3. Development of Canon Law. — Canon law (*q.v.*) derives from the Scriptures, conciliar canons, papal decrees and traditions and customs of the church. In the west it developed later and more slowly than in the east. In 774 Charlemagne received from Pope Adrian I a collection of canons and decretals accepted at the council of Aachen (802) by the Frankish church. Under the see of Toledo the Spanish church possessed a larger collection including canons of Greek, African, Gallic and Spanish councils and papal decretals. In the 9th century also appeared the collection of "false decretals" whose forgery was not detected until the 15th. This collection, containing both real and spurious decretals, circulated in Spain. Italy, France and even England but was not much used in Rome till the 11th century. Collections made by Burchard of Worms (1012–23) and Ivo of Chartres (c. 1040–1116), Lanfranc's pupil at Bec, prepared the way for Franciscus Gratianus' great work. Gratianus, or Gratian, a Camaldulian monk of Bologna, produced the *Decretum* (1139–41), a systematic treatise (Concordia *discordantium canonum*) in three parts dealing with (1) sources of law and ecclesiastical persons; (2) jurisdiction, procedure, property and marriage; and (3) consecration, sacrament and liturgy. During the 12th and 13th centuries five compilations were added. Gregory IX added the decretals of popes since the Decretum which were compiled by the Dominican Raymond of Peñafort. Later decretals were collected by Boniface VIII (1298) and Clement V (1314); and the Extravagantes (decretals not included in previous compilations) brought the law down to Sixtus IV (1484). These together formed the *Corpus juris* canonici ("body of canon law"), of which a definitive edition was issued by Gregory XIII in 1582.

4. Theological Controversy. — St. Augustine developed his doctrine of the church against the Donatists (*q.v.*) and his doctrine of grace against Pelagius (*q.v.*), but both doctrines were already full-grown. and the fundamental reason for his exposition lay in the need of the man Augustine, a sinner in need of grace and the citizen of a dying civilization in need of the City of God. In other words, the power and permanence of Augustinian theology was the result of his factual presentation of man as man in relation to his Maker and Saviour. The west, untroubled by the complicated disputes and theological parties of the east, developed its theology in simple and universal terms, not as a theory so much as a faith. At the council of Orange (529) under Pope Boniface II the Semi-Pelagians were condemned: "If anyone shall say that by the prevarication of Adam it was not the whole man . . . that was changed for the worse but that, while his soul's free will remained untouched, his body alone became the victim of corruption, such a man is misled by the errors of Pelagius." The question of predestination and depravity was raised in the 9th century by Gottschalk, a monk of Fulda. whose doctrine of a double predestination was condemned by Hrabanus Maurus of Mainz and Hincmar of Reims. But the doctrine of grace developed more surely and continuously as the doctrine of the Eucharist, and here also the church insisted on the reality of the sacrifice. For Ambrose it is Christ Himself who offers the sacrifice and changes the elements into His body and blood. For Augustine the church presents itself as a whole and living sacrifice. Gregory says that the daily offering of Christ's body and blood avail for salvation and that by this means "the lowest things are united to the highest, things earthly are joined to things divine and the visible and invisible become one." In the 9th century Paschasius Radbertus, monk and abbot of Corbie, wrote a treatise De *corpore* et sanguine *Domini*, which in 844 he presented to Charles the Bald, emphasizing the fact of the real change into the body and blood of Christ and equating the daily sacrifice with daily redemption. Another monk of Corbie. Ratramnus, at the same time described the sacrifice as "spiritual" and discussed the relation of "figure" and "truth" in a work afterward attributed to Johannes Scotus Erigena and condemned during the Berengarian controversy at Vercelli in 1050. Berengarius, *scholasticus* and archdeacon of Tours (d. 1088), outlined his doctrine in a letter to Lanfranc, and in 1080 Lanfranc set forth the orthodox doctrine in his book De *corpore* et *sanguine* Dontini.

The Christology of the western church was settled at Chalcedon. The Adoptionist heresy of Felix, bishop of Urgel (c. 783–799), and Elipandus of Toledo (d. 808) was condemned at Narbonne (791) and Regensburg (792) and answered by Alcuin of York, who said that the sonship of Christ is not of nature but of person: the divine and human natures are united in the person of the Son. During these centuries the west developed the devotion to the Virgin Mary defined at the council of Ephesus (431) and at Constantinople (553). "If anyone shall say that the holy. glorious and ever-virgin Mary was only in a certain sense and not most truly the Mother of God, or that she was so in some merely relative way as though it were simply a man that was born and not the Word of God that became incarnate and was born of her, or shall refer, as some do, the birth of the man to God the Word only in the sense that the Word was with the man nhen he was born . . . let him be anathema." In the 4th century St. Gregory of Nazianzus had written that "if anyone does not believe that Holy Mary is the Mother of God, such an one is a stranger to the godhead"; and in the early 8th century St. John of Damascus (c. 676–c. 754) eloquently proclaimed the doctrine of her bodily assumption. Pope Sergius I decreed that the litanies be held on the four feasts of Our Lady, and Pope Leo IV gave the feast of her "Falling Asleep" a vigil and octave. It is mentioned in Adrian I's sacramentary and commanded in the laws of Alfred. The devotion to the Mother of God became articulate and instituted as the doctrine of the incarnation was defined. The same uncompromising refusal to adapt the central mysteries of the faith or to modify them in the interests of rationalization appears through all the centuries of Christological dispute and social chaos. The sacrifice is a real sacrifice, the Saviour really present, the incarnation the real fullness of the godhead bodily, the church the really divine-human community and its head the real and effective sovereign, vicar of Christ.

5. Papal Reform. — This realism, the mark of Christian orthodoxy, is the heart of the work of St. Anselm (1033?–1109). His use of the ontological argument is thus the opposite in emphasis of the Cartesian: its essence is the emphasis on existence. His *Cur* Deus homo starts from divine justice, and his argument presupposes its absoluteness. Faith is the foundation of reason. The same unyielding realism of faith was expressed in the papal reform

initiated by Leo IX (1048–54): "The head of the entire discipline of the church is in that place where Peter, the summit and cardinal member of the apostles. waits for the blessed resurrection of his flesh in the last day." Leo IX had learned administrative method in the imperial service and his episcopal duty in a poor diocese. During the first two years of his pontificate he held 12 councils. He travelled to Reims, to Mainz and as far as Hungary, organized the papal chancery to sustain a large correspondence, employed legates like Adalbert of Bremen and Humbert of Moyenmoûtier and created a college of cardinals. He dreamed of the reunion of east and west. He brought to Rome young Hildebrand (Gregory VII), who had known the city's disorders as a boy and who devoted the remaining 40 years of his life to the reform. Stephen IX (Frederick of Lorraine) was already dying when he left Monte Cassino for the chair of Peter, but in his few months he consecrated the monk St. Pietro Damiani (Peter Damian) cardinal bishop of Ostia, secured the co-operation of cardinals and Roman burghers to ensure the canonical and independent election of his successor and enjoined upon them to await the return of Cardinal Hildebrand, then in Germany. Stephen was no sooner buried than the Roman nobles proved his wisdom by electing an antipope whom the cardinals excommunicated, appointing the Burgundian bishop of Florence, Nicholas II. At his death (1061) the struggle came to a head between the reforming cardinals and the bishops of Lombardy led by Milan. The cardinals elected Anselm of Lucca. Lanfranc's pupil at Bec, as Pope Alexander II. But it was only after bloodshed and an appeal to the German court at Augsburg, and even then at the risk of his life, that Alexander began his pontificate. Nevertheless, the reform was already visibly changing the relations between church and state.

Gregory VII (1073–85), who as monk, deacon, cardinal and pope served this cause for 40 years, was perhaps alone in his vision of all its meaning as. after 1072 (when Pietro Damiani and Adalbert of Bremen died), he was the sole survivor of Leo IX's circle of reformers. For him the battle was no longer limited to simony and celibacy. Likened by his contemporaries to the prophet Elijah, he was disinterestedly certain that the pope is the voice and speaks with the authority of Peter and claimed absolute authority over the souls of Christians without misgiving and without arrogance. Italian, not German, a monk trained in the service of the papacy, elected by cardinals and acclaimed by the people of Rome, he had never been a bishop until he mas made pope. As legate he had seen the church in France and Germany with the eyes of central authority. The arch-chancellor of the empire, who was also archbishop of Mainz, complained that Pope Alexander II had dealt directly with his suffragans of Prague and Olomouc instead of dealing through their archbishop. Liemar of Bremen refused to act at the orders of papal legates without consulting the German episcopate. Secular clergy revolted against a decree of celibacy. Only the Saxon bishops supported the pope, and that because they were opposed to the emperor. In 1075 Gregory revealed his determination: he suspended the archbishop of Bremen and the bishops of Bamberg, Speyer. Strasbourg and three Italian sees and threatened five imperial councillors with excommunication. Henry IV, the German king, having subdued the Saxons, was free to attack the pope. In 1076, at a council of German bishops held at Worms, he declared Gregory deposed and the north Italian bishops declared their agreement. Gregory then deposed and excommunicated the German and Lombard bishops who had signed Henry's letter, declared Henry deposed and excommunicated and his subjects absolved of their allegiance. The effect of this open clash was Henry's defeat and isolation, which he saved from complete disaster by submitting to Gregory at Canossa. There he did penance and awaited absolution. which Gregory gave in duty as a priest. The absolution disconcerted the papal party in Germany which had elected Rudolph of Swabia king in Henry's room. But now Gregory, who was not a partisan, remained neutral. Three years of civil war ended with the victory and death of Rudolph and the excommunication of Henry, who marched on Rome and mas crowned by Guibert of Ravenna (the antipope Clement III). Gregory. "having loved righteousness and hated iniquity died in exile" at Salerno, the guest or prisoner of Robert Guiscard, the Norman king of southern Italy. In France, his campaign against simony and clerical marriage had been more successful. In England, Lanfranc carried out his policy but with a characteristic independence. "Our island," he said in a letter refusing to side with the emperor, "has not yet disavowed Gregory VII nor given judgment whether it ought to obey Clement III." In Spain, Gregory claimed temporal as well as spiritual authority and induced the Spanish church to institute the *Ordo Romanus*. He sent legates to Poland and claimed Hungary as the gift of St. Stephen to St. Peter.

Urban II (1088–99) inherited Gregory's exile and carried on his work. A monk of Cluny and a canonist, he had been employed as legate in Germany to organize the papal party. More firmly than Gregory he maintained the opposition to lay investiture and required free and lawful election of bishops. Deprived at first of his centre at Rome, he held a number of councils. At Clermont (1095) he forbade clergy to do homage to laymen and proclaimed the first crusade (see CRUSADES), which, apart from its particular occasion and important results, inspired the first great movement of popular preaching. Urban employed permanent legates, encouraged appeals to Rome, graded the hierarchy and confirmed the privileges of monastic houses, exempting many of them from episcopal control. At the same time the emergence of an international school at Paris recovered scientific theology for western Christendom. William of Champeaux (c. 1070–1121) established the reputation of the cathedral school. Peter Abélard (1079–1142), who had studied under William, made it the most famous school in Europe and, using the *Organon* of Aristotle, laid the foundation of its tradition as a school of logic and philosophy. The university was the peculiar care and favoured nursling of Innocent III, who secured its independence. finally established by Gregory IX in 1231. At Paris the study of civil law was forbidden (1219) by Honorius III, perhaps in favour of Bologna, where it was well established (in succession to Ravenna and Rome) in the 11th century, and perhaps to ensure the study of theology at Paris. By the middle of the 13th century the schoolmen of Paris had access to original translations from the Greek of nearly all Xristotle's extant works. Forbidden by the legate, Robert de Courçon, in 1215 and again in 1231 and 1263, the physical and metaphysical works of Aristotle, together with the commentaries of Averroes, were nevertheless read and studied especially by the Dominicans Albertus Magnus and Thomas Aquinas, whose Aristotelian method was to become the orthodoxy of Catholic exposition. (See SCHOLASTICISM.)

At the fourth Lateran council (1215) Innocent III (1198–1216) published a definition of the faith which, after affirming the doctrine of the Trinity, the Incarnation and the Judgment, says:

There is moreover one universal Church of the faithful, outside which no man at all is saved, in which the same Jesus Christ is both the priest and the sacrifice, whose body and blood are truly contained in the sacrament of the altar under the species of bread and wine, the bread being transubstantiated into the body and the wine into the blood by the divine power, in order that, to accomplish the mystery of unity, we ourselves may receive of His that which He received of ours. And this thing, the sacrament to wit, no one can make (*conficere*) but a priest, who has been duly ordained, according to the keys of the Church, which Jesus Christ Himself granted to the apostles and their successors.

But the sacrament of baptism, which is consecrated in water at the invocation of God and of the undivided Trinity, that is of the Father, and of the Son and Holy Spirit, being duly conferred in the form of the Church by any person, whether upon children or adults, is profitable to salvation. And if anyone, after receiving baptism, has fallen into sin, he can always be restored *(reparari)* by true penitence.

Not only virgins and the continent, but also married persons, deserve, by right faith and good works pleasing God, to come to eternal blessedness (cited by Alexander Hamilton Thompson, Cambridge *Medieval History,* vol. vi, p. 635).

The last article of the definition quoted above refers to the Catharist or Albigensian heresy, which in the 12th and 13th centuries threatened large areas of Hungary, Germany, Italy and France. It rejected infant baptism, purgatory, the communion of saints, the use of images and the doctrine of the Trinity. Above all, the Cathars attacked the institution of marriage, which was the basis of all social custom and law, sacred and secular, in the west. Catharism was anarchy and heresy at once. It implied

the complete subversion of the social structure and the complete denial of the Christian faith. Its leaders. *perfecti,* admitted no obligation. moral or material. In Languedoc the crusades inaugurated by Innocent III against the heresy were eagerly supported by the French nobility (1209–44). At the same time the Inquisition was organized. Proposed at the council of Verona (1184) and established early in the 13th century, this court was designed to combine judicial procedure with propaganda. Under Gregory IX it was organized with specialist judges and advisers. Its activity varied with time and place. In England and Portugal it mas unknown. In Spain it was obsolescent during the 15th century but revived under Ferdinand and Isabella. In Germany its vigour waned between 1250 and 1350. It was most vigorous in France. As a rule its methods were laboriously and punctiliously just. though it could be misled and sometimes, as under Ferdinand and Isabella, was used for political ends. In an age whose most important industry was definition. in which social discipline and civilized living had still to be won. there could be no question of indifference. The enemies of faith were the enemies of man.

6. The Pattern of Catholic Humanism. — The 13th century was the age of an apostolate at every level of human life. The leaders of the movement were friars. orders initiated by laity (St. Francis') and the lower ranks of clergy (St. Dominic) under the immediate protection of the pope. In 1210 Innocent III sanctioned the Franciscan rule. In 1216 his successor. Honorius III (1216–27), took under his government and protection "the order of Master Dominic and Friars Preachers." The Franciscan movement was popular and spontaneous and as such reflected the social movement. the learning and the spiriruality which developed in centres of population. The Dominicans. a learned order from the beginning. were Augustinian canons called to preach by the spread of heresy and the demand for instruction in the faith. In Raymond of Peñafort. their third master general (1238–40) and confessor to Gregory IX, they produced the greatest canonist and constitutional lawyer of the age. The Swabian Albertus Magnus (*c.* 1200–1280), their regent master in Paris, "strove to make Aristotle intelligible to the Latins" and shares with his contemporary, Robert Grosseteste (1175–1253), bishop of Lincoln. the title of "father of modern science." His pupil Thomas Aquinas is still the "common doctor." the greatest teacher of the Roman Catholic Church. Leo XIII in the encyclical *Aeterni Pntris* (1879) required bishops "to restore the wisdom of St. Thomas and to spread it as far as possible for the safety and glory of the Catholic faith, for the good of society and for the increase of all sciences." It was the work not only of St. Thomas but of the 13th century as a whole to synthesize those three purposes.

In Paris, the metropolis of theological and philosophical controversy, and at the moment of the full recovery of Aristotelian method, St. Thomas (*see* AQUINAS, SAINT THOMAS) represents the arrival of scientific intelligence and the discovery by Christendom of the nature of man. His work is the first clear articulation of the full human confidence in human nature which in patristic and conciliar definitions, as in the earlier scholasticism of St. Anselm and in the preaching of St. Bernard. was still overshadowed by theological, controversial and ecclesiastical purpose. St. Thomas realized what neither pagan philosophy nor Christian theology had as yet clearly discerned, the naturalism of supernature, the divine right of man.

> The last end of man is the contemplation of truth. This alone is distinctive of his nature, and no other corporeal being shares it with him. Nor is there any end beyond it, for the contemplation of truth is an end in itself. Hereby man is united in likeness with superior spirits, because this alone oi human activities is an activity of God and the angels as u-ell. . . . And to this end all other activities seem to be directed. For perfect contemplation we require bodily health, which is secured by all such arts as are necessary to life. We require freedom from perturbation of the passions, a goal obtained by the moral virtues and by prudence. We require freedom from external perturbations, a freedom at which the entire organization of civil government aims. So, if you look at the matter rightly, all human occupations appear to be directed to the nerds of those who contemplate the truth. (Reprinted from the *Summa Theologica* with the permission of Benziger Brothers, Inc.. publishers and copyright owners.)

This coherence of economy, morals and politics in the contemplation of truth is the pattern of Catholic humanism, derived from Catholic faith in the union of human nature with the divine: by which the trial and error of subsequent history of Christendom is judged and to which man progresses and from which he falls.

7. Papal Authority. — Whether the claim of Nicholas I, Gregory VII and Innocent III to an effective sovereignty of Christendom was theoretically sound or not. the civilization of the west did in fact cohere in the church which cohered in the papacy. The papal victory of the 11th century, the development of law, theology and ecclesiastical order. had made the Holy See the centre of a judicial and administrative system not only more efficient than any other government but the basis of all government. It was the final court of appeal in international dealing. the source and standard of ministerial and judicial competence. The pope's authority was also popular and moral. Innocent III (*q.v.*), feudal suzerain of a large part of Europe, exercised also as head of the church a direct and real authority over its chief administrative officers, the bishops, and over the real religion of its people. He and his successors created the universities which trained public servants and presided over an international court in which every sovereign in Europe was prepared to plead. The distance between the papal and the imperial conceptions of government is illustrated in the 12th century by comparing the practical genius and personal ascendancy of Frederick I Barbarossa on the imperial side with the almost impersonal patience and judicial science of Alexander III on the papal. Both were just men, but. whereas Frederick conceived his office in terms of Otto the Great and Charles the Great, imposing peace on his vassals. making mar for the dream of a Roman empire and doing personal justice which made offenders tremble at his coming. Alexander III made decisions. worthy of Gratianus' pupil. which became part of the permanent system of canon law. The third Lateran council, with its successor under Innocent III, defined a conception of life and society which still endures. Frederick's use of the civil law and comparison of himself with Constantine and Justinian as lord of the world at the diet of Roncaglia (1158) was a soldier's romance which never became even plausible and was finally shattered by the Lombard cities at the battle of Legnano (1176). But even the Angevin Henry II of England was compelled like his Norman predecessors to submit to the authority of an order which needed no armament because it was inherent in the social structure.

C. THE CHURCH AND THE NATIONS

The converse was also true. The papacy reflected Christendom and reacted to the national. social and cultural revolution of the 13th and 14th centuries. Frederick II of Hohenstaufen was the first secular sovereign of the modern kind. He ignored without resenting the papal excommunication and was equally prepared to hand Germany over to the church (by the *privilegium* in *favorem principum ecclesiasticorum* of 1220), to make friends with the sultan of Egypt (1229) and to crown himself king in Jerusalem which he had sworn to protect. Having shocked German opinion with his harem and his Saracen bodyguard, he established a central court of justice (diet of Mainz, 1235j and attended the translation of the bones of St. Elizabeth of Hungary (canonized 1234) to Marburg. His greatest achievement, the constitution of Melfi (1231), drawn up in defiance of the pope. established an enlightened despotism in the Sicilian kingdom. His Cniversity of Naples, too, was a despotism governed by a royal chancellor. His friend and fellow-heretic Hermann of Salza used the Teutonic order to found the military state of Brandenburg (1230) which developed into the modern kingdom of Prussia.

France enjoyed peace and consolidation under Louis IX. who valued his throne as a means of making Christians. Provence was united to France in 1246 and the English expelled from all France save Gascony in 1259. The military adventures of the English Edward III and Henry V, picturesque rather than political, served, as did the wars of Burgundy and Armagnac, to confirm the French nationality which Louis XI (1461–83) centralized in the throne. By the 14th century the vernaculars of Italy, France. Spain. Germany and England were mature, their legal systems organized. They were aware of commercial rivalries and of national ambitions.

Feudalism was dying. The Italian cities of Venice, Florence and Milan were independent powers. The age of the crusades was passing; that of national states had arrived.

The Holy See reflected this revolution. It became the centre of Italian politics and international diplomacy, subject to international intrigue. Its judicial business was extended. From increasingly secular states it demanded increasing revenues. Nicholas III (1277–80) was a political realist; he accepted the situation in which every cardinal was the agent of a political interest. and he exalted his own family, the Orsini. His successor, Martin IV, a Frenchman, was the creature of Charles of Anjou. Honorius IV (Savelli) raised his family against the Orsini. Nicholas IV (Colonna) balanced the other t o. Then the cardinals sought to remedy the corruption and forced a hermit unacquainted with the world into the chair of Peter; Celestine V survived five months. was persuaded to abdicate and died in prison. His incompetence was less disastrous than the ability and ambition of his successor. When Boniface VIII, pursuing the logic of contemporary politics and Roman law to an extreme, forbade clergy to pay taxes to the secular government *(Clericis laicos,* 1296), Philip the Fair forbade the export of money from France. When Boniface claimed Scotland as a fief of the pope, Edward I annexed it to England. Both kings relied on their national assemblies, Edward I on the parliament of Lincoln (1301), Philip the Fair on the states-general (1302). Finally French troops seized and imprisoned the pope, who died in 1303. His successor Benedict XI denounced the outrage and died in a few weeks—of poison, it was said.

The next election took ten months and the next pope, Clement V, archbishop of Bordeaux, transferred his court to Avignon in 1309. The "Babylonish captivity" had begun *(see* PAPACY). Perhaps the most dramatic as it was the most shameful sign of the changed time was the suppression by Philip IV and Clement V of the Knights Templars (whose constitution had been drawn up by St. Bernard) after a trial of extorted confessions in which the slanders were dictated by Philip's agents and then confirmed by his victims under torture. The real offense of the Templars was that with the decline of the crusades they had taken to banking; a form of usury uhich evoked the resentment of their noble debtors and the greed of the king. The "Great Schism" which started in 1378 with the election of Robert of Geneva as Clement VII in opposition to the reigning Urban VI was the final tribute of the papacy to national rivalry. Nations bargained with one side or the other.

The doctrine which accompanied, explained and defended the new order was nominalism, uhich denied the reality of universals and declared it an "error to believe that there is something in reality besides the singular entity." Thus there is no such thing as the nature of man which could be defined and must be obeyed and which might be united to the divine nature in the person of Christ; there were only individual men, and the definition of human right and duty was promulgated and enforced by the prince. Nature and supernature, reason and revelation thus parted company. Natural science, whether legal, empirical or mathematical, could thus be rid of metaphysical assumptions and set free to handle facts and concepts each on its own terms. The prince was the source of rights and obligations and, in the words of John Wycliffe *(De officio regis,* 1379), was above human laws. The doctrine was expounded by those Franciscans who supported Louis the Bavarian (1314–47) in his claim to the empire as Louis IV. Marsilius of Padua and John of Jandun affirmed the absolute authority of the civil power *(Defensor pacis,* 1324). The papacy was a human institution which had usurped power. Henry of Langenstein and Conrad of Gelnhausen (1380) thought that a council is above the pope. Wycliffe's opinions, condemned in England, found a home at Prague and a more attractive apostle in John Huss, whose preaching in the Bethlehem chapel kindled the national imagination. Huss proclaimed the doctrine of Germany for the Germans. France for the French. Bohemia for the Bohemians. The council of Constance which condemned him adopted this principle at the suggestion of the bishop of Salisbury as the basis of voting and thereby defeated John XXIII's Italian majority. The conciliar movement (Pisa, 1409; Constance, 1414–18; Basle, 1431–38; *see* COUNCIL) represents an attempt to establish a parliament of Christendom or perhaps a league of nations. The decree *Frequens* declared that councils ought to be held every five years. At Basle the intention was even more explicit to make the pope the constitutional sovereign or nominal head of a Christendom whose national sovereigns were absolute.

The assembled doctors were not in a position to admit what was clear to the governments represented, that their authority was without foundation.

D. REFORM AND DEFINITION

Meanwhile the humanism of the Renaissance and a wide and increasing practice of mysticism intensified individual religion and magnified the individual person. At length the revolution broke. It is symbolized in three events. In 1517 Martin Luther nailed his theses on the door of the church at Wittenberg. In 1534 the Act of Supremacy proclaimed Henry VIII supreme head on earth of the Church of England, which he described as "part of the body politic"; in 1535 John Fisher. Thomas More and the London Carthusians were martyred. In 1543 was published the treatise *De revolutionibus orbium coelestium* of Nicolaus Copernicus. All three events in their several kinds were acts of revolt and signs of exodus into the unknown from the given and created world which Christianity presupposed. "It is not necessary," said Copernicus, "that hypotheses should be true or even probable. It suffices that they lead to calculations which agree with observations." "By reformation," said Luther, "I do not mean the reform of this human teaching and spirituality; I mean its complete and absolute abrogation." "The true significance of the Copernican revolution consisted not so much in displacing the world's centre from the earth to the sun as in implicitly denying that the world has a centre at all." (R. G. Collingwood, The *Idea of Nature* [Oxford, 1945]). In like manner the princes denied the organic unity of Christendom. The doctrine *Cujus regio, ejus religio,* "Let the religion of each state follow that of its prince"; (first announced at the Recess of Speyer, 1526) was adopted throughout Germany by the diet of Augsburg (1555) and then throughout Europe, Catholic and Protestant. In 1572 Catherine de Médicis answered the English protest against the St. Bartholomew massacre by proposing that Elizabeth I should use the same method with Catholics. In 1593 Henry of Navarre "bought Paris with a Mass." The supreme artist in this secular statecraft is Cardinal Richelieu.

1. The Counter-Reformation. — Reform of the church began under Leo X (1513–21). In Italy the Theatines (1524) were founded to reform parochial clergy. In 1526 Matteo de' Bassi founded the Capuchin branch of the Franciscans, and in 1530 the Barnabites were founded by St. Antonio Zaccaria. Paul III (1534–49) began the Counter-Reformation by appointing reformers—Giovanni Pietro Caraffa, Gasparo Contarini, Jacopo Sadoleto, Reginald Pole—to the sacred college. In 1536 they served with five others on a commission which urged the need for reform and did not spare the abuses. In 1534 St. Ignatius of Loyola and six others initiated the Society of Jesus (*q.v.*), established in 1540 by the bull *Regimini militantis ecclesiae.* In 1542, by the bull *Licet initio,* Paul III established the papal Inquisition under Caraffa's influence to supervise the whole church. Pius IV and Pius V enlarged its powers, and Sixtus V (1585–90) reorganized it as one of the Roman congregations. In 1545 a general council met at Trent, which was postponed indefinitely in 1547. It reassembled (1551–52) under Julius III and met again, finally, in 1563

Trent was nothing that Constance had been, everything that Constance was not. Constance had seen the triumph of nationalism; Trent ignored it. Constance made no definition of the faith; Trent made nothing else. Constance had deposed the pope; Trent left everything in his hands. Convoked at the will of Paul III and interrupted by war, Trent made no pretense of gathering or expressing the will of Europe. It reformed the church and accepted the world. It recovered the centre nhich the movement and confusion of powers had displaced and obscured. Its answer to the theology of the Reformation was an affirmation of the divine-

human unity: "In justification a person receives infused through Jesus Christ the remission of his sins, faith, hope and charity. For faith, unless there is added to it hope and charity. does not perfectly unite a person with Christ; nor does it make him a living member of His body; whence it is most truly said that faith without works is dead and unprofitable." *(See* TRENT, COUNCIL OF.)

The works were not lacking. The Counter-Reformation inaugurated above all an age of sanctity: the cardinal archbishop of Milan, St. Carlo Borromeo (1538–84); the Florentine priest St. Philip Neri (1515–95), whose Oratory founded in 1564 in Rome transformed the city; St. Francis of Sales (1567–1622), the most lovable of the doctors of the church, whose devout humanism and humane devotion influenced not only the Catholics of his century but Catholic and Protestant Christianity thereafter; St. Theresa of Avila (1515–82); St. John of the Cross (1542–91), the greatest of the mystics; and St. Vincent de Paul (1576–1660).

2. Establishment of the Jesuits. — Nothing like the apostolate of the Jesuits had yet dawned on the Christian imagination. Within two years of the society's foundation, St. Francis Xavier under the patronage of John III of Portugal established a mission at Goa and during his ten remaining years of life made thousands of converts in India. Malacca. Amboina, the Moluccas and Ceylon (where the king of Kandy and many of his subjects were baptized); he founded a mission in Japan and was on the point of entering China when he died. At the same time Alfonso Salmeron, afterward the colleague of Peter Canisius at Ingolstadt (1549), was sent to Ireland with orders from Paul III "to be all things to all men, constant in good deeds, and to uin souls by kindness." In 1542 the Jesuits were established in Bavaria. They were invited to Salzburg, to Mainz and to Osnabruck. Having carried the Counter-Reformation down the Danube and the Rhine, they Mere called to assist at Trent. They invaded Poland in 1570, England in 1580, Switzerland in 1586. In 1609 they took over the government of Paraguay and turned it into a perfect, almost too perfect, model of Christian social organization. In 1611 they arrived in Canada. Their Roman college. founded in 1551, was the mother of the greatest educational enterprise Christendom had ever known. In 1565 their College of Clermont was already disputing with the University of Paris, whose Gallican doctors had reason to fear their democratic and ultramontane doctrines. They were among the pioneers of patristic study. They quickly became and for two centuries remained the schoolmasters par excellence of Catholic Europe: their course of study laid down in 1585 and revised in 1599 survived until 1832. and among their pupils they number men who attained every variety of fame — Ferdinand II and Leopold I, Tilly and Wallenstein. St. Francis of Sales and St. John of the Cross, René Descartes and Molière. Pierre Huet and Jacques Bossuet, Pierre Bayle and Mazarin, Voltaire, Giovanni Vico and Denis Diderot. Placed under the direct command of the pope, they were the natural foes of national autocracy. At Trent they supported a doctrine of episcopal jurisdiction which placed national bishops under the see of Rome, as against jurisdiction by divine right, which would have established their national independence. Hence they stood opposed to the Gallican ambition represented by the Paris parliament, the university and the Bourbons. Confessors of popes and princes, they were exponents of the "rights of man"; Juan de Mariana's treatise *De rege et regis institutione* ("On kings and royal institution," 1599), dedicated to the future Philip III of Spain, lays its stress not on the legitimacy hut on the justice of the king. It offended public opinion above all in France by defending tyrannicide.

3. National Independence. — The splendour of French culture in the 17th century was the fruit of Catholic humanism and national self-consciousness. Gallicanism (*q.v.*) was another consequence of the union of church and nation The relations of the Gallican church with the Holy See were defined by the concordat of 1516. The same principles of Gallican independence were affirmed in Bossuet's articles in 1681 and spread in the 18th century to the rest of Catholic Europe. The Jansenists, whose doctrines were condemned in 1713 by Clement XI in the bull *Unigenitus,* joined the Gallican cause against the "ultramontane" influence of the Jesuits. In 1763, when the French Jesuits were being suppressed, Febronius (J. N. von Hontheim), auxiliary bishop of Trier and pupil of the Jansenist canonist Z. B. van Espen of Louvain, published his treatise *De statu ecclesiae et legitima potestate Romani pontificis* maintaining the subordination of the pope to general councils and the independence of bishops. Condemned in 1764, the book circulated throughout Catholic Europe. In 1769 the ecclesiastical electors jointly protested against "papal usurpation." Joseph II (on the death of Maria Theresa, 1780) carried out a Febronian policy in the Habsburg empire. In 1773 Clement XIV was forced by the governments of Portugal, France. Spain and Naples to suppress the Society of Jesus. By 1793 the French monarchy was dead, the aristocracy abolished and an egalitarian republic was preparing to establish the rights of man starting from the year I. The *Constitution civile du clergé* ("civil constitution of the clergy"; 1790) was a Gallican measure. The concordat of 1801 restored the terms of 1516.

During this century of anticlerical princes and antipapal bishops was founded the Feast of the Sacred Heart (1765), the order of the Passionists by St. Paul of the Cross (1694–1775) and the Redemptorists by Alfonso Maria dei Liguori (1696–1787).

E. THE CHURCH AFTER 1815

Napoleon passed as a storm and left Europe in ruins. Industrial revolution and economic determinism created a new absolute of natural necessity. The philosophers of reconstruction. idealist or utilitarian, were alike determinist. J. G. Fichte deified the state; G. W. F. Hegel identified God with history; T. R. Malthus and David Ricardo regarded man as the slave of natural forces. Determinism was presupposed in theories of *laissez faire* and of the absolute state, materialism loudly proclaimed by the apostles of revolution and unconsciously generated by the preoccupations of scientific industry and efficiency. Such were the elements and climate of liberalism. Joseph de Maistre opposed it; H. F. R. de Lamennais tried to capture it. In 1834, while Giuseppe Mazzini was founding Young Europe in the name of God and the people, J. B. H. Lacordaire drew crowds of young men to his lectures in Notre Dame with a similar message. In 1837 a German ultramontane movement under Joseph von Gorres sprang to life when the Prussian king imprisoned the archbishop of Cologne and other bishops for refusing to compromise on mixed marriages. Louis Veuillot founded *L'Univers religieux* as the organ of French ultramontanism in 1843. In 1843 also Vincenzo Gioberti's book *Del primato morale e civile degli Italiani* attempted to claim national sentiment for the church: he proposed that the pope should head a confederation of Italian states.

1. The Catholic Revival. — It was not through such political enmities and affinities that the Catholic revival took place. The attitude of the church puzzled its friends and enemies alike so long as they thought of it as a party or a policy, one among many contending for authority to solve political problems. The return of Pius VII from Fontainebleau to Rome was a triumph. Whole towns came out to do him honour; kneeling crowds lined the roads. It was a spontaneous gesture and expressed a piety deeper and older than the policies and theories which transformed European government. In 1848, when Europe was in revolution, Pius IX at Gaeta was visited by a priest who had begged his way from Subiaco whither he had walked a few months earlier from Pontigny, his purpose to ask the pope's approval (willingly bestowed) on the foundation of a religious house. Then he walked back to France and, in the forest near Sens, built a hut with chapel, kitchen and dormitory where, with two companions, he lived in extreme poverty according to the Benedictine rule. Four years later he died. The community, which had become the mother of seven others in France. Palestine and America, was driven from France in 1882, took over the ruins of Buckfast, Eng., and erected one of the most renowned of modern abbeys. This Jean Baptiste Muard was a child of peasants reared in poverty. So was Giovanni Bosco, whose work among the youth of Turin. begun in 1841, elicited the respect and won the support of the government and who founded the Salesian order which was approved in 1874. So was Jean Baptiste Vianney, who became the *curé* of Ars in 1818, and so was Giuseppe Sarto, who became Pope Pius X. In the fall

of the monarchies, the decay of aristocracies and the advance of secularism among the intellectuals, the revival of the church sprang from the devotion, the family life and the personal sanctity of the poor. Theirs was the mind which Pius IX. an indifferent politician and a great bishop, represented and understood. Poverty, chastity and obedience, the ancient prescription for the Christian life. were also the condition of social vitality and the answer of the Catholic people to the proletarian or capitalist theories of the secularist doctrinaires. They presuppose a universal humanity. But except as functions of a dismembered humanity, the politics and economics of power were meaningless, while for deity they substituted a religion of individual. national and class emancipation and enlargement. In 1848 this ancient adversary of the church appeared in Rome and demanded a liberal pope to lead a nationalist cause, Catholic Italy against Catholic Austria; the pope fled to Gaeta. The movement carried on these secularist assumptions mastered European politics. and the pope became the prisoner of the Vatican. In 1854 he defined the Immaculate Conception, the consummate affirmation of faith in human nature. Another statement of the same faith. sorely needed in the age of Nietzsche. appeared in the Vatican constitutions (1870): "The holy Church, our mother, holds and teaches that by the natural light of human reason, God, the principle and end of all that is, may be known with certainty through the medium of created things. . . . If anyone shall say that the only and true God, our Creator and Lord, cannot be known with certainty by the natural light of human reason, let him be anathema." At the moment of Bismarck's victory the pope defined the dogma of papal infallibility. Together with the dogma of the Immaculate Conception and the Dogmatic constitutions it defined the structure of Catholic humanity against the drift and scepticism of progress and power condemned in the syllabus of 1864. Forty years later Pius X began his pontificate, "taking courage in Him who strengtheneth us to proclaim that we have no other aim but that of restoring all things in Christ, so that Christ may be all in all" (E *Supremi apostolatus,* 1903).

2. The War of Ideologies. — The word ultramontane belongs to an age of territorial dominion. With the loss of the papal states it passed into history. The war of ideologies began. In 1872 Bismarck launched his *Kulturkamp* or "cultural struggle." In 1873 the May laws inaugurated a policy of nationalization. The Catholic bureau in the ministry of education was abolished. schools placed under state inspectors, seminaries under state control and, as the war proceeded, many of the bishops imprisoned. Rudolf Virchow, the radical. invented the name *Kulturkampf* to mark the real conflict not between church and state but between two civilizations fundamentally opposed. Resisted not only by Catholics and the centre but by the court. the conservatives and the Lutherans, the policy failed. By 1887 the *Kulturkampf* was over in Germany. It was beginning in France. The Italian governments of left and right, unable to cope with economic distress, suffered continual disorder, and the forces of communism and socialism increased. Leo XIII, who succeeded Pius IX in 1878, issued a series of encyclicals on social and political questions which were accepted through the whole church as a classical statement of its principles: *Inscrutabile Dei* (1878), on social evils caused by rejecting the church; *Quod Apostolici muneris* (1878), on socialism, communism. nihilism; *Arcanum divinae sapientiae* (1880), on marriage; *Diuturnum illud* (1881), on civil power; *Immortale Dei* (1885), on church and state; *Libertas* (1888), on liberty; *Sapientiae Christianae* (1890), on citizenship; *Rerum novarum* (1891), on the social order.

The French attack on the church, restrained after 1870, was brought to a head in 1900 in reaction to the ultramontanism of the army and in response to an intelligentsia of liberals and Freemasons. In 1901 the Law of Associations dissolved two-thirds of the religious houses in France. By 1904, 13,000 schools had been suppressed. In 1905 the government, having broken off relations with the Holy See, confronted the church with the alternatives of wholesale confiscation or subordination to the civil authorities. Pius X decided against subordination and himself consecrated 14 bishops in St. Peter's. Persecution united the "disestablished" church more firmly to the Holy See. The secularist and anti-clerical policy of the French government continued to World War I. "There are now no parties," said the president, "there is only immortal France." The government conceded to war what it denied to Christianity.

During the same period Austria was the scene of similar hostilities. *Los von Rom* ("away from Rome") and *Drang nach Osten* ("violence toward the east") together marked the drift of the Habsburg dominions from their ancient and central position in Catholic Europe. Catholics, suffering from the weakness of a large traditional majority, were divided. Josephism was still alive among the clergy and at court. The Germanic myth whose centre was neither Rome nor Vienna but Berlin was propagated among the German, liberal and anti-Catholic minority. The universities of Innsbruck, Vienna, Graz and Prague were agitated by the ideological war. A campaign of slander against the clergy raised a union of priests and lawyers in their defense (*Rechtschützverein*). A Catholic university at Salzburg was projected (1902). The *Piusverein* (1905) united the Catholic press, and at the Vienna congress (1905) it was declared that the "Catholic faith is the spiritual bond which unites the peoples of Austria." Pan-German deputies in the chamber demanded that the German provinces should join the empire of the Hohenzollerns as Lajos Rossuth and others in the 19th century had demanded separation for Hungary. With the outbreak of war in 1914 and the death of Francis Joseph in 1916 the Habsburg empire fell to pieces. The church and the Catholic faith remained.

3. The Struggle Against Materialism. — Between World Wars I and II the logic of determinism and power politics ceased to be national and became universal. The patriotism of the materialists perished and was succeeded by a materialism without frontiers or citizenship, which denied all obligations but those imposed by force and exacted by cruelty. The last acts of Benedict XV had been devoted to relief. Pius XI (1922–39), still urging relief, especially for Russia, instituted the Feast of Christ the King (1925). In 1931 he took up the theme of *Rerum novarum* in the encyclical *Quadragesimo anno* and against the fascist government reaffirmed moral freedom. Fascism. he said, was a "regime based on an ideology which amounts to a really pagan worship, the state." Two years later the struggle in Spain revealed the extent of the Russian revolution — "hatred of the Lord and His church nourished by groups subversive to any religious and social order as we have seen in Mexico and Russia." In 1937 he addressed his letter *Mit brennender Sorge* to the German bishops, denouncing the nazi regime; and in the encyclical *Divini Redemptoris* he denounced "the most persistent enemies of the church who from Moscow are directing the struggle against Christian civilization." In 1939 the next pope, Pius XII, broadcasted his five peace points, demanding the right to life and independence for all nations great and small, progressive disarmament, provision for revising treaties, the protection of minorities and the spirit of good faith. He broadcasted five points of a "new order based on moral principles" two years later and never ceased to confront the tide of racial degradation and massacre with pleas for justice and charity.

In the hemisphere dominated by the U.S.S.R. his voice could not be heard. The "iron curtain," a war frontier devised without consideration of human rights or needs by victorious powers, left eastern Europe and a great part of Asia at the mercy of a naïve necessitarianism, without faith in man or morals, to which "progress of science." in the words of *Pravda,* "all religions stand in direct contradiction." The 50,000,000 Catholics subject to this "progress" lived in a process of martyrdom. Their bishops were systematically deported, their schools controlled by Communists, their property confiscated and the unsubmissive "liquidated."

In 1949 the Congregation of the Holy Office decreed that it is unlawful for Catholics to enlist in or show favour to the Communist party, or to publish, write or read anything in support of the Communist doctrine and that any Catholic doing so must be denied the sacraments as an apostate from the Catholic faith.

Another decree of much deeper significance was the solemn proclamation on Aug. 15, 1950 by Pope Pius XII declaring and defining the Bodily Assumption of the Blessed Virgin Mary into heaven after her earthly life to be a dogma of the Catholic faith.

4. Activities of the Church. — In contrast with the destruction and unrest of secularized Europe, in which innumerable conflicts tended toward world war, the church was defined, consolidated and extended. Leo XIII commended Thomas Aquinas to all the bishops as the "master and prince of scholastic doctors" (Aeterni *Patris,* 1879), founded the Academy of St. Thomas in Rome (1880) and authorized a new edition of his works based on the edition of the Dominican pope, St. Pius V (1570). By 1906 the edition was complete. Pius X began the codification of canon law completed under Benedict XV in 1917. The study of philosophy and theology was ordered "to be carried on in seminaries according to the arguments, doctrines and principles of St. Thomas which they are inviolately to hold." In 1902 Leo XIII appointed a commission for biblical studies under four cardinals. Pius X imposed the study of Scripture on all seminaries (1906) and ruled (1907) that the commission should examine all important controversies relating to the Bible. He revived (1907) the nork of correcting the text of the Vulgate started under Pius IX by the Barnabite Fr. Vercollone; and in 1909 he founded the Biblical institute in Rome. In 1907 (*Pascendi* domznici gregzs) and again in 1910 (Editae saepe) he condemned "modernism," the "meeting place of all heresies." It is impossible to summarize the missionary activity of an apostolic church. Dominicans entered China in the 13th century; the Jesuits in the 16th were followed by Franciscans, Dominicans and Vincentians. The mission established by St. Francis Xavier in Japan (1549) had grown in 50 years to 300.000 members and then seemed by 1640 to be extinguished by a massacre. Yet in 186j Catholic missionaries discovered a surviving church of 30.000 who without priests or sacraments had maintained acknowledgment of the pope and devotion to Our Lady. In 1862 Pius IX canonized the Japanese martyrs. African missions started on the coast by Jesuits and Dominicans (1596. 1614) were revived in the 19th century by the Holy Ghost Fathers (1842), the Society for African Missions (1859), the White Fathers (1868) and the Society of St. Joseph (1866).

5. United States. — Whatever may be the final verdict of history in regard to the ancient and fascinating Celtic tales of ocean wanderings in which St. Brendan and his companions figure so prominently, many historians of the Catholic Church in the new world have accepted some of these legends as an initial page in their chronicles. A well-documented study of the *Navigatio* Brendani and the land of promise with an exhaustive bibliography was published in the Catholic Historical Review, pp. 395–477 (Jan. 1921), by Joseph Dunn, head of the Celtic department of the Catholic University of America., The historical link between the alleged pré-Columbian discoveries of the new world and the mediaeval church in Greenland is found in the Norse sagas. The Norse church in mediaeval America attracted the attention of scholars as a result of the publication (1893) of the documents from the Vatican archives pertaining to the diocese of Gardar in Greenland. This first Catholic diocese in the new world was established about 112 j and had resident bishops until 1377. After this date until 1492, few of the incumbents of the see resided in Greenland. The letter of Pope Alexander VI (1493) appointing the last bishop says that "on account of the freezing of the sea no ship is supposed to have touched there during the past eighty years."

Of the three principal colonizing nations — Spain, France and England — the two former mere Catholic and the third began its voyages of discovery under a Catholic king. Henry VII. The first attempt to set up church organization in the newly discovered continent was the appointment in 1493 of Bernard Boyl, or Buil, as vicar apostolic of the "Indies." Bishop-Elect Boyl accompanied Columbus on his second voyage. His labours were of short duration and of no permanent value. In 1504 Pope Julius II appointed three bishops to Hispaniola (Haiti). but the Spanish crown refused to confirm their election and the sees were suppressed. Seven years later the permanent dioceses of San Domingo and Conception (Haiti) and San Juan (Puerto Rico) were established. The see of Santiago de Cuba, erected in 1522. was the ecclesiastical centre of the Spanish missions on the mainland until 1545, when the three provinces or archbishoprics — Lima, Mexico City and San Domingo—were erected by Pope Paul III. In 156j the parish of St. Xugustine, the first within the confines of the present United States, was founded as part of the diocese of Santiago. Thus, three-quarters of a century after the discovery by Columbus, the regular canonical life of the church was well established. Out of the archdiocese of Mexico City grew later the suffragan Mexican sees of Guadalajara, Durango, Linares and Sonora, which ruled the southwestern portion of the United States until the middle of the 19th century. One of the heroic chapters in American history is that on the Franciscan. Dominican and Jesuit missions of the southwest and in California.

The French explorers and colonizers of the 16th and 17th centuries were. with few exceptions, Catholics and were ably supported by missionary groups; among them were the Récollets, Jesuits. Sulpicians, Capuchins and the secular clergy. New France was erected into a vicariate apostolic in 1658. with Bishop François de Montmorency Laval at its head. The see of Quebec (1674) had spiritual jurisdiction over all the vast province of France in North America, including the wide-spreading valley of the Mississippi, together with Louisiana.

In the English colonies along the Atlantic coast, Catholicism was generally legally proscribed. The exceptions were: Maryland, from its foundation by the Catholic Calverts in 1634 until the Puritan uprising of 1650; Rhode Island: presumably from its settlement by Roger Williams in 1636 and historically from the charter of 1663; and Pennsylvania, founded by William Penn in 1682, where there is evidence of Catholics from its earliest settlement. Thus. according to Catholic historians. Maryland has the distinction of being the first English settlement where religious freedom was part of the common law (cf. Russell, *Maryland,* Land of Sanctuary [1907]). From 1634 to 1773 Jesuits of English and American origin ministered to the Catholics in Maryland. Pennsylvania and northern Virginia. After the suppression of the Society of Jesus (1773), the legal Corporation of the Roman Catholic Clergy continued to carry on missionary work, with Father John Lewis as superior. In 1784 Father John Carroll. who had won national reputation through his part in the commission to Canada (1776). was appointed prefect apostolic of the church in the United States. Six years later he became the first bishop of Baltimore, with jurisdiction over the entire church in

the new republic. There were at this time (1790) 25 priests and about 30.000 Catholics in the United States. In 1808 Baltimore became a province or archdiocese with suffragan sees at Boston, New York, Philadelphia and Bardstown, Ky. Ten years later, Archbishop Xmbrose Maréchal reported to the Holy See, that there were 52 priests and about 100.000 Catholics in the United States.

There is hardly any parallel in the history of Catholicism to the rapid growth of the church in the United States during the 100 years following the death of Archbishop Maréchal (1828)—from about 300,000 to about 20,000,000. By mid-20th century this number had increased to approximately 34,000,000.

Composition.—The church in the United States is made up of groups from every nation in the world, with the English-speaking peoples in the majority. Up to the middle of the 19th century, the Irish and the Germans furnished the greater quota of its adherents. Later the French-Canadians, Italians, Mexicans, Poles, Lithuanians. Slovaks, Hungarians and others added notably to the number. There is also an appreciable percentage of oriental Catholics—Greeks (Uniates), Syrians, Armenians, etc. 4 development after 1945 was the increase in the number of immigrants from the Spanish-speaking Commonwealth of Puerto Rico. By 19jj an estimated 374,000 Puerto Ricans, mostly Catholics. had sought more favourable employment opportunities on the mainland. largely in the New York area,

External Relations.—This almost unprecedented growth of a religious organization which had been subject to legal and political disabilities since the 16th century was hound to give rise to misunderstandings in a country so largely composed of Protestants. After the rise of the American republic several organized politico-religious movements were instituted for the purpose either of hindering the exercise of the franchise on the part of U.S. Catholic citizens-or of keeping Catholic Americans out of offices of public trust. Chiei among these were the American Protestant association (1829), the Native-American party (1837–44), the Know Nothings (1855–61), the American Protective association (1896) and later the Ku Klux Klan. Being under the protection of the constitution, and enjoying, the advantages of the common law, Catholicism did not meet with any official governmental opposition. All such political or religious anti-Catholicism was temporary or local and did not represent the more general attitude of U.S. citizens.

Internal *Development*.—The internal development of the church in the United States was of a uniform nature. Its doctrinal history offers little of importance. The church discipline in vogue is similar to that of the other churches of Catholicism. Unity of doctrine, of moral law and of liturgical observance is preserved by an intimate union with the see of Rome. The universal canonical legislation of the church as reorganized in the New Code of Canon Law (1918), the legislation by papal rescript, the decisions in contentious cases by the apostolic delegation at Washington, D.C.. and a certain number of customs and practices which grew up in the U.S. church formed the basis for its domestic relations. Every five years each U.S. bishop is expected to pay a visit to Rome (ad *limina Apostolorum*) and to make a report of the spiritual condition of his diocese. A system of diocesan synods provides for local unity among the bishops, clergy and laity. Each province is convened into provincial councils from time to time, and at greater intervals a national or plenary council is held. Three such councils were held (1852, 1866, 1884) at Baltimore. A graduate school of canon law was established at the Catholic University of America, Washington, D.C.

Administration.—The government of the church in the United States was represented in 1956 by the apostolic delegate in Washington, D.C., and by the heads of 26 archdioceses (including four cardinals) and of 105 dioceses. In a total Catholic population of 33,574,017 there were 48,349 priests and 159,545 sisters.

Education.—An outstanding factor in the internal development of the church in the United States was in the field of education. The 1956 biennial summary oi Catholic education, covering the school year 1953–54, showed that since 1920 the number of Catholic schools of all types had increased by 39%, the number of teachers had increased by 142% and the number of students by 110%. In that school year there were 4,176,673 pupils enrolled in 12,118 schools staffed by 131,713 teachers. These included 3,235,251 students in the elementary schools, 623,751 high school students and 281,999 in colleges or universities. In addition there mere 11,623 theological students in the major seminaries and 17,955 in the minor seminaries. Catholic higher education listed 31 universities, 51 four-year colleges for men. 118 four-year colleges for u-omen, two junior colleges for men and 21 junior colleges for women. This system was crowned by the establishment of the Catholic University of America at Washington, D.C., in 1887 by Pope Leo XIII and the U.S. hierarchy. Catholic school authorities estimated that more than $500,000,000 in local school taxes is saved to the public yearly, for the grammar and secondary level alone by the existence of the Catholic school system.

Press.—The decade after World War II witnessed significant growth in the Catholic press. Circulation of Catholic newspapers and magazines in the United States reached a record high of 22,669,394 subscribers, according to the 1956–57 Catholic Press Directory. This was an increase of 1,585,172 over the preceding year. In 1955 there uere 100 archdioceses and dioceses which had their own weekly publications, publishing local and diocesan information and official episcopal notices. These carry national and world-wide news of Catholic interest, provided in most part by the National Catholic Welfare News Service (NC), along with inspirational and editorial features Other publications, weeklies, monthlies or quarterlies, serve the needs of various categories of the Catholic reading public on a national scale

Catholic Church and *the* Negro.—It was estimated in 1956 that only 3% (476,000) of American Negroes are Catholic After World War II special effort went into this sector of the apostolate. Already in 1936 the Catholic University of America had opened its doors to Negro students for the first time. In the autumn of 1947 Archbishop Joseph E. Ritter of St. Louis, Mo., ordered desegregation in all the grammar and high schools of his archdiocese. This example, though it encountered hitter protests from some Catholics, was imitated by other bishops in the years followiug as the opportunity arose. As a result the Roman Catholic Church assumed an acknowledged position as a spokesman for interracial justice. In 1956 there were 664 priests engaged in the Negro missions, with 1,894 sisters. There were 29 Catholic Interracial councils in major cities of both north and south.

National Development—Students of the social and intellectual forces of Catholicism in the United States gave considerable attention to the development of the church along national lines Changes in the immigration policy of the country rendered this development possible. since it permitted the racial elements to be more easily assimilated to national ideals. Many agencies helped effect this general evolution, among them the Catholic Educational association, the National Conference of Catholic Charities, the Catholic Hospital association, the International Catholic Guild of Nurses, the Catholic Near East Welfare association, the Central Bureau of the Central-Verein, the American Catholic Philosophical association and the American Catholic Historical association. All these organizations were aided by the central bureaus of the National Catholic Welfare conference at Washington. National organization was also effected through such societies as the Holy Name society, the Knights of Columbus, the Daughters of Isabella and the Catholic Daughters of America, the National Federation of Catholic College Students and the International Federation of Catholic Alumnae. An annual meeting of the U.S. hierarchy is held in November at the Catholic University of America for the discussion of mooted points in church discipline and progress. The National Catholic Welfare conference is directed by an administrative committee of bishops, reporting annually at the aforesaid meeting. The National Catholic Rural Life conference also meets annually.

Mission Work.—Impoverishment and problems of reconstruction in Europe after World War II meant a heavier burden upon the Catholic Church in the United States for the support of the foreign missions. In the mid-1950s American Catholics contributed 70% of the funds collected through the Society for the Propagation of the Faith throughout the world. In its biennial report of 1956 the Mission Secretariate (Washington, D.C.) reported that 5,126 U.S. priests, brothers and sisters were labouring in overseas missions. Of these 38% were in Latin America and the West Indies and 23% in Asia.

BIBLIOGRAPHY.—The chief foreign source collections for the history of the church in the United States are in Rome (Vatican archives and archives of propaganda), Paris, London (Westminster archives), Seville (Archivo General de Indias), Mexico City (national archives) and Quebec (archiepiscopal archives). Transcripts of these documents were deposited in the Shea collection at Georgetown university, in the archives of the Dominican House of Studies (Washington) and in the Guilday transcripts at the Catholic University of America. Every episcopal see has its own archives, and considerable material exists at the headquarters of the religious orders and congregations, particularly in Rome. The Catholic Archives of America at Notre Dame university are particularly rich in unpublished material. Printed sources will be found in the quarterly Records and Reviews of the Catholic historical societies in the United States and in *Official* Catholic Year Books. The Catholic Historical Review contains bibliographical references for all phases of U.S. Catholic history. Ecclesiastical legislation will be found in the *Acta* et Decreta of the Third Plenary Council of Baltimore.

The literature of American Catholic history of general and special nature is large in extent. J. D. G. Shea's four volumes on the History of the Catholic *Church* in the United States (1886–92) is still the standard work. The Catholic Encyclopedia contains articles on practically every noteworthy aspect of American Catholic history prior to 1918 and is especially valuable for biographical sketches. R. F. Clarke, The Lives of the Deceased Bishops, 2 vol. (1872), is generally trustworthy, though inadequate. Statistics are given annually in the *Official* Catholic Directory. The extended bibliographies of American church history, found in Peter Guilday's Lije *of* Archbishop Carroll (New York, 1922) and his Life *and Times* of John England, First Bishop of Charleston, *1786–1842* (Beirut. 1927), as well as in V. F. O'Daniel's *Right Rev. Edward Dominic Fenwick, Founder of* the *Dominicans* in *the United* States (Washington. D.C., 1920), give a list of provincial, diocesan and corporative histories. See also T. O'Gorman, *A* History

of the Roman Catholic Church in the United States (New York, 1895); Theodore Maynard, *Story of American Catholicisnz* (New York, 1948); Peter Guilday, *History of the Councils of Baltimore, 1791–1884* (New York, 1932); Jesuit Relations, *Anzerican Catholic Historical Researches,* 73 vol. (1896–1901), ed. by R. G. Thwaites, and the condensation into two volumes by Edna Kenton (New York. 1925). *See* also "Catholic Historical Scholarship in the United States," in *Catholic Historical Review!,* 7:470–477 (Washington, D.C., 1927); J. Ellis (comp.), *Select Bibliography of the History of the Catholic Church in the United States* (New York, 1947); Theodore Roemer, *The Catholic Church in the United States* (St. Louis, Mo., 1950); J. T. Ellis. *The Life of James Cardinal Gibbons, Archbishop of Baltimore, 1834–1921,* 2 vol. (Milwaukee, Wis., 1952); James H. Moynihan, *The Life of Archbishop John Ireland* (New York, 1953); Colman J. Barry, *The Catholic Church and German Americans* (Milwaukee, Wis., 1953). (P. GU.; J. LAF.)

6. Roman Catholicism in England. — In England, the political emancipation of Roman Catholics was granted in 1829. A number of disabilities, however, remained.

The Catholic population of England and Wales was estimated at 452,000 in 1840. In the following 60 years it rose to 1,300,000, mainly because of Irish immigration. The Irish factor indeed became dominant, overshadowing the small property-owning group of English Catholics that had survived the persecution There were great social, intellectual and cultural differences between this group, the Irish Immigrants and the converts who entered the church in growing numbers after J. H Newman's reception (1845). In the 20th century, however, there was an increase of the Catholic middle classes, to which the dispersal, particularly since 1939, of formerly closely knit Catholic centres in northern England and the migration of industry southward contributed as much as the assimilation of the former immigrants. There were also Irish and European newcomers from the professional classes

When Pius IX terminated the regime of vicars apostolic and restored the English hierarchy in 1850 (under the first cardinal-archbishop of Westminster, Nicholas Wiseman, with 12 suffragan sees), there was an outburst of anti-Catholic agitation, resulting in the Ecclesiastical Titles act (1851). This threatened the new hierarchy with fines and loss of property, but was never enforced and was repealed in 1871. Until 1908 the Roman Catholic Church in England and Wales: regarded as a church in a missionary land, was under the jurisdiction of the Congregation for the Propagation of the Faith.

Meanwhile religious orders and their teaching revived: colleges or schools for boys were established by the Jesuits at Stonyhurst (1794) and at Beaumont (1861), by the Benedictines at Ampleforth (1802) and at Downside (1814), by the Dominicans at Woodchester (1851) and by the Rosminians at Ratcliffe college (1844); and the Oratorians were introduced by Newman at Birmingham (1847). Religious communities of women were likewise developed: for instance the Society of the Holy Child Jesus, founded by Cornelia Connelly for educational purposes in 1846. Anticlerical legislation in France under the Third Republic caused a fresh influx of religious communities into England.

Henry Edward Cardinal Manning's tenure of the archbishopric at Westminster (1865–92) was characterized by his interest in social problems: he mediated successfully in the dock strike of 1889 and exerted some influence on the publication of Pope Leo XIII's encyclical on social justice, *Rerum novarum.* There was a clash of temperaments between Manning and Newman, the latter suffering many disappointments. particularly in his efforts on behalf of Catholic higher education. Catholics were forbidden by the hierarchy to attend Oxford or Cambridge university until 1895.

By the beginning of the 20th century, Protestant feeling against the church had become far less outspoken, and Catholics were to be found in all walks of the national life. Politically, the Irish Catholic influence died away, and the Catholic vote, significant though it remained in the Labour party, never exerted a decisive influence. Under the direction of the hierarchy, however, Catholics would act with unanimity on such matters as legislation on the family and on divorce and on the school question (they had to bear an increasing burden of the costs for their own schools).

The English Catholic minority, notably the converts, was well represented in the fields of letters and of journalism. John Lingard, Lord Acton, David Knowles and Christopher Dawson became eminent as historians; Gerard Manley Hopkins, Francis Thompson and Hilaire Belloc as poets; Frederick Rolfe (Baron Corvo), Maurice Baring, Evelyn Waugh and Graham Greene as novelists; and G. K. Chesterton primarily as an apologist. Weekly periodicals flourishing in the 1950s included *The Tablet* (founded in 1840), *The Catholic Times* (1859), the *Universe* (1860) and the *Catholic Herald* (1894). At the same time the Jesuits were publishing the *Month* (1863; monthly), the Benedictines the *Downside Review* (1880; quarterly) and the Dominicans *Blackfriars* (1920; monthly).

In 1957 the Catholic population of England and Wales was estimated to number 3,292,000. It constituted a strong and respected Christian community in a secularized society.

ROMANCE, originally a composition written in "Romance" language; *i.e.,* in one of the phases on which the Latin tongue entered after or during the dark ages. For some centuries by far the larger number of these compositions were narrative fictions in prose or verse; and since the *special* "Romance" language of France—the earliest so-called—was the original vehicle of nearly all such fictions, the use of the term for them became more and more accepted in a limited sense. Yet for a long time there was no definite connotation of *fiction* attached to it, but only of narrative story; and the French version of William of Tyre's *History of the Crusades,* a very serious chronicle written towards the close of the 12th century, bears the name of *Roman d'Éracle* simply because the name of the emperor Heraclius occurs in the first line. But if the explanation of the name "Romance" is quite simple, certain and authentic, the same is by no means the case with its definition, or even with the origin of the thing to which that name came mostly to be applied. For some centuries an abstraction has been formed from the concrete examples. "Romance," "romanticism," "the romantic character," "the romantic spirit," have been used to express sometimes a quality regarded in itself, but much more frequently a difference from the supposed ."classical" character and spirit. The following article will deal chiefly with the matter of Romance, excluding or merely referring to accounts of such individual romances as are noticed elsenhere. But it will not be possible to conclude without some reference to the vaguer and more contentious signification.

Romance in antiquity. — Speculations on the origin of the peculiar kind of story which we recognize rather than define under the name of romance have been numerous and sometimes confident; but a wary and well-informed criticism will be slow to accept most of them. It is certain that many of its characteristics are present in the *Odyssey;* and it is a most remarkable fact that these characteristics are singled out for reprehension—or at least for comparative disapproval — by the author of the treatise *On the Sublime.* The absence of central plot. and the prolongation rather than evolution of the story; the intermixture of the supernatural; the presence and indeed prominence of love-affairs: the juxtaposition of tragic and almost farcial incident; the variety of adventure arranged rather in the fashion of a panorama than otherwise: all these things are in the *Odyssey,* and they are all. in varying degrees and measures, characteristic of romance. Nor are they absent from the few specimens of ancient prose fiction which we possess. If the *Satyricon* of Petronius was ever more than a mass of fragments. it was certainly a romance, though one much mixed with satire, criticism and other things; and the various Greek survivals from Longus to Eustathius always and rightly receive the name. But two things were still wanting which were to be all-powerful in the romances proper—chivalry and religion. They could not yet be included. for chivalry did not exist and such religion as did exist lent itself but ill to the purpose except by providing myths for ornament and perhaps pattern.

The "Saint's **Life."**—A possible origin of the new romance into which these elements entered (though it was some time before that of chivalry definitely emerged) has been seen by one of the least hazardous of the speculations above referred to in the hagiology or "Saint's Life," which arose at an early though uncertain period. developed itself pretty rapidly, and spreading over all Christendom (which by degrees meant all Europe and parts of Asia) provided centuries with their chief supply of what may be called interesting literature. If the author of *On the Sublime* was actually Longinus, the minister of Zenobia. there is no doubt that examples both sacred and profane of the kind of "fiction" ("imitation" or "representation") which he deprecated were mustering and multiplying close to, perhaps in. his own time. The Alexander legend of the pseudo-Callisthenes is supposed to have seen the light in Egypt as early as A.D. 200. and the first Greek version of that "Vision of Saint Paul," which is the ancestor of all the large family of legends of the life after death, is pretty

certainly as old as the 4th century and may be as old as the 3rd. The development of the Alexandreid was to some extent checked or confined to narrow channels as long as something like traditional and continuous study of the classics was kept up. But hagiology was entirely free from criticism; its subjects were immensely numerous; and in the very nature of the case it allowed the tendencies and the folklore of three continents and of most of their countries to mingle with it. Especially the comparative sobriety of classical literature became affected with the Eastern appetite for marvel and unhesitating acceptation of it; and the extraordinary beauty of many of the central stories invited and necessitated embroidery, continuation, episode. Later, no doubt, the adult romance directly reacted on the original saint's life, as in the legends of St. Mary Magdalene most of all, of St. Eustace, and of many others. But there can be very little doubt that if the romance itself did not spring from the saint's life it was fostered thereby.

The Gathering of Matter. — Proceeding a little further in the cautious quest — not for the definite origins which are usually delusive, but for the tendencies which avail themselves of opportunities and the opportunities which lend themselves to tendencies — we may notice two things very important to the subject. The one is that as Graeco-Roman civilization began to spread north and east it met, to appearance which approaches certainty, matter which lent itself gladly to "romantic" treatment. That such matter was abundant in the literature and folk-lore of the East we know: that it was even more abundant in the literatures and folk-lore of the North, if we cannot strictly be said to know, we may be reasonably sure. On the other hand. as the various barbarian nations (using the word in the wide Greek sense), at least those of the North, became educated to literature, to "grammar," by classical examples. they found not a few passages in these examples which were either almost romances already or which lent themselves, with readiness that was almost insistence, to romantic treatment. Apollonius Rhodius had made almost a complete romance of the story of Jason and Medea. Virgil had imitated him by making almost a complete romance of the story of Aeneas and Dido: and Ovid, who for that very reason was to become the most popular author of the middle ages early and late, had gone some way towards romancing a great body of mythology. We do not know exactly who first applied to the legendary tale of Troy the methods which the pseudo-Callisthenes and "Julius Valerius" applied to the historical wars of Alexander, but there is every reason to believe that it was done fairly early. In short, during the late classical or semi-classical times and the whole of the dark ages, things were making for romance in almost every direction.

It would and did follow from this that the thing evolved itself in so many different places and in so many different forms that only a person of extraordinary temerity would put his finger on any given work and say, "This is the first romance," even putting aside the extreme chronological uncertainty of most of the documents that could be selected for such a position. Except by the most meteoric flights of "higher" criticism we cannot attain to any opinion as to the age and first developed form of such a story as that of Weland and Beadohild (referred to in the *Complaint of* Deor), which has strong romantic possibilities and must be almost of the oldest. The much more complicated Volsung and Nibelung story, though we may explore to some extent the existence backwards of its Norse and German forms, baffles us beyond certain points in each case; yet this, with the exception of the religious element, is romance almost achieved. And the origin of the great type of the romance that is achieved — that has all elements present and brings them to absolute perfection — the Arthurian legend, despite the immense labours that have been spent upon it and the valuable additions to particular knowledge which have resulted from some of them, is, still more than its own Grail, a quest unachieved, probably a thing unachievable. The longest and the widest inquiries, provided only that they be conducted in any spirit save that which determines to attain certainty and therefore concludes that certainty has been attained, will probably acquiesce most resignedly in the dictum that romance "grew" — that its birthplace is as unknown as the grave of its greatest representative figure.

But when it has "grown" to a certain stage we can find it, and in a way localize it, and more definitely still analyse and comprehend its characteristics from their concrete expressions.

CLASSES OF SOURCE

Approaching these concrete expressions, then, without at first putting forward excessively hard and fast requirements in regard to the validation of the claims, we find existing in Europe about the 11th century (the time is designedly left loose) divers classes of what we should now call imaginative or fictitious literature, nearly all (the exceptions are Scandinavian and Old English) in verse. These are: (i.) The saints' lives; (ii.) the Norse sagas, roughly so-called; (iii.) the French chansons de geste; (iv.) the Old English and Old German stories of various kinds; (v.) perhaps the beginning of the Arthurian cycle; (vi) various stories more or less based on classical legend or history from the tales of Alexander and of Troy down to things like *Apollonius* of Tyre, which have no classical authority of either kind, but strongly resemble the Greek romances, and which were, as in the case named, pretty certainly derived from members of the class; (vii.) certain fragments of Eastern story making their way first, it may be, through Spain by pilgrimages, latterly by the crusades.

Now, without attempting to fence off too rigidly the classical from the romantic, it may be laid down that these various classes possess that romantic character, to which we are, by a process of netting and tracking, slowly making our way, in rather different degrees, and a short examination of the dilference will forward us not a little in the hunt.

With i. (the saints' lives) we have least to do: because by the time that romance in the full sense comes largely and clearly into view, it has for the most part separated itself off — the legend of St. Eustace has become the romance of Sir Isumbras, and so forth. But the influence which it may, as has been said, have originally given must have been continually re-exerted; the romantic-dynamic suggestion of such stories as those of St. Mary of Egypt, of St. Margaret and the Dragon, of St. Dorothea, and of scores of others, is quite unmistakable. Still, in actual result, it works rather more on drama than on narrative romance, and produces the miracle plays.

In ii. (the sagas), while a large part of their matter and even not a little of their form are strongly romantic, differences of handling and still more of temper have made some demur to their inclusion under romance, while their final ousting in their own literatures by versions of the all-conquering French romance itself is an argument on the same side. But the Volsung story, for instance, is full of what may be called "undistilled" romance — the wine is there, but it has to be passed through the still — and even in the most domestic sagas proper this characteristic is largely present.

It is somewhat less so in iii. (the *chansons* de geste), at least in the apparently older ones, though here again the comparative absence of romantic characteristics has been rather exaggerated, in consequence of the habit of paying disproportionate and even exclusive attention to the Chanson de Roland. There is more, that is, of romance in Aiiscans and others of the older class, while *Amis* and Amiles, which must be of this class in time. is almost a complete romance, blending war, love and religion — salus, *venus*, *virtus* — in full degree.

The other four classes, the miscellaneous stories from classical, Eastern and European sources, having less corporate or national character, lend themselves with greater ease to the conditions of romantic development; but even so in different degrees. The classical stories have to drop most of their original character and allow something very different to be superinduced before they become thoroughly romantic. The greatest success of all in this way is the story of *Troilus* and Cressida. For before its development through the successive hands of Benoît de Sainte-More, Boccaccio (for we may drop Guido of the Columns as a mere middleman between Benoît and Boccaccio) and Chaucer, it has next to no classical authority of any kind except the mere names. In the

various Alexandreids the element of the marvellous — the Eastern element, that is to say — similarly overpowers the classical. As for the Eastern stories themselves, they are particularly difficult of certain unravelment. The large moral division — such as *Barlaam* and *Josaphat*, the Seven Wzse *Masters* in its various forms, etc., comes short of the strictly romantic. We do not know how much of East and how much of West there is in such things as Flore et *Blanchefleur* or even in Huon of *Bordeaux* itself. Contrariwise we ought to know, more certainly than apparently is known yet, what is the date and history of such a thing as that story of Zumurrud and Ali Shahr, which may be found partly in Lane and fully in the complete translations of the Arabian Nights, though not in the commoner editions, and which is evidently either copied from, or capable of serving as model to, a Western roman d'aventures itself.

We come, however, much closer to the actual norm itself — closer, in fact, than in any other place save one — in the various stories. English, French, and to a less extent German,' which gradually received in a loose kind of way the technical French term just used, a term not to be translated without danger. Nearly all these stories were drawn, by the astonishing centripetal tendency which made France the home of all romance between the 11th and the 13th centuries, into French forms; and in most cases no older ones survive. But it is hardly possible to doubt that in such a case, for instance, as *Havelok*, an original story of English or Scandinavian origin got itself into existence before, and perhaps long before, the French version was retransferred to English, and so in other cases. If, once more, we take our existing English *Havelok* and its sister King Horn, we see that the latter is a *more* romanced form than the former. Havelok is more like a *chanson* de grste — the love interest in it is very slight; while in *King* Horn it is much stronger, and the increased strength is shown by the heroine being in some forms promoted into the title. If these two be studied side by side the process of transforming the mere story into the full romance is to no small extent seen in actual operation. But neither exhibits in any considerable degree the element of the marvellous, or the religious element, and the love interest itself is, even in Horn, simple and not very dramatically or passionately worked out. In the later ronzan d'aventures, of which the 13th century was so prolific (such as, to give one example out of many, *Amadas* and *Idoine*), these elements appear fully, and so they do in the great Auchinleck collection in English, which. though dating well within the 14th century, evidently represents the meditation and adaptation of French examples for many years earlier.

The last of our divisions, however, exhibits the whole body of romantic elements as nothing else does. It is not our business in this place to deal with the Arthurian legend generally as regards origin, contents, etc., nor, in the present division of this actual article, to look at it except for a special purpose and in connection with and contradistinctive to the other groups just surveyed. Here, however, we at last find all the elements of romance, thoroughly mixed and thoroughly at home, with the result not merely that the actual story becomes immensely popular and widely spread; not only that it receives the greatest actual development of any romantic theme; but that, in a curious fashion, it attracts to itself great numbers of practically independent stories — in not a few cases probably quite independent at first — which seem afraid to present themselves without some tacking on (it may be of the loosest and most accidental description) to the great *poly*-centric cycle, the stages of which gather round Merlin, the Round Table, the Grail and the Guinevere-Lancelot-Mordred catastrophe. All the elements, let it be repeated, are here present: war, love and religion; the characteristic extension of subject in desultory adventure-chronicles; the typical rather than individual character (though the strong individuality of some of the unknown or half-known contributors sometimes surmounts this); the admixture of the marvellous, not merely though mainly as part of the religious element; the presence of the chivalrous ideal. The strong dramatic interest of the central story is rather superadded to than definitely evolved from these elements; but they are still present, just as, though more powerfully than, in the weakest of miscellaneous *romans* d'aventures.

'Italian romance seems to have modelled itself early on French, and it is doubtful, rich as is the late crop of Spanish romances, whether we have any that deserve the name strictly and are really early.

TYPES OF STORY, INCIDENT AND PERSONAGES

A further step in the logical and historical exploration of romance may be taken by regarding the character-and-story classes round which it groups itself, and which from the intense community of mediaeval literature — the habit of mediaeval writers not so much to plagiarize from one another as to take up each after each the materials and the instruments which were not the property of any — is here especially observable. Prominent above everything is the world-old motive of the quest; which, world-old as it is, here acquires a predominance that it has never held before or since. The object takes pretty various, though not quite infinitely various, forms, from the rights of the disinherited heir and the hand or the favour of the heroine, to individual things which may themselves vary from the Holy Grail to so many hairs of a sultan's beard. It may be a friendly knight who is lost in adventure, or a felon knight who has to be punished for his trespasses; a spell of some kind to be laid; a monster to be exterminated; an injured virgin or lady, or an infirm potentate, to be succoured or avenged; an evil custom to be put an end to; or simply some definite adventure or exploit to be achieved. But quest of some sort there must certainly be if (as in Sir Launfal, for instance) it is but the recovery of a love forfeited by misbehaviour or mishap. It is almost a sine qua non — the present writer, thinking over scores, nay hundreds, of romances, cannot at the moment remember one where it is wanting in some form or another.

It will be observed that this at once provides the amplest opportunity for the desultory concatenation or congregation of incident and episode which is of the very essence of romance. Often, nay generally, the conditions, localities and other circumstances of the quest are half known, or all but unknown, to the knight, and he is sometimes intentionally led astray, always liable to be incidentally called off by interim adventures. In many (perhaps most) cases the love interest is directly connected with the quest, though it may be in the way of hindrance as well as of furtherance or reward. The war interest always is so connected; and the religious interest commonly — almost universally in fact — is an inseparable accident. But everything leads up to, involves, eventuates in the fighting. The quest, if not always a directly warlike one, always involves war; and the endless battles have at all times, since they ceased to be the great attraction, continued to be the great obloquy of romance. It is possible no doubt that reports of tournaments and single combats with lance and sword, mace and battle-axe, may be as tedious to some people as reports of football matches certainly are to others. It is certain that the former were as satisfactory in former times to their own admirers as the latter are now. In fact the variety of incident is almost as remarkable as the sameness. And the same may be said, with even greater confidence, of the adventures between the fights in castle and church and monastery, in homestead or hermitage. The actual stories are not much more alike than those who have read large numbers of modern novels critically know to be the case with thern. But the absence, save in rare cases, of the element of character, and the very small presence of that of conversation, show up the sameness that exists in the earlier case.

The same deficiency in individual character-drawing, and in the conversation which is one of its principal instruments, brings out in somewhat unfair relief some other cases of apparent sameness — the "common forms" of story and of character itself. The disinherited heir, the unfaithful or wronged wife, the wicked stepmother, the jealous or wrongly suspected lover, are just as universal in modern fiction as they are in mediaeval — for the simple reason that they are common if not universal in nature. But the skeleton is more obvious because it is less clothed with flesh and garments over the flesh; the texture of the canvas shows more because it is less worked upon. Some of these common forms, however, are more peculiar to mediaeval times; and some, though not many, allow excursions into abnormalities which, until

recently, were tabooed to the modem novelist. Among the former the wickedness of the steward is remarkable, and of course not difficult to account for. The steward or seneschal of romance, with some honourable exceptions, is as wicked as the baronet of a novel, but here the explanation is not metaphysical. He was constantly left in charge in the absence of his lord and so was exposed to temptation. The extreme and almost Ephesian consolableness of the romance widow can be equally rationalized—and in fact is so in the stories themselves—by the danger of the fief being resumed or usurped in the absence of a male tenant who can maintain authority and discharge duties. While such themes as the usually ignorant incest of son with mother or the more deliberate passion of father for daughter come mostly from very popular early examples—the legend of St. Gregory of the Rock or the story of Apollonius of Tyre.

Characters of Romance Proper.—The last point brings us naturally to another of considerable importance—the singular purity of the romances as a whole, if not entirely in atmosphere and situation, yet in language and in external treatment. It suited the purposes of the Protestant controversialists of the Renaissance, such as our own Ascham, to throw discredit upon work so intimately connected with Catholic ceremony and belief as the *Morte d'Arthur;* and it is certain that the knights of romance did not even take the benefit of that liberal doctrine of the Cursor *Mundi* which regards even illicit love as not mortal unless it be "with spouse or sib." But if in the romances such love is portrayed freely, and with a certain sympathy, it is never spoken of lightly and is always punished; nor are the pictures of it ever coarsely drawn. In a very wide reading of romance the present writer does not remember more than two or three passages of romance proper (that is to say before the latter part of the 15th century) which could be called obscene by any fair judge. And the term would have to be somewhat strained in reference even to these.

The contrast with the companion divisions of fabliaux and farces is quite extraordinary; and nearly as sharp as that between Greek tragedy on the one hand and Greek comedy or satiric play on the other. It is brought out for the merely English reader in Chaucer of course, but in him it might have been studied. In the immense corpus of known or unknown French and English writers (the Germans are not quite so particular) it comes out with no possibility of deliberation and with unmistakable force.

The history of the forms in which romance presents itself follows a sufficiently normal and probable course. The oldest are always—save in the single case of part of the Arthurian division, in which we probably possess none of the actually oldest, and in some of the division of Antiquity which had a long line of predecessors in the learned languages—the shortest. They become lengthened in a way continued and exemplified to the present moment by the tendency of writers to add sequels and episodes to their own stories, and made still more natural by the fact that these poems were in all or almost all cases recited. "Go on" is the most natural and not the least common as well as the most complimentary form of "Bravo!" and the reciter never seems to have said "no" to the compliment. In not a few cases—Huon of Bordeaux, Ogier the Dane, Guy of *Warwick,* are conspicuous examples—we possess the same story in various stages; and can see how poems, perhaps originally like King Horn of not more than a couple of thousand lines or even shorter in the 13th century, grew to thirty, forty, fifty thousand in the 14th. The transference of the story itself from verse to prose is also—save in some particular and still controverted instances—regularly traceable and part of a larger and natural literary movement. While, also naturally enough, the pieces become in time fuller of conversation (though not as yet often of conversation that advances the story or heightens its interest), of descriptive detail, etc. And in some groups (notably that of the remarkable *Amadis* division) a very great enlargement of the proportion and degradation of the character of the marvellous element appears—the wonders being no longer mystical, and indeed being magical only in the lower sense.

CHARACTERISTICS OF ROMANCE

And so we come to the particular characteristics of Romance. What are these characteristics?

The answer given to this question universally (with a few dissidents) from the Renaissance to nearly the end of the 18th century and not infrequently since was that romance on the whole, and with some flashes of better things at times, is a jumble of incoherent and mostly ill-told stories. combining sameness with extravagance, outraging probability and the laws of imitative form, childish as a rule in its appeal to adventure and to the supernatural. immoral in its ethics, barbarous in its aesthetics, destitute of any philosophy, representing at its very best a necessary stage in the education of half-civilized peoples, and embodying some interesting legends. much curious folklore and a certain amount of distorted historical evidence. On the other hand, since the end of the 18th century, there have been some who have seen in romance almost the highest and certainly the most charming form of fictitious creation, the link between poetry and religion, the literary embodiment of men's dreams and desires. the appointed nepenthe of more sophisticated ages as it was the appointed pastime of the less sophisticated Between these opposites there is of course room for many middle positions.

Romance enmeshes and retains a vast amount of story material to which there is little corresponding in ancient literature. It lays the foundation of modern prose fiction and involves the whole structure of the novel (*q.v.*). It antiquates the classical assumption that love is an inferior motive, and that women, though they "may be good sometimes" are scarcely fit for the position of principal personages. It helps to institute and ensure a new unity—the unity of interest. It admits of the most extensive variety. It gives a scope to the imagination exceeding that of any known older literary form. At its best it embodies the new or Christian morality, and it establishes a concordat between religion and art in more nays than this. Incapable of exacter definition, it is nevertheless comprehensible and, informal as it is, possesses its own form of beauty—a precious one. These characteristics were taken at their worst by early critics; they were perceived by its champions and perhaps exaggerated. From both attitudes emerged that distinction between the "classic" and the "romantic" which mas referred to at the beginning of this article. The crudest is Goethe's "Classicism is health; Romanticism is disease." Classicism might be said to be method and romanticism energy. But in fact sharp distinctions do much more harm than good. It is true that the one tends to order, lucidity. proportion; the other to freedom, to fancy, to caprice. But the attempt to reimpose these qualities as absolutely distinguishing marks and labels on particular works is almost certain to lead to mistake and disaster, and there is more than mere irony in the definition of romance as "Something which was written between an unknown period of the Dark Ages and the Renaissance, and which has been imitated since the later part of the 18th century." What that something really is, is not to be knoun well except by reading more or less considerable sections of it.

German.—NIBELUNGENLIED; ORTNIT; DIETRICH VON BERN; WOLFDIETRICH; HELDENBUCH; WALTHARIUS; RUODLIEB.

Northern.—SIEGFRIED; WAYLAFD THE SMITH; HAMLET; EDDA.

Spanish.—AMADIS DE GAULA.
Various.—REYNARD THE FOX; ROMAN DE LA ROSE; GENEVIEVE OF BRABANT; GESTA ROMANORUM; BARLAAM AND JOSAPHAT; SEVEN WISE MASTERS; MAELDUIN, VOYAGE OF.

BIBLIOGRAPHY.—The first modern composition of importance on romance is the very remarkable dialogue De la Lecture des vieux *romans* written by Chapelain in mid-17th century, a surprising and thoroughgoing defense of its subjects. For long afterward there mas little save unintelligent and mostly quite ignorant depreciation. The sequence of really important serious works almost begins with Hurd's Letters on Chivalry and *Romance* (1762). In succession to this may be consulted on the general subject the dissertations of Percy, Warton and Ritson; Sir Walter Scott, "Essay on Romance" in the supplement to the Encyclopedia *Britannica* (1816–24); Dunlop, History oj Fiction (1816, useiully supplemented and completed by its 4th edition, 1888, with very large additions by H. Wilson); C. L. B. Wolff, *Allgemeine* Geschichte des Romans (1841–50); H. L. D. Ward, Catalogue of Romances in the British *Museum* (vol. i, 1883, vol. ii. 1893) (the most valuable single contribution to the knowledge of the subject); G. Saintsbury, The Flourishing of Romance and the Rire *of* Allegory (1897), and its companion volumes in Periods of European Literature [W. P. Ker, The Dark *Ages* (1904); F. J. Snell, The Fourteenth Century (1899); G. Gregory Smith, The *Transition* Period (1900); D. Hannay, The Later Renaissance (1898)]; W. P. Ker, Epic and Ronzance (1897). (G. Sa.; X.)

ROMANCE LANGUAGES, or Romanic languages (RL), derive their name from *Roman(ic)*—that is. "Latin" because they are modern continuations of Latin. To call them daughter languages of Latin is merely metaphoric. since no descent or new creation is involved. Neo-Latin is a satisfactory term: but the Romance languages are so different from ancient Latin that entirely new names are justified. Enumerating and classifying the many dialects of the RL requires determination of the extent to which idioms called by the same name must be similar or may differ. The "discovery" of a new Romance language such as Franco-Provençal merely expresses the scholar's conviction that a type of speech appears sufficiently distinct from others so as to deserve a name of its own. The problem of classification is simplified if language is defined as a standard literary form of speech as opposed to the numerous unwritten or uncodified dialects. In this sense, the following RL may be enumerated: (1) Italian, (2) Rumanian, (3) French. (4) Provençal, (5) Spanish, (6) Portuguese. (7) Catalan, (8) Rhaeto- (Raeto-) Romance and (9) Sardinian. Italian. with the exception of dialects north of the Apennines, and Rumanian are often classified as Eastern, the rest as Western Romance languages. Rhaeto-Romance and Sardinian have no single standard literary languages, Catalan is endeavouring to retain or revive one, and Provençal no longer has one. Other enumerations of RL are therefore possible, depending on the manner of counting and classifying.

In common usage. terms like French, Italian or Spanish refer to the standard languages as taught in schools. Dialects subsumed under each may well be as different from one another as are the standard languages from one another; hence, speaking of Italian or French dialects often reflects national or geographic rather than linguistic criteria.

Spoken Latin.— One generally says that the RL do not continue Classical Latin (CL) but Vulgar Latin (VL). The latter term is better avoided in this context because it is variously defined and mainly because it almost invariably refers to some kind of late, postclassical or unclassical, "bad" written Latin, whereas the RL are derived from the spoken idioms of the Latin-speaking world (the Romania). CL, like any other classical or standard language, had its roots in-spoken language, but with grammatical codification came some measure of petrifaction. The continuous change in spoken Latin (SL), like all cultural change, was in part a consequence of passing time but it was more significantly conditioned by the cultural history of the speakers.

As Latin spread over former non-Latin-speaking areas (the earliest Latin was spoken only in Rome and its surroundings), the natives transferred some of their linguistic habits to the new language (the influence of the linguistic substratum), and immigration, more or less intense or durable by speakers of foreign languages brought new linguistic traits which speakers of Latin then acquired (the superstratum). The history of Italy and Romania, including such recent events as the Latinization of the Americas, serves therefore as a background and base for their linguistic history.

Since not all regions of the Romania were Romanized at the same time, they were not all exposed to the same kind of Latin; indeed the new world learned Neo-Latin, *i.e.*, French, Spanish and Portuguese. Nor were they Romanized by the same Latin dialect: one district may have learned its Latin primarily from middle-class or lower-class veterans and farmers, another from upper-class administrators. officers and merchants. Some districts were soon provided with schools and learned Latin from, grammarians, others learned it merely by ear in daily intercourse.

Considering all these historic and cultural causes for linguistic variety. one cannot but believe that the entire Romania spoke throughout its history many Latin and Neo-Latin (Romance) dialects, and that the uniformity of Latin is no more than an illusion due to the identification of "Latin" with standard written CL, a view which is conducive to misunderstanding. It is true that apart from good CL there existed also all over the Romania a less classical common speech, something of an international language or *koine*, which became more un-Ciceronian with the passage of time and the political and cultural breakdown that accompanied the decline and fall of the Roman empire. But not all persons spoke this progressively worsening (from a classical viewpoint) common Latin. and it is certainly not the basis of the Romance languages. This *koine* is, however, the predominant idiom of texts coming from all over the empire. Being frequently identified as VL, it has given rise to the view that linguistic uniformity prevailed throughout the Romania until the 8th or 9th century, which suddenly, cataclysmically and catastrophically, disintegrated into the numerous Romance dialects. Linguistic development does not generally occur in this way: there is no reason to assume it did in this instance.

What are the linguist's sources of real spoken Latin, not only for postclassical and Proto-Romance (PR), but also for classical and preclassical times? Latin began to be codified in the mid-2nd century B.C. under Greek influence and with the influx of Greek literature and Greek teachers of grammar. The earlier preclassical texts available, literary and epigraphic (and they are far from abundant), represent fairly well the spoken language, much better than do later texts. With the establishment of a standard language, its use by "good" writers, and grammatical instruction for the youth of the upper classes, went a rejection of all substandard colloquial and popular usage. Henceforth no one wanted to commit the (social) error of using "bad" Latin, and deviations encountered in the extant records are mainly inadvertent. During the classical period and for some time thereafter, when fair public education was accessible to many people, such lapses tended to be few in comparison with their number in subsequent centuries, which experienced a general decline in literary standards and a relaxation of the requirements for grammatical correctness. Dialect literature and "realistic" writing are lacking in the literary records—if they ever existed. Plautus' preclassical comedies, Petronius' 1st-century novel Satyricon and Apuleius' 2nd-century novel The Golden *Ass* are the only examples available. Hence most information comes from the less inhibited inscriptional evidence, especially the *graffiti* (scratchings on walls), from grammarians quoting and chastizing "bad" language, from collections of "errors" such as the Appendix Probi (probably of the 3rd century A.D.), from glosses (interlinear or marginal explanations of difficult words in a manuscript). and, of course, from the RL themselves.

Proto-Romance.— Owing to the poor documentation and the overpowering influence that CL exerted on all writing, it is not surprising that one cannot detect genuine local Latin dialects as forerunners of the Romance dialects, apart from a few, often inconclusive forms. But it n-ould be shortsighted to deny their existence, just because the evidence is lacking, in an area so large and of such pre-Latin linguistic variety as the Romania, particularly since the Roman state attached no importance to the linguistic acculturation of its possessions. The absence anywhere in the Romania of dialectal texts that one could call PR rather than Latin before the 9th century, when they appear with some suddenness and differ in appearance from the Latin texts of the same

localities, is due to the absence of any incentive to use what was obviously bad Latin in writing. But once it was realized that the spoken vernaculars were not really just depraved Latin but languages in their own right, and that it was useless to try to communicate in Latin either in writing or speaking with persons nho knen no Latin, then these bad, rustic. vulgar dialects nere eventually thought worthy of being recorded for certain purposes. All higher literary and scientific endeavour, homever, remained for centuries to come the province of the prestige language. Latin. The history of the Romance dialects is the history of the linguistic emancipation of the Romania.

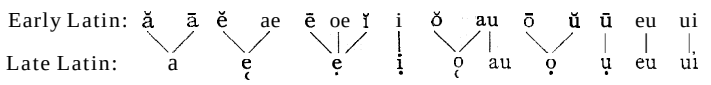
For a time, varying in length in the various regions. all dialects were of equal prestige, and the earlier Romance documents transmit fuller information on dialectal varieties than has since been available. But with the formation of national states of cultural and intellectual centres, often coinciding with the residence of the monarch and the political capital, certain local dialects augmented their prestige and usefulness at the expense of others. The ultimate consequence was the elevation of such dialects. often just one for each nation, to the dignity of a written standard language such as CL had once been, and the relegation of the other dialects to patois of lesser importance. Thus French is essentially the language of Paris. Italian that of Florence and Spanish that of Madrid. (For details, see the articles on the separate languages) The time when and the speed with nhich a new standard language mas formed and acquired currency depend on the accompanying cultural conditions and events

In the future, any one of the standard RL may share the fate of CL by becoming petrified·and estranged from common use to such an extent as to wither away. This evolution, however, is counteracted. first. by the tendency observable during the past several centuries. and likely to continue at a mounting rate, of the acquisition of the standard language by an increasing number of persons thanks to growing literacy. improved communications and the retreat of the nonstandard dialects; and second, by the anareness on the part of modern grammarians that attempts to keep a language "pure" and immutable are merely conducive to its mummification.

This article deals mainly with those historic changes of SL which are more or less common to all Romance dialects and pertain to a stage of development called PR. (For the changes which specifically lead to their current distinctions, see articles on the separate languages.)

It is customary, and. in view of the scanty documentation, virtually inevitable. to compare PR with CL. rather than preceding stages of SL. But such comparison should not imply a linear development·from CL to Romance. The chronological sequence (no matter hon poorly attested in parts) is not Old Latin → Classical Latin → "Vulgar Latin" → Proto-Romance, but rather Old (spoken) Latin → Spoken Latin of the classical period → late spoken Latin → Proto-Romance.

Phonology. — The most important phenomenon in the vowels concerns the change from phonemic quantity to phonemic quality. Where at one time the relative length of the vowels was significant, so that tno forms might be distinguished from one another solely by vocalic quantity. in PR only vocalic quality is distinctive. Since spelling was neither immediately nor consistently affected by this change, it is impossible to say when it began to operate. But it seems certain that its inception precedes the appearance of Romance documents not by decades but by centuries; its earliest traces can in fact be discerned in inscriptions of Rome's republican era. In general, long vowels become close (*uērum* > *ụerum*) and short vowels open (*bĕne* > bpne). (On the pronunciation of Latin spellings, see LATIN LANGUAGE) Where, then. earlier Latin distinguishes tno e-like sounds by their quantity, late SL and PR distinguish them by their quality. It may be assumed that already during the period of phonemic quantity, length was accompanied by closeness and shortness by openness of pronunciation. and that there eventually occurred a shift of distinction from one to the other of the vowel characteristics. Some diphthongs became monophthongized. The following schema illustrates the evolution of the stressed vowels.



Note that the qualitatively similar vowels. ē-ĭ and ō-ŭ. once their quantity ceases to be distinctive, coincide and have henceforth the same development in Romance, with the exception of dialects of southern Italy. Sardinia and some others. Following nasals, palatals or consonant clusters may produce various divergent developments in the different dialects.

The vowels not bearing the main stress develop somewhat differently. It is well to distinguish between final position (*murUm*), secondary stress position (*pótestÂtem*) and unstressed position (initial. *mAritus, Altárem;* pretonic. *potEstátem;* posttonic, *pópUlum*) Among these, the pretonic and posttonic (which occur necessarily in words of more than two syllables — othernise pretonic is impossible and posttonic is final) are weakest and tend to be syncopated early, whereas the secondary stress vonel is strongest and most likely to preserve its vowel in the original quality. The a is, among all vowels in these positions, the most stable. The place of the stress in PR is almost invariably the same as in earlier Latin.

While the history of the vowels is only secondarily determined by their phonetic surroundings and their stress. the consonants change primarily as a result of their surroundings (except h nhich disappears completely). Hence consonants that are different in terms of place of articulation (labial. dental. velar) often undergo changes of the same type in terms of kind of articulation (palatalization, lengthening. fricatization. loss. lenition) according to their position in the word (initial, medial, final) and their surroundings (intervocalic, in clusters, before *r* and 1, before yod). The developments are too varied to be schematized briefly. They will be found in detail in the articles on the separate RL.

Morphology and Syntax. — In the noun, the most important change is from a three-gender and six-case to a two-gender and one-case (*i.e.*, "no case") declension. In some Romance dialects there are remnants of the cases (Rumanian. Old French. Old Provencal) in the noun, and in all dialects of the cases and of the neuter gender in the pronoun. Case and gender reductions are tied up with the phonemic changes which eliminate the final consonants, especially *s* and *m,* which are of crucial importance in the Latin inflection. and with the blurring of distinctions among final vowels, which are essential for recognizing gender and case. In the modern RL the noun gender is formally expressed by the article (formerly a Latin demonstrative pronoun) and the adjective, which must "agree" with the noun they modify. The function of the cases is fulfilled either by a more rigid word-order (le *père aime le* fils: subject-verb-object : *cf.* Latin *pater amat filium, filium amat* pater, *amat* pater *filium,* etc., all meaning the same) or by prepositional phrases (*filio: au* fils; *filii: del figlio*). The Romance constructions are neither more "logical" or "natural." nor less efficient than the corresponding Latin ones. They are merely different.

In the verb. the RL dropped a number of forms (future perfect: except Rumanian. Spanish and Portuguese, but with new meanings: imperfect subjunctive. except in Sardinian; pluperfect. except in Spanish. Portuguese; perfect subjunctive) ; they created a number of new compound tense forms (mainly of the past, indicative and subjunctive) ; they replaced the future by a new composition of infinitive plus *habere,* less frequently *uelle* (Rum.) or *debere* (Sard.)—*cf.* Eng. "I will." "I shall"—which has. however, now lost all appearance of compoundness in most dialects (*amare* habeo > *j'aimerai, amerò,* etc.).

This type of replacement of Latin simple (synthetic) by Romance compounded (analytic) locutions pervades the entire morphology. It shows itself also in the substitution of prepositional phrases for case-forms; in the entire reformation of the passive voice (participle plus form of *esse; amatur: il* est *aimé*), which' causes the disappearance of deponent verbs; the use of plus or *magis* in the comparison of adjectives instead of suffixes (grandis, *grandior:* grand, *plus* grand, mas *grande;* the retained Latin comparatives are few: *melius* > *mieux, meglio; peius* > pis; *minus* > *moins*) ; the formation of the Romance adverb with *mente* (clare:

clara mente > *chiaramente*).

The number of subjunctive forms is reduced, or else they are employed for other purposes. The elaborate consecutio *temporum,* the rule on the sequence of tenses. is abolished. In general, the use of subjunctives is strongly reduced, a development which still continues, especially in colloquial use. Almost all Romance dialects have so-called conditionals. which are employed for expressing conditions contrary to fact and in the main clause of conditional constructions, with the if-clause following various rules (*s'il pouvait,* il le ferait; se potesse, lo farebbe).

Vocabulary.—Most areas of the Romania had been thoroughly Latinized in vocabulary so that relatively few pre-Latin (Celtic. Oscan. Cmbrian, Etruscan, Greek) words were retained. Similarly, linguistic superstrata in the Romania (Germanic, Arabic, Slavonic), while leaving stronger traces than the substrata, account for a small percentage of Romance vocabulary. The number depends on the political and cultural history of each region: it is greater in Rumania where the superstratum is Slavonic, for example, than in Italy where it is Germanic. The later a word is borrowed into the RL, the fewer historic changes it undergoes. This is especially true of "learned" words of Latin and Greek origin which were taken into the languages during the Renaissance and subsequent centuries: down to the present when scientists coin many of their terms from Latin or Greek roots. Any foreign word becomes, after a while, a less foreign loanword, and old enough loanwords may appear so native that they are often recognized as not such only when linguistically analyzed.

ROMAN DE LA ROSE, a French poem of which the first part was written about 1230 by Guillaume de Lorris, and which was completed about 40 years later by Jean de Meun (*q.v.*). Guillaume de Lorris wrote an allegory, which is an artistic presentment of the love philosophy of the troubadours. In a dream the Lover visits a park to which he is admitted by Idleness. In the park he finds Pleasure, Delight. Cupid and other personages, and at length the Rose. Welcome grants him permission to kiss the Rose. but he is driven away by Danger. Shame. Scandal, and especially by Jealousy. who entrenches the Rose and imprisons Welcome, leaving the Lover disconsolate. The story thus left incomplete, was finished in 19.000 lines by Jean de Meun, who allows the Lover to win the Rose. but only after a long siege and much discourse from Reason. the Friend, Nature and Genius. In the second part. however, the story is entirely subsidiary to picturesque and poetic digressions. and to violent satire in the manner of the fabliaux against the abuse of power, against women, against popular superstition and against the celibacy of the clergy. The length of the work and its heterogeneous character proved no bar to its enormous popularity in the middle ages, attested by the 200 manuscripts of it which have survived.

The *Romaunt of* the Rose was translated into English by Chaucer (see the prologue to the Legende of Good *Women*), but the version which has come down to us (*see* an edition by Max Kaluza, Chaucer society. 1891), is generally admitted to be by another hand. For a list of books on the authorship of the English translation see G. Korting, *Grundriss* der *engl.* **Lit.,** 4th ed.. p. 184 (1905). Three editions of the Ronzan de la Rose were printed between 1473 and 1490; two by Xntoine Verard (1490? and 1496?), by Jean du Pré (1493?), by Nicholas Desprez for Jean Petit and by Michel le Noir (1509 and 1519). In 1503 Jean Molinet produced a prose version. Marot modernized the text (1526), and his corrections were followed in subsequent editions. There is a modern English version by F. S. Ellis in 3 vol. (1900).

ROMAN DE LA VIOLETTE, a romance (1227–29) by Gerbert of Montreuil, dedicated to Marie of Ponthieu, wife of Simon, count of Dammartin. In the romance Gerart of Nevers stakes his domains on the fidelity of his mistress, Euriaut. Lisiart of Forez contrives to see Euriaut bathing and uses his knowledge, thus acquired, of her violet-shaped birthmark to convince Gerart of her faithlessness and claim the wager. Gerart abandons his mistress but later discovers Lisiart's treachery and, after many adventures, kills him and marries Euriaut.

Derived from the Conzte de *Poitiers* (c. 1180) and the *Roman* de la Rose (*Guillaume* de Dole) (c. 1200), this poem, like the latter, is interspersed with lyrics. The same theme, found in the *Decameron* (II, 9), underlies Shakespeare's *Cymbeline;* a 15th-century prose version inspired Wilhelmine de Chézy's libretto for Weber's opera, *Euryanthe* (1823).

See editions *by D.* L. Buffum, *Société des Ancient Textes Français* (1928) and (prose version) L. F. H. Lowe (1928).

ROMAN-DUTCH LAW. The term Roman-Dutch law describes the system of law which existed in the province of Holland from the 1 jth to the 19th centuries. This system, introduced by the Dutch into their colonies. was retained in those of them which passed to the British Crown at the end of the 18th and the beginning of the 19th centuries. These were the maritime districts of Ceylon. the Cape of Good Hope, and the settlements upon the coast of South America now comprised within the colony of British Guiana. In a secondary sense therefore Roman-Dutch law is the original common law of these countries. In Ceylon this system has been extended to the Kandyan Provinces (annexed in 1815), while in South Africa it was carried forward with the expanding range of white settlement into the Republics and Natal. To-day it is in force in the whole of British Africa south of the Zambesi, as well as in the Mandated Territory. known as the Protectorate of South-West Africa.

In British Guiana on the other hand the Roman-Dutch law having been found unsuited to the existing conditions of the colony has by the local Civil Law of ,British Guiana Ordinance 1916, taking effect from Jan. 1, 1917, been to a very great extent replaced by the common law of England. When it is said that Roman-Dutch law forms the common law of British South Africa and Ceylon, this must be understood with a reservation in favour of native law and custom, so far as these are recognized, and with the qualification that the general law of these countries, as will be seen, has in many respects departed from its original type.

Historical Development.— It does not fall within the scope of this article to investigate the historical sources of the old Dutch law. It is enough to say that in the 15th and 16th centuries the Roman law was "received" in *subsidium* in the province of Holland, as it was sooner or later in the Netherlands generally, as well as in Germany. General and local customs, based ultimately upon Germanic tribal law (Frankish, Frisian, Saxon), afforced by privileges and by-laws (keuren), and affected, doubtless, by an earlier "infiltration" of Roman law, held their ground. Hence resulted the mixed system for which Simon van Leeuwen in 1652 invented the term "Roman-Dutch law." This remained in force until superseded in 1809 by the Code Napoléon, which in 1838 gave place to the existing Dutch civil code. The old law was abrogated in the Dutch colonies also, so that to-day the Roman-Dutch law is no longer in force outside the British empire. (*See* ROMAN LAW.)

