 15, 1864, the Union army, commanded by Gen. George H. Thomas, marched out against Hood and overwhelmingly defeated the badly outnumbered Confederates. On the following day the Union victory was made complete and the Confederate army retreated in near disorder into Alabama.

Since Nashville had been occupied early in the war and without a fight, the city suffered less physical destruction than most occupied southern cities. Union warehousing and supply operations were not without economic benefit to the city and the many Federal soldiers who remained in Nashville after the war helped promote its economic recovery. Nashville resumed and improved its position as a leading investment and commercial centre and by the turn of the century was also becoming an important manufacturing centre in the state. Its continuing industrial development was greatly accelerated in the 20th century by the availability of cheap electric power from the Tennessee Valley authority and from the Cumberland river dams of the U.S. army corps of engineers.

Population and Government.—Nashville in the 1960s had a metropolitan area of more than 500 sq.mi. with almost one-half of the population residing outside the city limits. About one-fifth of the metropolitan population and one-third of the city population was Negro. Government of the city was by a mayor and council, while most residents of the metropolitan area outside of the city were governed by a county judge and county court. A few areas in the suburbs were incorporated as separate cities under varying forms of city government.

As was the case with other Tennessee cities, Nashville in the 1960s was grossly underrepresented in the state legislature, which still retained the rural dominance of the state's last reapportionment in 1907. The city frequently found less than a sympathetic understanding of urban problems among legislators from the rural areas. Slowness of the city to expand its boundaries with its population presented a major problem in government, and civic and political leaders were sharply divided on the question of annexation as against formation of a metropolitan government combining features of both county and city government. The city meanwhile engaged in ambitious and progressive programs of urban renewal, slum clearance, improved street lighting, expansion of airport facilities and other civic improvements.

Commerce, Industry and Transportation.—Nashville has a well diversified economy. Investment firms and insurance firms are both important. There are more than 500 manufacturing plants but no single one is a dominant element in the city's economy. The largest industrial plant is one producing dacron and cellophane at Old Hickory, a suburban industrial city built as an explosives centre during World War I. Other major industries produce shoes, major parts for airplanes, vacuum bottles and lunch kits, river transport equipment and paper bags. Important additions to the city's industrial development include a glass plant and a rubber plant.

Nashville is widely known as a religious centre. It is the site of the national headquarters of several boards and agencies of the Methodist Church, the Sunday school board of the Southern Baptist convention and the international headquarters of the Disciples of Christ Historical society. The Methodist Publishing House is said to be the largest religious publishing house in the world and is one of the few major publishers that operates its own printing plant; its interdenominational magazine The Upper *Room* is claimed to be the world's most widely used devotional guide, being printed in over 30 languages. This publishing house is only one of a large number that make printing and publishing one of the city's major industries. The Southern Baptist convention also operates a publishing house.

During the second quarter of the 20th century the city became widely known as an entertainment centre, largely through its "country music" industry, Regular radio broadcasts of the "Grand Ole Opry" began in 1925 and national network broadcasts in 1939; it consistently attracted capacity audiences to its performances in historic Ryman auditorium. Country music is also the mainstay of a very large recording industry.

Nashville is served by several airlines, two railroads and more than 40 motor-freight lines, several of which have their home offices in the city. It is the major river port on the Cumberland.

Education.—Vanderbilt, a private university founded in 1873, ranks as one of the nation's leading universities; it has schools of liberal arts, medicine, law, religion, engineering, nursing and graduate studies. On adjoining campuses are George Peabody College for Teachers (private), founded as Davidson academy in 1785, and Scarritt College for Christian Workers, a Methodist senior college and graduate school chartered in 1924. Nearby is Belmont college, established in 1951 by the Tennessee Baptist convention on the historic property formerly occupied by Ward-Belmont college, now defunct; farther south is David Lipscomb college, founded in 1891 and affiliated with the Churches of Christ. In the west portion of the city are Fisk university, established in 1865 and affiliated with the American Missionary association, and, on an adjoining campus, Meharry Medical college (Methodist), founded in 1876. Still farther west is Tennessee Agricultural and Industrial State university, established in 1912. The city also has two highly regarded private preparatory schools, Harpeth Hall (for girls) and Montgomery Bell academy (for boys). Well-known private schools in nearby outlying towns are Battle Ground academy in Franklin, Castle Heights Military academy in Lebanon and Columbia Military academy in Columbia, all for boys.

Parks and Recreation.—Nashville's park system includes more than 30 city parks. The best known is Centennial park, which occupies 132 ac. of the state centennial exposition grounds and features the world's only full-scale reproduction of the Parthenon. Edwin Warner park and Percy Warner park, adjoining each other in the southwestern portion of the county near the city's Fine Arts Center and Botanical Gardens, contain 2,665 ac. of hilly land of great natural beauty. These parks contain scenic roads, picnic and play areas, hiking and riding trails and a municipal golf course. Old Hickory lake, a 22,500-ac. impoundment of the Cumberland river, is another major recreational area.

The area's best-known historic site is The Hermitage, the home of Andrew Jackson. It annually attracts thousands of visitors, many of whom also visit Belle Meade, a famous 19th-century plantation home and thoroughbred nursery; Traveler's Rest the home of Jackson's close friend and business associate, John Overton; and Ft. Nashborough, a reconstruction of the fort around which the city developed. (W. T. A.)

NASI, JOSEPH (? –1579), Jewish statesman and financier, was born in Portugal of a Jewish (Marrano) family. Emigrating from his native land, he founded a banking house in Antwerp. Despite his financial and social prosperity there, he felt it irksome to be compelled to wear the guise of Catholicism, and determined to settle in a Mohammedan land. After two troubled years in Venice, Nasi betook himself to Constantinople. There he proclaimed his Judaism, and married his beautiful cousin Reyna. He rapidly rose to favour, the sultans Soliman (Suleiman) and Selim promoting him to high office. He founded a Jewish colony at Tiberias which was to be an asylum for the Jews of the Roman Campagna. In 1566 when Selim ascended the throne, Kasi was made duke of Naxos. He had deserved well of Turkey, for he had conquered Cyprus for the sultan. Kasi's influence was so great that foreign powers often negotiated through him for concessions they sought from the sultan; the Holy Roman emperor Maximilian II corresponded with Nasi; William of Orange and Sigismund II Augustus. king of Poland. conferred with him. On the death of Selim in 1574, Nasi receded from his political position, but retained his wealth and offices and passed the rest of his life at Belvedere (Constantinople). He died in 1579. (I. A.; X.)

NASIK, a city, with taluka (administrative subdivision), and a district of Bombay state, India. The city is on the Godavari river 6 mi. W. by road of Nasik Road station on the Central railmay, 97 mi. K.E. of Bombay city. Pop. (1951): city 97,042, taluka (52 j sq.mi.) 254,076. It is a place of Hindu pilgrimage, being associated with the hero-god Rama. Shrines and temples line the riverbanks. and in the vicinity are Buddhist caves of the 3rd century B.C to the 6th century A D., with many inscriptions. Nasik manufactures brassware and copperware. It is the seat of an undergraduate college of Poona university and of an Anglican bishop.

NASIK DISTRICT has an area of 6,021 sq.mi. Save a few villages in the west, the district is on a tableland, 1,300–2,000 ft. above sea level. The western part is hilly and intersected by ravines. The eastern tract is open, fertile and well cultivated. The Sahyadri range stretches from north to south; the watershed is formed by the Chandor range, running east and west, All the streams south of this range are tributaries of the eastward-flowing Godavari. North of the watershed the Girna and its tributary the Mosam flow through fertile valleys into the westward-flowing Tapti. The Kadwa canal (opened 1874), the Girna left-bank canal (1909) and Godavari right- and left-bank canals (1911) irrigate about 87,000 ac. At Gangapur, 8 mi. W. of Nasik, an earthen dam. built in 1949–54, irrigates about 45,000 ac. The population in 1951 was 1,429,916. The principal crops are millet, wheat, pulses and oilseeds; cotton and fine grapes and vegetables are grown. There is trade in copperware and brassware, and in sugar cane. At Ravalgaon (pop. 7,495) there is a sugar factory producing about 10,000 tons a year. There are railway workshops at Igatpuri (14,100) and Manmad (18,350). Other than these and Nasik city, the most important towns are Malegaon (55,022), 62 mi. N.E.; and Deolali (26,885), a large military station 4 mi. S.

NASIR-I KHUSRAU (1004–1088), Persian poet, theologian and religious propagandist, whose later life and work were influenced by his conversion to Ismailism, was born near Balkh (in Afghan Turkestan) of a Shiite family. He served in the Saljuq government of Khorasan before resigning to make the pilgrimage to Mecca. Continuing his journey into Palestine and Egypt, he was impressed by the splendour of Fatimid rule in Cairo and it was as an ardent Ismaili convert that he returned to Balkh in 1053. His vigorous advocacy of that heresy obliged him soon to flee to the mountains of Badakhshan (northwest Hindu Kush), where he ended his days. His poems of a didactic and devotional character consist mainly of long odes considered to be of high literary quality; he is also credited with two moralizing sequences, the *Sa'adat-nama* and the *Raushana'i-nama*. His most celebrated prose work is the *Safar-nama*, a diary describing his journey. It is a most valuable record of the scenes and events which he witnessed. He also wrote more than a dozen treatises expounding the doctrines of the Ismailis, among them the *Jami' al-hikmatain*, in which he attempted a harmony between theology and philosophy. Nasir-i Khusrau's style is straightforward and vigorous. In his verse he displays great technical virtuosity, while his prose is remarkable for the richness of its philosophical vocabulary.

NASMYTH, ALEXANDER (1758–1840), Scottish portrait and landscape painter, was born in Edinburgh on Sept. 9. 1758. His work attracted the attention of the portrait painter Allan Ramsay, uho took him to London and employed him upon the subordinate portions of his portraits. Nasmyth returned to Edinburgh in 1778. and was soon largely patronized as a portrait painter. He also assisted Patrick Miller of Dalswinton, as draftsman, in his mechanical researches and experiments. Miller advanced him money to go to Italy in 1782 where he remained two years. On his return he painted the portrait of Burns now in the Scottish National Portrait gallery. Although they are little known, some of his portraits. and in particular the conversation pieces he executed in the 1780s and 1790s, are of considerable interest Nasmyth's pronounced Liberal opinions gave offense to many of his aristocratic patrons, and led to the diminution of his practice as a portraitist. In his later years. accordingly, he worked mainly at landscapes. His subjects are carefully finished and coloured, but are wanting in boldness and freedom. He also designed sets for the theatre and worked as an architect. He invented the "bow-and-string" bridge and is known for his designs for the Dean bridge. Edinburgh, and the graceful circular temple covering St. Bernard's well.

Nasmyth died in Edinburgh on April 10, 1840.

His youngest son, James Nasmyth. was an engineer. His eldest son, PATRICK NASMYTH (1787–1831), called in his time the "British Hobbema," achieved a reputation as a landscape painter.

For an account of the Nasmyth family, *see* S. Smiles (ed.), *James Nasmyth, Engineer: an Autobiography (1883).*

NASMYTH, JAMES (1808–1890), Scottish engineer, inventor of the steam hammer, was born in Edinburgh on Aug. 19, 1808, and was the youngest son of Alexander Nasmyth, the "father of Scottish landscape art." He started business in Manchester on his own account in 1834, and in a few years he was at the head of the prosperous Bridgewater foundry at Patricroft, from which he was able to retire in 1856 with a fortune. The invention of the steam hammer, with which his name is associated, was actually made in 1839, a drawing of the device appearing in his notebook. or "scheme-book." as he called it. with the date Nov. 24 of that year. It was designed to meet the difficulty experienced by the builders of the "Great Britain" steamship in finding a firm that would undertake to forge the large paddle-wheel shaft required for that vessel, but no machine of the kind was constructed till 1842. In that year Nasmyth discovered one in Schneiders' Creuzot works, and he found that the design was his own and had been copied from his "scheme-book." Apparently, however, he was anticipated in the idea by James Watt. Nasmyth did much for the improvement of machine tools, and his inventive genius devised many new appliances—a planing machine ("Nasmyth steam-arm"), a nut-shaping machine, steam pile driver, hydraulic machinery for various purposes, etc. On his retirement he lived at Penshurst in Kent. and amused himself with the study of astronomy, and especially of the moon, on which he published a work, The *Moon Considered as a Planet, a World and a Satellite,* in conjunction with James Carpenter in 1874. He died in London on May 7. 1890.

NASR-ED-DIN [NÁṢIRU'D-DIN] (1829–1896). shah of Persia, was born on April 4, 1829. His mother, a capable princess of the Kajar family, persuaded Shah Mohammed, his father, to appoint him heir apparent, in preference to his elder brothers; and he was accordingly made governor of Azerbaijan. His succession to the throne, Oct. 13, 1848, was vigorously disputed, especially by the followers of the reformer El Bab, upon whom he wreaked terrible vengeance. In 1855 he re-established friendly relations with France and, coming under the influence of Russia, signed a treaty of amity on Dec. 17 with that power, but remained neutral during the Crimean War. In 1856 he seized Herat, but a British army under Outram landed in the Persian gulf, defeated his forces and compelled him to evacuate the territory. The treaty of peace was signed at Paris on March 4, 1857, and to the end of his reign he treated Great Britain and Russia with equal friendship. In 1866 the shah authorized the passage of the telegraph to India through his dominions and reminted his currency in the European fashion. In 1873 and again in 1889 he visited England in the course of his journeys to Europe. Nasr-ed-din was assassinated at Teheran on May 1, 1896, by a member of the Babi faction and was succeeded by his son Muzaffar-ed-din.

NASRIDES, THE, of Granada, were the last of the Mohammedan dynasties in Spain. They ruled from 1232 to 1492. The dynasty was of remote Arabic origin, but its immediate source was the mountain range of the Alpujarra, and the founder was Yusuf (or Yahia) l'Nasr, a chief engaged in conflict with the family of Beni-Hud, once kings at Saragossa, who held the fortress of Granada. Yusuf's nephew (or son) Mohammed completed the defeat of the Beni-Hud largely by the help of the king of Castile, to whom he did homage and paid tribute. From Mohammed I, called el Ghalib, *i.e.*, the Conqueror (1238–73), to Mohammed XI, called Boabdil, and also the little king, "El Rey Chico," by the Christians, who lost Granada in 1492, there are counted 29 reigns of the Nasrides, but several of them were expelled and restored two or three times. There were also contemporary reigns in different parts, and tribal or local rivalries between plain and hill, and the chief towns, Granada, Málaga and Guadix. The dissensions of the Nasrides reached their greatest pitch during the very years in which the Catholic sovereigns were conquering their territory piecemeal, 1482–92.

NASSAU, the capital of the Bahamas, is a port on the north-eastern coast of New Providence Island. Founded on the village of Charles Towne, it was not until 1690 that it took its present name and not until 1729 that the city was laid out. (*See* also BAHAMAS.) Pop. (1957 est.) 46,920.

The temperate climate (average temperature Nov.–May, 74° F., June–Oct., 82° F.), beautiful scenery and fine beaches make Nassau one of the chief pleasure resorts of the world. The city proper covers a comparatively small area but the residential districts extend for a considerable distance along the coast. From Bennett's hill, a ridge south of the city, there is a view not only of the city and harbour but also of almost the whole island. The water tower, a conspicuous landmark on the ridge, is the source of the city's water supply. Below the tower is Ft. Fincastle (1793), one of several built during the 18th century when Nassau was fortified. On Mt. Fitzwilliam above the city is the imposing white building of Government house; in the middle of a long flight of steps in front of it stands a statue of Christopher Columbus. In George street, which leads downhill to the town, stands Christ Church Anglican cathedral. The city's centre is Rawson square with the law courts and chief government buildings; Christ Church cathedral and the public library are nearby. The main shopping and business street is Bay street, which also has the public market (1901). Bay street runs parallel with the harbour front. Offshore, at the eastern end of the harbour, are the marine gardens where glass-bottomed boats are available for sight-seeing. The natural vegetation of Nassau is exceedingly beautiful, the scarlet poinciana tree flowering from May to September and the poinsettia at Christmastime, and the purple bougainvillaea growing profusely along the hedgerows. In the Ardastra gardens along Bay street to the west of the city are many rare tropical plants.

The harbour, which is sheltered by Hog Island, accommodates vessels of 24 ft. draft. There are no important industries on the island but products including sisal, sponges, citrus fruits, tomatoes and pineapples are exported.

Nassau is easily reached by sea or air. From the airport at Oakes field, 1 mi. from the town's centre, there are regular services to airports in the U.S., Great Britain and elsewhere. There are local services to other islands in the Bahamas.

See W. W. Cartwright (ed.), *Pocket Guide to Nassau, 8th* ed. (Nassau, 1954); *Historic Forts of Nassau* (Nassau, 1932).

NASSAU, formerly a territory of Germany forming the bulk of the government district of Wiesbaden, in the Prussian province of Hesse-Nassau. After World War II it was made part of the Land (state) of Hesse of the German Federal Republic. Until 1866 it was an independent and sovereign duchy of Germany consisting of a territory 1,830 sq.mi. in area divided into two nearly equal parts by the Lahn river and bounded on the south and west by the Main and Rhine, on the north by Westphalia and on the east by Hesse. The southern half of the area is almost entirely occupied by the Taunus mountains, while to the north of the Lahn is barren Westerwald. The valleys and low-lying districts are very fertile, producing an abundance of grain, flax, hemp and fruit, but by far the most valuable product is wine. Nassau is one of the most thickly wooded regions in Germany. There are over 100 mineral springs in the district; the best known are those of Wiesbaden and Ems. Minerals include iron, lead, copper, building stone, coal, slate, a little silver and a bed of malachite.

History.—During the Roman period the district was occupied by the Mattiaci and later by the Alamanni. The latter were subdued by the Franks under Clovis, and at the partition of Verdun in 843 the country became part of the East Frankish or German kingdom. Christianity seems to have been introduced in the 4th century. The founder of the house of Nassau is usually regarded as a certain Drutwin (d. 1076), who built a castle on a hill overlooking the Lahn, near the town of Nassau. Drutwin's descendant Walram (d. 1198) took the title of count of Nassau. In 1255 Walram's grandsons, Walram and Otto, divided between them their paternal inheritance; Walram took the part of Nassau lying on the left bank of the Lahn and Otto took the part on the right bank. The brothers thus founded the two branches of the house of Nassau.

The fortunes of the Ottonian or younger line belong mainly to the history of the Netherlands. William the Silent and his descendants were called princes of Orange-Nassau, and this line became extinct when the English king William III died in 1702. The descendants of Count John, his brother, remained rulers of Nassau until 1806, when the reigning prince, William VI, was deprived of his lands because he refused to join the Confederation of the Rhine. Some of them were given in 1815 to the line of the family descended from Count Walram. In 1815 William VI became king of the Netherlands as William I, and was compensated for that loss by the grant of parts of Luxembourg. When in 1890 William's male line died out, Luxembourg, like Nassau, passed to the descendants of Count Walram.

The territories possessed by the elder line of the house of Nassau were partitioned several times. In 1816 the whole of Nassau was united under the rule of Frederick William of Nassau-Weilburg as duke of Nassau. In 1866 Duke Adolph espoused the cause of Austria, but was soon a fugitive before the Prussian troops. On Oct. 3, 1866, Nassau was formally incorporated with the kingdom of Prussia.

NASSER, GAMAL ABDEL (1918–), Egyptian army officer, Arab political leader and first president of the United Arab Republic, was born in Beni Mor, upper Egypt, on Jan. 15, 1918. He attended secondary school in Cairo and in 1937 was accepted at the military college, where he was appointed lecturer in Nov. 1942. Soon afterward he founded the secret Free Officers' movement, which by 1952 had about 700 members known only to Nasser. The military coup d'état of July 23, 1952, forced King Farouk to abdicate and made Maj. Gen. Mohammed Naguib head of state and later premier and president of the republic.

Relations between Naguib and Nasser became embittered, however; after becoming premier in 1954, Nasser removed Naguib from the presidency in November. In June 1956 Nasser, the only candidate, was elected Egypt's president for six years. Nasser's nationalization of the Suez Canal company in July 1956 led to the Suez conflict *(see* Suez Canal). In Feb. 1958 Nasser nas proclaimed the first president of the union of Egypt and Syria in the new Cnited Arab Republic.

NAST, THOMAS (1840–1902) U S. cartoonist. best known for his attack on the political machine of William M Tweed (*q.v.*) in New York city in the 1870s, was born in Landau Ger., on Sept. 27, 1840. He was brought to New Tork city by his mother in 1846. He studied art there with Theodore Kaufmann and at the National Academy of Design. at the age of 15 became a draftsman for *Frank Leslie's Illustrated Newspaper,* at 19 for *Harper's Weekly,* at 20 went to England for the *New York Illustrated News,* and in the same year went to Italy to cover Garibaldi for *The Illustrated London News* and C S publications. His cartoon. "After the Battle" (1862). attacked Northerners opposed to pushing the Civil War vigorously. This and other cartoons published in *Harper's Weekly* during the Civil War led President Lincoln to call him "our best recruiting sergeant." Nast's cartoon campaign against Tweed was climaxed when a caricature of him led to his identification and arrest in Vigo, Spain in 1876. Originally a Republican, Nast turned first to the Mugwumps because of his advocacy of civil service reform and his distrust of James G. Blaine and in 1884 to the Democrats; in 1892 he returned to the Republicans. Having lost nearly all his money in the failure of the brokerage house of Grant and Ward in 1884. he was appointed consul general at Guayaquil. Ecuador, by Pres. Theodore Roosevelt in 1902, and he died there on Dec. 7 of the same year.

Nast did some painting in oil and book illustrations, but his fame rests on his caricatures and political cartoons. From his pen came the Democratic party's donkey. the Republican party's elephant. and Tammany's tiger.

See A. B. Paine, *Thomas Nast: His Period and His Pictures* (1904).
(D. H. W.)

NASTURTIUM or Indian Cress. *Tropaeolum majus,* a perennial climber, native of Peru, but in cultivation treated as a hardy annual. It climbs by means of the long stalk of the peltate leaf which is sensitive to contact like a tendril. The irregular flowers have five sepals united at the base, the dorsal one produced into a spur; of the five petals the two upper are slightly different and stand rather apart from the lower three; the eight stamens are unequal and the pistil consists of three carpels which form a fleshy fruit. The pungent leaves are sometimes eaten in salads, and the young green fruits are pickled in vinegar as a substitute for capers. The dwarf form known as Tom Thumb (*T. m. nanum*), is an excellent bedding or border flower, growing about 1 ft. high. Other fine annual tropaeolums are *T. peltophorum* with long spurred orange flowers and numerous varieties; and *T. minus,* a kind of miniature *T. majus* with yellow, scarlet and crimson varieties.

The genus *Tropaeolum* (family Tropaeolaceae). native to South America and Mexico, includes about 50 species of generally climbing annual and perennial herbs with orange. yellow, rarely purple or blue, irregular flowers; *T. peregrinum* is the well-known canary-bird flower. A fine nasturtium with brilliant scarlet blossoms is *T. speciosum* from Chile; it has tuberous roots. as have also such perennials as *T. polyphyllum* and *T. pentaphyllum.*

The *Nasturtium* of botanists is a genus of plants of the family Cruciferae; *N. officinale* is the water cress (*q.v.*).

NATAL, a province of the Republic of South Africa, is bounded by the Indian ocean, by the Cmtamvuna and Cmzimkulu rivers, which divide it from the Griqualand East division of Cape Province, by the Drakensberg. which separates it from Basutoland, the Orange Free State and part of the Transvaal, and by the Pongola river, the Lebombo range and, for a short distance, a line of latitude, nhich mark it off from the Transvaal Swaziland and Mozambique. Natal, in this extended and official sense includes Zululand and Amatongaland. The northern boundary of Natal proper for part of the way is the Tugela. The seaboard from the mouth of the Umtamvuna to the mouth of the Tugela is 166 mi., and from the Tugela to the Portuguese border near Ore point. 210 mi. Its total area is 33,578 sq.mi., or 7.47% of the Republic, while it carries a little more than 20% of the Republic's population. The area of Natal proper is 23,216 sq.mi.

Geologically. the country consists of a monoclinal fold affecting Karroo rocks. Along the axis. which runs more or less north and south, these have been eroded and the underlying rocks of the Swaziland system (granite, schists, etc.) have been exposed along a fairly continuous belt. which can be followed from a point. 5 or 6 mi. inland from Port Shepstone. through Inchanga. the Valley of a Thousand Hills, and on into Zululand. n-here their area broadens out. A great part of the country is formed of horizontal. or gently inclined. shales and sandstones among which numerous sills of dolerite are intercalated. Erosion attacking these beds has produced a distinctly terraced topography. The hills are often steep sided and flat topped.

Usually, three zones are distinguished: (1) the coast belt below 1,000 ft., n-hich is about 20 mi. wide behind Durban and n-hich narron-s southward and widens considerably when followed northward and into Zululnnd: (2) the midlands, between 2,000 and 4,000 ft.; (3) the highlands from 4,000 ft. to the foot of the Drakensberg. This classification is oversimplified. but may serve as a rough indication of the build of the country. The rivers: as a result of rejuvenation. have cut deep valleys in their lower courses. with the result that the topography of the coast belt and part of the midlands is very broken. In their middle. and in part of their upper courses, the rivers flow in broad: open valleys. Because of their high average gradient and the numerous waterfalls caused by the outcropping of hard beds of sandstone and dolerite, and also their low winter level. they are all unnavigable except for stretches of three or four miles at the mouths of the Cmkomaas and Umzimkulu. The dominant topographical feature is the great barrier of the Drakensberg (*q.v.*), which rises to more than 10,000 ft.. and from which several secondary ranges run out toward the coast. The Lebombo range in the north runs from north to south. and is caused by the outcrop of resistant lavas. Rivers such as the Usutu and the Pongola cut across this escarpment in great *poorts.*

Climate, Vegetation, Fauna.—These are described under South Africa, Union of. Because of the range of altitude from sea level to 5,000 or 6.000 ft. at the foot of the Drakensberg. there is a wide range of climate. which is further complicated by the varied topography. Always, however, the subtropical coast belt stands out as a distinct natural region. with its humid heat. small temperature ranges and its subtropical vegetation and production. Inland, the winter drought becomes more clearly marked and frosts more frequent and severe during the winter nights. The chief rain-bearing wind is from the southeast. A very characteristic feature of the Natal climate is the "hot winds." which are usually most frequent in spring and summer. They appear to be caused by the flow of air being drawn toward depressions passing southward along the coast. They blow from the northwest and are heated by compression as they descend the escarpments. The temperature often rises above go" and the relative humidity may fall to 30°. A hot wind may blow for a few hours. or for two or three days. It causes great clouds of dust. and all doors and windows in the houses have to be closed. Usually these winds change suddenly. or are replaced by a cool, moist wind from the southwest. which often brings greatly appreciated rain, or sometimes, in the higher districts, snow.

In addition to the trees. shrubs and grasses, described elsewhere, mention may be made of the flowers, which are often beautiful. Some of these, like the red bush lily. grow in the shade of the patches of bush. Others are more tolerant of light and are to be found in the open. Among these are the fire lily, which blooms in the early spring before the grasses have grown beyond a few inches, the agapanthus. the arum lily along the streams, the gladioli. etc. . A very common grassland flower, and one that blooms late. when the grasses are tall, is the leonotis, which attains a height of five or six feet and has terra-cotta to orange-coloured flowers. Many a hillside in early spring is enlivened by the flowers of the aloes, in various shades of red. The delightfully rich crimson of the Kaffir boom blossoms is peculiarly characteristic of much of Natal.

Some of the smaller buck have increased in numbers because of the cover afforded them by the large wattle plantations. Jackals are undesirably numerous in some of the upland districts, and they often destroy many lambs. Otters occur in some of the rivers. Snakes are common. The chief sporting birds are the quail, partridge and guinea fowl. About 450 sq.mi. of country were set aside as game reserves. in nhich no animals may be killed at any time. There are several such reserves, one near Giant's Castle. to protect the surviving eland. and one on the Mkuze, in Zululand. where the inyala (buck) still survives. as well as impala, the Zululand suni. etc. Reserves have been established in the Klip river and the Umgeni districts. In addition. several animals and birds have been declared royal game, and cannot be shot or captured. They include the white, or square-lipped, rhinoceros. which is still found in Zululand. the elephant. female eland, the impala, inyala. roan antelope, springbuck, sassaby; crested crane, Stanley crane. etc. (R. U. S.; X.)

HISTORY

Natal Before the British Settlement.— In 1497 the Portuguese Vasco da Gama, on his voyage to India, sighted the bluff at the entrance to the present harbour of Durban on Christmas day and named the country Terra Natalis. Neither then nor subsequently did the Portuguese settle or claim Natal. The nearest Portuguese settlement was 296 mi. farther north at Delagoa bay which offered safer anchorage and a more convenient entrepbt for trade.. It was, then. from shipwrecked mariners that the first tales of the Natal coast reached Portugal. King Sebastian of Portugal in 1575 commissioned Manuel Perestrelo to survey the South African coast and mark points for safe anchorage in storms, for these had already taken heavy toll of the merchantmen. In 1j93 the wreck of the Portuguese "Santo Alberto" north of the Great Kei river left a party of 28j stranded on the shore. This group, instead of pushing north along the coast to Delagoa bay, a route already notorious for its perils, used compass and sextant to "navigate" an inland route which took them through the heart of Natal Zululand and Tongaland to Lourenço Marques. These were the first Europeans known to have penetrated to the interior of Natal.

By the 17th century English, French and Dutch challenged the Portuguese monopoly of the Indian ocean; but for Natal the story was still one of wrecks and disasters rather than of trade and settlement. In 1685 the survivors of the English slaver "Good Hope" left a small company complete with guns in a shanty fort on the bluff. The following year the Dutch trader "Stavenisse" was wrecked farther south. The survivors were joined by English from the bluff and from another English vessel, the "Bonaventura." They built a boat and sailed with a cargo of ivory to Cape Town. In 1689 Simon van der Stel dispatched thence the "Noord" to open up trade in ivory and secure the bay of Natal. The bay was duly purchased, but the wreck of the "Noord" on the return voyage and the repudiation of the sale by the natives made the venture abortive. In 1721 another venture was made by Gov. Maurits Pasques de Chavonnes to place a settlement during the Dutch attempt to hold Delagoa bay. Both moves were abandoned in 1730. The coast was difficult and for practical purposes the hinterland of Natal was terra incognita. There was no obvious source of wealth to be tapped. For yet another century Natal was to lie off the beaten track of European adventurers. (See also Cape of Good Hope.)

Within Natal the Nguni branch of the Bantu seems to have settled early in the 16th century, Zulu (reputed dates 1627–1jog) being but the least of many founders of tribes. A. T. Bryant estimated that about 50 separate clans inhabited Natal proper at the opening of the 19th century and hazarded the calculation that at least 78,000 and probably 100,000 natives were technically aboriginals in Natal. North of the borders of modern Natal, the Tembu-Tongas seem to have acted as middlemen between the Portuguese traders and the natives in Zululand and Natal. They are credited with introducing maize, yams, the groundnut and, legend has it, the cat into Natal. Throughout the hinterland, which of course had as yet no political boundaries, there were the petty wars about land and cattle common to all primitive societies, but no major cataclysms. The first attempt at a paramountcy was made by Dingiswayo (1795–1818). He was chief of the Mtetwa, south of the Umfolosi river. He opened up trade with Delagoa bay by exchanging oxen and tusks for blankets and beads. Until his defeat and death at the hands of Zwide the Ndwandwe in 1818 he established a rough suzerainty which Shaka (Chaka) of the Zulus was to usurp (see Zululand). Already before Shaka crossed the Tugela in 1818. refugee tribes from Zululand headed by the Tembus and Cunus had hacked a way through the coastal tribes of Natal. Thereafter the Zulu impis first of Shaka and then of Dingaan (Dingane) completed the dispersal and destruction which was to mislead both Boer and Briton into thinking Natal was uninhabited. Those who had not been murdered or conscripted either hid or fled. From 1821 onward all the area between the Cmzimkulu and the Umzimvubu was in chaos. Ncapaai of the ama Baca (1826–44) forged some of the exiled tribes into a massive army of about 3,000 warriors. He defied both the pressure from Natal to the north and from Pondoland to the south until his destruction by Faku the Pondo in 1844. Three prime factors, then. provide clues to the policy of early European settlement in Natal: fear of Zulu military power; the myth that Xatal was uninhabited; and the chaos beyond the Umzimkulu n·hich threatened both Natal and Cape Province.

The First British Settlement, 1824.—One consequence of the occupation of the Cape by Britain in 1806 was the attempt to map the east coast for naval purposes. Throughout 1822 and 1823 Capt. W. F. On-en. R.N.. laboured at this task. Merchants and traders, already speculating in the coastal trade. follon-ed in his track. Two former naval lieutenants, F. G. Farewell and J. S. King. arranged with Owen to survey the port of Natal and St. Lucia bay which Owen had not completed. Farewell and King failed to land at St. Lucia bay. but a renewed attempt farther south brought them triumphantly across the bar of what is now Durban harbour. The following year Farewell with H. F. Fynn and others returned to the port of Natal to found a trading station and open up negotiations with Shaka at his Bulawayo (Zululand) kraal. Chiefly due to the courage, tact and medical skill of Fynn. Shaka rewarded Farewell's party by signing a treaty (Aug. 1824) ceding the port of Natal and about jo mi. of coast line to a depth of 100 mi. inland. This was never revoked. but Shaka seems to have regarded the traders as in some sort his vassals or subchieftains for in 1826 they were virtually conscripted into Shaka's war with the Ndwandwes. Both Shaka and Dingaan protested against shelter given to refugees from royal wrath. Shaka did not hesitate to make peremptory demands. as for instance in 1828 when he was infuriated because his ambassadors to George IV had returned empty handed from Port Elizabeth: equally because they had forgotten the Macassar oil he ordered. John Cane was compelled to set out for the Cape to purchase the oil and dared not defy. While the Cape authorities blamed the traders without warrant for the tribal upheavals, the traders themselves led a precarious existence. King died of dysentery in 1828. Farewell was murdered by Nqueto and the Quabas in 1829 in no man's land. In 1831 Fynn and his group narrowly escaped with their lives when Dingaan raided Port Natal, and the following year Fynn withdrem to Grahamstown.

It seems clear that both Shaka and, more particularly, Dingaan and their indunas were perturbed by European diffusion. especially after the opening of the land route through Pondoland. Jacob the interpreter, a Kaffir former convict (shot in 1832), combined distorted pictures of European power and greed with the self-claimed power to prophesy that the coming of traders and white missionaries spelled doom to the natives, and it is inconceivable that Matiwane. who was murdered by Dingaan in 1829, can have failed to report his disastrous encounter with Col. H. Somerset at Baziya hlount. In 1832 Andrew Smith arrived from the Cape to report on Natal. In 1833 a commissie trek arrived from the Eastern province directed by Piet Uys. They made contact with the Zulus by shouting across the Tugela and reported that Satal was vacant and available for settlement.

The European settlers at Port Natal reiterated the demand first made by King in 1826 that Natal should be taken over as a colony. In 1834 the merchants at Cape Town petitioned to the same end, while in Britain there was some mercantile support for the move. In Natal the settlers backed their demands by laying out a municipality which in 183j they called Durban after the then governor of the Cape, Sir Benjamin D'Urban. But in the Cape the renewal of frontier war and in Britain the reluctance of the colonial office to undertake wider commitments militated against intervention. One step was essayed. Capt. A. F. Gardiner had gone to Natal as a missionary and had secured from Dingaan (May 1835) a treaty ceding the southern half of Natal, on condition that refugees were handed back to Dingaan. He also secured the appointment of the Rev. F. Owen at Dingaan's kraal at Umgungundhlovu. With this behind him he secured in 1837 magisterial authority at Durban from the Cape. But without troops or police, he had no effective control in Natal where the traders, hunters and gunrunners wanted protection without control. For this reason the traders welcomed Piet Retief, the advance envoy of the trekkers who had crossed the passes of the northern Drakensberg in the late summer of 1837.

The Voortrekkers in Natal.—The settlers welcomed Retief and guided him to Dingaan's court. Dingaan promised Retief virtually the whole of Natal provided he first recovered cattle stolen from the Zulus by Sikonyela in Basutoland. This Retief rapidly achieved by a mixture of subterfuge and force so expeditious that together with the news of the defeat of Mzilikazi his kinsman at the Marico river (Nov. 183;) it alarmed Dingaan and the indunas. The deed of cession was duly signed and witnessed but it was sealed with Retief's blood, Piet Retief and more than 60 followers who were all unarmed being massacred on the spot (Feb. 1838). From Umgungundhlovu Zulu impis sped to exterminate the scattered laagers along the Bushman's and Blaauwkrantz rivers. Loss of life was appalling. The English from Durban hastened to the rescue with their native levies but were overwhelmed. Save for a few stalwarts the survivors embarked from Natal on the brig "Comet."

Undeterred by the murder of Retief and the death of Gert Maritz the following September, the trekkers. reinforced by timely supplies brought up by Andries Pretorius from Graaff-Reinet. simultaneously pursued two ends. viz.. the defeat of Zulu military dominance and the organization of a government in Natal in touch with trekkers west of the Drakensberg. In Dec. 1838 the Boers under the supreme command of Pretorius defeated the Zulus at the battle of the Blood river and destroyed more than 3,000 of Dingaan's army. H. Jervis, the British agent, mediated a peace in May 1839, but it was broken by both sides and Dingaan was finally defeated by the trekkers in alliance with his brother Mpande (Panda) at Magongo in Jan. 1840 and fled to his death in Swaziland. Mpande made valuable concessions to the allies of his treachery. He ceded a coastal belt from the Black Umfolosi to the entrance to St. Lucia bay, undertook to withdraw behind the Tugela and rule in the newly defined Zululand as the vassal of the new republic with its capital at Pietermaritzburg. Even before the territorial position had been secured, a constitution had been drafted. The volksraad (elected legislature) u-as to meet four times a year at the capital. leaving a *commissie* raad (committee) to function during the long recesses. Landdrosts (magistrates) were appointed at Pietermaritzburg, Weenen and Congella and 12 field cornets were elected. Financial stringency, acute after Capt. T. C. Smith (see below) took control of the port, lack of permanent trained officials, personal quarrels between the leaders, the difficulty of keeping touch with the adjunct raads at Winburg and Potchefstroom. all made progress toward effective administration difficult, but not necessarily impossible. What sabotaged the structure of the republic was the influx of natives returning to Natal to resettle the lands they had abandoned to the Zulus. The attempt of the trekkers to meet the crisis by their subjection and expulsion probably decided the British to intervene.

British Annexation of Natal, 1843.—Even before the trek, various groups in Britain and in the Cape had pressed for the annexation of the port of Natal. By 1838 there were clear grounds for decisive action. There were signs of coal in Natal which made Durban, in the days of steamships, a possible coaling point; there was anxiety about French colonial projects when it was discovered that J. A. Smellekamp, self-appointed political agent who visited the new republic in 1842, was financed in Paris; there was official as well as humanitarian concern that the "apprentices" scheduled for release at the end of 1838 should in fact be released; there was the ambiguity caused by the claim of jurisdiction to latitude 25° in the Cape of Good Hope Punishment act, together with the British refusal to admit that allegiance and therefore obedience could be discarded; there was above all the growing realization that disturbances in the Cape were in part the consequence of upheavals in Natal. At first British policy was dangerous by reason of its uncertainty. The Whig government was on its last legs by 1839 and fell in Sept. 1841. Between Jan. 1839 and Jan. 1846 there were five different secretaries of state for war and colonies. Though permanent officials like James Stephen exercised great influence, decisions at cabinet level had always to reckon with parliament. The slowly forming convictions as to what was the right policy were tempered by practical politics and the already heavy drain on Britain's financial resources. In the circumstances, with changing fronts in South Africa and changing fronts at Whitehall, it was difficult for policy to crystallize. Between Dec. 1838 and Dec. 1839 Durban had been reoccupied and held. Captain Jervis. the British agent, had actually patched up a truce (May 1839) between Dingaan and Pretorius. The military crisis over, the order came to withdraw the British forces from Durban in Dec. 1839. The republican flag was thereupon hoisted. But at the end of 1840 the Natalians sent a commando against Ncapaai, who with his Bushmen allies had raided republican cattle. This disturbed local opinion because of the scale of the plunder. which included "apprentices" taken in defiance of the Punishment act. It also alarmed Faku the Pondo, to reassure whom. in Jan. 1841, Captain Smith was sent with a small force to the Umgazi river. Hitherto the colonial office had toyed with the proposal of Pretorius that the republic should be officially recognized. But in Dec. 1841 came the news that in August the raad, harrassed by the unceasing flow of native refugees. had decided to evict them and settle them in the disputed territories between the Umtamvuna and the Cmzimvubu, the tinderbox of conflict. To avert this, in May 1842 Smith was ordered to reoccupy Durban. His leisurely advance gave the republicans time to organize, and Smith was besieged so closely at the port that only the heroic ride of Dick King to Grahamstown for reinforcements averted disaster. Col. A. J. Cloete rushed up reinforcements by sea and resistance collapsed. In June the republicans submitted. One year later Henry Cloete arrived as special commissioner and thenceforward though the raad, shorn of its more virile members. continued to function until Oct. 1845, in theory the administration was British, the land settlement liable to revision and the principle of legal equality pronounced. In Aug. 1843 Mpande, all claim to European suzerainty being tacitly dropped by Britain, accepted the Tugela as his frontier and confirmed the cession of St. Lucia bay. This fixed the northern boundary of Natal. To the south, the Cmzimkulu mas fixed as the boundary and beyond it Faku the Pondo, having disposed of Ncapaai. was given treaty status and recognized as ruler betneen the Umzimkulu and the Umtata. When it is recalled that in Dec 1843 similar treaty status had been given to Adam Kok and Moshesh across the Orange river, the annexation of Natal to the Cape appears not merely as it obviously was, in part a commercial in part a humanitarian, move but also as part of a constructive. if abortive, effort to give new stability to frontiers distorted by the Great Trek. On the maintenance of stability combined with flexibility, the well-being of all in southern Africa depended.

In the event. nhen the War of the Axe broke out in the Cape in 1846 the annexation proved to have been a wise insurance. Partly because, theoretically, the colonial office would allow no distinction between black and white. and pendant on that a revision of the land settlement was considered necessary, many trekkers withdrew from Natal. It is estimated that by the beginning of 1847 the number of Boer families had shrunk to less than 100. The largest immigration project was that launched by N. Byrne uho during 1849–51 brought out 2,500 emigrants from Britain.

From Annexation to Responsible Government in 1893.—Though from 1845 onward Natal had a local administration, until

1856 it mas substantially an adjunct of the Cape. In 1856 it was given its own legislative council of 4 official members and 12 elected representatives. As the settlers increased. they sought to establish control over the executive by securing more complete control over the revenue. There were two chief bones of contention. In 18j6 the crown stipulated that £5,000 annually should be set aside for native development. This was challenged on the constitutional ground that the legislature had incomplete control over expenditure. Secondly, Theophilus Shepstone (*q.v.*), first as diplomatic agent, then as secretary of native affairs, was a permanent official and tended to move without consultation with either government or legislature. Overemphasis on the niceties oi constitutional theory reached their climax during the depression which coincided with the lieutenant governorship of R. W. Keate (1867–72). Economic crisis. constitutional deadlock, uneasiness in the native areas, the threatened repercussions of the Langalibalele affair (see below) resulted in the dramatic intervention of the colonial office which sent out Sir (later Lord) Garnet Wolseley (*q.v.*) in April 1875 to stiffen official control. By dint of "drowning the constitution in champagne and sherry" he added. for a five-year period, eight more official members to the legislature. Between 1845 and 1875 Shepstone built up the Natal pattern of native administration. His influence was at its height when. in 1849. by ordinance, the lieutenant governor was made supreme chief and Shepstone his chief induna. Natal mas geographically isolated from the rest of South Africa. the European population was small and its resources slight. Across the Tugela was the powerful Zulu monarchy and within Natal the Europeans were hopelessly outnumbered. Merely to have preserved peace during the crucial period of Natal's growth was a major development. When in 1849 a hut tax oi 7*s.* was imposed on the natives. Shepstone supervised its collection. For years the hut tax was the most stable revenue of the colony. During 1851–54 Shepstone sought leave to draw off the natives to districts south of the Umzimkulu and to create, as J. Dunn was to do in Zululand. a quasi monarchy. This was vetoed by the colonial office. Instead, he settled about 80,000 natives in fixed locations in Natal, leaving about 50,000 as squatters on crownlands or on private property. In 1864. largely at his instigation, the Native Land trust was created with control over more than 2,000,000 ac, of land. In the same year provision was made for educated natives to apply for exemption from native 1 Little attempt was made nor indeed. with deficiency of men and money, could be made. to civilize the natives, though by the end of the century 188 mission schools were subsidized. Measure of Shepstone's achievement was given when. in 1873. Langalibalele, chief of the Hlubi tribe. settled at the foot of the Drakensberg and rebelled rather than hand in for registration the firearms his young men had earned in Kimberley. In the existing state of tension in South Africa, the revolt was probably intended to touch off a general rising. Its prompt suppression by Sir Benjamin Pine without a ripple of revolt in the rest of Natal is comment enough on the effectiveness of the Shepstone system at that stage of Natal's economic development.

As the European population of Natal in the 1870s was little more than 20,000, the Natalians sought not so much more land as a reliable labour supply. Various crops had been sampled: tobacco, indigo, cotton and tea in addition to staple farm products had been tried and found wanting. The future of the colony seemed to turn on the coastal belt which in the late 1850s was found suitable for sugar cane. Many natives, acclimatized to the uplands, could not adapt themselves to the malaria-ridden coastal belt. Most had all they needed without work. In 1860, therefore, and, save for the period 1866–74, without interruption until 1911, coolie labour was recruited in India on a five-year indenture with the option of settling on the expiration of the contract. At the same time free immigrants began to arrive in numbers.

The prosperity of the Natal sugar industry as also the development of market gardening was substantially due to Indian labour. On the eve of the union in 1910 there were 65,917 free Indians and 42,777 were still under indenture.

Until the 1870s Natal remained relatively isolated from the rest of South Africa. The Drakensberg, though not insurmountable. was a formidable barrier Across the Tugela lay Zululand and to the south (though Alfred county beyond the Umzimkulu was added to Natal in 1865) lay Pondoland and Griqualand East, both potential storm centres. Communications by sea were not easy Repeated attempts to make the harbour safe had failed and the coast mas often a coast of wrecks until the harbour mouth was narrowed and dredged. Economic impetus was, though, sharply felt in the 1870s and 1880s. The opening of the Kimberley diamond fields (1870) made transport riding profitable. The coming of railways facilitated the development of the Natal coal fields and railways in their turn were indebted to the development of the coal mines as well as to the opening of the Witwatersrand gold fields in 1886. By the 1890s Natal had a key role to play in the making of a new South Africa.

From 18; j to 1880, moreover, Natal had been the hub of political crisis. The annexation of the Transvaal (q v.) by Shepstone on the instruction of the earl of Carnarvon, secretary of state for colonies, in 1877 and the Zulu War of 1879 (see ZULULAND) were prelude to the first Transvaal war of 1881 which was fought out and extinguished in the Laing's Nek pass and over the Drakensberg at Majuba (Feb. 1881). The crisis made the Natalians acutely aware oi the South African position as a whole and H. Escombe and J. Robinson began to press for responsible government Robinson in particular pressed for a federal union, nhich, Carnarvon's project having ended so disastrously, he argued should next originate nith South Africa. Zululand, after abortive experiments. was annexed to the crown in 1887 and the sensitivity of the foreign office as well as the colonial office to the vulnerability of the South African coast line was shown in the sealing off of the coast by annexation. In 1884 St. Lucia bay was annexed, in 1886 Port St. Johns. in 1885 Galekaland and Bomvanaland, in 1894 Pondoland and in 189j Tongaland.

Economic development and greater security necessarily reacted on internal politics. The retirement of Shepstone in 187j had seen the beginning of a transitional phase in native policy. In 1875 a native high court of three judges was established thus separating the judicial from the administrative powers of the secretary for native affairs A commission was appointed to draw up a code of native law (1878). but in practice magistrates in each district had a wide margin of discretion There was a groning interest in native administration not altogether now divorced from land hunger and desire to tap more effectively the labour and fiscal potentialities of the natives. Native affairs mere more exposed to the exigencies of politics. Codification of native law tended to give rigidity to a tribal structure that economic changes were beginning to undermine.

In 1893 the increase in European colonization and settled development, greater prosperity and, it seems, conviction that the economic prosperity of Natal turned on forging links with the Transvaal, brought to a successful conclusion the demands for responsible government in Natal. The first prime minister was Sir John Robinson (1893–97). He had been a member of the legislative council since 1863 and had represented Natal at the London conference on federation (1876) and at the jubilee celebrations of 1887. In 1888 he had represented Natal at the South African customs conference and had declined to commit Natal to agreements which would have sacrificed the advantages of its geographical proximity to the Rand. In the three years that followed the customs agreement between the Cape and the Orange Free State and the extension of the Cape railway system to Pretoria, 'Natal revenues shrank by 50% and the colony was crippled by £250,000 interest charges on debt incurred to improve railways and harbours. Natalians tended unwarrantably to blame a nonresponsible administration for failure to press Natal's economic interest. The popular response to Robinson's renened agitation for responsible government was due to popular conviction that the future oi the colony depended on the exploitation of the Rand market which mas only 130 mi. from the Natal border. It was believed that one reason why, though the Natal railway system had reached Charlestown in 1891, the Transvaal nevertheless refused to allow the extension of it was that Natal was still a crown colony, so that obliquely the railway was a "crown" railway Certainly the conclusion of a railway agreement with the Transvaal (Feb 1894) followed hard on the heels of the establishment of responsible government. In Oct 1895 the new line was completed to Pretoria

Economic forces had proven a basic community of interests between the South African states. a conclusion endorsed in Natal when belatedly in 1898 Natal concluded customs agreements with the Cape and Orange Free State In the same way the native problem was even more clearly an Interstate problem once the mines at the Rand became dependent on migratory native labour Two things ruptured the approach to a common South African point of view. One was the cultural revival of Afrikander nationalism which fixed its political hopes on the republics; the other was the gross and inexcusable blunder of the Jameson raid (Dec 1895; see TRANSVAAL) Thus, though in 1897 Natal, as befitted its new status, assumed responsibility for Tongaland and Zululand, the necessary readjustments had hardly been made when in Oct. 1899, the South African War struck at the foundations of South African co-operation Natal was invaded by the Boers but the defense of Ladysmith, as well as the reinforcements hurried from overseas through the port of Durban, prevented the colony from being overrun. Natalians played an important part both in the civil and the military organization of the war. On its conclusion the districts of Vryheid, Utrecht and parts of Wakkerstroom were reattached to Natal Utrecht, settled and founded by Boers in 1848, had been enlarged by agreements with Mpande in 1861. While in 1884, also at the expense of Zululand. Vryheid had been founded and, with frontiers cut off from the sea by the British annexation of St. Lucia bay, had, to the exasperation of Natal, been recognized faute de *mieux* by Britain in 1884. Natal had made considerable efforts and sacrifices during the war and though it is arguable that as a colony its interests had on occasion either been ignored or even subordinated to those of the Cape and to the shifting trends of British colonial policy, its territory had been doubled since 1897 and now coincided with the boundaries envisaged by the trekkers.

Peace of Vereeniging to the Union of South Africa, 1910.—The peace of Vereeniging which ended the South African War was followed by the grant first of representative and then of responsible government in the Transvaal and the Orange River colony. This made the problem of evolving some kind of economic and political co-ordination as urgent as it had been before the war. Natal statesmen played a prominent part in the intercolonial conferences which preceded the union. In 1906 the Bambata rebellion was a sharp reminder that more was at stake than railway rates and customs. Responsible government in Natal had brought with it a tendency to subordinate native affairs to the exigencies of party politics while the rapid development of commerce and industry brought natives more sharply up against European notions of contract reflected in the Masters and Servants regulations. The migration of native labourers first to Kimberley, then to the Rand or, nearer home, to the coal fields of Natal was unsettling. First locusts, then rinderpest, then war had dislocated agriculture. Squatters' rents had gone up, the cost of living, even at Zulu levels, was rising and the poll tax of £1 a head imposed on all males, native and European, over the age of 18 was. though theoretically it treated all races equally, resented by the natives on whom it placed a disproportionate burden. There had been, too, much anti-white agitation. When, therefore, the attempt to collect the tax led to the killing of two European policemen at Byrnetown, there were signs and fears of a general rising. The arrested natives were tried and sentenced by court-martial, but Lord Elgin, secretary of state in the Campbell-Bannerman ministry. ordered stay of execution. The Natal protest that this was a violation of the rights of self-governing colonies received commonwealth support and Lord Elgin gave way. More serious was the threatened spread of the revolt through the attempt of Bambata to rouse Zululand. In less than six months the revolt was isolated and suppressed, but isolated events convinced Natalians that Dinizulu was implicated. He was arrested in Dec. 1907 and thanks to the skilled advocacy of W. P. Schreiner he was acquitted of most of the charges levied against him. The revolt had been promptly handled and Natal had received the active support of the other South African colonies. It is to the credit of Natal that the revolt caused some heart searching. A special commission was appointed in Aug 1906 to inquire into the whole position and more than 5,500 natives attended and 901 native statements were recorded in the schedule attached to the report Its analysis recognized the defects in native administration. in particular the loss of personal contact, the increased and often confusing regulations (there had been 48 new regulations since 1893) and the subordination of native affairs to political pressures One sentence in particular was long to be pertinent. "As we can neither assimilate nor destroy them, political forethought and commonsense alike call for a settlement of the question on a broad. enlightened permanent basis." It seems fairly certain that Natal's approach to the union was coloured by the experiences of 1906. The need for union on economic grounds was clear. The advantage of a strong front in view alike of the Indian and the native question was also clear, but Natal was sceptical of Cape liberalism quite as much as of Transvaal nationalism and strove vainly in the National convention which preceded union to substitute federation for an incorporating union. Natal was the only colony which held a referendum on the question of union. It was accepted by 11,121 votes to 3,701.

Natal After the Union.—By the South Africa act Natal like the other colonies suffered diminution of constitutional status in the interest of South Africa as a whole and became a province of the newly constituted union. Natal like the Orange Free State (subject to periodical distribution of seats) returned 17 members to the house of assembly, as against 51 in the Cape and 36 in the Transvaal. All provinces had equal representation in the senate and the provincial quota of eight senators, in Natal as elsewhere, was to be elected by the provincial councillors. The administrator of the province (in terms of the South Africa act) is appointed by the governor general for five years The provincial council of 25 is elected by the normal parliamentary electorate, and the council in its turn elects by proportional representation an executive committee which, like the council, holds office for three years.

Provincial administration in Natal has been traditionally vigorous and sound in a province where in 1946 74% of the European population was English speaking. Natal has tended to cling to its provincial powers. For instance, where the three other provinces handed over responsibility for poor relief and charitable institutions to the department of social welfare in 1940, Natal did not do so till 1950. During the constitutional crisis of 1952 *(see* SOUTH AFRICA. UNION OF) there was a marked revival of provincial liberalism, never entirely lacking from the Natal point of view. When the general election of 1953 confirmed the majority of the Nationalist party in the Union house of assembly. the provincial council passed a resolution demanding that if the government were to introduce a republic, a referendum should first be held. In May 1953 Sen. Heaton Nicholls of Natal launched a new Federal party to reassert the letter and the spirit of constitutional government and ultimately to relate South Africa to a greater Africa federation under the crown. In the provincial election of 1954 the Federal party failed to secure a single seat in the provincial council and Senator Nicholls resigned from the senate.

Economic and social factors have tended to militate against the political and cultural traditions of Natal. Economic development has increasingly integrated Natal with the structure of the Union. The *mariage de convenance* has become increasingly binding. Durban became the busiest port in the Union. In 1960 it was the third largest town in the Republic, the population being 655,-370 (all races). The great extension of secondary and tertiary industries where improved techniques have made for the simplification of operative movements has resulted in a great increase in the use of non-European labour in industry. Thus the economic structure has changed and has reacted on the racial pattern. In 1961 Natal had the densest population in the Republic with an average of 87.4 per square mile. Of the total provincial population of 2,933,447 only 340.293 were European.

Though the land shortage in the reserves was less acute in Zululand where the population density in 1961 was 52.5 per square mile as against 102.9 per square mile in the rest of Natal, it was inescapable that there was congestion in all the reserves where much of the land was not and never could be arable. Some effort was made under the Native Land and Trust act, 1936, to recondition parts of the locations, but it was doubtful whether this fragmentary approach could ease the position as a whole. Much of the native labour outside the reserves is traditionally that of migrant males who return periodically to their tribes, wherever locations are not near enough to municipal areas for more settled habits. In Natal for historical reasons (see above) the tribal structure is more intact than elsewhere in the Republic but the employment of natives in industry (which increased by 171% in a single decade) has made the maintenance of the tribal structure more precarious and less desirable to many of the Zulus, just as overcrowding in the reserves has made it less tolerable. Migrant labour in a period of industrial revolution has elsewhere always tended to check efficiency and to diffuse discontent; historical and sociological parallels. if drawn, would be disturbing. Though the majority of the Zulus are by European standards backward, there is a highly intelligent minority and the Zulu journal Ilanga lase Natal maintains a good standard of journalism.

The Representation of Natives act (1936), which put the Cape natives onto a separate electoral roll, set up the short-lived Natives' Representative council (1936–51) in which Natal natives were represented by one nominated and three elected representatives. By the same act. Natal natives were empowered to elect one of the four senators allotted to the four native constituencies in terms of the act. This latter privilege was not abrogated in 1951 when the Natives' Representative council was abolished. In 1951. by the Bantu Authorities act, in place of the Representative council new regional and territorial authorities, part tribal, part conciliar, were created with defined powers. The Natal natives were then not totally unrepresented, but they were not in a position to exert any electoral pressure on the ordinary course of democratic government. Though the Bantu Education act (1953) transferred education from the provinces to the department of native affairs. and justified Bantu medium and tempered education on sociological grounds, its minimum effect when implemented was expected to show a decrease in illiteracy in the Bantu languages.

The Asiatic population of Natal forms about 80% of the Republic's total Asiatic population, and in Natal it outnumbers the European population. By the Provincial ordinance of 1924. Natal thenceforward excluded Indians from the municipal franchise and tacitly accepted the policy of the Union government with regard to franchise, land tenure and immigration of Asiatics. In 1946 the Electoral Consolidation act provided that Natal and Transvaal Indians together should elect three European members to the house of assembly. In the senate, one additional senator was to be elected by them, one nominated by the government. By the same act the Indians were empowered to elect two additional representatives to the Natal provincial council. Indian refusal to accept the procedure led to the repeal of the act. Indian males who have passed standard vi and have an annual income of £84 or property worth £250 may vote. The Asiatic Land Tenure act of 1946 (amended 1949 and 1950) prevented the purchase of land by Asiatics save in insignificant exempted areas and was intended to peg the status quo. The Immigrants Regulation act (1953) restricted and, after 1956 prohibited the immigration of Indian women and children hitherto admitted to join relatives domiciled in the Union. As the number of males domiciled in the Union very greatly exceeded the number of females, this act was strongly resented.

Though on more than one occasion, as for instance in 1932, 1949 and 1953, there have been racial riots in Durban between natives and Indians, there has been some attempt to build a common front since common grievances give common ground. At the same time many interesting experiments to ease racial tension have been made as, for example, the founding of the International club in Durban. The University of Natal (which began as a constituent college of the University of South Africa and received a separate charter in 1949) has developed a large non-European section and at Wentworth has developed a training school for non-European medical students. (W. A. Ml.)

POPULATION

The total population of Natal in 1960 was 2,933,447. The natives (see Zululand; Cape of Good Hope) numbered in 1960 2,155,824, or nearly 75% of the total population. About half of them live under tribal conditions on locations, which are saturated with population, under 20th-century conditions of skill and methods of exploitation. The other half live on farms owned by Europeans, on crownlands or in the towns. In 1960 the Asiatics were numbered at 394,237. They were largely concentrated in the coastal belt. Originally imported as indentured labourers for the sugar plantations, many of these Indians have become small market gardeners, or have taken employment in hotels and domestic service or industry, where they supply much of the unskilled and semiskilled labour. The European population numbered 340.293. The northern districts, Utrecht and Vryheid, are chiefly inhabited by Afrikaans-speaking people of Dutch origin. In recent years the percentage of Europeans of non-British origin in the total population has probably increased, as a result of the considerable numbers employed in the government services. In 1951 the home language of the Natal European population was reported as follows: English 201,567, Afrikaans 60,150, English and Afrikaans 3,417, other languages 9,106. The German group is centred about New Hanover. Scandinavian settlers about the Umzimkulu, and in Durban, especially connected with the whaling industry, contribute a very valuable element to the population. There is also an appreciable French element, which originally migrated to Natal, largely from Mauritius, in connection with the sugar industry, though it is no longer confined to that industry. The number of coloured people in Natal is quite small, the "mixed and others" in 1960 numbered 43,093.

Towns. — Apart from Pietermaritzburg, the capital, and Durban (*qq.v.*), the only port and the largest centre, the towns of Natal are quite small. Only six, in addition to the two just mentioned, had a white population of more than 2,000, according to the 1960 census. These include Ladysmith (whites 7,260, total 22,997), which is now a railway centre of some importance; and Vryheid (whites 4.920, total 10,753); Glencoe (whites 2.482, total 8,317), a railway junction near the coal fields; and Newcastle (whites 3,212, total 17,418). Vryheid and Newcastle are also near coal mines, and Newcastle is developing an iron and steel industry.

Education. — For higher education see South Africa, Union of. The direction of public education. other than higher education, rests with the provincial education department, subject to the control of the provincial administration. At its head is the director of education. The department has direct management of primary and of some secondary schools, and makes grants to various private schools, which maintain the same standard as the government schools. Fees are charged for pupils in the secondary schools. Special schools are provided for native, coloured and Indian children. Attendance is compulsory for European children between 7 and 15 who live within three miles of a school. A government training college for teachers is situated in Durban and in Pietermaritzburg in conjunction with Natal university.

There are in Natal six training colleges for natives, Sastri college and four training classes for Indians and one training centre for coloured teachers. In addition to the government schools, there are several good schools in the province, both for boys and girls, which are modelled on the English public school. An agricultural college, connected with a government experimental farm, was opened in 1906 at Cedara, 14 mi. from Pietermaritzburg. To meet some of the requirements of the non-European population, there were, in 1958, 1,492 government and aided schools which catered for 309,679 pupils.

Agriculture. — The coast belt is sharply marked off from the rest of the country. It produces sugar, bananas, pineapples, citrus fruit, etc. Formerly, practically all the cane grown was of the Uba variety, but extensive research was undertaken with a view to the development of new mosaic-free varieties superior to Uba. In 1951 there were 386,669 ac. under cane, and in the same year 5,073,615 tons of cane were reaped by Europeans, and 434.048 tons by non-Europeans. The industry now satisfies the requirements of the South African market and has a surplus for export.

Among the by-products are molasses, used for cattle feeding and also exported, motor spirit produced from the molasses, methylated spirits, ether and wax. The cultivation of tea was abandoned in 1949. The rest of Natal is devoted to mixed farming, with increasing stress being laid on dairying. Maize thrives particularly well in the midlands, but little of this grain is exported because it is often sold by the white farmers to the natives, whose own food production is insufficient. Between 2,000 and 6,000 ft. above sea level the Australian black wattle is grown, especially in the mist belts along the escarpments. From the bark an extract is made which is used in tanning. The poles supply the mines with pit props and the towns with much of their domestic fuel. There is a wattle belt, fairly well defined, in the midlands of Natal, and wattle extract is exported. Cotton growing appears to have passed the experimental stage. It is being grown in some of the northern and eastern districts of Natal and in Zululand. The growing of tobacco was stimulated by the introduction of a preferential tariff for empire tobacco in Great Britain in 1925.

The chief mineral produced in the country is coal. The chief coal field is in the Klip river and Newcastle districts, centring about Dundee. Mines are also active in the Vryheid and Utrecht districts. The expense of the long railway journey to the coast, on the average about 240 mi., is partially counterbalanced by the nearness of the coal to the surface. At Waschbank the following by-products are produced: tar. sulphate of ammonia, light creosote oil and naphtha. Tar is also made.

Communications. — Railway construction has been greatly handicapped by the varied topography. The main line from Durban to the Transvaal climbs to 1,808 ft. at Krantzkloof (23 mi.), 3,006 ft. at Thornville Junction (61 mi.), drops to 2,218 at Pietermaritzburg (73 mi.), rises to 3,702 at Hilton Road (84 mi.), to 4,807 at Nottingham Road (116 mi.), drops to 3,280 ft. at Colenso (185 mi.) and rises again to 5,429 ft. at Van Reenen, just within the Orange Free State. Electrification of the whole Natal main line from Durban to Volksrust (323 mi.), begun in 1922, was completed in 1937. From the main system a line runs from Durban along the coast southward to Port Shepstone, and northward as far as Pongola in Zululand to serve the sugar-cane area. From Pietermaritzburg a line with two short branches was constructed to Kranskop through the wattle belt. Another runs southwestward across the grain of the country to open up Griqualand East; from Glencoe junction a line running through Dundee and Vryheid carries large quantities of coal. (R. U. S.; X.)

NATAL, chief city and capital of the state of Rio Grande do Norte, Brazil. It is located a little more than 5° S. of the equator, on the right bank of the Rio Potengi about 2 mi. above the river's mouth. Pop. (1950) 94,812. Natal is connected by rail with the interior of the state and southward to João Pessoa, Recife and Maceió. Its chief overland connections, however, are by all-weather gravel highways which reach all the major points in the northeast of Brazil and extend southward to R o de Janeiro. Natal is of major importance as a centre of air travel. About 8 mi. S.S.W. of the city is the transatlantic airport of Parnamirim, a major stop on all the airlines connecting Europe and South America south of the equator. From Natal to Dakar in Africa is 1.900 mi. and to Freetown is 1,800 mi. During World War II, Natal was a stage in the ferry route over which planes from the U.S. were flown to Africa and southeast Asia. Natal is also the port through which the products of the state are sent to other parts of Brazil. The chief products are cotton, sugar, salt and hides. In the city there are plants for the manufacture of cotton textiles and for the refining of salt. The city was founded by the Portuguese in 1599. (P. E. J.)

NATCHEZ, a Muskogian-speaking tribe formerly living in nine villages on the east side of lower Mississippi river between the Yazoo and Pearl rivers, near the site of the present city of Natchez, Miss. Early in the 18th century when the French first established themselves in what was later called the Natchez district, the tribe numbered perhaps 6,000. Relations with the French were at first friendly, and under Jean Baptiste Lemoyne, sieur de Bienville, governor of Louisiana, Ft. Rosalie was built on the site of the present city of Natchez. In 1723 the Natchez were nearly conquered by the French, and an unsuccessful uprising of the Natchez in 1728 was follo ed in Nov. 1729 by the massacre of more than 200 Frenchmen and the destruction of Ft. Rosalie. In the war that followed the French enlisted the aid of the Choctaw tribe, drove the Natchez from their villages and scattered them. More than 400 Natchez were captured and sold into the West Indian slave trade; the remainder took refuge with the Chickasaw, and later with the Creek and Cherokee. A few Natchez lived in northeastern Oklahoma in the second half of the 20th century.

The Natchez, allied in general culture to other Muskogian tribes, were primarily agricultural, highly developed in the arts, and exerted considerable influence on neighbouring tribes before their dispersal. They had developed a sun worship with which was related a perpetual fire of oak bark in a temple. The fire, as well as all fires in the villages, was allowed to die once a year on the eve of the harvest festival and was renewed at dawn on the festival day by a high priest who made fire by rubbing two sticks together. All the village fires were then made anew from this fire. The women then bore in the first maize, some of which was offered at the temple and some of which was ground and baked into bread for a ceremony at sunset. The ceremony was followed by general feasting.

The remarkable Natchez caste system was divided into "suns," nobles, "honoured" people and commoners or "stinkards." The tribal chief ("Great Sun") and heads of the villages claimed descent from the sun; there were both male and female "suns," each supposedly descended from a male and female who had come out of the sun. The system was matrilineal and exogamic. Male and female "suns" could not intermarry. Male "suns" married "stinkard" wives and their children were "honoured." "Sun" women married "stinkard" husbands and their children were "suns." The "Great Sun" had power of life and death over all the others and was followed in death by his spouses, attendants and voluntary victims. The succeeding "Great Sun" was the son of his sister or of the closest female relation.

See also MUSKOGIAN INDIANS.

NATCHEZ, a city of Mississippi, U.S., is located on the Mississippi river near the southern boundary of the state; the seat of Adams county. Founded by France as an outpost bastion of empire, Natchez has been part of the struggle for colonial mastery in North America and is symbolic of the south with its rich ante-bellum cotton culture, post-Civil War decline and modern industrialization.

The oldest settlement on the Mississippi river, the site was selected in 1700 as one of a series of military posts designed to halt British westward penetration, with actual settlement occurring in 1716. Surviving a massacre by Natchez Indians in 1729, one of the bloodiest in U.S. history, the settlement passed into British possession in 1763 at the conclusion of the French and Indian War. Becoming Great Britain's chief outpost on the Mississippi, Natchez was a haven for Loyalists driven from the revolting colonies during the early stages of the American Revolution until, in 1779, the town was captured by Spain. Spanish cession occurred in 1795, and with occupation by the United States in 1798 Natchez became the first incorporated town (1803) and the first capital of the Territory (1798–1802) of Mississippi. It was also the southern terminus of the famed Natchez Trace, the overland link between Natchez and Nashville, Tenn. As the old southwest was settled, Natchez burgeoned as the commercial and cultural centre of a vast and rich cotton-producing area. At the outbreak of the American Civil War it was the largest and wealthiest city in Mississippi.

Following a decline after the Civil War, modern Natchez has capitalized upon its natural resources, industrial potential, and historic legacy to become again one of Mississippi's leading cities. Transportation facilities include river, railway (nonpassenger), highway and airline systems. A $40,000,000 bridge spans the Mississippi at Natchez. Timber, petroleum and natural gas reserves have attracted major manufacturers of rubber, wood, paper and textile products as well as producers of petroleum and natural gas.

Possessing a legacy of the cotton barons' magnificent homes, sunken roads, an infamous though long extirpated river front section named "Natchez-Under-the-Hill" and a culture ranging from the supreme elegance of the "Cotton kingdom" to the lawlessness of the early river front. Natchez has become the stereotype of the ante-bellum south. The annual Natchez pilgrimage held during March and featuring homes and pageants of those days, attracts visitors from throughout the United States. Many novels and motion pictures have their setting in the city.

The city contains several parks. the largest of which was once part of Auburn and Sunnyside plantations; also three hospitals the Fisk public library and Natchez college, a Baptist junior college opened in 1885 For comparative population figures *see* table in MISSISSIPPI: *Population.* (P. F WA.)

NATHAN, GEORGE JEAN (1882–1958). U S author editor and drama critic, of whom, at the time of his death. the *New York Times* reported ". . . no other American critic of the period had so greatly raised the standards of play producers or so determinedly elevated the tastes of play goers." He was born Feb 14, 1882, in Fort Wayne, Ind., son of Charles and Ella (Nirdlinger) Nathan. He graduated from Cornell university Ithaca. N Y., in 1904 and joined the staff of the *New York Herald* Beginning in 1906. he was at various times drama critic for numerous magazines and newspapers, but his name is particularly associated with *Smart Set,* of which he was co-editor (1914–23) nith H L Mencken, and with the *American Mercury,* which also with Mencken, he helped to found (1924) As a critic Nathan championed the plays of Ibsen Strindberg. Shaw. Eugene O'Neill Sean O'Casey and William Saroyan He published his *Theatre Book of the Year* annually from 1943 through 1931. as well as more than 30 volumes of lively essays on theatrical and other subjects

Nathan married the actress Julie Haydon in 1955. He died in New York city on April 8, 1958. (B. HT.)

NATHANAEL, one of the first disciples of Christ, "an Israelite . . in whom there is no guile" (John i, 47) He was an inhabitant of Cana in Galilee (John xxi, 2), but is otherwise unknown Though Nathanael was one of the first disciples, his name does not appear in the apostle lists. A 9th-century Syrian tradition identified him with Bartholomew — so Isho'dad of Merv. Elias of Damascus and others. (See BARTHOLOMEW, SAINT.) This identification was adopted by Rupert of Deutz in the 12th century and became common from that time on in the Western church; it is commonly accepted by modern biblical scholars. The name means "God has given." (J. A. FI)

NATHANYA (NETANYA), a town of Israel situated on the coastal plain of Sharon 25 mi. N. of Tel Aviv-Jaffa. Founded in 1923 as an agricultural village of smallholders, it was named after Nathan Straus. a well-known C.S. philanthropist. Pop (1961) 40 907 It became a popular bathing resort for the region, and British forces had a big rest camp there in World War II. Many diamond cutters and polishers from the Netherlands and Belgium were settled in a suburb to carry on the diamond industry, and other important industries (textiles. chemicals paper products, food processing) have been developed. The Goldmunz Museum of Modern Art is in the southern part of the town. The park by the sea includes an open-air theatre. There is good road and railway communication with Tel Aviv-Jaffa. (No. B.)

NATICK, a city of Massachusetts, U S.. 18 mi W.S W. of Boston is situated on the southeast end of Lake Cochituate The area was granted to John Eliot (*q.v.*) in 1650 as a plantation where he could carry on his mission nork and establish a school of higher education for the most capable Indian converts; Natick was its original Indian name. Eliot published his Indian Bible in 1658, a copy of which the town possesses. The Indians held the land in common until 1719 and prevailed until 1762, at nhich time Natick became an English district. Incorporation as a town took place in 1781. Modern Natick serves in a dual capacity as a suburban residential community and as a growing industrial ton-n Of special interest is the research plant of the quartermaster research and development command, located on the lake. For comparative population figures *see* table in MASSACHUSETTS: *Population.* (M E L)

NATION, CARRY AMELIA (*née* **MOORE)** (1846–1911), U.S. temperance advocate, was born in Garrard county, Ky.. Nov. 25, 1846 In 1867 she married a drunkard; their brief unhappy life together prompted her later career of saloon-smashing in Kansas. With a few hymn-singing women, or alone she nould march into a saloon. sing pray, hurl vituperations at all "rummies" present and smash the fixtures and the stock with hatchets. This crusade, most violent in the 1890s. led to scattered temporary efforts at law enforcement. After this period of "hatchetation" of "joints"—her nords — she lectured in many states. in Canada and Great Britain. usually under her own management For a nhile she also spoke between acts of carnivals and burlesque shoas

The fact that her first husband had been an active member of a fraternal order as well as a drunkard led her to fight such organizations along with saloons, and she added to her list of things to be destroyed tobacco. foreign foods, corsets skirts of improper length and paintings of the sort often found in barrooms. She was an advocate of women's suffrage, but neither the national movement for suffrage nor that for temperance gave her much support. Her second husband. David Nation, divorced her in 1901 on grounds of desertion after a marriage of 23 years. She died June 9, 1911. Her autobiography *The Use and Seed of the Life of Carry A. Nation* (1904), is a hodgepodge of disorder. (G. BN.)

NATIONAL ANTHEMS. The official patriotic songs of some countries, used on various national and other festive occasions and as greetings to the sovereign in countries under a crowned head, are known as national anthems, although the word anthem has a special ecclesiastical connotation that is not strictly suited to such songs, nhich would be better called national hymns. The following are or have been the national anthems of various countries:

Abyssinia: "Etiopia hoy, des yibalish," tune by M. K. Salbadian (1925), words by a group of Ethiopian scholars (1930). *Argentina:* "Oid, mortales, el grito sagrado Libertad." words by V. Lopez y Planes, tune by J. Bias Parera (1813). *Australia:* "God Save the Queen" (see *Great Britain,* below); also used unofficially: "Advance, Australia Fair," words and tune by P. Dodd McCormick, and "Australia Will Be There," words and tune by W. W. Francis. *Austria:* After World War II: "Land der Berge, Land am Strome," tune by Mozart ("Bruder, reicht die Hand zum Bunde," from the Masonic cantata, K. 623. 1791), words by Paula Preradovic (1946). Under the empire: "Gott erhalte, Gott beschutze. unsern Kaiser, unser Land." words by L. L. Haschka, tune by Haydn (1797). After World War I: "Deutsch-Oesterreich. du herrliches Land," words by Karl Renner, tune by Wilhelm Kienzl (1920). After 1933: "Oesterreichische Bundeshymne" ("Sei gesegnet ohne Ende"), nords by Ottokar Kernstock, to Haydn's tune. *Belgium:* "La Brabançonne" ("Après des siècles d'esclavage"), original words by H. L. A. Dechet (Jenneval), tune by F. van Campenhout (1830). In 1951 the tune was revised by a specially appointed commission and a fourth verse was added. A Flemish version was also prepared, with words by M. Herreman, which replaced "De Vlaamsche Leeutv," words by H. van Peene, tune by K. Miry (1845). *Brazil:* "Ouviram do Ypiranga as margens plácidas," words by J. O. Duque Estrada, tune by F. M. da Silva. *Bulgaria:* From 1950: "Bulgario mila, zemya na gheroi," words by Nikola Furnadzhiev, M. Isaev and Elisaveta Bagriana, tune by G. Dimitrov G. Zlatev-Cherkin and S Obretenov. Until 1946: "Shumi Slaritsa." words by Marachek, tune by Gabriel Shebek; later version of words by N. Zhivkov. *Canada:* "God Save the Queen" (see *Great Britain,* below); also used unofficially: "The Maple Leaf Forever." words and tune by A Muir (186;); French-Canadians, "O Canada! terre de nos aïeux," words by Sir A. B. Routhier. tune by C. Lavallée (*c.* 1880). *Chile:* "Dulce patria, recibe los votos," original words by B. de Vera y Pintado (1819), modified by E. Lillo (1847). tune by R. Carnicer (1828). *Chzna:* Under the people's republic. interim anthem, tune by Niel Eel. After the 1912 revolution: "Tsung Kuoh hiung." words and tune anonymous (*c.* 1912). Later Kuomintang party song. "The Song of the Kuomintang." words from an address by Sun Yat-sen, tune by Ch'eng Mao-yün (1928). *Colombia:* "Oh! gloria inmarcesible." words by R. Núñez. tune by

O. Sindici (c. 1905). Cuba: "Himno Bayamés" ("Al combate corred Bayameses"), words and tune by P. Figueredo (1868). Czechoslovakia: Czech, "Kde domov můj," words by J. K. Tyl, tune by F. Škroup (1834); Slovak, "Nad Tatrou sa blyska." words by J. Matuška (1844), tune traditional. (These were combined in 1919.) Denmark: Danish royal anthem: "Kong Kristian stod ved højen mast," words by J. Ewald, tune probably adapted by J. E. Hartmann from D. L. Rogert (1779). Danish national anthem: "Der er et yndigt Land," words by A. Oehlenschlager, tune by H. E. Krøyer (c. 1819). Also used unofficially, "Den gang jeg drog afsted," words by F. Faber, tune by J. O. E. Horneman. Dominican Republic: "Quisqueyanos valientes, alcemos," words by E. Prud'homme, tune by R. Reyes (1883, adopted 1900). Two others before that, including "Himno de Capotillo," tune by I. M. Caldéron (1865). Ecuador: "Salve! O patria!" words by J. L. Mera, tune by A. Neumann (1866). Egypt: Instrumental march by Verdi (c. 1872), words added by Arabic Music institution (1940s). Estonia: "Mu isamaa, mu dnn ja rõõm," words by J. Jannsen (1865, adopted c. 1917), tune by F. Pacius (1848, Finnish national anthem). Finland: "Maamme laulu" ("Oi maamme Suomi synnyinmaa"), words by J. L. Runeberg (1846), tune by F. Pacius (1848). France: "La Marseillaise" (*q.v.*), words and tune by Rouget de Lisle (1792). During the reign of Napoleon III: "Partant pour la Syrie," words by A. de La Borde, tune attributed to Queen Hortense of Holland, but probably by L. Drouet. Germany: German Federal Republic: "Einigkeit und Recht und Freiheit" (verse three of "Deutschland, Deutschland uber alles"), tune by Haydn (see below) (adopted 1950). German Democratic Republic: "Auferstanden aus Ruinen und der Zukunft zugewandt," words by J. R. Becher, tune by H. Eisler (adopted 1949). The first German national anthem was "Heil dir im Siegerkranz," words by H. Harries (1790), modified by B. G. Schumacher (1793), tune "God Save the Queen" (see Great Britain, below) (adopted 1796). After World War I: "Deutschland, Deutschland uber alles," tune by Haydn ("Gott erhalte," see Austria), words by A. H. Hoffmann von Fallersleben (1841, adopted 1922). Great Britain: "God Save the Queen," words and tune anonymous, first sung semiofficially at Drury Lane and Covent Garden theatres in London, arranged by T. A. Arne and Charles Burney respectively, after Sept. 28, 1745, when the defeat of the Jacobite rebellion was announced. It was then merely an expression of party loyalty to George II, and the words (*e.g.,* "confound their politics") referred to the Jacobites, not to some enemy of the country as a whole. The tune has been traced back, unconvincingly, as far as John Bull (1619) and its opening phrase, to the words "God save the King," appears in a catch by Henry Purcell (1685) as though quoted from a song already familiar, which may, however, be a coincidence. The later claims made 'for Henry Carey and James Oswald rest on no solid foundations. The words became slightly altered when the song came into use as the British national anthem and "Queen" was first substituted for "King" in Queen Victoria's reign. Greece: "Se gnorizo apo tin kopsi," words by D. Solomos (1823), tune by N. Mantzaros (adopted 1863). Hungary: "Isten áldd még a magyart," words by F. Kolcsey (1823), tune by F. Erkel (1845). Iceland: "O Gud vors land," words by M. Jochumsson, tune by S. Sveinbjørnsson (1874). India: "Jana Gana Mana," words by R. Tagore, tune attributed to him but probably traditional (adopted 1950). Iraq: "Iraq Royal Salute," no words; composed by A. R. Murray and adopted in 1923. Ireland, Republic of: "The Soldier's Song" ("We'll sing a song"), words by P. Kearney. tune by P. Heaney (c. 1917, adopted 1937). *Israel:* "Hatikvah," words in Hebrew by N. H. Imber, English by Nina Salaman, tune based on traditional Hebrew melodies (adopted by the Zionist movement in 1907, by Israel in 1948). Italy: "Inno di Mameli" ("Fratelli d'Italia"), words by G. Mameli, tune by M. Novaro (1847, adopted 1946). From the foundation of the kingdom of Italy (1861): "Marcia Reale." *Japan:* "Kimi ga yo," words 9th century, tune by H. Hirokami, revised by F. Eckert (1880). Latvia: "Dievs, sveti Latviju," words and tune by K. Baumanis. Lithuania: "Lietuva, tévyné mūsu," words and music by V. Kudirka (1918). Mexico: "Mexicanos, al grito de guerra," words by F. Gonzalez Bocanegra, tune by J. Nun6 (1854). Netherlands: "Wilhelmus van Nassouwe," words attributed to Philip van Marnix heer van St. Xldegonde (c. 1590), tune anonymous (first published, 1626). New *Zealand:* "God Defend New Zealand," words by Thomas Bracken, tune by John J. Woods (adopted 1940); but "God Save the Queen" continues to be used. Nicaragua, Republic of: "Salve a ti Nicaragua," words by Sálomon Ibarra Mayorga (written 1917), tune anonymous. *Norway:* "Ja, vi elsker dette landet," words by B. Bjørnson (1869), tune by R. Nordraak (1863–64). Paraguay: "Paraguayos, República 6 muerte," words by F. Acuna de Figueroa, tune by Francés Dupuy. Persia: "Shāhanshāh i mā Zandah bādā," words by S. Afsar, tune by N. Moghaddam (adopted c. 1934). Peru: "Somos libres, seámos lo siempre," words by J. de la Torre Ugarte, tune by J. B. Alzedo (1821), tune rewritten by C. Rebagliati (1912). Poland: "Jeszcze Polska nie zginęła," words by J. Wybicki (1797), tune traditional (c. 1795, adopted 1927, altered 1948, harmonized by K. Sikorski). Portugal: "Herois do mar," words by L. de Mendonça, tune by A. Keil (1890, adopted 1910). Before the republic: "O patria, O rei, O povo," words and tune by Pedro IV (Pedro I of Brazil). Rumania: "Te slăvim, Romània, pământ părintesc," adopted on Aug. 23, 1953, words by E. Frunza and D. Deşir, tune by M. Socor. Before 1947: "Trăească Regele in pace si onor," words by B. Alexandri, tune by E. A. Hübsch (1861). South Africa: "Die Stem van Suid-Afrika," words by C. J. Langehoven (1936), tune by M. L. de Villiers (adopted 1938), official English translation, 1952. Spain: "hfarcha de Granaderos." Under the republic: "Himno de Riego." Sweden: "Du gamla, du fria, du fjallhoga Nord," words by R. Dybeck, tune traditional (adopted 1844). Switzerland: "Rufst du, mein Vaterland," words by J. H. Wyss (1811), tune, "God Save the Queen" (see Great Britain, above). Syria: "Humatal diyári 'alaikum salám," words by Khalil Mardam Bey, tune by the brothers Fulayfel (adopted 1939). *Thailand:* "Taurasben Barami," words and tune anonymous. Turkey: "Istiklal marsi," words by Mehmed Akif Ersoy, tune by Osman Zeki Ungor (adopted 1921). United States of America: "The Star-Spangled Banner," words by F. S. Key (1814), to the tune of J. Stafford Smith's song "To Anacreon in Heaven" (adopted 1931). Earlier, "My Country, 'Tis of Thee," words by S. F. Smith. tune "God Save the Queen" (see Great Britain, above) (1832); "Hail Columbia!" words by J. Hopkinson (1798), tune by P. Fyls (c. 1800). U.S.S.R.: "Gimn Sovietskogo Soyuza" (or "Song of Stalin"), original words by B. Lebedev-Kumakh (1942), rewritten by S. Mikhalkov and I. Registan (1944), tune by A. V. Alexandrov (1942). Used earlier by the U.S.S.R.: "L'Internationale," words (originally French) by E. Pottier (1871), tune by P. Degeyter. Tsarist Russia: "Bozhe Tsarya khrani," words by V. A. Zhukovsky, tune by A. Lvov (1833). *Uruguay:* "Orientales, la patria 6 la tumba," words and tune by J. Coppetti. *Venezuela:* "Gloria al bravo pueblo," words by V. Salias, tune by J. Landaeta (c. 1810). Yugoslavia: Since 194j: "Hej Slaveni," words anonymous, tune traditional (the Polish national tune). Earlier: A composite of three songs: "Bože pravde ti Sto spase" (Serbian), words by J. Djordje, tune by D. Jenko (1872), "Lijepa naša domovino" (Croatian), words by A. Mihanović, tune by J. Runjanin (1846) and "Naprej zastava slave" (Slovene), words by S. Jenko, tune by D. Jenko. (E. W. Bm.)