We have spoken of two elements in the Roman-Dutch system, Roman law and Germanic custom. To these must be added a third, viz., legislative acts of the Burgundian and Spanish periods. Such were the Great Privilege of Mary of Burgundy of 1476; the Placaat of the emperor Charles V. of 1529. requiring immovable property to be transferred before the local court; the Perpetual Edict of the same monarch of 1540, relating to clandestine marriages and other matters; the Maritime Laws of Charles V. of 1551 and of Philip II. of 1563; the Codes of Criminal and Civil Procedure of Philip II. of 1570 and 1580; the Political Ordinance of the States of Holland of 1580; the Placaat on Intestate Succession of 1599. There was much legislation in the 17th and 18th centuries, but it had little effect upon the general character of the legal system. Apart from legislation we derive our knowledge of the Roman-Dutch law from collections of decided cases, from col-

lections of opinions, commonly termed *consultatien* or *advijsen,* and from a rich juristic literature.

Systematization.—The first attempt to reduce the Roman-Dutch civil law to system was made by Hugo de Groot (Grotius) in his *Introduction to the Jurisprudence of Holland (Inleiding tot de Hollandsche Rechts-geleertlzeyd),* written while he was a prisoner in Loevestein in 1619–20, published in 1631. This short treatise, a masterpiece of condensed exposition, remains to this day a legal classic. But after Grotius honor must be assigned to Johannes Voet (1647–1713), professor at Utrecht and Leyden, whose *Commentarius ad Pandectas* (1698–1704) more than any work of the old law is in use to-day. In the 18th century the most famous name is Cornelis van Bijnkershoek, for 20 years president of the Supreme Court (1673–1743). Towards the end of the century Dionysius Godefridus Van der Keessel, professor at Leyden, lectured on the *jus hodiernum,* of which he published a summary in *Theses selectae juris Hollandici et Zelandici* (1800). Copies of the lectures themselves, commonly known as Van der Keessel's *Dictata,* circulate in ms., and these have been cited in judgments of the South African Courts. A younger contemporary of Van der Keessel was Joannes van der Linden, the author of a popular textbook, *Regtsgelecrd, Practicaal en Koopmans Handboek.* These two names conclude the list of the contemporary writers on the old Dutch law.

The Dutch carried to their colonies the law of the home country, just as the English took with them their common law, and subject to the same necessary adaptation to local conditions. In practice the law of the province of Holland was followed. Hence the extension to the colonial empire of the Roman-Dutch system of law. This was supplemented by local ordinances of the governors in council, and in the East Indies by laws made by the governor-general in council established at Batavia. These were collected by Van Diemen in 1642 and by Van der Parra in 1766. The supreme direction of the East India company was exercised by the Council of XVII. and of the West India company by the Council of X. The ultimate legislative authority was vested in the States General.

In the British Empire.—When the Dutch colonies passed to the British Crown, the old law was in principle retained, but during the century and more which has since elapsed it has undergone profound modifications due partly to changed social and economic conditions, partly to the incursion of rules and institutions derived from English law. In commercial matters, in particular, English influences have been predominant. This was so even in the South African republics, and after annexation their law was brought into closer harmony with that of the neighbouring colonies.

The South Africa Act 1909 provided (sec. 135) for the continuance of all laws in force in the several colonies at the establishment of the Union until repealed by the Union parliament, or by the provincial councils within the sphere assigned to them. But since this Act took effect on May 31, 1910, the Union parliament and the appellate division of the Supreme Court of South Africa (which hears appeals not only from the Union, but also from Southern Rhodesia and the Mandated Territory) have been active in consolidating, amending and explaining the law, and will continue to introduce uniformity in place of diversity. Many of the rules of the old law have already been pronounced to be obsolete by disuse.

But, except where the field is occupied by statute or invaded by English law, the law of South Africa (and in a less degree the law of Ceylon) retains the character of a Roman law system. In many departments of the law the texts of the *Corpus Juris* are still cited as authoritative. The approach to them is through the writings of the Dutch jurists, Grotius, van Leeuwen, Voet, van der Keessel, van der Linden and the rest. The influence of English law has been profound, most of all in British Guiana, where its victory has been complete, less in Ceylon, least in South Africa. But at some points the Roman-Dutch law has otiered a stubborn resistance. Thus, it is now settled for both South Africa and Ceylon that "consideration" is not necessary to the validity of a contract. South Africa (but not Ceylon) retains almost unchanged the old law of community of goods with its consequences in the proprietary relations of the spouses.

Upon a general view it must be said that a system of law, which can draw at the same time upon the treasures of the Roman and of the English law has great elements of strength, particularly in a virile and progressive community. But the need to resort to law-books of by-gone centuries is a serious inconvenience.

ROMANES, GEORGE JOHN (1848–1894), British biologist best known for his popular writings on evolution, was born at Kingston, Ont., on May 20, 1848. Educated at Gonville and Caius college. Cambridge, he at first wished to be a clergyman, but finally specialized in natural science. He began his researches with the study of jellyfish, starfish and sea urchins, but soon enlarged them to include broader problems of biology, and especially the development of intelligence. His *Mental Evolution in Man* (1888) maintained the essential similarity of the reasoning processes in the higher animals and in man. In 1893 he brought out the first part of *Darwin and After Darwin,* the last, unpublished portion of which contained much controversial material on physiological selection. Romanes never lost interest in religious ideas, however; at intervals throughout his life he published essays indicative of his changes of view from Protestant orthodoxy to agnosticism, and through monism back to orthodoxy again. In 1891 he founded at Oxford the Romanes lecture, to be delivered annually on a subject in science, art or literature. He died at Oxford on May 23, 1894.

ROMANESQUE ARCHITECTURE was the style of architecture of western Christendom from the 8th to the 12th century. It was a round-arched style (*i.e.,* Roman architecture with a difference). A preliminary phase marked by very interesting monuments in the northern region, in Italy, in France and in Spain, occurred during the Carolingian period (roughly from 775 to 950). The Romanesque is usually considered to have had its more definitive formative period between 950 and 1050, and it produced its greatest achievements in the High Romanesque period during the century that followed. French Romanesque entered a florid or baroque phase about 1120; then, beginning about 1145, Romanesque receded before the French Gothic style, but buildings in a tardy Romanesque style continued to be constructed even in the 13th century. The style was revived in the early 19th century, and is in occasional, though diminishing, use today.

(For a discussion of the architecture of the periods preceding the Romanesque, *see* ROMAN ARCHITECTURE and BYZANTINE ARCHITECTURE; the periods following the Romanesque are treated in GOTHIC ARCHITECTURE and RENAISSANCE ARCHITECTURE. *See* also ARCHITECTURE.)

CAROLINGIAN (775–950)

The monasteries, particularly those that followed the Rule of St. Benedict (Monte Cassino, 529), were peaceful islands devoted to prayer, the arts and good husbandry in the welter of confusion and local war that followed the collapse of the western Roman empire in 476. Just as Constantine recognized in the church the means of revitalizing the late empire, so Charlemagne recognized the potentialities of the monastic system and reinforced it by legislation. With the economic revival of Europe depending on them, the more important monasteries became imposing corporations with extensive mundane as well as spiritual powers. They controlled and managed considerable areas, and their establishments—intellectual, artistic, industrial, agricultural, judicial and administrative centres—were the training ground for ecclesiastical and governmental officials. The inevitable corollary was that

monastic architecture became the most important type of living architecture. Cathedral architecture was in general less ambitious, and dependent on monastic developments at this time.

Though the ideals of the monastic institute were Roman. Roman architectural uniformity was no longer possible. With communications difficult, localism necessarily flourished, and moreover the Carolingian revival was fecund in ideas and full of fresh energy. Tastes were different. There was no longer a preference for self-consistent. serene and classic design, which it was impossible to exemplify in the chief architectural problem of the age, the highly articulated monastic church.

In the old cities, Roman and early Christian architecture lived on in a somewhat degenerate form. For ordinary work simple Roman procedures survived. except that rubble, faced with stone (or, in other cases, solid brickwork), replaced concrete. Modest works. both urban and rural, employed half timber, timber, mud and thatch, as had been the case under the Romans, but much more picturesquely than in antiquity. Very striking and vigorous silhouettes for all types of buildings in the north resulted from the abundance of wood. the wet climate and the often inferior roofing material. which called for framed roofs of steeper slope and encouraged the addition of picturesque wooden gables, dormers, pinnacles and spires. Gifted northern designers systematized these developments and gave them monumental form in monastic construction.

Charlemagne's cathedral at Aachen (Aix-la-Chapelle, *c.* 790–805) which survives (a vaulted octagon with aisles. galleries, tribune and tower) is a beautiful, but not characteristic, building of its age. Much more typical was the destroyed imperial abbey church of St. Riquier (anc Centula. 790–799), which was the forerunner of the fully evolved medieval church. The scheme was based on the Christian Roman basilica (q *v.*). roofed in wood. The church at Centula had an imposing façade, perhaps the first really monumental church facade, in the shape of a "westwork," consisting of a low vaulted vestibule with a chapel and galleries in the tribune, stair toners and a tall openwork spire. At the east there was a transept with stair towers and a spire at the crossing, and an elaborate arrangement of chapels beyond. The general scheme, with variations. continued in use in the Rhineland during the Romanesque period; its influence affected the Gothic, and is still felt in present-day church architecture.

A Carolingian court architect in a famous plan, dated about 822 and preserved at the Swiss monastery of St. Gall, developed the basic scheme of the Roman rustic villa for the design of a great conventual establishment to house as many as a thousand people, with their multifarious activities and supplies. This type of monastery plan was used. with appropriate changes. throughout the middle ages. and it is still normative today. The residential court of the villa became the cloister (*q.v.*) of the monastery. The typical cloister was square. with arcaded walks and a garden. and the rooms used by the monks were systematically arranged about it. Usually there were. on the east, the chapter house (*q.v.*), where the community met as a corporation, the auditorium (a business room) and the camera (a workroom), with the dormitory on the upper floor above them all. The south side normally had the calefactory (a warmed room), the ceremonial lavatory, the refectory, pantries and kitchens. On the west were ranged. as a rule. the cellars, the almonry and the porter's lodge. The vast bulk of the church was typically on the north side of the cloister. Other courts served: on the east, the infirmary; on the east or south, the novitiate; on the west, the quarters ior lay brethren and wayfarers. North of the church. accommodations were provided for the abbot, for the monastic school and for visitors of mark. Gardens, yards, shops and barns were disposed logically in outer areas. In later times all these elements were enclosed within a fortified girdle wall.

The great contribution of the south during the Carolingian period was a simplified type of Roman vaulting and wall construction in rectangular brick. or more commonly, small stones, with characteristic decorative arcading and corbel tables. This spread from half-Byzantine Ravenna to Lombardy and thence to Germany, eastern France, southern France and Catalonia. The style was propagated by traveling masons called comacine masters (*i.e.*, fellow workers on the scaffold). Formed about 750, this style is called the First Romanesque, and it flourished until about 1050 (example, S. Pietro at Xgliate. in Lombardy, 875). In developed iorm, it became the Lombard High Romanesque style.

FORMATIVE PERIOD (950–1050)

Early independent styles resembling Romanesque are called proto-Romanesque. Such styles, the Mozarabic and the Asturian, based on Roman and Moslem work, flourished in northwestern Spain from about 815 to 950 (example, Sta. Maria de Naranco, vaulted. 848). Contemporaneously. there was a very interesting Irish proto-Romanesque style. The Irish built elegant round towers and small churches of simple form with corbel vaulting (example, Glendalough, about 980). By the 11th century the Scandinavians had developed their remarkable wooden ("stave") churches, often in the form of tall pinnacles built about a system of masts.

Western France suffered terribly in the Carolingian period, until 911, from Norse piratical raids. Kevertheless. considerable numbers of fine churches and monasteries were built, wooden-roofed, with something of Rhenish grandeur. The First Romanesque did not penetrate there, and the use of vaulting was limited, but the designs have a real French ingenuity and elegance, and excellent ashlar masonry. At the cathedral of Clermont, dedicated 946. the ambulatory and radiating chapels about the apse (adumbrated at St. Philibert de Grandlieu, 847, and St. Martin, Tours, 918) took systematic form, and as later developed (at Tours. 997–1014, for example, and in Gothic times) became one of the most inspiring interior features of medieval church architecture. On the exteriors. the towers, pinnacles, and spires gave the churches a finely animated silhouette.

Burgundy, lying in eastern France, mas in contact with the Rhenish, the Lombardo-Catalan and the west French areas. It received architectural influences from all sides, and integrated them successfully. The region became important architecturally about 950 through the development of federative monasticism. The abbey of St. Philibert at Tournus. with widely disseminated priories, built a church between 960 and 1120 in which the various elements of the Burgundian style are still perceptible, though not yet fused in synthesis. as they were to be in Cluniac and Cistercian architecture.

The monastery of Cluny, founded in 909, was the most important of the early monastic congregations. It soon became interregional and international, and ultimately had about 1,450 dependencies. The abbey's own second church (950–981) was a very interesting building, uhich became normative to a certain extent. It was one of the first churches to have the familiar arrangement of two western belfries and a tall crossing tower. There mas a series of seven chapels at the east. The Cluniacs built substantial vaulted churches as a matter of policy beginning about the year 1000, and the building art gained greatly by their interest in good construction. The monastery buildings which were built at Cluny between 990 and 1043 were widely influential all over western Europe.

There were interesting developments elsewhere in the formative period, as in the vast earlier cathedrals of Chartres (1020, 1037) and Auxerre (1025). In Catalonia a vast church in the Lombard style was built at Ripoll (1032). Huge abbey and cathedral buildings mere built in Ottonian Germany, as at Speyer in the Rhineland (1030 and later). Saxon England. from about 950 to 1050, built in a provincial version of the German Carolingian Romanesque style.

HIGH ROMANESQUE (1050–1150)

The High Romanesque style was made possible by increasing resources and greater skill in construction and decoration (both sculptured and painted). Oriental and Byzantine influences were absorbed. and many attractive regional types were worked out. High Romanesque may be said to have begun with the creation of a handsome spacious and stable type of entirely vaulted French church that was connected with the pilgrimage to Santiago

de Compostela, and consequently became interregional and international. On the pilgrimage roads there were four great French abbey churches (Tours, Conques, Limoges, St. Sernin at Toulouse), together with many smaller pilgrimage buildings. The chief shrine was at Santiago, built in 1078–1211. All five great churches had magnificent plans with ambulatories and radiating chapels, and impressive towers. There was beautiful and abundant decorative sculpture, especially at the portals and in the cloisters. These churches characteristically had the aisles covered by groin vaults, the galleries by quadrant vaults and the naves by banded barrel vaults. The churches at Conques and Toulouse survive uith very little change; that at Santiago has been rebuilt on the exterior.

On a still grander scale was the masterpiece of Romanesque architecture, the third church of the abbey of Cluny (1088–1130 and later; 615 ft. long, barrel vaults of the nave 32 ft. wide and 96 ft high to the crown, over a clerestory). This building had many features which prepared the way for Gothic: tall proportions, grouped piers, pointed arches, specialized wall and vault construction. It had a very elaborate and sophisticated modular system and characteristic carvings of great beauty in the apse (where one of the first medieval sculptural allegories was placed, 1095) and at the portals of the nave (where the first really grand ensemble of monumental carved and painted west portals was placed, about 1109–15). Further great projects of Cluny in and near Burgundy were Vézelay and La Charité-sur-Loire, where the two-towered Gothic cathedral faqades with rich portals were anticipated, about 1120–25. Vézelay (1104–32) had the first wide nave with groin vaults at a high level, anticipating the ribbed groin vaults which were essential to Gothic architecture.

In Lombardy, where the First Romanesque style developed (by better construction and decoration, rather than by radical change) into Lombard High Romanesque, there were experiments with domed-up rib vaulting in square bays for the naves in the early part of the 12th century at S. Ambrogio, Milan, with two smaller vaults in the corresponding aisles of each bay. The logical "alternate system" of alternately heavy and light supports was developed.

It is generally supposed that through high-ranking ecclesiastics of Lombard origin these ideas were introduced into Kormandy. Here a noble High Romanesque school, generally with unvaulted naves at first, came into being under the influence of western France and the Rhineland (Jumièges, 1040–67; Caen, 1062 and 1068) (See NORMAN STYLE.) It was carried to England; William the Conqueror founded magnificent and powerful Benedictine abbeys after 1066 as instruments of royal policy. All of them built nobly and well; one of them, the cathedral abbey of Durham, built the first splendid great church which was entirely vaulted with heavy ribbed groin vaults (1093–1133).

The innovation was adopted, along with proto-Gothic suggestions from Burgundy, and was improved by the use of lighter, cleverer cut-stone work, in the creation of the first consciously Gothic design (the abbey of St. Denis, near Paris, about 1137–44). This style attracted the attention of the bishops of the entire royal domain near Paris, and quickly superseded the undistinguished local Romanesque of the fle de France. The cities underwent a spectacular growth at this time in commerce, in intellectual and civic life. The new Gothic style flourished in them and became symbolic because of this, and it ultimately superseded the Romanesque.

The last great effort of monastic Romanesque was in buildings of the austere Cistercian order, which was founded in 1098 and expanded all over Europe during the 12th century. For their churches and monastic buildings a simple, practical version of the Burgundian Romanesque style was developed, using rather rudimentary heavy Gothic vaulting, which is often called "half-Gothic." An excellent example is the abbey of Fontenay, 1139 and later. This special type of design, representing the personal preference of St. Bernard, mas made obligatory. Thus, throughout western Christendom, it prepared the way for the expansion of the true Gothic of the Île de France. The Cistercians extended the use of vaulting, especially the use of repetitive square ribbed groin-vaulted bays, to the monastery quarters, though they also built these, in traditional fashion, with wooden roofs.

Because so many of the buildings in which the real history of Romanesque was written have been destroyed, it has become customary to study the style, catalogue fashion. in its various local manifestations. The designers employed local materials, and intermingled various traditions in special ways; a marvelous imaginative richness was the result. In the High Romanesque everywhere, ashlar masonry was used for the walls, often. by exception, in brick-building regions. Embellishments in painting and sculpture were usual.

The following are the various local schools, aside from those already mentioned.

Germany. — The traditional Carolingian heritage gave form to High Romanesque buildings of the 12th century, and Germany still bears their imprint. The vast imperial cathedrals of the Rhineland (Mainz, Worms and Speyer, now vaulted) had much Lombard detail. A special and interesting school developed in Saxony. Germanic Romanesque also spread to Hungary.

Italy.—Lombardy was an area in which the first Romanesque style was transformed into the High Romanesque, particularly because of the development of ribbed groin vaulting. Decorative arcading mas used, in enriched form. Brick was widely employed in later work. Romanesque forms continued in use long after the coming of Cistercian half-Gothic. The Lombard cities built tremendous cathedrals, simple in plan, during the 12th century. A very handsome belfry tower type was developed; also, spacious baptisteries (*e.g.,* Parma cathedral).

Tuscany retained strong early Christian traditions, exemplified in the octagonal baptistery of Florence (restored in 1059) and the common use of basilican church forms. In the High Romanesque, marble was used extensively, often in panels and zebra work (example, the cathedral group at Pisa, 1063–12th century).

Central Italy was still more conservative; the early Christian style survived there with little change except degeneration. The region about Monte Cassino was more inventive; the famous abbey built the typical church of the region, basilican in form (1066–71). It is believed that Moslem pointed arches entered the European church building tradition here (in the porches), from which they spread to Cluny, and from there to the fle de France and Gothic. A school of painters developed, under Byzantine influence, which was drawn on by the Cluniacs in their work.

Norman Italy and Sicily.—Buildings which are basically Lombard, Tuscan, Moslem, Byzantine or early Christian were built as the realm became prosperous. Nuances of design, and a strange mingling of influences, give them strong local feeling. Examples are S. Nicola, Bari (1087), where St. Nicholas is buried; the cathedral of Monreale, 1174, with wonderful mosaics; S. Cataldo at Palermo, 1160, a former synagogue in the Moslem domed style.

France. — Provence — Romanesque architecture is here most Roman in feeling: grand, simple, spacious bulks were built, usually in fine ashlar masonry, as at Avignon cathedral, about 1140–1200, and often with fine sculpture, as at the cathedral of Arles (1150 and later) and St. Gilles du Gard (1116 and later, to about 1170).

Aquitaine.—For spaciousness, domes on pendentives of special form (often four in line as at Angoulême cathedral) were used. The cruciform St. Front, Périgueux, of 1120, was an exceptional building, spoiled by modern restoration.

Poitou.—Here elaborately arcaded faqades formed somewhat illogical frontispieces for spacious "three-naved" churches with windowed aisles almost as tall as the central windowless naves. There are beautiful paintings (*e.g.,* St. Savin-sur-Gartempe). This region has several fine Romanesque castles, in the usual form (as at Loches, about 1100) of a great square tower, the donjon or keep, with guard and residential rooms on several levels, and appropriate outworks.

Languedoc.—The churches here have bold massing and beautiful sculpture, the tradition of which goes back to the formative period (St. Genis des Fontaines, 1020). St. Sernin at Toulouse (about 1080 to 1200) is in the Pilgrimage style, and many churches are related to it.

Auvergne.—A long tradition (Clermont cathedral, 946) developed here, more or less in the manner of the pilgrimage churches. The high "lantern transepts" are characteristic (*e.g.,* Kotre Dame at Clermont-Ferrand, 1150). The cathedral of Le Puy (11th and 12th centuries), with zebra work in the masonry and a file of domes, represents reflex influence from Spain: Moslem motifs were brought in via the pilgrimage road. Such influence is perceptible also in Burgundy, and perhaps in the west of France.

England. — The vast effort of the Norman Benedictines endowed England with magnificent works which still maintain their Romanesque dignity in spite of many later additions. particularly Gothic vaulting, towers and chapels. The grandest examples, like Durham, Ely and Norwich, have aisles and galleries flanking impressively long naves. Caen stone mas imported for much of this work.

Iberia. — Northern Spain *and Portugal* were expanding through the reconquest in Romanesque times. The architecture clearly testifies to the great influx of men and ideas, particularly from Burgundy, Poitou and Languedoc (as at Santiago cathedral). Cistercian half-Gothic became important (example, Poblet, 1180–96). Catalonia long remained faithful to the Lombard style. Everywhere there are Moslem reminiscences, sometimes obvious, sometimes very subtle.

The walls of Ávila (1090 and later) are among the finest of Romanesque military constructions. The Exchange at Lérida (after 1200) still has its medieval façade, with a characteristic upper window arcade. Bragança in Portugal has a'more or less contemporary municipal hall, also with a clerestory arcade.

Palestine. — The Crusaders built extensively in the Latin kingdom of Jerusalem. The buildings are south French or Burgundian Romanesque, or Burgundian half-Gothic in style (*e.g.,* new constructions at the Church of the Holy Sepulchre, 1099–1147; the present mosque of Beirut, late 12th century). Many remarkable castles were built before and after 1200, incorporating Byzantine and Moslem innovations in military architecture; by reflex this work influenced the west.

A representative Romanesque imperial palace is the Pfalz at Goslar, in south Germany (1050, rebuilt after 1132, and later). The Wartburg near Eisenach (about 1200, celebrated in *Tannhäuser*) is the best-preserved Romanesque dwelling. The plan is simple, with the main rooms on the upper floor and lighted by window arcades. Smaller houses (as at Cluny, 1159, and Lincoln) are like excerpts of such a building.

ROMANESQUE ART is the term applied to the art prevalent in western Europe prior to the Gothic and distinguished from the parallel Byzantine art (*q.v.*) of eastern Europe. As medieval archeology has shed light on the centuries of the so-called Dark Ages from the fall of Rome to the crusades, the scope of the term Romanesque has gradually contracted until it is generally understood to cover the period from A.D. *1000* to *1150.* The style, however, cannot be understood unless the developments of the preceding centuries are taken into account.

Prior to the florescence of the Romanesque, the Early Christian style may be distinguished; it emanated from Rome, included the art of the catacombs and the imperial basilicas built there under Constantine the Great, and concluded with the art of Ravenna through the last days of the Western empire and Theodoric's Ostrogothic kingdom. Constantine abandoned Rome and reestablished his capital at Byzantium around A.D. *328,* thereby establishing the bases for the separate but interrelated styles of eastern and western Europe—the Byzantine and Romanesque.

The Romanesque style followed the spread of Christianity; in this style the western Roman tradition and eastern Byzantine influences merged with the energetic, muscular paganism of the peoples of the north, whose imagination was unhampered by the classical heritage. Various historians, sometimes slanted by nationalistic considerations, have distinguished, among others, proto-Romanesque styles such as a Frankish Merovingian period (486–751) in France, a Carolingian period coincident with the reign of Charlemagne *(771–814).* an Ottonian period (c. 912–*1024)* in Germany, and a pre-Norman period in Britain before the conquest of 1066. Before the Romanesque could achieve full definition and maturity. it had to undergo a long period of consolidation after the disintegration of Roman power, the period of the great migrations, and the successive invasions of Europe by the Saracens from the south, the Hungarians from the east, and the Vikings from the north. The mature Romanesque consequently bears the imprint of all these events and may properly be characterized as an interplay of Roman, Byzantine, Saracenic and northern Barbarian elements.

Surviving examples of the migratory period are found in the designs of buckles, brooches, decorated dagger sheaths and the like. From Irish monasteries of the 6th through the 9th centuries there are monumental stone crosses carved in bold relief, curious tapering round towers, and manuscript illuminations characterized by fantastic animal forms and by interlaced designs of extraordinary complexity. In Britain a few remnants of architecture prior to the Conquest exist. such as the Saxon tower at Earl's Barton, and the small Church of St. Laurance at Bradford-on-Avon, The first significant architectural synthesis of southern Roman and northern Barbarian styles, however, occurred in the two structures erected during the reign of Charlemagne—the Imperial abbey at Centula (later destroyed), and the Chapel Palatine at Aachen (*Aix-la-Chapelle*), which mas an adaptation of San Vitale at Rsvenna. When the horizontal southern Roman basilica was combined with the vertical northern staged tower, the first step toward Romanesque architecture was taken. The floor plan and structural methods were a Roman heritage, but the silhouette of the rising toners against the skyline was distinctly northern.

Because of feudalistic rivalries and unsettled conditions generally, Romanesque art developed in the rural strongholds of the monastery and castle rather than in urban centres. Furthermore. since monasteries were less apt to be subjected to fire and sword than castles, the surviving examples are mainly monastic. The relative isolation of abbeys and priories, from Scotland to north Africa, and from Portugal to Jerusalem, accounts for the peculiarly diffused and diverse character of the style. This decentralization also helped make the Romanesque one of the most inventive, original and inspired periods in the history of art.

Surviving examples of Romanesque secular art are conspicuous by their rarity. A few castles and keeps, among them the well-known Tower of London, are extant. Town life, for its own protection in a feudal society, had to exist in the shadow of a castle, manor, monastery or cathedral. Enough Romanesque town houses from the 12th century have survived, however, to give a fair idea of the type. The most important secular pictorial work of the period is the Bayeux tapestry (*q.v.*) in which the battle of Hastings is recounted in *72* scenes. Stitched in eight colours of wool on a linen strip about *20* in. wide and 231 ft. long, the designer tells his story with boldly delineated figures and straightforward simplicity. Probably commissioned for the Bayeux cathedral, it nevertheless is modeled after the type of mural paintings and textile wall hangings that adorned the great halls of castles.

Architects of Romanesque abbey churches had to take into account such developments as the growing population in monastic communities, the increasing complexity and magnificence of the liturgies. the demand for additional altar space so that ordained monks could sing daily masses, the pilgrimages that brought large flocks of the faithful at festival seasons, the need for large fireproof structures, and the desire to express the great religious fervour of the time. Such considerations led to the rediscovery of the Roman art of vaulting with stone, and the expansion of space around the high altar especially in the transept and choir areas. Increased attention was given to the aisles and ambulatories, so that pilgrims could have access to side and apsidal chapels without disturbing monastic observances; vaulted narthex entrances were provided for the gathering and marshaling of processions as well as to accommodate pilgrims, and large areas were designed for the richly carved facades and impressive portals. Heavy and clumsy at first. Romanesque architecture, with increasing mastery of methods and materials, gradually achieved both monumentality and elegance. In the process such specifically Romanesque features emerged as the ambulatory with radiating chapels, rose or wheel windows above central portals. stone tracery in window mullions, concealed archaic flying buttresses over side aisles, pointed arches in the nave arcade and peaked barrel vaulting. All these features brought the Romanesque to the threshold of the Gothic.

With Romanesque architecture came the revival of monumental sculpture, a dormant art since late Roman days. In such French abbey churches as Vézelay, Autun and Moissac, large compositions depicting Christ in Majesty and the Last Judgment are found over the portals of the facade and narthex entrances. Such compositions reveal a jumble of large and small figures with no regard to natural proportion or scale. Distortions of the human figure occur partly for expressive purposes and because the sculptor had to fill the allotted surface space. In the interiors of such churches and adjoining cloisters, capitals of columns were carved with the greatest variety of figures and foliated forms. Romanesque painting exists in the extremes of delicate miniature illuminations and monumental murals on vaulted surfaces. The most striking examples of such large-scale frescoes are usually found on the semi-domed apse vaults from which position they dominate the entire interior.

Romanesque art also included the sacred vessels used in the liturgy, ivory and gem-studded book covers, embroidered vest-

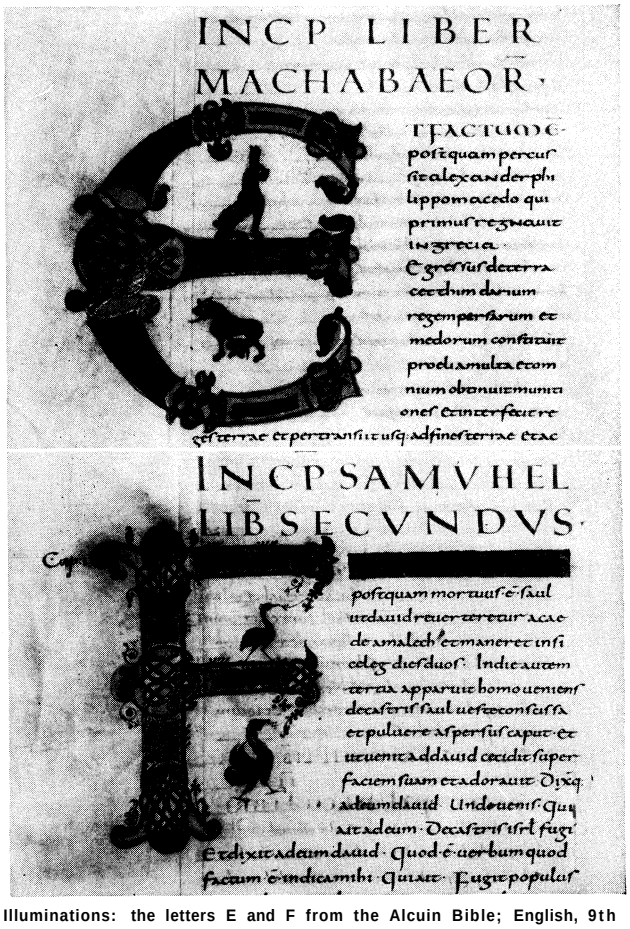
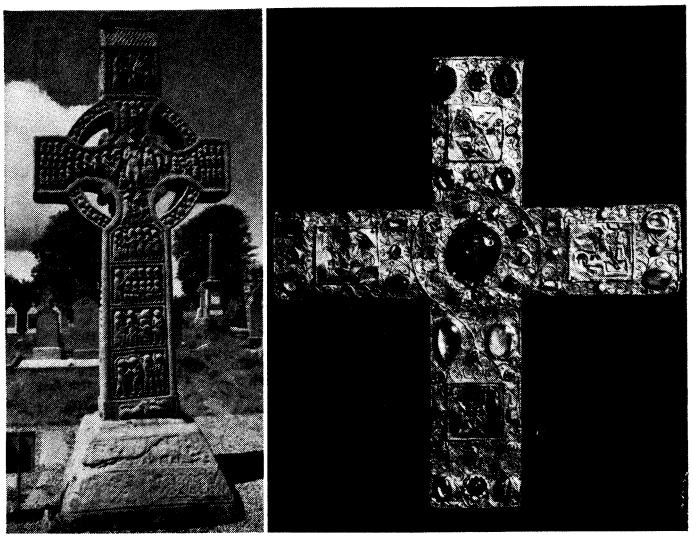
Fragment of a Sicilian brocade of the 12th or 13th century. Design in buff on green ground; details in silver thread



Illuminations: the letters E and F from the Alcuin Bible; English, 9th century



Crosses: Left, Muiredach's cross, Monasterboice, Ireland. Celtic, 10th century. *Right*, First Gertrudis cross from the Guelph treasure. Gold with cloisonné, niello, filigree and gems. Brunswick (Germany), middle of the 11th century

EXAMPLES OF ROMANESQUE ART, 9TH TO 13TH CENTURIES

ments and altar cloths, candelabra of burnished bronze, carved choir stalls and other embellishments. Since reverence for relics played such an important role in the pilgrimage movement. Romanesque reliquaries are objects of special interest. "Men's eyes' are set under a spell by reliquaries." observed Abbot Suger of St. Denis. "They see the shining image of a saint and in the imagination of the people his saintliness is proportioned to its brilliance."

Such sacred remains were enclosed in statues of gilded wood or polychromed stone. as well as in portable altars and caskets fashioned to resemble miniature churches and other forms. Such work was executed in copper and gilt, chased with low-relief designs and often encrusted with precious gems.

Exhibiting as it does the widest variety and greatest diversity, the Romanesque as a period is unequaled in the history of art for its expression of religious exaltation, bold imaginative qualities, subtle inventiveness and vigorous execution.

ROMAN LAW. The term "Roman law" is one of somewhat indefinite meaning. It denotes first of all the law of the city of Rome and of the Roman empire. This in itself is an enormously wide subject, for it includes, in the west. the law in force at any period from the foundation of the city (traditional date 753 B.C.) until the fall of the Western empire in the 5th century A.D., and in the east, can be taken to include the law of the Eastern empire, until it too fell with the capture of Constantinople by the Turks in 1453.

But "Roman law" does not mean merely the law of those political societies to which the name Roman may in some sense be applied, for the legal institutions evolved by the Romans have had, not merely influence on those of other peoples, but in many cases actual application, in times long after the disappearance of the Roman empire as a political entity, and even in countries which were never subject to Roman rule. Thus, to take the most striking example, in a large part of Germany until the adoption of a common code for the whole empire in 1900, the Roman law was in force as "subsidiary law," *i.e.*, it was applied unless excluded by contrary local provisions. This law, however, which was in force in parts of Europe long after the fall of the Roman empire, was not the Roman law in its original form. Its basis was indeed always the Corpus iuris *civilis, i.e.,* the codifying legislation of the emperor Justinian (AD. 527–565, see below), but from the 11th century (see GLOSS AND GLOSSARY) this legislation was interpreted, developed and adapted to later conditions by generations of jurists, and necessarily received additions from non-Roman sources. All the forms which it assumed in different countries and at different epochs can claim to be included under "Roman law."[1]

The importance of Roman law is, however, not confined to the actual application of its rules as such either in the Roman empire or elsewhere, for its influence on the development of law in general has been immense. Even if we look at the modern legal systems of peoples aith a aestern civilization. we can say that they fall (with some exceptions, especially the Scandinavian countries) into two groups—an English group, and a group in which the main elements are of Roman origin. To the English group belong England, nearly all the United States of America, and most of the British dominions and colonies; to the Roman group belong the rest. The nations of the continent are, nearly all of them. living under modern codes which, though they contain much that is not Roman, are Roman in their structure, their fundamental categories and their general method of thought. Within the British empire there is Scotland with a system fundamentally Roman. Quebec with its French law. built largely with Roman materials, and South Africa which. like Ceylon. has a system known as "Roman-Dutch," that is to say based on the Roman law as developed by the jurists of the Netherlands. Even English law itself, though owing less to Roman law than any other system, has at different times and in different ways received considerable accessions from Roman sources. (See ENGLISH LAW).

These developments however lie outside the scbpe of the article which is confined to the history of private law within the empire up to the death of Justinian.

Periods in the History of the Law.—Considerations of space make it impossible to discuss separately the different stages through which Roman law passed during the 13 centuries which elapsed between the foundation of the city and the death of Justinian, but some idea of the chief periods and their characteristics is essential and we may perhaps divide as follows:

(a) *The* Period of Conjecture.—This includes the monarchy (753–510 B.C. according to tradition) and the republic up to the passing of the XII tables (451–450). For this period we have really no evidence but unreliable tradition and inference from later institutions.

(b) Mid-Republican Period.—This covers the time from the XII tables until about mid-2nd century B C. Apart from fragments of the tables and from the historians, who are of course chiefly of use for constitutional law, our evidence is not a great deal better than for the previous period when it comes to detail, and the history of law, like the rest of Roman history, suffers still from the destruction of records when Rome was burnt by the Gauls in or about 387 B.C. However we know of some laws passed. of the existence of certain legal institutions and the names of some famous lawyers, though no professedly legal work has survived, and indeed few were written. The period is pre-eminently one of the *ius* civile, as opposed both to the *ius* honorarium or magisterial law and to the *ius* gentium.

(*c*) *The Late* Republican Period.—For the last century and a half of the republic the position as regards evidence is already different. A few quotations from legal writers of the time survive in Justinian's digest; we have Cicero, in all of whose works there are numerous references to legal matters, and we have other non-legal literature from which information on law can be deduced. We have too the text of a few laws in inscriptions. The period is that in which magisterial edict comes to be the chief reforming factor in Roman law and it may thus be described as the period of the earlier *ius* honorarium. It was also the period in which the *ius gentium* began to be of importance, and these two facts are not unconnected, for it was probably through the medium of the Edicts that a large part of the *ius* gentium found its way into the law as administered between citizens.

Ius *gentium* is a difficult phrase to explain, because it has two distinct, though related, meanings, the one practical, the other theoretical. In the practical sense it means that part of the Roman lam which was applied by the Romans both to themselves and to foreigners, while ius civile, as opposed to it, means that part which the Romans applied only to themselves. This dichotomy can only be explained historically. Roman law like other ancient systems. adopted originally the principle of personality, *i.e.,* that the law of the state applied only to its citizens. The foreigner was strictly rightless, and unless protected by some treaty between his state and Rome could be seized, like an ownerless piece of property, by any Roman. But from early times there were treaties with foreign states guaranteeing mutual protection, and even where there was no treaty, the increasing commercial interests of Rome made it necessary for it to protect, by some form of justice, the foreigners who came within its borders. Now a magistrate charged with the administration of such justice could not simply apply Roman law, because that was the privilege of citizens, and even had there not been this difficulty, the foreigners, especially those coming from Greek cities and used to a more developed and freer system, would probably have objected to the cumbrous formalism which characterized the early *ius civile.*

What the magistrate in fact did, was to apply a system composed of the already existing "law merchant" of the Mediterranean peopies and a strong Roman flavouring, the Roman element being, however, purged to a large extent of its formalist elements. This system was also adopted when Rome began to have

[1]The term "civil law" is frequently used in England to denote the Roman system, as opposed to the native "common law."

provinces and her governors administered justice to the provincial *peregrini* (foreigners), a word which came to mean, not so much persons living under another government (of which, with the expansion of Roman power, there came to be fewer and fewer) as Roman subjects who were not citizens. The general principle adopted seems to have been to allow disputes between members of the same (subject) state to be settled by their own courts according to their own law, while the governor's courts applied *ius gentium* to disputes between the provincials of different states or between provincials and Romans. The law thus developed in its turn reacted on the law as administered between Romans, especially by way of making it less formal, with the result that to a considerable extent the two systems were identical, and this is true particularly of the law of contract. When therefore a Roman lawyer says that the contract of sale, for instance, is *iuris gentium,* he means that it is formed in the same way and has the same legal results whether the parties to it are citizens or not. This is the practical sense of *ius gentium,* but the idea is closely interwoven with a theoretical sense, that of a law common to all peoples and dictated by Nature which the Romans took from Greek philosophy.

Aristotle had already divided law into that which is natural (φυσικόν) and that which is man-made (νομικόν) and had asserted that the natural part was in force everywher . This conception fitted well with the Stoic ideal of a life "according to nature," and became a commonplace which was borrowed by the Roman jurists, who, like other educated Romans, were much under the influence of the Stoic system. In their works this theoretical law of nature, "common to all mankind," then becomes identified with the really practical law which the Romans administered to all free men, irrespective of citizenship, simply on the basis of their freedom.

(d) The Early *Empire and* the Classical *Period.*—The change from republic to empire did not make any immediate difference to private law, except in so far as, bringing peace after a century of turmoil, it was favourable to legal progress. Legal literature, too, increased in volume and a number of quotations from authors of the first century survive in the Digest. This age in fact merges insensibly into the classical period. which is generally taken to include the second century A.D. and the early third century, and is thus considerably later than the classical period of Latin literature. It falls roughly into two divisions, an earlier one covered by the reigns of Hadrian (A.D. 117–138) and the Antonine emperors (death of Commodus A.D. 193) and a later one under the Severi (accession of Septimius Severus A.D. 193—death of Severus Alexander A.D. 235). Not that there is any break in the continuity of development, but the work of the earlier period was of a more creative character, while the later represents the working out of existing principles over the whole field of law. In the Digest there are quotations from all the authors of the classical age, but those taken from three writers of the later period (Papinian, Paul, Ulpian) alone comprise over half the work.

(e) The Post-classical Period.—With the era of confusion that followed the murder of Severus Alexander, there came a rather sudden falling off in the value of the legal work done, and the restoration of order by Diocletian (A.D. 284–305) did not revive legal literature. The law, of course, did not stand still. New ideas were introduced, especially from Greek sources, through the establishment of the Eastern empire with its capital at Constantinople, and through the growth of Christianity, while the great social and political changes of the sinking empire necessarily had their repercussions on private law. But it was not until the age just preceding Justinian that there was something of an intellectual revival in legal matters, and this revival Justinian was able to use for his great purpose.

SOURCES OF LAW

The Romans themselves divided their law into *ius scriptum* and *ius* non *scriptum;* by "unwritten law" they meant custom, by "written law," not only that derived from legislation, but, literally, that which was based on any source which was in writing and the list of written sources comprises *leges,* plebiscita, *senatus consulta, edicta magistratuum, responsa prudentium* and *constitutiones principum.* This list is repeated in Justinian's Institutes though ever since the close of the classical period the only source of new law (apart from custom) had been the emperor's constitutions.

A. Ius Non Scriptum or Custom.—Custom (mos *maiorum, consuetudo*) was recognized by the Romans not only as having been the original source of their law, but as a source from which new law could spring. The theory given by the jurists is that the people, by adopting a custom, show tacitly what they wish to be law, just as they might do expressly by voting in the assembly. In the developed law it would seem, however, that custom as an independent source was not very fruitful, and that it exercised its influence rather through the medium of juristic opinion and the practice of the courts.

B. **Ius Scriptum.**—(1) *Leges and Plebiscita.—Lex* is properly an enactment of one of the assemblies of the whole Roman people, the *comitia centuriata, tributa* or *curiata* (*see* COMITIA), but the most ancient of these, the *comitia curiata,* ceased, before the beginning of reliable history, to have any real political functions, though it continued right up to classical times to exist for certain formal purposes. The validity of plebiscite, *i.e.,* resolutions of the purely plebeian assembly, was one of the chief matters of contention between the patricians and plebeians, and the struggle between the orders may be said to come to an end in 287 B.C. when, by the *lex Hortensia,* plebiscita were given the force of *leges.* Thereafter enactments which were strictly plebiscita were often loosely referred to as *leges.*

Roman assemblies, like those of the Greek city states, were primary, *i.e.*, the citizen came and voted himself and did not send a delegate, but their power was restricted by the rule that only a magistrate could put a proposal before them and by the absence of any opportunity for amendment or debate. The only function of the people was to answer "yes" or "no" to the magistrate's "asking" (*rogatio*), and constitutional practice further required that the magistrate should consult the senate before putting a proposal to the assembly, In the later republic, at any rate, rejection of a bill was practically unknown and the real power lay with the senate and the magistrates.

Leges Regiae.—The historians have a good deal to say of *leges* passed in the time of the kings, but legislation at so early a date is unlikely. What they took for laws were probably statements of ancient custom from pontifical sources.

The XII. Tables.--Of greater importance are the' XII. Tables, said to have been passed in 451–450 B.C., some 60 years after the expulsion of the kings. The accounts given by the historians of their compilation (*see* ROME: *Ancient History: The Republic*) are inconsistent and mainly mythical, but tradition is no doubt right in representing it as an incident in the struggle of the plebeians for political equality. The moving cause was a desire to obtain a written and public code which patrician magistrates could not wrest at their will against plebeian litigants. What weight should be given to that part of the story which tells of a preliminary embassy sent to Athens to study the laws of Solon, has been much debated. That the embassy itself is legendary can hardly be doubted, but on the other hand, that there was some Greek influence is clear (See e.g., Tab. VII. 2-D. 10.1.13.) In the main, however, the materials of the code were taken from native customary sources. The authenticity of the whole compilation has been attacked in recent times, but the most authoritative modern opinion holds, in spite of all scepticism as to details, that the XII. Tables really were an enacted code of law, and that tradition is not far wrong in ascribing them to the middle of the fifth century B.C.

The text of the code has not suryived, a remarkable fact, for copies (probably in more or less modernized language) must have been abundant in Cicero's time if, as he says (De Leg. 2, 23, 59) it was still customary in his youth for boys to learn it by heart. All that we have is a number of "fragments" which have had to be collected from allusions and quotations in the works of various authors. *e.g.,* Cicero. (Modern collections are to be found in Bruns' *Fontes iuris Romani antiqui*, 7th ed., 1919, Girard's Textes de *droit Romain,* 5th ed., Paris, 1923, and Riccobono's

Fontes *iuris Romani anteiustiniani.*)

On the establishment of the empire by Augustus, the assemblies did not immediately cease to function, but their assent to any proposal was a mere formal ratification of the emperor's wishes. The last lex known to have been passed was a lex agraria under Nerva (A.D. 96–98).

Senatus Consulta.—The senate acquired legislative power in early imperial times though this was never conferred on it by any imperial enactment. The resolution of the senate preceding the placing of a bill before the people had always been practically decisive, and with the decay of the comitia their assent evidently came to be regarded as a formality which might be omitted. Actually, the senate nearly always, if not always, legislated at the instigation of the emperor, latterly, indeed, simply embodying his oratio or proposal in a resolution, and not long after the classical period, the emperors ceased to use the senate as a vehicle of their legislation

Edicta Magistratuum.—An edict is a proclamation, originally no doubt oral, later in writing, and any superior magistrate might find it necessary to issue such edicts regarding matters which came within his competence. A peculiarity of Roman law, however, is that the magistrates entrusted with jurisdiction made particular use of this power and that their edicts became one of the most important sources of law. Originally the duty of *iurisdictio*, which means supervising the administration of justice, rather than actually deciding cases (see p. 454, "Procedure") had presumably lain with the king, from whom it descended to the consuls. With the growth of business it became impossible for the consuls to discharge this duty in addition to their other functions and in 36; B.C. a new magistrate, the praetor, was appointed for the purpose. About the year 242 B.C. the increase of foreigners at Rome made it necessary to separate the conduct of suits in which they were concerned from those to which citizens alone were parties, and a second praetor, praetor *peregrinus*, was appointed to deal with cases in which a foreigner was involved. In contradistinction to him, the original praetor, now confined to suits between citizens, came to bear the title *urbanus*[1].

Other judicial officers at Rome whose edicts were of importance were the curule aediles, whose duties included the supervision of the market place. In the provinces supreme judicial power lay with the governors, and quaestors carried out functions analogous to those of the aediles at Rome. The law derived from the edicts of all these magistrates was called *ius* honorarium, as opposed to *ius civile* in the sense of law based on legislation or custom, but owing to the pre-eminent position of the praetors, the phrase is often used simply as equivalent to ius *praetorium.* The nature of this magisterial law is peculiar. The praetor was not a legislator, and he could not therefore make law directly as could the sovereign people, but the Roman system of procedure (especially the formulary system, see p. 454) gave him a great power over the provision or refusal of remedies as well as over the form which remedies were to take, and consequently the edict which he issued at the beginning of his term of office setting out what he intended to do was a document of the greatest importance. In it he could say, for instance, "If one man makes such and such an allegation against another, I will give an action," even though the circumstances alleged would not give any right at civil law. The edict called *perpetuum* (continuous) because it wes intended to announce the principles by which the praetor would be governed throughout his year of office, necessarily ceased to have any validity when that term expired, but it became the practice for each succeeding praetor to take over and reissue as his own much of his predecessor's edict, and by the end of the republic, the part which was thus carried on from year to year (tralaticium) must have been considerable, for jurists were just beginning to write commentaries on the edict, a practice which would not have been worth while if the greater part of it had been liable to annual alteration.

[1]This is the usual story, but the historians in an endeavour to reconcile discordant tradition may have read back into early times the institutions of their own day. *See* E. Pais, *Ricerche sulla Storia,* etc. Serie iv. (1921), 265 *seq.*

The change from republic to empire did not immediately make any difference, and the praetors continued to issue their edicts (though we may doubt whether they ever made changes without imperial or senatorial authority), but in the long run their wide powers were evidently felt to be inconsistent with the emperor's supremacy. Hadrian consequently, in or about A.D. 131, instructed the famous jurist Salvius Iulianus to revise and settle the praetorian and aedilician edicts. The changes in substance do not appear to have been of a far-reaching character, but the edict as revised was henceforward made unalterable except by the emperor himself.

The relationship between *ius* honorarium and *ius civile* has often been compared with that existing in England between common law and equity. In both cases we find, as Maine put it (Ancient Law, p. 25) a "body of rules existing by the side of the original civil law, founded on distinct principles, and claiming incidentally to supersede the civil law in virtue of a superior sanctity inherent in these principles," and in both cases the resulting duality enormously complicates the law, but, of course, when we come to detail the comparison no longer holds.

Responsa *Prudentium.*—The force attributed to professional opinions of a certain type was another peculiar feature of the Roman system, and one which contributed in no small measure to its success, for it was the "learned lawyers" (prudentes) to whom the moulding of the law into a coherent system was really due.

Originally, according to an entirely credible tradition, law was considered the special province of the *pontifices* (see PONTIFEX), who seem to have regarded it as a mystery to be exploited in the interests of their order. Their monopoly was however broken down, according to legend, in 304 B.C., by Gn. Flavius, a clerk of Appius Claudius Caecus, who is said to have stolen from his master and made public, a list of *legis* actiones (*i.e.,* forms of words which had to be followed exactly in the conduct of lawsuits), thereafter known as the *ius Flavianum.* The first known legal treatise, called the "cradle of the law" by Pomponius, is the *Tripertita* of Sextus Aelius Paetus Catus (consul 198 B.C.) which contained the text of the XII. Tables, the *interpretatio* put upon it by the jurists and the *legis* actiones. Probably the last part was identical with the *ius* Aelianunz which, according to Pomponius, was a collection of *legis* actiones like the earlier *ius Flavianum.*

It is plain in any case that from about 300 B.C. onwards there came into existence a class of men who made the study of the law their special interest. These iuris *consulti* or *iuris* prudentes were not professional lawyers in the modem sense, but men of rank who sought by giving free legal advice to obtain popularity and advancement in a public career. The responsa (answers) which they delivered to those who consulted them were of greater weight than are our modern "opinions of counsel" because the person who actually decided a case under the Roman system of procedure was not, as with us, a trained lawyer, but a lay iudex, who did not, like our jurymen, have a judge to direct him on points of law. Augustus empowered certain jurists to give *responsa* with the emperor's authority, and this practice led, perhaps by insensible degrees, to the view that rhe iudex was bound to abide by the *responsum* of a jurist who had received this *ius respondendi.* Gaius at any rate mentions a rescript of Hadrian which laid down that *responsa* were binding if they agreed, and that if they disagreed, the *iudex* could decide for himself which to follow. (See Wlassak, *Die klassische Prozessformel,* p. 45.)

The practice of conferring the *ius* respondendi appears to have fallen into disuse about the end of the third century A.D. when the classical period was over, but in the meanwhile, *responsa* had certainly come to be regarded as binding not only for the case for which they were originally given, but also as precedents for future cases, and, further, authority gradually came to be attached to the other writings of those iurists who had the emperor's patent. The "law of citations," an imperial enactment of 426, ultimately laid down that only the works of five jurists, Papinian, Paul, Gaius, Ulpian and Modestinus, might be cited and, subject to some provisos which are obscure, the works of authors quoted

by these five. If the authorities cited disagreed, the majority was to be followed; if numbers were equal, the side on which Papinian stood was to prevail; if he was silent, the *iudex* might please himself.

For the long succession of jurists reference must be made to the individual articles, but mention must be made here of the two "schools," the Sabinians (or Cassians) and the Proculians, into which they were divided in the early empire. Labeo (died between A.D. 10 and A.D. 22), one of the greatest figures in the history of jurisprudence, was the founder of the Proculians (who, however, took their name from a successor, Proculus); Capito, that of the Sabinians (so called from Massurius Sabinus, who was given the *ius respondendi* by Tiberius). What principles, if any, divided these schools, is unknown, though a number of controversies on particular points are preserved, especially in Gaius' Institutes. It is probable, though by no means certain, that there were teaching establishments or societies of some sort in connection with the "schools," for otherwise the list of "heads" given by Pomponius would be difficult to explain. The distinction does not seem to have survived the Antonine age; for Gaius, a Sabinian, is the last jurist of whom we know that he belonged to one or other of the schools.

Constitutiones Principum.—Neither Augustus nor his immediate successors expressly assumed legislative power, and yet Gaius, writing about A.D. 160, can say "there has never been any doubt that what the emperor lays down has the force of law." Ulpian, indeed, refers the validity of constitutions to the so-called *lex regia,* passed at the beginning of each emperor's reign; and there is indeed in the only surviving example of such a lex (the lex de *imperio Vespasiani* line 17 seq., see Bruns Fontes p. 202) a clause conferring such wide powers on the emperor that legislation might be deemed to be included. Nevertheless it is now generally held that this was not the original meaning of the clause and that the emperor's legislative power is a gradual growth. The chief forms of imperial legislation were:—(a) *Edicta, i.e.,* proclamations which the emperor, like other magistrates, might issue; but whereas the other magistrates were confined to their own spheres, the sphere of the emperor was in fact unlimited. (b) *Mandata, i.e.,* instructions to subordinates, especially provincial governors. (c) *Rescripta,* written answers to officials or others who have consulted the emperor, in particular on a point of law. In such cases the rescript lays down the point of law applicable and, since the emperor is supreme, the rule may be a new one. (d) Decreta, *i.e.,* decisions of the emperor sitting as a judge. Here too the emperor may lay down a new rule.

The Earlier Collections of Constitutions and the Legislation of Justhian.— The growth of legal literature and especially of imperial constitutions created a need for works of reference which made itself felt long before Justinian, and a beginning was made, almost certainly in Diocletian's day, by a collection of constitutions known as the codex *Gregorianus,* which was followed by the codex *Hermogenianus,* perhaps also dating in its original form from Diocletian. Both collections were unofficial, but their compilers must have had official countenance, for they clearly had access to the imperial archives. The Gregorianus contained constitutions from Hadrian to Diocletian, the *Hermo*genianus almost exclusively those of Diocletian's time; later constitutions attributed to it were probably only added in subsequent editions. It was clearly intended to supplement the *Gregori*anus. Unlike these two, the codex Theodosianus was an official work compiled by a commission appointed under Theodosius II. and Valentinian III., it was given the force of law as from Jan. 1, 439. Constitutions from the time of Constantine the Great onwards were, with very few exceptions, not to be valid unless contained in it. For the earlier imperial legislation the older codices still had to serve. Nearly the whole of the codex *Theo*dosianus has been preserved, whereas we only have fragments of the others. Theodosius had also planned a collection which would include juristic literature as well as imperial legislation, but this never came to fruition until it was taken up again by Justinian.

Justinian's Legislation.— (See also JUSTINIAN I.) Justinian's main object was, as he himself expresses it, to clear the path of legal authorities of the tangles with which it had become overgrown during the course of centuries, and he set about the task almost immediately on ascending the throne. It must be noted however that he was no mere codifier, but also the author of much new legislation, some of which was of the utmost importance for the later development of law. The emperor was no doubt largely responsible himself for the work undertaken, but it would probably not have been possible to carry it through but for the genius of his chief minister, Tribonian, who was clearly the leading spirit throughout the work. The course of legislation was as follows:—

(1) The Old Codex.—In Feb. 528, a commission of ten members including Tribonian (who, however, was not president) was appointed to compile a new collection of imperial constitutions which was to supersede the older ones entirely and, of course, to include legislation subsequent to the Theodosian. The commissioners were to cut out repetitions and contradictions and had large powers of alteration for this purpose. The work was rapidly done and published in April 529, with the force of law as from the 16th. It has not survived as it was later superseded.

(2) The "Fifty Decisions."—Justinian, probably partly with a view to facilitating the work of compiling the Digest, issued a number of constitutions settling matters on which the writings of the classical jurists disagreed and abolishing finally some institutions and distinctions which had ceased to be of practical importance. Some 90 constitutions of this character are known to us, but a collection of 50 seems to have been made and published separately. Its exact date cannot be determined.

(3) The Digest. (Digesta or *Pandectae*).—Instructions were given on Dec. 15, 530, to Tribonian to form a commission to collect excerpts from the works of the jurists. The collection was to serve practical purposes and consequently everything obsolete or superfluous was to be cut out and, where necessary to bring the matter up to date, alterations were to be made in the text. The excerpts were to be arranged in fifty books and the books into titles according to the subject matter, and the whole was to include all that it was necessary to know of juristic as opposed to imperial law. The compilers were definitely instructed not to adopt the summary methods of the "law of citations" but where the authorities disagreed, to choose what they thought best for themselves. The commission, consisting of 16 members in addition to Tribonian, rapidly completed their task and the Digest was published on Dec. 16, 533, with the force of law as from Dec. 30. Thenceforth no reference might be made to any other text for juristic law. Justinian gives us some idea of the work involved when he says that 2,000 books consisting of 3,000,000 lines were read and that this number was then reduced to 150,000 lines. The Digest is the most important of Justinian's works, for in it are preserved the writings of the classical jurists who were really responsible for the greatness of Roman law, and the "inscription" at the head of each quotation enables us to see from which jurist and from which work it is taken. But of course as evidence for the classical law quotations must be used with care, for the compilers made considerable use of their powers of alteration; much ingenuity, especially within the last 50 years, has gone to the discovery of their "interpolations."

The Institutes.—The revision of the law by Justinian was accompanied by a detailed scheme for the reform of legal education in the universities of Constantinople and Berytus, and one of the requirements of this scheme was a new book to be used for elementary instruction instead of the Institutes of Gaius which had for centuries been the standard work. While the Digest was still unpublished therefore orders were given to Tribonian and two professors to compile a manual for this purpose, and the Institutes were published on Nov. 21, 533, and given the force of law. The work is based on Gaius' Institutes, from which a great part is copied literally, as well as on other elementary works of the classical period; occasional references to imperial legislation are added. It is in fact almost as much a compilation as the Digest, but the references to the authors quoted are omitted and the whole made to read like a lecture delivered by the emperor to his students.

The New Code (Codex *Repetitae Praelectionis*).—The 50 decisions and the many other new constitutions promulgated since 529 necessitated a revision of the old codex and Tribonian, together with four others, was instructed shortly after the publication of the Digest, to prepare a new edition. This was published on Nov. 16, 534, and given the force of law as from Dec. 29.

The Novels.—Although the new code completed Justinian's scheme for providing a collection of authoritative legal texts, he did not cease to introduce new legislation. In all 175 laws published after 534 are known and these are called Novellae *Constitutiones* or Novels. Nearly all are in Greek, which was becoming more and more the official as well as the spoken language of the Byzantine Empire. Justinian never made any official compilation of them, but three private collections have come down to us, and the Novels, together with the Institutes, the Digest and the (new) Code together form what is known as the Corpus *Iuris Civilis*.

THE LAW OF PERSONS

I. Slavery.—"The main distinction in the law of persons," says Gaius, "is that all men are either free or slaves." The slave according to Roman law was in principle a human chattel who could be owned and dealt with like any other piece of property. As a piece of property the slave was not only at the mercy of his owner, but rightless, and (apart from criminal law) dutyless. This is the principle, but if the slave was, in law, a thing, he was, in fact, a man, and this fact produced modifications of the principle. In particular, a slave might be manumitted and would then become in most cases not only free but a citizen.

II. Citizenship.— This was of importance for the purposes of private law, because certain parts of private law applied only to citizens (ius civile). The general rule was that, if the status of the parents differed, the child followed that of the father, if the union was one recognized as marriage by Roman law; otherwise that of its mother, but a lex *Minicia* of republican times enacted that in cases of unrecognized unions between citizens and foreigners the child should always follow the inferior parent. The great extension of the citizenship by Caracalla in A.D. 212 reduced the importance of this part of the law.

III. Family.— (a) *Patria* potestas. The chief characteristic of the Roman family is the famous *patria* potestas which the father exercised over his children and over his more remote descendants in the male line, whatever their age might be, as well as over those brought into the family by adoption—a very common practice at Rome. This meant originally not only that he had control over the persons of his children, amounting even to a right to inflict capital punishment, but that he alone had any rights in private laws. Thus any acquisitions made by a child under power became the property of the father. The father might indeed allow a child (as he might a slave) certain property (peculium) to treat as his own, but in the eye of the law it continued to belong to the father. In classical times there were already modifications of the system; the father's power of life and death had shrunk to that of slight chastisement, and the son could bind his father by contract with a third party within the same strict limits as applied to slaves and their masters. Sons too could keep as their own what they earned as soldiers (peculium castrense) and even make wills of it. In Justinian's day the position as regards property had changed considerably; what the father gave to the son still remained in law the father's property, but the rules of peculium castrense had been extended to many sorts of professional earnings (*pec.* quasi castrense) and in all other sorts of acquisitions (*e.g.*, property inherited from the mother) the father's rights were reduced to a life-icterest (usufruct). At all times *Patria* potestas ceased normally only with the death of the father, but the father might voluntarily free the child by *emancipation*, and a daughter ceased to be under her father's potestas if she was married in such a way as to come under the *manus* of her husband.

(b) Marriage.—There were two types of marriage known to the law, one with *manus* and one without, but the former was rare already in the late republic and had disappeared long before Justinian's day. *Manus* was the autocratic power of the husband over the wife, corresponding to *patria* potestas over the sons, and it might result in any of three ways:—

(1) by confarreatio, a religious ceremony confined to patricians.

(2) by coemptio, a type of mancipation (see below) which was originally no doubt the Roman form of marriage by purchase; it was purely secular.

(3) *usus;* if a woman lived with a man as his wife for a year, he acquired *manus* over her by a kind of prescription. The XII. Tables had already provided that this might be prevented if the woman absented herself for a space of three nights during the year (usurpatio trinoctii). *Usus* was already quite obsolete in classical times.

It may be that at one time marriage with *manus* was the only form of union recognized as marriage at all, but by the time of the XII. Tables this was apparently no longer the case, for it is clear that the usurpatio trinoctii, though it prevented *manus*, left the marriage subsisting, so that it was possible to be married without *manus*.

In any case marriage without *manus* was by far the more common in all periods of which we have any real knowledge. It was formed (provided the parties were above the age of puberty and if under potestas had their fathers' consent) simply by the beginning of conjugal life with the intention of being married, and this was normally evidenced by the bringing of the bride to the bridegroom's house. It was however legally independent of all ceremonies whether pagan or Christian which might accompany it, and of consummation. The wife remained under her father's potestas if he were still alive, if he were dead, she continued (so long as guardianship of women continued) to have the same guardian as before marriage. It was necessary that both spouses should be citizens, or if one was not, that he or she should have conubium, the right given to some non-Romans of contracting a Roman marriage. The chief importance of this was that if a Roman contracted a union with a foreign woman, the children would not be in his potestas unless she had conubium. In marriage without *manus* the property of the spouses remained entirely distinct, and even gifts between husband and wife were invalid. It was usual however for a dowry to be given to the husband on the marriage by the woman or her father; this originally became the indefeasible property of the husband, but in classical times already the wife could recover it if the marriage ended by divorce or by the husband's death, and by Justinian's legislation it had always to be returned to the wife or her heirs.

Divorce was always possible at the instance of the husband in cases of marriage with *manus*, and in marriage without *manus* it was free to either party to put an end to the relationship at will; a letter of *repudium* was usual, but any manifestation of intention to end the relationship made clear to the other party and accompanied by actual parting was all that was legally necessary (see E. Levy, Der *Hergang* bei der romischen Ehescheidung). The Christian emperors imposed penalties on those who divorced without good reason, but the power of the parties to end the marriage by their own act was not taken away. *Concubinatus* was recognized in the empire as a sort of morganatic marriage, differing from marriage only by the different intentions of the parties, and excluding marriage, for a man could not have both a wife and a concubine. Constantine first enacted that the children of such unions might be legitimated by the subsequent marriage of their parents, a rule which the mediaeval civil law extended to all illegitimate children.

(c) Guardianship.—(1) Of children. Persons under the age of puberty (14 for males, 12 for females) needed tutores if they were not under *patria* potestas. Such tutors could be appointed under the will of the pater *familias;* failing such appointment the guardianship went to the nearest agnates (see p. 453 "Succession") until Justinian gave it to the next of kin whether agnatic or cognatic; if there were no qualified relation the magistrates made an appointment.

(2) Of women. Originally all women not under *patria potestas* or *manus* needed tutores, who were appointed in the same way as those for children. In classical times already this *perpetua* tutela *mulierum* was little more than a burdensome technicality and it had long disappeared from Justinian's law.

(3) Of lunatics and spendthrifts. Originally such persons were placed under the *cura* of their agnates; later, magistrates appointed curators.

(4) Of minors. Originally children were considered adult when of the age of puberty, but, by a long development, it became usual for those above puberty and under 25 to have curatores who were always magisterially appointed.

PROPERTY AND POSSESSION

The most striking thing to an English lawyer accustomed to the complexities of English real property law is the absence of any fundamental distinction between the treatment of land and the treatment of movables. Both can, in the law as we know it, be owned absolutely by individuals, though there may have been a time at Rome as elsewhere when land was subject to communal ownership of some sort. This conception of absolute ownership (dominium) is also characteristically Roman, as opposed to the relative idea of ownership as the better right to possession which underlies the Germanic systems, which also, originally, underlay that of Rome. This can be seen by comparing the form of a *vindicatio* (the claim of an owner out of possession) under the *legis* acfio system of procedure with that which it later assumed under the formulary system. In the earlier system the plaintiff first makes his assertion of ownership ("I say that this thing is mine") and then the defendant makes a similar assertion. Finally, the thing goes to the one whose assertion is based on the better right. Under the later system there is no assertion by the defendant at all; the iudex is instructed to condemn the defendant if it appears to him that the thing belongs to the plaintiff, otherwise to absolve the defendant. Hence, unless the plaintiff makes good his title absolutely, the defendant, though he may have no title at all, remains in possession.

A great part of what the jurists have to say on the subject of property comes under the heading "methods of acquiring ownership." These were divided into two classes according as they fell under the *ius* civile or the ius gentium.

I. Methods of the Ius Civile (a) *Mancipatio.*—This was a ceremonial conveyance needing for its accomplishment the presence of the tranferor and transferee, five witnesses (Roman citizens of full age) a pair of scales, a man to hold them (*libripens*) and an ingot of copper. The transferee grasped the thing and said: "I assert that this thing is mine by Quiritarian law; and be it bought to me with this piece of copper and these copper scales." He then struck the scales with the ingot which he handed to the transferor "by way of price." Clearly this was, as Gaius says, a "symbolical sale," and the relic of a real sale. Originally, when money was unknown, the price in uncoined copper had been really weighed out to the vendor. When this became unnecessary there was still a pretence of weighing, but the price was paid separately, and the form could be used as a conveyance where it was not intended that a price should be paid at all, *e.g.,* because the transferor was making a gift to the transferee.

(b) *In* Iure *Cessio.*—This was a conveyance in the form of a lawsuit. The transferee claims before the magistrate that the thing is his, and the transferor who is the defendant, admits the claim. The magistrate then adjudges the thing to the transferee.

(c) *Usucapio.*—According to the XII. Tables, two years' continuous possession gave title in the case of land, one year in the case of movables. In the developed law, possession must have begun in good faith, the thing must not be one which has been stolen (even though the possessor himself is quite innocent of the theft) or occupied by violence (this applies especially to land, which could not be stolen) and the possession must have had a justifiable beginning (*iustus* titulus). *Usucapio,* being an institution of the *ius* civile was possible only to citizens, but Justinian fused it with a similar institution (*praescriptio* longi temporis) which had grown up in the provinces. Under his system, three years were required for movables, 10 or 20 for land.

II. Methods of the Ius Gentium (a) *Occupatio.*—Ownerless things, provided they are capable of private ownership (not, e.g., res sacrae, such as temples) became the property of the first person to take possession of them. This applies *e.g.,* to game, and to articles which have been abandoned or left unattended by their owners.

(b) *Accessio.*—If an accessory thing belonging to A mas joined to a principal one belonging to B, the ownership in the whole went to B, *e.g.,* if A's purple be used to dye B's cloth, the dyed cloth belongs wholly to B. By far the most important application of this rule is expressed by the maxim *superficies* solo cedit, *i.e.,* whatever is built on land becomes part of the land and cannot be separately owned.

(c) *Specificatio.*—If A made a thing out of material belonging to B the Proculians held that ownership went to A, the Sabinians, that it remained in B. Justinian adopted a famous "middle opinion," according to which B retained ownership if reconversion to the original condition was possible (a bronze vase can be melted down), A obtained ownership if it was not (wine cannot be reconverted into grapes).

(d) Thesauri *Inventio.*—The final rule as regards treasure trove was that if it were found by a man on his own land, it went to him; if on that of another, half went to the finder, half to the landowner.

(e) Traditio, *i.e.,* simple delivery of possession with the intention of passing ownership. This was the method of conveyance of the *ius* gentium. It sufficed to pass full Quiritarian ownership of res *nec mancipi,* but not of res *mancipi* (land in Italy, slaves, beasts of draft and burden, and certain rustic servitudes) for which either mancipatio or in *iure cessio* was necessary. If therefore A sold and merely delivered a slave to B, A remained at civil law owner of the slave until usucapion had taken place. The praetor however devised methods of protecting B's possession in such a way that A's title became valueless, and B was said to have the thing in bonis. From this phrase later writers coined the expression "bonitarian" ownership. Already before Justinian's day mancipatio and *in iure* cessio had become obsolete and Justinian took the final step of abolishing the theoretical distinction between Quiritarian and "bonitarian" ownership.

Forms of Property in Land Other Than Ownership.—The ordinary leaseholder according to Roman law had no protection beyond a contractual right against his landlord, and he could not assign his tenancy, but there were two kinds of tenure which, under the praetorian system, obtained protection against third parties as well, and became assignable. These were *superficies* and *emphyteusis;* the former resulting from building leases granted for a long term or in perpetuity, the latter from similar agricultural leases. Both appear to have first originated in grants by the State, or municipalities. Under emphyteusis the grantee did not become owner, though he enjoyed a jus in *re aliena* hardly distinguishable from ownership.

Servitudes.—(a) Praedial servitudes (*i.e.,* easements or profits *à prendre*) were divided into two categories, rustic and urban, according as they served the need of agricultural land or of buildings. Thus rights of way and of water are usually classed as rustic, while rights to light, to view or to support were urban. Praedial servitudes could only be appurtenant, *i.e.,* they could not exist except as additional advantages attached to the ownership of a piece of land (the "dominant tenement").

(b) Personal *Servitudes.*—The law of Justinian's day brought under the heading of servitudes also the rights of *usufructus* and *usus.* Usufruct was the right to use and take the fruits (*e.g.,* crops) of a thing and corresponded to our life-interest. *Usus* was a more restricted right, also not extending beyond the life of the holder, merely to the use of a thing; thus the usuary of a house could live in it himself but could not let it, as that would be equivalent to taking the fruits.

Possession.—Implied in the absolute conception of ownership is a sharp distinction between ownership and possession. The civil law did not protect possession as such, but one of the most important parts of the praetorian system was constituted by the interdicta (special types of remedy) which protected an existing possession irrespective of its rightfulness, *i.e.,* anyone wishing to interfere with it must bring an action and prove his title. If he interfered on his own authority, the praetor would see that the original state of affairs was restored.

OBLIGATIONS

Obligations were classified by the jurists into two main categories, according as they arose from delict (tort) or contract: the remaining obligations the Byzantines placed under the headings of quasi-contract and quasi-delict.

I. **Delict.**—The XII. Tables already show the law in a state of transition from the system of private vengeance to that in which the state insists on the acceptance of compensation instead of vengeance by the person wronged and fixes its amount. Thus in the case of assault (iniuria) if one man broke another's limb, talion was still permitted, *i.e.,* the person wronged could inflict the same injury as he had received, but in other cases there were fixed money penalties, *e.g.,* 25 asses for a blow. Theft involved a penalty of twice the value of the thing stolen, unless the thief was caught in the act (*furtum* manifestum) in which case he was flogged and "adjudged" to the person wronged.

In classical times, praetorian reforms had substituted a fourfold penalty in the case of *furtum* manifestum and penalties for *iniuria* (which now included defamation and insulting behaviour) were assessed in each case by the court. The law of damage to property was regulated by a statute (lex *Aquilia*) dating from the republic, but later than the XII. Tables, much extended by interpretation and by the praetor, and praetorian actions lay for a number of new delicts of varying importance.

II. Contract.—At the time of the XII. Tables a law of contract can hardly be said to have existed, though we know of an institution called *nexum* of which hardly anything can be said with certainty except that it was a kind of loan so oppressive in character that it might result in the debtor's complete subjection to the creditor. It was obsolete long before classical times. The contracts of classical law were divided into four classes, literal, verbal, real and consensual. The literal contract was a type of fictitious loan formed by an entry in the creditor's account book; it was comparatively unimportant, and obsolete in Justinian's day. The verbal contract or stipulatio was of great importance, for it provided a form in which any agreement (provided it was lawful and possible) might be made binding by the simple method of reducing it to question and answer, *e.g.,* "do you promise to pay me ten thousand sesterces?"—"I promise." Originally it was absolutely necessary that the words should be spoken, but it may be said (technicalities apart) that by Justinian's day a written memorandum of such a contract would be binding, even though in fact there had been no speaking at all. If an agreement was not clothed in the form of a stipulation, it must, to be valid, fall, according to its content, under one of the types of real, or consensual contracts. A real contract is one which needs for its conclusion (in addition to the consent of the parties) that some thing should be transferred from one party to the other and that the obligation arising should be for the return of the thing transferred. The real contracts are *mutuum* (loan, *e.g.,* of money), commodatium (loan, e g., of a horse), deposit and pledge. Consensual contracts need no element for their formation except agreement—whether expressed in words or otherwise—between the parties, and though there were only four such known to the law, these were the most important in ordinary life—*emptio* venditio (sale), locatio *conductio* (hire of things or services and also giving out jobs to be done), societas (partnership) and *mandatum* (agency). In Justinian's day it was further a principle that in any case of reciprocal agreement, *e.g.,* an agreement for exchange (which was not sale), if one party had performed, he could bring an action to enforce performance by the other ("innominate contract").

SUCCESSION AT DEATH

I. Testamentary Succession.—That wills existed already at the time of the XII. Tables is certain. and it is highly probable that the form used was still that mentioned by Gaius as the oldest, the will made publicly in the assembly of the curiae (*testamentum comitiis calatis*), with the will made before the people drawn up for battle (testamentum in *procinctuas*) as a variant. It may be however that the mancipatory will (testamentum per aes et *libram*) had already been invented. This began as an expedient for effecting the purposes of a will in an emergency, when the other forms were impossible, and consisted in the use of mancipation to convey the estate of the dying man to a kind of trustee (*familiae* emptor) who then distributed it in accordance with the testator's instructions. By the end of the republic, however, the older forms had disappeared, the mancipation had become a mere formality and the instructions of the testator, which were now contained in a written document, constituted a true will, operative only at death and revocable at any time during the testator's lifetime by the making of a new will. In post-classical times the mancipation had ceased to be necessary and the commonest form of will was the testamentum tripertitum, needing for its completion the seals of seven witnesses and the signatures of the witnesses and of the testator. In classical times the praetor had already given effect in most cases to a document sealed by seven witnesses.

The first requirement of any Roman will of historical times was the appointment of one or more heredes. **A** heres is a universal successor, *i.e.,* he takes over the rights and duties of the deceased (in so far as they are transmissible at all) as a whole. On acceptance, the heir becomes owner where the deceased was owner, creditor where he was creditor and debtor where he was debtor, even though the assets were insufficient to pay the debts. It was thus possible for an inheritance to be *damnosa, i.e.,* to involve the heir in loss. Until Justinian's day this consequence could only be avoided by not accepting the inheritance, but Justinian made one of his most famous reforms by introducing the *beneficium inventarii, i.e.,* the heir who, within a certain time after the acceptance made an inventory of the deceased's assets, need not pay out more than he had received. In addition to appointing an heir, the testator might also leave legacies, *i.e.,* particular gifts which are a burden on the heir. Freedom of testation was, however, not complete, a man being obliged to leave a certain proportion of his property to his children and, in some cases, to ascendants, and brothers and sisters.

II. Intestate Succession.—The history of intestate succession consists broadly in the gradual supersession of a purely agnatic system (*i.e.,* one which takes account of relationship through males exclusively) by a cognatic system (in which relationship is traced indifferently through males or females). The agents in the change were first the praetors and afterwards imperial legislation.

By the XII. Tables those first entitled were the *sui* heredes of the deceased, *i.e.,* those who were in his potestas or *manus* when he died and became free from power at his death. Failing these, the nearest agnatic relation (or relations, if there were several of the same degree) succeeded, and, if there were no agnates, the members of the gens (clan) of the deceased. Praetorian reforms placed emancipated children on an equality with *sui* and gave to the nearest cognates, or failing such, to the surviving spouse (in marriage without *manus*) rights of succession in the absence of agnates; gentile succession became obsolete probably in the first century AD. Even under this system it will be seen that a woman would not succeed to a child of hers if any agnate (*e.g.,* a paternal uncle) were alive, nor a child to its mother if there were any agnate of hers. Both these cases were dealt with before thr end of the classical period, the former by the Sc. Tertullianum junder Hadrian) which gave certain rights of succession to mothers who had the *ius* Eiberorum (*i.e.,* had borne three children) and the latter by the Sc. *Orphitianum* of A.D. 178, which gave to children the first right to succeed to their mothers. Succeeding emperors made many changes but it was not until Justinian's day that the cognatic system completely triumphed. By Novel 118, completed by Novel 127, a new system was introduced, the principal features of which were the following: Descendants had the first claim, and failing these, a composite class consisting of ascendants, brothers and sisters of the full blood, and children of deceased brothers and sisters. Next came brothers and sisters of the half blood and finally the nearest cognate or cognates if there were several in the same degree.

Husband and wife were not mentioned, but their old (praetorian) rights were kept alive in the absence of any of the **above**

categories. Justinian also gave to the poor widow a right to one quarter of her husband's estate unless there were more than three children, in which case she shared equally with them. If, however, the heirs were her own children by the deceased, she only received the usufruct (life interest) in what she took.

PROCEDURE

The earliest form of procedure known to have existed is that of the *legis actiones;* this was superseded by the formulary system, which in its turn. gave way to cognitio extmordinaria. Characteristic of both the earlier systems is the division into two stages, a preliminary one before the jurisdictional magistrate (in *iure)* and the actual trial before the iudex. The object of the first stage is to arrive at an issue, which under the *legis* actio system has to be achieved by the speaking of set forms of words by the parties and sometimes, at least, by the magistrate. Thus in a *vindicatio* (v. supra) each party, when making his assertion of ownership grasps the thing in dispute and lays a wand on it, after which the magistrate intervenes and says "Let go both of you." So formal was the procedure that a plaintiff who made the slightest mistake lost his case. For this state of affairsthe formulary system provided a remedy. It superseded the older system, so Gaius tells us, as a result of the lex Aebutia (date much disputed, perhaps between 149 and 126 B.C.), and two leges Iuliae (of Augustus). Between the lex Aebutia and the leges *Iuliae* the two systems were both in use.

Under the new procedure the issue was formulated in written instructions (formula) to the iudex, couched in the form of an alternative, *e.g.*, "If it appear that the defendant owes the plaintiff ten thousand sesterces the iudex is to condemn the defendant to pay the Plaintiff ten thousand sesterces; if it does not so appear. he is to absolve him." A draft of the formula was probably prepared by the plaintiff before he came into court, but there could be no trial until it was accepted by the defendant; for there was always a contractual element about a lawsuit under both older systems. Pressure could, however, be exercised by the magistrate on a defendant who refused to accept a formula of which the magistrate approved. just as a plaintiff could be forced to alter a formula of which the magistrate disapproved.

The process by which the cognitio extraordinaria took its place was gradual. The new system meant that the magistrate used his administrative powers to settle disputes. As imperially appointed officers who had no iurisdictio in the old sense, superseded republican magistrates, so this administrative process became commoner. The result is that the old contractual element in procedure disappears, as well as the old division into two stages. Justice was now imposed from above by the state.

ROMANO, GIULIO (GIULIO PIPPI, originally GIULIO DI PIETRO DI FILIPPO DE' GIANUZZI) (?1499–1546), painter, architect, principal heir of Raphael and one of the founders of Mannerism. As his name implies. Giulio was born in Rome, but the exact date is unknown. According to the archives of Mantua, where he died, he was 47 at his death on Nov. 1, 1546, so that he was presumably born in 1498/99. G. Vasari, however, says that he was 54 at his death (which he dates correctly), thus making his birth fall in 1491/92. The earlier birthdate, which is not usually accepted, would make Giulio less precocious. He certainly went to Raphael as a child apprentice and had become so important in the workshop by Raphael's death in 1520 that Vasari names him with G. Penni as Raphael's chief heir; he became his principal artistic executor. Among the works of Raphael which Vasari specifically records as having been worked on by Giulio are the frescoes in the Sala dell'Incendio in the Vatican. completed in 1517, and many of the frescoes, from Raphael's designs, in the logge, certainly finished by June 16, 1519. He also worked on such oil paintings as the "Joanna of Aragon" and the "St. Margaret" for the king of France, both now in the Louvre, Paris. and both of about 1518. His facility was almost proverbial and is testified to by his works, as well as by Vasari.

In the period between Raphael's death on April 6, 1520, and Oct. 1524, when Giulio went to Mantua, it is clear that he and Penni finished a number of works left incomplete at Raphael's death. The most important such commission was the Sala di Costantino, the last and largest of the Vatican rooms, which had hardly been begun by Raphael. After some intrigue, Giulio and Penni secured the contract, completing the frescoes on Sept. 5, 1524. The two certainly finished the "Coronation of the Virgin" (now in the Vatican) for the nuns of Monteluce. Giulio painting the upper part and Penni the lower. They may also have put the finishing touches to the "Transfiguration." Giulio also painted some original works during these years, including the "Madonna and Saints," now in Sta. Maria dell' Anima. Rome; the "Stoning of St. Stephen" (1523; S. Stefano, Genoa); and the Naples "Madonna." He also undertook some of the decorative painting at the Villa Madama, begun under Raphael's general direction in 1516, and at the Villa Farnesina. The Roman palaces of the Cicciaporci and Maccarani families, closely based on the palace of Raphael by Bramante, are also by him.

Giulio left Rome in Oct. 1524 for Mantua, apparently at the request of Federigo Gonzaga, marquis of Mantua. Very soon, there was a great scandal over some obscene engravings which Marcantonio Raimondi (*q.v.*) had made from Giulio's drawings; Raimondi was imprisoned, but Giulio was by then safe in Mantua. Much the most important of all his works is the Palazzo del Te, on the outskirts of Mantua, begun in 1525 or 1526 and built and decorated entirely by him and his pupils. This palace is one of the first and greatest examples of Mannerist architecture, being almost a parody of the serene classicism of Bramante while retaining the forms of Roman antiquity. The building consists of a square block around a central court. with a splendid garden opening off at right angles to the main axis—in itself characteristic of the way in which all the elements are slightly different from what would be expected. There is a series of splendid staterooms, mostly decorated in the rich but elegant Roman manner invented by Raphael on the basis of the recently rediscovered Golden House of Nero. The principal rooms are the Sala di Psiche, with erotic frescoes of the loves of the gods; the Sala dei Cavalli, with life-size portraits of some of the Gonzaga horses; and the fantastic Sala dei Giganti. This is one of the showpieces of Mannerist decoration and consists of a room, roughly square, which is painted from floor to ceiling with a continuous scene of the giants attempting to storm Olympus and being repulsed by the gods. On the ceiling, Jupiter hurls his thunderbolts, and the spectator is made to feel that he, like the giants, is crushed by the mountains which topple on to him, writhing in the burning wreckage. Even the fireplace was incorporated into the decoration, and the flames had a part to play. This room was completed by 1534, with much help from Rinaldo Mantovano, Giulio's principal assistant. The colour is very crude; the subject is all too suited to virtuosity and tends to bring out the streak of cruelty and obscenity which runs just below the surface in much of Giulio's painting.

In Mantua itself he did a great deal of work (including the Sala di Troia) in the huge Reggia dei Gonzaga. He also built for himself a very Mannerist version of the house of Raphael (1544–46) and began the rebuilding of the cathedral (1543 onward). The decorations of the Sala di Troia are particularly noteworthy in that they look forward to the illusionistic ceiling decorations of the baroque; but this was probably inspired by the presence in Mantua of the Camera degli Sposi by Andrea Mantegna. who must have inspired Giulio to further audacities of illusionism, as well as confirming his taste for antique motives. See also RENAISSANCE ARCHITECTURE: Italy: Mannerism.

ROMANONES, ALVARO DE FIGUEROA Y TORRES-MENDIETA, COUNT DE (1863–1950), Spanish politician, born in Madrid, Aug. 9, 1863. He was president of the Madrid municipality, cabinet minister and home secretary (1905), before

thrice taking office as prime minister—in Nov. 1912; from Dec. 1915 to April 1917, and from Dec. 3, 1918, to April 15. 1919. He was minister of justice. Dec. 1922–Sept. 1923, and foreign minister, Feb.–April 1931. Later he became a leader of the right. He wrote *Las Responsibilidades Políticas del Antiguo Régimen de 1875 a 1922* (1924). He died in Madrid Sept. 11, 1950.

ROMANOS, SAINT (called MELODOS) (fl. 6th century A.D.), Byzantine hymnographer and greatest master of the kontakion (*q.v.*), was born at Emesa (Homs) in Syria. After officiating as deacon at Berytus (Beirut), he went to Constantinople during the reign of the emperor Anastasius I (491–518). Legend relates that when asleep one Christmas eve he was commanded by the Virgin to eat a scroll, and on awaking after doing so he recited his famous Christmas kontakion. Some 80 of his kontakia are extant but none of the music accompanying them survives. This literary form reached its full development in Romanos' kontakia, with their elaborate metrical system and vigorous dialogues, but they often contain too many rhetorical devices for modern taste. Romanos borrows heavily from earlier Greek sermons and other sources, though it is not certain whether he also depends on Ephraem Syrus. His most famous kontakia are perhaps those on Christmas, Easter and the Passion. His feast day is Oct 1.

There is no complete edition of Romanos' kontakia. The Christmas kontakion is edited by P. Maas in *Byz. Zeitschrift*, 24:1–13 (1923–24). Of several selections see *Analecta sacra*, vol. 1, edited by J. B. Pitra (1876); G. Cammelli, with Italian translation (1930); E. Mioni (1937); and N. B. Tomadakes. 3 vol. (1952–57).

ROMANOV, the name of the dynasty that ruled Russia from 1613 to 1917. The last direct descendant of the earlier dynasty of Rurik. Tsar Theodor, son of Ivan (John) the Terrible, died in 1598. After him the throne was occupied first by his brother-in-law: Boris Godunov, then by an adventurer claiming to be a son of Ivan the Terrible (usually known as the false Demetrius). After his murder, in 1606, Prince Basil Shuiski was proclaimed tsar: but was dethroned four years later. The faction which was in power offered the crown to Vladislas, son of the king of Poland. A Polish army advanced to support his claim. Another faction brought in a Swedish army to fight the Poles. In the meantime two more men sprang up in succession, both pretending to be Demetrius, miraculously saved from death. The country was in confusion and civil war until Minin, a tradesman from Nijni-Novgorod, joined hands with Prince Pojarski, one of the generals who had proved himself an efficient soldier. They formed an army and took Moscow in Oct. 1612; they then sent messengers all over the country urging the people to choose representatives who would assemble in Moscow to elect a new ruler. On Feb. 21, 1613, Michael Romanov was unanimously proclaimed tsar.

The Romanovs were not of Rurik's stock, nor were they even of very ancient lineage. They descended from a German nobleman who had emigrated to Moscow early in the 14th century. His fifth son. nicknamed Koshka ("the Cat"), became head of the family of Koshkins, many of whom were prominent at the court of Moscow in the 14th and 1 jth centuries. Early in the 16th century one of them. whose first name was Roman, called himself Romanov. His daughter, Anastasia, was Ivan the Terrible's first wife; it was her son. Theodor, who was the last tsar of the Rurik dynasty. As Ivan the Terrible had no high opinion of his son's mental powers, he appointed a council of noblemen to transact business for his successor, and Anastasia's brother, Nikita, was chairman of this council. He made himself very popular by his constant defense of common people's rights, and one of his sons, Theodor, u-as celebrated for his learning and refined manners. Boris Godunov, fearing the popularity of the Romanovs, had obliged Theodor and his wife to divorce and to become monk and nun. It was their son. Michael, who was elected tsar in 1613.

Theodor's monastic name was Philaret. After Boris Godunov's death Philaret became metropolitan of Rostov. At the time of his son's election to the throne, he was a prisoner in Poland. Michael was only 16 years old, and was living with his mother in a convent. His personal reputation played a minor part with those who chose him, as in their eyes he was the lawful heir, being nephew to the last tsar descending from Rurik. His name had been often mentioned in those years of civil war as the only one on which all shades of opinion might meet. A popular rumour asserted that when Tsar Theodor was dying, he appointed his cousin Theodor Romanov (now the monk Philaret) as his successor, but Godunov stepped in and prevented the tsar's will being fulfilled. As Philaret had taken monastic vows, he could not ascend the throne; besides the boyars thought Michael, a mere boy. would be a more manageable sovereign. His election was no doubt because of the general striving after legitimacy, which was satisfied by his close relationship to the extinct dynasty. Three years later his father returned to Moscow and was made patriarch; he then reigned jointly with his son and up to his death in 1633 all state documents bore Philaret's signature and Michael's.

The main work of the Romanov dynasty was to extend Russia to its natural geographical limits, and to turn it into a European state from the semi-Asiatic one it had become after being under Tatar rule. Though this policy is usually connected with the name of Peter the Great, it was actually started by his grandfather and unswervingly pursued by his successors down to the 20th century. But though the general trend of Russia's internal and international development progressed along the same lines for three centuries, various undercurrents predominated at certain times and were characteristic of definite epochs. Those epochs, into which the history of the Romanov dynasty may be divided for purposes of study, correspond fairly exactly with the customary division by centuries. The first epoch, when Moscow was the only important centre and when the general intercourse with western Europe was nearly as limited as in previous days, corresponds to the 17th century, as it lasted not only until 1689, when Peter the Great became sole ruler, but more exactly until the end of 1698, when, after his first journey abroad. he began transacting state business himself. The second period, down to the death of Paul I, corresponds to the whole of the 18th century, during which Russia, with St. Petersburg as principal centre, gradually became a European country and reached the shores of all the seas bordering on the Russian plain. The third period, from the accession of Alexander I. in 1801, down to the overthrow of the dynasty in 1917, marks the highest point of Russia's activity as a European power. Whatever territorial enlargements were acquired in this period were in Asia and mostly attributed to the necessity of reaching a natural and easily defensible frontier on the Asiatic continent, whereas most of the government's energies were devoted to the work of internal progress, both economic and educational.

17TH CENTURY

The state of chaos to which the country had been reduced in the first years of the 17th century, set a hard task to the new dynasty. The pervading poverty, insecurity and disorder required protracted and patient labours before the country could overcome its weakness and disorganization. All the first tsars of the Romanov house came to the throne at such an early age that no personal guidance could be expected from any one of them for a long time. Therefore the actual work of government was always in the hands of a council. The first three tsars never took any decision without its having been discussed by this council, but favouritism and intrigue naturally influenced the choice of its members. The government was constantly convening assemblies of deputies from the whole land—sometimes to discuss a special question, sometimes for submitting all pending business to their decisions. In those assemblies, called *zemski sobor*, the permanent boyar council represented the nobles; in addition came deputies from the clergy and from "all the land," both towns and villages. The *sobors* of later days, between 1653 and 1682, however, became mere commissions for elaborating points of law and had no positive authority. The government had become stronger and had built up an efficient staff of agents of its own. On the other hand the *sobor* of 1648–49 had promulgated a code of laws, which was commonly folloned and did not require further commissions to enforce universality.

Wars of the New Dynasty.—A great part of the country's strength was wasted in attempts to counteract the encroachments effected by the neighbouring powers on its territory during the period of anarchy. Russia got back Smolensk and Seversk. which had been seized by the Poles, and annexed Kiev and part of Little Russia, east of the Dnieper, because of a rising against Poland of the Cossack hetman, Bogdan Khmelnitski. But the mars against Sweden, which had annexed a large area in the Baltic region, led to no result in the 17th century, and Russia had to wait for Peter the Great in order to regain what she had lost in the northwest.

Down south, where since the 15th century a separate State, the khanate of Crimea, had arisen under Turkey's protectorate, the first Romanovs waged no regular wars; but the danger of Tatar incursions demanded the building up of defenses which slowly advanced into the steppe, and by the end of the 17th century the fortified line of defense was 400 mi. S. of the capital. But the farther Russia spread down in that direction the clearer it became that no peaceful agreement was possible so long as the Black sea was not reached, and that would have meant war with Turkey, a much too formidable opponent at that stage. A cossack hetman. Doroshenko, went to war with the Turks, applied to Moscow for help and was eventually supported; but this adventure led to a disastrous peace (1681) by which western Ukraine had to be surrendered to Turkey. It took 100 years more, and all the energy of Catherine II and of Potemkin to reverse the situation.

Taxation Reforms.—The finances of the country at the beginning of the new dynasty's rule were perhaps in a still more disastrous condition than any other branch of public service. The main spring of former revenue, taxation of cultivated land, was no more adequate because of so many fields having been abandoned during the years of anarchy. Besides, those peasants who returned to their devastated villages were often successful in defrauding the state of their taxes. The government was obliged gradually to work out a new system, that of taxing no more the land. but the landowner, not the "field," but the "house." Large landowners were made responsible for the taxes due from peasants who were settled on their land, besides being obliged to come forward with a fixed number of soldiers in case of war. In order that they should be able to fulfill their obligations the peasants were gradually attached to the soil; and thus a serfdom arose which lasted up to 1861 and practically transformed the peasants into slaves.

Religious Matters.—The administration of the church was at first entirely in the hands of Philaret, who was elected patriarch in 1616. Until his death, in 1633, he was the actual sovereign, and in ecclesiastical matters his power was absolute. In 1652 the patriarchal see mas again occupied by a strong personality. Nikon. Tsar Alexis called him his "particular friend" and gave him a free hand in the reforms he undertook. He revised and corrected the texts of prayer books, the manuscripts of which had been disfigured by ignorant scribes, and abolished ceremonial practices for which no authority existed. But his activity met with strong opposition, due in most part to Nikon's tactlessness, and led to a schism, Raskol. Nikon's opposition to secular legislation about monastic property, and his efforts to place his own authority above that of the tsar, eventually made Alexis alter his attitude toward him. He then retired to a convent and refused to perform his duties. For nearly ten years the tsar ruled the church in his stead, until a council was convened which deposed Nikon and appointed a new patriarch. The danger of having a man next to himself who might succeed in usurping such a measure of power, made Peter the Great abolish the Russian patriarchate.

A curious feature of the first Romanovs is that notwithstanding their efforts to rule in accordance with the people's wishes, and though each of them in turn manifested a total lack of personal ambition, circumstances so imperiously demanded a strong hand that autocracy was evolved and imposed upon a succession of totally ungrasping autocrats. This leaning of the country toward a firm rule prepared the way for Peter the Great's activities.

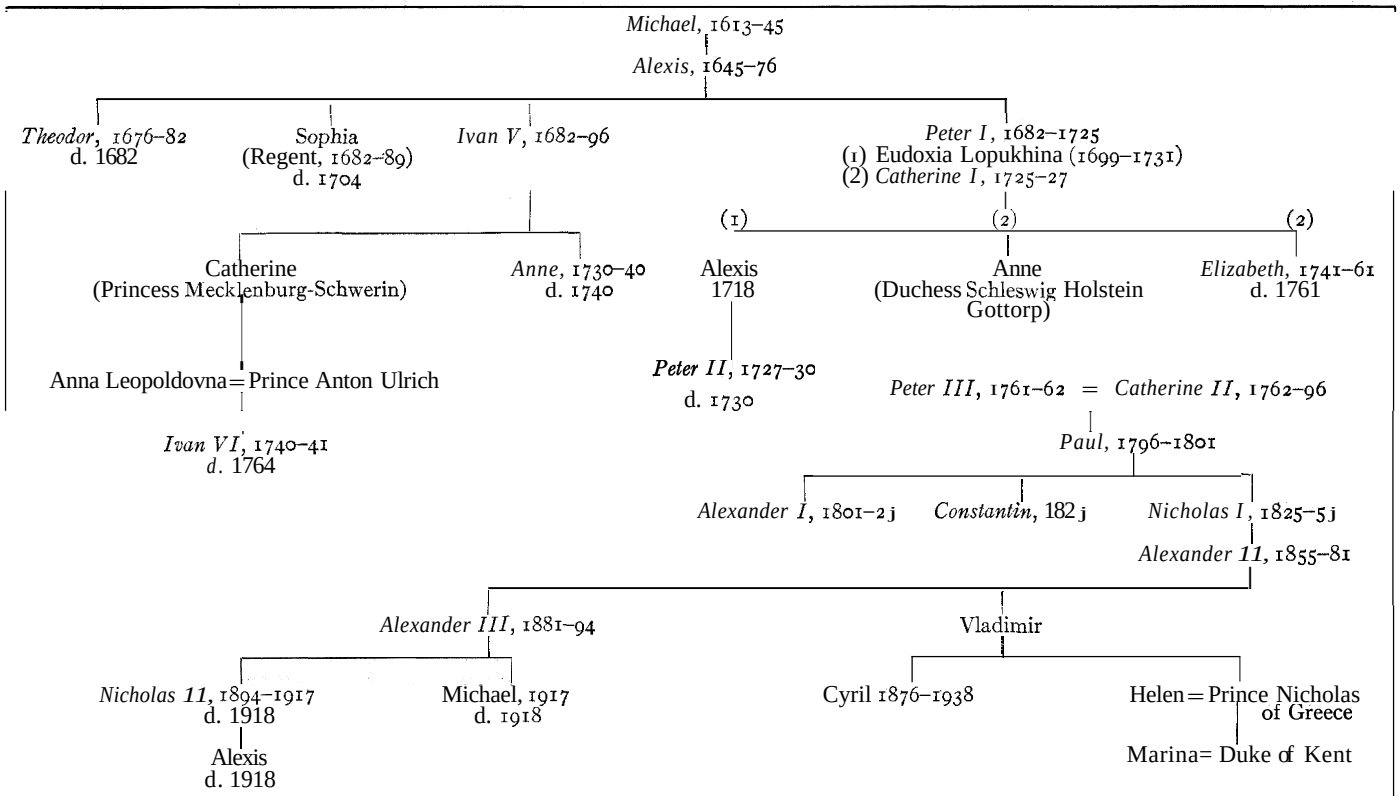
18TH CENTURY

The salient figures among the Romanovs of the 18th century are those of Peter the Great and of Catherine II. With Peter, Russia reached the Baltic sea after 20 years' war against Sweden; with Catherine, the southern frontier, after two wars against Turkey, came down to the Black sea, whereas, on the west, because of the partition of Poland, and the annexation of Courland, it came in contact with the Germanic confederation. Two brilliant episodic wars—that of the empress Elizabeth against Frederick the Great, and that of Paul I against the French in Italy and Switzerland—were brought on by political alliances and led to no tangible results. Sweden's two attempts (1741 and 1788) to regain by a sudden attack some of its lost advantages nearly led to Russia's spreading farther over southeast Finland. The conquest of Finland became necessary for the security of St. Petersburg, which gradually became the seat of government. Two attempts at advance in central Asia remained fruitless; Peter the Great's conquest of the southern border of the Caspian in 1723 was annulled by the empress Ann in 1732 when the annexed provinces were handed back to Persia. Peter the Great's attempt to seize Khiva failed.

Reforms of Peter the Great.——Peter the Great's decision to turn Russia into a western power demanded a complete upheaval of existing conditions. The emperor (he assumed this title in 1721) carried through his reforms against a stubborn resistance of the greater part of the nation. The whole of his tremendous energy mas aimed at making Russia strong, and at opening the country to the influence of western science and art. He started alone in the field, and the motto he chose for his seal is most characteristic: "I am of those who must be taught and am seeking for teachers." The work he performed between 1699 and his death in 1725 is astounding. (For a discussion of his accomplishments, see PETER 1.) Peter not only set a marvellous example of what personal energy can accomplish, but he was also the first to put forward the idea of "citizen" or "servant of his country" as being the highest aim of a man's activity. He did not hesitate to sacrifice even his only son when he saw he would undo his father's work and lead a life of ignorant self-indulgence. Later in the century Catherine II also seized every opportunity of showing that all her life and energies were devoted to the service of the country. Her grandsons, Alexander I and Nicholas I, and her great-grandson, Alexander II, proclaimed the same rule. In this respect Peter the Great was ahead of his times not only in Russia but in Europe, since the first western sovereign who prided himself on being the servant of his people was Frederick II. nearly half a century later. Peter's daughter, Elizabeth (1741–61), was also a pioneer in her way when she abolished capital punishment (1744), which from then on mas not practised in Russia except in retribution for attempts to overthrow the existing order of government. She also opened a fine arts academy. The short reigns of Peter the Great's immediate successors, his widow and his grandson, during which favourites ruled in their stead, prompted a group of political men to offer the throne in 1730 to Ann, a niece of the great reformer's. but on the condition that she sign a promise to take no steps without the approval of a council of eight men (themselves) and this council would recruit its members by free election. Ann signed the paper and then. backed by the guards, destroyed it as soon as she reached Moscow for her coronation. That was the only attempt made in the 18th century to limit autocracy in Russia.

The two 18th-century sovereigns of the Romanov dynasty whose political activity was not regulated by their sense of duty, but merely by their personal whims, Peter III and Paul I, rapidly became so unpopular, that conspiracies at once arose which did away with them, the first after six months'. the second after four years' rule. The one law of Peter III's which it was not possible to abrogate was that which freed the members of the nobility from being obliged to serve the country, an obligation which was the only justification of the privileges they enjoyed.

Liberalism Under Catherine 11.—The 34 years of Catherine II's reign produced a fundamental change in all paths of life. Liberal ideas, those of the French encyclopaedists, became the foundation of her reforms. She convened a commission for preparing a new code of laws and composed instructions to guide



this assembly in its labours. Catherine accomplished a vast number of reforms tending to economic prosperity and encouraging certain manifestations of local self-government. She did a great deal for art, protected artists and formed the nucleus of the great Hermitage collection. which has been a powerful instrument of culture in Russia. (See also CATHERINE II.)

19TH CENTURY

The beginning of the century saw the last of Russia's expansion in Europe. as the annexation of the Swedish province of Finland took place in 1809. The changes which occurred in the redistribution of parts of Poland and of Bessarabia. in the first half of the century, partook more of the character of frontier rectifications than conquest. Russia's territorial acquisitions of the century were mostly in Asia. In 1801 the kingdom of Georgia was annexed to Russia, and that led to a gradual absorption of Transcaucasia. the last part of which was pacified in 1864. Central Asia (or Russian Turkistan with Bokhara and Khiva), that perpetual hotbed of raids and stronghold of the slave trade, was conquered between 1830 and 1876, with the addition of the Turkoman steppe in 1831. But Russia's advance to the Black sea had opened up a new question, that of the Straits (Dardanelles and Bosphorus), for, without a free passage into the Mediterranean. the Black sea mas of small commercial value. Catherine II had obtained from Turkey the right of protection over Turkish subjects of the Orthodox faith. This new principle, akin to the more modern idea of "spheres of influence," originated the efforts of the Romanovs for the liberation of Slav nationalities from Turkish rule; Russia participated in the war for the independence of Greece and bore the greater part of the burden in those which eventually led to the creation of Rumania, Bulgaria, Serbia and Montenegro. The same policy brought on the Crimean War, which was disastrous for Russia and bared its weakness. even in military matters, before the eyes of the norld. The staunch qualities of the Russian soldier had left a durable impression in Europe from the time of the Napoleonic wars, but the Crimean War led to a general revaluation of Russian methods, both inside the country and abroad.

Conservatism of Later **Romanovs.**—However, the main characteristics of the Romanovs' rule in the 19th and early 20th century is undoubtedly the opposition to the principles of revolution which had triumphed in France. When Alexander I was confronted with them, as personified by Napoleon, he was beaten, then pretended to yield until his forces were ready for a second and triumphant struggle. He realized so well the true meaning of his victory that, though the halo of "liberator of Europe" put him in a situation in which he would hardly have met with a refusal on any point. he never turned Napoleon's downfall to any merely material advantage for Russia. All he had gone through; the disasters of Jena and Austerlitz, the humiliations of Tilsit and Erfurt, the fire of Moscow, the entry into Paris, the congress of Vienna, he used all that to enhance Russia's prestige and to create a situation where his own voice would carry most weight against revolutionary propaganda. The Holy Alliance was the only harvest he sought to reap for having led his army from Moscow to Paris.

Growth of Revolutionary Sentiment.— But this moral comfort was of short duration. and the emperor very soon perceived that he and his allies were unable to cope with the tide. Moreover. in his own country a vast conspiracy was formed, of which he was aware in the last weeks of his life, though he took no steps against it. A military revolt was organized the very moment his brother and successor came to the throne (Dec. 182 j), and though it mas suppressed in the course of one day, the danger he had undergone left its imprint on the whole of Nicholas I's mind and behaviour. After 1848, nhen most European governments gave nay to political reform, the emperor of Russia remained almost the sole bulwark of legitimacy. His son, Alexander II. understood that however well the principles of his ancestors might have been adapted to the requirements of his country, they had to be exercised in conformity with the spirit of the times, and he effected a number of important reforms. But the enemies of tsardom used these liberal measures merely as a broader basis for revolutionary propaganda, and this became so strong that it led to the murder of the emperor (1881).

His son. Alexander III, proclaimed his allegiance to reaction; the constitution his father had elaborated and would have granted had he lived a few days longer, was forgotten, and a police regime was instituted which appeared to stifle revolutionary activities but in reality drove them underground Outwardly. the country was quiet and prosperous. The political alliance with

France created an era of peace and permitted the whole force of the nation to be devoted to economic development. The building of railroads was pushed on in gigantic strides, the trans-Siberian railway (because of the emperor's personal initiative) being the most notable achievement.

The last Romanov emperor, Nicholas II, came to the throne at the age of 26, and strove to continue his father's work along the same lines. He succeeded in creating economic prosperity. His desire to obtain a strong footing on the Pacific, and thereby to prompt the development of eastern Siberia, led to a disastrous war with Japan (1904). A revolution broke out, and though it was suppressed the emperor attempted to pacify the land by granting constitutional rights (Oct. 1905). This, however, was done but half-heartedly, and led to incessant misunderstandings between the government and the people's representatives.

Final **Success** *of Revolution.*— Propaganda was already strong, and every liberal concession, instead of quieting public opinion, gave fresh opportunities of carrying it on. The emperor, while well-intentioned, was scarcely strong enough in character to withstand the forces of unrest which from 1905 on became yearly more active. At last, Russia's participation in World War I and the emperor's wish to unite all classes in one effort against the enemy cleared the ground for propaganda in the army; it was especially active in the hospitals, which were largely in the hands of volunteers. The general discontent and uneasiness produced by several years of war were put to use and a spark was sufficient for bringing on a general conflagration in the midst of which the last Romanov emperor descended from the throne. The three centuries of the Romanovs' rule correspond to a period of expansion and brilliancy such as Russia had not hitherto known. See also separate biographies of the Romanov emperors; and RUSSIA. ROMAN RELIGION. The religion of ancient Rome, from the earliest known times to the final suppression of paganism, may be conveniently divided into four periods: (1) native; (2) Italian (including Etruscan); (3) Greek, passing into Greco-Roman; and (4) oriental. These divisions emphasize the principal influence at each stage, without implying that no other influences existed.

Native.— The earliest Romans were a small community of peasant farmers, probably held together in a loose organization with a king at its head. Under him would be the heads (patres) of families or clans. with their retainers (clientes). Even in its earliest days the community probably engaged in a certain amount of trade in addition to farming and stock raising, since Rome lies advantageously on the principal natural highway of central Italy, which is the Tiber, and on the border between the Etruscan cities northward and the towns of the Latin league farther south. According to tradition the people were of mixed stock, with some Latin and some Sabine highland blood; various linguistic and other facts tend to confirm this. Threatened by powerful neighbours, they were of necessity warlike.

Like many peoples at a comparable or even at a lower stage of culture, the Romans had developed a few "high gods" by the earliest known period of their history. The names of some of their deities can be recovered, chiefly from surviving festival calendars. None of these was composed earlier than the 1st century B.C., and by that late date many of the oldest feast days and religious seasons had lost their former prominence; but the calendars nevertheless record the gods' names in large letters. Chief among them comes Jupiter (in Latin, Iuppiter), whose name is etymologically equivalent to the Greek Zeus and the Sanskrit Dyaus. It must therefore have come down from immemorial antiquity in the Indo-European family, along with the Latin language. The name Jupiter includes also the stock title pater; i.e., head of the house, hence, person in authority. (Neither pater nor its correlative mater had originally any physiological meaning.) Like Zeus and Dyaus, Jupiter was a sky- and weather-god, obviously important to farmers. With him were early associated two other gods. Mars and Quirinus. Mars was a deity of great importance, widely worshiped in Italy, but of doubtful origins—his name is of highly uncertain etymology. His functions were very wide, and included the protection of his worshipers, their cattle and other possessions against all manner of evils, such as disease or the devastation of their property. These evils included the perils of war, and Mars was consequently a warlike god. Quirinus, whose name is plainly adjectival, was much less important. He is said to have been Sabine, despite the fact that the sound represented by qu- did not exist in the Sabine dialect, and it seems that he was the god of the *quirium*, whatever that may have been. The word would seem to be connected with the name *Quirites* by which Roman citizens were collectively known. Jupiter, Mars and Quirinus formed a triad, but their festivals were separate. Jupiter was worshiped especially on the ides (day of full moon) of each lunar month. Mars was worshiped almost exclusively in his own month, the first of the original Roman year, *Martius* (i.e., March), and in October. Quirinus' feast day was the Quirinalia on Feb. 17.

At least one goddess, Juno, was important in the earliest-known times. She seems to have had no original connection with Jupiter or with any other god save perhaps Janus, one of whose titles was Iunonius. Juno's name may most reasonably be associated with words denoting young maturity, such as *iuuenis*, and so may signify a marriageable woman. Certainly her chief function was to supervise the life of women. and since their sexual life has what may be called a lunar rhythm, Juno has certain lunar associations, under the title of Iuno Couella. The month of June (*Iunius*) is hers, though its name is derived from a stem, *iuni-*, seen in the Etruscan corruption of her name, which is Uni. Her festival, marked by curious and obviously ancient ritual, was the Nonae Caprotinae, or Nones of the Wild Fig, on July 7. A sacrifice was made to her, together with Janus, on the first day (knlendae) of every month. On March 1, the dedication day of the temple of Juno Lucina, the birth-goddess, married women held a festival, the Matronalia. This, however, is not one of the oldest holy days. The u-omen swore an oath by this goddess, "Eiuno." There are several examples, too, of a woman speaking of "my Juno," as a man would speak of his "Genius." It has been suggested that there were to begin with many iunones, one for each woman, and that the goddess originated from the coalescence of these into the single great figure. But the evidence for an individual iuno is late, not earlier than the time of Augustus; while examples of a divine name coupled with a possessive pronoun are fairly common. The locution means no more than, for example: "Such-and-such a divinity, whom I worship"; "this deity in his or her dealings with me." Juno was widely worshiped outside Rome, being sometimes the chief deity of a state, and as such on occasion having warlike functions. Thus at Lanuvium, Juno Sospita Mater Regina was represented clad in a goatskin and bearing a spear and shield.

But the most characteristic deities of this period were vague figures of limited and sharply defined functions. Like the greater gods, they were regarded as possessing superhuman power, known as *numen* from at least the 2nd century B.C. This they could be induced to employ for the benefit of their worshipers if rightly approached. Beyond this, Roman curiosity did not go; the gods have no myths, do not form married pairs (though a masculine and a feminine name are often conjoined) and have no offspring. To name them correctly and to worship them with the proper words and gestures were supremely important; hence there grew up in time elaborate lists of liturgical formulas, the indigitamenta (*indigitare* means to address a deity with the appropriate titles, etc.). These are complicated by the intrusion into surviving documents of a host of names of godlings presiding over the most minute details of human life and activity. Some of the names were apparently invented for special occasions, others are due to false etymologies. These numerous godlings appear to be the result of priestly elaboration at a comparatively late period; but it seems true that some such di *minuti* did exist. Thus Janus, who was on his way to develop into a god of beginnings (hence the

name, January, of the first month in the reformed calendar and the sacrifice to Janus on all kalends), is almost certain to have been nothing more originally than the personification of an *ianus* or gateway. to pass through which is an act often of magico-religious significance. Vesta the hearth-goddess is the sacred hearth itself, the recipient of some cult in every household. Terra or Tellus Mater, the earth-goddess, probably was the holder of that *numen* which was necessary to make the Roman territory productive; certainly she was not goddess of the whole earth. The name of Ceres, the corn-goddess, may have been an adjective, "productive," applied to Terra; she owes her whole personality to her early identification with Demeter. A curious deity is the Genius, a sort of divine double of a man. The name means "begetter." and the Genius was supposed to be pleased if the man was well fed, defrauded if he lived poorly. In classical times every man, bond or free, had a Genius, but it may be that he belonged originally to the head of the house only. Various of these deities form groups. Such are the Indigetes and the Novensides, whose functions remain uncertain; the Lares, originally little gods of the farmland and of the houses standing on it, though their office was enlarged later; and the Penates (singular *penas*), who have an adjectival name: "of the inner rooms," and who particularly looked after the storeroom.

The cults of these and numerous other divinities were regulated in historical times by an elaborate priesthood, which was doubtless much simpler in earlier days. At its head, and including its most important members, stood the college of pontiffs (*pontifices,* or bridgebuilders). There were originally three pontiffs proper; they were increased to 16 under Julius Caesar. The college included also the rex *sacrorum* or king of the sacred rites, originally the actual king, but under the republic an official appointed for life to perform the king's sacral duties. In addition there were 15 *flamines* or priests of individual gods, the 3 chief (maiores) being those of Jupiter. Mars and Quirinus (*flamines Dialis, Martialis, Quirinalis*). Lastly came the vestal virgins, who tended the Vesta *publica,* or state hearth, in the forum. There were normally six of these; they were girls of patrician families, successors of the king's daughters or their substitutes. and chosen in childhood to serve for 30 years (originally for five; *i.e.,* until puberty). 411 other priests were men, at first patricians—*i.e.*, full citizens. This requisite remained in force for a few posts even after the attainment of equal political rights by the plebeians. Hence Ceres. though a goddess, was served by a man (the *flamen Cerialis*), a thing abnormal to ancient ideas in general. There was no priestly caste like that of the Indian Brahmins. Most of the priesthoods could be held along with a secular magistracy, although the elaborate taboos which the *flamen Dialis* was obliged to observe made this almost impossible in his case, and the rex *sacrorum* was excluded from other posts. The head of the whole body was the chief pontiff (pontifex *maximus*), who exercised disciplinary functions and formally appointed each new vestal and *flamen Dialis.* Outside their purely sacral duties, the priesthood had advisory (not executive) powers.

Outside the college of pontiffs stood the augurs (augere, "to increase"). The derivation of their name implies that they had once been officiants in fertility rites; they were now specialists in divination, particularly from the behaviour of birds. They did not themselves conduct the auspicia or taking of omens to ascertain whether the gods favoured a proposed action. for that was the business of every magistrate and could be done even by private citizens on occasion; the augurs were there to advise and direct as needed. There were also several minor bodies. The *Salii* (dancers) performed ceremonial dances, in archaic mar equipment, in honour of Mars and Quirinus; the Luperci ran naked, save for a girdle of goatskin. around the boundary of the original Palatine settlement every year on Feb. 15 (the Lupercalia), striking everyone whom they met with thongs of goatskin. They were popularly known as he-goats (*creppi*). Yet other bodies included the Xrval Brothers (*Fratres* Aruales), who were concerned with agricultural ceremonial of a very archaic type.

It is clear that not all these rites were of the same date. For instance, very ancient custom decreed that the *flamen Dialis* might not touch iron, his hair and nails being cut with a bronze implement. There is evidence that the customs of the vestals were less ancient; their goddess had her seat in the forum, outside the oldest settlement, and they regularly used an iron tool in the preparation of the salt needed for their ritual. The antiquity of some of the rites is evidenced by their not being directed to any deity. The performance of the Luperci, in particular, seems to have been purely magical; they drew a kind of magic circle around the Palatine. to keep good influences in and bad ones out. The evidence for the connection of the Lupercalia with a god or goddess is of the feeblest, and is probably the result of ancient speculation. Another piece of magic was the annual ceremonial of the *Argei,* in which 27 puppets were thrown from the oldest bridge (Pons sublicius) into the Tiber. Here may be recognized a primitive function of the "bridgebuilders" (*pontifices*); the river-god, who may feel insulted at the building of a bridge over his stream, is soothed by a pretense that many persons fall from it and are drowned. The reason for the exact number 27 is unknown.

Italian and Etruscan.— The Etruscan dynasty of the Tarquins (latter half of the 6th century B C) brought innovations to Rome, although it does not appear that the spirit of the local religion was much influenced. Cult statues were introduced, the worship having previously been conducted without images. Temples of Etruscan type began to appear; at any rate one such temple. that on the Capitol, was planned and nearly completed toward the end of the dynasty. (In Latin the word *templum* does not mean a temple in the accepted modern sense. but a piece of ground set apart and consecrated. This might or might not contain a "holy house"—aedes sacra—for the god or his emblem to reside in.) Elaborate funeral rites, such as remained in use for prominent people in historical times, appear also to be Etruscan. The Etruscans made known to the Romans a complicated method of divination by taking omens from the entrails, especially the liver, of a sacrificial victim; the practitioners of this rite (*haruspices*) never became Roman priests, however. They remained foreign or foreign-trained experts, consulted on occasion. Etruscan also was a system of divination from lightning. and a reform of the calendar. The primitive Roman calendar had consisted of only ten lunar months, a gap intervening between December ("tenth month") and March. This calendar was now replaced by one of 12 months, obviously meant to begin with January, since that month is named from the festival of Janus occurring in it. presumably at first called Ianuar. The fall of the Tarquins seems to have prevented the full use of the reformed calendar, however, for the year continued to begin with March for several centuries. (Two month-names, *Iunius* and Aprilis, witness to the Etruscan influence behind the reform. Aprilis cannot be derived, as was anciently supposed by some, from *aperire,* so as to mean "month of opening," but comes from the name of the goddess Aphrodite, corrupted into some such form as Apru.) The 12 lunations of the new calendar were about 11½ days short of a solar year. An extra month, called Mercedonius or Intercalaris, was therefore inserted at intervals to make up the difference, but so clumsily that the calendar lost touch more and more with the seasons until Julius Caesar's reform.

During this period (*i.e.,* the end of the regal epoch and the earlier part of the republican), importations of deities from other than purely Etruscan sources took place. The Capitoline cult gave Jupiter as partners Juno and Minerva, the latter not originally a Roman goddess. The grouping is most readily explained by Greek influence coming through Etruria. for the two goddesses were early identified with Hera and Athena, respectively the wife and the daughter of Zeus. Venus, Fortuna and Diana came in during this period from native Italian sources. Very early in the republic, Castor and Pollux were given a temple in the forum, in consequence, according to tradition, of their aid to the Romans at the battle of Lake Regillus (499? B.C.) against the Latin league. (The form Pollux is the Latin corruption of the Greek Polydeuces.) Even among the earliest-known deities are some whose names yield no discoverable Latin etymology, and certain of them are probably Etruscan. Examples are Volcanus, god of destructive fire, at first volcanic fire; Saturnus or Saeturnus, a deity of very

uncertain original functions; and Volturnus, apparently a river-god. probably of the Tiber. Almost certainly a very old importation was Hercules. This form of his name is an Italian corruption of the Greek Herakles. His altar stood in the cattle market (Forum boarium) near the Palatine, whose traditional boundary swung out to enclose the market. A widely recognized deity, such as Hercules had become, was needed to keep the peace in a market where strangers were dealt with.

Greek (Greco-Roman).—As Rome expanded, its relations with the Greek communities of southern Italy and, later, with Greece itself and with the empires of Alexander's successors became more frequent. As a result, Greek cults made their appearance, being sometimes new importations, sometimes modifications of existing worships brought about by identification of Greek with Roman or other Italian deities A new importation was the cult of Apollo, which steadily grew in importance; he had no generally accepted Italian equivalent. The oracles of the Sibyl of Cumae, supposedly inspired by him, were acquired at an early date, according to tradition by the elder or the younger Tarquin. They were thereafter consulted on occasion by a new priestly college, the *duouiri* sacris *faciundis,* whose numbers were gradually increased from the original 2 to 1 j or even more. In the hands of these priests lay the general management of all worship conducted otherwise than in native fashion (*i.e.,* worship by the Graecus ritus), and their importance grew as more foreign cults made their way into the city. Such cults did not as a rule invade the inner circle of Roman worship, for this lay inside the sacral boundary (pomerium) of the city; but they often spread into the inhabited quarters, which rapidly grew beyond the traditional limits. Apollo himself. in his capacity as a divine physician, soon followed the oracles of his inspired prophetess His first Roman temple is said to have been vowed in 433 B.C. "for the public health," which presumably means on the occasion of a plague; he appears. however, to have had some sort of sacred place (*Apollinar*) earlier than this. Evidence of the latter species of cult is the temple (on the Aventine and thus outside the *pomerium*) of Ceres, Liber and Libera, a triad copied from the Eleusinian uorship of Demeter, Kore and Iacchus. Iacchus was commonly identified with Dionysus and hence with Liber, the Italian wine-god and associate of Jupiter. The Aventine temple became the central sanctuary of the Roman plebs. It was dated 493 B.C., having been vowed three years earlier; its style was Etruscan, but its decorations were Greek. With Greek cults came Greek art, at least in the form of statues of deities, and Greek mythology also. This the Romans accepted eagerly and apparently at a fairly early date — for. despite their intense national pride, they were reinarkably ready to learn from foreign sources anything that struck them as important.

The Romans also developed a Greek attitude toward their own early history. It was hardly respectable for any important place not to have a founder with high, preferably divine, connections, and for a barbarian city to be thought something better than barbarous it was well for it to produce some evidence of Greek or, failing that, Trojan origins. As a result of this tendency there grew up various highly artificial legends concerning the foundation of Rome, which finally took their most familiar shape in the tale of Romulus and Remus, sons of Mars and descendants of Aeneas of Troy. The sequel of this particular legend stated that Romulus was transformed into the god Quirinus, this despite the fact that native Roman feeling drew a very sharp line between men and gods. Roman cult had nothing corresponding to Greek hero worship. This embellishment, however, is not known to have been current before the age of Cicero. A landmark in the hellenization of Rome is the *lectisternium,* a sort of banquet at which the gods were guests, which was held in 217 B.C. Such a banquet in itself was nothing new. but the old manner was to have the gods invisibly present, their attendance at the couches (*puluinaria*) prepared for them being denoted merely by bunches of herbs known as "gods' heads" (capita *deorum*). On this occasion, however, moved by their ill success in the early battles against Hannibal, the Romans resorted to a number of measures intended to secure divine favour. At the *lectisternium* of 217 the gods were represented by their statues and paired in a manner wholly Greek — Jupiter with Juno, Neptunus the water-god with Minerva, Mars with Venus, Apollo with Diana, Volcanus with Vesta, Mercurius, the traders' god, with Ceres. These, in fact, were Zeus with his consort Hera; Poseidon with Athena (a union of the two most characteristic Athenian cults), Ares with his love Aphrodite; Apollo and his sister Artemis; the two powers of fire, Hephaestus and Hestia; and the two deities most concerned with trade. for grain was a very important article of commerce. Together, therefore, the figures at the *lectisternium* made up the typical and popular Greek group of the 12 gods.

Greek myths seem to have had a remarkable effect on a people formerly piously incurious about the gods' character and activities except insofar as these concerned their worshipers. This effect was felt at a time when serious belief in the gods was at least greatly weakened among the Greeks themselves, and when they had a tendency to explain the traditional tales away or to use them merely as literary ornaments with the divine characters strongly humanized. The Romans, however, do not seem to have been greatly scandalized either by such plays as Plautus' *Amphitruo,* in which Jupiter and Mercurius appear as comic figures, or by Ennius' introduction of Euhemerus (*q.v.*), according to whom the gods were not gods at all, but deified kings and other notabilities. Such manifestations marked a stage toward the weakening of the traditional reverent attitude, and this by the last century of the republic had led to widespread indifference or skepticism. Yet, through their native conservatism, the Romans kept up all or most of the traditional observances, even when they had ceased to have any meaning or were at best a subject for learned speculation.

The age of Augustus saw a revival of the old cults, fostered and sponsored by his government and reinforced by new splendour of temples. An addition was the development of the worship of the emperor's patron, Apollo. His great temple on the Palatine became the centre of what might not unjustly be called a rival system to that headed by the Capitolian triad. Whatever Augustus' own beliefs may have been, and however much he may have regarded his religious revival as a useful political instrument, it was the beginning of something resembling an age of faith.

Oriental. — Although the Roman and the Greco-Roman modes of worship were as a rule decent and originally expressed genuine religious feeling, neither was exciting. Moreover, they were state or family cults concerned with this world, little attention being paid to aspirations for a future life. A dead Roman was thought to join the company of the Good People (*Manes,* a word that has no singular). As a member of a family or of a clan he would be one of the di *parentes*—again, no singular form of this description is known until at earliest the latter part of the 2nd century B.C.—and as such he would share in the respectful attentions of the surviving kin. But little hope was entertained of any effective survival for him, though it was trusted that the memory of a distinguished person would be long kept alive.

During the later years of the republic. however, and still more under the empire, a strong but mostly inarticulate demand for some kind of personal religion was growing. There grew up, chiefly in the east, sundry cults that promised their votaries the personal favour of deities, or even divine rank, if certain conditions were fulfilled. These usually included some form of initiation. The orient first obtained a foothold in Rome in 204 B.C., when by advice of the Sibylline oracles the Great Mother of the Gods (*q.v.; Mater* deum magna Idaea) was imported from Pessinus in Asia Minor and in 191 B.C. given a temple on the Palatine, in the heart of Rome itself Her rites, carried out by eunuch-priests, shocked Roman sentiment, and citizens were long forbidden to take part in them; but the goddess was treated uith respect, especially as she was associated with Troy and mith the legendary ancestry of the Roman people. In 186 B.C. came the affair of the Bacchanalia (*q.v.*). A cult of Dionysus was introduced into Italy, comprising rites of initiation and nightly ceremonies that had something of the wildness of the god's original Thracian or Thraco-Phrygian worship. They were alleged to be attended by all manner of sexual and other crimes. Scenting a conspiracy against law and order, the senate took severe and effective measures to suppress the movement, but it was the precursor of numerous Diony-

siac mysteries, apparently harmless enough, and varying from serious religious associations to dining and drinking clubs nominally under the patronage of the god. These last characterized the early empire especially. The older mysteries, especially the Eleusinian, retained their prestige and drew many Roman initiates, who seem to have read into them whatever philosophical doctrines they found attractive; but the most marked tendencies of the age were definitely toward the east, to Asia or to Egypt.

Astrology gained ground rapidly from about the age of Augustus, and its rigid determinism dismayed many, who sought refuge in anything that would enlist the power of the gods in their favour. (The gods were supposed to live beyond the stars, and so to be free from their centripetal influence.) Some people used elaborate magical practices of a kind supposed to bring the practitioner into contact with deities, and particularly those of theurgy (*theourgia*), a term literally meaning "god-working." But the most characteristic feature of this age (the last century B.C. to the end of paganism) was the multiplying of mystery cults. These generally had for their central feature the adventures, often including death, of a god with whom the initiates were brought into contact, being even perhaps identified with him, so that they passed through some simulacrum of his sufferings and shared his triumph. There were three principal mysteries. First came those of Isis, which although ultimately of genuine Egyptian origin, had been considerably hellenized in passing to the west. Their language was Greek, and they contained several elements not really Egyptian. Then there were the mysteries of Attis, which were an offshoot of the cult of the Great Mother. Attis. the goddess' young favourite, who had died and been at least partly revived, was their central figure. Lastly came the mysteries of Mithra (*see* MITHRAISM). They were in some ways the most important of all, and were originally Persian. The worship was for men only, and was popular especially in the army. It centred on the mythical career of Mithra, was divided into grades vaguely reminiscent of those of freemasonry, and carried with it a high and stern morality. It was for a while a formidable rival to Christianity.

Solar worship was very characteristic of the later imperial epoch. Certain Syrian cults, either originally solar or later held to be so, were partly responsible for this. Perhaps more important, however, was the conception that to the emperor corresponded the greatest of the visible heavenly bodies. The emperor was lord on earth, with power now grown absolute and having many features of that of an oriental despot, while the sun was lord in the sky. There was even a kind of solar monotheism, for a strong tendency existed to explain all other gods as equivalent to the sun. On occasion, the sun cult provided a sort of bridge to or compromise with Christianity, through the identification of the sun-god with the Sun of Righteousness (Mal. iv, 2).

Such was the religious world within which Christianity grew up, and over which it finally triumphed. Constantine the Great recognized Christianity (313) and Theodosius I in 391 and 393 forbade all pagan cult. public or private.

ROMANS, EPISTLE TO THE. The occasion of this New Testament epistle is revealed in i.8f, xv 14f. St. Paul had finished his mission in Greece and was on his way to Jerusalem with the proceeds of the collection made by his churches for the poor Christians in Judaea. Casting about for a new sphere, he turns to the extreme West of the Mediterranean, to Spain, where evidently no one had preached the gospel. On his way to Spain, after settling the business at Jerusalem, he proposes to visit the Christians at Rome. This corresponds to the situation outlined in Acts xx. 2f; it is probable, though not certain, that the apostle wrote the epistle from Corinth or on his way from Corinth eastward, i e, after the Corinthian epistles. What is certain is that he takes this opportunity of stating his gospel in its width and range of appeal In the light of his experience and in view of the fresh propaganda which he contemplated in the Western Empire, his aim is to reiterate the principles of the Christian religion as he preached it. There was an appropriate note in such an epistle being sent to Christians at the capital of the Empire. Besides, the apostle was not confronted here as, *e.g.*, in Galatia, with any attacks upon himself by the Jewish Christian party in the Church Hence the breadth of view and the comparative absence of controversial references, He sets himself to put forward what he regards as vital Christianity rather than to counteract any policy of his opponents at Rome, and this vital Christianity is stated in its relations to the older Jewish religion, with the object of persuading the Roman Christians, most of whom seem to have been Gentile converts, that the hopes and promises of God as revealed in the Christian gospel rest upon His previous revelation to Israel, although they go far beyond that. The two main errors before his mind seem to have been a tendency to throw over the earlier revelation and a tendency on the part of Jews to depreciate Christianity as morally inferior to Judaism. The epistle therefore is more of a treatise than any other; it does not ignore the Roman Christians, but it is not written with them constantly in view, since their local situation offered no particular problems But, while it is a tract, it does not contain any compendium of Christianity; topics like the sacraments, eschatology, and the resurrection, for example, are not discussed as they are in the First Epistle to the Corinthians. The predominating motive of the epistle is the desire to propound the faith as a faith for all men, which has its roots in the earlier revelation of God to the Jews and yet goes far beyond that. He pours out his very soul in expounding the glory of the gospel as the final and all-embracing revelation of God for mankind; every now and then the argument glows with passion, and the exposition thrills with the writer's joy in expressing convictions which had become for him living powers and hopes.

The outline of the epistle is as follows. After apologizing for his inability to visit the Roman Christians before now, he promises to visit them, bringing "some spiritual gift" to this world-famous church of the capital. Meantime he explains the gospel of which he is so proud, endeavouring to stir up his readers to a sense of its wonder and strength. Such is the theme of the first five chapters, God's "righteousness" or salvation for faith offered in Jesus Christ to all men, apart from national restrictions. To be right with God, to enjoy His fellowship and favour, is a position which is His gift. Both pagans and Jews have hitherto missed it, but in Jesus Christ (iii. 21f) it is now brought within reach of all men, as' they believe. Not that faith and revelation had been absent from the earlier history of God's people; the apostle shows that this was implicit in the religious experience of Abraham (iv.). Only, it required the divine revelation in Christ to overcome the sin of man, which had weakened the race hitherto (v. 1f). From a philosophy of history he is now passing to the deeper experience of religion, and the magnificent sweep of the next passage (vi.–viii.) shows how this faith embodies the power of receiving and realising the gift of God, since it invests man with the divine Spirit, which is the sole guarantee of a sound life in the present and of a secure life in the future.

Reverting to history, he now (ix.–xi) faces the problem of the Jewish nation's antipathy to the gospel, seeking to reconcile this with the justice and promises of God in the Old Testament. God is not to blame for such unbelief, he argues. And, with patriotic pathos, he hopes it will not be final; the rejection of Christ by the Jews, he contends, is merely partial and temporary. But part of his interest is to prevent Gentile Christians from depreciating their relation to God's earlier revelation in Israel

and from disparaging the historical link between themselves and the saving purpose of God in the world. All men are equally under the sweep of God's marvellous mercy, he concludes, in an impassioned outburst (xi. 25–36).

Such an experience of the divine mercy brings obligations in its train, however, and these are now outlined (xii.–xiii.) as they bear upon the conduct of Christians as members of the Church, of society, and of the State; love is the supreme law, and as the Day of the Lord is near, there is no time for indulgence in vice. "It is high time to wake up." But, instead of dwelling on this motive, he proceeds to apply the law of Christian love to one special problem of contemporary ethic, viz., the strain set up between the narrower and the more liberal parties over total abstinence and vegetarianism (xiv.–xv. 13), pleading for consideration on the part of the liberal majority, and finally calling on all alike to glorify God for His mercy to them in Jesus Christ.

Such is the outline of the epistle as a whole. It is not unfair to suggest that faith dominates the first part (i.–v.), hope the second (vi.–viii., ix.–xi.), and love the third (xii –xv.), though none of the three is ever isolated entirely from the others The epilogue (xv. 14–33) reverts to the situation noted in the opening paragraph; the apostle tells them of his plans and asks for their prayers.

The sixteenth chapter seems to contain a note intended for a different audience. It is possible that the apostle may have known a number of Christians who had found their way to Rome, but the probability is that the first part of this chapter (1–16, 1–20, or 1–23), represents a letter of commendation for Phoebe, addressed to the church at Ephesus The number of personal references and the unusual wealth of detail point to some community with which St. Paul was more familiar than he could be with the Roman church Ephesus answers this requirement better than almost any other sphere; besides, the sharp warning against errorists in verses 17–20 applies to Ephesus at this period (1 Cor, xvi. 8–9, Acts xx 29f) better than to what we know of the Roman church, for it is improbable that the apostle meant the words to be a vague warning against something that might happen in the future. For these reasons many editors and critics detach xvi. from the original Roman epistle.

The tone and style of xvi. 25–27 suggest also that it is an editorial addition, later than St. Paul. Indeed in some early copies of the epistle during the second century it is found after xiv. 23, perhaps in editions drawn up for reading in worship. This is merely one of a number of textual phenomena, which are discussed fully in Lake's *The Earlier Epistles of St. Paul* (pp. 335f), in Lightfoot's *Biblical Essays,* in Zahn's *Einleitung in das Neue Testament* (section 22), in Westcott and Hort's *Greek New Testament* (appendix), and in the present writer's *Introduction to the Literature of the New Testament* (pp. 134f), as well as by the critical editors. Some early editions of Romans seem to have omitted the words "in Rome" at i. 7 and 15. Unless this was due to a desire to make the epistle a catholic document, or to Marcion's revision, it may point to the fact that there were more than one edition of the epistle. Lake, for example, argues on textual grounds that Paul himself wrote an edition, without "in Rome," consisting of i. i.–xiv. 23, xvi. 25–27, as a companion letter to Galatians, and that later he edited the epistle as we have it for the special purpose of instructing the Roman church. Others, like Renan *(St. Paul,* pp. 461f), think of two editions, the first (i.–xiv., xvi. 1–20) intended for Asia or Ephesus, the second for Rome — a hypothesis which assumes a variety of forms. But it is not easy to suppose that the apostle ever left xiv. 23 with xvi. 25–27 as a self-contained letter, even if the doxology be accepted as Pauline. It is fairly clear that the canonical epistle represents an edited form of the original, and one natural hypothesis is that the original ended with xv., whilst xvi. 1f contains an addition. As Deissmann points out, the papyri supply numerous analogies for a "letter of commendation plunging at once *in medias res* and beginning with 'I commend' " *(Light from the Ancient East,* p. 235); and if Tertius wrote both, the smaller letter might be put in the wake of the larger, as the canonical editors drew upon the copybook in which both were preserved. The mechanical conditions for such a practice are discussed in Gregory's *Canon and Text of the New Testament* (pp. 319f).

It is no longer necessary to discuss theories that the whole epistle is a later forgery: Schmiedel's examination of this aberration (in *Hibbert Journal* i. 532f) sufficiently indicates the impossibility of taking such views seriously. Nor is it needful to criticize the theories which attribute xv.–xvi. in whole or part to some later hand, much less the idea, voiced recently by H. Delafosse (*L'epître aux Romains, traduction nouvelle, avec introduction, notes et commentaire,* Paris, 1926), that the canonical Romans represents an originally Pauline letter which was first edited by Marcion and then catholicized. The epistle as it stands was known early to writers of the second century like Justin and Polycarp, possibly even to Ignatius; indeed traces of it are to be found in the epistle of Clemens Romanus, which lies within the last decade of the first century, at the very latest *(see* for an even earlier date, G. Edmundson's *The Church* of *Rome in the first Century,* 1913, pp. 14f, etc).

ROMANUS (d. 897), pope, succeeded Stephen VI (VII) about Aug. 897 and died a few months later, perhaps in November. Very little is known about his life or his brief pontificate. He was born at Gallese, near Cività Castellana and was cardinal-priest of S. Pietro in Vincoli when he became pope. He seems to have been a virtuous man in an era of ecclesiastical degeneracy at Rome. He may have been deposed by one of the quarreling factions in the city. (D. AR.)

ROMANUS, the name of four East Roman emperors.

ROMANUS I (Lecapenus), who shared the imperial throne with Constantine VII (*q.v.*) and exercised all the real power from 919 to 944. was admiral of the Byzantine fleet on the Danube when, hearing of the defeat of the army at Achelous (917), he resolved to sail for Constantinople. Soon after the marriage of his daughter Helena to Constantine he was crowned colleague of his son-in-law. In 944 his own sons, Stephen and Constantine, compelled him to become a monk. He died in 948.

ROMANUS II succeeded his father Constantine VII in 959 at the age of 21, and died — poisoned, it was believed, by his wife, Theophano — in 963. The great event of his reign was the conquest of Crete by Nicephorus Phocas.

ROMANUS III (Argyrus), emperor 1028–1034, was an undistinguished Byzantine patrician, who was compelled by the dying emperor. Constantine VIII, to marry his daughter Zoe and to become his successor. He was mostly unfortunate in his enterprises, and in his endeavour to relieve the pressure of taxation disorganized the finances of the state. In 1030 he resolved to retaliate upon the incursions of the Moslems on the eastern frontier, but was defeated at Azaz near Antioch. His early death was supposedly due to poison administered by his wife.

ROMANUS IV (Diogenes), emperor 1068–1071, had risen to distinction in the army, when he was convicted of treason against the sons of Constantine X. He was pardoned, however, by the empress Eudocia, whom he subsequently married. After his coronation he carried on three successful campaigns against the Saracens and Seljuk Turks; in a fourth he was defeated by Alp Arslan on the banks of the Araxes and taken prisoner. After releasing himself by the promise of a large ransom and the conclusion of a peace, he turned his arms against the pretender Michael VII, but was compelled after a defeat to resign the empire and retire to the island of Prote, where he soon died in great misery. During this reign the Byzantine empire lost its last hold upon Italy.

ROMANY LANGUAGE, the language of the gypsies, is one of the Indo-Aryan languages (*q.v.*), a fact which constitutes the strongest proof that the gypsies originally came from India. Romany is not only derived from the same original source as the other Aryan languages of India, but must for many centuries after the Vedic age have shared their development nithin or near the borders of India, for in general it shows the phonetic and grammatical changes which the Indian languages as a whole reached not long before the beginning of the Christian era.

Dialectal Position. — The dialect group in which Romany had its origin is a question that has been widely discussed. One school holds that it belongs to the northwestern and especially to the Dardic, which comprises certain dialects of the Hindu Kush and also includes the more important Kashmiri. These languages, in some respects more conservative than those of areas farther in India, have kept certain features of the old Sanskrit sound system unchanged; *e.g.,* the preservation of two or more sibilants (S, *ṣ*, s) or of an r preceded by a consonant. The Romany dialects also show some of these peculiarities, but the preservation by descendants of characteristics that existed in the parent language is not proof that they have any specially close relationship other than common origin. The existence of the same early innovations in both is proffered by those who hold that Romany originally belonged to a more central group of dialects of which a typical modern representative in India is Hindi. It is with these that it shares its earliest sound changes. Romany does not however share other later innovations of the central group which had set in or were setting in at the time of Aśoka (c. 250 B.C.). They must, therefore, have severed their relations with this group before that date. The word rom, "gypsy man," southeast European rom, Armenian Ry. *lom,* Palestinian Ry. *dōm,* is the same word as the Skt. *ḍomba,* "a low caste of dancers and singers," from whom the *Ḍōms* of India derive their name. It is probable that wandering tribes, perhaps of the same character as some criminal tribes of modern India and speaking a central dialect, made their way to the northwest (probably western Panjab or Peshawar district) before the middle of the 3rd century B.C. There, among speakers of the northwestern dialect group, they stayed until some time before the 9th century A.D. they left India in a migration which spread them all over western Asia, Europe and even America.

Dialects. — It is not known whether the gypsies left India in one or several separate migrations or whether there were even marked dialectal variations in the language they spoke. But presently there are at least three distinct groups of dialects, Asiatic, Armenian and European. One of the most noticeable differences lies in the treatment of the original voiced aspirates of Sanskrit. The Asiatic dialects have either preserved these or, losing the aspiration, have reduced them to simple voiced sounds; the European and Armenian dialects on the other hand have changed them to surd aspirates: Skt. bh, dh, gh became Asiatic *b,d,g,* but Armenian and European *ph,th,kh* (*p',t',k'*). Thus Skt. *bhrâtā* "brother," *dhūmáḥ* "smoke," *ghṛtám* "melted butter" are in Eur. Ry. *p'ral,-t'uv,k'il* and in Pal. Ry. bar, dif, gir.

There is considerable dialectal variation even within a single group such as the European Romany group, dating probably from the time of separation within Europe itself. These dialects differ according to locality and the degree to which they have been influenced by surrounding languages. In this respect they may vary from the comparatively pure Indian idiom of, for example, some of the Balkan gypsies or even the gypsies of Wales, to mere jargons consisting of a framework of the local language; *e.g.,* English, in which a certain portion of the vocabulary is replaced by Romany words.

Phonology. — The vowel system rests on Sanskrit. As in all Middle Indian dialects, Skt. *ai* and au have become *ē* and *ō; e.g.,* Arm. Ry. tel "oil" from *tailám;* mol "price" from *maulyam.* In the European dialect, Skt. a in an open syllable appears as e but in an originally closed syllable as a, which is also the representative of Skt. *ā: merel* "dies," rak'el "keeps," *manuš* "man." from mdrate, *rákṣati, mānuṣáḥ.*

In the consonant system, the chief innovation is the change of the voiced aspirates already mentioned. Of the surd aspirates, *ph* appears to remain (*p'al* "board" from Skt. *phálaḥ*); ch loses its aspiration in west European Romany (W. Eur. *čin-* "to cut," S.E. Eur. *č'in-* from Skt. *chinná-*); kh perhaps becomes a spirant *χ* (*χanro* "sword" from Skt. khandakah). Intervocalic consonants, as in all other descendants of Sanskrit, are weakened. The gutturals and palatals disappear altogether; the cerebrals remain as r (S.E. Eur. *r̥*), the labials partly as v, the dentals as *l* in the European and Armenian dialects and as r in the Asiatic.

Sanskrit	*Romany*	*Sanskrit*	*Romany*
yūkā "louse"	*ǰuv* id.	*ā̆gataḥ* "came"	*alo* id.
sūcī "needle"	*suv* id.	*vijānāti* "bears young"	*benel* id.
kīṭáḥ "insect"	*kiri* "ant"	*bidālaḥ* "cat"	*blári (Syr.)* id.
sthāpáyati "places"	*t'ovel* id.	*píbati* "drinks"	*piel* id.
yuvatíḥ "young woman"	*ǰuvel* id.	*hṛdayam* "heart"	*yilo* id.
	ǰŭăr (Syr.)		*ẖri (Syr.)*

Assimilation of consonant groups has occurred generally, with the exception of r preceded by a stop and of sibilants followed by dental or cerebral stops, except in the Armenian dialect.

Sanskrit	*Romany*
dugdhám "milk"	*t'ud (from duddham), Arm.* ***lut'***
bhrâtā "brother"	*p'ral* id., *Arm. p'al, Syr. bar.*
hdstah "hand"	*vast, Syr. ẖăst, Arm. at'.*

Grammar. — In grammar too the main structure of the better preserved dialects rests upon its Sanskrit original. The declension of the noun is based on two cases, a direct (descended from the Sanskrit nominative and accusative) and an oblique (descended from the Sanskrit genitive) to which various postpositions can be added.

	Sanskrit	*Prakrit*	Romany
Sing. nom.	*cōráḥ (-ó)*	*cōrō*	} *čor*
	cōrám	*cōraṁ*	
gen.	*cōrásya*	*cōrassa (-asa)*	*čores*
Pl. nom.	*cōrā́ḥ*	*cōrā*	*čoy*
gen.	*cōrā́ṇām*	*cōrāṇaṁ*	*čoren*

The verb is built up of the old present stem, of which the indicative, the imperative and the participle still survive, and of the past participle, which alone or combined with auxiliaries forms past tenses.

		Sanskrit	*Romany*
Present indicative:	*Sing.*	*ráksāmi*	*rak'av*
		ráksasi	*rak'es*
		ráksati	*rak'el*
	Pl.	*ráksāmas*	*rak'as*
		ráksatha	*rak'en*
		ráksanti	*rak'en*

The opposition between present stem and past participle, though in most cases the latter has been remodeled on the former, still survives in a few verbs:

Skt. márate "dies"	:	*mṛtáḥ* "dead" =	*Ry. merel*	: *mulo.*
" *yâti* "goes"	:	*gatáḥ* "gone" =	" *ǰal*	: *gelo.*

Romany has preserved the Sanskrit numerals 1 to 6, 10, 20 and 100 but 7, 8, 9 and higher numbers are borrowed — by Asiatic generally from Persian, by European from Greek — or are formed by various methods of addition or multiplication from existing numerals.

Vocabulary. — The borrowing of vocabulary has been extensive. The first examples can be dated back to the time when, leaving the central group of dialects in India, the gypsies sojourned among the speakers of the northwestern group. Indeed, the borrowed words of a Romany dialect disclose the itinerary of its migrations. When in the dialect of the gypsies of Wales there are borrowed words from Persian. Armenian, Greek, Rumanian, Bulgarian, Serbian, Czech, German, French and English, it may be assumed that at some time or other the ancestors of this particular group passed through the countries where these languages were spoken. The form in which the words appear may give some clue as to the date when they mere borrowed. The most numerous source for the European dialects is Greek, a fact which accords with the long stay the gypsies appear to have made in the Eastern empire.

ROMBLON, the name of a province, the provincial capital and an island in the Republic of the Philippines. The province, located in the Sibuyan sea south of Luzon, north of Panay and east of Mindoro is made up of three main islands, Tablas. Sibuyan and Romblon, in order of decreasing size, plus six small populated islands and dozens of islets and reefs. Area 512 sq.mi. Pop. (1959 est.) 133,310, an increase of 33,943 over 1939. The area was attacked by Moro pirates several times during the Spanish regime. The islands are hilly to mountainous with cultivatable land at a minimum. The highest point is Mt. Guitinguitin on Sibuyan Island which reaches a height of 6,752 ft. The most extensive level land is along the western and southern shores of Tablas and the richest soil, of volcanic and coraline origin, is found on Romblon. About 65% of the cultivated land produces coconuts and almost 30% is planted in rice; crops of cassava, sweet potatoes, bananas, corn and tobacco are small but widespread. Larger settlements on the main islands are connected by hard-surfaced roads. Large and small interisland vessels call at Romblon; all the inhabited islands have at least weekly service. The capital is Romblon, a municipality with 27 *barrios* (villages) in addition to the *poblacion* (administrative centre), which has a deep, well-sheltered port. Pop. (1958 est.) 15,778. The main trading and commercial centre of the province, it is a collecting, processing and shipping point for copra and a sales centre for the province's buri mats. a product of home industries. (R. E. HE.)

ROME, a province of modern Italy, forming a part of the district of Latium (Lazio) (*q.v.*).

ROME, the capital of the Republic of Italy, lies on the Tiber river, 17 mi. northeast from its mouth on the Mediterranean. It was the capital of the ancient Roman republic and of the Roman empire and became very early the headquarters of the Christian Church. With a longer record of continuous political and religious importance than any other city it is unique for its antiquarian interest. In the following account the general subject of Rome is treated broadly under two aspects, themselves subdivided. These are: (1) the topography and growth of the city of Rome, the evolution of which is traced from the earliest times to the present, and (2) Roman history, *i.e.,* the political and social history of the Roman republic, empire, the mediaeval commune, and briefly the modern Rome.

THE ANCIENT CITY

The primitive city of Rome stood not in the Tiber valley, but on the ridges—so-called hills—of the Latin plain that jut unevenly into the valley. During the empire the city encroached more and more on the lower level till it covered the whole of the Campus Martius that lay in the wide bend of the river opposite the Vatican hill. These ridges, like the whole Latin plain, consisted of volcanic ash, partly cemented into hard tuff, which had, during a long series of eruptions in the Alban hills, filled an inland lake and built up an uneven plateau. In drilling wells outside of Rome's gates the following strata, enumerated from top to bottom, are usually pierced: several layers of brownish ash or tuff, a stratum of cappellaccio or friable grey tufa mixed with alluvial sediment, sand and gravel of the former lake bottom, and finally pliocene clay. Where erosion has not been very active the volcanic deposit near Rome rises to about 100 feet. Nearer the Alban hills it is far deeper.

The First Settlements.—On the part of Latium covered by the ash deposits we have as yet no convincing proofs of human settlements prior to the early iron age (about 1000 B.C.), whereas on the calcareous areas of Latium—on the Sabine and Volscian hills—which this ash did not reach, numerous remains even of Neolithic settlements have been found. It would seem that the site of Rome (and its neighbourhood on the south and east) was not an attractive place for settlement until about 1,000 years before our era, and the cause may well have been the activity of the Alban volcanoes. The first settlers coming from north of the Tiber seem to have taken possession first of the Alban hills and then of the Roman "hills." They were apparently shepherd and agricultural peoples of the "Italic" branch of the Indo-European race, related to the Villanovans (*q.v.*) who were settling in southern Etruria at the end of the second millennium B.C. The highest and safest points (the Palatine hill, probably the Capitoline and the outjutting spurs of the Esquiline) seem to have been chosen for the first communities. About the 8th century a related people came in from the older settlements of the Sabine hills and built their straw huts on the Esquiline and Quirinal ridges. In the 6th century Etruscan princes seem to have conquered the whole of Latium. They soon organized these communities into a city, and, bringing it into connection with the rapidly growing Etruscan cities north of the river. laid the foundations of a flourishing principality. Before they were driven out. about 500 B.C., a large temple had been built to Jupiter, Juno and Minerva on the Capitoline, a stone wall had been raised enclosing all the hill communities. and the forum valley had been drained.

In early Rome ordinary dwellings were straw huts or straw-thatched adobe huts, while temples and public buildings were erected in the Etruscan manner to suit the materials of the vicinity. The Capitoline temple, for instance, had walls of volcanic tuff well coated with stucco to hide the ugliness of the material. The ceiling beams which supported a tile roof were probably held up by a cantilever brace. The roof of the portico rested on four tuscan columns of wood or stuccoed tufa. The wooden architraves' were covered with figured terra-cotta slabs that provided some adornment and protection for the beams. The pediment figures were also of terra-cotta. Because of the absence of good building stone the Etruscans early developed for architectural adornment a dignified plastic art in terra-cotta. and its artistic qualities can now be appreciated in the splendid Apollo-figure recently discovered in Veii, a few miles north of Rome. This Etruscan method of building sufficed for the city till Greek artists were brought to Rome in the second century B.C. The building of stone bridges and aqueducts during the 2nd century popularized the use of the stone arch.

Materials.—Since public buildings were frequently rebuilt and enlarged it is difficult to assign the present remains to their proper epoch, and the accounts of early Roman architecture do not by any means agree as to dates. It is only by careful observation of the materials[1] used that we can assign the remains of the republican period to their approximate periods. Before the Gallic fire in 387 B.C. practically the only stone used was the soft grey volcanic tufa called cappellaccio. This is a very poor weathering stone so that it was regularly protected by a coat of stucco when used above ground. After the Gallic fire, the yellowish grey tufa of the Veientian quarries of Grotta Oscura came into popular use. This stone was as easily worked as the native one, and being more uniform in texture was cut into larger blocks of 2×2 feet. The massive fortification walls of Rome were largely rebuilt of this material during the 4th century, as were many of the public structures that had been destroyed by the Gauls. For rough work some very ugly volcanic stone, full of inclusions of black scoria, was also used for a while. This was also found in southern Etruria, and the blocks that mere used at Rome and Ostia may have come from the abandoned walls of Fidenae, north of Rome. The gray tufa of Grotta Oscura was the favourite building stone of the city for over 200 years, while the scoria-filled stone was soon abandoned.

These materials also weathered poorly and proved too weak for

[1]Middleton, *The Remains* of *Ancient Rome* (1892); Lanciani, *Ruins and Excavations* (1897); Delbriick, *Hellenistische Bauten (1907);* Van Deman, *The Date of Concrete Monuments (1912);* Frank, *Roman Buildings of the Republic (1924).*

heavy loads. Hence in the 3rd century architects went to the Alban hills for the stronger dark grey tufa (Lapis *Albanus, peperino*) when in search for architrave beams and heavy column drums. The Tullianum, Rome's first prison, which required a very hard stone, seems to be the first structure built of this material. It probably was constructed about 250 B.C., certainly not in the regal period as has been supposed. All the large temples built during the 2nd century B.C. used peperino for points of great stress and weight. At the Gabine lake, an old volcanic crater which was hearer Rome, a tufa somewhat rougher than peperino, but equally strong, was then brought into use. This Gabine stone (Lapis *Gabinus, sperone*) was freely employed in massive walls for a century or more, but its use was limited by the fact that it would not yield to ornamental cutting. Both of these stones were costly because of the heavy transportation charges. Hence during the 2nd century experiments were made with the brown tufas nearer Rome. As can still be seen, the hills of Rome had an abundant supply of this brown tufa lying above the cappellaccio, but these hills were now so well covered with buildings that quarrying inside the city was impracticable. South of the Jsniculum, on Mt. Verde, a quarry was opened and used for several buildings of the second century and of the early decades of the first. The Mt. Verde stone is hard, close-grained, but too brittle for heavy burdens, and was seldom used after Sulla's day. The brown tufa from the Anio river just above Rome proved to be very strong and uniform, in fact an excellent material except for its ugly appearance. After the fine arches of the Aqua Marcia were built of it in 144 B.C., it remained because of its durability and cheapness the favourite stone for ordinary ashlar masonry for two centuries. This Anio tufa is now to be found in the ruins of more than half of the buildings of the forum. During the 2nd century B.C. two very important discoveries of materials were made. The travertine deposits at Bagni on the road to Tivoli were found. This is a limestone of recent formation caused by the deposit of the carbonate of lime from the hot springs that arise at that point. Since the ground was level and covered with vegetation the splendid deposit had for centuries lain unobserved. The stone being rather soft when at first exposed is easily sawed and worked. It soon hardens under exposure. The Romans used it at first with some hesitation, but by Caesar's day they had learned to appreciate its good qualities. During the early empire it was freely used, as may be seen in the massive walls of the Colosseum. Recently this stone has been exported in large quantities to America.

Unfortunately for the aesthetic qualities of Roman architecture the process of making a cheap and durable, though ugly, concrete was discovered at about the same time. Since good sand is difficult to find near Rome, volcanic ash (*pozzolana*), which lies in abundance everywhere in Latium, was substituted. This ash is of course a crushed dehydrated slag, and it was eventually found that if the ash was taken from deep pits where rain-water had not destroyed its qualities it would mix with lime into a very firm hydraulic cement. By adding a filler of tufa fragments a very cheap and durable concrete could thus be made. Concrete was first used freely in the foundations and podia of the temple of Concord in 120 B.C. and the temple of Castor in 117 B.C., but it is found even earlier in a part of the platform that was constructed in front of Castor several years before. This platform probably belongs to the Gracchan period. Concrete however came into free use in superstructures only in the age of Caesar, when marble was imported in such abundance that it could be used as a veneer for ugly concrete walls. The great importance of concrete for Roman architecture lay in the fact that during the empire, when Rome required very extensive structures, domes and vaults of immense span could be built of this material. During the empire most of the heavy walls were constructed of concrete because of its cheapness and durability. They were usually faced with brick or with marble slabs. The bricks when used were generally triangular with one angle stuck into the concrete; the marble slab veneering was usually held in place by iron clamps.

Though the art of making good terra-cotta ware was known in primitive Rome, and roof-tiles of terra-cotta of excellent quality had freely been used for six centuries before Augustus' day, bricks were not burned at Rome for use in wall-construction during the republic. Immense heaps of fragments of broken roof-tiles had however accumulated, and the Augustan architects began to use these fragments in facing concrete walls. When this supply gave out, triangular bricks were made for the same purpose—during the reign of Claudius—and when, after the great fire of Nero's day, a vast programme of rebuilding followed, brick yards turned out an immense quantity of material for the facing of concrete walls. This material continued to be used freely through imperial times.

Marble was very expensive and relatively few buildings were made of solid marble; but for veneering, for columns, entablatures and decorative members large quantities of marble were imported. A few wealthy nobles had imported marble columns for their porticoes before Caesar's day. While Caesar was governor of Cisalpine Gaul his architects and engineers began to import to Rome Carrara marble, found in that province. The architects of Augustus developed the Numidian quarries of Simitthu, which yielded a variety of yellow and cream coloured marbles of great beauty (giallo antico). The transpottation costs were very heavy since it had to be brought 100m. over land before it was loaded on ships. Its use was largely confined to decorative purposes. The pavonazzetto of Synnada, 200m. inland from Smyrna in Asia Minor, also came into use, as well as the greenish cipollino of Euboea, the marbles of Pentelicon, Hymettus and Paros, and the red granites of Aswan in Egypt. During the empire architects vied with each other in attaining new colour effects with contrasting veneers, and the Christian basilicas and churches of Rome which are decorated with the marbles stripped from Roman buildings are rich with stones that the emperors had imported from all parts of the world. Besides those mentioned we may name the products of quarries of Chios (called Africano), Thasos (porta santa), Laconia (rosso antico and nero antico), Thessaly (verde antico), and the alabasters and porphyries of Egypt.

Early Town Walls.—Tradition speaks of very early fortifications around the Palatine and Capitoline hills. These may have been earthen mounds bearing a fence of stakes. There is no doubt that a stone wall was constructed of cappellaccio blocks around the whole city at the time of the Etruscan kings. This wall was almost wholly rebuilt after the Gallic fire (387 B.C.) with the stronger Grotta Oscura stone, and later strengthened and improved from time to time with better materials. This so-called Servian wall (at first not including the Aventine) was nearly 6km. long. It began at the Tiber near the present Ponte Rotto, had two gates between the Tiber and the Capitoline hill, skirted the Capitoline on its west side (where a few blocks of the 4th-century wall are visible), then proceeded across the valley to the edge of the Quirinal hill. A small gate (perhaps an embrasure for artillery) is still visible inside the Palazzo Antonielli, but this consists of Anio tufa and must date from about the time of the first civil war. The fragment of wall seen in the via Nazionale just above is of Grotta Oscura stone belonging to the 4th century. From this point the wall followed the edge of the Quirinal hill north-eastwards for over a mile to the porta Collina. At the via Finanze may be seen a well preserved portion in cappellaccio. Because of the material this part has usually been assigned to the 6th century, but the fine workmanship and battering would rather indicate a 4th century reconstruction. From the Porta Collina the wall turned southwards across the level plateau to the porta Esquilina, a distance of about a mile. Here the city was especially exposed to attack and the wall was not only made with special care in the 4th century but was later frequently strengthened and repaired. In constructing this portion a moat 30ft. deep and 100ft. wide was dug and the earth of this excavation was used for an agger about 40ft. thick. The stone wall itself that stood behind the moat and supported the mound was about 10ft. thick and more than 30ft. high and was made of Grotta Oscura stone. The inner side of the agger was supported by a lower cappellaccio wall. The numerous quarry marks found in the section near the railway station are probably those of the Etruscan workmen of the 4th century, while those found at Piazza Fanti seem to belong to the repairs of the second Punic War. The Gabine and Monte Verde stones of the reconstructed

Viminal gate may belong to the time of the Social War, while the concrete work and Anio stone at Piazza Macao seem to be a part of the repairs made during the Catilinarian Rebellion or the civil war.

The original wall skirted the Palatine hill on the south side and ran directly to the river. Here several portions of the 4th-century wall, built in Grotta Oscura tufa and the scoriated Fidenae stone, have been found, but at the south-west corner of the hill a fragment of the original 6th-century wall in cappellaccio blocks may still be seen. During the 4th century the Aventine was also included in the fortifications. The large wall on the Via di porta S. Paulo, however, was repaired with Anio stone and a concrete backing during the Sullan period, and near the gateway arched openings for the placement of defensive artillery were neatly constructed.

Streets. — It is doubtful whether Rome had paved streets before the 2nd century B.C. The earliest pavement that has been found is that of the street which ascends the Capitoline hill from the forum. It was laid in 174 B.C. The few remains of it still visible at the side of the temple of Saturn are hard rough lava blocks full of leucitic crystals. This lava was brought from beyond Civita Castellana and was preferred to the native lava of the Appian Way because the crystals furnish a rough surface which is essential on a steep roadway. During the 1st century B.C. most of the streets were paved with large polygonal lava blocks neatly fitted and (at times) set in a concrete bedding and curbed with travertine. Outside of the city some of these pavements are still in use after 2,000 years of wear.

Bridges and Drains. — The first bridges of Rome were laid on wooden piles. In 179, stone piers were built for the Aemilian bridge (the ponte *rotto*). In the period between Gracchus and Sulla, architects had learned to make strong arches and then the Aemilian and the Mulvian bridges were constructed of splendid stone arches. The Fabrician bridge, contracted for apparently during Cicero's consulship, with two vast arches, is still in use. The first large sewer which drained the forum and cattle market seems to have been an open channel lined with cappellaccio masonry. It was covered over early in the republic. The magnificent Cloaca Maxima which opens out near the Palatine bridge and was in use until the beginning of the 20th century was, to judge from its free use of Gabine stone, not constructed till the latter part of the 2nd century B.C. During the empire the whole city was as thoroughly drained with well-built sewers as any modern city.

Aqueducts. — Before 312 B.C. the city depended upon wells and springs for its water supply. In that year Appius Claudius, the censor, constructed an underground aqueduct 7m. in length to supply water to the poor of the crowded sections of the city. Forty years later the Anio Vetus was added. In 144 the Aqua Marcia was laid bringing an abundant supply of excellent water from high in the Sabine hills 44m. away. Where it crossed the lower plain outside of Rome the conduit was raised on splendid arches so as to bring the water to the top of the Capitoline hill. Some of these arches are still standing near Porta Furba; and the city of Rome is still using the springs that supplied the Aqua Marcia. Augustus, Claudius and later emperors enlarged the water supply, laid an extensive system of leaden pipes in the streets and built numerous fountains, till in Trajan's day the city was generously supplied with pure water.

THE FORUM[1]

In the early days the valley between the Palatine hill and the Capitoline was marshy ground with an open pool, the Lacus Curtius, near the centre, another near the west end, the Lacus Servilius, which caught the spring waters of the Capitoline hill, and another, the Lacus Juturnae at the base of the Palatine. On the lower slope of the Capitoline hill, on a protruding ledge of rock, were altars to Saturn and to Vulcan, and between them a speaker's platform. On the corresponding lower slope of the Palatine was the shrine of Vesta with the house of the vestals near by and the office of the pontifex maximus. Below the Esquiline was an extensive burial ground. When the marsh was drained and the three springs walled in the central part became an open market place — forum — which was soon lined with two rows of shops (tabernae), while the north-west corner was laid off for open-air town-meetings (the comitium), and a speaker's platform was early constructed between the comitium and the forum. Without regard for chronology we shall briefly mention the more important buildings of the forum of which there are remains, beginning at the Tullianum on the north-west corner.

The *Tullianum*[2] ("Mamertine prison") took the place, as death-chamber, of the older quarry caverns that here ran deep into the Capitoline hill. It was apparently built in the 3rd century B.C. Alban stone — the hardest material available — was used. The chamber was a truncated cone, about 12ft. high. It originally had a ceiling of oak beams, and could be entered only from a trap-door above. In the 2nd century an arc of the circle was cut away to make room for the road in front, and a straight wall of Grotta Oscura stone was built in its place. About 100 B.C. an upper vaulted chamber of Mt. Verde and Anio stone was constructed above the Tullianum, and later the lower chamber was given a horizontal stone vault. Finally, in the reign of Tiberius, a massive façade of travertine was built on the forum front. This is the chamber where noted prisoners like Jugurtha, the Catilinarian conspirators and Vercingetorix were kept before execution. It could never have been a well-house, as has been supposed, since the floor is actually above the republican level of the comitium. The present floor is about 6ft. above the original, if Sallust's measure of its depth is correct.

On the south of the Tullianum are the remains of the Temple of *Concordia*.[3] The original temple was erected to the deified abstraction of Concord in 366 to mark the temporary peace in the class conflict between the patricians and plebeians. The temple was rebuilt, partly with the earlier materials, and enlarged by the aristocratic consul Opimius in 120 B.C., to mark the end of the Gracchan class contests. The rededication to Concord was however considered an insult by the defeated Gracchans. Here Cicero delivered two of his Catilinarian speeches, using the temple for his addresses not only because he wished to remind the people of his programme of concordia *ordinum* but also because of the suggestive proximity of the place to the death-chamber. Tiberius rebuilt the temple in marble to commemorate the Concord of the Augustan régime. This new temple had a large portico and entrance on the forum side and the concrete base of this comes forward nearly to the Vulcanal. Portions of the elaborately carved cornice and of some of the capitals and bases are still to be seen in the corridor of the Tabularium. The temple was one of the most richly decorated at Rome and became a veritable museum of precious works of art. The corner of the podium nearest the prison originally belonged to the senaculum — a gathering place of senators — but was incorporated in the enlarged portico of this later temple.

Below the steps of the temple of Concord may be seen the remains of a very old Altar of *Vulcan* cut in the native cappellaccio, and near by several cuttings in the rock which give evidence of an early cemetery here. Passing the Arch of *Septimius Severus*, a work of pleasing proportions though covered with confused reliefs of a decadent and boastful art, we reach the remains of the old Rostra, the scene of Rome's legislative struggles from the time of the Twelve Tables till Caesar. It is the birthplace of modern democracy. In the centre of the mass may be seen a few of the old steps that may belong to the platform of the decemviral times. The name rostra derived from the iron rams taken as trophies from the warships of Antium (338 B.C.) and fastened on the back of the platform (on the forum side). The outer steps of Mt. Verde stone on the side of the Comitium and the circular rear wall of concrete lined with reticulate blocks belong to a rebuilding of the Sullan period.

Between the rostra and the Arch lies a black stone pavement that marks a sacred area uncovered in the excavations of 1899.

[3] Rebert and Marceau, in Memoirs of *Amer.* Acad. in Rome, v. 53.

The layer of gravel which covered this area as well as the pre-Sullan rostra shows that the sacred area was abandoned and covered up when the Sullan rostra were built. The objects found beneath the black stone are a 6th-century inscription of very great importance, though so much damaged that no line is complete, a truncated cone which probably supported a statue, a double base which, according to Varro, supported two figures of lions, presumably such as Etruscans placed in front of important tombs, and a great many votive objects of different periods—now to be seen in the forum museum. Some of these objects were found in their original setting, others had been removed here and buried as being too sacred to destroy at the time when the rostra were rebuilt.

The inscription is cut on stone imported from Etruscan territory, and since the lettering is too archaic for the 4th century, when Rome captured the region from which it came, we must assume that it was brought here during the Etruscan period, *i.e.,* before 509 B.C. The "black stone" was supposed by the Romans to mark the tomb of Romulus, of Faustulus or of Hostilius. The riddle has not yet been solved.

The *Curia* or senate chamber, which stands in the comitium, is the. debased structure of Diocletian's day, much altered and converted into a church. The first senate house (attributed to the king Hostilius) stood farther back, leaving room for a large comitium between the Curia and the rostra. The original bronze doors of Diocletian's Curia may now be seen at the end of the nave of the Lateran basilica.

Crossing the narrow street, the *Argiletum,* which led into the Forum from the north, we come to the extensive remains of the *Basilica Aemilia.* This was a covered hall in which court could be held when the weather was too inclement for sessions in the open forum. When building it in 179 B.C. Aemilius Lepidus and Fulvius Nobilior also rebuilt the row of public shops (*tabernae novae)* and included these under the same roof with a covered arcade in front. There was a hasty reconstruction by Aemilius Lepidus in 79. About the year 54 when Caesar planned his basilica along the opposite side of the forum at a higher level he lent large sums to Aemilius Paullus to reconstruct the Aemilian basilica at a corresponding level and in an appropriate style. This rebuilding, frequently interrupted, was not completed for 20 years. The foundations now visible are chiefly of this period, though the shop walls reveal materials of all three periods. Augustus later provided money for lavish repairs and decorations after the structure had been damaged by fire. Most of the splendid marble decorations now to be seen date from the Augustan period, deriving partly from the Doric façade, partly from the interior porticoes decorated with Ionic and Corinthian columns.

East of this basilica stands the temple which Antoninus Pius built in honor of his deified wife *Faustina.* After the emperor's death his name was added to the inscription. The columns are of the expensive and garish Carystian stone *(cipollino)* from Euboea, the walls are of peperino, a good fire-proof material, and were of course faced with marble slabs. The frieze has a charming design of griffins grouped in pairs around a candelabrum.

In front of this temple are the remains of the *Regia,* one of the oldest buildings of Rome. It may have been the office of the early kings, and certainly was of the pontifex maximus throughout the republic. The cappellaccio podium of the main quadrangle may well date from the fifth century. Professor Huelsen, who excavated the site, has drawings of a decorated terracotta slab from its frieze which belonged to the 5th-century structure. The rear wall, however, contains materials of a reconstruction, probably made in 148 B.C., when the place was damaged by fire. In this building were kept the important pontifical records and lists of magistrates which provided the skeleton of facts that historians eventually used in writing the story of the early republic. And because of this historical association, Domitius Calvinus, when rebuilding the house in 36 B.C. in marble, had a complete list of magistrates and of triumphs inscribed on its walls. Some remains of these inscriptions, called Capitoline Fasti, are now preserved in the Capitoline museum. The few architectural remains that lie near by reveal the fact that even as late as 36 B.C. marble cutting was still very crude.[1] The pontifex himself had his home in the *domus publica,* the foundations of which, as it was when Caesar lived there, may still be seen a few yards to the south-east of the regia.

The extensive *House of the Vestals,*[2] as it appeared in the late empire, has many of its walls intact. They date from several rebuildings and additions made at various times during the empire. A few of the Vestal statues and honorary inscriptions remain, but not on their original locations, since all were found in a confused heap ready for the limekiln. Of the small republican structure there are few remains except the simple mosaic floor visible at a low level near the entrance. The foundation of the round shrine of Vesta is visible between this Atrium and the Regia, and near by are remains of the marble entablature cut in the decadent workmanship of Septimius' day.

Between the Regia and the open space of the forum stands the podium of the *Temple of Divus Iulius* which Augustus erected to the deified Caesar (dedicated 29 B.C.). This site was chosen because Caesar's body was burned upon a speaker's platform at this place (probably the *tribunal Aurelianum*). The spot had first been marked by an altar, the foundations of which may still be seen.

Augustus in building the temple respected the altar, indenting the portico so that the steps of the temple rose at the sides of the altar. Hence the strange ground-plan. This temple was the first striking proof at Rome of the acceptance of the theory of "Divine rights" of Rome's princes. Foundation walls of heavy masonry built outside of the concrete mass now visible supported the walls of the temple. The temple itself was an Ionic hexastyle building of marble, the columns being about ten and a half metres high. The interior was very richly decorated with imported works of art, but the architectural decoration of the entablature, fragments of which are still to be seen on the south side, was rather crude, as was all such work at Rome during the period. A few feet south of this temple there still exist the foundations of the *Arch of Augustus* erected only ten years later. Fragments of the marble decoration of this arch may be seen lying at the nearby corner of the Regia. Though somewhat too graceful and delicate for the purpose of a triumphal arch those carvings are done with a care which shows a remarkable advance in such work during the ten years after the construction of the temple of Divus Iulius.

The famous *temple of Castor and Pollux,*[3] which still has three Pentelic columns erect with a part of the entablature, is the most prominent ruin of the Forum. The first temple on the site was built in the Tuscan style early in the republic (484 B.C.) to the divinities of the Greek cavalry who aided the Romans at the battle of Lake Regillus. Since these gods were adopted as the patron-deities of the Roman knights, the temple became the official meeting place of the knights and wealthy business men of Rome, and these took some interest in maintaining it. They used its coffers for safety deposits, and its basement offices for the protection of standard weights and measures and for an assay-laboratory for the testing of coins and metals. It thus came to be Rome's "Bureau of Standards." The cappellaccio blocks which may be seen in the podium remain from the first structure, while those found in a small room under the front stairway belonged to an early speaker's platform not directly connected with the first temple. Much of the inner core of concrete belongs to a reconstruction made by Caecilius Metellus in 117 B.C., while the rest of the concrete, as well as the heavy masonry, are a part of the reccnstructed temple built by Tiberius in AD. 6. The splendid Pentelic columns seem, however, to belong to a reconstruction of Hadrian's day. though of this we are not yet certain. This last temple was Corinthian, octostyle and peripteral, with 11 columns on each side, the whole measuring about 30x50 metres. No temple at Rome reveals finer decorative workmanship.

Along the west side of this temple runs the vicus Tuscus which leads to a very large brick structure behind Castor. This has long been called the *temple of Augustus,* though the brick-work belongs chiefly to the Flavian period and no traces of an earlier temple

[3] *Memoirs Amer. Acad. in Rome,* v. **p.** *79.*

have been found. The suggestion has also been made that it was intended as an audience chamber by Domitian.[1] There are serious objections to both hypotheses. East of this massive structure one enters the remains of the mediaeval church, *S. Maria Antica,* directly from the area of the Lacus Iuturnae. It contains frescoes—interesting to students of early Christian art, from the 7th, 8th and 9th centuries.[2] What the building was before Christian times is still a matter of dispute: older authorities assumed that it was a library, though it has not the usual form of a Roman library. A more recent suggestion is that it was the *Atrium Minervae* where the records of honourable dismissal of legionaries were kept. The impluvium, part of which is visible, belonged to the palace which Caligula had built here as an extension of his Palatine residence.

West of the vicus Tuscus, in the forum, are the confused remains of the *Basilica Iulia.* Caesar first built this on the site of the small basilica Sempronia, dedicating it in 46 B.C. To gain the necessary space he removed the shops which lined the Via Sacra of the Forum, and built in their place a row of shops all along the rear colonnade of his basilica. The whole was a vast structure designed to serve as a set for the four lower civil courts as well as for a market place. After a fire Augustus rebuilt it with lavish adornments of Oriental marbles, but later rebuildings after fires in the 3rd and 4th centuries left little of these structures to be seen. The modern excavators attempted to outline the ground plan by erecting bases of brick and marble fragments, but succeeded only in confusing the evidence of the structure found. An accurate reconstruction is no longer possible. The old *praetor's tribunal,* which stood in the forum in front of the Basilica Iulia, has now quite disappeared, but the remains of an inscription in honour of Naevius Surdinus, praetor, cut into the pavement blocks of the forum reveals the location. It was merely a low platform large enough to seat judges and jury, and was unprotected except for a canopy over the praetor's seat. The place was seldom used after the larger basilicas were built to house the courts, but it was here that the principles of Roman law were first formulated.

West of the Basilica Iulia, beyond the narrow street that was called the *vicus Iugarius,* stands a large part of the old *temple of Saturn.* The ugly granite columns with a portion of the entablature belong in part to a hasty reconstruction of the 4th century A.D.[3] (a part of one column is even inverted). The inscription recording the final restoration avoids mention of the pagan god, and the building was then in secular use. Some fragments of the cornice are remains of the republican temple of 42 B.C.—from the period of crude stone-carving—while others are later work done on the same design On the interior facing of the frieze may be seen some good decorative slabs that were actually filched from Trajan's forum for this hasty patchwork. The podium has not a little of the splendid travertine masonry of Plancus' temple of 42 B.C. The only remains of the original temple of the early republic (497 B.C.) are the few cappellaccio blocks visible in the podium (at the very base of the east side), and in the crude wall in front of the temple—remains apparently of the original altar. The low drain-vault that appears near the latter—also early work—carries a shelf on which was found a shallow trough, apparently the runnel constructed to carry away the blood of the victims sacrificed on the altar. Saturn was an early agrarian divinity, but since his temple stood not far from the senate house, the senators—who knew that temples alone might escape looting in times of war—began to store State moneys in this temple. It thus became the official Aerarium or State treasury at Rome.

West of the temple of Saturn stands the colonnade of the *Dei Consentes,* the 12 chief gods whose images were represented at public festivals, according to an imported Greek rite. The older parts of the structure belong to the 3rd century B.C., when the rite was introduced at Rome. The cult never received much attention. Between this and the temple of Concord is seen the podium of the *Vespasian Temple,* on which three fine Corinthian columns still stand. Titus began to build this temple to his deified father and after his death it was completed by Domitian. The well carved frieze and cornice are good examples of Flavian workmanship.

Finally at the very head of the market place are the remains of the *Rostra* built by Caesar and Augustus. What we see is a semicircular approach in travertine steps from the area of Concord to the platform, and, on the forum side, the front foundation in tufa blocks (partly restored). The timber platform extending from the one to the other was at first supported by travertine posts standing upright, a few of which are still visible. When these proved too weak brick piers were added. The fragment of a fine wall of tile seen on the inside seems to be Augustan, and is one of the earliest instances of brick (broken-tile) masonry of Rome. It was removed in large part during the empire and the foundation which it lined was cut back into a semicircle to make room for a small chamber. The tufa wall on the forum side was originally faced with marble and to this wall were attached the beaks of ships (rostra) brought from the old platform of the comitium. The platform held numerous statues, and in the older concrete mass of Caesar's period we may discern separate concrete bases which probably supported such statues. The interesting marble balustrades that now stand near the centre of the forum, decorated with excellent representations of political and sacrificial scenes, were probably made for this platform in Trajan's day.

East of the forum along the *Via Sacra* in its course over the *Velia* the excavations have left many problems unsolved. Between the street and the Palatine there are remains of many residences of the republican period. The foundations of old shops along the street—it was the jeweller's street—are probably of the Gracchan era. After Nero's fire the emperor covered the whole area with one vast commercial hall with an imposing portico of travertine arches along the street.[4] Owing to faulty construction this building had to be strengthened later with brick-lined concrete piers which are now seen everywhere throughout the building. North of the Via Sacra, beyond Faustina's temple, stands the church of Cosmas and Damianus, which seems to have been the *temple of the Penates.*[5] In front of this, later used as entrance to it, is an ugly round temple not yet identified with certainty.

Beyond the narrow street is the massive *Basilica of Constantine* (almost completed by Maxentius) which Michelangelo and Bramante studied for their plans of Saint Peter's, and which has influenced the architects of more than one structure in England and America. This basilica first had its entrance at the east end with its apse at the west. Constantine's architect built a portico at the centre of the south wall on the street, and made a tribunal against the north wall opposite this new entrance. Of the immense marble monolith columns (brought from the sea of Marmora) one is still standing in the piazza in front of S. Maria Maggiore. The plan is that which had been developed for the central halls of Roman baths rather than for the earlier basilicas. The four enormous piers, for instance, bear the weight on the interior, whereas in the Basilica Iulia, which is only a third as large, 74 pillars are used. The material of this immense basilica was sumptuous to a degree, but the decorative carving reveals the tasteless exaggerations and lack of practised artistry of Constantine's day.

At the top of the Velia stands the tasteful *arch of Titus,* as restored by Valadier more than a century ago. It commemorates the capture of Jerusalem, A.D. 70, and is decorated with two of the best reliefs that Roman art produced; the triumphal quadriga with the Dea Roma entering the city, and the floats that bore the chief objects of booty.

PALATINE HILL

The Palatine hill,[6] according to tradition, was the site of the earliest settlement at Rome. Since the "hut of Romulus" stood

on the southern brow of the hill above the Scalae *Caci*, farthest removed from the forum, that side was presumably the aristocratic quarter in the early day. Fragments of good terra-cotta revetments of temples and palaces of the 5th and 6th centuries B.C. have been found in this area, two large cisterns of early workmanship, and cappellaccio blocks of an early town wall. After the second Punic War many of the nobles are incidentally mentioned as living on the Palatine, especially on the northern brow of the hill, which overlooks the forum. In Cicero's day the Clivus Victoriae, the street which ran near the crest of the hill above the house of the vestals, was lined with palaces of important men, *e.g.*, Cicero, Catullus, Crassus, Metellus Celer, Scaurus and several members of the Claudian family. During the empire a large part of the hill was gradually covered by the expanding imperial palace. Augustus' first palace arose south of the centre on property confiscated from republican nobles. The Claudian emperors, especially Tiberius and Caligula, built extensively on the old properties of the family at the north-west corner. Nero enlarged the Augustan palace, connecting it with the Tiberian structure. Vespasian abandoned the Palatine palace for more modest quarters, but Domitian moved into the Augustan structure, enlarging it with magnificent State apartments and public halls. Septimius Severus finally threw out on massive substructures a vast complex of wings toward the south-east corner of the bills with a lofty facade on the Appian Way. As early as Augustus' day the word *palatium* began to be used to designate the imperial palace.

We begin the topographical survey at the very south-west corner of the hill, where there may be seen a portion of the regal fortifications in grey tufa, as well as a large section of the 4th century town wall built in Grotta Oscura and Fidenae stone. Turning eastwards we pass apartments of the Antonine period, perhaps those of the imperial guard. Ascending the hill by the old Scalae Caci we reach the confusion of walls that mark one of Rome's most venerated sites. From the area of Cybele's temple a few steps, made of brown tufa (2nd century B.c.), lead down to the stone platform on which the rethatched hut of *Romulus* apparently stood in Cicero's day. The stone water-trough around the platform indicates that the building above was incapable of bearing its own water-gutter. South of this, and at a lower level, the native rock of the nill has borings that seem to mark the position of poles that supported an early straw hut. Then are found a few stones of the 4th-century fortification, and immediately beyond an early inhumation grave. This is probably a grave of the very early period, since its position proves that it was there before the wall was built. The 4th-century urn found in it may have been placed there for expiation when the grave was disturbed by the builders of the wall. Here then we have actual remnants of the primitive settlement though much confused by later builders. The two cisterns near by probably belong to the same community. The one near the house of Livia has an interesting corbelled vault.

The concrete foundation overgrown with ilexes near by is a part of the temple of Cybele or Magna *Mater*, first built soon after the second Punic War. Here the first oriental cult gained entrance to Rome, and the orgiastic rites practised here probably inspired Catullus' remarkable poem, the Attis. The concrete podium and the peperino fragments from its stuccoed entablature date from a rebuilding in 111 B.C. Augustus' architects who reconstructed it in A.D. 3 seem to have used much of the old material, which they restuccoed in a new design. This temple became very important in the empire, being considered the "mother church" of a widely extended cult.

East of this temple area is the house of Livia, the wife of Augustus. Its very low level is due to the desire of later emperors to preserve this house intact when the other palaces about it were being raised on lofty substructures. It was built about 50 B.C., and contains excellent wall paintings (now badly faded) which correspond to the "second style" of decoration at Pompeii. The house is the best preserved of Roman houses of its period. South of this house is a level platform laid over the ruins of republican houses not yet excavated. On this platform, according to a plausible conjecture,[1] may have stood Augustus' first palace. The house at any rate was connected with Livia's.

The temple foundation that projects into this platform at the southern corner has recently been identified with plausible arguments as that of the great temple of Apollo erected by Augustus in 28 B.C.[2] (*cf.* Horace Odes 1. 28 and Propertius' description in Bk. II. 31). The final proofs have not yet appeared. The temple, octostyle and peripteral, was of Luna marble, with Numidian columns. The acroterion represented the sun-god in his chariot, the pediment group Apollo with Artemis and Leto; the doors were covered with ivory reliefs of the defeat of the Gauls at Delphi and the death of the Niobids—two themes reminding of Apollo's power. This too became a museum of splendid works of art. Adjoining the temple area—in the space on the south-east of the temple, if the identification is correct, was the extensive portico of the Danaids into which Augustus built the first great public library of Rome.

The centre of the Palatine is occupied by the ruins of *Domitian's* palace (usually called the *domus* Augustiana) which faces northwards. At the front are the audience and public chambers: (1) a "basilica" with an apse in the rear for the emperor's tribunal, used when he acted as judge in political cases; (2) on the east of this room, the aula or large audience room where foreign legations were heard and meetings of the senate were held; (3) farther to the right a smaller room which is incorrectly called the lararium. The centre of the palace was occupied by an extensive peristyle containing a garden with an elaborate fountain. In the rear was the large dining room flanked on both sides with curious fountain-chambers. The emperor's table apparently stood on a dais at the end. All of these rooms were decorated with coloured marbles and floor mosaics, and the architectural carving reveals the exquisite designing of the Flavian architects. The large central audience chamber was roofed with concrete vaulting, the earliest example of such a vault employed on a large scale.

Under this vast palace there are buried many houses of earlier periods which have recently been excavated in part but not yet described.[3] Under the basilica one enters the segments of a large room that has not only wall paintings of the second style but also stuccoed reliefs of bold design. The masonry is not unlike that of the house of Livia. If this is not a part of Octavian's first palace it must have belonged to one of his powerful friends. The room was later abandoned for the construction of a large reservoir and finally cut through by a solid curved wall which must be a part of the foundations of Nero's palace. Deep under the lararium are five rooms of an even earlier period; the oldest frescoes and mosaics of this house point to a period of about 75 B.C. Some important family of Cicero's time lived here. Under the dining room there are remains of two previous periods of the palace, the lower rooms pertaining apparently to the reign of Claudius. The delicate decorations of a fountain-house and tbe very charming wall-decorations in coloured stucco plaques that resemble those of the "golden house" of Nero are as successful as anything in their kind at Rome.

Of the *Domus Tiberiana* which occupied a large part of the north-west corner of the Palatine and which is now covered with pleasing gardens very little remains but the substructures with their dark rooms. Many of these rooms have not even been excavated, and since they must have been used for servant quarters it is not likely that things of importance would be found here. Tiberius' palace did not extend to the Clivus Victoriae on the brow of the hill because this street still retained several of its republican mansions when the palace was built. Caligula seems to have connected this corner of the palace with a new wing on the forum level behind the temple of Castor. The magnificent ramp that zigzags down to the forum seems to belong to the Flavian period. The splendid arches thrown over the Clivus Victoriae to carry the palace grounds forward to the very edge of the hill above the forum are attributed to the architects of Trajan and Hadrian. These lend much to the picturesqueness of the Palatine as seen from the forum and to the long vistas over Rome when viewed

from the platform laid over these piers.

The north-east quarter of the Palatine is still occupied by S. Sebastian and S. Bonaventura. What buildings stood there in antiquity we do not know. The south-east quarter is occupied chiefly by the so-called "hippodrome" and the substructures of Septimius' additions to the palace. The "hippodrome" (the word was sometimes used for gardens of the long oval type) seems to have been a large garden which was surrounded by high retaining walls to keep the higher portions of ground from caving in. It certainly contained fountains, trees and walks, with a portico circling the whole within the wall. Perhaps the portico roof had hanging gardens. The masonry is of the Flavian period with additions and changes of a century later. The substructures of Septimius' palace spread in several directions. The central portion contained very luxurious baths. The lofty ruins that extend along the brow of the hill were apparently substructures that supported apartments from which the emperor could view the games of the circus below, while farther south-east stood the Septizonium with its lavishly decorated façade which was to remind the African friends of Septimius on approaching Rome that one of their countrymen occupied the imperial palace. A large part of the Septizonium stood till the 16th century, when it fell a prey to the greed of Sixtus V. (1588).

THE CAPITOLINE HILL

The Capitoline hill,[1] which in ancient times could be approached only from the forum, had in the regal period a fort (*arx*) on the northern height, an area sacred to Jupiter on the southern height and a wooded asylum on the depression that lay between these two. In the area sacred to Jupiter the last of the kings built a magnificent Etruscan temple with three cellas to the triad Jupiter, Juno and Minerva, and this, officially called the temple of Jupiter Optimus Maximus, was ready for dedication the first year of the republic, 509 B.C. The foundations of this temple have long been known, and when in 1919 the German embassy, which stood upon it, was torn down to make place for an enlargement of the Capitoline museum the old walls were excavated and measured. (*Notizie degli Scavi*, 1919.) These foundations, built of the native cappellaccio, are now visible at two corners, and prove that though masonry was still fairly crude in technique, the original temple was built on the magnificent scale that it had in imperial restorations, about 60x50 metres. Since it was the largest temple in existence in Italy in that day we may conclude that the tradition was not far from correct which held that Rome was a large and wealthy city under the Etruscan princes. The first temple was probably, like the foundations, built of native tufa and covered with a white stucco. The porch was probably supported in four wooden columns set wide apart, and the wooden architraves were in Tuscan fashion covered with painted terra-cotta slabs. A few fragments which may possibly belong to the early temple have been found and placed in the museum near by. On the roof was placed a quadriga of Jupiter in terra-cotta made by the artists of Veii, probably by the same school of artists which created the splendid Apollo now to be seen in the Villa Giulia museum. This old temple, with its decorations renewed from time to time, stood until it was burned in 83 B.C. After various rebuildings it was reconstructed in marble with Pentelic columns by Domitian, and the surviving marble fragments of the entablatures that are in the museum give some idea of the magnificence of this Flavian temple. This marble structure was hexastyle with three rows of columns across the front and a row on each side.

Of the Arx and the temple of Juno Moneta later built thereon all traces have been hidden by the church of Ara Coeli and the recent monument to Victor Emmanuel II. The *Tabularium*, the gaunt walls of which command the view of the forum, has so frequently been altered in rebuilding the rooms of the modern council chamber of Rome that little but the rear remains intact. It was erected after the Sullan fire, which destroyed the Capitoline temple, to serve as a fireproof hall of records for the State. Gabine stone was employed for the exterior walls because it was known not to suffer from fire. The ceilings of the rooms were domed with concrete and an arcade of round and flat arches was developed far beyond the usual architectural customs of the day to avoid the use of inflammable material. It is probably the first attempt at a hall of records that was to be absolutely impervious to the accidents of the elements, and the attempt was successful as the present condition of the store-chambers proves.

[1]Rodocanachi, Le *Capitole romain*, 1904; Platner, Ancient *Rome*, p. 291.

THE IMPERIAL FORA[a]

The **Julian** Forum.—Julius Caesar set aside a large part of the moneys which he derived from Gallic booty for the relief of the overcrowded forum. Thus he moved the comitium to the new *saepta* farther north, and built in the forum the large basilica mentioned above. His most extensive building, however, was a new forum enclosure with high walls and numerous shops lining the walls north of the old forum. In the via delle Marmorelle there are remains of the portico and walls ingeniously constructed of the three varieties of stone best adapted to the requirements. This wall was veneered with marble. Beneath, not now visible, are the remains of several of the shops built of tufa and vaulted with concrete. In the centre of the forum Caesar erected a marble temple to Venus Genetrix, the "ancestress" of the Gens Iulia. This temple he vowed at the battle of Pharsalus, doubtless intending that it should be a visible reminder of his own exalted claims. The forum itself was planned in 54 B.C. but not yet fully completed at Caesar's death in 44.

Forum Augusti.—Augustus completed the forum of his predecessor and built a larger one on adjacent ground chiefly for the purpose of enclosing a *temple to Mars Ultor* which he vowed at Philippi, 42 B.C. To protect the temple from fire he raised a massive wall of Gabine and Alban stone about the area. This wall, one of the most imposing now at Rome, rises 100ft. high. On the outside the great blocks were left rustic, while on the inside, where it was faced with marble, two rows of niches were cut to hold statues and honorary tablets to the noted heroes of Roman history. The statues have disappeared but many fragments of the tablets have been found. The area in front of the temple and on its north side was excavated in 1925–27 and revealed fragments enough of the entablature to ensure complete drawings of the whole structure. The marble decoration was of the best that the Augustan age could produce. The temple proves to be octostyle with a row of columns on each side while the rear of the cella stands solidly against the massive enclosure wall.

Forum Vespasiani.—The next imperial forum to be built was that of Vespasian, through the area of which the Via Cavour now runs. In its centre he constructed a magnificent temple to Peace, which is frequently mentioned for its library and its large collection of works of art—among them statues of Phidias and Lysippus. No part of this structure is now visible. Between the forum of Augustus and that of Vespasian lay the long and narrow area of the lower Argiletum about forty metres wide in which Domitian began to build a forum to contain a small *temple of Minerva*. Since Nerva completed and dedicated it, the structure bore his name, but the decorative work is all of the luxurious style of the Flarian period. Two of the columns of the handsome colonnade still remain with a part of the entablature. Its frieze is in bold relief representing the story of Arachne and other themes suitable for the adornment of a precinct sacred to the goddess of arts and crafts. No portion of the temple of Minerva is now visible but the whole area will probably soon be excavated.

Forum Traiani.—The *forum of Trajan*, north-west of the Augustan group, was a large complex of open areas and buildings, including the spacious forum proper enclosed with a portico, the basilica Ulpia, the two library buildings, the column of Trajan, and, an addition of Hadrian, the massive temple of Trajan. Since the valley was too narrow for all these structures the opposing slopes of the Capitoline and Quirinal hills were cut back, and when necessary heavy retaining walls of concrete and brick erected, a part of which still remain. The forum proper had its stately entrance in the form of a triumphal arch near the forum

[2]Platner, *Ancient* Rome, p. 274 (1911), with earlier bibliography.

of Augustus. Its area is rectangular, 116 metres wide and 95 metres long. The large hemicycle against the Quirinal which is now being excavated served as a retaining wall of the Forum. The corresponding one on the opposite side has disappeared The forum was of course open to the sky. but was surrounded by a very beautiful marble portico backed by a masonry wall. Many fragments of this portico may be seen lying about in the area. Next to the forum proper stood the basilica, which far surpassed the earlier ones in magnificence. A double row of 96 Corinthian columns supported the upper arcade that bore the roof. The nave was 25 metres wide; the apses at the end have been destroyed. North of this judgment hall were the two wings of the library, a rendezvous of literary men and students. In the area between these was built the column of Trajan[1] which is still standing. This column is 100ft. high and is covered with reliefs arranged in a spiral band representing the events of Trajan's two campaigns in Dacia. This is apparently the first column which was decorated in this manner, and the reliefs are made with such fidelity to fact as to be our best document for the history of the wars. Since the porticoes of the library rose on both sides, the reliefs could then be seen from near at hand. Nothing now remains of the great temple of Trajan which Hadrian erected north of the column.

FORUM BOARIUM AND CAMPUS MARTIUS

Between the Capitoline and the well known church of S. Maria in Cosmedin is an area which in early Rome was used as a cattle market, though during the empire it was as thickly populated as it is now. In this area, near the river, are found two republican temples for which the original names have not yet been discovered. The rectangular temple, usually called the *Temple of Fortuna,* was freed from mediaeval additions in 1923 and conservatively restored. It is exceedingly interesting as showing the type of building used at Rome in the late republic before Caesar and Augustus began to reconstruct Rome's tetnples in marble. It is an Ionic tetrastyle pseudo-peripteral temple of pleasing proportions, though small, measuring only 20x12 metres. The walls are of Anio tufa as are also the imbedded columns except those at the corners. These latter, as well as the free columns of the portico, all the capitals, the entablature of the porch and the facing of the podium are of travertine. The whole was covered with white stucco and the stucco of the frieze was neatly moulded into low reliefs of ox-skulls and garlands. The careful distribution of these materials points to the period of about 70–50 B.C. The round temple near by stands on a foundation of the 3rd or 4th century B.C., but the marble temple itself seems to belong to the Augustan period. It would be a graceful temple if the entablature and roof could be restored as well as several of the capitals which have apparently been replaced by alien material. It is of course not a temple of Vesta, but its true name is not known. Huelsen has suggested "Portunus."

The double-arched *Ianus quadrifrons* which stands over the Cloaca Maxima, is of late date and of ugly proportions. The extensive remains that are found in and under S. Maria in Cosmedin apparently belong to the public granary as it was in Cicero's day. Under the church of S. *Nicola in Carcere* near the Piazza Montanara are seen the foundations of three temples that stood beside the vegetable market outside the ancient Porta Carmentalis. These seem to be—from north to south—the temples of Janus, Juno Sospita, and Spes, originally built respectively in 260, 194 and 258 B.C. Most of the materials now visible belong to the rebuildings of *c.* 90 B.C. (Janus), 90 B C. (Juno Sospita) and 31 B.C. (Spes). For the architectural history of the republic they are very important. Farther north on the site of S. Maria in Campitelli stood the famous old *temple of Apollo* where the sibylline books were kept and near which, on the slope of the Capitoline, Rome's early plays were given at the games of Apollo. The temple was first built in the early republic (431 B.C) but the extensive remains now to be seen under the church seem to belong to the reconstruction of 179 B.C.[2] Because of the association of this district with early dramatic performances Augustus constructed a very large theatre near by (first used, when still incomplete, in 17 B.C.) which he named in honour of his nephew Marcellus. A large part of the semicircular façade is still standing and when it has been cleared of its ugly shops and superstructure --excavations are in progress—it will be one of the most imposing ruins of ancient Rome. The exterior consisted of three series of open arcades, the lower one being decorated with engaged columns of the Doric order, the middle with Ionic ones, the third with Corinthian pilasters. The theatre seated about 10,000 spectators and had a stage of the enormous proportion of 80x20 metres.

North of this theatre may be seen the portal of the extensive Porticus of Octavia (originally the Porticus of Metellus) which enclosed large temples of Juno and Jupiter. The whole was originally built in the and century B C., but all the remains now visible belong to the debased art of the Septimian period. Within may be seen, rising above shabby walls, a column and capital of one of the great temples. North-east of this lay the extensive *Circus Flaminius* built before the second Punic war as a place to hold the plebeian games. Fragments of the supporting walls may be seen in the basements of several houses on the Via d. Bottege Oscure, but these all belong to a rebuilding of about 50–30 B.C. A few hundred feet to the north-west of this circus, Pompey built his massive theatre in 55 B.C.. the first permanent theatre of Rome. This was about the same size as the Marcellus theatre and its stage was even longer. Considerable remains of it are to be found under the shops east of the Campo dei Fiori.

Farther north, in the old Campus Martius is the Pantheon,[3] a structure which Hadrian built to replace the earlier temple of Agrippa and Domitian. This round temple was one of the boldest of old Roman structures, having a brick and concrete dome with a diameter of 433 metres without support except on the walls of the temple. The dome itself was built of narro ing circles of brick on which were laid several layers of concrete which hardened into one firm mass so that there is no lateral thrust on the walls. The walls of the rotunda are also of brick-faced concrete with solid brick arches running through the mass to aid in carrying the weight over the niches while the mass was solidifying. The portico is a rectangular structure, most of whose columns belong to Hadrian's time. Some of the repairs of its entablature seem to be of a later period. The large inscription on its front generously credits the building to Agrippa while the smaller one mentions the repairs of Septimius. Nothing is said of the actual builder, but the brick stamps and the style of work prove that Hadrian should have the chief credit. The exterior was of course faced with marble slabs, and the sumptuous decoration of the interior—originally even more elaborate—will give some idea of how lavish the whole building must have been. The temple was dedicated by Agrippa to the divinities of the Julian house, and the name was intended to convey the idea of "all-holy." Of other notable buildings in this region we may mention the *temple of Hadrian,* the walls of which have been incorporated in the Borsa, or stock exchange; the *Mausoleum of Augustus* which has till recently served as a concert hall, called the Augusteo, and the *tomb of Hadrian,* on the right bank of the Tiber, rebuilt during the middle ages into a fort called the Castel Sant' Angelo.[4]

The *Colosseum,*[5] or more correctly, the *Amphitheatrum Flavium,* was begun by Vespasian on the low ground that Nero had used for a lake in the centre of his imperial villa. It was used for hunts, sham battles, gladiatorial shows and races, and the arena could be flooded for sham naval battles. The façade consists of three series of 80 arches decorated in the three orders as were the theatres of Pompey and Marcellus, and rises 48½ metres. Stone masonry in travertine lined with tufa supports the heavier outer portion, while the vaulting of the arcades and the inner bowl consist of concrete. The seats were of marble and could hold about 50,000 spectators. The building which is elliptical measures

[5] **Ashby, *The Architecture of Ancient Rome,* p. 93.**

620 ft. in length and 513 ft. in width, and the arena measures 287x180 ft. It was apparently the largest amphitheatre in the Roman world.

Near by stands the well proportioned *Arch* of *Constantine* which however is largely constructed of materials taken from previous arches. The only sculpture upon it that belongs to Constantine's day is the very narrow frieze rudely carved in a band about its centre. The other reliefs were taken from structures of the second century and in the use of these the imperial portraits were rechiselled to represent Constantine. North-east of the Colosseum one may enter several rooms of the *golden house* of Nero,[1] or rather the private apartments of that emperor. The rooms have been to some extent preserved because the walls were later used as substructions for a part of Trajan's baths built at a higher level. Many of the rooms of the palace have recently been excavated and reveal much damaged frescoes and stucco reliefs which represent the best work of its kind at Rome for the period of Nero. It was here, as graffiti on the walls indicate, that several of the Renaissance painters borrowed themes and designs for the arabesque and "grotesque" decoration so popular when the loggia of the Vatican was decorated.

Several of the massive *Thermae* (Baths) of ancient Rome are still among the most conspicuous ruins of the city. The first large structure of this type was the one built by Agrippa in 20 B C. south of the Pantheon. Little now remains of this. More may be seen of the ruins of those constructed by Titus and Trajan (on the grounds of Nero's *Domus Aurea),* by Caracalla on the edge of the Aventine and by Diocletian (part of which is now used for the national museum). Since these buildings contained, besides the baths, playgrounds, gymnasia, clubrooms and auditoria for immense crowds, the architects who constructed them had to employ all the arts and sciences at their disposal. The central building of Caracalla's baths covers an area of 270,000sq.ft.; and the central hall has a clear space of 183x79ft. It is roofed with a solid concrete intersecting barrel vault that rests chiefly on four massive piers and rises 108ft. from the pavement. It was while solving the problems of such construction that the Roman architects made those contributions to their art which have been most frequently studied by recent architects. The baths of Diocletian have suffered more from time, but the church of S. Maria degli Angeli has preserved two of its great halls. Here may be seen in their most advanced use at Rome good examples of flying and rectangular buttresses, a careful system of thrusts and counter thrusts and of ribbed quadripartite vaulting. A large number of the smaller rooms are used by the Museo delle Terme.

Finally the *Subterranean Basilica*[2] discovered near Porta Maggiore in 1917 has proved to be not only one of the best preserved of ancient buildings but one of the most important for the interpretation of Roman life. Though it seems to have been built before the middle of the 1st century A.D. it has the regular basilican form with nave, apse and two aisles. It was built wholly underground apparently for the purposes of a secret religious sect. The ceilings of the nave, the apse and the aisles are richly adorned with excellent stucco reliefs, the interpretation of which has proved as difficult as would be the explanation of the biblical illustrations of a mediaeval cathedral if we had no copies of the Bible. The most generally accepted view is the one proposed by Cumont. that this basilica was the temple of a Neo-Pythagorean congregation which practised mystic rites of initiation that were not approved of by the imperial authorities, and that the reliefs in question pertain to myths and rites which had been given a symbolic interpretation in the Neo-Pythagorean ritual. But quite apart from their meaning, they now give us the best conception possible of the beauty of Roman interior decoration for the 1st century of the empire. *(See* Rivoira, *Roman Architecture,* p. 204.)

(T. F.)

THE MODERN CITY

The city proper is composed of 22 districts and covers an area of 9.07 sq.mi. The commune of Rome extends over 58.2 sq.mi. Pop. of the city: (1871) 244,484; (1901) 462,783; (1931) 1,008,083; (1951) 1,555,773; (1958 est.) 1,935,041.

Rome lies on the undulating plain of the Tiber river, the Roman Campagna, which is bordered by hills. or rather small mountains: to the northwest rise the Sabatini hills; on the other side of the Tiber, to the east of Rome, are the Sabini and the Prenestini hills; in the southeast are the Alban (Colli Laziali) hills with Mt. Cavo (3,113 ft.). Rome itself is built on seven hills and it varies in height above sea level between 44 ft. at the Pantheon, and 462 ft. at Monte Mario. Situated in the central part of the Italian peninsula in the sheltered valley of the Tiber, 16 mi. from the Tyrrhenian sea, Rome has summers that are dry and hot (up to 77° F. in July) and winters that are wet and mild (about 44° F.). Rainfall is heaviest in the spring and autumn.

Rome is built on both sides of the Tiber, but developed mostly on the left bank in the valley and on the low hills to the east. On the right (or western) bank is the Vatican City state (*q.v.*). The river makes two distinct bends within the city; below the Cavour bridge it flows westward under the Umberto I and S. Angelo bridges, where it passes on the right bank the Castel S. Xngelo, originally built for Hadrian's mausoleum. From there the Via di Conciliazione leads westward away from the river to the Piazza S. Pietro and Vatican City. The Tiber then flows southeast and, making an easterly bend past the island of Tiberina, passes beneath the Capitoline hill on the left bank. Further inland on the same bank are the Roman Forum and the Colosseum and other ruins of ancient Roman buildings on the Palatine hill. The Tiber then turns back again to the southwest past the Aventine hill on which, according to legend. Remus is buried.

On the right bank between these two bends there are extensive parks around the hill of Gianicolo and there are gardens around the Vatican palace behind St. Peter's. On the left bank, in the north of the city. is the Villa Borghese or Villa Umberto I, one of 'the most beautifully laid out parks in Italy. Although much was contrived in the way of statuary and fountains the park has great natural beauty.