NATIONAL ARBITRATION TRIBUNAL: see Industrial Court.

NATIONAL ARCHIVES, U.S. The national archives and records service. part of the General Services administration, consists of the national archives, the office of records management, the Federal Register division, the Franklin D. Roosevelt library at Hyde Park. N.Y., and the Harry S. Truman library at Independence, Mo. It is headed by the archivist of the United States, who is also chairman of the national historical publications commission.

The national archives selects, preserves. describes and services federal records retained because of their enduring value. It holds the nation's most important records dating from about 1774 through World War II. They include the original laws, executive orders and proclamations, treaties, records of the congress and virtually all records over 50 years old of federal executive agencies.

The holdings, most of which are freely open for research, are described in finding aids published from time to time. Records of high research value are available to scholars and research institutions through the agency's microfilm publication program.

The Declaration of Independence, the constitution of the United States, the Bill of Rights and many other historical documents are on display in the National Archives building.

The primary objective of the office of records management is to reduce the quantity and cost of federal records and improve their quality. It develops and promotes in federal agencies efficient, economical methods for creating, maintaining and retiring records. Economical storage for noncurrent records, pending their ultimate disposition, is provided in ten federal record centres.

The Federal Register division publishes the daily *Federal Register*, the *Code of Federal Regulations*, the *United States Statutes* and the *United States Government Organization Manual*, all obtainable through the government printing office.

In the Franklin D. Roosevelt and Harry S. Truman libraries are housed the papers of these presidents and some of their associates. These collections are among the most important bodies of source materials for the study of modern U S. history.

The national historical publications commission promotes and participates in documentary publication programs of public and private agencies. Projects for publishing papers of such men as Benjamin Franklin, John and John Quincy Adams, Alexander Hamilton and James Madison have been set up under private sponsorship. The commission itself is preparing documentary histories of the ratification of the federal constitution and the Bill of Rights and of the first federal congress. (W. C. G.)

NATIONAL ASSOCIATION FOR THE ADVANCEMENT OF COLORED PEOPLE, a U.S. voluntary interracial organization founded to combat racism, stamp out lynching and lynch law, eliminate racial discrimination and segregation and assure Negroes their constitutional rights. In response to a call issued by 60 Negro and white educators, clergymen and other leaders on Feb. 12, 1909, the centennial of the birth of Abraham Lincoln, a national conference on the Negro was held in New York city on May 30–June 1 of that year. The conference idea had been conceived by William English Walling, a journalist. and nurtured by two social workers — Mary White Ovington and Henry Moskowitz — together with Oswald Garrison Villard. grandson of William Lloyd Garrison. Out of this conference the National Association for the Advancement of Colored People (N.A.A C P.) was born.

Since its founding, the N.A.A.C.P has sought its goal through legal action to protect the rights of Negro citizens, nonpartisan political action to secure enactment of civil rights laws and a program of education and public information designed to win popular support. By the second half of the 20th centnry the N.A.A.C.P. had become a nationwide association of more than 400,000 members in 1,200 local units in 45 states and the District of Columbia. Headquarters were maintained in New York city with a bureau in Washington and regional offices in Atlanta, Dallas and San Francisco. Its monthly organ, *The Crisis*, had a circulation of more than 80,000. *See* also NEGRO, AMERICAN.

For current history *see* the *Britannica Book of the Year*, American edition. (Ro. C. W.)

NATIONAL ASSOCIATION OF MANUFACTURERS (U.S.) : *see* TRADE ORGANIZATION.

NATIONAL CITY, a city of California, U.S., on the southeast shore of San Diego bay adjoining the city of San Diego (*q.v.*), it is on the site of the Mexican land grant Rancho de la Nación. The mild and equable climate attracted pioneer Frank A. Kimball. who purchased the ranch and founded the city in 1868. It was incorporated in 1887. National City enjoys an exceptionally favourable location for industrial development; it is served by railroads and also has ready access to deepwater channels. The majority of its residents work in its expanding industries, retail centres, vegetable-packing houses and in the U.S. navy's repair base. For comparative population figures see table in CALIFORNIA; *Population*. (K. J. *R.)*

NATIONAL CONVENTION. National conventions of the Democratic and Republican parties are held at four-year intervals to nominate the party candidates for president and vice-president of the United States. The conventions, as the representative organs of the parties, also adopt party platforms, elect the party national committees and may adopt rules governing the national organization of the parties and their work between national conventions. In practice, the conventions also act as campaign rallies for the presidential election campaigns that follow. Disagreements within the parties often lead to heated argument at the conventions but also usually to reconciliation and greater cohesion as each party unites behind an existing or newly chosen leadership. The public image of the parties on the eve of the presidential election is in large measure the product of the conventions and their activities.

Early History. — The conventions originated during the presidency of Andrew Jackson (1829–37), after years of growing dissatisfaction over nominating procedures. The first president, George Washington, was so clearly the outstanding national leader of his time that no formal action was necessary to identify him as a candidate before his election. But when it became necessary to choose a successor among several candidates, it became apparent that somehow the field of choice must be narrowed as a preliminary step, if the electoral arrangements of the constitution were to operate effectively. By the election of 1796, the beginnings of party organization in congress were able to solve the problem; presidential nominations were then made mainly in informal congressional party caucuses until 1816, when James Monroe was nominated and elected.

Monroe's administration was marked by a virtual disappearance of such organized political parties as had previously existed in congress. In 1820, Monroe required no nomination for a re-election that was almost by unanimous consent; but in 1824, the popular vote was divided among four candidates who had come to public notice in one way or another. No candidate had a majority, and the presidential election was thrown into the house of representatives for settlement. John Quincy Adams was chosen president, although Andrew Jackson had been a leading candidate.

Jackson was promptly called upon by the legislature of Tennessee to run again in 1828, and agreed to do so. By that year, the Jackson men were so strongly organized that no formal action was needed to identify their candidate, although there had been talk of calling a national convention. Jackson won the presidency in 1828 without difficulty. A clarification of party lines followed in congress, but the congressional party caucus was too discredited for restoration as a nominating agency.

The opposition parties of the time held the first recognized national party conventions in preparation for the elections of 1832. The Antimasonic party met at Baltimore, Md., in Sept. 1831, with 116 delegates from 13 states and chose William Wirt. The National Republican party, generally identified as a predecessor of the Whig party and the present Republican party, held a convention at Baltimore in Dec. 1831, at which it nominated Henry Clay. The Jacksonians met at Baltimore in May 1832 as the "Democratic-Republican National convention." hailed Jackson as their chief and nominated Martin Van Buren for vice-president. This was the first national convention of the present Democratic party, which held such meetings regularly after that time.

The National Republicans held no convention in 1836 and were replaced in 1840 by the Whigs, who held national conventions through 1852. After that year the Whig party disintegrated over the issues of slavery. It was succeeded mainly by the Republican party. which held national conventions in preparation for every presidential election after 1856. Third parties and minor parties also held national political conventions; but as generally used, the term refers to the conventions of the two major parties that have alternated in winning presidential elections since 1832: the Democrats on the one hand, and the Republican party and its predecessors on the other.

Nominating Patterns.——Of the 65 presidential nominations in major party national conventions through 1960, 33 were made by the party currently in power in the White House. Of these 33, 17 were renominations of an incumbent president, usually without much of a contest. Franklin Pierce, defeated for renomination in 1856, was the only elected president who tried and failed to win a second nomination from the national convention of his own party. But others of the period declined the effort. James K. Polk had announced himself as a one-term president; and James Buchanan, who replaced Pierce, thought better of any second-term attempt.

After the turn of the century, it was generally expected that an incumbent first-term president would seek renomination and achieve it easily. The "Bull Moose" drive to prevent the renomination of William Howard Taft in 1912 was the main exception; and Taft was renominated in the end, although he lost the election. Franklin D. Roosevelt won a third-term nomination in 1940 with relatively little difficulty, and a fourth in 1944 with none at all. But under the 22nd amendment to the constitution, adopted in 1951, further third-term nominations were prohibited, except for a vice-president who becomes president with less than two years to serve in his first term.

All of the seven vice-presidents who succeeded to the higher officethrough death of the president through 1945 sought nominations to succeed themselves. The four who made the effort during the 19th century—John Tyler, Millard Fillmore, Andrew Johnson and Chester A. Arthur—were uniformly rejected Three in the 20th century—Theodore Roosevelt, Calvin Coolidge and Harry S. Truman—all won renomination and election.

Nominations in the party out of power have only rarely resulted in the renomination of a previous candidate. After Van Buren's failure to secure a third nomination in 1844, and Clay's final nomination in that same year, no "titular leader" of a defeated party was seriously considered for renomination until Grover Cleveland's third nomination and second election in 1892. William Jennings Bryan was nominated in 1896, 1900 and 1908, but lost the elections that followed in each case. A period followed in which defeated candidates again took themselves out of further nominating consideration; but Alfred E. Smith sought a second Democratic nomination unsuccessfully in 1932, and Wendell Willkie sought a second Republican nomination unsuccessfully in 1944. In 1948, Thomas E. Dewey became the first defeated Republican to receive a second nomination, but was again defeated; in 1956, Adlai E. Stevenson was renominated by the Democrats, and was also defeated.

The conventions have nominated occasionally with little or no contest even when no president or titular leader was available. Instances of this kind have included a few rare nominations that were akin to inheritance as a means for acquiring party leadership: Van Buren's first presidential nomination, in 1836; Taft, 1908; Herbert Hoover, 1928; Richard M. Nixon, 1960. Other instances have included the designation of an already obvious party choice: Clay in 1832 and 1844, Smith in 1928 (Smith had previously been involved in the lengthy Democratic contests of 1920 and 1924, but in 1928 his previous major opponent, William G. McAdoo, had declined the race).

A few other nominations have involved enough agreement among the inner groups of party leaders to make the work of the conventions relatively simple. Among the Democrats, such nominations have included those of Lewis Cass, 1848; George McClellan, 1864; Horace Greeley, 1872; Winfield S. Hancock, 1880; Cleveland's first nomination, 1884; Alton B. Parker, 1904. Republican nominations of this type have included those of John C. Frémont, 1856; Ulysses S. Grant, 1868; Charles Evans Hughes, 1916; and Alfred M. Landon, 1936. Inner-group selections of the kind just noted have rarely won elections—many were made in years of party weakness—and were more common in the early decades of the party system than in later periods.

New leadership was selected after a vigorous contest in 26 of the 65 major party conventions through 1960. Each of these contests involved at least two and often three or four leading candidates for the presidential nomination of the party concerned. In 19 cases, the prize was captured by one of the major contestants; 7 of these cases involved the succession in the party in power, 12 the nomination in the party out of power; 9 occurred in the period from 1832 through 1892, 10 in that from 1896 through 1960. indicating that there has been no diminution in the frequency of these occurrences in the American party system.

In the other seven cases of contest, compromise or "dark horse" candidates were selected after rejection of all the leading candidates. These include the cases of Polk, 1844; Pierce, 1852; Horatio Seymour, 1868; Rutherford B. Hayes, 1876; James A. Garfield, 1880; Warren G. Harding, 1920; and John W. Davis, 1924. In addition, Benjamin Harrison (1888) and Bryan (1896) have sometimes been regarded as "dark horse" candidates, but were in no sense the result of interfactional stalemate and compromise. Harrison was a secondary candidate of the James G. Blaine faction, and Bryan of the silver faction in their respective parties. Willkie (1940) has also been considered a "dark horse" candidate, but was conspicuously in the running before the convention opened and was not a compromise.

After the 1920s, the factors producing the "dark horse" candidacies of the past disappeared or changed considerably. In 1936, the Democratic party abandoned its century-old rule requiring a two-thirds vote of the convention to nominate. Under a regime of majority voting in both party conventions; with increasingly open campaigning before the conventions by willing candidates; and with the clarification of preconvention campaigns and candidate status that takes place through public opinion polls, preconvention primaries and modern processes of communication, national conventions can usually reach their decisions quickly when they finally come to the nominations—unlike the Democratic convention of 1924, which required 16 days and 103 ballots under the two-thirds rule to nominate a candidate who lost the election.

Sources of Candidates.—Candidates for the nominations have usually been persons with extensive political experience; although in rare instances others have been considered and nominated, as in the case of Willkie (1940), and even elected, as in the case of Dwight D. Eisenhower (1952). United States senators have provided the largest single category of contestants for both the presidential and vice-presidential nominations. Nominations for the lesser office were won by senators with increasing frequency from 1928 through 1956; but from the nomination of Stephen A. Douglas (1860) to 1956, Harding (1920) was the only incumbent senator to win a major party presidential nomination. In 1960, however, Sen. John F. Kennedy became the nominee of the Democratic party.

Governors have long been highly important as a source of aspirants for the nominations, and particularly as the category of officialdom from which the choice is most likely to be made in a situation of contest. Disregarding three presidential nominees who had succeeded to the presidency from the vice-presidency (two of whom were ex-governors), 8 of the 19 first-time presidential nominees from 1896 to 1960 were incumbent governors. Among the Democrats, they included Woodrow Wilson, James M. Cox, Smith, Roosevelt and Stevenson; among the Republicans, William McKinley, Landon and Dewey. Three first-time nominees, Bryan, Davis and Willkie. held no governmental position at (or immediately prior to) the time of their nomination; two, Taft and Hoover, were cabinet members; two, Parker and Hughes, were high court judges; two, Harding and Kennedy were senators; one, Eisenhower, was a regular army general; and one, Nixon was vice-president.

With so many sources from which candidates for the nominations may come, the conventions occupy a critical place in the career aspirations of the political and other leaders of the Cnited States. A final convention vote on a contested presidential nomination usually inserts a full stop in the development of a number of political careers; while creating a new political celebrity, and providing the basis for a new constellation of personal and power relationships. The career development and preconvention campaign activities that lead up to these final decisions tend to involve all elements of the U.S. social order. The presidential nominating process, consisting of the never-ending actions and activities that take place in anticipation of future convention decisions, is one of the main organizing features of U.S. life and politics.

Preconvention Campaigns.—When an open nominating situation is in prospect in one party or the other. willing candidates may announce as early as October or November of the preceding year, as Robert A. Taft did in 1947 and 1951 and Stevenson in 1955. Early candidates incur the hazards of the "front-runner," but the filing requirements for the presidential primary elections in several important states require action by December or January for a successful race in the primaries that follow.

Preconvention campaigning was dominated by the so-called presidential primary elections after World War II, although they were held in fewer than half of the states. The states holding presidential primaries have experimented with such widely different systems since 1904, when they originated, that no easy summary is possible; but in most of these states, the state delegates to the respective party national conventions are chosen in a public election at which the adherents of the respective parties may vote. The voters may also be given an opportunity, directly or indirectly, to express a preference among two or more of the candidates for a presidential nomination. The chronology of the presidential primaries in a typical presidential year begins with New Hampshire in March; includes Wisconsin, Illinois, New Jersey, Pennsylvania and Massachusetts in April; the District of Columbia, Maryland, Indiana, Ohio, Alabama, West Virginia, Nebraska, Oregon and Florida in May; and California, New York and South Dakota in June.

Something is usually known concerning the presidential candidate preferences of the would-be delegates, even in the states where there is no provision for putting such information on the ballot. In many of the primary states, would-be delegates can indicate their candidate preference on the ballot if the candidate gives consent; and in a few states, notably New Hampshire, Oregon and Florida, they can do so without the necessity of securing candidate consent. Generally when there is an active contest for the nomination of one party or the other, opposing presidential candidates of national stature can be expected to campaign vigorously in at least three or four of the presidential primary states. These state campaigns and elections usually have the effect of committing state delegations to the candidates winning in the respective states. They also attract national attention and clearly affect the estimates of the candidates that are held by the voters, as well as those held by the prospective delegates, even those from states where no primaries are held. In these states, delegates are usually selected by state and district party conventions.

Time, Place, Composition. — The national conventions meet at a time and place previously determined by the respective party national committees. Formerly the conventions were usually held in June, but in 1952 and 1960 both were held in July, and in 1956 in August. There is no policy on which party meets first. Chicago has been chosen as the convention city most frequently in the 20th century, with Philadelphia second. Baltimore was the favourite meeting place from 1832 to 1872. For most of a century, voting strength in both conventions was apportioned among the states in accordance with their electoral college vote, usually two convention votes for each of the state's senators and representatives in congress; and this was still a major factor in the apportionment in 1956. In preparation for its 1916 and later conventions, however, the Republican party adopted rules curtailing the representation of congressional districts (mainly in the south) where the Republican vote was light. Both parties later adopted the practice of giving "bonus" votes to the states carried by the party in a previous election, which had the effect of inflating total convention voting strength to more than 1,300 votes in each party in 1956. In Republican conventions, state delegations usually were restricted to their authorized size, with one vote for each delegate; but the Democratic party repeatedly authorized the election of additional delegates on a half-vote basis and frequently seated delegates who held less than half a vote, with resultant confusion of voting procedures. In 1960, the Democratic party put all delegates on a half-vote basis and increased the total number of votes to 1,521.

Proceedings. — Each convention is opened by the chairman of the national party committee, and usually elects a temporary chairman on the first day. The temporary chairman may give the keynote address and usually presides until the organization of the convention has been completed. Senators have often served as temporary chairmen, but governors have done so increasingly in the 20th century. The permanent chairman usually takes over on the second or third day of the convention and presides during the adoption of the party platform and the balloting on presidential and vice-presidential nominations. During the 19th century, state and local party leaders usually served as permanent chairmen; from 1896 to 1956, the post was filled, with the exception of the Republican convention of 1924, by an incumbent senator or representative in congress. Senators held the post more commonly during the early decades of the century; but from 1948 through 1956 both parties uniformly chose their party leader in the house of representatives as permanent convention chairman. In 1960, the Republican party did so again, but the Democrats chose a governor.

Party platforms are prepared in committees designated for the purpose. Platform issues have been hotly fought, with divided votes, in many Democratic conventions, including notably those of 1924 and 1948; but no platform issue came to a divided vote on the floor of a Republican convention between 1936 and 1960.

Nominations are the work of the convention as a whole and have not directly involved any prior committee action since 1840. Candidates are placed in nomination with nominating and seconding speeches, demonstrations are held, and eventually the convention votes. The roll of the states is called alphabetically and the vote of each state delegation is reported by its chairman; if necessary the delegation is polled. Many contests are settled on the first or second ballot, but even in the 1940s and 1950s, several ballots were sometimes necessary. The Willkie nomination of 1940 required six ballots; the Dewey nomination of 1948, three; the Stevenson nomination of 1952, three.

Vice-presidential nominations follow the presidential. Frequently the vice-presidential choice has been determined by the presidential nominee in consultation with other party leaders, after which other candidates for the lesser nomination have withdrawn and the convention has ratified the choice without a contest. But in 1956, Stevenson followed the example of Bryan in 1896—an example that Bryan never again followed himself—in insisting that the convention itself make the choice. Sen. Estes Kefauver won the nomination on the second ballot after an extremely close contest with Sen. John F. Kennedy.

Throughout the 19th century, the candidates usually remained at their homes while the conventions were in session; and committees were sent. often weeks later, to advise the successful candidates officially of the convention action. In the 20th century, willing candidates began to be present at the convention city oftener but rarely appeared in the convention itself before 1932. In that year, however, Franklin D. Roosevelt appeared in person at the end of the Democratic convention to accept its nomination. After that time. major candidates were usually present in the convention city during the proceedings, and appearance of the nominees to make acceptance speeches at the final session became customary.

Reform Proposals. — Throughout their history, the conventions have been among the most criticized of political institutions, perhaps because they provide so many opportunities for the organization, manipulation and display of political power. Throughout the 20th century, a favourite reform proposal has been to replace the conventions with a national presidential primary. to be provided either by a constitutional amendment or by federal law encouraging uniform state action. Public reaction to the conventions of 1952, the first to receive full television broadcasting over nationwide networks, was interpreted by some observers as giving great impetus to the movement for a national presidential primary. But that impetus failed to show itself in congress, except in the adoption of a presidential primary law for the District of Columbia.

State legislatures also were slow to register any notable desire to install primaries in states where they did not already exist. Florida revised its previous statute along lines recommended by a group of political scientists and claimed credit for developing a model presidential primary system.

At mid-20th century the conventions undoubtedly had become the object of a greater amount of professional and scientific research activity than at any previous time in their history. While such research mainly added to the store of knowledge concerning the complexities of the presidential nominating process, it also produced many suggestions for changes in procedures. It seemed that these might eventually have a significant cumulative effect without changing the fundamental nature of the convention institution, which seemed to be firmly established as a part of the U.S. political system.

NATIONAL COUNCIL OF CHURCHES. The National Council of the Churches of Christ in the U.S.A. was formed in Dec. 1950 by a merger of 12 national interdenominational agencies, several of which had been organized as early as 1908. Its purpose is to provide an organization through which the member churches can express their common faith and co-operate with one another on programs to which the bodies themselves consent or which they initiate. The council has no authority over its constituent bodies. Among its objectives and functions, as stated in its constitution, are to encourage fellowship and counsel concerning the spiritual life and religious activities of the churches; to promote co-operation among local churches and the development of state and local councils of churches; to encourage study of the Bible; to do for the churches such common services as are desired; and to provide a medium of consultation, research and joint planning.

By 1960 there were 33 Protestant and Orthodox bodies constituent to the council, of which 26 were Protestant denominations. Almost 40 other denominations or agencies of denominations cooperated in one or more of the council's programs. In the constituency of the council at that time were approximately 144,000 local congregations with about 107,000 ministers. In these were almost 40,000,000 individual members, of which more than 35,000,000 were in the Protestant bodies.

The council also co-operated with about 900 local and state councils of churches which were responsible to their own state and local churches.

The council carries out many of its activities through four divisions. Through the Division of Christian Life and Work there is encouragement of study and action in international affairs; education among groups and individuals to apply Christian principles to economic life and racial and cultural relations; counsel and guidance to the ministries in hospitals and prisons; and co-ordination of activities in furtherance of religious liberty, social welfare and stewardship. The Division of Home Missions maintains a consultation service on church building; administers a co-operative migrant ministry for seasonal farm workers; and encourages broad planning to meet the special needs of rural and urban churches and of home missions institutions. The Division of Foreign Missions co-ordinates, counsels and interprets the co-operative phases of the overseas work of participating foreign mission boards and denominations; supplies medical services to foreign missionaries; and conducts a literacy program in about 200 languages. The Division of Christian Education helps the churches to develop guidance materials for local work in religious education; gives leadership in the improvement of administration of Sunday school programs; and administers about 600 leadership schools annually. It encourages weekday religious education and vacation schools and co-ordinates the educational work of the denominations with respect to church-related colleges.

Among other units of the council, Church World Service, a department of the council, is a channel through which many denominations carry on a world-wide program of relief and rehabilitation to needy and suffering persons abroad. These are largely programs of emergency aid to victims of natural disasters and political upheaval. It has administered services resulting in the resettlement of more than 100,000 refugees in the United States and has shipped overseas as much as 346,000,000 lb. of materials, mainly food, in one year. An activity of the Department of Evangelism is a co-operative ministry in the national parks that provides religious services to visitors. United Church Women participates in activities of local interdenominational councils of churchwomen; encourages observance of the annual World Day of Prayer; and encourages various programs in missions, family life, race relations and civil liberties. United Church Men aids in the development of co-operative programs among local groups of laymen and encourages their interest in such subjects as Christian missions and education. The Broadcasting and Film commission presents radio and television messages; develops films and film strips; and provides training for both clergymen and laymen on the use of radio and television. The Bureau of Research and Survey carries on various research projects; promotes research by other agencies; and maintains a centre of information on church statistics. It edits the *Yearbook of American Churches,* which presents official information from all faiths.

The General Assembly of the council, triennial, and the general board, meeting between sessions of the assembly, on occasion issues policy statements. Among them are: the council stands opposed to racial segregation in the churches and community life; believes in and supports the right of both employers and employees to engage in collective bargaining; believes in and supports the procedures of the United Nations; advocates broad international trade and the foreign-aid program of the United States; is unalterably opposed to communism and stands against the evils, violence and violations of human rights by communist and other tyrannies.

The Council's general board consists of both clergymen (almost two-thirds) and lay persons, elected or appointed by the constituent bodies. On the committees supervising the program units there are about as many lay people as clergymen. Of the council's net budget, more than half comes from church bodies; the remainder is made up of proceeds from sales of materials. gifts of individuals, foundations and corporations and proceeds from investments. Headquarters of the National council, shared with a number of other organizations, is located in the Interchurch centre at 745 Riverside drive, New York city.

NATIONAL GEOGRAPHIC SOCIETY, a U.S. scientific society founded in Washington, D.C., in 1888, "for the increase and diffusion of geographic knowledge." From a small local organization founded by eminent explorers and scientists it had grown to become the largest scientific and educational society in the world, with an international membership of 3,000,000 (1962) in the second half of the 20th century. All members receive the society's monthly journal, the *National Geographic Magazine,* and many maps issued as supplements. Annual membership dues support all of the society's activities, which have included more than 200 major scientific projects and expeditions.

From the expeditions of Walter Wellman and Robert E. Peary to Richard E. Byrd and Paul A. Siple, the society has supported and encouraged arctic and antarctic exploration and published firsthand accounts of explorers. In the early 1930s its giant stratosphere balloons. launched jointly with the U.S. army air corps, pioneered in scientific exploration of the upper air and attained the greatest elevation reached by man up to that time (13.71 mi.). National Geographic expeditions, often cosponsdred with the Smithsonian and other institutions, have studied volcanic eruptions and earthquakes, excavated Machu Picchu, lost city of the Incas on a Peruvian mountain top, and discovered in Mexico the oldest dated work of man in the new world.

The society helped explore and bring into the C.S. national park system such national treasures as the Valley of Ten Thousand Smokes in Alaska. Carlsbad caverns and Pueblo Bonito in New Mexico and the giant sequoias of California. In 1958 the society presented Russell cave, Alabama—in which was uncovered a record of 9.000 years of North American prehistory—to the national park service. *(See* also ALABAMA: *History.)* In 1949–56 the society and the California Institute of Technology, working with the Palomar observatory telescopes. produced for world distribution a Sky *Atlas* of unprecedented scope. More recent activities have included archaeological examination of the vast. long-forgotten capital of Maya civilization, Dzibilchaltun, in Yucatbn, in co-operation with Tulane university, and anthropological research by Dr. and Mrs. L. S. B. Leakey in east Africa that has produced fossil remains of hominids of record antiquity.

Besides its expeditions. its magazine and its maps, the society fulfills the purpose for which it was organized—through its school service which issues weekly bulletins to educators. librarians and students in the Cnited States; a news service which issues daily releases on world events for press. radio and television; its illustrated books presenting scientific information in readily understandable form; globes, atlases, educational television; and occasional scientific monographs by its expedition leaders.

Melville Bell Grosvenor, son. grandson and great-grandson of presidents of the society, became its president and editor in 1957. *See* also GROSVENOR. GILBERT HOVEY. (M. B. G.)

NATIONAL GUARD is the name applied in the United States to a volunteer organization composed of individuals from all walks of life who devote part of their time each week to train as members of military units. Older than the nation it serves. it has the longest continuous history of any military organization in the United States. As an outgrowth of the early militia concept which provided for the common defense, its origin can be traced back to the early years of the 17th century when the colonists, in order to protect their lives and property, banded together to form militia companies (*see* MILITIA). These companies were equipped and trained according to the needs of the time. As the nation grew, the national guard grew, and as towns sprang up and states were added to the union, additional guard units were formed for local and national protection.

The distinction of being the oldest national guard units in the United States with unbroken lineages is shared by the 101st engineer battalion and the 182nd infantry regiment. Rlassachusetts national guard. These units trace their history back to Oct. 7, 1636, when the general court at Boston ordered that all military men in the area were to be formed into militia regiments. Two of these, the north regiment and the east regiment, both of which fought in the Revolutionary War, later became the 182nd infantry and the 101st engineers.

Throughout the Colonies, similar militia organizations were formed, and in 1775 the committee of safety of the second continental congress organized them into an over-all defense force. These militia provided approximately 165,000 of the 396,000 troops raised for George Washington's continental army. It was during the period 1776–90 that specific militia laws were first passed by the states for the purpose of regulating the militia and causing the enrollment of all free males between certain ages as a proper. natural and safe defense of a free state. These laws were based on the Declaration of Independence and the articles of confederation, which declared that a well-regulated militia was necessary but should not be superior to the civil power nor assume the role of a standing army in time of peace. From these laws arose the concept of the national guard as state-supported organizations of local volunteers.

After the Colonies had won their independence, the principle of the citizen-soldier was considered so important by Washington and the first congress that it was written into the constitution of the United States. Section 8. article I of the constitution empowered congress to provide for calling forth the militia to execute the laws of the union, suppress insurrections and repel invasions. and for organizing, arming and disciplining the militia. reserving to the states the appointing of officers and the training of the militia according to the discipline prescribed by congress. The second amendment to the constitution (article II of the Bill of Rights) recognized the right of the citizen-soldier, in the interests of "a well-regulated militia," to keep and bear arms. Ultimately, this basic authority was to result in the establishment of the national guard in its present form.

Although President Washington constantly pressed congress to prepare "a uniform and well-digested plan" for the militia, no action was taken, and militia were separately formed and trained by each state. By the act of Feb. 28, 1795, congress gave the president authority to call out the militia in cases of invasion and other emergency, but federal use of state militia depended on the individual state's acceptance or rejection of the president's request. A step toward a uniform militia and an eventual national guard was taken by congress in 1808. when legislation provided for specific federal aid-to be paid annually to the states to support their militia, although these forces still remained under state control.

The name "national guard" was first applied to a state militia on Xug. 16. 1824, when New York's 7th regiment (now the 107th infantry regiment, New York national guard), acting as an honour guard for the Marquis de Lafayette during his visit to the United States. adopted the name in tribute to his service during the Revolutionary War and in honour of his command of the Garde Nationale in Paris in 1789. By 1896 most states had adopted the title, although this change in name did not change the essential character of the guard as a state organization.

Throughout the 19th century, the militia remained a generally unwieldy and sprawling force, although it played an important part in providing troops and units in each of the four wars (1812, Mexican, Civil and Spanish-American Wars) in which the United States engaged during this period. In 1903 congress enacted laws whereby the federal government assumed a more direct and active part in organizing. training and equipping the militia under the same standards as those prescribed for the regular army. It was not until enactment of the National Defense act of June 3, 1916, however, that the organized militia was officially recognized as the national guard and made to conform to regular army organization. As such, it became a component of the nation's organized peace establishment and. when called into active federal service, a part of the army of the United States..

In 1916 approximately 151,000 guardsmen were called into federal service. of which 110,000 served on the Mexican border. During World War I. the national guard supplied more than 380,000 soldiers for the American expeditionary force. Seventeen guard divisions were sent overseas, of which eleven saw actual combat. Of the eight U.S. divisions rated excellent or superior by the German high command. six were national guard divisions.

The general demobilization of units and the discharge of individuals from federal service after World War I made it necessary to rebuild the national defense force, including the national guard. Under postwar amendments to the National Defense act of 1916, the national guard was reorganized to consist of the same guard divisions that had served during the war. This act, in setting forth a completely new military policy for the United States, established an "Army of the Cnited States" which consisted of the regular army, the organized reserve corps. and the national guard when called into federal service. The national guard remained a state force under the command of state authorities. The new act also provided for increased federal assistance for the national guard: when units reached certain minimum standards of strength, equipment and skill; they were formally recognized as eligible for federal support.

The act of June 15, 1933, created a new component of the army known as the "National Guard of the United States." This component. while identical in personnel and organization to the national guard of the several states. was a part of the army at all times and could be ordered into active federal service by the president whenever congress declared a national emergency without the necessity of being called through the governors of the states.

In August 1940 the president ordered the national guard of the United States to active military service. Between Sept. 16, 1940, and Oct. 1, 1941, the national guard brought into federal service more than 300.000 men in 18 combat divisions and numerous non-divisional units, including 29 air observation squadrons. These troops immediately doubled the strength of the standing army. Guardsmen supplied trained leaders for the expanding army. with an estimated 82,000 enlisted guardsmen later becoming officers. Nine divisions crossed the Atlantic to Europe and Africa and nine went to the far reaches of the Pacific.

Following World War II, national guard units were demobilized and their personnel separated from federal service and returned directly to civilian life. For a short period, there actually was no national guard. On Oct. 13, 1945, the secretary of war approved the policies relating to the organization of the postwar national guard, and on June 30, 1946, the first reorganized national guard unit was federally recognized. In 1947 the air units of the national guard mere organized separately from the army units and designated the air national guard. Since that time the national guard has consisted of the army national guard and the air national guard.

During the Korean war, more than 183,000 guardsmen in 8 infantry divisions. 22 wings and many other units of the army and air national guard were ordered into active federal service. Four divisions and 1; wings were stationed in the United States, 2 divisions and 3 wings served in Europe, and 2 divisions (the 40th and 45th) and 2 wings (the 116th and 136th) fought in Korea.

The national guard of the early 1950s was organized under regular army and air force tables of organization and equipment. The basic establishment of the army national guard was 21 infantry and 6 armoured divisions, 9 regimental combat teams, g armoured cavalry regiments, 123 antiaircraft and 80 field artillery battalions, and nearly 2,000 additional combat, combat support and service units of company or detachment size. The air national guard consisted of 27 combat wings with 87 tactical squadrons, plus a number of support groups, squadrons and other types of units. On Feb. 28, 1958. the strength of the army and air national guard was 476,061 officers and enlisted men organized into 5,952 federally recognized units located in more than 2,600 cities and toans throughout the United States including some of the territories and possessions.

The national guard has a dual status and mission. Each federally recognized unit is simultaneously a part of the national guard of its own state and of the national guard of the Cnited States. The function of the national guard of the several states is to provide organizations in each state, so trained and equipped as to enable them to function efficiently at existing strength in the protection of life and property and the preservation of peace, order and public safety under competent orders of the state authorities. The duty of the national guard of the United States is to provide units of the reserve components of the army and air force, adequately organized, trained and equipped, available for mobilization in the event of war or national emergency and capable of combat operations in support of war plans of the department of defense.

In addition to its basic duties, the national guard also became actively engaged in the defense of the United States. In the first peacetime duty assigned to it, the army national guard in March 1954 began active participation in the antiaircraft defense of the continental United States.

On Aug. 15, 1954. the air national guard began active participation in the air defense augmentation plan of the air defense command. Under this plan. 17 squadrons operated combat-ready aircraft from their air national guard bases in a five-minute runway alert status.

NATIONAL INCOME. The traditional purpose of national income studies is to furnish measures. of the production of the nation. Beginning approximately with the 1930s, and quite explicitly since World War II, their purpose has come to be conceived more broadly as that of providing a systematic account of the economic activity of the nation. Inasmuch as production is a major feature of economic activity the two aims are closely interrelated.

National Output.—Terminology has not become standardized; the terms "national output," "income," "product" and "expenditure" are often used interchangeably. In the following discussion national output will. in general, be employed to designate the common concept. National output is the total of final or end products produced by the nation during a specified period, such as the calendar year. That is to say. it is the sum of products available for consumption or for additions to the stock of capital. Ran materials and semifinished products used up in production are not counted separately. For instance, if flour is baked into bread, only the bread is counted. National output is expressed in monetary values. since these provide a common unit for summing the wide variety of goods (commodities and services) produced.

The bulk of the production covered by measures of national output consists of items that are intended for sale in the market. Goods provided outside the market place are usually excluded, even though they may resemble items that are included by virtue of the market criterion. For instance, the services of housewives are usually excluded while services rendered by domestics are included. However, monetary values are generally imputed to wages paid in kind, to food and fuel produced on farms for home consumption, to the services which owner-occupants derive from their homes, and sometimes also to certain services, such as the handling of bank deposits, which financial institutions render free of charge to individuals. The treatment of nonmonetary items raises difficult problems in the measurement of the output of industrially undeveloped countries, where many types of productive activity that are channeled through the market in western countries are performed within the confines of the individual household.

The above explanation of national output has been in terms of product flows. because such an approach makes clear that the goal is to measure goods available for the satisfaction of human wants. Honever, inasmuch as the production of goods gives rise to a simultaneous flow of incomes—wages. profits, etc.—national output may also be envisaged as a sum of income flows. In practice, national output measures are prepared both by summing product flows and by summing income flows.

The relationship between these two types of measures is basic to the understanding of the entire structure of national income statistics. Accordingly, a somewhat more exact explanation of it will be given by reference to the operations of a typical business enterprise. (The bulk of national output originates in such enterprises. although certain services—mainly those of household and government employees—also are counted as part of national output.)

The typical business enterprise produces goods which it either sells or adds to its inventories. Chargeable to this production are purchases of raw materials and other intermediate products from other enterprises (but not purchases of fixed plant and equipment); wages, salaries and other incomes paid out in production; indirect business taxes, such as sales, excise and property taxes; and depreciation and kindred allowances for fixed capital used up. A residual item of profit or loss equalizes the expenses chargeable to production with its value.

Expenses chargeable to production and profits	Production
Purchases of intermediate products Wages and other incomes chargeable to production Indirect taxes Capital consumption allowances Profits	Sales Inventory change

If a statement of this type is prepared for the business system as a whole, those sales of enterprises that represent purchases of intermediate products by other enterprises cancel one another. Thus purchases of intermediate products disappear from the left-hand side of the statement and sales on the right-hand side are correspondingly reduced. Matching the noncanceling final products there remains a numerically equivalent total consisting of income streams (including profits), indirect taxes and capital consumption allowances. (Inasmuch as the income aggregate reflects current production, capital gains and losses are not included.)

Variant Measures. — All measures of national output are net in the sense that intermediate products used up in production are not counted separately, but only as part of the value of the final products in which they are embodied. The definitions, however, vary significantly in other respects. Three points of differences may be noted.

1. Mainly because it is difficult to estimate how much fixed capital is used up in production during a given period, many national output measures are defined on a "gross" basis; *i.e.,* before deduction of capital consumption allowances. This definition is adopted even though in principle the using up of fixed capital is similar to that of intermediate goods. However, "net" measures allowing for the use of fixed capital are just as common. even though the allowances usually fall short of being meaningful from the standpoint of indicating the true net change in the capital stock.

2. Measures of national output are sometimes valued in terms of market prices and thus reflect indirect taxes, which are part of market price. Alternatively, national output may be defined net of these taxes (in technical terms, at factor prices or costs).

As is suggested by the previous demonstration of the equivalence of the product flow and income flow measures, net national output at factor prices is equivalent to the sum of incomes generated in production — wages and salaries, interest, rents and profits. These are measured before deduction of direct taxes — mainly taxes on individual or business earnings. .(For a further discussion of the factor price and market price measures see the concluding section of this article.)

3. Measures of national output may refer to the output produced within the confines of a nation. or to the output to which residents of a nation have a claim. The two definitions differ because earnings derived from abroad provide residents of one nation with claims on output produced in others.

Differences between the gross and net and the market price and factor price measures are usually substantial. In the United States, for instance, the gross market price measure (gross national product) exceeds the net factor price measure (national income) by about one-fifth, with capital consumption allowances and indirect taxes contributing about equally to the spread. Differences between output measures due to variant treatments of international claims may also be significant.

It is necessary to distinguish between genuine output measures and various related aggregates that are not strictly measures of output. A widely used aggregate of the latter type (personal income, in the commonly accepted terminology) measures the sum of incomes received by individuals. Although the bulk of this aggregate arises in the production of national output, it cannot be regarded as a measure of the latter, since. on the one hand, it excludes some forms of income arising in production (such as undistributed profits) and. on the other, it includes incomes that do not reflect current productive activity (for instance, relief payments).

Adjustment for Price Change. — Measures of national output are usually expressed in terms of the prices current in the period to which the measures refer. Accordingly, changes over time in similarly defined output magnitudes reflect both changes in the quantity of goods produced and in the level of prices at which these goods are valued. For many purposes it is useful to have measures which separate the effect of the "real" (*i.e.,* quantity) change from that of the price change. They are obtained by expressing the goods produced in different time periods in terms of constant prices. These are usually the market prices that actually prevailed in one year, or in an average of years, during the period for which the measure is constructed. The approach to the comparison of real outputs produced in different countries is similar to that just outlined for time comparisons.

Output Breakdowns. — Measures of national output are usually accompanied by breakdowns of the totals that provide significant information on various aspects of the economy. The following are the breakdowns most frequently used.

1. The value of national output is shown in terms of the economic character of the products — essentially consumption and additions to capital stock. with further subdivisions of these two basic categories. It is also shonn in the same statement in terms of the sales of these products to major purchaser groups, usually consumers, business enterprises, government and foreign nations. The exact manner in which the type-of-product and the type-of-purchaser classifications are reconciled is not uniform. The aggregate broken down in this way is usually valued at market prices.

2. The value of national output is shown in terms of the various types of incomes — wages and salaries, interest, rents and profits — originating in production. This classification is usually of the aggregate expressed net at factor prices Sometimes, however, capital consumption allowances and indirect taxes are included, and a breakdown of the entire value of national output gross at market prices is thus provided.

3. The value of national output may be classified to show the portions of it originating in the various industries, such as agriculture, manufacturing and trade. This classification is generally given in terms of the income rather than the product flow measure. Industry breakdowns of output vary as regards the output definition (net or gross, market or factor price, etc.) that is used.

4. National output may be shown allocated to the various regions of a nation. To sidestep some of the special problems involved in such an allocation, the total is often not strictly a measure of national output, but the related aggregate of individual income receipts.

5. Some variant of this aggregate also most frequently underlies statements in which income is classified by the size of the unit income, the unit being usually the family or the single individual living separately. Such size distributions show the number of consumer units and the total income in successive income brackets.

National Income Accounting. — It is apparent that the output breakdowns listed shed a great deal of light on the structure of the economy. However. the facets of the economy so illuminated remain separate, and no fully coherent picture of the whole in terms of its component parts emerges. The technique of national income accounting (social accounting. national accounting, etc.—terminology varies) has been designed to overcome this shortcoming. It helps to envisage the precise relation to one another of the various facets of the economy on which information has been obtained, and it provides a framework for the actual preparation of coherent statistical pictures of the economy.

In essence, the economy is regarded as consisting of transactors, such as enterprises, households and governmental units. each such entity recording its transactions in a consistent set of accounts. For each transactor, three types of accounts are usually distinguished conforming to certain basic and distinct economic functions. The first account records its transactions as a producer —along the lines sketched above in the explanation of the equivalence between the product and income flow measures. The second shows its transactions as a recipient of net income (from its own production as well as from other. sources) and as a consumer, and includes a residual item of saving. The third account summarizes its transactions as a saver and investor. showing the disposition of its total saving among financial and tangible investment. To show interrelationships clearly, each transaction would be identified twice in an ideal scheme. For instance, purchases made by one transactor unit in its capacity as consumer would be shown as sales of another unit in its capacity as producer.

Many problems are encountered in drawing up the specifications of this accounting scheme. Some of these arise because the basic types of accounts distinguished are not applicable to all types of transactors with equal ease. For instance. the essential features of the production account for enterprises can be envisaged by reference to the operating statement of a typical business firm. But there is no similar guide to set the pattern for the production accounts of households and governments. and experts are not unanimous in their choice among several alternatives.

As to the detail in which transactors might be classified, there is no limit in principle. In the extreme, the economy might be depicted in terms of a separate set of accounts for each transactor. In practice, information is insufficient to implement such a scheme; moreover, so detailed a picture would be of no use, because in it one would not see the forest for the trees. Accordingly, statistical pictures of the economy in terms of interrelated accounts are confined to broad consolidations of the ultimate detail. Essential information on aspects of the economy which these consolidations do not bring out is shown in supporting tables.

Many types of consolidations are possible; one deserves mention because closely related variants of it underlie the national income presentations of many countries. In this consolidation, the accounts showing the productive activities of enterprises and other economic transactors are summed to yield twin measures of the national output—one in terms of product flows, the other in terms of income flows. Accounts showing transactors as recipients of income—including transfers, such as relief payments and taxes—and as consumers of output are usually distinguished for two broad groups, households and government; a consolidated receipt and expenditure account is provided for each of these groups. (The corresponding accounts for enterprise transactors are often merged with the production accounts.) Next, the saving-investment accounts for all transactors are consolidated to show such an account for the nation as a whole. Finally, an external account is provided to show transactions with foreign countries.

This particular consolidation of the underlying accounting scheme is selected for statistical implementation for pragmatic reasons. It contains measures of total output. which is the focus of national income statistics; it shows explicitly the transactions of households and governments, and saving-investment transactions per se, which are important for understanding the functioning of the economy; and it suppresses distinctions that are of lesser significance or that cannot generally be quantified because statistical information is lacking.

Related Systems.—The term national income statistics is usually confined to the measures of national output and of its breakdowns, and to the summary descriptions of the economy that have been described. There are three bodies of statistical information, not covered by the conventional use of the term. that can be seen to be closely related to national income estimates if the national income accounting approach is adopted.

1. Interindustry relation (input-output) studies aim at a depiction of the economic process which focuses on product flows among industries. They provide a full accounting for these flows, including intermediate goods, which are excluded from conventional national income statistics because the latter are concerned with final output.

At a high level of abstraction which omits many detailed points of comparison that are of importance in the actual use of the data, the relationship of input-output to national income statistics may be grasped by reference to the detailed accounting scheme for individual units that has been shown to underlie the latter. Input-output tables can be regarded as an alternative manner of summarizing this scheme; in essence, transactors are grouped on an industry basis.

2. Moneyflow systems trace, in addition to the flows accounted for in national income statistics, financial transactions such as transfers of deposits and lending and borrowing. These are not reflected in conventional national income estimates because the latter provide only one consolidated saving-investment account for the nation as a whole in which domestic financial transactions cancel. These transactions could be introduced into national income statistics by providing separate saving-investment accounts for appropriate groups of transactors. Again. this is only a general sketch of the relationship between the two systems.

Input-output and moneyflow data have been developed less extensively than national income estimates narrowly defined, partly because they require additional primary statistical information that is difficult to obtain. The extent to which they have been integrated with the national income accounts varies from country to country.

3. Statistics of national wealth are usually distinguished from those of national income, but inasmuch as wealth is largely the result of saving and investment. which are part of the national income estimates. the close relationship between the two sets of figures is apparent.

Uses of National Income Statistics.—National income data are a tool for evaluating the performance of the economy, mainly in terms of the total amount and the Eomposition of goods provided, and their distribution among various groups of the community. They are also an aid in understanding the functioning of the economy; *e.g.*, the nature of business fluctuations. the regularities in the distribution of income and the tendencies for long-term economic growth or retardation. They foster such understanding essentially because they provide quantifications of many of the key magnitudes with which economic reasoning on these matters deals.

Among the practical uses of the data, those concerned with public policy have been most prominent. National income estimates have been used, for instance. in formulating policy recommendations relating to economic mobilization during war, to the stabilization of business activity and to economic reconstruction and development. Intelligent policy decisions in these and other matters involve the assessment of the probable course of future events. For instance. anti-inflatlonary measures are in order, not if inflation has prevailed in the past, but if it is believed that it will prevail in the future. National income categories have been used to furnish a set of concepts in terms of which the future is viewed, and the record of recent and past developments provided by the statistics has been studied to yield clues as to the probable course of future events.

The extent to which these economic forecasts have been elaborated has varied. Often policy recommendations have involved only implicit forecasts of selected aspects of the economy. Sometimes they have been based explicitly upon complete descriptions ("models") of the anticipated course of the economy as a whole. While the latter approach has not·been more successful, it will be outlined because it exhibits some of the logic and limitations that characterize also the more eclectic variant.

In problems relating to wartime economic mobilization. for instance. the broad technique is to estimate the total national output that can be produced under given assumptions relating to the availability of labour and other resources and probable trends in productivity. This total is then allocated among the conflicting military and civilian requirements. Next, the money demands for civilian output that would be generated at the projected level of national income are estimated. Finally. if these demands are found to differ from supplies at existing prices, the tax. monetary, allocation and other measures needed to bring them into equality at reasonably stable prices are determined.

The phase of this analysis that deals with the probable magnitude of private demands at the projected level of national income usually relies heavily on past regularities in economic behaviour, such as past relations between income and market demand. These relations are also used in gauging the effects on demand of tax measures. such as specified changes in tax rates. But relations that have obtained in the past are often modified in projecting the future, to take into account the expected effects of altered circumstances. Other techniques, such as surveys of spending intentions, can also be used to help in forecasting.

Similar techniques are applied to problems of peacetime stabilization. The demand for national output is forecast on the basis of foreseeable future developments. If this demand is found to deviate from a level of output that is satisfactory from the standpoint of the stabilization goal, the fiscal. monetary and other measures necessary to stimulate or restrict demand are gauged. Projection of past relationships and surveys of spending intentions are the mainstays of this analysis also.

Use of national income data in problems of economic reconstruction and development involves a similar confrontation of the projected national output with the demands upon it and adjustment of the two to each other by means of the policy actions available to the government. In many instances an analysis of the role of international trade, aid and investment is essential in working out a solution.

Even though national income statistics are used widely in formulating public policy recommendations, the precise nature and significance of their role is not clearly established. In only a few countries have the methods reviewed been used intensively even on a technical level. Moreover, the weight which policymakers have given to recommendations based on these methods has been limited by other considerations that influence practical policies, as well as by the admitted shortcomings of the methods themselves.

The conclusions these methods suggest are uncertain partly because national income data are subject to considerable error but mainly because our knowledge of the future behaviour of the economic system is imperfect. National income estimates provide only a record of past events, and there is no guarantee that regularities disclosed by them will persist in the future. Nor will plans indicated in surveys of spending intentions necessarily materialize. While improvements in the statistics and in economic knowledge can be expected, it would be unrealistic to be overly hopeful about the extent to which economic forecasts can be made more firm. The interplay of economic forces is so complex, and their connections with noneconomic factors so numerous and close, that the odds against predicting economic events with a great deal of certainty seem overnhelming.

Nongovernmental uses of national income statistics also have become prominent. In particular, businessmen use the estimates to gauge the general economic climate in which their enterprises will operate. The over-all magnitudes embodied in these forecasts are used also to infer future market conditions for particular goods in which individual firms are interested, either as purchasers or sellers. These evaluations aid in the formulation of investment, production, price and other policies.

In addition to these and other applications, which have made national income statistics a widely used tool for practical orientation in the economic world, the data have been employed increasingly in academic studies. to test and develop hypotheses of economic theory. The problems encountered have to a large extent coincided with those confronted in the practical use of the data.

Sources and Methods of Compilation. — Existing programs of primary data collection are not designed specifically to measure national output, its components and the other entries in the national accounts. Instead, these magnitudes must be estimated by utilizing information prepared largely for other purposes. Prominent among this information are census enumerations and sample surveys, and statistics that are by-products of various governmental activities such as the administration of social security systems, tax laws and expenditure programs. Many other sources, too varied to summarize, are also used. The basic data often depart definitionally and in coverage from the items in the national income accounts. Estimation of these items involves, accordingly, the integration of all the available — and sometimes conflicting — information, and the filling of data gaps by resort to partial and indirect evidence.

National income figures are thus subject to error not only because of inaccuracies in the basic data but also because of imperfections in the estimating methods. Moreover, their margin of error cannot be precisely quantified, because the usual mathematical techniques for measuring error are not applicable to this complex case. Estimates of the margin of error which occasionally accompany national income figures fall short of definitional precision and incorporate a great deal of subjective judgment.

The reliability of national income statistics depends on the adequacy of the primary information and the effectiveness of the estimating techniques. It varies greatly from country to country, and within each country among the several entries in the accounts and according to the time period covered. Reliability is likely to be vastly higher for advanced industrial countries than for countries in which industrial processes have not developed. This situation is so mainly because industrial economies are characterized by transactions that lend themselves to registration in statistical form, and because the problems confronting such economies are likely to induce extensive data collection.

Other things being equal, relative errors in broad aggregates are likely to be smaller than those in its separately estimated components, because of offsetting error. For any given series, estimates referring to the remote past and to very recent periods are likely to be less accurate than estimates for intervening dates. This situation is so because the primary data diminish rapidly as one explores further into the past, and because estimates for recent periods are usually made before all the source material is at hand. Similarly, quarterly and monthly series are likely to be less accurate than annual estimates.

In an intensive use of the data it will be necessary to go beyond these generalizations and, mainly by an examination of the methodology underlying the estimates, form a judgment as to the order of their reliability. Thus, not only the preparation of national income statistics but also their use requires skill.

Availability of National Income Statistics. — National income estimates were prepared (in England) as early as the 17th century. But workmanlike estimates covering a span of years and built up from detailed components are largely a product of the 20th century. The economic problems associated with the depression of the 1930s and World War II made, it vitally important to understand the economy and gave further impetus to the development of the statistics. largely under governmental aegis. In the postwar period, problems of economic reconstruction and development have had similar effects.

Originally indigenous to western industrial countries, national income estimates are now available for a large number of others, differing widely as to needs. resources, technologies and institutional structure. The United Nations and other organizations have been active in promoting international comparability, both by developing standard accounting systems and by preparing compilations in which reported series are adjusted to uniform definitions.

Other noteworthy tendencies are the preparation of estimates on a less than annual basis and a speed-up in their publication schedules. This emphasis on recency reflects the active use of the data in current business analysis.

Unsettled Problems. — In conclusion, some outstanding unsolved problems relating to the design of national income statistics will be sketched.

1. As noted earlier, measures of national output are confined largely to output intended for sale, but marginal departures from this rule are made by imputing values to certain nonmarket items. These imputations are a source of irritation logically, because they do not flow from any general definition of output that can be specified. Moreover, the treatment of nonmarket production constitutes an acute practical problem in the analysis of economic conditions in countries whose market economies are undeveloped and also in international comparisons. Accordingly. much thought has been devoted to nonmarket output. Some progress has been made through the proposal of international conventions for its treatment, and *ad hoc* solutions may be found to serve the needs of specific analyses. But it seems doubtful whether an operational definition of national output not anchored to the market criterion ever can be devised.

2. There has been a persistent tendency to advance either market or factor price as the sole basis for valuing output, to the exclusion of the other method. On the whole, the market price valuation has gained in acceptance. It expresses goods in terms of the prices at which they are actually exchanged. and hence is the more realistic, easily understood and statistically convenient method.

The major justification of factor price series is that they are the best available measures of the services rendered by the ultimate agents of production, such as labour and capital, and that they provide a tool for the investigation of problems involving the allocation of these productive resources among alternative uses. Indirect business taxes must be excluded. it is maintained, because they do not reflect the services of productive agents as does the sum of wages, profits and other incomes originating in production.

The main objection to this argument is that it is based upon an assumption of circumstances — mainly stable and competitive business conditions — that do not obtain in practice. If these are absent, national output aggregates cannot be used to gauge resource allocation even if indirect taxes are excluded. For instance, the productive contribution of capital resources will not be reflected adequately in the national income totals in times of reduced economic activity when profits are depressed and in some instances even negative; similarly, monopolistic practices in an industry may give rise to incomes that give an exaggerated notion of the proportion of procedure resources actually engaged there.

3. Questions have been raised as to the proper distinction between final output and intermediate products. Specifically, it has been urged that not all of the output purchased by government be considered final, as is commonly done. Some of it should be excluded from the national output total, it is said, as are intermediate products. Somewhat more tentatively, it has been suggested that not all output bought by consumers be regarded as final either. No clear-cut proposals have been made, but the general idea appears to be to distinguish purchases that are direct causes of final human satisfaction from those that are only indirect conditions of it. and to exclude the latter. Opponents of the idea have argued that the proposed distinction cannot in fact be drawn; and they have not been refuted, either in logic or through the presentation of a viable classjfication that implements the proposed narrowing of the final product concept.

4. For some of the uses that are made of the data, it would be desirable to extend the definition of capital formation beyond its core, tangible capital formation by business, to intangible items, such as expenditures for industrial research, and to capital formation by government and consumers. Little has been done to recognize intangible capital, but capital expenditures by government have increasingly been taken into account, instead of being treated like current consumption.

The acquisition of residences is the only consumer purchase that is generally recognized as capital formation. There are sound reasons for extending this treatment to other consumer durables, inasmuch as these also outlast the normal accounting period and thus constitute additions to wealth. However, the extent to which capital accounting has been applied to them in actual national income estimates has been limited.

Measurement of capital formation on a gross basis, *i.e.,* before deduction of capital consumption allowances. raises problems because it is difficult to frame a uniform definition. For instance, it is hard to draw a systematic line which will either exclude or include repair and maintenance expenditures. In addition. the gross measure is insufficient because it does not show net additions to the capital stock. However, it appears difficult also to obtain a net capital formation measure that is meaningful for output measurement.

The conventional capital consumption allowances made by business are inadequate to serve as subtrahends from gross capital formation for this purpose. To an increasing extent they are affectedand made noncomparable over time by changes in tax laws. In addition, they are usually stated in terms of the original cost of the capital goods, and hence cannot be deducted from gross capital formation, which is expressed in current prices, to obtain a meaningful indication of the net change in capital stock. The realism of the methods used to allocate capital consumption charges over the lifetime of the assets is also often in doubt. It is not easy. however, to devise alternative, more meaningful measures of capital consumption.

The task of offsetting capital equipment used up against capital equipment produced is made difficult by changes in the character of the equipment, and by inadequate knowledge of the actual life span of capital goods and the time pattern according to which they are consumed.

5. Difficulties (additional to those involved in the accounting for nonmarket production) are encountered in comparing outputs produced in situations that differ radically as to needs, resources, technologies and institutional organization. These difficulties arise because in these circumstances the composition and the types of goods produced are likely to be very different. If, for instance. output of commodity A in one country is double that in another while output of commodity B is one-half, it is not possible to make an unambiguous comparison of the outputs of A and B combined. The result depends on the relative value that is attached to each commodity. Again, if in one time period output of transportation equipment consists of horse-drawn carriages, and in another of automobiles, it is not really possible to make a quantitative comparison between the two. As long as differences in composition and kind are moderate, the methods for calculating real national output described earlier will yield useful results. But little significance attaches to. the precise outcome of comparisons when these differences are substantial.

6. Apart from problems involving the definition of output, many others have arisen concerning accounting design: what are the economic groups whose activities should be separately shown? What types of accounts should be established? How should the transactions registered in the accounts be classified? What part of the information should be presented in interrelated accounts, and what part in supporting tables? While many of these issues are largely presentational, some have broader significance. For instance. the finances of unincorporated business are usually intermingled with the household finances of their owners, and one of the important problems of accounting design is to find a satisfactory place for unincorporated enterprise among business and household transactors.

BIBLIOGRAPHY.—International Association for Research on Income and Wealth, *Bibliography on Income and Wealth* (London, 1952–54), covers the period beginning 1937 and includes references to earlier bibliographies. Contributions to the national income field can often be found in works mainly devoted to related disciplines; *e.g.,* A. C. Pigou, *The Economics of Welfare* (London, New York, 1924). A. L. Bowley, C. Clark, S. Kuznets and J. R. N. Stone have made outstanding contributions specifically to the development of national income statistics. J. R. Hicks, *The Social Framework* (Oxford, 1952), and R. and N. D. Ruggles, *National Income Accounts and Income Analysis,* 2nd ed. (New York, 1956), are introductions. The Statistical Office of the United Nations publishes international compilations of national income data. I. Ohlsson, *On National Accounting* (Stockholm, 1953), is a comprehensive treatise. *A System of National Accounts and Supporting Tables,* United Nations Statistical Office (New York, 1953), is a proposal for a uniform system of national income accounts. M. Gilbert and I. B. Kravis, *An International Comparison of National Products and the International Purchasing Power of Currencies* (Paris, 1954), considers basic problems of international income comparisons. *National Inconze,* 1954 edition, Tational Income Division, U.S. Department of Commerce (Washington, D.C., 1954), describes the theoretical framework and statistical methodology of the United States estimates. *National Income Statistics, Sources and Methods,* Central Statistical Office (London, 1956), is a similar statement for the United Kingdom. *Personal Income by States Since 1929,* National Income Division, U.S. Department of Commerce (Washington, D.C., 1956), contains a discussion of the methodology underlying regional estimates. Income size distributions are considered in *Income Distribution in the United States, By Size, 1944–1950,* National Income Division, U.S. Department of Commerce (Washington, D.C., 1953); S. Kuznets, *Shares of Upper Income Groups in Income and Saving* (New York, 193'3); and T. Barna, *The Redistribution of Incomes through Public Finance in 1937* (London, 1945; New York, 1946). The Conference on Research in Income and Wealth and the International Association for Research in Income and Wealth each publish a continuing series, *Studies in Inconze and Wealth* (New York and Princeton) and *Inconze and Wealth* (London), respectively. Vol. 22 of *Studies* contains a comprehensive discussion of theoretical problems. (G. JI.)

NATIONALISM, a state of mind, in which the supreme loyalty of the individual is felt to be due to the nation-state. Though attachment to the native soil, to parental traditions and to established territorial authorities have been known throughout history, it was only at the end of the 18th century that nationalism began to become a generally recognized sentiment molding public and private life and one of the great, if not the greatest, single determining factors of history. Thus nationalism is a modern movement, but, in the short span of its existence as a dominant element of societal life and organization, it has shown such a dynamic vitality and such an all-pervading character that the mistake has frequently been made of regarding nationalism as a permanent, or at least very ancient, factor of history. In reality, nationalism arose as a dominant force in the 18th century in western Europe and in North America; the American and the French revolutions may be regarded as its first powerful manifestations. From the western world, after having penetrated the new countries of Latin America, it spread in the early 19th century to central

Europe, thence, toward the middle of the century, to eastern and southeastern Europe, until. at the beginning of the 20th century. it put its stamp on the ancient lands of Asia and Africa. Thus nationalism has become a dominating force everywhere —so much so that the 19th century has been called "the age of nationalism" in Europe, while the 20th century has witnessed the rise and struggle of national movements throughout Asia.

Nationalism implies the identification of the state or nation with the people, or at least the desirability of determining the extent of the state according to ethnographic principles. In the age of nationalism, but only in the age of nationalism. the principle was generally recognized that each nationality should form a state, its state, and that the state should include the whole nationality. Formerly states, or territories under one administration, were not delineated by nationality; men's loyalty was not due to the nation-state, but to other, different forms of political organization: the city-state, the feudal fief and its lord, the dynastic state, the religious group or the sect. The nation-state was nonexistent during the greater part of history and for a very long time it was not even regarded as an ideal. In the first 15 centuries of the Christian era the ideal was the universal world-state, not loyalty to any separate political entity. The Roman empire had set the great example which survived not only in the Holy Roman empire of the middle ages, but also in the res *publica christiana* (Christian republic or community) and in its later secularized form of a united world civilization and world policy as it appeared in the aritings of the 17th century.

As political allegiance, before the age of nationalism, was-not determined by nationality. so civilization was not thought of as nationally determined. During the middle ages civilization was looked upon as determined religiously; for all the different nationalities of Christendom as well as for those of Islam there was but one civilization — Christian or Moslem — and but one language of culture — Latin (or Greek) or Arabic (or Persian). Later in the periods of the Renaissance and of classicism, it was the ancient Greek and Roman civilizations which became a universal norm. valid for all people and all times. Still later French civilization was accepted throughout Europe as a valid civilization for educated people of all nationalities. It was only at the end of the 18th century that, for the first time, civilization was considered to be determined by nationality and the principle was put forward that a man can be educated only in his own mother tongue, not in languages of other civilizations and other times. be they classical languages or the literary creations of other peoples who had reached a high degree of civilization. From the end of the 18th century on, the nationalization of education and national life went hand in hand with the nationalization of states and political loyalties. In many cases poets and scholars emphasized cultural nationalism first. They reformed the national language, eievated it to the rank of a literary language and delved deep into the national past, thus preparing the foundations for the political claims for national statehood soon to be raised by people in whom they had kindled the spirit of nationalism.

National feeling was evident in certain groups at certain periods, especially periods of stress and conflict, before the 18th century. Its rise was prepared by a number of complex events: the creation of large, centralized states by the absolute monarchs, who destroyed the feudal allegiances and thus made the integration of all loyalties in one centre possible; the secularization of life and education which fostered the development of the vernacular languages and weakened the ties of religious or sectarian loyalties; the growing economic interdependence which demanded larger territorial units, which would at the same time give the necessary scope to the dynamic spirit of the rising middle classes and their capitalistic enterprise. This large. unified territorial state with its political and economic centralization was filled in the 18th century with a new spirit — an emotional fervour, similar to that which in preceding periods characterized religious movements. Under the influence of the new theories of the sovereignty of the people and the rights of man, the people replaced the king as the centre of the nation. No longer was he the nation or the state; the state had become the people's state, a national state, a fatherland. Nation and state became identified, as civilization became identified with national civilization.

This was opposed to all the conceptions which had dominated political thought for the preceding 2,000 years. During that period man had commonly stressed the general and the universal and had seen in unity the desirable goal. Nationalism stressed the particular and parochial, the differences and the national individualities. These tendencies became more pronounced as nationalism developed. In the 17th and 18th centuries the common standards of western civilization, the regard for the universally human, the faith in reason, one and the same everywhere, and in common sense, the survival of the Christian and Stoic traditions were all too strong to allow nationalism to develop fully and to disrupt the society of man. Thus nationalism in its beginning was thought compatible with cosmopolitan convictions and with the general love of mankind. This was especially true in western Europe and North America.

The first full manifestation of modern nationalism occurred in 17th-century England, in the Puritan revolution. That century saw England the leading nation in the scientific spirit, in commercial enterprise, in political thought and activity. Swelled by an immense confidence in the new age, the English people felt upon their shoulders the mission of history, a sense that they were builders of destiny at a great turning point from which a new true reformation and a new liberty would start. In the English revolution an optimistic humanism and Calvinist ethics merged; the influence of the Old Testament gave form to the new nationalism by identifying the English people with ancient Israel. The new message, carried by the new people not only for England, but for all mankind, was expressed in the writings of John Milton in whose famous vision the idea of liberty was seen spreading from Britain, "celebrated for endless ages as a soil most genial to the growth of liberty" to all the corners of the earth. "Surrounded by congregated multitudes, I now imagine that I behold the nations of the earth recovering that liberty which they so long had lost; and that the people of this island are disseminating the blessings of civilization and freedom among cities, kingdoms and nations."

English nationalism was thus much nearer to its religious matrix than later nationalism which rose after secularization had made greater progress. The nationalism of the 18th century shared with it. however, the enthusiasm for liberty, the humanitarian character. the emphasis upon the individual and his rights and upon the human community beyond all national divisions. The rise of English nationalism coincided with the rise of the English trading middle classes; it found its final expression in Locke's political philosophy. It was in that form that it influenced American and French nationalism in the following century.

The rising nationalism of the settlers in British North America was influenced partly by the English traditions of the Puritan revolution and of Locke, and partly by the new rational interpretation given to English liberty by contemporary French philosophers. American nationalism became the typical product of the 18th century. The American settlers became a nation engaged in a fight for liberty and individual rights, basing that fight on current political thought, especially as expressed by Thomas Jefferson and Thomas Paine. This was a liberal and humanitarian nationalism. regarding America as the vanguard of mankind on its march to greater liberty, equality and happiness for all. The ideas of the 18th century found their first political realization in the Declaration of Independence and in the birth of the American nation. Their deep influence was felt in the French Revolution which enthroned French nationalism in place of French royalty.

Rousseau had prepared the soil for the growth of nationalism, not only by his stress on popular sovereignty and the general co-operation of all in forming the national will, but also by his regard for the common people as the true depository of civilization. Under his influence Herder gained a new understanding of art and civilization by emphasizing folklore, folk songs and primitive popular traditions as revealing the true creative forces of a nation. He went beyond Rousseau in his appeal to the past, often to the primitive past. He glorified the instinctive and irrational, and turned attention from the universally human and general to the peculiarities of each national tradition, regarding them as valuable sources of creative inspiration. Under Herder's influence German romantic nationalism later stressed these factors of irrationalism and of national peculiarities. The nationalism of the French Revolution, on the other hand, was the triumphant expression of a rational faith in common humanity and liberal progress. The famous slogan of "liberty, equality, fraternity" and the Declaration of the Rights of Man and of the Citizen were thought valid not only for the French people, but for all peoples. Individual liberty, human equality, fraternity of all peoples: these were the common cornerstones of all liberal and democratic nationalism. In their name the French nation constituted itself, overthrew the monarchy and soon began to spread the new gospel across Europe. Under their inspiration a new ritual was developed which partly took the place of the old religious ritual: festivals and flags, music and poetry, national holidays and patriotic sermons. In the most varied forms nationalism permeated all manifestations of life. Like the rise of American nationalism, the rise of the French produced a new phenomenon in the art of warfare: the nation in arms. In America and in France, citizen armies, untrained but filled with a new fervour, proved superior to professional armies which, though highly trained, fought without the incentive of nationalism. The revolutionary French nationalism stressed the element of will, of free individual decision, in the formation of nations. Nations were constituted by an act of self-determination on the part of their members. The plebiscite became the instrument whereby the will of the nation was expressed. In America as well as in revolutionary France, nationalism meant the adherence to an idea, a universal progressive idea, looking toward a common future of freedom and equality, not toward the past which had been characterized by authoritarianism and inequality.

Napoleon's armies spread this nationalism throughout Europe and even into the near east; on the other side of the Atlantic it aroused the Latin Americans. But Napoleon's yoke turned the newly awakened nationalism of the European peoples against France. In Germany, where the struggle was led by writers and intellectuals. it turned not only into a rejection of Napoleon's rule but of all the principles upon which the American and the French revolutions had been based and of the liberal and humanitarian form of nationalism. German nationalism began to stress instinct against reason; the power of historical tradition against rational attempts at progress and a more just order; the historical differences between nations against their common aspirations for the future. The French Revolution, liberalism and equality were regarded as a brief aberration, against which the eternal foundations of societal order would prevail. This interpretation was shown to be false by the development of the 19th century. Liberal nationalism reasserted itself, it permeated more and more peoples, the rising middle class and the new proletariat. The revolutionary wave of 1848, the year of "the spring of the peoples." seemed to realize the hopes of nationalists such as Mazzini, who had devoted his life to the unification of the Italian nation by democratic means and to the brotherhood of all free nations. Though his immediate hopes were disappointed, the 12 years from 1859 to 1871 brought the unification of Italy and Rumania, both with the help of Napoleon III, and of Germany; at the same time the 1860s saw everywhere great progress in liberalism, even in Russia and Spain. This victorious trend of liberal nationalism was, however, reversed in Germany by Bismarck. He unified Germany on a conservative and authoritarian basis and defeated German liberalism. The annexation of Alsace-Lorraine against the will of the inhabitants was contrary to the principle of nationalism based upon the free will of man. The people of Alsace-Lorraine were held to be German by objective factors, by race, independent of their will or of their allegiance to any nationality of their choice.

In the second half of the 19th century, nationalism disintegrated the supranational states of the Habsburgs and the Ottoman sultans, both of which were based upon prenational loyalties. In Russia the penetration of nationalism provoked a twofold attitude: some nationalists advocated an acculturation of Russia to the general progress of western mankind. They proposed a westernized Russia, following the common destiny of progressive society. Others stressed the distinctive character of Russia, its independent and different destiny, based upon its past of autocracy and orthodoxy. These Slavophiles, similar to and influenced by German romantic thinkers, saw Russia as a future saviour of a west undermined by liberalism and the heritage of the American and French revolutions.

As a result of World War I, nationalism triumphed in central and eastern Europe. The new nation-states emerging from the ruins of the Habsburg and Romanov empires were, however, subject themselves to the strains of internal nationality conflicts and territorial disputes with neighbouring states. World War I also stirred the masses in Asia into nationalist demands. In 1885 Indian nationalists had organized the Indian National Congress to promote a liberal nationalism, inspired by the English model. On the other hand, Japan, influenced by Bismarck's Prussia, made use of modern industrial techniques to strengthen a more authoritarian trend. After World War I the Asian peoples inaugurated their age of nationalism under the leadership of such powerful personalities as Kemal Ataturk in Turkey, Saad Zaghlul in Egypt, Ibn Sa'ud in the Arabian peninsula, Gandhi in India and Sun Yat-Sen in China. Ataturk succeeded in revitalizing and modernizing the formerly medieval structure of Turkey, replacing the Islamic monarchy by a secular republic. The demands of Arab nationalists for Arab unity were frustrated by French and British imperialism. Yet Britain showed a gift for accommodation with the new forces. It helped create an independent Egypt and Iraq, and displayed a similar spirit in India, where the Congress had become more radical after 1918. In China Sun Yat-Sen pleaded before his death (1925) for China's co-operation with communist Russia.

Lenin's triumph in Russia in Nov. 1917 meant the triumph of international communism over Russian nationalism. From the beginning, however, communism appealed to the new nationalist movements in Asia and Africa for support in its struggle against western capitalism. Fascism and National Socialism in the 1930s presented an unprecedented intensification of nationalism. In their turn they influenced the older totalitarian movement of communism. In World War II Russian nationalism and imperialism reasserted themselves under the communist dictatorship. After World War II the communist leaders tried to use nationalism everywhere for their own purposes.

On the other hand nationalism in communist-controlled countries turned against the Russian claim of centralized leadership throughout the communist world. With Tito setting an example in Yugoslavia, this so-called national communism became an important factor and helped inspire the liberation movements in Poland and Hungary in the fall of 1956.

The end of World War II also saw a mighty resurgence of nationalism throughout Asia and its first powerful manifestation in Africa. This new Asian-African nationalism, which dominated the conference of Asian and African peoples in Bandung, Indon., in 1955, made itself felt to a growing degree in the 1950s in the world community represented by the United Nations. A number of new nations arose, some in a peaceful way as a result of timely British and U.S. concessions—India. Pakistan, Ceylon, Burma, Malaya, the Philippines and Ghana. Others had to fight hard for their independence in bitter colonial wars, as in French Indochina (Vietnam. Laos and Cambodia) and French North Africa.

This progress to independence through nationalism from colonial status was in accord with the best traditions of western liberalism as embodied in the governing principles of the League of Nations and the United Nations. But conditions in the second half of the 20th century. with its rapid advances in communication, indicated, beyond the fragmentization of the world into nation-states. the need for international co-operation on a world-wide basis corresponding to the new reality of the growing common destiny of mankind.

NATIONALITY. As a legal concept, nationality is distinguishable from the popular use of the term to denote membership in a nation, meaning a people bound together by ethnic, religious or linguistic ties. *(See* NATIONALISM.) It is also distinguishable from citizenship (*q.v.*), a somewhat narrower term that is sometimes used to denote the status of those nationals who have full political privileges. Before an act of the U.S. congress made them citizens in the full sense of the word, for example, American Indians were sometimes referred to as "noncitizen nationals."

Not only individual human beings but also companies (corporations). ships and aircraft have nationality for the purposes of law. It is in reference to natural persons, however, that the term finds most frequent use. In general, nationality implies the duty of allegiance on the part of the person and the duty of protection on the part of the state. The UN Universal Declaration of Human Rights *(see* CIVIL LIBERTIES) in 1948 stated that "everyone has the right to a nationality" and that "no one shall be arbitrarily deprived of his nationality. . . ." Whether an individual possesses the nationality of a particular state may determine whether or not that state has a right to exercise jurisdiction over him in certain circumstances. If he is a national he may enjoy political and economic rights and privileges that he would not otherwise have. Wow one acquires nationality, how it may be lost, the possibility of statelessness and applications of the concept in international legal relations are matters of some practical importance.

The concept of nationality is found in both international law and national law. It is the nation-state which sets the criteria, through constitutional or statutory provisions, for determining who shall be its nationals. The right of a state to confer its nationality is, however, not unlimited, for otherwise it might impinge upon other states' rights to determine what persons shall be their nationals. By the *jus soli,* a person who is born within a state's territory and subject to its jurisdiction acquires that state's nationality by the fact of such birth. By the *jus sanguinis,* a person has a nationality as an inheritance from one or both of his parents. States vary in their use of these two principles. Some give priority to the *jus soli* but also rely to some extent on the *jus sanguinis;* others apply principally the *jus sanguinis,* but not all of these exclude the *jus soli.* When one state cedes territory to another, inhabitants of the region that is ceded commonly have. at the will of the acquiring state, an opportunity to acquire that state's nationality.

Practice, however, supports the idea that the individuals concerned should be allowed a free choice, with the understanding that those who choose to retain their old nationality may have to leave the territory. Still another method of acquiring nationality is through the process of naturalization.

An individual may lose his nationality through extinction of the state of which he has been a national. He may also lose it through naturalization in another state, but there is no universally binding law which requires that a state must recognize that one of its nationals, by reason of his being naturalized in a foreign state, has divested himself of his former nationality. There have been some treaties committing each signatory to recognize that its nationals who have migrated to the territory of another signatory and become naturalized there shall be regarded as having divested themselves of their original nationality.

The right of expatriation has not been universally recognized, however, and the possibility of dual or multiple nationality remains. Nor has the effort to eliminate statelessness been completely successful, although such an objective was considered by the Hague codification conference of 1930 under League of Nations auspices and by the International Law commission of the United Nations.

Under United States legislation of the 1950s, loss of nationality may be the result of treason, desertion from the armed forces, evasion of the military draft, service in the army of a foreign state or voting in an election in a foreign state. Naturalized citizens may in certain circumstances lose their acquired nationality by reason of long residence in some other state.

In the late 1940s there was a move in the British Commonwealth to continue, through parallel legislation, a common status of British subject or commonwealth citizen, while each of the states retained its own citizenship. *(See* COMMONWEALTH OF NATIONS: *Nationality and Citizenship.)* Such common status as was the result did not rest indefinitely upon a common allegiance, as some of the states concerned adopted the republican form of government.

One problem that has been dealt with in national legislation and in a projected international agreement is that of the nationality of married women. The trend has been away from the practice that allowed a woman's nationality to be changed by the mere fact of her marriage or by a change in her husband's nationality. The United Nations general assembly in 1957 approved a Convention on Nationality of Married Women that embodied the rule that a woman's nationality is not to be automatically changed by virtue of the celebration or dissolution of marriage.

In international legal relations nationality assumes significance in various circumstances. The fact that a person is a national of a state may be the basis for that state's exercising criminal jurisdiction over him, although his alleged crime may have been committed outside the state's territory. In making extradition treaties, states have often included clauses making it optional for them to surrender persons who are their own nationals. If a state desires to expel a person from its territory there is no international legal obligation for any state, other than the one of which the person is a national, to receive him.

A state's failure to afford reasonable protection to aliens may lead to claims by other states, the adjudication of which will require decision of questions concerning the nationality of claimants. The rule normally applied is that the claimant must be, for the purpose of a claim brought before an international claims commission, a national of the applicant state continuously from the time the cause of action has arisen to the time of the actual adjudication.

Legal questions may also arise in connection with legislation affecting alien enemies. Such persons may seek to avoid disabilities by becoming naturalized in a third state, but such efforts are not always successful. The International Court of Justice in the *Nottebohm Case* in 1955, for example, held that Guatemala was not bound to recognize the naturalization of a German national by Liechtenstein because the individual had not had a sufficiently close connection with the state concerned.

NATIONALIZATION is one of a number of ways in which the state can alter or terminate the control or ownership of private property. Generally, in mature systems of law, the state or local government authorities possess the right to take private property for particular public purposes, such as the construction of roads, reservoirs or hospitals. In 1254 a power of this nature was granted by charter to the city of Copenhagen. Other examples may be found in the middle ages in German and Scandinavian law. The same principle was acknowledged in the French Declaration of the Rights of Man in 1789, as it was also in the fifth amendment to the constitution of the United States. The exercise of this right, which is normally accompanied by the payment of compensation, may be described as "expropriation" or as "eminent domain" (*q.v.*). By contrast, "nationalization" is historically a more recent development and differs both in motive and degree from "expropriation."

Nationalization is customarily, though not exclusively, associated with the implementation of communist or socialist theories of government This is certainly true both of the transfer of industrial, banking and insurance enterprises to the state in Russia in the period after the acquisition of power by the Soviet regime in 1918 and of similar developments in Bulgaria. Czechoslovakia, Hungary, Poland, Rumania and Yugoslavia after World War II. The same may be said also of the nationalization of the coal. electricity, gas and transport industries in the United Kingdom and France between 1945 and 1950. However, the conscious implementation of political and economic doctrine has on occasion become mixed with resentment at foreign control over industries upon which the state may be largely dependent. This was clearly a factor in the nationalization of the oil industries in Mexico in 1938 and in Iran in 1951, and in the nationalization of the Suez Canal company in Egypt in 1956. (See PERSIA: History; SUEZ CANAL.)

The process of nationalization may take various forms, especially in the case of industries owned primarily by companies. In some instances, the assets of the nationalized companies are transferred to the state; in others, the share capital is made the object of the transfer, leaving the company in existence to carry on its business under state control. But whatever the process employed, the result is ultimately that title to or control over the property is placed in the state itself or in a state-established and publicly controlled organ.

Questions of international law normally arise only when the property is owned either by aliens or by companies in which aliens have a large shareholding interest. It has become established as a matter of general principle that aliens carrying on activities or owning property in foreign states are entitled to treatment in accordance with a "minimum standard of international law" In particular. the arbitrary treatment of aliens is unlawful, as is discriminatory treatment directed toward them solely because they are aliens. In addition, as a result of a number of diplomatic episodes and international arbitrations, it is acknowledged, at least in relation to isolated takings of private property, that such taking is lawful only if accompanied by the payment of fair compensation. There are two leading decisions on this point. In the case of the Norwegian ships (Norway v. United States, 1925), the Permanent Court of Arbitration held that the United States was under an obligation to pay to Norwegian nationals, whose rights under certain shipbuilding contracts had been seized by the United States during World War I, a sum described as "fair compensation" for the loss which they had suffered. In assessing the amount payable, the court took into consideration such factors as the value of the contracts as between a willing buyer and a willing seller on the date of the seizure, the sum which the Norwegian nationals had actually expended and the amount of interest due if payment in respect of the seizures had been promptly made. The second case, that of the *Chorzów* factory, between Poland and Germany, decided by the Permanent Court of International Justice in 1927 and 1928, arose out of the seizure by the Polish authorities of certain German property in breach of the terms of the treaty of Versailles and of the Geneva convention of 1922. The case is notable for the distinction drawn by the court between lawful takings of alien property. for which fair compensation should be paid, and unlawful takings, for which not mere compensation, but true damages, assessed on the principle of *restitutio* in *integrum* (restoration of the original situation), should be paid. This principle requires that if the wrongdoer cannot discharge his primary obligation of restoring the injured party to his control of the property unlawfully seized, the injured party should be paid such sum as would notionally put him in the same position as if the wrong had not been committed. Although in this case the taking was unlawful because it involved a breach of a treaty, the judgment is also open to the interpretation that a taking may be unlawful if no genuine attempt is made to assess or pay fair compensation. A further important feature of the judgment is that, in relation to lawful taking, it identifies "fair compensation" with "the value of the undertaking at the moment of dispossession, plus interest to the day of payment," and thus establishes an objectively ascertainable standard of fair compensation.