During the 20th century new roads were cut and many old ones widened. The principal but rather narrow street in Rome is the Via del Corso with its elegant shops. It is the central of the three roads radiating southward from the Piazza del Popolo, a beautiful and spacious square in the north of the city, situated between the river and the gardens of the Pincio hill. The Via del Corso runs almost due south to the Piazza di Venezia and thus traverses the central part of the city. From the northeast three wide straight thoroughfares, the Via Venti Settembre, the Via Nazionale and the Via Cavour approach the centre of the city near the Piazza di Venezia. Of these, the Via Nazionale falls gradually from the Piazza della Repubblica (formerly dell' Esedra), near the main railway station, down to the Piazza di Venezia, from there. as the Via del Plebiscito and the Corso Vittorio Emanuele, it runs through the heart of the old city northeastward to the Vittorio Emanuele bridge, which was opened in 1911.

The early settlements of Rome were on seven hills rising above the marshy lowlands of the Campagna. The seven hills (all on the left bank of the Tiber) are: the Quirinal. Viminal, Esquiline, Caelian and Aventine hills—these five form a sort of semicircle facing west—roughly in the centre is the Palatine hill, above the Colosseum and the Forum; and, to the northwest, the Capitoline hill.

Rome is unique in its possession of so many fine buildings spanning so many centuries. In addition to the ancient Roman remains, there are buildings of the early Christian period and a wealth of beautiful Renaissance architecture. Rome is a city of palaces and churches, of parks and squares and statuary and fountains.

Apart from the ancient Roman remains some of the earliest extant building dates from the 4th century, when, under Constantine I. the city entered upon a new life with the recognition of Christianity by the edict of Milan (A.D. 313). Whereas worship had taken place in private houses. churches were built. and an entirely new art form was introduced. The basilica of St. Peter's is one of the churches dating from this period. Among

others are: St. John Lateran (S. Giovanni in Laterano), the cathedral of Rome, said to have been given to Pope Silvester I by Constantine: S. Maria Maggiore in the piazza of the same name east of the Via Cavour; and S. Pudenziana, built on the site of a house where St. Peter was said to have been given hospitality. Near the beginning of the Appia Nuova is S. Croce in Gerusalemme, built by Constantine or his mother St. Helena, to house the relics of the True Cross; while south of the Colosseum is the 4th-century SS. Giovanni e Paolo. Across the Tiber, on the right bank. is S. Maria in Trastévere, which was the first church in Rome to be dedicated to the Virgin Mary.

Far from the centre of Rome, on the ancient consular roads, several other basilicas were built during the reign of Constantine: S Paolo fuori le Mura in the extreme south between the Via Ostiense and the river; S. Lorenzo fuori le Mura to the east in the Campo Verano, the Roman cemetery; S. Agnese fuori le Mura to the north of the Via Nomentana, the northeastward continuation of the Via Venti Settembre. Built in the 4th century this church was erected over the catacombs where St. Agnes uas laid. Adjoining it is the church of S. Costanza, the mausoleum of Constantina. the daughter of Constantine.

The invasions of the barbarians during the latter part of the 5th century wrought great damage to the city. The ancient aqueducts were destroyed, buildings were pillaged and the Romans were forced to abandon large residential areas and to withdraw to the banks of the Tiber. There were outbreaks of malaria, buildings were allowed to decay and earthquakes did further damage. Those buildings which lay in ruins were used as sources of stone for new building.

In the 6th century the papal power increased and from that century onward many hitherto secular buildings were used as churches. An example of this type of conversion is SS. Cosma e Damiano, adjoining the Roman Forum, which mas originally the Bibliotheca Pacis S. Maria in Cosmedin, a fine example of medieval Romanesque ecclesiastical architecture. was built from the remains of the Statio Annonae. In the midst of the piazza are two of the best-preserved temples in Rome. the so-called temples of Fortuna Yirilis and of Vesta, the latter possibly dating from the 1st century AD. The church of S. Adriano, also near the Forum, was converted in the 7th century from the Curia (senate house), built originally by Tullus Hostilius: the church of S. Teodoro was built in the Horrea Agrippiana; S. Maria Antiqua was transformed into a church possibly from the library of the temple of Augustus. Perhaps the most remarkable conversion of this period was the consecrating of the Pantheon, built by Agrippa in 27 B C., which in 609 became the church of S. Maria ad Martyres or S. Maria Rotunda.

Between the 8th and 9th centuries the Lateran palace, adjoining St. John Lateran. was enlarged and enriched by Popes Zacharias (741–752), Adrian I (772–795) and Leo III (795–816). It was the earliest papal residence and used as such until the exile of the popes to Avignon. Under Leo IV (847–855) walls were built around the Vatican after damage done by Saracen raids, and the fortified suburb on the right bank was known as the Leonine city. Later (1277) the Vatican was connected by a covered passageway, the Passetto Vaticano, with the Castel S. Angelo. At this period monasteries such as SS Quattro Coronati to the south of the Via di San Giovanni in Laterano assumed the aspect of small forts. Many churches were rebuilt, among them SS. Nèreo ed Achilleo, a church near the baths of Caracalla to the south of the city; S. Maria in Domnica was rebuilt by Paschal I in 817. S. Prassede, south of S. Maria Maggiore. the foundations of which date from the 5th century, was rebuilt in the 9th century; S. Maria in Trastévere was one of the most important churches to be rebuilt between the 9th and 12th centuries.

The beginning of Rome's feudal period as well as the rise of papal poner may be said to date from the 9th century; turreted fortresses superseded the ancient buildings which had outlived their usefulness. After 1143, when the republic was proclaimed, the commune of Rome was fully constituted, and the Palazzo Senatorio was built on the Piazza del Campidoglio to the north of the Capitoline hill.

During the 12th and 13th centuries a remarkable number of churches. which had been damaged and pillaged by the Normans under Robert Guiscard in 1084, mere restored. One of the best examples is S. Clemente east of the Colosseum mhich Paschal II rebuilt 1099–1118 on the ruins of an earlier church During this period too. the cloisters of St. John Lateran were constructed between 121 5 and 1232, one of the famous achievements of I. and P. Vassalletti The small forts of the Torre delle Milizie close to Trajan's market and of the tower of the Conti (Torre dei Conti) off the Via Cavour date from the 12th–13th centuries. With the removal of the popes to Avignon in 1305 there followed a period of stagnation in the city.

When Pope Martin V came to Rome in 1420, it was to a city half-deserted. He began the work of renovation which was to be continued by his successors. Nicholas V (1447–55) was responsible for the restoration of 40 churches, and bridges and aqueducts; he also began the reconstruction of the Vatican palace, in which the popes had lived after the return from Avignon in 1377. The basic plan of the Vatican and the approach to St. Peter's was on the designs of Leon Battista Alberti.

The Palazzo di Venezia. which houses a museum containing medieval and Renaissance works of art, was begun north of the Capitoline hill about 145 j by Cardinal Pietro Barbo. later Pope Paul II (1464–71). He was also responsible for the reconstruction of the adjacent basilica of S. Marco.

During the latter part of the 15th century many sumptuous buildings were erected by Sixtus IV (1471–84), who rebuilt the ruined Valentinian bridge (Ponte Sisto) between 1473 and 1475 and the church of S. Maria del Popolo (1472–77); he built S. Maria della Pace in 1480. S. Agostino, north of the Piazza Navona, was built by G. da Pietrasanta (1479–83). Its interior decorations include paintings by Raphael and Caravaggio and the high altar by Bernini. Of the 1 jth century, too, are S. Pietro in Montorio where legend has it that St. Peter was crucified, the hospital of S. Spirito (1474–82) and the Sistine chapel (in the Vatican palace), which was built for Sixtus IV by G. de' Dolci betneen 1473 and 1480. **(See** VATICAN, THE.)

Cardinal Riario's palace was also built at this time, begun probably by A. Bregno and completed by D. Bramante. Later called the Palazzo della Cancelleria it stands on the Corso Yittorio Emanuele and is one of the finest examples of early Renaissance architecture in Rome.

At the beginning of the 16th century, under Pope Julius II (1503–13), a new plan for St. Peter's basilica was evolved by Bramante to whom the work of rebuilding was entrusted The ground plan was to be in the form of a Greek cross. Michelangelo was the most famous of the architects who directed the building after Bramante's death (1514), and with others was responsible for the construction of the magnificent dome.

Also under Julius II the Via Giulia was opened and a beginning was made in the building of the three streets radiating from the Piazza del Popolo; this layout is evident in the 20th century in the Via del Babuino (leading to the Piazza di Spagna), Via del Corso and Via di Ripetta.

Other major alterations in the layout of the city were effected during the 16th century, notably the development of the Piazza del Campidoglio according to Michelangelo's plan; the Campidoglio mas not completed. however. until the 17th century. The construction of the Strada Pia (after 1870 called the Via Venti Settembre) encouraged a growing tendency for the city to expand eastward beyond the Quirinal hill.

Plans for the development of the city co-ordinated by Sixtus V (1585–90) included a series of streets radiating from S. Maria Maggiore toward the basilicas of St. John Lateran, S. Croce and S. Lorenzo. By 1586 the Via Sistina was already in progress up to the Trinità dei Monti, the church which stands at the top of the monumental flight of steps leading from the Piazza di Spagna. Sixtus V favoured the shift of the old centre toward the Piazza di Spagna and encouraged expansion in its vicinity. During his pontificate, the front squares of the major basilicas were embellished with obelisks, the Lateran palace was reconstructed by D. Fontana (1586) and a Sistine chapel was added

to S. Maria Alaggiore.

Not only did Rome take on the shape of a planned city in the 16th century, but many existing buildings were restored and more remarkably beautiful ones erected. These included the Palazzo Massimo alle Colonne by B. Peruzzi (1532–36); the Palazzo Farnese, a masterpiece of Renaissance building begun by A. da Sangallo and completed by Michelangelo; the Palazzo Caetani of Ammanati; and the Palazzo Colonna in the Via del Corso.

This great activity in planning and building was continued into the 17th century. During the pontificate of Paul V (1605–21), work on the Palazzo del Quirinale was continued, the buildings and gardens of the Villa Borghese mere laid out and the Palazzo Borghese finished. The churches of S. Susanna (C. Maderno, 1605), S. Andrea delle Fratte and S. Carlino in the Quattro Fontane, a baroque masterpiece by F. Borromini. are of the early 17th century The city was further embellished by fountains, notably the fountains of the Piazza S. Pietro (earlier one by Maderno. 1614); of the Ponte Sisto (G. Fontana. 1613); and the Fontana Paola near the Piazzali del Gianicolo, nhich was designed by Fontana and F. Ponzio (1612) to commemorate the restoration of the ancient aqueduct of the Aqua Trajana (Acqua Paolo).

Under Urban VIII (1623–44) baroque art reached a peak in the work of Bernini. Borromini and Pietro da Cortona. They directed the building of the Palazzo Barberini (begun by Maderno) on the Quirinal hill and the Collegio di Propaganda Fide overlooking the Piazza di Spagna. Bernini designed the Triton fountain in the centre of the Piazza Barberini. Further developments, under Innocent X (1644–55), included Borromini's interior reconstruction of St. John Lateran, the construction of the Palazzo Pamphili by G. Rainaldi in the Piazza Navona. This piazza mas given the Fontana dei Fiumi by Bernini in 1651. Alexander VII (1655–67), helped mainly by Bernini, started the Palazzo Odescalchi in the Piazza dei SS. Apostoli; enlarged the Piazza Colonna; built the church of S. Maria in Campitelli: finished the restoration of the Palazzo della Sapienza; completed the Piazza del Popolo with its two churches. S. Maria di Monte Santo (1675) and S. Maria dei Miracoli (1678). Bernini's finest achievement was the colonnade with nhich he surrounded the piazza in front of St. Peter's basilica.

Early in the following century the port of Ripetta on the Tiber was established. Architectural achievements of the 18th century included new façades to St. John Lateran, S. Maria Maggiore and S. Croce in Gerusalemme; the building of the Palazzo della Consulto, the Palazzo Braschi and the sacristy of St Peter's built by C. Marchionni (1776–84). The most imposing of Rome's fountains. the Fontana di Trevi (N. Salvi. 1732–62) and the Scalinata della Trinità dei Monti, a flight of 137 steps (1721–2j), are among the finest adornments to the city. Other developments in the north of the city, the embellishment of the Piazza del Popolo, the laying out of a public garden on the slopes of the Pincio took place at the beginning of the 19th century. Under Pius IX (1846–78) the \.-ia Nazionale was designed to give access to the new railway station — Stazione Termini.

As the capital of the kingdom of Italy after 1870, many plans were drawn up for the improvement of Rome. One of the greatest achievements was the building of high walls along the Tiber to prevent extensive flooding; in addition to the seven bridges across the river ahich existed in 1870, another 12 were built. During the last two decades of the 19th century the face of Rome greatly changed. Buildings around the Palazzo di Venezia were demolished, giving greater prominence to the historic buildings in the vicinity, including the ancient Roman remains; the Piazza di Venezia was enlarged and the Corso Vittorio Emanuele constructed (1876), opening a route from the heart of the old city to the Tiber and thus giving access to St. Peter's and the Vatican. The immense monument to Vittorio Emanuele II on the northern slopes of the Capitoline hill was begun by G Sacconi in 1885. The city spread across the Tiber and beyond the city walls. Such buildings as the Palazzo di Giustizia (palace of justice) on the right bank of the river and to the northeast the Policlinico one of the finest hospitals in Europe, were erected. With this expansion outward. the area around the baths of Caracalla. the Roman Forum and the Palatine was entirely preserved and made a protected area because of its archaeological importance.

At the beginning of the 20th century a tunnel was cut under the Quirinal hill. By the ambitious city plan of 1931, the Via dei Fori Imperiali from the Piazza di Venezia to the Colosseum was opened. extensive excavations in the vicinity were carried out, and, with the demolition of houses which had cluttered its slopes, the Capitoline hill was made more impressive by its isolation. In 1935 the new University of Rome (Citta Universitaria) was completed.

Industry and Communications. — Rome developed remarkably as a centre of industry and commerce after the 1920s. There are many medium and light industries covering almost every type of hand- and machine-made product. Of particular importance are the film and printing industries, and the production of foodstuffs and pharmaceutical goods. Certain of Rome's light industries depend on the existence in the hinterland of an agricultural region capable of producing such raw materials as wool, leather, milk and wheat, and all can rely on the consumers' market of the largest town in Italy.

More than a quarter of the working population is employed in local administration and transport. The city is primarily a cultural and religious centre, and the tourist trade is an important feature in its economy.

Its central position in the Italian peninsula makes Rome a focus of road, rail and air communications. Although a terminal station, the capital is an important junction of the railway lines connecting northern and southern Italy. The airport for Italian and international airlines is at Ciampino, a village to the southeast nearly 7 mi. from the centre of the city.

ANCIENT HISTORY

I. THE BEGINNINGS OF ROME

The limestone ridges that border Latium contain numerous remains of stone age settlements, and one has even been found on Monte Mario within 3m. of the Vatican in the old volcanic stratum that borders the right bank of the Tiber. On the left bank, however, nithin the area that was in prehistoric times subject to rains of volcanic ash from the Alban craters there are very few traces of human habitation before the iron age.[1] Perhaps the activity of the volcanoes kept migrants from settling there during the bronze age. The oldest settlements so far discovered within this peculiar region seem to be those of the Alban hills. between Grotta Ferrata and Albano. Here several groups of cremating people belonging apparently to the so-called Villanova[2] (*q.v.*) branch of the Indo-Europeans came down from Tuscany and settled. about the end of the 2nd millennium B.C. In the early part of the 1st millennium they spread here and there over the Latin plain as far at least as Antium on the sea and the Palatine hill on the Tiber. In the primitive cemetery of the Forum 40 graves have so far been excavated. The deepest and earliest mere cremation burials containing the same kind of pottery and personal ornaments as those of the Alban hills. Later, possibly in the 8th century, the rite of inhumation began to take the place of cremation here as on the Alban hills, at Antium, at Veii and at Falerii north of the Tiber. It is generally assumed that Sabine people from the central mountains were at this time pressing into Latium in large enough groups to become in several towns the dominating element. Whether further excavations will prove that this rite replaced cremation in all the primitive burial places at Rome is doubtful. The fact that cremation again became the orthodox rite during the Roman republic would indicate that cremation survived in some cemeteries that have not yet been discovered.

Early Institutions. — By the 7th century we may assume that

[1]Von Duhn, *Italische Gräberkunde,* 392 (1924); Antonielli, in *Hull Palet. Ital.,* 161 (1924)

[2]Randall MacIver, *Villanovans and Early Etruscans* (1925); *Iron Age in Italy* (1927)

the Palatine, the Capitoline, the Esquiline and the Quirinal hills had compact settlements of "Villanovan" and Sabine farmers and shepherds. These two groups were closely related in culture, language and religion. Philology proves that the bearers of the Latin language (probably the cremating group) and those who spoke the Sabellic dialects had not been separated very many centuries, and that they had been one people before entering Italy over the Alps. Several of their deities—Jupiter, Mars, Juno, Minerva and others—were also a common inheritance, and were worshipped by both peoples with rites that knew nothing of anthropomorphism. That it was a religion peculiarly adapted to an agricultural people we learn from the oldest calendar of festivals, which was drawn up before the Etruscans came to Rome. (W. Warde-Fowler, *The Religious Experience of the Roman People* [1911], 92.) Their political and social organizations were also of the same kind. The property-owning males constituted the "town-meeting" and the army. They elected the annual leaders (usually two "praetors" or "consuls") who summoned and conducted the meetings, held the elections and directed the army. The consuls must consult a smaller group of elders (senators), heads of important families, in all matters of public interest. Without the approval of the elders no proposal was put before the commons. For purposes of transacting business the commons of a town were usually divided into ten wards called *curiae*. That Rome had 30 instead of ten seems therefore to indicate that Rome was a union of three settlements already organized into regular polities before the city government was formed. In taking possession of the country, these people had settled in village groups, usually upon some hill which could be defended, and which gave access to a good spring of water or a stream. Most of the land near each village was apparently divided into private holdings, though it also seems probable that some land was left undivided for community grazing. Sacred land, used for the support of the cult, was also set apart at a very early period. These villages were independent and autonomous within the tribe. A tribal organization, however, existed, which supported a tribal cult on the Alban mount. This tribal organization was kept alive by an annual religious festival, and it had a presiding officer whose duty it was in time of danger to summon the forces of the different communities to common action. Since both the Villanovan and the Sabine communities shared in these democratic customs they coalesced readily in such a large tribal organization.

Finally both peoples long retained the institutions of a very strong patriarchal organization. Women, children and slaves were subject to the *potestas* of the family patriarch. He gave the members of his household in marriage, assigned the properties—there are but shadowy traces of clan-ownership, and testamentary rights are highly developed—and he, with his family council, meted out punishment for crimes committed within the family, and in the earlier day at least, directed the vendetta of the family against those who had committed a wrong against him or his. While the villages were still small, there were few opportunities for community action, whether judicial or legislative, so long as the patriarchal customs were respected.

City States.—At an early day these numerous communities belonging to a wide-spread tribe began to aggregate to a few favoured centres where cities grew up. Such cities soon overshadowed the villages and endangered the existence of the Latin tribal organizations. It is likely that raids from across the Tiber and from the Sabine and Volscian hills emptied the more exposed villages that could not well be fortified, drove the populace to more defensible villages, and in the case of places like Praeneste, strongly situated near the natural road between Etruria and Campania, trade of a lucrative kind also attracted settlers. It was in this way that some six city-states gradually grew up in Latium to take the place in each case of several villages. The growth of such cities in these circumstances naturally required stronger and more efficient governments, a better army organization, the building of walls or at least defensible earthen mounds with protecting pickets.

Kings.—At Rome the coalescing of three villages with their 30 curiae may date from the 8th century B.C. And here since the threats of Etruscan raiders from Veii and Caere added much to the difficulty of governing communities that are not wholly homogeneous, elective princes holding office for life seem for a while to have displaced the customary annual magistrates. Tradition held that of these early princes Romulus (*q.v.*), Hostilius and Ancus Marcius were Latins, but that Titus Tatius (the prince of a Sabine group) and Numa Pompilius (*q.v.*) were Sabine in origin, while Tarquinius Priscus was said to be the son of a Corinthian adventurer who had first settled in Tarquinium and married an Etruscan woman, and Servius Tullius was an Etruscan chief by the name of Mastarna.

There is nothing unreasonable in this tradition, and since the art of writing was already known, the names may well have survived from early times on inscriptions of public buildings, treaties and tombs. The tradition regarding Servius Tullius was at least derived from Etruscan documents of an early date (*See* the speech of the Emperor Claudius, Dessau, *Ins. Lat. Sel.*, 212.) History, however, need not take seriously the numerous legends preserved by Livy regarding the wars and deeds of these kings. Villages near Rome which naturally dwindled to insignificance under the attractive power of a neighbouring city left traces of themselves in abandoned walls; and picturesque legends grew up to account for their annihilation, but most of them had decayed several centuries before history was written.

Etruscan Kings.—The Etruscan house of the Tarquins seems to be more tangible. Tradition places their rule in the latter half of the 6th century B.C., at a time in fact when we know that Etruscan princes were making conquests southward as far as Capua, when Etruscan art and Greek objects of art carried by Etruscans (*q.v.*) came into Rome as they did into Praeneste. Velitrae, Ardea, Satricum[1] and other Latin towns, when Rome received a stone ring-wall enclosing a remarkably large area and ceased to use the Forum cemetery for burial—since that now was included within the ring—and when Rome's rulers began to reach out to gain the control of the larger part of Latium.

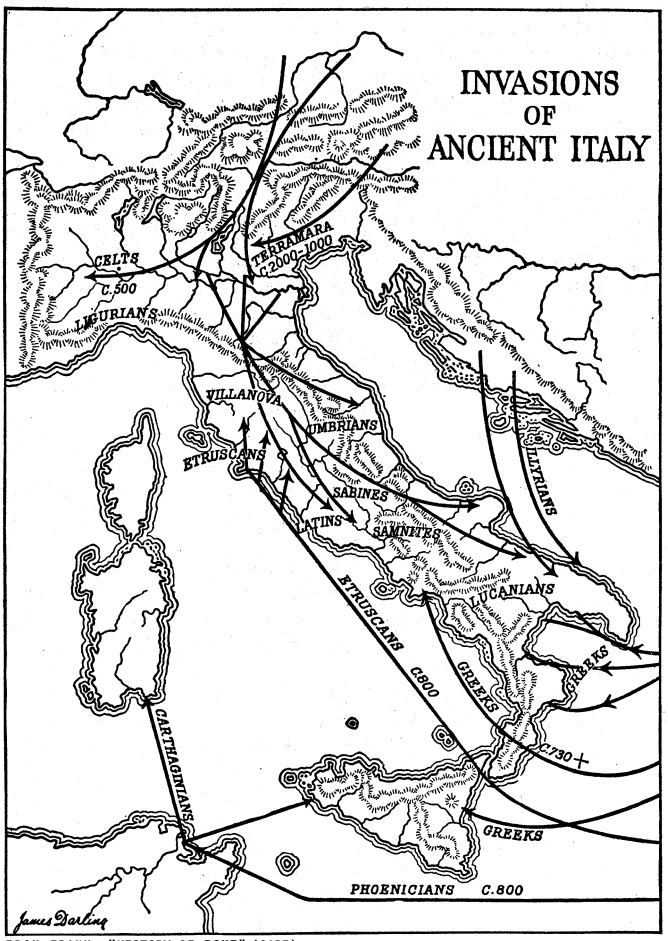
The Etruscan adventurers, employing methods like those of the Normans who ruled the Sicilian cities in the 12th century, had come by sea to govern and exploit the unorganized communities of the Villanovans some two centuries before. Different families had secured control of most of the districts of Tuscany, had fortified their various cities, trained their subjects into effective armies as well as into obedient tenants and serfs, had developed farming by improved methods of planting, draining and irrigation, had exploited the copper and iron mines of Etruria and organized a flourishing industry in metal work with which they attracted Phoenician and Greek traders and had even entered actively into maritime commerce[2]

Whether the Tarquins actually seized Rome by force or migrated to Rome and secured control by political devices we do not know. Under them Rome and Latium underwent very remarkable changes. An extensive wall[3] of almost 6m. was built to enclose an area that would readily house 200,000 inhabitants living in low small houses. There could hardly have been so many inhabitants when the enclosure was made; and indeed the walls, in order to make use of natural escarpments and to include outlying shrines, probably took in many undeveloped tracts. We cannot be sure that the regal wall extended as far out as the so-called Servian wall, despite the existence of very old remains in the gardens of the "Villa Spithoever." Tombs of the 4th century within the area seem to prove at least that the sacred *pomerium* did not extend so far, even if the fortifications did. Nevertheless the regal city was remarkably large when compared with other Italian cities, and its size points to a builder who was intent upon extensive projects of development. The Tarquins certainly opened the city to the currents of Mediterranean commerce now being attracted westward by Etruscan prosperity. Tradition plausibly holds that a port was used at the mouth of the Tiber as early as the 6th century; Greek and Etruscan articles came

[1] Della Seta, *Museo di Villa Giulia*, i., 235 (1918).
[2] D. Randall-MacIver, *The Etruscans* (1927).
[3] *Papers of the American Academy in Rome*, iii., 112 (1924).

to the city, Greek and Etruscan artisans were at work on the public buildings, and it is not unlikely that some of the industries that prospered in Etruria were enticed to Rome.

A strong army was also organized. Tradition attributes the regal army of nearly 20,000 men to Servius, who came from Etruria and doubtless employed the same methods as other Etruscan princes. Of these, 9,800 belonged to the "first class" of property holders, the rest to the other four classes; that is to say, all of the "first class" men were liable to army service, but



FROM FRANK, "HISTORY OF ROME" (CAPE)

MAP SHOWING INVASIONS OF ANCIENT ITALY. WITH APPROXIMATE DATES

only a diminishing proportion of the lower classes. In any modern industrial city where 10,000 males of military age constitute the highest 20% of taxpayers one would have to assume a population of at least 500,000 souls, or 100,000 male citizens; and that would be a very large population for a city with a rural territory of only about 500sq.m. (320,000ac.). It must, however, be remembered that in early Latium the proportion of property owners was large, that the Latin communities had consisted chiefly of farmers practising hoe-culture to whom 5–10ac. would not only suffice for a family but would require all its energies for cultivation. In the rural area, at least, property was more evenly divided than would be the case in an industrial community to-day, so that the 9,800 soldiers of the first class need not imply as large a population as it might to-day. Considering the extent of the city walls and the intensive cultivation of the Latin soil, we may accept for the last years of the regal period the tradition of the army of 193 centuries (19,300 men), and conjecture an urban population of about 200,000 and a rural population of about the same size. That the Latin country was at that time intensively cultivated we may well believe, when we recall the long underground drainage channels which were driven through the tufa on the Alban slopes to carry off torrential rain waters in order to save the surface soil from erosion. Such expensive work of salvage would not have Seen undertaken unless land had been very much in demand and the population much more dense than in historical times.

The Etruscan princes were also vigorous conquerors, bent on extending their power throughout Latium. Tradition, reported by Livy and Dionysius, dwells long on their wars of conquest with Veii, Latin towns like Gabii, Aricia, Ardea and the Volscians as far as Tarracina. That this tradition happens to be fairly correct we may conclude from the facts that the region below Velitrae was particularly submitted to agricultural development (Frank, Economic History of Rome, 8 and 35, 2nd ed. 1927), that the colony of Cora existed at the founding of the first Latin league, and that the terms of the first treaty between Carthage and Rome, signed in 509, prove that the principality developed by Tarquin extended as far as Tarracina. This famous treaty recorded by Polybius (III. 22–3) is our oldest genuine document of Roman history. It was signed with the new republic of Rome immediately after the Etruscans had been banished and doubtless to a large extent reiterated the provisions of the previous treaty which the Tarquins had signed when in control of Rome. In the first sections it assumes that the free Romans would continue commerce on the seas to the extent that the Tarquins had, and it therefore makes an effort to safeguard the Punic trade monopoly at Punic ports. That proved to be a needless precaution, for the Romans abandoned the seas soon after they fell out of touch with Etruscan enterprise. A paragraph of the second part of the treaty reveals how far the ambitions of Etruscan Rome had advanced. It reads, "The Carthaginians shall do no injury to the people of Ardea, Antium, Laurentum, Circeii, Tarracina, nor any other people of the Latins that are subject to Rome. From those townships of Latium which are not subject to Rome they shall hold their hands; and if they shall take one they shall deliver it unharmed to the Romans." If, as seems to be the case, these clauses remain standing from Tarquin's last treaty with Carthage, they indicate that Tarquin had conquered at least the towns named, and that such towns as Pometia and Satricum, which are not mentioned, are considered within the sphere of Rome's natural interests, so that even if Carthage in some dispute should attack them she must deliver them to Rome. Needless to say the Roman republic which signed this treaty could not long entertain such ambitions, inherited for the time from Tarquin. Rome discovered within a few years that she had to release the Latins from subjection in order to win their support in her struggle with the returning Etruscans.

The terms of this treaty reveal how powerful Rome had become under the Tarquins and explain to us the resources that could pay for the building of a wall of 6m. and the power that could muster and employ an army of 20,000 men. They also help us to picture the resources that were expended in a very aggressive building programme. The temple to Jupiter which Tarquin nearly completed on the Capitoline hill stood on a lofty stylobate more than 20ft. high and measured about 200ft. x 185ft. None of the flourishing Etruscan cities with all their commercial prosperity had any temple comparable to this. Tarquin also moved the Diana cult from Aricia to Rome so as to make Rome the religious centre of the Latin communities of the Alban hills, and to Diana he built a famous temple on the Aventine. To the Etruscan period are also attributed several Fortuna temples—since soothsaying was particularly in favour with the Etruscans. Then in the first years of the republic there were built several temples begun by the Tarquins or vowed in the vigorous spirit of enterprise that the Tarquins had instilled; the large temple of Saturn below the Capitoline, the temple of Mercury—the god of commerce—behind the Palatine, the temple of Ceres nearby, and the splendid temple of Castor in the Forum. Not till two centuries later did the republic spend so much energy and money in public buildings, for with the expulsion of the Etruscans Rome became again a rural market place.

The effects of the Etruscan régime were widespread, though it apparently did not last more than about a century—if we are right in dating the last of the Forum burials about 600 B.C. In the Etruscan Government the senate had been retained, though virtually stripped of power, and the assembly was probably never

summoned by the last Tarquin. A large industrial class must have come into existence in the city in the regal period, for even though the walls were raised by forced citizen-labour as tradition held, the increase in trade at the Roman market, the manufacture of the elaborate decorations for the new buildings, the service of a luxurious court, the provisioning and equipping of a large army would require much skilled labour. In some of the regions of Latium taken by force it is probable that the natives were reduced to serfdom as had been the custom in various parts of Etruria. The long and expensive drainage canals that are found between the Alban hills and the sea are not explicable in a system of small free farmers. In that region at least there must have been one or more strong lords who commanded much labour and capital. Whether the prince retained the land as a royal domain or assigned it as fiefs to favourites we have no means of knowing, and we must also admit that no conclusive evidence survived in Roman custom of the servile system which is frequently posited for this period.

This foreign régime also accounts for certain changes in rites, customs and institutions that were more or less lasting. The Etruscans had usually accepted the Italic deities from their subjects, but having come from the East and imbued with anthropomorphic conceptions they made representations of these deities in bronze or terra-cotta and built temples for them. Since such representations were usually derived from figures of Greek gods this process not only localized and gave human form to the Italic deities, but syncretized them with definite Greek gods regarding whom there existed a mythology. In this respect therefore the intervention of the Etruscans completely revolutionized the ideas of the younger generation of Romans. The Etruscans also lent their influence to the growing custom of inhuming the dead, and, for a while at least, to the interment of costly adornments with the body. Since the Etruscan burial rites—brought from Asia—were definitely connected with beliefs of the survival of the *genius* in a state of happiness or suffering, the Italic ideas of future existence were thus permanently altered, even though the Republican Government when restored tried to abolish funeral adornments and encourage a return to the Italic burial customs. That the Latin language was not displaced at Rome even in official regal inscriptions is proved by the survival of the famous "stele" of the forum, which is written in Latin though on an Etruscan stone and containing a reference to the king.

Expulsion of the King.—Near the end of the 6th century the Etruscan usurpers were ejected and a republican government formed with a restoration of annual elective magistrates, an advisory senate of nobles and a timocratic popular assembly. The traditional date is 509 B.C., but since the chronology adopted by later writers is a reconstruction from consular lists and from the marks made every year on the doorposts of the Capitoline temple, and since a discrepancy of a few years existed between these two records, we must not insist upon exact dates. Livy attributes the revolt against the Tarquins to a general objection to forced labour on public buildings and in the last instance to the wrong done to Lucretia by a son of the king. That tradition should have kept an accurate and adequate explanation of causes for several hundred years is not plausible, but in view of the evidence of archaeology and of institutional survivals we cannot doubt that Etruscan princes held Rome for a while and that they were ejected with a restoration of native rule.

II. THE REPUBLIC

Period A: 509–265 B.C.—(*a*) The Struggle Between the Orders.—The Tarquins apparently did not at once acquiesce in the results of the revolution. Securing the aid of friends in Etruscan cities and also in some Latin towns like Tusculum, still held by friendly princes, they attacked Rome again and again. An Etruscan tradition mentions a temporary victory by Lars Porsenna of Clusium by which he was able to disarm Rome for a while; and as late as 499 there was a famous battle at Lake Regillus in which the Romans won a decisive victory over Etruscan and some Latin forces, and the general on that occasion vowed the temple to Castor in recognition of aid received from Greek cavalry. Rome also had trouble with the Latin cities, for the new Government attempted to take over the hegemony of the Latin towns that had been subjected by the Tarquins, while these Latin towns also wished a restoration of independence. Rome's wars with the Etruscans made it impossible to enforce her claims over the Latins, and consequently she had to come to terms with them. The independent league of Latin towns' consisting of Tibur, Tusculum, Aricia, Lanuvium, Ardea, Pometia and Cora, formed in order to resist Rome's pretensions, soon (c. 493) entered into a defensive alliance with her (the *foedus Cassianum*), and this new league made enough progress at once so that Signia and Norba were settled as common Latin colonies. But the Volscian towns of Antium, Satricum, Velitrae and Tarracina fell away from Latin connections.

The Government.—The new Government of Rome was more nearly an aristocracy than the old native Italic Governments. During the regal period with its great prosperity, its immigration of labourers, its partial imposition of serfdom, and grants of fiefs and privileges, class distinctions had come into existence. The favoured elders, selected by position, influence and favour for seats in the senate, were now considered a caste apart from the rest and they and their descendants were called patricians (*q.v.*). Since this group seems to have led the revolution and formed the new Government it is not strange that they imposed the requirements that patricians alone could hold the magistracies and priesthoods and interpret the laws, and that no resolution of the popular assembly should be binding unless ratified by the patrician senators. And when the more influential of the plebeians were enrolled as senators these *conscripti* apparently were not allowed to participate in the ratification of laws. Economic changes added to the disagreement between the classes. With the departure of the king and his court Rome fell out of the current of sea-going commerce, if we may judge from the evidence of excavations. For a while also trade relations with Etruria were cut off. Building construction which had flourished also soon came to an end. Furthermore when Rome had to surrender her hegemony not only over the Volscians of southern Latium but also over all the towns of central Latium, the profits that had flowed into the city from those regions ceased. There must have been much poverty and a large number of unemployed. And since the laws still permitted imprisonment and under certain conditions enslavement for debts, there arose among the poorer plebeians a demand for political rights with which to win some relief from economic distress. There were still in the vicinity several primitive Latin villages with their old town meetings which reminded the Romans of the old democratic government that had existed before the Etruscan invasion.

In the domain of external politics the 5th century was largely devoted to a reconquest by the league of the parts of Latium which were lost to the Volsci and Aequi during the distressing years of warfare with the Etruscans. In internal politics the plebeians made some progress during the century in their battle for recognition. What the plebeians first asked for was the right to elect advocates (tribunes of the people) who should have the right to prevent arbitrary arrest, and to speak for them in court when arrested. This seems to have been an attempt to find a remedy against harsh debtor-laws, and a substitute for the king who had listened to such appeals. The historians say that the plebeians were not granted this request until they had seceded to Mons Sacer when called upon for service against the Volsci. The fact that the privilege was granted by a sacred agreement which also invoked a curse upon any who impeded a tribune in the performance of his duty gives evidence that the measure rested upon a solemnly sworn compact between the orders. The story of the political strike is therefore plausible. There may at first have been four tribunes, one for each city tribe; but before the time of the decemvirs there were ten, and this remained henceforth the standing number.

It would be difficult to find a parallel to the tribunate anywhere. The tribune never became, strictly speaking, a magistrate of the Roman people. His one prerogative in the early day was

[1]Rosenberg, in Hermes, 159 (1919).

to protect individual plebeians against summary arrest by patrician officials and he must exercise this function in person and within the city. That he was sacrosanct and absolutely protected in the performance of his duty clearly points to the intention that in this one function he was to be as efficient a protector of the oppressed individual as the absolute monarch had been. Such powers could hardly be kept from abuse, and in time the tribunes became powerful individuals who could intervene in almost any department of state.

Since the tribunes were elected annually by the plebeians it was only natural that the plebeian assembly — which met by local groups or tribes — might remain to discuss policies and instruct the tribunes by resolution. In 471, if Livy is correct, a law was passed (the lex Publilia) which recognized the plebeian tribal assemblies as lawful, and authorized the tribunes to propose and carry resolutions in such assemblies. These resolutions (plebiscites) had of course only such force as plebeian influence gave them, but the time was to come when the plebeians were the most powerful element of the state, and when the law-making body dared not long resist the demands of plebiscites.

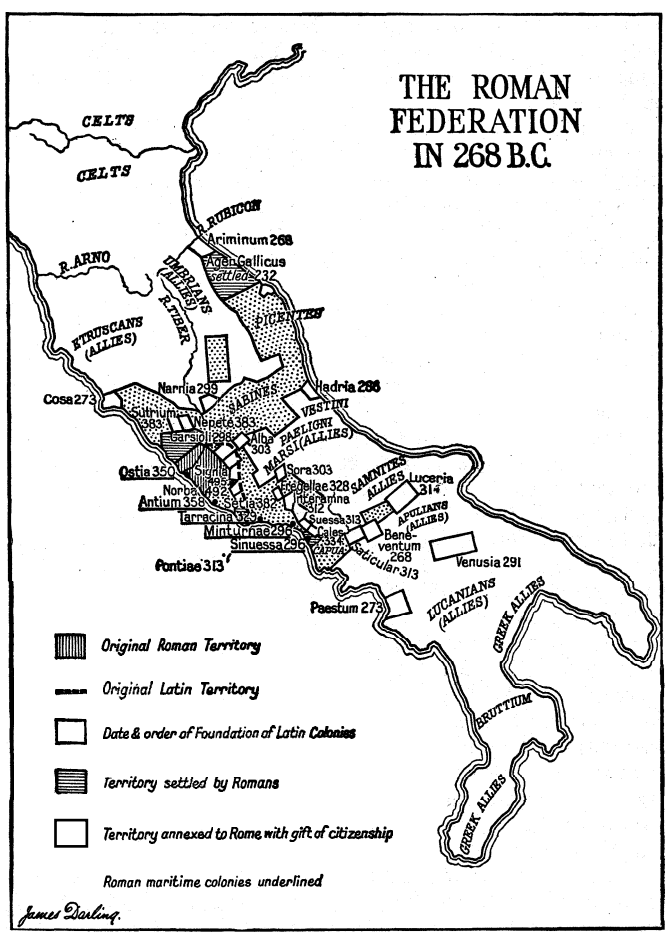
The Twelve Tables. — The plebeians now had advocates in court, but the tribunes were hampered by the fact that court judgments were rendered according to unwritten custom preserved from father to son within a narrow group of learned patricians. It therefore became apparent that the customary law must be codified and posted. After many years of discussion a law was passed substituting for the while a board of ten patricians in place of the two consuls and authorizing this board of ten to frame and publish a code of laws to be binding upon all. The *decemviri* worked on this code in 451 and 450, when it was inscribed and posted in the Forum. These "XII. tables" were in no sense a reform or a liberalizing of old custom. They recognized the prerogatives of the patrician caste and of the patriarchal family, the validity of enslavement for unpaid debt and the interference of religious custom in civil cases. That they reveal a remarkable liberality for their time in respect to testamentary rights and to contracts is probably not due to any alteration brought in by the *decemviri,* but rather to the progress that had been made in commercial customs in the Roman Forum in the days of prosperity and vigorous trade. The gist of this code has survived in quotations and is now the historian's safest index of the state of Rome's culture in the 5th century. (T. F.)

Constitutional Changes.—The *decemviri,* who had incurred much opposition because of their autocratic administration of Rome, were deposed at the demand of the plebeians who seceded to the Janiculan Hill and made a formal demand that the former Government be restored. The assemblies accordingly met and elected consuls and tribunes again. But the plebeian assembly went farther and demanded certain reforms in the constitution. These demands were embodied in the very important Valerio-Horatian laws passed by the popular (centuriate) assembly in 449. These laws granted or reaffirmed the inviolability of the tribunes, the right of every citizen to carry his appeal to the assembly in cases of death sentences, and finally enacted that plebiscites passed by the plebeian assembly should be placed before the senate and if ratified by the *patres* should be recognized as law. Only a few years after the Valerio-Horatian legislation came the *lex Canuleia,* itself a *plebiscitum* (445 B.C.), by which mixed marriages between patricians and plebeians were declared lawful, and the social exclusiveness of the patriciate broken down. In the same year with this measure, and like it in the interests primarily of the wealthier plebeians, a vigorous attack commenced on the patrician monopoly of the consulate, and round this stronghold of patrician ascendancy the conflict raged until the passing of the Licinian laws in 367. The original proposal of the tribune Gaius Canuleius, in 445, that the people should be allowed to elect a plebeian consul was evaded by a compromise. The senate resolved that for the next year, in the stead of consuls, six military tribunes with consular powers should be elected, and that the new office should be open to patricians and plebeians alike. The consulship was thus for the time saved from pollution, as the patricians phrased it, but the growing strength of the plebs is shown by the fact that in 50 years out of the 78 between 444 and 366 they succeeded in obtaining the election of consular tribunes rather than of consuls. Despite, however, these discouragements, the patricians fought on. Each year they strove to secure the creation of consuls rather than consular tribunes, and failing this strained every nerve to secure for their own order at least a majority among the latter. Even the institution of the censorship (435), though rendered desirable by the increasing importance and complexity of the census, was, it is probable, due in part to their desire to discount beforehand the threatened loss of the consulship by diminishing its powers. Other causes, too, helped to protract the struggle. Between the wealthier plebeians, who were ambitious of high office and the poorer, whose minds were set rather on allotments of land recently taken from Veii, there was a division of interest of which the patricians were not slow to take advantage, and to this must be added the pressure of war. The death struggle with Veii and the sack of Rome by the Gauls absorbed for the time all the energies of the community. In 377, however, two of the tribunes, G. Licinius Stolo and L. Sextius, came forward with proposals which united all sections of the plebs in their support. Their proposals were as follows: (1) that consuls and not consular tribunes be elected; (2) that one consul at least should be a plebeian; (3) that the priestly college, which had the charge of the Sibylline books, should consist of ten members instead of two, and that of these half should be plebeians; (4) that no single citizen should hold in occupation more than 500 ac. of the common lands, or pasture upon them more than 100 head of cattle and 500 sheep; (5) that interest already paid on debts should be deducted from the principal, and the remainder paid off in three years. The last two proposals were obviously intended to meet the demands of the poorer plebeians, and to secure their support for the first half of the scheme. Ten years of bitter conflict followed, but at last, in 367 B.C., the Licinian rogations became law, and one of their authors, L. Sextius, was created the first plebeian consul. For the moment it was some consolation to the patricians that they not only succeeded in detaching from the consulship the administration of civil law, which was entrusted to a separate officer, praetor *urbanus,* to be elected by the comitia of the centuries, with an understanding apparently that he should be a patrician, but also obtained the institution of two additional aediles (aediles *curules*), who were in like manner to be members of their own order. With the opening of the consulship, however, the issue of the long contest was virtually decided, and the next 80 years witnessed a rapid succession of plebeian victories. Now that a plebeian consul might preside at the elections, the main difficulty in the way of the nomination and election of plebeian candidates was removed. The proposed patrician monopoly of the new curule aedileship was almost instantly abandoned. In 356 the first plebeian was made dictator; in 350 the censorship, and in 337 the praetorship was filled for the first time by plebeians; and lastly, in 300, by the *lex Ogulnia,* even the sacred colleges of the pontiffs and augurs, the old strongholds of Patrician supremacy, were thrown open to the *plebs*. The patricians lost also the control they had exercised so long over the action of the people in assembly. The *patrum auctoritas,* the sanction given or refused by the patrician senators to laws and to elections, had hitherto been a powerful weapon in their hands. But in 339 a law of Q. Publilius Philo, a plebeian dictator, enacted that this sanction should be given beforehand to laws enacted in the *comitia centuriata,* and a *lex Maenia* of uncertain date extended the rule to elections in the same assembly, Henceforward the *patrum auctoritas* sank into a meaningless form, though as such it still survived in the time of Livy. From 287 onwards it is certain that measures passed by the plebs, voting by their tribes, had the full force of lams without any further conditions whatsoever. The legislative independence of the plebeian assembly was secured, and with this crowning victory ended the long struggle between the orders.

(b) Conquest of Italy.—Twelve years after the passing of the *lex Hortensia,* King Pyrrhus, beaten at Beneventum, withdrew from Italy, and Rome was left mistress of the peninsula.

The steps by which this supremacy had been won have now to be traced.

The expulsion of the Tarquins from Rome, followed as it seems to have been by the emancipation from Etruscan supremacy of all the country between the Tiber and the Liris, entirely altered the aspect of affairs'. North of the Tiber the powerful Etruscan city of Veii, after a vain attempt to restore the Tarquins, relapsed into an attitude of sullen hostility towards Rome, which, down to the outbreak of the final struggle in 407, found vent in constant and harassing border forays. The Sabines recommenced their raids across the Anio; from their hills to the south-east the Aequi pressed forward as far as the eastern spurs of the Alban range, and ravaged the low country between that range and the Sabine mountains; the Volsci overran the coast-lands as far as Antium, established themselves at Velitrae and even wasted the fields within a few miles of Rome. But the good fortune of Rome did not leave her to face these foes single-handed, and it is a significant fact that the history of the Roman advance begins, not with a brilliant victory, but with a timely alliance. According to Livy, it was in 493, only a few years after the defeat of the prince of Tusculum at Lake Regillus, that a treaty was concluded between Rome and the Latin communities of the Campagna. The alliance was in every respect natural. The Latins were the near neighbours



FROM FRANK, "HISTORY OF ROME" (CAPE)

MAP SHOWING GROWTH OF THE ROMAN FEDERATION UP TO 268 B.C.

and kinsmen of the Romans, and both Romans and Latins were just freed from Etruscan rule to find themselves as lowlanders and dwellers in towns face to face with a common foe in the ruder hill tribes on their borders. The exact terms of the treaty cannot, any more than the precise circumstances under which it was concluded, be stated with certainty (see LATIUM), but two points seem clear. There was at first a genuine equality in the relations between the allies; Romans and Latins, though combining for defence and offence, did so without sacrificing their separate freedom of action, even in the matter of waging wars independently of each other. But, secondly, Rome enjoyed from the first one inestimable advantage. The Latins lay between her and the most active of her foes, the Aequi and Volsci, and served to protect her territories at the expense of their own. Behind this barrier Rome grew strong, and the close of the Aequian and Volscian wars left the Latins her dependents rather than her allies. Beyond the limits of the Campagna Rome found a second ally, hardly less useful than the Latins, in the tribe of the Hernici, in the valley of the Trerus, who had equal reason with the Romans and Latins to dread the Volsci and Aequi, while their position midway between the two latter peoples made them valuable auxiliaries to the lowlanders of the Campagna.

Capture of Veii.—During the period 449–390 there is an unmistakable development of Roman power on all sides. In southern Etruria the capture of Veii (396) virtually gave Rome the mastery as far as the Ciminian forest. Sutrium and Nepete, "the gates of Etruria," became her allies and guarded her interests against any attack from the Etruscan communities to the north, while along the Tiber valley her suzerainty was acknowledged as far as Capena and Falerii. On the Anio frontier we hear of no disturbances from 449 until some ten years after the sack of Rome by the Gauls. In 446 the Aequi appear for the last time before the gates of Rome. After 418 they disappear from Mt. Algidus, and in the same year the communications of Rome and Latium with the Hernici in the Trerus valley were secured by the capture and colonization of Labicum. Successive invasions, too, broke the strength of the Volsci, and in 393 a Latin colony was founded as far south as Circeii. In part, no doubt, these Roman successes were due to the improved condition of affairs in Rome itself, consequent upon the great reforms carried between 450 and 442; but it is equally certain that now, as often afterwards, fortune befriended Rome by weakening, or by diverting the attention of, her opponents. In particular, her rapid advance in southern Etruria was facilitated by the heavy blows inflicted upon the Etruscans during the 5th century B.C. by Celts, Greeks and Samnites. By the close of this century the Celts had expelled them from the rich plains of what was afterwards known as Cisalpine Gaul, and were even threatening to advance across the Apennines into Etruria proper. The Sicilian Greeks, headed by the tyrants of Syracuse, wrested from them their mastery of the seas, and finally, on the capture of Capua by the Samnites in 423, they lost their possessions in the fertile Campanian plain. These conquests of the Samnites were part of a great southward movement of the highland Sabellian peoples.

Sack of Rome by the Gauls.—But in 390, or more probably 389, the Roman advance was for a moment checked by a disaster which threatened to alter the course of history in Italy, and which left a lasting impress on the Roman mind. In 391 a Celtic horde left their newly won lands on the Adriatic, and, crossing the Apennines into Etruria, laid siege to the Etruscan city or Clusium (Chiusi). Thence, provoked, it is said, by the conduct of the Roman ambassadors, who, forgetting their sacred character, had fought in the ranks of Clusium and slain a Celtic chief, the barbarians marched upon Rome. On July 18, 390 B.C., only a few miles from Rome, was fought the disastrous battle of the Allia. The defeat of the Romans was complete, and Rome lay at the mercy of her foe. But in characteristic fashion the Celts halted three days to enjoy the fruits of victory, and time was thus given to put the Capitol at least in a state of defence. The arrival of the barbarians was followed by the sack of the city, but the Capitol remained impregnable. For seven months they besieged it, and then in as sudden a fashion as they had come they disappeared. The Roman chroniclers explain their retreat in their own way, by the fortunate appearance of M. Furius Camillus with the troops which he had collected, at the very moment when famine bad forced the garrison on the Capitol to accept terms. More probably the news that their lands across the Apennines were threatened by the Veneti, coupled with the unaccustomed tedium of a long siege and the difficulty of obtaining supplies, inclined the Celts to accept readily a heavy ransom as the price of their withdrawal. But, whatever the reason, it is certain that they retreated, and, though during the next 50 years marauding

bands appeared at intervals in the neighbourhood of Rome, and even once penetrated as far south as Campania (361–360), the Celts never obtained any footing in Italy outside the plains in the north which they had made their own.

Annexation of Southern Etruria.—Nor, in spite of the defeat on the Allia and the sack of the city, was Rome weakened except for the moment by the Celtic attack. The storm passed away as rapidly as it had come on. The city was hastily rebuilt, and Rome dismayed the enemies who hastened to take advantage of her misfortunes by her undiminished vigour. Her conquests in southern Etruria were successfully defended against repeated attacks from the Etruscans to the north. The creation in 387 of four new tribes (Stellatina, Sabatina, Tromentina and Arnensis) marked the final annexation of the territory of Veii and of the lands lying along the Tiber valley. The addition of these tribes, containing Roman settlers as well as Veientines, increased the number and influence of the plebeian group. A few years later Latin colonies were established at Sutrium and Nepete for the more effectual defence of the frontier, and finally, in 353, Caere (*q.v.*) signed a treaty of peace for 100 years[1].

Next to the settlement of southern Etruria, the most important of the successes gained by Rome between 390 B.C. and 343 B.C. were those won against her old foes the Aequi and Volsci, and her old allies the Latins and Hernicans. The Aequi indeed, already weakened by their long feud with Rome, and hard pressed by the Sabellian tribes in their rear, were easily dealt with, and after the campaign of 389 we have no further mention of an Aequian war until the last Aequian rising in 304. The Volsci, who in 389 had advanced to Lanuvium, were met and utterly defeated by Camillus, the conqueror of Veii, and this victory was followed up by the gradual subjugation to Rome of all the lowland country lying between the hills and the sea as far south as Tarracina. Latin colonies were established at Satricum (38j), at Setia (382), and at Antium and Tarracina some time before 348. In 358 two fresh Roman tribes (Pomptina and Publilia) were formed in the same district.

Reorganization of the Latin League.—Rome had now nothing more to fear from the foes who a century ago had threatened her very existence. The lowland country, of which she was the natural centre, from the Ciminian forest to Tarracina, was quiet, and within its limits Rome was by far the strongest power. But she had now to reckon with the old and faithful allies to whose loyal aid her present position was largely due. The Latini and Hernici had suffered severely in the Aequian and Volscian wars; it is probable that not a few of the smaller communities included in the league had either been destroyed or been absorbed by larger states, and the independence of all alike was threatened by the growing power of Rome. The sack of Rome by the Celts gave them an opportunity of reasserting their independence, and we are consequently told that this disaster was immediately followed by the temporary dissolution of the confederacy, and this again a few years later by a series of actual conflicts between Rome and her former allies. Between 383 and 358 we hear of wars with Tibur, Praeneste, Tusculum, Lanuvium, Circeii and the Hernici. But in all Rome was successful. In 382 Tusculum was fully incorporated with the Roman state by the bestowal of the full franchise; in 358, according to Livy and Polybius, the old alliance was formally renewed with the Latini and the Hernici. We cannot, however, be wrong in assuming that the position of the allies under the new league was far inferior to that accorded them by the treaty of Spurius Cassius. Henceforth they were the subjects rather than the equals of Rome, a position which it is evident that they accepted much against their will, and from which they were yet to make one last effort to escape.

First Samnite War.—Rome had won her supremacy from the Ciminian forest to the Liris as the champion of the comparatively civilized communities of the lowlands against the rude highland tribes which threatened to overrun them, and so, when her legions first crossed the Liris, it was in answer to an appeal from a lowland city against invaders from the hills. While she was engaged in clearing Latium of Volsci and Aequi, the Sabellian tribes of the central Apennines had rapidly spread over the southern half of the peninsula. Foremost among these tribes were the Samnites, a portion of whom had captured the Etruscan city of Capua in 423, the Greek Cumae in 420, and had since then ruled as masters over the fertile Campanian territory. But in their new homes the conquerors soon lost all sense of relationship and sympathy with their highland brethren. They dwelt in cities, amassed wealth, and inherited the civilization of the Greeks and Etruscans whom they had dispossessed; above all, they had before long to defend themselves in their turn against the attacks of their ruder kinsmen from the hills, and it was for aid against these that the Samnites of Campania appealed to the rising state which had already made herself known as the bulwark of the lowlands north of the Liris, and which with her Latin and Hernican allies had scarcely less interest than the Campanian cities themselves in checking the raids of the highland Samnite tribes.

The Campanian appeal was listened to. Rome with her confederates entered into alliance with Capua and the neighbouring Campanian towns, and war was formally declared (343) against the Samnites. While to the Latins and Hernicans was entrusted apparently the defence of Latium and the Hernican valley against the northerly members of the Samnite confederacy; the Romans themselves undertook the task of driving the invaders out of Campania. After two campaigns the war was ended in 341 by a treaty, and the Samnites withdrew from the lowlands, leaving Rome the recognized suzerain of the Campanian cities which had sought her aid.

The Latin War.—There is no doubt that the check thus given by Rome to the advance of the hitherto invincible Sabellian highlanders not only made her the natural head and champion of the low countries, south as well as north of the Liris, but also considerably added to her prestige. Carthage sent her congratulations, and the Etruscan city of Falerii voluntarily enrolled herself among the allies of Rome. Of even greater service, however, was the fact that for 15 years the Samnites remained quiet, for this inactivity, whatever its cause, enabled Rome triumphantly to surmount a danger which theatened for the moment to wreck her whole position. This danger was nothing less than a desperate effort on the part of nearly all her allies and dependents south of the Tiber to throw off the yoke of her supremacy. The way was led by her ancient confederates the Latini, whose smouldering discontent broke into open flame directly the fear of a Samnite attack was removed. From the Latin Campagna and the Sabine hills the revolt spread westwards and southwards to Antium and Tarracina, and even to the towns of the Campanian plain, where the mass of the inhabitants at once repudiated the alliance formed with Rome by the ruling class. The struggle was sharp but short. In two pitched battles the strength of the insurrection was broken, and two more campaigns sufficed for the complete reduction of such of the insurgent communities as still held out. The revolt crushed, Rome set herself deliberately to the task of re-establishing on a new and firmer basis her supremacy over the lowlands, and in doing so laid the foundations of that marvellous organization which was destined to spread rapidly over Italy, and to withstand the attacks even of Hannibal. The old historic Latin league ceased to exist, though its memory was still preserved by the yearly Latin festival on the Alban Mount. Most if not all of the common land of the league became Roman territory; five at least of the old Latin cities were compelled to accept the Roman franchise (Livy viii. 14; Lanuvium, Aricia, Nomentum, Pedum and Tusculum) and enter the pale of the Roman State. The rest, with the Latin colonies, were ranked as Latin allies of Rome, but on terms which secured their complete dependence upon the sovereign city. The policy of isolation, which became so cardinal a principle of Roman rule, was now first systematically applied. No rights of *conubium* or *commercium* were any longer to exist between these communities. Their federal councils were prohibited, and all federal action independent of Rome forbidden.

In Campania and the coast-lands connecting Campania with Rome, a policy of annexation was considered safer than that of alliance. Of the two frontier posts of the Volsci, Antium and

[1] For the status of Caere, see *Klio* xi., 377.

Velitrae, the former was constituted a Roman colony, its long galleys burnt and their prows set up in the Forum at Rome, while the walls of Velitrae were razed to the ground, its leading men banished beyond the Tiber, and their lands given to Roman settlers. Farther south on the route to Campania, Fundi and Formiae were, after the precedent set in the case of Caere, declared Roman and granted the civil rights of Roman citizenship, while lastly in Campania itself the same status was given to Capua, Cumae and the smaller communities dependent upon them[1]. During the ten years from 338 to 328 the work of settlement was steadily continued. Tarracina, like Antium, was made a Roman colony. Privernum, the last Volscian town to offer resistance to Rome, was subdued in 330, part of its territory allotted to Roman citizens, and the state itself forced to accept the Roman franchise. Lastly, to strengthen the lines of defence against the Sabellian tribes, two colonies with the rights of Latin allies were established at Cales (334) and at Fregellae (328). The settlement of the lowlands was accomplished. As a single powerful and compact state with an outer circle of closely dependent allies, Rome now stood in sharp contrast with the disunited and degenerate cities of northern Etruria, the loosely organized tribes of the Apennines, and the decaying and disorderly Greek towns of the south.

Second Samnite War.—The strength of this system was now to be tried by a struggle with the one Italian people who were still ready and able to contest with Rome the supremacy of the peninsula. The passive attitude of the Samnites between 342 and 327 was no doubt largely due to the dangers which had suddenly threatened them in South Italy. But the death of Alexander of Epirus, in 332, removed their only formidable opponent there, and left them free to turn their attention to the necessity of checking the steady advance of Rome. In 327, the year after the ominous foundation of a Roman colony at Fregellae, a pretext for renewing the struggle was offered them. The Cumaean colony of Palaepolis had incurred the wrath of Rome by its raids into her territory in Campania. The Samnites sent a force to defend it, and Rome replied by a declaration of war. The two opponents were not at first sight unequally matched, and had the Sabellian tribes held firmly together the issue of the struggle might have been different. As it was, however, the Lucanians to the south actually joined Rome from the first, while the northern clans, Marsi, Vestini, Paeligni and Frentani, after a feeble and lukewarm resistance, subsided into a neutrality which was exchanged in 304 for a formal alliance with Rome. An even greater advantage to Rome from the outset was the enmity existing between the Samnites and the Apulians, the latter of whom from the first joined Rome and thus gave her a position in the rear of her enemy and in a country eminently well fitted for maintaining a large military force. These weaknesses on the Samnite side were amply illustrated by the events of the war.

After several years of partial success, the Romans were thoroughly defeated at Caudine Forks (321) and, in order to save their captured army, were compelled to sign a dishonourable treaty of peace. Rome, however, continued to strengthen her connections with the Lucanians and Apulians, settling a Latin colony at Luceria (314), and to draw the net of alliances more closely by winning over the Vestini and Frentani, north and east of Samnium. The Samnites accordingly, finding that peace was more dangerous than war, renewed hostilities in 316, by making a series of desperate efforts to break through the lines of defence which protected Latium and Campania. Sora and Fregellae on the upper Liris were captured by a sudden attack; the Ausones in the low country near the mouth of the same river were encouraged to revolt by the appearance of the Samnite army; and in Campania another army, attracted by rumours of disturbance, all but defeated the Roman consuls under the very walls of Capua. But these efforts were unavailing. Sora and Fregellae were recovered as quickly as they had been lost, and the frontier there was strengthened by the establishment of a colony at Interamna. The Ausones were punished by the confiscation of their territory, and Roman supremacy further secured by the two colonies of Suessa and Pontiae (313). The construction of the famous Via Appia, the work of the censor Appius Claudius Caecus, opened a safe and direct route to Campania, while the capture of Nola deprived the Samnites of their last important stronghold in the Campanian lowlands. The failure of these attempts broke the courage even of the Samnites. Their hopes were indeed raised for a moment by the news that Etruria had risen against Rome (310), but their daring scheme of effecting a union with the Etruscans was frustrated by the energy of the Roman generals. Five years later (305) the Romans revenged a Samnite raid into Campania by an invasion of Samnium itself. Arpinum on the frontier was taken, and at last, after a 22 years' struggle, the second Samnite War was closed by a renewal of the ancient treaty with Rome (304).

The six years of peace which followed (304–298) were employed by Rome in still further strengthening her position. Already, two years before the peace, a rash revolt of the Hernici had given Rome a pretext for finally annexing the territory of her ancient allies. The tribal confederacy was broken up, and all the Hernican communities, with the exception of three which had not joined the revolt, were incorporated with the Roman State as municipia, with the civil rights of the Roman franchise. Between the Hernican valley and the frontiers of the nearest Sabellian tribes lay what remained of the once formidable people of the Aequi. In their case, too, a revolt (304) was followed by the annexation of their territory, which was marked in this case by the formation there (301) of two Roman tribes (Aniensis and Teretina). Not content with thus carrying the borders of their own territory up to the very frontiers of the Sabellian country, Rome succeeded (304) in finally detaching from the Sabellian confederacy all the tribes lying between the north-east frontier of Latium and the Adriatic sea. Henceforward the Marsi, Paeligni, Vestini, Marrucini and Frentani were enrolled among the allies of Rome, and not only swelled her forces in the field but interposed a useful barrier between her enemies to the north in Etruria and Umbria and those to the south in Samnium, while they connected her directly with the friendly Apulians. Lastly, as a security for the fidelity at least of the nearest of these allies, colonies were planted in the Marsian territories at Alba Fucentia (303) and at Carsioli (298). A significant indication of the widening range of Rome's influence in Italy, and of the new responsibilities rapidly pressing upon her, is the fact that when in 302 the Spartan Cleonymus landed in the territory of the Sallentini, far away in the south-east, he was met and repulsed by an Italic and Roman force.

Third Samnite War.—Six years after the conclusion of the treaty which ended the second Samnite War, news arrived that the Samnites were harassing the Lucanians. Rome at once interfered to protect her allies. Samnium was invaded in force, the country ravaged and one stronghold after another captured. Unable any longer to hold their own in a position where they were hedged round by enemies, the Samnite leaders, turned as a last hope to the communities of northern Etruria, to the free tribes of Umbria and to the once dreaded Celts. With a splendid daring they formed the scheme of uniting all these people with themselves in a last desperate effort to break the power of Rome.

For some 40 years after the final annexation of southern Etruria (351 B.C.) matters had remained unchanged in that quarter. Sutrium and Nepete still guarded the Roman frontier; the natural boundary of the Ciminian forest was still intact; and up the valley of the Tiber, Rome had not advanced beyond Falerii, a few miles short of the most southerly Umbrian town Ocriculum. But in 311, on the expiry, apparently, of the long truce with Rome, concluded in 351, the northern Etruscans, alarmed no doubt by the rapid advances which Rome was making farther south, rose in arms and attacked Sutrium. The attack, however, recoiled disastrously upon the heads of the assailants. A Roman force promptly relieved Sutrium, and its leader, Q. Fabius Rullianus, without awaiting orders from home. boldly plunged

[1] For the controversy as to the precise status of Capua and the "equites Campani" (Livy viii. 14), *see* Beloch, *Ital. Bund*, 122 seq.; *idem, Cnmpanien,* 317; Mommsen, ***Staatsr.*** iii. 574; **Frank, *Roman Imperialism.*** 41.

into the wilds of the Ciminian forest, and crossing them safely swept with fire and sword over the rich lands to the north. Then turning southwards he met and utterly defeated the forces which the Etruscans had hastily raised in the hopes of intercepting him at the Vadimonian lake. This decisive victory ended the war. The Etruscan cities, disunited among themselves, and enervated by long years of peace, abandoned the struggle for the time, paid a heavy indemnity and concluded a truce with Rome (309–08). In the same year the promptitude of Fabius easily averted a threatened attack by the Umbrians, but Rome proceeded nevertheless to fortify herself in her invariable fashion against future dangers on this side, by an alliance with Ocriculum, which was followed ten years later (299) by a colony at Narnia, and an alliance with the Picenes, whose position in the rear of Umbria rendered them as valuable to Rome as the Apulians had proved farther south.

Fourteen years had passed since the battle on the Vadimonian lake, when the Samnites appeared on the borders of Etruria and called on the peoples of northern Italy to rise against the common enemy. Their appeal, backed by the presence of their troops, was successful. The Etruscans found courage to face the Roman legions once more; a few of the Umbrians joined them; but the most valuable allies to the Samnites were the Celts, who had for some time threatened a raid across the Apennines, and who now marched eagerly into Umbria and joined the coalition. The news that the Celts were in motion produced a startling effect at Rome, and every nerve was strained to meet this new danger. While two armies were left in southern Etruria as reserves, the two consuls, Q. Fabius Maximus Rullianus and P. Decius Mus the younger, both tried soldiers, marched northwards up the valley of the Tiber and into Umbria at the head of four Roman legions and a still larger force of Italian allies. At Sentinum, on the farther side of the Apennines, they encountered the united forces of the Celts and Samnites, the Etruscans and Umbrians having, it is said, been withdrawn for the defence of their own homes. The battle that followed was desperate, and the Romans lost one of their consuls, Decius, and more than 8,000 men. But the Roman victory was decisive. The Celts were annihilated, and the fear of a second Celtic attack on Rome removed. All danger from the coalition was over. The Etruscan communities gladly purchased peace by the payment of indemnities. The rising in Umbria, never formidable, died away, and the Samnites were left single-handed to bear the whole weight of the wrath of Rome. During four years more, however, they desperately defended their highland homes, and twice at least, in 293 and 292, they managed to place in the field a force sufficient to meet the Roman legions on equal terms. At last, in 290, the consul M. Curius Dentatus finally exhausted their power of resistance. Peace was concluded, and it is significant of the respect inspired at Rome by their indomitable courage that they were allowed to become the allies of Rome, on equal terms and without any sacrifice of independence.

Between the close of the third Samnite War and the landing of Pyrrhus in 281 B.C. we find Rome engaged, as was her wont, in quietly extending and consolidating her power. In southern Italy she strengthened her hold on Apulia by planting on the borders of Apulia and Lucania the strong colony of Venusia. In central Italy the annexation of the Sabine country (290) carried her frontiers eastwards to the borders of her Picentine allies on the Adriatic. Farther east, in the territory of the Picentes themselves, she established colonies on the Adriatic coast at Hadria and Castrum (286–283). North of the Picentes lay the territories of the Celtic Senones stretching inland to the north-east borders of Etruria, and these too now fell into her hands. Ten years after their defeat at Sentinum (285–284) a Celtic force descended into Etruria, besieged Arretium and defeated the relieving force despatched by Rome. In 283 the consul L. Cornelius Dolabella was sent to avenge the insult. He completely routed the Senones. Their lands were annexed by Rome, and a colony established at Sena on the coast. This success, followed as it was by the decisive defeat of the neighbouring tribe of the Boii, who had invaded Etruria and penetrated as far south as the Vadimonian lake, awed the Celts into quiet, and for more than 40 years there was comparative tranquillity in northern Italy.

Pyrrhus.—In the south, however, the claims of Rome to supremacy were now to be disputed by a new and formidable foe. At the close of the third Samnite War the Greek cities on the southern coast of Italy found themselves once more harassed by the Sabellian tribes on their borders, whose energies, no longer absorbed by the long struggles in central Italy, now found an attractive opening southwards.

The city of Thurii appealed to Rome for protection, and the plebeian assembly at Rome—recently given full legislative powers by the Hortensian law—voted to send the consul Fabricius to aid the Greeks. The consul easily routed the barbarians and established a garrison in the city. Thurii thus accepted Rome's suzerainty. The Tarentines, who claimed to be the protectors of the Greeks in Italy, were offended at the course taken by Thurii, and rightly feared that Rome's advance to the sea would soon compel all the cities of Magna Graecia to acknowledge the dominance of Rome's influence. While the Tarentines were debating whether to protest, several Roman ships (presumably of the *socii navales*), bound for the Adriatic colonies of Rome, appeared off the harbour of Tarentum. Since the Romans had long before signed a treaty that no Roman ships of war should sail east of the Lacinian cape, the Tarentines regarded the appearance of this squadron as a hostile act, attacked it. killed the admiral and sank most of the ships. Rome, desiring peace, asked for reparations without making a hostile demonstration, but the democratic party in Tarentum, bent upon asserting the independence and power of their city, engaged King Pyrrhus of Epirus to come to their aid and, in reliance upon his forces, declared war upon Rome (281).

King Pyrrhus (see PYRRHUS), whose timely appearance seemed for the moment to have saved the independence of Tarentum, was the most brilliant of the military adventurers whom the disturbed times following the death of Alexander the Great had brought into prominence. High-spirited, generous and ambitious, he had formed the scheme of rivalling Alexander's achievements in the East, by winning for himself an empire in the West. He aspired not only to unite under his rule the Greek communities of Italy and Sicily, but to overthrow the great Phoenician state of Carthage—the natural enemy of Greeks in the West, as Persia had been in the East. Of Rome it is clear that he knew little or nothing; the task of ridding the Greek seaports of their barbarian foes he no doubt regarded as an easy one; and the splendid force he brought with him was intended rather for the conquest of the West than for the preliminary work of chastising a few Italian tribes, or securing the submission of the unwarlike Italian Greeks. He defeated the Roman consul, M. Valerius Laevinus, on the banks of the Siris (280), and gained the support of the Greek cities as well as that of numerous bands of Samnites, Lucanians and Bruttians. But, to the disappointment of his new allies, Pyrrhus showed no anxiety to follow up his advantage. His heart was set on Sicily and Africa, and his immediate object was to come to terms with Rome. But though he advanced as near Rome as Anagnia (279), nothing could shake the resolution of the senate, and in the next year (278) he again routed the legions at Asculum (Ascoli), but only to find that the indomitable resolution of the enemy was strengthened by defeat. He now crossed into Sicily, where, though at first successful, he was unable to achieve any lasting result., Soured and disappointed, Pyrrhus returned to Italy (276) to find the Roman legions steadily moving southwards, and his Italian allies disgusted by his desertion of their cause. In 275 the decisive battle of the war was fought at Beneventum. The consul M. Curius Dentatus, the conqueror of Samnium, gained a complete victory and Pyrrhus, unable any longer to face his opponents in the field, and disappointed of all assistance from his allies, retreated in disgust to Tarentum and thence crossed into Greece.

A few years later (272) Tarentum was surrendered to Rome by its Epirot garrison; it was granted a treaty of alliance, but its walls were razed and its fleet handed over to Rome. In 270 Rhegium also entered the ranks of Roman allies, and finally in 269 a single campaign crushed the last efforts at resistance in Sam-

nium. Rome was now at leisure to consolidate the position she had won. Between 273 and 263 three new colonies were founded In Samnium and Lucania — Paestum in 273, Beneventum in 268, Aesernia in 263. In central Italy the area of Roman territory was increased by the full enfranchisement (268) of the Sabines, and of their neighbours to the east, the people of Picenum. To guard the Adriatic coast, colonies were established at Ariminum (268), at Firmum and at Castrum Novum (264), while to the already numerous maritime colonies was added that of Cosa in Etruria.

Rome the Mistress of Italy. — Rome was now the undisputed mistress of Italy. The limits of her supremacy to the north were represented roughly by a line drawn across the peninsula from the mouth of the Arnus on the west to that of the Aesis on the east. Beyond this line lay the Ligurians and the Celts; all south of it was now united as "Italy" under the rule of Rome.

But the rule of Rome over Italy, like her wider rule over the Mediterranean coasts, was not an absolute dominion over conquered subjects. It was in form at least a confederacy under Roman protection and guidance; and the Italians, like the provincials, were not the subjects, but the "allies and friends" of the Roman people. In the treatment of these allies Rome consistently followed the maxim, *divide et impera*. In every possible way she strove to isolate them from each other, while binding them closely to herself. The old federal groups were in most cases broken up, and each of the members united with Rome by a special treaty of alliance. In Etruria, Latium, Campania and Magna Graecia the city was taken as the unit; in central Italy where urban life was non-existent, the unit was the tribe. The northern Sabellian peoples, for instance — the Marsi, Paeligni, Vestini, Marrucini and Frentani — were now constituted as separate communities in alliance with Rome. In many cases, too, no freedom of trade or intermarriage was allowed between the allies themselves. Nor were all these numerous allied communities placed on the same footing as regarded their relations with Rome herself. To begin with, a sharp distinction was drawn between the "Latini" and the general mass of Italian allies. The "Latins" of this period had little more than the name in common with the old 30 Latin peoples of the days of Spurius Cassius. With a few exceptions, such as Tibur and Praeneste, the latter had either disappeared or had been incorporated with the Roman State, and the Latins of 268 B.C. were almost exclusively the "Latin colonies," that is to say, communities founded by Rome, composed partly of allies but chiefly of men of Roman blood, and whose only claim to the title "Latin" lay in the fact that Rome granted to them some portion of the rights and privileges formerly enjoyed by the old Latin cities under the Cassian treaty. Though nominally allies, they were in fact offshoots of Rome herself, bound to her by community of race, language and interest, and planted as Roman garrisons among alien and conquered peoples. The Roman citizen who joined a Latin colony lost his citizenship — to have allowed him to retain it would no doubt have been regarded as enlarging too rapidly the limits of the citizen body; but he received in exchange the status of a favoured ally. The member of a Latin colony had the right of *commercium* and down to 268 of *conubium* also with Roman citizens. Provided they left sons and property to represent them at home, they were free to migrate to Rome and acquire the Roman franchise. In war-time they not only shared in the booty, but claimed a portion of any land confiscated by Rome and declared "public." These privileges, coupled with their close natural affinities with Rome, successfully secured the fidelity of the Latin colonies, which became not only the most efficient props of Roman supremacy, but powerful agents in the work of Romanizing Italy. Below the privileged Latins stood the Italian allies; and here again we know generally that there were considerable differences of status, determined in each case by the terms of their respective treaties with Rome. We are told that the Greek cities of Neapolis and Heraclea were among the most favoured; the Bruttii, on the other hand, seem, even before the Hannibalic War, to have been less generously treated. But beyond this we have no detailed information.

Rome, however, did not rely only on this policy. Her allies were attached as closely to herself as they were clearly separated from each other, and from the first she took every security for the maintenance of her own paramount authority. Within its own borders, each ally was left to manage its own affairs as an independent State. The badges which marked subjection to Rome in the provinces — the resident magistrate and the tribute — were unknown in Italy. But in all points affecting the relations of one ally with another, in all questions of the general interests of Italy and of foreign policy, the decision rested solely with Rome. The place of a federal constitution, of a federal council, of federal officers, was filled by the Roman senate, assembly and magistrates. The maintenance of peace and order in Italy, the defence of the coasts and frontiers, the making of war or peace with foreign Powers, were matters the settlement of which Rome kept entirely in her own hands. Each allied State, in time of war, was called upon for a certain contingent of men, but, though, its contingent usually formed a distinct corps under officers of its own, its numerical strength was fixed by Rome, it was brigaded with the Roman legions, and was under the orders of the Roman consul.

The Roman State. — This paramount authority of Rome throughout the peninsula was confirmed and justified by the fact that Rome herself was now infinitely more powerful than any one of her numerous allies. Her territory, as distinct from that of the allied States, covered something like one-third of the peninsula south of the Aesis. Along the west coast it stretched from Caere to the southern borders of Campania. Inland, it included the former territories of the Aequi and Hernici, the Sabine country, and even extended eastwards into Picenum, while beyond these limits were outlying districts, such as the lands of the Senonian Celts, with the Roman colony of Sena, and others elsewhere in Italy, which had been confiscated by Rome and given over to Roman settlers. Since the first important annexation of territory after the capture of Veii (396), 12 new tribes had been formed, and the number of male citizens registered at the census had risen from 152,000 to 290,000. Within this enlarged Roman State were now included numerous communities with local institutions and government. At their head stood the Roman colonies (*coloniae civium Romanorum*), founded to guard especially the coasts of Latium and Campania. Next to these eldest children of Rome came those communities which had been invested with the full Roman franchise, such, for instance, as the old Latin towns of Aricia, Lanuvium, Tusculum, Nomentum and Pedum. Lowest in the scale were those which had not been considered ripe for the full franchise, but had, like Caere, received instead the *civitas sine suffragio*, the civil without the political rights. Their members, though Roman citizens, were not enrolled in the tribes, and in time of war served not in the ranks of the Roman legions but in separate contingents. In addition to these organized town communities, there were also the groups of Roman settlers on the public lands, and the dwellers in the village communities of the enfranchised highland districts in central Italy.

The administrative needs of this enlarged Rome were obviously such as could not be adequately satisfied by the system which had done well enough for a small city State with a few square miles of territory. The old centralization of all government in Rome itself had become an impossibility, and the Roman statesmen did their best to meet the altered requirements of the time. The urban communities within the Roman pale, colonies and *municipia*, were allowed a large measure of local self-government. In all we find local assemblies, senates and magistrates, to whose hands the ordinary routine of local administration was confided, and, in spite of differences in detail, e.g., in the titles and numbers of the magistrates, the same type of constitution prevailed throughout. But these local authorities were carefully subordinated to the higher powers in Rome. The local constitution could be modified or revoked by the Roman senate and assembly, and the local magistrates, no less than the ordinary members of the community, were subject to the paramount authority of the Roman consuls, praetors and censors. In particular, care was taken to keep the administration of justice well under central control. The Roman citizen in a colony or *municipium* enjoyed, of course, the right of appeal of the Roman people in a capital

case. We may also assume that from the first some limit was placed to the jurisdiction of the local magistrate, and that cases falling outside it came before the central authorities. But an additional safeguard for the equitable and uniform administration of Roman law, in communities to many of which the Roman code was new and unfamiliar, was provided by the institution of prefects (*praefecti iuri* dicundo), who were sent out annually, as representatives of the Roman praetor, to administer justice in the colonies and *municipia*. To prefects, moreover, were assigned the charge of those districts within the Roman pale where no urban communities, and consequently no organized local government, existed. In these two institutions, that of municipal government and that of prefectures, we have already two of the cardinal points of the later imperial system of government.

Lastly, the changes which the altered position and increased responsibilities of Rome had effected in her military system tended to weaken the intimate connection between the Roman army in the field and the Roman people at home, and thus prepared the way for that complete breach between the two which in the end proved fatal to the republic. It is true that service in the legion was still the first duty and the highest privilege of the fully qualified citizen. But this service was gradually altering in character. Though new legions were still raised each year for the summer campaigns, this was by no means always accompanied, as formerly, by the disbandment of those already on foot, and this increase in the length of time during which the citizen was kept with the standards had, as early as the siege of Veii, necessitated a further deviation from the old theory of military service—the introduction of pay. Moreover, while in the early days of the republic the same divisions served for the soldier in the legion and the citizen in the assembly, in the new manipular system, with its three lines, no regard was paid to civic distinctions, but only to length of service and military efficiency, while at the same time the more open order of fighting which it involved demanded of each soldier greater skill, and therefore a more thorough training in arms than the old phalanx. One other change resulted from the new military necessities of the time, which was as fruitful of results as the incipient separation between the citizen and the soldier. Under the early republic, the chief command of the legions rested with the consuls of the year. But, as Rome's military operations increased in area and in distance from Rome, a larger staff became necessary, and the inconvenience of summoning home a consul in the field from an unfinished campaign became intolerable. The remedy found, that of prolonging for a further period the imperium of the consul, was first applied in 327 B.C. in the case of Q. Publilius Philo, and between 327 and 264 instances of this *prorogatio imperii* became increasingly common. This proconsular authority, originally an occasional and subordinate one, was destined to become first of all the strongest force in the Republic, and ultimately the chief prop of the power of the Caesars.

Period B: Rome and the Mediterranean States, 265–146 **B.C.**—(*a*) Conquest of the West.—Though marked out by her geographical position as the natural centre of the Mediterranean, Italy had hitherto played no active part in the Mediterranean politics, but, now that she was for the first time united, it was felt throughout the Mediterranean world that a new Power had arisen, and Rome, as the head and representative of Italy, found herself irresistibly drawn into the vortex of Mediterranean affairs. Egypt sought her alliance, and Greek scholars began to interest themselves keenly in the history, constitution and character of the Latin republic which had so suddenly become famous. But Rome looked naturally westwards rather than eastwards. The western coasts of the peninsula were the most fertile and populous and wealthy; and it was in this direction that the natural openings for Italian commerce were to be found. It was, however, precisely on this side that Rome had serious ground for anxiety. Carthage was now at the height of her power. Her outposts were threateningly near to Italy in Sardinia and in Sicily, while her fleets swept the seas and jealously guarded for the benefit of Carthage alone the hidden treasures of the West. In the east of Sicily, Syracuse still upheld the cause of Greek independence against the hereditary foe of the Greek race; but Syracuse stood alone, and her resources were comparatively small. What Rome had to fear was the establishment, and that at no distant date, of an absolute Carthaginian domination over the western seas—a domination which would not only be fatal to Italian commerce, but would be a standing menace to the safety of the Italian coasts.

First Punic War, 265–241.—It was above all things essential for Rome that the Carthaginians should advance no farther eastwards. But in 265 Rome was threatened with the establishment of Carthaginian rule at Messana, within sight of the Italian coast. The intervention of both powers in a quarrel between the Mamertines, a body of Campanian mercenaries who had occupied Messana, and Hieron II. of Syracuse, led to the outbreak of war between Rome and Carthage in 264 B.C. The military history of the struggle which followed is treated in the article PUNIC WARS; it will suffice to note here that the war lasted until 241 B.C., when the Carthaginians were compelled to cede Sicily and the Lipari islands to Rome, and to pay an indemnity of 3,200 talents (about £800,000).

The struggle was one in which both Rome and Carthage were serving an apprenticeship in a warfare the conditions of which were unfamiliar to both. The Roman legions were foes very unlike any against which the Carthaginian leaders had ever led their motley array of mercenaries, while Rome was called upon for the first time to fight a war across the sea, and to fight with ships against the greatest naval power of the age. The chief dangers for Carthage lay obviously in the jealousy exhibited at home of her officers abroad, in the difficulty of controlling her mercenary troops, and in the ever-present possibility of disaffection among her subjects in Libya—dangers which even the genius of Hannibal failed finally to surmount. Rome, on the other hand, was strong in the public spirit of her citizens, the fidelity of her allies, the valour and discipline of her legions. What she needed was a system which would make a better use of her splendid materials than one under which her plans were shaped from day to day by a divided senate, and executed by officers who were changed every year, and by soldiers most of whom returned home at the close of each summer's campaign.

The interval between the first and second Punic Wars was employed by both Rome and Carthage in strengthening their respective positions. The eastern end of Sicily was still left under the rule of Hieron as the ally of Rome, but the larger western portion of the island became directly subject to Rome, and a temporary arrangement seems to have been made for its government, either by one of the two praetors, or possibly by a quaestor. Sardinia and Corsica had not been surrendered to Rome by the treaty of 241, but three years later (239), on the invitation of the Carthaginian mercenaries stationed in the islands, a Roman force occupied them; Carthage protested, but, on the Romans threatening war, she gave way, and Sardinia and Corsica were formally ceded to Rome, though it was some seven or eight years before all resistance on the part of the natives themselves was crushed. In 227, however, the senate considered matters ripe for the establishment of a separate administration in her oversea possessions. In that year two additional praetors were elected; to one was assigned the charge of western Sicily, to the other that of Sardinia and Corsica, and thus the first stones of the Roman provincial system were laid. Of at least equal importance for the security of the peninsula was the subjugation of the Celtic tribes in the valley of the Po. These, headed by the Boii and Insubres and assisted by levies from the Celts to the westward, had in 225 alarmed the whole of Italy by invading Etruria and penetrating to Clusium, only three days' journey from Rome. Here, however, their courage seems to have failed them. They retreated northwards along the Etruscan coast, until at Telamon their way was barred by the Roman legions returning from Sardinia to the defence of Rome, while a second consular army hung upon their rear. Thus hemmed in, the Celts fought desperately, but were completely defeated and the flower of their tribesmen slain. The Romans followed up their success by invading the Celtic territory. The Boii were easily reduced to submission. The Insubres, north of the Po, resisted more obstinately, but by 222 the war was over,

and all the tribes in the rich Po valley acknowledged the supremacy of Rome. The conquered Celts were not enrolled among the Italian allies of Rome, but were treated as subjects beyond the frontier. Two colonies were founded to hold them in check—Placentia (218) and Cremona in the territory of the Insubres—and the great northern road (Via Flaminia) was completed as far as the Celtic border at Ariminum.

On the Adriatic coast the immediate interests of Rome were limited to rendering the sea safe for Italian trade. It was with this object that, in 229, the first Roman expedition crossed the Adriatic, and inflicted severe chastisement on the Illyrian pirates of the opposite coast. This expedition was the means of establishing for the first time direct political relations between Rome and the states of Greece proper, to many of which the suppression of piracy in the Adriatic was of as much importance as to Italy. Alliances were concluded with Corcyra, Epidamnus and Apollonia; and embassies explaining the reasons which had brought Roman troops into Greece were sent to the Aetolians, the Achaeans and even to Athens and Corinth. Everywhere they were well received, and the admission of the Romans to the Isthmian games (228) formally acknowledged them as the natural allies of the free Greek states against both barbarian tribes and foreign despots. Meanwhile Carthage had acquired a possession which promised to compensate her for the loss of Sicily, Sardinia and Corsica. The genius of her greatest citizen and soldier, Hamilcar Barca, had appreciated the enormous value of the Spanish peninsula, and conceived the scheme of founding there a Carthaginian dominion which should not only add to the wealth of Carthage, but supply her with a base of operations for a war of revenge with Rome. The conquest of southern and eastern Spain, begun by Hamilcar (236–228) and carried on by his kinsman Hasdrubal (228–221), was completed by his son Hannibal, who, with all his father's genius, inherited also his father's hatred of Rome, and by 219 the authority of Carthaqe had been extended as far as the Ebro (see SPAIN, History). Rome's ancient ally Massilia (mod. Marseilles) was especially disturbed by these advances, for she had trading posts on the coast of Spain which would become unprofitable if Carthage conquered the whole of the interior and drew the commerce of the peninsula southwards to the Punic ports. Furthermore, since Carthage forbade Massiliot traders to make use of the straits of Gibraltar, Massiliot trade in British tin would be endangered if Carthage succeeded in reaching southern Gaul. From the fact that Marseilles lent her whole navy to Rome when the war broke out we may assume that her envoys were active in reporting the advance of Carthage in Spain and in interpreting that advance as aimed at Rome. Rome finally was induced to act. A defensive alliance was signed with Saguntum, a seaport of Spain which was still independent, and Hasdrubal was asked to promise that Carthage should not carry her arms beyond the Ebro river (226).

Second Punic War, 218–211.—But these precautions were of no avail against the resolute determination of Hannibal, with whom the conquest of Spain was only preliminary to an attack upon Italy, and who could not afford to leave behind him in Spain a state. allied to Rome. In 219, therefore, disregarding the protests of a Roman embassy, he attacked and took Saguntum, an act which, as he had foreseen, rendered a rupture with Rome inevitable, while it set his own hands free for a further advance.

For the details of the war which followed, see the articles PUNIC WARS; HANNIBAL; and SCIPIO, PUBLIUS CORNELIUS. From the outbreak of hostilities until the crowning victory of Cannae in 216 Hannibal's career of success was unchecked; and the annihilation of the Roman army in that battle was followed by the defection of almost the whole of southern Italy, with the exception of the Latin colonies and the Greek coast towns. In 21 j, moreover, Philip V. of Macedon formed an alliance with Hannibal and threatened to invade Italy; in 214 Syracuse revolted, and in 212 the Greek cities in northern Italy went over to Hannibal. But the indomitable spirit of the Romans asserted itself in the face of these crushing misfortunes. In 212 Syracuse was recovered; in 211 Capua fell after a long siege which Hannibal failed to raise, even by his famous march up to the gates of Rome, and in the same year a coalition was formed in Greece against Philip V. of Macedon, which effectually paralysed his offensive action. Hannibal was now confined to Lucania and Bruttium; and his brother Hasdrubal, marching from Spain to join him, was defeated and slain on the river Metaurus (207). The war in Italy was now virtually ended, for, though during four years more Hannibal stood at bay in a corner of Bruttium, he was powerless to prevent the restoration of Roman authority throughout the peninsula. Sicily was once more secure; and finally in 206, the year after the victory on the Metaurus, the successes of the young P. Scipio in Spain (211–206) were crowned by the complete expulsion of the Carthaginians from the peninsula. On his return from Spain Scipio eagerly urged an immediate invasion of Africa. The senate hesitated; but Scipio gained the day. He was elected consul for 205, and given the province of Sicily, with permission to cross into Africa if he thought fit. Voluntary contributions of men, money and supplies poured in to the support of the popular hero; and by the end of 205 Scipio had collected in Sicily a sufficient force for his purpose. In 204 he crossed to Africa, where he was welcomed by the Numidian prince Massinissa, whose friendship he had made in Spain. In 203 he twice defeated the Carthaginian forces, and a large party at Carthage were anxious to accept his offer of negotiations. But the advocates of resistance triumphed.

Hannibal was recalled from Italy, and returned to fight his last battle against Rome at Zama, where Scipio, who had been continued in command as proconsul for 202 by a special vote of the people, won a complete victory. The war was over. The Roman assembly voted that the Carthaginian request for peace should be granted, and entrusted the settlement of the terms to Scipio and a commission of ten senators. Carthage was allowed to retain her territory in Africa; but she undertook to wage no wars outside Africa, and none inside without the consent of Rome. She surrendered all her ships but ten triremes, her elephants, and all prisoners of war, and agreed to pay an indemnity of 10,000 talents in 50 years. The Numidian Massinissa (*q.v.*) was rewarded by an increase of territory, and was enrolled among the "allies and friends" of the Roman people.

The West Under Roman Rule.—Thebattle of Zama decided the fate of the West. The power of Carthage was broken and her supremacy passed to Rome. Henceforth Rome had no rival to fear westward of Italy, and it rested with herself to settle within what limits her supremacy should be confined and what form it should take. In Sicily the former dominions of Hieron were at once united with the western half of the island as a single province, and in Spain, after nine years of a provisional Government (206–197), two provinces were in 197 definitely established, and each, like Sicily, assigned to one of the praetors for the year, two additional praetors being elected for the purpose. But here the resemblance between the two cases ends. From 201 down to the outbreak of the Slave War in 136 there was unbroken peace in Sicily, and its part in the history is limited to its important functions in supplying Rome with corn and in provisioning and clothing the Roman legions. The governors of the two Spains had very different work to do from that which fell to the lot of the Sicilian praetors. The condition of Spain required that year after year the praetors should be armed with the consular authority, and backed by a standing force of four legions, while more than once the presence of the consuls themselves was found necessary. Still, in spite of all difficulties, the work of pacification proceeded. To M. Porcius Cato (consul, 195) and to Tiberius Sempronius Gracchus (praetor and pro-praetor, 180–179), father of the two tribunes, is mainly due the credit of quieting the Celtiberian tribes of central Spain, and the government of Gracchus was followed by 30 years of comparative tranquillity. The insurrection headed by Viriathus in 149 was largely caused by exactions of the Roman magistrates themselves, while its obstinate continuance down to the capture of Numantia, in 133, was almost as much the result of the incapacity of the Roman commanders. But the re-settlement of the country by Scipio Africanus the younger in that year left all Spain, with the exception of the highland Astures and Cantabri in the north-west, finally and tranquilly subject to

Rome.

Third Punic War, 153–146.—In Africa there was no question at first of the introduction of Roman government by the formation of a province *(see* AFRICA, ROMAN). Carthage, bound hand and foot by the treaty of 201, was placed under the jealous watch of the loyal prince of Numidia, who himself willingly acknowledged the suzerainty of Rome. But it was impossible for this arrangement to be permanent. Every symptom of reviving prosperity at Carthage was regarded at Rome with feverish anxiety, and neither the expulsion of Hannibal in 195 nor his death in 183 did much to check the growing conviction that Rome would never be secure while her rival existed. It was therefore with grim satisfaction that many in the Roman senate watched the increasing irritation of the Carthaginians under the harassing raids and encroachments of their favoured neighbor Massinissa, and waited for the moment when Carthage should, by some breach of the conditions imposed upon her, supply Rome with a pretext for interference. At last in 151 came the news that Carthage, in defiance of treaty obligations, was actually at war with Massinissa. The anti-Carthaginian party in the senate, headed by M. Porcius Cato, eagerly seized the opportunity, and war was declared, and nothing short of the destruction of their city itself was demanded from the despairing Carthaginians. The demand was refused and in 149 the siege of Carthage begun. During the next two years little progress was made, but in 147 P. Cornelius Scipio Aemilianus, grandson by adoption of the conqueror of Hannibal, was, at the age of 37, and though only a candidate for the aedileship, elected consul and given the command in Africa. In the next year (146) Carthage was taken and razed to the ground. Its territory became the Roman province of Africa, while Numidia, now ruled by the three sons of Massinissa, remained as an allied state under Roman suzerainty, and served to protect the new province against the raids of the desert tribes (see CARTHAGE).

In Italy itself the Hannibalic War had been followed by important changes. In the north the Celtic tribes paid for their sympathy with Hannibal by the final loss of all separate political existence. Cispadane Gaul, studded with colonies and flooded with Roman settlers, was rapidly Romanized. Beyond the Padus (Po) in Polybius's time Roman civilization was already widely spread. In the extreme north-east the Latin colony of Aquileia, the last of its kind, was founded in 181, to control the Alpine tribes, while in the north-west the Ligurians were held in check by the colony of Luna (180), and by the extensive settlements of Roman citizens and Latins made on Ligurian territory in 173. In southern Italy the depression of the Greek cities on the coast, begun by the raids of the Sabellian tribes, was completed by the repeated blows inflicted upnn them during the Hannibalic struggle. Some of them lost territory[1]; all suffered from a decline of population and loss of trade; and their place was taken by such new Roman settlements as Brundisium (Brindisi) and Puteoli (Pozzuoli) In the interior the southern Sabellian tribes suffered scarcely less severely. The Bruttii were struck off the list of Roman allies, and nearly all their territory was confiscated. To the Apulians and Lucanians no such hard measure was meted out; but their strength had been broken by the war, and their numbers dwindled; large tracts of land in their territories were seized by Rome, and allotted to Roman settlers, or occupied by Roman speculators. That Etruria also suffered from declining energy, a dwindling population, and the spread of large estates is clear from the state of things existing there in 133. It was indeed in central Italy, the home of the Latins and their nearest kinsmen, and in the new Latin and Roman settlements throughout the peninsula, that progress and activity were henceforth concentrated.

(*b*) **Rome in the East, 200–133.**—Ever since the repulse of Pyrrhus from Italy, Rome had been slowly drifting into closer contact with the eastern states. With one of the three great powers which had divided between them the empire of Alexander, with Egypt, she had friendly relations since 273, and the friendship had been cemented by the growth of commercial intercourse between the two countries. In 228 her chastisement of the Illyrian pirates had led naturally enough to the establishment of friendly relations with some of the states of Greece proper. In 214 the alliance between Philip V. and Hannibal, and the former's threatened attack on Italy, forced her into war with Macedon, at the head of a coalition of the Greek states against him, which effectually frustrated his designs against herself; at the first opportunity, however (205), she ended the war by a peace which left the position unchanged. The results of the war were not only to draw closer the ties which bound Rome to the Greek states, but to inspire the senate with a genuine dread of Philip's restless ambition, and with a bitter resentment against him for his union with Hannibal. The events of the next four years served to deepen both these feelings. In 205 Philip entered into a compact with Antiochus III. of Syria for the partition between them of the dominions of Egypt, now left by the death of Ptolemy Philopator to the rule of a boy-king. Antiochus was to take Coele-Syria and Phoenicia, while Philip claimed for his share the districts subject to Egypt on the coasts of the Aegean and the Greek islands. Philip no doubt hoped to be able to secure these unlawful acquisitions before the close of the second Punic War should set Rome free to interfere with his plans. But the obstinate resistance offered by Attalus of Pergamum and the Rhodians upset his calculations. In 201 Rome made peace with Carthage, and the senate had leisure to listen to the urgent appeal for assistance which reached her from her Eastern allies. With Antiochus indeed the senate was not yet prepared to quarrel; but with Philip the senate was ready to have a serious discussion despite the depletion of all resources. Philip had compelled Rome to give way to him in Illyricum, and he had proved by his attack on Egypt that he would prove to be a dangerous neighbour in time of peril. Furthermore philhellenism had grown very strong at Rome since Livius, Naevius and Ennius had translated scores of Greek plays for production at the Roman festivals. To the nobles who were now eagerly reading Homer, Plato and Euripides, the appeal of the old Greek cities for protection of independence, democracy and culture in Greece came to open ears. The people, to be sure, remembering all too well what they had suffered in the last war, at first rejected the senate's proposal to aid the Greeks, but the nobles, insisting that postponement would only result in a Macedonian invasion of Italy, finally secured a declaration of war (200).

Second Macedonian War, 200–197.—The war began in the summer of 200 B.C., and, though the landing of the Roman legions in Epirus was not followed, as had been hoped, by any general rising against Philip, yet the latter made no progress south of Boeotia. The fleets of Pergamum and Rhodes, now the zealous allies of Rome, protected Attica and watched the eastern coasts. The Achaeans and Nabis of Sparta were obstinately neutral, while nearer home in the north the Epirots and Aetolians threatened Thessaly and Macedonia. His own resources both in men and in money had been severely strained by his constant wars, and the only ally who could have given him effective assistance, Antiochus, was fully occupied with the conquest of Coele-Syria. It is no wonder then that, in spite of his dashing generalship and high courage, he made but a brief stand. T. Quinctius Flamininus (consul, 198), in his first year of command, defeated him on the Aous, drove him back to the pass of Tempe, and in the next year utterly routed him at Cynoscephalae. Almost at the same moment the Achaeans, who had now joined Rome, took Corinth, and the Rhodians defeated his troops in Caria. Further resistance was impossible; Philip submitted, and early the next year a Roman commission reached Greece with instructions to arrange terms of peace. These were such as effectually secured Rome's main object in the war, the removal of all danger to herself and her allies from Macedonian aggression. Philip was left in possession of his kingdom, but was degraded to the rank of a second-rate Power, deprived of all possessions in Greece, Thrace and Asia Minor, and forbidden, as Carthage had been in 201, to wage war without the consent of Rome, whose ally and friend he now became.

The second point in the settlement now eifected by Rome was the liberation of the Greeks. The "freedom of Greece" was

[1] *E.g.,* Tarenturn, Livy, xliv. 16. A Roman colony was established at Croton in 194, and a Latin colony (Copia) at Thurii in 193 (Livy, xxxiv. 45, 53).

proclaimed at the Isthmian games amid a scene of wild enthusiasm, which reached its height when two years later (194) Flamininus withdrew his troops even from the "three fetters of Greece"—Chalcis, Demetrias and Corinth. There is no reason to doubt that, in acting thus, not only Flamininus himself, but the senate and people at home were influenced, partly at any rate, by feelings of genuine sympathy with the Greeks and reverence for their past. It is equally clear that no other course was open to them. For Rome to have annexed Greece, as she had annexed Sicily and Spain, would have been a flagrant violation of the pledges she had repeatedly given both before and during the war; the attempt would have excited the fiercest opposition, and would probably have thrown the Asiatic as well as the European Greeks into the arms of Antiochus. But a friendly and independent Greece would be at once a check on Macedon and a barrier against aggression from the East. Nor while liberating the Greeks did Rome abstain from such arrangements as seemed necessary to secure the predominance of her own influence. In the Peloponnese, for instance, the Achaeans were rewarded by considerable accessions of territory; and it is possible that the Greek states, as allies of Rome, were expected to refrain from war upon each other without her consent.

War with Antiochus, **192–189.**—Antiochus III. of Syria, Philip's accomplice in the proposed partition of the dominions of their common rival, Egypt, returned from the conquest of Coele-Syria (198) to learn first of all that Philip was hard pressed by the Romans, and shortly afterwards that he had been decisively beaten at Cynoscephalae. It was already too late to assist his former ally, but Antiochus resolved at any rate to lose no time in securing for himself the possessions of the Ptolemies in Asia Minor and in eastern Thrace, which Philip had claimed, and which Rome now pronounced free and independent. In 197–196 he overran Asia Minor and crossed into Thrace. But Antiochus was pleasure-loving, irresolute, and no general, and it was not until 192 that the urgent entreaties of the Aetolians, and the withdrawal of the Roman troops from Greece, nerved him to the decisive step of crossing the Aegean; even then the force he took with him was so small as to show that he completely failed to appreciate the nature of the task before him. At Rome the prospect of a conflict with Antiochus excited great anxiety, and it was not until every resource of diplomacy had been exhausted that war was declared, and the real weakness which lay behind the once magnificent pretensions of the "king of kings" was revealed.

Had Antiochus acted with energy when in 192 he landed in Greece, he might have won the day before the Roman legions appeared. As it was, in spite of the warnings of Hannibal, who was now in his camp, and of the Aetolians, he frittered away valuable time between his pleasures at Chalcis and useless attacks on petty Thessalian towns. In 191 Acilius Glabrio landed at the head of an imposing force; and a single battle at Thermopylae broke the courage of Antiochus, who hastily recrossed the sea to Ephesus, leaving his Aetolian allies to their fate. But Rome could not pause here. The safety of her faithful allies, the Pergamenes and Rhodians, and of the Greek cities in Asia Minor, as well as the necessity of chastising Antiochus, demanded an invasion of Asia. A Roman fleet had already (191) crossed the Aegean, and in concert with the fleets of Pergamum and Rhodes worsted the navy of Antiochus. In 190 the new consul L. Scipio, accompanied by his famous brother, the conqueror of Africa, led the Roman legion for the first time into Asia. At Magnesia ad Sipylum, in Lydia, he met and defeated the motley and ill-disciplined hosts of the great king. For the first time the West, under Roman leadership, successfully encountered the forces of the East, and the struggle began which lasted far on into the days of the emperors. The terms of the peace which followed the victory at Magnesia tell their own story clearly enough. There is no question, any more than in Greece, of annexation; the main object in view is that of securing the predominance of Roman interests and influence throughout the peninsula of Asia Minor, and removing to a safe distance the only eastern Power which could be considered dangerous. The line of the Halys and the Taurus range, the natural boundary of the peninsula eastwards, was established as the boundary between Antiochus and the kingdoms, cities and peoples now enrolled as the allies and friends of Rome. This line Antiochus was forbidden to cross; nor was he to send ships of war farther west than Cape Sarpedon in Cilicia. Immediately to the west of this frontier lay Bithynia, Paphlagonia and the immigrant Celtic Galatae, and these frontier states, now the allies of Rome, served as a second line of defence against attacks from the east. The area lying between these "buffer states" and the Aegean was organized by Rome in such a way as should at once reward the fidelity of her allies and secure both her own paramount authority and safety from foreign attack. Pergamum and Rhodes were so strengthened—the former by the gift of the Chersonese, Lycaonia, Phrpgia, Mysia and Lydia, the latter by that of Lycia and Caria—as not only amply to reward their loyalty, but to constitute them effective props of Roman interests and effective barriers alike against Thracian and Celtic raids in the north and Syrian aggression in the south. Lastly, the Greek cities on the coast, except those already tributary to Pergamum, were declared free, and established as independent allies of Rome.