It remains a matter of controversy whether these authorities apply with equal force when the scale of the taking of alien property is expanded from isolated expropriation to large-scale nationalization. On the one hand, emphasis is placed upon the continuing rights of the foreign investor. It is argued that these rights remain unaffected by any difference in degree between expropriation and nationalization; that there is no reason why the foreign investor should bear the cost of implementing local political policies; and that the alien suffers equal material loss in both cases. The right to nationalize alien property is, for these reasons, said to be conditional upon the payment of "prompt, adequate and effective compensation." On the other hand, stress is laid upon the sovereign right of every state to determine its own political, social and economic future. If need or theory require that the ownership of property should be vested in the state, its freedom of action should not be fettered by the fact that it is too poor to pay the fair market price for alien property. The foreign investor, it is argued, places his capital abroad in the hope of making profits, and he would not do so if he did not consider that the returns outweighed the risks. This contention is frequently coupled with the assertion that in many cases the value of the original investment of the alien had been fully returned to him in the shape of profits repatriated during the period of operation.

No international tribunal has yet been placed in a position to express an authoritative view on the controversy. The suggestion has been made that in case of true nationalization the solution lies in the payment of "partial compensation." It is doubtful, however, whether this formula is either sufficiently precise or adequately supported by authority for it to be accepted as representing existing law; though, admittedly, in practice, many disputes have been settled by agreement for amounts which have fallen short of the real value of the property involved. When the British claims against Mexico in respect of the expropriation of the oil properties were settled in 1947, the compensation secured probably did not amount to more than one-third of the value of the property seized. Nor was any higher standard of compensation achieved by the "lump sum" agreements relating to the nationalization measures of the eastern European states after World War II. Although this method of settlement normally leads to the certain payment of at least a proportion of the true value of the property, it has been estimated, for example, that under the agreements between the United Kingdom and Yugoslavia and Czechoslovakia the original owners can have received respectively no more than 45% and 25% of their claims. It is more difficult to assess the value of the settlements reached in the Anglo-Iranian oil company and Suez Canal company disputes. In the former, it was agreed in 1954, as part of a wider arrangement relating to the oil industry in Iran, that Iran should pay to the company the sum of £25,000,000 which represented a balance struck after taking into consideration various unspecified claims and counterclaims. In addition, the company became a 40% participant in the consortium of oil companies established to operate the oil industry on behalf of the Iranian government and is understood to have received certain payments from the other members of the consortium.

In the case of the Suez Canal company, the Egyptian government agreed in 1958 to pay to the company a sum of £E28,300,000 over a period of six years and to allow the company to retain all its assets situated outside Egypt.

However, despite the apparent generality of the practice of settling nationalization disputes by agreements providing for compensation which does not represent the full value of the property nationalized, there does not appear to be sufficient warrant for the view that customary international law now acknowledges the validity of nationalizations which are not accompanied by the payment of fair compensation. There is equally no adequate justification for the view that, because a number of states have nationalized foreign companies in breach of express undertakings to permit their operation for a fixed period of years, there is no rule of international law which protects specific contractual commitments. Nevertheless, as a means of reducing difficulties arising out of the uncertain content of the rules of customary international law relating to compensation, states whose nationals tend to be investors are placing increasing reliance upon specific treaty clauses providing for the protection of investments. The United States, in particular, has since the end of World War II entered into treaties of friendship, commerce and navigation which contain mutual undertakings on this point, coupled with clauses conferring compulsory jurisdiction upon the International Court of Justice.

For socialist and communist attitudes toward nationalization *see* COLLECTIVISM; COMMUNISM; SOCIALISM.

NATIONAL PARKS AND NATURE RESERVES. For hundreds if not thousands of years and in many countries man has given some sort of protection to those wild animals he has used for food and sport. Before the 19th century he seldom had any other motives; it is only relatively recently that animals have been thought worthy of preservation for their own sakes and for the appreciation of future generations of mankind. Even more recently has man begun to realize that it is not only the so-called game animals that need to be preserved, but the forests, the water and the soil itself—in fact, the whole natural scene.

Whatever the motives for preservation, the means must nearly always include setting aside areas where restraints are enforced. Such restraints may be permanent or restricted to certain months of the year; they may give protection to all creatures or to one class only (for example, birds) or even to one particular species, or they may impose restrictions upon the use of certain natural resources, such as timber. The area may be tiny or very large, privately owned or in government hands.

Because there are so many kinds of areas of preservation and because they have been coming into being in many countries at the same time, it is hardly surprising that there has been little uniformity of terminology. A national park in the United States or Canada is intended to safeguard natural features and wildlife in a way that will contribute to public enjoyment. National parks in England and Wales are thinly inhabited regions where the natural scenery is safeguarded; animal and bird life in Britain is preserved in nature reserves. In Africa, generally, the chief purpose of a national park is the preservation of wildlife. A game reserve may be a place where a stock of game for shooting is maintained by game management or it may be a larger area designed to preserve wildlife that is rapidly disappearing elsewhere. Even within a single country where the legal status implied by a name is usually clear, the actual effect of restrictions may vary from being highly effective to being worse than useless. A game reserve that is small in area may be invaluable because it protects a rare species and is properly guarded; another enormous area without guards and with only nominal restrictions may be a happy hunting ground for lawbreakers. In some countries, also, the local people have not learned the economic and tourist potential in their wild animals and slaughter them indiscriminately, either for meat or for portions of the carcass, or destroy the essential habitat by overgrazing of domestic livestock or by using the lands for crops.

The paradox of national parks is that whereas they may depend on tourists for their existence by creating public interest in wildlife preservation, the animals themselves depend for their preservation on being unmolested. The best way of resolving this paradox would seem to be to restrict the movement of the visitor, as has been done in numerous parks, by setting aside an area within or near the national park where hotels, restaurants, parking places for cars, etc., can be provided, and by locating a limited number of roads within the park. A constructive partnership must, in fact, be established between those responsible for tourism and those responsible for the preservation of the natural features the park was established to safeguard.

In a comprehensive article such as this it is not possible to distinguish between the effectiveness of areas of preservation nominally enjoying the same status, a fact that should be kept in mind in using the tables in this article. (These tables are derived from *Derniers Refuges, Atlas Commente des Réserves Naturelles dans le Monde*, published in 1956 by the International Union for the Conservation of Nature and Natural Resources and parts i and ii of the United Nations' *List of National Parks and Equivalent Reserves*, 1961 and 1962. Permission to use them is gratefully acknowledged.) (C. L. BE.)

This article is divided into the following main sections:

I. United States
II. Canada
III. Africa
IV. Asia
V. Great Britain
VI. Europe
VII. Australasia
VIII. Central and South America

I. UNITED STATES

The United States was long notoriously wasteful with its resources. In the brief span of three centuries verdant forests of vast regions were leveled, cover was torn from its soil, wildlife was pillaged and countless other offenses were committed against the natural fertility of the land. Fortunately, steps were taken early to prevent the exhaustion of natural resources. One early move in this direction was the transfer to the state of California, in 1864, of the Yosemite valley and the Mariposa grove of *Sequoia gigantea;* they were added to Yosemite National park in 1906. The concept of national parks under federal ownership originated in 1870, when the Doane-Washburn expedition investigated reports of the wonders of the Yellowstone. After some discussion of developing this region under the homestead laws, the matter was resolved when a member of the expedition, Cornelius Hedges, proposed that it should be the possession of all the people. Members of the expedition drafted legislation to that end, creating Yellowstone park, and it was signed by Pres. Ulysses S. Grant in 1872. Eighteen years passed before Yosemite, Sequoia and General Grant National parks were established in 1890. During this time the idea of protecting outstanding scenic and scientific resources, wildlife and vegetation, for their own sakes, and to ensure perpetuation of the aboriginal attributes of the American scene grew into a concept of national policy.

The national park system was expanded during the following decades, not only with the addition of vast natural areas, but also with the inclusion of places of especial significance in the human history of exploration of the continent and the development of American Indian culture. By the 1960s, the system included 192 areas encompassing 26,500,000 ac., of which 26,000,000 were in federal ownership.

Much of this land was originally part of the public domain, as was almost all of the land acquired by the new republic, beginning with western lands ceded by seven of the original thirteen states and continuing with later acquisitions such as the Louisiana Purchase. (For the disposition of this vast amount of territory *see* LAND TENURE: ECONOMIC AND AGRARIAN ASPECTS: The *United States;* and LAND SYSTEM [U.S.].) From these public lands were reserved the national forests, most of the national park system and many other reservations. However, large tracts have been donated to the national park system by some of the states and some gifts have been made by individuals.

Kinds of Protected Areas.—National parks are established by congress; another act of congress is required to change boundaries or to modify the basic protection, unless boundary adjustment provisions were specifically stated in the original act. National parks have been defined as spacious land and water areas of nation-wide interest established as inviolate sanctuaries for the permanent preservation of scenery, wilderness, and natural vegetation and animal life in their natural condition. By the 1960s, there were 30 national parks. encompassing 13,500.000 ac., most of them quite large, 20 comprising more than 100,000 ac. each.

National monuments are established by specific acts of congress or under the Antiquities act of 1906 which authorizes the president to reserve, by proclamation, federal lands for 'the protection of objects of historic, prehistoric and scientific interest: the latter provision enables the president to act without delay to safeguard assets in danger of despoilment. Jurisdiction over national monuments was originally in the hands of several different federal agencies but in 1933 it was consolidated under the national park service.

By 1962 the system included 83 national monuments (9,148,908 ac.), 33 of which protect natural areas of scientific importance. Among the largest, Katmai, in Alaska, contains active volcanoes and the Valley of the Ten Thousand Smokes as well as extensive forested habitat of several species of bears and other wildlife; Glacier Bay National monument (*q.v.*), also in Alaska, contains some of the most impressive active tidewater glaciers on the continent, high mountains and abundant wildlife; Death valley (*q.v.*) in California-Nevada contains outstanding sonoran desert ecology.

Other monuments, ranging from a square mile to several hundred thousand acres, are notable for their canyons, caverns, natural arches and other geological features, or for botanical exhibits such as succulent cactus, Joshua trees, coastal redwoods, etc. Some have been established especially to safeguard particular species of wildlife. Remains of aboriginal Indian cultures are preserved in 20 national monuments; most of these are in the southwestern states but some are in other parts of the country. The remaining 30 relate to the history of the continent after the coming of the white man. Places notable in the colonial. Revolutionary and Civil War periods in the east, sites made famous in the settling of the west and landmarks in the careers of the nation's leaders are preserved and restored.

The national park service also administers national historical parks, military parks, battlefield parks and sites, and memorials commemorating principal engagements of the French and Indian War, the American Revolution and Civil War, and historic residences and sites not included in the system of national monuments. The value of this kind of preservation may be seen, for example, in the village of Appomattox Court House in Virginia, where Gen. Robert E. Lee surrendered to Gen. U. S. Grant on April 9, 1865, thus effectively terminating the Civil War. The village was at that time the seat of Appomattox county; later, when the county seat was moved elsewhere, it fell into decay and was in danger of total disappearance when its establishment as a national historical monument was authorized in 1935. It was thus established in 1940 and became a national historical park in 1954. It encompasses 972 ac.; the Wilmer McLean house, where the surrender took place, was restored, as were some other buildings.

There are three national parkways: the Blue Ridge parkway (to be 477 mi.), following the Appalachian ridges between Shenandoah and Great Smoky Mountains National parks; the Natchez Trace parkway, to follow the old Indian trail for 450 mi. between Nashville, Tenn., and Natchez, Miss.; and the George Washington Memorial parkway in Maryland and Virginia, 49 mi. when completed. Also included in the system are 10 Civil War cemeteries; the Cape Hatteras National Seashore Recreation area in North Carolina; the Theodore Roosevelt National Memorial park in the badlands of North Dakota; and the national capital parks in the District of Columbia, Maryland, Virginia and West Virginia. Public use of three large reclamation reservoirs is administered (as national recreation areas) by the park service: Lake Mead (1,951,928 ac.) in Arizona and Nevada, created by Hoover dam; Franklin D. Roosevelt lake (98,500 ac.). formed by Grand Coulee dam in Washington state; and Shadow mountain (18,240 ac) on the western edge of Rocky Mountain National park in Colorado.

Administration of the National Park System.—The national park service was established by an act of congress on Aug. 25, 1916, to administer the assigned areas "by such means and measures as conform to the fundamental purpose of said parks, monuments and reservations, which purpose is to conserve the scenery and the natural and historic objects and the wildlife therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations." This directive protects the national park system (a generic term that includes all the areas the park service administers except reservoirs) from exploitation for profit or from any development that would contravene the primary objective, that of preserving natural or historical features.

Park service policy, based on this act and augmented by more detailed formulations issued by the secretary of the interior and the service itself, is applied equally to all the categories in the system, with minor adjustments that recognize their varied characters. Placing first emphasis on protection, with public use and enjoyment an essential corollary part of the objective, this concept of park administration has been adopted by many nations which later established national park systems of their own.

The system possesses natural resources attractive to interests that might profit from their exploitation, and from the beginning there have been repeated attempts to induce congress to weaken the rigid legal protection given one area or another. Yellowstone, Yosemite, Kings Canyon, Glacier, Grand Canyon and other areas include canyons where construction of hydroelectric or reclamation dams has been vigorously resisted; national controversies have raged over legislation that would have permitted Yellowstone lake to be dammed, Echo park in Dinosaur National monument to be flooded and other similar projects. Frequent efforts have been made to open individual parks and monuments, and even all of them. to mining; except within four areas (Mt. McKinley National park, Glacier Bay. Death Valley and Organ Pipe Cactus National monuments) in which mining is subject to regulation by the secretary of the interior, and a small section of Katmai National monument, mining was prohibited in the system.

On the principle that the native species should follow their natural behaviour patterns insofar as possible, hunting of all wildlife, including predators, is prohibited. In a few instances this policy, together with the fact that the aboriginal wildlife habitat lying beyond the park boundaries has been developed for human economic reasons, has resulted in overpopulations of certain large mammals so that the carrying capacity of the park ranges has been endangered, and the secretary of the interior has authority to reduce such species when scientific evidence demonstrates the need. The most notable case is that of the wapiti in Yellowstone, where thousands of these elk share insufficient ranges with bison, deer, bighorn sheep and antelope. Proposals to open the park to public hunting were rejected as violating the fundamental objective, and a program of elk reduction by deputized hunters in parts of nearby Grand Teton National park proved ineffectual.

Grazing of livestock is considered an activity not conforming to the purpose of the parks but occasionally there are demands that the grasslands in the system be made available to domestic animals. Grazing privileges in effect at the time lands are brought under park service jurisdiction are continued only through the lifetime of the permittee's immediate heirs, and grazing is gradually being reduced.

Overdevelopment, imperiling the assets the parks were established to safeguard, is probably the most difficult problem now confronting the administrating agency. Earlier, when most of the areas were remote and transportation slow and expensive, it was necessary to advertise them to arouse public interest in the national park program. Hotels and lodges were built in the parks, roads were provided to serve the infant tourist movement and dude ranching was developed. During the depression of the 1930s the modest appropriations provided by congress were sup-

Table I.—*A Partial List of Areas Administered by the United States National Park Service*

Name and location	Total gross acreage	Date established	Principal features
National Parks			
Acadia (Maine)	41,634	Part as Sieur de Monts National monument, 1916, and Lafayette National park, 1919; named Acadia, Jan. 19, 1929	Mount Desert Island and adjacent Atlantic coastal headlands; forests, mountains, sea birds
Big Bend (Texas)	708,221	June 12, 1944	Great bend of Rio Grande river; desert and mountain scenery; sonoran wildlife and botany
Bryce Canyon (Utah)	36,010	National monument, 1923; national park, Sept. 15, 1928	Vast eroded amphitheatres on Paunsagnnt plateau, with brilliantly colored spires, pinnacles and walls
Carlsbad Caverns (New Mexico)	49,448	National monument, 1923; national park, May 14, 1930	World's largest limestone caverns; calcite formations; hats; sonoran desert ecology
Crater Lake (Oregon)	160,290	May 22, 1902	Azure caldera 20 sq.mi. in area with multicolored 'walls 500 to 2,000 ft. high; conifer forests alpine tundra, abundknt wildlife
Everglades (Florida)	1,400,533	June 20, 1947	Subtropical wilderness grassland prairies, with mangroves, cypress and other plants; breeding colonies of egrets, herons ibises, etc.; manateed; includes most of Florida bay
Glacier (Montana)	1,013,129	May 11, 1910	Glaciated Rocky mountain peaks, glaciers, lakes, forests, wildlife. Forms part of Waterton-Glacier International Peace park, established 1932
Grand Canyon (Arizona)	673,575	National monument, 1908; national park, Feb. 26, 1919	Upper half of 217-mi. gorge of Colorado river, 4 to 8 mi. wide, about 1 mi. deep; tremendous pediments, mesas and buttes carved in multicolored rocks dating from Archean to Mesozoic eras; sonoran and montane ecology
Grand Teton (Wyoming)	310,350	Feb. 26, 1929; most of Jackson Hole National monument added 1950	Isolated glaciated Teton range with peaks to 13,766 ft.; broad open basin in foreground; conifer forests; winter feeding ground of largest American elk herd; moose, trumpeter swan, other wildlife
Great Smoky Mountains (North Carolina-Tenn.)	511,714	June 15, 1934	Appalachian ranges; primeval hardwood forests; wildlife
Haleakala (Hawaii)	26,403	July 1, 1961	Haleakala volcano on Maui; endemic plants. products of volcanif activity
Hawaii Volcanoes (Hawaii)	220,345	National park including Haleakala, 1916; separate unit, July 1, 1961	Mauna Loa and Kilauea active volcanoes on island of Hawaii; tree fern forests with rare endemic plants and wildlife
Hot Springs (Arkansas)	989	Federal reservation, 1832; national park, March 4, 1921	Hot mineral springs and baths; characteristic Ozark woodland
Isle Royale (Michigan)	539,339	April 3, 1940	Forested island in Lake Superior; moose and other wildliie
Kings Canyon (California)	454,650	General Grant National park, 1890; enlarged as Kings Canyon National park, March 4, 1940	Canyons of Kings river and crest of Sierra Nevada range; General Grant grove of *Sequoia gigantea*
Lassen Volcanic (California)	106,933	Part as national monument 1907; national bark, Aug. 9, 1916	Lassen peak is the only recently active volcano in continental U.S. outside of Alaska; geologic, botanic' and wildliie features
National Parks (*Cont.*)			
Mammoth Cave (Kentucky)	51,354	July 1, 1941	Limestone cave, 150 mi. of passages explored, with limestone, gypsum and cave onyx formations; underground rivers and lakes
Mesa Verde (Colorado)	51,334	June 29, 1906	Protects prehistoric Basket Maker and Pueblo Indian pit houses and finest cliff dwellings in the U.S.; Rocky mountain ecology
Mount McKinley (Alaska)	1,939,493	Feb. 26, 1917	Highest peak in North America, glaciers in Alaska ranee; arctic tundra: caribou. Dall sheep, wolves, 'bears, other wildlife
Mount Rainier (Washington)	241,782	March 2, 1899	Spectacular ancient volcano, with glaciers; dense forests, meadows, wildlife
Olympic (Washington)	896,599	Mount Olympus National monument, 1909; enlarged as national park, June 29, 1938	Wilderness of peaks, glaciers and rain forests; Roosevelt elk (subspecies of the wapiti); headlands and beaches along Pacific ocean
Platt (Oklahoma)	912	Sulphur Springs reservation, 1902; national park, June 29, 1906	Cold mineral springs; prairie ecology
Rocky Mountain (Colorado)	260,018	Jan. 26, 1915	Front ranges of Rocky mountains, with 65 named peaks in excess of 10,000 ft.; conifer forests alpine tundra, abundknt wildlife
Sequoia (California)	386,551	Sept. 25, 1890	Groves of *Sequoia gigantea;* adjacent to Kings Canyon National park and administered jointly with it
Shenandoah (Virginia)	212,304	Dec. 26, 1935	Blue Ridge of Appalachian mountains with hardwood forests and wildflowers. Skyline drive traverses crest, continuing south as Blue Ridge parkway to connect with Great Smoky Mountains National park
Virgin Islands (Virgin Islands)	9,500	Dec. 1, 1956	Caribbean island with green hills, bkaches, tropical plants and animals; historic relics of Carib Indians and colonial sugar plantations
Wind Cave (South Dakota)	28,059	Jan. 9, 1903	Limestone caverns in Black hills; conifer forests, open prairies; bison, antelope, prairie dogs, other wildlife
Yellowstone (Wyoming-Montana-Idaho)	2,221,773	March 1, 1872	World's largest geyser area; canyons falls, lakes, moun'tains; abundant ,wildlife of many species
Yosemite (California)	760,951	Oct. 1, 1890	Spectacular peaks, canyons, waterfalls in Sierra Nevada range; three groves of giant sequoias; dense forests; alpine tundra, wildlife
Zion (Utah)	147,035	Mukuntuweap National monument, 1909; named Zion National monument, 1918; national park, Nov. 19, 1919	Colourful tertiary canyons and mesas in high desert region
National *Monuments*			
A. Natural Areas			
Arches (Utah)	34,010	April 12, 1929	Eroded arches, pinnacles, in desert
Badlands (South Dakota)	111,530	Jan. 25, 1939	Eroded sedimentary badlands many fossils; short-grass prairie ecology

TABLE I.—A Partial List of Areas Administered by the United States National Park Service (Continued)

Name and location	Total gross acreage	Date established	Principal features
A. Natural Areas (*Cont.*)			
Black Canyon of the Gunnison (Colorado)	13,548	March 2, 1933	Sheer-walled canyon in San Juan mountains region
Buck Island Reef (Virgin Islands)	850	Dec. 28, 1961	Coral reefs and undersea formations; marine gardens
Capitol Reef (Utah)	39,173	Aug. 2, 1937	Colorful sedimentary sandstone cliffs dissected by a narrow gorge along Fremont river
Capulin Mountain (New Mexico)	680	Aug. 9, 1916	Asymmetrical recently extinct volcanic cinder cone
Cedar Breaks (Utah)	6,155	Aug. 22, 1933	Vast natural amphitheatre eroded into variegated Pink cliffs 2,000 ft. thick; wildflowers
Channel Islands (California)	18,167	April 26, 1938	Santa Barbara and Anacapa Islands (1,120 ac. land area) offshore from southern California to protect sea lion and sea bird rookeries
Chiricahua (Arizona)	10,646	April 18, 1924	Tertiary rhyolitic monolitbs and other geological features; arid mountains, desert and montane ecology with Mexican affinities
Colorado (Colorado)	17,693	May 24, 1911	Canyons, monoliths, in arid mesa region; bison
Craters of the Moon (Idaho)	48,184	May 2, 1924	Volcanic geology
Death Valley (California-Nevada)	1,907,760	Feb. 11, 1933	Desert wilderness: geological, botanical, faunal features; pioneer history
Devils Postpile (California)	798	July 6, 1911	Basaltic lava columns rising as high as 60 ft.
Devils Tower (Wyoming)	1,347	Sept. 24, 1906	865-ft. exposed volcanic intrusion
Dinosaur (Utah-Colorado)	205,136	Oct. 4, 1915	Spectacular canyons of Green and Yampa rivers; quarry of dinosaur fossils
Glacier Bay (Alaska)	2,274,595	Feb. 26, 1925	Large tidewater glaciers, fiords; postglacial forests; abundant wildlife, especially several species of bears
Grand Canyon (Arizona)	198,280	Dec. 22, 1932	Lower part of Grand canyon, including inner gorge
Great Sand Dunes (Colorado)	36,740	March 17, 1932	Shifting aeolian dunes at foot of Sangre de Cristo mountains; among the largest and highest dunes in U.S.
Jewel Cave (South Dakota)	1,275	Feb. 7, 1908	Limestone caverns with fine calcite encrustations
Joshua Tree (California)	557,992	Aug. 10, 1936	Stands of Joshua tree; sonoran desert ecology
Katmai (Alaska)	2,697,590	Sept. 24, 1918	Active volcanoes; Valley of Ten Thousand Smokes; subarctic conifer forests; Alaskan brown bear and other wildlife
Lava Beds (California)	46.239	Nov. 21, 1925	Volcanic geology; semiarid mountain ecology; site of Modoc Indian war of 1873
Lehman Caves (Nevada)	640	Jan. 24, 1922	Ornamented limestone cavern in isolated Snake range
Muir Woods (California)	504	Jan. 9, 1908	Virgin stand of coastal redwood (Sequoia *sempivirens*)
Natural Bridges (Utah)	2,650	April 16, 1908	Three natural bridges, the highest 222 ft. above stream bed, with span of 261 ft.
Oregon Caves (Oregon)	480	July 12, 1909	Limestone caverns, with Jeffrey pine forest on surface
Organ Pipe Cactus (Arizona)	330,874	April 13, 1937	Outstanding exhibit of sonoran desert plants and wildlife
Petrified Forest (Arizona)	94,161	Dec. 8, 1906	Extensive exhibit of petrified wood, Indian ruins and part of colourful Painted desert
Pinnacles (California)	14,498	Jan. 16, 1908	Volcanic and other geological features, with spire formations 500 to 1,200 ft. high

Name and location	Total gross acreage	Date established	Principal features
A. Natural Areas (*Cont.*)			
Rainbow Bridge (Utah)	160	May 30, 1910	Largest, most beautiful natural arch known, rising 309 ft. over stream bed
Saguaro (Arizona)	78,644	March 1, 1933	Saguaro forest and other succulent cacti
Sunset Crater (Arizona)	3,040	May 26, 1930	Volcanic cinder cone with summit crater formed just prior to A.D. 1100
Timpanogos Cave (Utah)	250	Oct. 14, 1922	Colorful limestone cave on Mt. Timpanogos
White Sands (New Mexico)	146,535	Jan. 18, 1933	Gypsum dunes 10 to 45 ft. high; wildlife showing adaptation to environment
B. Archaeological Areas			
Aztec Ruins (New Mexico)	27	Jan. 24, 1933	Excavated 12th-century Indian town
Bandelier (New Mexico)	30,703	Feb. 11, 1916	Prehistoric Indian homes of later Pueblo period in canyon-slashed slopes of Pajarito plateau
Canyon de Chelly (Arizona)	83,840	April 1, 1931	More than 400 cliff dwellings dating as early as A.D. 1066, in magnificent canyon scenery on Navajo Indian reservation
Casa Grande (Arizona)	473	Reserved 1892; national monument, Aug. 3, 1918	Unique adobe tower probably built by Salado Indians in the 1300s in earlier Hohokam settlement
Chaco Canyon (New Mexico)	21,509	March 11, 1907	13 major Indian ruins; hundreds of smaller ruins
Effigy Mounds (Iowa)	1,476	Oct. 25, 1949	Large Indian mounds in shapes of birds and other animals.
El Morro (New Mexico)	1,279	Dec. 8, 1906	Prehistoric petroglyphs, inscription in rock by explorers
Gila Cliff Dwellings (New Mexico)	160	Nov. 16, 1907	Cliff dwellings in centre of Gila Wilderness area
Grand Portage (Minnesota)	770	Historic site 1951; national monument, Jan. 27, 1960	Principal canoe portage route of Indians, explorers and missionaries
Hovenweep (Utah-Colorado)	505	March 2, 1923	Unique towers built in 12th century
Montezuma Castle (Arizona)	842	Dec. 8, 1906	Outstanding cliff dwelling dating from about A.D. 1100
Mound City Group (Ohio)	68	March 2, 1923	24 ceremonial burial mounds of Hopewell people, dating from about A.D. 1000
Navajo (Arizona)	360	March 20, 1909	Three of largest known cliff dwellings; Betatakin, Keet Seel and Inscription house, dating from 13th century
Ocmulgee (Georgia)	683	Dec. 23, 1936	Mounds built by farming Indians, dating from 10th century
Pipestone (Minnesota)	283	Aug. 25, 1937	Quarry from which Indians obtained materials for peace pipes
Tonto (Arizona)	1,120	Dec. 19, 1907	Salado Indian cliff dwellings, in Salt river valley, dating from about A.D. 1350
Tuzigoot (Arizona)	43	July 25, 1939	Outstanding pueblo containing 110 rooms, which flourished between A.D. 1000 and A.D. 1400
Walnut Canyon (Arizona)	1,879	Nov. 30, 1915	200 small cliff dwellings, dating from A.D. 1000 to A.D. 1200
Wupatki (Arizona)	35,545	Dec. 9, 1924	Pueblos built by several tribes, dating from about A.D. 1100; desert ecology
Some other units of national park system Protecting natural features			
Theodore Roosevelt National Memorial park (North Dakota)	70,374	April 25, 1947	Badlands along Little Missouri river, with abundant wildlife
National Capital parks (District of Columbia-Virginia-Maryland-West Virginia)	36,186		Park system of the nation's capital, comprising 780 units
Cape Hatteras National Seashore Recreational area	28,500	June 12, 1953	Atlantic coastal beach; migratory waterfowl
Cape Cod National Seashore	...	Authorized, Aug. 7, 1961	50 mi. of natural Atlantic coastal beach; migratory waterfowl

plemented by hundreds of millions of dollars in emergency relief funds and Civilian Conservation corps enrollees aided in keeping the parks in condition. World War II reduced the annual appropriations to as little as $5,000,000 and terminated emergency funds, but during that period relatively few tourists could travel to distant places for recreation.

The end of the war released an affluent, restless population with abundant leisure. Tens of millions of people sought their national parks, spending millions of dollars which served as a catalyst to all the myriad businesses and industries dependent on travel and recreation. Appropriations did not keep pace with this invasion of the parks, and as a park director commented, "The American people are loving their parks to death."

Supported by citizens' organizations, the park service urgently requested adequate funds from congress, with some success. But by 1953 only $33,000,000 was being provided to administer 180 areas. Antiquated accommodations were deteriorating, roads were being pounded to ruin, campgrounds were unable to withstand the constant overuse; in short, the parks were being worn out. "Mission 66," a ten-year, $459,000,000 park conservation, improvement and development program planned to meet the conditions anticipated in 1966, was announced in 1956 by Conrad L. Wirth, park service director.

In 1956 the Park Service had 3,500 personnel; by 1966, it was projected, 6,250 would be needed, mostly rangers, naturalists and seasonal employees. Interpretive services would be strengthened and facilities to translate park concepts and features to the public — visitor centres, museums, roadside and trailside exhibits, etc.— would be increased, as would opportunities for scientific research. In 1956 there were 12,833 automobile campsites in the system; about 30.000 would be required. Administration buildings, ranger quarters and other structures would be rehabilitated and new ones built. Where feasible. such buildings would be moved or constructed outside the park boundaries. About 2,000 mi. of roads were to be realigned and improved, 300 mi. of new roads were to be built and six parkways would be completed; 1,500 mi. of trails would be added to the 8,100 mi. then available. Historical and archaeological structures would be restored and stabilized.

New projects and the backlog of deferred construction were started immediately. The Sierra club, the Wilderness society, the National Parks association and other nongovernmental conservation organizations supported the program and offered their advice. They supported the park service in its insistence on the importance of ensuring that physical development did not impair the wilderness character of the parks and monuments, and they also approved of the decision to concentrate visitor and personnel facilities (if required to be built inside the parks) in a limited number of restricted localities connected by motor roads, leaving 95% of the land in its undisturbed natural state. These groups cautioned against the possibility that Mission 66 might yield to the pressures of special interests and become essentially a construction program. They also recognized that expansion of the interpretive program under Mission 66 was an equally vital aspect.

The park service's work in interpreting its areas provides factual information about scenic features, wildlife. geology, botany, history or archaeology, and also helps the visitor to widen his interests and knowledge. A staff of scientists, naturalists, historians, museum and educational experts, augmented during the travel seasons by additional ranger-naturalists and other interpretive personnel. conduct field trips, staff museums and devise original methods of enlarging the visitor's appreciation of what he sees.

Such visitor facilities as roads. trails, campgrounds and utilities are provided by the park service. Services for which a charge is made — hotels and lodges, cabins, restaurants. automobile services, buses, pack horses and other similar services — are under private management. If a facility or the land it occupies is owned by the federal government, the concessioner operates under a contract with the park service which regulates the character and financial aspects of the concession. There remain several hundred thousand acres within the parks held in nonfederal ownership (which are gradually being acquired by purchase or exchange) and visitor facilities on these lands are not under government control.

Mission 66 envisions expansion of the national park system to include additional examples of wilderness and pristine nature and significant historical sites and also types of environment not now represented. The remaining stretches of natural shore line along the Atlantic and Pacific oceans, the Gulf of Mexico and the Great Lakes have been surveyed with this in mind. The national park service serves as consultant to the states on park and recreational planning; in 1962 this function was transferred to the new Bureau of Outdoor Recreation. In all of its activities, the park service is guided by the statutory advisory board on national parks, historic sites, buildings and monuments. (*See* also articles on the various national parks. For state parks *see* articles on the various states.)

National Forests: Wilderness. Primitive and Wild Areas. —As the United States was settled, more and more land was of course cleared of forests, and not until 1877 was official recognition given to the danger inherent in the practice. In that year the secretary of the interior, Carl Schurz, aroused congressional interest in retaining permanent forests in public ownership and in improving administration of the federal real estate. This led to the beginning of a system of forest reserves authorized in 1891; 30 were created by Presidents William Henry Harrison and Grover Cleveland. Gifford Pinchot (*q.v.*), appointed chief of the forestry division in 1898, vigorously promoted the old-world concept of forest management through sound forest practices, enforced on public lands by laws and regulations imposed by the government as custodian of their resources. Pres. Theodore Roosevelt, who strongly supported this judgment, strengthened the federal interest in forest resources by assigning responsibility in 1905 to a new forest service in the department of agriculture, with Pinchot as chief forester, and created additional national forests. The practice of reserving portions of the federal real estate for regulated use and perpetuation of their resources was gradually extended to many aspects of a national conservation program.

Initially, the national forests were intended to safeguard watersheds (and were therefore located where preservation of water resources was a vital social and economic consideration) and to ensure a permanent supply of timber, harvested by private operators under forest service regulation. Since the national forests include large areas of grassland, grazing of livestock was soon added as a proper use. Mining laws apply to these lands, hunting of wildlife in accordance with state law is permitted, reclamation and power projects are located within them and other utilization of resources is authorized by law and regulation. This concept of multiple use is the conscious goal of administration of the national forests as a whole, although opinion varies as to whether this term should be construed to mean various uses on the same area, or whether emphasis on, or limitation to, the highest or most significant use should be applied on respective parts of a given area.

Even under careful regulation most of these activities change the character of the terrain and convert primeval wilderness into artificially controlled environment. Aldo Leopold of the University of Wisconsin was the first eloquent advocate of the wilderness concept: undisturbed wilderness itself is a resource of value; present and future generations require opportunity to experience the inspiration and surcease from an increasingly mechanized culture through healthful outdoor pursuits undertaken by individual effort;and those who inherit these resources should be bequeathed some virgin forests and unmodified open spaces which they could determine how to enjoy and use in light of the cultural patterns of their day. In 1921 Leopold aroused official interest in this proposition, and in 1924 the Gila Wilderness area was established in the Gila National forest in New Mexico as the first of what was to become a series of such reservations. In 1929 Regulation L-20 mas promulgated under which several chiefs of the forest service established 72 primitive areas totaling nearly 14,000,000 ac between 1930 and 1939. The wilderness area system was given another strong impetus in 1939 when regulations were set forth providing for the establishment of wilderness areas of more than 100.000 ac each by the secretary of agriculture and the establishment of suitable tracts of between 5,000 and 100,000 ac. by the chief forester. The existing primitive areas which had been established since 1929 continued in effect but were scheduled for restudy and reclassification within the new definitions. The wilderness concept received vigorous popular support, especially through the educational program undertaken by the Wilderness society and private citizens throughout the country.

Within the wilderness, wild and primitive areas and the Boundary Waters canoe area, no developments are permitted which are detrimental to the preservation of primitive conditions of transportation and environment. Roads may not be built in them nor timber harvested (except in one-half of the canoe area under certain specific regulations), and other commercial uses are kept to a minimum. Hunting is permitted, since the states have not ceded jurisdiction over the wildlife there.

Unlike the national park system, the wilderness area system is subject to alteration of boundaries and change of policy by executive order within the department of agriculture; congressional action is not required. Certain citizens' organizations feel that it should be, to ensure the permanence of the protection afforded by the system, and legislation to that end was introduced in congress.

Most of the wilderness and primitive areas are west of the Great Plains. Robert Marshall described them as "regions which contain no permanent inhabitants, possess no means of mechanical conveyance, and are sufficiently spacious that a person may spend at least a week or two of travel in them without crossing his own tracks. The dominant attributes of such areas are: first, that visitors to them have to depend exclusively on their own efforts for survival; and, second, that they preserve as nearly as possible the essential features of the primitive environment." Most of them are high, rugged terrain of peaks and forests, tundra and mountain glades, clear rivers and lakes. Some are vast stretches of arid and semiarid country, interspersed with varied ecological

TABLE *11.—Principal Refuges Administered by the United States Bureau of Sport Fisheries and Wildlife*

Name and location	Total gross acreage	Date established	Principal features
Big Game Refuges and Game Ranges			
Arctic National Wildlife range (Alaska)	8,900,000	1960	Undisturbed arctic coastal environment and eastern Brooks range; grizzly and polar bears Dall sheep, caribou, moose: wolves, wolverine, etc.
Cabeza Prieta Game range (Arizona)	860,000	1939	Mexican antelope, Gaillard bighorn, peccary; sonoran desert
Charles Sheldon Antelope Range and refuge (Sevada-Oregon)	543,898	1936	Pronghorn antelope, mule deer, sage hen, waterfowl; sonoran desert
Clarence Rhode National Wildlife range (Alaska)	1,890,000	1960	Low-lying tundra on northwestern coast near Bering sea; waterfowl, fur-hearing mammals, etc.
Desert Game range (Nevada)	188,415	1936	Pronghorn, Nelson bighorn, mule deer; sonoran desert
Fort Niobrara National Wildlife refuge (Nebraska)	14,401	1912	Bison, Texas longhorn cattle, elk, beaver, upland birds
Fort Peck Game range (Montana)	375,238	1936	Pronghorn, Rocky mountain bighorn, deer, elk, upland game birds; sagebrush basin
Hart Mountain National Antelope refuge (Oregon)	239,933	1936	Pronghorn, mule deer, upland birds; sagebrush plateau
Izembek National Wildlife range (Alaska)	415,360	1960	Waterfowl nesting and feeding grounds on the Alaskan peninsula; brown bears, caribou
Kenai National Moose range (Alaska)	2,057,197	1941	Kenai moose, brown bear, Dall sheep, mountain goat, fur bearers, birds; rugged wilderness of mountains, swamps, lakes and rivers.
Kodiak National Wildlife refuge (Alaska)	1,815,000	1941	Kodiak bear, deer, waterfowl colonial sea birds; forested Kodiak Island
Kofa Game refuge (Arizona)	660,000	1939	Gaillard bighorn, sonoran desert wildlife and vegetation, including rare *Washingtonia filifera* palm
Little Pond Oreille National Wildlife refuge (Washington)	41,708	1939	Upland birds, deer, black bear
National Bison range (Montana)	18,541	1908	300 to 400 bison, elk, deer, Rocky mountain bighorn; high prairie
National Elk refuge (Wyoming)	23,790	1912	Winter range of southern Yellowstone elk herd, trumpeter swan, sand-hill crane, beaver; in Jackson Hole basin adjacent to Grand Tcton Rational park
National Key Deer refuge (Florida)	6,744	1954	Rare dwarf Key deer, spoonbills, great white heron; on Florida Keys
Nunivak National Wildlife refuge (Alaska)	109,384	1929	Musk ox, reindeer, shore birds; tundra
Pribilof Islands reservation (Alaska)	50,163	1910	Established to protect endangered fur seals, which had increased to 1,500,000 animals in 1959; controlled harvesting under bureau of commercial fisheries; colonial sea birds
San Andreas National Wildlife refuge (New Mexico)	57,215	1941	Nelson bighorn, deer, bird life; sonoran desert
Simeonof National Wildlife refuge (Alaska)	10,442	1958	In southeastern part of Shumagin Island chain; sea otters
Sullys Hill National Game preserve (North Dakota)	994	1914	Bison, elk, deer, geese
Wichita Mountains Wildlife refuge (Oklahoma)	59,019	1905	Bison, elk, deer, pronghorn, longhorn cattle, turkey, rare Mississippi kite, water fowl; upland prairies and mountain range
Migratory Bird Refuges General			
Aleutian Islands Wildlife refuge (Alaska)	2,720,235	1913	50 major islands extending 1,200 miles from Unimak to Attu; active volcanoes, Pacific coastland arctic tundra; rare sea otters, colonial sea birds, shore birds, waterfowl, bears, whales, seals
Bering Sea Wildlife refuge (Alaska)	41,113	1909	Eiders and other sea ducks, alcidae, arctic foxes; tundra
Great White Heron Wildlife refuge (Florida)	2,127	1938	Great white heron, spoonbill, Key deer; mangrove keys
Okefenokee Wildlife refuge (Georgia)	330,973	1937	Cranes, ibises, egrets, limpkins, alligators, fur bearers; primeval bald cypress swamp
Santa Ana Wildlife refuge (Texas)	1,981	1943	Remnant of tropical forest on Rio Grande river; tree ducks chachalacas and other bird life with Mexican affinities
Migratory Bird Refuges Waterfowl			
Aransas Wildlife refuge (Texas)	47,261	1937	Sole wintering ground of rare whooping crane; abundant wintering waterfowl, migratory land birds and shore birds; spoonbill, egret and heron rookeries; deer, peccary; peninsula on Gulf of Mexico
Bear River Wildlife refuge (Utah)	64,899	1928	Vast marshes of Bear river delta on Great Salt lake; millions of nesting and migratory ducks and geese; 200 species of birds recorded; fur bearers
Cape Romain Wildlife refuge (South Carolina)	34,716	1932	Atlantic coastal marshes and islands; waterfowl, shore birds, rails, loggerhead turtles, fur bearers
Delta Wildlife refuge (Louisiana)	48,832	1935	Vast marshes on coast of Gulf of Mexico; major wintering grounds of blue, snow and other geese; abundant ducks, herons, rails and other birds; muskrats
Lacassine Wildlife refuge (Louisiana)	31,125	1937	
Sabine Wildlife refuge (Louisiana)	142,717	1937	
Kentucky Woodlands (Kentucky)	65,759	1938	Upland hardwood forests; eastern turkey, grouse, waterfowl
Lower Klamath (California)	21,460		Vast restored marshes on Pacific waterfowl flyway; millions of geese and ducks, white pelicans, shore birds, herons, upland birds, waterfowl
Sacramento (California)	10,776		
Tule (California)	37,337	1928	
Des Lacs (North Dakota)	18,881	1935	River marshes in northern prairies, restored to provide waterfowl nesting, feeding and wintering grounds; prairie chicken, sharp-tailed grouse
Lower Souris (North Dakota)	58,694	1935	
Upper Souris (North Dakota)	32,084	1935	
Loxahatchee (Florida)	145,477	1951	Subtropical swamp created by diked reserve, waterfowl wintering ground; limpkin, rare Everglade kite
Malbeur (Oregon)	184,747	1908	Restored river marshes on Pacific waterfowl flyway; abundant bird life, antelope, muskrat, beaver
Upper Klamath (Oregon)	12,533	1928	
Mattamuskeet (North Carolina)	50,178	1934	Atlantic flyway wintering grounds for waterfowl, especially whistling swan; fur bearers
Swanquarter (North Carolina)	15,501	1932	
Red Rock Lakes (Montana)	39,944	1935	Lakes and marshes on continental divide; principal U.S. breeding ground of rare trumpeter swan; Shiras moose, fur bearers
White River (Arkansas)	116,302	1935	Bottomland hardwood forest; abundant waterfowl, herons, turkeys, songbirds, fur bearers

conditions. Others have special attributes, such as the Boundary Waters canoe area (formerly known as the Superior Roadless area) in Minnesota, which protects the finest lakeland canoeing country in the United States by prohibiting logging on shore lines or the use of airplanes for transport, and which is contiguous with similar regions in Canada's Quetico Provincial park, in Ontario. Hikers and campers may follow thousands of miles of trails, on foot or with pack horses, to experience the kind of life their forefathers knew. The wild areas provide similar pursuits but are of smaller size. They are equally valuable as undisturbed examples of primeval ecology important to scientific research and for the determination of proper conservation practices on other land.

In 1961 there were within U.S. national forests 12 wilderness areas (total acreage 4,897,039); 41 primitive areas (7,964,309); 30 wild areas (1,052,743); and 1 boundary waters canoe area (1,034,852). (These totals included small acreages outside the national forests.)

Wildlife Refuges. — Before the advent of white man, the American continent teemed with wildlife. Bison in the millions roamed the eastern forests and Great Plains. Pronghorn antelope may have been even more numerous. Passenger pigeons. more than a billion in a flock, nested in the hardwood forests. Waterfowl bred by the tens of millions in lakes and sloughs and marshes. Great rookeries of egrets, ibises and other herons inhabited the southern swamps. Beavers and other fur bearers filled the waters of the forests, prairies and coastal swales. North America supported as many species and greater numbers of birds and mammals than any other temperate region on the earth.

Loss of the bulk of this wildlife heritage is part of the price the United States has paid for its civilization. The forest habitat of deer, bear, moose and many other species gave way to clearings as first the eastern and midwestern hardwoods were cut. and then vast stands of western conifers were logged. The prairies and plains became farms, many of their natural lakes, potholes and marshes were drained and plowed. Cities and highways occupied extensive acreages where once myriad animals lived. The pioneer settlers lived off the game of the land until cattle usurped the ranges. Meat from wild animals supported the rising cities; hundreds of thousands of barrels of passenger pigeons and Eskimo curlews, among other species, were shipped from St. Louis and other midwestern cities to cities in the east. Bison and antelope were slaughtered nearly to extinction, and the vogue for plumes on women's hats led to decimation of the egret and heron rookeries.

During the second half of the 19th century the states began to enact game laws but enforcement was weak until national sentiment stimulated more effective protection under state game and conservation commissions. Fortunately, action came in time to enable most species to survive but the passenger pigeon became extinct in 1914 and some species and subspecies of other animals no longer exist. The ranges of many animals, such as the grizzly bear and timber wolf, were restricted to a small number of protected localities, especially in national and state parks, refuges and preserves. A more thoughtful type of sportsman began to exert influence and to promote funds for restoration of endangered animals. The American Bison society purchased the last intact herd of bison left in the United States and shipped it to Yellowstone National park, where it thrived; in 1958, more than 6,000 bison existed in the United States and additional herds inhabited reserves in Canada. Pronghorn antelope were re-established in many places and spread into adjacent regions. Elk recovered so successfully under reasonable laws and on protected ranges that new herds were established in many parts of the country. White-tailed deer actually benefited from the conversion of dense forests into smaller woodlands bordered by open terrain and may be more numerous now than in aboriginal times.

The vigorous interest taken by the federal government in wildlife restoration has been primary in the success of this program. On July 1, 1885, the branch of economic ornithology was established in the division of entomology, U.S. department of agriculture; it became the bureau of biological survey in 1905 under the direction of C. Hart Merriam. Originally designed to undertake research into the economic importance of birds and mammals, the bureau achieved international eminence as a scientific institution. It administered the Lacey act of 1900 which prohibited shipment across state boundaries of game taken illegally, and gradually market hunting was eliminated. Under the Migratory Bird Treaty act of 1918, the bureau was given power to extend federal protection to avian species that migrated between Canada and the United States; in 1937 a similar treaty with Mexico broadened this power. Prior to ratification of these treaties, conservation of wildlife had been a responsibility only of the states, except in the national park system where jurisdiction over wildlife has been ceded to the federal government; these conventions enabled the federal government to share this responsibility.

Reservation of federal land as national wildlife refuges was accomplished initially by executive orders of the president, the first refuge being the three-acre Pelican Island off the east coast of Florida, established by Theodore Roosevelt in 1903. Many early bird sanctuaries, however, were created by the National Audubon society, a citizens' organization, to preserve egret rookeries in the south. The severe decline of waterfowl and shore birds because of overshooting and drought, and diminishing populations of larger mammals, evident during the first decades of the 20th century, stimulated reservation of large federal units such as Malheur and Upper Klamath National wildlife refuges in Oregon, the Pribilof Islands reservation in Alaska, the National Bison range in Montana and the Wichita Mountains Wildlife refuge in Oklahoma. By 1929, there were 87 federal refuges in 24 states and the territories.

The Migratory Bird Conservation act of 1929 provided broad legislative authority for refuge acquisition and development and some funds were appropriated for the programs. A second decline in the waterfowl population became evident and under the dynamic leadership of Director J. N. Darling new sources of funds for the refuge program were provided. The Migratory Bird Hunting Stamp act of 1934 required all waterfowl hunters 16 years of age and over to have in their possession a federal stamp, and the Pittman-Robertson act of 1937 called for a 10% (later 11%) federal excise tax on sporting arms and ammunition to be allocated to the states to pay three-quarters of the expense of wildlife restoration programs, By 1953 the federal grant amounted to $10,000,000 annually. Originally, refuges purchased with duck stamp money were inviolate but in 1949 the secretary of the interior was empowered to open one-quarter of the area of such refuges to public shooting if the status of the species' population warranted and in 1958 this was increased to 40% of most refuges. The 1940 Convention on Nature Protection and Wild Life Preservation in the Western Hemisphere extended the application of certain protective measures to those American republics ratifying the treaty. In 1939, the biological survey was transferred to the U.S. department of the interior and in 1940, together with the bureau of fisheries, became the fish and wildlife service; in 1958, it was reorganized as the bureau of sport fisheries and wildlife, a part of the U.S. fish and wildlife service.

As of June 30, 1960, the bureau administered 280 national wildlife refuges containing 28,506,105 ac.; in addition, the secretary of the interior withdrew 9,000,000 ac. in the Brooks range of northeastern Alaska as an arctic wildlife range, pending proclamation or congressional action. Fifteen big-game refuges and five game ranges comprised 10,171,888 ac., and 255 migratory bird refuges comprised 7,147,857 ac. In 1958 the game refuges and ranges supported the following numbers of animals, compared with the estimated total United States populations (1951–55): pronghorn antelope, 3,352 (total 262,262); bear, 276 (143,086); bighorn sheep, 2,199 (19,438); bison, 1,306 (3,858); white-tailed deer, 23,601; mule deer, black-tailed deer, 22,818; (8,603,000 all species); elk, 5,511 (303,315); among other animals. The revival of these once drastically decimated species to these national population levels has been due in significant measure to these refuges, as well as to the protection afforded by the national park system and state game reserves and improved laws.

Similarly, largely as a result of preservation and restoration of essential breeding, feeding and wintering habitat in federal and state refuges, combined with favourable continental weather cycles, waterfowl population trends of the continent reached a peak during the years 1952 to 1956. Unfavourable weather conditions over a large segment of the breeding habitat, starting in 1956, resulted in a marked population decline in some species of waterfowl, especially the diving duck species. The objective of preserving waterfowl nesting areas, migration resting places and winter feeding grounds was co-ordinated in planning and legislative programs with other conservation activities. Vast sums were spent not only to acquire existing habitat on coastal marshes, bottomlands on the principal river systems and interior sloughs, but also to restore great areas that had been drained. Many storage reservoirs and other impoundments built to secure water benefits proved invaluable as waterfowl sanctuaries. Continued research by the fish and wildlife service revealed that waterfowl follow certain routes or flyways to and from their nesting grounds, each flyway being used by the population nesting in a particular geographic region. Series of refuges have been established to serve the welfare of the respective populations during the entire course of their movements.

In spite of the success achieved in arresting waterfowl declines and in perpetuating the species of ducks, geese and swans, their future security requires increased efforts to offset continued conversion of essential habitat to other purposes. Expert opinion indicates that as the matter stood in 1960 another 4,000,000 ac. should be added to the federal refuge system, and that if the states undertook to supplement the federal activity through restoration and protective programs, 12,500,000 ac. could be made available to meet the needs of the present waterfowl population and enable it to increase significantly.

The growth of such a large and varied system of federal refuges, and the corollary development of refuges and sanctuaries by the states and private organizations, is evidence of changed attitudes toward wildlife on the part of the American people. Since they seldom are dependent on game meat for food, hunting is regulated to preserve species for future generations, and most sportsmen's organizations support governmental controls. During the 20th century there developed a large body of public opinion interested in wildlife for its own sake and as a source of personal enjoyment and scientific study. Both of these interests have strongly endorsed refuge programs and the expenditure of tax revenues for this purpose.

II. CANADA

National parks in Canada are established by parliament and are administered by the national parks branch of the department of northern affairs and national resources. Banff, Jasper, Kootenay and Yoho National parks adjoin each other in the spectacular Rocky mountains, and Mt. Robson, Hamber and Mt. Assiniboine Provincial parks and Glacier National park, in British Columbia, extend the continuous protected complex to cover 13,000 sq.mi. These are accessible by highway and rail and have excellent visitor accommodations. Vast portions of these parks are true wilderness, enjoyed by explorers and mountaineers. Other national parks in the Canadian Rockies, in the forests and lakelands of the plains and eastward to the Atlantic coast, provide a variety of environment, recreation and wildlife. Except for recognition of native Indian rights, hunting is prohibited, and legislative action is required to alter boundaries.

Six provinces have set aside provincial parks, many as magnificently scenic and as important to wildlife as the national parks.

TABLE 111.—*Principal Parks in Canada*

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
National Parks			
Banff (Alberta)	2,564 (1,641,000)	1885	Central Rocky mountain scenery, with peaks to 11,900 it.; bighorn sheep, mountain goat, elk, moose, bears, etc.
Cape Breton Highlands (Nova Scotia)	367 (234,900)	1936	Rugged Atlantic and Gulf of St. Lawrence shore line, with coves and forests
Elk Island (Alberta)	75 (48,000)	1913	Rolling prairie; fenced herds of mammals
Fundy (New Brunswick)	79.5 (50,900)	1948	Mixed conifer and hardwood forests rising above Bay of Fundy; moose, white-tailed deer, black bear and other wildlife
Georgian Bay Islands (Ontario)	5.4 (3,500)	1929	Tiny islands in Georgian bay, Lake Huron
Glacier (British Columbia)	521 (333,400)	1886	Rocky mountain wilderness; peaks, glaciers, lakes, coniier forests, abundant wildlife
Jasper (Alberta)	4,200 (2,688,000)	1907	Peaks to 12,394 it., famous Columbia ice field covers 150 sq.mi.; conifer forests; abundant wildliie
Kootenay (British Columbia)	543 (347,500)	1920	Rocky mountain scenery and wildlife; hot springs
Mount Revelstoke (British Columbia)	100 (64,000)	1914	Rolling alpine plateau 6,000 ft. in elevation; snow fields, glaciers
Point Pelee (Ontario)	6 (3,800)	1918	Peninsula in Lake Erie, noted as sanctuaty for birds
Prince Albert (Saskatchewan)	1,496 (957,400)	1927	Conifer and deciduous forest lakeland with excellent canoeing; migratory waterfowl and otber wildlife
Prince Edward Island	7 (4,500)	1937	25 mi. of forested coast line on Gulf of St. Lawrence, with beaches and bays; many kinds of small mammals
Riding Mountain (Manitoba)	1,148 (734,700)	1929	Forested plateau rising 1,000 ft. above the plains; many glacial lakes; abundant wildlife
St. Lawrence Islands (Ontario)	0.3 (172)	1914	Protects a mainland area and 12 of the Thousand Islands in the St. Lawrence river
Terra Nova (Newfoundland)	156 (99,800)	1957	Forests barrens and rocky hills rising! from sheltered sounds indenting Atlantic coast
National Parks (*Cont.*)			
Waterton Lakes (Alberta)	203 (129,900)	1895	Canadian portion of Waterton-Glacier International Peace park. Rocky mountain ecology, noted for lakes, wildflowers and animals
Wood Buffalo (Alberta–Northwest Territories)	17,300 (11,072,000)	1922	Protects only remaining herd of wood buffalo in its natural state, and related plains buffalo, the total herd numbering 12,000 to 14,000 animals
Yoho (British Columbia)	507 (324,500)	1886	Glaciers, ice fields, lakes and waterfalls among canyons and peaks, in Rocky mountains
Provincial Parks (partial list)			
Cypress Hills (Alberta)	77 (49,453)	1952	Rare specimens of preglacial plant and insect life
Garibaldi (British Columbia)	957 (612,615)	1927	Pacific coast mainland, with mountain lakes, peaks and glaciers
Hamber (Britisb Columbia)	3,800 (2,431,960)	1941	Northern wilderness conifer forest, adjoining Jasper and Banff National parks, on Big Bend highway
Mt. Assiniboine (British Columbia)	20 (12,800)	1922	Outstanding Rocky mountain scenery, south of Banff
Mt. Robson (British Columbia)	803 (513,920)	1913	Rocky mountain peaks, lakes and glaciers
Strathcona (British Columbia)	828 (529,920)	1911	Peaks, glaciers, alpine meadows and Della Falls, in centre of Vancouver Island
Tweedsmuir (British Columbia)	5,400 (3,456,000)	1938	Vast mountain wilderness area, with abundant wildlife
Algonquin (Ontario)	2,741 (1,754,240)	1893	Wilderness area and wildlife preserve in northern forests
Quetico (Ontario)	1,860 (1,190,400)	1913	Forested wilderness lakeland, adjoining Boundary Waters canoe area in U.S.
Gaspesian (Quebec)	514 (328,960)	1937	Rugged terrain on Gaspé peninsula reserved to protect caribou'and otber wildlife
Laurentide (Quebec)	3,612 (2,312,100)	1895	Park containing many lakes and tumultuous rivers; abundant wildlife
La Verendrye (Quebec)	4,746 (3,038,000)	1939	Wild terrain of forests, lakes and rivers
Lac La Ronge (Saskatchewan)	1,140 (729,600)	1939	Representative northern spruce and poplarforests, with many species of wildlife

They are administered under regulations promulgated by the respective provincial governments, and hunting is permitted in some of them. Tweedsmuir Provincial park, in British Columbia, is one of the largest wilderness areas (3,456,100 ac.) in North America. The Quetico Provincial park, in Ontario, protects 1,190,400 ac. of forested lakeland adjoining the Boundary Waters canoe area in Minnesota. Canada has reserved dozens of game preserves and wildlife sanctuaries. some of great size. Musk oxen, caribou and other abundant wildlife are safeguarded on about 1,000,000 ac. in the Northwest Territories, Yukon and Alberta. More than 1,200 sq.mi. of crown lands comprise bird sanctuaries under the Canadian wildlife service, and the provinces and local governments have reserved many other refuges. Until well into the 20th century much of Canada was remote wilderness, but the accelerated expansion of industrial exploration and development throughout the country, especially after World War II, increased the importance of these reservations in ensuring the survival of Canada's extraordinary wildlife populations.

III. AFRICA

Popular imagination envisions Africa as a continent still teeming with millions of wild animals roaming freely over velds, forests and jungles. Actually the habitat has been so restricted by human settlement and economic development and so many species of larger mammals have been hunted so ruthlessly that in many countries wildlife persists in significant numbers only where national parks and reserves have been established.

Even in the areas where the natural environment is preserved and the animals are protected, poaching by natives for meat and ivory endangers the wildlife populations. Parks and reserves are further threatened by pressures from native tribes to permit use of grasslands in national parks for cattle, frequently a symbol of wealth and prestige rather than a source of food, which have destroyed verdant pastures over wide ranges.

During the latter part of the 19th century the preservation of Africa's wildlife began to be a matter of concern, and various steps were taken in that direction (see WILDLIFE CONSERVATION: International Co-operation). The rise of independent native governments after World War II threatened to reverse these gains because of indifference and inexperience on the part of the new governments and the attitude of many native peoples that all land must be devoted to producing economic commodities to raise the standard of living for their increasing populations. Many tribes consider wildlife only a competitive nuisance and poaching is both widespread and increasing.

Most of the new nations have retained the parks and reserves their predecessors established and are endeavouring to provide administrative machinery to handle them. The future of these areas and their natural resources depends on how effectively sound policies are applied. Various conferences, such as the one at Arusha, Tanganyika, in Sept. 1961, under the sponsorship of the Commission for Technical Cooperation in Africa south of the Sahara (CCTA) and the International Union for Conservation of Nature were held to analyze these problems.

By the early 1960s there were about 25 African countries with national parks or equivalent reserves, protecting a total of about 265,678 sq mi. Kruger National park, in Transvaal, Republic of South Africa, covers 8.000 sq.mi. and presents one of the most extraordinary exhibits on earth of wild animals. From their cars, visitors can watch lions, elephants, giraffes, hippopotamuses. many kinds of antelopes and other creatures living their natural lives. Established in 1898 in response to Pres. Paul Kruger's warning that African wildlife would be exterminated unless protected, the park was enlarged in 1926 and is administered by a National Park Board of Trustees with official and civilian members. This board also supervises four other national parks, of which the Kalahari Gemsbok National park, in Cape Province and Bechuanaland, created in 1931, is a unique sanctuary for oryx, springbok, red hartebeest, kudus, elands, ostriches and many other animals of the arid desert, as well as the nearly extinct race of primitive human Bushmen. Other parks in South Africa are administered by similar but provincial boards.

Three national parks in Cape Province are notable for rare species protected in them. Addo National park preserves the last Addo elephants; Bredasdorp Bontebok National park safeguards a remnant herd of bontebok antelopes; the Mountain Zebra National park has ensured the survival of that race of zebras. The Umfolozi reserve in Natal has a population of about 300 rare southern white (or square-lipped) rhinoceroses (1959), as well as black rhinoceroses. The Orange Free State has 16 game reserves, of which the Somerville Game reserve (26,000 ac.) is the most important. There are many other reserves in South Africa where hunting is prohibited or strictly controlled, or where particular botanical, zoological, geological or historical features are protected.

Outstanding among the reserves of the world are the national parks of the Republic of the Congo. These were most efficiently protected under the careful policies of the Institut des Parcs Nationaux du Congo Belge, and in spite of the confusion attending establishment of an independent government the new administration continued the protection of these areas to the best of its ability. Albert National park was reserved in 1925, initially to protect the shy mountain gorilla, but by subsequent acts and royal decrees it was enlarged as a reserve dedicated to the protection of all animal life and vegetation and to scientific and ecological exploration and study. This park (part in Rwanda), and three others established later, Kagera National park (Rwanda), Garamba National park and Upemba National park, safeguard a wide variety of natural environment from the snow-clad peaks of the Ruwenzoris to the jungle rain forests of the Congo basin. They are the habitat of such rare animals as the okapi and bongo, as well as many other species and the pygmy people. Scientists from all over the world come to these parks, and their reports on every ecological aspect of the region published by the Institut are invaluable contributions to knowledge of Africa and to its development. Because of the scientific importance of preserving natural conditions unchanged, only certain portions of the Albert National park and of the Kagera National park are open to tourists.

In Southern Rhodesia an official program endeavouring to eliminate the tsetse fly, carrier of the nagana parasite in cattle, by widespread slaughter of the larger wild animals has led to scarcity of most wildlife except in national parks and forest reserves, where animals are protected. The Wankie National park with the adjacent Robin Game sanctuary covers a large area where tourists are encouraged to come between June and November to see great herds of antelope, buffalo. elephant, many species of birds and other animals. Victoria Falls National park to the north preserves one of the most famous scenic features in Africa.

Northern Rhodesia established its first national park, Kafue, in 1950 in the basin of the Kafue river; it is a reserve larger than Kruger National park. Native tribes, occupying 5% of the park, retain certain aboriginal rights, but passage through the reserve is restricted to determined routes. The park is open to tourists and supports a wealth of wildlife. Northern Rhodesia also possesses game reserves and "controlled areas" where the number of animals allowed to be killed by nonresidents is regulated according to the population of those animals; there are also reserves for fish protection, forest reserves and others where careful policies of protection are enforced. Some of these contain famous waterfalls, caves and other scenic and archaeological features.

In northern Tanganyika eastward from Lake Victoria as far as the conservation area stretches the Serengeti National park, which preserves the finest assembly of plains animals in Africa. During the dry season the animals roam the comparatively well-watered western section of the park which the tsetse fly makes uninhabitable to man and livestock. The park contains the best extensive grassland range of central Africa. undamaged by the light grazing of the native animals. In the wet season, the wildlife migrates into the eastern area of the park and even farther eastward into the conservation area, where it comes into contact with thousands of cattle herded by nomad Masai tribesmen. These cattle, sometimes diseased, usually undernourished and of little economic value, threaten to overgraze and destroy the range. In the mid-1950s, demands from the Masai, some of whom consider wild

TABLE IV.—*Principal Parks and Reserves in Africa*

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
ALGERIA			
Djurdjura	64 (40,900)	1935	High terrain of Djurdjura; conifer and cedar forests; monkeys, boars, jackals wildcats, raptores and othkr birds; reptiles and other wildlife
ANGOLA			
Cameia National a	3,906 (2,500,000)		In the Haute-Cuenene; gnus and antelopes
Egito reserve			Central coast; elephants, elands, etc.
Luando reserve	7,740 (4,953,600)		Central Angola; protects abundant wildlife, especially giant sable antelope
Milando reserve	4,344 (2,780,000)		Near Congo border, especially rich in species of antelope
Moçamédès National park	7,277 (4,657,500)		Southwest coast; black rhinoceros, Hartmann's zebra, Burchell's gaeelle, oryx and other wildlife
Mupa reserve	2.578 (1,650,000)		South central Angola; black rhinoceros, many elephants and zebras, variety of antelope
Quiçâma reserve	3,889 (2,489,000)		Northern coast; abundant mammals and birds; eland has increased to more than 1,000 individuals
CAMEROON			
Waza Game reserve	580 (371,200)	1934	Sudanese plains, wooded on the west; giraffe, antelope, aquatic and marsh birds
Boubandjida Nature reserve	775 (496,000)	1947	Wooded plains; rhinoceros, giant eland and others
Faro Nature reserve	1,270 (812,800)	1947	Uninhabited plains; rhinoceros giant eland and other animal;
Campo Game reserve	1,200 (768,000)	1932	Dense equatorial forest and swamp completely uninhabited
Dja Game reserve	2,025 (1,296,000)	1950	Equatorial forest inhabited by 200 to 300 pygmies
REPUBLIC OF CONGO			
Odzala National park	424 (271,400)	1940	Almost inaccessible area in western Congo; abundant forest wildlife, including elephant, bongo antelope, anthropoid apes; pygmies
REPUBLIC OF THE CONGO			
Albert National park	3,160 (2,022,400)	1929; 1934	A world-famous national park on the Uganda and Rep, of Rwanda border; equatorial jungles, Ruwenzori mountains (Mountains of the Moon) and Virunea volcanoes with cloud forests giant lobelias and heath&; most of Lake Edward; great variety of wildlife, including mountain gorilla, elephant, thousands of hippopotamuses; pygmies
Garamba National park	1,000 (640,000)	1938	Grass and wooded savannas on ancient peneplain, on northern border; abundant wildlife, including white rhinoceros, giraffe, elephant, hippopotamus and other plains species
Upemba National park	2 3	1939	Vast plains, with deep river valleys rising to forested Kibara plateaus, in central Katanga; varied animal life, including eland, klipspringer and other antelope many elephants and buffalo. lion and other mammals, aquatic birds
Kibali–Ituri Nature reserve	1,300 (832,000)		Ituri forest, home of pygmies; rare animals, including okapi and bongo antelope
ETHIOPIA			
Managasha National park	12 (7,500)	1958	On mountain range west of Addis Ababa; experimental forestry practiced; most beautiful sections maintained in primeval state; wildlife strictly protected
FRENCH SOMALILAND			
Mt. Goudah reserve	38 (24,320)	1939	Mt. Dai and surrounding primitive forests of junipers (*Juniperus procera*), firs, *Medenia* palm, etc.
GHANA			
Mole River Game reserve	900 (576,000)	1958	Owned by the Gonja people, managed ior complete protection of wildiife; savanna forest
IVORY COAST			
Banco National park	12 (7,500)	1954	Dense ancient forest and forestry school
Bouna Game reserve	3,516 (2,250,000)	1953	Peneplain grasslands and dry woodlands; most large west African antelopes, carnivores, monkeys, etc.
IVORY COAST (*Cont.*)			
Tai Game reserve	1.660 (1,062,500)	1956	Little explored plains, with abundant wildlife
Elephant Plain reserve	76.5 (49,000)		Protection of elephants
KENYA			
National Parks			
Aberdare	228 (145,900)	1950	Higher elevations of Aberdare range, with glaciers lakes dense forests, bamdoo and moorland alpine meadows, abundant populations of elephant buffalo rhinoceros and other 'wildlife: including rare bongo antelope
Mount Kenya	227 (145,300)	1949	Elevations above 11,000 ft. surrounding Mt Kenya (17 058 ft.), with glaciers, tarns 'and moraines; heavily forested, alpine meadows many birds and smaller mammals but no larger animals
Nairobi	44 (28,200)	1946	Open plains and acacia savanna, deep river valleys, near, Nairobi; Ngong reserve contiguous; famous place to see lion, cheetah, leopard, rhinoceros, giraffe
Tsavo	8,034 (5,141,760)	1948	Semiarid plains, with dense brush and two principal rivers, lava cones, the Mzimi springs; baobab, acacia, euhorbia; elephant, rhinoceros, Eippopotamus, lion, many species of antelope
African District Council *Reserves*			
Masai Amboseli Game reserve	1,259 (805,800)	1948; 1961	Open level terrain at about 4,000 ft., north of Mt. Kilimanjaro; arid, interspersed with swamps and springs, belts of acacia forest; dry salt bed of Lake Amboseli; native trust land of Masai tribe; outstanding exhibit of most east African mammals and birds; competition with cattle being reduced by providing artificial water supplies; transferred to A.D.C., 1961
Masai Mara Game reserve	700 (448,000)	1948; 1961	Open rolling plains with thickets and riverine vegetation; abundant wildlife, including most east African mammals; part of Masai land unit, transferred to A.D.C., 1961
Meru Game reserve	600 (384,000)	1961	Foothills of Nyambeni hills to Tana river; grassland, rain forest and riverine forest; abundant variety of wildlife, *Oryx* beisa, reticulated giraffe, Grevy's zebra; transferred to A.D.C., 1961
National Reserves			
Marsabit	10,280 (6,579,200)	1948	Semidesert covered nith thornbush, two mountain ranges, eastern shore of Lake Rudolph; Crown land, but natives have vested rights; varied animal life, including reticulated giraffe, Grevy's zebra, northern ostrich
Ngong	455 (291,200)	1950	Migratory zone for wildlife inhabiting Nairobi National park; open plains with acacia rising to Ngong hills 8,000 ft. in elevation; Masai grazing land
West Chyulu	145 (92,800)	1948	Scenic western Chyulu ranges of recent volcanic origin, covered by bush grass and belts of forest; no surface water, heavy rainfall in season; migratory population of larger mammals; adjacent to Tsavo National park
MALAGASY REPUBLIC			
Ambre Mountain National park	71 (45,500)	1958	Volcano with smaller craters and lakes; dense deciduous moss forest; lemurs
11 nature reserves	1,639 (1,048,873)	1927–1952	Protects birds and small mammals, especially lemurs; forests with orchids and lepidoptera
MALI			
Boucle du Baoulé National park	1,367 (875,000)	1954	Baoulé river basin, with sudanese savanna and forests; elephant, giant eland, sable antelope and other wildlife
MAURITIUS			
Bel Ombre Kational reserve	3.5 (2,271)		High montane climax forest, with ebony .

TABLE IV.—*Principal Parks and Reserves in Africa* (*Continued*)

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
MAURITIUS (*Cont.*)			
Round Island National reserve	0.6 (374)		Volcanic formations, with endemic vegetation and animal life some species peculiar to the) island; red-tailed and white-tailed tropic birds, wedge-tailed shearwater, Trinidad petrel; endemic snakes, lizards and insects
MOROCCO			
Tazekka National park	2.3 (1,450)	1950	Jebel Tazekka (1,979 m. [6,493 ft.]) in Middle Atlas range; high rainfall produces forest cover, including Atlantic cedar; wildlife
Toubkal National park	141 (90,000)	1942	High Atlas mountains, peaks rising to 4,185 m. (13,730 ft.); desert, with juniper and oak forests at higher altitudes; endemic plants; mouflon, mountain gazelle, endemic lake trout
MOZAMBIQUE			
Gorongoza Nature reserve	906 (580,000)	1935	Protects all animals; surrounded by a protected zone of 7,000 sq.km.
Limpopo Game reserve	4,245 (2,716,498)		South African animal life; regulated hunting; adjacent to Kruger National park
Maputo Game reserve	930 (595,200)		Southern tip of Mozambique, between Indian ocean and Swaziland; South African fauna
NIGER			
National Park du "W"	1,289 (825,000)	1937; 1954	Wooded sudanese savanna, bounded by Mékrou, Niger and Tapoa rivers; all characteristic western African plains animals, except giant eland; contiguous with reserves in Dahomey and Upper Volta with combined total of 3,120,500 ac.
NIGERIA			
8 game reserves	5,348 (3,422,500)		Regulated hunting; giraffe, elephant, waterbuck, kob and other wildlife; several smaller animal life sanctuaries
NORTHERN RHODESIA			
Kafue National park	8,650 (5,536,000)	1950	Kalahari sand (south), forests flood plains, grasslands and marshes (north); Kafue river and tributaries flow 100 mi. within the park; eland, sable, roan, kudu, lechwe and other antelope, zebra, elephant, hippopotamus, rhinoceros, carnivores and other plateau species; marsh birds; tsetse flies
Isangano Game reserve	325 (208,000)	1957	Woodland and grassy plains with perennial streams and Bangweulu swamps; only sanctuary for the rare black lechwe elephant, buffalo lion, various antelope, bird life, etc
Kasanga Game reserve	150 (96,000)	1941	Papyrus swamp bordered by grassland and' woods; many wildlife species, including rare sitatunga and shoebill stork
Lavushi Manda Game reserve	580 (371,200)	1941	Wooded plateau and rocky hills; varied wildlife
Luangwa Valley Game reserve	4,990 (3,193,600)	1942	Flat valley of Luangwa river, with lower foothills; acacia woodlands, lagoons in river plain flood in rainy season, abundant and varied animal life, including elephants, rhinoceros, Thornicroft's giraffes
Lukusuki Game reserve	1,050 (672,000)	1942	Wooded escarpments and plateaus; primarily a breeding ground for elephants; other animals
Lunga Game reserve	650 (416,000)	1951	Low forests and small grass plains; varied wildlife
Lusenga Plain Game reserve	340 (217,600)	1942	Woodlands and plains along Kalungwishi river; varied wildlife
Mweru Marsh Game reserve	1,210 (774,400)	1942	Papyrus and Phragmites marsh merging into dry plains and woodlands; animal life abundant, including elephant, sitatunga, some black rhinoceros; myriad wading birds on mud flats in dry season
Sumbu Game reserve	780 (499,200)	1942	On southern shore of Lake Tanganyika, with river deltas rocky ridges. woodland and small grass plains; many animals, especially elephant and blue duiker
Lochinvar ranch (private game reserve)			A large area, especially important to perpetuation of the red lechwe

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
NYASALAND			
Kasungu Game Reserve	772 (494,100)		Buffalo, greater kudu, eland, bushbuck and other wildlife
Kota Kota Game reserve	347 (267,900)		Elephant, hippopotamus, rhinoceros, many antelope
Lengwe Game reserve	50 (32,000)		Protects nyala and other animals
REPUBLIC OF RWANDA			
Kagera National park	970 (627,500)	1934	Verdant basin of Kagera river on Rep. of the Congo border; varied animal life, with zebra, antelope and marsh birds predominating
SENEGAL			
Niokolo-Koba National park	977 (625,000)	1951	The limit of the northern sudan savanna, principal refuge for Senegalese wildlife, including elephants, giant eland, antelopes, carnivores, hippopotamus
SEYCHELLES			
Aldabra Islands Nature reserve	60 (38,400)		Complete protection of giant tortoise and, on South Island, of all animals
Praslin Island Vallée du Main	2 (1,280)	1946	Protects *Coco de mer* palm and native birds
REPUBLIC OF SOUTH AFRICA			
National Parks			
Addo Elephant (Cape province)	26.5 (16,932)	1931	Southern tip of province impenetrable bush, habitat for 28 rare Addo elephants (a South African race of *Loxodonta africana*) and scarce Cape buffalo; 11 species of extirpated antelope reintroduced, abundance of other mammals, birds and reptiles
Bredasdorp Bontebok (Cape province)	5 (3,200)	1959	Forested and open basin plateau; habitat for last 110 bontebok antelope; gray rhebok, gray duiker, steinbok
Kalahari Gemsbok	3,730 sq. mi. (2,387,200) in Cape province; 4,300 sq. mi. (2,752,000) in Bechuanaland	1931	Bright red Kalahari sandveld, 5 in. of rainfall annually; acacia trees and desert shrubs and grasses; Kalahari lion and other endemic species, pther animal life characteristic of Kruger National park
Kruger (Transvaal province)	8,000 (5,120,000)	1898; 1926	World famous wildlife sanctuary, extending from Crocodile and Levubu rivers to the Lebombo mountains and the Mozambique border; mostly open veld, other parts dense brush and open forests; almost every species of South African animal life may be seen at close range
Mountain Zebra (Cape province)	5.5 (3,545)	1937	arroo mountain region; established especially to protect the very rare mountain zebra; other indigenous animals reintroduced; not open to public
Royal Natal (Natal province)	32 (20,500)	1916	High scenery of Drakensberg mountains; gray rhebok, mountain reedbuck, other wildlife; Bushmen's paintings
Nature Reserves			
Cape province			
Cape of Good Hope	27 (17,300)	1939	On tip of Cape of Good Hope; rare vegetation, including blue *Disa* orchid, mielie heath, Vaal rhebok, grysbok, other wildlife
Game Reserves			
Natal province			
Giant's Castle	92 (59,000)	1903; 1952	Open rugged grassland and peaks of Quathlamba Drakensberg range, and headwaters of Mooi and Busman's rivers; highland species of antelope, many leopard
Hluhluwe	89 (57,000)	1951	Almost every species of wildlife in Zululand including white rhinoceros, black rhinoceros, impala, kudu, etc.
Ndumu	37 (23,700)	1924; 1947	Thorn savanna, Ficus riverine forests and a large lake; hippopotamus, crocodile, nyala
Nkuzi	97 62,000)	1912	Thorn veld and Ficus forest; nyala, impala and some black rhinoceros
St. Lucia	190 (121,600)	1897; 1939	St. Lucia lake and estuary on False bay, and coastal scrub and jungle; hippopotamus and many kinds of birds, especially waterfowl
Umfolozi	112 (72,000)	1897	Rolling thorn veld; sanctuary for white rhinoceros

TABLE IV.—*Principal Parks and Reserves in Africa (Continued)*

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
REPUBLIC OF SOUTH AFRICA			
Nature Reserves (*Cont.*)			
Orange Free State			
Willem Pretorius		1956	Open plains, bush and *kloofs* and Doornberg range; plains species of wildlife
Transvaal province			
Barberspan	14 (8,940)	1954	Ornithological research station on Lake Barberspan; thousands of waterfowl flamingo, pelican and other dirds
Loskop dam	41 (26,200)	1940	Protects wildlife on four farms bordering Loskop reservoir; cycads, including *Encephalartos*
SOUTHERN RHODESIA			
Robert McIlwaine National park	20 (12,800)	1952	Bushmen's paintings; lake
Matopos National park	300 (192,000)	1953	Granite *kopjes* and Bushmen's cave paintings; sable and other antelope
Rhodes Inyanga National park	133 (85,100)	1950	Mountainouscountry; exoticand indigenous forests; wildlife
Victoria Falls National park	205 (131,200)	1952	Victoria falls, 355 ft. high, 5,580 ft. long, in Zambesi valley; rain forest; elephant, sable, roan and other antelopes; lion; many other species
Wankie National park	5,128 (3,281,900)	1950	Gemsbok, 2,000 elephants, buffalo, wildebeest, sable antelope, impala, roan antelope, kudu, lion and other wildlife
Gona-re-Zhon Gape reserve	1,000 (640,000)		Contains all species of animallife of Southern Rhodesia
Kazuwa		1961	
SOUTH-WEST AFRICA			
Estosha Pan Nature reserve	26,000 (16,640,000)	1928	Desert region extending from ocean to plains; contiguous with Moçamédès reserve in Angola; huge herds of elephants, springhok, zebras and blue wildebeest
SUDAN			
Dinder National park	2,470 (1,580,800)	1939	Roan antelope, kudu, and other antelope, many other species of wildlife
Southern National park	7,800 (4,992,000)		Dense and open forests and plains; many species of wildlife in abundance
TANGANYIKA			
Serengeti National park	4,450 (2,848,000)	1940	Open grasslands, acacia bush and riverine thickets, rocky outcrops and ridges, extending east irom Lake Victoria to Kenya; habitat of largest populations of ungulates in Africa (about 400.000 head). and manv lions.' leopards. cheetahs
Ngorongoro Conservation area	2,500 (1,600,000)	1959	Grass plains thornbush rain forest and' mountain 'moorland, dominated by vast extinct Ngorongoro crater, rising over 11,000 ft., main gorge and Lake Eyasi branch of Rift valley; rhinoceros, elephant buffalo leopard mountain 'reedbudk and' giant forest hog in higher terrain; plains species at lower elevations
Game Reserves			
Biharamulo	450 (288,000)	1959	Wooded rolling plains on shore of Lake Victoria; northern limit of range of sable antelope; Lichtenstein's hartebeest, common reedbuck and Sharp's steinbok
Gombe Stream	61 (39,000)	1943	Shore of Lake Tanganyika, on Rwanda-Burundi boundary; precipitous mountain country, with woodland and thick gallery forest, and mountain meadows; chimpanzee red colobus monkey and 'other wildlife
Katavi Plain	650 (416,000)	1951	Woodland, thornbush, plains and lakes many buffalo, hippopotamus, elephant, lion and other animals
Kilimanjaro	720 (460,800)	Before 1914; 1951	Summit of Mt. Kilimanjaro between 6 000 ft., at forest line to 19,340 ft with rain forest, moorland, 'tundra and ice fields; animal life includes Harvey's and Abbott's duikers elephant, buffalo, leopard, 'eland., colobus and blue monkeys, and other wildlife

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
TANGANYIKA			
Game Reserves (*Cont.*)			
Lake Manyara	375 (460,800)	1957	An area between escarpment of rift wall and Lake Manyara, with swamp and gallery forests, acacia woods, meadows and flats; elephant, many buffalo, hippopotamus, oryx, white-bearded wildebeest, lion and other mammals; waterfowl, wading birds
Mkomazi	1,350 (864,000)	1951	Very arid hilly area, adjoining Tsavo National park in Kenya; semidesert vegetation and animal life, including lesser kudu, oryx, gerenuk, rhinoceros,, elephant and larger carnivora
Mt. Meru	99 (63,400)	Before 1914; 1951	Upper slopes of volcanic Mt. Meru from 5,500 to 14,979 ft., with rain forest, bamboo, cedar and heath; colobus monkey, giant forest hog, rhinoceros, elephant, etc.
Rungwa River	7,822 (5,006,100)	1951	Rolling wooded plains, with rocky ridges; sable and roan antelopes, greater kudu, elephant, buffalo, etc.
Selous	11,512 (7,367,700)	Before 1914; 1951	In Rufiji river basin, with open grasslands patches of dense hardwood ' forest; primarily an elephant reserve, with many other animals
Tarangire	525 (336,000)	1957	Acacia thornbush and flood plains; elephant, rhinoceros, wildebeest impala, Coke's hartebeest', eland, lesser kudu, etc.; ecological research station
Ngorodoto Crater	5	1961	
TUNISIA			
Djebel Bou Hedma State park	508 (32,500)	1936	Plateau area in southern Tunisia, with remnant of acacia park land; gazelle, mouflon
UGANDA			
Murchison Falls National park	1,504 (962,600)	1952	Includes famed Murchison falls and the Victoria Nile; mostly open grassy plains, large number of crocodile, hippopotamus, and characteristic plains animals, such as elephants rhinoceroses, lions, etc., and aquatic birds
Queen Elizabeth National park	764 (489,000)	1952	Includes Kazinga channel joining Lake Edward to Lake George, and adjacent to Albert National park in Congo; tropical forests, swamps, open grassland and volcanic crater area; mountain gorillas, chimpanzees, elephants., antelopes, lions, hippopotamuses
Aswa Lolim Game reserve	40 (25,600)	1959	Dry savanna, seasonal habitat of Uganda kob ranging from Murchison Falls National park adjacent; elephant, buffalo, various antelope
Kigezi Game reserve	200 (128,000)	1952	Grassland and tropical forest, a buffer zone for Queen Elizabeth National park; plains and forest animals
Toro Game reserve	202 (129,300)	1946	Savanna and swamps on shore of Lake Albert; variety of wildlife, including elephants, buffalos, lions, hippopotamuses
Bugungu Hippopotamus and Elephant sanctuary	183 (117,100)		On southwest boundary of Murchison Falls National park; special protectton for hippopotamus and elephant
Debastien Game sanctuary	760 (486,400)	1958	Open plains, with characteristic wildlife
Elephant sanctuary	1,350 (864,000)		On southern boundary of Murchison Falls National park; s ecial protection for eleplants
Gorilla sanctuary	17 (10,900)		On Congo border, special protection for gorilla
Mt. Kei and Otze Crown Forest White Rhinoceros sanctuaries	250 (160,000)		Basin of the White Nile river, special protection for the rare white rhinoceros

animals a competitive nuisance, threatened to cause drastic reduction of the national park with consequent destruction of the wildlife and its habitat. In 1956 the world-famous botanist and ecologist W. H. Pearsall studied the problem and recommended drastic changes in the government's plans. For the most part these changes were put into effect. In addition to the Serengeti, Tanganyika possesses game reserves where hunting is prohibited and other reserves where certain species are protected and where hunting is regulated.