In a space of little over 11 years (200–189) Rome had broken the power of Alexander's successors and established throughout the eastern Mediterranean a Roman protectorate.

Third Macedonian War, 171–168.—It was in the western half of this protectorate that the first steps in the direction of annexation were taken. The enthusiasm provoked by the liberation of the Greeks had died away, and its place had been taken by feelings of dissatisfied ambition or sullen resentment. Internecine feuds and economic distress had brought many parts of Greece to the verge of anarchy, and, above all, the very foundations of the settlement effected in 197 were threatened by the reviving power and aspirations of Macedon. Loyally as Philip had aided Rome in the war with Antiochus, the peace of Magnesia brought him nothing but fresh humiliation. He was forced to abandon all hopes of recovering Thessaly, and he had the mortification to see the hated king of Pergamum installed almost on his borders as master of the Thracian Chersonese. Resistance at the time was unavailing, but from 189 until his death (179) he laboured patiently and quietly to increase the internal resources of his own kingdom, and to foment, by dexterous intrigue, feelings of hostility to Rome among his Greek and barbarian neighbours. His successor, Perseus, his son by a left-handed alliance. continued his father's work. He made friends among the Illyrian and Thracian princes, connected himself by marriage with Antiochus IV. of Syria and with Prusias of Bithynia, and, among the Greek peoples, strove, not without success, to revive the memories of the past glories of Greece under the Macedonian leadership of the Great Alexander. The senate could no longer hesitate. They were well aware of the restlessness and discontent in Greece; and after hearing from Eumenes of Pergamum and from their own officers, all details of Perseus's intrigues and preparations, they declared war. The struggle, in spite of Perseus's courage and the incapacity at the outset of the Roman commanders, was short and decisive. The sympathy of the Greeks with Perseus, which had been encouraged by the hitherto passive attitude assumed by Rome, instantly evaporated on the news that the Roman legions were on their way to Greece. No assistance came from Prusias or Antiochus, and Perseus's only allies were the Thracian king Cotys and the Illyrian Genthius. The victory gained by L. Aemilius Paulus at Pydna (168) ended the war. Perseus became the prisoner of Rome, and as such died in Italy a few years later. Rome had begun the war with the fixed resolution no longer of crippling but of destroying the Macedonian State. Perseus's repeated proposals for peace during the war had been rejected; and his defeat was followed by the final extinction of the kingdom of Philip and Alexander. Macedonia, though it ceased to exist as a single State, was not, however, definitely constituted a Roman province. On the contrary, the mistake was made of introducing some of the main principles of the provincial system—taxation, disarmament and the isolation of the separate communities—without the addition of the element most essential for the maintenance of order—that of a resident Roman governor. The four petty republics now created mere each

autonomous, and each separated from the rest by the prohibition of *commercium* and *conubium*, but no central controlling authority was substituted for that of the Macedonian king. The inevitable result was confusion and disorder, resulting finally (149–48) in the attempt of a pretender, Andriscus, who claimed to be a son of Perseus, to resuscitate the ancient monarchy. On his defeat in 148 the senate declared Macedonia a Roman province, and placed a Roman magistrate at its head.

From 189 to the defeat of Perseus in 168 no formal change of importance in the status of the Greek states had been made by Rome. The senate, though forced year after year to listen to the mutual recriminations and complaints of rival communities and factions, contented itself as a rule with intervening just enough to remind the Greeks that their freedom was limited by its own paramount authority, and to prevent any single state or confederacy from raising itself too far above the level of general weakness which it was the interest of Rome to maintain. After the victory at Pydna, however, the sympathy shown for Perseus, exaggerated as it seems to have been by the interested representations of the romanizing factions in the various states, was made the pretext for a more emphatic assertion of Roman ascendancy. All those suspected of Macedonian leanings were removed to Italy, as hostages for the loyalty of their several communities, and the real motive for the step was made clear by the exceptionally severe treatment of the Achaeans, whose loyalty was not really doubtful, but whose growing power in the Peloponnese and independence of language had awakeped alarm at Rome. A thousand of their leading men, among them the historian Polybius, were carried off to Italy (see POLYBIUS). In Aetolia the Romans connived at the massacre by their so-called friends of 500 of the opposite party. Acarnania was weakened by the loss of Leucas, while Athens was rewarded for her unambitious loyalty by the gift of Delos and Samos.

But this somewhat violent experiment only answered for a time. In 148 the Achaeans rashly persisted, in spite of warnings, in attempting to compel Sparta by force of arms to submit to the league. When threatened by Rome with the loss of all that they had gained since Cynoscephalae, they madly rushed into war. They were easily defeated, and a "commission of ten," under the presidency of L. Mummius, was appointed by the senate thoroughly to resettle the affairs of Greece. Corinth, by orders of the senate, was burnt to the ground and its territory confiscated. Thebes and Chalcis were destroyed, and the walls of all towns which had shared in the last desperate outbreak were razed to the ground. All the existing confederacies were dissolved; no *commercium* was allowed between one community and another. Everywhere an aristocratic type of constitution was established, and the payment of a tribute was apparently imposed. Into Greece, as into Macedonia in 167, the now familiar features of the provincial system were introduced-disarmament, isolation and taxation. The Greeks were still nominally free, and no separate province with a governor of its own was established, but the needed central control was provided by assigning to the neighbouring governor of Macedonia a general supervision over the affairs of Greece. From the Adriatic to the Aegean, and as far north as the river Drilo and Mt. Scardus, the whole peninsula was now under direct Roman rule.

The Roman Protectorate in Asia.—Beyond the Aegean the Roman protectorate worked no better than in Macedonia and Greece, and the quarrels and disorders which flourished under its shadow were aggravated by its longer duration and by the still more selfish view taken by Rome of her responsibilities. At one period indeed, after the battle of Pydna, it seemed as if the more vigorous, if harsh, system then initiated in Macedon and Greece was to be adopted farther east also. The levelling policy pursued towards Macedon and the Achaeans was applied with less justice to Rome's two faithful and favoured allies, Rhodes and Pergamum. The former had rendered themselves obnoxious to Rome by their independent tone. On a charge of complicity with Perseus they were threatened with war, and though this danger was averted they were forced to exchange their equal alliance with Rome for one which placed them in close dependence upon her, and to resign the lucrative possessions in Lycia and Caria given them in 189. Finally, their commercial prosperity was ruined by the establishment of a free port at Delos. With Eumenes of Pergamum no other fault could be found than that he was strong and successful; but this was enough. His brother Attalus was invited, but in vain, to become his rival. His turbulent neighbours, the Galatae, were allowed to harass him by raids. Pamphylia was declared independent, and favours were heaped upon Prusias of Bithynia. These and other annoyances and humiliations had the desired effect. Eumenes and his two successors—his brother and son, Attalus II. and Attalus III.—contrived indeed by studious humility and dexterous flattery to retain their thrones, but Pergamum (*q.v.*) ceased to be a powerful State, and its weakness, added to that of Rhodes, increased the prevalent disorder in Asia Minor. During the same period we have other indications of a temporary activity on the part of Rome. The frontier of the protectorate was pushed forward to the confines of Armenia by alliances with the kings of Pontus and Cappadocia beyond the Halys. In Syria, on the death of Antiochus Epiphanes (164), Rome intervened to place a minor, Antiochus Eupator, on the throne, under Roman guardianship. In 168 Egypt formally acknowledged the suzerainty of Rome, and in 163 the senate, in the exercise of this new authority, restored Ptolemy Philometor to his throne, but at the same time weakened his position by handing over Cyrene and Cyprus to his brother Euergetes.

But this display of energy was short-lived. From the death of Eumenes in 159 down to 133 Rome, secure in the absence of any formidable power in the East, and busy with affairs in Macedonia, Africa and Spain, relapsed into an inactivity the disastrous results of which revealed themselves in the next period, in the rise of Mithridates of Pontus, the spread of Cretan and Cilician piracy, and the advance of Parthia.

'Both the western and eastern Mediterranean now acknowledged the suzerainty of Rome, but her relations with the two were from the first different. The West fell to her as the prize of victory over Carthage, and, the Carthaginian power broken, there was no hindrance to the immediate establishment in Sicily, Sardinia, Spain, and finally in Africa, of direct Roman rule. To the majority, moreover, of her western subjects she brought a civilization as well as a government of a higher type than any before known to them. And so in the West she not only formed provinces but created a new and wider Roman world. To the East, on the contrary, she came as the liberator of the Greeks; and it was only slowly that in this part of the empire her provincial system made way. In the East, moreover, the older civilization she found there obstinately held its ground. Her proconsuls governed and her legions protected the Greek communities, but to the last the East remained in language, manners and thought Greek and not Roman.

(*c*) The Period of the Revolution (146–49 B.C.).—In the course of little more than a century, Rome had become the supreme power in the civilized world. Although in its outward form her old constitution had undergone little change during the age of war and conquest from 265 to 146, the causes, both internal and external, which brought about its fall had been silently at work throughout. Its form was in strictness that of a moderate democracy. The patriciate had ceased to exist as a privileged caste, and there was no longer any order of nobility recognized by the constitution. The senate and the offices of state were in law open to all, and the will of the people in assembly had been in the most explicit and unqualified manner declared to be supreme alike in the election of magistrates, in the passing of laws, and in all matters touching the *caput* of a Roman citizen. But in practice the constitution had become an oligarchy. The senate, not the assembly, ruled Rome, and both the senate and the magistracies were in the hands of a class which, in defiance of the law, arrogated to itself the title and the privileges of a nobility. The ascendancy of the senate is too obvious and familiar a fact to need much illustration here. It was but rarely that the assembly was called upon to decide questions of policy, and then the proposal was usually made by the magistrate in obedience to the

express directions of the senate. In the enormous majority of cases the matter was settled by a *senatus consultum,* without any reference to the people at all. The assembly decides for war or peace, but the conduct of the war and the conditions of peace are matters left to the senate (*q.v.*). Now and then the assembly confers a command upon the man of its choice, or prolongs the *imperium* of a magistrate, but, as a rule, these and all questions connected with foreign affairs are settled within the walls of the senate-house. It is the senate which year after year assigns the commands and fixes the number and disposition of the military forces, directs the organization of a new province, conducts negotiations and forms alliances. Within Italy, though its control of affairs was less exclusive, we find that, besides supervising the ordinary current business of administration, the senate decides questions connected with the Italian allies, sends out colonies, allots lands, and directs the suppression of disorders. Lastly, both in Italy and abroad it managed the finances. Inseparably connected with this monopoly of affairs to the exclusion of the assembly was the control which in practice, if not in theory, the senate exercised over the magistrates. The latter had become what Cicero wrongly declares they were always meant to be, merely the subordinate ministers of the supreme council, which assigned them their departments, provided them with the necessary equipment, claimed to direct their conduct, prolonged their commands, and rewarded them with triumphs. It was now at once the duty and the interest of a magistrate to be in *auctoritate senatus,* "subject to the authority of the senate," and even the once formidable *tribuni plebis* are found during this period actively and loyally supporting the senate, and acting as its spokesmen in the assembly.

The Senatorial Government. — Behind both senate and magistrates, lay the whole power and influence of the new nobility. These *nobiles* were essentially distinct from the older and more legitimate patrician aristocracy. Every patrician was of course noble, but the majority of the "noble families" in 146 were not patrician but plebeian. The title had been gradually appropriated, since the opening of the magistracies, by those families whose members had held the consulship. It was thus in theory within the reach of any citizen who could win this office, and, moreover, it carried with it no legal privileges whatsoever. Gradually, however, the ennobled plebeian families drew together, and combined with the older patrician *gentes* to form a distinct order. Office brought wealth and prestige, and both wealth and prestige were liberally employed in securing for this select circle a monopoly of political power, and excluding new men. Already by the close of the period it was rare for anyone but a noble to find his way into high office or into the senate. The senate and magistrates were the mouthpieces of this order, and identified with it in policy and interest Lastly, it must be allowed that both the senate and the nobility had to some extent justified their power by the use they made of it. It was their tenacity of purpose and devoted patriotism which had carried Rome through the dark days of the Hannibalic War. The heroes of the struggle with Carthage belonged to the leading families; the disasters at the Trasimene lake and at Cannae were associated with the blunders of popular favourites.

From the first, however, there was an inherent weakness in this senatorial government. It had no sound constitutional basis, and with the removal of its accidental supports it fell to the ground. Legally the senate had no positive authority. It could merely advise the magistrate when asked to do so, and its decrees were strictly only suggestions to the magistrate, which he was at liberty to accept or reject as he chose. It had, it is true, become customary for the magistrate not only to ask the senate's advice on all important points, but to follow it when given. But it was obvious that if this custom were weakened, and the magistrates chose to act independently, the senate was powerless. It might indeed anathematize the refractory official, or hamper him if it could by setting in motion against him a colleague or the tribunes, but it could do no more, and these measures failed just where the senate's control was most needed and most difficult to maintain — in its relations with the generals and governors of provinces abroad. The virtual independence of the proconsul was before 146 already exciting the jealousy of the senate and endangering its supremacy. Nor again had the senate any legal hold over the assembly. Except in certain specified cases, it rested with the magistrate to decide whether any question should be settled by a decree of the senate or a vote of the assembly. If he decided to make a proposal to the assembly, he was not bound except by custom to obtain the previous approval of the senate, and the constitution set no limits to the power of the assembly to decide any question whatsoever that was laid before it.

From 150, at least, onwards, there were increasing indications that both the acquiescence of the people in senatorial government and the loyalty of the magistrates to the senate were failing. The rich landowners were not only taking possession of the public lands but were buying out the small farmers. And since the Government took little interest in commerce and industry, the poor were drifting idly to the cities or migrating to the Po valley. Slaves were being brought in to do the work of citizens, and the levies for the wars, which never ceased, fell more and more upon a decreasing citizenry. Between 165 and 135 the number of citizens, which should have increased by at least 100,000, actually dropped 20,000. The populace began to object to the constant levies and to criticize the régime which seemed only to be interested in foreign policies.

It is possible that these constitutional and administrative difficulties would not have proved so rapidly fatal to the republic had not its very foundations been sapped by the changes which followed more or less directly on the conquests of the 3rd and 2nd centuries B.C. For the opening of the world to Rome, and of Rome to the world, produced a radical change in the structure of Roman society. The subjugation of the Mediterranean countries, by placing at the disposal of Rome the vast natural resources of the West and the accumulated treasures of the East, caused a rapid rise in the standard of wealth and a marked change in its distribution. The Roman State was enabled to dispense with the direct taxation of its citizens, since it derived all the revenue which it needed from the subject countries. But this wealth enticed the Romans away from a beneficial development of their own resources into a dangerous parasitism. In time generals and soldiers learned to depend upon the profits of wars, governors to provide for their estates out of illegitimate perquisites of office far away from the vigilant eyes of magistrates at home. Speculators learned to place mortgages in the provinces where interest rates were high, to profit by the protection of Rome's armies, and secure the high return of their investments from lenient governors. Roman nobles, engaged all their lives in the expensive civil and military service, unable to devote any attention to developing their own properties for a livelihood, excused their own and their fellows' exploitation of the subjects. Compelled to find leisure from financial concerns, they disregarded the needs of industry and commerce that might have employed citizens and developed the resources of Italy. Instead they acquiesced in the slave-driven culture of large estates which yielded meagre returns and begot out of war captives a body of citizens bred in servility, ignorance and hatred. Surely the great successes of the 2nd century had come too speedily.

The New Learning. — It was not only the structure and composition of Roman society that underwent a transformation. The victory of Rome in her struggle for supremacy in the Mediterranean basin had been largely due to the powerful conservative forces by which her institutions were preserved from decay. Respect for the *mos maiorum,* or ancestral custom, imposed an effective check on the desire for innovation. Though personal religion, in the deeper sense, was foreign to the Roman temperament, there was a genuine belief in the gods whose favour had made Rome great in the past and would uphold her in the future so long as she trod in the old paths of loyalty and devotion. Above all, the healthy moral traditions of early Rome were maintained by the discipline of the family, resting on the supreme authority of the father — the *patria potestas*—and the powerful influence of the mother, to whom the early training of the child was entrusted. Finally, the institution of the censorship, backed as it was by the mighty force of public opinion, provided a deterrent

which prevented any flagrant deviation from the accepted standard of morals. All this was changed by the influence of Greek civilization with which Rome was first brought face to face in the 3rd century B.C. owing to her relations with Magna Graecia. At first the results of contact with the older and more brilliant culture of Hellas were on the whole good. In the and century B.C., when constant intercourse was established with the communities of Greece proper and of Asia Minor, "philhellenism" became a passion, which was strongest in the best minds of the day and resulted in a quickened intellectual activity, wider sympathies and a more humane life. But at the same time the "new learning" was a disturbing and unsettling force. The Roman citizen was confronted with new doctrines in politics and religion, and initiated into the speculations of critical philosophy. Under the influence of this powerful solvent the fabric of tradition embodied in the *mos maiorum* fell to pieces; a revolt set in against Roman discipline and Roman traditions of self-effacement, and the craving for individual distinction asserted itself with irresistible vehemence. As it had been in the days of the "sophistic" movement at Athens, so it was now with Rome; a higher education, which, owing to its expense, was necessarily confined to the wealthier classes, interposed between the upper and lower ranks of society a barrier even more effectual than that set up by differences of material condition, and by releasing the individual from the trammels of traditional morality, gave his ambition free course. The effect on private morals may be gauged by the vehemence with which the reactionary opposition, headed by M. Porcius Cato (consul, 195 B.C.; censor, 184 B.C.), inveighed against the new fashions. and by the list of measures passed to check the growth of luxury and licence, and to exclude the foreign teachers of the new learning. It was all in vain. The art of rhetoric, which was studied through the medium of Greek treatises and Greek models, furnished the Roman noble with weapons of attack and defence of which he was not slow to avail himself in the forum and the senate-house. In the science of money-making which had been elaborated under the Hellenistic monarchies, the Roman capitalists proved apt pupils of their Greek teachers. Among the lower classes, contact with foreign slaves and freedmen, with foreign worships and foreign vices, produced a love of novelty which no legislation could check. Even amongst women there were symptoms of revolt against the old order, which showed itself in a growing freedom of manners and impatience of control, the marriage tie was relaxed, and the respect for mother and wife which had been so powerful a factor in the maintenance of the Roman standard of morals, was grievously diminished. Thus Rome was at length brought face to face with a moral and economic crisis which a modern historian has described in the words: "Italy was living through the fever of moral disintegration and incoherence which assails all civilized societies that are rich in the manifold resources of culture and enjoyment, but tolerate few or no restraints on the feverish struggle of contending appetites." In this struggle the Roman republic perished. and personal government took its place. The world had outgrown the city-state and its political machinery, and as representative government, tried in Thessaly and Macedonia, was out of the question in a heterogeneous empire, no solution of the problem was possible save that of absolutism. But a far stronger resistance would have been opposed to political revolution by the republican system had not public morals been sapped by the influences above described. Political corruption was reduced to a science for the benefit of individuals who were often faced with the alternatives of ruin or revolution; there was no longer any body of sound public opinion to which, in the last resort, appeal could be made; and, long before the final catastrophe took place, Roman society itself had become, in structure and temper, thoroughly unrepublican.

The Gracchi, 133–121.—The first systematic attack upon the senatorial government is connected with the names of Tiberius and Gaius Gracchus (*qq.v.*) and its immediate occasion was an attempt to deal with no less a danger than the threatened disappearance of the class to which of all others Rome owed most in the past. The small landholders throughout the greater part of Italy were sinking deeper into ruin under the pressure of accumulated difficulties. The Hannibalic war had laid waste their fields and thinned their numbers, nor when peace returned to Italy did it bring with it any revival of prosperity. The heavy burden of military service still pressed ruinously upon them, and in addition they were called upon to compete with the foreign corn imported from beyond the sea, and with the foreign slave-labour purchased by the capital of wealthier men. Farming became unprofitable, and the hard laborious life with its scanty returns was thrown into still darker relief when compared with the stirring life of the camps with its opportunities of booty, or with the cheap provisions, frequent largesses and gay spectacles to be had in the large towns. The small-holders went off to follow the eagles to try fortune in some province, or swell the proletariat of the cities, and their holdings were left to run waste or merged in the vineyards, olive-yards and above all in the great cattle farms of the rich, and their own place was taken by slaves. The evil was worst in Etruria and in southern Italy; but everywhere it was serious enough to demand the earnest attention of Roman statesmen. Of its existence the Government had received plenty of warning in the declining numbers of able-bodied males returned at the census, in the increasing difficulties of recruiting for the legions, in servile outbreaks in Etruria and Apulia, and between zoo and 160 a good deal was attempted by way of remedy. In addition to the foundation of 20 colonies, there were frequent allotments of land to veteran soldiers, especially in Apulia and Samnium. In 180, 40,-ooo Ligurians were removed from their homes and settled on vacant lands once the property of a Samnite tribe, and in 160 the Pomptine marshes were drained for the purpose of cultivation. But these efforts were only partially successful. The colonies planted in Cisalpine Gaul and in Picenum flourished, but of the others the majority slowly dwindled away, and two required recolonizing only eight years after their foundation. The veterans who received land were unfitted to make good farmers; and large numbers, on the first opportunity, gladly returned as volunteers to a soldier's life. Moreover, after 160 evtn these efforts ceased, and with the single exception of the colony of Auximum in Picenum (157) nothing was done to check the spread of the evil, until in 133 Tiberius Gracchus, on his election to the tribunate, set his hand to the work.

The remedy proposed by Gracchus amounted in effect to the resumption by the State of as much of the "common land" as was not held in occupation by authorized persons and conformably to the provisions of the Licinian law, and the distribution in allotments of the land thus rescued for the community from the monopoly of a few. It was a scheme which could quote in its favour ancient precedent as well as urgent necessity Of the causes which led to its ultimate failure something will be said later on; for the present we must turn to the constitutional conflict which it provoked. The senate from the first identified itself with the interests of the wealthy occupiers, and Tiberius found himself forced into a struggle with that body, which had been no part of his original plan. He fell back on the legislative sovereignty of the assembly; he resuscitated the half-forgotten powers of interference vested in the tribunate in order to paralyse the action of the senatorial magistrates, and finally lost his life in an attempt to make good one of the weak points in the tribune's position by securing his own re-election for a second year. But the conflict did not end with his death. It was renewed on a wider scale and with a more deliberate aim by his brother Gaius, who on his election to the tribunate (123) at once came forward with a vast programme of legislation. He shrewdly began by weakening the influence of the senate. Since his followers had every reason to dread the *senatus consultum ultimum,* the senate's chief weapon of attack against opponents, his first plebiscite reasserted the "right of appeal." He then destroyed the senate's prerogative to assign the provinces to its partisans, took away the jury panels from the senators, and also claimed for the assembly the right to assign public contracts and to control the budget so far as it desired. Thus the senate lost control of the gifts by which it cajoled and the lashes by which it compelled obedience. Very early also he gave doles of grain to the poor This later led to great evils, but it must have been instituted as a temporary

measure since he intended soon to distribute the needy in colonies. The evils of the dole must be accredited to the senate which stopped the colonization and did not have the courage to stop the dole. The jury panels he now made up of knights instead of senators. Gracchus wished, it seems, to give official recognition through civil service to men of business, in whom he had great faith. He would thus widen the group interested in public concerns and build up an influential order as a balance to the old nobility. Later it proved a disadvantage that publicans could sit in judgment over provincial governors who had to hold the publicans in check, but this difficulty could hardly have been foreseen since publicans did not yet have provincial contracts. In order to secure larger returns from the Asiatic province recently inherited by Rome, Gracchus permitted the knights to form corporations of limited liability (such corporations were otherwise prohibited) with the privilege of taking contracts to gather and dispose of the Asiatic tithe. The advantages would be that the State would receive in advance the sums bid, would not have to build up a large taxing bureau in order to get all that was due, and the taxpayers could pay the tithe in kind according to the yield of each year. Since this system had not been tried before by Rome, its inherent evils were probably not yet known. In time it led not only to harsh exactions because of collusion between governors and publicans, but also to costly exploitation, because the publicans lent money to delinquents at high rates and engaged generally in unseemly speculation. Gracchus used the money in such public works as the assembly at his bidding authorized. The colonies which Gracchus founded — it was only the beginning of a large project — were well selected. Two were planted in southern Italy where many allotments had recently been made to small farmers — at Tarentum and Scylacium. For these, men specially selected for their capacity were chosen. Then 6,000 hardy farmers were sent to the province of Africa which had been lying desolate for a generation, and which had had to depend upon the Punic city of Utica for its harbour and its praetorian residence. Not even then did the senate comprehend its duty to its provincials, but cancelled the colonial charter, though it dared not cancel the allotments. And now though Gracchus lost his re-election to the tribunate he attempted his last great reform of giving the franchise to the Latins in order that the democracy might rest on a wider and sounder basis. Since Caesar, who took many suggestions from Gracchus, later proposed to extend balloting through Italy by local polls, it is not unlikely that Gracchus had that in view. That would finally have removed democratic legislation from the control of the urban crowd. Be that as it may, the attempt to broaden the franchise failed, not this time because of senatorial opposition but because of the selfishness of the voters who did not wish to diminish their own prerogatives. Gracchus lost his influence, and soon after when a riot arose the senate declared martial law and summoned Gracchus to the bar of the senate. He refused to recognize a procedure which the assembly had outlawed the year before. The senate insisting on the legality of its course ordered his arrest and in the riot which ensued he was slain.

The agrarian reforms of the two Gracchi had little permanent effect. Even in the lifetime of Gaius the clause in his brother's law rendering the new holdings inalienable was repealed, and the process of absorption recommenced. In 118 a stop was put to further allotment of occupied lands, and finally, in 111, the whole position of the agrarian question was altered by a law which converted all land still held in occupation into private land. The old controversy as to the proper use of the lands of the community was closed by this act of alienation. The controversy in future turns, not on the right of the poor citizens to the State lands, but on the expediency of purchasing other lands for distribution at the cost of the treasury.

But, though the agrarian reform failed, the political conflict it had provoked continued, and the lines on which it was waged were in the main those laid down by Gaius Gracchus. The sovereignty of the assembly continued to be the watchword of the popular party, and a free use of the tribunician powers of interference and of legislation remained the most effective means of accomplishing their aims.

Marius, 118–100. — Ten years after the death of Gaius the *populares* once more summoned up courage to challenge the supremacy of the senate; but it was on a question of foreign administration that the conflict was renewed. The course of affairs in the client state of Numidia since Micipsa's death in 118 had been such as to discredit a stronger government than that of the senate. In defiance of Roman authority, and relying on the influence of his own well-spent gold, Jugurtha had murdered both his legitimate rivals, Hiempsal and Adherbal, and made himself master of Numidia. The declaration of war wrung from the senate (112) by popular indignation had been followed by the corruption of a consul (111) and the crushing defeat of the proconsul Albinus. On the news of this crowning disgrace the storm burst, and on the proposal of the tribunes a commission of enquiry into the conduct of the war was appointed. But the popular leaders did not stop here. Q. Caecilius Metellus, who as consul (109) had succeeded to the command in Numidia, was an able soldier but a rigid aristocrat; and they now resolved to improve their success by entrusting the command instead to a genuine son of the people. Their choice fell on Gaius Marius (see MARIUS), an experienced officer and administrator, but a man of humble birth, wholly illiterate, and one who, though no politician, was by temperament and training a hater of the polished and effeminate nobles who filled the senate. He was triumphantly elected, and, in spite of a decree of the senate continuing Metellus as proconsul, he was entrusted by a vote of the assembly with the charge of the war against Jugurtha (*q.v.*).

Jugurtha was vanquished; and Marius, who had been a second time elected consul in his absence, arrived at Rome in Jan. 104, bringing the captive prince with him in chains. But further triumphs awaited the popular hero. The Cimbri and Teutones were at the gates of Italy; they had four times defeated the senatorial generals, and Marius was called upon to save Rome from a second invasion of the barbarians. After two years of suspense the victory at Aquae Sextiae (102), followed by that on the Raudine plain (101), put an end to the danger by the annihilation of the invading hordes; and Marius, now consul for the fifth time, returned to Rome in triumph. There the popular party welcomed him as a leader with all the prestige of a successful general. Once more, however, they were destined to a brief success followed by disastrous defeat. Marius became for the sixth time consul; of the two popular leaders Glaucia became praetor and Saturninus tribune. But Marius and his allies were not statesmen of the stamp of the Gracchi; and the laws proposed by Saturninus had evidently no serious aim in view other than that of harassing the senate. His corn law merely reduced the price fixed in 123 for the monthly dole of corn, and the main point of his agrarian law lay in the clause appended to it requiring all senators to swear to observe its provisions[1]. The laws were carried, but the triumph of the popular leaders was short-lived. Their period of office was drawing to a close. At the elections fresh rioting took place, and Marius as consul was called upon by the senate to protect the State against his own partisans. Saturninus and Glaucia surrendered, but while the senate was discussing their fate they were surrounded and murdered by their opponents.

The popular party had been worsted once more in their struggle with the senate, but none the less their alliance with Marius, and the position in which their votes placed him, marked an epoch in the history of the revolution. The transference of the political leadership to a consul who was nothing if not a soldier was at once a confession of the insufficiency of the purely civil authority of the tribunate and a dangerous encouragement of military interference in political controversies. The consequences were already foreshadowed by the special provisions made by Saturninus for Marius's veterans, and in the active part taken by them in the passing of his laws. Indirectly, too, Marius, though no politician, played an important part in this new departure. His military reforms at once democratized the army and attached it more closely to its leader for the time being. He swept away

[1] For the *leges Appuleiae*, *see* SATURNINUS, LUCIUS APPULEIUS, and authorities there quoted.

the last traces of civil distinctions of rank or wealth within the legion, admitted to its ranks all classes, and substituted voluntary enlistment under a popular general for the old-fashioned compulsory levy. The efficiency of the legion was increased at the cost of a complete severance of the ties which bound it to the civil community and to the civil authorities.

The Social War.—The next important crisis was due partly to the rivalry which had been growing more bitter each year between the senate and the commercial class, and partly to the long-impending question of the enfranchisement of the Italian allies. The *publicani*, negotiatores and others, who constituted what was now becoming known as the equestrian order (see EQUITES), had made unscrupulous use of their control of the courts and especially of the *quaestio* de repetundis against their natural rivals, the official class in the provinces. The threat of prosecution before a hostile jury was held over the head of every governor, legate and quaestor who ventured to interfere with their operations in the provinces. The average official preferred to connive at their exactions; the bolder ones paid with fines and even exile for their courage. In 92 the necessity for a reform was proved beyond a doubt by the scandalous condemnation of P. Rutilius Rufus, ostensibly on a charge of extortion, in reality as the reward of his efforts to check the extortions of the Roman equites in Asia. The difficulties of the Italian question were more serious. That the Italian allies were discontented was notorious. After nearly two centuries of close alliance, of common dangers and victories, they now eagerly coveted as a boon that complete amalgamation with Rome which they had at first resented as a dishonour. But, unfortunately, Rome had grown more exclusive in proportion as the value set upon Roman citizenship increased. During the last 40 years feelings of hope and disappointment had rapidly succeeded each other; Marcus Fulvius Flaccus, Gaius Gracchus, Saturninus, had all held out promises of relief—and nothing had yet been done. On each occasion they had crowded to Rome, full of eager expectation, only to be harshly ejected from the city by the consul's orders. The justice of their claims could hardly be denied, the danger of continuing to ignore them was obvious—yet the difficulties in the way of granting them were formidable in the extreme, and from a higher than a merely selfish point of view there was much to be said against the revolution involved in so sudden and enormous an enlargement of the citizen body.

Marcus Livius Drusus (*q.v.*), who as tribune gallantly took up the task of reform, is claimed by Cicero as a member of that party of the centre to which he belonged himself. Noble, wealthy and popular, he seems to have hoped to be able by the weight of his position and character to rescue the burning questions of the day from the grasp of extreme partisans and to settle them peacefully and equitably. But he, like Cicero after him, had to find to his cost that there was no room in the fierce strife of Roman politics for moderate counsels. His proposal to reform the law courts excited the equestrian order and their friends in the senate to fury. The agrarian and corn laws which he coupled with it alienated many more in the senate, and roused the old anti-popular party feeling; finally, his known negotiations with the Italians were eagerly misrepresented to the jealous and excited people as evidence of complicity with a widespread conspiracy against Rome. His laws were carried, but the senate pronounced them null and void. Drusus was denounced in the senate house as a traitor, and on his way home was struck down by the hand of an unknown assassin. His assassination was the signal for an outbreak which had been secretly prepared for some time before. Throughout the highlands of central and southern Italy the flower of the Italian peoples rose as one man. Etruria and Umbria held aloof; the isolated Latin colonies stood firm; but the Sabellian clans, north and south, the Latinized Marsi and Paeligni, as well as the Oscan-speaking Samnites and Lucanians, rushed to arms No time was lost in proclaiming their plans for the future. A new Italian State was to be formed. The Paelignian town of Corfinium was selected as its capital and re-christened with the proud name of Italica. All Italians were to be citizens of this new metropolis, and here were to be the place of assembly and the senate house. A senate of 500 members and a magistracy resembling that of Rome completed a constitution which adhered closely to the very political traditions which its authors had most reason to abjure.

Now, as always in the face of serious danger, the action of Rome was prompt and resolute. Both consuls took the field; with each were five legates, among them the veteran Marius and his destined rival L. Cornelius Sulla, and even freedmen were pressed into service with the legions. But the first year's campaign opened disastrously. In central Italy the northern Sabellians, and in the south the Samnites, defeated the forces opposed to them. And though before the end of the year Marius and Sulla in the north, and the consul Caesar himself in Campania, succeeded in inflicting severe blows on the enemy, and on the Marsi especially, it is not surprising that, with an empty treasury, with the insurgents' strength still unbroken, and with rumours of disaffection in the loyal districts, opinion in Rome should have turned in the direction of the more liberal policy which had been so often scornfully rejected and in favour of some compromise which should check the spread of the revolt, and possibly sow discord among their enemies. Towards the close of the year go the consul L. Julius Caesar (killed by Fimbria in 87) carried the *lex Iulia*, by which the Roman franchise was offered to all communities which had not as yet revolted; early in the next year (89) the Julian law was supplemented by the *lex* Plautia *Papiria*, introduced by two of the tribunes, M. Plautius Silvanus and C. Papirius Carbo Arvina, which enacted that any citizen of an allied community then domiciled in Italy might obtain the franchise by giving in his name to a praetor in Rome within 60 days. A third law (lex *Calpurnia*), apparently passed at the same time, empowered Roman magistrates in the field to bestow the franchise there and then upon all who were willing to receive it. This sudden opening of the closed gates of Roman citizenship was completely successful, and its effects were at once visible in the diminished vigour of the insurgents. By the end of 89 the Samnites and Lucanians were left alone in their obstinate hostility to Rome, and neither, thanks to Sulla's brilliant campaign in Samnium, had for the moment any strength left for active aggression.

The termination of the Social War brought with it no peace in Rome. The old quarrels were renewed with increased bitterness, and the newly enfranchised Italians themselves complained as bitterly of the restriction which robbed them of their due share of political influence by allowing them to vote only in a specified number of tribes. The senate itself was distracted by violent personal rivalries—and all these feuds, animosities and grievances were aggravated by the widespread economic distress and ruin which affected all classes. Lastly, war with Mithridates VI. had been declared; it was notorious that the privilege of commanding the force to be sent against him would be keenly contested, and that the contest would lie between the veteran Marius and L. Cornelius Sulla.

Sulla.—It was in an atmosphere charged with the elements of disturbance that P. Sulpicius Rufus as tribune brought forward his laws. (See SULPICIUS RUFUS, PUBLIUS.) He proposed: (1) that the command of the Mithridatic War should be given to Marius, though it had legally been assigned to the consul Sulla; (2) that the new citizens should be distributed through all the tribes; (3) that the freedmen should no longer be confined to the four city tribes; (4) that any senator owing more than 2,000 denarii should lose his seat; (5) that those exiled on suspicion of complicity with the Italian revolt should be recalled. These proposals provoked a storm, and both sides were ready for violent measures. The consuls, in order to prevent legislation, proclaimed a public holiday. Sulpicius armed his followers and drove the consuls from the forum. The proclamation was withdrawn and the laws carried, but Sulpicius's triumph was short-lived. From Nola in Campania, where lay the legions commanded by him in the Social War, Sulla advanced on Rome. and for the first time a Roman consul entered the city at the head of the legions of the republic. Resistance was hopeless. Marius and Sulpicius fled, and Sulla, summoning the assembly of the centuries, proposed the measures he considered necessary for the

public security, the most important being a provision that the sanction of the senate should be necessary before any proposal was introduced to the assembly. Then, after waiting in Rome long enough to hold the consular elections, he left for Asia early in 87.

Sulla had conquered, but his victory cost the republic dear. He had first taught political partisans to look for final success, not to a majority of votes in the forum or campus, but to the swords of the soldiery. The lesson was well learnt. Shortly after his departure L. Cornelius Cinna as consul revived the proposals of Sulpicius; his colleague, Gnaeus Octavius, at the head of an armed force, fell upon the new citizens who had collected in crowds to vote, and the forum was heaped high with the bodies of the slain. Cinna fled, but fled, like Sulla, to the legions. When the senate declared him deposed from his consulship, he replied by invoking the aid of the soldiers in Campania in behalf of the violated rights of the people and the injured dignity of the consulship, and, like Sulla, found them ready to follow where he led. The neighbouring Italian communities, who had lost many citizens in the recent massacre, sent their new champion men and money; while from Africa, whither he had escaped after Sulla's entry into Rome, came Marius with 1,000 Numidian horsemen. The senate had prepared for a desperate defence, but fortune was adverse, and after a brief resistance they gave way. Cinna was acknowledged as consul, the sentence of outlawry passed on Marius was revoked and Cinna and Marius entered Rome with their troops. Marius's thirst for revenge was gratified by a frightful massacre, and he lived long enough to be nominated consul for the seventh time. But he held his consulship only a few weeks. Early in 86 he died, and for the next three years Cinna ruled Rome. Constitutional government was virtually suspended. For 85 and 84 Cinna nominated himself and a trusted colleague as consuls. The state was, as Cicero says, without lawful authority. A partial registration of the newly enfranchised Italians was made, but beyond this little was done. The attention of Cinna and his friends was in truth engrossed by the ever-present dread of Sulla's return from Asia. The consul of 86, L. Valerius Flaccus (who had been consul with Marius in 100 B.C.), sent out to supersede him, was murdered by his own soldiers at Nicomedia. In 85 Sulla, though disowned by his Government, concluded a peace with Mithridates. In 84, after settling affairs in Asia and crushing Flaccus's successor: C. Flavius Fimbria, he crossed into Greece, and in the spring of 83 landed at Brundusium with 40,000 soldiers and a large following of *émigré* nobles. Cinna was dead, murdered like Flaccus by his mutinous soldiers; his most trusted colleague, Cn. Papirius Carbo, was commanding as proconsul in Cisalpine Gaul; and the resistance offered to Sulla's advance was slight. At Capua, Sulla routed the forces of one consul, Gaius Norbanus; at Teanum the troops of the other went over in a body to the side of the outlawed proconsul. After a winter spent in Campania he pressed forward to Rome, defeated the younger Marius (consul, 82) near Praeneste, and entered the city without further opposition. In north Italy the success of his lieutenants, Q. Caecilius Metellus Pius (son of Metellus Numidicus), Cn. Pompeius and Marcus Crassus, had been fully as decisive. Cisalpine Gaul, Umbria and Etruria had all been won for Sulla, and the two principal leaders on the other side, Carbo and Norbanus, had each fled, one to Rhodes, the other to Africa. Only one foe remained to be conquered. The Samnites and Lucanians whom Cinna had conciliated, and who saw in Sulla their bitterest foe, were for the last time in arms, and had already joined forces with the remains of the Marian army close to Rome. The decisive battle was fought under the walls of the city, and ended in the complete defeat of the Marians and Italians (battle of the Colline gate).

For a period of nearly ten years Rome and Italy had been distracted by civil war. Sulla (*q.v.*) was now called upon to heal the divisions which rent the State asunder, to set in working again the machinery of civil government, and above all so to modify it as to meet the altered conditions, and to fortify it against the dangers which visibly threatened it in the future. The real charge against Sulla is not that he failed to accomplish **all** this, for to do so was beyond the powers even of a man so able, resolute and self-confident as Sulla, armed though he was with absolute authority and backed by overwhelming military strength and the prestige of unbroken success. He stands convicted rather of deliberately aggravating some and culpably ignoring others of the evils he should have tried to cure, and of contenting himself with a party triumph when he should have aimed at the regeneration and confirmation of the whole State. His victory was instantly followed, not by any measures of conciliation, but by a series of massacres, proscriptions and confiscations, of which almost the least serious consequence was the immediate loss of life which they entailed. From this time forward the fear of proscription and confiscation recurred as a possible consequence of every political crisis, and it was with difficulty that Caesar himself dissipated the belief that his victory would be followed by a Sullan reign of terror. The legacy of hatred and discontent which Sulla left behind him was a constant source of disquiet and danger. In the children of the proscribed, whom he excluded from holding office, and the dispossessed owners of the confiscated lands, every agitator found ready and willing allies. The moneyed men of the equestrian order were more than ever hostile to the senatorial government, which they now identified with the man who cherished towards them a peculiar hatred, and whose creatures had hunted them down like dogs. The attachment which the new Italian citizens might in time have learnt to feel for the old republican constitution was nipped in the bud by the massacres at Praeneste and Norba, by the harsh treatment of the ancient towns of Etruria, and by the ruthless desolation of Samnium and Lucania. Quite as fatal were the results to the economic prosperity of the peninsula. Sulla's confiscations, following on the civil and social wars, opened the doors wide for a long train of evils. The veterans whom he planted on the lands he had seized did nothing for agriculture, and swelled the growing numbers of the turbulent and discontented. The "Sullan men" became as great an object of fear and dislike as the "Sullan reign." The *latifundia* increased with startling rapidity—whole territories passing into the hands of greedy partisans. Wide tracts of land, confiscated but never allotted, ran to waste. In many districts of Italy the free population finally and completely disappeared from the open country; and life and property were rendered insecure by the brigandage which now developed unchecked, and in which the herdsmen slaves played a prominent part. The outbreaks of Spartacus in 73, and of Catiline ten years later, were significant commentaries on this part of Sulla's work. His constitutional legislation, while it included many useful administrative reforms, is marked by as violent a spirit of partisanship, and as apparently wilful a blindness to the future. The re-establishment on a legal basis of the ascendancy which custom had so long accorded the senate was his main object. With this purpose he had already, when consul in 88, made the *senatus* auctoritas legally necessary for proposals to the assembly. He now as dictator followed this up by crippling the power of the magistracy, which had been the most effective weapon in the hands of the senate's opponents. The legislative freedom of the tribunes was already hampered by the necessity of obtaining the senate's sanction; in addition, Sulla restricted their wide powers of interference (intercessio) to their original purpose of protecting individual plebeians, and discredited the office by prohibiting a tribune from holding any subsequent office in the State. The control of the courts (quaestiones *perpetuae*) was taken from the equestrian order and restored to the senate. To prevent the people from suddenly installing and keeping in high office a second Marius, he re-enacted the old law against re-election, and made legally binding the custom which required a man to mount up gradually to the consulship through the lower offices. His increase of the number of praetors from six to eight, and of quaestors to 20, though required by administrative necessities, tended, by enlarging the numbers and further dividing the authority of the magistrates, to render them still more dependent upon the central direction of the senate. Lastly, he replaced the pontifical and augural colleges in the hands of the senatorial nobles, by enacting that vacancies in them should, as before the *lex* Domitia (104), be filled up by co-optation. It cannot be said that Sulla was **success-**

ful in fortifying the republican system against the dangers which menaced it from without. He accepted as an accomplished fact the enfranchisement of the Italians, but he made no provision to guard against the consequent reduction of the comitia to an absurdity, and with them of the civic government which rested upon them, or to organize an effective administrative system for the Italian communities. In fact he prevented the further registration of the new citizens by abolishing the censorship. Of all men, too, Sulla had the best reason to appreciate the dangers to be feared from the growing independence of governors and generals in the provinces and from the transformation of the old civic militia into a group of professional armies, devoted only to a successful leader, and with the weakest possible sense of allegiance to the State. He had himself, as proconsul of Asia, contemptuously and successfully defied the home Government, and he, more than any other Roman general, had taught his soldiers to look only to their leader, and to think only of booty. Yet, beyond a few inadequate regulations, there is no evidence that Sulla dealt with these burning questions, the settlement of which was among the greatest of the achievements of Augustus. One administrative reform of real importance must, lastly, be set down to his credit. The judicial procedure first established in 149 for the trial of cases of magisterial extortion in the provinces, and applied between 149 and 81 to cases of treason and bribery. Sulla extended so as to bring under it the chief criminal offences, and thus laid the foundation of the Roman criminal law.

Overthrow of the Sullan Constitution.— The Sullan system stood for nine years, and was then overthrown—as it had been established—by a successful soldier. It was the fortune of Cn. Pompey, a favourite officer of Sulla, first of all to violate in his own person the fundamental principles of the constitution re-established by his old chief, and then to overturn it. In Spain the Marian governor Q. Sertorius (see SERTORIUS, QUINTUS) had defeated one after another of the proconsuls sent out by the senate and was in 77 master of all Hither Spain. To meet the crisis, Pompey (*q.v.*), who was not yet 30 and had never held even the quaestorship, was sent out to Spain with proconsular authority. Sertorius held out, until in 73 he was foully murdered by his own officers. The native tribes who had loyally stood by him submitted, and Pompey early in 71 returned with his troops to Italy, where, during his absence in Spain, an event had occurred which had shown Roman society with startling plainness how near it stood to revolution. In 73 Spartacus (*q.v.*), a Thracian slave, escaped with 70 others from a gladiators' training school at Capua. In a startlingly short time he found himself at the head of 70,000 runaway slaves, outlaws, brigands and impoverished peasants, and for two years terrorized Italy, routed the legions sent against him, and even threatened Rome. He was at length defeated and slain by the praetor, M. Licinius Crassus, in Apulia. In Rome itself the various classes and parties hostile to the Sullan system had, ever since Sulla's death in 78, been incessantly agitating for the repeal of his most obnoxious laws, and needed only a leader in order successfully to attack a Government discredited by failure at home and abroad. With the return of Pompey from Spain their opportunity came. Pompey, who understood politics as little as Marius, was anxious to obtain a triumph, the consulship for the next year (70), and as the natural consequence of this an important command in the East. The opposition wanted his name and support, and a bargain was soon struck. Pompey and with him Marcus Licinius Crassus, the real conqueror of Spartacus, were elected consuls, almost in the presence of their troops, which lay encamped outside the gates in readiness to assist at the triumph and ovation granted to their respective leaders. Pompey lost no time in performing his part of the agreemtnt. The tribunes regained their prerogatives. The "perpetual courts" (*quaestiones perpetuae*) were taken out of the hands of the senatorial iudices, who had outdone the equestrian order in scandalous corruption, and finally the censors, the first since 86 B.C., purged the senate of the more worthless and disreputable of Sulla's partisans. The victory was complete; but for the future its chief significance lay in the clearness with which it showed that the final decision in matters political lay with neither of the two great parties in Rome, but with the holder of the military authority. The tribunes ceased to be political leaders and became lieutenants of the military commanders, and the change was fatal to the dignity of politics in the city. Men became conscious of the unreality of the old constitutional controversies, indifferent to the questions which agitated the forum and the curia, and contemptuously ready to alter or disregard the constitution itself when it stood in the way of interests nearer to their hearts.

Pompey, Caesar and Cicero.—When his consulship ended, Pompey impatiently awaited at the hands of the politicians he had befriended the further gift of a foreign command. He declined an ordinary province, and from the end of 70 to 67 he remained at Rome in a somewhat affectedly dignified seclusion. But in 67 and 66 the laws of Gabinius and Manilius gave him all and more than all that he expected (see POMPEY). By the former he obtained the sole command for three years against the Mediterranean pirates. He was to have supreme authority over all Roman magistrates in the provinces throughout the Mediterranean and over the coasts for 50m. inland. Fifteen *legati*, all of praetorian rank, were assigned to him, with 200 ships, and as many troops as he thought desirable. The Manilian law transferred from Lucullus and Glabrio to Pompey the conduct of the Mithridatic War in Asia, and with it the entire control of Roman policy and interests in the East. The unrepublican character of the position thus granted to Pompey, and the dangers of the precedent established, were clearly enough pointed out by such moderate men as Q. Lutatius Catulus, the "father of the senate," and by the orator Hortensius—but in vain. Both laws were Supported, not only by the tribunes and the populace, but by the whole influence of the publicani and negotiatores, whose interests in the East were at stake.

Pompey left Rome in 67. In a marvellously short space of time he freed the Mediterranean from the Cilician pirates and established Roman authority in Cilicia itself. He then crushed Mithradates (*q.v.*), added Syria to the list of Roman provinces, and led the Roman legions to the Euphrates and the Caspian, leaving no power capable of disputing with Rome the sovereignty of western Asia. He did not return to Italy till towards the end of 62. The interval was marked in Rome by the rise to political importance of Caesar (*q.v.*) and Cicero, and by Catiline's attempt at revolution. As the nephew of Marius and the son-in-law of Cinna, Caesar possessed a strong hereditary claim to the leadership of the popular and Marian party. He had already taken part in the agitation for the restoration of the tribunate; he had supported the Manilian law; and, when Pompey's withdrawal left the field clear for other competitors, he stepped at once into the front rank on the popular side. He took upon himself, as their nearest representative, the task of clearing the memory and avenging the wrongs of the great popular leaders, Marius, Cinna and Saturninus. He publicly reminded the people of Marius's services, and set up again upon the Capitol the trophies of the Cimbric War. He endeavoured to bring to justice, not only the ringleaders in Sulla's bloody work of proscription, but even the murderers of Saturninus, and vehemently pleaded the cause of the children of the proscribed. While thus carrying on in genuine Roman fashion the feud of his family, he attracted the sympathies of the Italians by his efforts to procure the Roman franchise for the Latin communities beyond the Po, and won the affections of the populace in Rome and its immediate neighbourhood by the splendour of the games which he gave as curule aedile (65), and by his lavish expenditure upon the improvement of the Appian Way. But these measures were with him only means to the further end of creating for himself a position such as that which Pompey had already won; and this ulterior aim he pursued with an audacious indifference to constitutional forms and usages. His coalition with Crassus, soon after Pompey's departure, secured him an ally whose colossal wealth and wide financial connections were of inestimable value, and whose vanity and inferiority of Intellect rendered him a willing tool. The story of his attempted coup d'ktat in Jan. 65 is probably false, but it is evident that by the beginning of 63 he was bent on reaping the reward of his exertions by obtaining from the people an extraordinary command

abroad, which should secure his position before Pompey's return; and the agrarian law proposed early that year by the tribune P. Servilius Rullus had for its object the creation, in favour of Caesar and Crassus, of a commission with powers so wide as to place its members almost on a level with Pompey himself. It was at this moment when all seemed going well, that Caesar's hopes were dashed to the ground by Catiline's desperate outbreak, which not only discredited every one connected with the popular party, but directed the suspicions of the well-to-do classes against Caesar himself, as a possible accomplice in Catiline's revolutionary schemes.

The same wave of indignation and suspicion which for the moment checked Caesar's rise carried Marcus Tullius Cicero to the height of his fortunes. Cicero (*q.v.*), as a politician, has been equally misjudged by friends and foes. That he was deficient in courage, that he was vain, and that he attempted the impossible, may be admitted at once. But he was neither a brilliant and unscrupulous adventurer nor an aimless trimmer, nor yet a devoted champion merely of senatorial ascendancy[1]. He was a representative man, with a numerous following, and a policy which was naturally suggested to him by the circumstances of his birth, connections and profession, and which, impracticable as it proved to be, was yet consistent, intelligible and high-minded. Born at Arpinum, he cherished like all Arpinates the memory of his great fellow-townsman Marius, the friend of the Italians, the saviour of Italy and the irreconcilable foe of Sulla and the nobles. A "municipal" himself, his chosen friends and his warmest supporters were found among the well-to-do classes in the Italian towns. Unpopular with the Roman aristocracy, who despised him as a *peregrinus,* and with the Roman populace, he was the trusted leader of the Italian middle class, "the true Roman people," as he proudly styles them. It was they who carried his election for the consulship (63), who in 58 insisted on his recall from exile, and it was his influence with them which made Caesar so anxious to win him over in 49. He represented their antipathy alike to socialistic schemes and to aristocratic exclusiveness, and their old-fashioned simplicity of life in contrast with the cosmopolitan luxury of the capital. By birth, too, he belonged to the equestrian order, the foremost representatives of which were indeed still the *publicani* and *negotiatores,* but which since the enfranchisement of Italy included also the substantial burgesses of the Italian towns and the smaller "squires" of the country districts. With them, too, Cicero was at one in their dread of democratic excesses and their social and political jealousy of the *nobiles.* Lastly, as a lawyer and a scholar, he was passionately attached to the ancient constitution. His political ideal was the natural outcome of these circumstances. He advocated the maintenance of the old constitution. but not as it was understood by the extreme politicians of the right and left. The senate was to be the supreme directing council, but the senate of Cicero's dreams was not an oligarchic assemblage of nobles, but a body freely open to all citizens, and representing the worth of the community. The magistrates, while deferring to the senate's authority, were to be at once vigorous and public-spirited; and the assembly itself which elected the magistrates and passed the laws was to consist, not of the "mob of the forum," but of the true Roman people throughout Italy. For the realization of this ideal he looked, above all things, to the establishment of cordial relations between the senate and nobles in Rome and the great middle-class of Italy represented by the equestrian order, between the capital and the country towns and districts. This was the *concordia ordinum,* the *consensus Italiae,* for which he laboured.

Cicero's election to the consulship for 63 over the heads of Caesar's nominees, Antonius and Catiline, was mainly the work of the Italian middle-class, already rendered uneasy both by the rumours which were rife of revolutionary schemes and of Caesar's boundless ambition, and by the numerous disquieting signs of disturbance noticeable in Italy. The new consul vigorously set himself to discharge the trust placed in him. He defeated the insidious proposals of Rullus for Caesar's aggrandizement and assisted in quashing the prosecution of Gaius Rabirius. But with the consular elections in the autumn of 63 a fresh danger arose from a different quarter. The "conspiracy of Catiline" *(see* CATILINE) was not the work of the popular party, and still less was it an unselfish attempt at reform; Catiline himself was a patrician, who had held high office, and possessed considerable ability and courage; but he was bankrupt in character and in purse, and two successive dkfeats in the consular elections had rendered him desperate. To retrieve his broken fortunes by violence was a course which was only too readily suggested by the history of the last 40 years, and materials for a conflagration abounded on all sides. The danger to be feared from his intrigues lay in the state of Italy, which made a revolt against society and the established Government only too likely if once a leader presented himself, and it was such a revolt that Catiline endeavoured to organize. Bankrupt nobles like himself, Sullan veterans and the starving peasants whom they had dispossessed of their holdings, outlaws of every description, the slave population of Rome, and the wilder herdsmen-slaves of the Apulian pastures, were all enlisted under his banner, and attempts were even made to excite disaffection among the newly conquered people of southern Gaul and the warlike tribes who still cherished the memory of Sertorius in Spain. In Etruria, the seat and centre of agrarian distress and discontent, a rising actually took place headed by a Sullan centurion, but the spread of the revolt was checked by Cicero's vigorous measures. Catiline fled from Rome, and died fighting with desperate courage at the head of his motley force of old soldiers, peasants and slaves. His accomplices in Rome were arrested, and, after an unavailing protest from Caesar, the senate authorized the consuls summarily to put them to death.

Coalition **of** Pompey, Caesar and Crassus.—The Catilinarian outbreak had been a blow to Caesar, whose schemes it interrupted, but to Cicero it brought not only popularity and honour, but, as he believed, the realization of his political ideal But Pompey was now on his way home[2], and again as in 70 the political future seemed to depend on the attitude which the successful general would assume; Pompey himself looked simply to the attainment by the help of one political party or another of his immediate aims, which at present were the ratification of his arrangements in Asia and a grant of land for his troops. It was the impracticable jealousy of his personal rivals in the senate, aided by the versatility of Caesar who presented himself not as his rival but as his ally, which drove Pompey once more, in spite of Cicero's efforts, into the camp of what was still nominally the popular party. In 60, on Caesar's return from his propraetorship in Spain, the coalition was formed which is known by the somewhat misleading title of the First Triumvirate. Pompey was ostensibly the head of this new alliance, and in return for the satisfaction of his own demands he undertook to support Caesar's candidature for the consulship. The wealth and influence of Crassus were enlisted in the same cause, and the *publicani* were secured by a promise of release from their bargain for collecting the taxes of Asia. Cicero was under no illusions as to the significance of this coalition. It scattered to the winds his dreams of a stable and conservative republic. The year 59 saw the republic powerless in the hands of three citizens. Caesar as consul procured the ratification of Pompey's acts in Asia, granted to the *publicani* the relief refused by the senate, and carried an agrarian law of the new type, which provided for the purchase of lands for allotment at the cost of the treasury and for the assignment of the rich *ager Campanus.* But Caesar aimed at more than the carrying of laws in the teeth of the senate or any party victory in the forum. An important military command was essential to him. An obedient tribune, P. Vatinius, was found, and by the *lex Vatinia* he was given for five years the command of Cisalpine Gaul and Illyricum, to which was added by a decree of the senate Transalpine Gaul also. This command not only opened to him a great military career, but enabled him, as the master of the valley of the Po, to keep an effective watch on the course of affairs in Italy.

[1] Mommsen is throughout unfair to Cicero. The best estimates of Cicero are those given by Strachan-Davidson in his *Cicero* (1894), by Prof. Tyrrell in his Introductions to his edition of Cicero's *Letters,* and by Petersson, *Cicero, a Biography* (1920).

[2] For the history of the next 18 years, the most important ancient authority is Cicero in his letters and speeches.

Early the next year the attack upon himself which Cicero had foreseen was made. P. Clodius (*q.v.*) as tribune brought forward a law enacting that anyone who had put a Roman citizen to death without trial by the people should be interdicted from fire and water. Cicero, finding himself deserted even by Pompey, left Rome in a panic, and by a second Clodian law he was declared to be outlawed. With Caesar away in his province and Cicero banished, Clodius was for the time master in Rome. But, absolute as he was in the streets, and recklessly as he parodied the policy of the Gracchi by violent attacks on the senate, his tribunate merely illustrated the anarchy which now inevitably followed the withdrawal of a strong controlling hand. A reaction speedily followed. Pompey, bewildered and alarmed by Clodius's violence, at last bestirred himself. Cicero's recall was decreed by the senate, and early in Aug. *57* in the *comitia centuriata,* to which his Italian supporters flocked in crowds, a law was passed revoking the sentence of outlawry passed upon him.

Break-up of the Coalition.—Intoxicated by the acclamations which greeted him, and encouraged by Pompey's support, and by the salutary effects of Clodius's excesses, Cicero's hopes rose high. With indefatigable energy he strove to reconstruct a solid constitutional party, but only to fail once more. Pompey was irritated by the hostility of a powerful section in the senate, who thwarted his desires for a fresh command and even encouraged Clodius in insulting the conqueror of the East. Caesar became alarmed at the reports which reached him that the repeal of his agrarian law was threatened and that the feeling against the coalition was growing in strength; above all, he was anxious for a renewal of his five years' command. He acted at once, and in the celebrated conference at Luca *(56)* the alliance of the three self-constitubed rulers of Rome was renewed. Cicero succumbed to the inevitable and withdrew in despair from public life. Pompey and Crassus became consuls for 55. Caesar's command was renewed for another five years, and to each of his two allies important provinces were assigned for a similar period—Pompey receiving the two Spains and Africa, and Crassus Syria. The coalition now divided between them the control of the empire. For the future the question was, how long the coalition itself would last. Its duration proved to be short. In *53* Crassus was defeated and slain by the Parthians at Carrhae, and in Rome the course of events slowly forced Pompey into an attitude of hostility to Caesar. The year *54* brought with it a renewal of the riotous anarchy which had disgraced Rome in *58–57.* Conscious of its own helplessness, the senate, with the eager assent of all respectable citizens, dissuaded Pompey from leaving Italy; and he accordingly left his provinces to be governed by his legates. But the anarchy and confusion only grew worse, and even strict constitutionalists like Cicero talked of the necessity of investing Pompey with some extraordinary powers for the preservation of order[1]. At last in *52* he was elected sole consul, and not only so, but his provincial command was prolonged for five years more, and fresh troops were assigned him. The rôle of "saviour of society" thus thrust upon Pompey was one which flattered his vanity, but it entailed consequences which it is probable he did not foresee, for it brought him into close alliance with the senate. In the senate there was a powerful party which was resolved to force him into heading the attack upon Caesar that otherwise they could not successlully make. It was known that Caesar, whose command expired in March *49,* but who in the ordinary course of things would not have been replaced by his successor until Jan. *48,* was anxious to be allowed to stand for his second consulship in the autumn of *49* without coming in person to Rome. His opponents in the senate were equally bent on bringing his command to an end at the legal time, and so obliging him to disband his troops and stand for the consulship as a private person, or, if he kept his command, on preventing his standing for the consulship. Through 51 and 50 the discussions in the senate and the negotiations with Caesar continued, but with no result. On Jan. 1, 49, Caesar made a last offer of compromise. The senate replied by requiring him on pain of outlawry to disband his legions. Two tribunes who supported him were ejected from the senate house, and the magistrates with Pompey were authorized to take measures to protect the republic. Caesar hesitated no longer; he crossed the Rubicon and invaded Italy. The rapidity of his advance astounded and bewildered his foes. Pompey, followed by the consuls, by the majority of the senate and a long train of nobles, abandoned Italy as untenable, and crossed into Greece. At the end of March Caesar entered Rome as the master of Italy. Four years later, after the final victory of Munda (45), he became the undisputed master of the Roman world[2].

Dictatorship of Caesar, 48–44.—From the very first moment when Pompey's ignominious retreat left him master of Italy, Caesar made it clear that he was neither a second Sulla nor even the reckless anarchist which many believed him to be. The Roman and Italian public were first startled by the masterly rapidity and energy of his movements, and then agreeably surprised by his lenity and moderation. No proscriptions or confiscations followed his victories, and all his acts evinced an unmistakable desire to effect a sober and reasonable settlement of the pressing questions of the hour; of this, and of his almost superhuman energy, the long list of measures he carried out or planned is sufficient proof. The "children of the proscribed" were at length restored to their rights, and with them many of the refugees who had found shelter in Caesar's camp during the two or three years immediately preceding the war; but the extreme men among his supporters soon realized that their hopes of *novae tabulae* and grants of land were illusory. In allotting lands to his veterans, Caesar carefully avoided any disturbance of existing owners and occupiers, and the mode in which he dealt with the economic crisis produced by the war seems to have satisfied all reasonable men. It had been a common charge against Caesar in former days that he paid excessive court to the populace of Rome, and now that he was master he still dazzled them by the spectacles he provided, and by the liberality of his largesses. But he was no indiscriminate flatterer of the mob. The popular clubs and gilds which had helped to organize the anarchy of the last few years were dissolved. A strict enquiry was made into the distribution of the monthly doles of corn, and the number of recipients was reduced by one-half; finally, the position of the courts of justice was raised by the abolition of the popular element among the indices. Nor did Caesar shrink from the attempt, in which so many had failed before him. to mitigate the twin evils which were ruining the prosperity of Italy—the concentration of a pauper population in the towns and the denudation and desolation of the country districts. He carried out the scheme so often proposed by the popular leaders since the days of Gaius Gracchus, the colonization of Carthage and Corinth. Allotments of land on a large scale were made in Italy; decaying towns were reinforced by fresh drafts of settlers; on the large estates and cattle farms the owners were required to find employment for a certain amount of free labour; and a slight and temporary stimulus was given to Italian industry by the reimposition of harbour dues upon foreign goods.

The reform of the calendar (*q.v.*) completes a record of administrative reform which entitles Caesar to the praise of having governed well, whatever may be thought of the validity of his title to govern at all. But how did Caesar deal with what was after all the greatest problem which he was called upon to solve, the establishment of a satisfactory government for the empire? One point indeed was already settled. Some centralization of the executive authority was indispensable, and this part of his work Caesar thoroughly performed. From the moment when he seized the moneys in the treasury on his first entry into Rome down to the day of his death, he recognized no other authority but his throughout the empire. He alone directed the policy of Rome in foreign affairs; the legions were led, and the provinces governed, not by independent magistrates, but by his legates; and the title *imperator* which he adopted was intended to express the absolute and unlimited nature of the *imperium* he claimed, as distinct

[1] Cicero himself anticipated Augustus in his picture of a *princeps civitatis* sketched in a lost book of the ***De rebublica,*** written about this time, which was based upon his hopes of what Pompey might prove to be; ***Ad Att.*** viii. 11; August ***De civ. Dei,*** v. 13

[2] For the Civil Wars, ***see*** CAESAR, GAIUS JULIUS; CICERO, MARCUS TULLIUS; POMPEY.

from the limited spheres of authority possessed by republican magistrates. In so centralizing the executive authority over the empire at large, Caesar was but developing the policy implied in the Gabinian and Manilian laws, and the precedent he established was closely followed by his successors. It was otherwise with the more difficult question of the form under which this new executive authority should be exercised and the relation it should hold to the republican constitution.

Caesar did not explain to the public what shape he intended ultimately to give to the new system. It could hardly have been the "perpetual dictatorship," which was decreed him by the senate after his victory at Munda (45). The dictatorship was associated with those very Sullan traditions from which Caesar was most anxious to sever himself, and the name had no value in the empire at large. It was rumoured that he intended to follow Alexander's example and at least in the eastern provinces adopt the title of king with the theocratic associations which the title bore in the East. Roman proconsuls who had served in Asia and had seen the ease with which kings ruled when not hampered by constitutions and privileged to utter decrees that were considered sacred, would well have comprehended the advantages of such divine absolutism. Caesar might readily remain in the East for some years after his Parthian campaign, and while busy reorganizing the provinces there he would inure his court and the senators in his train to accept the new *rex*. When the time was ripe he might proclaim the title at Rome, and then, being recognized as more than human and above legal restrictions, he could carry whatever reforms he desired by decree. That these rumours deserve some credit we may believe, not only because Caesar before his death accepted several "divine" honours from the senate, but also because Mark Antony, who knew Caesar's plans, pursued such a course after Caesar's death. It is not unlikely that Caesar intended some day to accept for himself the position of an absolute monarch like Alexander or Ptolemy Philadelphus[1]. But he was well aware that it would require many years of training to prepare the senate for the announcement.

The old constitution was not formally abrogated. The senate met and deliberated; the assembly passed laws and elected magistrates; there were still consuls, praetors, aediles, quaestors and tribunes; and Caesar himself, like his successors, professed to hold his authority by the will of the people. But senate, assembly and magistrates were all alike subordinated to the paramount authority of the dictator; and this subordination was, in appearance at least, more direct and complete under the rule of Caesar than under that of Augustus. For months together Rome was left without any regular magistrates, and was governed like a subject town by Caesar's prefects. At another time a tribune was seen exercising authority outside the city bounds and invested with the *imperium* of a praetor. At the elections, candidates appeared before the people backed by a written recommendation from the dictator, which was equivalent to a command. Finally, the senate itself was transformed out of all likeness to its former self by the raising of its numbers to 900, and by the admission of old soldiers, sons of freedmen and even "semi-barbarous Gauls." But, though Caesar's high-handed conduct in this respect was not imitated by his immediate successors, yet the main lines of their policy were laid down by him. These were: (1) the municipalization of the old republican constitution, and (2) its subordination to the paramount authority of the master of the legions and the provinces. In the first case he only carried farther a change already in progress. Of late years the senate had been rapidly losing its hold over the empire at large. Even the ordinary proconsuls were virtually independent potentates, ruling their provinces as they chose, and disposing absolutely of legions which recognized no authority but theirs. The consuls and praetors of each year had since 81 been stationed in Rome, and immersed in purely municipal business; and, lastly, since the enfranchisement of Italy, the *comitia*, though still recognized as the ultimate source of all authority, had become little more than assemblies of the city populace, and their claim to represent the true Roman people was indignantly questioned, even by republicans like Cicero. The concentration in Caesar's hands of all authority outside Rome completely and finally severed all real connection between the old institutions of the republic of Rome and the Government of the Roman empire. But the institutions of the republic not merely became, what they had originally been, the local institutions of the city of Rome; they were also subordinated even within these narrow limits to the paramount authority of the man who held in his hands the army and the provinces Autocratic abroad, at home he was the chief magistrate of the commonwealth; and this position was marked, in his case as in that of those who followed him, by a combination in his person of various powers, and by a general right of precedence which left no limits to his authority but such as he chose to impose upon himself. During the greater part of his reign he was consul as well as dictator. In 48, after his victory at Pharsalia, he was given the *tribunicia potestas* for life, and after his second success at Thapsus the *praefectura morum* for three years. As chief magistrate he convenes and presides in the senate, nominates candidates, conducts elections, carries laws in the assembly and administers justice in court. Finally, as a reminder that the chief magistrate of Rome was also the autocratic ruler of the empire, he wore even in Rome the laurel wreath and triumphal dress, and carried the sceptre of the victorious imperator.

Nor are we without some clue as to the policy which Caesar had sketched out for himself in the administration of the empire, the government of which he had centralized in his own hands. The much needed work of rectifying the frontiers he was forced, by his premature death, to leave to other hands, but within the frontiers he anticipated Augustus in lightening the financial burdens of the provincials, and in establishing a stricter control over the provincial governors, while he went beyond him in his desire to consolidate the empire by extending the Roman franchise and admitting provincials to a share in the Government. He completed the Romanization of Italy by his enfranchisement of the Transpadane Gauls, and by establishing throughout the peninsula a uniform system of municipal government, which under his successors was gradually extended to the provinces.

The Second Triumvirate, 43–28.—On the eve of his departure for the East, to avenge the death of Crassus and humble the power of Parthia, Caesar fell a victim to the republican nobles; and between the day of his death (March 15, 44) and that on which Octavian defeated Antony at Actium (Sept. 2, 31) lies a dreary period of anarchy and bloodshed.

For a moment, in spite of the menacing attitude of Caesar's self-constituted representative Marcus Antonius (Mark Antony), it seemed to one man at least as if the restoration of republican government was possible. With indefatigable energy Cicero strove to enlist the senate, the people, and above all the provincial governors in support of the old constitution. But, though his eloquence now and again carried all before it in senate house and forum, it was powerless to alter the course of events. By the beginning of 43 civil war had recommenced; in the autumn Antony was already threatening an invasion of Italy at the head of 17 legions. Towards the end of October Antony and his ally M. Aemilius Lepidus coalesced with the young Octavian, who had been recently elected consul at the age of 20, in spite of senatorial opposition; and the coalition was legalized by the creation of the extraordinary commission for the "reorganization of the commonwealth" known as the Second Triumvirate. It was appointed for a period of five years, and was continued in 37 for five years more. The rule of the triumvirs was inaugurated in the Sullan fashion by a proscription, foremost among the victims of which was Cicero himself. In the next year the defeat of M. Iunius Brutus and C. Cassius Longinus at Philippi, by the combined forces of Octavian and Antony, destroyed the last hopes of the republican party. In 40 a threatened rupture between the two victors was avoided by the treaty concluded at Brundisium. Antony married Octavian's sister Octavia, and took command of the eastern half of the empire; Octavian appropriated Italy and the West; while Lepidus was forced to content himself with Africa. For the next 12 years, while Antony was indulging in

[1] E. Meyer, *Kleine Schriften* (2nd ed. i. 449).

dreams of founding for himself and Cleopatra an empire in the East, and shocking Roman feeling by his wild excesses and his affectation of Oriental magnificence, Octavian was patiently consolidating his power. Lepidus, his fellow-triumvir, was in 36 ejected from Africa and banished to Circeii, while Sextus Pompeius, who had since his defeat at Munda maintained a semi-piratical ascendancy in the western Mediterranean, was decisively defeated in the same year, and his death in 35 left Octavian sole master of the West. The inevitable trial of strength between himself and Antony was not long delayed. In 32 Antony openly challenged the hostility of Octavian by divorcing Octavia in favour of the beautiful and daring Egyptian princess, with whom, as the heiress of the Ptolemies, he aspired to share the empire of the eastern world. By a decree of the senate Antony was declared deposed from his command, and war was declared against Queen Cleopatra. On Sept. 2, 31, was fought the battle of Actium. Octavian's victory was complete. Antony and Cleopatra committed suicide (30), and the eastern provinces submitted in 29. Octavian returned to Rome to celebrate his triumph and mark the end of the long-continued anarchy by closing the temple of Janus; at the end of the next year he formally laid down the extraordinary powers which he had held since 43, and a regular Government was established.

III. THE EMPIRE

Period I.: The Principate, 27 **B.C.–A.D.** 284.—**The Constitution of the Principate.**—The conqueror of Antonius at Actium, the great-nephew and heir of the dictator Caesar, was now summoned, by the general consent of a world wearied out with 20 years of war and anarchy, to the task of establishing a Government which should as far as possible respect the forms and traditions of the republic, without sacrificing that centralization of authority which experience had shown to be necessary for the integrity and stability of the empire.

The new system which was formally inaugurated by Octavian in 28–27 B.C. assumed the shape of a restoration of the republic under the leadership of a *princeps*. Octavian voluntarily resigned the extraordinary powers which he had held since 43, and, to quote his own words, "handed over the republic to the control of the senate and people of Rome." The old constitutional machinery was once more set in motion; the senate, assembly and magistrates resumed their functions; and Octavian himself was hailed as the "restorer of the commonwealth and the champion of freedom." But his abdication, in any real sense of the word, would have simply thrown everything back into confusion. Any revival of the kingly title was out of the question, and Octavian himself expressly refused the dictatorship. Nor was any new office created or any new official title invented for his benefit. But by senate and people he was invested according to the old constitutional forms with certain powers, as many citizens had been before him, and so took his place by the side of the lawfully appointed magistrates of the republic—only, to mark his pre-eminent dignity, as the first of them all, the senate decreed that he should take as an additional cognomen that of "Augustus," while in common parlance he was henceforth styled *princeps*, a simple title of courtesy, familiar to republican usage, and conveying no other idea than that of a recognized primacy- and precedence over his fellow-citizens. The ideal sketched by Cicero in his *De Republica*, of a constitutional president of a free republic, was apparently realized; but it was only in appearance. For in fact the special prerogatives conferred upon Octavian gave him back in substance the autocratic authority he had resigned, and as between the restored republic and its new *princeps* the balance of power was overwhelmingly on the side of the latter.

Octavian had held the *imperium* since 43; in 33, it is true, the powers of the triumvirate had legally expired, but he had continued to wield his authority, as he himself puts it, "by universal consent." In 27 he received a formal grant of the *imperium* from the senate and people for the term of ten years. and his *provincia* was defined as including all the provinces in which military authority was required and legions were stationed. He was declared commander-in-chief of the Roman army, and granted the exclusive right of levying troops, of making war and peace, and of concluding treaties. As consul, moreover, he not only continued to be the chief magistrate of the State at home, but took precedence in virtue of his *maius imperium*, over the governors of the "unarmed provinces," which were still nominally under the control of the senate. Thus the so-called "restoration of the republic" was in essence the recognition by law of the personal supremacy of Octavian, or Augustus, as he must henceforth be called.

In 23 an important change was made in the formal basis of Augustus's authority. In that year he laid down the consulship which he had held each year since 31, and could therefore only exert his *imperium pro consule*, like the ordinary governor of a province. He lost his authority as chief magistrate in Rome and his precedence over the governors of senatorial provinces. To remedy these defects a series of extraordinary offices were pressed upon his acceptance; but he refused them all, and caused a number of enactments to be passed which determined the character of the principate for the next three centuries. First, he was exempted from the disability attaching to the tenure of the *imperium* by one who was not an actual magistrate, and permitted to retain and exercise it in Rome. Secondly, his *imperium* was declared to be equal with that of the consuls, and therefore superior to that of all other holders of that power. Thirdly, he was granted equal rights with the consuls of convening the senate and introducing business, of nominating candidates at elections, and of issuing edicts. Lastly, he was placed on a level with the consuls in outward rank. Twelve lictors were assigned to him and an official seat between those of the consuls themselves.

Tribunicia **Potestas.**—Thus the proconsular authority was for the time admitted within the walls of Rome; but Augustus was too cautious a statesman to proclaim openly the fact that the power which he wielded in the city was the same as that exercised in camps and provinces by a Roman military commander. Hence he sought for a title which should disguise the nature of his authority, and found it in the "tribunician power," which had been conferred upon him for life in 36, and was well suited, from its urban and democratic traditions, to serve in Rome as "a term to express his supreme position." From 23 onwards the *tribunicia potestas* appears after his name in official inscriptions, together with the number indicating the period during which it had been held (also reckoned from 23); it was in virtue of this power that Augustus introduced the social reforms which the times demanded; and, though far inferior to the *imperium* in actual importance, it ranked with or even above it as a distinctive prerogative of the emperor or his chosen colleague.

The *imperium* and the *tribunicia potestas* were the two pillars upon which the authority of Augustus rested, and the other offices and privileges conferred upon him were of secondary importance. After 23 he never held the consulship save in 5 and 2 *B.C.*, when he became the colleague of his grandsons on their introduction to public life. He permitted the triumvir Lepidus tc retain the chief pontificate until his death, when Augustus naturally became *pontifex maximus* (12 B.C.). He proceeded with the like caution in reorganizing the chief departments of the public service in Rome and Italy. The *cura annonae, i.e.*, the supervision of the corn supply of Rome, was entrusted to him in 22 *B.C.*, and this important branch of administration thus came under his personal control; but the other boards (*curae*), created during his reign to take charge of the roads, the water-supply, the regulation of the Tiber and the public buildings, were composed of senators of high rank, and regarded in theory as deriving their authority from the senate.

Such was the ingenious compromise by which room was found for the master of the legions within the narrow limits of the old Roman constitution. Augustus could say with truth that he had accepted no office which was "contrary to the usage of our ancestors," and that it was only in *auctoritas*[1] that he took precedence of his colleagues. Nevertheless, as every thinking man must have realized, the compromise was unreal, and its signif-

[1] *See* Ramsay and Primerstein. *Mon. Antioch*, iv. 3 (1927).

icance was ambiguous. It was an arrangement avowedly-of an exceptional and temporary character, yet no one could suppose that it would in effect be otherwise than permanent. The powers voted to Augustus were (like those conferred upon Pompey in 67 B.C.) voted only to him, and (save the *tribunicia potestas)* voted only for a limited time; in 27 he received the *imperium* for ten years, and it was afterwards renewed for successive periods of five, five, ten and ten years. In this way the powers of the principate were made coextensive in time with the life of Augustus, but there was absolutely no provision for hereditary or any other form of succession, and various expedients were devised in order to indicate the destined successor of the *princeps* and to bridge the gap created by his death. Ultimately Augustus associated his stepson Tiberius with himself as co-regent. The *imperium* and the *tribunicia potestas* were conferred upon him, and he was thus marked out as the person upon whom the remaining powers of the principate would naturally be bestowed after the death of his stepfather. But succeeding emperors did not always indicate their successors so clearly, and, in direct contrast to the maxim that "the king never dies," it has been well said that the Roman principate died with the death of the *princeps.*

Changes in the Constitution of the **Principate.**—In theory, at least. the Roman world was governed according to the "maxims of Augustus" (Suet. *Ner.* 10), down to the time of Diocletian. Even in the 3rd century there is still in name at least a republic, of which the emperor is in strictness only the chief magistrate, deriving his authority from the senate and people, and with prerogatives limited and defined by law. The case is quite different when we turn from theory to practice. The division of authority between the republic and its chief magistrate became increasingly unequal. Over the provinces the *princeps* from the first ruled autocratically; and this autocracy reacted upon his position in Rome, so that it became every year more difficult for a ruler so absolute abroad to maintain even the fiction of republican government at home. The republican institutions, with the partial exception of the senate, lose all semblance of authority outside Rome, and even as the municipal institutions of the chief city of the empire they retain but little actual power. The real government even of Rome passes gradually into the hands of imperial prefects and commissioners, and the old magistracies become merely decorations which the emperor bestows at his pleasure. At the same time the rule of the *princeps* assumes an increasingly personal character, and the whole work of government is silently concentrated in his hands and in those of his own subordinates. Closely connected with this change is the different aspect presented by the history of the empire in Rome and Italy on the one hand and in the provinces on the other. Rome and Italy share in the decline of the republic. Political independence and activity die out; their old pre-eminence and exclusive privileges gradually disappear; and at the same time the weight of the overwhelming power of the *princeps,* and the abuses of their power by individual *principes,* press most heavily upon them. On the other hand, in the provinces and on the frontiers, where the imperial system was most needed, and where from the first it had full play, it is seen at its best as developing or protecting an orderly civilization and maintaining the peace of the world.

The decay of the republican institutions had commenced before the revolutionary crisis of 49. It was accelerated by the virtual suspension of regular government between 49 and 28; and not even the diplomatic deference towards ancient forms which Augustus displayed availed to conceal the unreality of his work of restoration. The *comitia* received back from him "their ancient rights" (Suet. *Aug.* 40), and during his lifetime they continued to pass laws and to elect magistrates. But after the end of the reign of Tiberius we have only two instances of legislation by the assembly in the ordinary way[1], and the law-making of the empire is performed either by decrees of the senate or by imperial edicts and constitutions. Their prerogative of electing magistrates was, even under Augustus, robbed of most of its importance by the control which the *princeps* exercised over their choice by means of his rights of nomination and commendation, which effectually secured the election of his own nominees. By Tiberius this restricted prerogative was still further curtailed. The candidates for all magistracies except the consulship were thenceforward nominated and voted for in the senate house and by the senators, and only the formal return of the result *(renuntiatio)* took place in the assembly (Dio lviii. 20). The *princeps* himself as long as the principate lasted, continued to receive the *tribunicia potestas* by a vote of the assembly, and was thus held to derive his authority from the people.

This almost complete effacement of the *comitia* was largely due to the fact that they had ceased to represent anything but the populace of Rome, and the comparatively greater vitality shown by the old magistracies is mainly attributable to the value they continued to possess in the eyes of the Roman upper class. But, though they were eagerly sought (Plin. *Epp.* ii. g, vi. 6), and conferred on their holders considerable social distinction, the magistrates ceased, except in name, to be the popularly chosen executive officers of the Roman State. In the administration of the empire at large they had no share, if we except the subordinate duties still assigned to the quaestor in a province. In Rome, to which their sphere of work was limited, they were overshadowed by the dominant authority of the *princeps,* while their range of duties was increasingly circumscribed by the gradual transference of administrative authority, even within the city, to the emperor and his subordinate officials. .

The senate alone among republican institutions retained some importance and influence, and it thus came to be regarded as sharing the government of the empire with the *princeps* himself. It nominally controlled the administration of Italy and of the "public provinces," whose governors it appointed. It is to the senate, in theory, that the supreme power reverts in the absence of a *princeps.* It is by decree of the senate that the new *princeps* immediately receives his powers and privileges, though he is still supposed to derive them ultimately from the people. After the cessation of all legislation by the *comitia,* the only law-making authority, other than that of the *princeps* by his edicts, was that of the senate by its decrees. Its judicial authority was co-ordinate with that of the emperor, and at the close of the 1st century we find the senators claiming, as the emperor's "peers," to be exempt from his jurisdiction. But in spite of the outward dignity of its position, and of the deference with which it was frequently treated, the senate became gradually almost as powerless in reality as the *comitia* and the magistracies. The senators continued indeed to be taken as a rule from the ranks of the wealthy, and a high property qualification was established by Augustus as a condition of membership; but this merely enabled the emperors to secure their own ascendancy by subsidizing those whose property fell short of the required standard, and who thus became simply the paid creatures of their imperial patrons. Admission to the senate was possible only by favour of the emperor, both as controlling the elections to the magistracies, which still gave entrance to the curia, and as invested with the power of directly creating senators by *adlectio,* a power which from the time of Vespasian onwards was freely used. As the result, the composition of the senate rapidly altered. Under Augustus and Tiberius it still contained many representatives of the old republican families, whose prestige and ancestral traditions were some guarantee for their independence. But this element soon disappeared. The ranks of the old nobility were thinned by natural decay and by the jealous fears of the last three Claudian emperors. Vespasian flooded the senate with new men from the municipal towns of Italy and the Latinized provinces of the West. Trajan and Hadrian, both provincials themselves, carried on the same policy, and by the close of the 2nd century even the Greek provinces of the East had their representatives in the senate. Some, no doubt, of these provincials, who constituted the great majority of the senate in the 3rd century, were men of wealth and mark, but many more were of low birth; on some rested the stain of a servile descent, and all owed alike their present position and their chances of further promotion to the emperor. The procedure of the senate was as completely

at the mercy of the *princeps* as its composition. He was himself a senator and the first of senators; he possessed the magisterial prerogatives of convening the senate, of laying business before it, and of carrying *senatus consulta;* above all, his tribunician power enabled him to interfere at any stage, and to modify or reverse its decisions. The share of the senate in the government was in fact determined by the amount of administrative activity which each *princeps* saw fit to allow it to exercise, and this share became steadily smaller. The jurisdiction assigned it by Augustus and Tiberius was in the 3rd century limited to the hearing of such cases as the emperor thought fit to send for trial, and these became steadily fewer in number. Its control of the State treasury, as distinct from the imperial *fiscus,* was in fact little more than nominal, and became increasingly unimportant as the great bulk of the revenue passed into the hands of the emperor.

The process by which all authority became centralized in the hands of the *princeps* and in practice exercised by an organized bureaucracy was of necessity gradual; but it had its beginnings under Augustus, who formed the equestrian order (admission to which was henceforth granted only by him) into an imperial service, partly civil and partly military, whose members, being immediately dependent on the emperor, could be employed on tasks which it would have been impossible to assign to senators *(see* EQUITES). From this order were drawn the armies of "procurators'—the term was derived from the practice of the great business houses of Rome—who administered the imperial revenues and properties in all parts of the empire. Merit was rewarded by independent governorships such as those of Raetia and Noricum, or the command of the naval squadrons at Misenum and Ravenna; and the prizes of the knight's career were the prefectures of the praetorian guard, the corn-supply and the city police, and the governorship of Egypt. The household offices and imperial secretaryships were held by freedmen, almost always of Greek origin, whose influence became all-powerful under such emperors as Claudius. The financial secretary *(a rationibus)* and those who dealt with the emperor's correspondence *(ab epistulis)* and with petitions *(a libellzs)* were the most important of these.

Caesar Worship.—This increase of power was accompanied by a corresponding elevation of the *princeps* himself above the level of all other citizens. The comparatively modest household and simple life of Augustus were replaced by a more than regal splendour, and under Nero we find all the outward accessories of monarchy present, the palace, the palace guards, the crowds of courtiers and a court ceremonial. In direct opposition to the republican theory of the principate, members of the family of the *princeps* share the dignities of his position. The males bear the cognomen of Caesar, and are invested, as youths, with high office; their names and even those of the females are included in the yearly prayers for the safety of the *princeps;* their birthdays are kept as festivals; the praetorian guards take the oath to them as well as to the *princeps* himself.

These honours culminate in the "imperial cult" which most definitely marks the vast distance between republican and imperial Rome. Julius Caesar, for policy's sake, had been enticed by Alexander's example to attempt the introduction of autocracy in the only form known in the ancient world. The East was accustomed to accepting commands from the semi-divine king and made no objection, and since half the population of Rome now consisted of the stock of slaves and captives the plan met with noisy applause by the lowest classes at Rome. But Brutus's dagger was the senate's answer to the proposal. Octavian, who rested his hopes of succession on the favour of Caesar's devout soldiers and on the sacred character of Caesar's last will and testament, did all in his power to canonize Julius, and built a temple to *Divus Iulius* in the Forum. This sufficed for his immediate purpose, and when he consolidated his position after Antony's defeat he wisely forbade the bestowal of divine honours upon himself within Italy while welcoming deification in Asia and Egypt where the populace could not understand why the successor of Ptolemies and Seleucid kings should not be a god. However, even in Italy the Oriental ex-slave population, very numerous everywhere, would revert to non-Roman mysticism. Here and there in Italy shrines arose and were permitted, not to Augustus, but to the "genius" of Augustus[1], and in 12 B.C the court devised an organization of ex-slaves in the towns of Italy for devotions to the Augustan *lares.* Thus the Oriental cult crept in gradually. And as the worship of Augustus by the eastern provincial communes seemed to the court to be a pleasing token of loyalty, attempts were also made officially to introduce the worship at the meetings of the provincial gatherings in Gaul, Spain and Africa. But it must be said that, except so far as Orientals took part in the worship, in the West it was and remained to the end merely lip service. As the cult was worked out for Italy after Augustus's death the emperor: were deified only after death and the worship was directed to the *Divi.* But in the provinces the worship of the living ruler continued. The image of the living emperor was on the army standards and was made the object of devotion, and refusal to perform libations to it became the ugly test of treason and of heterodoxy. A few emperors, like Caligula and Domitian, attempted to invite, while living, the honours of *Divi* even in Rome, but with little success. Diocletian was the first emperor who actually brought into the very senate the worship of the emperor as it was practised all through the empire in Asiatic cities, and he had his capital in Asia.

The Frontiers.—To secure peace it was necessary to establish on all sides of the empire really defensible frontiers; and this became possible now that for the first time the direction of the foreign policy of the state and of its military forces was concentrated in the hands of a single magistrate. To the south and west the generals of the republic, and Caesar himself, had extended the authority of Rome to the natural boundaries formed by the African deserts and the Atlantic ocean, and in these two directions Augustus's task was in the main confined to the organization of a settled Roman government within these limits. In Africa the client state of Egypt was ruled by Augustus as the successor of the Ptolemies, and administered by his deputies *(praefecti),* and the kingdom of Numidia (25 B.C.) was incorporated with the old province of Africa. In Spain the hill-tribes of the north-west were finally subdued and a third province, Lusitania, established. In Gaul Augustus (27 B.C.) established in addition to the "old province" the three new ones of Aquitania, Lugdunensis and Belgica, which included the territories conquered by Julius Caesar. Towards the north the republic had left the civilized countries bordering on the Mediterranean with only a very imperfect defence against the threatening mass of barbarian tribes beyond them. The result of Augustus's policy was to establish a protecting line of provinces running from the Euxine to the North sea, and covering the peaceful districts to the south —Moesia (A.D. 6), Pannonia (A.D. 9), Noricum (1 j B C.), Raetia (15 B C.) and Gallia Belgica. Roman rule was thus carried up to the natural frontier lines of the Rhine and the Danube. It mas originally intended to make the Elbe the frontier of the empire; but after the defeat of P. Quintilius Varus (A.D. 9) the forward policy was abandoned. Tiberius recalled Germanicus as soon as Varus had been avenged; and after the peace with Maroboduus, the chief of the Marcomanni on the upper Danube, in the next year (A.D 17), the defensive policy recommended by Augustus was adopted along the whole of the northern frontier. The line of the great rivers was held by an imposing mass of troops. Along the Rhine lay the armies of Upper and Lower Germany, consisting of four legions each; eight more guarded the Danube and the frontiers of Pannonia and Moesia. At frequent intervals along the frontier were the military colonies, the permanent camps and the smaller intervening *castella.* Flotillas of galleys cruised up and down the rivers, and Roman roads opened communication both along the frontiers and with the seat of government in Italy.

In the East, Rome was confronted with a well organized and powerful State whose claims to empire were second only to her own. The victory of Carrhae (53 B.C.) had encouraged among the Parthians the idea of an invasion of Syria and Asia Minor, while it had awakened in Rome a genuine fear of the formidable power which had so suddenly arisen in the East. Caesar was at the moment of his death preparing to avenge the death of Crassus by

[1]L. R. Taylor, in Trans. ***Amer.*** *Phil. Assn. 1920,* 116.

an invasion of Parthia, and Antony's schemes of founding an Eastern empire which should rival that of Alexander included the conquest of the kingdom beyond the Euphrates. Augustus, however, adhered to the policy which he recommended to his successors of "keeping the empire within its bounds"; and the Parthians, weakened by internal feuds and dynastic quarrels, were in no mood for vigorous action. Roman pride was satisfied by the restoration of the standards taken at Carrhae. Four legions guarded the line of the Euphrates, and, beyond the frontiers of Pontus and Cappadocia, Armenia was established as a "friendly and independent ally."

The **Provinces.**—Next in importance to the rectification and defence of the frontiers was the reformation of the administration, and the restoration of prosperity to the distracted and exhausted provinces. The most serious defect of the republican system had been the absence of any effective control over the Roman officials outside Italy. This was now supplied by the general proconsular authority vested in the emperor. The provinces were for the first time treated as departments of a single State, while their governors, from being independent and virtually irresponsible rulers, became the subordinate officials of a higher authority. Over the *legati* of the imperial provinces the control of the emperor was as complete as that of the republican proconsul over his staff in his own province. They mere appointed by him, held office at his good pleasure, and were directly responsible to him for their conduct. The proconsuls of the senatorial provinces were in law magistrates equally with the *princeps,* though inferior to him in rank; it was to the senate that they were, as of old, responsible; they were still selected by lot from among the senators of consular and praetorian rank. But the distinction did not seriously interfere with the paramount authority of the emperor. The provinces left nominally to the senate were the more peaceful and settled districts in the heart of the empire, where only the routine work of civil administration was needed, and where the local municipal governments were as yet comparatively vigorous. The senatorial proconsuls themselves were indirectly nominated by the emperor through his control of the praetorship and consulship. They wielded no military and only a strictly subordinate financial authority, and, though Augustus and Tiberius, at any rate, encouraged the fiction of the responsibility of the senatorial governors to the senate, it was in reality to the emperor that they looked for direction and advice, and to him that they were held accountable. Moreover, in the case of all governors this accountability became under the empire a reality. Prosecutions for extortion (de pecuniis *repetundis*), which were now transferred to the hearing of the senate, were tolerably frequent during the first century of the empire; but a more effective check on maladministration lay in the appeal to Caesar from the decisions of any governor, which was open to every provincial, and in the right of petition. Finally, the authority both of the legate and the proconsul was weakened by the presence of the imperial procurator, to whom was entrusted the administration of the fiscal revenues; while both legate and proconsul were deprived of that right of requisitioning supplies which. in spite of a long series of restrictive laws, had been the most powerful instrument of oppression in the hands of republican governors. The financial reforms of Augustus are marked by the same desire to establish an equitable, orderly and economical system, and by the same centralization of authority in the emperor's hands. The institution of an imperial census or valuation of all land throughout the empire, and the assessment upon this basis of a uniform land tax, in place of the heterogeneous and irregular payments made under the republic, were the work of Augustus, though the system was developed and perfected by the emperors of the 2nd century and by Diocletian. The land tax itself was directly collected, either by imperial officials or by local authorities responsible to them, and the old wasteful plan of selling the privilege of collection to *publicani* was henceforward applied only to such indirect taxes as the customs duties. The rate of the land tax was fixed by the emperor, and with him rested the power of remission even in senatorial provinces. The effect of these reforms is clearly visible in the improved financial condition of the empire. Under the republic the treasury had been nearly always in difficulties, and the provinces exhausted and impoverished. Under the emperors, at least throughout the 1st century, in spite of a largely increased expenditure on the army, on public works, on shows and largesses, and on the machinery of government itself, the better emperors, such as Tiberius and Vespasian, were able to accumulate large sums, while tht provinces showed but few signs of distress. Moreover, while the republic had almost entirely neglected to develop the internal resources of the provinces, Augustus set the example of a liberal expenditure on public works, in the construction of harbours, roads and bridges, the reclamation of waste lands and the erection of public buildings.

The **Julio-Claudian** Line.—Augustus founded a dynasty which occupied the throne for more than half a century after his death. The first and by far the ablest of its members was Tiberius (**A.D.** 14–37). He was undoubtedly a capable and vigorous ruler, who enforced justice in the government of the provinces, maintained the integrity of the frontiers and husbanded the finances of the empire, but he became intensely unpopular in Roman society, and was painted as a cruel and odious tyrant. His successor, Gaius (**A.D.** 37–41), generally known as Caligula, was the slave of his wild caprices and uncontrolled passions, which issued in manifest insanity. He was followed by his uncle, Claudius (**A.D.** 41–54), whose personal uncouthness made him an object of derision to his contemporaries, but who was by no means devoid of statesmanlike faculties. His reign left an abiding mark on the history of the empire, for he carried forward its development on the lines intended by Augustus. Client-states were absorbed, southern Britain was conquered, the romanization of the West received a powerful impulse, public works were executed in Rome and Italy, and the organization of the imperial bureaucracy made rapid strides. Nero (**A.D.** 54–68), the last of the Julio-Claudian line, has been handed down to posterity as the incarnation of monstrous vice and fantastic luxury. But his wild excesses scarcely affected the prosperity of the empire at large; the provinces were well governed, and the war with Parthia led to a compromise in the matter of Armenia which secured peace for half a century.

The **Antonine** Empire.—The fall of Nero and the extinction of the "progeny of the Caesars" was followed by a war of succession which revealed the military basis of the principate and the weakness of the tie connecting the emperor with Rome. Galba, Otho, Vitellius and Vespasian represented in turn the legions of Spain, the household troops, the army of the Rhine, and a coalition of the armies of the Danube and the Euphrates; and all except Otho were already de facto emperors when they entered Rome. The final survivor in the struggle, Vespasian (**A.D.** 70–79), was a man of comparatively humble origin, and as the principate ceased to possess the prestige of high descent it became imperatively necessary to remove, as far as possible, the anomalies of the office and to give it a legitimate and permanent form. Thus we find an elaborate and formal system of titles substituted for the personal names of the Julio-Claudian emperors, an increasing tendency to insist on the inherent prerogatives of the principate (such as the censorial power), and an attempt to invest Caesarism with an hereditary character, either by natural descent or by adoption, while the worship of the *Divi,* or deified Caesars, was made the symbol of its continuity and legitimacy. The dynasty of Vespasian and his sons (Titus. **A.D.** 79–81. Domitian, **A.D.** 81–96) became extinct on the murder of the last named, whose high-handed treatment of the senate earned him the name of a tyrant: his successor, Nerva (**A.D.** 96–98), opened the series of "adoptive" emperors (Trajan, **A.D.** 98–117, Hadrian, 117–138, Antoninus Pius, 138–161, Marcus Aurelius 161–180) under whose rule the empire enjoyed a period of internal tranquillity and good government. Its boundaries were extended by the subjugation of northern Britain by Agricola, **A.D.** 78–84 (see **BRITAIN**: *Roman*), by the annexation of the districts included in the angle of the Rhine and Danube under the Flavian emperors, and by the conquest of Dacia (the modern Transylvania) under **Trajan** (completed in **A.D.** 106). Trajan also annexed Arabia

Petraea and in his closing years invaded Parthia and formed provinces of Armenia, Mesopotamia and Assyria; but these conquests were surrendered by his successor, Hadrian, who set himself to the task of consolidating the empire and perfecting its defences. To him is due the system of permanent *limites* or frontier fortifications, such as the wall which protected northern Britain and the palisade which replaced the chain of forts established by the Flavian emperors from the Rhine to the Danube. The construction of these defences showed that the limit of expansion had been reached, and under M. Aurelius the tide began to turn. A great part of his reign was occupied with wars against the Marcomanni, Quadi, Sarmatians, etc., whose irruptions seriously threatened the security of Italy, Henceforth Rome never ceased to be on the defensive.

Within the frontiers the levelling and unifying process commenced by Augustus had steadily proceeded. A tolerably uniform provincial system covered the whole area of the empire. The client-states had one by one been reconstituted as provinces, and even the government of Italy had been in many respects assimilated to the provincial type. The municipal system had spread widely; the period from Vespasian to Aurelius witnessed the elevation to municipal rank of an immense number of communities, not only in the old provinces of the West, in Africa, Spain and Gaul, but in the newer provinces of the North, and along the line of the northern frontier; and everywhere under the influence of the central imperial authority there was an increasing uniformity in the form of the local constitutions, framed and granted as they all were by imperial edict. Throughout the empire again the extension of the Roman franchise was preparing the way for the final act by which Caracalla assimilated the legal status of all free-born inhabitants of the empire, and in the west and north this was preceded and accompanied by the complete romanizing of the people in language and civilization. Yet, in spite of the internal tranquillity and the good government which have made the age of the Antonines famous, we can detect signs of weakness. It was in this period that the centralization of authority in the hands of the *princeps* was completed; the "dual control" established by Augustus, which had been unreal enough in the 1st century, was now, though not formally abolished, systematically ignored in practice. The senate ceased to be an instrument of government, and became an imperial peerage, largely composed of men not qualified by election to the quaestorship but directly ennobled by the emperor. The restricted sphere of administration left by Augustus to the old magistracies was still further narrowed; their jurisdiction, for example, tended to pass into the hands of the Greek officers appointed by Caesar—the prefect of the city and the prefect of the guards. The complete organization of Caesar's own administrative service, and its recognition as a state bureaucracy, was chiefly the work of Hadrian, who took the secretaryships out of the hands of freedmen and entrusted them to procurators of equestrian rank. All these changes, inevitable, and in some degree beneficial, as they were, brought with them the attendant evils of excessive centralization. Though these were hardly felt while the central authority was wielded by vigorous rulers, yet even under Trajan, Hadrian and the Antonines we notice a failure of strength in the empire as a whole, and a corresponding increase of pressure on the imperial Government itself. The reforms of Augustus had given free play to powers still fresh and vigorous. The ceaseless labours of Hadrian were directed mainly to the careful husbanding of such strength as still remained, or to attempts at reviving it by the sheer force of imperial authority. Among the symptoms of incipient decline were the growing depopulation, especially of the central districts of the empire, the constant financial difficulties, the deterioration in character of the local governments in the provincial communities, and the increasing reluctance exhibited by all classes to undertake the now onerous burden of municipal office.

It is to such facts as these that we must look in passing a final judgment on the imperial Government, which is admittedly seen in its best and most perfect form in the Antonine period. In our review of the conditions which brought about the fall of the Roman republic, we saw that the collapse of the city-state made Caesarism inevitable, since the extension of federal and representative institutions to a heterogeneous world-empire was out of the question. The benefits which Caesarism conferred upon mankind are plain. In the first place, the Roman world, which had hitherto not been governed in the true sense of the word, but exploited in the interests of a dominant clique, now received an orderly and efficient government, under which the frightful ravages of misrule and civil strife were repaired. The financial resources of the empire were husbanded by skilled and, above all *trained* administrators, to whom the imperial service offered a *carrière ouverte aux talents;* many of these were Greeks, or half-Greek Orientals, whose business capacity formed an invaluable asset hitherto neglected. Augustus caused an official survey of the empire to be made, and a scientific census of its resources was gradually carried out and from time to time revised; thus the balance of revenue and expenditure could be accurately estimated and adjusted, and financial stability was established. The system of tax-farming was gradually abolished and direct collection substituted; commerce was freed from vexatious restrictions, and large customs-districts were formed, on whose borders duties were levied for revenue only. The Government took even more direct measures for the encouragement of industry and especially of agriculture. The most remarkable of these were the "alimentary" institutions, originally due to Nerva and developed by succeeding emperors. Capital was advanced at moderate rates of interest to Italian landowners on the security of their estates, and the profits of this system of land banks were devoted to the maintenance and education of poor children. The foundation of colonies for time-expired soldiers, who received grants of land on their discharge, contributed something to the formation of a well-to-do agricultural class; and although the system was not successful in lower Italy, where economic decline could not be arrested, there can be no doubt that central and northern Italy, where the vine and olive were largely cultivated, and manufacturing industries sprang up, enjoyed a considerable measure of prosperity. The extension of the Roman municipal system to the provinces, and the watchful care exercised by the imperial Government over the communities, together with the profuse liberality of the emperors, which was imitated by the wealthier citizens of the towns, led to the creation of a flourishing municipal life still evidenced by the remains which in districts such as Asia Minor or Tunis stand in significant contrast with the desolation which was brought about by centuries of barbaric rule. Mommsen[1] has, indeed, expressed the opinion that "if an angel of the Lord were to strike the balance whether the domain ruled by Antoninus were governed with the greater intelligence and the greater humanity at that time or in the present day, whether civilization and national prosperity generally had since that time advanced or retrograded, it is very doubtful whether the decision would prove in favour of the present."