Similar problems exist in Kenya and elsewhere in east Africa. The game department, the Royal National parks of Kenya and the Kenya Wild Life society have experimented with the concept of encouraging native participation in the benefits derived from national parks and reserves with a success that indicates this approach is feasible. Poaching, for biltong (meat), ivory and rhinoceros horn. is a serious threat to protected animals. Between 1946 and 1960 six national parks and six national reserves were established in Kenya. In 1961, three of the national reserves were transferred to African district councils under careful agreements in recognition of the growing interest of the native people in wildlife preservation. Nairobi National park is close to the principal city and is famous as a place where visitors can see lions at close range, giraffes, Thomson's and other gazelles, and a host of other mammals and birds beside the roads. It is too small to provide sufficient range for its wildlife, and herds of zebras and antelopes sometimes roam out of the park onto nearby farms, followed by lions which may commit depredations on livestock. Were it not for the supplementary habitat provided by the Ngong reserve nearby, the wild populations would find it difficult to perpetuate themselves. Tsavo National park to the south contains 8,034 sq.mi. of thorn scrub considered useless for human development but abounding with much wildlife. In its Mzimi pools hippopotamuses have lived for generations and may be observed swimming with escorts of fish in the crystal-clear water. A proposal to utilize these pools for a reclamation project was defeated by Mervyn Cowie, director of the Royal National park system in Kenya, and other conservationists. The Mount Kenya and Aberdare National parks were temporarily closed to the public because of the Mau Mau uprisings. The Marsabit reserve is one of the most beautiful regions of Africa and protects many species, some not found in the southern part of the country. There are also other reserves that support large wildlife populations. Two small national parks are historical and archaeological sites.

Murchison Falls National park, established in 1952 in Uganda, protects one of the famous waterfalls in Africa and is the habitat of many crocodiles, hippopotamuses, elephants, lions, leopards, antelopes and other species. Queen Elizabeth National park was also established in 1952 between lakes Edward and George. The view of the Ruwenzoris and other mountains across the lakes attracts many visitors and the park itself is noted for its volcanic craters. Among other forms of wildlife here, this park supports a considerable population of chimpanzees. Its thousands of hippopotamuses have so greatly increased under protection that they are creating an overgrazing problem near the two lakes and the Kazinga channel which connects them. The solution to this problem seems to lie in the hippopotamus-cropping program now in operation. Uganda also has special reserves for the rare northern white rhinoceros, for gorillas, and the large elephant sanctuary.

Equatorial Africa has suffered loss of animal life and vegetal cover, but the French authorities there were interested in preserving the most outstanding scenic areas and wildlife populations. The governments that replaced French administration endeavoured to continue this protection, although the change in political status caused some uncertainty about the future of the reserves. A number of nature reserves were established, of which the Vassako-Bulo reserve (375,000 ac.) protects wooded plains and arid forests in the Central African Republic. Adjacent to this reserve, and bounded also by three others, is the Parc National du Baminui-Bandoran (2,500,000 ac.); it has been suggested these areas be combined into a single national park. The Parc National Saint-Floris (40,000 ac.) is the sole habitat of the heronlike shoe-bill (Balaeniceps rex) in the Central African Republic. The Odzala National park in the Republic of Congo and the Parc Nationale de l'Okanda (475,000 ac. in Gabun) have been reserved in relatively unexplored regions. Most of these reservations are patrolled only by local inhabitants.

In Cameroon the Waza Game reserve protects rich animal life of plains species and thousands of aquatic birds. A 1,000 ac. isolated mountain forest was set aside in 1948 as the Monts Bamboutos reserve, and extensive areas are devoted to zoological reserves, game reserves and protected forest reserves where wildlife is safeguarded.

The Guinea Monts Nimba reserve (48,750 ac.), on the border between the Ivory Coast and Guinea, supports varied forest animal life, notably chimpanzees, and an abundance of epiphytic plants. In the mid-1950s proposals for mining activities in adjacent parts of Liberia threatened to extend into this reserve.

A large population of mammals and birds is protected in the Niokolo-Koba Kational park (625,000 ac.) in Senegal. The Parc National du "W" in Niger and a complex of contiguous reserves in Upper Volta and Dahomey, totaling 3,120,500 ac., protect many west African animals. The Banco National park (7,500 ac.) in the Ivory Coast contains a dense relict forest. In Mali, the Boucle du Baoulé National park is a mountainous scenic forested area with abundant wildlife, bordered by large game reserves.

The extraordinary and unique animal life and vegetation of the island of Madagascar have been decimated over seven-tenths of the country by exploitation, but between 1927 and 1960 six nature reserves were established under the guardianship of the Museum National d'Histoire Naturelle in Paris. Under a decree of 1952, four similar reserves were created to protect especially dugongs, all species of lemurs, egrets and the endemic vegetation. In 1956 Jean-Jacques and Arlette Petter undertook an ecological study of the lemurs on the island, under the sponsorship of the Museum, the Institut de Recherche Scientifique de Madagascar, the Conseil National pour la Recherche Scientifique en France and the International Union for Conservation of Kature; this study added greatly to scientific knowledge and led to recommendations for additional reserves.

In Angola elands have increased markedly in the Quiçâma National park (2,489,000 ac), as have other species. The beautiful rare giant sable antelope is especially protected with other wildlife in the Luando reserve. Black rhinoceros (150–200 in 1960) and Hartmann's zebra are abundant in the Moçamédès National park and inhabit others. The largest elephants in the world are found in Angola, and sizable herds are safeguarded in several of the reserves.

The Somali Republic has four national parks and one nature reserve for the protection of animal life and vegetation, and laws have been enacted to ensure the survival of certain endangered species and to regulate hunting of others. Zoological and game reserves have also been established.

The two national parks in Morocco, the Toubkal National park and the Tazekka National park, are bordered by game reserves where hunting is regulated on a rotation basis. The land is arid but supports some protected forests.

National parks in Algeria are administered under strict policies to ensure perpetuation of natural ecological conditions. Visitors may see the varied wildlife of North Africa, including apes, foxes, several species of cats, reptiles and birds. The animals of this region were depleted by the ancient Romans to provide for their circuses. Tunisia has reserved two areas of interest to tourists, the Parc forestier d'Ain–Draham and the Forêt domaniale du Bou Kornine.

IV. ASIA

Although interest in national parks came later in Asia than in Africa, several countries have very well-developed park systems. In Japan, for example, in spite of the large human population and need for agricultural and other economic exploitation of land, 4% of the total land area has been set aside as parks. Inspired by visits to the national parks of the United States in 1923 and 1924, Tsuyoshi Tamura influenced the Japanese government to enact a national parks law in 1931. By 1936, although funds were limited, 12 national parks had been established. After the close of World War II came recognition that the natural beauty of Japan represented one of its richest natural resources. Seven new parks were created and their development for tourists and the enjoyment of the Japanese people was stimulated. In addition. 20 quasi-national parks, administered by the prefectures, were established.

The Japanese people are highly sensitive to natural beauty and visit their parks in great numbers. The parks also protect many religious shrines and temples, the most notable being the Grand Shrine of Ise in Ise–Shima National park. Mt. Fuji, in Fuji–Hakone–Izu National park, is among the most nearly perfect volcanic cones in the world; it is revered by the Japanese people, and is also a major attraction for foreign tourists.

Japan possesses more crater lakes, or caldera, than any other country, and some of the largest in the world are in the national parks, those in Aso. Akan and Towada–Hachimantai being especially magnificent. The Japanese Alps are noted for gorges and waterfalls. for virgin forests and unusual wildlife. Equal in beauty are the rocky headlands and serene islands of the ocean coasts and borders of the Inland sea, with their forests and beaches and rocky islets inhabited by myriad nesting sea birds.

Any of the national parks may be visited from centres of population in a single day; accommodations in or near the parks are excellent.

India's national parks protect some of the outstanding forest, jungle and mountain scenery of the subcontinent and an abundance of wildlife of many species. They are administered by the chief conservator of forests, the North-East Frontier agency, or by other departments of the government; the Indian Board for Wild Life, founded in 1952, serves in a quasi-official advisory capacity.

Four of the many wildlife sanctuaries established in the respective states are of especial importance in the survival of rare endangered species. The Gir forest, northwest of Bombay, is the only remaining habitat of the Asiatic lion *(Panthera leo persica)*. (This or a closely related race survived in Greece until A.D. 100. The lion is referred to 130 times in the Bible; it became extinct in Palestine about the time of the Crusades, but survived into the 20th century in Arabia, Iraq and Iran.) In India, lions inhabited much of the north and central portions until the 19th century,

TABLE V.—*Principal Parks and Reserves in Asia*

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
BURMA			
Nature Reserves (by Forest division)			
Kahilu (Thaton)	62 (39,700)	1928	Sumatran rhinoceros, serow, sambar, muntjac, barking deer, hog deer, musk deer; jungle birds
Kyatthin (Shwebo)	104 (66,600)	1941	Forests of Mt. Thaw: gaur, sambar, thamin, muntjac
Maymyo (Maymyo)	49 (31,400)		Barking deer, jungle fowl, partridge, peafowl
Mulayit (Thaungyin)	54 (34,200)	1936	Barking deer, muntjac, pig, tiger, leopard, birds
Pidaung (Myitkyina)	279 (178,400)	1918	East of upper Irrawaddy river; elephant, tiger gaur and hanteng (rare 'wild cattle), bear, leopard, barking deer, pig, jungle birds
Shwe-u-daung (east Katha and Mongmit)	126 (80,600)	1918	Sumatran rhinoceros, elephant, hanteng, serow, sambar, tiger, leopard, jungle birds
Shwezet-taw (Minbu)	213 (136,600)	1940	Gaur, tharnin, sambar, muntjac
CEYLON			
Gal Oya National park	98 (63,000)	1954	Skirts Gal Oya water storage reservoir; dry evergreen and savanna forests, range of mountains on outer border; elephant leopard, deer, sloth bear and' other animals; remnants of an ancient jungle tribe
Ruhuna National park	91 (58,300)	1938; 1954	Open plains jungle, rock outcrops and water holes; sambar, chital barking deer, mouse deer; sloth hear, elephant, leopard; former sites of Buddhist monasteries of 2nd century B.C., caves contain pre-Christian inscriptions
Wilpattu National park	252 (161,300)	1938	Mainly sandy area, a few rocky outcroppings; abundant wildlife, including elephant, sambar, leopard and many species of hirds
Yala Strict Nature reserve	111 (71,000)		High forests and rocky hills; elephant, deer, leopard and other mammals and birds
Amparai sanctuary	148 (94,700)		Noted for its aquatic bird population, including painted storks; migrating herds of elephants
INDIA			
National Parks			
Corbett (Uttar Pradesh)	125 (80,000)	1935	Jungle animal life, including elephant, tiger, leopard, sloth bear, several species of deer, sambar, goral, pig, wild dog, crocodile, python, many species of birds
Hacarihagh (Bihar)	150 (96,000)	1955	Tiger, ieopard bear sambar, barking deer)and dther wildlife
Hailey (Uttar Pradesh)	125 (80,000)	1935	Orchids; sambar, chital, elephant, leopard, caracal, etc.
Kanha (Madhya Pradesh)	98 (62,500)	1956	Vast amphitheatre covered with forestsin upper Banjar valley; abundant wildlife, including gaur, sambar, axis deer, muntjac, etc.
INDIA			
National Parks (Cont.)			
Shivpuri (Madhya Pradesh)	61 (39,000)		Tiger leopard, bear, sambar, spdtted bull, four-horned antelope, Indian gazelle and varied bird life
Taroba (Bombay)	45 (28,800)	1935; 1956	Tiger, leopard, sambar, spotted deer
Tirap (Assam)	800 (512,000)		Mountainous region in northeast Assam on China border, tiger, takin and other wildlife
Wildlife Sanctuaries			
Dachigam (Kashmir)	55 (35,200)		Denselv forested Himalayan mountain area north and east of the valley of Kashmir, between 9,000 and 13,000 ft.; primary refuge of the rare Kashmir stag; also musk deer, leopard, black bear, brown bear, boar and other wildlife
Gir (Bombay)	527 (337,300)	1900	On Kathiawar peninsula, arid desert with dry mixed deciduous teak forest surrounded by a belt of thorn scrub, intersected by narrow rivers; only remaining habitat of Asiatic lion; also chital, sambar, boar, chinkara, four-horned antelope, nilgai, monkey and leopard
Kaziranga (Assam)	166 (106,200)	1908	Tall elephant grassland bounded on north by Brahmaputra river; principal refuge of great Indian rhinoceros: buffalo. gaur, elephant, tiger, sambar hog deer swamp deer, boar: crocodile'and bird life
Keibul Lamjao (Manipur)	20 (12,800)	1954	Established to protect only known wild population in India (100 in 1960) of the brow-antlered deer
INDONESIA			
G. Indrapura Nature reserve (West Sumatra)	49 (31,325)	1929	Wildlife; habitat of rare *Anaphalis javanica* plant
Gunung Loser Nature park (North Sumatra)	1,625 (1,040;250)	1934	Habitat of elephant, Sumatran rhinoceros, deer, tiger
Lautan Pasir Tengger Nature reserve (East Java)	20 (13,025)	1919	A sea of sand in the Tengger mountains
S. M. Bali Nature park (Nusa Tenggara)	78 (50,000)	1941	Especially for protection of the "white starling" (*Leucopsar rothschildi*), tiger, deer and an ox indigenous to Bali
Sumatra-Selatan Nature park (South Sumatra)	1,394 (892,000)	1935	Sumatra; rhinoceros. elephant. deer, serow, mouse deer; tapir; macaques, gibbons; giant *Rafflesia arnoldi*
Udjung Kulon–Panailan Nature reserve	161 (102,800)	1921	On two Javan islands; especially protects the very rare Javan rhinoceros; also tiger, chevrotain, barking deer; extraordinary vegetation
JAPAN			
National Parks			
Akan (Hokkaido)	342 (218,745)	1934	Active volcanoes caldera lakes and hot spring;; virgin conifer forests with rhododendron, azalea and birches; brown bear, snow rabbit and other wildlife; home of primitive Ainu people

TABLE V.—*Principal Parks and Reserves in Asia (Continued)*

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
JAPAN			
National Parks (*Cont.*)			
Aso (Kyushu)	285 (182,717)	1934; 1953	Mt. Aso and vast atrio or sunken crater ringed with mountains in south, the Kuju plateau with many peaks in north, separated by grassland wilderness; forests and alpine meadows; wildlife; large human population
Bandai–Asahi (Honshu)	741 (474,153)	1950	Three disconnected sections: Mt. Gassan volcano and Asahi range (north); Mt. Iide, a granite peak with virgin forests and Mt. Azuma and Mt. Adatara volcanoes (central); Mt. Bandai (south) erupted in 1888 to produce some of world's largest dammed volcanic lakes; bear, monkey, serow in central section
Chichibu–Tama (Honshu)	475 (304,000)	1950	Spectacular scenic vistas of sedimentary ranges, rivers and dense dwarf bamboo moss forests with virgin pine and spruce' fir forests at higher elevations; several villages
Chubu Sangaku (Honshu)	663 (424,420)	1934	Forested Japanese Alps, with peaks, gorges and perpetual snows
Daisen (Honshu)	48 (31,008)	1936	Mt. Daisen and other peaks, with virgin pine and beech forests and snow-clad summits; religious shrines
Daisetsuzan (Hokkaido)	906 (579,823)	1934	Three volcano groups and Ishikari range, with cliffs, gorges, waterfalls; vast alpine meadows and virgin conifer forests; brown bear only Japanese habitat of ' crying "hare" (pika)
Fuji–Hakone–Izu (Honshu)	370 (237,035)	1936; 1955	Famous Fujiyama volcanic cone (3,776 m. [12,388 ft.]) with virgin forests, lakes and plains; Mt. Hakone area includes several volcanic peaks and hot springs; volcanic Izu peninsula noted for hot springs
Ise–Shima (Honshu)	203 (130,090)	1946	Forested peninsula and coast line and island archipelago; Grand Shrine of Ise is national centre of religious worship; pearl farms in bays; bird life abundant
Jo–Shin–Etsu Kogen (Honshu)	738 (472,288)	1949; 1956	Rugged Tanigawa range in north, with plateaus and volcanoes stretching south, including Mt. Asama, highest active volcano in Japan (2,542 m. [8,340 ft.]); Mt. Myōkō–Mt. Togakushi volcano complex to northwest; hot springs, forests; monkeys, antelopes
Kirisbima (Kyushu)	84 (54,000)	1934	23 volcanoes, some active, others with calderalakes; hot springs; evergreen and azalea forests; several religious shrines, with giant cryptomeria trees
Nikkō (Honshu)	550 (351,745)	1934; 1950	Scenic Nikkō volcanic area, peaks, lakes waterfalls, marshes, virgin'forests; abundant mammals and birds; several temples, including Toshogu shrine
Rikuchu Kaigan (Honshu)	34 (21,535)	1955	90 km. (56 mi.) of coast line, cliffs, islands and beaches; pine and deciduous forests and subtropical vegetation; abundant bird life
Saikai (Kyushu)	95 (60,810)	1955	Dendritic coast line, Kujuku islands and Goto archipelago; subtropical forests; many harbours
Seto Naikai (Honshu)	257 (164,775)	1934; 1950	About 600 islands and coast land of Inland sea; fishing villages and farmlands; religious shrines; monkeys
Shikotsu–Toya (Hokkaido)	385 (246,650)	1949	Scenic volcanoes and. caldera lakes, with virgin conifer forests and alpine vegetation. brown bear, Yeso squirrel' Japanese sable, birdsandothe; wildlife
Towada–Hachirnantai (Honshu)	326 (208,378)	1936; 1956	Lake Towada, a double caldera lake, headwaters of scenic Oirase river, and Hakkōda volcanoes, with primeval deciduous forests at lower elevations and dense conifers and alpine vegetation on slopes, the Hachimantai section includes a range of volcanoes and wide plateau, with hot springs
JAPAN			
National Parks (Cont.)			
Unzen–Amakusa (Kyushu)	100 (64,000)	1934; 1956	Northern unit consists of plateau of Mt. Fugen and other peaks, overlooking Sea of Ariake; noted for azaleas, hoxtrees and deciduous forests; Amakusa section is an archipelago, with villages and historical relics of Christianity in Japan
Yoshino–Kumano (Honshu)	216 (138,435)	1936	Mt. Yoshino and Yoshino shrine, noted for cherry blossoms; rugged Ōmine mountain chain and Mt. Odaigahara plateau stretch southward, with dense forests, gorges and cascades; the Kumano seacoast is bordered by innumerable rocky islets
Quasi-national *Parks*			
Abashiri (Hokkaido)	146 (93,530)	1958	Coast line with shallow lakes and dunes, arctic vegetation, sea birds, seals; relics of Ainu culture
Biwa-ko (Honshu)	430 (274,955)	1950	Lake Biwa and surrounding Mt. Ibuki region
Hakusan (Honshu)	185 (118,398)	1955	Small volcanic peaks gorges waterfalls, fossil forests; bear', antelope and other wildlife inhabit virgin forests; shrines
Izu Shichitd (Honshu)	109 (69,538)	1955	Chain of active volcanic islands
Sado–Yahiko (Sea of Japan)	180 (115,075)	1950	Volcanic Sado Island in the Sea of Japan
Yaba–Hida–Hikosan (Kyushu)	425 (272,023)	1950	Volcanic area, adjacent to Aso National park; religious relics
MALAYA			
King George V·National park	1,760 (1,126,400)	1938	Includes mountains, a wide plateau with unusual plant associations and many rivers and limestone outcrops; tropical rain forest; elephant, Sumatran rhinoceros, gaur, sambar, muntjac, Malayan tapir, bear, tiger, leopard
Endau–Kota Tinggi Wild Life reserve ,	878 (561,900)		Protection of native animal life
Templar	5 (3,000)	1955	Limestone deposits; forests
PHILIPPINES			
National Parks			
Aurora (Luzon)	22 (14,190)	1937; 1941	Rolling terrain, with dipterocarp forests and varied wildlife
Basilan (Basilan)	25 (16,128)	1939	Peaks and rough terrain, headwaters of six large rivers; virgin forest with large trees; varied wildlife
Bataan (Luzon)	123 (78,500)	1954	Verdant virgin forests on Bataan peninsula overlooking Manila bay; commemorates battle of Bataan; abundant and varied wildlife
Bicol (Luzon)	16.5 (10,563)	1934	Scenic virgin dipterocarp forests on plateaus and river valleys; deer, wild boar hornbill, jungle fowl and other wildlife
Canlaon (Negros)	96 (61,444)	1934	Mt. Canlaon (8,035 ft.) and surrounding rugged forested terrain, with craters, hot springs; monkey, deer, boar, upland birds
Central Cebu (Cebu)	60 (38,483)	1937	Only extensive remaining virgin forest on Cebu; wildlife abundant
Hundred Islands (Luzon)	7 (4,710)	1941	Coral islets, underwater coral formations, caves and fine beaches, Indian pygmy goose Philippine bulbul, fish and other wildlife
Mayon Volcano (Luzon)	21 (13,675)	1938	Mt. Mayon (7 943 ft.) and rugged terrain,' with grasslands and forests of dwarf trees; deer, boar, monitor lizard, many birds
Mt. Apo (Mindoro)	302 (193,250)	1936	Mt. Apo (9,691 ft.) volcano, highest in the Philippines, with moss anddipterocarp forests; varied wildlife, including monkey-eating eagle
Mt. Arayat (Luzon)	14.5 (9,285)	1934	Forested volcanic peak (3,379 ft.), with springs, rivers and small waterfalls
Mts. Banahaw–San Cristobal (Luzon)	43 (27,833)	1941	Rough forested country surrounding Mt. Banahaw (6,000 ft.) and Mt. San Cristobal (7 000 ft.); abundant wildlife
Mt. Data (Luzon)	21.5 (13,780)	1936	pine)-covered peak with ravines and waterfalls; varied wildlife
Mt. Isarog (Luzon)	52 (33,082)	1938	Rough forested region, with canyons, rivers and waterfalls; boar, deer hornbill and other wildlife; inhabited by Negritos

TABLE V.—Principal Parks and Reserves in Asia (Continued)

Name and location	Total gross area in sq mi (approx acreage in parens)	Date established	Principal features
PHILIPPINES *National Parks (Cont)*			
Mt Makiling (Luzon)	15 (9,723)	1933	Three peaks, with ridges and deep valleys covered with dipterocarp forests and dwarf trees, hot springs, deer, pig, waterfowl and upland birds
Naujan Lake (Mindoro)	11 5 (7,414)	1956	Naujan lake and surrounding marshes and forests, principal breeding area of marsh birds in the Philippines; crocodile, sail-finned lizards
Sohoton Natural Bridge (Vizayan)	9 4 (5,995)	1935	Large natural bridge in forested rolling terrain, with limestone cave, deer, boar, monkey, upland birds
Game Refuge and Bird Sanctuary			
Liguasan Marsh (Mindanao)	172 (109,825)	1940	Lush mangrove marsh; waterfowl nesting area, with other birds, monkey, deer, pig
SIYGAPORE			
Bukit Timah reserve	0 3 (184)	1883	Forest lowland covering granite hill with 581 ft elevation; type locality for many species of plants
Pandan reserve	2 (1,373)	1883	Pioneering and tidal mangrove plant associations
THAILAND			
Tung Slang Luang Natural park	425 (271,810)	1959	Virgin area of river, waterfalls and mountain scenery in northwest Thailand, wildlife includes tiger, leopard, deer, elephant and other mammals; varied bird life
TURKEY *National Parks*			
Karatepe–Arslantas	16 (10,297)	1958	High elevation red oak and red pine forests, inhabited by roe deer, wolf, jackal, wild swine, marten and other animals; partridges and eagles, Hittite epitaphs, Phoenician and Roman mosaics and reliefs, and historical museum
Manyas Bird Paradise	0 2 (130)	1950, 1959	Grove of willows and shore line reeds on Lake Manyas, in Balikesir, provides nesting habitat for 2,000 pairs of cormorants, egrets spoonbills, glossy ibises and'other birds
Soğuksu	4 (2,525)	1959	Protects forested watershed adjacent to thermal spring resort of Kizilcahamam; soil and forest conservation, wolf, fox bear, many species of land birds
Yozgat Pine Forest	1 (660)	1958	Representative example of indigenous pine and oak forests of Anatolia; reforestation projects

but the last recorded outside the Kathia ar peninsula was in 1884. Some 300 lions survive in the Gir forest, where they feed on other wild species and on livestock owned by the Maldhari, who have religious scruples against killing animals. After 1900 the lion was protected by decree of the many princes and the maharajah of the peninsula, and the animals have increased since.

The Kaziranga Wild Life sanctuary, in Assam, is the principal remaining habitat of the great Indian rhinoceros (Rhinoceros *unicornis*), which 500 years ago ranged over a large part of northern India and Nepal. Hunting, dessication of fertile land by unrestricted livestock grazing, agriculture and fires, and the fantastic value placed on rhinoceros horn and other parts of the carcass for magical medicine, to detect poison in drinking potions and as an aphrodisiac, reduced the population drastically. Nearly all of these animals remaining in India (about 400 in 1960) are in sanctuaries and reserves, 260 of them in Kaziranga, where they are safe from poaching and have become tolerant of human activity. In spite of royal, restrictions on hunting in the Rapti valley of Nepal, poaching is a serious problem.

The Keibul Lamjao sanctuary is the only habitat of the browantlered deer (*Cervus* eldi eldi), feared to be near extinction before World War II but now holding its own locally under protection.

The Kashmir stag (Cervus *elaphus hunglu*), the Himalayan relative of the European red deer and the American wapiti, was carefully protected by the maharajah of Kashmir prior to independence, and is safeguarded in the Dachigam and Chumnaiye sanctuaries.

Indonesia has set aside over 100 nature reserves, ranging from small sanctuaries for bird life to large territories designed to protect all natural features and wildlife. The most important is the Udjung–Kulon–Panailan Nature reserve at the western end of Java. This is the only known habitat of the Javan rhinoceros (R. sondaicus), a single-horned inhabitant of dense low tropical forest, of which possibly 24 to 48 individuals were surviving in the 1960s. Although these are given careful protection, scientists fear their numbers are too low to permit adequate reproduction, and that the species may become extinct in the near future.

In Ceylon, under the Fauna and Flora Protection act of 1938, three national parks and four strict nature reserves are dedicated to complete protection of native vegetation and animal life; entry to them requires payment of a fee in the case of national parks or a written permit in that of the strict nature reserves. Intermediate zones mostly adjacent to the reserves serve as buffers between them and areas of human culture; controlled hunting and other activities may be permitted in these zones by the warden.

In addition, several sanctuaries give strict protection to vegetation and wildlife. Preservation of a number of Ceylonese animals is dependent on these reserved areas. including the hog deer, leopard. sloth, bear and especially the Indian elephant, which may cease to exist as a wild species outside the reserves. (F. M. PD.)

V. GREAT BRITAIN

National Parks.—The tenth national park in England and Wales was established in 1957 in the Brecon Beacons. A total area of over 5,000 sq.mi. was then covered by national parks. They are: the Lake District National Park, the Peak District, Snowdonia, Dartmoor, the Pembrokeshire Coast, the North York Moors. the Yorkshire Dales, Exmoor, Northumberland (a part of the county) and the Brecon Beacons. National parks in England and Wales are set up under the National Parks and Access to the Countryside act which received the royal assent in Dec. 1949 and established a National Park commission among whose duties is that of selecting areas which it considers suitable to become national parks.

These are extensive areas of country possessing a marked degree of natural beauty and good opportunities for open-air recreation, which have been designated by the commission and confirmed by the minister of housing and local government, in order to preserve and enhance their characteristic beauty and to improve their facilities for enjoyment by the public. The provisions of the 1949 act relating to national parks did not extend to Scotland, but those relating to nature conservation extended to all parts of Great Britain and are the responsibility of the Nature Conservancy, as explained below.

The passing of the 1949 act was the culmination of a campaign dating from the second half of the 19th century, fought by various voluntary organizations which strived to preserve the countryside and its wildlife and to secure public rights of access to mountain and moorland. These included the Commons, Open Spaces and Footpaths Preservation society, the National Trust, the Society for the Promotion of Nature Reserves, the Ramblers Association, the Royal Society for the Protection of Birds and the Councils for the Preservation of Rural England (C.P.R.E.) and Wales.

In the early 1930s there was a growing public interest in the idea of creating national parks, and the efforts of the voluntary organizations were co-ordinated by the formation in 1935 of the C.P.R.E.'s standing committee on national parks, which made representations to the government to take effective action. Committees were appointed by the government of the day to consider the question of national parks and other relevant problems concerning the countryside, notable reports of this period being those of the Addison committee (Cmd. 3851) in 1931 and the Scott committee (Cmd. 6378) in 1942. It was by now generally realized that a further and more comprehensive investigation was needed.

In May 1945 a report on national parks (Cmd. 6628) by John Dower—an architect and a great authority on the landscape—was presented to parliament by the minister of town and country planning and published for information and as a basis for discussion. Later the same year the government appointed a committee under the chairmanship of Sir Arthur Hobhouse to consider the Dower report and to make recommendations.

The report of the Hobhouse committee (Cmd. 7121), published in 1947, recommended the setting up of a National Parks commission and the creation of 12 national parks. This report formed the basis of the legislation of 1949, but the passing of the Town and Country Planning act in 1947, which transferred planning control from district councils to county councils, had a profound effect on the degree to which the Hobhouse committee's recommendations were accepted.

The National Parks commission does not itself administer the national parks, as was recommended in the Hobhouse report; apart from its executive powers to select areas for such designation, the commission's duties are mainly advisory. The national parks are administered by special park planning authorities set up under the 1949 act, on which sit a proportion of members appointed upon the nomination of the minister of housing and local government by reason of their special concern with the national aspect of the parks.

Within national parks the normal life of the area goes on; the land is not sterilized, neither does designation affect in any way the existing ownership of the land. The park planning authorities control development just as county councils do elsewhere throughout England and Wales, but in doing this they pay special regard to the fact that the park is one of Britain's finest landscapes which stands in need of preservation.

Other duties of the park planning authorities include the drawing up of annual programs to accomplish the purposes of the parks. And they have special powers. They may, for example, make arrangements to provide accommodations, meals and places of refreshment where the existing facilities are inadequate. They may lay out caravan sites and parking places, and arrange for facilities for sailing, bathing, boating and fishing. For approved facilities of this kind, the government pays grants up to 75% of the total expenditure. Grants are also payable for approved measures taken to preserve and enhance the natural beauty of the parks, such as the removal of disfigurements, the restoration of derelict land and the planting of trees. (L. J. W.)

Nature Reserves.—Nature reserves in Great Britain may be traced back as far as the medieval royal forests which had nothing to do with silviculture but were managed under strict legislation designed to secure the maximum protection, cover and food for beasts and birds of the chase. In modern times a few small bird sanctuaries were created informally during the 19th or early 20th century and from 1894 there was statutory power to establish bird sanctuaries, although most of the orders made for this purpose were not actively enforced.

During World War I a comprehensive list of proposed nature reserves was drawn up for the board of agriculture but no official action was taken until the appointment by the planning ministers in 1945–46 of the two Wildlife Conservation Special committees for England and Wales and for Scotland, in connection with the National Parks committees. The reports of these committees resulted in the creation by royal charter in 1949 of the Nature conservancy as a crown body under the supervision of a committee of the privy council with the objects of advising scientifically on conservation, of operating nature reserves and of undertaking scientific research.

The program of national nature reserves includes areas in England, Scotland and Wales ranging in size up to approximately 40,000 ac. and forming the best available examples of natural or seminatural habitats including arctic-alpine vegetation, bogs, woodlands (both deciduous and coniferous), fens, grasslands, inland waters, dunes, salt marshes, expanses of shingle, sea cliffs and islands.

Up to February 1962, 95 national and 7 local nature reserves (the latter maintained by local authorities) had been declared under part 3 of the National Park and Access to the Countryside act. 1949. which includes powers of acquisition and control. The largest of these are the Cairngorms Nature Reserve in the eastern Scottish Highlands (39,689 ac.), the Inverpolly Nature Reserve in the western Highlands (26,791 ac.), the Moor House Nature Reserve in the Westmorland Pennines (10,000 ac.) and the Beinn Eighe Nature Reserve in the western Scottish Highlands (10,450

TABLE VI.—*National Parks in Great Britain*

Name and location	Total gross area in sq.mi. (with approx. acreage in parens.)	Date established	Principal features
Peak District (mainly Derbyshire but including parts of Cheshire, Staffordshire, West Riding of Yorkshire and Sheffield)	542 (346,900)	1951	Gritstone moorland of the south Pennines in central England; limestone uplands, wooded dales
Lake District (Cumberland, Lancashire and Westmorland)	866 (554,200)	1951	Spectacular mountain scenery with lakes and fells in northwestern England; interesting wildlife, rock climbing, wooded valleys
Snowdonia (Caernarvonshire, Denbighshire and Merioneth)	845 (540,800)	1951	Snowdon and the Cambrian mountains in north Wales and Cader Idris. Cwm Idwal and other National Nature reserves
Dartmoor (Devonshire)	365 (233,600)	1951	Plateau of wild moorland in southern England; tors, river valleys and hanging oak woods; prehistoric relics
Pembrokeshire Coast (Pembrokeshire)	225 (144,000)	1952	Rocky coast line and the Prescelly mountains in south Wales. Sorman castles, prehistoric sites and island bird sanctuaries
North York Moors (North Riding of Yorkshire)	553 (353,900)	1952	Open moorland plateau extending from the plain of York to the northeast coast of England; medieval castles and abbeys
Yorkshire Dales (North and West Ridings of Yorkshire)	680 (435,200)	1954	Wide, sweeping upland moors cut by deep pastoral valleys: in the central Pennines of England caves, castles and prehistohc and Roman sites
Exmoor (Devon and Somerset)	265 (169,600)	1954	Heather moorland, once a Norman Royal hunting forest with a fine sea coast on Bristol channel; prehistoric camps
Northumberland (Northumberland)	398 (254,700)	1956	Cheviot hills on Scottish border of England and Hadrian's wall; moorlands, fells, rivers and forests, ancient British and Roman camps
Brecon Beacons (mainly Brecknockshire, but including parts of Carmarthenshire and Monmouthshire)	515 (329,600)	1957	Northward-facinp escarpment in south Wales, rising nearly to 3,000 ft., with moorland on southern slopes, and many rivers; caverns, prehistoric and Roman remains; Carreg Cennen castle

ac.). At that date national nature reserves totaled 179,704 ac. and local nature reserves 5,168 ac.

British nature reserves inevitably differ from those in less developed countries in being mostly smaller, more frequented and farther from their primitive state. The majority are open to public access but several are closed except to permit holders. Some are primarily selected as "living museums" to conserve picked examples of natural communities of plants and animals or to serve as refuges for rarities. Others are partly or mainly used as open-air laboratories on which experiments are conducted into the effects of climate and drainage, or of different types of management treatment such as grazing, planting, fencing and control of burning. Comprehensive records are kept of the elements and changes in the animal life and vegetation and of the enrichment or impoverishment of soils.

The broad purpose of the conservancy's nature reserves is to provide suitable and secure arrangements for long-term studies of the natural resources of Great Britain and to preserve for future generations the best possible range of examples of the natural vegetation and animal life. These official nature reserves are supplemented by a somewhat larger number of unofficial reserves managed by the Society for the Promotion of Nature Reserves, the Royal Society for the Protection of Birds, the National trust, the National Trust for Scotland and various regional or county trusts, of which the Norfolk, Yorkshire and Lincolnshire Naturalists' trusts are leading examples. In addition the conservancy has notified to local planning authorities more than 1,700 sites of special scientific interest over which the Nature conservancy must be consulted before permission for development is given.

(E. M. N.)

VI. EUROPE

Plato and other philosophers of antiquity recognized the desirability of a harmonious relationship between man and his natural environment, but the ancient civilizations did not develop the concept that nature itself is worth preserving. Royal prerogatives, from early times through the middle ages and into modern times, often restricted hunting of certain species of animals to nobles, protected eagles and hawks for falconry and closed extensive areas to trespass by commoners. These were feudal measures to benefit the oligarchy, although they resulted in some measure of nature protection.

Some of these preserves were maintained for centuries and saved primeval regions and wildlife species. The aurochs, ancestor of domestic cattle, protected by royal decrees, survived in Poland until 1627. In the same country, all hunting was prohibited in the Bialowieza forest in the 17th century and only by this protection was the wisent, the European bison, perpetuated to modern times.

The Renaissance brought an interest in natural philosophy and with it the stirring of an appreciation of nature and its processes. Local communities began to restrict exploitation of the resources of economic importance, to control woodcutting and grazing, and even to preserve natural areas intact, as in the case of the Bois de la Haye, in Holland, in 1576. During the mid-19th century the German naturalist Alexander von Humboldt conceived the idea of establishing natural monuments for preservation of natural ecology.

It was not until the 20th century, however, and mainly after World War I, that European nations undertook extensive establishment of national parks and nature reserves in the modern sense. By 1960, almost every European country had set aside some areas to protect scenery, natural environment and wildlife.

In Austria, for example, the *Länder* have promulgated laws and ordinances which provide varying degrees of protection to a large number of nature reserves ranging in size from a few acres to many square kilometers. These include outstanding scenic mountain areas, forests, lakes, geological formations and relic habitats of

TABLE VII.—*Principal Parks* and ***Reserves in Europe***

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
AUSTRIA			
Karwendel Schutzgebiet	280 (179,200)	1943; 1947	Alpine and subalpine vegetation and animal life in limestone region of the Karwendel mountains of Tyrol
Hohe-Tauern Scenic reserve		1942	The valleys from the Gerlostal to the Raurisertal Gasteinertal, Kleinarltal anh the upper reaches of the Grossarltal
Neusiedler See and Seewinkel Scenic reserve		1940	On the Danube plain at the Hungarian border; source of major rivers; notable bird life; hydrobiological research station
BELGIUM			
Lesse et Lhomme National park	4 (2,500)	1954	Protects scenic region with unusual geological formations
Haute Fagues Nature reserve	8 (5,250)	1957; 1958	Swamps, peat bogs and Ardennes plateau with glacial and subalpine plant associations; ecological research station
Westhoek Nature reserve	1.3 (823)	1957	Sand dunes; beach research
BULGARIA			
Vitocha National park	25 (16,000)	1933	In the massif of Rila, near the Yugoslavian border, with forested mountains and a peat bog noted for its wild flowers
CZECHOSLOVAKIA			
Krkonose and Jizerské Hory	460 (294,400)	1955	Glaciers alpine meadows, peat bogs, hot springs, plants and wildlife; 150 sq.mi. classified as a strict nature reserve
Tatra	190 (121,600)	1946	High mountain scenery, on Polish border with glaciers, forests endemic plants, chamois, bear and other wildlife
DENMARK			
Skallingen	12 (7,700)	1939	Largest nature reserve in Denmark, on the west coast of Jutland, with dunes, marshes and a research laboratory
Tipperne og Klaegbanken	3.5 (2,200)	1895; 1936	Several islands on west coast of Jutland protect thousands of nesting shore birds, terns and other birds, also migrant species; ecological laboratory
FINLAND			
Linnansaari	3 (2,000)	1956	Group of about 20 islands in Lake Haukivesi; osprey colony; rare plants; access by boat
Pyhähäkki	4 (2,500)	1956	Virgin pine forest, swamps and peat lakes
Oulanka	40 (25,645)	1956	Wild terrain along the Oulounjoki river and its tributaries
Pyhätunturi	12 (7,500)	1938	Pyhätunturi is the most southerly arctic mountain in Finland, a traditional sacred place for Lapps
Palles–Ounastunturi	195 (125,000)	1938	Lapp fiord country, with arctic mountains, peat lands and forests
Lemminjoki	148 (95,000)	1956	Lemminjoki river drainage with mountain gorge and lakes
FRANCE			
Camargue Nature reserve	53 (33,750)	1927	Zoological refuge on delta of Rhône river; noted for nesting flamingoes; ecological research
Forest of Fontainebleau	6.5 (4,200)	1853	Protects natural beauty and biological features in environs of Paris
Pelvoux National park	107 (68,750)	1914	Alpine region, with chamois and other wildlife
FEDERAL REPURLIC OF GERMANY			
Naturschutzpark Hoher Vogelsberg (Hessen)	84 (53,750)	1958	Volcanic uplands; one-third covered by copper beech and spruce forest; balance agricultural
Naturschutzpark Luneburger Heide	78 (50,000)	1909	Established to protect and restore the landscape and native heath; spur ridges extend over a wide plain of alluvial sands, with valleys and streams; oak, birch and pine forests. Wilsede retains ancient village character; access is by foot and horse-drawn vehicles
Naturpark Munden (Lower Saxony)	76 (48,868)	1951	Hilly area with volcanic peaks, copper beech and spruce forests, and open pastures

TABLE VII.—*Principal Parks and Reserves in Europe (Continued)*

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
FEDERAL REPUBLIC OF GERMANY (*Cont.*)			
Naturpark Pfälzer Wald	654 (418,250)	1958	A sandstone plateau with deep valleys, the largest continuous forest in the Federated Republic. 120 villages are scattered in the area
Naturschutzpark Siebengebirge (Cologne)	33 (21,250)	1922; 1930	Many volcanic mountains and limestone formations; forests and wildflowers, including orchids. Mining, destruction of plants (except removal of timber under permit) and disturbance of wildlife prohibited
Naturpark Südeifel	42 (26,750)	1958	Plateau area in mountainous Eifel region on the Luxembourg frontier; one-half mixed deciduous and conifer forest, the remainder mostly farmland; wildlife abundant
GREECE			
National Park of Olympus	16 (10,000)	1938	Includes Olympus mountain peak, mythological home of the gods; light forests of pine, beech and broad-leaved evergreens
Park of Samarias Nature reserve	3 (2,000)	1953	An area of the Levka Ori (White mountains) between 800 and 2,200 m. (2,600 and 7,200 ft.) in elevation on the island of Crete: established mainly to protect the rare Cretan chamois
HUNGARY			
Tihany National park	2.7 (1,700)	1952	Volcanic area, with 100 rock cone geysers and lakes; Bronze Age ramparts and 12th-century monk cave dwellings
Kisbalaton reserve	5.5 (3,508)	1951	Reed marsh rookery of egrets, ibises, spoonbills and other herons; entry by permit only
Aggtelek–Jósvafő	3 (1,970)	1945; 1958	Limestone cavern, 15 km. (9 mi.) long, with large chambers and formations, extending into Czechoslovakia, where it is also protected
Szalajkavölgy reserve	2.2 (1,395)	1955	Centre of paleolithic culture in the Bukk mountains
ICELAND			
Thingvellir National park	15.5 (9,900)	1928	Postglacial lava plain with deep fissures; Öxará river; meeting place of ancient *althing* (parliament) of chieftains from A.D. 930
Eldey Nature reserve		1940; 1960	Rookery of 15,000 pairs of gannets; last two living examples of the now extinct great auk were found here
IRELAND			
Bourn Vincent Memorial park	17 (10,550)	1932	Mountains and lakes of Killarney, with farm and forest lands; last herds in Ireland of European red deer; Japanese deer introduced
North Bull Island Nature reserve	5 (3,200)	1931	Sandy island; sanctuary for migratory and wintering birds
ITALY			
Abruzzi	113 (72,000)	1923	High mountains in Marsica region in central Italy, with cirques, moraines and peaks rising to 2,247 m. (7,372 ft.); thick pine and deciduous forests; chamois, bear, roe deer and other wildlife
Circeo	29 (18,400)	1934	Promontory, southeast of Rome, containing maritime forest of Terracina, coastal dunes and associated animal life and vegetation
Gran Paradiso	219 (140,000)	1922	Scenic mountain ranges, rising to 4,061 m. (13,323 ft.), in northwest Italy, with extensive glaciers, alpine vegetation and animal life
Stelvio	368 (235,600)	1935	Magnificent alpine region on Swiss border, with [illegible]ral life zones and their characteristic plant associations and forests, with crags rising nearly 3,000 m. (9,842 ft.); glaciers; stag, chamois, roe deer, bear and other wildlife
NETHERLANDS			
Hoge Veluwe National park	23 (14,700)	1936	Forests, heaths with red deer and mouflon (introduced)
Kennemerduinen National park	4 (2,600)	1950	Dunes and bird life
Naardermeer Nature reserve	3 (1,900)	1906	Bearded tit and other marsh birds
Texel Island Nature reserve	5.5 (3,500)	1909	Terns and other sea birds
NORWAY			
Kong Karls Land National park (Spitsbergen)	200 (128,000)		Established to protect polar bears
Gutuha area	3 (2,000)		Primeval forests of Norway pine; marshes and moors
Ormtjernkampen area	1.8 (1,125)		Contains spruce fir, primeval forest and modrs
Vaggetem area	2 (1,250)		Pine barrens
POLAND			
Babia Gora	6 (4,105)	1924; 1954	Remnants of ancient Carpathian forests in the western Beskid range, in southern Poland, on the Czechoslovakian border
Bialowieza	20 (12,683)	1919; 1947	Protects examples of the primeval taiga, mixed deciduous and conifer lowland forest; herds of rare European bison, elk and other wildlife
Holy Cross mountains	24 (15,135)	1932; 1950	Lysogory mountain range, in southeast Poland, with virgin forests
Kampinos	159 (101,710)	1959	Forested dune area, near Warsaw; prehistoric dwellings; wildlife
Karkonosze	22 (13,773)	1959	Northern slope of Karkonosze mountain range in southeast Poland on Czechoslovakia border, with glaciated peaks, lakes, waterfalls and forests
Ojcow	6 (3,600)	1925; 1955	Picturesque Pradnik river valley, in northern Poland, covered with deciduous forests and endemic plant associations; notable rock formations and caves
Slowinski	150 (96,000	1960	Coastal dunes and lakes
Pieniny mountains	9 (5,580)	1921; 1954	Scenery of Dunajec river gorge; forests with endemic plants and varied wildlife
Tatra mountains	84 (53,890)	1954	Highest peaks of the Carpathians, with highland forests and ibex, bear and other wildlife
Wielkopolski	40 (25,773)	1957	Moraine area on Warta river; mixed forests and wildlife
Wolin	18 (11,500)	1960	Maritime scenery
RUMANIA			
Retezat National park	39 (25,000)	1935	40 glaciated summits above 2,200 m.; conifer forests; chamois, lynx, bear, raptorial birds
124 nature reserves	269 (172,250)		
SPAIN			
Cavadonga National park	60 (38,400)	1918	Forests of oak, beech, sycamore, ash, hazel; roe deer, chamois, brown bear, boar, wolf, wildcat
Gredos Nature reserve	290 (185,600)	1932	Protects Spanish ibex
Caza de la Serrania de Ronda Nature reserve	83 (53,100)	1948	Protects Spanish ibex and roe deer
Saja y Agregados Nature reserve	230 (147,200)	1948; 1949	Roe deer boar, brown bear, chamois', capercaillie
SWEDEN			
Absiko	19.5 (12,500)	1909	The forested Jokk river valley in northern Sweden, with abundant wildlife; Lapps pasture reindeer in park
Muddus	192 (123,000)	1941	Virgin conifer forests and extensive marshes in northeast Sweden; wildlife abundant; Lapps pasture reindeer in park
Sarek	742 (475,000)	1909	Alpine peaks with 70 glaciers, in northwdst Sweden; bear, lynx, wolf, wolverine and other wildlife; summer encampment of Lapps
Stora Sjöfallet	539 (345,000)	1909	Mountain ranges in central Sweden, with glaciers, waterfalls, sparse forests, and moors; wildlife abundant
SWITZERLAND			
Swiss National park	66 (42,175)	1914; 1959	Part of park area has been protected since 13th century; high Alps from 1,500 to 3,173 m.. with magnificent scenery; endemic plants; chamois, red deer, roe deer ibex (introduced 1920) an6 other wildlife
UNION OF SOVIET SOCIALIST REPUBLICS			
Russian S.F.S.R.			
Altai (Gorno-Altai autonomous *oblast*)	3,575 (2,287,800)		Scenic taiga of fir, cedar and larch, rising to alpine tundra; many wildlife species, including snow leopard, wild dog, ibex, musk and roe deer, bear and others

TABLE VII.—*Principal* Parks and Reserves in *Europe* (*Continued*)

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
U.S.S.R. (Cont.) Russian S.F.S.R. (Cont.)			
Astrakhan (Astrakhan oblast)	295 (189,075)		Protects nesting area of coot, sheldrake, pelicans, herons and spoonbills, and molting grounds for myriad waterfowl, on Volga delta; fish are abundant; hydrological research
Barguzin (Buryat A.S.S.R.)	970 (620,500)		Protects mountainous terrain of northern Transbaikalia and especially the dark sable inhabiting its forests; seal rookeries on the Ushkany Islands
Bashkir (Bashkir A.S.S.R.)	313 (200,250)		Mountain and steppe forests of southern Urals; varied wildlife; Kapov cave contains primitivedrawings
Caucasus (Krasnodar krai)	984 (629,500)		Beech and conifer forest with rhododendrons, rising to alnine meadows in western Caucasus; mountain goat, chamois, deer; re-established bison roaming at liberty
Darwin (Vologda & Yaroslavl *oblasti*)	651 (416,500)		Broken pine forest, sphagnum marshes and heather; elk, bear, lynx, upland birds, shore birds, waterfowl: established to study ecological changes in connection with building of Rybinsk reservoir
Denezhkin Kamen (Sverdlovsk oblast)	573 (366,750)		Taiga of spruce, fir and cedar, with pine forests alternating with belts of scrub, tundra and bare stony areas, in northern Urals; bear, wolverine, sable, upland birds
Ilmen (Chelyabinsk *oblast*)	125 (80,000)		In honour of Lenin; pine and birch forest; stretches of steppe covered with feather grass; preservation and study of geology; minerals and semiprecious stones
Kandalaksha (Murmansk oblasf)	79 (50,750)		Arctic tundra and mountainous terrain along Murmansk coast; vast numbers of alcids and other sea birds; elk, brown bear, lynx and wolverine on Veliki Island; islands in Kandalakshski gulf in the White sea are covered with spruce, pine and birch forests; seals along shore
Kedrovaia Pad (Primorski krai)	59 (37,750)		Mixed forest of Mongolian oak, Manchurian fir, cedar, Amur cork and other far eastern trees; sika (*Cervus nippon*), roe deer, musk deer, boar, leopard, bear, marten and other wildlife
Khoper (Voronezh oblast)	62.5 (40,000)		Oak and aspen groves and alder woods along Khoper river, protecting especially muskrat and beaver; semifree bison herd
Khosta Grove (Krasnodar krai)	0.9 (595)		Residual grove of yew and box, near Khosta
Kivach (Karelian A.S.S.R.)	40 (25,788)		Central taiga pine and spruce forests, with sphagnum marshes; Kivach waterfall on Suna river; elk hear, lynx, marten, forest birds
Kroroki (Kamchatka oblast)	3,766 (2,410,000)		Thin taiga of fir, birch, creeping cedar; volcanoes, only geysers in U.S.S.R.; Lake Kronotskoiye; snow ram reindeer, bear, sable, seal ahd sea lion rookeries; sea bird colonies and wintering waterfowl
Lapland (Murmansk oblast)	306 (195,750)		Mountain tundra thin spruce and pine forests: Imandra and other islands; established to protect a subzone of northern taiga and especially wild reindeer and beavers
Mari (Mari A.S.S.R.)	115 (73,750)		Coniferous and broad-leaved forests; otter,, bear, capercaillie, other wildlife
Mordovian (Mordovian A.S.S.R.)	118 (75,250)		Pine forests with some deciduous trees; varied wildlife
Oka (Ryazan oblasf)	88 (56,500)		Mixed forests and flood-plain marshes and lakes of Pra river
Pechera–Ilych (Komi A.S.S.R.)	2,790 (1,785,750)		Central taiga of spruce and pine; mountain taiga of conifers, including stone pine; sable, reindeer, capercaillie; domestication of elk
Prioksko–Terrasny (Moscow oblast)	19 (12,000)		Pine and broad-leaved forests, steppe vegetation; breeding of bison
U.S.S.R. (Cont.) Russian S.F.S.R. (Cont.)			
Sikhotye–Alin (Primorski krai)	2,342 (1,499,000)		Broad-leaved and conifer forests, including Amur lime, Korean pine, Yeddo spruce, Khingan fir and other species; tiger, leopard, baribal bear,' Amur bear, Manchurian deer and other wildlife
Stolby (Krasnoyarsk krai)	184 (117,500)		Mountain taiga belt mixed pine and larch forest;; pillarlike rock formations
Sudzukhe (Primorski krai)	547 (350,000)		Mountain zones are same as in Sikhote–Alin; southern vegetation of Manchurian type; sika, mountain antelope
Suputinka (Primorski krai)	62 (39,750)		Border zone between Manchurian cedar forests and mixed deciduous spruce and fir forests; varied wildlife
Teberda (Stavropol krai)	361 (231,000)		Conifer and beech forests. with rhododendrons, rising to alpine meadows on north slope of greater Caucasus mountains; a major tourist attraction
Tsentralno–Chernozemny (Kursk and Belgorod oblasti)	16 (10,500)		Three areas of virgin steppe, with oak groves
Tsentralno–Lesnoi (Kalinin *oblast*)	82 (52,750)		Mixed forests and meadow steppe; bear, marten, capercaillie
Volga–Kama (Tatar A.S.S.R.)	30 (19,000)		Varied pine forests, with lichen and moss; lime and oak forests; discontinuous section of taiga on forest steppe
Voronezh (Voronezh and Lipetsk oblasti)	120 (77,000)		Oak and pine forests with groves of European alder along Usman river: established to increase number of beaver: many roe deer
Zhigulevsk (Kuibyshev oblast)	53 (33,750)		Oak groves; residual pines on limestone; picturesque cliffs and crags
Armenian S.S.R.			
Dilizhan	113 (72,348)		Northern slopes of lesser Caucasian range and basin of Kura river; groves and sparse woods
Garni	103 (65,900)		Basin of Azat and Veda rivers, from 900 to 2,000 m.; scenery with waterfalls; Armenian mouflon, bezoar goat, boar, bear
Shikakhokh	39 (25,000)		Oak forests above Tsov river with plane trees in flood-plain: porcupine, leopard, roe deer, boar, bear
Azerbaijan S.S.R.			
Gek–Gel	27 (17,500)		Upper forest belt and sub-alpine meadows; Lake Gek–Gel, formed by landslide in A.D. 1139; bear, marten, roe deer
Kyzylagach	363 (232,500)		Gulf of Kirov in the Caspian sea and adjacent islands: coastal reed and salt marshes. wintering habitat of waterfowl, waders, flamingoes, bustards and other birds
Lenkoran	61 (38,750)		Protects remnant of Talysh forest with Hircanian species
Turianchai	109 (70,000)		Protects the only habitat of elder pine in the world, a stand of thick-trunked pistache and desert vegetation
Zakataly	109 (70,000)		Southern slope of greater Caucasian range, rising to 3,668 m.; zones of forest and alpine meadows; Dagestan mountain goat, chamois, deer, boar and other wildlife
Belorussian S.S.R.			
Belovezhskaia Pushcha	293 (187,500)		Mixed and deciduous forests of alder, oak and hornbeam; to protect and foster pure-blooded Belorussian bison and other wildlife
Berezina	262 (167,500)		Pine groves and spruce woods on Berezina river; to protect habitat of beaver and other wildlife for eventual distribution to other areas
Estonian S.S.R.			
Matsalu	137 (87,500)		Matsalu gulf and basin of Kassari river, nesting grounds and migratory routes of waterfowl and other birds; largest colony of graylag geese in Baltic area
Nigula	11 (6,825)		Pine and sphagnum marsh
Vaika	0.1 (88)		Eider duck and other sea birds
Viydumyaye	2 (1,493)		Rare and endemic plants on Saaremaa Island

TABLE VII.—*Principal Parks and Reserves in Europe (Continued)*

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
U.S.S.R. (*Cont.*)			
Georgian S.S.R.			
Adzhameti	18.5 (11,883)		Residual stands of Imeritian oak, *Quercus hartwissiana*, and *Kolkhidian zelkova*
Babaneuli	11 (6,838)		To preserve stands of *Kolkhidian zelkova*
Batsarsky	12 (7,630)		To preserve residual yew groves and stands of beech
Borzhom	56 (35,875)		Forested western part of Trialeti range; mineral springs
Gumista	11 (6,860)		Black sea coastal forests and wildlife
Kintrish	23 (15,000)		Preserves native species of trees
Kolkhida	2 (1,250)		Lake Palnostomi, wintering grounds of waterfowl
Lagodekhi	52 (33,250)		Forested mountains and alpine meadows; mountain goat, deer and other wildlife
Mariamdzhavarsky	4 (2,750)		Scotch pine groves
Myussera	10 (6,363)		To preserve natural features of Abkhazia
Pitsunda	4 (2,778)		Groves of Pitsunda pine near seacoast
Pontic Oak	5.5 (3,500)		To preserve stands of Pontic oak
Ritsa	62 (39,820)		Lake Ritsa and deciduous forests; mountain goat, chamois, roe deer
Saguram	19.5 (12,500)		Residual tertiary vegetation
Satapliysky	1.2 (750)		Limestone caves with fossils
Tsiskarsky	15 (9,820)		Virgin oak forest, with rhododendron
Vashlovani	26 (16,900)		Steppe, semidesert and stands of pistache and juniper; central Asian gazelle
Kazakh S.S.R.			
Alma-Ata	500 (320,000)		Forested mountains of northern Tien Shan rising to 3,000 m., with meahows and glaciers; bear, Siberian deer, central Asian gazelle, mountain sheep and other wildlife
Aksu-Dzhabaglinsky	273 (175,000)		Talass Alatau range, rising to 4,000 m.; Aksu river canyon; snow leopard, bear, mountain sheep, bustard and other wildlife
Barsa-Kelmes	77 (49,500)		Coast of Lake Aral and Barsa-Kelmes Island; onager and central Asian gazelle introduced; gulls, waterfowl and flamingoes on shore
Kurgaldzhino	90 (57,500)		Highland desert and virgin steppe on Lake Kurgaldzhino
Naurzum	703 (450,000)		Most southerly Naurzum pine forest in plain region; areas of virgin steppe; waterfowl and wading bird nesting grounds
Kirghiz S.S.R.			
Kemin	78 (50,000)		Forest of Schrenk spruce; mountain sheep, mountain goat, roe deer
Sarychelek	156 (100,000)		Semenov fir, Schrenk spruce forest, with nut and fruit trees, in southern Tien Shan; water conservation
Latvian S.S.R.			
Engures	5 (3,350)		Lake Engures, habitat of nesting and migratory birds
Grini	2.7 (1,750)		Only habitat of cross-leaved heath (*Erica tetralix*) in U.S.S.R.
Kemeri	113 (72,250)		Mixed forests with rare plants; sapropelic mud medicinal resort
Moricsala	3 (2,088)		Gulf and islands in Lake Usmas with deciduous forests and rare herbaceous plants
Slitere	31 (19,620)		Protects virgin forest
Lithuanian S.S.R.			
Zuvinto	12 (7,918)		Lake Zuvinto and adjacent forest and marsh areas, nesting grounds of waterfowl, including 50 pairs of whooper swans
U.S.S.R. (*Cont.*)			
Tadzhik S.S.R.			
Childukhtaron	59 (37,500)		Residual nut and maple forests
Gazimailik	59 (37,500)		Natural environment of Kok-Tau range
Iskanderkul	117 (75,000)		Deciduous and juniper forest and high mountain steppe; picturesque mountain lake at 2,176 m.; snow leopard, ibex
Ramit	59 (37,500)		Forested upper reaches of Kafirnigan river, and alpine meadows
Tigrovaia Balka	162 (103,375)		Southern deserts of central Asia: flood plain forest of Vakhsh river, Tugai deer, central Asian gazelle, bird life
Turkmen S.S.R.			
Badkhyz	294 (187,863)		Hilly plains spurs of Paropamiz range anh deep Yeroilanduz salt depression; 500 onager, also gazelle and cheetah
Gasan-Kuli	272 (174,150)		Reed and salt marshes on Caspian sea; waterfowl wintering grounds; only habitat in central Asia of the partridge *Francolinus orientalis*
Repetek	135 (86,500)		Eastern sand desert of Kara-Kum, with desert plants; gazelle, the wild cat *Felis margarita*, the hare *Lepus tolai*, sand jerboa, reptiles, bird life
Ukrainian S.S.R.			
Azov-Sivash	47 (30,000)		*Solonets* steppe on islands and salt marshes around Sivash; protects migratory and wintering waterfowl; deer and game birds acclimatized on Biryuchy Island, and pheasant; and the goat antelope *Saiga tatarica* have been introduced
Aksania-Nova	2 (1,250)		Residual virgin steppe
Black Sea	47 (30,000)		Protects migratory and wintering waterfowl and nesting gulls and terns, as well as other bird life
Crimea	118 (75,500)		Highest peak in Crimean mountains Roman-Kosh (*1,545* m.); 'zones of oak, beech, mountain steppe, pasture, with Crimean and Scotch pine on southern slope; deer, mouflon (acclimatized), stone marten Crimean barbel and other wilhlife
Kamennye Mogily	1.4 (890)		Granitic hills rising to 100 m. above stony steppe, with rare types of plants
Khomutovskaia Steppe	4 (2,564)		Virgin feather grass and meadow steppe, with semidesert and desert animal life
Mikhaylovskaia Steppe	0.8 (505)		Virgin meadow steppe
Streletskaia Steppe	2 (1,313)		Virgin grass steppe; habitat of *Marrnota bobac*
Uzbek S.S.R.			
Amu-Darya	234 (150,000)		Delta and marshes of Amu-Darya river, with nesting and migratory waterfowl, flamingo, bustard and, other bird life: central Asian gazelle, saiga, boar
Chatkal Mountain forest	137 (87,500)		Stands of juniper and deciduous trees in western Tien Shan; central Asian goat, white-toed brown bear, snow leopard, Pallas's cat, other mammals and varied bird life
Zaamin Mountain forest	31 (19,750)		Forested mountains and alpine meadows of northern slope of Turkestan range; bear, lynx, mountain goat, mountain sheep and other wildlife
YUGOSLAVIA			
Tara	117 (75,000)		Mountainous region; forests of Siberian spruce (*Picea omorica*) and othrr conifers: brown bear and other wildlife
Fruska Gora (Serbia)	89 (57,125)	1961	Hills; native vegetation; birds; archaeological sites

rare plant associations as well as important wildlife habitat. A 200-m. zone is protected from exploitation along a number of scenic highways, and green belts have been established around certain cities.

In France, part of the Forest of Fontainebleau, near Paris, was established as a nature reserve in 1853; later the protected area was enlarged. The Pelvoux National park, established in 1914, is a scenic alpine area where, in spite of wars, many wild animals have survived, notably the chamois. The Camargue reserve. established in 1927, is a world-famous ornithological sanctuary and research area, where flamingoes, herons, avocets and other marsh birds breed in numbers and unusual plant associations occur.

A considerable number of nature reserves and bird refuges have been established in Belgium by the citizens' associations Ardenne et Gaume, Reserves ornithologique de Belgique, and De Wielewaal, to protect scenic features, habitat of nesting and migrating birds, plant associations and other natural features. They are relatively small but serve important conservation purposes. Two official nature reserves were established in 1957.

Nature protection has been practiced in Denmark since 1805 and in Czechoslovakia since 1838, but modern nature reserves in both countries are of much more recent establishment. In Poland. nature protection began in the 15th century. when the aurochs and other endangered species were given royal protection, but it was not until 1919 that a provisional state commission for the protection of nature was founded; this commission initiated establishment of national parks and enactment of conservation legislation. A nature protection act, which placed the national parks under the ministry of forestry, was passed in 1949. Scientific research is conducted in the parks by many institutions, under the direction of the Polish Academy of Sciences.

In the Federal Republic of Germany, legislative control over nature protection was the responsibility of the *Länder* after 1945; the federal government acts to develop uniformity of state legislation. Many agencies are concerned with problems relating to nature protection and a large volume of law has been promulgated, the most fundamental being the Reich Nature Protection law of 1935. In addition, there are numerous private organizations that co-ordinate their efforts and co-operate with the official agencies as closely as possible. Their problems are complicated by the fact that all nature reserves in Germany are leased from private landholders, except a part of the Liineburg Heath reserve that is owned by the Nature Reserves society. A variance of opinion exists between those people interested in the establishment of nature reserves primarily for the strict protection of species and associations of vegetation and animal life and related scientific research, and those who regard outdoor recreation as an essential purpose of reserves. In practice, reserves serving both purposes have been created, and in addition to the major nature parks there are hundreds of smaller reserves of scientific significance and scenic importance.

In Finland, legislation enacted in 1923, 1938 and 1956 provides for the establishment of reserve areas on government land. National parks are set aside on virgin land for the preservation of animal life and vegetation and for visitor enjoyment. Nature reserves are established mainly for scientific purposes and entry is by permit. Of ten national parks and reserves created in 1938, six were located on the area ceded to the Soviet Union; to compensate for their loss the 1956 law was passed to establish additional parks and reserves in southern Finland. The national parks and nature reserves protect forested mountains, lakes, coastal shore lines and islands. Roads, trails, lodges and campgrounds and other accommodations are provided in the national parks.

National parks and nature reserves in the U.S.S.R. are state property and come under the national budget. Special organizations or committees set up by the council of ministers direct the work in the parks, the responsibility in some cases resting with the U.S.S.R. Academy of Sciences or the Academies of Sciences of the union republics.

The natural features as a whole are under protection and may be put to use only by permission of the government of the U S.S.R. or of the union republics. If any special features in a certain area are protected, the area is declared a prohibited area; otherwise the parks are open to visitors insofar as the maintenance of the parks allows. Hunting and fishing or other destruction of wildlife and plants, as well as mining and livestock grazing are prohibited.

Extensive scientific research is carried out by personnel attached to the park administrations, by other scientific bodies and by universities. The results are published by the national parks themselves, some of which publish their own journals, and in scientific periodicals. Every park has a natural history museum, and the most popular parks. such as the Crimea, Caucasus, Ritza and Teberda, have prepared special itineraries for tourists. Several films have been made on the national parks. The U.S S R. also has set aside nature reserves for the protection of particular features and resources.

VII. AUSTRALASIA

The preservation of natural areas and wildlife in Australia is, generally speaking, on a state, not a commonwealth, basis. In New South Wales, for example, each national park is administered by a separate trust of local residents or, in some cases, by representatives of government departments. Western Australia has a similar system. The forestry department administers the national parks of Queensland, supported in an advisory capacity by citizens' organizations. notably the National Parks association of Queensland. An official National Parks authority has been established in Victoria, also assisted by a National Parks association. A board of commissioners in South Australia and a Scenery Preservation board in Tasmania have jurisdiction over national parks and reserves in those states.

Within the parks and reserves are representative examples of most of the scenic characteristics of the continent—mountain ranges, gorges, waterfalls, marshes and lagoons—and its extraordinary vegetation and animal life. They are vital to the perpetuation of endemic species of wildlife, including unique marsupials, platypuses and other rare animals, and most unusual bird

Table VIII.—*Principal Perks and Reserves in Australasia*

Name and location	Total gross area in sq.mi. (approx. acreage in parens.)	Date established	Principal features
AUSTRALIA			
New* South *Wales			
Blue Mountains Kational park	242 (155,000)	1959	Rugged scenic sandstone country in Blue mountains. with peaks, towering cliffs, deep gorges and bushland valleys; stunted trees on higher slopes, dense rain forest in valleys; with eucalypts and blue gums; varied wildlife
Brisbane Water National park	23 (15,000)	1959	Broad ridges dropping to tidal waters; rain forest in gullies; Hawkesbury sandstones have unique vegetation and abundant wildflowers; Bouddi National park (1,280 ac.) and sanctuaries adjacent
***New* South Wales (Cont.)**			
New England National park	88 (56,150)	1935	East slopes of Great Dividing range, to 5,200 ft., largely rain forest, with hardwoods on ridge tops; varied wildlife
Royal National park	57.5 (36,800)	1955	Forest reserve, with coastal surf beaches
Warrumbungle National park	13 (8,300)	1953	Rugged volcanic Warrumbungle range; kangaroos, wallaroos, giant wedge-tail eagles, etc.
Kosciusko State park	2,344 (1,500,000)	1944	Mt. Kosriusko, 7,316 ft.. and other peaks and rolling grassy plateaus; Yarrangubilly caves; Snowy mountains hydroelectric scheme is mainly withln park; winter sports area

TABLE VIII.—*Principal Parks and Reserves in Australasia (Continued)*

Name and location	Total gross area in sq.mi. (approx acreage in parens)	Date established	Principal features
AUSTRALIA (*Cont.*)			
New South Wales (*Cont.*)			
Kuring-gai Chase	59 (38,000)	1894	Exposed sandstone ridges, hushland scrub, rain forest in gullies, tidal inlets; profuse native flowers; koalas, kangaroos, dormouse "opossums" (phalangers), Albert lyrebird, etc.
Shoalhaven (Morton Primitive Area reserve)	70 (45,000)	1938	Rugged mountain terrain with sandstone summits and deep gorges; open bloodwood-scribbly gum forest and heathland on higher slopes; hardwood forests and rain forest in gorges
Nadgee Faunal reserve	44 (28,000)	1957	Combination of seashore, lagoon, moorland, swamp, river valley, open forest and mountain habitat, with great variety of plant and animal life
Northern Territory			
Ayers Rock Mount Olga National park	487 (311,700)	1958	Two huge quartzite monoliths rising out of open plain from 1 720 to 2,820 ft ; native paintings on rocks; desert oak, mulga, mallee and spinifex; wildlife
Cobourg Peninsula Flora and Fauna reserve	100 (64,000)	1924	Large, indented peninsula 20 to 50 ft. above high-water mark, with two small hills to 230 ft.; open savanna forest, with eucalypt, cypress pine; kangaroo, buffalo, many species of birds
Queensland			
Rartle Frère and Bellenden-Ker Group National park	125 (80,000)	1921; 1940	Mt. Bartle Frère and other jungle-clad peaks in McPherson and Great Dividing ranges; kangaroos
Eungella National park	188 (120,360)	1936; 1950	Dense jungle and tropical forest; waterfalls on peaks up to 4,000 ft.
Lamington National park	76 (48,640)	1915	Magnificent mountain scenery, waterfalls and forests which include the antarctic beech; Albert 1s-rebird, ruious scrub-bird, marsupials
Hinchinhrook Island National park	152 (97,000)		One of the world's largest insular national parks
South *Australia*			
Ferries and McDonald Nature rcserves	3 (2,000)	1956	On east slope of Mt Lofty ranges; low, scrubby eucalypts and brush; last habitat of mallee fowl (*Leipoa*) in South Australia; kangaroos
Flinders Chase	212 (135,700)	1905; 1919	Ancient peneplain and coastal cliffs and beaches on Kangaroo Island; great gray and sooty kangaroos, endemic black-faced kangaroo, wallaby, echidna, phalangers; koala and platypus introduced; penguins, pelicans and other birds; orchids
Tasmania			
Cradle Mountain–Lake St. Clair National park	525 (333,107)	1922	Mountain region, 2,000 ft. to 5,305 ft. (Mt. Ossa), with rivers and lakes; extensive forests of Sing William pine, pencil pine, eucalypt, Tasmanian rain forest, savanna and plains; various marsupials and other wildlife
Mt Field National park	60 (42,020)	1916	Glaciated valleys with forests of giant eucalypt and rain forest, rising to Mt Field West (4,721 ft.) and highland moors; Russell Falls, extensive areas of vegetation unique to Tasmania; mountain shrimp (*Anaspides tasmanica*) in mountain tarns; wildlife plentiful
Victoria			
Kinglake National park	22 (14,079)	1928	Heavily forested south slopes of Plenty ranees, with deep fern gullies and waterfalls; 326 plant species recorded, including rare orchids; several species of kangaroo, wallaby, bandicoot, dasyure, wombat, koala, echidna, plat>-pus, reptiles and a variety of birds
Victoria (*Cont.*)			
Mallacoota Inlet National park	17.5 111.225)	1932	Evergreen bush on Genoa river; wildlife
hft. Buffalo National park	(	[illegible]	Granite plateau rising nearly 6,000 ft.; wet sclerophyll forest, subalpine woodland, sod tussock grassland in valleys; wombat, wallaby, echidna, kangaroo, lyrebird and other bird life
Wilson's Promontory National park	160 (102,379)	1905	Magnificent mountain and coastal scenery, fern gullies; wombat, koala, emu and other wildlife
Wyperfeld National park (Mallee)	219 (140,000)	1921	Semidesert Mallee region in west, sand hills lightly covered with heath and dwarf shrubs in east; black box and red gum trees on creek flats; black-faced kangaroo; abundant bird life including Regent parrot, cockatoo, emu, mallee fowl
BRITISH SOLOMON ISLANDS PROTECTORATE			
Queen Elizabeth park	24 (15,200)	1954	Contains Mt. Austen and the Mantanikai river valley, a very broken country interlaced with ridges and valleys; tropical hardwood forests; bird life
FIJI			
Ravilevu Nature reserve	15.5 (9,930)	1959	Forested mountain area with spectacular waterfalls and gorges: distinctive animal life
Tomaniivi Nature reserve	6 (3,720)	1958	Tomaniivi (4,341 ft.) and surrounding forests; rkre birds
NEW ZEALAND			
National Parks			
Abel Tasman (South Island)	67 (43,061)	1942	Coastal and elevated region along Tasman bay, with virgin forests and beaches
Arthur's Pass (South Island)	374 (239,152)	1929	Southern Alps, with glaciers, river valleys and virgin forests, birds; 29,990 ac. wilderness area where buildings, horses and vehicles are excluded
Egmont (North Island)	127 (81,236)	1900	Mt. Egmont, with alpine vegetation, subtropical forests, sphagnum swamp and waterfalls; kiwi, rifleman bird, fantail and other birds
Fiordland (South Island)	4,567 (2,923,153)	1952	Mountain forests and fiords on coast line, with lakes. rivers and waterfalls; only habitat of the rare flightless rail or takahe (Sotornis *hochstetteri*) and of the large owl parrot or kakapo (*Strigops habroptilus*); other birds; seals
Nount Cook (South Island)	270 (172,979)	1953	17 peaks above 10,000 ft. in Southern Alps, Tasman glacier and other glaciers, montane scrub and alpine growth
Nelson Lakes (South Island)	218 (139,834)	1956	Two lakes in mountainous terrain, with dense virgin forest
Tongariro (North Island)	252 (161,552)	1894	Three active volcanoes, forests, treeless plains, and Mt. Ruapehu with small glaciers; crater lake; hot springs and geysers
Urewera (North Island)	709 (453,971)	1954	Mountain ranges, crags, waterfalls and virgin forests; Maori-owned Lake Waikareiti; kiwi and other bird life
Westland (North Island)	328 (210,070)	1960	Western slope of Alpine chain iover 11,000 ft.) extending to sea level; glaciers, lakes, dense forests
Scenic, *Natural* and *Historic Reserves*			
Waipoua Forest reserve	36 (22,800)	1952	Kauri pine (*Agathis australis*)
Kapiti Island Bird sanctuary	6 (4,300)		Bush birds, waterfowl, sea birds, tuatara
Little Barrier Island Bird sanctuary	11 (6,960)	1894	Bush birds
SARAWAK			
Bako National park	10 (6,400)	1956	Coastal hays and coves near Cape Po; forest and open country; wild pig, mouse deer, monkeys, gibbon, bird life

life. Some of these are dependent upon preservation of particular habitat or plant associations, an example being the koala, which requires oils of certain varieties of eucalyptus trees in its diet. Some Australian reserves are in remote sections, while many others are popular localities for camping, hiking, swimming and other outdoor pursuits. The more accessible parks have excellent accommodations within or near their boundaries.

In New Zealand, public reserves in general. including those set apart for the preservation of vegetation acd animal life, are administered by the department of lands and survey. The minister of internal affairs is charged with the protection and control of wildlife, and the regulation of shooting of such wildlife as is considered game. Research and field work are conducted by the wildlife division of the department of internal affairs, the department of scientific and industrial research and various museums. In New Zealand native wildlife consists mainly of birds, there being no indigenous land mammals other than rare bats and the native rat. Marine animals are protected by the marine department. The deficiency of wild game animals led to the introduction of various species for sporting purposes in the latter half of the 19th and the beginning of the 20th century. These included red deer, wapiti, chamois. Himalayan tahr and opossum. Pigs and goats were allowed to run wild, and introduced rabbits soon became so great a pest that stoats, weasels and ferrets were let loose to prey upon them. A spectacular result of their importation was the rapid diminution in the numbers of ground-dwelling and flightless birds

TABLE IX.—*Principal Parks and Reserves in Central and South America*

Name and location	Total gross area in sq mi (approx acreage in parens)	Date established	Principal features
ARGENTINA			
El Rey	140 (89,600)	1948	Subtropical forests on border of Bolivia, with tapir, jaguar giant anteater, birds, reptile6 and other wildlife
Iguazú	210 (134,400)	1934	Subtropical forest on Brazilian border, with cataracts, including Iguazú falls, 240 ft. high; abundant wildlife
Laguna Blanca	44 (28,200)	1949	Black-necked swans
Lanfn	1,520 (972,800)	1937	Lanín volcano on Chilean border, with Araucaria forests and many lakes; varied wildlife
Los Alerces	1,000 (640,000)	1937	Mountainous region with immense forests; ancient glaciers, lakes; principal habitat of guemal deer: other wildlife
Los Glaciares	2,300 (1,472,000)	1937	Southern Andes on border of Chile aith growing intercontinental glaciers, lakes and unusual plant associations; guanaco, chinchilla, guemal and pudu deer, condor and other wildlife
Nahuel Huapi	3,057 (1,956,500)	1922; 1934	Andean peaks on Chilean border, with glaciers forests and lakes; guemal and pudu deer, condor and other wildlife
Perito Francisco P. Moreno	450 (288,000)	1936	Forested Andean peaks on southern border of Chile; habitat of guanaco, guemal deer, Patagonian fox, condor, swan and other wildlife
Angel Gallardo Nature reserve	231 (147,800)	1945	Subtropical forests and swamps of the Chaco, near Paraguayan border, with pure forests of quebracho (*Schinopsis balansae*) and characteristic animal life
Tierra del Fuego	251 (160,620)	1961	Spectacular lakes and mountains
BRAZIL			
Ignaçu National park	801 (512,500)	1939	Mountains and canyons, on Argentine border, with virgin evergreen forests and tropical vegetation; abundant wildlife
BRITISH GUIANA			
Kaieteur	45 (28,800)	1930	Savanna and brushwood fauna on Potaro river; Kaieteur falls; wildlife, especially tropical birds
CHILE			
Cabo de Hornos		1949	Protects islands, some in primeval state, in Strait of Magellan; aquatic animals
Easter Island and Juan Fernández	138 (88,250)		Protect vegetation, animal life and archaeological relics on islands in Pacific ocean
Fray Jorge	20 (12,997)	1931	Extensive forests and wildlife
Los Paraguas	70 (45,000)	1940	Spectacular scenery, including the Llaima volcano; Araucaria forests
Nahuelbuta	21 (13,558)	1939	Coastal cordilleros primeval *Araucaria* and dther forest species
GUATEMALA			
Atitlán		1955	Lake Atitlán is bordered by active volcanoes and the park supports pine, cypress and oak forests on their slopes; deer, squirrel and bird life, including a grebe (*Podilymbus gigas*) endemic to the lake
GUATEMALA (*Cont.*)			
Rio Dulce		1955	Lake Izabal and Río Dulce from Atlantic ocean to ruins of San Felipe castle, magnificent jungle scenery, with tapir jaguar, howler monkey and tropic bird life; open savannas with mahogany, blood trees and other native trees
Santa Rosalia	16 (10,153)		Pine and deciduous forests, with abundant wildlife, including deer, the raccoon *mapache* (*Procyon lotor*)
Tikal		1955	Tropical forest in El Petén, with mahogany, Spanish cedar and the sapodilla tree, or *chicozapote* (*Achras sapota*); deer, Puma, jaguar, ocelot, tapir, mapache and other wildlife; Mayan ruins
MEXICO			
Cañon del Rio Blanco (Veracruz)	218 (139,225)	1938	Forested headwaters of Rio Blanco
Cumbres de Monterrey (Nuevo Leon)	963 (616,255)	1939	In Sierra Madre Oriental range, thick pine forests and wildlife
El Tepozteco (Mexico)	78 (50,000)	1937	Protects archaeological and natural features
Grutas de Cacahumilpa (Guerrero)	5 (3,080)	1936	Spectacular cave formations; source of Amacuzac river
Iztaccíhuatl-Popocatepetl (Puebla, Moreles, Mexico)	100 (64,198)	1935	Two volcanoes rising to over 5,000 m. (16,100 ft.); with forested slopes and perpetual snows
La Malinche (Tlaxcala, Puebla)	154 (98,665)	1938	La Malinche peak and forested slopes
Lagunas de Chacahua (Oaxaca)	55 (35,468)	1937	Lagoons bordering centre of Mixtec kingdom at time of Spanish conquest; waterfalls
Nevado de Colima (Jalisco)	86 (55,000)	1936	Active volcano with subtropical forest on lower slopes, and pine and evergreen oaks above
Nevado de Toluca (Mexico)	262 (167,500)	1936	Nevado de Toluca (4,570 m. [15,433 ft.]) with lagoons in extinct crater; pine and oyamel forests; wildlife
Pico de Orizaba (Veracruz)	77 (49,375)	1936	Citlaltepetl (5,700 m. [18,701 ft.]), highest peak in Mexico; forests include giant trees
Pico de Tancítaro (Michoacán)	115 (73,290)	1940	Extinct volcano
Sierra de San Pedro Mártir (Baja California)	215 (137,500)	1947	San Pedro mountain range, with streams, canyons, forests and wildlife
URUGUAY			
San Miguel National park	6 (3,740)		Scenic coastal area with endemic vegetation
Santa Teresa	13 (8,220)		Scenic coastal area. with endemic vegetation
VENEZUELA			
Avila	312.5 (200,000)	1958	Forested mountain area between Caracas and the Caribbean sea
Guatopo	352 (225,000)	1958	Established to safeguard watershed endangered by agricultural burning, natural cloud forest on Cerro Azul in eastern section
Rancho Grande (Henry Pittier)	352 (225,000)	1937	Primeval tropical cloud forest in Cordillera de la Costa, with abundant wildlife, especially tropical birds; biological research station
Sierra Nevada de Mérida	625 (400,000)	1952	Pico Bolivar (16,411 ft.) and other snow-clad peaks in Venezuelan Andes near Colombia forested on lower slopes 'with glacial lakes and wildlife
Alexander von Humboldt Natural monument		1949	Guácharo caves, with limestone formations and oilbirds (*Staetornis caripensis*)
Yacambú		1962	Scenic forested volcano

and significant effects on other birds. Active extermination measures had to be taken against many of the foreign animals in order to try to restore the balance.