But there is another side to the picture. During the last two centuries of the republic Rome, by introducing slaves and captives to perform the hard labour of Italy while the free population spent itself in war or lost itself in the provinces, had thoroughly changed the Italian stock. Had the change come gradually and had Rome received the newcomers into schools that might have trained them into a consistent tradition this introduction of a varied stock might perhaps have enriched the spirit of Rome. But this was not to be. Such an amalgam requires time to eliminate the products of incongruous physical mixture,[2] to unify the peoples of a dozen languages until they can comprehend each other and effectually shape common ideals, to distil and throw off the hatred, servility and unsocial hostility to the community bred by years of suffering in slavery, and in a word to create a new people homogeneous enough to act together. The invasion was so rapid and the time so short that such a process of unification never completed itself at Rome. And when Rome, which was the heart of the empire, lost its rhythm and balance, when Rome no longer had a definite culture, a certain inspiration to impart to the provinces, when Rome's religion suc-

[2] M. P. Nilsson, in *Hereditas* (1921), 370.

cumbed to the several mystical cults brought in by her slaves, when her moral standards yielded before a dozen incongruous traditions, and her literature lost itself in blind gropings after a bygone tradition of a freer day, the provincials in despair abandoned her guidance.

Furthermore, the empire brought into being in the provinces a new nationality, due to the partial fusion of Roman ideas with Hellenic culture, beside which other elements, saving only, as we shall see, those contributed by the Oriental religions, were insignificant. This new nationality grew in definition through the gradual disappearance of distinctions of language and manners, the assimilating influence of commercial and social intercourse, and the extinction of national jealousies and aspirations. But the cosmopolitan society thus formed was compacted of so many disparate elements that a common patriotism was hard to foster, and doubly hard when the autocratic system of government prevented men from aspiring to that true political distinction which is attainable only in a self-governing community. It is true that there was much good work to be done, and that much good work was done, in the service of the emperors; true, also, that the *carrière ouverte* aux talents was in large measure realized. Distinctions of race were slowly but steadily efiaced by the grant of citizen rights to provincials and by the manumission of slaves; and the career open to the romanized provincial or the liberated slave might culminate in the highest distinctions which the emperor could bestow. In the hierarchy of social orders — senate, *equites* and plebs — ascent was easy and regular from the lower grade to the higher; and the more enlightened of the emperors — especially Hadrian — made a genuine endeavour to give a due share in the work of government to the various subject races. But nothing could compensate for the lack of self-determination, and although during the first century and a half of imperial rule a flourishing local patriotism in some degree filled the place of the wider sentiment, this gradually sank into decay and became a pretext under cover of which the lower classes in the several communities took toll of their wealthier fellow-citizens in the shape of public works, largesses, amusements, etc., until the resources at the disposal of the rich ran dry, the communities themselves in many cases became insolvent, and the inexorable claims of the central Government were satisfied only by the surrender of financial control to an imperial commissioner. Then the organs of civic life became atrophied, political interest died out, and the whole burden of administration, as well as that of defence, fell upon the shoulders of the bureaucracy, which proved unequal to the task.

The **Empire**, 180–284.—Marcus Aurelius died in 180, and the reign of his worthless son, Commodus (A.D. 180–192), was followed by a century of war and disorder, during which nothing but the stern rule of soldier emperors saved the empire from dissolution. The first and ablest of these was Septimius Severus (193–211), whose claims were disputed by Clodius Albinus in the West, and by Pescennius Niger in the East; in these struggles rival Roman forces, for the first time since the accession of Vespasian, exhausted each other in civil war. Severus emphasized strongly the military character of the principate; he abstained from seeking confirmation for his authority from the senate, and deprived that body of most of the share in the government which it still retained; he assumed the title of proconsul in Rome itself, made the prefect of the guard the vicegerent of his authority, and heaped privileges upon the army, which, although they secured its entire devotion to his family, impaired its efficiency as a fighting force and thus weakened Rome in face of the barbarian invader. He succeeded in founding a short-lived dynasty, which ended with the attempt of the virtuous but weak Alexander (222–235) to restore the independence of the senate. This led to a military reaction, and the elevation of the brutal Maximinus, a Thracian peasant, to the throne. The disintegration of the empire was the natural result; for the various provincial armies put forward their commanders as claimants to the purple. These "tyrants," as they were called when unsuccessful, sprang up in ever-increasing numbers, and weakened Rome's power of resistance to the new enemies who were threatening her frontiers — the Alamanni and Franks, who broke through the German *limes* in 236; the Goths, who crossed the Danube in 247, raided the Balkan provinces, and defeated and slew the emperor, Decius, in 251, and the restored Persian kingdom of the Sassanidae (see PERSIA), whose rulers laid claim to all the Asiatic possessions of Rome and in 260 captured Antioch and made the emperor, Valerian, a prisoner. During the reign of Gallienus, the son of Valerian (260–268), the evil reached its height. The central authority was paralysed; the romanized districts beyond the Rhine were irrevocably lost; the Persians were threatening to overrun the eastern provinces; the Goths had formed a fleet of 500 sail which harried Asia Minor and even Greece itself, where Athens, Corinth, Sparta and Argos were sacked; and the legions on the frontiers were left to repel the enemies of Rome as best they could. A provincial empire was established by M. Cassianius Latinius Postumus in Gaul and maintained by his successors, M. Piavonius Victorinus and C. Pius Esuvius Tetricus. Their authority was acknowledged, not only in Gaul and by the troops on the Rhine, but by the legions of Britain and Spain; and under Postumus at any rate (259–269) the existence of the Gallic empire was justified by the repulse of the barbarians and by the restoration of peace and security to the provinces of Gaul. On the Danube, in Greece and in Asia Minor none of the "pretenders" enjoyed more than a passing success. In the Far East, the Syrian Odaenathus, prince of Palmyra (*q.v.*), though officially only the governor of the East (dux Orientis) under Gallienus, drove the Persians out of Asia Minor and Syria, recovered Mesopotamia, and ruled Syria, Arabia, Armenia, Cappadocia and Cilicia with all the independence of a sovereign. Odaenathus was murdered in 266. His young son Vaballathus (Wahab-allath) succeeded him in his titles, but the real power was vested in his widow Zenobia, under whom not only the greater part of Asia Minor but even the province of Egypt was forcibly added to the dominions governed by the Palmyrene prince, who ceased to acknowledge the supremacy of Rome.

Gallienus was murdered at Milan in 268, and after the brief reign of Claudius II. (A.D. 268–270), who checked the advance of the Goths, Aurelian (270–275) restored unity to the distracted empire. Palmyra was destroyed and Zenobia led a prisoner to Rome (273) and in the next year the Gallic empire came to an end by the surrender of Tetricus. Aurelian, it is true, abandoned the province of Dacia, but the defences of the Danube were strengthened, and in 276 Probus repulsed the Franks and Alamanni, who had been pressing on the Rhine frontier for some 40 years. Finally, Carus (282) recovered Armenia and Mesopotamia from the Persians and restored the frontier fixed by Septimius Severus.

The Empire at the Close of the 3rd Century.—Although any serious loss of territory had been avoided, the storms of the 3rd century had told with fatal effect upon the general condition of the empire. The "Roman peace" had vanished; not only the frontier territories, but the central districts of Greece, Asia Minor, and even Italy itself, had suffered from the ravages of war, and the fortification of Rome by Aurelian was a significant testimony to the altered condition of affairs. War, plague and famine had thinned the population and crippled the resources of the provinces. On all sides land was running waste, cities and towns were decaying and commerce was paralysed. Only with the greatest difficulty were sufficient funds squeezed from the exhausted taxpayers to meet the increasing cost of the defence of the frontiers. The old established culture and civilization of the Mediterranean world rapidly declined, and the mixture of barbaric rudeness with Oriental pomp and luxury which marked the court, even of the better emperors, such as Aurelian, was typical of the general deterioration, which was accelerated by the growing practice of settling barbarians on lands within the empire and of admitting them freely to service in the Roman army.

Period **II.**: The Dominate, A.D. **284–476. (a)** From the Accession of Diocletian to the Death of Theodosius **(A.D. 284–395).**—The work of fortifying the empire alike against internal sedition and foreign invasion, begun by Aurelian and Probus, was completed by Diocletian and Constantine the Great,

whose system of government, novel as it appears at first sight, was in reality the natural and inevitable outcome of the history of the previous century. Its object was two-fold, to give increased stability to the imperial authority itself and to organize efficient administrative machinery throughout the empire. In the second year of his reign Diocletian associated Maximian with himself as colleague, and six years later (293) the hands of the two "Augusti" were further strengthened by the proclamation of Constantius and Galerius as "Caesares." Precedents for such an arrangement were to be found in the earlier history of the principate; and it divided the burdens and responsibilities of government without sacrificing the unity of the empire; for, although to each of the Augusti and Caesars a separate sphere was assigned, the Caesars were subordinate to the higher authority of the Augusti, and over all his three colleagues Diocletian claimed to exercise a paramount control. It also reduced the risk of a disputed succession by establishing in the two Caesars the natural successors to the Augusti, and it satisfied the jealous pride of the rival armies by giving them *imperatores* of their own. The distribution of power between Diocletian and his colleagues followed those lines of division which the feuds of the previous century had marked out. The armies of the Rhine, the Danube and of Syria fell to the lot respectively of Constantius, Galerius and Diocletian, the central districts of Italy and Africa to Maximian.

Diocletian's Reforms.—In the new system the imperial authority was finally emancipated from all constitutional limitation and control and the last traces of its republican origin disappeared. The emperors from Diocletian onwards were autocrats in theory as well as in practice. This avowed despotism Diocletian, following in the steps of Aurelian, hedged round with all the pomp and majesty of Oriental monarchy. The final adoption of the title *dominus,* the diadem on the head, the robes of silk and gold, the replacement of the republican salutation of a fellow-citizen by the adoring prostration even of the highest in rank before their lord and master, were all significant marks of the new régime. In the hands of this absolute ruler was placed the entire control of an elaborate administrative machinery. Most of the old local and national distinctions, privileges and liberties which had once flourished within the empire had already disappeared under the levelling influence of imperial rule, and the process was now completed. Roman citizenship had, since the edict of Caracalla, ceased to be the privilege of a minority. Diocletian finally reduced Italy and Rome to the level of the provinces: the provincial land-tax and provincial government were introduced into Italy, while Rome ceased to be even in name the seat of imperial authority.[1] Throughout the whole area of the empire a uniform system of administration was established, the control of which was centred in the imperial palace. Between the civil and military departments the separation was complete. At the head of the former were the praetorian prefects, next below them the *vicarii,* who had charge of the *dioceses;* below these again the governors of the separate provinces (*praesides, correctores, consulares*), under each of whom was a host of minor officials. Parallel with this civil hierarchy was the series of military officers, from the *magistri militum,* the *duces* and *comites* downwards. In both there is the utmost possible subordination and division of authority. The subdivision of provinces, begun by the emperors of the 2nd century, was systematically carried out by Diocletian, and each official, civil or military, was placed directly under the orders of a superior; thus a continuous chain of authority connected the emperor with the meanest official in his service. Finally, the various grades in these two imperial services were carefully marked by the appropriation to each of distinctive titles, the highest being that of *illustris,* which was confined to the prefects and to the military *magistri* and *comites,* and to the chief ministers.

There can be little doubt that on the whole these reforms prolonged the existence of the empire, by creating a machinery which enabled the stronger emperors to utilize effectively all its available resources, and which even to some extent made good the deficiencies of weaker rulers. But in many points they failed to attain their object. Diocletian's division of the imperial authority among colleagues, subject to the general control of the senior Augustus, was effectually discredited by the 20 years of almost constant conflict which followed his own abdication (305–323). Constantine's partition of the empire among his three sons was not more successful in ensuring tranquillity, and in the final division of the East and West between Valens and Valentinian (364) the essential principle of Diocletian's scheme, the maintenance of a single central authority, was abandoned. The "tyrants," the curse of the 3rd century, were far from unknown in the 4th. The system, moreover, while it failed altogether to remove some of the existing evils, aggravated others. The already overburdened financial resources of the empire were strained still further by the increased expenditure necessitated by the substitution of four imperial courts for one, and by the multiplication in every direction of paid officials. The gigantic bureaucracy of the 4th century proved, in spite of its undoubted services, an intolerable weight upon the energies of the empire.

The Division of the **Empire.**—Diocletian and Maximian formally abdicated their high office in 305. Nineteen years later Constantine I. the Great, the sole survivor of six rival emperors, united the whole empire under his own rule. His reign of 14 years was marked by two events of first-rate importance—the recognition of Christianity as the religion of the empire and the building of the new capital at Byzantium. The alliance which Constantine inaugurated between the Christian Church and the imperial Government, while it enlisted on the side of the State one of the most powerful of the new forces with which it had to reckon, imposed a check, which was in time to become a powerful one, on the imperial authority. The establishment of the new "City of Constantine" as a second Rome paved the way for the final separation of East and West by providing the former for the first time with a suitable seat of government on the Bosporus. The death of Constantine in 337 was followed, as the abdication of Diocletian had been, by the outbreak of quarrels among rival Caesars. Of the three sons of Constantine who in 337 divided the empire between them, Constantine the eldest fell in civil war against his brother Constans; Constans himself was, ten years afterwards, defeated and slain by Magnentius; and the latter in his turn was in 353 vanquished by Constantine's only surviving son Constantius. Thus for the second time the whole empire was united under the rule of a member of the house of Constantine. But in 3jj Constantius granted the title of Caesar to his cousin Julian and placed him in charge of Gaul, where the momentary elevation of a tyrant, Silvanus, and still more the inroads of Franks and Alamanni, had excited alarm. But Julian's successes during the next five years were such as to arouse the jealous fears of Constantius. In order to weaken his suspected rival the legions under Julian in Gaul were suddenly ordered to march eastward against the Persians (360). They refused; and when the order was repeated, replied by proclaiming Julian himself emperor and Augustus. Julian, with probably sincere reluctance, accepted the position, but the death of Constantius in 361 saved the empire from the threatened civil war. Julian's attempted restoration of pagan and in especial of Hellenic worships had no more permanent effect than the war which he courageously waged against the multitudinous abuses which had grown up in the luxurious court of Constantius. But his vigorous administration in Gaul undoubtedly checked the 'barbarian advance across the Rhine, and postponed the loss of the western provinces; on the contrary, his campaign in Persia, brilliantly successful at first, ended in his own death (363), and his successor, Jovian, immediately surrendered the territories beyond the Tigris won by Diocletian 70 years before. Jovian died on Feb. 17, 364; and on Feb. 26, Valentinian was acknowledged as emperor of the army at Nicaea In obedience to the wish of the soldiers that he should associate a colleague with himself, he conferred the title of Augustus upon his brother Valens, and the division of the empire was at last effected—Valentinian became emperor of the West, Valens of the East. Valentinian maintained the integrity of the empire until his death (in 375), which deprived the weaker Valens of a trusted

[1] The seats of government for Diocletian and his three colleagues were Nicomedia, Mediolanum, Augusta Trevirorum, and Sirmium.

counsellor and ally, and was followed by a serious crisis on the Danube. In 376 the Goths, hard pressed by their new foes from the eastward, the Huns, sought and obtained the protection of the Roman empire. They were transported across the Danube and settled in Moesia, but, indignant at the treatment they received, they rose in arms against their protectors. In 378 at Adrianople Valens was defeated and killed, and the victorious Goths advanced eastwards to the very walls of Constantinople. Once more, however, the danger passed away. The skill and tact of Theodosius, who had been proclaimed emperor of the East by Gratian, conciliated the Goths; they were granted an allowance, and in large numbers entered the service of the Roman emperor. The remaining years of Theodosius's reign (382–395) were mainly engrossed by the duty of upholding the increasingly feeble authority of his western colleague against the attacks of pretenders. Maximus, the murderer of Gratian (383), was at first recognized by Theodosius as Caesar, and left in undisturbed command of Gaul, Spain and Britain; but, when in 386 he proceeded to oust Valentinian II. from Italy and Africa, Theodosius marched westwards, crushed him and installed Valentinian as emperor of the West. In the very next year, however, the murder of Valentinian (392) by Arbogast, a Frank, was followed by the appearance of a fresh tyrant in the person of Eugenius, a domestic officer and nominee of Arbogast himself. Once more Theodosius marched westwards, and near Aquileia decisively defeatrd his opponents. But his victory was quickly followed by his own illness and death (395), and the fortunes of East and West passed into the care of his two sons Arcadius and Honorius.

(b) From the Death of Theodosius to the Extinction of the Western Empire (395–476).—Through more than a century from the accession of Diocletian the Roman empire had succeeded in holding at bay the swarming hordes of barbarians, But, though no province had yet been lost, as Dacia had been lost in the century before, and though the frontier lines of the Rhine and the Danube were still guarded by Roman forts and troops, there were signs in plenty that a catastrophe was at hand.

From all the writers who deal with the 4th century we have one long series of laments over the depression and misery of the provinces.[1] To meet the increased expenditure necessary to maintain the legions, to pay the hosts of officials and to keep up the luxurious splendour of the imperial courts, not only were the taxes raised in amount but the most oppressive and inquisitorial methods were adopted in order to secure for the imperial treasury every penny that could be wrung from the wretched taxpayer. The results are seen in such pictures as that which the panegyrist Eumenius draws of the state of Gaul (306–312) under Constantine, in the accounts of the same province under Julian 50 years later, in those given by Zosimus early in the 5th century, and in the stringent regulations of the Theodosian code, dealing with the assessment and collection of the taxes. Among the graver symptoms of economic ruin were the decrease of population, which seriously diminished not only the number of taxpayers, but the supply of soldiers for the legions; the spread of infanticide; the increase of waste lands whose owners and cultivators had fled to escape the tax collector; the declining prosperity of the towns; and the constantly recurring riots and insurrections, both among starving peasants, as in Gaul, and in populous cities like Antioch. The distress was aggravated by the civil wars, by the rapacity of tyrants, such as Maxentius and Maximus, but above all by the raids of the barbarians, who seized every opportunity afforded by the dissensions or incapacity of the emperors to cross the frontiers and harry the lands of the provincials. Constantine (306–312), Julian (356–360) and Valentinian I. (364–375) had each to give a temporary breathing-space to Gaul by repelling the Franks and Alamanni. Britain was harassed by Picts and Scots from the north (367–370), while the Saxon pirates swept the northern seas and the coasts both of Britain and Gaul. On the Danube the Quadi, Sarmatae, and above all the Goths, poured at intervals into the provinces of Pannonia and Moesia, and penetrated to Macedon and Thrace. In the East, in addition to the constant border feud with Persia, we hear of ravages by the Isaurian mountaineers, and by a new enemy, the Saracens.

Even more ominous of coming danger was the extent to which the European half of the empire was becoming barbarized. The policy which had been inaugurated by Augustus himself of settling barbarians within the frontiers had been taken up on a larger scale and in a more systematic way by the Illyrian emperors of the 3rd century, and was continued by their successors in the 4th. In Gaul, in the provinces south of the Danube, even in Macedon and Italy, large barbarian settlements had been made — Theodosius in particular distinguishing himself by his liberality in this respect. Nor did the barbarians admitted during the 4th century merely swell the class of half-servile *coloni*. On the contrary, they not only constituted to an increasing extent the strength of the imperial forces, but won their way in ever-growing numbers to posts of dignity and importance in the imperial service. Under Constantine the palace was crowded with Franks. Julian led Gothic troops against Persia, and the army with which Theodosius defeated the tyrant Maximus (388) contained large numbers of Huns and Alans, as well as of Goths. The names of Arbogast, Stilicho and Rufinus are sufficient proof of the place held by barbarians near the emperor's person and in the control of the provinces and legions of Rome; and the relations of Arbogast to his nominee for the purple, Eugenius, were an anticipation of those which existed between Ricimer and the emperors of the latter half of the 5th century.

Barbaric Invasions. — It was by barbarians already settled within the empire that the first of the series of attacks which finally separated the western provinces from the empire and set up a barbaric ruler in Italy was made, and it was in men of barbarian birth that Rome found her ablest and most successful defenders. The Visigoths whom Alaric led into Italy had been settled south of the Danube as the allies of the empire since the accession of Theodosius. But, like the Germans of the days of Caesar, they wanted land for their own, and Alaric aspired to raise himself to the heights which had been reached before him by the Vandal Stilicho at Ravenna and the Goth Rufinus at Constantinople. The jealousy which existed between the rulers of the western and eastern empires furthered his plans. In the name of Arcadius, the emperor of the East, or at least with the connivance of Arcadius's minister Rufinus. he occupied the province of Illyricum, and from thence ravaged Greece, which, according to the existing division of provinces, belonged to the western empire. Thence in 396 he retreated before Stilicho to Illyricum, with the command of which he was now formally invested by Arcadius; he thus gained a base of operations against Italy. In 400 he led his people, with their wives and families, their wagons and treasure, to seek lands for themselves south of the Alps. But in this first invasion he penetrated no farther than the plains of Lombardy, and after the desperate battle of Pollentia (402 or 403) he slowly withdrew from Italy, his retreat being hastened by the promises of gold freely made to him by the imperial Government. Not until the autumn of 408 did Alaric again cross the Alps. Stilicho was dead; the barbarian troops in Honorius's service had been provoked into joining Alaric by the anti-Teutonic policy of Honorius and his ministers, and Alaric marched unopposed to Rome. The payment of a heavy ransom, however, saved the city. Negotiations followed between Alaric and the court of Ravenna. Alaric's demands were moderate, but Honorius would grant neither lands for his people nor the honourable post in the imperial service which he asked for himself. Once more Alaric sat down before Rome, and the citizens were forced to agree to his terms. Attalus, a Greek, the prefect of the city, was declared Augustus, and Alaric accepted the post of commander-in-chief. But after a few months Alaric formally deposed Attalus, on account of his incapacity, and renewed his offers to Honorius. Again they were declined, and Alaric marched to the siege and sack of Rome (410). His death followed hard on his capture of Rome. Two years later (412) his successor Ataulf led the Visigoths to find in Gaul the lands which Alaric had sought in Italy. It is characteristic of the anarchical condition of the West that Ataulf and his Goths should have fought for Honorius in Gad

[1] Rostovtzeff, *Social and Economic History of Rome*, ch. 12.

against the tyrants and in Spain against the Vandals, Suebi and Alani; and it was with the consent of Honorius that in 419 Wallia, who had followed Ataulf as king of the Visigoths, finally settled with his people in south-western Gaul and founded the Visigothic monarchy.

It was about the same period that the accomplished fact of the division of Spain between the three barbarian tribes of Vandals, Suebi and Alani was in a similar manner recognized by the paramount authority of the emperor of the West. These peoples had crossed the Rhine at the time when Alaric was making his first attempt on Italy. A portion of the host led by Radagaisus actually invaded Italy, but was cut to pieces by Stilicho near Florence (405); the rest pressed on through Gaul, crossed the Pyrenees, and entered the as yet untouched province of Spain.

Honorius died in 423. With the single exception of Britain,[1] no province had yet formally broken loose from the empire. But over a great part of the West the authority of the emperors was now little more than nominal; throughout the major part of Gaul and in Spain the barbarians had settled, and barbarian states were growing up which recognized the supremacy of the emperor, but were in all essentials independent of his control.

The long reign of Valentinian III. (423–45j) is marked by two events of first-rate importance — the conquest of Africa by the Vandals[2] and the invasion of Gaul and Italy by Attila. The Vandal settlement in Africa was closely akin in its origin and results to those of the Visigoths and of the Vandals themselves in Gaul and Spain. Here, as there, the occasion was given by the jealous quarrels of powerful imperial ministers. The feud between Boniface, count of Africa, and Aetius, the "master-general" or "count of Italy," opened the way to Africa for the Vandal king Gaiseric (Genseric), as that between Stilicho and Rufinus had before set Alaric in motion westwards, and as the quarrel between the tyrant Constantine and the ministers of Honorius had paved the way for the Vandals, Suebi and Alani into Spain. In this case, too, land-hunger was the impelling motive with the barbarian invader, and in Africa, as in Gaul and Spain, the invaders' acquisitions were confirmed by the imperial authority which they still professed to recognize. In 429 Gaiseric, king of the Vandals, crossed with his warriors, their families and goods, to the province of Africa, hitherto almost untouched by the ravages of war. Thanks to the quarrels of Boniface and Aetius, their task was an easy one. The province was quickly overrun. In 435 a formal treaty secured them in the possession of a large portion of the rich lands which were the granary of Rome, in exchange for a payment probably of corn and oil. Carthage was taken in 439, and in the following year the Vandal kingdom was firmly established over a wide area in the ancient Roman realm.

Eleven years later (451) Attila invaded Gaul, but this Hunnish movement was in a variety of ways different from those of the Visigoths and Vandals. Nearly a century had passed since the Huns first appeared in Europe and drove the Goths to seek shelter within the Roman lines. Attila was now the ruler of a great empire in central and northern Europe and, in addition to his own Huns, the German tribes along the Rhine and Danube and far away to the north owned him as king. He confronted the Roman power as an equal; and, unlike the Gothic and Vandal chieftains, he treated with the emperors of East and West as an independent sovereign. His advance on Gaul and Italy threatened, not the establishment of one more barbaric chieftain on Roman soil, but the subjugation of the civilized and Christian West to the rule of a heathen and semi-barbarous conqueror. But the Visigoths in Gaul, Christian and already half romanized, rallied to the aid of the empire against a common foe. Attila, defeated at Châlons by Aëtius, withdrew into Pannonia (451). In the next year he overran Lombardy, but penetrated no farther south, and in 453 he died. With the murder of Valentinian III. (455) the western branch of the house of Theodosius came to an end, and the next 20 years witnessed the accession and deposition of nine emperors.

The End. — Under the three months' rule of Maximus, the Vandals under Gaiseric invaded Italy and sacked Rome. From 456–472 the actual ruler of Italy was Ricimer, the Suebe. Of the four emperors whom he placed on the throne, Majorian (457–461) alone played any imperial part outside Italy. Ricimer died in 472, and two years later a Pannonian, Orestes, attempted to fill his place. He deposed Julius Nepos and proclaimed as Augustus his own son Romulus. But the barbarian mercenaries in Italy determined to secure for themselves a position there such as that which their kinsfolk had won in Gaul and Spain and Africa. Their demand for a third of the lands of Italy was refused by Orestes, and they instantly rose in revolt. On the defeat and death of Orestes they proclaimed their leader, Odoacer the Rugian, king of Italy. Romulus Augustulus laid down his imperial dignity, and the court at Constantinople was informed that there was no longer an emperor of the West.

The installation of a barbarian king in Italy was the natural climax of the changes which had been taking place in the West throughout the 5th century. In Spain, Gaul and Africa barbarian chieftains were already established as kings. In Italy, for the last 20 years, the real power had been wielded by a barbarian officer. Odoacer, when he decided to dispense with the nominal authority of an emperor of the West, placed Italy on the same level of independence with the neighbouring provinces. But the old ties with Rome were not severed. The new king of Italy formally recognized the supremacy of the one Roman emperor at Constantinople, and was invested in return with the rank of "patrician," which had been held before him by Aetius and Ricimer. In Italy too, as in Spain and Gaul, the laws, the administrative system and the language remained Roman. But the emancipation of Italy and the western provinces from direct imperial control, which is signalized by Odoacer's accession, has rightly been regarded as marking the opening of a new epoch. It made possible in the West the development of a Romano-German civilization; it facilitated the growth of new and distinct states and nationalities; it gave a new impulse to the influence of the Christian Church and laid the foundations of the power of the bishops of Rome.

Chronological Table of the Roman Emperors

B.C.
27. Augustus.

A.D.
14. Tiberius.
37. Gaius.
41. Claudius.
54. Nero.
68, 69. Galba. Otho. Vitellius.
69. Vespasian.
79. Titus.
81. Domitian.
96. Nerva.
98. Trajan.
117. Hadrian.
138. Antoninus Pius.
161. Marcus Aurelius.
180. Commodus.
193. Pertinax. Didius Iulianus. Septimius Severus.
211. Caracalla.
217. Macrinus.
218. Elagabalus.
222. Alexander Severus.
23j. Maximinus.
238. The two Gordiani. Pupienus and Balbinus. Gordian III.
244. Philip.
249. Decius.
251. Gallus.
253. Aemilianus.
260. Valerian. Gallienus.
268. Claudius.
270. Quintillus. Aurelian.
275. Tacitus.
276. Probus.
282. Carus.
283. Carinus and Numerian.
284. Diocletian (Maximian associated with him, 286).
305. Constantius and Galerius.
311. Licinius. Constantine I.
324. Constantine I.
337. Constantine II. Constantius II. Constans.
350. Constantius II., sole emperor.
361. Julian.
363. Jovian.

BIBLIOGRAPHY.—I. REPUBLICAN PERIOD: *Ancient Sources.* No history of Rome was written till Fabius Pictor issued his Annals about 200 B.C. His sources were inscribed laws, treaties and *senatus consulta,* a great many of which had been preserved, the annual priestly records of important events requiring thank-offerings and atonements—tablets that contained the lists of magistrates from the early republic—family records that did not go far back, some inscriptions on public buildings, some records of early colonies and oral tradition. Recent excavations indicate that the substructure of history which he gave from the early republic is fairly sound. But the traditional account of the regal period must be considered legendary, as indeed the Roman historians assumed that it was. The early historians, Fabius, Cincius, Acilius and Postumius, were all statesmen who seem to have written with a keen sense of responsibility. Those who followed, Cato the Elder, Calpurnius Piso, Cassius Hemina, Tuditanus and Fannius (who wrote of the Gracchan period), were also well informed, and wrote chiefly regarding contemporary events. At the same time the Greek statesman, Polybius, wrote an accurate history from the time of the first Punic War, valuable portions of which have survived. After the Gracchi, historians like Gnaeus Gellius began to insert family legends into the dry annals of the early period and he was followed by diffuse and rhetorical writers like Claudius Quadrigarius and Valerius Antias who composed popular accounts with little regard for accuracy. During the same period numerous apologetic autobiographies, memoirs and political pamphlets appeared which unduly coloured later accounts of Rome. Of all that we have mentioned (except Polybius) only brief fragments are extant, but the substance of all these books went into later histories that have survived. We have two valuable pamphlets of the amateur historian Sallust, the excellent commentaries of Julius Caesar (*q.v.*), the exceedingly important correspondence of Cicero (*q.v.*) as well as many of his speeches. In the Ciceronian period much valuable antiquarian work was done by men like Varro, Pomponius Atticus, and others which aided later writers to correct the mistakes of their predecessors.

In the Augustan age the materials accumulated by previous generations were worked up by compilers whose works are in some cases preserved. The work of Livy (*q.v.*) covered the history of Rome from its foundation to 9 B.C. in 142 books; of these only 35 are preserved in their entirety, while the contents of the rest are known in outline from an epitome (*periochae*) and from the compendia of Florus and later authors. Diodorus Siculus (*q.v.*) of Agyrium in Sicily followed the earlier annalists in the sections of his *Universal History* (down to Caesar) which dealt with Roman affairs; Dionysius Halicarnassensis (*q.v.*), in his *Roman Archaeology* (published in 7 B.C.), treated early Roman history in a more ambitious and rhetorical style, with greater fullness than Livy, whose work he seems to have used. Universal histories were also written in the Augustan age by Trogus Pompeius, whose work is known to us from the epitome of Justin (2nd century A.D.), and Juba, the learned king of Mauretania. Strabo (*q.v.*), whose *Geography* is extant, was the author of a continuation of Polybius's history (to 27 B.C.). The learning of the time was enshrined in the encyclopaedia of Verrius Flaccus, of which we possess part of Festus's abridgement (2nd century A.D.), together with an epitome of Festus by Paulus Diaconus (*temp.* Charlemagne). An official list of the consuls and other chief magistrates of the republic was inscribed on the walls of the Regia (rebuilt 36 B.C.), followed somewhat later by a similar list of *triumphatores;* the former of these is known as the *Fasti Capitolini* (C.I.L.I.^{2},I. *sqq.*), since the fragments which have been recovered are preserved in the palace of the Conservatori on the Capitol.

Among writers of the imperial period who dealt with republican history the most important are Velleius Paterculus, whose compendium of Roman history was published in A.D. 30; Plutarch (*c.* A.D. 45–125), in whose biographies much contemporary material was worked up; Appian, who wrote under the Antonines and described the wars of the republic under geographical headings (partly preserved) and the civil wars in five books, and Dio Cassius (*v. infra*), of whose history only that portion which deals with events from 69 B.C. onwards is extant.

The evidence of inscriptions (*q.v.*) and coins (*see* NUMISMATICS) begins to be of value during the last 150 years of the republic. A series of laws and *Senatus consulta* (beginning with the *Senatus consultum de Bacchanalibus,* 189 B.C.) throws light on constitutional questions, while the coins struck from about 150 B.C. onwards bear types illustrative of the traditions preserved by the families to which the masters of the mint (*triumviri monetales*) belonged.

MODERN AUTHORITIES.—The criticism of early Roman history begins with Giambattista Vico, 1725, and Louis de Beaufort, 1738, Niebuhr (1811–12) and Schwegler (1853–58) laid a sound foundation for the historical reconstruction of Theodore Mommsen, whose great history appeared in 1854–56. In Roman constitutional history Mommsen's *Staatsrecht* (1st ed. 1872–75) has not been superseded, though Lange's *Römische Alterthümer* (1856–71) is still serviceable. The soundest modern history of republican Rome (incomplete) is De Sanctis, *Storia dei Romani* (1907–). Heitland's *Roman Republic* (3 vols., 1909) is a fresh and independent work. Groebe's recent revision of Drumann is of value for its accumulation of references for the later period. Other briefer histories devoted to special topics are Greenidge, *History of Rome* vol. i. (for the Gracchan period); several volumes of Pais chiefly concerned with criticism; E. Meyer, *Caesars Monarchie und der Principat des Pompeius;* Homo, *L'Italie Primitive;* Holleaux, *Rome, la Grèce;* Beloch, *Römische Geschichte;* Holmes, *The Roman Republic* (chiefly military history of the late republic); Rostovtzeff, *Rome;* Frank, *Roman Imperialism* and *An Economic History of Rome;* and finally the chapters devoted to Rome in volumes vii.–ix. of the *Cambridge Ancient History.* (*See* VICO, GIAMBATTISTA.)

II. IMPERIAL PERIOD: *Ancient Sources.*—The memoirs of Augustus as well as those of his contemporaries (Messalla, Agrippa, Maecenas, etc.) and successors (Tiberius, Agrippina the younger, etc.) have perished, but we possess the *Res gestae divi Augusti* inscribed on the walls of his temple at Ancyra (ed. Mommsen, 1883, Ramsay and Premerstein's *Mon. Antiochenum,* 1927, includes the fragments recently found at Antioch). Aufidius Bassus wrote the history of the civil wars and early empire, perhaps to A.D. 49, and this was continued by Pliny the Elder (*q.v.*) in 31 books, probably to the accession of Vespasian. These works and others were used by Cornelius Tacitus (*q.v.*), whose *Annals* (properly called *ab excessu divi Augusti*) and *Histories,* carried the story of the empire down to A.D. 96. Pliny's correspondence with Trajan about the affairs of Bithynia, which he administered in A.D. 111–113, is of great historical value. Suetonius (*q.v.*), who was for some time secretary of state to Hadrian, wrote biographies of the emperors from Julius Caesar to Domitian. Arrian, a Bithynian Greek, wrote on Rome's policy and wars in the East. Appian (*v. supra*) dealt with the wars waged under the early empire in the closing books of his work, which have not been preserved. Dio Cassius, a Bithynian, wrote a history of Rome to the death of Elagabalus in 80 books. We possess only epitomes and excerpts of the portion dealing with events from A.D. 46 onwards, except for parts of the 78th and 79th books, in which Dio's narrative of contemporary events is especially valuable. Herodian, a Syrian, wrote a history of the emperors from Commodus to Gordian III., which as the work of a contemporary is not without value. The *Historia Augusta* (*see* AUGUSTAN HISTORY), upon which we are obliged to rely for the history of the 3rd century A.D., consists in a series of lives of the emperors (including most of the pretenders to that title) from Hadrian to Carinus, professedly written by six authors, under Diocletian and Constantine. Modern criticism has shown that (at least in its present form) it is an unreliable compilation made in the latter half of the 4th century. The fragments of Dexippus, an Athenian who successfully defended his native town against Goths, throw much light on the barbaric invasions of the 3rd century. The most important historian of the 4th century was Ammianus Marcellinus, a native of Antioch and an officer in the imperial guard, who continued the work of Tacitus (in Latin) to the death of Valens. We possess the last 18 books of his history which cover the years A.D. 353–378. Two compendia of imperial history pass under the name of Aurelius Victor, the *Caesares,* or lives of the emperors from Augustus to Julian, and the *Epitome de Caesaribus* (not by the same author) which goes down to Theodosius I. Similar works are the *Breviarum* of Eutropius (secretary of state under Valens) and the still more brief epitome of Festus. The writings of the Emperor Julian and of the rhetoricians Libanius, Themistius and Eunapius—the last-named continued the history of Dexippus to A.D. 404—are of great value for the latter part of the 4th century A.D. They wrote as pagans, while the Christian version of events is given by the three orthodox historians Socrates, Sozomen and Theodoret, and the Arian Philostorgius, all of whom wrote in the 5th century. An imperial official, Zosimus, writing in the latter half of that century, gave a sketch of imperial history to A.D. 410; the latter part is valuable, being based on contemporary writings. The bishops Synesius and Palladius, who lived under Arcadius and Theodosius II., furnish valuable information as to their own times;

while the fragments of Priscus tell us much of Attila and the Hunnish invasions. Mention must also be made of the poets and letter-writers of the 4th and 5th centuries—Ausonius, Claudian, Symmachus, Paulinus of Nola, Sidonius Apollinaris, Prudentius, Merobaudes and others—from whose writings much historical information is derived. Cassiodorus, the minister of Theodoric, wrote a history of the Goths, transmitted to us in the *Historia Gotlzorum* of Jordanes (*c.* A.D. 550), which gives an account of the earlier barbaric invasions. Several chronological works were compiled in the 4th and 5th centuries. It will suffice to name the *Clzronology of Eusebius* (to A.D. 324), translated by Jerome and carried down to A.D. 378, and the *Chronography of* A.D. *354,* an illustrated calendar containing miscellaneous information.

The codes of law, especially the *Codex Theodosianus* (A.D. 438) and the code of Justinian, as well as the army list of the early 5th century, known as the *Notitia Dignitaturn,* possess great historical value. For the inscriptions of the empire, which are of incalculable importance as showing the working of the imperial system in its details, *see* INSCRIPTIONS; the coins *(see* NUMISMATICS) also throw much light on the dark places of history in the lack of other authorities. Egyptian papyri are not only instructive as to legal, economic and administrative history, but also contribute to our general knowledge of events. *(See* especially Mitteis-Wilcken, *Chrestomatie,* 1912, and bibliography in Rostovtzeff, *Social and Economic History of Rome,* 1926.) The *Zeitschrift fur Papyrusforschung,* ed. by U. Wilcken, gives an account of progress in this branch of study.

MODERN AUTHORITIES.—Tillemont's *Histoire des empereurs* (6 vols., 1690–1738), supplemented by his *Mémoires,* furnished Gibbon with material for his *Decline and Fall of the Roman Empire* (1776–78), which has never been superseded as a history of the entire imperial period, and has been rendered adequate for the purposes of the modern reader by Prof. J. B. Bury's edition (1897–1900). The history of the empire has yet to be written in the light of recent discoveries. Mommsen's fifth volume (Eng. trans., as *Provinces of the Roman Empire,* 1886) is not a narrative, but an account of Roman culture in the various provinces. H. Schiller's *Geschichte der romischen Kaiserzeit* (1883–88) is a useful handbook. Rostovtzeff's *Social and Economic History of Rome* (1926) is very valuable for its thorough siiting of inscriptions and papyri, while Dessau's *Gesch. der romischen Kaiserzeit* (1924), two volumes of which have appeared, promises to give a good survey of political history. H. S. Jones, *The Roman Empire* (1908) and Chapot, *Le Monde romain* (1927) are brief but sound and independent, For the later period we have Seeck, *Gesch. des Untergangs der antiken Welt* (6 vols., 1897–1920), Bury's *History of tlze Later Roman Empire* (1889), beginning from A.D. 395, and *Constitution of tlze Later Empire* (1910), and T. Hodgkin's *Italy and her Invaders* (8 vols., 1880–99), which tells the story of the barbaric invasions at great length. The imperial constitution is described by Mommsen in the second volume of his *Staatsrecht* (v. *supra);* divergent views mill be found in Herzog's *Geschichte und System der romischen Staatsverfassung* (1884–91); the working of the imperial bureaucracy is treated by O. Hirschfeld, *Die römischen Yerwaltungsbeamten* (1905). The *Prosopographia Imperii Romani,* compiled by Dessau and Klebs (1897–98), is a mine of information, as is the new edition of Pauly's *Realencyklopadie der classischen Alterthumswissenschaft* (in progress). Other useful books are: Greenidge, *Roman Public Life* (1901); Abbott and Johnson, *Municipal Administration in the Roman Empire* (1926); Dill, *Roman Society in the Last Century* (1906), Paribeni, *Trajano* (1927); Mattingly, *Roman Coins* (1928). *(H.* F. P.; H. S.-J.; T. F.)

MEDIAEVAL HISTORY

The history of the city of Rome during the middle ages was overshadowed by the history of the papacy. The latter has left many documents; for the city there are very few, especially for the period before the 13th century. As the foundations were so ill-defined there was opportunity for historians to theorize on what the superstructure had been; and the theories were influenced by the ideas, patriotic or otherwise biased, held in the 19th century. One favourite theory was the existence of an aristocratic republic contending against the popes until overthrown by the popular revolution in 1143, when the commune arose. Of this aristocratic republic the consuls were thought to have been the heads, and the existence and functions of the senate were much discussed. This theory was held by some of the leading historians: Hegel, Gregorovius and Villari.

These views are no longer held. Some important documents have been discovered and made accessible by publication. Halphen and others whose works are cited in the bibliography have done much to elucidate the early history. Much still remains to be done, but it is probable that the analogies drawn in the past between the history of Rome and that of the other cities in Italy are misleading. The deserted Campagna surrounding the city checked any notable increase of trade or industry and prevented the establishment of gilds on the footing that elsewhere made them the basis and support of a commune. Moreover, the Campagna was unhealthy and ill-fitted for agriculture. The population of the city was very small. There was no strong middle class among its citizens, whose leaders were usually rude, illiterate nobles. Only slowly did the forces which were at work elsewhere in Italy penetrate into the city and cause the rise of a belated commune. What part mas played by the memory of the traditions of republican Rome is a mooted question. The city was styled *respublica;* the titles senator, consul, prefect, occur repeatedly; but it is necessary to be on one's guard against drawing inferences from the long-continued or revived use of old terms.

Gothic and Byzantine Rule.—The removal of the seat of empire to Constantinople effected a radical change in the political situation of Rome, but the civil administration remained unaltered. The Gothic rule merely superimposed upon the Roman social order a Teutonic stratum that never penetrated beneath its surface. The senate, the principal magistrates, both provincial and municipal, the prefect of the city, and the Roman judges enforcing the enactments of the Roman law, were all preserved. Hence there was no visible change in the constitution of the city. The wars of Belisarius and Narses against the Goths (A.D. 535–555) caused terrible slaughter and devastation in Italy, and finally subjected her to Constantinople. In place of a Gothic king she was ruled at first by a pretorian prefect and later by an exarch (first mentioned in 584), who had his seat of government at Ravenna. The pragmatic sanction (554), promulgating the Justinian code, separated the civil from the military power, and, by conferring on the bishops the authority over the provincial and municipal government, soon led to the increase of the power of the Church.

Roman institutions were altered; but their original features were still to be traced, and no heterogeneous element had been introduced. The dawn of a new epoch can be dated from the invasion of the Lombards (568–572). Their conquest of a large portion of Italy reduced the inhabitants almost to slavery. But, in the unsubdued parts of the country—namely, in Ravenna, Rome and the maritime cities—a very different state of things prevailed. The necessity for self-defence and the distance of the empire, now too weak to render any assistance, compelled the inhabitants to depend solely on their own strength. In Rome we behold the rapid growth of the papal power and the continual increase of its political influence. Not only the superintendence but often the nomination of public functionaries and judges was in the hands of the popes. And the accession to St. Peter's chair of a man of real genius in the person of Gregory I., surnamed the Great, marked the beginning of a new era. By force of individual character this pope was the true representative of the city, the born defender of Church and State. His ecclesiastical authority, already great throughout Italy, was specially great in the Roman diocese and in southern Italy. The offerings of the faithful had endowed the Church with enormous possessions in the province of Rome, in Sicily, Sardinia, and other parts. The administration of this property assumed the shape of a small government council in Rome. The use made by the pope of his revenues greatly contributed to the increase of his moral and political authority. When the city was besieged by the Lombards and the emperor left his army unpaid, Gregory supplied the required funds and thus made resistance possible. And when the defence could be no longer maintained he alone, by the weight of his personal influence and the payment of large sums, induced the Lombards to raise the siege. He negotiated in person with Agilult and was recognized by him as the true representative of the city.

A prefect of Rome is not mentioned between 599 and 772, and then again there is silence until the time of the Ottos. It is impossible to say whether the office was discontinued. In the later days the prefect was an official of the pope, who had taken over the care of the aqueducts and the preservation of the city walls. There is also much doubt about the existence of a senate. We know that many senators had lost their lives in the long war. The pragmatic sanction of 554 did mention the senate, but this

was the last formal recognition of it as a governing body; and, if we may trust a despairing cry of Gregory the Great, it had disappeared, or at least was reduced to a shadow.

The popes now make common cause with the people against the Lombards on the one hand and the emperor on the other. This alliance was cemented by the religious disputes of the East and the West; for Pope Gregory II. (715–731) opposed the celebrated edict of the iconoclastic emperor Leo the Isaurian, and Venice, Ravenna, the Pentapolis and Rome took up arms against the emperor and elected dukes of their own.

Duchy of Rome.—In the midst of these warlike tumults a new constitution was being set up in Rome. In 711 the *Liber Pontificalis* makes the first mention of the duchy of Rome, and we find the people struggling to elect a duke of their own. In the early days of the Byzantine rule the territory appertaining to the city was no greater than under the Roman empire; but, partly through the weakness of the government of Constantinople, and above all through the decomposition of the provinces under the Lombards, this dukedom was widely extended; its limits were always changing in accordance with the course of events. At the beginning of the 8th century it had almost the same extent, except on the north, that the papal states had in 1860–70.

In the provinces, the administrators of church lands were important personages, and exercised both judicial and political functions. It was very natural that the heads of this vast administration resident in Rome should have a still higher standing and, in fact, from the 6th century, their power increased to such an extent that in the times of the Franks they already formed a species of papal cabinet with a share and sometimes a predominance in the affairs of the republic. The pope was thus at the head of a large administrative body and, in addition, was possessed of enormous revenues. He considered himself the real representative of the Roman republic. Gregory II. (715–731) accepted in the name of the republic the submission of other cities and protested against the conquest by the Lombards of those already belonging to Rome. The empire was now powerless in Italy, while the advance of the Lombards was becoming more and more threatening; they seized Ravenna in 751, thus putting an end to the exarchate, and next marched towards Rome, which had only its own forces and the aid of neighbouring cities to rely upon. To avoid being conquered Stephen II. (752–757) appealed to Pippin, king of the Franks, and concluded an alliance with him. The pope consecrated Pippin king of the Franks and named him *patricius Romanorum*. This title was given to Pippin as defender of the Church, for the pope styled him at the same time *defensor* or *protector ecclesiae*. And the king pledged himself not only to defend the Church but also to wrest the exarchate and the Pentapolis from the Lombards and give them to the pope. Pippin brought an army (754–755) and fulfilled his promise. The pope accepted the donation in the name of St. Peter and as the visible head of the Church. Thus in 755 central Italy broke its connection with the empire; thus was inaugurated the temporal power of the papacy.

Charles the Great.—In the years immediately succeeding the popes vacillated in their policy but it was soon apparent that their hopes must be placed on renewed aid from the Franks in order to check the constantly threatened danger from the Lombards, who were seeking to recover the territory which they had lost and also to seize Rome. Adrian I. (772–795) besought the assistance of Charlemagne, who made a descent into Italy in 773, destroyed the Lombard kingdom, and seized the iron crown. Entering Rome in 774, he confirmed the donation of Pippin. The pope was now regarded and regarded himself as master of Rome; he always spoke of Rome and the Romans as "our city," "our republic," "our people." It is true that Charlemagne held the supreme power, but this power was only occasionally exercised in Rome. The pope was most tenacious of his own authority, made vigorous protest whenever rebels fled to Charlemagne or appealed to that monarch's arbitration, and contested the supremacy of the imperial officials in Rome. Yet the pope was no absolute sovereign, nor, in the modern sense of the term, did any then exist. The Roman nobles were different from other aristocratic bodies elsewhere. Their power was chiefly derived from the high offices and large grants of money and land conferred on them by the popes. Every pope aggrandized his own kindred and friends, and these were the natural and often open adversaries of the next pontiff and his favourities. Thus the Roman nobility was powerful, divided, restless, and turbulent; the pope needed the support of an effective force for his own preservation; hence the necessity of creating an empire of the West.

Leo III. (795–816) further strengthened the ties between Charlemagne and the Church by sending the former the keys of the grave of St. Peter and the banner of Rome. Charlemagne had already joined to his office of patrician the function of high justice. The pope urged him to despatch an envoy to receive the oath of fealty from the Romans. Leo had antagonized the Romans, and during a procession had been attacked and barbarously maltreated (799). He fled to Charlemagne and returned guarded by his envoys; Charlemagne himself went to Rome in Nov. 800. As there was no one authorized to try a pope, Leo was permitted to clear himself of the charges against him by taking an oath on three altars. Then, on Christmas day, in St. Peter's, before an assemblage of Roman and Frankish lords, clergy, and people, the pontiff placed the imperial crown on Charlemagne's head and all proclaimed him emperor. Thus the new emperor was accepted by the Romans and consecrated by the pope. Yet Charlemagne was not sovereign of Rome; he possessed scarcely any regalia there, and was not in command of the army.

The death of Charlemagne in 814 was the signal for a further conspiracy of the nobles against the pope, who instantly put the ringleaders to death. He was severely blamed by the new emperor Louis for this violation of the imperial prerogative, as the emperor was determined to have his power recognized in Rome, and especially to insure that his assent must be secured for the election of a pope. To assure this he sent his son Lothair to be king of Italy, and the latter was crowned co-emperor in 823. In the following year Lothair promulgated a new constitution, to which Pope Eugenius II. (824–827) had to give his oath of adherence. The more direct power was to appertain to the pope—the supreme authority, presidency of the tribunals, and final judgment on appeal to the emperor. The new constitution also established the right of contending parties to select either the Roman or a Teutonic code for settlement of their disputes.

This is a convenient point to attempt a summary of the relations of the papacy with the City of Rome. By the donations and aid of the Franks it had become legal as well as actual ruler of the city. Charles the Great as emperor was the sovereign, but he never wished to take the place of the pope as chief of the Roman administration. The imperial *missus* of the constitution of 824 had as an associate a papal *missus*, and the two were ordered to refer all matters first to the pope; the emperor reserved a right of appeal to himself. But the power of the pope was secure only when he had outside support. At other times there was always danger that the nobles in the city would either revolt against him or, and more frequently, put in their own pope and use him for their own advantage. It must be noted, however, that the nobility as such never, before the middle of the 12th century, played a constitutional rôle in the administration of the city.

The City Officials.—The principal official was the prefect, who was the chief of police and judge in criminal matters. In civil cases he presided over the court and announced the decision, but was not himself a judge. He held his power from the pope except during periods of strife between an emperor and a pope, when the former sometimes usurped the right of appointment. Next in rank were the consuls of the Romans, or the dukes. They were nobles employed by the popes for special duties such as presiding over tribunals. Apparently the titles were applied to the same office, "duke" being used before the 11th century and "consul of the Romans" later, although in the period of transition the same man was sometimes styled both "duke" and "consul." Then there were "the seven judges," the *primicerius* and the *secundicerius*, who may be roughly described as first and under secretaries of state; the *arcarius*, or papal receiver; the *sacellarius*, or cashier;

the *protoscriniarius,* who was at the head of the papal chancery; the *primus* defensor, who was the advocate of the Church and administered its possessions; and the nomenclator, who pleaded the cause of widows, orphans and paupers. These men were called judges, a term then used generally for officials. (For example, the judices de *militia* were military officials and not judges at all.) These seven officials had apparently been created as need arose; the *primicerius* is mentioned in the 4th century, the *protoscriniarius* not until the ninth. They gradually ceased to be chiefs of administration and by the middle of the 11th century were thought of only as civil judges. For example, the camerarius, or treasurer, had taken over the duties of both the arcarius and *sacellarius.* In addition there were other civil judges, the judices dativi, who assisted the seven, but could not give judgment without the consent of some of "the seven ordinary judges." The latter were always members of the clergy; the judices dativi were not. For administrative purposes the city was divided into 12 districts. These 12 had succeeded the division of the city in the 6th century into 14 districts for civil administration and seven for ecclesiastical. Just when the change was made is uncertain, but Duchesne thinks it goes back to the time of the Byzantine rule. Finally it may be noted that "senator" was merely a title of honour carrying no power except when a usurping aristocrat bore the title. These statements as to the officials are based mainly on Halphen's study, which has done so much to correct former erroneous notions. Many details are still in doubt, but in general this outline applies to the period before the rise of the commune.

The fall of the Frankish empire left all Italy a prey to anarchy and torn by faction fights. The Saracens were advancing from the south, the Hungarians from the north. Anarchy was at its climax in Rome. The aristocracy gained strength and wrested fresh privileges from the pontiffs. Early in the 10th century Theophylact, who had been an official of the Sacred palace, was the chief of the Roman nobles. He was a senator, and his wife Theodora was styled "senatrix." She and her daughter Marozia were influential, and tradition has assigned to them both greater influence and more vice than can be proved by historical data. Marozia's husband was Alberic, the marquis of Spoleto. After Theophylact, Theodora and Alberic were all dead Marozia became the leader of the noble faction, and added to her power by marrying Guy, marquis of Tuscany. The pope was imprisoned by her and soon died, possibly murdered. Marozia was supreme, and raised her son to the papacy as John XI. When on Guy's death she married King Hugh of Italy (932), a revolt against her and her new husband was led by Alberic, her son; he was successful and became the ruler of the city. Of Marozia no more is heard,

Otto the Great.—Alberic, as "prince and senator of all the Romans," ruled Rome and the duchy until his death in 954. "His yoke was heavy on the Romans and on the Holy Apostolic See"; but the popes were docile and the nobles were kept in order by a stem hand. Alberic was so completely master of Rome that he may have dreamed of creating an hereditary dynasty. He gave his son the name of Octavian, and on his deathbed he made the nobles swear to elect Octavian pope at the next vacancy. The lad was then 16 years old, and the following year was elected pope with the name of John XII. His palace was the scene of scandalous licence, while his public acts were those of a tyrant. He desired to be both pope and prince, but utterly failed to be either. In 960, realizing the impossibility of maintaining his power without outside aid, he sought help from Otto I. and promised him the imperial crown. Otto vowed to defend the Church, to restore her territories, to refrain from usurping the power of the pope or the republic, and was crowned on Feb. 2, 962. Otto confirmed to the pope the territories granted by the Carolingians and even enlarged them, but he also revived the constitution of 824, by which the election of a pope required the imperial confirmation, and he reserved for himself the suzerainty over the papal territory as the Carolingians had done. John XII., finding a master in the protector he had invoked, joined the discontented nobles who were conspiring against the emperor. But the latter hastened to Rome in Nov. 963, assembled the clergy, nobles and heads of the people, and made them take an oath never again to elect a pope without his consent and that of his son. He also convoked a synod presided over by himself in St. Peter's, which judged, condemned and deposed Pope John and elected Leo VIII. (963–965), a Roman noble, in his stead. All this was done at the direct bidding of the emperor, who thus deprived the Romans of their most valued privilege, the right of choosing the pope. Moreover, Otto was hated as a foreign ruler and the clergy were resentful at the uncanonical deposition of a pope and the equally uncanonical election of a layman. On Jan. 3, 964, the Romans attacked the Vatican, where the emperor was lodged. The German knights repulsed them with much slaughter, but Otto departed in February, and John XII. returned with an army of followers and compelled the defenceless Leo VIII. to seek safety in flight. Soon afterwards Leo was deposed and excommunicated by a new synod, and many of his adherents were cruelly murdered. When on May 14, 964, John suddenly died, the Romans, amid violent struggles and tumults, elected Benedict V., and procured his consecration in spite of the emperor's veto. Otto appeared at the head of an army, besieged the city, reduced it by famine and, after holding a council which deposed Benedict, restored Leo VIII. to the papal throne.

The emperor's arbitrary exercise of power roused a long and obstinate resistance. When Leo VIII. died in 965, the imperial party elected John XIII. (965–972), who tried to create a party of nobles to offset the power of the party of Alberic. Upon this there was a general revolt. The nobles were led by Peter, prefect of Rome. The leaders of the people were 12 decarconi, a term of unknown derivation but probably indicating chiefs of the 12 regions. The new pope was seized and imprisoned; but the emperor quickly marched against Rome, and this was sufficient to produce a reaction which recalled the pope (Nov. 966), sent the prefect into exile and put several of the rebellious nobles to death. Shortly after the emperor sacked the city; many Romans were exiled, some tortured, others, including the 12 decarconi, killed.

The Crescentii.—Pope John XIII. was succeeded by Benedict VI. (973–974) and Otto I. by his son Otto II., a youth of 18. Thereupon the Romans, who had supported the election of another pope, and were in no awe of the new emperor, rose to arms under the command of Crescentius, a rich and powerful noble. They not only seized Benedict VI. by force, but strangled him in the castle of St. Angelo. The factions then successively elected popes who were either exiled or persecuted, and one of them is said to have been murdered. During this turmoil the anti-imperial party, led by Crescentius II., son of the Crescentius mentioned above, had taken possession of the government. Crescentius assumed the title of patrician and sought to imitate Alberic. Fortunately for him, the reigning pope was a detested tyrant, and the emperor Otto III. a child entirely guided by his mother. But the emperor was backed by a powerful party, and on coming to Rome in 996 was able, although only aged 15, to quell the rebellion, oust Crescentius from public life, and elect as successor to John XV. his own cousin, Gregory V. (996–999). This first German pope surrounded himself with compatriots, and by raising them to lofty posts even in the tribunals excited a revolt that drove him from the throne (Sept. 29, 996). Crescentius, being master of the castle of St. Angelo, resumed the title of patrician, expelled the German judges, reconstituted the government and created a new pope. The following year Otto III. came to Rome, and his party opened the gates to him. Although deserted by nearly all his adherents, Crescentius held the castle valiantly against its besiegers, until, on April 29, 998, he was forced to make terms, and the imperialists, violating their pledges, first put him to torture and then hurled him from the battlements.

Thus Otto III. was enabled to establish his mastery of Rome. He wished to reconstitute a Romano-Byzantine empire with Rome for his capital. Nevertheless he was German, and during his reign Germanic institutions made progress in Rome and many families of feudal barons arose. The Church made grants of lands, cities and provinces in the feudal manner, while the bishops, like feudal barons, became actual counts. Meanwhile the Roman barons were growing more and more powerful, and were neither submissive nor faithful to the emperor. On the contrary, they

resented his attitude as a master of Rome, and, when he subjected Tivoli to the Holy See, attacked both him and the pope with so much vigour as to put both to flight (Feb. 16, 1001).

By the emperor's death in Jan. 1002 the family of the Ottos became extinct; the papacy then began to decline, and the nobles, divided into an imperial and an anti-imperial party, were again predominant. They reserved to themselves the office of patrician, and, electing popes from their own ranks, obtained enlarged privileges and power. John Crescentius was elected patrician; one of his kinsmen was invested with the office of prefect, and the new pope John XVIII. (1003–09) was one of his creatures. His power lasted for ten years, until his death in 1012. Pope Sergius IV. having died the same year, the count of Tusculum compassed the election of Benedict VIII. (1012–24), one of his own kin. This pope expelled the Crescentii, changed the prefect and reserved the title of patrician for Henry II. whom he consecrated emperor on Feb. 14, 1014. He also succeeded in placing his own brother, Romano, at the head of the republic with the title of "Senator of all the Romans." The prefect still retained his authority, and the emperor was by right supreme judge; but when a violent revolt broke out the emperor only stayed to suppress it and then went to Germany in disgust. The pope, aided by his brother, conducted the government with energy; he awed the party of Crescentius and waged war against the Saracens in the south. When he died in 1024 there was a repetition of the same events that had followed the death of Alberic, and with no less fatal consequences. Benedict's brother, Romano, head of the republic, was, although a layman, elected pope. He took the name of John XIX. (1024–33), and in 1027 conferred the imperial crown on Conrad the Salic. The latter abolished the Lotharian edict of 824 and decreed that throughout Rome and its territory justice should be administered solely by the Justinian code.

The Three **Rival** Popes.—John XIX. was succeeded by his nephew, Benedict IX. (1033–45), whose brother became head of the republic. Thus Church and State assumed the aspect of hereditary possessions in the powerful house of the counts of Tusculum. The vices and excesses of Benedict were so monstrous that he was driven from the city and Sylvester III. elected by his opponents. Benedict still had some support and succeeded in driving out Sylvester; then, finding his position untenable, he sold the papacy to a reformer who took the name of Gregory VI. Benedict soon attempted to regain his office, and in 1045 three popes were struggling for the tiara in the midst of scandal and anarchy. The streets and neighbourhood of Rome swarmed with thieves and assassins; pilgrims were plundered; citizens trembled for their lives, and petty barons threatened the rival popes, who were obliged to defend themselves by force. This state of things lasted until Henry III. came to re-establish order. He summoned a synod which deposed the three popes, and then, with the consent of the Romans, assuming the right of election, proposed a German, Clement II., who was consecrated at Christmas 1046. Henry III. was then crowned, and also took the title of patrician.

Henry III. procured the election of four German popes in succession. But the fourth German pope, Victor II., died in 1057, and Henry III. had been succeeded in 1056 by the young Henry IV. under the regency of a weak woman, the empress Agnes. The nobles by violence and bribery brought about the election of Benedict X. The cardinals were opposed to him and, fleeing from the city, elected Nicholas II. (1059–61). This pope could only enter Rome when escorted by the troops of Godfrey of Tuscany. When Nicholas died the nobles, assisted by some Lombard bishops, elected Honorius II. and sought aid from the German king, while the cardinals chose Alexander II. (1061–73). Although supported by an armed force of Normans, the latter had to fight his way into Rome, whither Honorius II. soon followed and won a battle against the forces of Alexander II. with much slaughter. Both candidates were compelled to withdraw from the city until their claims were settled by the German court. Strife continued, but Alexander II. finally was recognized as pope and attempted to reform the church, though he had little power in the city.

At Alexander's funeral Hildebrand was seized by the crowd and acclaimed as pope. The cardinals who were favourable to him, hastened to go through the form of an election in order to give a legal warrant to what had been done by popular violence; he chose the name of Gregory VII. (1073–85) and secured recognition from Henry IV. Gregory confirmed his predecessor's decrees against simoniacal and non-celibate priests and forbade the clergy to receive investiture at the hands of laymen. As the high ecclesiastical dignitaries held much territory and were also high officials of the empire, this decree was certain to cause a fierce contest between the emperor and the pope. Some of the nobles had already shown their hostility to Gregory; at Christmas 1075 the prefect Cencius and other nobles seized Gregory while he was celebrating mass in Santa Maria Maggiore and dragged him away to imprisonment. The people were incensed at this outrage and fear of popular wrath compelled Cencius to release Gregory. About the same time Henry IV., exasperated by a letter in which Gregory had sharply rebuked him for his sins, declared Gregory deposed from the papacy, and Gregory in turn decreed the excommunication and deposition of the emperor. That monarch afterwards made submission to Gregory at Canossa (1077), then again turned against him and was again excommunicated. In 1081, with his anti-pope Clement III., he besieged Rome in vain. He was equally unsuccessful in each of the two following years, but at last forced his way into the city (March 1084) and compelled Gregory to seek refuge in the castle of St. Angelo. The emperor, as master of Rome, procured the consecration of Clement III., by whom he was crowned in turn. He then attacked and seized the capitol and assaulted the castle of St. Angelo in the hope of capturing the pope. But Robert Guiscard brought his Norman army to the rescue. Emperor and anti-pope fled; the city was taken, the pope liberated, and Rome was brutally sacked for three days by the Normans. After this Gregory, broken with grief and hated by the Romans, had to go away with the Normans and died at Salerno on May 25, 1085.

Victor III. was elected only after an interval of *a* year and reigned only a short time. He was consecrated in St. Peter's but was unable to maintain his position in Rome. Urban II. (1088–99), the next pope elected, also had little power in Rome, as the city was usually in the hands of the supporters of the anti-pope. It was not until 1096, when he had won prestige by preaching the crusade, that he could enter the city as its master, and even then the castle of St. Angelo was held by the followers of the anti-pope, until 1098.

Revolt Under **Paschal** II.—Pope Paschal II. (1099–1118) tried to rule the city through the faction of nobles who favoured him, but with little success, as the imperial party frequently had the upper hand. When Henry V. seized the pope in 1111 the people rose in his defence and forced Henry to leave the city; but under ordinary circumstances Paschal could not count on any hearty support. In 1116, when he wished to make one of the Pierleoni prefect, there was a bloody revolt and a rival was put in as prefect by the imperial partisans. Soon after this Henry V. came to Rome and Paschal had to flee. Later he returned with Norman troops but could not put down the revolt, and the opposition still held the capitol when Paschal died.

The cardinals met in haste and secretly elected Gelasius II. The election had scarcely been completed when Cencius Frangipani broke into the assembly, seized the pope and carried him bleeding to one of the Frangipani towers. As they had done when another Cencius had seized Gregory VII., the people of the 12 districts rose in their wrath and, led by the prefect (whose election Paschal had opposed), forced the Frangipani to give up their prisoner. The Frangipani fled to the emperor and he came to Rome. Gelasius had to flee to his native city of Gaeta, where he was safe under Norman protection. An anti-pope was chosen by the imperial party; but when Henry left Rome Gelasius was able to return, although the anti-pope was also in Rome and a new revolt threatened the life of Gelasius.. Consequently he fled to France, where he died in 1119, having been pope a year and a few days.

Calixtus was next chosen and restored peace. The Frangipani succeeded in electing his successor Honorius II. (1124–30), who was quietly accepted by the Roman people. At his death some **of**

the cardinals chose Innocent II.; others, and the more numerous part, elected one of the Pierleoni, who took the name of Anaclete II. The greater part of the people now favoured the Pierleoni, and his rival, who was supported by the Frangipani, had to flee. He secured support in France and Germany, especially through the aid of Bernard of Clairvaux, and was finally recognized as pope almost everywhere except in Rome and among the Normans in Italy. Anaclete II. retained the upper hand in the city almost until the time of his death in 1138. In the following year Innocent attempted a military campaign against Roger of Sicily, but was captured by him and compelled to acknowledge his kingship, with which he had been invested by Anaclete. Humiliated, Innocent returned to Rome and there he was to suffer further humiliation.

Rise of the Commune. — Throughout upper and central Italy the cities were being organized as free and independent communes on a democratic basis. Their example was followed in the ancient duchy of Rome and almost in the immediate neighbourhood of the city. The same tendencies were at work in Rome. Gradually in the troubled times when the factions of the nobles were contending together and the papal rule was so weak, a lesser nobility had grown into power in the city, in alliance with the people, with whose interests they had much in common. They were irritated against the pope by his submission to the Normans and this irritation was greatly increased by his attitude toward Tivoli. In 1142 this city openly rebelled against the mother city, and the pope sent the Romans to subdue it. They were not only repulsed, but ignominiously pursued to their own gates Afterwards, returning to the assault in greater numbers, they conquered the hostile town. Its defenders surrendered to the pope, and he immediately concluded a treaty of peace without consulting the people. The soldiery, still flushed with victory, were furious at this slight. They demanded the submission of Tivoli to the Roman people, as well as permission to demolish its walls and dwellings and expel its population. Innocent II. refused his consent and a revolution ensued. In 1143 the rebellious people rushed to the capitol, proclaimed the republic, reconstituted the senate, with the almost entire exclusion of the nobles, and declared the abolition of the temporal power. Just after this Innocent died.

The pontificates of the next two popes, together, lasted less than 17 months. The second, Lucius II. (1144–45), tried to withstand the revolution by seeking Norman aid and throwing himself into the arms of the feudal party, but this only precipitated the course of events. The people, after having excluded nearly all aristocrats from the senate, now placed at its head the noble Jordan Pierleoni, who had joined the revolutionary party. They named him patrician, and also conferred on him the judicial powers appertaining to the aristocratic and imperial office of prefect. The pope was requested to resign the temporal power, the regalia and every other possession and content himself with the tithes and offerings of the faithful. He indignantly refused, marched at the head of the nobles against the capitol, but was repulsed, and received a blow on the head from a stone, which is supposed to have caused his speedy death, Feb. 15, 1145. Eugenius III. was then elected (1145–53), but soon had to flee to Viterbo in quest of armed assistance, in consequence of the senate's resolve to prevent by force his consecration until he recognized the new state of things in the Eternal City.

It was at this time that Arnold of Brescia (*q.v.*) was absolved by the pope and ordered to make a pilgrimage to Rome. An arch-revolutionist, he began to preach and his eloquence brought him fame. But his influence on events has been greatly exaggerated in most accounts. The people had already formed an equestrian order, which was probably a mounted force of the lesser nobility, and also were fortifying the capitol. The revolution spread beyond the walls, several cities of the state proclaimed their independence, and the barons of the Campagna profited by the opportunity to act as independent sovereigns. Thus the whole domain of the Church was threatened with dissolution. The pope marched towards Rome with an army, but hoped to come to terms. The Romans in fact recognized his authority, and he in his turn recognized the republic. The office of patrician was abolished, and the prefect was revived. The senators received investiture from the pope, who returned to Rome at Christmas 1145.

The Commune Fully Constituted. — The commune now seems to have been fully constituted, so a short sketch will be given here of its more important features. The senate was dra n, at least in part, from the lower classes and the petty nobility, and this was the special characteristic of the new revolution. In 1144 there were 56 senators, but the number often varied. In 1151 there were 50; in 1163 only 25; in 1181 again 56, and still more in 1191. After that it was more usual to have only one or two senators and these were generally chosen from the aristocracy. From the few existing documents of the period we learn that the senators were divided into *senatores consiliarii* and ordinary senators. The former constituted a smaller council, which consulted with the head or heads of the republic on the more urgent and secret affairs of the State. The senate exercised its powers under the control of the council and parliament. The former was a deliberative assembly called together by the senate to discuss important affairs such as treaties or declarations of war. The councillors varied in number — at times nine, once as many as 84. Their advice was taken but not necessarily followed by the senate. The parliament was an assemblage of all the citizens. In it there was no discussion of the matters brought before it by the senate, but each matter was accepted or rejected by the people. Senators held office for only one year. They were elected usually by the whole people; but at times the pope was allowed to appoint an elector or electors to choose the senator or senators; in this latter case, however, the choice apparently had to he submitted to the popular assembly for ratification. The pope also was compelled to pay salaries to the senators and their officials.

The senate had usurped the right of coinage; and although by a treaty of 1188 it agreed to restore this right to the pope on condition that one-third of the money coined should be given to the senate, the pope did not take advantage of the retrocession and all the money was coined by the senate; Innocent III. even decreed that only senatorial coins should be used in the whole of the Campagna. The senate also seized for its own advantage the right of levying taxes on merchandise brought into the city. It also took over the appointment of judges, but in place of seven appointed a single Palatine judge for a term of three months. He was assisted by a *judex dativus*. Thus it is seen that while the pope still exercised certain rights he had actually lost control of the city.

The agreement with Pope Eugenius was of short duration. The revolution could not be checked; the Romans desired independence, and their spiritual lord fled to France, whence, in 1147, he proclaimed a new crusade, while the Romans were employed in demolishing Tivoli, banishing its inhabitants and waging war on other cities. Jordan Pierleoni was head of the republic, and Arnold, supported by the popular favour and the enthusiasm of the lower clergy, was preaching with even greater fervour than before. The new pope now re-entered Italy, proclaimed Arnold a schismatic, and advancing to Tusculum assembled an army in order to attack Rome. In this emergency the Romans applied to Conrad III., the first emperor of the house of Hohenstaufen; and their letters are expressive of Arnold's theories and his medley of ancient and modern, sacred and profane, ideas. "Rome," so they said, "is the fountain of the empire confided to you by the Almighty, and we seek to restore to Rome the power possessed by her under Constantine and Justinian. For this end we conquered and destroyed the strongholds of the barons who, together with the pope and the Normans, sought to resist us. These are now attacking us on all sides. Haste to Rome, the capital of the world, thus to establish thy imperial sway over the Italian and German lands." After long delay the king of the Romans replied to these appeals, stating that he would come "to re-establish order, reward the faithful and punish the rebellious." These words promised ill. In fact, Conrad had already arranged terms with the pope; but his life came to an end on Feb. 15, 1152.

Frederick **Barbarossa.**—He was succeeded by Frederick I., surnamed Barbarossa, who took no notice of letters urging him to come and receive the empire from the Roman people. In accord.

ance with his design of subduing all the independent cities, he made an agreement with the pope, in which he vowed to give no truce to the Romans, but subject them to their spiritual lord, whose temporal power should be restored. The pope, on his side, promised to crown him emperor. Thereupon the people again rose to. arms and broke off all negotiations with Eugenius III. Frederick was in command of a powerful army, and was no friend of half measures. To increase the gravity of the situation, an English pope, Adrian IV., was elected (1154–59), who was also a man of strong and resolute temper. In fact, even before he was able to take possession of the Lateran, he requested the Romans to banish Arnold, who was directing his thunders against the papacy. These utterances increased the wrath of Adrian, who, encouraged by the knowledge that Frederick and his host were already in Italy, at last launched an interdict against Rome. It was the first time that a pope had laid an interdict on the Eternal City. This put a summary stop to the religious life of the inhabitants and men's minds were seized with terror; a fierce tumult broke out. Thereupon the senators implored pardon; but Adrian demanded the expulsion of Arnold before consenting to raise the interdict. Arnold was therefore obliged to leave Rome, and, abandoned by all, was forced to wander from castle to castle, until given up to Frederick Barbarossa and then consigned by the latter to the papal legates. The pope in his turn gave the reformer into the hands of the prefect, who hanged his prisoner, burnt his body at the stake, and cast his ashes into the Tiber.

But the Romans would not give up their commune. Their envoys went to meet Frederick near Sutri, and made an address in the usual fantastic style on the privileges of the Roman people and its sole right to confer the imperial crown. Frederick indignantly cut short their harangue, and they had to depart full of rage. He then continued his march, and, entering Rome on June 18, 1155, was forthwith crowned in St. Peter's by the pope. Thereupon the Romans rushed to arms and made a furious attack on the Leonine city and the imperial camp. A desperate battle went on throughout the day; many Romans perished by the sword or by drowning, but their fellow-citizens made such determined preparations to continue the struggle that Frederick, on June 19, hastily retreated, or rather fled, together with the pope and the cardinals. The commune still survived. Its existence was in truth favourable rather than injurious to Frederick, but he had not yet discerned that his best policy would be to support the commune against the pope. The latter, with keener acumen, made alliance with the communes of Lombardy and encouraged them in their resistance to the emperor. Adrian IV. died in 1159, and the anti-imperial party elected Alexander III. (1159–81), who energetically opposed the pretensions of Frederick, but, having to struggle with three anti-popes successively raised against him by the imperial party, was repeatedly driven into exile. During these schisms the senate quietly carried on the government, administered justice and made war on some neighbouring cities and barons. An army comprising many nobles marched against Tusculum, but found it defended by several valiant officers and a strong band of German soldiery, who, on May 29, 1167, inflicted on the Romans so severe a defeat that it is styled by Gregorovius "the Cannae of the middle ages." Shortly afterwards the emperor arrived in Rome with his anti-pope Paschal III., and Alexander had to flee. Then, at last, Frederick came to terms with the commune, recognized the senate, which accepted investiture at his hands, re-established the prefecture as an imperial office, and bestowed it on John, son of Peter di Vico. He departed hastily, as a deadly fever broke out and decimated his army.

Concord between **Pope and** Commune.—Meanwhile Pope Alexander continued Adrian's policy with better success, however, for the Lombard cities had now formed a league and inflicted a signal defeat on the emperor at Legnano on May 29, 1176. One of the results of this battle was the conclusion of an agreement between the pope and the emperor, the latter resigning his pretensions on Rome and yielding all that he had denied to Adrian. By the Treaty of Venice (Aug. 1, 1177), the anti-pope was forsaken, Alexander III. recognized and hailed as the legitimate pontiff and the prefect of Rome was again to be nominated by the pope, to whom the emperor restored the temporal power, acknowledging him the independent sovereign of Rome and of the ecclesiastical State. Frederick's troops accompanied the pope to Rome, where the commune was forced to make submission to him. But, proudly conscious as it still was of its strength, its surrender wore the aspect of a voluntary concession, and its terms began with these words: "It has been decreed by the council and deliberation of the whole Roman people," etc. The senators, elected yearly in November, had to swear fealty to the pope. On his return to Rome Alexander received a solemn welcome from all. He died on Aug. 30, 1181. The fact that between 1181 and 1187 there were three popes always living in exile proves that the commune was by no means crushed. On Dec. 20, 1187, Clement III. (1187–91) made a solemn agreement with the government of the capitol before coming to Rome. And this peace or *concordia* had the air of a treaty between potentates of equal importance. Rome confronted the pope from the same standpoint from which the Lombard cities had confronted the emperor after Legnano. This treaty was confirmed on the last day of May 1188 (*Anno XLIV.* of the senate). The pope was recognized as supreme lord, and invested the senators with their dignity. Almost all the old pontifical rights and prerogatives were restored to him. The pope might employ the Roman militia for the defence of his patrimony, but was to furnish its pay. The rights of the Church over Tivoli and Tusculum were confirmed; but the commune reserved to itself the right of making war on those cities, and declared its resolve to dismantle and destroy the walls and castle of Tusculum. In this undertaking the pope was to co-operate with the Romans, even should the unhappy city make surrender to him alone.

From all this it is clear that the Church had been made independent of the empire, and that the commune, despite its numerous concessions, was by no means subject to the Church. The republic had no patrician nor any other imperial magistrate and preserved its independence even as regarded the pope, who merely granted investiture to magistrates freely chosen by the people and had no legislative nor administrative power in the city. His temporal dominion was limited to his great possessions, to his regalia, to a supreme authority that was very indefinite, and to a feudal authority over the barons of the Campagna and many cities of a State that seemed ever on the point of dissolution. The senate continued to frame laws, to govern, and to administer justice. The army carried on the wars of the commune, as we see by the tragic fate of Tusculum, which was razed to the ground on April 19, 1191. In consequence, the nobles, seeing that the commune remained firmly established, began to adhere to it and succeeded in obtaining admission to the senate. In fact, whereas since 1143 plebeians and petty nobles had prevailed in its ranks, nobles of ancient descent are now found outnumbering the knights and burghers. In 1191 this state of things caused a sudden popular outbreak which abolished the aristocratic senate and gave the headship of the commune to a single senator, of unknown origin. During the two years he remained in office this personage stripped the pope of his revenues, despatched *justitiarii* even. to the provinces, and with the aid of the parliament and council promulgated laws and statutes. He was overthrown by a counter-revolution; John Capoccio of the party of the nobles became senator for two years, and had been succeeded by one of the Pierleoni when, in 1197, a fresh revolution re-established a senate of 56 members, chiefly consisting of feudal barons in high favour with Henry VI., who had revived the imperial faction in Rome. But this emperor's life ended the same year, and the pope's in 1198, and the new pontiff, Innocent III. (1198–1216), began to make war on the nobles, who were again masters of the commune. Their leader was the prefect Peter di Vico. Owing to the revolution of 1143, most of the prefectorial attributes were now vested in the senate; nevertheless, Peter still retained a tribunal of police both within and without the city, and derived great strength from the vast possessions of the Vico family, in which the office of prefect now became hereditary. Very soon* after this, however, the independent municipal office lost its true character. Then the popes made a point of according great pomp and dignity to this nominal

prefect, in order to overshadow the senator, who still represented the independence of the republic.

Innocent III., dissatisfied with this state of things, contrived by bribing the people to arrogate to himself the right of appointing a commissioner to elect the senator, who had to swear fealty and submission to the pope, and also that of nominating the provincial *justitiarii,* formerly chosen by the government of the capitol. This was a deadly blow to the commune, for the principal rights of the people—*i.e.,* the election of pope, prefect, and senate—were now lost. The general discontent provoked fresh revolutions, and the people made a loud outcry for a senate of 56 members; the pope, making a virtue of necessity, caused that number to be chosen by 12 mediani specially named by him for the purpose. Even this did not calm the popular discontent, and when, six months later, the pope again had a single senator elected the Romans rose to arms and in 1204 formed a government of "Good Men" (Buoni Uomini) in opposition to that created by the pope. But an amicable arrangement being concluded, the pope once more had 56 senators nominated; and when, soon after, he again reduced them to one, the people were too weary to resist (1205).

Pretensions of the Commune.--On Nov. 22, 1220, Honorius III. (1216–27) conferred the imperial crown on Frederick II., who confirmed to the Church the possession of her former States, of those bequeathed to her by Countess Matilda, and even of the March of Ancona. But it was soon seen that he sought to dominate all Italy, and was therefore a foe to be dreaded. The successor of Honorius, Pope Gregory IX. (1227–41), was speedily insulted and put to flight by the Ghibelline nobles, whose courage had revived, and the republic began to subdue the Latian cities on its own account. Peace was several times made and unmade by pope and people; but no enduring harmony was possible between them, since the former wished to subject the entire State to the Church, and the latter to escape from the rule of the Church and hold sway over "the universal land from Ceprano to Radicofani" formerly belonging to the duchy. Accordingly, the Roman people appointed judges, imposed taxes, issued coin, and made the clergy amenable to secular tribunals. In 1234 the senator Luca Savelli published an edict declaring Tuscia and Campania territories of the republic, and sent judges thither to exact an oath of obedience. He also despatched the militia to the coast, where it occupied several cities and erected fortresses; and columns were raised everywhere inscribed with the initials S.P.Q.R. The pope, unable to prevent but equally unable to tolerate these acts, fled from Rome, hurling his anathema against Savelli and his associates. The Romans sacked the Lateran and the houses of many cardinals and marched on Viterho, but were driven back by the papal troops. The people had to make peace and submission in 1235, and were obliged to give up their pretensions of subjecting the clergy to ordinary tribunals and the urban territory to the commune. Thus matters were virtually settled on the footing established by Innocent III., thanks to the aid given to the pope by Frederick II., who had previously aided the rebellion.

Meanwhile the struggle between Frederick II. and the pope was once more renewed. The nobility was again split into a Guelph party headed by the Orsini and a Ghibelline party under the Colonna. In 1238 it was deemed advisable to elect two senators instead of one, in the hope of conciliating both factions by simultaneously raising them to power. Afterwards one only was elected, alternately an Orsini and a Colonna, then again two, and so on. But all these changes failed in their aims, since the struggle between emperor and pope exasperated party feeling in Rome. Frederick desired to emancipate the State from the Church, but he was opposed to the communal democracy, which was then the chief strength of the secular State in Italy. Thus, although he had a strong party in Rome, it seemed to dissolve at his approach, inasmuch as all feared that he might abolish the statutes and liberties of the commune. In fact, when he advanced towards Rome on the death of Gregory IX. in 1241, he was energetically repulsed by the people, and later even by Viterbo, a city that had always been faithful to him. After he had withdrawn, his adherents gained strength and put to flight his opponent, Innocent IV. (1243–54), the newly elected pope, who then from Lyons hurled an excommunication against him. On Frederick's death in Dec. 1250 the pope instantly returned to Rome with the set purpose of destroying the power of the Hohenstaufens.

Brancaleone.—The commune meanwhile being harassed by the factiousness of the nobility in 1252 decided on the election of an alien senator armed with ample powers, precisely as other communes gave the government into the hands of a podesta. Accordingly a Bolognese noble, Brancaleone degli Andalo, count of Casalecchio, and a Ghibelline, was invited to Rome. Before accepting office he insisted on making definite terms; he desired to hold the government for three years; and this although contrary to the statutes, was granted. Further, to insure his personal safety, he demanded that many scions of the noblest Roman houses should be sent as hostages to Bologna; and to this also the commune consented. Then, in Aug. 1252, he came with his judges and notaries, made oath to observe justice and the laws, and began to govern. He was head of the republic in peace and in war, supreme judge and captain in chief. He nominated the podestas of subject territories, despatched ambassadors, issued coin, concluded treaties, and received oaths of obedience. He convoked the council as seldom as was possible, although he frequently assembled the people in parliament. The chief complaint made against him was of undue severity in the administration of justice. He rendered the clergy amenable to secular tribunals, subdued the neighbouring cities of Tivoli, Palestrina, etc., and commanded in person the attacking force. But his greatest energy was directed to the repression of the more turbulent nobles, hanging some and banishing others. He recognized the expediency of winning the popular favour and was the first senator to add to his title that of "captain of the people." He befriended the people by promoting the organization of gilds, 13 in all. The admission of their heads into the councils of the commune in 1267 shows how far their interests had been promoted by Brancaleone.

When, on the expiration of his three years' term of office, Brancaleone's re-election was proposed, his enemies rose against him, accused him, threw him into prison, and vehemently protested against the continuance of "foreign tyranny." His life was spared only on account of the hostages sent to Bologna. The next senator chosen was a Brescian Guelph, Emanuele de Madio, a tool of the nobles, who were masters of the situation. But soon afterwards, in 1257, the people rose in revolt, drove the nobles from power, put the pope to flight, and recalled Brancaleone for another three years' term. He ruled more sternly than before, hung several nobles, and made alliance with Manfred, the representative of the Swabian party in Italy. This rendered him increasingly odious to the pope and procured his excommunication. But, disregarding the thunders of the Church, he marched against Anagni, the pope's birthplace, and Alexander was quickly obliged to humiliate himself before the senator of Rome. Brancaleone next set to work to destroy the fortified towers of the nobility, and in razing them to the ground ruined many of the adjacent dwellings. In 1258 Brancaleone died. Thus ended the career of a truly remarkable statesman. He was succeeded by his uncle, Castellano degli Andalo, who only retained office until the following spring (1259). Then the people, being bribed by the pope, joined with the nobles and overthrew him. His life too was saved by having followed his nephew's shrewd plan of sending hostages to Bologna. Two senators of Roman birth were next elected.

Charles of **Anjou** Senator— At this period the fall of the empire had induced many Italian republics to seek strength by placing their governments in the hands of some prince willing to swear respect for their laws and to undertake their defence. In Rome the Guelphs and Ghibellines proposed various candidates for this office, and after many fierce quarrels ended by electing a committee of *boni* homines, charged with the revision of the statutes, reorganization of the city, and choice of a senator. This committee sat for more than a year without nominating anyone; then, the Guelph party being predominant, the majority agreed on the election as senator of Charles of Anjou, who after a long delay became senator, but held office for less than a year. Two Romans were elected in his stead, but soon

fell out with the pope, because the Guelph nobles again tried to exercise tyranny. The people, however, profited by these disturbances to rise on their own account, and formed a democratic government of 26 *boni homines* with Angelo Capocci, a Ghibelline, as its captain. By this government Don Henry, son of Ferdinand III., of Castile, was elected senator (1267). The rule of the new senator was very energetic, for he kept down the clergy, subdued the Campagna, persecuted the Guelph nobles, made alliance with the Tuscan Ghibellines, forcibly drove back the troops of King Charles, who was advancing towards Rome, and gave a splendid reception to Conradin. But the battle of Tagliacozzo (Aug. 23, 1268), followed by the murder of Conradin, proved fatal to the Ghibelline party. Charles was re-elected senator immediately after the battle, and the pope confirmed his powers for a term of ten years.

In 1278, the ten years' term having expired, the pope, after declaring that he left to the people the right of electing the senator, promulgated a new constitution (July 18, 1278), which, while confirming the rights of the Church over the city, prohibited the election of any foreign emperor, prince, marquis, count or baron as senator of Rome. Thus the Colonna, Savelli, Orsini, Annibaldi and other Roman nobles again rose to power, and the republic was again endangered and plunged into disorder. The Romans then gave the reconstitution of the city into the pope's hands by yielding to him the right of nominating senators. So Nicholas proceeded to name senators, alternating a Colonna with an Orsini, or simultaneously choosing one of each faction. The same power over the senate was granted with the same restriction to Martin IV. (1281–85), and he at once re-elected Charles of Anjou. Thus, greatly to the disgust of the Romans, the capitol was again invaded by French vicars, notaries, judges and soldiery. But the terrible blow dealt at Charles's power by the Sicilian Vespers (March 31, 1282) resounded even in Rome. The Orsini, backed by the people, rose in arms, massacred the French garrison, and quickly re-established a popular government. John Cencio, a kinsman of the Orsini, was elected captain and defender of the people, and ruled the city with the co-operation of the senator and a council of priors of the gilds. This government was of brief duration, for, although the pope had professed his willingness to tolerate experiment, he quickly arranged fresh terms, and, forsaking Charles of Anjou, again nominated two Roman senators. Pope and king both died in 1285, and Nicholas IV. (1288–92), also holding sway over the senate, favoured the Colonne in order to curb the growing mastery of the Orsini. But thus there were two powerful houses instead of one. In fact, John Colonna, when elected senator, ruled from the capitol as an independent sovereign, conducted in person the campaign against Viterbo, and subjected that city to the republic on May 3, 1291.

Boniface VIII. (1294-1303) tried to reduce the power of the Colonna family and succeeded for a time in exercising more power in Rome than any of the recent popes. This was due largely to the Jubilee which brought thousands of pilgrims to Rome. The citizens wished to profit by the gold which the pilgrims brought and for that reason were ready to postpone their rivalries.

Removal of the Popes to **Avignon.**—When the popes removed to Avignon the city was left almost entirely to govern itself. There was the same strife between the "ins" and the "outs," who persisted in using the names Guelphs and Ghibellines, although these names had lost their old meaning since the fall of the Hohenstaufens. The commune employed its freedom in trying to hold its own against the nobles, whose power was much lessened by the absence of the pope, and endeavoured to gain fresh strength by organizing the 13 regions. Accordingly, in 1305, a captain of the people was elected with 13 elders and a senator, Paganino della Torre, who governed for one year. The pope was opposed to these changes at first, but in 1310 he issued a brief granting Rome full permission to select its own form of government. Thus, the first pope in Avignon restored the rights of the Romans. The latter still considered Rome the Eternal City, the source of all law, and the only natural seat of the spiritual and temporal government of the world. To their republic, they thought, appertained a new and lofty destiny. In 1312, in spite of the opposition of the nobles, they insisted upon the coronation of the emperor Henry VII. In the same year, after a brief interval of rule by the nobles, the popular party again got the upper hand, only to be overthrown the following year.

Then the pope appointed King Robert of Naples as senator. Affairs took a fresh turn under Pope John XXII. (1316–34). Rome was still ruled by the vicars of King Robert; but, owing to the continued absence of the pope, matters grew daily worse. Trade and industry declined, revenue diminished, the impoverished nobles were exceedingly turbulent, deeds of murder and violence occurred on all sides; even by day the streets of the city were unsafe. Hence there was universal discontent. Accordingly the Italian Ghibellines hailed Louis the Bavarian as they had previously hailed Henry. The Roman people were roused to action, and, driving out the representatives and partisans of King Robert, in the spring of 1327 seized on the castle of St. Angelo and again established a democratic government. Regardless of the reproofs of the pope, they elected a haughty Ghibelline, Sciarra Colonna, captain of the people and general of the militia, with a council of 52 *popolani,* four to each region. Then ranged under the standards of the militia, the Romans gave chase to the foes of the republic, and Sciarra, returning victorious, ascended to the capitol, and invited Louis the Bavarian to Rome.

Encircled by a crowd of heretics, reformers and Minorite brethren, Louis convoked a parliament on the capitol, asking that the imperial crown might be conferred upon him by the people, from whom alone he wished to receive it. And the people proclaimed him their captain, senator and emperor. On Jan. 17, his coronation took place in St. Peter's. But, as he had neither money nor practical sense, his method of taxation and the excesses committed by himself and his over-excited philosophers speedily aroused the popular discontent. His ecclesiastical vicar, Marsilius of Padua, and John Janduno placarded the walls with insulting manifestos against the pope, whom the Minorites stigmatized as a heretic and wished to depose. The emperor decreed that henceforth the popes must reside in Rome — that if, when invited, they should fail to come they would be thereby held deposed from the throne. As a logical consequence, proceedings were immediately begun for the election of a new pope, Nicholas V., who on May 12 was proclaimed by the popular voice in St. Peter's square, and received the imperial sanction. But this ephemeral drama came to an end when the emperor departed with his anti-pope on Aug. 4. This caused the immediate downfall of the democratic government. A new parliament cancelled the emperor's edicts, and had them burnt by the public executioner. Meanwhile King Robert was again supreme in Rome, and being re-elected senator appointed vicars there as before. Anarchy reigned.

After the election of Benedict XII. (1334–42) confusion reached so great a pitch that, on the expiration of Robert's senatorial term, the Romans named 13 heads of regions to carry on the government with two senators, while the king still sent vicars as before. The people, for the sake of peace, once more granted the supremacy of the senate to the pope, and he nominated two senators. But in 1339 the Romans attacked the capitol, named two senators of their own choice, re-established a democratic government, and sent ambassadors to Florence to ask for the ordinances of justice by which that city had broken the power of the nobles, and also that a few skilled citizens should lend their help in the reconstitution of Rome. Accordingly some Florentines came with the *ordinamenti,* some portions of which may be recognized in the Roman statutes, and, after first rearranging the taxes, elected 13 priors of the gilds, a gonfalonier of justice, and a captain of the people after the Florentine manner. But there was a dissimilarity in the conditions of the two cities. The gilds having little influence in Rome, the projected reform failed, and the pope, who was opposed to it. re-elected the senators. Thereupon public discontent swelled. Another revolution in Rome re-estabiished the government of the 13 elders and the two senators.

Cola di Rienzi.—The people, anxious to show their intention of respecting the papal authority, had despatched to Avignon as ambassador of the republic, in 1343, Cola di Rienzi (*q.v.*), who

begged the pope to return to Rome, to allow the city to celebrate a jubilee every 50 years, and then, as a personal request, asked to be nominated notary to the urban chamber. The pope consented to everything, and Rienzi communicated this good news to Rome in an emphatically worded epistle. After Easter, in 1344, he returned to Rome and found that the city was a prey to the nobles. He secretly built up a party of conspirators and in May 1347 convoked a parliament of the people and obtained its sanction for the following proposals: that all pending lawsuits should be at once decided; that justice should be equally administered to all; that every region should equip 100 foot soldiers and 25 horse; that the dues and taxes should be rearranged; that the forts, bridges, and gates of the city should be held by the rector of the people instead of by the nobility; and that granaries should be opened for public use. On the same day, amid general homage and applause, Rienzi was proclaimed head of the republic, with the title of tribune and liberator of the Holy Roman Republic, "by authority of the most merciful Lord Jesus Christ." The nobles withdrew scoffing but alarmed. Rienzi engaged a bodyguard of 100 men, and assumed the command of the 1,300 infantry and 390 light horse; he abolished the office of senator, retained the Thirteen and the general and special councils, and set the administration on a new footing. These measures and the prompt submission of the other cities of the State brought an instant increase of revenue to Rome.

The pope, willingly or unwillingly, accorded his approval to Rienzi's deeds. The provincial cities did homage to Rome and her tribune, and almost all the rest of Italy gave him its enthusiastic adherence. Great men like Petrarch were transported with joy. But on the convocation of a national parliament few representatives obeyed the summons and the scheme was a failure. Nevertheless, on Aug. 15, Rienzi caused himself to be crowned tribune with great pomp, and confirmed the rights of Roman citizenship to all natives of Italy. The nobles remained steadily hostile; conflict was unavoidable. At first Rienzi succeeded in vanquishing the Gaetani by means of John Colonna; he next endeavoured to suppress the Guelph and Ghibelline factions, and to restore Italy to "holy union."

The pope, however, was weary of toleration, and, coming to terms with the nobles, incited them to war. A battle took place in which 80 nobles, chiefly of the Colonna clan, were left dead; the aristocracy never again achieved the rule of the republic. Rienzi's head was turned by this sudden success, and in his great need of money he began to play the tyrant by levying taxes and exacting instant obedience. The papal legate saw his opportunity and seized it, by threatening to bring a charge of heresy against the tribune. Rienzi was dismayed. He declared himself friendly to the pope and willing to respect his authority; and he even sought to conciliate the nobles. At this moment certain Neapolitan and Hungarian captains, after levying soldiers with the tribune's consent, joined the nobles and broke out in revolt. On their proving victorious in a preliminary encounter with some of Rienzi's guards, the tribune suddenly lost heart, resigned the power he had held for seven months, and fled to Naples.

Meanwhile the Romans remained tranquil, intent on making money by the jubilee; but no sooner was this over than disorders broke out and the tyranny of the baronage recommenced. To remedy this state of things, application was made to the pope. He consulted with a committee of cardinals, who sought the advice of Petrarch, and the poet suggested a popular government, to the complete exclusion of the nobles, since these, he said, were strangers who ruined the city. The people had already elected the Thirteen, and now, encouraged by these counsels, on Dec. 26, 1351, chose John Perrone as head of the commune. But the new leader was unable to withstand the hostilities of the nobles; and in Sept. 1353 Francis Baroncelli was elected tribune. He was a follower of Rienzi, and did little beyond imitating his mode of government and smoothing the way for his return.

Rienzi, after various adventures, was at Avignon in confinement. Innocent VI. (1352–62) decided to send Cardinal Albornoz to Italy, in order to bring the State into subjection to the Church; and he further decided that Rienzi should accompany him to give him the support of his own popularity in Rome. In fact, directly the pair arrived Baroncelli was overthrown, the supremacy of the senate granted to the pope, and the government confided to Albornoz, who, without concerning himself with Rienzi, nominated a senator. Rienzi, profiting by his prestige and the apparent favour of the pope, was able to collect a band of 500 soldiers of mixed nationalities and on Aug. 1, 1354, took possession of the government. But his money ran short, and he resorted to violence to fill his purse. The result was a sudden revolt on Oct. 8, when the people stormed the capitol with cries of "Death to the traitor." Rienzi was killed.

Foreign Senators and the **Banderesi.**—Rome submitted to the pontiff, and the pope, instead of two senators, hastened to name a single one of foreign birth. This was a shrewd device of Albornoz and another blow to the nobles, with whom he was still at war. Thus was inaugurated, in 1358, a series of foreign senators, fulfilling the functions of a podesta, and changed every six months together with their staff of judges, notaries, and knights. The people approved of this reform as being inimical to the nobles and favourable to the preservation of liberty.

Hitherto the senators had been assisted, or rather kept in check, by the 13 representatives of the regions. In 1360 these were replaced by seven reformers, who soon became the veritable chiefs of the republic and were elected by ballot every three months, and the nobles, already shut out from power, were also excluded from the militia, which had been reorganized on the democratic system. Three thousand men, mostly archers, were enrolled under the command of two *banderesi,* with four *antepositi,* or lieutenants, constituting a supreme council of war. And the whole body was styled the *"Felix societas balestrariorum et pavesatorum."* It was instituted to support the reformers and re-establish order in the city and Campagna, to keep down the nobles and defend the republic. It fulfilled these duties with much severity. *Banderesi* and *antepositi* had seats in the special council beside those of the reformers, the gonfaloniers of the companies were seated beside the priors. Later these officials constituted the so-called *signoria dei banderesi.* When in 1362 the nobles made a riot in Rome, the *banderesi* drove them all from the city. The fight became so furious that all Rome was in arms, and even mercenaries were hired. Finally renewed submission was made to the pope.

On the death of Innocent VI. in 1362, an agreement was concluded with his successor, Urban V. (1362–70), who was obliged to give his sanction to the government of the reformers and *banderesi.* And then, Albornoz being recalled in disgrace to Avignon and afterwards sent as legate to Naples, these Roman magistrates were able, with or without the co-operation of the foreign senator, to rule in their own way. They did justice to the nobles by hanging a few more; and they defended the city from the threatening attacks of the mercenaries, who had become Italy's worst foes. It was at this period that the Roman statutes were revised and rearranged in the compilation which has come down to us supplemented by alterations of a later date.

Urban V. Begins to Destroy the Republic.—Urban V. (1362–70), no longer in safety at Avignon, decided to return to Italy. The Romans implored him to do so, and he was urged to it by the Italian *literati,* with Petrarch at their head. In April 1367 he left Avignon, and, entering Rome on Oct. 16, was given the lordship of the city. He showed much acumen in profiting by the first burst of popular enthusiasm to effect quick and dexterous changes in the constitution of the republic. After naming a senator, he abolished the posts of reformers and *banderesi,* substituting three conservators, or rather a species of municipal council, alone charged with judicial and administrative powers. The 13 leaders of the regions and the consuls of the gilds still sat in the councils, which were left unsuppressed. But all real power was in the hands of the pope, who, in Rome as in his other cities, nominated the principal magistrates. Thus, by transforming political into civil institutions, and concentrating the supreme authority in his own grasp, Urban V. dealt a mortal blow to the liberties of Rome. Yet he felt no sense of security among a people who, after the first rejoicings over the return of the Holy See, were

always on the brink of revolt. Besides, he felt himself a stranger in Italy, and was so regarded. Accordingly, in 1370 he decided to return to France, and died there on Dec. 19.

The Romans retained the conservators, conferring on them the political power of the reformers; they re-established the *banderesi* and the four *antepositi.* The new French pope, Gregory XI. (1370–78), had to be content with obtaining supremacy over the senate and the possession of the castle of St. Angelo. In Feb. 1376 the Romans nominated John Cenci captain of the people and gave him uncontrolled power over the towns of the patrimony and the Sabine land. The two councils were preserved, and a new magistracy was created, the "Three Governors of the Peace and Liberty of Rome."

Gregory XI. decided in 1376 to return to Rome and entered into a treaty with the republic, which, anxious for his return, promised him the same powers that Urban V. had had. He returned early in 1377, but was not able to get control of the government before his death in the following year. The next pope, Urban VI. (1378–89), whose election and acts provoked the Great Schism (1378–1417), had much trouble, but finally got himself recognized as supreme in Rome by promising a jubilee in 1389. He died before it could take place, and was succeeded by Boniface IX. (1389–1404). The latter was very shrewd. He crowned Ladislaus and by a skilful use of jubilees, of which he celebrated two, succeeded in bringing the city wholly under his power; he also reduced the Colonna to submission.

The next pope, Innocent VII. (1404–6), aided by Ladislaus of Naples, put down a revolt of the people, but had to make a concession that they might elect "seven governors of the liberty of the Roman republic." After Innocent's death King Ladislaus seized Rome, sacked it brutally and held sway over it until his death in 1414. Then the Romans revolted against the Neapolitans, and with the aid of the papal legate established a new government of 13 conservators.

Martin V. Supreme.—When after the Schism Martin V. was elected pope he made peace with Joanna, queen of Naples, who yielded Rome to him. Martin V. reduced the remains of the free Roman government to a mere civil municipality. Following the method of the other despots of Italy, he allowed the old republican institutions to retain their names and forms, their administrative and some of their judicial attributes, while all their political functions were transferred to the new government. Order was re-established and justice rigidly observed. Rome was in ruins; nobility and burghers were equally disorganized, the people unable to bear arms and careless of their rights, while the battered walls of the capitol recorded the fall of two republics.

Eugenius IV. (1431–47) was forced by a revolt to flee from Rome, and then the people re-established the "Seven Governors of Liberty.". Later Eugenius recovered control over Rome. Under Nicholas V. (1447–55) there were conspiracies to restore the republic, headed by Stephen Porcari, who attempted to play the part of a Rienzi. He was pardoned the first time, but was executed after a second attempt. After that the Popes ruled Rome. Under Paul II. some scholars were seized on the charge of desiring to re-establish paganism in the republic. Under Sixtus IV. (1471–84) the Colonna were either put to death or made powerless, and the Orsini met the same fate under Alexander VI. (1492–1503). There was still a senator of Rome, whose nomination was entirely in the hands of the pope, still three conservators, and an elected council of 26 citizens. Now and then also a shadowy semblance of a popular assembly was held to cast dust in the eyes of the public, but even this was not for long. All these officials, together with the judges of the capitol, retained various attributes of different kinds. They administered justice and gave sentence. There were numerous tribunals, all with undefined modes of procedure, so that it was very difficult for the citizens to ascertain in which court justice should be sought. But in last resort there was always the supreme decision of the pope. Thus matters remained up to 1789. For Modern City *see* p. 472.