The Wildlife act. 1953, provided for the establishment of wildlife sanctuaries and refuges; it also protected most indigenous species wherever they might be found. Most reserves protect native plants as well as animals and some are set aside for the preservation of a certain species of plant; *e* g., the stands of kauri pine at Waipoua, the very rare evergreen shrub *Pittosporum obcordatum* in Hurumua reserve and the buttercup *Ranunculus pancifolium* at Mount White sheep station. There is also a large number of scenic reserves. The main purpose of the national parks is to provide untouched country for the enjoyment of the people, but their work in the preservation of the indigenous birds is also vitally important. In the parks of the North Island may be seen tuis, bellbirds, rifleman birds, owlet-frogmouths (moreporks), wekas and many others. But the largest of the parks, Fiordland, in the South Island. contains the greatest number of birds peculiar to New Zealand, especially the famous flightless rail or takahe (*Notornis hochstetteri*), long thought extinct but rediscovered in 1948. The area in which the takahe occurs is specially protected and no one may enter without a permit.

VIII. CENTRAL AND SOUTH AMERICA

Mexico first reserved land to protect historical sites late in the 19th century. but the establishment of national parks for the preservation of natural features and vegetation and animal life was undertaken on a major scale in the 1930s. Included in the system are spectacular scenic areas. The parks also protect vital watersheds, forests and wildlife in a country which has suffered devastating destruction of its natural resources irom shortsighted exploitation. The most famous landmark in Mexico is the towering snow-clad summits of Iztaccihuatl-Popocatepetl, visible from the capital city and visited by thousands of people annually. Other peaks in the Sierra Madre ranges, caverns, forests and lagoons inhabited by myriad waterfowl are protected in other parks.

In Guatemala, national parks have been established to protect outstanding natural and archaeological features. Lake Atitlán, dominated by active volcanoes, resembles scenery found in Java; the precise boundaries of the national park have not been defined. The boat trip up the Rio Dulce from Livingston through Lake Izabel, winding amid virgin jungles resounding with the calls of tropical birds and howler monkeys, is a famous attraction. The great plain of El Petén is a region of grasslands and tropical forests, the habitat of abundant wildlife, with buried Mayan cities.

The long-continued destruction of Venezuelan natural resources by overgrazing, fire and abusive agricultural practices stimulated an active conservation program in that country. which has included the establishment of national parks and natural monuments. Avila National park, near Caracas, is a popular recreational area as well as one of scientific importance. The tropical cloud forests in Rancho Grande and Guatopo National parks preserve humid jungle growth on the upper slopes of mountain ranges, with many unusual birds: mammals, reptiles and insects. The Sierra Nevada de Mérida National park is an Andean terrain of exceptional beauty.

The southern Andes possess some of the most spectacular mountain scenery in the world and several outstanding examples along the Argentine–Chilean border have been set aside as national parks. There live two Andean deer, the guemal and the pudu, and also guanaco, chinchilla, condor and other unusual animals. Of Argentina's other national parks, El Rey and Iguazú protect subtropical forests on the Bolivian and Brazilian border, while the Angel Gallardo Nature reserve in the Chaco on the boundary of Paraguay includes dense subtropical forests and swamps. These forests, rich in a variety of unusual plant life, are the habitat of most species of jungle fauna, including tapirs, carnivores and other mammals, many reptiles and myriad species of tropical birds. Often considered to be of almost limitless extent, these forests could easily be destroyed by exploitation. Their preservation is essential to the perpetuation of plants and animals of still little-understood economic and sociological importance.

Several of Chile's national parks are corollaries of the Andean parks in Argentina, protecting similar mountainous terrain and its forests and wildlife. Among Chile's other parks. the Cabo de Hornos National park is difficult of access, a region of gales and cold fogs, established to safeguard islands inhabited by seals and other aquatic mammals and birds. Easter Island is famous for its mysterious archaeological sculptures. Juan Fernández National park supports an endemic vegetation and animal liie of scientific importance. which is seriously endangered by livestock grazing.

See also references under "National Parks" in the Index volume and, for current developments, the annual summary in *Britannica Book of the Year*. (F. M. Pd.)

NATIONAL PROVINCIAL BANK LIMITED. This British banking institution, founded in 1833, has branches in London and the provinces. The amalgamation movement wrought great changes in the English banking system, and the National Provincial bank was closely identified with it, particularly during the period from 1918 to 1924. An important amalgamation effected by the bank took place in 1918 when it took over the Union of London and Smiths Bank, Limited. In the same year, the business of the Bradford District Bank, Limited was acquired. The Sheffield Banking Company, Limited was absorbed in 1919, the Northamptonshire Union Bank, Limited in 1920 and the Guernsey Banking Company, Limited in 1924.

NATIONAL SAVINGS: *see* Savings, National.

NATIONAL SECURITY COUNCIL, U.S. The need for a national policy co-ordinating group more formal in character than the presidential cabinet was not recognized in the United States until the eve of World War II. Until the Budget act of 1921 even that basic policy control which a unified budget creates did not exist. During the McKinley. Theodore Roosevelt and Taft administrations no secretary of state asked for a military accounting before some diplomatic venture. Thereafter in the 1920s and 1930s co-ordination was either nonexistent or rudimentary.

It was not until 1938 that a standing liaison committee of the undersecretary of state, the chief of naval operations and the army chief of staff was created. With the onset of World War II, however, policy co-ordination virtually ceased except in the person of the president, Franklin D. Roosevelt. Not until the last year of the war did a group, the state-war-navy co-ordinating committee, come into being with the express purpose of co-ordinating policy. The SWNCC was ineffective for it could consider only policy referred to it by one of the departments, and furthermore its membership, made up of the assistant secretaries, lacked the requisite political prestige.

Following World War II, congressional investigation focused attention on the lack of co-ordination which had been a factor in the Pearl Harbor disaster, and there was a general pressure for reorganization of deiense agencies. The suggestion for a national security council (NSC) originated in studies by a staff of experts appointed by James Forrestal, then secretary of the navy. The NSC was established by law in 1947, and consisted of the president, the secretary of state, the secretary of defense, the secretaries of the three military services and the chairman of the national security resources board. (Reorganization Plan 6 abolished the national security resources board. An executive order of March 13, 1953, named the director of the Office of Defense Mobilization to replace the chairman of the NSRB on the council.) Most important, the NSC was provided with a staff of its own. In time it was felt by those called upon to observe NSC operations that the staff base should be further strengthened and its military top-heaviness reduced. These criticisms were taken into account in the National Security act amendments of 1949.

The functioning of the NSC continued to be the butt of criticism. however, even after that second reorganization. After President Eisenhower took office in 1953 the NSC was given a new importance. Meetings were made smaller. with fewer departmental advisors Members were categorized in different fashion. Some were named statutory members. the president, the vice-president, the secretaries of state and defense and the director of the Office of Defense Mobilization (later called the Office of Civil and Defense Mobilization). Others, although actually enjoying a status equal to that of statutory members, were categorized as "regular participant members." Such members included the secretary of the treasury and the director of the bureau of the budget. Still others, such as the attorney general, the chairman of the Atomic Energy commission, and the administrator of the National Aeronautics and Space agency. attended on an *ad hoc,* participant basis for subjects material to their responsibilities.

More active than before. the NSC was given a stronger staff by the formation of a Planning board. The members of this board, each with the rank of assistant secretary, functioned as representatives of members of the NSC. An Operations Coordinating board was also established by executive order.

The NSC seems in the second half of the 20th century to be an institution destined for continuous change as the philosophy of government alters with changes in party control and executive personnel. Major segments of national policy may well continue to be formed outside it, and the extent to which its advice will be followed will depend on the policies of the president.

(E. L. KH)

NATIONAL SOCIALISM, the name of a movement started as the Nationalsozialistische Deutsche Arbeiterpartei (N S.D.A.P.), National Socialist German Workers'—called Nazi—party, by Adolf Hitler (*q.v.*) in Germany in 1919 Its name revealed its emphasis upon nationalism, socialism. Germanism and the working class. Like Benito Mussolini's Fascism, it combined an appeal to extreme and exclusive nationalism and chauvinist expansionism with a revolutionary call to the masses. It had from the beginning many traits in common with Fascism. and National Socialism may be regarded as the German form of Fascism. Both proclaimed themselves the implacable enemies of liberalism and democracy, of individual rights and all movements of international co-operation and peace; both stressed the subordination of the individual to the state, the inequality of men and races, the right of the strong to rule the weak and the necessity of the principle of blind and unswerving obedience to leaders appointed from above. Both praised the military virtues, despised and rejected pacifism, humanitarianism and charity, glorified hatred and conquest and aimed at the transformation of the whole nation into an armed camp and an instrument of perpetual readiness for warfare.

Origins. — National Socialism, however, had its peculiarly German roots. Some can be traced to the Prussian tradition as it developed under the inspiration of great soldier kings, such as Frederick William I and Frederick II, and men of blood and iron, such as Bismarck. This tradition had always regarded the militant spirit and the discipline of the Prussian army as the model for all individual and civic life. To it was added the tradition of political romanticism. with its sharp hostility to rationalism, to the principles underlying the French Revolution and to the "superficiality" of the west. and with its emphasis on instinct, on the past. even on the remote past, and its proclamation of the rights of the exceptional over all universal law and rules. Thus, the exceptional becomes a law unto himself. These two traditions were later enforced by the 19th-century adoration of science and of the laws of nature, which, with their "iron logic," worked out beyond all concepts of good and evil. Further reinforcements came from a biological theory of life that led to the acceptance of that racialism first proclaimed by Joseph Arthur, count de Gobineau, in his *Essai sur l'inégalité des races humaines* (1853–55). It was then propounded by Richard Wagner (1813–83), who combined it uith a heroic ideal of the Nordic superman, and by his son-in-law Houston Stewart Chamberlain. whose *Grundlagen des neunzehnten Jahrhunderts* (1899; Eng. trans., *Foundations of fhe Nineteenth Century,* 1911) profoundly influenced early Hitlerism. To romanticism, National Socialism owed the vague and fluid conceptions of folk as the basis of cultural and political organization, and of *Weltanschauung* or "total world outlook" as opposed in the name of *Kultur* to the more rational civilization of the west.

In addition to these currents in the German tradition, it ought to be pointed out that Hitler's formation was influenced during his youth by specific Austrian movements. National Socialism owed much to Karl Lueger (1844–1910), who organized the Catholic lower middle classes of Vienna in an anticapitalistic and anti-Semitic movement called the Christian Socialist party, but who remained loyal to Habsburg conservatism; and to Georg von Schonerer (1842–1921), who combined racial anti-Semitism with a violent anti-Catholicism and pan-Germanic expansionism and a bitter hostility to the Habsburgs. Schonerer's disciple Karl Hermann Wolf founded among the Sudeten Germans in Bohemia a German Workers' party that later was to assume the name of Deutsche National-Sozialistische Arbeiterpartei. This occurred a few years before Hitler founded his almost identically named N.S.D A.P. in Munich.

Much in Hitler's ferocious nationalism and his contempt of the Slavs can be explained by the experience of his youth amid the bitter nationality struggles of the multiracial Habsburg empire.

When Hitler started his agitation in Munich immediately after World War I he found the intellectual soil well prepared by the writings of the German romanticists and of the German publicists of the War of Liberation, such as Ernst Moritz Arndt (1769–1860) and Friedrich Ludwig Jahn (1778–1852).

The last years before World War I were characterized by a renewed interest in romanticism and in the War of Liberation of 1813. In those years a German youth movement with its longing for a true community, a *Gemeinschaft,* the rebirth of the nation, and with its vague mystical enthusiasm for leadership and comradeship. expressed the opposition to rationalism and "bourgeois" liberalism. It had come largely under the influence of Friedrich Nietzsche (1844–1900) and the German poet Stefan George (1868–1933). Oswald Spengler (1880–1936; *q.v.*) and Arthur Moeller van den Bruck (1876–1925) can be regarded as the immediate forerunners of National Socialism in the intellectual field.

But the intellectual preparation would in no way have been sufficient for the growth of National Socialism in Germany if the defeat in World War I. with its ensuing disillusionment and pauperization. especially in the lower middle classes. had not paved the way for Hitler's propaganda. The peace treaty of Versailles gave Hitler a starting point, but the violent opposition which he evoked was not directed in reality against the peace treaty but against the fact that Germany had been defeated and that its plans had been frustrated. From the beginning Hitler's propaganda appealed to the military circles, which regarded the peace only as a temporary setback in Germany's expansionist program. Hitler added to the pan-Germanic aspirations for world hegemony the almost mystical fanaticism of a faith in the mission of the German race and the fervour of a social revolutionary gospel. In the years of political and economic depression which followed Germany's defeat, Hitler's appeal to the German masses as the bearers of the most exalted racial ideals in the world was eagerly accepted to counteract their inferiority complex.

Psychological Methods and Theoretical Aims. — Though Hitler accepted many elements of the technique of the Bolshevik revolution, he found a powerful ally in the widespread fear of Bolshevism. which he exploited, first in Germany and then on a world-wide scale, posing as the bulwark against Bolshevism. Thus, he secured the financial and moral support of many conservative elements that misunderstood the revolutionary and nihilistic character of his movement and its many points of similarity (as in its antiliberalism) with Bolshevism. On the other hand, he gained the adherence of the masses by vague promises of an anticapitalistic order. The banner of the N.S.D.A.P. was the red flag of the revolution, but altered to the German imperial colours by the addition of a white circle and a black swastika in the centre. Thus Hitler combined the appeal of social revolution and that of a militant and mystical nationalism; the extraordinary flexibility of his dynamic doctrine enabled him to stress different elements at different times and to adapt his attitude momentarily to changing circumstances, even with complete disregard for previous statements.

Hitler's most important individual contribution to the theory and practice of National Socialism was his deep understanding of mass psychology and mass propaganda in the contemporary world and his perfection of the methods learned from Bolshevik technique. His chapter on propaganda in *Mein·Kampf* (1925–27) can be regarded as of the most fundamental importance. He stressed the fact that all propaganda must hold its intellectual level at the capacity of the least intelligent of those at whom it is directed. and that its content of truth does not count compared with the only valid criterion. that of success. "The slighter its scientific ballast, and the more exclusively it considers the emotions of the masses, the more complete the success." Propaganda should concentrate on a few simple statements (however terrible they may be in their denial of the humanity of man)

Hitler understood that, especially with as wide and far-reaching a goal as world domination, it was of the utmost importance to be able to present under one common denominator all potential adversaries who might themselves change according to the circumstances.

The art of truly great popular leaders in all ages has consisted chiefly in not distracting the attention of the people, but concentrating always on a single adversary. The more unified the object of the people's will to fight, the greater will he the magnetic attraction of the movement and the more tremendous its impact. It is part of a great leader's genius to make even widely separated adversaries appear as if they belonged to hut one category, because among weakly and undecided characters the recognition of various enemies all too easily marks the beginning of doubt of one's own rightness. (From Hitler's *Mein Kampf.)*

It was a stroke of genius on the part of Hitler to find this common denominator in the Jews and Judaism. This enabled him to discover the "Jew" behind all his changing adversaries, sometimes behind Communism or Moscow, at other times behind Great Britain and the United States—in short, behind everybody and everything that at a given moment opposed his wishes or aroused his wrath.

Anti-Semitism served him also for two other purposes. National Socialism was fundamentally opposed to all concepts of international co-operation and universal catholicity; it destroyed the framework of a common humanity with common and absolute standards of law, truth and good, applicable to all men. National Socialism, therein following Nietzsche, regarded Christianity and prophetic Judaism. with their emphasis on the equality of all men under one common God and upon absolute standards of justice, as alien and inimical to the new hero ideal of the superrace, which was interpreted—not by Nietzsche. but by the National Socialists—as the true Germanic ideal. Judaism and the ethics of the Bible therefore stood in opposition to National Socialism.

National Socialism proclaimed the Germanic race as the new corpus *mysticum* on which the salvation of the world depended. as the embodiment of all nobility and creative genius and as the Reich ("empire") which must become the world-controlling *Reich.* This Reich necessarily had to have a Gegenreich ("Counter-*Reich*"), a counterrace that on a similarly world-wide basis would represent the antithesis of salvation and creative genius. So the Jewish people became the counterrace. National Socialism saw its duty not only in the destruction of this counterrace, but in the preparation of the German race for its real task of establishing the new world order. The third Reich—the hoped-for successor to the defunct second or Hohenzollern Reich—ruled by what Hitler called "the highest human species given by the grace of the Almighty to this earth," will have, by suitable education of the youth, in the future a generation mature for the ultimate and greatest decision on this globe. "The nation which will first take this road will be victorious," and become "one day the master of the globe."

The Jews were to be discriminated against not according to their religion but according to their "race." The fundamental contention of Hitler was that man is inescapably determined by his descent or "blood." Whoever was born from German parents remained a German forever in his nationality and character; whoever was born from Jewish parents remained forever a Jew by nationality and character. Thus Jews were declared, whatever their educational and environmental development, to be forever fundamentally different from Germans.

Hitler's racial theory was applied not only to Jews but also to people of German "blood" living in non-German lands. Germans who had emigrated from Germany and had become nationals of other countries, and even their descendants, were regarded as Germans, as *Stammesbruder* ("racial bretheren") and *Volksgenossen* ("national comrades"). Active propaganda was to be started among these Germans living in the "diaspora" (*Auslandsdeutsche*). If possible they were to be brought "home" into Germany, the true homeland of all Germans wherever they lived. If they could not be brought home, at least their loyalty to and activity for the German homeland was to be encouraged by all means. Study of German language and culture was to be promoted by all means among those Germans.

Rise to Power.—Working from these principles, Adolf Hitler was able to carry his party from its small beginnings in a beer cellar in Munich to a dominant position in world politics within 20 years. Among his more important collaborators were Alfred Rosenberg, the author of Der *Mythus* des *20ten* Jahrhunderts ("The Myth of the 20th Century"; 1930), the most widely read book of the National Socialist movement besides Hitler's own *Mein* Kampf; Rudolf Hess, who helped Hitler write *Mein* Kampf during their internment in the fortress in Landsberg am Lech in 1924; Gregor Strasser, probably the most important of Hitler's collaborators, who separated from him in protest against the leader's opportunist policies and was killed in the blood purge of June 1934; his brother Otto Strasser, who in 1930 founded the Black front as a more radical wing opposed to Hitler; Gottfried Feder, who drew up the first program of National Socialism and was for several years its economic "expert" but thereafter receded into oblivion; Capt. Ernst Roehm, the founder and organizer of the SX. or *Sturmabteilung,* the National Socialist militia, who was purged in June 1934; Julius Streicher, who became famous through his anti-Semitic weekly Der *Stürmer;* Heinrich Himmler, the organizer and commander of the SS. or *Schutzstaffel,* Hitler's personal elite guard, and of the Gestapo, the secret state police; Josef Goebbels, the master of National Socialist propaganda; Hermann Goring, the organizer of the German air force and controller of the German industrial mobilization; R. Walther Darre, the organizer of the National Socialist peasant policy; and finally Robert Ley, the leader of the German Workers' front.

It took 14 years for the N.S.D.A.P. to achieve power in Germany. It had been born at a time when it was only one of many semirevolutionary, reactionary and terrorist organizations springing up throughout Germany, composed of former officers and soldiers, students and other elements dissatisfied with the republican, democratic and peaceful order which seemed to dawn for Germany in 1919. That it survived and absorbed all others was due to Hitler's leadership and to the fact that Captain Roehm interested the *Reichswehr* in supporting Hitler. On Feb. 24, 1920, the N.S.D.A.P. drafted in Munich, the centre of its activities, a program of 25 points, which in 1926 was declared unalterable, but which in reality was very soon surpassed by developments. On Nov. 9, 1923. Hitler, supported by Field Marshal Erich Ludendorff, attempted his first Putsch in Munich, but it miscarried. Reaction was so firmly entrenched then in Bavaria, however, that Hitler was let off with only a formal punishment. The ensuing years of political and economic consolidation in Germany did not allow Hitler to make any considerable progress. The economic crisis at the beginning of the '30s, however, and the lack of energetic measures on the part of the government against the indefatigable propaganda to undermine democracy brought the first great success of the N.S.D.A.P. in the Reichstag elections of Sept. 14, 1930.

The Reichstag elections of Nov. 6, 1932, marked a temporary setback for Hitler; but an intrigue, started by Franz von Papen, prevailed upon the aged president of the German republic, Marshal Paul von Hindenburg, to name Hitler chancellor on Jan. 30, 1933. He was then only the head of a coalition cabinet of National Socialists and members of the conservative and nationalistic right. A fire in the Reichstag building on Feb. 27, 1933, gave Hitler the chance to rouse the spectre of a Bolshevik revolutionary danger and to hold the elections of March 5, 1933; though they gave the National Socialists only 44% of the votes, the antidemocratic totalitarian parties (National Socialists and Communists) had a majority following in Germany against the democratic republic, while the democratic forces were weak and without a clear program. Thus: the new Reichstag, meeting on March 21, 1933, in the garrison church in Potsdam, the historic receptacle of Prussian military spirit, "enabled" the government to assume dictatorial powers. From that moment on, the relentless process of Gleichschaltung ("co-ordination") began, and within a few months the German *Reich* had become a totalitarian state which was entirely identical with the N.S.D.A.P. in every concern of public or private life, and that meant with the will of its leader. *(See* GERMANY: History.)

Once firmly in power Hitler wished to secure his position against the left within his own party and against opposition from conservative circles without. Many of the adherents of National Socialism, especially in the SA., demanded radical social reforms. Hitler, on the other hand. wished to stabilize his revolution and to avoid alienating big business circles. The leader of the SA., Roehm, also wished to incorporate his semimilitary formations into the army. thus endangering Hitler's relationship not only with big business but also with the army leadership. The approaching crisis was heightened by the intraparty rivalries between Roehm on the one hand and Goring and Himmler on the other. The crisis was solved by the "blood purge" of June 30, 1934, when Roehm and many other Nazi leaders were executed without trial. Hitler used the opportunity to have murdered a number of other prominent men whom he feared or disliked. Among these were Gen. Kurt von Schleicher, Hitler's predecessor as chancellor of the German *Reich,* and Gregor Strasser, who had been friendly to the trade-union movement.

National Socialism regarded Christianity from the beginning as an un-German faith, National Socialism was, in itself, a total creed centred upon Germanism and its unique and special mission bestowed upon it by nature and history. Though Hitler, for opportunist reasons, stressed his tolerance of the Christian church, or what he called "positive Christianity." true Christianity was incompatible 'with National Socialism as it is incompatible with Russian Communism, and the Nazis and the Communists knew it better and earlier than many Christians. The Vatican even signed a concordat with Hitler's government on July 8. 1933. But the concordat protected the Roman Catholic Church in Germany as little as it did the Protestant church from constant interference and even persecution by the German authorities. Many Protestant ministers, though acknowledging the Nazi government's authority in all secular and political matters, denied it the right to interfere with the preaching of the Gospel and with the internal administration of the church. They founded the *Bekenntniskirche* ("confessional church"), of which the best-known leader was Martin Niemoller.

The last conservative obstacle to Hitler's totalitarian police state was removed by the death of Hindenburg in his 87th year on Aug. 2, 1934. Hitler abolished the presidency and assumed the position of supreme commander. He now contented himself with the titles of *Reichsführer* and *Reichskanzler,* leader and chancellor of the *Reich.* All troops and officials were immediately forced to take the oath of fidelity to Hitler personally. A plebiscite held on Aug. 19 confirmed these measures. Out of 43,529,710 votes 88.2% were cast in Hitler's favour.

In Power. — Outwardly, the Nazi party, following the pattern of the Communist party. was strictly centralized. Hitler's word was the supreme and undisputed command. The outward aspect of efficiency and unity was impressive. Nazi documents found after 1945 revealed, however, how much the party, like other totalitarian parties, was torn by internal dissensions and jealousies. There was constant overlapping and aorking at cross-purposes on all levels of the complex organizational system. The situation deteriorated when. after 1938 and especially with the progress of the war, the older. trained civil servants and army leaders were replaced by party members.

Opposition to the regime was broken either by outright terror or. more frequently, by the all-pervading fear of possible repression, even if no actual repression took place. As in the Soviet Union, all opponents of the regime were declared enemies of the state and of the people. An elaborate web of informers—often members of the family or intimate friends—working and reporting in secrecy imposed utmost caution on all expressions and activities. Justice was no longer recognized as objective but was completely subordinated to the alleged needs and interests of the "people." In addition. however, to the now debased methods of the normal judicial process, special detention camps were erected. In these camps—of which some, such as Dachau and Auschwitz, achieved notoriety—the SS. exercised supreme authority and introduced a system of sadistic brutality unknown in modern times and by far surpassing anything known in that respect in Fascist Italy or Communist Russia.

Resistance. — Church leaders participated actively in the resistance movement against Nazism. This movement never reached any popular dimensions and did not become active before the later years of the war into which Germany plunged Europe and the world. When the more rational leaders of the German army, together with members of the German official and educated class, recognized that Hitler was leading the Germans into defeat, they joined in a conspiracy that led to the attempt on July 20, 1944, to assassinate Hitler in his headquarters in East Prussia. The attempt miscarried, and the party took a frantic revenge on the conspirators. Many members of the German aristocracy and many high-ranking officers were executed, and the movement stressed again its antiaristocratic mass character as it had done at its beginning.

Turning Point; the War.—The history of National Socialism after 1934 can be divided into two parts of about equal length. The years between 1934 and 1939 were used to establish the full control of all phases of life in Germany by the party. The principal instrument of control was the unification of all the police, security and SS. organizations under the direction of Himmler and his chief lieutenant. Reinhard Heydrich. The years between 1938 and 1945 witnessed the attempt to expand and apply the Nazi system to territories outside the German *Reich.* This attempt was confined. in 1938, to lands inhabited by a German-speaking population. In 1939 began the subjugation of non-German-speaking nationalities to the totalitarian Nazi police state. In 1945 this attempt collapsed.

'The turning point in the brief but disastrous career of the Nazi regime in Germany was the year 1938. In that year the conservative influence in the two remaining bulwarks of an older, authoritarian but civilized Germany was ended—in the army and in the foreign office. In the same year. Hitler began German territorial expansion, carried through under diplomatic pressure, by "peaceful" means. In such a way he incorporated into the German *Reich* first the republic of Austria and then the Sudetenland (the German-speaking parts of the republic of Czechoslovakia).

By 1939 the military preparations, including the militarization of German life and education and the establishment of a war economy, had made such progress in Hitler's opinion that he could challenge the European order even at the risk of a second great war. On Aug. 23, Hitler, without consultation with his Italian and Japanese "allies," concluded a pact of friendship and nonaggression with the U.S.S.R. The pact contained a secret treaty between Germany and Russia partitioning Poland and dividing the whole of eastern Europe into spheres of influence. It was the first step opening the road into the heart of central Europe to Stalin and Russian Communism and the immediate prelude to World War II *(q.v.),* which began in Poland on Sept. 1.

To a certain extent World War II repeated the pattern of World War I: great initial German military successes; the forging of a large-scale coalition against Germany as the result of German pretensions and behaviour; the loss of the war because of German overreaching and conduct. *(See* also Germany: *History.)*

Ultimate Party Goals and **Failure.**—When Germany started World War II, it came as the logical outcome of Hitler's plans, known to the Germans since his publication of *Mein Kampf* (1926), and of his systematic preparations since 1933. From the beginning, National Socialism did not intend to establish a new order of authoritarianism and of inequality for Germany alone. Therein it again imitated Communism. Its dynamism was bound to expand and to spread By its own nature it could not recognize any limits to its own volition, only limits set by opposed superior forces. Thus Hitler's first years were spent in preparing the Germans for the approaching struggle for world control and in forging that instrument which would enable Germany to establish its military and industrial superiority, and thus to fulfill its ambitions. With mounting success, the aims grew in quick progression. The first aim was to unite all people of German descent within their historic homeland on the basis of "self-determination." The next step foresaw the creation of a *Grosswirtschaftsraum* ("large economic unified space") or a *Lebensraum* ("living space"). *(See* GEOPOLITICS.) Thereby the Germans would acquire sufficient soil to become economically self-sufficient and militarily impregnable. There, the German master race *or Herrenvolk* would rule over a hierarchy of subordinate peoples and organize them with German ruthlessness and efficiency. The initial success of that plan in 1941 widened it into the vision of a hemispheric order that would embrace all of Europe, western Asia and Africa, and finally of a world order that would establish the principle of National Socialism all over the globe and give to mankind as a whole the "benefits" of a peace maintained by German bayonets and administered by a unified party bureaucracy.

The extreme neomercantilist economic self-sufficiency, protectionism and rejection of free trade, which received the new name of *Wehrwirtschaft* ("defense" or "war economy"), was accompanied by an extreme cultural nationalist self-sufficiency and a resolute hostility against all western thought. The world rule to which National Socialism aspired would not only represent a military, economic and political domination, but equally an intellectual and moral leadership. The new world age or *Weltzeitalter* would be German and National Socialist at the same time.

These extravagant German hopes came to an end with Germany's defeat in 1945, after almost six years of war. Out of the ruins of National Socialist Germany there arose a divided and occupied Germany. The eastern provinces were put under Russian and Polish administration. The lands east of the Elbe, Saxony and Thuringia, formed, under Russian occupation, a Communist-dominated state, called the German Democratic Republic. In western Germany, in close co-operation with'the western democracies, the German Federal Republic, under the chancellorship of Konrad Adenauer, came into being in 1949. Though a number of Germans remained faithful to National Socialism, its principles and dreams, even after Hitler's downfall, and though there were several attempts made to reorganize National Socialist groups in the German Federal Republic, the political and mental climate there was not favourable to it, and it was hardly possible to speak of, or to expect, a revival of National Socialism in Germany.

NATIONAL WORKSHOPS (in French, *Ateliers Nationaux),* the term applied to the workshops established to provide work for the unemployed by the French provisional government after the revolution of *1848.* (The term is also incorrectly applied to the proposed *ateliers sociaux* of Louis Blanc [*q.v.*], state-supported co-operative productive societies.) The revolution was both preceded and followed by a severe financial and industrial crisis which rendered the problem of unemployment in Paris very acute. The provisional government under the influence of one of its members, Louis Blanc, and on the demand of a deputation of Parisian workers, passed a decree (Feb. 25, 1848) which contained bold promises assuring relief from the extreme conditions then prevailing. Moreover, this relief was to be immediate, effectual and universal. As stated in the decree:

> "The provisional government of the French Republic undertakes to guarantee the existence of the workmen by work. It undertakes to guarantee work for every citizen.':

For the carrying out of this decree Louis Blanc wanted the formation of a ministry of labour, but this was shelved by his colleagues who, as a compromise, appointed the "Luxembourg" labour commission under the presidency of Louis Blanc and with power of inquiry and consultation only. The carrying out of the decree of Feb. 25 was entrusted to the minister of public works, Marie de Saint-Georges, and various public works were immediately started. These included clearing the trench of Clamart and conveying the earth to Paris for the construction of a railway station on the *chemin de ter* de l'Ouest; construction of the Paris terminus of the Paris-Chartres railway; improvement of the navigation of the Oise and extension of the Sceaux railway to Orsay.

Those applying for work far exceeded the number of jobs available. There was no effective administrative service and no real desire on the part of the government to make the experiment a success. The disorder and waste were amazing.

Owing to the increase in the number of those claiming work or relief, disorganization set in, and both the bureaus and the *mairies* became the centres of disturbances, those in charge of the offices being unable to control the crowds. As a consequence Marie de Saint-Georges commissioned Émile Thomas, a chemist, connected with the École Centrale, to reorganize the works. When Thomas took the work in hand on March 5, the number of unemployed had increased to 14,000 in addition to about *4,000* or 5,000 employed on public works, and it was steadily on the increase. On March 16 the daily pay of the workmen who were not working was reduced to one franc; work was guaranteed for at least every other day, in which case the pay was to be two francs for the day.

The national assembly had in the meanwhile been elected, and met on May 4. The executive commission was elected a few days later; Louis Blanc was excluded, but all the other members of the provisional government were on it. Blanc renewed his motion for a ministry of labour; this was rejected. The dispersal of the *emeute* of May 15 freed the assembly from fear of the revolutionary clubs, and on May 15 Thomas received instructions to dismiss all unmarried men under 25 years of age who would not enlist in the army, all men who could not prove six months' residence in Paris and all who refused offers of private employment. Piecework was to be established instead of timework, and men were to be prepared to be drafted into the provinces. The protests of Thomas held this plan up, but he was removed from office on May 26 and on June 20 the proposals were approved, and the sequel was the insurrection of June 23 and following days *(see* FRANCE: *History*).

NATIVISTIC MOVEMENTS. Nativistic movements are efforts by members of a society to build for themselves a more satisfying way of life by eliminating foreign persons, customs, material objects or ideas. Such movements belong to the larger class of revitalization movements, all of which aim to better the life of a society, but not all of which are nativistic. Sometimes the term nativistic movement is used loosely to denote any type of revitalization movement. The term is largely restricted in usage to anthropologists and is therefore commonly applied to primitive peoples in contact with western civilization. Similar events occur, however, in western societies and are frequently studied by historians and sociologists, who employ a different vocabulary (sect formation, messianic movement, revolution, religious revival).

Revitalization movements occur in societies which have been subjected to stress and whose culture has suffered disorganization. The typical process of a revitalization movement (and therefore of a nativistic movement) may be divided into six states: (1) the inspiration of the prophet; (2) the preaching of the inspired new code; (3) the development of an organization of disciples and followers; (4) the modification of the new code to fit local and temporal requirements; (5) the transformation of the society's culture along the lines of the new code; (6) the redefinition of the new code as traditional and the translation of the revolutionary organization into a conservative status.

Generally speaking, nativistic movements are religious; the new (or revived) religion itself details the changes to be made in such secular affairs as political organization, family structure. economic pursuits, war and international relations. Revitalization movements may bring about drastic changes in culture in very short periods of time.

Typologies of nativistic movements have been developed. One such analysis divides them into four groups: (1) revivalistic-magical; (2) revivalistic-rational; (3) perpetuative-magical; and (4) perpetuative-rational. Another typology is based on the extensiveness of the new code's coverage of cultural categories. There exist also various culture-area classifications based on typical forms taken by nativistic movements in various regions.

Thus Melanesia. and especially New Guinea, has been since the latter part of the 19th century the home of various native cargo cults, which emphasize the belief that a ship. with the ancestors as crew and passengers, is approaching with a cargo of European goods. On its arrival European personnel and native custom alike are to be cast aside and the cult members will enjoy the full benefits of European civilization without the interference of white masters. Some believers destroy much of their property in anticipation of the new wealth.

South American Indians have for centuries produced *terre sans mal* (literally, "land without evil") movements, based on the belief in a promised land, either on earth or on some other plane, to which the people can by religious ritual or physical migration actually translate themselves. Africa south of the Sahara is the home of hundreds of separatist churches.

North American Indians have tended to produce revivalistic doctrines, emphasizing the spiritual purity to be achieved by following ancestral (or at least distinctively Indian) ways of ritual and daily life. In 1805 in Ohio the "Shawnee Prophet" Tenskwatawa preached rejection of European mode of dress, the use of alcohol, and intermarriage with whites, and certain Indian practices such as witchcraft. The movement became an antiwhite religious crusade lasting until the War of 1812. The so-called Ghost Dance of the 1870s and 1890s is the best known example of a North American Indian nativistic movement. Although the prophet Wovoka was a Paiute, the Dance itself spread widely among tribes west of the Mississippi river. In essence the doctrine was millenarian: the world was soon coming to an end and the new dawn would see all Indians, dead and alive, reunited to live according to more or less aboriginal standards; in the meantime, the Indians were to avoid any sort of conflict, to dance and in trances induced by continued dancing to meet ancestors (ghosts) and supernatural beings. The second Ghost Dance received special notoriety from its association with the Sioux outbreak of 1890.

Theories about the causes of nativistic and other revitalization movements generally emphasize that individual psychological and physiological stress are elicited by cultural disorganization and in turn elicit both the inspiration of the prophet and the motivation of his followers. Study of such movements has contributed to a scientific understanding of the dynamics of culture change and of processes of mental disorder and resynthesis.

NATROLITE, a mineral species belonging to the zeolite group, is a hydrated sodium and aluminum silicate. Needlestone or needle zeolite are other names, alluding to the common shape (acicular habit) of the crystals, which are often very slender and are aggregated in divergent tufts. Larger crystals have the form of a square prism terminated by a low pyramid: the .prism angle being nearly a right angle, the crystals are tetragonal in appearance. though actually orthorhombic. There are perfect cleavages parallel to the face of the prism. The mineral also often occurs in compact fibrous aggregates, the fibres having a divergent or radial arrangement. Natrolite is usually white or colourless, but sometimes reddish or yellowish. The lustre is vitreous, or in finely fibrous specimens sometimes silky. The formula is $Na_2Al_2Si_3O_{10}2H_2O$. The specific gravity is 2.2 and the hardness 5.5.

The mineral is readily fusible. It is decomposed by hydrochloric acid with separation of gelatinous silica.

See also ZEOLITE.

NATSUME SŌSEKI (pseudonym of NATSUME KINNOSUKE) (1867–1916), is by general consent the outstanding figure of modem Japanese literature. He was graduated from the English literature department of Tokyo university in 1893 and from 1900 to 1903 studied in England.

The influence of English literature is most conspicuous in his earliest published works, the satirical *Wagahai wa Neko de Aru* ("I Am a Cat," 1905) and *The Tower of London* (190j). but it can be traced through most of his later writings as well. To this knowledge of European literature Natsume brought an unusual understanding of Japanese *haiku (see* JAPANESE LITERATURE) and Chinese poetry, in both of which he excelled. His writings, indeed, represent one of the rare successful blendings of western novelistic techniques with Japanese traditions.

Natsume's reputation as a novelist was firmly established with *Botchan* (1906; Eng. trans., in part, by Watson, in D. Keene, *Modern Japanese Literature,* 1956) and *Kusamakura* (1907). In 1908 he left his post at Tokyo university, where he had been teaching English since 1903, in order to devote himself entirely to his novels, which were published serially in the *Asahi* newspaper. *Mon* ("The Gate." 1910) contains a first enunciation of Natsume's concern with egoism in human relations, a theme that was treated with increasing profundity and incisiveness in each of his successive novels and finally resolved in his principle of *sokuten kyoshi,* "to follow Heaven and depart from the self." *Kokoro* (1914; Eng. trans. by E. McClellan, 1957) and *Meian* ("Darkness and Light," unfinished at his death in 1916), perhaps Natsume's finest novels, deal largely with this same theme.

Natsume also wrote literary criticism, diaries and works, such as *My Individualism* (1915), in which he stated his philosophy. He died on Dec. 9, 1916, leaving behind many devoted disciples.

See Toyotaka Komiya, *Natsume Sōseki* (1953); Okazaki, *Japanese Literature in the Meiji Era,* trans. *by* Viglielmo (1955). (DD. K.)

NATTIER, JEAN MARC (1685–1766), French painter, known for his portraits of the ladies of Louis XV's court in mythological attire, was born on March 17, 1685, in Paris. the son of Marc Nattier, a portrait painter. and of Marie Courtois, a miniaturist. He received his first instruction from his father and took the first prize at the Paris academy at the age of 1j. He refused to study at the French Academy in Rome and in 1715 went to Amsterdam, where Peter the Great was then staying. There he painted portraits of the tsar and his wife, the empress Catherine, but declined an offer to go to Russia. Between 171j and 1720 he painted the "Battle of Poltava" for Peter the Great, and the "Petrification of Phineus and of His Companions" (Tours museum), which led to his election to the Academy. The financial collapse of 1720 all but ruined Nattier, who was obliged to turn to portraiture. Notable examples of his straightforward approach are the "Marie Leszczinska" at the Dijon museum and "The Artist Surrounded by His Family," dated 1730.

Among his pictures are the "Magdalen," at the Louvre; "La Camargo" and "A Lady of the Court of Louis XV," at Nantes; the "Head of a Young Girl," at Orléans; and "Mme. de Pompadour," at Marseilles. The Versailles museum owns a group of two ladies, and the Dresden gallery, a portrait of the Maréchal de Saxe. In the Wallace collection are "The Comtesse de Dillières," "The Bath (Mlle. de Clermont)," "Portrait of a Lady in Blue," "Marie Leszczinska" and "A Prince of the House of France." Four portraits of the daughters of Louis XV, with the attributes of the four elements, are in the Museo de São Paulo, Braz.

He died in poverty in Paris on Nov. 7, 1766.

(M. N. B.)

NATURAL **GAS** is the name given to flammable gas found in porous, subsurface, imperviously capped earth formations in North and South America, Europe, Asia and Africa. Estimates by the American Gas association, World Power conference and International Conference on Peaceful Uses of Atomic Energy indicated (in trillions of cubic feet) these known reserves in 1955: United States 225; Canada 22.5; Mexico 1.2; Argentina 0.5; Chile 0.14; U.S.S.R. 35; France 0.22; Hungary 0.13; Rumania 8.9; Italy 2.5; Japan 2.9.

Recoverable reserves in the United States might run as high as 500 to 1,000 trillion cubic feet, and 300 to 500 trillion cubic feet in Canada.

Natural gas is frequently found with petroleum; in the U.S. one-third of natural gas production comes from oil wells. Thus, it is assumed that huge stores of gas exist in the middle east countries of Kuwait, Saudi Arabia, Iraq and Iran which have three-quarters of the entire world's known oil reserves.

In geologic terms, natural gas is found in the Carboniferous, Devonian. Silurian, Ordovician, Cambrian, Tertiary, Cretaceous and Jurassic systems. Some wells are more than 3 mi. deep.

Chemical Composition.—Natural gas is largely methane (CH,) and other gaseous hydrocarbons of the paraffin series, including ethane, propane, the butanes, pentane, hexane, heptane, and octane. (For the chemistry of these organic compounds, see PARAFFIN HYDROCARBONS.) Varying percentages of carbon dioxide, nitrogen, hydrogen sulfide and helium are removed as valuable by-products before the "sweet" gas is transported to consuming markets. Unconditioned "sour" gas is burned to produce carbon black.

Natural gas in the U.S. is generally 80% to 95% methane which has a high heat of combustion:

$$CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O + 210{,}800 \text{ cal.}$$

Heating value of commercial "dry" natural gas, at 60° F. and atmospheric pressure, varies from 1,000 to 1,200 British thermal units (B.T.U.) per cubic foot. Common terms of measurement are MCF (thousand cubic feet) and therm (100,000 B.T.U.). Specific gravity of natural gas (air= 1) varies from 0.56 to 0.67. Explosive limits in air are 4.5% to 14.5%. Natural gas has no odour, so that chemical odorants are added to aid in detecting leaks; with such odorants, a concentration of 1% gas in free air may be detected.

Natural gasoline and liquefied petroleum gas (LP-Gas) plants, located at or near producing wells, strip these products from natural gas before it goes to consumers. Natural (or casinghead) gasoline made up about 10% of U.S. motor fuel supply in the 1950s. LP-Gas is shipped under pressure in liquid form in railroad tank cars, tank trucks, pipelines and tank ships all over the world.

Production of Natural Gas.—Gas and oil men were under constant pressure in the 1950s to find new supplies and extend known fields, because of growing populations and spiraling use of fuel per capita all over the world.

The American Petroleum institute (A.P.I.) estimated well completions in the U.S. in 1956 at a new all-time high: gas 4,275; oil 31,500; dry 22,025; and service 1,050. A.P.I. also estimated new record production of 12.7 trillion cubic feet of natural gas in 1956.

U.S. bureau of mines natural gas statistics for 1955 gave these details (in trillions of cubic feet): gross withdrawals 11.72; marketed production 9.4; repressuring 1.54; vented and wasted 0.77. Value at point of production in the U.S. was 10.8 cents per MCF; with a low of 5.6 in Arkansas, 8 in Texas, and a high of 29.9 in Pennsylvania. Natural gas was produced in 29 states, Texas leading with almost half of the U.S. total, followed by Louisiana, Oklahoma, California, New Mexico and Kansas. Natural gas accounted for 26% of 1955 U.S. production of energy from fuels and energy from water power, the remainder of production being crude petroleum 37%, coal and lignite 33.3%, water power 3.7%.

Transporting Natural Gas.—Few large diameter natural gas pipelines had been built for long distances outside of the U.S. by the mid-1950s. Notable among these were a 348-mi. line from Sui to Karachi in West Pakistan; a 530-mi, line from Yelshanka, on the Volga river, to Moscow; a 1,100-mi. line from Commodoro Rivadavia field to Buenos Aires; an 800-mi. line from Stavropol oil fields to Moscow; and scheduled to be the longest line in the world, about 2,250 mi. in length, from Alberta to eastern Canada. A 1951 study of a proposed 2,500-mi. line from the middle east to Paris indicated a delivery price of 32 cents per MCF.

Because natural gas is found under only 1% of total U.S. land area, large (10- to 36-in. diameter) pipelines carry this fuel to distant consuming markets, as far as 2,000 mi. away. The American Gas association (A.G.A.) reported in 1955 some 46,000 mi. of field and gathering lines, and 142,000 mi. of transmission lines. Pressures in these lines range from 200 to 1,000 lb. per square inch (p.s.i.), and average speed of gas travel is about 25 m.p.h. Average deviation of natural gas from Boyle's law (*q.v.*) at 60° F. is 8% at 300 lb. pressure and 20% at 1,300 lb.

Before World War II, natural gas pipelines were built for about $100,000 per mile, and cost of transporting 1,000 cu.ft. for 100 mi. was about 1 cent. Postwar costs rose to about $150,000 and 1½ cents.

Liquefaction of Natural Gas.—Because it is mostly methane, natural gas can be liquefied at atmospheric pressure by refrigerating it to −258° F.; and 1 cu.ft. of liquefied product is equivalent to 600 cu.ft. of gas. Thus, storage of huge supplies can be accomplished economically during summer months, to be released for peak winter demands, especially home heating.

A liquefaction plant was operated successfully by the East Ohio Gas Co. at Cleveland, O., from Feb. 1941 to Oct. 1944, when one of four insulated storage containers ruptured, causing a disastrous fire. An official bureau of mines investigation concluded that "the application of the system . . . is not invalidated."

Transportation of liquefied natural gas in insulated ships or barges is considered practical and economical; such shipments could be made from the middle east to London at about half the thermal cost of manufacturing gas in England. Similar transportation from Central and South America to distant markets is also considered feasible.

Storage of Natural Gas.—U.S. producers, pipelines and distributing companies have accelerated programs for safe, economical storage of natural gas closer to major markets. In 1955, A.G.A. reported, there were 178 underground storage pools in 18 states, with ultimate capacity of 2.1 trillion cubic feet. Most of these pools were in depleted oil and gas fields, but there were also salt domes and aquifers (rock-capped domes with water seal underneath) for the same purpose. Maximum day's output from these 178 pools was estimated at 6.5 billion cubic feet. Pennsylvania, Ohio, Michigan, West Virginia and Oklahoma have the largest total reservoir capacities.

Natural Gas Use in U.S.—The bureau of mines report for 1955 showed interstate shipments and exports to Canada and Mexico constituted 54% of marketed production. Natural gas was served in 43 states and the District of Columbia. Oregon and Washington received natural gas in 1956; and Idaho in 1957.

Major 1955 uses in the U.S. (in trillions of cubic feet with average value in cents per MCF at points of consumption) were: residential, including heating, 2.1 and 88.7 cents; commercial 0.63 and 62.7 cents; field use, drilling, pumping 1.5 and 10.1 cents; carbon black 0.245 and 7.9 cents; refinery fuel 0.625 and all other industrial 3.9 and 25.7 cents. The Federal Power commission in

1955 estimated 1.15 trillion cubic feet used for generating electricity, and this was included in industrial use. Average value at all points of consumption was 40 cents per MCF.

Greatest growth in use in the **1950s** was for residential heating (by **1956** more dwelling units were heated by gas than any other fuel) and as raw materials for petrochemicals, the latter included in "all other industrial" above. Petrochemical production in the U.S. was estimated at 35,000,000,000 lb. in **1956,** with natural gas supplying raw material for about **75%** of tonnage.

(H. W. Sn.)

Minor uses of natural gas include the following:

1. Pentane in the production of 50 synthetic chemicals of greater or less commercial importance.

2. Mixtures of ethane, propane and the butanes in the mass production of 100 synthetic chemicals—alcohols, alcohol ethers, ketones, esters, acids, acid anhydrides, aldehydes, oxides, amines, ethers and chlorinated derivatives.

3. Mixtures of ethane, propane and the butanes in the mass production of "poly" gasoline—a motor fuel of high octane rating.

4. Butane in the production of butadiene, synthetic rubber and as a solvent for the extraction of oils, fats, resins, nicotine and perfumes.

5. Propane as fuel in isolated districts and as selective solvent in mass production of motor oils of low cold test, high viscosity index, better colour and bloom and high resistance to oxidation and the formation of carbon and sludge.

6. Ethane in the production of ethylene—useful in citrus fruit ripening, as an anesthetic, as a refrigerant and in the manufacture of mustard gas and ethylene bromide. Large quantities of the latter chemical are used in connection with tetraethyl lead to yield high octane (antiknock) motor fuels. (J. B. G).

See Gas Industry: *Gas Supply* in *the United States; see* also Index references under '.Natural Gas" in the Index volume.

NATURALIZATION: *see* Nationality; Naturalization Laws.

NATURALIZATIONLAWS. Naturalization is the act of investing an alien with the status of a national in a given state. It takes place wherever a new nationality is acquired by a person after his birth. It may be accomplished as the result of voluntary application, special legislative direction, marriage, parental action or annexation of territory. The conditions under which the privilege of naturalization will be granted are fixed by the laws of each nation. International law, however, imposes some limits on the power of a state to naturalize persons, especially nonresidents.

UNITED STATES

The constitution of the United States, article 1, section 8, clause **4,** authorized congress to "establish an uniform Rule of Naturalization." Congress fulfilled that mandate by enacting naturalization statutes, commencing in 1790, to establish the conditions under which aliens may be admitted to citizenship. The requirements have never been exacting, and the consistent national policy has been to encourage the naturalization of all qualified aliens. That policy aided in developing the strength and homogeneity of a nation whose growth resulted largely from the contributions of millions of immigrants and their descendants.

Naturalization by Court Process.—The principal method of acquiring a new nationality is through voluntary application in the manner provided by law. Most countries authorize the grant of citizenship by an administrative official. In the United States, however, naturalization from the first became a function of the courts. Congress conferred power to grant naturalization upon all federal district courts and upon state courts of unlimited jurisdiction which have a seal and a clerk. An applicant may appeal to the higher courts from a decision rejecting his petition. The government also is a party in every naturalization case, and it too may appeal when it deems that naturalization was improperly awarded.

The principal disqualification for naturalization was directed against some racial groups. Originally the statutes permitted the naturalization only of "free white persons." In 1870, folloning the Civil War, Negroes were granted the privilege of naturalization. The next modification was made by the Nationality Act of 1940, which permitted the naturalization of races indigenous to the western hemisphere, chiefly North American Indians and Eskimos. Further modifications were made in 1943, when Chinese were declared eligible; in **1946,** when Filipinos and East Indians were permitted to apply; and in 1950, when naturalization benefits were extended to noncitizens of Guamanian ancestry. Except for these specifically designated racial groups, Asiatics were not eligible at mid-century for naturalization as United States citizens. Also disqualified from naturalization were: (1) aliens identified with certain proscribed organizations, activities or beliefs at any time during the period of ten years immediately preceding the petition for naturalization; (2) certain aliens who claimed exemption from military service because of their alienage; and (3) deserters from the armed forces during time of war.

Several basic qualifications always have been prescribed, virtually without change, in the statutes relating to naturalization. It is important to bear in mind that these are general requirements which often have been modified with respect to special groups whom congress desired to favour.

First, the applicant for naturalization must have resided in the United States for at least five years following a lawful admission for permanent residence. Lesser periods of residence, and in some cases no fixed residence requirements, were prescribed for naturalization applications by wives and children of U.S. citizens, persons who serve in the armed forces or the merchant marine and other special categories.

Second, the applicant must establish that he is, and was during the requisite period of residence, a person of good moral character. Persons who have committed serious crimes during that period generally are barred.

Third. the applicant must establish that he is, and was during the requisite period of residence, attached to the principles of the constitution of the United States and well disposed to the good order and happiness of the United States. The latter requirement was designed to exclude from citizenship aliens hostile to the United States and its institutions. For many years the courts also interpreted this requirement as forbidding the naturalization of conscientious objectors to military service. In **1946,** however, the supreme court, reversing its earlier holdings, determined that conscientious objectors might be naturalized (Girouard v. *United States,* **328** U.S. **61** [1946]).

Finally, the applicant generally must meet several educational requirements. He must demonstrate an understanding of the English language, including an ability to read, write and speak words in ordinary usage. He must sign the petition for naturalization in his own handwriting if he is physically able to write, and must demonstrate some understanding of the constitution and form of government of the United States.

While the ultimate power to grant or deny naturalization was conferred upon the courts, the law vested in the immigration and naturalization service of the department of justice administrative supervision over the naturalization process. The service, headed by a commissioner of immigration and naturalization, was placed under direction of the attorney general and was organized into **16** district offices as well as numerous suboffices throughout the United States. Under the act of June **29,** 1906, the immigration and naturalization service was given broad legal authority to receive applications, issue certificates of legal entry, interrogate the applicants and their witnesses and make recommendations to the naturalization courts. This administrative function was designed to aid the courts in discharging their responsibilities in granting or denying naturalization.

The naturalization process commences with the filing of a declaration of intention to become a U.S. citizen. Prerequisites to the filing of such a declaration are lawful entry into the United States for permanent residence and the procurement of an official certificate establishing such entry. The requirement that a declaration of intention be filed is waived in the cases of spouses of U.S. citizens, persons with specified service in the armed forces or the merchant marine and other special groups.

The next step is the filing of a petition for naturalization. **If** a declaration of intention is required, the petition may not be filed sooner than two years nor later than seven years after the date of the declaration of intention. An applicant who desires to file his petition for naturalization is notified to appear with two citizen witnesses in court, where they are interrogated under oath in the office of the clerk of court by an examiner of the immigration and naturalization service. Then the applicant files the petition for naturalization, which is signed and sworn to by the petitioner and his two witnesses. Further investigation is conducted and the petitioner is then notified to appear before a judge for final hearing. At the final hearing a representative of the immigration and naturalization service appears and recommends that the petition be granted or that it be denied.

If the court grants the petition, the petitioner takes an oath in open court forswearing all foreign allegiance and pledging allegiance to the United States; the judge then signs an order admitting him to citizenship. Thereafter the newly invested citizen receives an official certificate of naturalization. The fees established by law were as follows in 1951: $3 to the clerk of court at the time of filing the declaration of intention and $8 to the clerk of court at the time of filing the petition for naturalization. The latter fee included all charges through completion of the hearing before the naturalization court; no further fee was prescribed for the final hearing or for issuance of the certificate of naturalization.

A naturalized citizen acquires status equal to the native-born, except that he is not eligible to become president of the United States. However, even after naturalization is finally granted, it may be revoked through a judicial proceeding. The statute authorizes such revocation only if the naturalization was induced by fraudulent misstatements or was illegally granted (*e.g.*, misstatements relating to entry into the United States or to criminal record). The supreme court insisted upon strong evidence of irregularity before any naturalization might be cancelled and declared that such revocations would be sanctioned only if there was clear, unequivocal and convincing proof that the naturalization was improperly awarded (Schneiderman v. United States, 320 U.S. 118 [1943]).

Other Forms of Naturalization. — Another method of acquiring citizenship is by derivation through a husband or parent. Prior to Sept. 22, 1922, marriage to a U.S. citizen or the husband's naturalization conferred U.S. citizenship upon an alien wife. The Cable act of Sept. 22, 1922, abolished the joint citizenship of husband and wife and enabled a wife to choose her own nationality. Citizenship status previously acquired, however, was not affected.

Prior to the Nationality Act of 1940 a child under 21 years of age acquired U.S. citizenship through the naturalization of either parent while he resided in the United States or if he subsequently commenced to reside in the United States prior to his 21st birthday. After Jan. 13, 1941, the effective date of the Nationality Act of 1940, such transmission of citizenship could not occur after the child had attained the age of 18 years. In addition, derivation was to take place only if both parents became citizens, unless one parent was dead or there had been a divorce or legal separation, in which event the naturalization of the parent having legal custody would suffice.

A person who has acquired U.S. citizenship by derivation may apply to the commissioner of immigration and naturalization for a certificate recognizing that status. The fee for this application in 1951 was $5. Upon presentation of proof establishing a valid claim to U.S. citizenship, the commissioner issues a certificate of citizenship to the applicant.

Congress also may grant citizenship by special legislation. In some instances, so-called private bills have been enacted conferring citizenship rights upon named individuals. Much more common has been the award of collective naturalization to large groups of noncitizens, particularly the inhabitants of U.S. territories and possessions.

The nationality status of the inhabitants of certain acquired territories was fixed by the treaty-making power of congress. Statutes have from time to time effected collective naturalization either prior to or upon the admission of territories to statehood. Such action was taken in territory acquired under treaties concluded with Great Britain (territory of Michigan, 1794, 8 Stat. 116), France (Louisiana, 1803, 8 Stat. 200), Spain (Florida, 1819, 8 Stat. 252), Mexico (Guadalupe-Hidalgo, 1848, 9 Stat. 922; Gadsden, 1853, 10 Stat. 1031), Russia (Alaska, 1867, 15 Stat. 542) and Denmark (Virgin Islands, 1916, 39 Stat. 1706).

In the absence of definite treaty stipulations, citizenship has been conferred upon inhabitants of acquired territory by legislative enactmects. In this category were the Hawaiians (act of April 30, 1900, 31 Stat. 141), Puerto Ricans (sections 5 and 5[a], act of March 2, 1917, as amended; section 202, Nationality Act of 1940), Virgin Islanders (act of Feb. 25, 1927) and Guamanians (act of Aug. 1, 1950, 64 Stat. 385). Finally, United States citizenship was conferred collectively through the political incorporation of the original states into the United States; in the case of the state of Texas, upon its annexation and direct admission into the union; and upon American Indians born in the United States through special legislation on June 2, 1924.

Full status as U.S. citizens, however, was not conferred on all the inhabitants of U.S. territorial possessions. Complete citizenship rights were extended to inhabitants of Alaska and Hawaii (when still territories), Puerto Rico, the Virgin Islands and Guam; but the natives of other possessions such as American Samoa were regarded as noncitizen nationals of the United States, entitled to U.S. protection but not to full citizenship status.

COMMONWEALTH OF NATIONS

United Kingdom. — In 1844 Great Britain adopted legislation which authorized for the first time the naturalization of aliens as British subjects. Previously aliens could acquire British allegiance only through a private act of parliament or through the grant of letters of denization by the crown. After 1844 the latter processes were invoked only in rare cases. One such instance occurred when Lord Reay succeeded to a Scottish peerage in 1877 and was naturalized by an act of parliament. The process of denization fell into disuse because denizens were not granted full rights as British subjects.

The British Nationality act, 1948, which became effective Jan. 1, 1949, drastically revised earlier concepts of British nationality. It abolished the previously recognized status of common British nationality throughout the empire and recognized separate citizenship status for the United Kingdom and colonies and for each of the commonwealth nations; namely, Canada, Australia, New Zealand, the Union of South Africa, Newfoundland, India, Pakistan, Southern Rhodesia and Ceylon. Every citizen of the United Kingdom and colonies and of each of the other constituent nations of the commonwealth consequently acquired the status of a British subject, and was also referred to as a commonwealth citizen. Following enactment of the British Nationality act, 1948, Newfoundland became a province of Canada and was governed by the Canadian Citizenship Act of 1946. Citizens of the Republic of Ireland were no longer regarded as British subjects.

Under the British Nationality act, 1948, a noncitizen of the United Kingdom and colonies generally could acquire such status either through registration or naturalization. Both processes are entirely administrative and are entrusted to the discretion and control of the secretary of state, whose discretion in passing upon applications generally is absolute and unqualified. He may, with or without assigning any reason, grant or withhold any such registration or naturalization for any reason he deems conducive to the public good. His decision on any such application is not subject to appeal or review in any court.

Persons in the following groups may be registered as citizens of the United Kingdom and colonies upon application made in the prescribed manner to the secretary of state: (1) citizens of the Commonwealth of Nations or Ireland ordinarily resident or in crown service in the United Kingdom; (2) noncitizen women who marry citizens of the United Kingdom and colonies and who take an oath of allegiance to the British crown; (3) minor children of any citizen of the United Kingdom and colonies, upon application filed by the parent or guardian; (4) in such special circumstances as the secretary of state thinks fit, any other minor may be registered as a citizen of the United Kingdom and colonies.

The second major process for acquiring status as a citizen of the United Kingdom and colonies is through naturalization, which also is accomplished ordinarily upon application to the secretary of state in the prescribed manner. The naturalization application may be made by an alien or by a British protected person (a citizen or resident of a protectorate, protected state, mandated territory or trust territory). Upon satisfying the secretary of state that he meets the established requirements such applicant is granted a certificate of naturalization and, on taking an oath of allegiance to the British crown, he becomes a citizen of the United Kingdom and colonies by naturalization from the date on which the certificate was granted.

The following qualifications must be met by an applicant for naturalization: (1) he must have resided or been in crown service in the United Kingdom for at least 12 months immediately preceding the date of the application; (2) he must, in addition, have resided for specified periods aggregating at least four years in the United Kingdom or its colonies; (3) he must be of good character; (4) he must have sufficient knowledge of the English language; (5) he must intend to reside in the United Kingdom or its colonies or to perform crown or other specified service in the United Kingdom or its colonies. In special cases the secretary of state may waive or modify the residence requirements. Any person whose status as a citizen of the United Kingdom and colonies is in doubt may be granted a special certificate of naturalization by the secretary of state, and such certificate may declare that it is issued for the purpose of quieting such doubts. A certificate of naturalization granted for this purpose is conclusive evidence that the recipient was a citizen on the date of its issuance, but does not preclude his establishing that he was a citizen at an earlier date. A certificate of naturalization does not become effective until the applicant takes an oath of allegiance.

A person who becomes a citizen of the United Kingdom and colonies by registration or naturalization is entitled to all the rights, powers and privileges and is subject to all obligations, duties and liabilities of a natural-born citizen of the United Kingdom and colonies and to all intents and purposes enjoys the status of a natural-born citizen. However, such a person may be deprived of his citizenship, through order of the secretary of state, for fraud, false representation or material concealment in procuring registration or naturalization. In addition, a naturalized citizen may be deprived of his citizenship through order of the secretary of state on any one of the following grounds: (1) disloyalty, before or after the naturalization; (2) unlawful communication with or assistance to an enemy in time of war; (3) conviction and sentence in any court of certain serious crimes within five years of the naturalization; (4) continuous residence in foreign countries, except under certain specified conditions, for seven years after the granting of the certificate. The secretary of state may also revoke the naturalization of a citizen of the United Kingdom and colonies who is deprived of his citizenship in any of the commonwealth nations or in Ireland on grounds that are substantially similar to those mentioned above.

In no case does the secretary of state deprive any person of citizenship, even under the enumerated conditions, unless he is satisfied that it is not conducive to the public good that the person should continue to be a citizen of the United Kingdom and colonies. Before making an order revoking citizenship the secretary of state is required to give to the person affected written notice specifying the cause for the proposed action; in addition, such persons generally may demand a hearing before a committee of inquiry before any final action is taken.

The citizenship status of alien women married to British subjects has been treated differently at different times. The original common-law doctrine regarded a woman's citizenship as independent from that of her husband, and an alien woman did not gain British nationality or lose her native citizenship upon her marriage. The act of 1884 provided for the first time that an alien woman acquired British nationality upon marriage to a British subject. Thereafter, and until 1933, the statutes directed that the wife of a British subject should be deemed a British subject This mas modified by the act of 1933, which provided that when a certificate of naturalization was granted to an alien, his wife did not become a British subject unless she elected to, accept British nationality. The original common-law concept was fully reinstated by the British Nationality act. 1948. so that after Jan. 1, 1949, an alien woman married to a citizen of the United Kingdom and colonies did not automatically acquire her husband's citizenship. She could become a citizen of the United Kingdom and colonies, if she desired such citizenship, only by applying for registration, in the manner previously described. The minor children of naturalized citizens likewise might become citizens of the United Kingdom and colonies through registration, upon application made by a parent or guardian.

British Colonies.—As previously indicated. the British colonial possessions were joined with the United Kingdom for the purpose of determining a common citizenship status in the United Kingdom and colonies. The authority of the secretary of state in granting registration or naturalization as a citizen of the United Kingdom and colonies and in revoking such citizenship status is reposed in the governor of any colony, protectorate or United Kingdom trust territory, whose actions generally are subject to the approval of the secretary of state.

Commonwealth Nations.—Completing a process inaugurated on a limited basis in 1914, the British Nationality act. 1948, recognized separate citizenship privileges for each of the countries in the Commonwealth of Nations and confirmed in addition the authority. without any limitation, of each of such countries to enact laws defining its own citizenry. As previously stated. the citizens of each such nation—Canada, Australia, New Zealand, the Union of South Africa, Newfoundland, India, Pakistan, Southern Rhodesia and Ceylon—were designated as British subjects or as commonwealth citizens. It has already been noted that Newfoundland became a province of Canada after enactment of the British Nationality act, 1948, and thereby became subject to Canadian laws.

The nationality laws adopted in each of the commonwealth countries must be consulted in order to determine citizenship status in those countries. Typical of such laws was the Canadian Citizenship act, 1946, which became effective Jan. 1, 1947. Indeed, the enactment of the Canadian law doubtless was an important factor in the subsequent revision of the British statute which ultimately mas enacted as the British Kationality act. 1948

Under the Canadian statute, naturalization became essentially a judicial function. An executive officer, the secretary of state. was entrusted with broad administrative responsibilities in relation to that process. This division of responsibility thus resembled the system prevailing in the United States.

An applicant for naturalization must meet the following qualifications: (1) he must have filed a declaration of intention in the office of the clerk of court not less than one year nor more than five years prior to the date of final application; British subjects and spouses of Canadian citizens are exempt from this requirement; (2) he must have been lawfully admitted to Canada for permanent residence; (3) he must have resided continuously in Canada for one year immediately prior to the application and generally must also establish residence in Canada for a further specified period of not less than four years; applicants with specified military service and wives of Canadian citizens are exempt from this latter residence requirement; (4) he must be of good moral character; (5) he generally must have an adequate knowledge of either the English or the French language; (6) he must have an adequate knowledge of the responsibilities and privileges of Canadian citizenship; (7) he must intend to reside permanently or to enter public service in Canada.

Naturalization applications are filed and posted in the office of the clerk of court. After a three-month waiting period, during which any person may file objections, the applicant must personally appear before the court for an examination and must produce such evidence as the court may require. The court determines whether the applicant has satisfied the prescribed requirements. If the court orders that naturalization shall be granted. its decision is transmitted to the secretary of state together with the application and other relevant documents.

The certificate of citizenship is issued by the secretary of state to any person whose application has been granted by the court. However, if the secretary of state questions whether such application was properly approved he may refer it to the court for a rehearing, but the court's decision on such rehearing is final and conclusive.

The marriage of an alien woman to a Canadian citizen does not change her nationality status. The law recognizes her right to control her own nationality status. She may acquire Canadian citizenship through naturalization upon her own application, but provision is made for some relaxation of the normal requirements on her behalf. A certificate of citizenship may be issued to a minor child of a naturalized citizen upon application made by his parent.

The secretary of state may grant a certihcate ot citizensnip to any person whose status as a Canadian citizen is in doubt, and the certificate may specify that it is granted for the purpose of quieting such doubts. No certificate of citizenship can become effective, except in the case of a minor under the age of 14 years, until the applicant has taken the prescribed oath of allegiance.

Naturalization may be revoked upon order of the secretary of state for any of the following reasons: (1) unlawful communication with or assistance to an enemy in time of war; (2) fraud, false representation or material concealment in procuring naturalization; (3) residing outside Canada for a period of six years following the naturalization; (4) disloyal acts or speech outside Canada, or, if in Canada, conviction of treason or sedition.

The secretary of state must give advance notice to the naturalized person concerning the proposed revocation and must afford him an opportunity to request that the case be referred for a hearing: If such hearing is requested it is held before a commission of inquiry or, in specially designated cases, before a court. Revocation of a naturalized person's citizenship generally does not terminate the Canadian citizenship derived through him by his wife and minor children unless specially directed or unless the wife of such person files a declaration renouncing her Canadian citizenship or her status as a British subject.

The Canadian Citizenship act also provided specifically that a Canadian citizen is a British subject; that a naturalized citizen shall have full equality with a natural-born Canadian citizen; and that a citizen of any country of the British Commonwealth other than Canada shall be recognized in Canada as a British subject.

OTHER COUNTRIES

Virtually every nation has some provision for the naturalization of aliens. Most countries entrust the authority to grant naturalization to executive officers. In this group in 1951 were: Afghanistan, Albania, Algeria, Australia, Austria, Belgian Congo. Belgium, Bolivia, Brazil, Bulgaria, Chile, Costa Rica, Dominican Republic, Ecuador, Egypt, Finland, France, Germany, Greece, Guatemala, Haiti, Honduras, Hong Kong, Hungary, Iceland, Iraq, Italy, Japan, Madagascar, Monaco, Morocco, the Netherlands, New Zealand, Nicaragua, Norway, Palestine, Panamá, Paraguay, Poland, Portuguese East Africa, Rumania, Salvador, Siam, Spain, Sweden, Switzerland, Syria, Tunisia, Turkey, the Union of South Africa, the U.S.S.R., Uruguay, Venezuela and Yugoslavia.

In still other countries naturalization is granted by the legislature, although in some of these executive officers perform coordinate or auxiliary functions. In 1951 these included Belgium, Bolivia, Paraguay, Rumania, Salvador and Uruguay.

In Belgium and Uruguay the legislature, the executive branch and the judiciary each might award naturalization. Other nations in which naturalization remained a judicial function in 1951 included Algeria, Argentina, Bulgaria, Liberia, Mexico and Spain.

Naturalization laws of the various countries vary as to the requirements for age, residence, eligible classes and other basic qualifications and procedures. A collection of the naturalization laws of each country is found in R. W. Flournoy, Jr., and M. O. Hudson (eds.), *Collection of Nationality Laws of Various Countries, as Contained in Constitutions, Statutes and Treaties* (1929). Some of the important requirements of such laws were summarized in *Research in International Law* (1929), published as special supplement to *American Journal of International Law*, 23:83–100.

NATURALIZATION OF PLANTS AND ANIMALS, in the broad sense, is a term applied to the fact that plants or animals may be introduced, artificially or naturally, into a country with a climate the same as or different from that of their original habitat, and may successfully propagate there. What would come to the same thing is the successful persistence and propagation of plants and animals in a country whose climate has undergone some notable change, such as would be involved in the setting in of an ice age or a period of aridity. In this broad usage the term naturalization is practically synonymous with acclimatization (*q.v.*).

But in its narrow usage naturalization means a process by which organisms are changed in the course of generations in adaptation to new climatic conditions in the same or in another country. This usage implies the theoretical postulate of racial adaptation to withstand climatic influences which were at first more or less unfavourable. The establishment of the adaptation might be interpreted by some along Lamarckian and by others along Darwinian lines, and this raises additional theoretical questions.

Thus some investigators, *e.g.*, G. M. Thomson, who find little evidence of acclimatization in the strict sense, prefer to keep the term naturalization, which expresses an indisputable fact that organisms may thrive well when taken to another and in some respects different country.

Effects of Naturalization.— When plants and animals get a footing in a new and different country, what changes may be looked for? (1) There is often a marked increase in the number of individuals in a given area, as is illustrated by the multiplication of the rabbits in Australia, or of greenfinches and skylarks in New Zealand. The reason is twofold: favourable conditions, such as abundant food, may increase the rate of multiplication, and there may be an absence of the enemies and other checks which kept the numbers down in the old country. There have been some costly verifications of the numerical increase that is apt to follow naturalization, as in the familiar case of rabbits in Australia and New Zealand.

(2) Another consequence that has been repeatedly noted is increase in individual size and perhaps vigour. The new conditions prove unusually stimulating. Speaking of plants introduced into New Zealand, G. M. Thomson writes: "Water-cress—a plant of two to four feet in length in European waters—grew in some streams to a length of from 12 to 14 ft., and with stems as thick as one's wrist." This riotous exuberance is due positively to the stimulating conditions of the new territory, and negatively to the absence of the previous checks.

The popular interpretation of the rapid spread of introduced plants, *e.g.*, "weeds," in new countries, is that they come from places where the struggle for existence is keener and where they have therefore become particularly efficient. According to John Christopher Willis, "the real explanation, in all but a very few doubtful cases, is that their spread is due to change of conditions. This has usually been effected by man, who has often altered, or even destroyed, the conditions under which many societies of plants formerly flourished, thus giving a fair field to those newcomers that were suited to the new circumstances."

(3) Many naturalists have concluded that the lessening of the stringency of natural selection after transport to a new country allows an increase in the number of varieties, and the survival of peculiar forms, which would be speedily eliminated in the original environment. Thus, if there are few enemies, one might expect more numerous conspicuous variants, such as albinos. Here the careful work of G. M. Thomson is of great value. In 1891, he concluded that conspicuous colour variations were on the increase

among the rabbits introduced into New Zealand, and also among introduced birds like sparrows, thrushes, blackbirds, skylarks and starlings. Thirty years later he definitely withdrew this conclusion, the fallacy being that he was at first so busy looking for anomalous characters that he met with many, and unconsciously exaggerated the ratio of their occurrence. But inquiry must be made in other fields to see whether there is nothing to be said for the old view.

(4) So many naturalizations have been effected in different parts of the world that one would expect to find it easy to collect instances of change of habit; but there seems to be a strong conservative tendency among animals introduced into new haunts. When domesticated animals are transported to a wilder country there is sometimes an interesting individual rehabilitation of a long lost ancestral trait. Thus cows taken from Scotland to wilder conditions in California have been known to hide their calves in the thicket when they went to graze in the open. Sometimes, however, something novel occurs. Thus, sheep in New Zealand have shown in some places the novel habit of stripping off long pieces of bark from the gaya trees. On the whole it seems that change of habit in consequence of naturalization is infrequent and very gradual.

(5) Some types are quickly at home in a new country, but do not show external change. Horses, rabbits, rats, sparrows and fowls are usually somewhat indifferent to change of climate, while a tough animal like the yak of the Tibetan mountains refuses to thrive below a certain altitude.

Many facts confirm the suggestion that the success or failure of attempted naturalization may depend on inconspicuous constitutional peculiarities. Thus G. M. Thomson notes for New Zealand that the greenfinch and the chaffinch have thriven remarkably, while the allied linnet has failed. "The reasons for these failures are often so obscure that no plausible explanation has yet been given."

A hint of the frequent subtlety of conditions may be found in cases where the attempted naturalization of a plant fails, as of heather in Ceylon, because the associated root-fungus or mycorrhiza will not grow.

(6) When an organismal change directly induced by some change in environment, nutrition or habit, takes such a grip that it persists after the inducing conditions have ceased to operate, it is called a modification, or less conveniently, an individually acquired character. There seem to be some climatic modifications, and the following may be mentioned: *(a)* An Englishman who works half his lifetime under a tropical sun may become so tanned that the deposit of melanin pigment in the skin does not disappear during all the years in which he enjoys his pension at home. Of course it must not be inferred that the blackness of the Negro's skin was directly produced in this way by the tropical sun. *(b)* Karl Naegeli brought some Alpine plants to the Botanical garden at Munich, and there many of them became in the first year so much modified that they were hardly recognizable as the same species. Their descendants in the garden were also quite different from the Alpine originals. Thus the small ha kweeds (*Hieracium*) became large and thickly branched with abundant blossoms. The modifications were very striking, and in some cases many generations were observed—even for *13* years. The reappearance was probably due to the fact that the original modifications were directly reimpressed on each successive crop, for when the plants were removed from the rich garden to poor, gravelly soil, the acquired characters gradually disappeared, and the plants exhibited once more the original Alpine characters. There was no convincing evidence of hereditary entailment.

It is important not to think of these matters too simply. Thus, as Richard B. Goldschmidt points out, the normal development of particular characters, such as general growth and pigment formation, has been "harmonized" for a definite environment. But they have different temperature coefficients, and novel conditions may throw them out of harmony. Moreover, modifications resulting from climatic change must not be thought of as necessarily beneficial. Thus some Lepidoptera tend to melanism in the cold, and others at high temperatures, without there being any demonstrable advantage in either case.

(7) If evidence could be obtained of the hereditary entailment of climatic modifications, this would serve as a basis for a Lamarckian theory of acclimatization. It is necessary to inquire afresh whether there are any facts supporting the Lamarckian interpretation. Bordage records some observations on peach trees (*Prunus persica*) grown from seed of European origin sown in Reunion. For ten years or so the trees shed their leaves as in Europe. Later on, after 20 years, a considerable degree of evergreenness was exhibited. There was no bare period. When seeds of these partial evergreens were sown in the lowlands they grew into trees verdant throughout the year, but the same was true of seeds sown in certain mountainous districts with a considerable degree of frost. They also grew up into young peach trees which were also evergreen. But European seeds sown in similar situations developed into ordinary deciduous trees. This is a peculiar case and may be interpreted as follows: The original imports underwent a gradual constitutional change—some modification of their metabolism; this might affect the constitution of the seed during the period when it was still part and parcel of the parent's body. The change in the metabolism might result in the affected seeds developing into evergreens, though the direct environmental influence would work in the opposite direction. It is unfortunate that the observations mere not carried further.

A famous case, often referred to, is that of the feral horses of the Falkland Islands, which Charles Darwin studied on his "Beagle" voyage *(1833)*. He says that the horses and also the cattle were introduced by the French in *1764*. Whereas the cattle are large, the horses are small, and Darwin speaks of them as "having degenerated." "They have lost so much strength that they are unfit to be used in taking wild cattle with the lazo: in consequence, it is necessary to go to the great expense of importing fresh horses from the Plata. At some future period the southern hemisphere probably will have its breed of Falkland ponies, as the northern has its Shetland breed." Darwin regarded the degeneration of the Falkland Islands horse as due to the humid climate and the lack of suitable food, but it is difficult to believe that marked changes were effected between *1764* and 1833. It would be necessary to know more about the horses originally imported.

Various statements have been made in regard to changes brought about in the hair of sheep, goats, cattle, sheep dogs and even cats, when these animals are taken to a more rigorous climate. It is said that the fur becomes longer and thicker, which would be a useful adaptation. But there is a lack of precision in these statements, and a regrettable absence of measurements. It would be useful to know what additions were made to the coat after the climatic change; whether the offspring, exposed to the cold from birth, showed further additions; and the character of the fur in the grand-offspring. As regards modifications, no inference can be drawn from the occurrence of adaptive peculiarities, unless the history is known.

On the whole we are forced to the conclusion that the evidence of the heritability of climatic modifications is unsatisfactory.

Naturalization in the Past.—All the world over there are instances of related species flourishing under different climatic conditions, and few evolutionists have any hesitation in regarding these as the outcome of divergent evolution. It may be recalled that while Darwin did not think much of man's achievements in naturalization, he had no doubt as to nature's powers in this direction.

Three saving-clauses should be kept in mind: *(a)* when two nearly related species are thriving in climatically different surroundings, it should not be taken for granted, as it usually is, that all their differences are now part and parcel of the inheritance. Some of the differences may be modificational, hammered on each successive generation in the course of development. There is need for more experimental study of species. *(b)* There has been a tendency to strain the interpretation of specific characters as adaptive to particular conditions of life, such as those implied in climate. Many characteristics separating related species in different localities may be reasonably interpreted as climatic adaptations, but each case should be carefully judged on its merits. (c) When a species is extending its range in consequence perhaps of increasing numbers, the factor of isolation may come into operation, say in the form of a river or a watershed, and variations may be separated off which have no particular relation to the new territory or climate in which the leaders of the advance find themselves. Thus new species may arise by the physical segregation of diversely varying contingents of an advancing army, till the climatic difference itself may become an isolating factor.

Accepting, with these saving-clauses, the idea of naturalization, we must now ask how it may have been effected. The Lamarckian answer involves the postulate of the transmissibility of modifications, especially of functional modifications; and the evidence of this, summed up by Paul P. R. Kammerer (1924) and by Ernest William MacBride (1924), appears inconclusive. The interpretation which seems to involve fewest assumptions is that of Darwin. In discussing naturalization (1868), Darwin laid most emphasis on the natural selection of spontaneous variations. As to these variations he expressly says "there is no evidence that a change in the constitution of the offspring necessarily stands in any direct relation with the nature of the climate inhabited by the parents." In regard to selection he lays emphasis on two points: (a) the organism's power of resistance to difficult conditions in the new climate, and (b) some useful change in the period of reproduction, such as earlier flowering and fruiting.

To Darwin's interpretation an addition may be suggested. It is conceivable that the climatic peculiarities may affect the metabolism of the organism through and through, and may thus serve as stimuli to the variability of the germ cells. If the climatic peculiarity should induce (a) an adaptive modification in the body of the organism and (b), at the same time, a variation in the germ cells which finds expression as a similar new character in the offspring, the phenomenon is called "parallel induction." It must be distinguished theoretically from the transmission of a somatic modification; it is a change induced in the germ cells along with, but not through, the bodily modification (see EVOLUTION, ORGANIC).

But it is possible that climatic peculiarities may penetrate into the germ cells and affect them without producing any modification in the body. Thus W. L. Tower subjected full-grown potato beetles (Leptinotarsa) to peculiar conditions of temperature and humidity during the time when the eggs were maturing, and found that "mutations" occurred in a certain proportion of the offspring. The parents were not affected, having passed the plastic stage; and some of the eggs were not affected at all. Moreover, the same environmental peculiarity, analogous to a climatic change, did not always evoke the same mutation. Some of the mutations in colour and markings were very striking; others affected minute details of structure. In subsequent generations there was no reversion. This case is of particular interest in connection with naturalization, for the artificial environmental conditions, effected in large steel and glass cages, were comparable to different climatic conditions in which different species of potato beetle live.

By Hermann J. Muller in particular it has been shown that an exposure of the germ cells of the fruit-fly (Drosophila *melanogaster*) to appropriate doses of X-rays is followed by numerous mutations, which often breed true. This experimental irradiation illustrates the possible action of the environment as a variational stimulus. A mutation following a climatic change might have this origin. As August Weismann said many years ago (1904): "It does not seem impossible that the climate may have a variational influence upon certain determinants of the germ-plasm, for we have already seen that the influence of cultivation may incite plants and animals to hereditary variations, and that slowly increasing disturbances in the equilibrium of the determinant system may thereby be produced, which may suddenly find marked expression as 'mutations.' But there is little probability that adaptations, that is, transformations corresponding to the altered climate, can arise in this way!" The meaning of this last sentence is that Weismann believed these adaptations were the outcome of the prolonged natural selection of fluctuating variations in the germ-plasm.

The Darwinian theory, as applied to naturalization may be briefly resumed in more technical terms. In any species in any given environment there will be an observable percentage of variations from type in a given number of births, and these variations yield a curve of frequency or probable error. The steepness of the curve is a measure of the variability of the species. The aberrants on all sides are pruned off by selection. If the environment is changed, selection may no longer operate on the same axis as before, but may tend to prune off variations on one side of the mean more than on another. In the course of time, the apex of the curve, representing the type form, will shift to suit the new conditions, since more of the aberrants on the favoured side will live to reproduce.

Quite a separate question is this: that the new environment may increase the variability of the species, flattening the curve of probable error. The effect of this is that selection has more material to work with, and therefore attains its end more rapidly, although of the variations appearing as many will be unfavourable as favourable. A species in which there is little variation presents a greater inertia to the shifting effect of altered climatic conditions than a variable species. In the less variable species there will be relatively fewer favourable variations to mate with the type.

William Bateson's Silliman Lectures contain a valuable criticism of the somewhat facilely accepted views (a) that local and climatic varieties are adaptational, (b) that the influences of environment have directly led either to the production of these varieties or to their selective stabilization, and (c) that there is gradual transition — or mass transformation — from one species to another in response to climatic influences. Bateson lays much emphasis on the role of isolation and on the intrinsic character, *e.g.*, Mendelian dominance of the sporadic variations that are of frequent occurrence.

Of importance in connection with naturalization is Erwin Baur's study of cultivated snapdragons, especially *Antirrhinum majus*. He finds a frequent occurrence of small mutations, transmissible in Mendelian fashion, often showing themselves in "pure lines," and sometimes suggesting an enhancement of vigour, as when a mutant appears with deeper green in its leaves. According to Baur wild species of snapdragon, like garden races, have often arisen by the summation of small mutations (see EVOLUTION, ORGANIC: GENETICS OF POPULATIONS).

Change of Climate. — So far we have considered what may happen when organisms are naturalized, perhaps acclimatized, in a new and different environment. But similar biological problems are raised when we think of the changes that occur or have occurred in the fauna and flora of a country after some drastic alteration of the climate—toward aridity or humidity, toward markedly higher or lower temperature. To what extent have changes of climate functioned as factors in organic evolution?

(1) In extreme cases, as when a country is covered with glaciers, there may be an almost complete elimination of life, as happened over the greater part of Britain during the quaternary glacial periods.

(2) In less severe conditions the gradual setting in of unfavourable climatic conditions would exert a selective influence. Thus xerophytic plants would tend to survive when arid conditions encroached; quickly flowering and fruiting plants, entrenched below ground in winter, with reserves in rhizome and bulb, would tend to survive when the snow began to cover the ground for many months of the year. In a country becoming warmer there might be survival value in aestivation; in a country becoming colder the advantage might be with the hibernators. In scores of ways a gradual change of climate would sift the fauna and flora.

(3) Some animals able to move about for considerable distances and not too slowly would be prompted by climatic changes to shift their quarters. As the severity of the ice ages spread southward in Europe, many northern mammals came with it; thus remains of reindeer, lemming and arctic fox are found in deposits far to the south. As milder climates set in and the glaciers melted, the descendants of some of the arctic types, like reindeer and white fox, were able to trek for the north. Some, however, remained as refugees on the mountains, like the snow vole (*Microtus nivalis*) of the high Alps. Some of the true bird migrations may owe their origin in part to distant climatic changes such as those of the quaternary ice ages (see MIGRATION, BIRD; MIGRATION OF ANIMALS).

(4) It is reasonable to suppose, though difficult to prove, that change of climate in a country induced important changes of habit. Thus Barrell and Richard Swann Lull have suggested that continental elevation and consequent aridity, especially in the Himalayan region, led in the Miocene or early Pliocene ages to a dwindling of the forested area where man's ancestors were at home. The alternatives

were to find other forests in warmer countries, as the present-day anthropoid apes did, or to be eliminated, or to come to earth and begin afresh on a new line of life. The last solution may have been of critical moment in the evolution of Hominoids.

(5) Climatic changes in a country may also have played an important part in punctuating the life history. A kind of variation which has not received adequate attention may be called "temporal." It includes alterations in the tempo, or rate, or rhythm of metabolic processes, or in the duration of particular phases in the life history. In vertebrate animals, at least, this might be brought about by variations (also, of course, requiring to be accounted for somehow) in the secretory activity of the ductless or endocrinal glands, the hormones of which serve now as accelerators and again as brakes. The life histories of many types differ from one another in the shortening or lengthening of particular arcs on the life curve or trajectory. Here is a kind of evolution to which climatic variations may have applied a frequent spur. Thus, when the rate of development was such that the life cycle could not be completed in the first summer, there would be a tendency to favour variations in the direction of interpolating a larval phase, as in insects, suited for an accumulation of reserves, a reduced intensity of life in cold weather, a diminished exposure of vulnerable surface, and so on. Opinions may differ in regard to particular cases, but it is a legitimate and instructive inquiry to associate temporal variations in the life curve with seasonal and with climatic periodicities.

The Arctic tundra is marked by a long dark winter of bitter cold and a short nightless summer of intense illumination, therefore it is reasonable to postulate a prolonged process of elimination as the climate changed—an elimination of those types which did not vary in the direction of quick-flowering and quick-fruiting, dying down in winter, dispensing with all but a little water and accumulating stores in underground parts.

Among the features of the life curve that may be tentatively associated with climatic changes, the following may be suggested—the length of the mammalian gestation and the season for giving birth; the periodicities of migrating birds; the interpolation of periods of winter sleep, rest, coma, lethargy and even de-differentiation. Every trajectory of life should be looked at in the light of the evolution of climates.

Often in the history of the earth a change toward great cold has involved severe elimination. In humid periods there tends to be abundant succulent fodder for browsing animals and extensive forests affording shelter. Diminution of moisture, if it does not go too far, favours the increase of grasses and of grazing animals. Aridity makes the forests shrink and prompts the search for new haunts. The times of quickening, the "expression-points" or "pulsations" of evolution, may often be correlated with climatic changes, chiefly in temperature and humidity, due sometimes to topographic, at others to general atmospheric, conditions. Behind these, again, lie larger factors still, such as shrinkages of the earth's crust.

Interaction of Endemic and Introduced Faunas.—The newcomers may destroy the indigenous or previously naturalized forms. Thus the mongoose, introduced into Jamaica, destroyed the indigenous "cane-rats" and the alien ship-rats. The introduced animals may become so numerous that they make life difficult for their predecessors though they do not actually devour them. They may, for instance, seriously reduce the food supply, but they may be prejudicial with varying degrees of directness. When the brown rat (*Rattus norvegicus*) found its way to Britain in the early 18th century, it proved itself hardier, more plastic and more fecund than the black rat (*Rattus rattus*), with the result that in 50 years the latter was almost exterminated except in places where it was continually being reintroduced by ships.

Sometimes the influence is more subtle. Thus, an extension of squirrels into an area may be followed by the reduction of the number of wood-pigeons. There does not seem at first sight any intersection of the two lives; but squirrels, though largely vegetarian, cannot resist killing and eating the young squabs in the nest; and this is, from the farmer's point of view, a useful check.

The introduction of an animal into a new country may involve the introduction of its parasites; thus rats harbour rat-fleas which disseminate bubonic plague, and it is from rats that pigs, and thence men, become infected with the disease of trichinosis, which is due to *Trichinella spiralis,* a small nematode. Many of these interrelations are very subtle; thus the problem of getting rid of Bilharziasis in Durban is easier than it is in Japan, for in South Africa the only host of the adult parasite is man, whereas in Japan it also occurs in cattle. In both countries the juvenile stages are spent in various water snails, and their abundance or rarity in turn is correlated with the presence of water birds which feed upon them and of water plants on which they feed.

The Case of New Zealand.—The peculiar value of New Zealand in reference to the problems of naturalization is that the introduction of the majority of the nonindigenous larger animals is more or less definitely known; *see* G. M. Thomson's masterly study: *The Naturalization of Animals and Plants in New Zealand* (Cambridge, 1922).

Apart from two species of bats, it is doubtful if there are any indigenous mammals in New Zealand; but 48 species have been introduced, 44 purposely and 4 accidentally. The 4 comprise the mouse and 3 rats, one of which, the Maori rat (*Mus exulans*), disappeared after European settlement began. Twenty-five of the 48 species of mammals are at present well-established and feral in certain districts—wallaby, common opossum, sooty opossum, pig, horse, various deer, cattle, sheep, goats, chamois, cat, ferret, stoat, weasel, black rat, brown rat, mouse, rabbit, hare and hedgehog.

About 130 species of birds have been purposely introduced into New Zealand since the date of Captain James Cook's landing, and 24 have become truly wild, such as mallard, pheasant, pigeon, skylark, thrush, blackbird, hedge sparrow, rook, starling, Indian mynah, house sparrow, chaffinch, goldfinch, greenfinch and yellowhammer.

On the other hand, since 1868, nine species of birds have become either very rare or extinct, such as native crows, huia, native thrushes, the burrowing parrot *Stringops,* the native quail and the white heron. Others, once abundant, have been driven back into areas where there has not been much settlement. As to the causes, Thomson writes: "It must not be supposed that it is the introduced animals alone which have produced this effect, even though rats, cats, rabbits, pigs, cattle, stoats and weasels, as well perhaps as some kinds of introduced birds, have penetrated beyond the settled districts. It is largely the direct disturbance of their haunts and breeding-places, and the interference with their food supply, which has caused this destruction and diminution of the native fauna."

What is true for birds holds also for lower animals, from lizards to insects; but again the reasons are to be found in human intervention rather than in direct competition with newcomers. This is corroborated by the fact that there were some notable cases of increase after about the 1870s. Thus the bellbird has become abundant in the South Island, though scarce in the North Island; and the harrier has greatly increased, perhaps in relation to the abundance of young rabbits. The wax-eye or blight bird (*Zosterops coeruleus*) has apparently increased greatly since first recorded in 1832, perhaps in relation to the supply of animal food about houses and stockyards. The case of the long-tailed cuckoo (*Urodynamis taitensis*) is interesting as an illustration of the complexity of interrelations. It seems to have become increasingly numerous after the 1890s and this is attributed to the increase of small European birds, whose eggs and young it eats, and also to the food afforded in and about trout hatcheries.

Method of Naturalization.—What should man do when he wishes to naturalize a valuable plant or animal in a new and markedly different country? If trial has shown that naturalization is not easy, the transporter should work with those varieties which seem most likely to be suitable. Attention should also be paid to the quality of variability, for some stocks are much more fixed than others. It may be useful to transport individuals of the most promising stocks to some intermediate station, where selection may be made among the variations that continue to arise. Darwin noted that "Merino sheep bred at the Cape of Good Hope have been found far better adapted for India than those imported from England." (*Variation,* p. 305 [1868].) In cases where success in the new country seems to depend on the possession of a particular character, such as thick fur or woolly leaves, the variants selected would be those tending most markedly in that direction, but Mendelian methods might enable the breeder to "graft" on to the tentative imports the desirable character in question if it existed elsewhere in an allied race. By more systematic selection of heritable variations and by Mendelian hybridizing, it seems likely that the process of acclimatization might be greatly extended and hastened.

Willis notes that man has often failed in naturalization by attempting too much abruptly. Learning from failure, he is now trying gradual transitions, "as in the way he has treated Liberian coffee in Java, taking the seed of successive generations a few score yards higher up each time, till he has persuaded the tree to do well at a much higher elevation than that to which it is naturally suited." The attempts to acclimatize the beautiful *Cyperus papyrus* in the Ceylon Botanic garden failed when seed from Europe was used, but seed from Saharanpur in India succeeded at once. The moral is that man must moderate his impatience and take a hint at least from nature's operations by small steps throughout long periods.

NATURAL LAW, in science, means the formulation of some uniform character, mode of behaviour or uniform correlation of things or events; but it is frequently used for the uniformity itself as it exists in natural phenomena. Any such uniformity may be called a natural law; *e.g.,* all the laws formulated in physics and chemistry. On the other hand the term law of nature is sometimes restricted to irreducible or ultimate laws (like the law of gravitation) as distinguished from derivative laws (like Johannes Kepler's three laws of planetary motion). See LAW; SCIENTIFIC METHOD.

NATURAL PRODUCTS, TOTAL SYNTHESIS OF. Natural products include all chemical substances produced by living plants and animals. Examples of classes of natural products include fats, proteins, carbohydrates, vitamins, alkaloids, antibiotics, steroids, terpenes, essential oils and many others. Total synthesis, rigidly defined, means the synthesis of a chemical substance from the elements of which it is composed; since many relatively simple substances have already been made from the elements, in practice a total synthesis means synthesis from these substances rather than from the elements themselves.

The original objective of the science of organic chemistry was to elucidate the structures of and to totally synthesize all knonn natural products. Before such an ambitious objective could be realized, however, it was necessary to develop a logical and systematic science of organic chemistry. (See CHEMISTRY. *Organic* Chemzstry). This development occupied the attention of numerous chemists over a period of about 200 years. Although many notable successes in total synthesis were achieved relatively early in the history of organic chemistry, only in the mid-20th century was sufficient knowledge accumulated to permit organic chemists to turn vigorously and successfully toward their original objective. Many truly amazing total syntheses of natural products were achieved during the 1940s and 1950s.

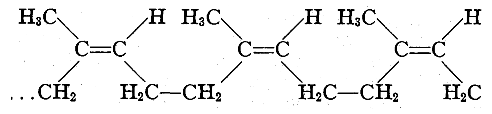
Perhaps the first total synthesis of an organic substance was the synthesis by F. Wöhler in 1828 of urea, a nitrogenous waste product formed in the kidneys of animals. Wöhler found that urea was formed simply by heating an aqueous solution of ammonium cyanate:

$$NH_4^+OC\overline{N} \longrightarrow H_2N{-}CO{-}NH_2$$

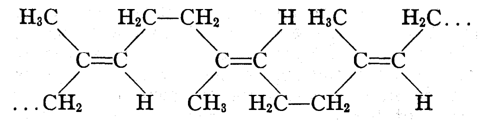
Since ammonium cyanate was a well-known inorganic substance and could be made from the elements carbon, nitrogen, oxygen and hydrogen, this reaction constituted a total synthesis. This first synthesis of a typical organic substance from purely inorganic starting material contributed toward abandonment of the idea of a "vital force" associated with the formation of organic matter, and organic chemistry was free to develop as a logical, orderly science utilizing concepts which had been formulated much earlier in the study of inorganic chemistry.

Total synthesis of organic substances is taken by the organic chemist as final and conclusive proof for the correctness of a structure arrived at by degradative or other methods. Sometimes this conclusive structure proof is the motivation for total synthesis. Frequently, however, total synthesis has important economic significance. As an example, the cultivation of the plant from which the blue dye indigo may be prepared was once an important agricultural industry. In 1883 A. von Baeyer elucidated the structure of indigo as the result of experiments extending over 18 years and devised two syntheses for the substance. In 1890 K. Heumann devised a commercially practical synthesis of indigo permitting the sale of the synthetic product at a price lower than that of the natural dye. The synthetic product soon controlled the market. A quite different case is that of the total synthesis of the natural drug quinine by R. Woodward and W. Doering in 1945. Although a brilliant chemical achievement, the synthesis has not been applied commercially. Other synthetic drugs such as Atabrine adequately control malaria, and are much easier to produce.

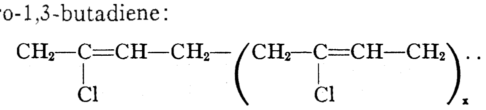
It is to be emphasized that a total synthesis leads to a material which is chemically identical in all respects to the natural product; the synthetic product is not a substitute or "artificial." The field of the rubbers affords a good example of this distinction. Natural rubber is a polymer (see POLYMERIZATION) of isoprene (2-methyl-1.3-butadiene) in which all of the isoprene units are arranged in the cis manner; *i.e.,* similar groups are arranged on the same side of the molecule. The arrangement is as follows:



The alternative all trans arrangement of the isoprene units represents the structure of gutta-percha:

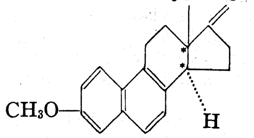


During the World War II period, when supplies of natural rubber were cut off from the western Allies, many synthetic rubbers were developed and used. All of these were substitute rubbers having some of the desirable properties of natural rubber but only grossly approximating its chemical structure. One of the first synthetic rubbers widely used in the United States was neoprene, a polymer of 2-chloro-1,3-butadiene:

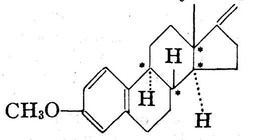


Neoprene has a random cis-trans arrangement of the 2-chloro-1, 3-butadiene units. It was not until later that a synthesis of natural rubber was achieved. In 1954 Goodrich-Gulf Chemicals, Inc., announced the synthesis of a rubber identical with natural rubber (referred to as "synthetic natural rubber"). In 1955 the Firestone Tire and Rubber company announced a similar product, and in 19j6 the Phillips Petroleum company announced the synthesis of both cis and trans polyisoprene in pure form. These syntheses were achieved by polymerizing isoprene by means of certain stereospecific catalysts, perhaps a trialkylaluminum complexed nith titanium tetrachloride.

The attainment of stereospecificity was one of the principal problems to be conquered in the total synthesis of natural products. In the case of the rubbers, the problem nas production of a cis rather than a trans arrangement of the isoprene units. An even more subtle type of isomerism is involved in the structures of many natural products, so-called optical or dextro-levo (d, *l*) isomerism (see STEREOCHEMISTRY). This isomerism is dependent upon the fact that a molecule containing an asymmetric carbon atom (one which is attached to four entirely different groups) can exist in two arrangements in three-dimensional space. The two possible arrangements are mirror images of each other; *i.e.,* bearing the relationship of a right to a left hand. A given natural product represents only one of the various possible geometrical arrangements. Thus, the natural estrogenic hormone (*q.v.*) equilenin (I) contains two different asymmetric carbon atoms (denoted by the asterisks) and is capable of existence as 2^2 or 4 isomers; these are d- and 1-equilenin and .d- and 1-isoequilenin. The first total synthesis of a steroid was the W. Bachmann, W. Cole and A. Wilds synthesis of equilenin in 1939. All four of the possible stereoisomers were obtained.



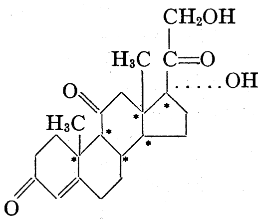
I



II

The estrogenic hormone estrone (II) represents a more difficult synthesis problem. Since there are four different asymmetric carbon atoms present, this structure can exist as 2^4 or 16 possible stereoisomers. Due largely to the efforts of G. Anner and K.

Miescher in 1948 and by W. Johnson later, all of the stereoisomers of estrone were synthesized. Only one of these, of course, is the natural product. Considerable interest centred around the steroid cortisone (111), which is able to relieve the



III

symptoms of rheumatoid arthritis and is beneficial in the treatment of various allergies. A partial synthesis of this steroid from other naturally occurring steroids is carried out commercially. Total syntheses were devised by Woodward in 1951, by L. Sarett and by L. Barkley.

The examples cited above point up some of the problems encountered in total synthesis and indicate the extremely rapid progress being made. The following listing of a few notable total syntheses further indicates something of the scope of the field: camphor (G. Komppa, 1903); cocaine (R. Willstatter, 1923); riboflavin or vitamin B_2 (R. Kuhn, W. Karrer, 1935); thiamine or vitamin B_1 (R. Williams, 1936); vitamin A (O. Isler, 1947); carotene (Karrer, H. Inhoffen, 1950–51); morphine (M. Gates, 1952); sucrose or cane sugar (R. Lemieux, 1953); oxytocin, a peptide hormone (V. du Vigneaud, 1953); strychnine (Woodward, 1954); reserpine, a Rauwolfia alkaloid (Woodnard, 1956); penicillin V (J. Sheehan, 1957).

NATURAL RESOURCES. The materials of the environment useful to man are resources. Any of the many substances of the earth, the oceans and the air may become invested with an economic interest and thereby become resources. For anything to be sufficiently useful to be a resource it must satisfy three fundamental conditions: (1) it must satisfy a need of man without alteration, as water does, or it must be easily adaptable to his needs; (2) man must have developed his skills sufficiently so that he can utilize the resources available to him; and (3) the resource must be readily available with a reasonable expenditure of energy or other resources. A material may be essentially inert and economically useless one day and become a valuable resource the next.

Resources are either human or physical, and physical resources are either natural or manufactured. This article is concerned with natural resources which are commonly classified as vegetable, animal or mineral but these three categories may be extended to include energy from the sun, the soils of the earth and water. Resources may be further classified as nonrenewable (*e.g.,* minerals) or renewable (vegetation and water). The nonrenewable resources may be regarded as fund resources which are diminished by use. This is particularly the situation in the case of the fuel minerals. Many of the metals are not destroyed and varying fractions, depending upon the metal, can be recovered and reused. The renewable resources may be termed flow resources for the reason that with careful use they may last indefinitely. For example, a forest, managed on a sustained-yield basis, can produce timber and other forest products year after year without depleting the resource.

The adequacy of the earth's resources to sustain a growing population at different levels of culture is subject to debate, depending in part on the outlook of the inquirer. The more optimistic observer looks to technology to satisfy man's increasing demands. Great dams can be built to impound water; crop yields may be increased by plant breeding, fertilization, irrigation and mechanization. By geophysical methods mineral resources may be located and by improved methods of recovery, beneficiation and processing greater quantities of minerals may become available. The more pessimistic investigator observes the destructiveness of wars and the unproductive use of a rich heritage. He notes the impoverishment of the soil, the evidences of accelerated erosion, the destructiveness of great floods and the rapid use of fund resources.

It is obvious that wastefulness and the capacity to conserve resources, especially nonrenewable resources, exist simultaneously and a people would be without hope if they did not believe in the ability of man to satisfy his needs for an indefinite future.

Aside from economic motives, there may be humane or historic reasons for conservation of natural resources (see NATIONAL PARKS AND NATURE RESERVES; WILDLIFE CONSERVATION; FISH AND WILDLIFE SERVICE).

This article is divided into the following sections representing the main categories of natural resources:

I. Soils
II. vegetation
III. Animal Life
IV. Water
V. Minerals
VI. Strategic Resources
VII. Climate

The natural resources of the continents and nations are discussed more specifically in the articles on those areas.

I. SOILS

The soil is one of the most fundamental resources of the world. The countries that have large areas of arable land are most fortunate. The food-producing capacity of the land, if protected against destructive erosion and depletion of the plant nutrients, can be maintained indefinitely. To the extent that the fertility is maintained without impairment, soil may be regarded as a flow resource.

The soils of the world were formed under a variety of conditions. The parent material from which the soil is derived is acted upon by a number of physical and chemical processes. The properties of the soil reflect something of the climate, the slope of the land, drainage conditions and the stage of development the soil has attained, but the parent material imparts distinctive characteristics to the soil which other factors cannot destroy or alter substantially. A sandy soil derived from a sand-yielding formation remains a sandy soil although climatic conditions may impart to it distinctive structural characteristics. Abundant precipitation may result in excessive leaching but limited rainfall may permit the retention of plant nutrients in sufficient quantities to guarantee high productivity over a long period of time. Plants and animals, and especially the microorganisms in the soil, assist in the formation of the soil and contribute humus (*q.v.*), which serves a number of useful purposes such as the retention of moisture and the maintenance of cultivability.

Soils may be classified into zonal soils, intrazonal soils and azonal soils. These major groups of soils may be further classified into families, series and types. The well-developed or mature zonal soils are strongly identified with the climatic and vegetational conditions under which they have developed. The intrazonal soils show less distinctively the influence of climate and vegetation and show more certainly their relation to other factors such as slope or drainage. The azonal soils, such as recent alluvium and slightly altered parent material, have not advanced sufficiently in development to take on the physical and structural characteristics of the mature soils.

Within the tropics where rainfall is abundant and the temperatures are uniformly high, the tropical forest is the typical vegetational cover, Under these conditions the mature zonal soils are generally low in plant nutrients because of excessive leaching, high in the oxides of iron and aluminum, and under cultivation deteriorate rapidly. These soils are commonly brick red in colour and contain beneath the surface a claylike substance known as laterite (*q.v.*). The mature soils in tropical America, central Africa, Indonesia and southeastern Asia, developed under humid tropical conditions, are known as latasols and require careful management to maintain their fertility once the original forest has been removed and the land brought under cultivation.

On the savannas and the steppes of the tropics the soils are not so seriously leached as in the humid tropics but laterization is an important feature of the soil-forming processes. The leaching process is interrupted during the dry season and the maturing of the grasses helps to maintain the fertility of the soil. The mineral nutrients that the grasses have brought up from the lower horizons are made available in the surface layer when the grasses die and decay or are burned. The soils of these extensive grasslands, to the extent that they have been brought under cultivation or will be transformed from natural savannas into cultivated fields, constitute a resource of major dimensions. When the world needs the food and industrial raw materials these fertile soils can produce, cultivation can be greatly expanded.

Extensive areas in the humid subtropics such as southeastern United States, southern China, southern Brazil and southeastern Australia have soils that have developed under a forest cover. The soils in these areas are commonly red or yellow and display some of the characteristics of soils of the tropics. They show also the results of podsolization, a process identified with soil formation in the northern latitudes. These are not everywhere rich in plant nutrients because of excessive leaching, but with proper land management and fertilization these soil areas can produce great quantities of corn, cotton, tobacco, peanuts and vegetables. If they are neglected, their erodibility may result in rapid deterioration. To preserve and maintain the land in a high state of productivity will require vigilance and an understanding of the needs of the land.

Over a broad area across central Canada from the Rocky mountains to the Atlantic and across Eurasia from Scandinavia to the Pacific, the soils developed under the northern softwood forest or taiga are classed as podsols. These light gray or ashen-coloured soils are the result of the decomposition of organic matter which charges the downward-moving waters with acids which help to remove in solution the iron compounds which otherwise would give the soil a reddish colour. Beneath the thin layer of leaf litter the topsoil or A horizon of the podsols is distinctly light coloured and generally infertile. The do nward percolating waters transfer the humus, clay and other fine materials downward into the subsoil. The topsoil becomes a white bleached layer directly beneath the forest litter. The subsoil is compact and coffee bronn in colour. In the glaciated parts of northeastern North America and northwestern Europe are extensive areas of true podsols, which because of their sandy character, natural acidity and poor drainage have limited usefulness. Land just cleared is deceptively dark in colour because of the thin layer of leaf litter, but after being cultivated for a few years the organic matter decays and an infertile layer of ashen-gray inorganic matter is all that remains. These acidic podsols are not well suited for agriculture though potatoes, rye, oats, certain meadow grasses and vegetables do well. Large areas probably should remain in forest and be used for the production of timber and other wood products.

In northeastern United States, in much of west central Europe and in northern China the soils, developed under the deciduous forest, are mainly podsolic in character. These soils are grayish-brown in colour and have inherent structural characteristics that give them an enduring quality. The humus content is greater than in the podsol soils but they require care to maintain their high productivity.

The eternally rich lands of the world are those that have developed under a cover of grass in the intermediate latitudes. The soils in these great grasslands originated and evolved in areas of moderate to scant rainfall. In the tall-grass prairie there has been sufficient precipitation over a long period of time to remove the calcium salts and other easily dissolved minerals. The soils developed under these conditions are deep and fertile though they may require the application of lime. Nowhere in the world are the black prairie soils so well developed as in the corn belt of the United States.

In the grassland areas that receive a smaller amount of precipitation, the calcium salts and other minerals are retained and the soil may be described as slightly alkaline. These soils are known as chernozems (black earth). They are widely distributed in the dry plains of the United States and Canada, the Soviet Union, Manchuria, India, the Argentine pampas, Uruguay and eastern Australia. Where the surface of the land is relatively flat or gently undulating the danger of water erosion is slight. Under cultivation the chernozems and other soils rich in organic material suffer from wind erosion if not protected by wind stripping, mulch tillage (stubble mulching) or by the use of cover crops.

On the dry margins of the chernozems lie extensive areas that are best described as steppe. In these areas the soils have developed under subhumid conditions. These dark-coloured soils are not as rich in organic matter as the chernozems and the prairie soils. In favourable years these dry lands may be brought under cultivation and used for the production of the drought-tolerant grains such as wheat and barley. The steppes are well suited to grazing and most areas should be left in grass and used to support a pastoral industry. The soil resources of the steppes can be used most effectively if only limited areas are brought under cultivation.

In the deserts of the world small areas of fertile soils can be irrigated and brought under cultivation. The soils developed under low-rainfall conditions are potentially productive where sufficient water is available. These irrigable lands usually have soils that are rich in mineral nutrients but are generally low in organic matter and nitrogen.

The full use of the soil resources of the world to meet the needs of an increasing population for more food, fibres and other industrial raw materials will require the clearing of virgin lands, the drainage of marshlands, the irrigation of larger areas of desert and semiarid lands, the use of fertilizers and the development of more productive plants and animals. Extensive areas must be protected from destructive erosion and depletion if their productivity is to be maintained and enhanced for an indefinite future. See SOIL; SOIL EROSION AND CONSERVATION; SOIL FAUNA; SOIL TESTING AND ANALYSIS; AGRICULTURE; FERTILIZERS AND MANURES; IRRIGATION; LAND RECLAMATION.

II. VEGETATION

A very high proportion of the earth, in spite of great irregularities in terrain, high altitude, expansive ice-covered areas in Antarctica, Greenland and the high mountain areas, and the extensive wastelands of the deserts, is mantled by vegetation either natural or cultivated. The natural or original vegetation of the earth may be classed as grasslands, grass and shrubs of the steppes and deserts. and forest. The plant communities may differ greatly over the world, particularly in respect to floristic composition, but the assemblage of plants makes it possible to identify the major vegetation zones of the earth. The forest of equatorial Africa is very different from the spruce forest of Canada but both are forests. Similarly, the component grasses of the campos of Brazil may be quite unlike the plants that make up the assemblage of grasses in the Nebraska prairie but both are grasslands. Also the scant grasses and shrubs of the desert margin of the Sudan produce a steppe area not unlike the great steppes that border upon the desert of Soviet Central Asia. The science concerned with plant communities and the environmental, biological and physical factors that affect composition and succession is known as plant ecology (see PLANTS AND PLANT SCIENCE: Plant Ecology).

Grasslands. — Approximately 13,000,000 sq.mi. or 24% of the land area of the earth can be classed as grassland. The great grasslands consist of (1) tall-grass savanna, 31%; (2) high-grass savanna, 2270; (3) desert-grass savanna, 18%; (4) tall-grass prairie, 13%; (5) short-grass steppe, 10%; and (6) mountain grassland, 6% of the total.

The savanna grasslands cover extensive areas between the equatorial forests and the trade-wind deserts and lie largely within the tropics. The rainfall ranges from 30 to 80 in. annually with the maximum strongly concentrated in the summer or high-sun period. It is this marked seasonality of the precipitation that has favoured the development of the tall luxuriant grasses that make up the savanna. Where the savanna borders upon the equatorial forest the expanse of grass may be interrupted by clumps or islands of trees or by a gallery forest along the watercourses or in low areas where water is available in all seasons. Toward the desert margin of the savanna the grasses are shorter and less abundant and drought-resistant shrubs become a part of the assemblage of species in the plant communities.

The tropical savannas are well represented in South America in the llanos of the Orinoco basin, the campos of Brazil and the Gran Chaco of northern Argentina and Paraguay. In Africa the Sudan is largely an expansive grassland extending from the Atlantic to the highland of Ethiopia along the parallel of latitude 10° N. This grassland extends southeastward onto the highland of east Africa. Also south of the equatorial forest an area of savanna lies across northern Angola and the southern portion of the Belgian Congo. In northern and northeastern Australia, savanna covers an important fraction of the continent.

These extensive grasslands of the tropics, in spite of hot humid summers and the dry season in the winter or low-sun period, are widely used for cattle grazing. Locally the grassland has been brought under the plow and cultivated crops such as cotton, peanuts, sorghum grains and vegetables are grown. Potentially large areas in the tropical savannas can be cultivated and when the world requires larger quantities of the crops that can be produced there, greater use will be made of these fertile and productive lands.

The tall-grass prairies originally included the immense prairies of midland North America, the pampas of South America, the rich prairies of eastern Europe such as the Hungarian basin, the Rumanian plain and the extensive grasslands of the Soviet Union north of the Black sea and extending eastward between the northern forest and the desert interior of Asia. Limited areas of prairie once made up the vegetational cover of the veld in South Africa, the upland of Madagascar, the plains of southeastern Australia and the eastern half of South Island in New Zealand.

The tall-grass prairie of the mid-latitudes was the natural habitat of a great variety of grazing animals such as the buffalo in North America. Because of the high fertility of the soil developed under the prairie vegetation and an annual precipitation of 15 to 40 in., a high proportion of the mid-latitude prairie has been brought under cultivation. In many areas in the corn belt of North America the original grasses, including bluejoint (blue stem), needle grass and wheat grass. have all but disappeared. Only along fence rows and in a few relict areas have the original plant communities been preserved. These immense grasslands are now the great granaries of the world where much of the world's corn, wheat, rye, flax, oats, barley, soybeans and sorghum grains are grown. Also, the cultivated grasses and feed grains that have replaced the native grasses support a livestock industry of major proportions.

Grasses and Shrubs of the Steppes and Deserts.—Short scant grasses and intermingled shrubs border the desert areas both in the tropics and in the intermediate latitudes. With the mountain grasslands these areas cover approximately 32% of the land area of the world. The component grasses of these steppelands include grama, buffalo grass and needle grass. In drier parts of the steppe open spacing of the clumps of grass and herbaceous plants is a characteristic feature. These great realms of scant grass supported a pastoral civilization in the old world, and briefly a range industry in the new. In the more fertile parts of the steppe and where the annual precipitation exceeds 12 in., dry farming may be practised. The crops grown must be drought resistant such as wheat, barley, millet and the sorghum grains.

Other areas commonly included among the grasslands are the diminutive patches of grass and herbaceous plants that give greenness to desert areas after each rain or brief rainy season. In the high latitudes the tundra, and in high altitudes, the alpine meadows present some of the aspects of grassland. To a limited extent they are used for grazing and support an animal population of reindeer, musk oxen and a variety of fur-bearing animals. (See Grassland; Grasses.)

Forests.—The natural forest areas of the world cover approximately 22,000,000 sq.mi. or 42% of the earth's surface. The forests may be classified into a number of major types related chiefly to the nature of the assemblage of trees and the geographic location of the forest.

Tropical Rain Forest.—This is luxuriant, evergreen forest consisting of trees of unequal size and height and of varying ages forming a dense canopy of thick, leathery leaves, and composed of a variety of trees such as legumes, laurels, myrtles, figs, satinwood, mahogany and rubber trees, a true climax forest with an intermingling of many species. This type of forest thrives in areas within the tropics where temperatures are uniformly high and where the annual precipitation amounts to 60 to 200 in. In the equatorial areas of South America, Africa and Indonesia and the windward coasts within the tropics the temperature and moisture conditions support the true tropical rain forest.

Light rain forest consists of a variety of conifers and deciduous trees in the lower middle latitudes and extending into the tropics. It occupies extensive areas in southeastern United States, eastern Brazil, southeastern Asia, parts of east Africa and northern Australia. Temperatures are not as high in these areas as in the equatorial lowlands. The rainfall is also somewhat lower, averaging from 40 to 80 in. annually. As a consequence these humid subtropical areas originally were mantled by a light but valuable forest.

Deciduous forest consists of broadleaf trees which drop their leaves chiefly in the autumn and come into leaf again each spring. Typical trees include the oak, birch, beech, maple, ash and hickory. The dominant trees differ from place to place depending in part on drainage. The beech-maple association may be dominant in the wetter areas whereas the oak-hickory association may be characteristic of the higher, well-drained regions. The original deciduous forest was best developed in eastern United States, western and central Europe and eastern China. The total area of approximately 6,500,000 sq.mi. covered 12% of the land area of the earth.

Coniferous Forest.—Characteristic of middle and higher latitudes, this type of forest is made up of uniform stands of similar or related evergreen trees such as pine, fir and spruce. In the northern hemisphere it is commonly known as the northern softwood forest. In Eurasia from Scandinavia to the Sea of Okhotsk it is called the taiga. To the north, this evergreen forest decreases in height and merges into the tundra. This is a rich commercial forest and supplies large quantities of timber and pulpwood to the world's markets.

Dry Forest.—In the dry areas of the world, particularly where there is a long dry season, the open woodland may be described as the dry forest or the monsoon forest. Extensive areas in southern Asia, Australia, South America and Africa have a hot wet summer that alternates with a dry winter season. Most of the trees in this dry forest lose their leaves during the dry season but come into leaf at the beginning of the rainy season.

Thorn Forest.—Locally within the dry subtropical and tropical areas the limited rainfall of 10 to 20 in. annually may support a thorn forest. A tangle of thorn-bearing trees may make the area difficult to penetrate or cross. These areas have little or no value agriculturally but limited areas in Africa, South America, Mexico, Australia and Asia produce gums, fruits, rubber and tanbark.

Sclerophyll brushland is a meagre forest of diminutive trees and brush. Since it is characteristic of the Mediterranean borderlands it is sometimes called the Mediterranean forest. The rainfall of these areas varies from 20 to 30 in. annually and in spite of dry summers these lands are well suited to the cultivation of citrus fruits, olives, vegetables and cereals such as wheat and barley. This type of brushland covers important areas of Mediterranean climate in north and south Africa, southern Europe, western Asia, southern California, central Chile and southwestern Australia.

Land Use and Forest Products.—As in the case of the prairies and other rich grasslands, extensive areas that were once forested have been converted into cropland. In China and in many parts of Europe and the United States the forest has been sacrificed in order that the cultivated lands might be greatly expanded to meet the demand for increasing quantities of food and industrial raw materials. The soils of the forestlands generally were not as fertile as the chernozems and other black and brown soils developed under a cover of grass. However, the soils are easily cultivated and amenable to fertilization so that their productivity can be maintained indefinitely with proper management.

Over the many centuries when the farms of Europe and North America were literally being hewn out of the forest, the need for lumber was met by using the trees from the nearby woods. But as clearing continued and the woodlands were greatly reduced, the need for timber for homes, factories and other structures had to be met by tapping the forest resources of more distant areas. In Europe the great forests of Scandinavia, the Baltic countries and the mountain areas supplied lumber and other timber products for centuries. In eastern Asia the more heavily wooded lands of Hokkaido and the Amur valley and forests in the Soviet Union supply lumber, wood pulp, mine timbers, posts and other wood products to southern Japan and China where local supplies of timber have been largely exhausted. In, the United States, after the forests of the northeastern part of the country and the middle west had been greatly reduced, commercial lumbering in the Great Lakes basin provided a rich harvest of white pine and other woods. Lumbering on a large scale spread to the south. to the Rocky mountains, the Pacific northwest and. later, to the northern forest of Canada. See FORESTS AND FORESTRY; LUMBERING: ARBORICULTURE; TIMBER; RAIN FOREST.

III. ANIMAL LIFE

Before man took possession of the earth and modified the natural environment to meet his needs. the numerous animals were widely distributed in accordance with the suitability of the various habitats and the competitive situation among the animals themselves. The animals of the world, both wild and domesticated, constitute a major biological resource subject to both the laws of nature and the facts of economics and culture. Man in his ignorance or thoughtlessness has brought destruction and virtual extermination to herds of wild animals such as the buffalo and the caribou and to great flocks of waterfowl and other birds. At the same time he has brought his scientific knowledge and management skills to bear upon the animals he nished to retain. At mid-20th century the number of cattle in the world reached an estimated 972,000,000 head; sheep numbered 917,000,000; and swine, representing one of the major food animals of the world, totaled 386,000,000. These and other animals available to the more than 2,600,000,000 people in the world constitute a viable resource of immense worth. Yet among the animals of the earth there are predators, insects and microscopic forms of life nhich may challenge man's mastery over the animal kingdom The predators may serve to hold in check the rate of gronth of certain animals nhich might become destructive. Among the insects there are some such as the bees that are of great value, but others may be the carriers of disease germs causing unnumbered deaths each year. Man's control over the animals of the world is partial rather than complete and in effect he may be in competition with other animals, particularly the insects, to see which shall win supremacy.

In nature, without any interference from man, wild animals established a living relationship with the environment, both physical and biological. Over a long period of time the animal populations evolved from more primitive ancestors and became dispersed over the earth in relation to the favourable and limiting conditions of the environment. A habitat that is particularly favourable in respect to the essential requirements of a single or a number of species may become fully populated in a relatively short period of time. Conversely, an environment that is repeatedly subject to extremes of temperature or moisture may be sparsely occupied and the native and migrant animals may be subject to restrictions on continued increase in numbers. Under natural conditions something in the nature of a biological balance is achieved but this nice relationship can easily be disturbed by a change in the physical habitat or by a devastating disease that may weaken or decimate an animal group. The science of animal ecology is concerned with the relation of animals to the conditions of the environment, both physical and biological. (See ECOLOGY, ANIMAL.)

Habitat Factors.—All animals are dependent upon an adequate supply of oxygen and water to meet their essential physiological needs. The temperature conditions of the habitat must have limits that can be tolerated by the animal community. Through the process of natural selection only the fittest survive. By this means a species retains its competitive advantage. The food supply must be adequate and available at the usual and necessary feeding times to maintain the animal populations. Whereas many animals such as the carnivores feed upon other animals, fundamentally they are all dependent upon adequate supplies of plant substances for continued existence. From the smallest and lowliest forms of life to the largest predators there are animals that derive their food from other animals, many of which are plant eaters. In the sea, the larger fish and other forms of life are dependent upon the availability of smaller animals, particularly fish, to maintain life but the smallest animals of the sea are dependent upon plankton (q v.) and other very tiny forms of life.

Domesticated Animals.—When man began to domesticate animals and use them as a means of livelihood for himself, his family, his tribe or his group, economics became a factor in the life of the people. Before this time, only natural factors had significance in the evolution. dispersal and relative abundance of the many animals that populated the earth.

Man in his early evolutionary history became a meat eater and satisfied his need for this type of food by hunting and fishing, two occupations that have continued to the present time. The domestication, breeding and the biologic and economic development of a number of animals have contributed immense quantities of animal products to the food resources of the world and introduced a stabilizing factor in the animal food industries.

The principal animals that have been domesticated include poultry. swine, cattle, water buffaloes, horses, sheep, goats, camels, the Tibetan yak, reindeer and llamas. It was largely because of man's need for a work animal and a burden bearer that several animals were domesticated, although some of these'same animals also contributed products such as wool, milk, meat and hides.

Animal Power.—Domestication of animals was for companionship, for hunting, for food and for transportation. The principal work animals for centuries have been horses, cattle, water buffaloes, camels. llamas and elephants. In the densely populated areas of the orient where manpower is relatively abundant and food resources are limited, the larger work animals such as horses and oxen have been eliminated or are maintained in limited numbers only. Water buffaloes, because they are particularly well suited for work on the wet rice lands, have been retained. In parts of the tropics, because of the climatic conditions and the economic status of the people, oxen have continued to be an important source of power.

Into the early 19th century, oxen mere also widely used as work animals in much of Europe and America, but they were shortly displaced by the horse. Prized for its speed, endurance, longevity and intelligence, the horse became the principal work animal throughout west and central Europe, much of Russia, in the United States and in the intermediate latitudes where European culture spread. When the European or American farmer prospered he gave up the slow plodding oxen for the horse, which was able to hold its own until the development of the tractor and the subsequent mechanization of agriculture.

Animals as a Source of Food.—The use of animal products for food is largely the result of cultural inheritance. Taboos of cultural origin may limit the consumption of certain foods which, from the nutritional point of view, are edible. For example, certain visceral organs may not be acceptable in the diet of some people but may be regarded as a delicacy by others. In India, where cattle are most numerous, the use of meat for food is restricted. On the other hand, Eskimos and other peoples far removed from foods of plant origin are heavy consumers of meat.

Although there are millions of people who do not eat meat because of religious prejudice or personal preference, meat in varying amounts is consumed widely throughout most parts of the norld, depending on its relative abundance and its cost in relation to other available foods. While it is most economical for man to derive his foods directly from plant sources, there are many plants that he cannot eat. Animals act as intermediate processors of such plant foods as the coarse feed grains.

The rich agricultural lands of the world that were once in forest or in grass are now the leading producers of meat animals. Cattle by the millions are raised on the farms and ranches of the United States, Canada, Mexico, Argentina. Uruguay and Chile and on the extensive grasslands of the tropics. In Europe from the Atlantic to the dry steppes of the Soviet Union cattle are raised for dairy products, for meat and as sources of pomer.

Snine and poultry are more economical in the utilization and conversion of feed into edible products than cattle. Both are scavengers and make use of food materials that would otherwise go to naste. Both reproduce rapidly and mature quickly. When there is a need to increase the quantity of foods of animal origin, it can be done more quickly with swine and poultry than with cattle. In China, Europe and the United States swine and poultry are raised in great numbers though the feeds used differ from country to country. In China these animals are scavengers but in the U.S. quantities of grain are used for feed. In Europe the by-products of the dairy industry. locally grown and imported grains and wastes from the table support the two industries.

The intensive development of animal industries is a means of maintaining soil fertility if the methods of cultivation are nondestructive. By giving the animals the feeds grown on the land and by returning all manures and other organic wastes to the land, the soil, by means of the livestock industry, may be regarded as a renewable resource, and with proper management is virtually inexhaustible.

Fisheries. — The animal resources of the sea have been used for human food for centuries. The most important fisheries are located in the northern hemisphere between 40° and 60° N. where the cool waters of the North Atlantic and the North Pacific cover extensive areas of the continental shelf and where plankton and other foods are relatively abundant. They include the North sea and the shallow waters off the coast of Europe. the Grand Banks south of Newfoundland and other nearby coastal waters. the shallow coastal waters along western North America and favourable waters around Japan and the seas adjacent to the mainland of northeastern Asia. Through the years certain species such as cod, salmon and halibut have been taken in such quantities that the fishery resources have been reduced and require regulation to maintain their continued productivity.

In somewhat warmer latitudes the shellfish industry contributed important quantities of lobsters, oysters, clams and crabs to the food resources of the world, but depletion has been a threat to the industry. In Japan, western France, northnestern Washington and Chesapeake bay the oyster industry has been brought under control and a continued supply is assured. In the warm waters of the tropics fish are not as abundant as in the cooler waters of the intermediate and higher latitudes, but fish caught in local waters are important in the diet of the people. The tuna fishery in the Pacific and the shrimp industry in the Gulf of Mexico provide valuable foods prized by millions. See DISTRIBUTION OF ANIMALS; ZOOGEOGRAPHY; FISHERIES; FISH CULTURE; ANIMALS, DOMESTICATION OF.

IV. WATER

Approximately 71% of the surface of the earth is covered by the oceans. These extensive salt-water areas function in various ways in the affairs of men. The broad seas serve or did serve to separate the continents and the nations that have divided the land areas of the world among themselves. The size and the distribution of the seas affect in various ways the climatic conditions of the earth and influence, as a consequence, the character of the soils, natural vegetation. agriculture and commerce. Also, the sea is a reservoir of mineral resources, but only a few, such as salt and magnesium, have been recovered.

The fresh waters that lie upon the land in the form of streams, lakes, ponds, swamps, springs and reservoirs and the ground water that occurs beneath the surface constitute the water resources of the land, though the saline waters of inland seas and subsurface structures have commercial value also.

If all the fresh water on the land and the quantity contained in the rock formations could be calculated accurately, it probably would not exceed much more than 1% of the total water on the earth. Fresh-water resources become available through the operation of the hydrologic cycle. The energy of the sun evaporates enormous quantities of water from the sea and the resulting vapour becomes a part of the atmosphere. The winds distribute this vaporous moisture widely over the earth. Upon condensation and precipitation. 30% of it is returned directly to the sea. Out of the water vapour that is transported over the land areas, precipitation provides varying amounts of fresh water for use by man. Of the water that falls on the land an important fraction penetrates the soil, percolates downward to levels below the root zone and becomes, temporarily at least. a part of the reservoir of ground water.

Under favourable topographic and geologic conditions, some of the ground water returns to the surface in springs, many of which, because of their perennial character, contribute to the regularity in the flow of streams. Waters that penetrate deeply may be returned to the surface by the numerous wells that have been put down in thickly settled areas to provide the people with potable water. By evaporation and by transpiration some water is returned to the atmosphere. but much of it becomes runoff and returns to the sea, thus completing the hydrologic cycle.

Water is a multiple-purpose resource that may be made to serve a number of functions on its way to the sea. Water on the land supports vegetation and if it is more abundant than is necessary for agriculture it may form a habitat for aquatic plants and animals. Only to a limited extent is water an industrial ingredient, but it does serve as a source of power and as a coolant. Water of the larger streams and lakes may be used to supply the culinary and personal needs of people in urban communities and the wastes from cities are discharged into these same streams and water bodies. Abundant supplies of water are required in a sanitary system to treat the sewage, dilute the effluent and flush away the wastes. In quantity, the fresh waters of the earth bear a significant relationship to the amount of precipitation that falls upon the land and its seasonal distribution. When the first land areas were uplifted above sea level, fresh water began to enter the pore spaces and other cavities in the various geologic formations. Originally most formations, especially those originating through deposition of sediments in the oceans and saline seas. contained salt water. But as fresh water penetrated these aquifers and moved along under hydrostatic pressure, most of the salt water was gradually replaced by fresh water. In the deeply buried formations salt water is still trapped and there is very little prospect that these saline waters or brines will ever be replaced by fresh water. Some rock formations contain soluble minerals that are taken into solution by the deeply penetrating fresh waters that originally fell as rain. These brines, whether they represent deeply entrapped sea uater or solutions containing saline materials from the country rock, constitute an important natural resource.

Where thick layers of sedimentary and other porous rocks are so disposed structurally that surface waters are readily absorbed and penetrate deeply. the total quantity of underground water may be enormous. This reservoir of ground water is in a sense a capital fund that can be drawn upon to meet local and regional needs for water. The earth materials into which the surface waters penetrate filter and purify the water and make it readily usable for most culinary and industrial purposes. However, the water may contain sufficient mineral matter such as lime carbonate and other salts to make it hard and unsatisfactory for particular purposes unless treated.

The fresh water on the land in the form of streams. lakes, ponds and marshes represents only a fraction of the total rainfall. Like springs, lakes, ponds and marshes help to steady the flow of streams. These natural regulators have been supplemented by the construction of dams both large and small to hold back the water in times of heavy precipitation so that adequate supplies may be available for power, irrigation, industrial and culinary purposes in times of low rainfall.

The total power derived from falling water is relatively small when compared with the power available from coal, petroleum, natural gas and atomic sources, yet certain countries such as Italy, France, Switzerland, Norway, Sweden, Canada and Japan are heavily dependent upon water power. In the mid-1950s the capacity of the water-power plants in the United States was in excess of 130,000,000 h.p., a little more than one-quarter of the world total.

Inland waters have long been highways of commerce. In the United States other means of transportation, except on the Great Lakes, have competed strongly with the waterways. In Europe, waterways, both natural and man made, are relatively more important. But throughout history, the great rivers of the world such as the Rhine, the Volga, the Yenisei, the Yangtze, the Nile, the Amazon and the Mississippi have been arteries of trade.

As the demand for water increases, the available supplies will need to be more carefully utilized. With proper treatment. water may be used over and over again as it moves downstream toward the sea. By cloud seeding in areas where conditions are favourable. the amount of precipitation may be increased slightly. By desalting saline waters the quantity of fresh water may be increased, but except in areas of scant supply where desalting may be practical, the immediate needs for more water mill probably be met by the treatment and reuse of known supplies. See WATER; GROUND WATER; HYDROLOGY; OCEAN AND OCEANOGRAPHY; WATER SUPPLY AND PURIFICATION; and individual articles on hydrographic features.

V. MINERALS

In order to simplify this discussion of minerals, the great variety of inorganic substances contained in the earth's crust and the seas is treated in a limited number of categories: mineral fuels, iron and the ferroalloys, the nonferrous metals, the precious metals and the nonmetallic minerals.

Mineral Fuels.—Coal.—The coal resources of the world are essential to continued industrial development. Petroleum and natural gas and to a limited extent water power and nuclear fuels supplement coal, but the strong industrial nations must have access to this essential industrial fuel.

All coal, whether classed as anthracite, bituminous or lignite, is derived from vegetable matter accumulated and preserved under favourable geologic conditions. To be regarded as workable resources for the foreseeable future, the coal must occur at depths not exceeding 6.000 ft. beneath the surface and under structural conditions that will permit economic mining at the greater depths. The thickness of the seams or layers is an important factor in the economic production of coal, particularly in deep mines.

The leading producers of coal are the United States. Germany, the Soviet Union, the United Kingdom and Poland, all of which produce from 100,000,000 to more than 400,000,000 tons annually. Smaller quantities, generally under 100,000,000 tons annually, are produced by China, India, Japan, Czechoslovakia, France, Belgium and Australia.

The reserves of coal yet to be developed are similarly distributed over the world. In North America, chiefly in the United States, more than 2,000,000,000,000 tons of coal remain to be mined. In the Soviet Union and China the reserves total more than 2,400,000,000,000 tons, enough to meet the needs of these two great powers for many decades or even centuries. In Europe significant reserves are located in Germany, the United Kingdom and Poland. In the southern hemisphere large reserves are available in Australia and South Africa.

Petroleum.—Like coal, petroleum is believed to be of organic origin. Because it is a liquid it can be transported in pipelines, tank cars, barges and tankers. The refining of petroleum consists of distilling or fractioning off the various liquid constituents and of cracking, a process in which the heavier oils are used to produce the lighter products such as gasoline, kerosene and fuel oil which are in great demand. From petroleum are derived a number of basic raw materials used in the manufacture of plastics, detergents, synthetic rubber, explosives and dyes.

Petroleum occurs in porous sandstones and other formations with large and abundant interstices. Early man used limited quantities of petroleum as an illuminant, as a lubricant and for pharmaceutical purposes. The first well drilled specifically for oil was put down at Titusville, Pa., in 1859. For 100 years the United States has held the leadership in production except for a brief period from 1898 to 1901 when leadership passed to Russia. The principal petroleum producers are the United States, Venezuela, Saudia Arabia and Kuwait, the Soviet Union and Iraq. Others of importance include Canada, Mexico, Rumania, Indonesia and Iran. From 1918 to 1926 Mexico mas second to the United States, only to be surpassed by the Soviet Cnion. The relative decline of Mexico was offset by the rise of Venezuela, which achieved second place in 1944, a position it continued to hold.

The ease with which crude petroleum can be transported makes it possible to concentrate refining capacity in or near the market areas. Approximately half of the world's refining capacity is located in the United States. Other major refinery centres are in the Soviet Union, the Netherlands West Indies (Curaçao and Aruba), Canada, the United Kingdom, France, Italy and Iran (Abadan).

The reserves of petroleum are unequally distributed over the earth. The United States, long a leading producer, has less than 20% of the world's known reserves. The middle east countries, having achieved recently a high place among producing areas, have approximately 66% of the reserves. The proven reserves in the Soviet Union amount to only 5%, though future exploration may increase them greatly. In South America, particularly along the eastern margin of the Andes, reserves of petroleum may maintain production for many decades.

Natural Gas.—In most petroleum areas natural gas is available for use as a fuel and as a raw material. Outside of the Soviet Union, for which production data are not available, natural gas is produced chiefly in the United States, Canada, Mexico, Venezuela and Italy. In the United States natural gas from Texas, Louisiana, New Mexico, Kansas and Oklahoma is distributed by pipeline to the industrial and domestic consumers in the northeast including New England, the south, the middle west and the Pacific coast. Production of natural gas in the United States in 1957 amounted to 10,200,000,000,000 cu.ft.

The recoverable reserves of natural gas in the United States were estimated to be 446,500,000,000,000 cu.ft. in the late 1950s. New discoveries in the southwest and California have increased U.S. proven reserves substantially.

Atomic Energy.—Uranium (*q.v*) is the chief source of atomic energy though thorium and other radioactive minerals may be used as fissionable fuel. The known quantity of uranium in the earth's crust is equivalent to 0.008%. It is twice as abundant as zinc and many times more abundant than the precious metals. However, it is widely distributed and only in a few places is it sufficiently concentrated to warrant development and production. It has been estimated that the total heat energy available from the reserves of atomic minerals may be as much as 25 times that available from the known reserves of coal.

Atomic energy thus far has been used chiefly for weapons, but a number of reactors are being used as sources of power in electrical generators and on submarines. It will continue to be used for these and other purposes, but in the United States and other countries where other sources of power are available at low cost the use of atomic energy may be restricted for some time to come.

Uranium is recovered from deposits of pitchblende which occur in the Belgian Congo, Canada and Czechoslovakia. In the United States, uranium ores are contained in the thick sedimentary formations of the Colorado plateau of western Colorado, New Mexico and Utah. Other sources of uranium are in the Union of South Africa, Australia, France and Portugal. (See FUELS; COAL AND COAL MINING; PETROLEUM; NATURAL GAS; GAS INDUSTRY; ATOMIC ENERGY.)

Iron and the **Ferroalloys.**—*Iron.*—In the earth's crust, iron is one of the most abundant metals, exceeded only by aluminum.

Whereas iron as an element is widely distributed, however, the major iron minerals such as hematite (Fe_2O_3), magnetite (Fe_3O_4), limonite ($Fe_2O_3H_2O$), siderite ($FeCO_3$) and others are concentrated in rich ore deposits in a limited number of places. The richest ores. consisting chiefly of magnetite, contain 60% to 70% iron. Hematite ores seldom contain metallic iron in excess of 60% and the poorer or leaner ores may contain as little as 20%–25%. When the iron content is under 25% the ores may be described as uneconomic or submarginal. In the United States ores under 35% iron are seldom used unless first treated to enrich them.

With the exhaustion of the rich ores in the iron ranges of the upper Lakes area in Minnesota and Michigan, the iron-bearing taconites and jasperites have become potential sources of iron. These iron-bearing formations are crushed and by magnetic and other means of enrichment the iron minerals are concentrated and pelletized by a sintering process so that the resulting ore can compete with the naturally rich ores. Domestic sources of iron ore have been unable to meet the demand and as a consequence foreign ores to the extent of 15,000,000 tons annually are imported from Canada, Sweden, Venezuela and Chile and from a number of countries that supply only limited quantities of ore.

With the completion of transportation facilities from the Gulf of St. Lawrence to the rich iron resources along the Labrador-Quebec boundary, the Knob lake ores have become available to Canadian and U.S. blast furnaces. Other Canadian ores are mined in the Steep Rock and Michipicoten areas in the Lake Superior upland. The Wabana ores of Newfoundland have long been available to furnaces in eastern Canada.

In the Latin-American countries important iron deposits in the Cerro Bolivar area of Venezuela have become available for domestic use and for shipment to the U.S. Iron ores are also produced in Chile and Brazil. The rich resources of Venezuela and the state of Minas Gerais in Brazil constitute a major reserve that may be drawn upon to support the iron industry of the future.

In Europe the chief centres of iron-ore production are in the United Kingdom, France, Germany, Sweden and the Soviet Union. In western Europe the Minette ores of Lorraine have long held first place as a source of iron. Other contributors include Spain, Italy and Austria. The Soviet Union is the leading producer of iron ore in Europe with the Krivoi Rog of the Ukraine and the Magnitnaya and other centres in the Urals accounting for most of the production. Large reserves of iron ore are known to exist in the Soviet Union so that its iron and steel industry will be adequately supplied with ore in the future.

Ferroalloys.—Limited amounts of a number of ferroalloy metals are required to produce the specialty steels needed by modern industry. These metals include manganese, chromium, nickel, tungsten, vanadium. molybdenum and cobalt.

Manganese is used as an oxidizer and as an alloy and is required in the manufacture of all steel. In the late 1950s manganese ores were mined in the Soviet Union, India, Brazil, the Union of South Africa, Ghana and Morocco. Chromium, used with nickel to make stainless steel and as a plating metal, is available in quantity in the Philippines, Turkey, the Union of South Africa. Southern Rhodesia and the Soviet Union. The Sudbury area of Canada produces nearly 60% of the world's nickel. Smaller quantities are produced in Cuba, the Soviet Union and New Caledonia. Tungsten, important in the manufacture of tungsten carbide and as an alloy, is widely distributed but for many years China has been a principal supplier of this metal. Other producers include the Soviet Union, the Cnited States, Bolivia, Portugal and the Republic of Korea. Molybdenum, like nickel, is highly concentrated in a single mining centre, Colorado. More than 95% of the world's molybdenum is produced in the United States. Vanadium, which imparts strength and resilience to steel, is produced chiefly in the Cnited States, Peru, southwest Africa and Finland.

These ferroalloys, considered together, are widely distributed among many nations, but the major steelmaking countries are largely dependent upon imports to meet their needs. For example, the United States produces only molybdenum and vanadium in sufficient quantities to meet its requirements. All the other ferroalloy metals must be imported. (See IRON; ALLOYS; ORE DEPOSITS; and articles on the various minerals and ferroalloy metals.)

Nonferrous Metals. — These. including copper, aluminum, lead and zinc, tin, mercury. magnesium and several others, have become essential to modern industry. In the early history of man the metals that occurred in the native state such as gold, silver and copper were used for decorative and practical purposes. Either by accident or intention, copper and tin were combined to produce bronze, a metal of immense cultural and economic importance. In time other nonferrous metals acquired industrial importance. These include lead and zinc alone or in combination with other metals, aluminum, magnesium. tin and several more.

Copper. — Because of its superior quality as an electrical conductor and its usefulness as sheet metal and as a component metal in a number of alloys, copper ranks high among the nonferrous metals. Copper as a metal was known and used before the Christian era but its use in quantity came with the development of the electrical industry. Only limited quantities of copper are produced in Europe, where the mining and smelting of copper were developed early. With the development of practical methods of processing low-grade ores, many formerly uneconomic deposits have become major factors in the mining industry. The leading producers of copper ores are the United States, Chile, Northern Rhodesia, the Soviet Union, Canada and the Belgian Congo.

Aluminum. — The difficulty of separating aluminum from bauxite and a number of other aluminum-containing minerals deferred its industrial use for many centuries. The lightness of aluminum, its conductivity and its resistance to corrosion led to its use as sheet metal, for electrical equipment, in transportation equipment and for a variety of products. Bauxite, the chief source of aluminum, is produced chiefly in Jamaica, Surinam, British Guiana, France, the United States and the Soviet Union. In the production of aluminum metal the United States, Canada, the Soviet Union, west Germany and Norway, all producers of cheap electrical power, are the leading contributors. The major producers and users of aluminum are dependent upon imported raw materials with the exception of France and the Soviet Union, which are generally self-sufficient.

Lead and Zinc. — Modern industry continually requires supplies of lead and zinc. In the mid-1950s approximately 2,400,000 tons of lead were produced annually. The leading countries included the United States, Australia, the Soviet Union, Mexico, Canada and South Africa. In spite of the threat of rapid depletion of reserves, production of lead increased through the extension of known reserves and the recovery of a higher proportion of the metal in the ores.

Despite competition from aluminum and other metals, corrosion-resistant zinc is extensively used for galvanizing. Along with copper, zinc is used in the manufacture of brass. Nearly 40% of the world's zinc is produced in North America with the United States in first place. Large quantities are contributed by Canada and Mexico. The continent of Europe produces 32% of the world's supply with important contributions from the Soviet Union, Poland, Italy, Spain and west Germany. In Asia, Japan is the leading producer but larger quantities are mined in Australia. In South America, Peru is the major source. In tonnage zinc exceeds lead but both serve particular purposes in industry.

Tin. — The mining of tin ore is highly concentrated in a few centres but the metal is marketed in all parts of the world. Major production areas are in Malaya, Indonesia, Bolivia and the Belgian Congo. During World War II Japan controlled the tin resources in the far east. The United States and many other countries had to reuse tin already on hand by detinning tin cans and recovering the metal from collapsible tubes and other sources. The U.S. built a tin smelter at Texas City, Tex., and processed imported ores. chiefly from Bolivia, to help meet its needs.

Other *Nonferrous* Metals. — The list of nonferrous metals could be extended to include magnesium, antimony, mercury and several others but the metals discussed above are of major importance and are representative of this group of metals. ***(See*** ORE DE-

POSITS and articles on the various nonferrous metals.)

The Precious Metals.—Because of the nonperishable character of gold and its use as a monetary standard, the total quantity of metal in the world accumulates over the years. Small quantities are consumed, dispersed or lost each year but generally the total supply of gold in the world tends to increase. New gold comes chiefly from the Union of South Africa, the Soviet Union, Canada and the United States.

While silver does not enjoy the preferred status of gold as a monetary metal, it is widely used in domestic and international transactions. In addition to its monetary use, it is also used extensively in the arts: for tableware, jewelry, photographic film and other purposes. Some silver occurs in nature as a pure metal but more often it is only one of several metals occurring together as sulfides. Mining, smelting and refining of these ores results in the recovery of copper, nickel, lead and zinc as well as silver. North America is the leading silver continent. Mexico, the United States and Canada usually rank as first, second and third. respectively, in the mining of silver ores. Other producers include the Soviet Union, Peru, Australia and Bolivia.

Platinum, osmium, iridium, rhodium, ruthenium and palladium collectively make up the platinum group of metals. These metals are of major importance in the electrical industry, in the chemical industry, chiefly as catalysts, in the arts, especially jewelry manufacture, and in dentistry and medicine. They are most nidely used in the industrial countries. Production is highly centralized in the Union of South Africa, Canada, the Soviet Union, Colombia and the United States. (See articles on the various precious metals)

Nonmetallic Minerals.—The common earth materials such as rocks of various kinds, unconsolidated sediments such as sand and gravel, and clay and silt are so abundant in most parts of the world that any needed material not available locally can be obtained from nearby areas. Generally these earth materials are low-value, short-haul resources. Only a few, such as china clay, decorative stone and others that may have some special quality, can be transported over great distances economically.

Among the nonmetallic substances present in the earth's crust, a few have special qualities which make them vitally necessary in industry. Among these are such minerals as asbestos, sulfur, quartz crystals, mica, salt, the fertilizer minerals and several others.

Sulfur.—Modern industry is heavily dependent on sulfur for its proper functioning. Sulfur is obtained chiefly from deposits of elemental or native sulfur and from sulfur-containing minerals such as the sulfides. Along the Gulf coast of Louisiana, Texas and Mexico are numerous salt domes that contain native sulfur. This coastal strip is the world's leading producer. Other major producers of native sulfur are Italy, chiefly in Sicily, and Japan, where the deposits are associated with volcanic rocks. More widely over the world the processing of sulfide ores yields important quantities of sulfur. This is done in Spain, a long-time producer, Canada, Japan, the United States, the Soviet Union, Norway and the island of Cyprus.

Quartz.—Silica, consisting of oxygen and silicon and commonly occurring as quartz or in silicate minerals, is one of the most abundant earth materials. As quartz sand it is used for a variety of purposes from glassmaking to sandblasting. In spite of its relative abundance in nature, quartz crystals of great purity and large size are relatively rare and production to meet the needs of the electronics industry is largely centred in Brazil. (See QUARTZ; SILICA.)

Mica —A thin platelike mineral, mica is widely known in nature where it occurs in small flakes in igneous and schistose rocks. Sheet mica in large crystals occurs in pegmatite dikes and can be quarried, split and cut to the required dimensions. Large quantities of flake mica are available wherever coarse-grained igneous rocks occur and the needs of the rubber, roofing, paint and abrasive industries can be met from these sources, The high-quality sheet mica used by the electrical industry is produced in more restricted areas including India, Madagascar, eastern Siberia, Brazil and the United States. (See MICA; PEGMATITE.)

Asbestos.—Before the development of spun glass and rock wool as noncombustible and heat-resistant materials, asbestos was in high demand for these purposes. Asbestos, because of its fibrous nature, can be spun and woven into heat-resistant fabrics for fire curtains, gaskets, brake linings, fire fighters' suits and many other items. Asbestos in combination with portland cement, magnesia and other substances is used in the manufacture of roofing materials and wallboard. High-quality asbestos is produced chiefly in the Thetford area of eastern Canada, but important tonnages are contributed by the Soviet Union, the southern part of Africa and Japan. (See ASBESTOS.)

Fertilizer Minerals.—The continued productivity of the land is dependent upon the availability of four major elements, calcium. nitrogen, phosphorus and potassium, and a number of minor or trace elements including magnesium, manganese, boron, iron, copper, sulfur, zinc and others. Calcium, chiefly in the form of lime carbonate, is relatively abundant and areas without limestone can easily secure this material.

Nitrogen in the form of nitrates is widely distributed in soil but because of its solubility it is continually being lost. The nitrogen content of the soil can be maintained by the application of manures and other organic wastes to the land. Mineral nitrates. available in the Atacama desert of northern Chile, were formerly used extensively in the manufacture of commercial fertilizers. After World War I nitrogen obtained by fixation from the atmosphere became increasingly important and makes up more than three-quarters of the nitrogen content of the commercial fertilizers.

Phosphorus usually is available from phosphate rock which contains the mineral calcium phosphate. In order to make the phosphorus readily available, the phosphatic material is treated with sulfuric or nitric acid. Small quantities of calcium phosphate occur aidely in limestones and, as a result of weathering, phosphatic minerals may be residual in the soils locally. Phosphate rock in sufficient abundance to support the fertilizer industry is available in the United States. Morocco and Tunisia in north Africa, the Soviet Union and Nauru in the west central Pacific. Phosphatic material is also available from phosphorus-containing minerals and ores. For example. basic slag from the steel industry may contain enough phosphorus to justify its preparation and use as a fertilizer.

Before World War I Germany had a virtual monopoly on potash but with the loss of Alsace a portion of the production and reserves passed to the jurisdiction of France. Stassfurt, Ger., remains a major source of potash but production from deposits in New Mexico has given the United States second place. Other producers include the Soviet Union, Spain and Israel. (See FERTILIZERS AND MANURES; MINERAL PHOSPHATES.)

VI. STRATEGIC RESOURCES

All materials, inorganic or organic in origin, necessary to national defense or the prosecution of war may be said to be strategic No nation should risk involvement in a major war unless its supplies of strategic materials are adequate for an extended conflict or unless it has the capacity to produce or secure these resources by trade. Certain resources may be available in quantity but they may be regarded as strategic if they are essential to de-' fense or military effort. For example, steel and cotton are strategic materials but in the case of the United States adequate production can be maintained. The resource situation may vary from completely adequate supplies of a number of materials to negligible supplies of others. Because of technological developments, the number of materials that may be classed as strategic has grown and the problem of securing and maintaining adequate supplies has become increasingly complicated.

Stock-piling.—In the case of scarce materials the resource situation may be so critical that stock piles of a long list of metals, ores and organic materials should be built up to meet the needs of a nation while it absorbs the first shocks of a major war. Such emergency supplies should be large enough to meet wartime needs over a period of two to five years or even more, depending on the ease or difficulty of securing replacements.

Stock piles of organic materials such as rubber, fibres, timber, hides and skins, condiments and mood pulp are subject to deterioration or destruction while in storage. For example, the stock-piling of raw rubber requires that a regular and continual renewal program be maintained to keep up the quality of a nation's hoard of this essential commodity.

The program of stock-piling of Strategic materials should be reexamined from time to time to make sure that the proper quantities are maintained. People can be lulled into a false sense of security by the knowledge that the strategic materials have been stock-piled. As the needs of defense change the character and dimensions of the stock pile will need to be restudied.

Substitution. — If metals and other materials are not available in sufficient quantities to meet defense needs, the national security may be endangered. Substitute materials should be included in the stock pile or be in production so that the national economy will not suffer if it becomes necessary to substitute one material for another. If all of the ferroalloys are not accessible in the proper quantities the steel industry may make more abundant use of the alloy metals that are available. This in effect is the substitution of an abundant metal for one in short supply. During World War II, when the supply of tin was greatly reduced. glass containers and lacquered cans replaced the widely used tin can. It is evident that plastics can be used extensively to replace metals and wood. Continued research and technological developments will provide a variety of substitute materials when the need arises.

Subsidies. — In some instances a mining operation or manufacturing facility engaged in the production of a strategic material may be in financial difficulties. A modest subsidy may be all that is required to give such an industry economic stability and the prosperity it requires to continue in operation.

Trade and **Tariffs.**—National security for all nations, even such powerful countries as the U.S. and the U.S.S.R., depends upon international trade. Materials in short supply are imported and inventories and stock piles built up. To encourage this, nondiscriminatory tariffs and other politico-economic devices may be used to facilitate the movement of essential materials. *See* ECONOMIC WARFARE; MOBILIZATION, ECONOMIC.

VII. CLIMATE

On the basis of temperature and rainfall, the earth can be divided into a variety of climatic regions. Five major thermal zones may be identified: the tropical zone. the north and south intermediate zones and the north and south polar zones. On the basis of precipitation. the earth can be divided into rainfall regions: humid, subhumid, semiarid and arid. By combining temperature and moisture conditions the earth can be divided into approximately 15 major types of climate though individual climates may be repeated over the surface of the earth as many as five or six times.

Humid Tropical Climates. — Between the equator and approximately latitude 18° to 20° north and south lies an area with a humid tropical climate. Near the equator the climate is rainy at all seasons because the area is always under the influence of the doldrums. The annual amount of precipitation varies between 60 and 100 in. except in mountains where the maximum may exceed 300 in. In these equatorial areas the precipitation in the driest month may be as little as three inches in the low-sun period. When the sun is directly overhead the amount of precipitation may exceed ten inches per month. These wet equatorial climates are well developed in the Amazon basin and nearby coastal areas, in the Belgian Congo and the borderlands of the Gulf of Guinea and in Indonesia, the Philippines and the coastal margin of southeast Asia.

Generally poleward from the equatorial climates there are extensive areas that have a savanna type of climate, a name that indicates the character of the natural vegetation. These areas have a hot climate the year around with a precipitation of 30 to 60 in. The rainfall is heavily concentrated in the summer season or the high-sun period. When the sun is low in the sky and the trade winds prevail, these savanna areas are very dry. The savanna type of climate is characteristic of large areas in South America such as the llanos and the campos and of many areas in Central America and the Caribbean. In Africa the Sudan and the plateaus of east and south central Africa contain extensive savanna areas. Large areas in India, southeast Asia and northern Australia also have this type of climate.

Dry Climates. — Large areas in the trade-wind belt and in latitudes 15° to 30° north and south are characterized by desert or semiarid conditions. These dry areas extend generally poleward into the interior areas of the continents of South America, North America and Asia. Those that lie between the true deserts and the humid areas near the coasts are semiarid and characterized by the scant vegetation of the steppe.

Humid Climates of Intermediate Latitudes. — On both the west and east sides of the continents in latitudes 30° to 65° north and south the precipitation varies from 20 to 80 in. annually. In these latitudes the annual range of temperature is much greater than in the tropics. Along the west coasts temperatures are more moderate than on the east coasts, where continental extremes are common. Summers are hot and winters cold. On the west coasts the maximum precipitation comes in the winter season but on the east sides of the continents precipitation is more evenly distributed throughout the year. Interior locations generally have a warm-season maximum.

Polar Climates. — In the arctic and antarctic areas, where the sun is continuously above the horizon for as much as six months and is below the horizon for a similar period of time, the climate is characterized by a low mean annual temperature and even in summer the temperatures are low. The winters are long and bitterly cold. Limited areas that are free of ice and snow during the short summer have a tundra type of climate. Extensive areas are always covered by ice and snow and have an icecap or glacial climate. *See* CLIMATE AND CLIMATOLOGY; SEASONS; METEOROLOGY.

NATURAL RIGHTS. The doctrine that all men equally are naturally free "to order their actions and dispose of their persons and possessions as they think fit, within the bounds of the law of nature," found its clearest expression in John Locke's *Second Treatise* of *Government* (1690), from which this passage is quoted. It is characteristic of Locke, as of modern political thought generally, that he conceived of natural law not so much as a law ultimately derived from God and imposing obligations upon men but as a principle self-evident to human reason that all men are "equal and independent" and that "no one ought to harm another in his life, health, liberty or possessions." Since men are by nature "free. equal, and independent" it follows that "no one can be put out of this estate and subjected to the political power of another without his own consent." According to Locke "the great and chief end" for which men agree to form governments, to live in community, "is the preservation of their property."

The doctrine of natural rights stems from the individualism that emerged at the time of the Renaissance and Reformation and the transformation of the medieval Christian theory of natural law (which prescribed conduct appropriate to human beings as creatures of God) into a theory of natural rights (which emphasized the self-evident character of individual freedom and equality). This transformation was accomplished principally by Hugo Grotius (1583–164j). Thomas Hobbes (1588–1679), Samuel Pufendorf (1632–94) and John Locke (1632–1704) (*qq.v.*). The doctrine which in its Lockian form emphasized the natural right to acquire unequal amounts of property, especially in the form of money, appealed to the rising middle classes and helped to supply a justification for capitalism. Although the doctrine was frequently employed in the 19th century by conservative thinkers who sought to justify the economic *status* quo, originally it had radical implications nhich were fully exploited in the American and French Revolutions.

Locke was defending the Whig revolution of 1688 but his argument was employed in the American Revolution and found succinct summarization in the Declaration of Independence (1776), which states that, "We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life. Liberty and the pursuit of Happiness — That to secure these rights. Governments are instituted among Men, deriving their just powers from the consent of the governed. — That whenever any Form of Government becomes destructive of these ends, it is the Right of the People to alter or to abolish it. . . ." The French National Assembly adopted a similar Declaration of the Rights of Man and of the Citizen in 1789 in the belief "that the grievances of the citizen, being henceforaard based upon simple and indisputable principles, should always be conducive to the preservation of the Constitution and to the happiness of all."

The doctrine did not go unchallenged and the English utilitarian Jeremy Bentham characterized natural rights as "rhetorical nonsense. — nonsense upon stilts" (*Anarchical* Fallacies, 1795). One can speak meaningfully, he contended, of legal rights but not of "natural" rights. Despite such objections, which became more numerous in the 19th century, 20th-century thinkers have persisted in proclaiming "the equal and inalienable rights of all members of the human family." a phrase which occurs in the Universal Declaration of Human Rights adopted by the general assembly of the United Nations at its meeting on Dec. 10, 1948, in Paris.

The revolutionary significance of the doctrine of natural rights which emerged in the 17th century was the fact that it sought to ground government upon individual will and consent. Society itself was thought to be the product of a contract; justice was no longer conceived as embodying principles transcending individual will and consent but rather as a reflection of the terms of the contract. In the Christian tradition as reflected in the thought of St. Thomas Aquinas, as well as in the older Aristotelian tradition, the purpose of the state was dictated not by the subjective desires of individuals but by the nature of man and the end for which he is destined. The state was conceived as existing to promote justice among men, to help men to become better human beings, to help unleash their creative capacities for good and to restrain their propensity to do evil. Justice was not a subjective concept but was rooted in objective reality. Within this tradition individuals are conceived as having rights as human beings but the rights derive from duties rather than the duties from the rights.

The proclamation of "equal and inalienable rights of all members of the human family" would appear to stem from the conviction that there are principles of justice which transcend the positive laws of any society, principles which are the same for all men in all places at all times. They provide the inspiration for social justice and the norms for evaluating existing legislation. They are the raison *d'être* of constitutional government.

Difficulties arise when an effort is made, as it must be made in practice, to distinguish between the possession of such rights and their exercise. Not only may the rights claimed by one individual conflict with the rights claimed by another, but questions arise as to the priority to be established among rights. Is "the pursuit of happiness." which the proclamation of human rights is designed to foster and protect, to be conceived in hedonistic terms or in terms of a life of reason or a life of spiritual growth in awareness of God?

There is more widespread agreement concerning the enumeration of human rights than there is agreement concerning their ultimate justification and practical exercise. Ultimately these disagreements reflect basic disagreement concerning what constitutes the good life for man. Much depends upon whether this good is conceived in material or spiritual terms, whether man is conceived to be primarily a producing and consuming animal or a spiritual creature whose ultimate destiny lies beyond life in this world. In speaking of natural rights much hinges upon how "nature" is interpreted, whether we mean by "nature" how men do in fact act when unrestrained by reason or how men ought to act in order to perfect their natural (human) potentialities.

NATURE RESERVES: see NATIONAL PARKS AND NATURE RESERVES; WILDLIFE CONSERVATION.

NAUKRATIS, an ancient Greek settlement in Egypt. The site uas discovered by W. M. Flinders Petrie in 1884, on the eastern bank of a canal, about 10 mi. W. of the present Rosetta branch of the Nile. In ancient times it was approached by the Canopic mouth, which was farther to the west.

The identification of the site is placed beyond doubt by the discovery of inscriptions with the name of the town and of great masses of early Greek pottery. A list of the temples of Naukratis is given by Herodotus; they were the Hellenion, common to all the colonizing cities, and those dedicated by the Aeginetans to Zeus, by the Samians to Hera and by the Milesians to Apollo. A temple of Aphrodite is mentioned by Athenaeus. A temple of the Dioscuri was also found.

In addition to these temples, there was a great fortified enclosure, about 860 by 750 ft., in the southeastern part of the town; within it was a square tower or fort. Another great walled enclosure was found to the northeast of the town.

Apart from the historic interest of the site, as the only Greek colony in Egypt in early times, the chief importance of the excavations lies in the rich finds of early pottery and in the inscriptions upon them, which throw light on the early history of the alphabet. There are clear traces of a settlement going back to the 7th century, including a scarab factory, and yielding fragments of early Greek pottery. It seems a fair inference that the makers of these were Greeks, and that they probably represent the early Milesian colony, settled there in the time of Psammetichus I.

NAUMACHIA, the Greek word denoting a naval battle, used by the Romans as a term for a mimic sea fight. These entertainments took place in the amphitheatre, which was flooded with water, or in specially constructed basins (also called naumachiae). The first on record. representing an engagement between a Tyrian and an Egyptian fleet, was given by Julius Caesar (46 B.C.) on a lake which he constructed in the Campus Martius.

See GAMES, CLASSICAL; PANATHENAEA; ROME: Ancient City.

NAUMBURG, a town in the district of Halle, Ger., in the former *Land* of Saxony, on the Saale, near its junction with the Unstrut, 29 mi. S.W. from Halle. Pop. (1959 est.) 37,607. In the 10th century it was a stronghold of the margraves of Meissen, who in 1029 transferred it to the bishopric of Zeitz.

The bishopric fell to the elector of Saxony. In 1631 the town was taken by Tilly, and in 1632 by Gustavus Adolphus. It became Prussian in 1814. The cathedral, a building in the Romanesque Transition style (1207–42), is remarkable for its large crypt and its towers.

NAUNDORFF (NAÜNDORFF), **KARL WILHELM** (d. 1845), French pretender. claimed to be the dauphin Louis Charles, son of Louis XVI and Marie Antoinette, who was announced as having died in the Temple in 1795.

Kaundorff, who had arrived from nowhere in Berlin in 1810, with papers giving the name Karl Wilhelm Naundorff, in order to escape the persecutions of which he declared himself the object, settled at Spandau in 1812 as a clockmaker, and married in 1818 Johanna Einert. In 1822 he removed to Brandenburg, and in 1828 to Crossen, near Frankfurt. He was imprisoned from 182j to 1828 for coining, though apparently on insufficient evidence, and in 1833 came to push his claims in Paris, where he was recognized as the dauphin by many persons formerly connected with the court of Louis XVI. Expelled from France in 1836, the day after bringing a suit against the duchess of Angoulême for the restitution of the dauphin's private property, he lived in exile until his death at Delft on Aug. 10, 1845.

NAUPLIA, a town in the Peloponnesus, Greece, at the head of the Argolic gulf, the seaport of the plain in which Argos and Mycenae are situated, with several tombs of the Mycenaean age. A hero Nauplius took part in the Argonautic expedition; another was king of Euboea. In classical times it was of no importance, and Pausanias, about A.D. 150, found it deserted. The mythic importance of the town revived in the middle ages, when it became chief city of the Morea. It was captured in 1211 by Godfrey Villehardouin with the help of Venetian ships; a French dynasty ruled in it for some time and established feudalism. In 1388 the Venetians bought Argos and Nauplia. In the wars between Venice and the Turks it often changed masters: given to the Turks in 1540, it was recaptured by Venice in 1686, and the Palamidhi hill was fortified. In 171j it was taken by the Turks; in 1770 the Russians occupied it for a short time. The Greeks captured it during the War of Independence on Dec. 12, 1822, and it was the seat of the Greek administration till 1834, when Athens became the capital of the country. It is the chief town of the department of Argolis. Pop. (1951) 8.459.

NAUSICAA, in Greek legend, daughter of Alcinous, king of the Phaeacians in the island of Scheria. When Odysseus (*q.v.*) swam ashore to Scheria, he was found by Nausicaa, who supplied him with clothes and took him to her father's palace, where he was hospitably entertained.

NAUTCH, a dance form of India, literally, any art presentation of song and dance combined. After about 192j the title was generally applied to the stage presentation of dances of Marwari women who wear and manipulate the wide *gargari* skirt. Spinning turns, the beating of belled feet, coquetry and fluid arm movements are characteristic. (R. M. Hs.)

NAUTILUS, the name given by the ancient Greeks to a cephalopod mollusk, *Argonauta argo* (the paper nautilus). Linnaeus, however, applied it as a scientific designation to another cephalopod, the pearly nautilus of eastern seas, and named the "nautilus" of the Greeks, *Argonauta.* The structure and zoological position of the pearly nautilus are discussed in the article CEPHALOPODA. It is represented at the present time by four species, which are restricted to the area between the Fiji and the Philippine islands. It usually lives near the sea bottom at considerable depths, though at night it comes into shallow water where it is caught for food by the natives.

The paper nautilus (*Argonauta*) is found in practically all subtropical and tropical seas. Although it has been taken from depths of more than 500 fathoms it is characteristically found at the surface. It is placed along with a few other genera in a separate family of the Octopoda or eight-armed cephalopods. The genus is characterized by several very peculiar features. In the first place the male *Argonauta* is very much smaller than the female, the latter in certain cases being as much as 15 times the size of the male. Like the rest of the Octopoda the male *Argonauta* lacks an external shell, but the two dorsal arms of the female secrete a calcareous shell which is unique in the mollusk phylum. Its origin from the arms is unlike that of the shell of other mollusks, which is developed from the mantle. Moreover this shell is used as a receptacle for the eggs and in it they are incubated until the young are hatched out. (G. C. R.)

NAUVOO, a small historic town in Hancock county in western Illinois, U.S., situated on the Mississippi river about 15 mi. S. of Fort Madison, Ia., and 50 mi. N. of Quincy, Ill. The population is about 1,000. Chief industries are nine and *bleu* cheese making. A grape festival held each fall includes the "wedding of wine and cheese," a ceremony brought from Roquefort, France. In Nauvoo is St. Mary's academy, a Roman Catholic boarding school for girls

Nauvoo's history and significance is especially related to the Mormon era in Illinois history (see LATTER-DAY SAINTS. CHURCH OF JESUS CHRIST OF: *Nauvoo*). When the Mormons arrived in 1839 there were already a few buildings in what was called Commerce City; it mas renamed Kauvoo (Hebrew for "beautiful place") by Joseph Smith.