BIBLIOGRAPHY.—There is a good bibliography for mediaeval Rome in E. Calvi, *Bibliografia generale di Roma* (1906). The more important sources for the history of Rome in the middle ages, as far as they have been edited, are found in the *Liber Pontificalis,* edit. by Duchesne (1886–92) and by Mommsen, in the *Monumenta Germaniae Historica* (1896); in Baronius, *Annales Ecclesiastici* (best ed. Paris, 1864–82); and in the *Archivio della Reale Societd Romana di Storia Patria. See* also Watterich, *Pontificum romanorum,* etc. (1862); Kehr, *Regesta pontificum,* etc. (1896). For the period 568–751 there is a good bibliography in C. Diehl, *Études sur l'adnzinistration byzantine* (1888); for 751–1252, in L. Halphen, *Etudes sur l'administration de Rome au moyen âge* (1907); for 1354–1471, in E. Rodocanachi, *Histoire de Rome* (1922). Each of these three books also has a bibliography of secondary works. Duchesne's *Les premiers temps de l'état pontifical, 754–1073* (1898) has corrected many errors formerly held, Older books which are still valuable are: Savigny, *Geschichte des romischen Rechts im Mittelalter; J.* Ficker, *Forschungen zur Reichs-und Rechtsgeschichte Italiens* (Innsbruck, 1868–74); F. Papencordt, *Geschichte der Stadt Rom.* (Paderborn, 1857); *A.* von Reumont, *Geschichte der Stadt Rom.* (1867–68). *F.* Gregorovius, *Geschichte der Stadt Rom* is a standard work and very interesting. It was finished in 1872 and consequently needs correction on many points. There is a fifth edition in German (Stuttgart, 1903 *seq.)* and an English translation, from the fourth edition, by Annie Hamilton (1894 *seq.).* P. Villari, *Il comune di Roma nel medio evo,* in his *Saggi storici e critici* (Bologna, 1890) is a "brilliant essay"; *cf.* also his *Mediaeval Italy from Charlemagne to Henry VII.* (1910). Camillo Re, *Statuti della città di Roma* (1880) prints the statutes, with a long introduction; *cf.* G. Gatti, *Statuti dei mercanti di Roma* (1885). For the time of Innocent III., *A.* Luchaire, *Innocent III.; Rome et Italie* (1904); *cf.* his article in *Revue Historique,* vol. 81 (1903). For Brancaleone, M. Rovere, *Brancaleone degli Andalò* (Udine, 1895). For the 14th and 15th centuries, the work of Rodocanachi, cited above, and also his *Les institutions communales de Rome* (1901), which is better for this later period than for the earlier ages. Hartmann Grisar S.J. announced a very elaborate work on the history of Rome and the popes in the middle ages, only the first volume, in German, was published (1899–1901, Eng. trans. 1911 *seq.).* O. Rossler, *Grundriss einer Geschichte Roms im Mittelalter* (1909) is useful. *See* also the two series *Storia politica d'Italia,* one written by a *Societd di professori* and the other by a *Societd d'amici,* in which appeared the following useful volumes: G. Romano, *Donzinazioni barbariche 395–1024* (1909); F. Bertolini, *Dominazioni germaniche* (1872); F. Lanzani, *Comuni* (1881); C. Cipolla, *Signorie italiane* (1881). *See* also M. Creighton, *History of the Papacy,* 2nd ed. (1897); L. Pastor, *Geschichte der Päpste* (1884 *seq.),* Eng. trans. (1898).

(D. C. M.; X.)

ROME, a city of Georgia, U.S., the seat of Floyd county, is located at the confluence of the Etowah and Oostanaula rivers, 70 mi N.W. of Atlanta.

Founded in 1834 at the southern gateway of Georgia's valley region, it was an important connecting link between the middle Georgia cotton belt and Tennessee, serving as a clearinghouse for corn, wheat and livestock from the north and cotton from the Coosa river valley which begins just west of the city. The surrounding agricultural area, once devoted primarily to cotton, later became diversified, with livestock and poultry of leading importance. Considerable forest land, two-thirds of which is in pine. provides saw timber and pulpwood. Mining is of some importance, including bauxite, shales and limestones. Textile products have long been a major segment of the city's economy but other manufactured products include paper, furniture, agricultural implements, boats, cotton gins, casket shells, aluminum products and stoves.

The city has a council-manager form of government, in effect since 1919. Near Rome is Berry college, a private liberal arts college founded in 1903, whose students all participate in a work experience program on the campus; in the city is Shorter college. a coeducational liberal arts institution chartered in 1873 and affiliated with the Baptist Church, and Darlington, a private preparatory school for boys. For comparative population figures *see* table in GEORGIA: *Population.* (Js. C. B.)

ROME, a city of Oneida county, east-central New York, U.S. 15 mi, N.W. of Utica (*q.v.*) on the Mohawk river, Wood creek, the State Barge canal and the thruway. With a 1960 population of 51.646 it is the second city of the Utica-Rome standard metropolitan statistical area, comprising Herkimer and Oneida counties (pop. 330.771).

Highlights of its history revolve around colonial and Revolutionary War events. Several forts were built by the British to protect the settlement in 1755, but the most famous was Ft. Stanwix built in 1758 by the general whose name it bore. It was the scene of an important treaty (1768) between Sir William Johnson and Indians of the Six Nations in which lands of western

Pennsylvania, Kentucky and West Virginia were surrendered to the crown. The fort was dismantled thereafter and rebuilt in 1776 by order of Gen. Philip Schuyler, for whom it was named (causing the original Ft. Schuyler to be renamed Old Ft. Schuyler, before becoming Utica), but the original name: Stanwix, continued in popular usage. The fame of the fort arose from its role in the battle of Oriskany (*q.v.*), 6 mi. E. on Aug. 6, 1777, a turning point in the American Revolution, when the British advance into the Mohawk valley was stopped. According to local tradition the "Stars and Stripes" was raised in battle there for the first time, but this flag had no stars *(see* FLAG: *Flags of the United States).*

The first earth was turned there for the Erie canal in 1817. Rome later achieved industrial importance as the "copper city" through the manufacture of wire, brass, cable and other copper products. Various metals and machinery industries (vacuum cleaners, radiators, air-conditioning equipment) have since developed but the most important facility after World War II was the Griffiss air force base, a national procurement centre. With employment of thousands of civilian and military personnel it has fundamentally changed the economic and social life of Rome.

The township of Rome was organized in 1796, receiving its name "from the heroic defense of the republic made here." The village of Rome was incorporated in 1819, and in 1870 it was chartered as a city. Rome tried city-manager government between 1954 and 1958 but returned to the mayor-and-council system.

For comparative population figures *see* table in NEW YORK: *Population.* (V. C. C.)

ROMFORD, a market town, municipal (1937) and parliamentary borough. and residential centre in Essex. Eng., 12 mi. E. of London by road. Pop. (1921) 19,448; (1961) 114,579. Area 14.6 sq.mi.

Romford is a shopping centre for adjoining localities and includes the London County council quasi-satellite town of Harold Hill which was begun in 1947 and by 1956 had an estimated population of 30,000. Romford has a brewery and there are a number of light industries.

ROMILLY, SIR SAMUEL (1757–1818), English law reformer whose chief efforts were devoted to the reform of English criminal law and procedure, was born in London March 1, 1757; he was the second son of Peter Romilly, an English tradesman of Huguenot stock. In the years that followed his call to the bar in 1783, he rose in his profession to become the outstanding chancery advocate in England. He early became identified with the liberal movement of his time. He gave assistance and sympathetic support to the early leaders of the French revolution and became associated with Jeremy Bentham (*q.v.*) and the circle of English law reformers. In 1806 he became solicitor-general in the Ministry of All the Talents and entered the house of commons where he attacked the savage penal laws of the period which indiscriminately authorized the sentence of death in a host of minor felonies. Romilly's program for mitigation of the law was founded on utilitarian assumptions similar to those expressed in the writings of Bentham and Cesare Beccaria (*q.v.*). However, his efforts were obstructed by the conservative reaction in parliament to the French revolution and its aftermath, perhaps best exemplified by the attitudes of Lord Ellenborough in the house of lords. and his immediate successes were not impressive. In 1808 he managed to achieve repeal of an Elizabethan statute that imposed capital punishment on theft from the person. He likewise secured elimination of the punishment of transportation for stealing from bleaching-grounds and the death penalty for soldiers and sailors found begging without a permit. Though frustrated in his larger efforts, Romilly's writings and speeches eventually produced a profound effect and contributed importantly to the reforms effected in the years following his death. Distracted by the death of his wife, he committed suicide on Nov. 2, 1818, in London. His *Memoirs,* with a selection from his correspondence, appeared in three volumes in 1840; a two-volume edition of *The Speeches of Sir Samuel Romilly in the House of Commons* was published in 1820.

See also "Life and Work of Sir Samuel Romilly" by Sir W. J. Collins, in *Trans. of the Huguenot Society* (1908); *C.* Phillipson, *Three Criminal Law Reformers* (1923). (F. A. A.)

ROMMEL, ERWIN (1891–1944), German army officer, outstanding field commander and desert-warfare tactician in World War II. was born of a schoolmaster father at Heidenheim, near Ulm, on Nov. 15, 1891. He entered the army as a cadet in 1910 and distinguished himself in World War I. After serving mostly as infantry regimental officer and instructor between World Wars I and II, Rommel took command of Hitler's bodyguard battalion in 1939. He commanded the 7th panzer division, which led the rapid advance to the channel in May 1940. In Feb. 1941 he became commander of German troops in Libya and quickly pushed British forces back into Egypt.

Known as the "Desert Fox," he was highly respected by both sides. Despite German and Italian reinforcements, he was compelled by logistic difficulties and superior British strength to withdraw to Tunisia, whence he was evacuated on Hitler's orders. As a field marshal Rommel then commanded army group B in France, under Gerd von Rundstedt; wounded in an air raid on July 17, he was sent home to recover.

Rommel had become increasingly disillusioned with Hitler's highhanded conduct of the war and the atrocities ordered by Hitler's headquarters. He therefore did not oppose the conspiracy to remove Hitler, although favouring arrest rather than assassination. He would have been proclaimed chief of state if the assassination attempt against Hitler of July 20, 1944, had succeeded; the investigation of the plot revealed this.

On Oct. 14, 1944, Rommel was taken from his home and forced to swallow poison.

Rommel wrote *Infanterie greift an* (1937) and *Krieg ohne Hass* (1950), published in English as *The Rommel Papers* (1953).

See Lutz Koch, *Die Wandlung eines grossen Soldaten* (1950); Desmond Young, *Rommel,* in English (1950). (P. N. T.)

ROMNEY, GEORGE (1734–1802), English history and portrait painter, next in importance after Reynolds and Gainsborough during the latter half of the 18th century, was born at Dalton-in-Furness. Lancashire, on Dec. 15, 1734. the son of a cabinetmaker. After working in his father's studio, in 1755 he became the pupil for two years of an itinerant portrait and genre painter. Christopher Steele, at Kendal, Westmorland. Romney's early work is a harder and provincial variant on the style of Joseph Highmore and much less accomplished than Steele's. Having married and set up as a portrait painter, he toured the northern counties, producing likenesses for a few guineas each. A series of about 20 figure compositions were exhibited in Kendal and afterward sold by lottery.

In 1762, having saved about £100, he left a portion of this sum for his wife and children and went to London, never returning, except for brief visits. until he came in 1798. a broken-down and aged man, to die. He quickly gained notice when in 1763 he won an award from the Society of Arts for a "Death of Wolfe." It was judged worthy of the second prize but, after a recommendation from Sir Joshua Reynolds in favour of J. H. Mortimer's "Edward the Confessor." Romney had to be content with a donation of £50. This incident led to a subsequent coldness between him and the president and thereafter he held aloof from the Academy. However. Romney was an ambitious yet nervous and introspective character, shunning society and the company of his fellow artists.

He paid his first visit to Paris in 1764, where he was befriended by Joseph Vernet and, significantly, admired the work of Nicolas Le Sueur; Romney had not yet seen Raphael, and Le Sueur's use of the antique would have strongly appealed to him. In all his portraits Romney avoids any suggestion of the positive characteristics or sensibilities of the sitter and, although himself unsociable, ironically his great success with society sitters depended largely upon just this ability for dispassionate flattery.

Line rather than colour dominates; it is the flowing rhythms and easy poses of Roman classical sculpture which underlie the smooth papery patterns of his compositions. Among the works exhibited at the Society of Artists from 1763 to 1772 (this is the only period that he did exhibit publicly) are the "Sir George and Lady Warren and Their Daughter" (1769) and "Mrs. Yates as The Tragic Muse" (1771), in which the figures are abnormally elongated and trapped out in pretentious classical poses. He kept his fees low

and soon acquired a large clientele, rivaling in popularity Reynolds, whose near neighbour he had become in Great Newport street. A more intimate portrait group is the "Peter and James Romney" of 1766; and the "Mr. and Mrs. William Lindotv" (1772, Tate gallery, London) is one of this period's maturest works.

Romney spent more than two years in Italy, leaving for Rome with the miniature painter Ozias Humphrey in 1773. He studied chiefly the Stanze figures by Raphael, although several months were spent studying Titian in Venice and Correggio at Parma. The year following his return to London in 1775 he bought Francis Cotes's fine house in Cavendish square. The months abroad had matured his art and a new gracefulness appears in portraits such as "Mrs Carwardine and Son" (1775, Lord Hillingdon collection); the bland, handsome "Earl Grey" (1784, Eton college); and the conscious elegance of the large full-length "Sir Christopher and Lady Sykes" (1786, Sledmere, Yorkshire). His best years are 1775–85, although the seeds of decline were sown at the time of his meeting nith Emma Hart (later Lady Hamilton) about 1781–82 and his acquaintance with the poet William Hayley. Lady Hamilton exercised a morbid fascination over Romney and she became for him a means of escape into an imaginary, ideal world. His "divine Emma" appears in over 50 paintings, in the roles of Cassandra. Circe. Calypso, a Bacchante, a Magdalene or Joan of Arc. John Flaxman, his friend in later years. attests that Romney disliked the drudgery of face painting and longed to do ideal subjects, but little remains of these except a large collection of drawings for ambitious history pieces (mainly in the Fitzwilliam museum, Cambridge) and a few unattractive compositions for John Boydell's Shakespeare gallery of 1787 onward.

Although Romney's fashionable portraits fell off in the last years of his career, his own unhappiness had given him an insight into a mature character, and the "Warren Hastings" (1795, former India office) is a grave and noble work. For Romney it was a swan song. In 1797 he moved to a large studio in Hampstead with the fine collection of casts from the antique which Flaxman had gathered for him in Italy. But he soon retired to Kendal, where he died on Nov. 15, 1802.

ROMNEY, HENRY SIDNEY, EARL OF (1641–1704), was born in Paris in 1641. In 1672 he was sent on a mission of congratulations to Louis XIV, and in 1677 became master of the robes to Charles II. He entered parliament in 1679, and became a close political ally of his nephew Sunderland. Sidney mas sent in 1679 on a mission to urge William of Orange to visit England, a task he discharged nhile acting as the official envoy of Charles II at The Hague. Recalled in 1682, he was again sent to Holland in 1685. He returned to England in 1688, and sought support for the prince of Orange in the event of his landing. He was allowed to leave England on giving his word not to visit The Hague, but he broke his promise and conveyed to William a duplicate of the invitation addressed to him by the English nobility, together with intelligence of affairs of state. He landed with William at Torbay, and received substantial rewards for his undoubted services. including the titles of Baron Milton and Viscount Sidney of Sheppey. William made him secretary of state in 1690. and in 1692, lord-lieutenant of Ireland. His inability to cope with the difficulties of this position led to his recall in the next year, when he became master-general of the ordnance. He was created earl of Romney in May 1694. On Anne's accession he was dismissed from his various offices. He died on April 8, 1704.

ROMNEY (Kent. England): *see* NEW ROMNEY.

ROMSEY, a market tonn and municipal borough in the Winchester parliamentary division of Hampshire, Eng., 9 mi. N.W of Southampton by road. Pop. (1951) 6,278. Area 1.9 sq.mi. The town received its first charter from James I in 1607. the year he visited Broadlands, which is situated on the outskirts of the town and is the home of Earl Mountbatten, the town's high steward. This house. though originally a Tudor building, was largely built in the 18th century by the 1st viscount Palmerston and has been held by the Temple and Ashley families. Romsey received a second charter from William III in 1698, and its ancient buildings have considerable character and beauty. Romsey abbey (which replaces a wooden original) was built in the 12th century and owns many treasures including a 14th-century illuminated Romsey psalter. King John's hunting lodge, near the abbey, dates from 1206 and is registered as an ancient monument; it is now used as a museum. Embley house (2 mi. W.), the home of Florence Nightingale, is now a college. Situated on the edge of the New forest, Romsey is only 20 mi. from the sea coast at Milford-on-Sea and is surrounded by beautiful country including the valley of the Test, beloved of Izaac Walton. The town's chief industries are brewing and market gardening but in the 16th century it was famous for the making of a cloth called shalloon.

ROMUALD, SAINT (c. 950–1027), founder of the Camaldolese Benedictines (Hermits), was born at Ravenna of the ducal family (Onesti). After witnessing his father kill a relative in a duel, he retired to the monastery of St. Apollinaris near Ravenna and later took the habit. Romuald's life throughout was marked by great austerity. In 975 he went to Catalonia, and seems to have been greatly impressed by the vigorous life in the monasteries. In 996 he was appointed abbot of St. Apollinaris, but left after three years and for the next 30 years wandered through Tuscany, Romagna and southern France reforming old or establishing new monasteries. The most important was Camaldoli. near Arezzo. in Tuscany, which he founded about 1012 and which became the mother house of the new order. The order combined cenobitic and eremitical elements. though Romuald's own aim seems to have been only for a more austere following of the Benedictine rule than currently obtained. He attempted to go to Hungary, but was prevented by illness; however, a monastery founded there for him and St. Bruno of Querfurt, by Otto III, was important for missions to the Slavs and Prussians. Romuald stayed for many years in solitude on Mt. Sitria, but in 1026 returned to Val di Castro, where he died, alone in his cell, on June 19, 1027. His chief feast is Feb. 7, since on that date in 1481 his relics were taken to Fabriano. *See* also CAMALDULIANS.

See H Thurston and D. Attwater (eds.), *Butler's Lives of the Saints,* p. *266* ff (1957). (Fs. P. C.)

ROMULUS, together with Remus, the legendary founder of Rome. Traditionally they were the sons of Rhea Silvia (Ilia), daughter of Numitor, king of Alba Longa. Numitor had been deposed by his younger brother Amulius and his daughter made a Vestal Virgin to prevent offspring contenders. When Rhea gave birth to tnins claiming Mars as their father, Amulius ordered them thrown into the Tiber. The trough in which they were placed came to ground at the site of the future Rome near the *Ficus Ruminalis,* a sacred fig tree of historical times. There a she-wolf and a woodpecker (both sacred to Mars (*q.v.; cf.* PICUS), suckled and fed them. Later they were found and brought up by the herdsman Faustulus and his wife Acca Larentia (*q.v.*). They became leaders of a band of adventurous youths and eventually, recognized as the grandsons of Numitor, they killed Amulius and restored their grandfather to the throne. Later they founded the city of Rome. Romulus surrounded the city uith a wall, but Remus in contempt jumped over it and Romulus slew him nith the uords "thus perish any other who leaps over my malls." Thus Romulus ruled supreme and the city was named for him. Romulus added to the population of the new city by offering asylum to fugitives and exiles. Because of a shortage of women, he invited the neighbouring Sabines to a festival and carried off their women. The intermarriage of Roman and Sabine was followed, after some hostility, with a political union under Romulus and Titus Tatius (*q.v.*), king of the Sabines. Titus Tatius' early death left Romulus in complete control. After a long rule he one day mysteriously disappeared in a storm. He was believed to have been changed into a god and was worshipped as Quirinus (*q.v.*) by the Roman people.

This legend, probably originating in the 4th century B.C. and set down in coherent form by the early annalists at the end of the 3rd century B.C., is of course artificial and shows a strong Greek influence. Rationalizations of various aspects of the story have been made in both ancient and modern times. The theme of

exposed children is a familiar one in Greek legend and literature. The name Romulus (and perhaps also Remus) is derived from Rome and is consonant with the Greek practice of seeking an eponymous hero who of course is inevitably deified. The story is well adapted to the topography of ancient Rome, but the places mentioned are clearly introduced to account for sacred areas of historical time. The *ficus ruminalis* ("the suckling fig"?) and the nearby Lupercal ("wolf's den"?) may have themselves suggested the suckling by the she-wolf. Livy gives an interesting rationalizing version: that Larentia, because of her loose morals, had got the nickname "she-wolf" among the shepherds. The story of the asylum was clearly invented to explain the name of the depression between the Arx and the Capitol. The rape of the Sabine women explains the custom of simulated capture in the Roman marriage ceremony as well as the historical admixture of Sabine elements in the Roman population.

The importance of Mars in the legend is an obvious attempt of Romans to connect their origins with this principal Italian deity, and it is perhaps no coincidence that Romulus is apotheosized into Quirinus, a god not unrelated to Mars. On earth Romulus, a warlike king, was founder of many of the Roman military and political institutions.

BIBLIOGRAPHY.—J. Carter in Roscher's *Lexikon,* s.v.; E. Pais, *Ancient Legends of Roman History (1906)*; Hugh Last in *Cambridge Ancient History,* vol. vii, pp. 363 ff., *370* ff. (R. B. LD.)

ROMULUS AUGUSTULUS, last Roman emperor of the West (Oct. 31, A.D. 475, to Sept. 4, 476), was elevated to the throne by his father, Orestes, "master of the soldiery" (Jordanes), who drove the emperor Julius (Nepos) to Dalmatia in 475.

The reins of power were held for him by his father, and there is no event of his reign worthy of record except the conclusion of peace with Gaiseric the Vandal. Shortly after his elevation to the throne, barbarian mercenaries presented to Romulus's father a demand that they be allotted one-third of the lands of all Italy. Orestes refused: the mercenaries revolted under Odoacer (Aug. 23, 476). Orestes was defeated and beheaded and the Western empire came to an end. Romulus retired to the villa built by Lucullus four centuries before, near Naples. There he died at a date unknown.

RONALDSHAY, LAWRENCE JOHN LUMLEY DUNDAS, EARL OF (1876–1961). British administrator. and a leading authority on India. was born on June 11, 1876. the eldest surviving son of the 1st marquess of Zetland, and was educated at Harrow and Trinity college, Cambridge. From 1898 to 1907 he traveled extensively in Ceylon, India. Persia, Asiatic Turkey. Central Asia. Siberia. Japan. China and Burma. In 1900 he was appointed aide-de-camp to the staff of. the viceroy. Lord Curzon. in India. He sat in the house of commons as Conservative member for the Hornsey division from 1907 to 1916. He was a member of the royal commission on the public services in India. 1912–14. and governor of Bengal, 1916–22. He succeeded to the marquessate of Zetland in 1929. Ronaldshay was secretary of state for India. 1935–40, and, in addition. for Burma, 1937–40. He died on Feb. 6. 1961, at Richmond, Yorkshire.

Lord Ronaldshay published several books about India and the east, notably the trilogy, *Lands of the Thunderbolt* (1923). *India: a Bird's Eye View* (1924) and *The Heart of Aryavarta* (1925). He also wrote *The Life of Lord Curzon,* three volumes (1927–28); *Lord Cromer* (1932); and *Essayez,* a volume of memoirs (1957).

RONCESVALLES (Fr. RONCEVAUX), a village of northern Spain, in the province of Navarre; situated among the Pyrenees within five miles from the French frontier. Pop. (1950) 106. Roncesvalles is famous in history and legend for the defeat of Charlemagne and the death of Roland in 778. The battle is said to have been fought in the valley known as Valcarlos.

RONDA, a town of southern Spain, in the province of Málaga; on the river Guadiaro. Pop. (mun., 1950) 30,653. Ronda is nearly surrounded by the Guadiaro or Guadalevin. which flows through an abrupt chasm. There is trade in leather, saddlery, horses, soap. flour, chocolate. wine and hats. Remains of an aqueduct and theatre. about 7 mi. N. of Ronda, are supposed to represent the Acinipo or Arunda of ancient geographers. Ronda gives its name to the Sierra or Serrania de Ronda. one of the main sections of the coast mountains.

RONDEAU (Old French, RONDEL), the general name in French for verse forms which develop from the *rondet de carole,* originally evolved as an accompaniment for the *ronde,* a round dance with soloist and chorus and, sometimes, a viol player. A few *rondets* are found incorporated in 13th-century romances *(Le Châtelain de Coucy, Cleomadès)*; they closely resemble the early rondels of Adam de la Halle (first to use the name *rondel)* and Guillaume d'Amiens who wrote the following *(AB aA abAB,* capitals indicating repeated lines, printed in italics below):

Hareu! commant m'i maintendrai
Qu'Amors ne m'i laissent durer?

Apansez sui que j'en ferai;
Hareu! commant m'i maintendrai?

A ma dame consoil prendrai
Que bien me le savra doner.
Hareu! commant m'i maintendrai
Qu'Amors ne m'i laissent durer?

This type of *rondel* (identical in form with the 15th-century *triolet),* treated as a literary form governed by rules, is one of three types. composed however in decasyllabics instead of octosyllabics, admitted by Eustache Deschamps (*q.v.*) in 'his *Art de Dictier* (1392) and there called the *rondel sangle* (simple). The second type, apparently peculiar to the 14th century, is of 13 lines (A^1BA^2 abA^1B $abaA^1BA^2$ or AB^1B^2 $abAB^1$ $abbAB^1B^2$, numbered capitals indicate repeated lines which rhyme). The third type, the *rondel double,* is of 16 lines ($A^1B^1A^2B^2$ abA^1B^1 $ababA^1B^1A^2B^2$ or $A^1B^1B^2A^2$ abB^2A^2 $abbaA^1B^1B^2A^2$). Christine de Pisan (*c.* 1363–c. 1430) introduces up to eight lines in the first strophe. curtails the refrain, repeating only one or two lines throughout. and sometimes uses lines of unequal length. Rondeaux with strophes of more than four lines becoming known as *rondeaux doubles;* those having *16* lines (Desportes' *rondel double*) are renamed *rondeaux quatrains,* of which this well-known example, in its full form, by Charles d'Orléans (1391–1465) is an excellent specimen:

Le temps a laissié son manteau
De vent, de froidure et de pluye,
Et s'est vestu de brouderie,
De souleil luisant, cler et beau.

Il n'y a beste, ne oyseau,
Qu'en son jargon ne chante ou crie:
Le temps [a laissié son manteau
De vent, de froidure et de pluye.]

Rivière, fontaine et ruisseau
Portent, en livree jolie,
Gouttes d'argent d'orfavrerie,
Chascun s'abille de nouveau:
Le temps la laissié son manteau
De vent, de froidure et de pluye,
Et s'est vestu de brouderie,
De souleil luisant, cler et beau.]

Copyists being content, as in the manuscript of the above poem, to give only the first two or three words of a refrain (the *rentrement),* they seem to have prompted a reduction of that element, the substitution of two *rentrements* for six refrain lines to produce a 12-line rondeau from the *rondeau quatrain* (a new *rondeau* simple abandoned in the 16th century), or of two *rentrements* for the eight refrain lines of a 21-line type (*aabba aabAAB aabbaAABBA*) to create the 15-line rondeau (*aabba aabR aabbaR*) which became the standard form in the 16th century: good examples are Clément Marot's "Xu bon vieulx temps" *(see* L. E. Kastner in *Bibliography).* The 17th-century *précieux* revived this form, neglected by the Pléiade.

Not until the 19th century did the rondeau, rejected by the classical school. reappear first in irregular form with Alfred de Musset (*ababa* for *aabba*), then in regular form with Théodore de Banville (*e.g.,* "Sa mère"), who also revived the *rondeau quatrain,* and with Maurice Rollinat (1853–1903) who composed more than a hundred.

In German. G. R. Weckherlin composed regular rondeaux (the form was called *Rundum* or *Ringelgedicht*), J. N. Götz and Johann Fischart, less regular ones.

Ex. 1 ***Gavotte en*** *Rondeau* (Rondeau en Couplets) from Bach's Sixth Violin Solo.

With the exception of Anthony Hamilton (1646–1720), who wrote in French (his "Mal-à-propos," quoted by Kastner, is a perfect imitation of Marot's manner). and of a set of rondeaux in the *Rolliad,* attributed by Edmund Gosse to Edward Burke's friend, F. Laurence, Englishmen had little success with either rondel or rondeau until the 19th century when they enjoyed a considerable vogue. Swinburne. in his *Century* of Roundels, made the shortened first-line refrain rhyme with the second line of the poem and suppressed the refrain after the second strophe to produce an 11-line poem (*abaR* bab *abaR*).

Regular rondels have been written by Robert Bridges, Austin Dobson, Gosse and W. E. Henley. The following, by Dobson, is an excellent example of the English rondel:

Love comes back to his vacant dwelling,—
The old, old Love that we knew of yore!
We see him stand by the open door,
With his great eyes sad, and his bosom swelling,
He makes as though in our arms repelling
He fain would lie as he lay before;—
Love comes back to his vacant &telling,—
The old, old Love that we knew of yore!
Ah! who shall help us from over-spelling
That sweet, forgotten, forbidden lore?
E'en as we doubt, in our hearts once more,
With a rush of tears to our eyelids welling,
Love comes back to his vacant dwelling,
The old, old Love that we knew of yore!

Crosbie Garstin's *On* Newlyn *Hill* is, structurally, a good example of the regular rondeau:

On Newlyn Hill the gorse is bright;
Upon the hedgerows left and right
Song-dizzy birds the Spring-time greet;
The bluebells weave a perfect sheet;
Primroses star the lanes' green night.

Across the Bay each moorland height
Glows golden in the evening light,
And Dusk walks violet-eyed and sweet
On Newlyn Hill.

A swarm of lights, pearl-soft and white,
A fairy-lamp-land exquisite,
Opens its star-eyes at the feet
Of hills where shore and wavelets meet;
Then dreams come, mystic, infinite,
On Newlyn Hill.

As Banville says, these verse forms are useless unless the refrain is reintroduced in a gay and natural way, appears inevitable and gives the reader a new point of view. Properly used, it knits the structure together and intensifies the emotional energy of the poem. The rondeau's greatest weakness lies, however, not in the refrain, but in the recurrent rhyme which must be used very skilfully to give an impression of grace, delicacy and rhythm.

See L. E. Kastner, *History of French Versification,* pp. 249–261 (1903); Gaston Raynaud's introduction to *Rondeaux et autres poésies du XVe siècle,* Société des Anciens Textes Français (1889).

(F. J. WE.)

RONDO, a musical form originally derived from the rondel in verse; as may be seen, long before the development of instrumental forms, in some of the chansons of Orlando di Lasso. The rondeau en couplets of Couperin and his contemporaries shows the same connection with verse. It consists of a single neatly rounded phrase alternating with several episodes (the *couplets*) without any important change of key. Example 1 (p. 523) shows Bach's handling of this early form.

The later rondo is an important member of the sonata forms (*q.v.*), chiefly found in finales; but rondo form sometimes occurs in slow movements. Example 2 (pp. 525–526) is not more elaborate than the adagio of Beethoven's Fourth Symphony. Philipp Emanuel Bach invented an extraordinary kind of rondo, not part of a sonata, but on a voluminous scale with wildly incoherent episodes and modulations.

Later Forms.—The later sonata style rondo forms may be divided into two main classes:

1. Sectional rondos (*i.e.,* with little or no development or transition between episodes and the main theme) are characteristic of Haydn, who, however, may run away with it in unexpected developments. The name rondo implies at least two episodes and a sectional rondo may have more. Beethoven in his early works shows the influence of Haydn in this type of rondo—the finales of sonatas, opp. 10, no. 3 and 14, no. 1 and 2, and the slow movements of the sonatas, opp. 2, no. 2 and 13 (*Pathétique*).

The sectional rondo last appears on a gigantic scale in the finale of Brahms' G minor pianoforte quartet, Opus 25. It lends itself, like the cognate idea of a dance with several trios to Schumann's pianoforte pieces and to some of his finales.

2. Rondos which are influenced by the form of a first movement (see SONATA FORMS). In the normal scheme for this, which is Mozart's favourite rondo form, the rondo theme (which may contain several clauses) is followed by a well-organized transition to the key of the first episode, which key is chosen as if for the complementary key of a first movement. The return to the rondo theme may be elaborate or abrupt, and the theme itself may be reduced to its first complete clause (but not to a mere fragment, without loss of the rondo effect). The second episode will be in a new key and may be followed by wide modulations, or itself be widely modulatory, or it may even be entirely a development of the previous material, as in the rondo of Beethoven's Sonata Opus 90. (example 2).

When the rondo theme returns again it is followed by a recapitulation of the first episode (perhaps preceded by the transitional passage suitably modified? in the tonic; after which the coda may contain a final return of the rondo theme. When the second episode is concentrated on development the only difference between the rondo and a first movement is the slender fact that the whole first theme returns immediately after the first episode. Yet the rondo style can be recognized from the outset by the tunelike character of the main theme, and also by the fact that, unlike the most tuneful openings of first movements. it comes to a definite close instead of swinging continuously into the transition passage.

A rondo with a development in its middle episode may return to the tonic with an immediate recapitulation of the first episode, omitting the expected second return of the main theme, thus: A, B (new key), A, C (development), B (tonic), A, coda (where A is the rondo theme and B and C the episodes). Mozart, Schubert and Brahms have a form, always worked on a very large scale, which consists only of A, B (new key), A, B (tonic), coda; where a certain amount of development is edged in apropos of the transition passage on its recapitulation. Only the style of the main theme can distinguish this from a first movement that omits its normal development section.

In the rondos of classical concertos (*q.v.*) the orchestra (especially in Mozart) finds its opportunity in a series of accessory themes announced as soon as the solo instrument has given out the rondo theme. These accessories are then held in reserve for the coda.

RONDÔNIA, a federal territory in the central-west region of Brazil, bounded north by Amazonas, east by Mato Grosso, west by Bolivia and south by Bolivia and Mato Grosso. Pop. (1950) 36.935; area 93.816 sq.mi. The territory, established in 1943 as Guaporé, was renamed Rondônia in 1956 after Marshal Candido Mariano Rondon, Brazil's famous explorer. The area was important during the Amazon rubber boom, but declined after the collapse of the industry. in 1912.

The Madeira-Mamoré railroad. operational between Pbrto Velho and Guajará Mirim, was built there in connection with the rubber industry. Rubber exports still provide the territory with a large part of its income. Brazil nuts are also an important export commodity. Mineral resources include diamonds, mercury, gold. bauxite, gypsum and quartz.

The population is composed largely of Indians and mestizos.

Pôrto Velho (1950 pop., 10,036) is the territorial capital, terminus of the Madeira-Mamoré railroad and entrepbt for the Bolivian trade.

River transportation on the Madeira, Mamoré, Guaporé (*qq.v.*) and their affluents is supplemented by air service from Pôrto Velho. Guajará and Principe da Beira. (J. L. TR.)

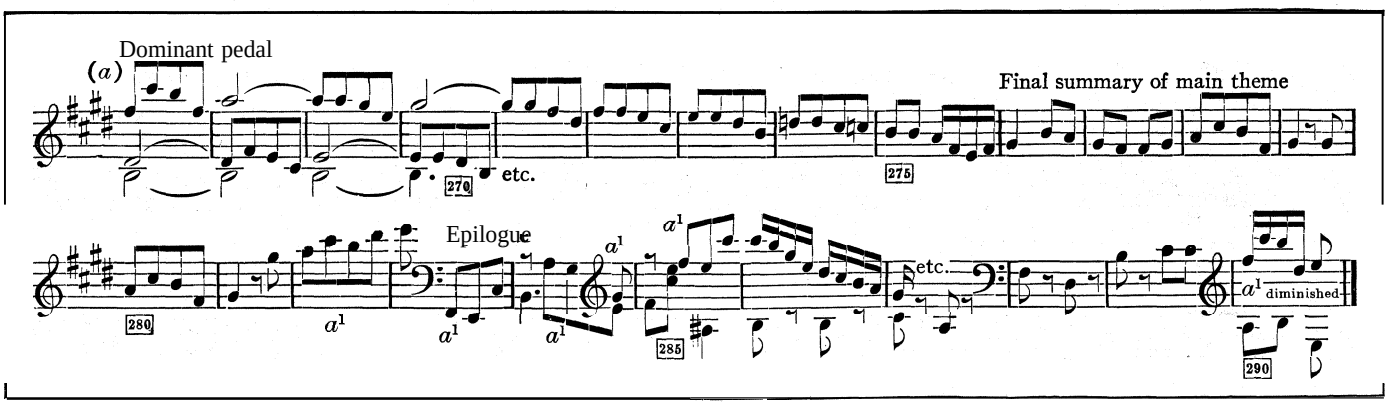
and indicate prevalent movement of accompaniment. Blank bars indicate prevalence of the same chord.



RONSARD, PIERRE DE (*1524–1585*), French poet, chief of the Pléiade *(see* FRENCH LITERATURE), was born Sept. 11 (?), 1524, at the Chbteau de la Possonnikre (Loir-et-Cher). His father Louis de Ronsard, a member of the Vendômois nobility, held a court appointment. Ronsard spent his youth in his native province, which was often to inspire his poetry. In 1536 his father placed him as page first to the dauphin, later to Prince Charles. He accompanied Princess Madeleine to Scotland after her marriage to James V in 1537. Returning in 1538, he was sent to Flanders, again to Scotland (where his ship was wrecked in the very last stage of the voyage) and to England. Early in 1540 he resumed his education at the Écurie Royale and from May to August accompanied the diplomat Lazare de Baïf on a mission to Haguenau. In the autumn. a severe illness followed by a long convalescence at la Possonnière left Ronsard partially deaf and forced him to abandon all thought of a military or diplomatic career. In 1543 he received the tonsure, which enabled him to qualify for ecclesiastical benefices without being ordained priest.

Encouraged by Jacques Peletier, Ronsard then turned to poetry, which, he tells us, had always attracted him. His father died in 1544 and Ronsard went to Paris. He studied with Antoine de Bai'f, the diplomat's son, under the famous Hellenist Jean Daurat (Dorat). Daurat's brilliant lectures at the Collkge de Coqueret inspired Ronsard and Baïf with a passion for Greek poetry and a desire to revolutionize French poetry. They were joined at Coqueret by others, including Belleau and Du Bellay, who in 1549 published the manifesto of the new *brigade* of poets, the *Défense et illustration de la langue française,* preaching judicious imitation of the ancients and Italians and cultivation of their genres. Ronsard's contributions to this manifesto are erudite, full of mythological lore and arrogantly addressed to a learned élite. His *Odes* (1550, 4 books) are inspired by Pindar and Horace; his *Amours* (1552), decasyllabic sonnets of great lyrical intensity celebrating a young court beauty, Cassandre Salviati, imitate the manner of Petrarch. They were set to music by Pierre Certon, Claude Goudimel, Marc-Xntoine Muret and Clément Janequin.

The *Odes* brought Ronsard fame and provoked the raillery and enmity of Mellin de Saint-Gelais, then the favourite court poet. He was defended by Princess Marguerite, sister of Henry II, and her chancelor Michel de L'Hôpital. Ronsard expressed his triumph, his gratitude and his lofty conception of poetry in the Pindaric *Ode* a *Michel de L'Hôpital* (1552). Then he turned to less pretentious models—the Greek Anthology, the Anacreontea, Catullus—and wrote simpler poems. The *Folastries* (1553), *Bocage* (1554). *Mélanges* (1554, title page 1555), the sonnets and odes written for new editions of the *Amours* and *Odes,* all show a lighter mood. Next Ronsard, in love with Marie, a simple country girl, published the *Continuation des amours* (1555) and the *Nouvelle Continuation* (1556), sonnets and songs no longer chastely Petrarchan but playful and epicurean in tone, with a charming background of country sights and sounds. The lofty *Hymnes* in alexandrines, (1555–56) show a return to the erudite manner. Modeled on Callimachus. Theocritus and others, they contain fine epic descriptions and religious or philosophical meditations. Many of Ronsard's hymns and odes are of an official or laudatory character. He was in the favour of Henry II, who made him counselor and almoner (1559). His collected *Oeuvres* appeared in 1560.

With the deaths of Henry II in 1559 and Francis II in 1560 France entered the dangerous period of the religious wars. Ronsard, intensely loyal and patriotic, used his pen in the cause of the monarchy, the established religion and national unity. His *Institution pour l'adolescence du Roi Charles IX* (1562) shows him unafraid to preach duty and morality to the young king. His polemical *Discours des misères de ce temps, Remonstrance au peuple de France* (1562) and *Réponse aux injures et calomnies* (1563) show him aware of the political and religious problems and critical of abuses in the church. Patriotic indignation, vigorous satire and invective against the Protestants alternate with passages of imaginative poetry or sincere self-revelation. Ronsard appears here, as alnays. versatile and original. In 1565 the *Elegies, mascarades et bergerie* shoa Ronsard producing official poems and verses for court entertainments. He enjoyed the friendship of Charles IX, a passable poet. and exchanged poems with him. He went on experimenting, correcting, adding new poems for his editions of 1567, 1571, 1572–73, 1578 and 1584. Ronsard's most ambitious work, his epic *La Franciade* (1572), tracing in decasyllabic couplets the founding of the French nation by the Trojan hero Francus, had little success and only four books appeared.

Ronsard had been undisputed "prince of poets and poet of princes" for many years but a new poet, Desportes, became the favourite of Henry III. Ronsard, stung into competition, published many new poems in the 1578 edition: *Diverses amours,* the exquisite sonnets and elegies *Sur la mort de Marie* and the *Sonnets pour Hélène (H.* de Surgères), a learned and virtuous lady-in-naiting of 20. Some are erudite or precious in the Italianate style that was again fashionable; others, harmonious, intimate and sincere, shom, a new maturity.

The poet's last years were tormented by arthritis and recurrent fevers; he usually avoided the court and lived at his priories of Croixval (Vendômois) and Saint-Cosme (near Tours). He gave his time to his religious duties, gardening and the tireless revision of his poems. In Paris he often stayed with Jean Galland at the Collège de Boncourt. Ronsard remained a poet to the last. The moving sonnets which he dictated to a monk a few hours before his death (*Derniers vers,* 1586), show his splendid gifts still unimpaired. He died at Saint-Cosme, Dec. 27–28, 1585.

Claude Binet in his *Life of Ronsard* (1586) gives an attractive picture of the poet—tall, athletic, distinguished, soldierly; in conversation charming, frank and sincere. "His life and his writings bore an indefinable stamp of nobility and in all his actions shone forth the characteristics of a true French gentleman." Ronsard was the greatest poet of the French Renaissance. He had a European reputation; Elizabeth I and Mary Stuart sent him gifts; he was imitated in England. He deeply influenced his contemporaries, Du Bartas. A. d'Aubigné, R. Garnier.

Ronsard held a noble conception, deriving from Pindar and Plato, of the poet's mission as the recipient of divine inspiration and the interpreter of higher truths to mankind; he believed that the poet should be morally worthy of this divine gift of genius. He also believed that the poet should work unceasingly to attain perfection. Innumerable variants (no poet has left more) testify eloquently to his labours. He had made a meticulous study of the

poetic technique of the Ancients and of the problems of French verse, which he enriched with new lyrical forms. He developed the alexandrine, making it capable of the finest effects. Though deaf. Ronsard greatly loved music and harmony was for him an essential quality of poetry; his sense of rhythm is extremely subtle. His theories appear in *Abrégé de l'art poétique* (1565) and in the prefaces to the *Franciade* (1572; 2nd pref. 1586; title page 1587). Ronsard's work is immensely varied in subject, form and style. Only Victor Hugo can be compared with him for fertility of invention. He writes freely of his own emotions; his best lyrics have the quality of universality. His chief fault, in modern eyes, is an over-lavish adornment of his poems with the Greek mythology he loved. He has fine descriptive powers and, like the Elizabethans, uses magnificent imagery to express his feeling for the majesty of the universe, the power of the cosmic forces, the beauty of Nature and her impact on man's emotions. He meditated on man: his diversity. his greatness, his ambitions, his passions, his destiny of inevitable deieat by decay and death. Death is a subject on which Ronsard always writes well, whether in an epicurean mood or in a Christian spirit.

In the 17th century the development of a new poetic ideal demanding clarity, refinement and restraint put Ronsard's richly imaged poetry out of fashion. Malherbe and Boileau condemned his poetry and he was forgotten until the 19th century, when the appreciation of Sainte-Beuve and others reinstated him. In the 20th century a vast amount of research once more revealed his greatness and his reputation continues to grow. The general public, however, appreciates him most as a simple lyric poet, the poet of nature, love and fleeting time.

RÖNTGEN (ROENTGEN), **WILHELM CONRAD** (1845–1923), German physicist, received the first Nobel prize for physics in 1901 for his discovery of X-rays. Born at Lennep on March 27, 1845, he received his early education in the Netherlands, and then went to study at Zurich. He then became assistant to August Kundt at Würzburg and afterward at Strasbourg, becoming *Privatdocent* (official but unpaid lecturer) at Strasbourg in 1874. He was next professor of mathematics and physics at Hohenheim (1875), extraordinary professor at Strasbourg (1876), ordinary professor of physics and director of the Physical institute at Giessen (1879) and professor at Wiirzburg (1885) and Munich (1900). It was at Wiirzburg in 1895 that he made the discovery for which his name is chiefly known, Rontgen or X-rays. While experimenting with a highly exhausted vacuum tube on the conduction of electricity through gases, he observed the fluorescence of a barium platinocyanide screen which happened to be lying near. Further investigation showed that this radiation had the power of passing through various substances which are opaque to ordinary light, and also of affecting a photographic plate. Its behaviour being curious in several respects, particularly in regard to reflection and refraction, he doubted whether it was to be looked upon as light or not, and put forward the hypothesis that it was due to longitudinal vibrations in the ether. not to transverse ones like ordinary light; in view of the uncertainty existing as to its nature, he called it X-rays. For this discovery he received the Rumford medal of the Royal society in 1896, jointly with Philip Lenard, who had already shown, as also had Heinrich Hertz, that a portion of the cathode rays could pass through a thin film of a metal such as aluminum. Rontgen also conducted researches in various other branches of physics, including elasticity, capillarity, the ratio of the specific heats of gases, the conduction of heat in crystals, the absorption of heat rays by different gases, piezoelectricity and the electromagnetic rotation of polarized light. He died at Munich on Feb. 10, 1923. *See* also X-RAYS.

See O. Glasser, *Dr.* W. C. *Rontgen* (1945).

ROOF is a cover or shelter of the uppermost part of a building. Its primary purpose is to protect against the rain. snow and other inclemencies of the weather. (This article deals primarily with the construction of roofs. The historical development of the design of residences will be found in HOUSE; the design of industrial structures is treated in INDUSTRIAL ARCHITECTURE. For the factors affecting the choice of a roof for a contemporary dwelling, *see* HOUSE DESIGN. *See* also ARCHITECTURE.)

The construction of the roof was one of man's earliest engineering accomplishments. With ingenuity and manual skill prehistoric peoples developed structural forms for shelter using crude tools and materials. The form and covering of roof structures continue to be important elements in the design of buildings. From the purely functional point of view the design of roofs includes many complex problems. The risk of fire must be considered in the choice of materials, as well as strength and weight. The manner in which the roof is supported may influence the use of the area that it covers. The quality of the material used for the roof system should be compatible with the standard of the building as a whole, the initial expense and the cost of maintenance. Standards of performance have become increasingly exacting. Comfort is no longer measured by degrees of temperature alone; it is affected by all of the factors that make up a climate within the structure. The roof, being the part of the house most exposed to the elements, is the main boundary between conflicting forces. Insulation against heat losses in the winter and heat gains in the summer should be provided. Insulation may be classified in two groups: those that resist the flow of heat, having low conductivity, and those that reflect radiant heat waves.

The presence of moisture in the air can result in condensation on the inner surface of the roof, or, if there is a difference in vapour pressures, the condensation can occur within the roof assembly. Both conditions can be corrected, but they should be prevented by giving consideration to possible effects of moisture in the choice of materials for the roof assembly.

The form of the roof is not influenced by problems of insulation or condensation, both of which may be present in all types. The form determines the selection of the nonstructural waterproof cover; horizontal or slightly inclined surfaces require a membrane type, and unit types of waterproof materials may be used on more inclined surfaces. The principal factors determining the form of the roof are structural or aesthetic. Roofs may have flat, pitched, vaulted, domical or warped surfaces. They may be supported on walls, columns, piers or they may extend directly to their foundations.

FORMS OF ROOFS

WOODEN ROOFS

The flat roof is the simplest. least distinguished of roof forms. It is a cover adaptable to rectilinear plan arrangements over large areas. When it is applied to dwellings a light frame construction is appropriate. This type of construction consists of beams, called joists, laid horizontally and supporting a structural cover of boarding on which a membrane type of roofing is applied. The joists have nominal widths of 2 in. and nominal depths ranging from 6 in. to 12 in, in multiples of 2 in. (Nominal dimensions refer to the sawn timber before being finished or sized.)

The joists span from wall to wall and are spaced 16 in. to 18 in. on centres. When the joists are used on long spans, 16 ft. to 18 ft., they require lateral support at intervals of 6 ft. to 8 ft. This lateral support in the form of X bracing is called bridging. Flat roofs of timber construction are found appropriate for industrial plants, but due to the risk of fire they are constructed by using heavy timber beams, spaced 6 ft. to 8 ft. on centres, supporting a plank roof cover. This type of roof is classified as a mill or slow burning construction. Although this type of framing introduces limitations in planning arrangements due to interior column supports (at intervals of 16 ft. to 18 ft.), it is found to be economical

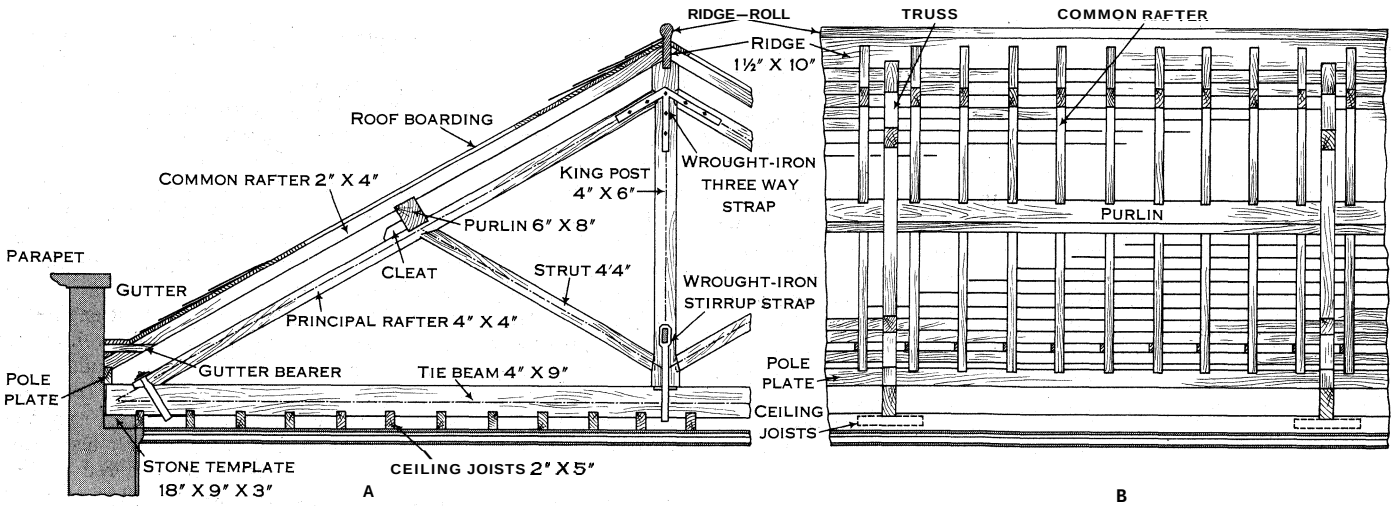

FIG. 1.—KING-POST ROOF TRUSS

and suitable for some industrial operations. Variations of the flat roof construction, in which the plane of the roof has a decided slope, are called lean-to and shed roofs. The supporting sloping beams are called rafters and have the same proportions and dimensions as the joists in the light frame construction. These roofs have the advantage of permitting the use of unit types of roof covering when the slope is sufficiently steep.

The widespread use of the double-sloped or gable (*q.v.*) roof is attributable to tradition, as well as a certain amount of standardization. The principal elements of this type of roof are pairs of rafters meeting at their highest points at a horizontal ridge beam (fig. 1 [A]) that acts as a tie and stiffener. The elements are resolved into a stable framework when the sloping surfaces are boarded in. The lower ends of the rafters rest on a plate which is securely attached to the supporting walls. The weight of the structure and its covering. in addition to the snow and wind forces, bring a considerable thrust to the walls. The magnitude of these thrusts varies with the slope of the rafters, becoming larger as the slopes are reduced. To avoid the thrusts on the walls, a horizontal tie may be introduced for each pair or each alternate pair of rafters. If the ceiling joists rest on the plate or are reasonably close to the elevation of the plate. they may be secured to the walls or rafters and act as ties. If it is impracticable for reasons of headroom (clear height) to place the ties at or near the elevation of the plate, it is possible to reduce the thrust by tying the rafters at an intermediate elevation above the plate with horizontal beams attached to pairs of rafters. These ties. known as collar beams, with pairs of rafters form A frames. This type of roof structure may be used for relatively large spans, ranging up to 26 ft.; without the need of intermediate supports for the rafters. When tie beams also serve as ceiling joists they may require intermediate supports on the longer spans. Support may be provided by means of a tie or hanger attached at mid-span of the rafter, or at the ridge. and secured to the ceiling joist.

When the roof span is very large (30 ft. or more), intermediate supports are required in order to avoid the necessity of excessively heavy rafters. These supports are provided by purlins which in turn are carried by roof trusses (see TRUSS). (See fig. 1 and 2.) The trusses are spaced at intervals of 10 ft. to 12 ft. and provide support for the purlins at the intersection of the axis lines of the struts and principal rafters. The vertical components of force in the struts are carried by the king post into the principal rafters at the intersection of the axis line at the peak. The resulting thrusts in the principal rafters are carried by the tie beam. The queen-post truss is similar in action to the king-post truss except at the connection of the straining beam and straining sill. Both of these early truss forms are assembled in a manner requiring skill in joinery (see fig. 3) and are inefficient even when done with great skill. A more acceptable truss form for long spans is the Fink type (fig. 7[D]) which may be built up of rafter stock and assembled with bolts. (See also CARPENTRY.)

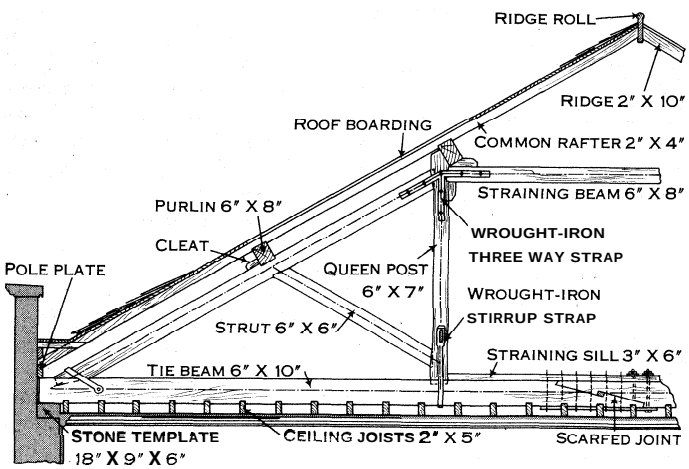

FIG. 2.— QUEEN-POST ROOF TRUSS

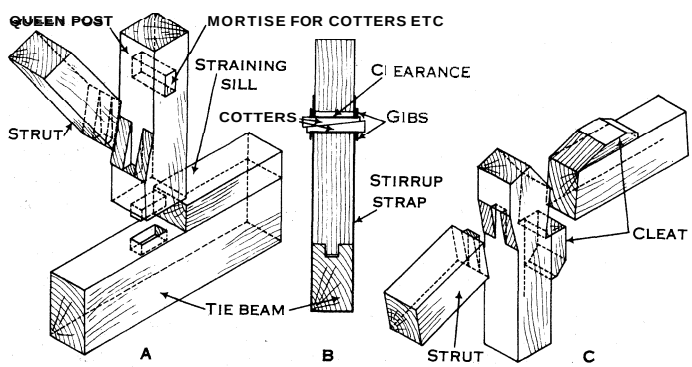

FIG. 3.— QUEEN-POST ASSEMBLY

(A) Detail of queen-post truss and (B) vertical section through queen post at base. (C) Detail of aueen-post truss at head. (Purlin and wrought-iron straps are omitted for clearness)

Open Timber Roofs.—When trusses or frames are exposed to view, a justification for less efficiency can be made in the interest of fine workmanship. The hammer-beam truss, which is essentially an A frame, was developed into a highly decorative element of roof construction displaying fine workmanship in joinery and carving by the builders of the middle ages. (See HAMMER-BEAM ROOF.)

The section and elevation (fig. 4) with the roof plan (fig. 5), show the construction of a hip roof in which the rafters slope upward from the plate to the high points along the hip rafter. The hip roof, having no gable ends, has the effect of making the building appear lower, and transmits the thrusts through the hip

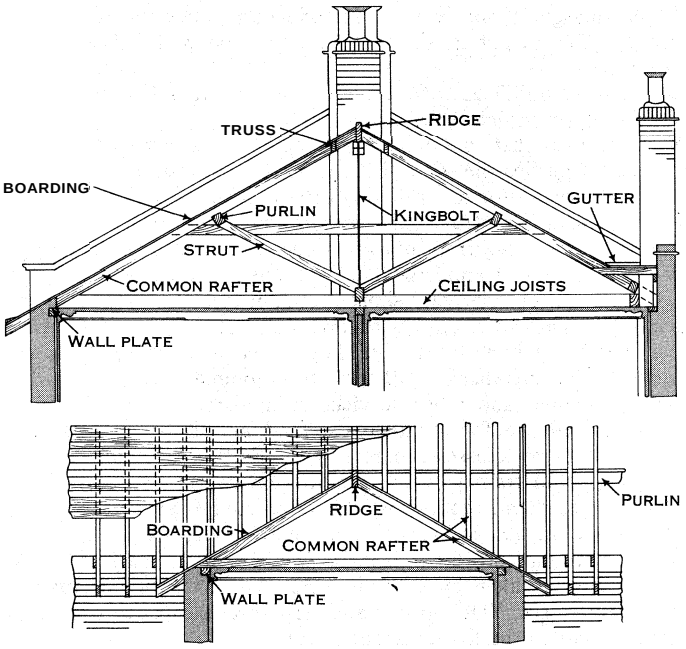

FIG. 4.— SECTION AND ELEVATION OF A ROOF FOR A DOMESTIC BUILDING

rafters to comers where the plates, acting as ties, can more readily resist outward forces.

The Mansard Roof.—The mansard roof (*q.v.*) (fig. 6), though rarely used in present-day construction, was once a common form in Europe and the U.S. Its form was primarily a device for providing additional usable area without the necessity of adding a full story. With the cornice line at the base of the upper floor, it gave the appearance of a lower building. Remnants of its influence in the U.S. survived in the practice of using shingles for the upper story of dwellings and clapboards for the lower story. The device of lowering the cornice line to the lower chord of deep trusses and introducing a strip of sloping roof at the exterior walls may well be due to the influence of the mansard roof. (See also GAMBREL **ROOF.**)

Long-Span Timber Roofs.—In the early years of the 20th century the use of timber trusses and frames was generally limited to spans of 50 ft. to 60 ft. This limitation was largely due to the difficulties in joining the various parts with any real assurance of developing the predicted strengths. together with uncertainties about the behaviour and strength of the timbers. The uncertainties of joining since have been reduced with the use of split ring connectors, which in effect have the advantages of larger diameter bolts without reducing the cross-sectional areas of the timbers appreciably.

By mid-20th century the elements of the trusses could be made up of narrow stock which permitted a more accurate selection. The elements are then assembled with ring connectors.

Long-span trusses of the bowstring type, using a laminated curve member, may be employed for spans up to 200 ft., while the Pratt, Howe, Warren and Fink trusses (fig. 7) are acceptable for spans of 100 ft. Frames can be assembled from laminations 1⅝ in. or less in thickness, which permits an accurate selection and arrangement of the laminates for high strengths. The improvements in glues have made the use of laminated arches and frames reliable for long-span structures. Arches and frames have been constructed for spans up to 100 ft.

Laminated frames have become increasingly acceptable for

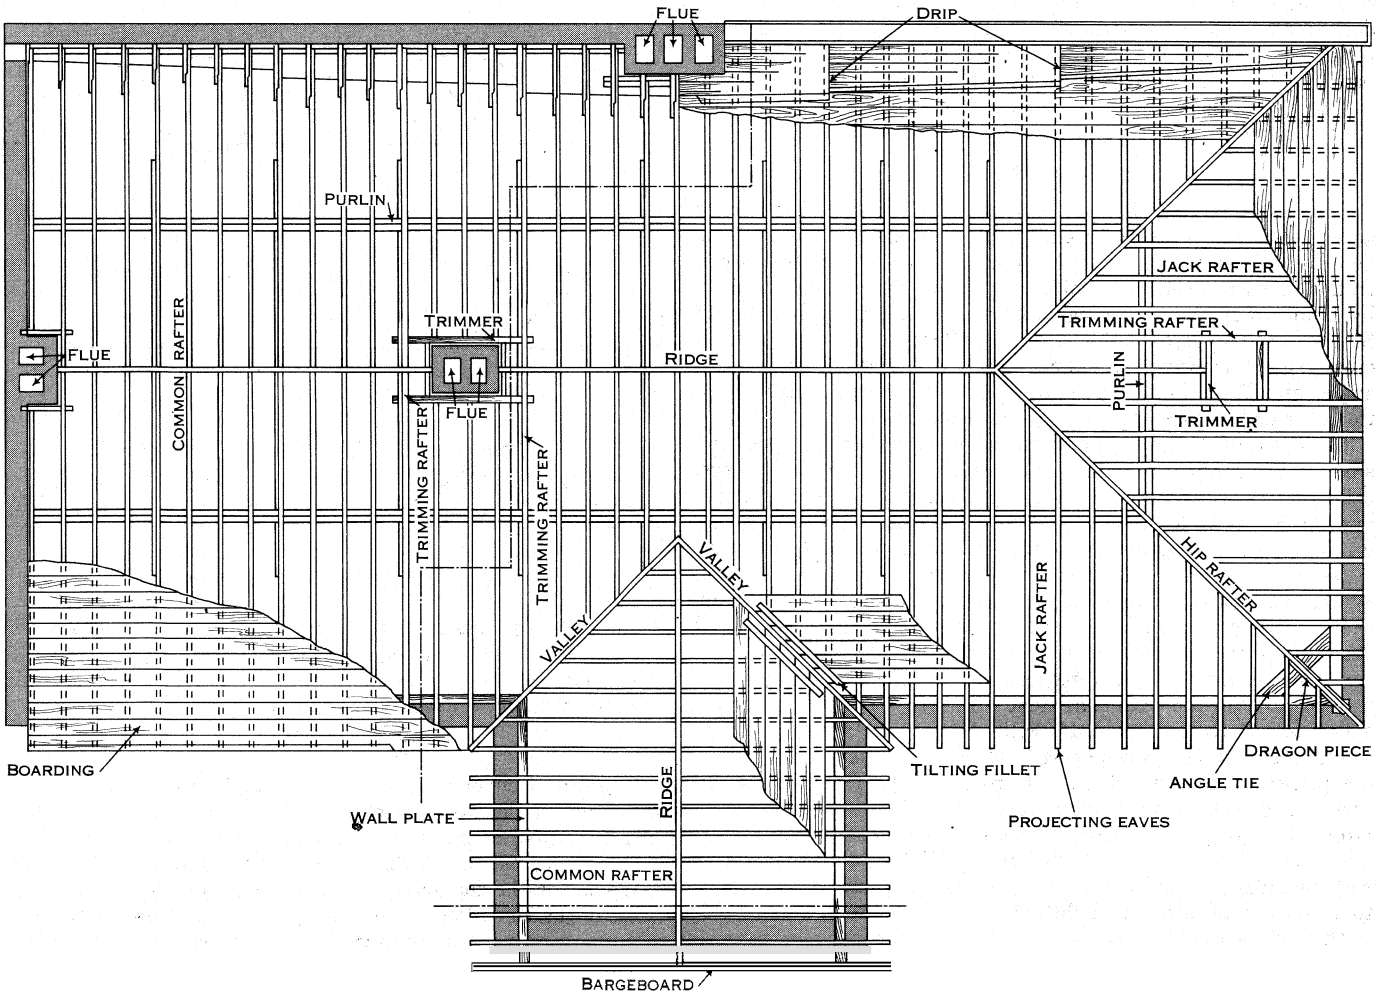

FIG. 5.— PLAN OF A ROOF SHOWING THE DETAILS OF CONSTRUCTION

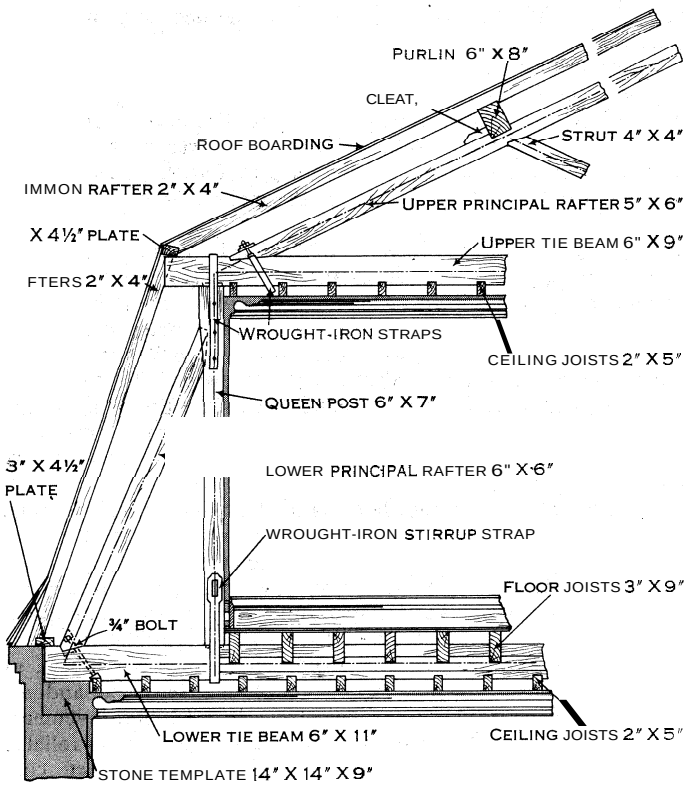

FIG. 6. — MANSARD ROOF TRUSS

spans of 40 to 60 ft. in buildings where it would be normally undesirable to expose the structure of the roof. Since the laminated frame is a continuous formed member. proportioned in its various parts to resist the forces to which it is subjected, without any visual indication of the joining, its appearance does not conflict with other interior finished surfaces.

STEEL ROOFS

Steel as a material for roof structures has many desirable characteristics. It is strong and stiff, it can be prefabricated in a shop and erected rapidly on the site. The manufacture of steel is controlled so as to produce a uniform quality. Steel permits joining by means of rivets or welding without appreciable loss in strength. Structural steel is available in straight lengths of many efficient cross-sectional forms, including plates, I beams, [channels, L angles and T sections. In addition to these there are lighter sections formed or assembled into joists and trusses.

For flat roofs requiring noncombustible materials the open-truss steel joist supporting a steel deck and protected by a plastered ceiling is appropriate. The steel joists are available in depths varying by multiples of 2 in. from 8 in. to 20 in. and may be spaced up to 3 ft. on centres on spans ranging from 16 ft. to 36 ft. Other types of structural roof covers or decks may include wood plank or various types of composite materials consisting of a cementing agent. usually portland cement, and a light aggregate having such desirable properties as insulation, resistance to fire, holding power for nails or fasteners and strength. The decking materials are usually precast into sizes consistent with their structural capacities and attached to their supports with clips or fasteners.

Industrial buildings requiring large areas of unobstructed space are usually built with steel roof trusses supporting purlins that carry the structural roof cover. For flat roofs the chord members (top and bottom) are parallel (see fig. 7) except for long spans where the top chord is sloped slightly from the mid-span to the ends in order to facilitate draining of the roof surface. The bottom chord may also be slightly higher at mid-span (cambered) so that the deflected truss does not have the appearance of sagging. The parallel chord trusses are usually designed with depths equal to $\frac{1}{10}$ to $\frac{1}{12}$ of their span and with lateral bracing for the top and bottom chords. For aesthetic as well as economic reasons a sloping margin of roof may be introduced at the outer walls, thus reducing the height of the wall and the apparent height of the building.

For some buildings with moderate spans pitched roofs may be desirable. In principle the structure of the roof using steel trusses is the same as that for timber construction. Thus with the introduction of purlins the span of the rafters or structural roof covering is reduced. For roofs of this type it is often desirable to use a noncombustible structural cover in the form of nailable precast slabs. spanning from purlin to purlin, to which the unit type of covering may be applied. The Fink truss is well adapted to the pitched roof for relatively short spans; it may be used economically for spans of about 40 ft. up to 100 ft. For long spans, a considerable volume of the building is taken by the trusses and their bracing members. Although this volume may be used for ducts, pipelines and other services in industrial plants, it has a more limited use for auditoriums, field houses or gymnasiums, where long-span trusses are required. For these buildings steel arches or rigid frames, which require less depth, are more desirable. Frames and arches may be fabricated from the available standard elements, in the form of plate angles and T sections. Both the frame and the arch introduce thrusts at the foundation which may be taken by tie rods concealed in the floor structure or by buttresses. The purlins and structural cover are similar in arrangement to the flat or pitched roof.

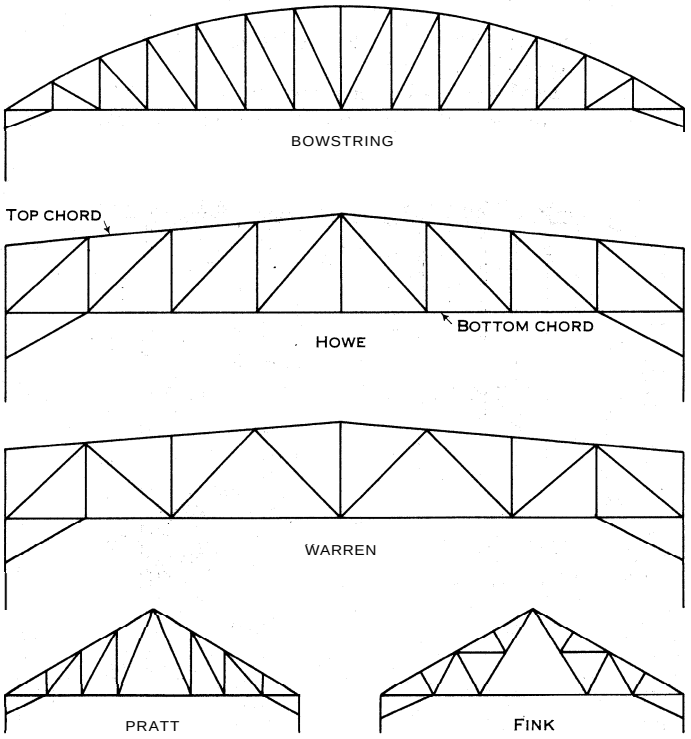

FIG. 7. — TYPES OF MODERN ROOF TRUSSES

Arches and frames are equally well adapted to short spans. Because of their greater strength and their ability to be incorporated with concrete, they are used for roof structures where the minimum of structural presence is desired.

CONCRETE ROOFS

The use of concrete as a structural material had its beginning in the era of the Roman empire. The cementing material was a mixture of hydrated lime and volcanic ash, known today as a slag or puzzolan cement. With this cementing material a mortar was made having the characteristics of portland cement mortar. The dome of the Pantheon (*q.v.*) in Rome, having a diameter of about 141 ft., was constructed during the 1st century using cement mortar and masonry. The masonry material was laid with large joints of cement mortar to the extent of approximating a concrete dome. True hydraulic cement, having the ability to set under

water, was made during the mid-18th century by an English engineer, during his researches in connection with the building of the third Eddystone lighthouse. The introduction of reinforcing steel and the advances in the technology of concrete since the mid-19th century have resulted in its increasing use as a structural material for roofs.

Concrete, being plastic, may be formed into various shapes having flat or curved surfaces. It has an inherent characteristic of continuity when reinforced with steel which eliminates most of the problems of joining and permits the construction of monolithic structures. At first reinforced concrete was used in forms that were modeled after masonry structures, but during the latter part of the 19th century the more familiar forms developed in wood and steel were followed. For roof structures, concrete is rarely used without reinforcing steel. An interesting example of concrete vaulting and domical roofing without metal reinforcement is the Roman Catholic cathedral at Westminster, London, a remarkable building designed by J. F. Bentley and constructed between 1895 and 1903.

Present-day practice tends toward the use of lighter roof structure using thin-shell forms reinforced with steel rods where tension may occur and relying on the capacities of the concrete to resist compression. Structures of thin-shell construction appeared in the 1930s in the form of semispherical domes having diameters up to 80 ft. with shell thicknesses of 3 in. The domes were supported on columns on their periphery.

In more recent years other forms have been built, including cylindrical or barrel shells, spanning in the direction of their long axis. They have cross sections in the form of segments of thin-walled cylinders with stiffening edge beams. Thus they are similar in appearance to vaults with edge beams at the springing line. When placed adjacent to one another and supported on columns along the edge beams, they can provide large areas of unobstructed space.

Unique roof structures using cables as the supports for the roof were constructed during the 1940s and 1950s. A stadium built in Montevideo. Urug., of this type is cylindrical with a diameter of 310 ft. The cables are arranged radially with outer ends attached to a circular ring at the top of the outer wall 85 ft. high; the inner ends are attached to a steel ring at the centre. The roof itself is of precast concrete slabs (2 in. thick) attached to the cables.

COVERING MATERIALS FOR ROOFS

Roof covers may be classified in two general groups depending upon the manner in which they seal off the entrance of water. One group consists of waterproof membrane, or built-up roofing; the other group of a unit type of waterproof material arranged in a manner so as to avoid direct passage of water through the joints. The membrane or built-up roofing is commonly applied to decks having slopes 2 in. or less per foot and single curved surfaces with varying slopes. The unit type is used on roofs having slopes of 6 in. or greater per foot.

For intermediate slopes, a wide selvage type of roll roofing may be used, or a built-up roof may be adapted. Built-up roofing is made up of several layers or plies of tarred felt, laid in coal-tar pitch so that one layer of felt is never in contact with another. Over the entire roof surface a uniform coating of pitch is poured and a covering of gravel or slag is sprinkled before the pitch has set. When the roof is to be used as a terrace or promenade, the built-up roofing is laid without gravel or slag, but with additional plies on which the tile or terrace flooring is set in a 1 in. mortar bed. Expansion joints filled with some elastic cement are usually installed in the tiled surface. Such roofs. either covered with tile, slag or gravel, are watertight, do not crack under extreme heat or cold and have become common for the better class of flat roof coverings. If adequately flashed at intersections with walls and parapets, they require a minimum of slope, sufficient only to drain the surface.

Corrugated Sheets. — Corrugated iron or steel is supplied either black, galvanized or with protective coatings. It is especially suited for the roofs of storage buildings and buildings of a temporary or semipermanent character. Being to a large extent self-supporting, it may have a specially designed roof framework of light construction. If, as is usually the case, the sheets are laid with the corrugations running with the slope of the roof, they can be fixed directly on purlins spaced at full or half lengths of the sheets according to the stiffness of the sheets. In pure air the zinc coating of the galvanized sheets is durable for many years, but in large cities and manufacturing towns its life is short unless protected by painting. In such districts it has been found that sheets manufactured with protective coatings applied on iron or steel are more serviceable. In such districts it has been found that plain sheets, well coated with paint, will last longer than those galvanized, for the latter are attacked by corrosive influences through minute flaws in the zinc coating developed in the process of corrugation, in transit or from some defect in the coating.

For roofing purposes the sheets are supplied in several thicknesses ranging from no. 16 to no. 22 standard wire gauge. No. 16 is for exceptionally strong work. No. 18 and no. 20 are used for standard work and no. 22 for temporary buildings. The sheets when laid should lap one full corrugation at their sides and from 3 in. to 6 in. at the ends. Riveting is the best method of connecting the sheets, although galvanized bolts, which are not as satisfactory, are frequently employed. The joints should be along the crowns of the corrugations to avoid leakage. Holes can be punched during the erection of the roof. For attachment to timber framework, galvanized screws or nails with domed washers are used. Fixing to a steel framework is effected by galvanized hook bolts which clip the purlins and pass through the sheet. Sheets formed with V crimps, spaced about 15 in. on centres with the portion between being flat, give a better effect in some positions than the $1\frac{1}{4}$ in. to $2\frac{1}{2}$ in. corrugated sheets.

Aluminum. — In addition to the surface-protected iron and steel corrugated sheets, there are available in many areas aluminum sheets and rolls. As a light material having insulation value this corrugated material is well adapted to general use. It should be applied to a structural roof cover in a manner similar to that used for laying corrugated iron and steel sheets, using aluminum nails with screw shanks.

Composition. — A widely accepted corrugated sheet manufactured under various trade names consists of a formed sheet using portland cement and asbestos fibre compressed under great pressure into a monolithic unlaminated sheet having good strength characteristic and durability. It resists corrosion, has a high resistance to acid fumes and to exposure to extreme weather conditions. It may be used as the structural cover for flat roofs and the complete cover for pitched roofs having slopes greater than 2 in. per foot. The distance between supports may be 54 in., and the method of fixing is similar to that used for metal corrugated sheets. The sheets are manufactured in 42 in. width, ranging in length from 3 ft. to 11 ft.

Zinc. — Zinc in sheets is a material largely used as a roof covering and. if care is taken to select metal of good quality, is strong and durable as well as light and relatively inexpensive. Zinc is stronger weight for weight than lead, slate, tile or glass, but weaker than copper, wrought iron or steel, although with the exception of the latter two it is not so durable under normal roofing conditions. It is not liable to easy breakages as are slates, tiles and glass. It is usually supplied in flat sheets, and may be had in corrugated form. When exposed to air a thin coating of oxide is formed on the surface which protects the metal beneath from further change and obviates the necessity of painting. In laying the sheets, the use of solder and nails should be avoided entirely except for fixing clips and tacks which do not interfere with the free expansion and contraction of the sheets. Zinc expands and contracts freely with changes in temperature, sheets laid with soldered seams or fixed with nails are liable to buckle, thus causing the zinc to become brittle and after repeated buckling to break away.

Zinc sheets are usually 7 ft. or 8 ft. long by 3 ft. wide, weighing from $11\frac{1}{2}$ oz. to 25 oz. per square foot. The thickness varies from 25 to 19 standard wire gauge. A dependable method of laying zinc on flat roofs is with the aid of wood rolls, about 2 in. by 2 in. in section, splayed at the sides, spaced 2 ft. 8 in. apart and fixed to

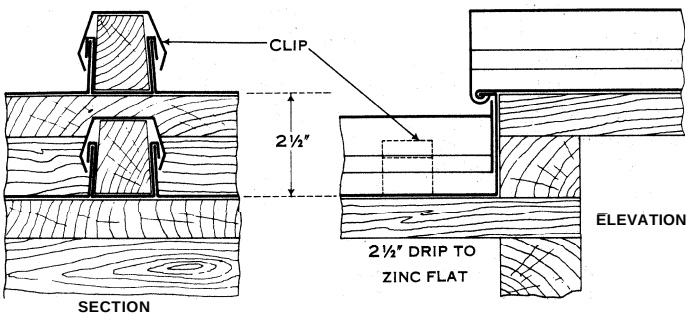

FIG. 8.—DETAILS OF ZINC FLATS

the roof boarding with zinc nails.

The sheets of zinc are laid between the rolls with sides bent up 1½ in. or 2 in. against them, and held firmly in position by clips of zinc attached to the rolls. A cap of the same metal is slipped over each roll; tacks about 3 in. long, which are soldered inside the cap, hook it under the same clips that anchor the sheet.

Drips of about 2½ in. are made in the slope at intervals of 6 ft. or 7 ft., *i.e.*, the length of the sheet, and care must be taken at these points to keep the work waterproof. The lower sheet is bent up to the face of the drip and under the projecting portion of the upper sheet, which is finished with a rolled edge to turn the water. The end of the roll has a specially folded cap which also finishes with a curved or beaded water check, and this, in conjunction with the saddle piece of the wood roll beneath, forms a weatherproof joint (fig. 8). The fall between the drips is usually about 1½ in. deep, but where necessary it may be less, the least permissible fall or slope being about 1 in 80. Felt laid beneath the zinc has the effect of lengthening the life of the roof and should always be used, as the edges of the boarding upon which it is laid are, when warped. apt to cut the sheets. It also forms a cushion protecting the zinc if there is traffic across the roof.

Lead.—Sheet lead forms a much heavier roof covering than other sheet metals, but it lasts a great deal longer and more easily withstands the attacks of impure air. Lead must be laid on a close boarding. for its great ductility prevents it from spanning even the smallest spaces without bending and giving away. This characteristic of the metal, however, conduces largely to its usefulness and enables it to be dressed and bossed into awkward corners without the necessity of jointing. The coefficient of expansion for lead is nearly as great as that for zinc and much higher than for iron; precautions to allow free expansion and contraction must be taken when laying the lead covering. The manner of laying is with rolls and drips as in the case of zinc, the details of the work differing somewhat to suit the character of the material (see fig. 9); the use of nails and solder should be avoided

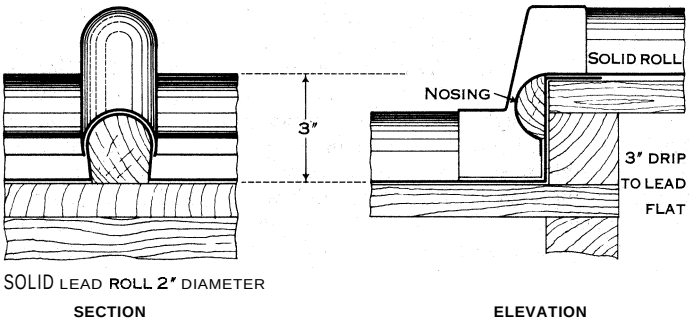

FIG. 9.—DETAILS OF LEAD FLATS

as far as possible. Contact with iron sets up corrosion in lead and when nails are necessary they should be copper; screws should be brass. Lead is supplied in rolls of 25 ft. to 35 ft. long and up to 7 ft. 6 in. wide. That in general use varies from $\frac{1}{14}$ in. to $\frac{1}{7}$ in. in thickness. The weights most suitable for employment in roofing are 7 or 8 lb. per square foot for flats and gutters, 6 lb. for ridges and hips and 5 lb. for flashings.

Copper.—As a roof cover, copper is lighter, stronger and more durable than either zinc or lead. It expands and contracts less than these metals, and although not so strong as wrought iron or steel it is much more durable. From a structural point of view these qualities enable it to be classed as the best available metal for roof covering, although its heat-conducting properties require it to be well insulated by layers of felt and other nonconducting materials placed beneath the metal. On exposure to the air, copper develops a feature of great beauty in the coating of green carbonate which forms upon its surface and protects it from further decomposition. Perhaps the chief disadvantage in the use of copper has been its first cost, but account must be taken of the almost imperishable nature of the metal and of the less substantial framework that its light weight requires for support. Copper roofing should be laid in a similar manner to zinc, with wood rolls at intervals of 2 ft. 4 in. It is, however, often laid with welted seams. The general stock sizes of sheets are from 4 ft. to 8 ft. long and 2 ft. to 3 ft. wide. The thickness almost invariably used is known as 24 standard wire gauge and weighs 16 oz. per square foot. Thinner material would suffice, but with the increased cost of rolling. little would be gained by adopting the thinner gauge.

Slate.—Slate is a strong and very impermeable material, it is easy to split into thin plates suitable to laying. and its cost is comparatively low: these qualities have made it the most generally used of all materials for roof covering for many years.

Slates are cut to many different sizes varying in length from 10 in. to 36 in, and in widths from 5 in. to 24 in. There are perhaps 30 or more recognized sizes, each distinguished by a different name. In common practice those generally used are "large ladies." 16 in. by 8 in.; "countesses," 20 in. by 10 in.; and "duchesses." 24 in. by 12 in. Generally speaking, the rule governing the use of the different sizes is that the steeper the pitch the smaller the slate, and vice versa. Buildings in very exposed positions naturally require steeply pitched roofs, if they are to be covered and rendered weathertight by small lapped units of covering. Slates may be fixed by nailing at the head or at about the middle. The latter method is the stronger. as the levering effect of the wind cannot attain so great a strength.

The nails used in slating are important and the durability of work depends on good selection. They should have large flat heads. The most satisfactory are those made of a composition of copper and zinc, but others of copper, zinc, galvanized iron and plain iron are used. Those of copper are most durable but are soft and expensive. Zinc nails are soft and not very durable; they will last for about 20 years. Iron nails even if galvanized are only employed in cheap and temporary work; they may be preserved by being heated and plunged in boiled linseed oil. The pitch of a roof intended for slating should not incline less than 25° from the horizontal; for smaller sizes 30° is a safer angle. Modern slate roofs are frequently laid with varying courses and varying thicknesses, usually with the heavier slate from ¾ in. to 1½ in. thick at the eaves. with thinner and smaller slate in the upper part of the roof. Marked variation of colour is often sought by combining green and purple slate, or fading and unfading slate.

Tile.—Tiles for roofing purposes are made from clay and baked in a kiln like bricks. The clay from which they are made is, however, of a specially tenacious nature and prepared with great care so as to obtain a strong and nonporous covering. Tiles are obtainable in many colours. some having beautiful effect when fixed and improve with age. They comprise tints from yellowish red, red and brown to dark blue. As with brick, the quality depends to a large extent upon the burning; underburned tiles are weak and porous and liable to early decay, while overburning, though improving durability, will cause warping and variations in colour. Variation in colour is now deliberately obtained, and artistic effects are secured by sand facing, artificial rustication and by burning to metallic surfaces. The usual shape is the "plain tile," but they are made in other shapes for lighter weight and ornamental effect. There are also several patented forms on the market for which the makers claim special advantages. The ordinary tiles are slightly curved in the direction of their length to enable them to lie closely at their lower edges. Some of them have small nibs at the head by which they are hung upon the battens without nails. Nail holes

are provided, and it is advisable to nail at least every fourth or fifth course. Others are made without the nibs, and are either fixed by nailing to the battens or boarding or are hung by means of oak kegs wedged in the holes to the battens, the kegs in the latter case acting in the same way as the mentioned nibs. Plain tiles are of rectangular form, the standard dimensions are 10½ in. long by 6½ in. wide. They are usually 3 in. thick and weigh about 25 lb. each. There are many forms of ornamental tiles, which are plain tiles having their tails cut to various shapes instead of molded square. Patented forms of tiles are also on the market, some of which possess considerable merit. "Pantiles" are suitable for temporary and inferior buildings, if laid dry and on flat slopes. but if laid upon board and felt and if bedded and pointed in mortar, pantiles may prove an excellent covering. They are laid on a different principle from plain tiles, merely overlapping each other at the edges. This necessitates bedding in mortar and pointing, inside and sometimes outside, with mortar or cement. This pointing plays an important part in keeping the interior of the building free from penetration of wind and water. Pantiles are generally made to measure 13½ in. long by 9½ in. wide and weighing from 5 lb. to 5½ lb. each. Molded on the head of each tile is a small projecting nib which serves to hang the tile to the batten or lath.

They are laid with a lap of 3½ in., 25 in. or 1½ in.. giving a gauge (and margin) of 10 in., 11 in. and 12 in., respectively. The side lap is generally 1½ in., leaving a width of 8 in. exposed face. There are many other forms based upon the shape of the pantile, some of which are patented and claim to have advantages that the original form does not possess. Among them are "corrugated tiles" of the ordinary shape or with angular flutes, the Italian pattern "double roll tiles" and "Foster's lock-wing tiles." Poole's bonding roll tiles are a development of the Italian pattern tile. French and Belgian tiles of the "Marseilles" pattern are economical and therefore popular for housing schemes and cheap building.

There are other forms of roof covers that were once in common use but no longer meet the requirements set up by regulations and ordinances of most communities. Because of the risk of fire. shingles of wood and other combustible materials have been replaced nith asphalt and asbestos cement units. These coverings are available in many colours and textures as individual units or strips and sheets. The quality of the materials has been improved and the techniques of applying them developed to such a point that they have practically replaced the older types of roof coverings. The colours and textures of the older roofing, such as wood, slate and tile have been reproduced with limited success in the newer materials, but for the most part their acceptance has been the result of their own inherent characteristics.

Insulation has become an integral part of the roof assembly of most buildings; it is available in types adapted to various conditions of the roof structures. For the purpose of reducing the conductivity of the roof assembly a low density material composed of vegetable fibres. cork, glass fibres or mineral wool are formed into "rigid" units, semirigid units (batts) or flexible strips. The insulation for flat roofs having precast units or concrete structural covers is usually in the form of a rigid insulation board on which the built-up roofing is applied. For other types of structural roof coverings, the insulation is usually a flexible type or it consists of batts applied below the structural roof cover. The reflective type of insulation in the form of a metallic foil mounted on strong paper backing is applied as an air space boundary below structural cover. The function of the vapour seal is to prevent the warm moist air of the interior from reaching the colder areas of the roof assembly and should therefore be located below the insulating material. The vapour seal is an asphalt membrane on sheathing paper or it may be an integral part of the paper surfaced with the reflective insulation.

ROOK (*Corvus frugilegus*), throughout a great part of Europe, the commonest of the crow tribe. Besides its gregarious habits, which are distinctive, the rook is distinguished from the rest of the *Corvidae* by losing at an early age the feathers from its face, leaving a bare, scabrous and greyish-white skin visible at some distance. In the rare cases in which these feathers persist, the rook may be known from the crow (*q.v.*) by the rich purple gloss of its black plumage, especially on the head and neck, as well as by its voice. The sexes are very similar. It nests in colonies on large trees (occasionally on buildings), making a strong nest of twigs and earth and using it year after year. The three to five green eggs, marked with grey and brown, are laid in early April. In Britain the rook is resident and stationary, but in most of Europe it is either a summer or winter visitor. Its food is very varied, but includes a high percentage of noxious insects The bird is thus of great value to the farmer.

ROON, ALBRECHT THEODOR EMIL, COUNT VON (1803–1879), Prussian general field-marshal, was born at Pleushagen, near Colberg, in Pomerania, on April 30, 1803. He entered the corps of cadets at Kulm in 1816, proceeded to the military school at Berlin, and in Jan. 1821 joined the 14th (3rd Pomeranian) regiment. In 1826 he was appointed an instructor in the Berlin cadet school, and in 1832 published his *Grundzüge der Erd-, Volker- und Staaten-Kunde* (3 vols.), gaining a great reputation. This was followed by *Anfangsgründe der Erdkunde* (1834), *Militärische Länderbeschreibung von Europa* (1837) and *Die iberische Halbinsel* (1839).

In 1832, he rejoined his regiment, and became alive to the inefficient state of the army; in 1842 he was promoted to be major and attached to the staff of the VII Corps. In 1848 he was appointed chief of the staff of the VIII. Army Corps, and during the disturbances of that year served under the Crown Prince William (afterwards emperor), distinguishing himself in the suppression of the insurrection at Baden. At that time he broached the subject of his schemes of army reform. In 1850 came the revelation of defective organization; next year Roon was made a full colonel and began active work as reorganizer.

Prince William became regent in 1857, and in 1859 he appointed Roon (now lieutenant-general) a member of a commission to report on military reorganization. Supported by Manteuffel and Moltke, Roon was able to get his plans to create an armed nation, to extend Scharnhorst's system and to adapt it to Prussia's altered circumstances generally adopted. To attain this he proposed a universal three years' service, and a reserve (*Landwehr*) for the defense of the country when the army was actively engaged. During the Italian War he was charged with the mobilization of a division. At the end of 1859, though the junior lieutenant-general in the army, he succeeded von Bonin as war minister, and two years later the ministry of marine was also entrusted to him. His proposals of army reorganization met with the bitterest opposition, and it was not until after long fighting against a hostile majority in the chambers that, with Bismarck's aid, he carried the day. Even the Danish campaign of 1864 did not wholly convince the country of the necessity of his measures, and it required the war with Austria of 1866 (when he was promoted general of infantry) to convert obstinate opposition into enthusiastic support. After that von Roon became the most popular man in Prussia, and his reforms were ultimately copied throughout continental Europe. His system, adopted after 1866 by the whole North German Confederation, produced its inevitable result in the war with France 1870–71. He was created a count, and in Dec. 1871, succeeded Bismarck as president of the Prussian ministry. Ill-health compelled him to resign in the following year. He was promoted field-marshal on Jan. 1, 1873, and died at Berlin on Feb. 23, 1879.

After his death his son published the valuable *Denkwürdigkeiten aus dem Leben des Generalfeldmarschalls Kriegsministers Grafen Roon* (2 vols., Breslau, 1892), and *Kriegsminister von Roon als Redner politisch und militärisch erläutert* (Breslau, 1895). His correspondence with his friend Professor Cl. Perthes, 1864–67, was also published at Breslau in 1895.

ROORKEE, a municipal town and tehsil in the Saharanpur district of Uttar Pradesh. India. Pop. (1951) of town. 23,239; of cantonment. 9,853. The town contains the workshops of the Ganges canal and is the site of Koorkee university which was originally founded in 1848 as the Thomason Civil Engineering college. The university was inaugurated in 1949 to provide for the teaching of all branches of engineering.

ROORKEE TEHSIL (area 306 sq.mi.) had a population in 1951 of 410,787. The cantonment is the headquarters of the Bengal engineer group, corps of engineers.

ROOSEVELT, FRANKLIN DELANO (1882–1945),

thirty-second President of the United States, was born at Hyde Park, N. Y., Jan. 30, 1882. His father, James Roosevelt a wealthy landowner, vice-president of the Delaware & Hudson Railroad, and Democratic politician, held several minor diplomatic offices under President Cleveland; his mother, Sara Delano, had sprung from a family of New York merchants and shippers. The upper Hudson Valley community in which Franklin D. Roosevelt was reared was devoted to sports, and he early learned to hunt to hounds, shoot, play polo and tennis, and manage an ice-boat. In summers at Campobello on the New Brunswick coast he made long cruises by catboat and yacht. European travel began when the boy was three and he learned to speak German and French fluently. Passing through Groton School, he entered Harvard in 1900 and on graduation went to the Columbia University Law School in 1904. In March, 1905, he married Anna Eleanor Roosevelt of New York, a sixth cousin, the wedding being attended by President Theodore Roosevelt, who was uncle of the bride and fifth cousin of the groom. Thereafter the couple frequently saw President Roosevelt in Washington or at Oyster Bay. In 1907 Franklin D. Roosevelt completed his course at Columbia, was admitted to the bar, and began practice in New York City. His father had meanwhile died. and he combined his legal work with frequent visits to Hyde Park where he took an important position in business, philanthropic and social activities.

Contact with Theodore Roosevelt inspired the young man with an interest in politics; the Democratic leaders in Dutchess County saw in him a promising recruit. In 1910 they gave him the nomination for State Senator. Though only one Democrat had been elected to that post since 1856, by virtue of a pleasing personality, a strenuous automobile campaign, and a schism in the Republican party, he obtained a narrow majority. In his first year in Albany he attained prominence by leading a small band of Democratic legislators who refused to accept the Tammany Hall candidate for election to the U. S. Senate, William F. Sheehan. Declaring Sheehan unfit for the place by his character and close association with predatory traction corporations, Roosevelt held his fellow-insurgents firm against the party caucus till a better candidate was substituted. The reputation for progressivism and independence which he thus obtained was extended by his championship of reform legislation. In 1911 he was prominent in the New York movement for nominating Woodrow Wilson to the Presidency, and in June, 1912, led an unofficial delegation of 150 men to the Democratic Convention in Baltimore, where he did effective work. Reelected that fall to the State Senate, he introduced some notable bills for protecting the farmers against unfair commission merchants and stimulating rural co-operation. The incoming Wilson Administration offered him a choice of several minor posts; he accepted the Assistant Secretaryship of the Navy.

Spending the years 1913–1921 in the Navy Department, Mr. Roosevelt was the principal lieutenant of Secretary Josephus Daniels in administering naval affairs. During 1913–1916 he was an unwearying advocate of greater naval preparedness, producing many speeches and articles; he set about converting useless navy yards into industrial plants for making naval supplies; and he and Mr. Daniels broke up an alleged combination of armour plate manufacturers. Before war broke out he had built up a small Naval Reserve on the basis of systematic civilian training. During the conflict he gave much attention to the submarine problem. He was one of the earliest and most enthusiastic advocates of the mine barrage between Norway and the Orkneys, refusing to heed American and British experts who pronounced it impossible; and he was also largely responsible for the 110-foot submarine chasers, of which about 400 were built. In the summer of 1918 he had charge of the inspection of American naval forces in European waters and did much to promote co-operation with the British Admiralty. After the armistice he took charge of demobilization in Europe and helped dispose of naval supplies stored there. He returned to the United States on the same ship with Wilson (February, 1919) and began speaking for the League of Nations. The following year he received the Democratic nomination for Vice President, made approximately a thousand speeches, and after the Democratic defeat returned to New York to practise law.

In August, 1921, Mr. Roosevelt was stricken with infantile paralysis and emerged with the muscles of his legs and lower abdomen paralyzed. By careful exercises and winter treatments at Warm Springs, Ga., he gradually recovered. Meanwhile he continued legal work, establishing the firm of Roosevelt & O'Connor in 1924, and kept up much of his business and civic activity. As head of the Boy Scouts Foundation in New York City he raised large sums, and at Warm Springs he established an important hydrotherapeutic centre on a non-profitmaking basis. In 1924 he placed Alfred E. Smith in nomination at the Democratic National Convention. After the Democratic defeat of that year he made efforts to bring the Bryan-McAdoo and Smith-Raskob factions together on a progressive basis. These failed, but he succeeded in softening much of the Southern opposition to Smith. In 1927 he urged acceptance of Smith and in 1928 nominated him again at the Houston Convention. At Smith's insistence, though protesting that two more years of private life were necessary to his health, he allowed himself to be drafted as Democratic candidate for governor of New York. Carrying the State by about 25,000 votes while Smith lost it by more than 100,000, he was inaugurated in January, 1929. He furnished a conciliatory administration, and in 1930 was reelected by the unprecedented plurality of 725,000, economic depression and the quarrel over prohibition cutting down the Republican vote. His principal achievements in his two terms as governor were partial settlement of the hydroelectric question on the basis of public development of the St. Lawrence waterpower; a strengthening of the Public Service Commission; and passage of various pieces of social welfare legislation, including an old-age pension law.

With the approach of the election of 1932, it became evident that Mr. Roosevelt was in a happy position to unite the discordant Democratic elements. At the Chicago Convention in July the rival candidates proved unable to unite, and on the third ballot a change by the California and Texas delegations gave Mr. Roosevelt the nomination. He at once began a campaign which took him into every section, travelling 12,500 miles and delivering some 200 speeches. Making effective use of demands for tariff reduction, farm relief, and greater attention to the "forgotten man," he enlisted the support of many influential Progressive Republicans. The economic depression caused an enormous defection of Republican voters, and in h'ovember Roosevelt received 472 electoral votes against 59 for Hoover, carrying all but six states with a popular plurality of over seven million.

Mr. Roosevelt took office, March 4, 1933, amid the throes of a crisis unprecedented in time of peace. Between his election and inauguration he had realized its imminence and had prepared the broad outlines of a programme. Details of his plans, in a fast-changing situation, had to be worked out in the heat of the moment. His first task, as the nation seemingly stood on the brink of an abyss, was to restore its morale. An eloquent inaugural address caught the popular imagination. It was at once followed by a proclamation closing banks, embargoing gold, and proving the government's power to cope with the financial crisis. From that point he moved swiftly toward three objectives already outlined: restoration of prosperity "by re-establishing the purchasing power of half the people"; a better balance between farm, factory, and trade; and reshaping the American economic system to eliminate abuses and excesses.

The 99-day session of the 73rd Congress which began March g, 1933, witnessed the most daring Presidential leadership in American history. Congress, dazed and planless, found itself subjected to a carefully timed bombardment of bills. Mr. Roosevelt sent a rapid succession of presidential messages, sufficiently spaced to avoid confusion; followed each message by a bill to implement it; and thus dealt with the agricultural crisis, banking crisis, relief crisis, and a dozen other problems with amazing speed. The fact that Congress was passing laws to order was never concealed; never before had the American Government so closely a p proached the British system of Ministerial leadership. In his first month Mr. Roosevelt used this unprecedented authority (1) to reopen banks; (2) to restore Federal credit by temporarily

abolishing some of the worst forms of waste; (3) to relieve distress by Federal grants, creation of the Civilian Conservation Corps, and stoppage of foreclosures; (4) to reform the handling of investments and securities; and (5) to begin a system of public works. These emergency measures were at once followed by four steps of the most far-reaching character: (1) a farm relief law; (2) creation of the Tennessee Valley Authority to plan the development of a 640,000-sq. mi. region; (3) passage of the National Recovery Act; and (4) the decision to abandon the gold standard and move toward revaluation of the dollar. His programme had a scope never before approached in time of peace. When Congress adjourned June 16. after heeding all his principal recommendations, the nation had been placed squarely upon a new path.

Mr. Roosevelt's administration then entered upon a different phase. His primary task for the next three years was to administer the legislation already obtained. Since his genius was for originating rather than executing, his record was uneven. The Agricultural Adjustment Administration under Secretary Henry A Wallace proved highly efficient. Its crop restriction plans, together with two great droughts, relieved the farmer of the incubus of crop surpluses and restored prices. When the Supreme Court struck down the A A. A., Mr. Roosevelt and Mr. Wallace had a substitute scheme ready for immediate operation. Mr. Roosevelt was less fortunate when he placed the National Recovery Administration under General Hugh Johnson, whose attempt to carry the code system into all industries and to resort to moral coercion brought the law into discredit. When the Supreme Court held the Recovery Act unconstitutional (May 27, 1935), Mr. Roosevelt expressed bitter disappointment and indicated a temporary disposition to seek an amendment to the Constitution conferring enlarged power in social and economic spheres upon Congress. But public opinion was chilly and he abandoned the idea. He made excellent appointments for administering the Tennessee Valley Authority (Dr. Arthur Morgan) and the Securities Commission (Mr. Joseph P. Kennedy); his choice of Mr. Harry Hopkins as principal agent in charge of relief was also sound, though he was not able to prevent costly bickering between Mr. Hopkins and Secretary Harold L. Ickes. His administration at first moved too rapidly for the civil service merit system, but the attacks on its alleged subserviency to spoilsmen were grossly exaggerated.

While busy with administration Mr. Roosevelt continued to demand new measures of social and economic reconstruction. One of the most important was the Gold Reserve Act of January 1934, under which he devalued the dollar to 59.06 cents in terms of its former gold parity. A measure close to Mr. Roosevelt's heart, the Utilities Act, designed to end abuses in the organization of huge holding companies, became law Aug. 26, 1935. It was essentially an attack upon one of the most complicated and mischievous forms of quasi-monopoly in the postwar period. Still more important uas the Social Security Act, passed in August 1935. Setting up two great Federal-State systems for unemployment compensation and contributory old-age insurance, it obviously required amendment in the light of future experience, but held great social possibilities. Meanwhile Mr. Roosevelt on June 19, 1935, urged legislation to effect a wider distribution of wealth, calling for two sets of measures: one (inheritance taxes, high income surtaxes, abolition of tax-exempt securities) to halt the accumulation and transmission of great fortunes; the other (graduated corporation income taxes, holding-company taxes, and taxes on unwieldy corporate surpluses) to limit the concentration of power in big business. A highly controversial tax law shortly embodied some of these proposals.

Mr. Roosevelt's views on national policy were never left in doubt. He was an earnest advocate of national planning; but by this he meant not the regimentation of society, but only a constant use of foresight in dealing with national problems. He was hostile to great accumulations of wealth; suspicious of efforts by large-scale business to manipulate the government; eager to give better treatment to the farmer as against urban industry, and to labour as against capital; a believer in constant experimentation in government; certain that a more co-operative, less individualistic society must come into existence. In a time when conflict of opinion was violent, his way of zigzagging between "right" and "left" perhaps gave him a maximum of public support. His method of pushing reform, as the Securities and Exchange Act and other laws showed, was to ask for maximum remedies, then accept modifications as experience showed them necessary.