Following the exodus of the Mormons to Utah in 1846 the town was settled temporarily by a new group. the Icarians, a body of socialists chiefly of French origin; their founder and leader was Étienne Cabet (*q.v.*) of Dijon, France. After purchasing land, Cabet proceeded to establish a communal settlement not unlike other so-called communistic, frontier experiments of the time. At their peak the Icarians at Nauvoo numbered between 1.200 and 1,800. The community was open to anyone who would pay the introductory sum of 300 francs and would donate all his possessions to the community. Men 21 and over and women 18 and over were extended suffrage. A community school was established with separate instruction for boys and girls and a large community dining hall was constructed in the remains of the Mormon temple where all members of the community took their meals. Their economic theories proved unworkable in a frontier situation, however, and the Icarian community was doomed to early failure. A crisis developed when Cabet demanded and mas refused dictatorial powers over the settlement. Voted from office, he left Nauvoo with 200 loyal follouers and went to St. Louis, where he died soon after on Nov. 8, 1856. The community never recovered from the split; it soon disbanded and the members were absorbed into the general population.

Evidences of the Mormon and Icarian settlements are still standing, particularly in the area set aside in 1948 as the Nauvoo state park. A number of buildings are maintained as shrines by the Reorganized Church of Latter-Day Saints. (G. R. GA.)

NAVAHO, the largest Indian tribe in the United States, numbering close to 90,000 in 1960 according to estimates of the bureau of Indian affairs. Contrary to the myth of the "vanishing Indian," their numbers have increased remarkably; in 1868 there were not more than 12,000. The Navaho reservation and government-allotted lands in the states of New Mexico, Arizona and Utah comprise an area roughly the size of New England without Maine. The region, however, is mainly arid and will not support enough agriculture and livestock to provide a livelihood for the tribe. Thousands earn their living as transient workers away from the Navaho country, and appreciable numbers have settled more or less permanently on irrigated lands along the lower Colorado river and in cities such as Los Angeles and Kansas City.

The Navaho speak a language closely related to the Apache tongues and more distantly related to other Athabascan languages spoken in California, Oregon and northwestern Canada (see ATHABASCAN). The ancestors of the Apache and Navaho undoubtedly came from the north and probably did not reach the southwest until A.D. 1000 or later. The Navaho borrowed extensively from the Pueblo Indians: agriculture, weaving, sand paintings and ceremonial traits. Later they acquired livestock from the Spanish through the Pueblos. In the 19th century they learned metalworking from the Mexicans and came to specialize in the silversmithing for which — along with Navaho rugs — they are famous. Painted pottery was never strongly developed and the arts of pottery and basketry have nearly disappeared. The traditional type of house — the hogan — is made of logs plastered with earth and sticks, and always faces to the east. In some localities, hogans are made of stones. Nearby is a sweat house, where male members of the family bathe in ceremonial fashion.

Social Organization. — The Navaho trace descent through the mother, and residence of a newly married couple is most often near that of the bride's mother. The brothers of the mother take certain responsibilities for the upbringing, marriage and property of their sister's children. Traditionally, inheritance was mainly in the mother's line, but this custom is breaking down in the face of the law of the United States and the practices of the English-speaking neighbours of the Navaho. Today children often inherit from both parents.

There are about 60 clans. A Navaho belongs to the clan of his mother but also considers himself related to the clansmen of his father. No Navaho may take a spouse uho belongs to the clan of either parent. Indeed the circle of forbidden matings is larger, for some clans are considered to be "linked," and marriage into such clans closely associated with the parental ones is also forbidden. In modern times clans function largely in the regulation of marriages, although one owes a clan relative hospitality and certain other courtesies. In the past, clan as well as biological relatives could claim part of the property left by a deceased person. Some clans have a particular association with certain ceremonials.

Traditional Navaho society was organized primarily along the lines of kinship. Toward one's relatives on the mother's side and on the father's side and toward one's connections by marriage one had specified obligations according to the kinship category in question. These relatives had. of course, reciprocal duties. Even the permitted and expected forms of joking between two classes of relatives were prescribed in some detail. The code of behaviour to ard those not related either by biology or by clan was an extension of these: "Behave toward everyone as you behave with your relatives."

Religion. — The religious system is intricate. Some of the many myths relate the emergence of the first people from various worlds beneath the surface of the earth; others tell stories which justify the numerous rites that are performed. Some of these are simple rituals carried out by individuals or families for luck in travel, trade and gambling and for protection of crops and herds. The more complex rites demand a specialist who is paid according to his skill and the length of the ceremonial. One type of specialist is the "diagnostician," who carries out one of various forms of divination to determine what is required. Most rites are primarily for the purpose of curing an illness, mental or physical. Ordinarily, ill-health is held to have a supernatural cause, such as the violation of a taboo or the malevolent activity of ghosts or witches. The patient is purified by emetics and sweating. fed herbal medicines, sung and prayed over, placed upon a sand painting. In other ceremonies there are simply prayers or songs, and dry paintings may be made of pollen and flower petals — rather than of minerals upon a background of sand. In some cases there are public dances and exhibitions at which hundreds or thousands of Navahos gather.

Whites often attend these, especially the "squaw dance" which is frequently held during the summer months. This "girl's dance and sway-singing" (as the Navaho call it) is a feature of an ancient war ceremonial held to cure men who had been made sick by the ghosts of slain enemies. In modern times it serves as a marriage mart where young people meet each other and parents and other relatives can discuss the economic arrangements for projected alliances. More solemn are the night chants and mountain chants, held in the autumn months "after the thunder sleeps." The former concludes with all-night singing and dancing by masked impersonators of the divinities, and the latter with the famous fire dance in which the almost naked participants jump through flames and chase each other with burning brands.

Arts. — There are hundreds of Navaho silversmiths, principally men. For most of them silversmithing is a part-time occupation, but some are full-time professionals, either self-employed or working for stores both on and off the reservation. They make bracelets, necklaces, rings and other kinds of jewelry. Turquoise and, to a lesser extent, coral and various stones are used as settings. Silver pieces are both hammered and cast. Increasingly in modern times tableware. cigarette boxes and other articles are made for white use. First American and later Mexican coins were the source of the silver; now it is supplied by traders. The Navaho — mostly the women — have practised the art of weaving wool since at least 1706. The earliest surviving specimens date from the first years of the 19th century. The "classical" period. which attracts most collectors, dates from the late 1840s to about 1875. The blankets, poncho blankets and women's dresses from this period exhibit both technical excellence and great beauty of design. While hand-spun yarns continued to be used as weft elements in coarser utility articles, ravelings of a red cloth, imported from England and called in Spanish bayeta, were prominent in loom goods intended as body coverings. Bayeta provided a shade of red brighter than could be obtained from the native dyes then available. Three-ply yarns (Saxony and zephyr) of European manufacture were also introduced by some traders.

After the mid-1870s the importation of bayeta and other foreign yarns declined. Four-ply yarns (Germantown type) made in the United States were often substituted. At about the same time the increase in the availability of manufactured clothing and other textiles brought about a gradual shift in the type of articles woven. Since 1890 the Navaho have woven only saddle blankets and women's sashes for their own use, concentrating the bulk of their production on floor coverings purchased by whites. These rugs are of varying quality and aesthetic appeal. Commercial dyes of garish colour have frequently been employed, and outlandish designs (railroad trains, flags, masonic emblems and the like) have sometimes been woven. On the other hand, many rugs of the 20th century have been produced in the natural colours of white. black, brown and gray or in the soft tones derived from vegetable dyes. A small number of rugs reproducing sand paintings have been woven, often by the few Navaho men who weave. In the past all adult Navaho women knew how to spin, card and weave, and most of them produced rugs, at least occasionally.

The Navaho Today. — In spite of the activities of missionaries and of U.S. government officials, Navaho religion and social behaviour remained — except in areas immediately adjacent to the railroad and the highway — little altered until about the time of World War II, when several thousand tribesmen entered the armed services and thousands more worked in defense industries. The period after 1946 was one of vast change. Many Navaho moved into white-style cabins and began to dress much like their non-Indian rural neighbours. The level of literacy and of competence in English greatly increased. After 1955 the vast majority of children of school age were receiving instruction, as opposed to a minority in earlier years; 26,787 Navahos between the ages of 6 and 18 were in school in 1957 — 91% of this age group. The tribal council, using funds accruing from gas, oil and mineral royalties. was providing loans and scholarships for hundreds of young people to attend college or pursue other forms of advanced training. In 1956–57, 294 Navaho were attending institutions of learning beyond the high school level. The council was also vigorous in building roads and motels to attract tourist income, and in inviting small industries to locate on or near the reservation.

The income of the tribe from oil and gas leases and royalties came to $1,500,000 for 1956. In the same year tribal income from other minerals came to about $500,000, and there were also substantial increments from timber and other tribal properties. In addition, the tribe has received very sizable lease bonuses — about $45,000,000 from 1950 through 1957. The tribal budget for 1958 went to more than $14,000,000, of which about half was allocated to capital investments. The remainder was assigned to such categories as community services, legal and judiciary, management of minerals and range lands and operations of the tribal council.

There remained many serious problems for the tribe. Per capita income was low. About 1,590 Navahos were the recipients of public financial assistance in 1957. Of those relocated off the reservation nearly 40% had returned; yet the reservation could not support steadily increasing numbers. Young people who received training beyond high school found it difficult to obtain positions with salaries appropriate to their skills.

Death rates were still very high; of major causes of death only those for heart disease and malignant growths were appreciably lower than for the United States as a whole. Tuberculosis and certain diseases of the intestinal tract were nine times as great and accidents and various diseases of early infancy twice as great as the U.S. average. *See* INDIAN, NORTH AMERICAN: *Southwest Periphery; see* also references under "Navaho" in the Index volume.

NAVAL ACADEMY, UNITED STATES: *see* MILITARY, NAVAL AND AIR ACADEMIES.

NAVAL AFFAIRS (ARTICLES ON). The survey article SEA POWER analyzes the nature of the influence that navies and naval bases have exerted on the course of history. and the contributions to combat strength of ships of various categories. The principles of naval warfare are outlined, and illustrated in terms of decisive battles, in NAVAL STRATEGY AND TACTICS; ATLANTIC, COMMAND OF THE; and PACIFIC, COMMAND OF THE.

The roles of the various components of a navy in contesting control of the sea lanes and in serving as mobile bases for artillery and aircraft are summarized in FLEET. NAVAL. Individual types of warship are described, and their historical backgrounds and contemporary roles discussed. in a series of articles that includes AIRCRAFT CARRIER; BATTLESHIP; CORVETTE; CRUISER; DESTROYER; FIRESHIP; FRIGATE; MONITOR, NAVAL; and SUBMARINE. Navies of antiquity and the strategic plans around which they were built are discussed in NAVIES, EARLY HISTORY OF.

Articles on naval installations include DOCKYARDS AND NAVAL BASES; and BUKKERING, SHIP. NAVAL SCHOOLS, U.S., describes the general educational program and specific types of functional training for enlisted men of the U.S. navy and naval reserve. The training of professional officers is treated in MILITARY, NAVAL AND AIR ACADEMIES.

Various shipboard activities in war and peace are covered in such articles as GUNNERY, NAVAL; KNOTS; NAVIGATION; RULE OF THE ROAD AT SEA; SEAMANSHIP; and SIGKAL COMMUNICATION. Articles on equipment include ARMOUR, NAVAL; BUOY; ECHO SOUNDER; LOG, MARITIME; MINE, NAVAL; PARAVANE; RADAR; RADIO; SONAR; TORPEDOES; etc.

Specialized phases of naval warfare, in addition to those mentioned above, are described in BLOCKADE; COAST DEFENSE; and CONVOY. Articles devoted to special branches of naval service include COAST GUARD; MARINES; and SEABEES.

Many articles deal in whole or in part with the relationship between sea power and international relations. These articles include ANGARY, RIGHT OF; CONTRABAKD; EMBARGO; MARE CLAUSUM AND MARE LIBERUM; NORTH ATLANTIC TREATY ORGANIZATION; PARIS, DECLARATION OF; PRIZE COURTS AND PRIZE LAW; STRAITS QUESTION; VISIT AND SEARCH; WATERS, TERRITORIAL; WATERWAYS, INTERNATIONAL; etc. Additional listings are given under INTERNATIONAL RELATIONS (ARTICLES ON).

Articles on wars and major campaigns that contain sections on naval warfare include AMERICAN CIVIL WAR; AMERICAN REVOLUTION; DARDANELLES CAMPAIGN; DUTCH WARS; FRENCH REVOLUTIONARY WARS; NAPOLEONIC CAMPAIGNS; SEVEN YEARS' WAR; etc. Additional articles are devoted to great naval battles; *e.g.,* ARMADA; COPENHAGEN: *Battle of Copenhagen;* CORONEL, BATTLE OF; DOGGER BANK; FALKLAND ISLANDS, BATTLE OF; FIRST OF JUNE; JUTLAND, BATTLE OF; "MONITOR" AND "MERRIMACK," BATTLE OF; NAVARINO, BATTLE OF; NILE, BATTLE OF THE; QUIBERON, CAMPAIGN AND BATTLE OF; SAINTS, BATTLE OF THE; ST. VINCENT, BATTLE OF; TOULON: The *Battle* of *Toulon* (1744); TRAFALGAR, THE BATTLE OF; YORKTOWN.

Further information on the historic encounters of individual navies and on their contemporary status will be found in history and defense sections in articles on nations; *e.g.,* FRANCE; GERMANY; GREAT BRITAIN; UNITED STATES (OF AMERICA).

Questions of administration and personnel are dealt with under ADMIRAL; ADMIRALTY; INSIGNIA, MILITARY; MEDICAL SERVICES, MILITARY; MIDSHIPMAN; STAFF, NAVAL; UNIFORMS; etc.

Articles on related topics include those listed under MILITARY AFFAIRS (ARTICLES ON); also, such articles as BOAT; SEAPLANE; SHIP; and SHIPBUILDING (MERCHANT AND NAVAL).

Biographical articles summarize the careers of the great naval strategists and tacticians.

Wherever comprehensive information on a topic is desired, the Index should be consulted for an inventory of material connected with it.

NAVAL ARCHITECTURE is the art and science of designing boats and ships to perform the missions and to meet the requirements laid down by the prospective owners and operators. It involves knowledge of mechanics, hydrostatics, hydrodynamics, steady and unsteady body motion, strength of materials and design of structures. A good naval architect and ship designer must have experience in a number of fields of engineering. He must also understand the characteristics and properties of construction materials and be familiar with the latest and best methods of fabricating parts and joining them. Like other branches of engineering, naval architecture involves estimates and predictions of the final performance of the ship and all its parts. Such calculations must be made while the ship is still in the paper stage in the form of plans and specifications.

This article is divided into the following sections and subsections:

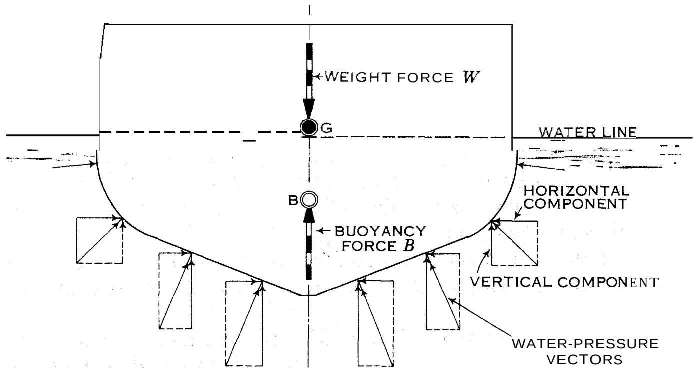

FIG. 1.—FORCES ACTING ON A SHIP HULL AT REST IN CALM WATER

I. THE MISSION OF A SHIP

The detail requirements for any given ship are made up on the basis of its mission. Just how much cargo and how many passengers is it to carry? What are the limitations on draft in the harbours it must enter? What is to be its maximum or sustained speed, and under just what conditions? What must be its cruising radius. in terms of days as well as of distance? For a tug, the towing pull or free-running speed must be stated. For an icebreaker, capacity to push its way through ice of a specified thickness must be shown. For a warship, the armament must be given, and the boundaries to be protected by armour must be specified.

The wide variety of missions for watercraft produces a great number of distinct and specialized types. Considering naval architecture and design. these are subdivided roughly into two main classes, warships and merchant ships. But the distinction is not alnays a sharp one. A naval transport may closely resemble a merchant passenger ship, and may be designed in the same way. A fast motor cruiser may be designed like a PT boat nithout torpedoes, guns and depth charges. In fact, the navy of any nation includes many merchant types, among them store and supply ships. oilers, ammunition- and missile-supply ships, repair ships, tenders for small craft, hospital ships and personnel transports.

II. WEIGHT AND BUOYANCY

1. Hydrostatic Forces.—A ship floating at rest in calm water is acted upon by two gravity forces: weight and buoyancy. Weight is the downward force on the ship. The total weight force (W) acts on the ship as if it were concentrated at the balancing point or the centre of gravity (G). Buoyancy is the upward force of all the hydrostatic pressures on the hull. The horizontal components of the water pressures on unit areas of the ship's sides and bottom, increasing with depth, act in opposite directions and cancel each other (fig. 1). The vertical components of the water pressures on unit areas combine to form an upward force (B) equal to the weight of the water displaced by the underwater hull volume. This weight varies slightly with the specific gravity of the water. The centre of buoyancy (B) lies at the geometric centre of the immersed volume. The ship sinks in the water until the force B exactly equals the force W.

2. Calculation of Ship Weight and Buoyancy **Volume.**—In an early stage of the design, the ship weight is estimated as the sum of the weights of the cargo, hull, fittings! equipment, propelling and auxiliary machinery, piping systems. electrical and electronic gear, fuel, water, consumable stores, passengers and crew, plus a margin of a few per cent for weights that are underestimated. At a later stage the weights are calculated more precisely, or are taken from actual weights of similar items. In many cases, the weight estimates are revised constantly as the design proceeds to avoid an ultimate overweight that might detract seriously from the ship's performance.

The underwater volume of the ship under design must be adequate not only to displace a weight of water that will support the entire ship, but it must be so disposed in length, breadth and height and so shaped in every part that all the other operating and naval architectural requirements are fulfilled. When the ship is built and fully laden it must float level and upright at the designed water line (fig. 2).

As the naval architect fashions the underwater and above-water portions of the hull and maintains a running check of the estimated weights and calculated buoyancy volumes, he also keeps track of the products of these weights and volumes times the horizontal fore-and-aft distances or "moment arms" of each from the transverse vertical reference plane at mid-length. These products are known as the longitudinal weight and buoyancy moments.

To carry out these operations systematically, the underwater hull is divided into segments by imaginary transverse planes called stations. There may be 10 such segments for a boat, 40 or more for a large ship. The volume of each segment is computed together with the position of the centre of volume for each. The forward and after moments of volume are then computed in the same way as for the fore-and-aft moments of weight. A summation of the individual segment volumes gives the total underwater hull volume. The fore-and-aft positions of the centres of gravity of the individual weight groups are then estimated. Separate sums are kept of the moments of these groups forward of and abaft the mid-length. Dividing the total underwater hull volume by the volume per unit weight of the fresh. brackish or salt water in which the ship is to run gives the neight of nater displaced This must equal the total neight if the ship is to float at the designed water line. The net weight moment. forward of or abaft mid-length, is divided by the total weight to give the distance at nhich the centre of gravity (G) lies forward of or abaft the mid-length. The same operation for the volume moments gives the fore-and-aft position of the centre of buoyancy (B).

3. Achieving Level Attitude or Trim.—For the ship to float at the level attitude or zero trim desired, G and B must lie in the same vertical transverse plane (fig 2). If their calculated positions are different, and the size, proportions and shape of the underwater hull are satisfactory, it is customary to shift the weights within the hull until the desired trim is attained.

In practice, the record of estimated weights and fore-and-aft moments is accompanied by a record of vertical moments above the keel (K) or the base plane. From this it is possible to estimate the position of G above K. At the same time, a record is made of vertical moments of buoyancy. When summed up and

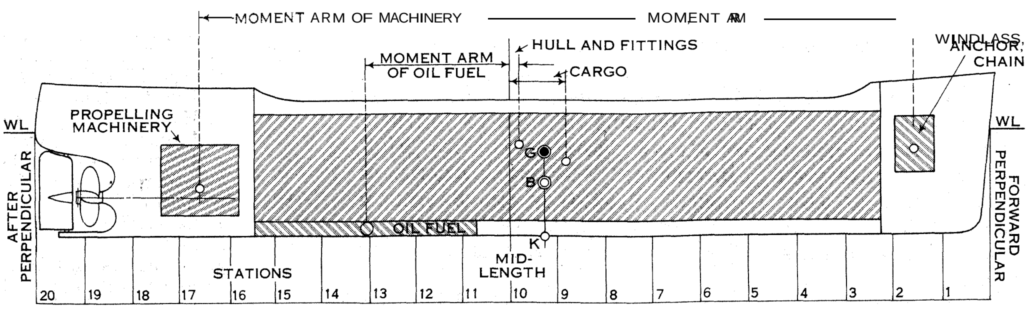

FIG. 2.— CENTRES OF BUOYANCY, GRAVITY AND PRINCIPAL WEIGHTS FOR A SHIP

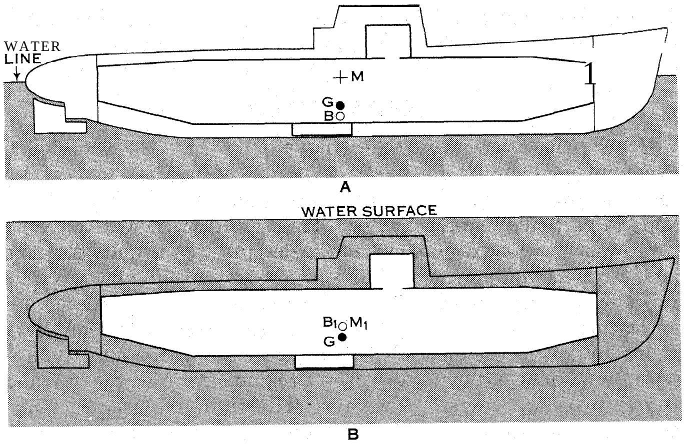

FIG. 3.— RELATIVEPOSITIONS OF CENTRES OF BUOYANCY AND GRAVITY FOR A SUBMARINE (A) DURING SURFACE CONDITION WHEN MAIN-BALLAST TANKS ARE EMPTY TO PROVIDE RESERVE BUOYANCY AND (B) DURING SUBMERGED CONDITION WHEN MAIN-BALLAST TANKS ARE FLOODED

B = centre of buoyancy of the outer hull; B_1 = centre of buoyancy of pressureproof hull

divided by the volume, these give the position of B above the keel. Both the distances $\overline{KG}$ and $\overline{KB}$ are required for estimating the metacentric stability, discussed below.

If, when the ship is built, the actual weights and volumes, or their centres, do not agree exactly with the estimated values (some equipment may have been added during the construction period), the ship floats at a water line slightly different from that contemplated by the operator and designer. For a surface ship this difference is usually of no great importance. However, for a submarine, *W* and B must equal each other exactly. It is' also important to ensure that, when submerged, the centres G and B are in the same transverse plane, so that the craft floats level when stopped under water (fig. 3).

The weights and weight moments for a submarine are estimated and calculated exactly as for a surface ship but two separate volumes must be calculated, one for the surface condition. nith main-ballast tanks empty, and one for the submerged condition, involving principally the volume of the pressureproof hull. To the volume of the latter there must be added the water-excluding volumes of all parts external to it. Among these are the outer hull structure, shafting, propellers, rudders and diving planes, anchors and chains, masts and periscopes, and the great multitude of external items. For every seven tons of solid steel in this category, about one ton of buoyancy force is gained.

III. METACENTRIC STABILITY

1. Concept of the **Metacentre.**—One would think, at first sight, that the average surface ship of fig. 1, nith its weight concentrated above its point of support (considered as the centre of buoyancy), would fall over like a top that has stopped spinning. But if properly designed it does not do so, because as the ship is inclined transversely. say by a strong wind, the centre of buoyancy of the immersed portion of the hull shifts sideways, in the same direction as the inclination. This is because the volume of the wedge of emersion (fig. 4) shifts to the low side, in the position indicated for the wedge of immersion. At the new inclined water line (W_1L_1) the centre of buoyancy moves from B to B_1. The total buoyancy force continues to act upward along the true vertical, now in the direction of B_1M. Provided no weights shift as the ship inclines, the centre of gravity remains at G, in the keel-to-deck centreline. The buoyancy force acting upward along B_1M and the weight force acting downward through G produce a righting moment $W(\overline{GZ})$ which acts to return the ship to its upright position.

For small angles of inclination 4. say less than 10°, the verticals through the shifted centres of buoyancy intersect the ship centreline at or close to a point M, called the metacentre. The stability provided by the action described is therefore called metacentric stability. For the situation diagramed in fig. 4, the one most often encountered in practice, it is transverse metacentric stability. For a similar situation in which the ship is inclined or trimmed in its fore-and-aft centre plane, it is longitudinal metacentric stability.

If the centre of gravity of the ship is too high, as at G_1 in hg. 4, the righting moment for any inclination is negative; that is, it acts to incline the ship still further. The ship then has transverse metacentric instability. Whether it will capsize or not depends upon whether the position G_1 is overtaken by the vertical through B_1 as the inclination increases. If so, the ship remains in that inclined position, with a righting moment that is practically zero.

2. Indexes of Metacentric Stability. — The distance $\overline{GM}$ for positive stability, known as the metacentric height, is taken as one index of the degree of metacentric stability. The other is the range of stability, or the angle of inclination at which the metacentric height diminishes to zero. For example, when a ship is heeled transversely until the depressed deck edge goes under water (fig. 4[B]), the centre of buoyancy B_2 cannot move to the inclined side far enough to keep the metacentre M_2 well above the centre of gravity G_2 on the ship centre plane. At a critical inclination the metacentre lies at the centre of gravity and the righting moment disappears. For inclinations beyond this the metacentric height becomes negative, the righting moment becomes a capsizing moment and the ship rolls over.

A greater range of metacentric stability is built into a ship by raising the uppermost watertight deck to a higher position above the calm-nater plane of flotation. The ship can then heel to a greater angle before water comes over the lower deck edge. For a craft like a sailing yacht, with a deep, heavy stabilizing keel, the deck edge can actually go under water and the range of positive stability can extend to large angles, provided water is kept out of the hull as the water level climbs higher and higher over the inclined deck.

The desirable value of transverse $\overline{GM}$ varies with the type, size and service of the ship. but within limits it is still subject to the experience and judgment of the naval architect. It averages from 0.04 to 0.06 of the beam but may be as high as 0.10 of the beam for combatant vessels subject to heavy damage. For fishing vessels it may have two values, one for the outgoing and one for the return or loaded part of the voyage. The range of positive transverse $\overline{GM}$ for a normal ship to run in the open sea is usually in excess of 40° and may run as high as 70° or more, provided the hull remains intact and the weights do not shift.

3. Vertical Position of **Metacentre.**—The height of the metacentre above the keel. or other selected point, depends upon the shape and size of the underwater body and of the at-rest water line. The total height $\overline{KM}$ (fig. 4) is the sum of the height $\overline{K}$B of the centre of buoyancy above the keel and the height B$\overline{M}$ of the metacentre above the centre of buoyancy, The latter is known as the metacentric radius. The distance KB can be estimated by an approximate formula; it can be calculated by procedures applying to irregular volumes; or it can be determined by a mechanical integrator. The distance $\overline{BM}$ is the quotient of **I** divided by V, where *I* is the square moment of area of the water line plane from W to L (the sum of each unit of area multiplied by the square of its distance from the centreline) and V is the immersed

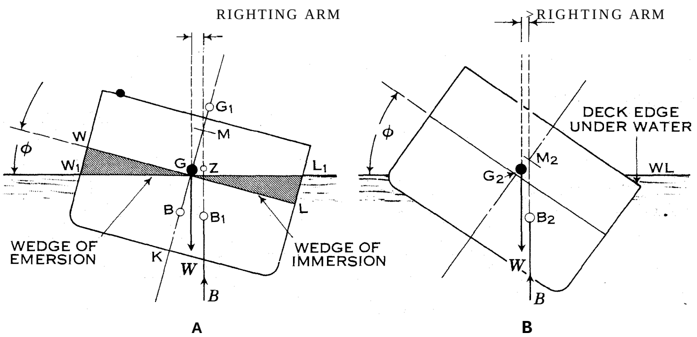

FIG. 4.— FORCESACTING ON A SHIP WHEN HEELED

volume. For a given ship length and underwater volume, both I and $\overline{BM}$ are proportional to the cube of the beam, so that the latter is an important factor in transverse metacentric stability.

4. Vertical Position of Centre of Gravity.— The vertical position of the centre of gravity is as important as that of the metacentre in determining metacentric stability and the behaviour of the ship at sea. For a cargo ship, or even for a warship. this position may change by many feet, depending upon the nature, amount and vertical position of the loads, fuel and stores. Ballast may be used to increase the total moving mass in a seaway or to place G in a more advantageous position. Ice accumulating on the upper works of fishing boats, trawlers and other small craft may be so thick, so heavy and so high above the normal centre of gravity, as well as so difficult to remove at sea, that G rises above M and the craft capsizes.

5. Inclining Experiment.— Fortunately, the naval architect is able to make a full-scale check of the predicted or calculated metacentric stability before the completed ship goes to sea. By shifting liquids or solid masses whose weights and offset positions are known accurately, the centre of gravity of the whole ship is shifted and the ship is heeled. This shift, corresponding to the distance $\overline{GZ}$ in fig. 4, is sideways for a determination of transverse $\overline{GM}$ and lengthwise for a measurement of longitudinal $\overline{GM}$. The angle of inclination ϕ of the ship for each such shift is measured accurately with special devices. Then from the relation $\overline{GZ} = \overline{GM} \sin \phi$, the actual metacentric height GM is determined for that loading condition. The height of the centre of gravity above the keel is then calculated from the relation $\overline{KG} = \overline{KB} + \overline{BM} - \overline{GM}$.

6. Stability **of Submarines.**—When a submarine is in surface condition its metacentric stability situation is the same as that of any surface ship. When diving or submerging its water-plane area diminishes progressively to a negligible amount. The square moment of area I_T of this plane likewise diminishes and with it the value of $\overline{BM}$. Moreover, as the main-ballast tanks are flooded and the pressure hull is taken under, buoyancy is transferred from a low to a high position, so B rises in relation to the hull. Since G remains in its original position, M drops to the vicinity of G. Indeed, for some moments during diving and surfacing it may be below G, with a negative $\overline{GM}$. The flooding, venting and blowing of the main-ballast tanks, with separate port and starboard controls, enable the submarine crew to counteract any list that may develop during this brief transition period.

When the submarine is under the surface the water-plane area is zero, as is $\overline{BM}$. This means that B_1 and M coincide (fig. 3). In this condition B_1 is higher than G, so that the action of the buoyancy force and the weight force produces a stable situation and the craft is said to have pendulum stability. $\overline{B_1G}$ (or $\overline{GM_1}$) then replaces $\overline{GM}$ as the criterion of both transverse and longitudinal stability.

IV. ARRANGEMENT

Despite the many ships of each type that have been designed over the years and the general similarity of various spaces and their locations within the types, ship operators still find advantages in particular arrangements. This situation reveals the variety of combinations possible when the designer endeavours to make large-scale compromises with both major and minor features. Propelling machinery at the stern with crew accommodations and navigating spaces in one group aft over the machinery represents efforts to devote the most useful spaces to the cargo and to concentrate services and living spaces in a region clear of cargo-stowing and cargo-handling areas. Naval architectural requirements impose limitations concerning weight distribution, metacentric stability, hull strength and stiffness and subdivision and damage control which can rarely be disregarded.

1. General Arrangement Features by Ship Type.—A brief tabulation of principal ship types serves to highlight the arrangement features characteristic of each.

Passenger liners for ocean crossings, carrying only passengers, baggage and incidental cargo, devote large volumes in the most comfortable part of the ship to passenger accommodations, with large additional volumes for public spaces in deckhouses and superstructures. The propelling machinery, uptakes and hatches are placed clear of the accommodations.

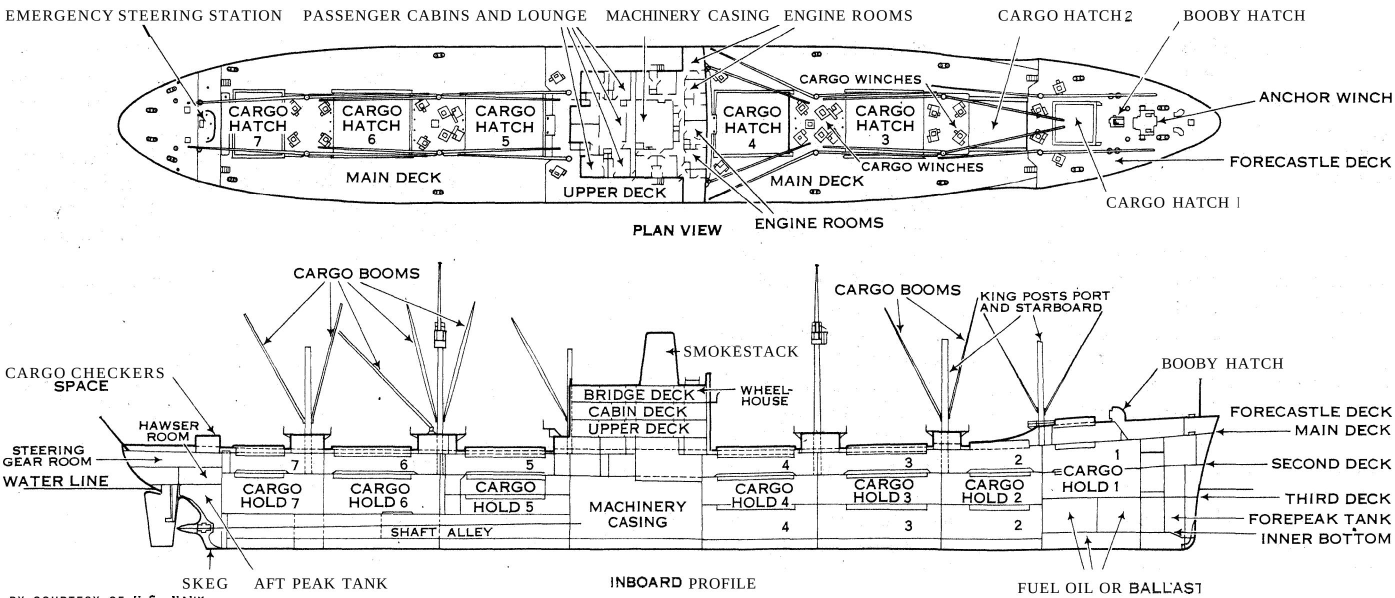
Passenger ships for service on rivers and in protected waters utilize deck and superstructure volume as passenger spaces for practically the entire length. Excursion ships for day service extend the accommodations to overhangs beyond the main hull.

Combined passenger and cargo ships devote the most comfortable positions to the passengers without encroaching unduly on storage and handling facilities for cargo.

General dry-cargo ships provide the best available spaces and facilities for the cargo hatches, side-loading ports and holds (fig. 5). The propelling machinery is preferably aft, to keep the best cargo spaces clear; means are provided to trim the ship with liquids in ballast tanks.

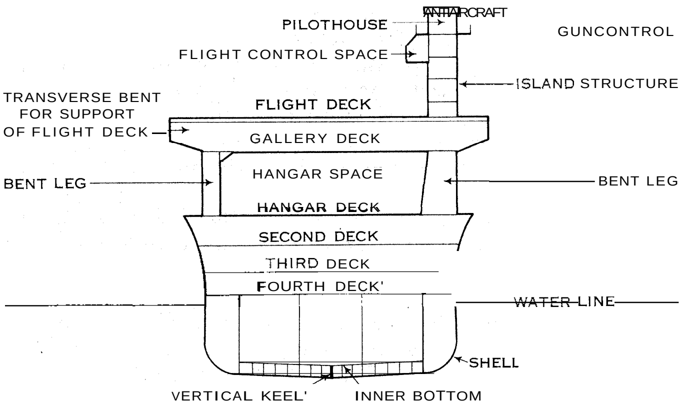
Container ships, roll-on-roll-off ships, seatrains and car ferries embody special arrangements of structure, machinery and crew spaces to keep them clear of the spaces for large containers and for wheeled vehicles.

Bulk-cargo carriers. for solids or liquids or both, are the ultimate in large, single-purpose ships, with everything possible sacri-



BY COURTESY OF U S NAVY

FIG. 5.— PLAN OF WEATHER DECKS AND INBOARD PROFILE OF A "MARINER" CLASS CARGO SHIP



BY COURTESY OF U.S. NAVY

FIG. 6.— CROSSSECTION OF AN AIRCRAFT CARRIER

ficed to cargo capacity.

Aircraft carriers (*q.v.*) have flight decks of the greatest practicable area, even to the extent of using overhangs beyond the main hull. High hangars under the flight deck (fig. 6) provide storage and repair space for aircraft. Internal and deck-edge elevators move these craft to and from the flight deck.

Submarines (*q.v.*) are of the double-hull type. with a ship-shaped outer hull of relatively light construction, if their mission calls for high speed and good sea-keeping qualities on the surface. If submerged performance is the primary function they have single hulls of suitable shape. The volume between the heavy inner and light outer hulls of a double-hull craft is devoted to carrying fuel and ballast liquids which need not be protected from hydrostatic pressure.

Underwater cargo vessels or submersible bulk carriers also require some of their bulk volume devoted to main-ballast tanks, by the blowing of which the craft may be lifted with its deck above water and aith its bottom high enough to clear the beds of estuaries and harbours. (See also SHIP.)

2. Cargo Handling.— The ship arrangement must lend itself to getting the cargo and other objects in and out as well as to carrying them from one port to another. Indeed, speed in loading and unloading cargo is just as important as speed through the aater. Access to the holds and to the internal deck spaces is provided by hatches through the decks and by doors in the ship's side leading to the deck storage areas.

Ships carrying dry general cargo usually are equipped with their own handling gear. This enables them to transfer cargo in any port and to load to and from lighters in places where they must anchor offshore. Some bulk-cargo ships carry a huge swinging boom nith a belt conveyer running on it, by which material may be dumped in high piles at a distance from the ship's side. Freight cars are loaded and unloaded from seatrains by special dock cranes that pick up an entire loaded car. Liquid cargo is pumped aboard through flexible pipes from storage tanks on shore; the unloading is invariably done by the ship's own high-capacity pumps.

3. Watertight Closures.—Whatever the mission of a craft, or the arrangement of major and minor features adopted, nater must definitely be excluded from the hull under severe operating conditions. This calls for strong. tight closures for openings. including doors, port covers and protectors for glass windows. It also requires the watertight and wave-resistant sealing of large openings such as cargo hatches. On many ships these openings are closed by heavy meta! covers handled by mechanical power and capable of secure sealing and locking. The structure surrounding these openings must be so rigid that its deformation under nave or sea loads or other service conditions does not jeopardize the watertightness of the cover.

4. Ballast **Tanks.**—When a ship is running rather light, carrying little or no cargo, and with its hull relatively high out of water, it is at a disadvantage in winds and waves It needs added inertia to help it drive through waves, added weight to put the hull farther donn in the water and more mass high in the ship to reduce the righting moment and to ease the rolling. These needs are met by building in tanks that can be filled with fresh water or reserve fuel. The tanks are easily emptied when the weight is no longer desired. Anknard and inaccessible places in the hull, where neither cargo, machinery nor useful load can be placed to advantage, can often be used for these tanks.

All submarines, whether they have two separate hulls or not, carry main-ballast tanks. These are empty when the craft is on the surface; they help to lift the bridge. the deck and the hatches above the water and to provide reserve-buoyancy volume mhen rolling and pitching in waves. By opening flood valves at the bottom and air-vent valves at the top, these tanks may be completely flooded with sea water to make the craft submerge. To raise the submarine, the vent valves are closed and the water is blown out by compressed air. Another set of tanks, called the variable-ballast tanks. have water taken into or pumped out of them from time to time to keep the weight of the submarine always equal to the weight of the water displaced by the buoyant volume. When a submarine runs from salt water into brackish water having less weight per unit volume, some water must be pumped out of the variable-ballast tanks because the supporting forces are less in the lighter water.

V. RESISTANCE AND PROPULSION

The resistance to forward motion of a ship is of three principal kinds: friction; wave making; and separation or eddy making. Friction or viscous resistance is caused by the necessity for accelerating liquid particles in a forward direction as the bow continually runs into a region of liquid at rest. The layer of accelerated particles, augmented by vortex motion and turbulence, becomes progressively thicker as it moves aft, forming what is known as the boundary layer. The vortexes and disturbances in this layer are visible in the belt of "confused" water around a moving ship at the water line. The energy in this layer represents the work done by the ship in overcoming viscous resistance. It is eventually dissipated as heat and is not recovered.

Wave-making resistance is caused by transferring kinetic energy in the ship to energy in the surface or gravity wave system which accompanies it. While the configuration of this system near the ship remains fixed for a given speed, waves are continually left astern and the energy in them is lost.

Separation is caused by the lack of sufficient pressure in the water (see *Separation* Resistance, below) in a given region to force this water laterally inward and to make it flow closely along all parts of the ship. especially in the tapering or blunt after portion. In the region knonn as the separation zone, water is dragged in from astern to fill the gap that mould be left because the flow does not close in from the sides. Resistance is generated by the forward acceleration of nater that would otherwise flow aft and be left behind. The confused and eddying mass of water being dragged along in the separation zone abaft the square transom stern of a motorboat is clearly visible at low and moderate speeds. The added drag due to separation abaft the square stern of a skiff, immersed deeply by passengers sitting in the stern, is very real to the rower in that skiff.

1. Computing Friction Resistance.— For want of a better or more precise method, the friction resistance of a ship is computed from a knowledge of its wetted area and a friction value per unit area derived from the towing of flat planks or friction planes of various lengths at various speeds. By using very thin sections, sharply pointed at the ends, nave making and eddy making are eliminated. From the known towing forces and wetted area of the plank or plane there are derived a set of friction values per unit surface area of the plane. in terms of the towing speed For calculating the friction resistance of a ship at any given speed, it is usually assumed that the friction value for each unit of wetted-surface area is equal to that for a friction plane having the same length as the ship and toned at ship speed. The wetted area of the ship is calculated by averaging the girth at a series of stations equally spaced along the length and multiplying by the wetted length. The flat-plate friction data cannot be applied indiscriminately to the curved surfaces of ships. Effects of given curvatures are not well known but it is assumed that the friction resistance increases as the curvature becomes sharper.

Rough areas on wetted ship surfaces are caused by uneven plating and planking; laps, butts, rivet points and weld beads; anticorrosive and antifouling coatings of plastic paint and other materials; and fouling due to marine organisms. All of them increase friction resistance and the thickness of the boundary layer. For resistance calculations their effects are lumped in a general roughness allowance, which is added to the value of the friction for a given area of smooth surface.

2. Wave-making Resistance.— Information available to the naval architect on the surface waves generated by a moving ship is derived originally from the observations of John Scott Russell in the 1840s, the experimental work of W. Froude and R. E. Froude in the 1870s and 1880s and the analytic studies of Lord Kelvin in the latter decade. These showed that: (1) A gravity wave system is formed by a moving pressure disturbance. For example, drawing one's finger across a water surface makes waves. (2) Pressure disturbances exist where there are changes in curvature around a ship, such as those at the extreme bow and stern and at the "shoulders." (3) The progressive or traveling wave system caused by each pressure disturbance consists of two parts: (a) a diverging group of waves, with crests and troughs lying at a small angle to the direction of motion of the disturbance, and (b) a transverse group of waves, with crest lines slightly convex forward, where they cross the path of the moving disturbance. The diverging waves at the bow are easily seen on any moving boat or ship, as are the transverse waves abaft the stern on any craft which is traveling rapidly. The transverse waves of the bow system, modified by the forward shoulder system, are also indicated by the crests and troughs in the wave profile alongside the ship.

In addition to the progressive waves, whose shape remains the same for a given speed but which spread outward and aft, there is a water-level disturbance that moves along with the ship and whose elevations at the bow and stern and depression amidships are not radiated as gravity waves. There may thus be six or eight or more sets of water-level changes generated by the movement of one ship. The changes of elevation due to each are superposed so that two crests coinciding produce a sort of double crest, while a crest and a trough coinciding act to cancel each other.

From a resistance standpoint the most important progressive wave systems are generated at the bow and stern. The length of a gravity wave depends upon its velocity, and the velocity of a wave whose crest travels along with the bow must correspond to the ship speed. It follows, therefore, that the second, third and succeeding crests of the transverse bow series move aft along the ship as the speed increases. This means that at certain ship speeds a transverse crest of the bow system is superposed on the stern system in such manner as to build up a traveling mound of water at the stern. The internal hydrostatic pressure in this mound acts to push the ship forward and hence to diminish its wave-making resistance.

At other ship speeds the superposition of the bow and stern wave systems drops the water level at the stern, with no compensation for the hydrostatic pressure which the bow of the ship must push against at this speed. As a result the total resistance of a ship fluctuates above and below what is known as its "natural" resistance as the speed is increased and as the various progressive wave systems combine to produce beneficial or harmful effects (fig. 7).

The velocity of gravity waves varies as the square root of the product of the acceleration of gravity and the wave length. The forward speeds of the transverse waves generated by a ship correspond to the ship speed V. The interference effects described depend upon a relation between the wave lengths L_W and the ship length L, hence the wave systems are geometrically similar if the ratio of V to the product $\sqrt{gL}$ remains constant, where g is the acceleration of gravity. This ratio is the Froude number $= \frac{V}{\sqrt{gL}}$.

D. IT. Taylor simplified this relation in the 1900s to the ratio of the ship speed V in knots to the square root of the ship length L in feet. Thus the speed-length quotient = Taylor quotient $T_q = \frac{V}{\sqrt{L}}$.

When the estimated wave-making resistance is plotted on a basis of Froude number or Taylor quotient, humps and hollows show up in the curves, as shown in fig. 7, corresponding to the wave-crest and wave-trough positions in the three ship-and-wave profiles of that figure. The naval architect selects a ship length whose wave-making resistance will be less than its "natural" resistance when the ship is traveling at its most efficient speed.

The extreme case in this category occurs with the destroyerlike craft which, at a speed-length quotient of about 2.0 or a Froude number of about 0.6, rides largely on the back of its own first bow-wave crest with its stern in the first trough following. It is, in fact, constantly running uphill; part of its resistance, called the slope drag, is due to this action. A planing boat such as a speedboat is in a corresponding position, with bow high in the air and stern squatting deeply, when about to pass through what is known as its hump speed. As this speed is reached and exceeded: if the engine has ample power and the boat is not too heavy, the boat approaches and reaches full planing speed. Here it is literally riding on top of the first crest of its own bow-wave system. With its flat stern sliding gracefully over the water there is, in effect, no stern-wave system.

A great deal of theoretical work, having as its aim the calculation of wave-making resistance from the known form of a ship hull, produces resistance curves which resemble those obtained by toning tests in model basins. The work is still limited by certain mathematical simplifications and it appears that more physical laws, not yet fully known, will have to be taken into account before the method becomes practical for engineering predictions.

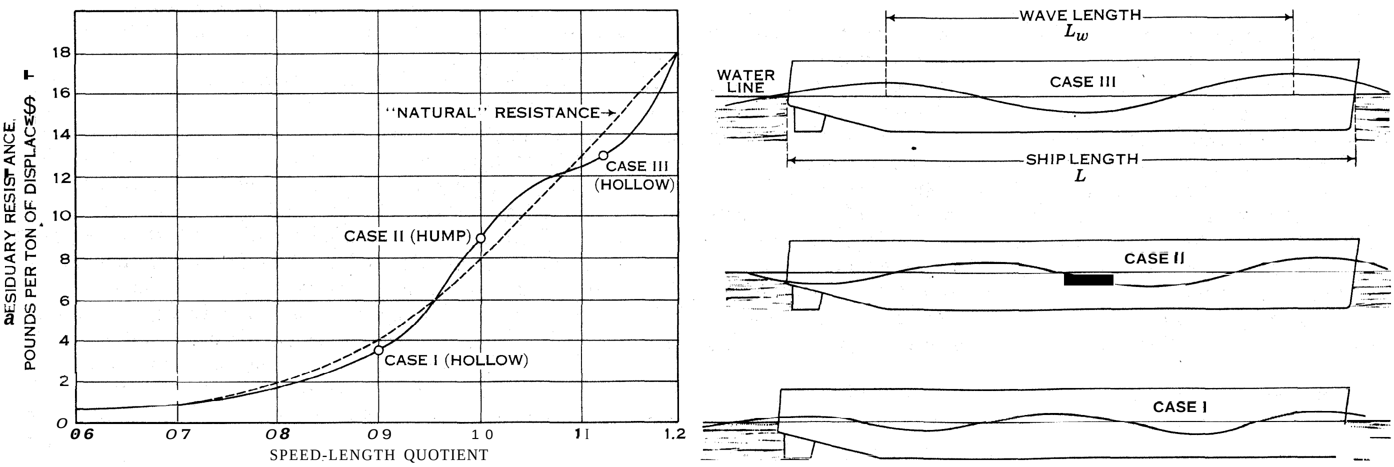


FIG. 7.— WAVE FORMATIONS CAUSING HUMPS AND HOLLOWS IN A GRAPH OF SHIP RESISTANCE. FOR CASE I, $\frac{L_w}{L} = 0.451$; FOR CASE II, $\frac{L_w}{L} = 0.557$; AND FOR CASE III, $\frac{L_w}{L} = 0.698$

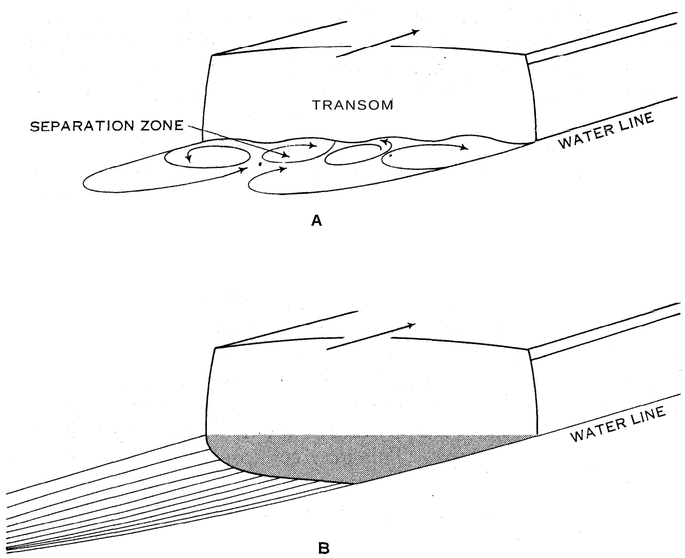

FIG. 8—SEPARATION ZONE AND AIR FILLED DEPRESSION ABAFT A MOTORBOAT (A) DURING SLOW SPEED AND (B) DURING HIGH SPEED, WHEN THE LOWER TRANSOM AREA IS EXPOSED TO ATMOSPHERIC PRESSURE

3. Separation Resistance.—The drag due to separation of the boundary layer from a ship surface, and to eddying and backwash in the separation zone, is a form of pressure resistance. This means that. like nave-making resistance and some types of roughness resistance, it is due to forces exerted at right angles to the hull surface. Like these resistances, it varies usually as the square of the ship speed.

Hydrodynamic knowledge of separation phenomena and the physical laws nhich govern them have not progressed to the point where the onset of separation can be predicted in advance aith certainty and uhere the magnitude of separation resistance can be calculated. It is known, however, that the pressure in such a zone is less than atmospheric, so that the water literally sucks backward on the ship. If air can be led to the zone to displace the eddying water, the suction is removed. When a motorboat with a square or transom stern extending below the water is speeded up until the stern "clears." the backwash and eddying disappear (fig. 8). With the square stern exposed to the atmosphere, the separation resistance also disappears.

4. Resistance of **Submarines.**—When a submarine submerges to a depth below the surface equal to four or more times its maximum diameter or its hull depth, the surface disturbance resulting from its forward motion becomes negligible and its wave-making resistance practically disappears. This is a great advantage, especially at high speed, despite the increase in wetted surface and friction resistance caused by taking the whole craft under the aater. However, much of the gear above the nater line in surface condition, such as flat decks, rails, anchors, capstans, chocks and similar fittings, are put there for operation on the surface. It is difficult to streamline them for low resistance under water. Moreover, minor irregularities which are accepted on the undernater hulls of surface ships become, when taken all together, major sources of added and unnecessary resistance on a submerged submarine moving at high speed.

5. Resistance in Shallow and Restricted Waters.—The forces on a ship traversing shallow waters are governed by the presence of solitary waves caused by ship motion and other disturbances. If the ship speed is slightly less than the solitary wave speed, the ship runs uphill on the back of this wave so that its hydrodynamic resistance is increased by the slope drag. If it can be speeded up so as to run slightly faster than the wave, it slides downhill on the face of the wave and its resistance is reduced below that of its deepwater resistance.

The speed of progressive waves of a given length is less in shallow than in deep water. If a tug, for example, is running at a speed in shallow water at which it has a crest at the bow and another at the stern, its speed must be decreased if the two crests are to be kept at the advantageous positions indicated. At the same time. the crests may be higher and the trough may be lower because waves become steeper as they enter shallow nater. A fast craft also squats more deeply at the stern when running in shallow water. In fact, this increase in squat may be sufficient to cause the craft to scrape bottom even though it has plenty of water under it when at rest.

When the clearance between the bottom of the ship and the bed of the water body is initially small, the water that flows under the ship is speeded up, with an increase in friction resistance on the ship. When the sides or walls of the channel are close to the ship, the lateral constriction speeds up this flow still further. Methods of approximating the increased resistance and the depth of water necessary to give the equivalent of deepwater resistance are available, based on the method of O. Schlicting (*Hydrodynamics in* Ship *Design,* vol. ii, ch. 61, 1957).

Self-propelled craft designed for efficient operation in shallow and restricted waters must have (1) provision for adequate flow of water to the propellers; (2) adequate shielding to prevent drawing air from the surface; and (3) rudders of extra-large area, usually one rudder abaft each propeller, to overcome the horizontal forces resulting from the closeness of adjacent banks or of other craft being met in a channel.

6. Ship **Form** for Minimum Resistance.—The art and the science of naval architecture have not yet progressed to the point where the form of a ship to meet given requirements, including minimum resistance at a given speed, can be fashioned by a direct method, starting with a clean sheet of paper. Nevertheless, certain general rules based upon hydrodynamics are available: (1) The use of easy and fair surfaces along the general paths followed by the water flow. Small changes of curvature in the flou lines are particularly important. (2) At and near the surface the flow lines must follow the surface or the wave profile. Since most of the wave-making resistance is generated by pressure disturbances near the surface, easy curvature is important there. Proof of good design in this respect is low wave crests and shallow troughs around the ship nhen running. (3) Most of the flow in almost any type of ship goes under the bottom rather than around the sides, hence the ship form must not interfere with it. (4) Submerged bulbs intended to produce surface-wave systems that will partly neutralize the crests and troughs produced by pressure disturbances elsewhere require careful design and positioning. (5) Probably the most important feature in shaping the hull of a self-propelled craft is to provide a good flow of water to the propulsion devices. So far as known, this calls for the highest practicable degree of uniformity of relative velocity over the whole thrust-producing area, the greatest possible degree of flow opposite to the direction of advance of the blades of the propulsion device and the greatest mass density of the water in uhich the device is to work. Concerning the last item, it is known that the water entering the propeller disks of destroyers and other high-speed craft contains many air and gas bubbles. In the aggregate, the reduction of mass density due to them can be appreciable.

7. Action of Propulsion Devices.—Thrust by a ship propulsion device acting on the water (or on the air) is produced by imparting sternward acceleration to a mass of that nater or air. The forward thrust is proportional to the product of the mass of fluid acted upon and the accelerating rate. For the most efficient propulsion, the mass should be large and the acceleration small. In a screw propeller, this calls for a large diameter and a small increase in relative backward velocity when water is passing through the propeller.

The thrust per blade of a propulsion device is measured by the reduction in pressure on the back or advancing side of the blade and the increase in pressure on the face or after side. As a rule, the former is much larger than the latter so that the blade draws or pulls rather than pushes itself through the fluid in which it works.

Modern propulsion methods for boats and ships include oars, sails, paddle tracks, paddle wheels, hydraulic and pump jets, airscrews, rotating-blade propellers and screw propellers. Screws are usually run in the open but for producing high thrusts at low ship speeds, as when towing, they may be surrounded by a fixed shrouding such as the Kort nozzle. Rotating-blade propellers offer the great advantage that the magnitude and direction of thrust can be varied at will, making them vastly more versatile than any known combination of screw propeller and rudder and giving the craft exceptional maneuverability. A tug fitted with one or more such propellers can exert a pull equally well in any direction with respect to its axis.

The number of propulsion devices depends upon the available power in each engine, the need for reliability or maneuverability, the limiting draft and many other factors. By the late 1950s shaft powers of 25,000 h.p. had been applied to single screws and in excess of 50,000 h.p. on each of four screws.

8. Interactions Between Propeller and Ship. — The operation of a screw propeller involves a number of interactions that are by no means fully understood. Part of the water through which the propeller moves is the boundary layer moving aft past the hull, with a relative velocity less than that at a distance. Another part of it lies within the wave crest (or trough) that runs along above the propeller. Because of these and other effects, the water moves at different velocities and in different directions in different parts of the propeller disk. In general, the ship drags the water along with it to a certain extent, so that its speed past the propeller is less than the ship speed. The difference is the wake velocity, and the ratio of this velocity to the ship speed is the wake fraction.

There are reduced pressures in the region forward of the propeller, resulting from corresponding pressures on the fonvard sides of the blades. These act to retard the ship, diminishing by a certain amount the usefulness of the full propeller thrust.

9. Efficiency of Propulsion. — The efficiency with which any mechanical propulsion device drives a ship is a product of three separate ratios. The first is the ratio of input to output when the device is running in open water by itself, as when a model is tested in a model basin. The second, known as the hull efficiency, is the ratio of the quantity representing the proportion of useful thrust to total thrust to the quantity expressing the ratio of the speed of advance to the ship speed. The third, known as the relative rotative efficiency, is the ratio of the turning moment on the propulsion-device shaft to produce a given thrust when the device is running in open water to the moment on the shaft when the device is operating in conjunction with the ship.

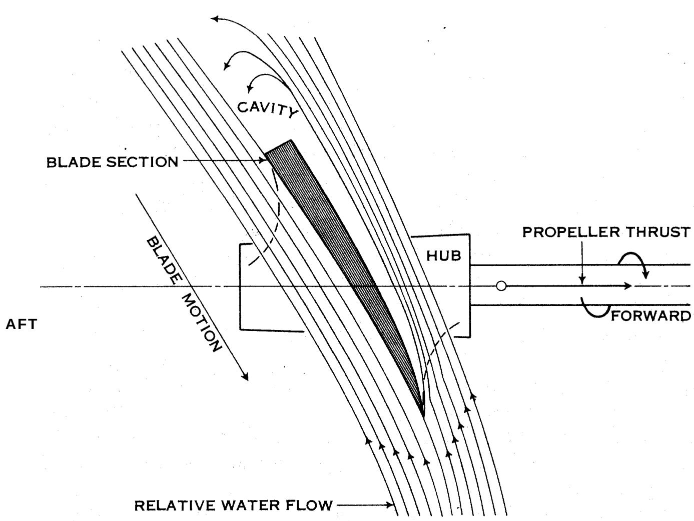

FIG. 9.—SECTION OF A SUPERCAVITATING PROPELLER BLADE

For ships having screw propellers, the efficiency of propulsion decreases as more propellers are added. It varies from 0.76 to 0.80 or more for a well-placed and well-designed single screw, from 0.65 to 0.72 for twin screws and from 0.60 to 0.64 for quadruple screws such as are carried by large liners and warships.

In practice. the open-water efficiency for a given size of propulsion device is found to vary in almost predictable fashion with the ratio of the thrust produced to the square of the speed of advance. This ratio is known as the thrust loading. Starting with this factor, it is possible to estimate in advance the shaft power required to drive a ship having a known resistance at any given speed.

10. Cavitation. — Any moving submerged body, like a screw-propeller blade, has to push the water aside as it moves. If it moves so fast that the surrounding pressure is not sufficient to cause the water which has been pushed aside to close in around the body and follow its contours, or if the pressure is so low that the same thing occurs when the blade moves slowly, the water either "opens up" or it leaves the blade. In the first case, bubbles are formed in it, each filled with water vapour. When they move along into a region of increasing pressure, they collapse suddenly. The resulting severe pressure fluctuations may cause pieces of the metallic blade surface to break off in an action known as erosion. In the second case, a relatively large vapour-filled cavity is formed next to the blade (fig. 9). This may collapse on the blade or at a distance behind it.

For screw propellers of normal form, any cavity next to the blade interferes with proper flow around it and usually has a harmful effect on thrust and propulsion. Cavitation can be minimized by proper attention to the design of the propeller. The shape selected for the section is one known to be relatively free from cavitation and one on which the reduced pressure is as uniform as possible along the chord (length) of the section, from leading to trailing edge.

At each radius the blade is made wide enough to carry the local thrust load at the velocity of and at the average water pressure for that radius. The use of large blade areas to delay cavitation must be balanced against the loss of efficiency caused by greater friction drag on the wider blades.

On supercavitating propellers of special design, the blades travel so fast that the water pressure is never sufficient to permit the flow to follow the blade. The vapour cavity is then allowed to expand until it covers the whole back of the blade. The pressure on the back approaches absolute zero while the friction on that side disappears, since the water no longer touches it. Propeller blades of this type. with sharp leading edges and blunt or square trailing edges (fig. 9), have been used successfully on racing motorboats since the 1920s. New techniques developed in the late 1950s permitted them to be designed by logical methods.

11. General Design and Positioning of Propellers. — The propulsion device should be treated as an essential part of the ship, not as a sort of appendage to the hull, and should be designed with it. The flow to and from the propulsion device, whatever its form, is a most important feature from the standpoint of efficient propulsion as well as avoidance of objectionable vibration. Fortunately, it is possible to "see" this flow on medium and large models in circulating-water channels, to study it at length and to correct unsatisfactory features of it while the ship is still in the design stage. Model techniques are also available to give the designer a reasonably good preliminary warning of excessively large periodic forces which may be generated on the ship if corrective measures are not taken.

Because of the great thrust sometimes exerted by the single blades of powerful propulsion devices and the rapid changes of pressure and velocity which take place near them, adequate clearance spaces must be allowed between these blades and the adjacent parts of the ship.

Propulsion devices mounted in transverse ducts or tunnels, extending through the thin ends of the ship from one side to the other, apply transverse forces or swinging moments when the ship is moving or stationary. These devices greatly improve the ship's handling qualities around docks and piers.

On shallow-draft vessels, screw propellers are fitted inside fore-and-aft arch-shaped recesses called tunnels. A large proportion of the propeller area is often above the at-rest water line, but if air is excluded from entering. the tunnel fills with water when the propeller starts rotating, permitting the latter to develop thrust over its entire area.

In many cases it is possible to select the principal features and proportions of a screw propeller by the use of one or more of the many sets of series charts based upon test results of systematic series of propeller models. The disadvantage of this method is that the designer is restricted to the number of blades, blade profiles and blade-section shapes of the models that have been tested. However, there are usually two or three sets of models which approximate what the designer has in mind so that with the data from these he may feel that his combination of tentative characteristics is rather well bracketed. If the designer feels that he may encounter cavitation or if he is able to spend more time on the project, a propeller may be designed rationally by methods described in the technical literature.

12. Model Experiments. — The towing of ship models to determine their resistance and similar characteristics was initiated in 1872 by W. Froude to take the place of limited knowledge of physical laws governing ship behaviour, complexity of the interactions encountered and lack of understanding of the effects of changes in shape and proportions. To make the procedure workable at all, Froude had to separate the friction resistance from the total observed resistance. After subtracting the friction resistance, estimated on the basis of tests which he made by towing flat planks, Froude called what was left the residuary resistance. For corresponding ship and model speeds, where the Froude numbers were the same, he extrapolated the residuary resistance on the basis that this resistance per ton of displacement was the same for both ship and model. The expanded friction and residuary resistances were then added to give the total ship resistance.

In later years, techniques were developed for the testing of propellers, for self-propelling ship models, for determining lines of flow and wave profiles and for measuring the effects of minute changes upon the total resistance. Nevertheless, many of the old problems remain, despite all the time, thought and effort devoted to their solution. Indeed, it appears that advances in knowledge in the field of hydrodynamics raise new problems faster than the old ones are solved. In spite of this, the model-test procedure has been of great assistance to naval architects and, in general, of great engineering value. All the maritime nations of the world have ship-model testing establishments and very few large and important ships are built without first testing one or more models of them.

VI. MANEUVERABILITY

All self-propelled craft, of whatever size, shape, form or type. are required to steer a reasonably straight course in both smooth and rough water, to turn so as to change course or heading or to take emergency evasive action, to start, stop and back and to perform any other desired maneuvers. Submarines are required to maneuver similarly in a vertical plane. including the operations of diving, depth keeping, hovering in one spot and surfacing.

1. Dynamic Stability of Route. — The ease and reliability of steering of a ship depend, among other things, upon whether or not it has dynamic stability of route. A self-propelled ship that is stable in this sense will, if left to itself with no rudder angle applied, continue generally on its original course. If disturbed by some external force. it may swing slightly or moderately to a new course. whereupon it will continue along that course or route until again disturbed. Most slender ships like destroyers are dynamically stable in route. Others of fat or chubby shape, if left to themselves and then disturbed. will swing farther and farther from the original route. A sign of route instability is the persistence of the ship in swinging one way after moderate corrective or opposite rudder is applied to stop the swing. A ship of this type may become positively unmanageable in shallow water, where the sluggishness of any ship is intensified.

2. Steering and Turning. — Steering involves corrections to bring a ship back to a given course or heading after it has deviated as a result of some disturbance. Steering by hand control is easier and more efficient if instruments in front of the steersman show almost instantly when these deviations begin. Gyrocompasses are far more satisfactory than magnetic compasses for this purpose. Further, a ship that is dynamically stable in route, but not too much so, and one that is not oversteered, requires only a small rudder angle and relatively infrequent use of the rudder. Automatic steering by gyro pilot is available for all sizes and types of ships.

Turning is involved when changing course, when maneuvering in formation with other ships and when following a curved channel. However, the most important turning maneuver for any ship is to sheer off suddenly and to get clear of its original course when danger is unexpectedly sighted ahead along that course. To clear the extension of its original path in the shortest distance and the least time, assuming that the ship is going too fast to be stopped completely, requires rapid laying of the rudder to the emergency

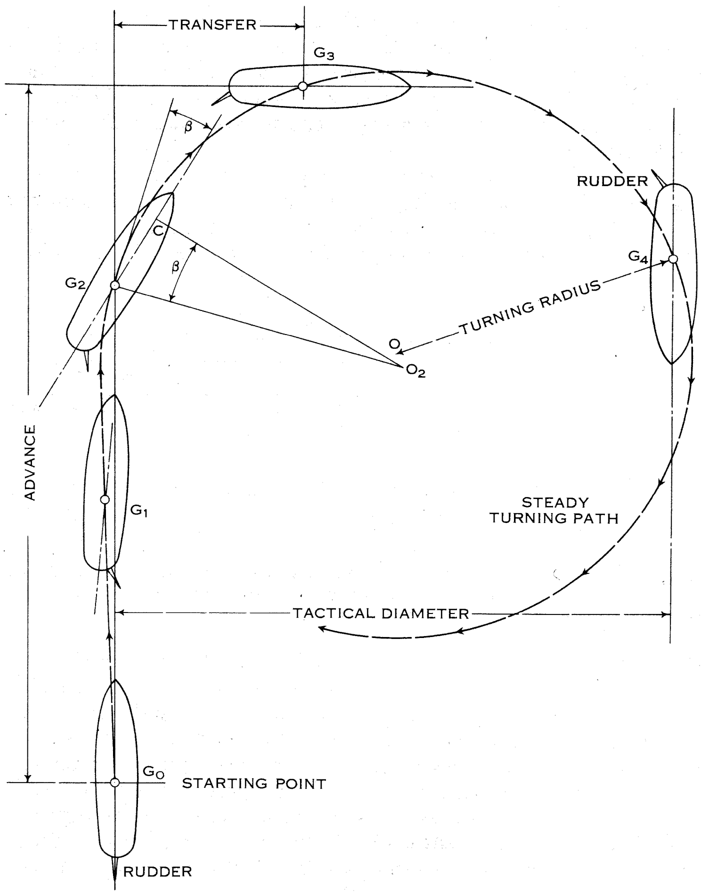

FIG. 10.— SUCCESSIVEPOSITIONS OF A SHIP WHEN TURNING

angle, rapid response of the ship in starting to turn and rapid motion of the ship to the right or left of the course to clear the danger ahead.

The rudder action serves not only to swing the ship in the desired direction but also to keep its bow pointed inside the path of its centre of gravity so that the inward-acting hydrodynamic force on the hull equals the outward-acting centrifugal force resulting from motion in a curved path. The amount by which the ship heads inside the instantaneou? direction of motion is the drift angle.

Fig. 10 shows the path, the positions and the orientation of the ship and the angles of its rudder when making a large change of heading. In the figure, the successive positions of the ship's centre of gravity are marked by G_0, G_1, G_2 . . . . At G_2 the instantaneous turning centre is at O_2. Actually, because the ship is swinging as though attached to a rotating arm. the uater seems to be approaching it along curved streamlines, nearly head on at the bow and at a considerable angle inward toward the stern. This angle of relative flow, involving cross flow at the stem from the outside toward the inside of the turn, acts to reduce the effective angle of attack of the rudder. At the point C the nominal flow about the ship is parallel to its centreline. To an observer on board, the ship appears to be turning about this point, hence it is called the pivoting point.

In the course of turning, especially with a large drift angle (β), the increased hull resistance causes the ship to slow down, sometimes involving a reduction of 40% or more of the speed with which it approached the turn. After the average ship has turned at least 90°, conditions become steady and its centre of gravity moves at uniform speed in a circular path with its centre at O.

In the steady-state portion of the turn the inward force caused by the drift angle exactly balances, in both magnitude and moment about the centre of gravity, the outward rudder force and the centrifugal force at the centre of gravity caused by the turning action. If the wind and sea were entirely quiet, the ship would continue to turn in a steady circle as long as the rudder was held at a constant angle and the speed remained constant.

Ability to steer a straight course or to turn readily is achieved in any given ship design by the use of a large rudder area. When the rudder is at zero angle, it serves as a vertical stabilizing fin. When angled, the large area provides the large swinging moment necessary for good turning.

3. Stopping and Backing.—Stopping in an emergency, as contrasted with normal coasting and gradual retardation, is achieved by slowing the propulsion device to less than driving speed and then by reversing its direction of thrust. If reversed too rapidly it is liable to overload the engine, to draw air down from the surface to the propeller in large quantities and to churn the air-water mixture into excessive turbulence without developing the maximum astern thrust. Capacity to start and stop quickly is built into a craft by providing an engine that will reverse rapidly and readily and by using a propulsion device with a large thrust-producing area. Both these features are stressed in the design of tugs.

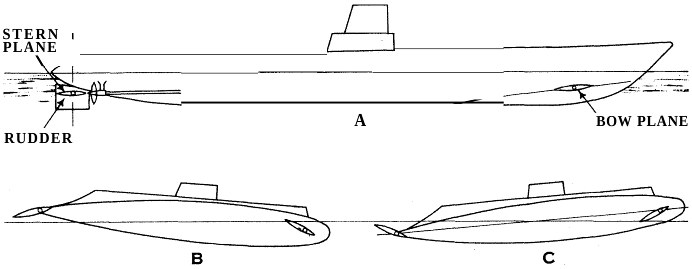

FIG. 11.—DIVING PLANE LOCATIONS AND POSITIONS ON SUBMARINES (A) IN NEUTRAL PLANE POSITION CONFORMING TO FLOW; (B) IN DIVING PLANE POSITION: AND (C) IN RISING PLANE POSITION

4. Rudders and Planes.—Rudders and other control surfaces are usually placed at the stern of a ship for several reasons. When placed abaft screw propellers, they benefit from the increased velocity in the propeller outflow jet or race. When a vertical rudder is placed at the bow, it causes the ship to turn with a smaller drift angle and hence a larger turning radius. If the rudder is attached to the bow, it is ineffective hydrodynamically in producing a swinging moment. In fact, a normal ship, 'when moving backward, steers only indifferently or not at all. The rudder also receives better mechanical protection at the stern than it would at the bow.

For craft that are required to back out of long slips, or even to back into harbour entrances, like the English channel ferries at Dover, a rudder is fitted at the bow. This becomes the trailing end when backing, and the ship steers satisfactorily with a rudder at that end.

A centreline rudder mounted between two widely spaced wing propellers benefits only little or perhaps not at all from the augmented water velocity in the propeller outflow jets. Adequate swinging effect is then achieved by mounting two rudders abreast, one abaft each propeller.

The diving planes for controlling the rise and dive angle of a submarine are placed at the stern, directly abaft the propellers, to benefit from the higher water velocity in that region (fig. 11). Bow planes, if fitted, are used principally to control the depth at which the craft runs. They are effective as control surfaces because only vertical forces, not swinging or diving moments, are desired and because they project from the hull and create up or down forces independent of the hull forces.

Control surfaces called flanking rudders are placed forward of the screw propellers on shallow-draft push boats to produce side forces when the propellers are rotating astern. They enable these craft. nhen pushing groups of barges 1,000 or more feet in over-all length, to maneuver around river bends and through channel turns.

5. Heel When Turning.—In a turn, the inward hydrodynamic force produced by the drift angle is applied at a point well below the water line. The outward centrifugal force is applied at the centre of gravity, usually located at or above the water line. This couple acts to heel the ship outward to an angle at which it is balanced by the righting moment resulting from the transverse metacentric stability. The contribution of the rudder to this pattern is a force acting to reduce the angle of heel. Thus, in a steady turn, if the rudder angle is suddenly removed, the outboard heel is momentarily increased. Ships with small metacentric stability and comparatively large rudders have capsized through this cause.

Submarines with large, highly streamlined fairwaters around the periscopes and masts heel in ard on submerged turns, especially if running at more than low or moderate speeds. This is because a large part of the inward hydrodynamic force is generated by the drift angle on the fairwater. This force acts inward at a level well above the centre of gravity, where the outward centrifugal force is applied. The outward lateral force on a rudder mounted below the main hull acts at the same time to increase the inward heel.

6. Effect of Propulsion-Device Action on Maneuverability.—The individual thrusts of independent wing propellers, with axes offset from the centre of gravity. exert a sninging moment about that centre. Ships with the rudder damaged or lost have been steered by suitable operation of the wing propellers. On some ships. pushing ahead on one screw and pulling astern on the other acts to turn the ship around almost on its oun centre. Tugs with port and starboard paddle wheels driven independently, or with rotating-blade propellers, can maneuver even more readily in this fashion.

Blades of stern propellers that encounter crossflow under the ship when swinging or yawing produce lateral forces that counteract the swinging motion and increase the diameter of the turn. If air is drawn into the upper blades of the propeller on a single-screw ship, excess lateral forces on the lower blades swing the stern in the direction that the upper blades are moving, say from port to starboard. To a certain extent these forces can be counteracted by the rudder but for the most part the operator of a single-screw ship must foresee their existence and make adequate allowance for them.

7. Maneuverability of Submarines in the Vertical Plane.—Many of the factors involved in the steering and turning of ships in the horizontal plane apply also to the depth keeping, rising and diving of submarines in the vertical plane. The problem is much more severe here, however. because of the extreme relative thinness of the layer of water between the surface and the permissible working depth. The situation is somewhat similar to that which would confront the pilot of a transport airplane if he knew that at an altitude above 500 ft. his craft would disintegrate.

The undersea craft, required to run at almost constant depth for extended periods, requires reasonable dynamic stability of route in the vertical plane. It also requires controllability at extremely low submerged speeds so that it may hover at one spot or creep along slowly, without making any noise. Should the submarine crew lose vertical control nith the craft headed for dangerous depths, a high-pressure air-blowing system serves to expel some of the water in the main-ballast tanks. The additional buoyancy thus gained checks and stops its descent.

8. Maneuvering Predictions and Model Experiments.—The ultimate aim of the naval architect is to formulate and collect rules and formulas by which a ship may be designed directly or by which its behaviour and performance may be predicted directly. The first are available in small part; some data for the second have been derived by tests under model towing carriages and rotating arms. These serve to determine the forces and

moments resulting from elementary motions such as ahead motion with yawing deviations and motion at various drift angles when the centre of gravity is moving in a circular path, simulating a steady turn. The forces and moments are then fed into the equations of motion as outlined, for example, by K. S. M. Davidson and L. I. Schiff (*Transactions of the Society of Naval Architects and Marine Engineers*, 1946) and the integrated performance is predicted therefrom. This approach has been used primarily for the determination of dynamic stability of route, which involves only fairly small angles of attack and angular velocities. When these motions become large, as they do for large course departures, this approach can be used only with large empirical corrections.

Free-running self-propelled ship models, sometimes radio controlled, can simulate turns and other maneuvers, permitting derivation of the path of the centre of gravity, changes in forward speed, rudder angles, angles of heel and related data. Self-propelled models, supplied with power and steered by distant control from a towing carriage following, provide experimental checks on steering, dynamic stability of route, effectiveness of rudders and certain maneuvers which can be performed within the limited width of a model testing basin.

VII. SHIPS IN WAVES

Considered as the environment for boats and ships of all kinds and sizes, the term sea is used to denote all waters large enough for the operation of these craft, from creeks and ponds to lakes and oceans. The wind and the ships moving across the sea create a pattern of undulations ranging from minute ripples to waves of gigantic size. The currents moving through it must also be taken into account in all ship operations and in some ship-design problems. The variations in density, resulting from the amount of salts in solution, determine the variable-ballast tank capacity of submarines and the ability of a submarine to "sit" on a layer of dense water while largely supported by a less dense layer above.

Considering the over-all surface configuration, termed the seaway, the classical concept of a train of regular waves is highly unrealistic but it has some practical uses. The normal seaway is highly irregular, with waves of different heights and lengths traveling in many directions. For analytic purposes, it may be considered as made up of a multitude of very low waves, having the actual lengths and periods of all the sea waves and traveling in the same directions, superposed in quantity to produce the actual seaway. When this is done, a promising approach is to accept a multicomponent, random nature and to use statistical methods to define the sea ay (*see* WAVES OF *THE* SEA).

The sea is also home to teeming masses of marine life, many of which are detrimental to ships. Marine borers attack wood exposed on undenvater portions of the hull. Barnacles cling to the underwater hull, roughening its surface and increasing the ship's resistance to travel through the water. Sea water is highly corrosive to most materials, and severe electrochemical effects cause rapid disintegration of submerged metals that are unprotected.

1. Ship Motions in Waves. — Treated as a rigid body, a ship partakes of six oscillatory motions in a seaway. Three are translatory motions of the whole ship in one direction: (1) surge is the oscillation of the ship fore and aft; (2) sway is the motion from side to side; and (3) heave is the up-and-down motion. The other three oscillations are rotary: (4) roll is the angular rotation from side to side about a fore-and-aft axis; (5) pitch is the bow-up, bow-down motion about an athwartships axis; and (6) yaw is the swing of the ship about a vertical axis. Yawing is not necessarily oscillatory for every service condition. All six of these motions can and do take place simultaneously in a confused sea, so the situation is most complex.

The forces and moments caused by waves are balanced by three types of forces and moments opposing them: (1) those required to move the ship and cargo and the adjacent water to which kinetic energy is imparted by the ship motion; (2) those absorbed in damping the oscillatory ship motion or reducing its extent by the generation of surface gravity waves, eddies, vortexes and turbulence; the energy required for setting up these disturbances is carried away and lost; (3) those of hydrostatic or hydrodynamic nature that act to restore the ship to a position of equilibrium as, for example, when the ship rolls to an angle greater than that called for by the exciting moment.

2. Effect of Shape and Proportions. — The most important single factor in cutting down the increased resistance of ships running in waves appears to be a small fatness ratio; in other words, a small underwater volume compared with the ship length. This slenderness is difficult to work into ships intended to carry cargo, but relatively easy for passenger ships. For reduction in the magnitude of ship motions in waves it is important that the damping forces and moments be as large as practicable. Moderate flare in the above-water sections at bow and stern, large beam compared with draft and fineness of the underwater sections all help to achieve this result. A deep-sea sailing yacht embodies these characteristics to a high degree.

To keep the ship reasonably dry while undergoing the rolling, pitching and heaving motions that remain, large freeboard is essential, especially at the bow. In fact, to prevent slamming under the bow when it lifts out of water and then drops heavily upon the surface, the forefoot under water must also be deep.

A good degree of damping is most necessary to avoid deep rolling. If this cannot be achieved by a transverse form suited to the service, such as that of a sailing yacht with a deep fin keel, it is accomplished by adding long fins on each side in the form of roll-resisting or bilge keels. When placed along the lines of flow, these keels add little to the ship resistance in calm water.

Active roll-resisting fins serve to quench the greater part of the roll on a fast ship with a reasonable expenditure of weight, space and cost. These fins, much shorter than bilge keels but extending several times as far outboard when in use, are rotated mechanically about transverse axes to produce angles of attack and girthwise forces which continually oppose the rolling motion. Since the moments of the roll-resisting forces diminish as the square of the ship speed, the active fins are ineffective at low speeds.

Active roll-resisting tanks of U shape have been built and tested in ships. In these, water or other liquids can be transferred rapidly from one side of the ship to the other to counteract the rolling motion, using controllable (and reversible) axial-flow propellers placed in ducts connecting the port and starboard tanks.

Considering the vertical accelerations involved, pitching and heaving, or a combination of the two, are the most objectionable for passenger comfort and safeguarding of cargo. Some form of passive pitch-resisting fin may be evolved mhich will accomplish its primary purpose without introducing detrimental features.

3. Hydrostatic and Hydrodynamic Loads in Service. — The naval architect must know the loads imposed upon a ship in all the conditions of its expected service in waves so that he may design the hull structure to withstand them. Aside from the static distribution of load along the length when the ship is floating at rest in calm water, there are many other buoyancy distributions in waves for exactly the same loading condition of the ship. Further, the wave action and the ship motion in waves generate dynamic forces which, under certain conditions, may be extremely important. When the bow and stern are on wave crests, with a wave trough between, the ship hull sags or bends downward in the middle. As the middle body reaches a wave crest. with the ends over wave troughs, the ship bends the other way or "hogs" and the ends droop because of the greater buoyancy amidships. Waves also produce torsional moments and the hull twists in the seaway, as when the ship is traveling obliquely through waves. Both bending and twisting actions involve shear in the structural members. as when a region that was square in shape under no load takes the shape of a rhombus when deformed. When the ship rolls, racking strains are induced in the hull because the above-water portion wants to continue to roll as the underwater portion starts to roll back the other way. Ship motions also induce inertia forces similar to those felt in elevators when starting or stopping.

It often happens that a part of the hull and an adjacent wave surface, each parallel to and approaching the other, meet with

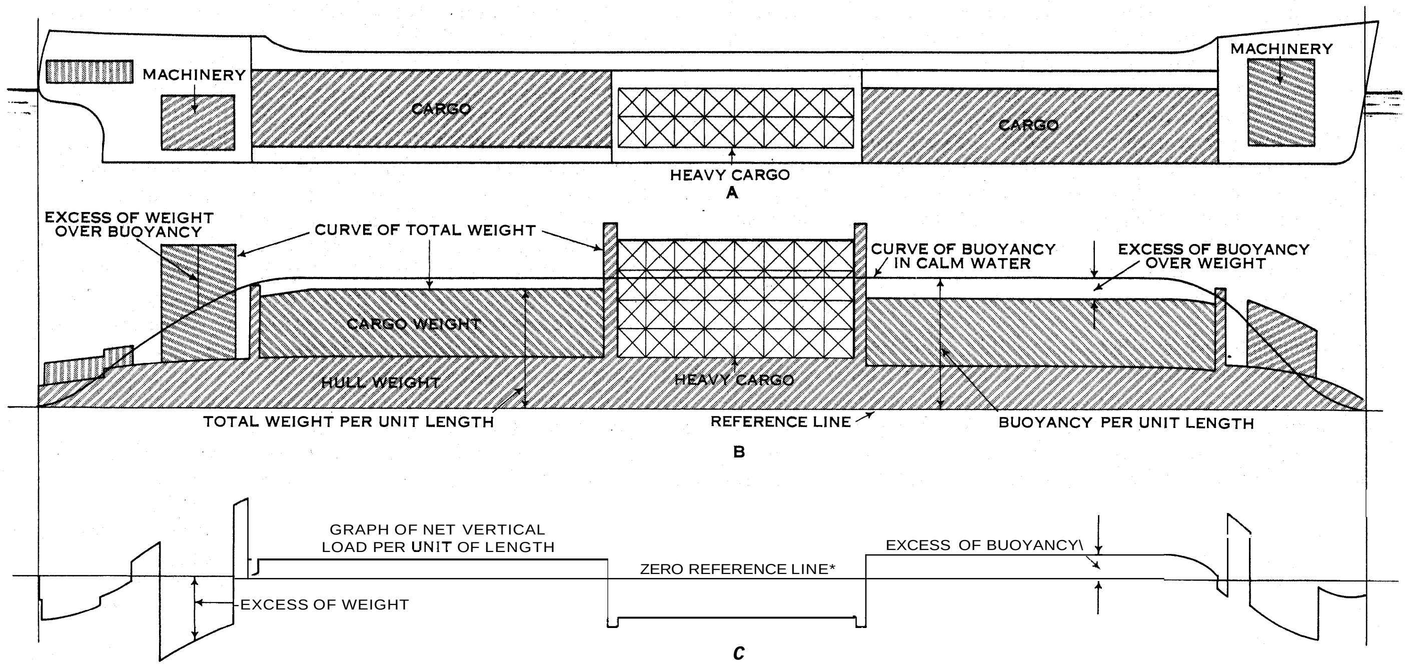

FIG. 12.— DIAGRAM SHOWING VARIATION OF WEIGHT AND BUOYANCY ALONG THE LENGTH OF SHIPS *(See text)*

a heavy shocklike impact known as slamming. This can occur if the bow of a ship emerges from the water on a violent up-pitch and drops down upon a rising wave surface. It can also occur if a large wave strikes an overhanging part of the ship, such as the flaring hull under the forward end of the flight deck on an aircraft carrier. The tremendous blow against one end of the hull causes the whole structure to vibrate in an action known as whipping. The strains thus caused may be as great as those encountered in sagging and hogging over large waves.

Other natural loads are those caused by wind and ice. Typhoon and hurricane winds may blow with velocities of 100 knots or more. In subfreezing weather the sea spray freezes on the exposed portions of the ship, thereby adding a substantial weight. Icebreakers must be able to withstand the shock of ramming thick, solid layers of sea ice and to survive the squeezing action of pack ice.

Many of these loads may be reduced by judicious operation of the ship; for example, by slowing down or heaving to in a storm. Ship structures are designed to withstand most of them, but the exercise of good seamanship significantly lessens their intensity.

4. **Variation of Buoyancy and Weight Along the Length.**—At a given draft and trim in calm water, the upward buoyancy forces vary from bow to stern in a fixed fashion because each unit length of the 'ship is supported by a force equal to the weight of water displaced by a transverse section of unit length at that point. When summed up, all the buoyancy forces on the unit lengths equal the total ship weight. The fixed or "hardware" weights of the ship structure, the machinery, the fittings, the equipment and the fuel and stores. have a somewhat different bow-to-stern distribution when reckoned by the same unit lengths (fig. 12). If the ship is loaded with cargo, so that the fore-and-aft distribution of total weight is shown by the total hatched area in fig. 12(B), some unit lengths weigh less and some more than the water displaced by the immersed volume in those lengths. Fig. 12(C) indicates the irregular nature of the net weight or buoyancy forces at all points along the ship length.

Cargo loaded at the ends aggravates this condition and creates an elastic hogging deformation, with the midship portion bent upward and the ends drooping. Cargo loaded in the middle, with the ends empty, creates a sagging of the structure, with the midship portion bent downward. As a first requirement, the ship structure must be strong enough to take care of all the nonuniform weight distribution in calm nater during normal loading and unloading. The bending caused by uneven loading, in a tanker carrying liquids and floating in still water, can be sufficient to crack the structure or to break it in two.

When the ship is in waves, the upward buoyancy forces are greatest in way of a crest and least in way of a trough while the ship and cargo weights and the distribution of these weights along the length remain the same. Since two successive waves are rarely alike, it is customary to design the hull structure to withstand the bending moments: in both hogging and sagging, produced by some assumed "standard" series of waves. One such wave has a vertical height in feet, from trough to crest: of 1.1 times the square root of the wave length in feet. This takes care of the observed fact that short waves, the most severe for small boats and ships, have height-to-length or steepness ratios greater than those of long waves. All the "standard" waves have lengths equal to the ship length.

5. **Determination of Forces and Moments.—The** maximum forces that a ship is likely to encounter in service, excluding temporarily those due to above-water or underwater explosions, are the weight and buoyancy forces that act vertically, caused by gravity. The moments of greatest interest to the designer are the maximum bending moment in the vertical fore-and-aft plane, for both the hogging and the sagging conditions on the assumed "standard" wave. Slamming forces may act in almost any direction, and they are usually applied at or near the ends of the ship. To predict them it is necessary to make certain assumptions and to use certain approximate formulas not described here.

Prediction of the forces and moments due to above-water or underwater explosions—a possible emergency load for all ship types—requires specialized knowledge and a great deal of experience, much of it of a secret or confidential status. Aside from direct or close hits, the explosive forces produce vertical and lateral bending and whipping, much as do the waves of the sea.

The procedure for determining the vertical bending moment is to consider the ship poised and balanced statically on the assumed wave. This means that the buoyancy graph in fig. 12(B) is replaced by one based on a curved "standard" wave profile instead of a straight one, with a crest either at mid-length or with two crests at the ends. The wave profile must be adjusted on the ship profile until the total buoyancy forces equal the total weight of the ship, and the centre of gravity is vertically in line with the centre of buoyancy. With the ship balanced on the wave a load curve similar to that in fig. 12(C) is drawn, showing the differences between weight and buoyancy at all stations along its length. At any transverse section, the vertical shear is determined by summing up the area under the load curve from one end of the ship to the section in question. By a process known as integration of the moments about a given station, the vertical bending moment curve is obtained.

6. Superposition of Calm-Water and Dynamic Wave Loads.—The final forces and moments which a ship structure is designed to withstand must take account of those imposed by the static loading, such as those due to cargo, fuel and stores loaded at a pier in port (fig. 12), plus those imposed by wave action and ship motion after the ship puts to sea. In fact, under some service conditions the calm-water bending moment may exceed in magnitude the wave-and-motion movement in a seaway.

VIII. STRENGTH OF SHIPS

A ship hull, of whatever materials it may be made, must be strong enough to withstand all the loads that may be imposed upon it by normal service and by any seaway that may be expected during its life. It must. in fact, have a reserve of strength to take care of excessive loads carelessly or negligently applied or of loads caused by unusually high, large or steep waves. The latter are encountered only on rare occasions, but they do occur.

The structural configuration. involving the disposition of material as well as the elasticity of that material, must be such tnat the structure does not bend or flex unduly under the specified loads. It is customary to make a ship hull much stiffer than. say, the wings of a large airplane, just as the fuselage of that plane is stiffer than its wings.

The material must be so disposed and proportioned that the hull has the minimum weight—and can be built for the minimum cost—to perform all its functions acceptably. A knowledge of how the various parts are strained. of how the applied loads are distributed among the various members and of how all of them work together is essential in order to place and proportion them in the most effective manner.

1. Strength and Stiffness.—A ship structure is sufficiently strong if it can support all the fixed loads of its machinery, fittings and equipment and all the cargo loads, and if it can withstand without permanent change of shape. cracking and fracture all the hydrostatic and hydrodynamic loads which can be imposed upon it in calm water or in any kind of seaway in which it is supposed to operate. It is sufficiently stiff if, under any of these service loads, it does not flex or deform unduly so as to interfere with the alignment of operation of machinery or aith any other function, major or minor. A bronze screw propeller of a high-powered ship, having blades that are too thin, may deform so much when generating full thrust that its shape and propulsive characteristics are changed. If the blades are permanently bent under emergency maneuvering conditions, the propeller is not strong enough.

Vibratory motion can build up to unacceptable peaks if local portions of the structure are in resonance with the periodic applied forces. In consequence, rudder plating and shell plating at the stern must be stiffened to control panting or pulsating deflections from propeller forces. The shell at the bow is also subject to panting from wave-impact loadings; this requires extra stiffeners, called panting stringers.

It is customary in ship structures and ship components to limit the calculated strains under the heaviest contemplated service loading to a certain fraction of the limiting strain for the material being used at which permanent change of shape or damage will occur. The margin thus provided takes care of unusual and emergency conditions which rarely can be foreseen at the time of design. For a submarine pressure hull the collapsing depth is calculated—or determined by model tests—as part of the original design. It is considerably greater than the working depth, at which the calculated strains are limited to values which can be endured indefinitely.

2. Structural Configurations.—The arrangement and disposition of the structural material in a hull and the proportions of the structure, all known as the configuration, are most important features. A too-shallow ship hull. like a too-shalloa bridge truss, requires an inordinate amount of steel for strength and stiffness. A hull that is too deep also requires too much steel because of its size, unless the various members are made too thin. Structural material in the form of a closed box, like a ship hull with a deck, resists vertical and lateral bending and twisting all at the same time.

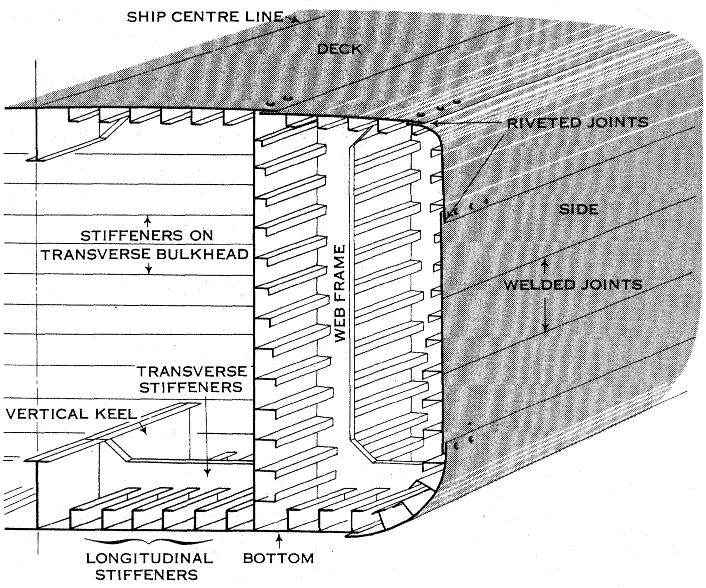

FIG. 13.—HALF SECTION OF THE STRUCTURE OF A LARGE TANKER

It is important, for cost and weight as well as for strength and stiffness. that the structural material be placed in the ship where it will do the most good. If there is too much material in the bottom structure and not enough in the decks, the neutral axis of the section (above and below which the moment of area through the structural members is the same) will be too close to the bottom.

For a given bending deformation the upper members will be unduly strained and the lower members only partly strained. It may be advantageous to make the hull girder deeper amidships, by about one deck height, where the vertical bending moment is greatest, and shallower at the ends where it is least.

Every boat or ship hull, both above and below the water, embodies a watertight boundary or shell which provides the buoyant volume to float it. Taken with a deck to which it is firmly attached. the whole forms a hollow box, a most economical and efficient principal structural member of the hull Since some part of this box is in compression for bending loads, and much of it is in shear for twisting loads, the relatively thin shell—bottom, sides and deck—must be prevented from buckling, crumpling and wrinkling nhen it is strained. This is done by stiffening it at intervals with frames and stringers of some convenient type. They hold the flat surfaces in shape and take some of the working loads as well (fig. 13).

When the stiffening system of the deck and shell plating lies predominantly parallel to the principal ship axis the ship is said to be longitudinally framed. When the majority of stiffeners lie at right angles to that axis, it is transversely framed. Whatever the system of deck and shell stiffeners, they must be supplemented by deep, web or belt frames in the first case, placed transversely (fig. 13 and 14), or by longitudinal stringers in the second case, run fore and aft. These hold the primary stiffened system in shape and help to distribute concentrated loads resulting from nonuniform placing of cargo, wave action on the outside and external blows from striking piers and quay walls and rubbing against fenders and the sides of other ships. Longitudinal framing saves hull weight because the metal in the fore-and-aft stiffeners supplements the metal in the shell and the uppermost decks in resisting the bending moments

FIG. 15.— HALF-MIDSHIPSECTION OF A TRANSVERSELY FRAMED CARGO SHIP

imposed in vertical and horizontal planes.

Fig. 15 shows the hull structure for a typical transversely framed cargo ship (1953 "Mariner" class, U.S.). The construction is predominantly welded. The riveted joints at bilge strake, gunwale and main deck, just outboard of the cargo hatch. function as crack arresters in case of progressive failure of the wide, flat, welded areas. The inner bottom plating forms part of the bottom flange of the ship girder; in addition, it is made watertight so that it serves as a tank top and as an additional watertight boundary if the outside plating at the bottom is pierced.

The transverse and longitudinal bulkheads required for subdivision, the internal platforms and decks required for service: access and storage and the boundaries of internal tanks for liquids are utilized for structural strength wherever practicable, to avoid unnecessary weight.

3. Scantlings and Strength Calculations.— When a structural configuration has been sketched, conforming satisfactorily to the ship arrangement, the designer selects the scantlings, defined as the size, shape, area and unit weight of the individual structural members. This is done first for the midship section, where the vertical bending moment is usually the greatest. The preliminary scantlings are chosen from experience, from a ship generally similar, from classification society rules or by a scientific analytic process.

The parts of a ship structure that make up the hull girder resisting the longitudinal bending moments must at the same time carry the more localized loadings, such as concentrated machinery loads and large external water forces. Often the latter govern the design of the part. The transverse bulkheads and the transverse web frames are designed on the basis of local loads. Watertight bulkheads are required to resist maximum water pressure when the compartment on one side is flooded.

Gun and launcher foundations present special problems. They are designed by assuming various directions of impulse or recoil to find the critical direction for each important member of the foundation.

FIG. 16.—HALF-MIDSHIP SECTION OF A SUBMARINE

4. Structural Design of Submarine Pressure Hulls.—The depths to which combat submarines are required to submerge and the necessity for conserving weight in the inner or always-buoyant hulls of cargo submarines call for correct proportioning of the structural elements and accurate selection of thicknesses for the various parts. The uniform pressure around the entire inner hull at working depth enables the designer to calculate the exact hydrodynamic loads, but the fact that the entire structure is loaded in compression and that the inner shell may be expected to fail by buckling more than makes up for the simplicity of loading.

The lightest pressure-resisting inner-hull form is a cylinder of circular section, stiffened by ring-shaped frames with a longitudinal spacing of from one-fifth to one-tenth or less of the diameter, depending upon the specified working depth and external pressure (fig. 16). Whether riveted or welded, the plates forming the circular sections are butted together at their fore-and-aft joints, so as to transmit the compression loads directly from one plate to the other. Theoretical formulas, supplemented and confirmed by the tests of many hundreds of scale models of steel, enable the designer to determine the plating thickness, the frame spacing, the form and size of the frames and the best method of attaching the frames to the cylindrical shell.

At each end of the submarine hull, where it diminishes in beam and depth to facilitate propulsion, the inner hull takes the form of the frustum of a cone, with circular or elliptical transverse sections of reduced diameter.

5. Detrimental Effects of Discontinuities.— The various parts of a ship hull made of elastic material are found to stretch. shorten, twist and flex as the external loads cause the whole hull to change shape. If the adjacent parts cannot deform locally by about the same amount, the heavier and stiffer members pull or push on the lighter ones.

The result may be excessive local strains, out of all proportion to the strains which would be caused normally by the principal external load. After reaching the fatigue limit the local metal may crack, buckle or break. Good structural design calls for the tapering or narrowing of members to correspond to the strength and rigidity required, and for great care in making transitions from heavy members to lighter ones along a given line of application of a load.

6. Materials of Construction.— Wood was for many centuries the most important and, in fact, the only shipbuilding material. It is still used for boats and small craft of many types, as it is easily handled and worked by local craftsmen with simple tools. However, it is a relatively weak material and is subject to rapid deterioration. Slippage along fore-and-aft flush seams is difficult to prevent. Large wooden ships had to have diagonal metal straps bolted to the planking to counteract slipping at the seams and. to keep the hulls in shape. Others made use of hogging girders or tie rods running over high vertical posts to prevent the ends of the hulls from drooping. Many modern metal ships have wooden weather decks to help insulate the spaces below and to provide a good walking surface.

The development of strong waterproof glues and techniques for building up large curved members from thin laminations has greatly improved the strength and stiffness of wooden ship structures. Checking, splitting, knots and other imperfections are largely eliminated, and many short pieces can be used. Molded plywood yacht hulls made of five thin layers glued together, with the grain running in different directions, are stiff enough to hold their shape without an internal framework.

The steels most widely used for hull structures are of the medium, high-tensile and special-treatment types. By far the greatest proportion of parts are of medium steel, where the working strains are small or moderate compared with the yield strain. Both high-tensile and special-treatment steels have higher yield points; the latter has ballistic and shock-resisting properties as well. They are used for parts subjected to high strains in order to save hull weight.

Investigations in the latter 1940s revealed that many of the fracture casualties of that period were due to the use of steel lacking in notch toughness. This term refers to the steel's ability to absorb energy by stretching in the vicinity of sharp corners, notches and cracks, particularly at low temperatures or at high stretching rates. This quality is particularly important where all the plating seams around the girth are welded. Many ship structures have several riveted seams to permit adjustment of the strains due to butt welding and to localize progressive cracking. Specifications for shipbuilding steels of the 1950s required certain minimum limits on notch toughness and on adaptability to welding.

Aluminum alloys are used for the hulls of small and experimental craft and for large shipboard elevator platforms and similar structures. They are also used for the superstructures and upper works of many cargo and passenger vessels; they form the upper parts of steel hull girders which bend elastically in service. For the last-named purpose, the increased deformation or stretch of these alloys is an advantage. For a given weight, panel plates of aluminum alloy are thicker and stiffer than those of steel. They thus provide a better appearance and for many installations they do not require painting.

Use of aluminum for large ship structures, such as the hull proper, in which appreciable savings in weight are to be achieved. requires reliable welding and riveting in large thicknesses. What is more, it necessitates the acceptance of increased bending deformations along the length and lowered natural frequencies of vibration as compared with similar structures of steel.

Hulls of heavily reinforced concrete have been used for ships and barges in times of emergency, uhen steel reinforcing rods and labour trained in building construction were available and shipbuilding steel and labour having shipbuilding skills mere not.

Plastics reinforced with glass fibre eliminate many of the joints in a hull and greatly decrease the deterioration encountered in wooden or metal hulls. They may be coloured with pigment and they lend themselves admirably to "sticking in" stiffening members and other parts and to repairs in a similar manner when damaged. Many nonstructural parts of boats and ships of all sizes and types are easily fabricated by molding in reinforced plastic.

7. Jointing, Connections and Attachments.—It is possible. with Fiberglas and similar materials, to make a small-boat hull entirely in one piece. However, as the boat becomes large enough to require a Fiberglas deck, this is made separately and attached to the hull. For larger craft. the individual planks and plates have to be joined by gluing, screwing, bolting, riveting or welding (see also RIVET; WELDING). Flush seams (fore-and-aft joints) and butts (girthwise joints) for smooth external hull surfaces are possible by gluing and melding. Screwing, bolting, riveting or melding require lapping the members over each other or the use of internal (and external) connecting straps, strips or other parts. Nailing for small-boat structures of wood is no longer favoured because of the difficulty in making repairs. If the limitations and advantages of each of the jointing methods is kept firmly in mind, it is found that practically every one of them serves well in some particular application on board ship.

Welding has the great advantage over riveting in that it eliminates excess metal and saves weight practically everywhere in a ship structure, sometimes as much as 10%. As a rule, the loads are transmitted from one member to another more directly, and the resulting structure is more rigid. Under heavy deformation, such as collision damage, the welded joints will hold together better than riveted connections. Under mild deformation they are less liable to leak. Welded shell plating is much smoother than riveted plating, with appreciable savings in friction and total resistance. On the other hand, poor welding is often undetected from the outside. One small flaw in an unfortunate position can initiate a major crack.

8. Structural Tests of Ships and Models.—Those who made the early strength calculations of iron ships in the 1850s and 1860s benefited from the studies and tests of I. K. Brunel and W. Fairbairn on the tubular or box-shaped bridges previously built in Great Britain. Fracture and loss of the fast, light British destroyer "Cobra" in the early 1900s led to tests of another destroyer, H.M.S. "Wolf." The need for information on the behaviour of similar structures when actually loaded to the buckling or fracture point led, in 1930, to full-scale tests of the U.S. destroyers "Preston" and "Bruce" and, later, of the British destroyer "Albuera."

These tests confirmed the use of the simple beam theory for large, thin, box-shaped structures, and indicated the relative effectiveness of stiffened and unstiffened material and the rigidity of riveted joints.

Fractures of welded ship hulls during the early 1940s led to a new series of extensive structural-testing programs by Great Britain and the United States on full-size ships, including tests with various load distributions in calm water.

Beginning with the German M.S. "San Francisco" in 1934, a number of ships have been instrumented to determine in heavy seaways the wave profile along the ship's side, the water pressures and accelerations resulting from ship motion, the deflection of the ship girder and the simultaneous strains in many parts of the ship structure.

After the 1920s the techniques of making and testing structural models vastly improved. The availability, after the 1940s, of the wire-resistance strain gauge, with its small size and tiny wires cemented to the metal, made possible the testing and structural analysis of models (and ships) under high-speed dynamic loads such as impacts and shocks from underwater explosions.

IX. LAWS AND REGULATIONS FOR SAFETY

Certain safety requirements have been imposed upon the normal naval architectural requirements by law, by official regulations and by international convention. These cover a wide field, involving health, hygiene, fire protection. lifesaving and communications (radio and radar) as well as seasonal loading, watertight integrity. freeboard, subdivision and other provisions to ensure that ships will remain upright and afloat. Provision for freeboard, subdivision and other major items in the present category must be made in the original layout and arrangement sketches as part of the preliminary design.

1. Freeboard.—Aside from providing reserve buoyancy when rolling and pitching and keeping the upper decks free from green water and spray, freeboard is required to keep those decks above water when the hull is partly flooded. Adequate freeboard for running in waves must be larger in proportion to its length for a small ship than for a large one, because short waves are steeper than long ones. Freeboard must increase as the ship speed increases because of the greater pitching at higher speeds.

2. Subdivision and Floodable Length.—Subdivision by watertight bulkheads is necessary to prevent extensive flooding after only local damage. A well-designed ship should, with some damage and moderate flooding, still be able to move, steer and stay afloat. In recognition of this premise the major maritime nations of the world have approved international treaties and drafted rules specifying the minimum amount of freeboard and the extent of transverse watertight subdivision.

This subdivision is expressed as a function of the floodable length of a ship. 4 convenient method of relating floodable length to the ship is by a floodable-length curve. The curve is plotted on the profile of the ship so that the vertical ordinate at each point equals the portion of the ship length, centred at that point, which can be flooded without immersing a margin line. The margin line is parallel to the uppermost deck to which the transverse watertight bulkheads extend and is several inches below it, so that in calm mater the ship can sink to this line without water leaking or flooding into other compartments.

When plotting the floodable-length curve, allowance is made for trim but not for heel since the ship is assumed to be open to the sea from side to side. The curve is used by the naval architect to help him decide where to place the transverse watertight bulkheads so they may be most effective in restricting the extent of flooding after damage.

The amount of water that can enter any compartment depends upon the ratio of the open-space volume to the total volume, known as its permeability. An empty hold can take nearly its entire volume of water, with a permeability of say 98%. If filled with coal, its permeability may be 20% or less.

3. Situation After Damage.—Any heel after damage makes a ship vulnerable. Excessive heel may be disastrous, as it was for the "Andrea Doria" in 1956. In a well-designed ship, subdivision is planned to ensure that the ship remains upright, or nearly so, no matter where it is opened to the sea, or that heel can be corrected by counterflooding on the opposite side. Unless the flooding occurs amidships, the ship trims by the bow or stern. This may render it vulnerable in a heavy sea. Compartments at the ends are usually shorter than those nearer amidships.

Because of the intact water plane lost and the free surface in the flooded areas, the partly flooded ship almost invariably loses some transverse metacentric stability. Such a ship can survive if somehow it can be kept upright. Several ships bombed in the 1940s were saved by lashing them to adjacent piers and other craft to hold them upright until they could be pumped out.

X. SHIP DESIGN PROCEDURE

The work outlined in the foregoing, together with other tasks depending upon the type and mission of the ship, is carried out in several rather definite stages, indicated by the following headings.

1. Preparation of Requirements.—When the operator decides a new ship is needed he prepares an outline of the desired requirements, often with the technical advice of a professional ship designer. The latter endeavours to embody in the specifications many features requiring decisions to be made by the owner. Settling them early avoids interruptions and delays at later stages. If these decisions are not readily made. a number of preliminary designs may be worked up to indicate the range of possibilities within the limits tentatively established by the operator. The latter is then in a better position to make his decision, or to require that further sketch designs be prepared.

2. Compromises Necessary.—A layout of the proposed ship is no sooner begun than the naval architect encounters limitations on every side. If the ship is made large enough to house all the necessary components conveniently. it becomes too large, too costly to build and consumes too much fuel. If held to a moderate size, cramping, squeezing and overlapping begin as the components are worked into the arrangement plan. The mission of the ship must constantly be kept in mind as space and facilities are pared here and there. To carry out this give-and-take process intelligently and logically, the naval architect must have a fundamental and general knowledge of all aspects of the design and an intimate knowledge of all features mentioned in this article.

Imperfect knowledge of physical laws relating to ships and their behaviour forces the naval architect to rely heavily on experimental data, empirical rules and past experience. This situation is aggravated when, as frequently occurs, he is forced to apply trial-and-error methods to certain features of the design.

3. Preliminary Design Stage.—The purpose of the preliminary stage is to present to the prospective owner one or more designs which represent a feasible and economical fulfillment of the requirements. Usually only the major features of the ship are worked out at this stage. However, an extensive knowledge of the details of ship design is called for to determine the effect of the minor features without actually designing them.

As the first step in this stage, the naval architect chooses the ship type and its size. Usually a number of existing vessels meet roughly the requirements he is trying to fulfill. With these as guides he selects combinations of hull type, machinery and structural material to form one or more parent or basic types. At other times he is faced with most unusual requirements and with design problems that appear to be entirely new to the profession. Here he must start from the beginning, with his experience, knowledge and judgment as his principal guides.

Following the roughing out of the design in small-scale sketches, the major features of the ship are laid out in three types of drawings. The general arrangement drawings show the arrangement of spaces and equipment in profile elevations and deck plans (fig 5). The line drawings depict the external shape of the underwater and above-water hulls. This is delineated by intersections of the hull with three series of planes at right angles to each other. The structural arrangement drawings embody midship sections such as fig. 13, 14, 15 and 16, together with typical sections at other stations and drawings showing other general features of the structural configuration and the principal scantlings. The latter are based upon a preliminary calculation of longitudinal strength (see *Stvength of* Ships, above).

In preparing these drawings the naval architect must determine whether each design proposal satisfies the performance and naval architectural requirements. Based on this and a weight study, the stability can be checked.

When the preliminary design studies have been carried as far on paper as existing knowledge permits, especially with respect to the power needed to achieve the given speed, one or more models are built. These models are towed and then self-propelled with a stock propeller (many of which are available at most model basins) to determine more accurately the ship's resistance and required propulsive power. Additional data can be obtained during these and other tests, concerning the nature of the flow into the propeller position, to enable the naval architect to design a final propeller, provided the hull shape and loading conditions are not changed in the meantime.

4. Contract Design **Stage.**—When a preliminary design appears to give promise of a ship that will meet all the requirements to everyone's satisfaction, the naval architect proceeds with the preparation of contract plans. These are intended to be sufficiently complete and comprehensive to enable the shipbuilders to make estimates of cost and time of construction. When combined with the detail specifications, prepared concurrently by the naval architect. there is enough information at hand to enable the successful bidder to draw the working plans, fabricate the parts and build the ship in accordance with the wishes of the prospective owner and the naval architect.

The preliminary lines, general arrangement and structural plans are drawn to a large scale and in more detail. Accompanying these are diagrammatic and arrangement plans of the main propelling and auxiliary machinery or of other major features in this category, such as the pumping machinery on a dredge or on a fireboat, prepared by marine and mechanical engineers. Calculations for strength and metacentric stability and the weight estimate are also expanded and done with more precision. Diagrammatic plans of cargo-handling arrangements, hull piping, ventilation and air-conditioning systems are prepared. Similar plans are drawn for the electrical systems and for location of the electronic equipment.

The detail specifications cover particular features and characteristics of all components of the ship which cannot conveniently be shown on the plans.

The preparation of working drawings to be used by the artisans and mechanics in the shipyard is a phase of shipbuilding and is not discussed here. *See* SHIPBUILDING (MERCHANT AND NAVAL).

NAVAL SCHOOLS, U.S. The **U.S.** navy operates a number of schools to train enlisted men to man naval aircraft and vessels. with their complex mechanical, electrical, hydraulic and other equipment. In the early days, all navies enlisted boys who learned seamanship on board ship, as a prelude to qualifying as ordinary seamen and later as able seamen. School ships were used for a time, but modern navies have their schools on shore.

Recruit training is conducted at naval training centres at Bainbridge, Md., Great Lakes, Ill., and San Diego, Calif. Every new recruit is indoctrinated, taught military drill, instructed in caring for and firing a rifle, introduced to the elements of seamanship and the problems of damage control on board ship, while being given an idea of naval life and discipline, in a course lasting about three months. Women recruits for the WAVES have a shorter course at Bainbridge. The number of recruits trained each year is about 97,000.

The U.S. marine corps trains recruits at Parris Island. S.C., and at San Diego, Calif., for 12 meeks, followed by 4 meeks at Camp Lejeune, N.C., or at Camp Pendleton, Calif. In 1959 the marines trained about 39,000 regular recruits and 7,000 six-month reservists.

In addition to recruit training schools, there are four other types, known as class A, B, C and P, respectively. for enlisted men of the navy and two types for marines.

Class A schools are in the nature of apprentice training units. They are intended to provide elemental technical knowledge and skill to enable the student to specialize as soon as he goes on board ship or is assigned to a naval air squadron or station. Kith the training thus received, he should be able to acquire enough practical experience to permit him to qualify as a petty officer 3rd class About 45,000 men attend class A schools each year in courses varying from 9 to 26 weeks.

Class B schools are designed to give advanced instruction to 1st or and class petty officers who have reached these ratings by demonstrating leadership and supervisory ability by self-training on their jobs. In almost all instances the records of such men indicate that they are excellent chief petty officer material. About 6,000 men took class B school courses in 1958.

Class C schools are intended to provide instruction and training for a particular skill or technique which is not peculiar to any one rating, or which becomes necessary to meet a specific need. In the true sense. many of these courses are specialist courses. For example, the welding school at San Diego offers three courses: welding, 12 weeks; advanced welding. 6 weeks; and underwater cutting and welding. 6 weeks. To be eligible for the latter class a student must have successfully passed the first two and have. previously qualified as a diver. Enlisted men seeking to enter the Naval academy under the enlisted quota are eligible for the Naval academy preparatory class at Bainbridge. a class C school. Men seeking appointment to naval ROTC units in universities and colleges may also compete for this school.

Class P schools, of which only two remained in 1959, prepared men for further training. The school of electricity and electronics at Great Lakes introduces students to the fundamentals of these subjects prior to their being assigned to schools for further training. The school for stenard's mate's apprentices at San Diego trains men to care for, prepare and serve food.

The U.S. marine corps has two classes of schools for ground and aviation technical training for noncommissioned officers. In addition. they send a number of marines as students to many naval and army schools. About 18,000 marines took one or more school courses in 1958, aside from recruit training. (J. B. Hs.)

NAVAL STORES, a term that originally designated the pitch, tar, resin. flax, cordage, masts and timber used in building and maintaining wooden sailing ships but is now applied only to the products of the pine tree. These products fall into two groups: gum naval stores derived from the oleoresin (gum or pitch) of the living pine. commonly called crude turpentine, and wood naval stores obtained by processing dead pine wood.

The United States is the foremost producer of naval stores, with France ranking second. Large amounts also come from Greece, Spain, Portugal and Mexico. Pines planted in the maritime provinces of France by order of Napoleon I as a measure to control the sand dunes are the profitable source of French naval stores, its constancy assured by careful forestry. In the U.S. the industry is centred in the south. where longleaf and slash pines abound.

The raw material of the gum naval stores industry. oleoresin, is a semifluid substance composed of resins dissolved in turpentine oil, its chief component being pinene. It is extracted from the pine by cutting through the sapwood into the heartwood of the tree (where resins accumulate) and collecting the exudate that issues from the wound. Formerly, gum aas obtained by cutting a recess or box into the pine at its base and collecting the gum in a cup placed at the point of a V-shaped gash in the rear wall of the recess. Each tapping of the tree required the cutting of a new gash, leaving a succession of scars on the tree's heartwood. Boxing was destructive of tree life, many trees surviving this treatment by only a year or two. It has given way to a wiser shallow cutting with which narrow metal gutters are employed to channel the gum into collecting cups. It has been found that an application of sulfuric acid to a fresh cut induces a fuller and more prolonged gum flow, with the result that the turpentine yield is materially increased.

Turpentine is extracted from oleoresin by distillation; the residual compounds harden into the substance known as rosin. The individual farm still was once essential to the processing of gum. The farm operation consisted of subjecting the gum to heat in a brick-supported copper pot heated by a wood fire. Turpentine and water vapour were condensed in the water-cooled copper pipes of the still. and the liquid material was discharged into a container where it quickly separated into two layers with the turpentine on top. Remaining in the still was the molten rosin, combined with dirt, sand. bark, pine needles and such other foreign matter as had escaped the occasional skimmings of the pot. Although the rosin was strained through wire mesh and cotton batting, it proved upon hardening to be impure and was dark in colour.

The farm still has largely yielded to the large central cleaning and distilling plant where the gum is freed of foreign bodies by thorough washing and filtering. From cleansed and purified gum, after the extraction of turpentine by steam distillation, a pure, translucent, pale amber rosin is produced.

Wood naval stores are derived from salvaged pine wood, such as tree stumps and "downwood" or lightwood—pine from which the bark and sapwood have fallen away in decay. Although methods of treating the wood vary, generally it is shredded and subjected to heat under pressure in a digester. The volatile components—carried off, condensed and refined by fractional distillation—yield wood turpentine and pine oil, the latter product unobtainable from the oleoresin of the living tree. The residual resin retained in the shredded wood is extracted by treatment with a mineral oil solvent. The resulting resinous solution, purified and relieved of solvent by vaporization, gives wood rosin.

Sulfate wood turpentine, a by-product of the sulfate method of making pulpwood paper, is obtained by condensing the vapour from the digester in which the wood is treated. The turpentine, seriously contaminated by sulfur compounds, is purified by chemical treatment and fractional distillation. Although no rosin is recoverable in this pulping operation, the cooking liquor used in the process may be salvaged and treated chemically to yield the useful mixture of resinous and fatty acids known as tall oil.

NAVAL STRATEGY AND TACTICS. Naval strategy embraces all phases of the planning, disposition and general employment of naval forces preliminary to their contact with an enemy force. Tactics denotes the maneuvering of naval forces during combat. Strategy must include planning and dispositions that will enable a fleet or naval force to begin fighting in accordance with tactical plans when an enemy is encountered.

Naval strategy has been described as "the art of the admiral," but naval tactics, which follow after and merge into naval strategy, are also an admiral's art. The fundamental principles of naval strategy have changed little over the years, but their application has been greatly influenced by the higher speeds and greater ranges of ships and planes and by the development of rapid methods of communication. Naval tactics have always been influenced primarily by the weapons in use and the characteristics of their carriers. (For the military aspect, *see* STRATEGY; TACTICS.)

Naval strategic planning must be carefully directed toward attainment of the national objectives as determined by the government. In supporting national policy, a navy is primarily useful as a means of obtaining control of vital sea areas so that they may be used freely or their use may be denied to an enemy. Plans for a particular naval campaign should be based on the naval forces available. and on careful evaluation of the various courses of action that are open. The planner must also consider the naval forces available to the enemy, their relative strength, their location and the possible courses of action open to them. In deciding on a definite course of action the status of fuel supplies, food, water, ammunition and other essential stores as well as repairs, medical attention, mail and other factors must be considered. As ships can operate only for a limited time without receiving replenishment, plans must provide for keeping open lines of communication by which they may be supplied.

EXAMPLES OF NAVAL STRATEGIC PLANNING

Spanish Armada.—In 1587 Sir Francis Drake argued that the best way to defend England against Spain was to attack Spanish ships on the Spanish coast. He attacked Cádiz and burned 24 or more ships. Drake wanted to attack again in the following year. The court opposed the plan for several weeks; finally consented, too late. An early attack on the Spanish coast in 1588 would probably have prevented the Spaniards from sailing north.

Seven Years' War.—During the Seven Years' War, Great Britain intended to take Canada and drive the French out of India. The Royal Navy reasoned correctly that the principal naval effort should be devoted to preventing France from sending a fleet to Canada or India. In pursuance of this strategy Adm. Edward Hawke watched Brest with a powerful fleet. while smaller naval forces were sent to Canada and India. Adm. Charles Saunders not only guarded the Quebec expedition against French naval interference (1759), but he staged a diversion which misled the French and facilitated victory. The soundness of the British strategy was proven in Nov. 1759. Weather permitted the French fleet to escape from Brest, but Hawke pursued and won a great victory at Quiberon bay.

American Revolution.—In 1776 the Royal Navy removed Gen. William Howe and his army from Boston after Washington had the city invested; it then helped the British army to capture New York city. Afterward it moved British troops to Savannah, Wilmington and Charleston. By 1778 Washington realized that the co-operation of a superior French fleet was essential if he was to win a truly decisive victory; he wrote to the Continental Congress as well as to Benjamin Franklin to this effect. He sent Col. John Laurens to Paris to join Franklin in pleading for a fleet. In May 1781 Washington learned that a French fleet would come to the coast, and the comte de Rochambeau's army was marched from Newport, to the Hudson north of New York. Washington and Rochambeau started for Virginia with their armies in August. Adm. François de Grasse displayed genuine strategic ability in taking his entire fleet north from the West Indies. He arrived in Chesapeake bay on Aug. 30. The British Adm. Samuel Hood had looked into the bay and gone on to New York, arriving Aug. 28. Adm. Thomas Graves went to sea on Aug. 31, with 5 ships and the 14 of Hood, hoping to intercept Adm. Louis de Barras who had sailed from Newport. Graves arrived at the Virginia capes on Sept. 5 and was unpleasantly surprised to find De Grasse at anchor inside. Graves made a poor strategic decision when he failed to attack the French fleet at their anchorage and force his way into the bay. This battle sealed the fate of the British army.

De Grasse showed excellent strategic judgment again the next day while both fleets repaired damages. Knowing that he had no repair facilities nearby, and reasoning that he could accomplish his objectives without a second battle, De Grasse drew the British fleet slowly southward for two more days to permit De Barras to reach the safety of the bay. Crowding on sail, on Sept 9 De Grasse returned to the Chesapeake and placed himself between Cornwallis and Graves. After three days of irresolution, Graves returned to New York. Had it not been for the presence of the French fleet, the Royal Navy could have rescued Cornwallis and his army from the combined armies of Washington, Rochambeau and Lafayette. Gen. Sir Henry Clinton, in New York, made a bitter comment: "Clinton was promised a fleet; Washington had one." (See AMERICAN REVOLUTION, THE.)

Admiral de Grasse and his fleet were able to interfere in North America because Adm. Sir George Rodney made a poor strategic decision. Admiral Hood arrived in the West Indies from England in Jan. 1781 and became Rodney's second in command. In February Rodney sent Hood with a portion of the fleet to cruise off Martinique to intercept a naval force expected from France. Hood estimated that the French could not arrive before mid-April, and he advised refitting all ships, filling with provisions and water and concentrating the entire fleet ready to inflict a decisive blow. The French outnumbered Hood and they suffered very little damage in the skirmish which occurred on April 28. As Rodney then had to refit and provision his fleet before he could act, the French fleet proceeded westward to Haiti and later went north to the Chesapeake. Thus Rodney missed an opportunity to defeat the French fleet.

War of 1812.—Northern Ohio, Indiana, Michigan and the states to the west were preserved for the United States in the War of 1812 by good naval strategy on Lake Erie. War was declared on June 18, 1812, and on Aug. 16 Detroit was surrendered to a British army. Soon afterward, Gen. Henry Procter invaded Ohio, depending for supplies on lake transportation. Commodore Oliver Hazard Perry constructed a small squadron on Lake Erie and took it to Put-in-Bay in the Bass Islands, where his presence cut off Procter's supplies. The British squadron under Capt. Robert Barclay was compelled to come out from Malden and fight before it was fully prepared for battle. Perry's victory, Sept. 10, 1813, cut the communications of the British army and compelled it to retreat. Perry then ferried the army of Gen. William Henry Harrison across Lake Erie, enabling it to intercept and defeat the British troops in the battle of the Thames. Thus, Perry's naval victory on Lake Erie forced British troops to abandon northern Ohio, Detroit, all of Michigan and western Ontario.

On Lake Champlain, Commodore Thomas Macdonough had a squadron ready in the summer of 1814. The governor general of Canada, Sir George Prevost, marched into Plattsburg, N.Y., on the lake, with 12,000 veteran troops on Sept. 5, 1814. The small squadron of Macdonough was anchored in carefully chosen positions inside of Cumberland head, and he awaited naval attack there. Prevost hurried Capt. George Downie's British vessels into battle. In the battle of Plattsburg, Sept. 11, Macdonough defeated the British squadron. Knowing that the lack of roads prevented an invasion of the United States except by water on Lakes Champlain and George, and seeing that control of the lakes was denied him, Prevost marched back to Montreal. Careful strategic and tactical planning, combined with courage and leadership, won a victory over a superior force for Macdonough.

The duke of Wellington was British ambassador in Paris, and the cabinet in London invited him to go to Canada as soon as it learned of Macdonough's victory. Wellington was offered full powers to conclude a treaty of peace with the United States. He replied, "What you need in Canada is not a general officer, or an army, but a naval superiority on the lakes."

Civil War.—The Union navy strangled the Confederacy by a blockade of the southern coast, from Virginia to Texas, in the U.S. Civil War, 1861–65. A river navy, created on the Mississippi and its tributaries, completed the blockade and cut the Confederacy in two, besides giving invaluable support to the Federal army.

World War II.—In order to bring the U.S. fleet into a position where it might be dealt a decisive defeat, the Japanese planned an attack on the island of Midway in 1942. The idea was strategically sound, but the execution exemplified poor strategic planning. Instead of holding their valuable carrier planes in reserve, ready to strike the decisive blow against the U.S. aircraft carriers, these planes were used against installations on Midway, with the result that the Japanese carriers were caught in a vulnerable position with their planes on deck. Some powerful Japanese fleet units were not brought to the Midway area, and those present were not concentrated ready to employ their effective night-fighting tactics or to fight in daylight.

NAVAL TACTICS

The art of disposing naval forces for battle and maneuvering them in battle and the methods employed to gain advantage in battle at sea are called naval tactics. Some writers insist that the essence of tactics is offensive action, but this is not invariably correct. One fundamental principle of tactics applies to battles at sea as on land: concentration of all or the major part of one force on a part of the enemy's forces is essential for winning decisive results.

Early History. — In the earliest known naval battles the fighting was done by soldiers armed with swords who defended themselves with shields. The earliest vessels were simply platforms for the fighting men. The first vessels designed specifically for naval service were the mar galleys. They were long, narrow craft, propelled by oars, which required a large number of rowers as well as fighting men, had little stowage space for food and water and were unable to remain away from port for long. Naval tacticians soon evolved two ideas: ramming the enemy ship and shearing off an enemy's oars before closing for the fighting. To counter such tactics, ship designers lined the sides of the war galleys with heavy beams at the water line to make them less vulnerable to damage from ramming. The addition of these beams made the vessels slower to maneuver and thus less able to ram an enemy or to avoid being rammed. Missile weapons of ancient times were bows and arrows, including burning arrows. Bolts and other heavy weights were discharged from crossbows and other missiles were dropped on or hurled at the enemy *(see* ENGINES OF WAR). Greek fire (*q.v.*) was developed at Byzantium and used effectively against ships and their crews.

The earliest naval battles illustrate the principle of concentration of force. In the battle of Salamis, 480 B.C., the Persian fleet outnumbered the Greeks. but the latter formed their ships across a strait, with their line protected at each end by the rocky shore, a second line in support and a rear guard. The Persians were unable to concentrate all their force on the Greeks and suffered heavy losses. At Actium, 31 B.C., the ships of Octavian evaded ramming by the larger vessels of Mark Antony and applied worrying tactics, such as dashing in to break oars and then avoiding hand-to-hand fighting. Fire arrows of blazing tow and oil were used to turn the tide. King Edward III of England defeated the French at Sluys, 1340, by concentrating his attack on a portion of the enemy and taking ship after ship by boarding. The French used crossbows. but the English archers with very rapid discharges of arrons from their longbows were much more effective. Both commanders in the great battle of Lepanto, 1571, went into battle believing that their force outnumbered the enemy. Both had formed three divisions in line abreast, with a reserve division in the rear. Don John of Austria, commander of the Christian fleet. had six large galleasses, each mounting 30 cannon and carrying a large force of soldiers armed with the arquebus or the musket. He planned to have two of these large three-masted vessels ahead of each division of his line abreast. Those in advance of the left and centre were very useful in inflicting damage on the approaching Turkish line, but the right division failed to reach its assigned position before the fighting started. The Turkish division commander, Uluch Ali, took advantage of the fact that the Christian division opposite him was not in position and he headed his vessels off to his own left, drawing the Christians after him. Giovanni Andrea Doria. great-nephew of the famous Genoese Andrea Doria, failed to grasp the opportunity presented to him by Uluch Ali. Doria might have thrown half of his division on the left flank of the centre Turkish force, already engaged, and by this concentration saved many Christian lives and hastened the defeat of the Turks. By so doing. Doria could have held half of his division in reserve to meet Uluch Ali if he returned. In fact, Uluch Ali drew Doria away from his assigned position and then turned back to fall on the exposed flank of the Christian line, where he inflicted very severe damage before being driven off. Hard fighting, the spirit of the Christians and their skillful use of firearms won them the battle in spite of Doria's tactical error. Cannon had been introduced on board ship in the latter part of the 14th century, but they were still small in 1571.

The defeat of the Spanish Armada was a clear-cut example of the value of superior tactical handling of ships. It was the first battle between large sailing fleets; the gun was the weapon used by both sides, and both were short of ammunition much of the time; there were many engagements but no fight to a finish. The English commanders understood the tactical needs of the situation, and with their lighter, more easily handled vessels they avoided giving the Spaniards any opportunity to board them, or an occasion to fight broadside to broadside. George Monk with an English fleet defeated the Dutch off North Foreland in July 1666. It had become evident by this time that a fleet must fight broadside to broadside, and Monk had no effective signaling system. nor did any navy have one for another century. Although Monk did not inflict a decisive defeat on Michael de Ruyter, he did follow up by burning Terschelling and 160 merchantmen.

The *Fighting Instructions* of the Royal Navy were issued as a result of the Dutch Wars and the doughty Dutchmen were envisioned as the enemy. These instructions were valuable and based on sound principles. but they limited the opportunities for tactical skill and prevented concentration. They led to many inconclusive battles. Meanwhile the construction of ships. seamanship and ship handling improved considerably in the period between 1666 and 1750. Hawke instituted the continuous blockade in 1758–59, and this was afterward perfected by the earl of St. Vincent and others. Prior to this time it was considered rash to keep large men-of-war out of port between September and May. Three Frenchmen, Paul Hoste. Sebastien Bigot de Morogues and Jacques Bourde de Villehuet. published treatises on fighting instructions ahich mere translated into other languages and it seemed that the naval world was accepting them as gospel. But John Clerk of Eldin (1728–1812), who began to study the subject in the middle of the 18th century. came to the conclusion that the British navy could rely on its efficiency in gunnery and seamanship and should concentrate on an enemy's rear to defeat it decisively.

In the battle off Dominica, 1782, Rodney won a decisive victory by such a concentration. Concentration was employed again by British admirals in the battles of the First of June. St. Vincent. Camperdown. the Nile and Trafalgar. Tactical skill was, of course, combined with excellent leadership.

19th Century. — This century produced no great fleet battle after Trafalgar. 1805, but it witnessed the adoption of steam poner. iron and steel for shipbuilding, armour protection, rifled guns, explosive shells, mines and the automobile torpedo. Sailing vessels nere supplanted by the battleship. cruiser, monitor, torpedo boat, destroyer and submarine. Higher speeds. longer effective ranges for guns and more powerful explosive charges modified tactical conditions from year to year. It was claimed that the torpedo had made large ships obsolete, and many tactical ideas had to be reconsidered. The U.S. Civil War nas a war of blockade, although it produced the first duel between ironclads, "Monitor" and "Merrimack." Certain Civil War events, and the battle of Lissa, 1866, led to the installation of rams on nearly all large ships. After 1866 no major warship was sunk by a ram in battle. but two large British ships were accidentally sunk by rams in fleet maneuvers.

World War 11.—This war introduced new problems in the application of time-tested tactical principles. The presence of the aircraft carrier (q v.) made a radical change in fleet tactical formations; it also resulted in naval battles in which the opposing ships did not sight each other. but employed carrier-based aircraft to bomb, strafe and torpedo their opponents. Three great naval fleet battles in the Pacific were of this type, Coral Sea. Midway and the Philippine Sea. The battle for Leyte Gulf included three actions in which carrier planes fought distant ships and two other actions in which ships fought each other with gunfire and torpedoes. One of these latter actions, in Surigao strait, involved the classical "capping of the T" against one force. The action off Samar not only involved ships in sight of each other using guns and torpedoes, but also escort carriers (CVE's) using their planes to defend themselves against enemy gunfire. The Japanese showed great tactical skill in night fighting, especially Adm. Raizo Tanaka's destroyers at Tassafaronga. ***See*** **WORLD WAR** I: *Naval;* WORLD WAR II: ***War at Sea;*** NAVIES, EARLY HISTORY OF; AIRCRAFT CARRIER; BATTLESHIP; CRUISER; DESTROYER; SUBMARINE and under names of military leaders and battles.

NAVARINO, BATTLE OF, fought on Oct. 20, 182;. By the treaty signed in London on July 6, 1827 (*see* GREECE: *Modern History)*, England, France and Russia agreed to demand an armistice in the Greek War of Independence as preliminary to a settlement. Sir Edward Codrington (*q.v.*), then British commander in chief in the Mediterranean, received the treaty on the night of Aug. 10 at Smyrna, together with instructions to demand an armistice within 14 days. He at once proceeded to Nauplia to communicate with the Greeks, accompanied by his French colleague. Rear Adm. H. D. G. de Rigny. The Greek government agreed to accept the armistice. Codrington found a Turkish squadron at anchor at Navarino on Sept. 12. The Turkish government refused to accept the armistice, but on Sept. 25 an interview took place between Codrington, De Rigny, who had just arrived. and Ibrahim Pasha on behalf of the sultan, at which Ibrahim gave a verbal engagement not to act against the Greeks pending further orders. The allies, who were in want of stores, now separated again, Codrington going to Zante and De Rigny to Cervi, frigates being left to watch Navarino. The British admiral had barely anchored at Zante before he was informed that the sultan's forces intended to put to sea. He resumed his watch off Navarino, and on Oct. 13 was joined by De Rigny and the Russian squadron under Rear Admiral Heiden. Ibrahim Pasha, though unable to operate at sea, considered himself at liberty to carry on the war by land, and his men mere employed in burning the Greek villages. On Oct. 17 a joint letter of expostulation was sent to Ibrahim, but was returned with the manifestly false answer that he had left Navarino. A French officer in the Egyptian service, named Letellier, had anchored the vessels of Ibrahim and the Turkish admiral in a horseshoe formation, of which the points touched the entrance to the bay, and there were forts on the land at both sides of the entry. The allies entered in two lines and began to anchor alongside Ibrahim's fleet. Capt. Thomas Fellowes, commanding the British frigate "Dartmouth," seeing a Turkish fireship close to windward of him, sent a boat to demand that she should be removed. The Turks opened fire on the boat, and the action at once became general. Three-fourths of the Turkish and Egyptian vessels were sunk or fired by their own crews. The victory, ahich came when the Greek cause seemed lost, assured Greek independence, which was acknowledged by the sultan in 1829.

NAVARRE, a province of northern Spain, and formerly a kingdom which included part of France. The province is bounded on the north by France (Basses Pyrénées) and Guipbzcoa, east by Huesca and Zaragossa, south by Zaragossa and Logroño and west by Alava. It is traversed from east to west by the Pyrenees and the Cantabrian Mountains. Area 4,023 sq.mi. Pop. (1960 est.) 396,023. The highest summit is the Monte Adi (4,767 ft.). The chief river flowing toward the Atlantic is the Bidassoa, which rises near the Puerta de Maya. After flowing southward through the valley of Baztán it takes a northeasterly course, and for a short distance above its outfall at Fuenterrabia constitutes the frontier between France and Spain (Guipbzcoa); by far the larger portion of Navarre is drained to the Mediterranean through the Ebro, which flows along the western frontier and crosses the extreme south of the province. The hilly districts consist almost entirely of forest and pasture. the most common trees being the pine, beech, oak and chestnut. Much of the lower ground yields grain; the principal fruit is the apple, from which cider is made in some districts; hemp, flax and oil are also produced, and mulberries are cultivated for silkworms. Navarre is one of the richest provinces of Spain in livestock. Game is plentiful.

Besides Pamplona (*q.v.*), the capital, other important municipalities with more than 5.000 (1950) are Baztán (9.219). Corella (5,761), Estella (7,296), Tafalla (6,815) and Tudela (13.518).

History. — The kingdom of Navarre was formed out of a part of the territory occupied by the Vascones (*i.e.*, the Basques and Gascons), who occupied the southern slope of the western Pyrenees and part of the shore of the Bay of Biscay. In the course of the 6th century there was a considerable emigration of Basques to the north of the Pyrenees.

The name of Navarre is derived by etymologists from "nava," a flat valley surrounded by hills, and "erri," a region or country. It began to appear as the name of part of Vasconia toward the end of the Visigoth epoch in Spain in the 7th century. Its early history is more than obscure. The first historic king of Navarre was Sancho Garcia, who ruled at Pamplona in the early years of the 10th century. Under him and his immediate successors Navarre reached the height of its power and its extension (*see* SPAIN: *History*, for the reign of Sancho el Mayor, and the establishment of the Navarrese line as kings of Castile and Leon and of Aragon). When the kingdom was at its height it included all the modern province of the name; the northern slope of the western Pyrenees called by the Spaniards the "Ultrapuertos" or country beyond the passes. and now known as French Navarre; the Basque provinces; the Bureba, the valley between the Basque mountains and the Montes de Oca to the north of Burgos; the Rioja and Tarazona in the upper valley of the Ebro. In the 12th century the kings of Castile gradually annexed the Rioja and Álava.

While Navarre was reunited to Aragon, 1076–1134 (*see* SPAIN: *History)*, it was saved from aggression on the east, but did not recover the territory taken by Castile. About the year 1200 Alfonso VIII of Castile annexed the other two Basque provinces, Biscay (Vizcaya) and Guipbzcoa. Tarazona remained in possession of Aragon. After 1234 Navarre, though the crown was claimed by the kings of Aragon, passed by marriage to a succession of French rulers. In 1516 Spanish Navarre was finally annexed by Ferdinand the Catholic.

French Navarre survived as an independent kingdom till it was united to France by Henry IV. From 1510 until 1833, when it was incorporated with Spain, Navarre was a viceroyalty.

NAVARRETE, MARTÍN FERNÁNDEZ DE (1765–1844), Spanish historian. was born at Abalos on Nov. 9, 1765, and entered the navy in 1780. He was engaged in the unsuccessful operations against Gibraltar in 1782 and afterward in the suppression of the Algerine pirates. Ill health compelled him for a time to withdraw from active service, but he devoted this forced leisure to historical research, and in 1789 he was appointed by the crown to examine the national archives relating to the maritime history of Spain. Rejoining the navy in 1793, he was present at the siege of Toulon and afterward received command of a frigate. From 1797 to 1808 he held a succession of posts in the ministry of marine. In 1808 the French invasion led to his withdrawal to Andalusia, and the rest of his life was entirely devoted to literature.

In 1819 appeared his *Vida de Cervantes*, an appendix to the Academy's edition of *Don Quixote*. The first two volumes of his *Coleccidn de los viajes y descubrimientos que hicieron por mar los españoles desde fines del siglo XV* were published in 1825; volumes three and four appeared in 1829 and 1837, respectively. In 1837 he was made a senator and director of the academy of history and at the time of his death on Oct. 8, 1844. he was assisting in the preparation of the *Coleccidn de documentos inkditos para la historia de España*. His *Disertacidn sobre la historia de la náutica*

(1846) and *Biblioteca marítima española (1851)* were published posthumously.

NAVARRO, PEDRO (c. 1460–1528), Spanish military engineer and general. Beginning as a sailor, he became *mozo de espuela,* or running footman, to the cardinal Juan de Aragon. Later he enlisted as a mercenary in a war between Florence and Genoa and took part in the warfare between the Genoese corsairs and the Mohammedans of northern Africa. He enlisted under Gonzalo de Córdoba when he sailed to Sicily to take part with the French in the partition of Naples, and in 1500 he laid mines to breach the walls at Cephalonia without much success. He distinguished himself in the campaigns of 1502–03, by the defense of Canosa and of Taranto and by his share in the victory at Cerignola.

His mining operation against the castles of Naples, held by French garrisons, in 1503, won him fame as the first military engineer of his age. At the expulsion of the French from Naples, he received from his king a grant of land and the title of count of Olivetto. In 1508 he took Velez de Gomera, largely by means of a species of floating battery which he invented. He did excellent service in the conquest of Oran (1509) and took Bougie and Tripoli in 1510.

At Ravenna he covered the orderly retreat of the Spanish foot, was taken prisoner by the French and imprisoned in the castle of Loches. Ferdinand, "the Aragonese skinflint," refused to pay his ransom, and after three years of imprisonment, Navarro entered the service of Francis I in a pique. He distinguished himself in the passage of the Alps, at Marignano, at Milan and in the siege of Brescia. He was at the battle of Pavia and in 1522 was taken prisoner at Genoa by the Spaniards. He was confined at Naples till the peace of 1526 and his Olivetto estate was confiscated.

His last service was in the disastrous expedition of Odet de Foix Lautrec to Naples (1527).

See *Documentos inéditos para la Historia de España,* **vol.** XXV *(1854)*; article *sub nomine* in *Enciclopedia Universal Ilustrada.*

NAVE, in architecture, is the central and principal part of a church, extending from the main front to the transepts, or to the choir or chancel (*q.v.*) in the absence of transepts. When the nave is flanked by aisles, light is admitted to the church through clerestory windows. (*See* ROMANESQUE ARCHITECTURE; GOTHIC ARCHITECTURE.) At times, a gallery was carried above the side aisles.

Ecclesiastically considered, the nave is that part of a church appropriated to the laity as distinguished from the chancel, the choir or the presbytery, reserved for the clergy. In a 14th-century letter (quoted in Gasquet's *Parish Life* in *Medieval England,* p. 45, 1906) from a bishop of Coventry and Lichfield to one of his clergy, the reason for this appropriation is given. "Not only the decrees of the holy fathers but the approved existing customs of the Church order that the place in which the clerks sing and serve God according to their offices be divided by screens from that in which the laity devoutly pray. In this way the nave of the church . . . is alone to be open to lay people, in order that, in the time of divine service, clerics be not mixed up with lay people, and more especially with women, nor have communication with them, for in this way devotion may be easily diminished."

NAVIES, EARLY HISTORY OF. The term navy originally meant the whole of a country's shipping, whether used for war, the carrying of merchandise or fishing. In modem parlance, however, the word is generally taken to mean a nation's warships and craft of every kind maintained for fighting on, under or over the sea and the personnel manning them. The Royal Navy, for example, consists of the surface warships—battleships, cruisers, aircraft carriers. destroyers, mine layers. mine sweepers, gunboats and other auxiliary craft; the submarines; and the fleet air arm. Behind the actual fighting units there is, necessarily, a vast organization for their administration and upkeep.

See the sections *Defense* of the articles UNITED STATES (OF AMERICA); FRANCE; GERMANY and other countries for the modern history of naval establishments; *see* also NAVAL AFFAIRS (ARTICLES ON).

In early history navies took the form of the armed men of a tribe or town putting to sea in such large boats or ships as might be available to give battle to enemies similarly equipped or to raid territory from the sea. The craft themselves were for the most part those used for commerce, fishing or, when occasion served, for war or piracy. Only exceptionally were they built specifically for fighting. Later special types of war craft appeared. There are definite indications of long ships built for speed as distinguished from round ships for burden from the time of the ancient Greeks and Romans. In 483 B.C. the threat of Persian attack caused Athens to increase its fleet from 50 to 100 long ships which were paid for out of the proceeds of the mines of Laurium (*see* THEMISTOCLES). The effectof this was to make Athens the predominant partner in the league formed by the Greeks for their common naval defense. By the end of the 5th century B.C. the fleet had increased to 300 long ships and later to as many as 360. In peace these war vessels were kept on slips and under cover in sheds; in war a strategos was appointed in command and he chose the trierarchs nho were deputed to commission the vessels, partly at their own expense, under the supervision of state inspectors.

In general the organization of the Athenian navy resembled closely that of the British navy in the 16th and 17th centuries. The trierarch, who was either one of a group of citizens assisting to finance one or more war vessels or someone paid to discharge the duty, answered to the captain. There were also sailing masters, petty officers. seamen and oarsmen. Soldiers or marines formed the fighting personnel. The most ancient warships were many-oared galleys (*q.v.*), each requiring a very large number of rowers. The result was that the personnel provided to man a fleet of those times had to be a considerable one. For instance, the Roman and Carthaginian forces in the first Punic War numbered approximately 150,000 men on each side. The great rowing galleys relied for their offensive powers on boarding or ramming, and they appeared in great numbers in the Mediterranean in the war fleets of

Alexander, of Carthage, of Rome, of Byzantium, of the Italian republics, of the Arabs and of Aragon. *(See* also SHIP.)

In the naval organization of ancient Rome can be seen the beginning of the idea of an admiralty in the navy commissioners appointed in 311 B.C. It is interesting to note, too, that the Roman empire was faced, on a small scale, with the same kind of maritime problems that assumed such vast importance for the British government in the 19th century. Rome maintained a fleet to neutralize the threat arising from rival sea powers and to deal with pirates and protect its trade routes. Its naval organization, which was very complete, included two main fleets which guarded the coasts of Italy at Ravenna and Misenum. These were known as the praetorian. Other squadrons were allocated to Forum Julii, to the mouth of the Orontes, to Alexandria, to Carpathus (between Crete and Rhodes), to Aquileia (at the head of the Adriatic), to the Black sea and to Britain. River flotillas were stationed on the Rhine and Danube and, later, on the Euphrates. All these squadrons did not exist at the same time, but there was always a highly organized navy with a body of soldiers, the *classici,* specially assigned for service afloat.

The navy of the eastern empire may be said to have originated with the foundation of Constantine's New Rome on the site of Byzantium. The threat of attack from the Vandal kingdom of Carthage (from A.D. 428 to j24) compelled the emperors to attend to their fleet. but with the fall of that kingdom the navy was neglected until the rise of Mohammedan power at the end of the 7th century produced a new menace. The Byzantine navy reached a high state of efficiency under the sovereigns of the Macedonian dynasty (867–1056). It consisted of an imperial fleet commanded by the great *drungarios,* the first recorded lord high admiral, and of provincial squadrons under their strategoi. The imperial fleet was essentially a war organization, while the provincial or thematic squadrons were smaller but more permanent forces maintained for police purposes. It is interesting to note that this navy included a corps corresponding to the gunnery experts of a modern fleet. These were the *siphonarioi,* who worked the siphons used for discharging 'the Greek fire (*q.v.*).

After the disorganization of the eastern empire by Turkish invasions in the 12th century. the Byzantine navy withered. In the middle ages the Italian republics and monarchial states bordering on the Mediterranean possessed appreciable fleets, and their seamen, especially those of Genoa, were regarded as some of the finest in the world, so much so that their services were sought by the powers of western Europe and even by England. Edward III and the kings of France employed Genoese to assist them in nautical matters. The Mediterranean navies made their last great appearance in history at the battle of Lepanto, 1571 (*q.v.*). The scene of naval activity then changed and the ships and fleets took on a new form — one to fit them for ocean sailing and fighting.

NAVIGATION, the process of conducting a craft from one place to another. In its widest sense the word thus embraces not only finding the way but also the avoidance of collision and the handling of the craft. The processes of navigation in general consist in defining the route, conducting the craft along it and finding the craft's position from time to time to check its progress.

The most common way of defining direction on the earth is in relation to its axis of rotation. Position on the earth's surface: or at points close to the surface. is usually expressed in terms of latitude and longitude. Position may be established by dead reckoning (the accounting of distance and direction traveled) or by independent fixes which establish that the craft lies along one or more lines of position. Methods of fixing used at sea and in the air today include visual fixes, astronomical navigation, radio systems and radar. Dead-reckoning methods include the compass and distance or speed indicators of one kind or another, inertial guidance systems and systems making use of the Doppler shift.

The methods of navigation used by the ancients can be deduced from fragmentary evidence in literature, even though there are large gaps in our-knowledge. Modern navigation, both at sea and in the air, relies more and more upon mechanical and electronic devices, even though the human intelligence remains as a vital link. In outer space, navigation is likely to be done solely by nonhuman means.

This article contains the following main sections:

I. HISTORICAL BACKGROUND

Ocean voyages well out of sight of land have been made for thousands of years in every civilization. The Minoans. for example. carried on a regular trade between Crete and Egypt and built the port of Cnossus especially for it. The Phoenicians were trading to Cornwall for tin in about 600 B.C., and 1.200 years later the Vikings were making regular journeys across the Atlantic to their settlements in Greenland and North America. There is thus no evidence for the popular supposition that all early navigators clung to the coast.

Exactly how the earliest navigators found their way must remain to some extent a matter of conjecture, but we know enough to reconstruct some of their methods. Herodotus. for example. tells us that the Phoenicians used Polaris (the pole star) to find direction. Homer has the wise goddess bid Odysseus keep Ursa Major (the Great Bear) on his left hand as he crosses the sea after leaving Calypso's island. In the Acts of the Apostles and in some of the early Norse sagas there are passages that make it clear that the sun and stars were used as guides.

Divisions of the Horizon.—North. south, east and west have always been defined by sunrise and sunset and by the direction of the sun's noonday shadow. The apparent rotation of stars around the north pole of the sky, too, would have been familiar to seamen and others nhose calling involved a knowledge of direction. The division of the horizon into more than these four basic directions first seems to have been made by the Greeks, who differentiated between the directions of sunrise and sunset in winter and summer. a difference of about 30° in those latitudes. For reasons of symmetry, no doubt. they also defined directions on either side of the north–south line corresponding to the lines each side of east and west, and so the twelvefold compass of classical antiquity developed. The Tower of the Winds at Athens, however, shows eight winds, and it seems more probable that seamen from the earliest times accepted this division based simply on dividing and subdividing the four basic directions. The Anglo-Saxons, for example, distinguished 8 "points." and the Portuguese in the great age of discovery abandoned the age-old Mediterranean wind rose, probably of Etruscan origin, for a 16-point system.

Early Sailing Directions. — All directions long were thought of as winds, and early pilot books give the courses between ports in these terms. Distances are given in terms of a day's sail. The earliest surviving pilot book is the *Periplous of Scylax,* which dates from about 350 B.C. These directions, which were the first aids to navigation, describe routes, headlands, landmarks, anchorages. currents, port entrances, etc. No doubt the information was originally handed down from father to son, as it is in some Arab lands today. It seems improbable that any sort of sea chart was used with these sailing directions. even though maps go back to the Alexandrian Greeks. Not until the advent of the magnetic compass was the construction of an accurate sea chart possible.

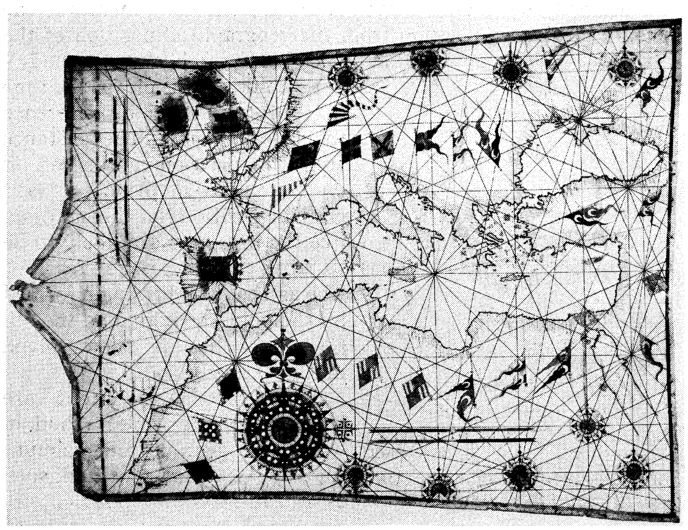
A passage from a book of sailing directions for the Arabian sea, originally written in Sanskrit in A.D. 424, gives an illuminating description of navigation before the days of chart and compass: "The pilot" it says, "knows the course of the stars and can alnays orient himself; he can evaluate the signs of good and bad weather; he distinguishes the regions of the oceans by the fish. the colour of the water, the nature of the bottom, and birds, the mountains and other indications."

The distance traveled was deduced from the speed. The first method of measuring speed was by timing the passage of a chip of wood (hence "log") dropped from the stem until it passed the poop Later a triangular piece of wood, knonn as the log ship. mas attached to a line payed over the stern from a reel, the amount of line that ran out in a given time shoning the speed. Timing was first done by such devices as repeating syllables and counting the pulse, but later the sandglass mas introduced, a 28-second glass being used for speeds up to 6 knots and a 14-second glass for speeds above that. The first suggestion that the line should be knotted (hence "knot") seems to have been made by Richard Norwood in 1637. Knots at 51-ft. intervals were used with the 28-second glass.

The Magnetic Compass.—The birthplace of the magnetic compass is sometimes disputed. The first written reference to the use of the magnetic needle for direction finding at sea seems to have been made by an Englishman, Alexander Neckam. writing in 1180. He speaks of "a needle placed upon a dart which sailors use to steer by when the Bear is hidden by clouds." Writing about 80 years later, a Dominican friar. Vincent of Beauvais. tells how seamen, when they can no longer see sun or stars to steer by, magnetize the needle with a loadstone and place it through a straw floating in water. The needle comes to rest, he says. pointing at the pole star.

The compass card. with its painted nind rose displaying the division of the horizon, was probably first attached to the needle in the 13th century. So familiar has this combination become that it is customary to think of the compass as the instrument itself, whereas the word originally meant merely the division of the horizon.

Later Sailing Directions.— The earliest surviving set of Mediterranean sailing directions, *Lo Compasso da Navigare* (1296), talks in terms of half points. that is. $\frac{1}{64}$ of the compass of the horizon It was from such directions, accumulated over generations and then collected during the 13th century into a single



BY COURTESY OF THE TRUSTEES OF THE NATIONAL MARITIME KUSEUM, GREENWICH LONDON

FIG. 1.— PORTOLANCHART OF THE MEDITERRANEAN BASED ON RHUMB LINES, ASCRIBED TO SIMON FERNANDEZ. 16TH CENTURY

volume for the entire Mediterranean. that the first marine chart was drawn. This chart, the famous Carta Pisana, was drann on sheepskin and is oriented toward the Stella Maris rather than Jerusalem (as most land maps mere). It carried a scale of miles and a pattern of rhumb lines distinguished by coloured inks, corresponding to the directions shown on the wind rose. To set a course on such a chart the pilot would draw a line between his departure point and destination and then, with a pair of dividers, pick out the coloured rhumb line most nearly parallel to it; when traced back to the parent wind rose the rhumb line would show the required course

So long as navigation nas simply by dead reckoning and was restricted to that area, the Mediterranean chart. unrelated to latitude and longitude. nas perfectly satisfactory. It ignored the magnetic variation (the angle at any place between true and magnetic north), but since sailing was by the magnetic needle the variation could be neglected. It also ignored (though not always through ignorance) the fact that the earth is a sphere and that any flat representation of it must somehow take into account the convergence of the meridians toward the poles. But here again no great harm was done so long as sailing was still a matter of going a certain distance on a certain rhumb of the wind or compass point.

When the Portuguese under the leadership of Prince Henry the Navigator ventured farther and farther south along the African coast, they encountered navigational difficulties because they assumed that the plain charts used in the Mediterranean could simply be extended. But over long distances the rhumb lines could not be taken as straight, and the chart proved completely inadequate to the new methods of checking the dead reckoning that Portuguese astronomers and mathematicians had devised under Prince Henry's patronage. These methods demanded a chart related to latitude and longitude, not one merely built upon bearing and distance. In 1569 Gerardus Mercator published his world map on a "true projection suitable for navigation." Thirty years later. Ednard Wright provided an explanation of the projection and computed tables of meridional parts so that cartographers could make use of the principle. However, a long struggle ensued between seamen who wanted to keep the "plain." simple chart and the enlightened few who saw that only a "true" chart could be free of errors. The struggle lasted until well into the 18th century

The Portuguese method of position finding involved observation of the altitude of the pole star in order to determine latitude. The star mas observed when it was "in rule." that is, when the position of the "guard" stars in Crsa Minor (the Little Bear) showed that the pole star. which circles around the pole of the sky, nas precisely at the altitude of the pole. When the navigators approached the equator, where the star of course disappears, latitude was obtained by observations of the noonday sun.

Altitude-Measuring Instruments.— The first instrument used for these observations seems to have been the quadrant, long known to astronomers The star is observed through pinhole sights and its altitude read off where a plumb bob cuts the scale. Later it seems to have become the practice to mark the scale of the quadrant directly with the altitude of the pole star at certain locales, such as Lisbon. The pilot could thus directly observe the latitude of his destination. The ship would sail north or south until she reached the required latitude and then go east or west to her destination, making continual latitude observations.

Columbus is often credited with having discovered the variation of the compass but it seems improbable that the Portuguese pilots, not only in making continual observation of the pole star but also in sailing east or nest along a parallel of latitude, could have failed to observe the phenomenon.

Another instrument used for measuring altitudes at sea was the mariner's astrolabe, an adaptation of the astronomer's astrolabe (*see* ASTROLABE). The instrument used at sea carried only the altitude-measuring alidade. normally fitted to the back of the astronomer's astrolabe. The central part of the instrument was cut anay to lessen wind resistance.

However, the mariner's astrolabe did not achieve the popularity of its 16th-century successor, the cross-stag—a simple device consisting of a staff about three feet long fitted with a sliding crosspiece that made it possible for even an unskilled observer to measure the angle of elevation of a star or the sun. The cross-staff remained in use until the 18th century despite several drawbacks, the most serious being that the sun could be observed only by looking straight at it. Coloured shades were fitted to the cross-pieces, but the major improvement came in 1594 when John Davis, a navigator famous for his Arctic explorations, invented the back-staff. This instrument, with a scale divided into two and used with the observer's back to the sun, remained popular even after the introduction of the far superior Hadley's quadrant (so called, but actually an octant). John Hadley, who was a fellow of the Royal society, described his quadrant in 1731. Its virtue lay in the use of the principle of double reflection to overcome the motion of the ship. Thomas Godfrey, a Philadelphia glassworker, independently devised a similar instrument at about the same time. The sextant, is a refinement of Hadley's quadrant, followed soon afterward and is in regular use today.

Almanacs and Tables.—Working at first from knowledge derived from translations of Portuguese and Spanish manuals, a flourishing school of instrument makers, chart makers and teachers grew up in Tudor and Stuart England. They quickly improved the theory of navigation and compiled more accurate tables. One of the earliest almanacs, which also set forth the principle of determining longitude by lunar distances, was the astronomical ephemeris of Regiomontanus, published in Nurnberg in 1474. The first purely national almanac was the *Connaissance des temps*, published in Paris, which contained tables for the crude determination of longitude from the eclipses of Jupiter's satellites. In 1675 the Royal observatory was founded in Greenwich with the specific object of providing the sailor with astronomical data of the required precision. In 1753 Johann Tobias Mayer published his tables of the motion of the moon, which heralded an enormous advance.

The Marine Chronometer.—Latitude could be observed by measuring the altitude of the pole star or the sun or any star when it crossed the meridian, but the great problem remained the determination of longitude at sea. Medieval astronomers knew that longitude differences could be determined by noting the local time of an eclipse, and in the 16th century the principle of determining longitude by comparing the readings of an accurate clock with local time was pointed out. However, for seamen the problem remained unsolved. In 1714, largely because of a number of disasters due to bad navigation at sea, an act of the English parliament established the Board of Longitude. The board offered an award of £20.000 to anyone who could discover a method of finding out longitude within 60 mi, after a voyage of six weeks. The award was ultimately won by John Harrison, whose fourth marine chronometer, made in the form of a watch, heralded the introduction of the practice of taking timed observations of heavenly bodies at sea.

The 19th Century.—Modern methods of astronomical navigation are based on two fundamental advances made in the 19th century: the discovery of the concept of the astronomical position line by an American, Capt. Thomas H. Sumner, in 1837. and the introduction in 1875 by the French naval officer Marcq St. Hilaire of the intercept method of sight reduction.

In the 20th century, radio methods of navigation at sea and in the air, from the simple direction finder to sophisticated hyperbolic systems, largely replaced older methods of position fixing.

(M. W. Ri.)

II. TECHNIQUES AND INSTRUMENTS COMMON TO MARINE AND AIR NAVIGATION

Dead reckoning (the determination of position by keeping an account of the distance and direction traveled) is common to all forms of navigation. At sea the dead-reckoning position (or "estimated position," as the position corrected for set and drift is sometimes called) is customarily maintained either by plotting with parallel rules and dividers on the chart or a special plotting sheet or by means of the traverse table which can be used to derive change of latitude and longitude for course and distance traveled. The course steered must be corrected for the effects of compass error, currents or tidal streams and drift from the wind. Distance at sea is measured by the ship's log, which records distance directly in the case of towed logs, or speed, which may be converted into distance, in the case of a pressure-type log. The magnetic compass is still standard at sea, but most large ships are fitted with a gyrocompass (*q.v.*) which indicates true north.

Various considerations render the north-seeking gyrocompass impracticable in the air, but the magnetic compass may be gyro-stabilized so that it will be unaffected by turning, acceleration and other errors. Air speed is usually measured by a differential pressure gauge that records the difference between the dynamic pressure due to the aircraft's speed and the static ambient pressure. There are a number of ways of estimating wind drift. The effect of wind on the aircraft's progress is allowed for by an application of the triangle of velocities, either by plotting or by means of a dead-reckoning computer.

The instruments used in celestial navigation are an accurate timepiece, such as a chronometer (*q.v.*) or a navigational watch used in conjunction with radio time signals, and the sextant. The marine sextant is used for measuring the altitude of a heavenly body above the visible horizon. The horizon is not normally available as a reference to the air navigator, so the air sextant is fitted with an artificial horizon in the form of a bubble that defines the vertical. To eliminate the numerous acceleration errors that affect the bubble, an integrating device that automatically averages a number of sextant observations over a run of one or two minutes is generally incorporated. Although other methods of defining a horizon in the air are in use, the bubble is the most general.

In astronomical navigation the navigator adopts the concept of the celestial sphere, in which all heavenly bodies are apparently located on the interior surface of an infinitely large sphere that has the earth as its centre. The celestial sphere appears to rotate westward about the extension of the earth's axis of rotation.

The geographical position of a heavenly body is the point immediately below it on the earth's surface. The latitude of this position is defined by the body's declination and the longitude by its Greenwich hour angle. Both these values may be extracted from the nautical (or air) almanac for a particular time. In navigation the earth and the celestial sphere are considered as two concentric spheres and, since the radius of the earth is known, any angle measured in the celestial sphere can be directly related to distance on the earth's surface. A nautical mile by definition is the length on the earth's surface of one minute of arc.

A navigator making a timed sextant observation of the altitude of a heavenly body thus (subtracting it from 90") measures the distance of his own position from the geographical position of the body. He establishes the body's geographical position for the time of the observation by reference to his almanac. The distance from this position can be laid off on the chart, in principle, as a circular position line, but in practice the distances are likely to be so large that this is not feasible. The astronomical triangle formed by the pole, the body and the observer's zenith is then solved mathematically.

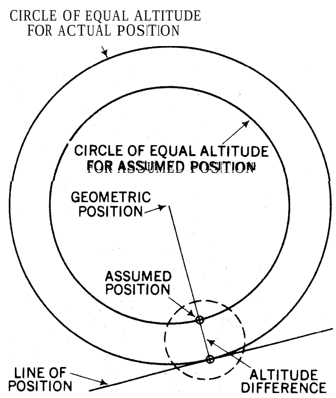


FIG 2.—METHOD OF PLOTTING DEAD-RECKONING POSITION

Most modern solutions are based on the intercept method, in which the altitude and azimuth for any convenient position, such as a dead-reckoning position, are calculated for the instant of observation and compared with the altitude and azimuth obtained from the observations. The procedure is illustrated in fig. 2. Only the portion encircled by the dotted line need be plotted on the chart. The two circles normally differ only by a few minutes of arc, which results in the encircled position being relatively small. The line tangential to the circle of equal altitude for the actual position is perpendicular to the radius of the circle at the point of tangency. No appreciable error is involved, because a straight position line may be said to correspond over a comparatively short distance to a position circle of very large radius tangential to it. An astronomical fix is obtained by the intersection of two or more astronomical position lines.

III. TECHNIQUES AND INSTRUMENTS FOR MARINE NAVIGATION

In coastal navigation the ship's position is normally established by bearings of nearby landmarks. Lighthouses are placed in prominent positions around the coast and show lights by night with characteristic phases by which they may be identified. By day lighthouses are easily recognized landmarks, and their known heights are often used to obtain the distance by sextant angle, Light vessels are generally placed offshore either to mark some danger (such as the Goodwin Sands in the English channel) or as an aid to landfall (the Ambrose lightship off New York harbour). Lighthouses and light vessels are equipped with sound fog signals and usually with radio beacons.

Buoys are used to mark channels and off-lying dangers. The colour and shape of a buoy, and sometimes its numbering. indicate on which side it should be passed. Two systems of buoyage are in use internationally: the lateral and the cardinal systems. The cardinal system is used along coasts fringed with isolated dangers and reefs, and the marks vary according to the quadrant of true compass in which they are situated with reference to the danger. Buoys may be identified at night by their light. characteristics, which are indicated on the chart.

Sailing directions or pilot books, published by national hydrographic authorities, give detailed descriptions of the coast line, landmarks, tides and currents, lights, dangers, etc., for every navigable part of a coast. They give detailed directions for entering harbours and describe the anchorages, port facilities, buoyage, etc. Light lists describe the characteristics of lights (with the exception of buoys) around the coast and the buildings that exhibit them. In strongly tidal uaters, such as the English channel, a tidal stream atlas is published to show the strength and direction of the stream for every hour.

Charts are normally issued by the national hydrographic authority. which is generally a department of the navy. The hydrographic department of the British admiralty has world coverage with some 3,500 charts. The United States Hydrographic office also has world coverage. Since 1920, the International Hydrographic bureau at Monaco, of which most maritime nations are members, has standardized chart making and acted as a medium for the exchange of hydrographic information. Most sea charts are on the Mercator projection. the great advantage of which for navigation is that rhumb lines appear as straight lines. Information to keep charts up to date is published by the hydrographic offices in the form of "notices to mariners."

The directional reference most used by modern navigators is the gyrocompass. The magnetic compass is alnays installed as a standby. and it may be the only compass in smaller ships. The advantage of the gyrocompass is that it indicates true instead of magnetic north and is subject to fewer errors. The compass is used both for steering and for fixing the ship's position by bearings.

The ship's log. which may be of the towed or submerged type. records the speed or distance steamed. The ship's speed may also be estimated from the speed of its engines.

Although the lead line, possibly the oldest navigating instrument. is still in use. sounding at any depth is normally done nith the echo sounder. which gives a continuous indication of the depth of water. In nell-surveyed areas the ship's position may be ascertained by comparing a continuous echo-sounding record of the bottom with the soundings shown on the chart.

IV. TECHNIQUES AND INSTRUMENTS FOR AIR NAVIGATION