The Democratic national convention renominated Mr. Roosevelt by acclamation June 27, 1936, and the balloting on Nov. 3 resulted in what nas probably the most sweeping victory in all American elections, a popular plurality of 11,069,785 votes, and an electoral vote of 523 to 8 for Alfred M. Landon, governor of Kansas.

A political precedent as old as the republic was broken July 18, 1940, when Mr Roosevelt was nominated by the Democrats for a third term. He was elected the following November 5 by 27,244,160 votes to 22,305,198 for Wendell L. Willkie. In 1944 he was elected to a fourth term. defeating Gov. Thomas E. Dewey of New York. Although Roosevelt's plurality was only slightly more than 3,000,000 votes, he won 432 electoral votes to Dewey's 99. Franklin D. Roosevelt died on April 12, 1945, at Warm Springs. Ga. (For events of the second and third Roosevelt administrations, see UNITED STATES.) (A. N.; X.)

ROOSEVELT, THEODORE (1858–1919), 26th president of the United States, was born in New York city on Oct. 27, 1858. His father, Theodore Roosevelt, was of a Dutch family conspicuous for centuries in the affairs of the city of his birth; his mother, Martha Bulloch, was of Scotch-Irish and Huguenot origin. Young Roosevelt's ill-health necessitated tutors and withheld him from the rough-and-tumble companionship of boys his own age; but deliberately and with great persistence, he built up his frail body. He was graduated from Harvard in 1880 and the same year married Alice Hathaway Lee, of Boston. At the Columbia Law school, and in the office of his uncle, Robert B. Roosevelt, he prepared himself for the bar. But law did not attract him. Roosevelt joined a local political club, and his associates there guided him (1881) through his initial campaign for the State legislature. Roosevelt was in the New York assembly three years; and in 1884 became his party's candidate for speaker. He became the acknowledged leader of a small but potent group of young men who were willing to fight both in the legislature and within the Republican party to keep corrupting influences in check. As chairman of the New York delegation to the Republican convention in Chicago in 1884, Roosevelt supported the candidacy of Sen. George F. Edmunds, and vigorously opposed the nomination of James G. Blaine. When Blaine was chosen Roosevelt refused to desert the party, contending that Blaine, having been fairly nominated, had a right to the support of all loyal Republicans. For three years Roosevelt lived thereafter a ranchman's life in the Dakota territory, and wrote biographies of Thomas H. Benton and Gouverneur Morris. A call from the Republicans in New York city to be their candidate for mayor brought Roosevelt back into politics in 1886; Abram S. Hewitt, the Democratic nominee, was elected however, third.

Immediately after the election, Roosevelt, whose first wife had died in Feb. 1884 after the birth of their daughter, married Edith Kermit Carow, a friend of his childhood, and thereafter made his home at Sagamore Hill, near Oyster Bay, L.I. In 1889, President Harrison appointed him a member of the U.S. Civil Service commission in Washington, and for six years he directed the battle against defenders of the spoils system. He left the Civil Service commission in 1895 to become president of the police board of New York city. Roosevelt built up the morale of the force by substituting a system of appointment and promotion by merit and by enforcing the laws regardless of pressure. Politicians of both parties opposed him.

The election of William McKinley to the presidency brought Roosevelt back to Washington as assistant secretary of the navy. He reorganized the system of rank and promotion among naval officers, and he adjusted the differences between the "line" and the "engineers." When the United States battleship Maine was blown up in Havana harbour on Feb. 15, 1898, Roosevelt sharpened his efforts to strengthen the navy.

On the outbreak of hostilities with Spain in April, Roosevelt resigned from the Navy Department and joined with his friend, Leonard Wood, a young army surgeon, to organize the 1st U.S. Volunteer Cavalry. Roosevelt succeeded to the command of the regiment on the promotion of Wood after the first fight. In the battle of San Juan hill Roosevelt personally led the cavalry division in the assault of the Spanish outpost known as Kettle Hill and from that position, at the head of his brigade, charged across an intervening valley and up the slopes of the ridge which was the enemy's main line of defence. The advance of the Rough Riders, as they were popularly known, lacked military form and was called "the school-boy charge" by officers of the regular army who led the orderly advance of the regiments of regular infantry which captured the San Juan blockhouse. But the impetuous rush of Roosevelt and his men—joined by the 1st and 10th cavalry, all dismounted—had a reckless and exultant sweep which contributed notably to breaking the Spanish spirit.

Governor of New **York.**—The Rough Riders were mustered out of service on Sept. 15, 1898. Two weeks later, the Republican party of New York State nominated Roosevelt as its candidate for governor. Thomas C. Platt, the Republican boss, who distrusted Roosevelt as a radical of "altruistic" views, reluctantly agreed to his nomination. Roosevelt was elected by a scant majority, and remained governor for two years.

He was able to secure (1899) from Platt's own legislature, against his opposition and that of the conservative press, the important Ford Franchise Act, taxing corporation franchises. Roosevelt's administration as governor marks the beginning of an effort on his part to secure the subservience to government and law of great business combinations. Platt decided to resist Roosevelt's desire to succeed himself as governor by lifting him into the honorable seclusion of the vice-presidency. Roosevelt and his Eastern friends laboured hard to prevent his nomination, but his friends in the West, out of a real enthusiasm, played into the hands of the man who was plotting their hero's political demise. The combination proved irresistible, McKinley refused to intervene and Roosevelt was nominated. He spoke a little ruefully of having "taken the veil," and made plans to beguile the dreary boredom of the vice-presidency with the study of law.

ROOSEVELT AS PRESIDENT

President McKinley was shot in Buffalo on Sept. 6, 1901, and died Sept. 14. On the same day Theodore Roosevelt took the oath as president of the United States.

Campaign Against Financial **Interests.**—On Feb. 18, 1902, Roosevelt threw what was in effect a bomb into the financial world when he announced through his attorney general, Philander C. Knox, that he had brought suit in behalf of the United States for the dissolution of a holding corporation known as the Northern Securities Company. The announcement caused consternation among such financiers as J. P. Morgan, Edward H. Harriman and James J. Hill. The holding company was a device designed by shrewd legal minds to evade the restrictions of the Sherman anti-Trust act of 1890, and was generally regarded as impregnable. In the Knight case (1895) involving the American Sugar Refining Company, the Supreme Court had, in fact, held that Congress was without constitutional power to forbid it. On April 9, 1903, however, the U.S. circuit court, sitting at St. Louis, ordered the dissolution of the Northern Securities Company; and on March 14, 1904, the Supreme Court affirmed the decree.

The anthracite coal strike in 1902 brought the menace of popular unrest to the surface. The miners, under the leadership of John Mitchell, were insistent in their demands; the operators led by J. P. Morgan and George F. Baer, president of the Philadelphia and Reading Railway, were obdurate. Roosevelt for the first time asserted the right of the President to act as representative of the public in an industrial dispute. The miners agreed to arbitrate, but the operators were indignant at the President's "interference" in what they regarded as their private concern Roosevelt saw clearly what the operators failed to see, that the labour problem had entered upon a new phase; that the growth of industry necessitated a new approach to the questions affecting it; that the public was in no mood to suffer for the inability of the operators to recognize the parity of human rights with the rights of property, and that in a winter of coal famine lay the possible beginnings of irreparable discontent. After a long-drawn struggle he succeeded in impressing these views upon the operators.

The initiation of the Government's suit against the Northern Securities Company marked the beginning of a conflict between Roosevelt and the large financial interests which continued unabated throughout his administration and for years thereafter, until the outbreak of the World War (1914) brought a shift of issues and a truce. The business leaders were convinced that the President was a destroyer, and was shaking the foundations of the social structure and undermining the institution of private property. His objection, in regard to corporations, as he frequently pointed out, was not to size but to wrongdoing. In swift succession, the President ordered suits brought against the United States Steel Corporation, the Standard Oil Company, the American Sugar Refining Company and other powerful combinations. Meanwhile, he inspired important legislation involving the regulation of railroads. The Elkins law (Feb. 19, 1903) forbade rebates; the Hepburn rate bill (June 29, 1906) granted the interstate commerce commission the right to fix railroad rates. A Pure Food bill, forbidding the manufacture, sale or transportation of adulterated foods, drugs, medicines and liquors, became law on June 30, 1906; the fbllowing day another act, providing for the inspection of stockyards and packing-houses, was signed by the President. An Employers' Liability act was adopted. A department of commerce and labour, including a bureau of corporations, was established by congressional action on Feb. 14, 1903. President Roosevelt strengthened his position in reference to the excesses and transgressions of corporations by setting himself with equal firmness against the violence of labour agitation. He noted that the hunger for special privilege was not limited to the ranks of capital. He was by nature sympathetic to the labouring man and scrupulously fair to his interests, but struck at him fearlessly when he thought he was wrong, linking two advocates of violence in the ranks of labour on one occasion with a law-dodging railroad magnate, as "undesirable citizens."

Conservation.—Early in his administration, with the purpose of breaking the strangle-hold of a small minority on the sources of wealth which should be open to the honest endeavours of all the people, the President—under the guidance of Gifford Pinchot—embraced the policy of conservation. The established theory in regard to the national resources was that the general prosperity of the country could best be advanced by the development of these resources by private capital, and upon this theory land was either given away or sold for a trifle. Under this policy, over wide areas, the timber-lands had been stripped bare with reckless waste; the control of the nation's water power had to a dangerous extent passed into private hands; and the public grazing lands and the wealth in minerals and oil in the public domain were bringing enormous dividends to a few, but no returns whatsoever to the people as a whole to whom these natural resources belonged.

Under Roosevelt's administration the area of the national forests was increased from 43 to 194 million acres, the water power resources of those areas were put under government control to prevent speculation and monopoly, and cattle-raisers grazing their herds on the reserves were forced to pay for what they got. In March 1907 Roosevelt created the Inland Waterways commission, and in May 1908 held a conference of State governors at the White House in behalf of conservation. As a result of this conference he appointed a national conservation commission to prepare an inventory, the first ever made for any nation, of all the natural resources within the territory of the United States. A joint Conservation Congress held in Dec. 1908 was followed by a North American Conservation conference in Feb. 1909. The movement for the reclamation of land either excessively or insufficiently watered was essentially a part of the effort in behalf of conservation. It received congressional sanction in the Reclamation Act (June 17, 1902) and achieved its most noteworthy result in the building of the Roosevelt dam in

Arizona, which, by impounding the waters of the Salt river, turned a desert into one of the most fertile farming districts in the world. No policy of Roosevelt's administration excited deeper public interest or sharper opposition than his efforts in behalf of conservation. His official acts and the influence of his speeches and messages led to the adoption by both citizens and government of a new theory regarding natural resources. It is that the Government, acting for the people who are the real owners of public property, shall permanently retain the fee in public lands, leaving their products to be developed by private capital under leases which are limited in their duration and which give the Government complete power to regulate the industrial operations of the lessees.

Re-election.—The popularity which Roosevelt enjoyed at the end of his first term found emphatic expression in the election of 1904. By the largest majority which, up to that time, had been accorded any candidate, Roosevelt was chosen to succeed himself in the White House, receiving 7,623,486 popular votes and 336 electoral votes, against 5,177,971 popular votes and 140 electoral votes cast for Alton B. Parker, the Democratic nominee.

Foreign **Policy.**—Roosevelt's warfare with the forces popularly symbolized as "Wall Street" was punctuated at intervals during his administration by actions in the realm of international relations which greatly stimulated national pride. The President was brilliantly assisted in his conduct of foreign affairs, first by John Hay and then by Elihu Root, but he was in reality his own Secretary of State. His policy in regard to the army and navy was a highly important part of his foreign policy. He believed in the virtue of being ready as a preventive of war, pointing out the results of unpreparedness in the preface to his first book, ***The*** *Hzstory of the Naval War of 1812* (1882), and urging an effective army and navy in many of his later writings. He increased greatly the general efficiency of the army. His promotion of officers for merit in defiance of the rules of seniority and his order directing officers to demonstrate their ability to ride go m. in three successive days caused some criticism, especially in the more conservative element in the army. Roosevelt's services as Assistant Secretary of the Navy contributed vitally to the distinguished success of the American fleets during the Spanish War. As President he sought with great persistence to build up the navy's power and to make it as effective as possible, giving younger and more progressive officers the prestige of his support in their struggles within the service. When in 1907 he sent the battleship fleet around the world—against the advice of experts in naval construction—he did so partly to call the attention of the great powers, notably Japan, to the fighting strength of the United States, and partly to dramatize the navy and its needs to the American people. The voyage was brilliantly successful.

The attitude of Roosevelt in foreign affairs as in domestic was frank, clear-cut and firm. He knew the involutions of international politics in the Old World as no American president before him had known them, and he countered and checked his subtle opponents in diplomacy with skill and relish. He was bold—startlingly bold at times—but never reckless, calculating costs in advance, saying unambiguously what he had to say and taking account of the human equation. His handling of the German emperor in the matter of Venezuela in 1902 was so firm and so courteous that the emperor became his devoted admirer even though he recalled the ambassador who had failed to warn him that the President meant what ne said. His action in regard to an old dispute with Great Britain over the boundary of Alaska was equally friendly and effective.

Swift and vigorous was his action (1903) in sending a cruiser to Panama immediately following its secession from Colombia. He was one of the first Americans to apprehend the part which the Pacific was destined to play, both commercially and politically, in world history. The long delay, moreover, during the Spanish War, in bringing one of the navy's greatest battleships, the *Oregon,* from the Pacific coast of the United States to the Atlantic, had convinced Roosevelt of the urgent need, if only for strategic reasons in the event of war, of a canal across the Isthmus of Panama. When, therefore, after years of fruitless negotiations, the opportunity came to him to acquire for the United States the right to build the canal, he acted promptly, convinced that to do otherwise was to invite a new and dangerous succession of postponements.

The charge was made that President Roosevelt had encouraged or even fomented the revolution in Panama; but no evidence has been produced to give the accusation the slightest support. Roosevelt's boast (1911) "I took Panama," must, moreover. be considered in conjunction with a phrase he added at the semi-jocose request of a French engineer who himself claimed the credit and the responsibility for the insurrection—"when Bunau-Varilla handed it to me on a silver platter." Roosevelt's leadership in the actual construction of the canal was of vital significance. When private engineers failed in the task, he appointed an army engineer, Col. George W. Goethals, as head of the Canal commission with autocratic powers. He broke the precedent which was supposed to prevent an American president from leaving the territory of the United States during his term of office in order to inspect the work and encourage the workers.

Roosevelt approved and eloquently defended the policy of national expansion adopted by the Government under President McKinley. Aside from the acquisition of the Canal Zone, however, he made no move to acquire further territory for the United States. To the surprise of Europe, he carried out the provisions of the American pledge not to annex Cuba, and launched that long-oppressed people as an independent republic under the protection of the United States but not under its Government. By assuming supervision of the finances of San Domingo he put an end to controversies in that unstable republic which threatened to disturb the peace of Europe.

Roosevelt's action in bringing about peace between Japan and Russia in 1905 added greatly to his prestige at home and abroad. Portions of Roosevelt's papers, published since his death, reveal the extent to which international politics on the Continent were involved in a struggle which appeared to be localized in the Orient and indicate that it was Roosevelt's intervention which prevented in 1904 and again in 1906, during the Algeciras Conference, the outbreak of the World War which actually came in 1914. The Nobel Prize committee recognized his services in ending the Russo-Japanese War by conferring upon him in 1906 its award for the promotion of international peace. In accepting the honour in an address at Christiania in 1910, he suggested the possibility of a League of Nations for the prevention of war. He was the first to send an international controversy for settlement to the International Court of Arbitration at The Hague and was instrumental in having the Second Hague Conference called. He was opposed, however, to peace treaties which promised more than human nature could be counted upon to fulfil, and had no patience with any policy remotely resembling "peace at any price."

His administration had a profound effect on the national prestige of his country. He found the Government of the United States, when he took up the reins, in the position among world powers of a new boy in school; he left it firmly established in the first rank, admired and feared, its favour sought after, its citizenship respected in the remotest corners of the globe.

Home Affairs.—In domestic affairs his influence was even more far-reaching. His success in drawing the leaders on both sides of the social and economic struggle back from the danger zone where extremes meet in violent disturbance was possible only because he had to an unprecedented degree the support of the public, regardless of party. His vigour, his courage, his abounding vitality, his lack of presidential pomposity, his familiarity with all manner of men, even his loudness of action or utterance, and his undisguised delight in driving the "band wagon," all endeared him to "plain folks." He entered into men's lives, kindled fires in them, impelled them to scorn ease and safety and rejoice to do the fine, the difficult thing. His power to inspire his followers to take a pride in their country and her welfare brought to his side hundreds of young men of ability, who asked no greater privilege than to serve under him in an enterprise which in its details was prosaic enough but which he had somehow invested

with the spirit of high adventure. The President gave them work to do in the Federal departments and in the island possessions. Their high quality impelled the British ambassador, James Bryce, an acute observer of governments, to remark to Roosevelt that he had "never in any country seen a more eager, high-minded and efficient set of public servants, men more useful and creditable to their country, than the men then doing the work of the American Government in Washington and in the field." Roosevelt had, indeed, the gift of stimulating men to raise themselves for the moment above the ordinary level of their abilities and their desires.

SCIENTIFIC EXPEDITIONS AND TRAVELS

In March, 1909, Roosevelt retired from the Presidency. He adhered to a pledge which he had made after his election in 1904 not to accept the nomination for the Presidency in 1908, and gave his support to the candidacy of William H. Taft, his Secretary of War. Taft was nominated and elected. On April 23, 1909, Roosevelt, accompanied by his son Kermit, sailed for Africa on a scientific expedition under the auspices of the Smithsonian Institution in Washington.

Africa.—Roosevelt entered Africa at Mombasa, and for ten months, moving slowly northward, he hunted big game and collected specimens. He was a keen naturalist, accepted by scientists in his field as a trustworthy observer who had added substantially to the study of American fauna. He had a memory which all who came in contact with him agreed was astonishing in its tenacity and accuracy; and for one who had given only the off-hours of a busy life to scientific study, his knowledge was wide and thorough; but he recognized its limitations and humbly yielded to instruction.

Roosevelt emerged from the wilderness at Gondokoro at the end of Feb. 1910. Nothing showed better the fascination which he exercised over the imaginations of men the world over than the interest which his reappearance created. An address at Khartum on orderly government created a mild stir, but another address, delivered before the students of the University of Cairo, denouncing the assassination by nationalists of the pro-British premier, Boutros Pasha, brought him threats of assassination.

Europe.—Roosevelt's journey northward was in the nature of a triumphal procession. An official at the Vatican precipitated an unpleasant situation by stipulating certain conditions for an interview with the Pope, but Roosevelt's refusal to permit any limitation on his freedom of action was direct and emphatic. In Paris he made a public address at the Sorbonne on "Citizenship in a Republic," in Berlin he spoke at the University on "The World Movement," and, at the emperor's side, reviewed the Imperial Guard, the first civilian who had ever reviewed German troops.

Before he reached England, the king. Edward VII, died, and when Roosevelt arrived in London it was as President Taft's special ambassador to the funeral. His Romanes lecture at Oxford on "Biological Analogies in History" was widely praised, but a speech at the Guildhall in London in which he criticized what appeared to him as the timid ineptitude of the British Government in Egypt brought sharp rebukes from both sides of the Atlantic, but had the endorsement of the new king and of his Foreign Secretary. The address had certain momentous consequences in the appointment of Lord Kitchener as consul general to Egypt (in effect, governor) and the strengthening of a British position which, through its control of the Suez canal and the road to India, became of vital importance to the British Empire on the outbreak of the World War four years later. What remained to Englishmen, however, as the most striking memory of Roosevelt's stay in England, was the walk he took through the New Forest with Sir Edward Grey, when he proved that, though he had spent less than a month altogether in England since his boyhood, he could identify every bird which he saw or heard.

THE RETURN TO POLITICS

Roosevelt returned to the United States on June 18, 1910, disembarking at New York, and received a tumultuous welcome. He had already been put in touch with the political situation. The struggle between the conservative and the progressive elements in the Republican party, which under Roosevelt had remained under the surface, had, under President Taft, developed into what threatened to become a definite schism. A new tariff law, the dismissal of certain commissions which Roosevelt had appointed, the President's position in a bitter controversy regarding western lands, and the general mood of the Administration led Roosevelt to believe that Taft, instead of carrying forward the policies of the former administration, was definitely aligned with their opponents.

Security for Roosevelt and his fame lay in his retirement to his home acres as a kind of national sage; but at the request of the governor of New York, Charles Evans Hughes. he plunged into a factional fight within the Republican Party in the State (1910) and was sharply defeated. In numerous addresses in many parts of the country, however, and in the columns of the *Outlook*, a weekly periodical of which he was "contributing editor," Roosevelt carried forward his fight for what he called the new nationalism; a struggle for "social justice and popular rule," the control by the people of their political instruments and their government for the purpose of providing a condition approximating equality of opportunity. "The new nationalism" was denounced as revolutionary; it was, in fact, essentially conservative, seeking, as it did, merely a reinvigoration of established American institutions. Certain mildly radical expedients which it proposed were: the recall of elective officers by popular vote, the referendum, intended to make the legislatures more directly responsive to the popular will, and the direct primary. The recall of judicial decisions, advocated by Roosevelt as a check on the reactionary tendency of the judiciary in its function as the interpreter of the constitution, frightened the conservatives. As the struggle between the two factions in the Republican Party became increasingly bitter, pressure was brought to bear upon Roosevelt to declare himself a candidate for the presidency; and on Feb. 25, 1912, to use his own phrase, he "threw his hat in the ring."

It was not in Roosevelt's nature, once he had entered a struggle of any sort, to strike with cushioned gloves. The quarrel between Roosevelt and Taft, brought into the open by the contest for delegates, proved distressing alike to the friends of the protagonists and to the general public. In the 13 States where presidential primaries were held, the result, however, gave evidence that the majority of the Republican voters wanted him as their candidate; for of 362 delegates thus selected, 278 favoured Roosevelt and 48 Taft. The President's strength, in fact, came largely from States which cast a very small Republican vote and in which the control of the political machinery was in the hands of the office-holders. In many cases, the progressive voters named protesting delegations who appeared before the Republican National Committee in Chicago before the convention met (June 22, 1912) to claim the seats which they declared had been fraudulently assigned to their rivals. By a margin of 15 votes—which were offered to Roosevelt, but on terms which he felt he could not accept—the convention was organized by his opponents.

In the stirring events of the convention—though not in the hall itself—Roosevelt played the dominant part. He was ready to agree on a compromise candidate, but only on condition that the rolls of the convention be purged of those delegates who, he insisted, had been fraudulently seated. The convention nominated Taft, and the defeated elements, under the leadership of Roosevelt, formed the Progressive Party. Its first convention, held in Chicago early in August, proved unique in American political history in the fact that women were admitted as delegates. Roosevelt announced the principles of his party, demanding what he had fought for throughout his presidency—the control of the government and the resources of the United States by the people rather than by the professional politicians and financiers; asking, in effect, for a return to fundamental principles. On Aug. 7, the convention nominated Roosevelt for president and Hiram Johnson of California, for vice-president. The Democrats, meanwhile, meeting in Baltimore, had nominated Woodrow Wilson for president. During the campaign, both Wilson and Taft concentrated their artillery on Roosevelt. At the height of the campaign,

on Oct. **14,** Roosevelt was shot by a maniac in Milwaukee as he was getting into the automobile which was to take him to the hall where he was to speak; he insisted, however, on making his address and it was an hour and a half before he consented to be taken to a hospital. In the election, Wilson received 435 electoral votes, Roosevelt 88 and Taft 8 The popular vote was 6,293,097 for Wilson; 4,119,507 for Roosevelt; 3,484,956 for Taft, and 901,873 for the Socialist candidate, Eugene V. Debs.

RETIREMENT

Roosevelt had expected defeat and it brought no bitterness. He returned to his editorial work on the *Outlook,* wrote his ***Autobiography*** and only interrupted the life of a country gentleman to move upon a little town in Michigan with a score of "character witnesses" in May, 1913, to confound the editor of a magazine called *Iron Ore* who had rashly put in print a charge widely current, that the ex-president was occasionally or, in fact, frequently, drunk The defendant admitted that he had combed the country in vain for witnesses to substantiate his charge, acknowledged his error and paid the six cents in damages which was all Roosevelt would accept.

In the autumn of 1913, Roosevelt went to South America to address numerous learned bodies and to secure specimens in the jungles of Brazil for the American Museum of Natural History. His journey from capital to capital—a repetition of his triumphal progress through Europe—belied the theory that his action as President regarding Panama had angered the South American peoples. At the suggestion of the Brazilian government and accompanied by a gallant Brazilian explorer, Col. Candido Rondon, he set out to determine the course of a hitherto unknown river, vaguely indicated on existing maps as the River of Doubt. The journey of 900 m. through primeval wilderness was arduous and full of peril, with death by starvation awaiting the expedition if it went too slow; and death in the rapids waiting if it went too fast Canoes were crushed in the treacherous waters; supplies were lost; fever made sharp inroads. Finally Roosevelt himself was taken desperately ill, but he struggled forward, until at last, when disaster seemed inevitable, the party reached civilization at the confluence of the river they had charted with the Madeira, a tributary of the Amazon. In honour of the exploit the Brazilian government christened the stream the Rio Roosevelt.

The World War.—He returned to the United States in May 1914 Early August brought the catastrophe in Europe which, as President, he had foreseen and postponed. His sympathies were with France and England, for he distrusted the German emperor whose imperious and unstable mind had during his presidency caused him frequent irritation and anxiety; but he maintained for a few weeks a neutrality in utterance if not "in thought," which he later regretted. But before September was over, he was once more in the centre of public discussion and debate. He saw earlier than the leaders of the administration in power that America could not remain untouched by the gigantic struggle, since any disturbance of the existing balance of power would have a profound effect not only on the foreign relations of the United States but on the personal lives of the American people. America could afford to see England, France and their allies win, but she could not afford to see Germany win, for a German victory implied an aggressive neighbour in Canada and in the Caribbean and the adoption by the United States of the European condition of an "armed peace." He wanted America to enter the war on the side of the Allies because he was convinced that if she did not accept the gage of battle at that time, she would have to accept it later under less favourable conditions. He pleaded for preparedness, but he went beyond the immediate need to what he was convinced was the ultimate necessity—an international tribunal backed by force to execute its decrees. He attacked the divided allegiance—"fifty-fifty Americanism" was his phrase—which permitted certain Americans of German origin to praise all things German at the expense of the American institutions under which they lived; but at the same time he pleaded for justice for the German-American who kept his head and was loyal.

The destruction of the *Lusitania* by a German submarine brought from Roosevelt a scathing denunciation of German methods of warfare, and successive attacks on what seemed to him the timid and inept statesmanship of the Wilson administration. There was a kind of berserker fury in these attacks. Between himself and his opponents in power he kne no middle ground of compromise and party truce; the issues that divided him from them were to his mind not political but moral. It seemed to him that Wilson was deliberately lulling the public into **a** sense of false security, permitting it to dissipate its spiritual energies in an orgy of acquisition while their president set about with gestures and phrases to exorcise an opponent both aggressive and armed. Once more Roosevelt appealed to the public conscience, and stirred it as never before.

In this last struggle of a stormy life, he rose to what seemed to many of his countrymen new heights of devotion, as he pleaded for the defence of those institutions which he had as president himself revitalized. "Let us pay with our bodies for our souls' desire!" The shift of issues had brought to Roosevelt's support many of the men who had been his bitterest enemies, and early in 1916 he was put forward as a candidate for the Republican nomination for president. He warned the public that he must not be nominated unless the nation were in an "heroic mood." An effort was made by the Progressives to persuade the Republicans to join them in nominating Roosevelt, but the majority of the Republican delegates were not ready to forgive the schism of 1912, and his suggestion that Gen. Wood be named as a compromise candidate never reached the convention. Roosevelt refused the nomination of the Progressive Party, and gave the Republican nominee, Charles Evans Hughes. his support.

When the United States entered the war in April 1917, "the Colonel," as he was affectionately known, offered to raise a division of volunteers from among the ranks of the "outdoor men" of the country who would be almost immediately ready for service; 250,000 men recorded their desire to go under his leadership to France and Congress passed a bill authorizing the creation of two divisions of volunteers, but the President refused his consent. "This is a very exclusive war," Roosevelt remarked, "and I have been blackballed by the committee on admissions" His four sons all went to the front; two were wounded, one Quentin, the youngest, a lieutenant in the Air Service, was killed in combat over the German lines. Roosevelt, forbidden to fight in the field, grimly and in bitter disappointment flung himself into the work that lay at hand. Here and there over the country he spoke for the Liberty Loan campaign. for the Red Cross and other relief agencies, and in the pages of the Kansas City *Star* and the *Metropolitan Magazine* fought week after week for speed in military preparation, for an honest facing of facts and for whole-hearted and unreserved participation in the war by the side of the allies, greeting the Administration's satisfaction over the "happy confusion" of the war preparations with words of stinging realism.

The fever he had contracted in Brazil returned now and again. For weeks he travelled and made public addresses in spite of it. In Feb. 1918, however, he became dangerously ill; was operated upon, recovered, returned to his full activity and was again laid low. His illness scarcely abated his ceaseless activity and in nowise seemed to weaken the force of his fighting spirit. At no previous period in his career was his following so large or so devoted. It seemed as though, in the intensity and grief of the war-years, his countrymen turned to him with new understanding and affection. While scholars talked of this or that notable act of an administration which was already acquiring a kind of glamour in the perspective of a decade, the common man called him "the great American" and let others analyse why. He died in his sleep on Jan. 6, 1919.

Character and Influence.—It can be said of Washington that he founded the American nation, and of Lincoln that he preserved it; it can be said of Roosevelt that he revitalized it. Twice, at critical times, through his vision, his ardour, his effective anger, his faith in American institutions and his peculiar understanding of all sections of the American people, he cleansed the body of the nation of treacherous poisons, and set its soul to work on labours

higher than the acquisition of physical comforts. He dreamed nobly for his country and impelled millions of his countrymen to dream nobly. Roosevelt was one of the most versatile presidents of the United States. In addition to his talents as a politician, statesman and popular leader, he was eminent as naturalist, soldier, orator, historian; and was one of the most widely-read men of his time. *The Winning of the West* has faults of hasty composition inevitable in a book written in the off-hours of a crowded life, but it maintains its authority; his *Naval History of the War of* **1812** has not been supplanted as the leading work on the subject. He was an assiduous and occasionally a brilliant writer. His narratives are lucid and swift, his descriptions full of colour and significant detail, his literary criticism straightforward and free from the jargon of the craft. His letters have taken a high place in epistolary literature; his volume of *Letters to his Children* is already a classic. His political writings, moreover, are direct and clear, open to the most untutored intelligence, and flashing at intervals with arresting epithets. Under the stress of emotion, in some of the prefaces of his hunting books, in a descriptive passage here and there—in his appeal, for instance for imagination in the writing of history—his prose became transmuted into the gold of poetry.

"A man who could do so much could not do everything perfectly, though few have ever done so many things so well," wrote his friend Albert Bushnell Hart *(Encyclopedia Britannica,* 12th edition). "It was more true of him than of most men that his defects were inherent in his virtues. There were few half-tones in Roosevelt's moral perceptions and fewer in his vocabulary; he saw things as either black or white, and he forgot sometimes that he had not previously seen them as he saw them at the moment. . . . The very intensity of his convictions sometimes blinded him to the sincerity and even to the justice of other points of view. Nevertheless, this intensity, this moral fervour, gave his ideas a momentum and a success which they could never have acquired had they proceeded from a more judicial mind. He scorned 'weasel words,' and on occasion he did not hesitate to describe his enemies as thieves and liars. His remarkable energy reminded observers of some great elemental force which, like any natural phenomenon, is controlled by its own necessary laws."

Writings.—Theodore Roosevelt's published works, including books, pamphlets, addresses, campaign speeches, contributions to the books of others, translations and periodical articles, number between two and three thousand titles and date from 1877 to his death. During his life Theodore Roosevelt wrote not less than 150,000 letters, most of which were included with the Roosevelt papers in the Library of Congress in Washington, and there are a great number of published works dealing with his colourful life. There have been many collections of Roosevelt's works, including the Memorial edition, 24 vol. (1923–26); and the National edition, 20 vol. (1926).

Roosevelt's principal works are: *Naval War of* **1812** (1882); *Hunting Trips of a Ranchman* (1885); *Thomas Hart Benton* (1887); *Gouverneur Morris* (1888); *Ranch Life and the Hunting Trail* (1888); *Winning of the West,* 4 vol. (1889–96); *New York* (1891); *Wilderness Hunter* (1893); *Hero Tales from American History* (with Henry Cabot Lodge) (1895); *American Ideals* (1897); *Rough Riders* (1899); *Oliver Cromwell* (1900); *Outdoor Pastimes of an American Hunter* (1905); *African and European Addresses* (1910); *African Game Trails* (1910); *New Nationalism* (1910); *Realizable Ideals* (1912); *History as Literature* (1913); *Progressive Principles* (1913); *Autobiography* (1913); *Through the Brazilian Wilderness* (1914); *Life Histories of African Game Animals* (with Edmund Heller) 2 vol. (1914); *America and the World War* (1915); *Book-lover's Holidays in the Open* (1916); *Fear God and Take Your Own Part* (1916); *Foes of our Own Household* (1917); *Great Adventure* (1918); *Theodore Roosevelt's Letters to his Children* (1919); *Theodore Roosevelt and his Time Shown in his Own Letters,* Ed. by J. B. Bishop, 2 vol. (1920); *Roosevelt in the Kansas City Star* (1921); *Letters to Anna Roosevelt Cowles* (1924); *Selections from Correspondence of Theodore Roosevelt and Henry Cabot Lodge* (1925).

BIBLIOGRAPHY.—The more important biographical studies are: L. F. Abbott, *Impressions of Theodore Roosevelt (1926);* Corinne Roosevelt Robinson, *My Brother Theodore Roosevelt* (1921); *H.* A. Beers, *Four Americans* (1920); Joseph Bucklin Bishop, *Theodore Roosevelt and His Times* (1920); Archie, Butt, *Letters* (1924); Lord Charnwood, *Theodore Roosevelt* (1924); Tyler Dennett, *Roosevelt and the Russo-Japanese War* (1925); Bradley Gilman, *Roosevelt the Happy Warrior* (1921); *H.* F. Gosnell, *Boss Platt and His New York Machine* (1924); William Hard, *Theodore Roosevelt:* a *Tribute* (1919); Henry L. Stoddard, *As I Knew Them—fromGrant to Coolidge* (1927); W. D. Lewis, *Life of Roosevelt* (1919); J. F. ROOT, **ELIHU** (1845–1937), American lawyer and political leader, was born at Clinton (N.Y.), on Feb. 15, 1845. He graduated at Hamilton college where his father was a professor in 1864, taught at the Rome (N.Y.) academy in 1865, and graduated at the University Law school, New York city, in 1867. As a corporation lawyer he soon attained high rank and was counsel in many famous cases. Politically, he became identified with the reform element of the Republican Party. He was U.S. attorney for the Southern District of New York (1883–85), and a delegate to the State Constitutional Convention of 1894, acting as chairman of its judiciary committee. From Aug. 1899 until Feb. 1904 he was secretary of war in the cabinets of Presidents McKinley and Roosevelt, and in this position reorganized the army and created a general staff, and in general administered his department with great ability during a period marked by the Boxer uprising in China, whither troops were sent under Gen. A. R. Chaffee, the insurrection of the Filipinos, the withdrawal of U.S. troops from Cuba and the establishment of a government for the Philippines under a Philippine Commission, for which he drew up the "instructions," in reality comprising a constitution, a judicial code and a system of laws. In 1903 he was a member of the Alaskan Boundary Tribunal. In July 1905 he re-entered President Roosevelt's cabinet as secretary of State, where he considerably improved the consular service. In the summer of 1906, while attending the Pan-American Conference at Rio de Janeiro, he was elected its honorary president, and during a tour through the Latin-American republics, brought about a better understanding between the United States and these republics. In general he did much to further the cause of international peace, and he concluded treaties of arbitration with Japan, Great Britain, France, Italy, Spain, Portugal, Austria-Hungary, Switzerland, Norway, Sweden, Denmark, Holland and other countries. Upon his resignation from the cabinet he was elected, in Jan. 1909, as U.S. senator from New York. In 1910 he was chief counsel for the United States before The Hague Tribunal for the arbitration of the long-standing dispute concerning fisheries between his country and Great Britain. Upon his return, he was appointed by President Taft a member of the Permanent Court of Arbitration. In the same year he was elected president of the Carnegie Endowment for International Peace. Root thus took up again the work which he had initiated when secretary of State, and became the recognized leader of the peace movement in the United States. In 1912 he was awarded the Nobel Peace Prize. He strongly supported in the Senate the treaty of obligatory arbitration concluded between the United States and Great Britain in 1912, but failed to prevent amendments to the treaty being inserted by the Senate which prevented an exchange of ratifications.

He took a leading part in the passage of the Federal Reserve bill of 1913, providing for a Federal Bank under Federal control, in order to stabilize the finance of the country. In matters of foreign policy also his opinion had great weight. In 1915 a treaty negotiated by Secretary of State Bryan with Colombia provided for payment by the United States of $2 5,000,000 to Colombia in settlement of all outstanding claims between the two countries

arising out of the independence of Panama; Mr. Root opposed ratification, principally because a statement of regret on the part of the United States had been inserted in the preamble, though he also considered the sum too much. His opinion prevailed, and later on, in 1922, when the Senate finally ratified the treaty, the clause in question was omitted.

On March 4, 1915, his term as senator expired and he declined to be a candidate for re-election. That summer he was president of the New York State Constitutional Convention, and advocated, among other measures, the short ballot, means for remedying the law's delays, the reduction of costs involved in the administration of justice and measures which would facilitate the impeachment of unworthy public officials. After the declaration of war by the United States, on April 6, 1917, he gave his whole support to the Government. He was asked by President Wilson to head the mission which was sent to Russia shortly thereafter with a view to encouraging the Revolutionary Government under Kerensky to carry on the war with vigour. He accepted, but while in Russia the overthrow of the Moderates there by the Bolsheviks under Lenin frustrated the purposes of his mission.

At the conclusion of the war, though not a member of the U S. Mission to Paris to conclude peace, his advice was requested in the matter of the Covenant of the League of Nations and his views prevailed to a certain extent. To the Covenant as actually drafted, however, he was opposed. He was, nevertheless, of the opinion that the Covenant and the Treaty of Versailles should be accepted with reservations, to secure the interests of the United States, inasmuch as the President's re-election in 1916 and his presence as negotiator at Paris had led the other plenipotentiaries, however erroneously, to believe that he represented the opinion of his fellow countrymen. In Mr. Root's opinion it would be better to accept the Covenant with reservations, and by subsequent amendments to remove the obstacles which had originally stood in the way of its acceptance.

He accepted an invitation from the League of Nations to become a member of the Advisory Committee of Jurists which met at The Hague in 1920 for the purpose of devising a plan for a permanent court of international justice, in accordance with Art. 14 of the Covenant. His presence enabled the committee to frame a plan acceptable to all by which the judges were to be elected by the separate and concurrent action of the Council (in which the Great Powers had a preponderance) and the Assembly (in which the Small Powers were in a majority), each interest, real or alleged, having thus a veto upon the abuse of power by the other. The plan was accepted with modifications by the Council and Assembly on Dec. 14, 1920, and became the statute of the court. It functioned perfectly when the judges were elected in 1921.

Root was appointed by President Harding one of the U.S delegates to the International Conference on Armament Limitation, which met at Washington in Nov. 1921. There he secured the adoption of the convention subjecting submarines to the requirements of surface vessels and prohibiting the use of noxious gases in warfare. He devised the Pacific agreements which resulted in the cancellation of the Anglo-Japanese alliance, and drafted the Four Power Pacific Treaty, which took its place. In Jan.. 1929, he accepted an invitation to be a member of a committee of jurists meeting at Geneva to test and revise the original statutes of the Permanent Court of International Justice in the light of eight years' experience. He participated in every session held for this purpose and offered valuable suggestions. His main work, however, was the working out of a formula upon which the United States might see its way clear to become a member of the court. This Root protocol, as redrafted by Sir Cecil Hurst, was unanimously accepted by the committee of jurists, and was intended to replace the protocol of Sept. 23, 1926 drawn up in answer to the American Senate reservations The changes made were only in the article on advisory opinions and were held to be favourable to the United States. The hope was general that the Cnited States Senate would act favourably after the report of the committee had been formally accepted by the League Council, but the Senate rejected it. Mr. Root died Feb. 7, 1937.

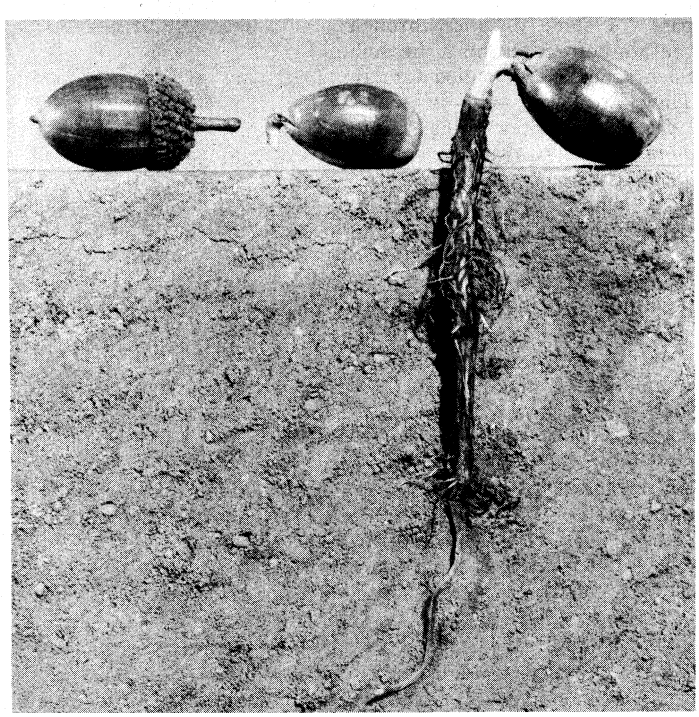
A collection of Root's public addresses has been edited by Robert Bacon and James Brown Scott in eight volumes. He also published *Experiments* in *Government and the Essentials of the Consztutzon* (Princeton Lectures, 1913) and *American Ideals During the Past Half Century* (International Conciliation, no. 210, 1925).

ROOT, in popular usage. the part of the plant which is normally below the surface of the earth. Botanically its application is more restricted, for many plants develop subterranean structures that are in reality specialized stems (rhizomes. tubers, corms) The root is distinguished from such underground stems by not bearing leaves and by having its apex enclosed by a cap (rootcap) which protects the actively dividing cells of the growing point or meristem. There are also structural differences which distinguish roots from stems. The most important of these is the manner in which lateral members or offshoots originate and the arrangement and development of the primary vascular or conducting tissues (xylem and phloem). (For internal structure see PLANTS AND PLANT SCIENCE: *Anatomy* of Plants.)

Not all plants have true roots; they are lacking in thallophytes (algae and fungi) and bryophytes (mosses and liverworts), although some of these lower plants develop organs (rhizoids) which perform some of the functions of roots. Phylogenetically the root is associated with the evolution of the sporophytic generation in the higher land plants. They occur in pteridophytes (ferns and their allies) and spermatophytes (seed plants).

The primary function of the root is absorption of water and inorganic salts in solution and the conduction of these to the stem, but it also affords anchorage and support and frequently serves for storage of reserve foods. In some instances it may function in vegetative (asexual) reproduction and in special cases (some aerial and aquatic roots) may carry on photosynthesis — a function usually carried out in the leaves. The root usually develops root hairs. slender unicellular outgrowths formed by the lateral extension of cells of the outer layer (epidermis). These serve to increase the absorbing surface of the root and bring it into intimate relationship with the soil particles. The older root hairs generally die — rarely some are persistent — so that the active zone of root hairs usually lies just back of the apex of the root.

When the seed germinates, the primary root or radicle is the first organ to appear. It grows downward through the soil, anchoring the seedling and establishing contact with the soil. Secondary roots, which often repeat the form and structure of the main root, are developed in regular succession from above downward (acro-



JOHN H GERARD

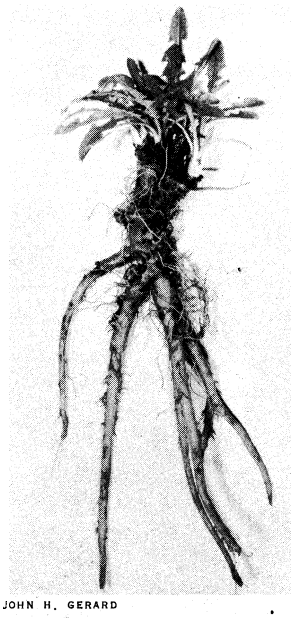
FIG. I.—ROOT DEVELOPMENT OF THE WHITE OAK (QUERCUS ALBA)

petal), and because they originate in a definite position in the interior of the root (generally opposite the xylem masses) they develop in longitudinal rows and must penetrate the overlying tissue of the parent root. True forking of the root (dichotomy) occurs in the Lycopodiaceae (club moss and fern allies) but not in higher plants.

In addition to the main root and its acropetal outgrowths are adventitious roots, which may arise on any part of a plant. They are especially numerous on underground stems, such as the underside of rhizomes, and also develop from stems under favourable conditions such as moisture and absence of light; a young shoot or a cutting placed in moist soil may quickly form adventitious roots. This ability of many plants to develop adventitious roots from stems is widely used in horticulture as a means of vegetative propagation to ensure the production of plants that resemble the parent stock. It is also a rapid method of propagation in the case of slow-growing woody plants. Adventitious roots may also arise from leaves under similar conditions—for instance: from begonia leaves planted in soil.

The form of a root depends on its shape and mode of branching. When the central axis goes deep into the ground in a tapering manner without dividing, a taproot is produced. This kind of root is sometimes short and becomes swollen by storage of foodstuffs, as in the conical root of carrot, the fusiform or spindle-shaped root of radish or the napiform root of turnip. In some forest trees the first root protruded continues to elongate and forms a long primary root axis from which secondary axes arise. In many plants, especially monocotyledons, the primary axis soon dies and the secondary axes take its place. When the descending axis is very short, and at once divides into thin. nearly equal fibrils, the root is called fibrous, as in many grasses; when the fibrils are thick and succulent, the root is fasciculated, as in the sweet potato. dahlia. *Ranunculus ficaria* and Oenanthe crocata. Some so-called roots are formed of a stem and root combined. as in *Orchis,* where the tuber consists of a fleshy, swollen root bearing at the apex a stem-bud. As in the stem, growth in length occurs only for a short distance behind the apex, but in long-lived roots increase in diameter occurs continually in a similar manner to growth in thickness in the stem.

Roots are not invariably underground. In some cases where they arise from the stem they pass for some distance through the air before reaching the soil. Such roots are called aerial. They are seen well in maize (Zea), the screw pine (Pandanus), the banyan (*Ficus indica*) and many other species of Ficus, where they eventually assist in supporting the stem and branches. In the mangrove they often form the entire support of the stem, which has decayed at its lower part. In tree ferns they form a dense coating around and completely conceal the stem; such is also the case in some Dracaena and palms. In epiphytes, or plants growing in the air, attached to the trunks of trees, such as orchids of warm climates, the aerial roots produced do not reach the soil; they continue aerial and greenish and they possess stomata. Delicate hairs are often seen on these epiphytic roots, as well as a peculiar spongy investment formed by the cells of the epidermis which have lost their succulent contents and are filled with air. This layer, the velamen, serves to absorb the moisture contained in the air, on which the plant is partially dependent for its water supply. Some leafless epiphytic orchids, such as species of Angraecum,



JOHN H. GERARD

FIG. 2.— ROOT OF THE DANDELION (TARAXACUM)

depend entirely upon their aerial roots for nourishment; these perform the functions of both leaves and roots. A respiratory or aerating function is performed by roots of certain mangroves growing in swampy soil or water and sending vertical roots up into the air which are provided with aerating passages.

Parasitic plants, as the mistletoe (*Viscum*), broomrape (*Orobanche*), dodder (Cuscuta) and *Rafflesia,* send rootlike processes into the body of the host plant. Leaf buds are sometimes formed on roots, as in plum, cherry and other fruit trees.

FIG. 3.—FLESHY TUBERS AND ROOTS OF THE DAHLIA

In the coralroot orchid, *Corallorhiza,* a stem structure, the shortly branched underground rhizome, performs all the functions of a true root, which is absent. In some aquatic plants the root acts merely as an anchor. or it may be flattened and contain chloroplasts for the manufacture of food; in others it is altogether absent, as in *Salvinia* and *Utricularia.*

The well-known epiphyte *Tillandsia usneoides* (Spanish moss) is rootless.

See also PLANT PROPAGATION; STEM: Rhizomes, *Corms,* Tubers and *Bulbs.* (H. E. HD.; X.)

ROOT. Arab writers of the 9th century spoke of one of the equal factors of a number as a root, and their medieval translators used the Latin radix (root) for the same concept. The adjective is radical.

If a is a positive real number and n is a positive integer, there exists a unique positive real number x such that $x^n = a$. This number is called the (principal) nth root of a, and is written $\sqrt[n]{a}$. The integer n is called the index of the root. For $n = 2$, the root is called the square root and is written $\sqrt{a}$. The root $\sqrt[3]{a}$ is called the cube root of a. If a is negative and n is odd, the unique negative nth root of a is termed principal.

The practical determination of square and higher roots of positive numbers is discussed in the article on ARITHMETIC.

If a rational integer (whole number) has a rational nth root, *i.e.*, one which can be written as a common fraction, then this root must be an integer. Thus 5 has no rational square root since $2^2 < 5$ while $3^2 > 5$.

There are exactly n complex numbers which satisfy the equation $x^n = 1$, called the complex nth roots of unity. If a regular polygon of n sides is inscribed in a unit circle with centre at the origin so that one vertex lies on the positive half of the x-axis, the radii to the vertices are the vectors representing the n complex nth roots of unity. If the root whose vector makes the smallest positive angle with the positive direction of the x-axis is denoted by w, then $w, \omega^2, w^3, \ldots \omega^n = 1$ constitute all of the wth roots of unity. Thus $\omega = -\frac{1}{2} + \frac{1}{2}\sqrt{-3}$, $\omega^2 = -\frac{1}{2} - \frac{1}{2}\sqrt{-3}$, $\omega^3 = 1$ are the cube roots of unity.

Any root ϵ which has the property that $\epsilon, \epsilon^2, \ldots \epsilon^n = 1$ give all of the nth roots of unity is called primitive.

Evidently the problem of finding the nth roots of unity is equivalent to the problem of inscribing a regular polygon of n sides in a circle. For every integer n, the nth roots of unity can be determined in terms of the rational numbers by means of rational operations and radicals; but they can be constructed by ruler and compasses (*i.e.*, determined in terms of the rational operations and square roots) only if n is a product of distinct prime numbers of the form $2^h + 1$, or 2^k times such a product, or is of the form 2^k.

If a is a complex number not 0, the equation $x^n = a$ has exactly n roots. (*See* COMPLEX NUMBERS.) All of the nth roots of a are the products of any one of these roots by the nth roots of unity.

The term root has been carried over from the equation $x^n = a$

to all polynomial equations. Thus a solution of the equation

$$f(x)=a_0x^n+a_1x^{n-1}+\ \ldots\ +a_{n-1}x+a_n=0,\ a_0\neq 0$$

is called a root of the equation. If the coefficients lie in the complex field, an equation of the nth degree has exactly n not necessarily distinct complex roots. If the coefficients are real and n is odd, there is a real root. But an equation does not always have a root in its coefficient field. Thus $x^2-5=0$ has no rational root.

If $f(x)=0$ is an equation with coefficients in a field F, there exists a unique field F^* obtained by adjoining to F all of the roots of $f(x)=0$. This field is called the root field of $f(x)=0$. In F^* the polynomial $f(x)$ can be factored into linear factors. (See EQUATIONS, THEORY OF.)

A rigorous proof of the existence of the root field F^* can be made along the following lines. Let $f_1(x)$ be a factor of $f(x)$ which is irreducible in F. The set of all polynomials in x with coefficients in F, taken modulo $f_1(x)$, constitute a field F containing F in which $f_1(x)$ has a linear factor. A continuation of this process leads to the root field F^*. (C. C. M.)

ROOT CROPS. Many kinds of roots are cultivated for human use, some of which are grown extensively on a commercial scale. Those most commonly produced for human consumption include the beet, carrot, onion, parsnip, potato, radish, sugar beet, sweet potato and turnip. Representative minor root crops are the chufa (*Cyperus esculentus*), cultivated in the southern U.S., and the so-called tule potato (tubers of Sagittaria *latifolia*), cultivated by the Chinese in central California. Many roots grown for other economic purposes assume local importance as crops; *e.g.*, the licorice grown in southern Europe.

The term root crop is sometimes restricted to those grown in rotation with other crops. See also ROOT; ROTATION OF CROPS; BEET; MANGEL; TURNIP, etc.

ROOZEBOOM, HENDRIK WILLEM BAKHUIS (1854–1907), Dutch physical chemist, best known for his introduction into chemistry of the phase rule, was born on Oct. 24, 1854; he was at first (1878) assistant in the Chemistry institute at Leyden, then lecturer (1890) and finally (1896) professor of inorganic and physical chemistry at Amsterdam. He died on Feb. 8. 1907. The phase rule had been deduced previously by J. Willard Gibbs on thermodynamical grounds. With his students he made a large number of investigations of melting points and solubilities in studying the equilibriums between solid and liquid phases in various systems. He started in 1904 to publish a compilation under the title of Dze heterogenen *Gleichgewichte* vom *Standpunkt* der Phasenlehre, which was completed in 1918, after his death, by his pupils.

ROPE AND ROPEMAKING. Rope is made of animal or vegetable fibres and of metallic wires. Fibre rope alone will be considered here. (See WIRE: Wire Rope.) "Cordage" is a term applied generally to yams, twines, ropes and cables but refers specifically to "rope" in the industry.

Fibre rope is cordage of "stranded" construction, *i.e.*, fibres or hairs laid parallel and twisted together making a yarn; two or more of these yarns twisted together "forming" the strand and three or more of these strands twisted together "laying" the rope. Three or more ropes laid together make a "cable-laid" rope, sometimes referred to colloquially as "hawser-laid." The smallest fibre ropes made are approximately $\frac{1}{2}$ in. in circumference or $\frac{3}{16}$ in. in diameter so that any similar products of less than these dimensions are not rope in the usual acceptation of the term.

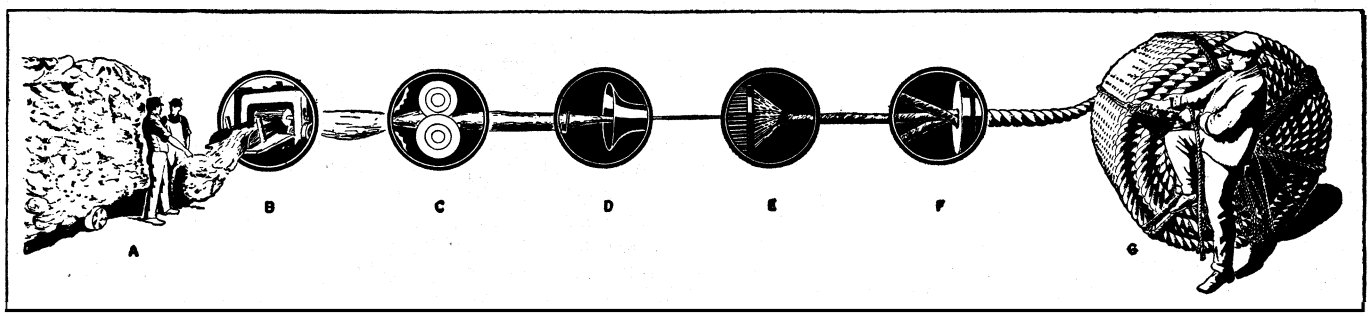
Two or more yams twisted together, either plain twisted or laid, are twine regardless of the form of put-up; laid twine is sometimes referred to as "corded." Single yarns are known as yarns except binder twine, which is a single yarn product. This group of products is known as "ply and yarn goods" in the hard fibre cordage industry and as yarns, twines or cords in the soft fibre industry. Braided construction of yarns, such as sash cords, is sometimes referred to as "rope." (X.)

Early History of **Ropemaking.**—Rope is already represented in use in southwest Asia (Elam) in the chalcolithic period (4th millennium B.C., *v.* Lasso), but this was probably made of plaited thongs, a type which has persisted down to modem times, especially in arrested cultures, *e.g.*, among the Rodiyas of Ceylon, a retarded, outcast group. But probably almost, if not quite, as ancient is that of bark fibre, represented in more evolved forms by the coir types of southeast Asia, where one kind is still made in the very primitive technique of rolling the fibres together with the palm of the hand on the bare thigh, *e.g.*, among the Nayadis of Malabar, the nucleus of whose culture remains epipalaeolithic in character. The thong-plaiting is the simplest and quite likely the first stage of plaiting out of which grew, before the end of the palaeolithic period, mat- and basketmaking, which in turn engendered, in the neolithic, true weaving. The primitive coir-ropemaking method, on the other hand, is the most rudimentary, and almost certainly the initial way of spinning, still used, *e.g.*, well down into historical times in Egypt. Thus ropemaking is the technical ancestor of both the two fundamental textile processes.

Cord (the primary element of rope, and incorporating its essential principle) must have been used very early, probably in the upper palaeolithic period at least, to attach tools to handles; and the same need for rope implies its common currency in the 4th millennium, when numerous bone handles are sometimes found with the blade or point missing (E. Schmidt, *Tepe Hissar*, Phil., 1937, p. 59). In the middle of the 3rd millennium B.C., patterns impressed with spun cords are the definitive feature of a south-eastern European pottery; and by the middle of the 2nd millennium heavy rope must have been a commonplace in the east Mediterranean, given the development there of shipping and hence ships, which even when propelled by oars require rope equipment. Moreover, at about this same time a number of terms for "rope" are found in Akkadian, *e.g.*, though they are not yet more specifically translatable, while actual examples of papyrus rope of about this period have been found in Egyptian tombs. Late in the millennium heavy cables are reproduced in bronze as handles of vessels in China, whither the technique had probably been conveyed by the bronze casters, most likely from the eastern Asia Minor-Adharbayjan region, and heavy cable mouldings appear about the same time on pottery from Luristan whose bronze art can be traced to the same source.

When Xerxes (480 B.C.) built the bridge of boats across the Hellespont "the Phoenicians constructed one line with cables of white flax, the Egyptians in the other used ropes made of papyrus (Herod., Hist., vii, 34). In India in the 4th century B.C., rope-making was so specialized that one class of experts made ropes just for horses, another for elephants (*Arthasastra*); and in China, in the Han period if not earlier, the emperor's carriage in time of mourning was equipped with silk ropes (Li *Ki*, Bk. iii, sect. iii). The craft was carried, along with various textile and other techniques such as pottery making and metallurgy, into the early American cultures. (P. AN.)

Ropemaking had been going on for centuries with little change up to the time of the introduction of machinery about the middle of the 19th century. In the early days all the yarn was spun by hand. The hemp was first hackled by combing it straight over a board studded with sharp steel teeth. A bunch or "head" of this hackled hemp was placed around the spinner's waist, who attached a few fibres to a hook on the spinning wheel and, as the hook was revolved by means of a large wheel turned by hand, walked backwards away from the wheel feeding the fibre from the supply around his waist, preserving the uniformity and proper size of the yarn. Several yarns were twisted together by use of a hand wheel and several hooks, forming the "strand" and three or more strands twisted together "laying" the rope. Horsepower was used in old times for forming and laying rope which was too large to be made by hand. The term "ropewalk" came from the long low buildings used and the walking back and forth of



BY COURTESY OF THE COLUMBIAN ROPE CO.

the spinners and ropemakers. In the early days every community of any size had its ropewalk, there being 173 in the United States in the year 1810. These walks were often goo ft. or more in length. Many were in the open air.

The crude methods of ropemaking of centuries ago are still used in many parts of the world today. Improved ropewalk methods are used extensively today for making extra large ropes and all but the smaller sizes of tarred hemp ropes; it is also an economical and quick method of making ropes to special order for immediate delivery.

Raw **Materials.**—In the United States and European countries soft fibres, principally hemp (coming mostly from Russia, Italy and the United States) and flax were used for rope until the second quarter of the 19th century. Hemp is still used for tarred hemp rope and fittings for marine purposes. Abaca commonly referred to as Manila fibre, because it is grown almost exclusively in the Philippine Islands and exported principally from the port of Manila, has established itself as the best material for ropemaking where strength and durability are the prime requirements. Henequen, sometimes misnamed sisal, is next in importance as a rope fibre, and comes from Yucatan, Mexico and Cuba. Sisals are important rope fibres and come principally from Java, Africa and the Bahamas. Other fibres used are New Zealand, Mauritius, Maguey and Istle fibres. Jute and cotton are used to a limited extent in the manufacture of ropes of stranded construction. Cotton is used to a greater extent in the manufacture of braided cords.

Present Manufacturing Processes.—The primary object of twisting fibres together in a rope is that, by mutual friction, they may be held together when a strain is applied to the whole. Hard twisting has the further advantage of compacting the fibres and preventing, to some extent, the penetration of moisture when the ropes are exposed to water; but the yield of rope from a given length of yarn diminishes in proportion to the increase of twist.

The ropemaking process is essentially the same, no matter what kind of fibre is used. The process divides itself into five operations. First, selection of fibre; second, preparing the sliver; third, spinning the yarn; fourth, forming the strands; fifth, laying the strands into rope. With cable-laid ropes there is another operation, laying the strands of the cable, which are in fact completed ropes, into the finished cable.

At the start of the manufacturing process the bales of fibre are opened and heads of fibre shaken out. The fibre is put through several processes of combing and straightening. These operations are, in general, all of the same kind. The fibre is slowly carried along on a series of bars connected by endless chains, the bars being studded with sharp steel pins, like combs, that stand upright as the fibre passes along with them. A similar set of combs, moving very much faster, pulls the fibre rapidly away from the first set, combing it out at the same time. Fine jets of lubricant are sprayed on the fibre as it enters the first machine.

The fibre is delivered from the machine in a heavy, continuous stream or sliver which is coiled by hand or machine into a receptacle, or on the floor. Several of these slivers are then fed into a similar machine, and the kinks and unevenness further removed by a repetition of the same process. This preparation or combing is repeated from 8 to 12 times on five different machines, each operation combing the fibre and producing a smaller and more even sliver, until finally it comes out of the finisher in a continuous stream as water flows from a hose. The thoroughness with which these operations are carried out—the care taken in preparing the fibre—is largely responsible for the uniformity and excellence of the finished product.

In the preparation of the sliver, the object has been merely to eliminate all sorts of dirt and foreign matter and to lay these fine, threadlike strands parallel with one another so that they can be more easily spun together. As the sliver enters the spinning machine it is taken from the rollers by another series of fine combs. From the combs it passes through a funnel-shaped tube and is then wound about a little capstan. It is between the tube and the capstan that the yarn comes into being. The friction on the revolving capstans draws the yarn through the machine. From the capstans it is automatically wound on a large spool about 12 in. long, named a bobbin. The capstans and the bobbin whirl very fast, and the combination of this whirling motion and the drawing forward of the revolving capstans, spins the heretofore parallel fibres into what is known as a yam. For different sizes of yarn and for yarns designed for various purposes, a varying number of twists per foot are imparted to the yarn. This yarn is the first merchantable product of the cordage mill and may be sold in this original form or used as the basis of other cordage products.

A rope is usually formed of three or four strands, each strand composed of a number of yarns laid parallel and slightly twisted together. Making these strands is "forming." As the strand is tnisted it is wound on a large reel and appears as a smooth, round strand composed of a number of individual yarns. This is known as the "ready." The yarn has a tendency to untwist; to overcome this the twist of the ready or strand is made in the opposite direction. The result is that the tendency of the yarn to untwist in one direction, and the tendency of the ready to untwist in the other direction balance each other.

The ropemaking operation is "laying." In laying the rope, three or four of the reels containing the readies or strands are put on the laying machine, and the strands are led through a "block," wound around the capstan, and reeled on the finishing end of the laying machine. In laying there is a different twisting problem, for the ready is *neutral*—that is, it has no tendency to untwist—and if the readies were twisted together without altering this neutral condition the rope would continually untwist. So an extra twist is added to the ready as it is passed into the machine, this twist being computed so that it will he just sufficient to counteract the tendency of the three strands to untwist when they are formed into a rope. All good rope is absolutely neutral; if cut off in 5-ft. to 10-ft. lengths and laid on the ground, it will not untwist of its own accord.

Cable-laid rope consists of three completed ropes, nine of the simple strands which form an ordinary rope. The same method of balancing the twisting strands is used, an additional twist or foreturn being given to the three-strand ropes just before they are laid up, so that their tendency to untwist in one direction shall exactly counterbalance the tendency of the cable to untwist in the opposite direction.

Uses and Care of Rope.—The uses of rope are many and varied. The marine and fishing industries consume more than half of the rope produced. Cable-laid rope is also used extensively for the drilling of oil, water and gas wells. Ropes are used in the transmission of motive

power. (*See* POWER TRANSMISSION: *Mechanical.*) Small cotton ropes are used extensively in textile mills for small machine drives. Rope is used on the farms for hoisting, hauling, harness and many other uses. Rope is used in building and engineering projects construction. In the home also it has many applications.

The useful liie of rope depends on the quality of the rope, and on the care and treatment it receives. To give the best service, it must be made of high-grade raw material, selected with a thorough knowledge of what the rope is to do. It must be so made that every strand will be of even tension. It must be properly treated with a lubricant which will at once preserve and lubricate. There are three general sources of damage which mill shorten the life of rope: first, mechanical injury, such as bending over too sharp a pulley; second, damage from chemicals, such as acids; and third, damage from climatic or other conditions of storage, such as moisture or dry rot. It should be stored in a cool dry place with air circulation. (J. S. McD.)

In addition to the heavy rope there are many varieties of cord and twine made by means of the preparing, spinning and doubling machines. The fishing industry takes many different types for lines and nets, while the variety of cord and twine for other industrial and for household purposes is almost unlimited. All yarn from long vegetable fibre is more or less rough as it leaves the spinning frame, even after two or more threads have been twisted together. It is therefore necessary, for many uses, to impart a polish to the cord or twine. Special machines are used for this purpose. Bobbins of yarn, equal to the number required, and depending upon the capacity of the machine, are placed in a bank or creel, and the ends are collected and passed under a roller which is immersed in hot starch. The yarns become saturated with this starch, but, as they emerge from the starch-box. the superfluous starch is removed by passing the yarns between two rollers. The yarns now pass over a series of drying cylinders and polishing rollers, and are finally rewound by the same machine on to other bobbins. This machine is termed a bobbin-to-bobbin polishing machine. In some cases the hot drying cylinders are replaced by a system of hot-air drying. The finished yarns arc now made up by machinery into hanks, balls or cheeses, according to which happens to be the best state for future use and for transport.

Driving Ropes.—It has already been stated that cotton driving ropes are extensively applied in the transmission of motive power. Although the mechanical efficiency of transmission by ropes is less than that obtained by wheel gearing, rope driving has several compensating advantages:—

1. It is practically noiseless.
2. It occupies less space than belt driving, and the slip is not so great.
3. The turning movement is better; machines therefore run more steadily and production is increased.
4. Shaits may be run at higher speeds.
5. Greater range of drives; anything from 10 ft. to over 80 ft., and much greater distances when carrier pulleys are used.
6. The drive is usually obtained by a number of ropes; if one should break, the rope may be removed and the machinery run in most cases until stopping-time.

The number of ropes to be used depends upon the power to be transmitted; upon the sectional area of the ropes, and upon the surface speed of the driving pulley. The speed of the rope may vary from 2,000 ft. to 6,000 ft. or over per minute. In some few exceptional cases 60 ropes have been used on one pulley; the number usually varies between 15 and 40. (*See* POWER TRANSMISSION: *Mechanical.*)

The foregoing reiers exclusively to ropes made from fibrous yarns; metallic ropes appear under the heading WIRE: *Wire Rope.*

Carter, *Modern Flax, Hemp and Jute Spinning and Twisting* (1925); P. J. Stopiord, *Cordage and Cables* (1925); "U.S. Government Master Specifications for Rope Cotton," *Bureau of Standards Cir.* 326, (1927).

ROPES, JOHN CODMAN (1836–1899), U.S. military historian and lawyer, was born at St. Petersburg (later Leningrad), Russia, on April 28. 1836. He graduated from Harvard Law school in 1861, and became a successful lawyer. He founded in 1876 the Military Historical Society of Massachusetts for the collection and discussion of evidence relating to the Civil War. To it he presented his military library and his collection of prints and medals.

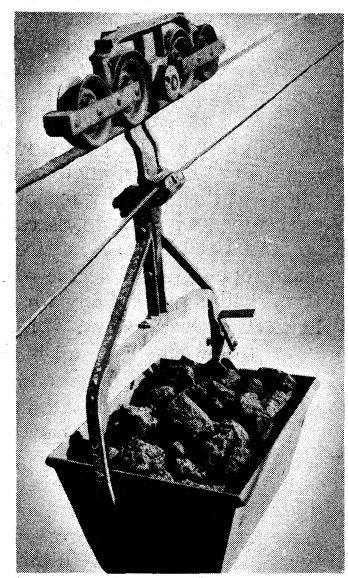
Ropes died at Boston, Mass., on Oct. 28, 1899.

His chief work is an unfinished *Story* of *the Civil War,* to which he devoted most of his later years; this covers the years 1861–62 (1894–98). It was completed in five volumes in 1913 by W. R. Livermore. *The Army under Pope* (in "Campaigns of the Civil War," vol. iv, 1881) is a detailed narration of the Virginia campaign of Aug.–Sept., 1862, which played a great part in reversing contemporary judgment on the events of those operaticns, notably the condemnation of Gen. Fitz John Porter's conduct. His *Campaign* of *Waterloo* (1892) is a standard work.

ROPEWAYS AND CABLEWAYS. An aerial ropeway is a special form of railway in which the traffic-carrying unit is a steel wire rope. Whereas in a railway the path for the traffic is formed by steel rails laid along the ground, a ropeway uses a tensioned wire rope supported above the ground. It can be used for the transport of both materials and passengers.

Until steel wire ropes came into use, ropeways were limited in scope by the relatively low strength of hemp or other natural fibres; and the popular impression of the origin of ropeways is based on a mid-17th-century print showing a crude form of installation in which such fibre ropes were used. It was the steel wire rope which made ropeways an important modern means of transport. They are particularly useful in regions where their facility in surmounting natural barriers gives them a great advantage over railways or roads, both of which m a need heavy civil engineering work to secure easy gradients. Quite apart from this, ropeways have other advantages. They are inexpensive to maintain; their power demand is modest; and they are not seriously affected by adverse climatic conditions.

There are two main types of ropeway systems: monocable and bicable, both are described below. The choice of a particular type depends upon the length and topography of the route, the type and intensity of the traffic, and in many cases the remoteness of the site and the class of labour available for operation.



BRITISH ROPEWAY ENGINEERING CO., LTD.

BICABLE CARRIAGE. BUCKET AND HANGER ON AERIAL ROPEWAY

Monocable **Ropewav.**—This comprises an endless loop of rope which is maintained in continuous circulation by a grooved driving wheel at one end of the route, and kept under tension by a counterweighted wheel at the other end. Tension is necessary both to keep the rope clear of the ground when it is carrying traffic and to prevent it from slipping on the driving wheel. Between the two ends of the route, the outward and return legs of the rope are supported on pulleys carried on towers; these are positioned so as to ease gradients and also maintain ground clearance where the profile is irregular.

The loads are usually carried in containers spaced at regular intervals along the moving rope. The containers are slung from carrier heads provided with clips which, when the rope gradient does not exceed about 23°, merely rest saddlewise on the rope or, for steeper gradients, are arranged to grip the rope mechanically. Small wheels are mounted on the carrier heads, to allow them to be detached in the terminal stations from the moving rope and to run on to a fixed rail where they can come to rest to be loaded or unloaded. The modern practice is to mechanize the propulsion and control of the carriers on the fixed rails by means of slow-speed haulage ropes or chains. This enables angle stations (see below) to work automatically.

Capacities of up to 120 tons per hour can be carried on the less steeply graded routes at a speed of about 2 yd. per second; but in favourable conditions both speed and capacity can be increased by as much as 50%. Steeper gradients are restricted to the smaller capacity installations of up to 50 tons per hour. The individual gross load on the rope seldom exceeds 1% of the hourly net capacity. For example, a monocable system with a net capacity of 100 tons per hour and a speed of 2 yd. per second would be designed with gross loads of 1 ton, the containers and carriers having a total tare weight of about $\frac{1}{4}$ ton.

Monocable ropeways with positive-acting, mechanically operated grips can work on rope gradients of up to 40°, and can run at speeds of 3 yd. per second or more. They are most com-

monly used for the transport of passengers, particularly in mountainous districts, since the carriers with two or four persons lend themselves to the fitting of special devices required by law to ensure safe transport of the passengers.

Bicable Ropeway. — In this system two stationary carrying ropes are employed, these being parallel to one another and held under tension above the ground. on towers suitably positioned. Spans of over 1,000 yd. can be used if conditions permit. The containers have carriers with wheels arranged to run on the t o fixed ropes; a separate endless moving rope is used to haul the carriers along these fixed ropes, the moving rope being driven and tensioned as in the case of the monocable system. The carriers are provided with mechanical grips which automatically attach and detach themselves from the moving rope when the carriers are leaving from or arriving at the terminal stations. Angle stations are automatic in action unless the carrier needs to be detached for other reasons.

The terminal stations have fixed rails on which the carriers can run. these rails being structural prolongations of the fixed ropes along the route, and usually arranged to provide a connecting loop between the incoming and outgoing ropes. The propulsion of the carriers along the station rails is usually mechanized by a prolongation of the haulage rope, or by a separate slow-speed rope if the containers have to be loaded.

Bicable ropeways are used where rope gradients are considerable—up to 40'—and where capacities are high—up to 500 tons per hour, at the generally accepted speed of about 3 yd. per second. Very heavy individual loads can be carried because the carrying ropes can be increased in size without materially affecting the haulage rope. Many bicable ropeways exist with individual loads of over 5 tons net, usually for carrying logs.

Length of Ropeways. — Many long ropeways have been built, on both the monocable and bicable systems, but they all consist of a series of short, interconnected ropeways. Each section is preferably routed in a straight line of 3–6 mi. length, but the junction of two sections can be set at an angle to secure any necessary diversion of the general route. The junction stations can be arranged as intermediate loading or unloading stations, with accommodation sidings or shunts.

Two examples of long ropeways are: Kristineberg to Boliden. in Sweden, a distance of 60 mi., with a bicable ropeway handling 500.000 tons of iron ore per year; and Mariquita to Manizales, in Colombia, a distance of 47 mi., with a monocable ropeway handling 25 tons of general merchandise per hour.

Aerial Cableways. — An aerial cableway is a special form of overhead crane in which the hoisting and cross-traveling carriage runs in a single span on one or more steel wire ropes instead of on a rigid horizontal girder. The use of a single rope span mith a traveling carriage goes back to Roman times, but one of the earliest recorded cableways with steel ropes was built in Scotland in 1873 for a load of 3 tons of granite. Lifting capacities grew steadily over the years: 8 tons in 1884; 10 tons in 1902; 20 tons in 1919 and 150 tons in 1932.

An aerial cableway can cover much larger areas than a rigid structure can, and installations are commonly built with spans of 1.500–3,000 ft. The carrying ropes terminate at each end of the span in structural steel towers. One of these, known as the head tower, incorporates the mechanism for tensioning the ropes. and also the driving machinery and controls both for moving the hoisting and cross-traverse carriage backward and forward over the spans, and for raising or lowering the load hook. The tail tower. at the other end of the span, provides termination and support for the ropes at the required elevation.

The cross-traverse motion is obtained by means of an endless loop of rope tensioned and driven by means similar to those applying to monocable ropeways, and spanning the gap between the towers just below the carrying ropes on which the carriage runs. The carriage is permanently attached to the cross-traverse rope and moves mith it. The hoisting motion is obtained by a separate rope passing from a winch mechanism out over the span, and reeved through the carriage down to the load hook. The carrying ropes are sufficiently tensioned to ensure that the ratio between sag and span is not more than about 1 to 20 when the fully-loaded carriage is at the middle of the span.

In the simplest case both head and tail towers are fixed, in which case the cableway provides service along the line only; but either one or both of them can be mobile, thus covering an area which is either triangular or rectangular in shape. Their ability to cover large service areas makes cableway installations particularly useful in the construction of dams. The head and tail towers are usually situated high up on the flanks of the valley in which the dam is to be built, and their available movements are arranged so as to command beneath the load hook the whole of the construction area. The cableway then serves to remove excavated material, to place the formwork and reinforcement for the concrete, and finally to carry the concrete itself from the mixing plant to the formwork.

The largest cableway built was for the U.S. reclamation bureau, Denver, Colo., for use on the Hoover (Boulder) dam. It had a capacity of 150 tons, a span of 1,256 ft. and used six supporting ropes for the carriage to run upon.

The rope techniques evolved for ropeways and cableways have been extended to new forms of conveying; instead of the intermittent containers mentioned above, continuous systems are carried by running ropes.

ROPS, FÉLICIEN (1833–1898), Belgian painter and graphic artist. who ranks as a modern master in printmaking, was born at Namur, July 10, 1833. Rops spent his childhood in Namur, later going to Brussels. In 1856 he composed for friends at the university the *Almanach crocodilien,* his first work. He brought out two *Salons illustrés* and collaborated on the *Crocodile,* a students' magazine. This attracted the attention of publishers and he designed frontispieces for P. A. Poulet-Malassis and Gay. In 1859–60 he contributed some of his finest lithographs to the satirical journal, *Uylenspiegel.* About 1860 he went to Paris and worked in the studio of H. A. Jacquemart but returned to Brussels and founded the short-lived International Society of Etchers. In 1865 he produced his famous "Buveuse d'absinthe" (Absinthe drinker) and in 1871, "Dame au Pantin." After 1874 Rops resided in Paris, devoting himself principally to illustrating books. Among his notable book illustrations are *Le'gendes flamandes* by *C.* de Coster, *Jeune France* by Théophile Gautier, *Les Diaboliques* by Barbey d'Aurévilly, *Zadig* by Voltaire and the poems of Stéphane Mallarmé. Many have frontispieces which exhibit his fertile and powerful imagination. He published *Cent croquis pour réjouir les honnêtes gens* ("One hundred sketches to delight solid citizens"). Rops joined the Art Society of the "XX," formed at Brussels in 1884, as their revolutionary views were in harmony with the independence of his spirit. He died at Essonnes, Fr., on Aug. 22, 1898.

After Rops's death, the Libre Esthétique, which had succeeded the "XX," arranged a retrospective exhibition (1899) of his paintings and drawings. M. Exsteens, in his definitive catalogue of the prints of Rops, lists 1.193 subjects. It is unfortunate that these survive more for their so-called licentiousness and their free choice of subject than for any other reason, because his work as a printmaker is most important, both for its brilliance of technique and its originality of content. His handling of dry point marks him as one of the masters of the medium; he was one of the first modern etchers to revive the neglected medium of soft-ground etching and employ it to great effect. Although Rops was a friend of Charles Baudelaire, the poet, Rops's work has a spiritual counterpart in literature in the diabolical dandyism of Barbey d'Aurevilly more than in the *Fleurs du mal.*

See E. Ramiro, *Fe'licien Rops* (1905), the best monograph on the artist, and M. Exsteens, *L'Oeuvre grave' et lithographié de Félicien Rops,* 4 vol. (1928), a complete descriptive catalogue of all of Rops's prints with illustrations of each work. (H. Es.)

ROQUE: *see* CROQUET AND ROQUE.

RORIDULA, a genus of flowering undershrubs of the family Droseraceae, of which there are two species peculiar to the mountains of South Africa. In both species the leaves are armed with numerous stalked glands, superficially resembling the tentacles of Drosera (see SUNDEW) and secreting a sticky material which catches insects. These characters led to the belief that the plants are carnivorous. It was shown, however, that the secretion is not mucilaginous but resinous. which at once excludes the possibility of carnivory. since enzymes work in a watery medium. Moreover, the tentacular glands in Roridula are of entirely different structure from that in Drosera, having resin glands opening by ducts at the apex of the gland. (F. E. L.; X.)

RORQUAL, the common name for several species of large whales of the genus Balaenoptera. They are slender and elongate, with a small dorsal fin and longitudinal folds on the throat. The flippers are small, the head small and flat, the baleen or whalebone coarse and short and the tail much compressed. All rorquals feed on small crustaceans and fish, which they strain from the water through the baleen plates. Among the rorquals is Sibbald's rorqual or the blue whale, the largest of all living animals; the common rorqual or fin whale; Rudolphi's rorqual or Sei whale; and the lesser rorqual or piked whale. Most rorquals are cosmopolitan in distribution. ***See*** WHALE.

RORSCHACH, HERMANN (1884–1922), Swiss psychiatrist, who devised the ink-blot test known by his name and widely used in diagnosis of psychopathologic conditions, was born in Ziirich, Switz., Nov. 8, 1884. As a psychoanalyst, Rorschach was oriented toward exploring the personality in depth, not only tracing the intellectual activity but also reaching into the emotional forces and the unconscious. The test consists of ten symmetrical ink blots. Earlier investigators had used ink blots as free association stimuli but had generally limited themselves to studying the thematic content. Rorschach's advance was in systematically analyzing the patient's attention to wholes or details of the blot figures, colour and shading, apparent movement in human form percepts and other factors. Thus he penetrated to psychologic processes or "structure" of the personality and found differential patterns for the several clinical pictures. The test has been criticized by experimentalists because of the difficulty of maintaining its variables under strict laboratory control. As an aid toward diagnosis in psychopathology, however, it has proved itself very valuable and is used in many countries. Rorschach looked on his work as experiment in perception and emphasized an empirical statistical orientation. He died at Herisau, Switz., April 2, 1922. His best-known work is Psychodiagnostics (English translation by P. Lemkau and B. Kronenberg, 1942).

See Samuel J. Beck, *Rorschach's Test,* vol. iii *(1952).* (S. J. BK.)

ROSA, CARL AUGUST NICHOLAS (1842–1889), English musical impresario, was born at Hamburg, Ger., on March 22, 1842, his family name (which he subsequently changed) being Rose. He started as a solo violinist, studying at Leipzig and Paris. In 1867 he met and married the famous operatic soprano Madame Parepa (1836–74). In 187j he started the Carl Rosa Opera company. He died in Paris on April 30. 1889.

ROSA, SALVATOR (1615–1673), Italian painter of the Neapolitan school, best known for his wild landscapes and battle scenes, was born in Arenella, near Naples, on July 21, 1615, according to the writer G. B. Passeri. Rosa went to his uncle Paolo Greco to learn painting, then to his brother-in-la+ Francesco Fracanzano, a pupil of Giuseppe Ribera, and afterward to Ribera himself. He obtained some instruction under the battle-painter Aniello Falcone. Encouraged by the painter G. Lanfranco, he went to Rome in 1635 to study, but catching fever, he returned to Naples and Falcone. and for a while painted nothing but battle pieces.

Rosa went on to the landscape art peculiarly characteristic of him — savage scenes peopled with shepherds, seamen or. especially. soldiers. He then revisited Rome and was housed by Cardinal Brancaccio. In 1637 he took part in the insurrection of Masaniello against the Spaniards but on the approach of Don John of Austria he escaped to Rome. He was an actor, poet and musician as well as a painter. It was about this time that Rosa wrote his satire Babylon, under which name Rome was indicated.

Cardinal Giancarlo de' Medici invited the painter to Florence, where he remained for the better part of nine years, introducing there the new style of landscape; he had no pupils, but various imitators. Lorenzo Lippi the painter-poet, and other *beaux* esprits shared with Rosa the hospitalities of the cardinal, and they formed an academy named I Percossi ("the Stricken"). He was well acquainted also with Ugo and Giulio Maffei in Volterra, where he wrote four other satires—*Music,* Poetry, *Painting* and *War.* Finally he returned once more to Rome. To confute his detractors he wrote the last of the series, entitled Envy. Among the pictures of his closing years were the "Battlepiece" (Louvre, Paris); "Pythagoras and the Fishermen"; the "Conspiracy of Catiline," considered one of his best works (Pitti gallery, Florence); and "Saul and the Witch of Endor" (Louvre. Paris:).

His etchings reflect his sympathy with the rough and ready life of the soldier and peasant. He also produced a number of large mythological and historical plates. He died in Rome on March 1 j. 1673.

See E. W. Manwaring, *Italian Landscape in 18th Century England* (1925); Irene Cattaneo, *Salvatore Rosa* (1929).

ROSA, MONTE, the name of a great glacier-clad mountain mass (Aostan patois word roese, "a glacier") which rises southeast of Zermatt and on the frontier between Switzerland and Italy. Ten summits in this huge mass are distinguished by name; of which four (Nordend, 15,131 ft., Zumstcinspitze, 14.964 ft., Signalkuppe or Punta Gnifetti, 14,957 ft., and Parrotspitze. 14,-642 ft.) rise on the frontier. The five lower summits are on the Italian slope. but the highest of all. the Dufourspitze, 15,203 ft. (named by the Swiss government in honour of General Dufour. the head of the survey which first accurately fixed the position of these points), rises west of the frontier ridge, on a buttress, and being entirely in Switzerland, is its highest peak (not, as often stated, the Dom, 14,911 ft., in the Mischabel group). The summit of the Dufourspitze was first attained in 1855 by a large English party, including G. and C. Smyth and C. Hudson. The Zumsteinspitze was first climbed in 1820, the Signalkuppe (on top of which there is now a club hut) in 1842, the Nordend in 1861 and the Parrotspitze in 1863.

ROSACEAE, a large cosmopolitan family of seed-bearing dicotyledonous plants belonging to the order Rosales (see PLANTS AND PLANT SCIENCE: Dicotyledons) and containing about 100 genera with more than 2,000 species.

Habit of Growth. — The plants vary widely in habit of growth. Many are herbaceous, growing erect, as *Geum,* or with slender creeping stem, as in species of Potentilla, sometimes sending out long runners, as in strawberry; others are shrubby, as raspberry, often associated with a scrambling habit, as in the brambles and roses, while apple, cherry, pear. plum and other fruit trees represent the arborescent habit. Vegetative propagation takes place by means of runners, which root at the apex and form a new plant, as in strawberry; by suckers springing from the base of the shoot and rising to form new leafy shoots after running for some distance beneath the soil, as in raspberry; or by shoots produced from the roots. as in cherry or plum. The scrambling of the brambles and roses is effected by means of prickles on the branches and leafstalks.

Distribution. — In North America, Rosaceae are represented by about 40 genera, the largest being Crataegus (ha thorn) with about 70 or more species, *Rubus* (bramble) with 100 or more species. Potentilla (cinquefoil, five finger) with about 100 species, *Prunus* (plum, cherry, etc.) with 30 species, and Rosa with 90 species. Potentilla is the most generally distributed genus in the United States.

The family is characteristically typical of temperate and subtemperate regions, but some genera, such as *Rubus,* are of worldwide distribution. The strictly tropical groups are mostly trees and shrubs in such genera as *Chrysobalanus, Hirtella, Coupeia, Parinarium,* etc.

Leaf Arrangement. — The leaves, which are arranged alternately, are simple. as in apple. cherry. etc., but more often compound. with leaflets palmately arranged, as in stranberry and spe-

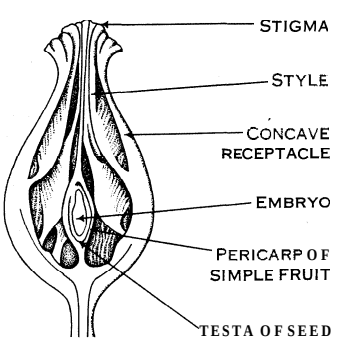
FIG. 1.—CHERRY (PRUNUS CERASUS), SHOWING (A) VERTICAL SECTION OF THE DRUPE OF CHERRY, CUT VERTICALLY THROUGH THE VENTRAL AND DORSAL SUTURE: (B) FRUIT CUT VERTICALLY IN A PLANE AT RIGHT ANGLES TO PRECEDING ONE

cies of *Potentilla*, or pinnately arranged, as in the brambles, roses, mountain ash, etc. In warm climates the leaves are often leathery and evergreen. The leaves are stipulate, the stipules being sometimes small and short-lived, as in *Pyrus*, *Malus* and *Prunus* (cherry, plum. etc.), or more important structures adnate to the base of the leafstalk, as in roses, brambles, etc.

Flowers.— The flowers, which are regular, generally bisexual and often showy, are sometimes borne singly, as in some species of rose, or of the cloudberry (*Rubus chamaemorus*), or few or more together in a corymbose manner, as in some roses, hawthorn and others. The inflorescence in agrimony is a raceme, in *Poterium* a dense-flowered spike, in *Spiraea*, a number of cymes arranged in a corymb. The parts of the flowers are arranged on a pentamerous plan, with generally considerable increase in the number of stamens and carpels.

The shape of the thalamus or floral receptacle, and the relative position and number of the stamens and carpels and the character of the fruit, vary widely and form distinguishing features of the different subfamilies, six of which may be recognized.

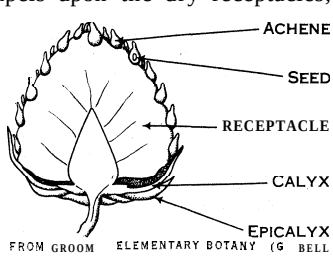


FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

FIG. 2.—DOG ROSE (ROSA CANINA), SHOWING VERTICAL SECTION OF COMPOUND FRUIT

Subfamilies.—*Subfamily I.*—Spiraeoideae is characterized by a flat or slightly concave receptacle on which the carpels, frequently two to five in number, form a central whorl; each ovary contains several ovules, and the fruit is a follicle except in *Holodiscus*. The plants are generally shrubs with simple or compound leaves and racemes or panicles of numerous small white, rose or purple flowers. This subfamily is nearly allied to Saxifragaceae, chiefly north temperate in distribution. The largest genus is *Spiraea*, with numerous species cultivated in gardens.

Subfamily II.—*Rosoideae*, the largest subfamily, with **40** genera and more than 1,000 species. is characterized by the receptacle being convex and swollen, as in strawberry, or cup-shaped, as in rose, and bearing numerous carpels, each of which contains one or two ovules, while the fruit is one-seeded and indehiscent. The genera are grouped in tribes according to the form of the receptacle and of the fruit. The Potentilleae bear the carpels on a large, rounded or convex outgrowth of the receptacle. In the large genus *Rubus* the ripe ovaries form drupels upon the dry receptacles; the genus is almost cosmopolitan, but the majority of species occur in the forest region of the north temperate zone and in the mountains of tropical America. *R. fruticosus* is blackberry, *R. idaeus*, raspberry and *R. chamaemorus*, cloudberry. In the flower of *Potentilla*, *Fragaria* (strawberry) and a few allied genera an epicalyx is formed by stipular structures arising at the base of the sepals.

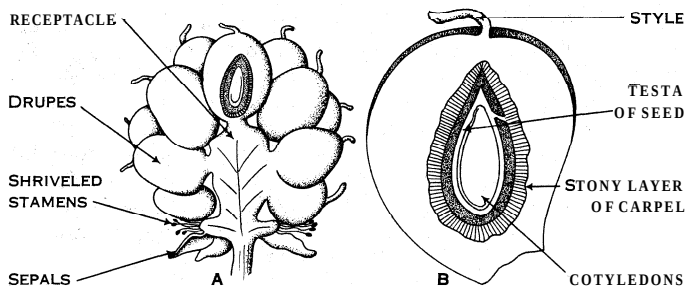


FROM GROOM ELEMENTARY BOTANY (G BELL & SONS)

FIG 3.—STRAWBERRY (FRAGARIA VESCA), SHOWING VERTICAL SECTION OF COMPOUND FRUIT

The fruits consist of numerous dry achenes, borne in *Fragaria* on the much-enlarged succulent torus, which in the other genera is dry. In *Geum* (avens) and in *Dryas* (an arctic and alpine genus) the style is persistent in the fruit, forming a feathery appendage (*Dryas*) or a barbed awn (avens), either of which is of service in distributing the fruit. The Potentilleae are chiefly north temperate, arctic and alpine plants.

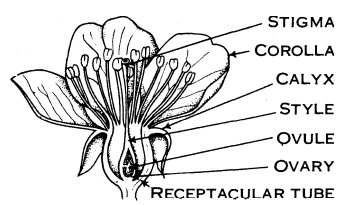
The Roseae comprise the large genus *Rosa* (with possibly 200 species) characterized by a more or less urn-shaped torus enclosing the numerous carpels which form dry one-seeded fruits enveloped in the bright-coloured fleshy torus. The plants are shrubs bearing prickles on the stems and leaves; many species have a scrambling habit resembling the brambles. The species of *Rosa*, like those of *Rubus*, are extremely variable, and a great number of subspecies, varieties and forms have been described. Petals are often wanting, as in *Alchemilla* (lady's mantle) and *Poterium*, and the flowers are often unisexual and frequently wind-pollinated, as in salad burnet (*Sanguisorba minor*), where the small flowers are crowded in heads, the upper pistillate, with protruding feathery stigmas, and the lower staminate (or bisexual), with exserted stamens. *Agrimonia* (agrimony) has a long spike of small honeyless flowers with yellow petals; in the fruit the torus becomes hard and crowned by hooked bristles, which ensure the distribution of the enclosed achenes.



FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

FIG. 4.— BLACKBERRY (RUBUS FRUTICOSUS), SHOWING (A) VERTICAL SECTION OF COMPOUND FRUIT. (B) VERTICAL SECTION OF SINGLE DRUPE (ENLARGED)

Subfamily III.—*Pomoideae* is characterized by a deep cup-shaped receptacle with the inner wall of which the two to five carpels are united; the carpels arc also united with each other, and each contains generally two ovules. The fruit is made up of the large fleshy receptacle surrounding the ripe ovaries, the endocarp of which is leathery or stony and contains one seed. The plants are shrubs or trees with simple or pinnately compound leaves and white or rose-coloured often showy flowers. The genera are distributed through the north temperate zone, extending southward in the new world to the Andes of Peru and Chile.

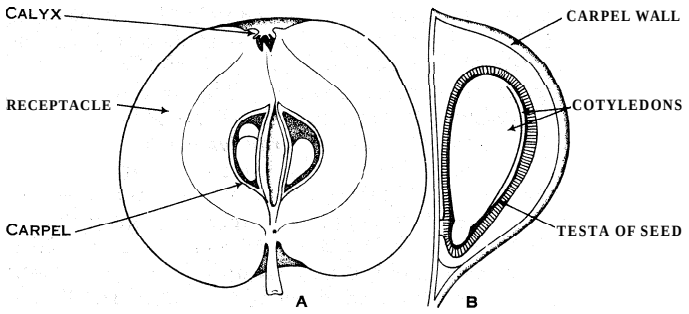


FROM GROOM, "ELEMENTARY BOTANY" (G. BELL & SONS)

FIG. 5.—VERTICAL SECTION OF FLOWER OF CHERRY

While some botanists still continue to include the pears and the apple and even the mountain ash in *Pyrus* as a collective genus, most now recognize three genera, *Malus* to take the apples, a genus of about 25 species, the common apple being *Malus pumila*, formerly known as *Pyrus malus; Pyrus* to take the pears, a genus of about 20 species, the common pear being *Pyrus communis;* and *Sorbus*, a genus of about **80** species to take the rowan or mountain ash (*S. aucuparia*), wild service (*S. torminalis*), American mountain ash (*S. americana*) and white beam (*S. aria*). *Mespilus* (medlar), with a single species, and *Cotoneaster*, with about **50** species, are also included. All these genera are confined to the north temperate zone.

Subfamily IV.—*Neuradoideae* contains only three genera of small annual herbs of African and Indian deserts. The flowers are yellow, and the five to ten carpels are united together and with the base of the cup-shaped torus, which enlarges to form a dry



FROM GROOM, "ELEMENTARY BOTANY (G BELL & SONS)

FIG. 6.— APPLE (MALUS PUMILA), SHOWING (A) VERTICAL SECTION OF FRUIT, (B) ONE OF THE PARCHMENTLIKE SEED CHAMBERS REMOVED FROM THE FRUIT

covering round the one-seeded fruits.

Subfamily V.—Prunoideae is characterized by a free solitary carpel with a terminal style and two pendulous ovules, and the fruit a one-seeded drupe. The torus forms a cup from the edge of which spring the other parts of the flower. The plants are deciduous or evergreen trees or shrubs with simple leaves, often with small caducous stipules, and racemes or umbels of generally showy. white or pink flowers. There are six genera. the chief of which is Prunus, to which belong the plum (Prunus communis), with several well-marked subspecies—sloe or blackthorn (P. *spinosa*). bullace (P. *insititia*), wild plum (P. *domestica*), the almond (P. amygdalus) with the nearly allied peach (P. *persica*), cherry (P. *cerasus*), birdcherry (P. *padus*) and cherry laurel (P. laurocerasus). The subfamily is distributed through the north temperate zone, passing into the tropics.

Subfamily VI.—Chrysobalanoideae resembles the last in having a single free carpel and the fruit a drupe, but differs in having the style basal, not terminal, and the ovules ascending, not pendulous; the flowers are frequently zygomorphic. The genera are tropical evergreen trees or shrubs, the great majority being South American. See also STRAWBERRY; APPLE; CHERRY; PLUM.

(G. N. J.)

ROSAMOND, known as "The Fair" (d. c. 1176), mistress of Henry II, king of England, is believed to have been the daughter of Walter de Clifford of the family of Fitz-Ponce. Rosamond is said to have been Henry's mistress secretly for several years. but was openly acknowledged by him only when he imprisoned his wife Eleanor of Acquitaine as a punishment for her encouragement of her sons in the rebellion of 1173–74. Rosamond died in 1176. and was buried in the nunnery church of Godstow before the high altar. The body was removed by order of St. Hugh, bishop of Lincoln, in 1191, and was, seemingly. reinterred in the chapter house. The story that she was poisoned by Queen Eleanor first appears in the French Chronicle of London in the 14th century. The romantic details of the labyrinth at Woodstock, and the clue which guided King Henry II to her bower, were the inventions of story writers of later times. There is no evidence for the belief that she mas the mother of Henry's natural son William Longsword, earl of Salisbury.

ROSARIO, a city and river port of Argentina, in the province of Santa FC, on the west bank of the Paraná, 186 mi. N.W. of Buenos Aires by rail. Pop. (1960) 671,852. It ranks next to Buenos Aires in size and in trade. It is accessible to ocean-going steamers of 26 ft. draught. The city stands on the eastern margin of the great pampean plain, 65 to 75 ft. above the wide riverbed washed out by the Paraná. It extends back a considerable distance from the river. The city is laid out with chessboard regularity, with wide streets and spacious parks. The Boulevard El Santafecino is an attractive residential street with double driveways separated by a strip of garden and bordered by fine shade trees. The chief edifices of an official character are the custom-house, post office, municipal hall and law courts. Industries include sugar refining, flour milling, brening, printing and the manufacture of bricks. leather, furniture and various kinds of food. The city is chiefly commercial, being the shipping port for a large part of northern Argentina. Among its exports are wheat, flour, baled hay, linseed, Indian corn, sugar, rum, cattle, hides, meats, wool and quebracho extract.

ROSARY, a popular devotion of the Roman Catholic Church, consisting of 15 Pater Nosters and Glorias and 150 Aves. The word also denotes the chaplet of beads for counting the prayers. It is divided into three parts, each containing five decades, a decade comprising one Pater, ten Aves and a Gloria, in addition to a subject for meditation selected from the "mysteries" of the life of Christ and of the Blessed Virgin. The Christian practice of repeating prayers is traceable to early times: Sozomen mentions the hermit Paul of the 4th century who threw away a pebble as he recited each of his 300 daily prayers. It is not known precisely when the mechanical device of the rosary was first used. William of Malmesbury says that Godiva, who founded a religious house at Coventry in 1043, left a string of jewels, on which she had told her prayers, that it might be hung on the statue of the Blessed Virgin. Thomas of Cantimpré, who wrote about the middle of the 13th century, first mentions the word "rosary," using it in a mystical sense as Mary's rose garden. Jacob Sprenger, a Dominican, founded the first confraternity of the Rosary at Cologne in 1474. The feast of the Rosary of the Blessed Virgin Mary was ordered to be observed on the first Sunday in October in such churches as maintained an altar in honour of the Rosary. Clement XI, by bull of Oct. 3, 1716, directed the observance of the feast by all Christendom.

ROSAS, JUAN MANUEL DE (1793–1877), tyrant of Buenos Aires and noted political figure in Argentine history, mas born March 30, 1793, in Buenos Aires. His parents were Léon Ortiz de Rozas and Agustina Lopez de Osornio, both of noble Spanish descent, and together they held perhaps the greatest family wealth in Buenos Aires province, consisting mainly of *estancias* (cattle ranches). Rosas received a primary education in the city of Buenos Aires, but as a young man preferred to spend his time on the family ranches where he became a complete *gaucho* (cowboy). He himself gradually acquired land south of the Salado river in Buenos Aires province, stocked it with cattle, and organized about him a force of *gauchos* trained with an iron discipline to which he was the first to subject himself..

On March 16, 1813, he married Encarnación Ezcurra y Arguibel. Then, after turning back to his parents all the properties he had administered for them. he established the large *estancia* of Los Cerrillos and a meat-salting plant in partnership with a friend.

His fame as a trainer of men brought him in 1815 the title of ojicial de *milicias* and in 1820 he was made a colonel of cavalry. Col. Manuel Dorrego, Federalist leader and governor of the province of Buenos Aires, later made Rosas *comandante* de la *campaña*, and when Dorrego was overthrown and executed in 1828 by Juan Lavalle, Rosas took over the Federalist party command, defeated Lavalle, the leader of the *unitarios* (Centralists), and in Dec. 1829 had himself elected governor of Buenos Aires. During his three-year term Rosas gave the province the first peace it had known in many years using bribery, political maneuvers and force to bring malcontents into line. A servile legislature made him brigadier-general and gave him the title of "Restorer of the Laws." He refused to be re-elected in 1832 and instead went south to fight the Indians, freeing white captives and capturing much-desired lands for himself and his followers.

Renewed political agitation, instigated and abetted by his followers (including his wife), brought disorder and confusion again to the province and an urgent demand for Rosas' return to power. But this time he refused to serve as governor unless granted complete dictatorial power, which the legislature gratefully gave him. In March 1835 he became dictator of Buenos Aires, a position he held until 1852. Other provincial governments permitted him to run their military and foreign affairs and usually did his bidding. Rosas refused to call a constitutional convention. His Argentine confederation (as he called it) continued under his domination as leader of the Federalist party, while the *unitarios* were pursued until captured or harried out of the land.

He quashed several revolutions that broke out against his tyranny. Killings of Rosas' opponents by his henchmen became the

order of the day. By 1840 few dared oppose him.

Rosas' policies embroiled him also in foreign conflicts, including wars with neighbouring countries and with England and France. Finally a coalition of Brazilians, Uruguayans, French troops and native Argentines under the leadership of Justo José de Urquiza overthrew him in the battle of Caseros (Feb. 3, 1852). Rosas fled to England and retired to a farm near Southhampton, where he died on March 14, 1877.

Much has been written on the Rosas regime, including some comparisons with the later Péron regime. Rosas has his modern admirers in Argentina, but in general Argentine historians have been critical of his rule, pointing out at the same time that he was perhaps indispensable in his day to bring law and order to an Argentina sunk in political anarchy following the winning of independence from Spain. (F. L. HN.)

ROSCELIN (*c.* 1050–*c.* 1125), in Latin called ROSCELLINUS COMPENDIENSIS, French philosopher and theologian, famous as an extreme nominalist, was born at Compiègne (Compendium). Having studied at Soissons and at Reims, he taught at Compiègne, at Loches (where he had Abelard as his pupil), at Besançon and at Tours. His only extant work seems to be a violent and vulgar letter to Abelard on the Trinity; the little that is known of his doctrines is otherwise derived from St. Anselm's and from Abelard's works and from the anonymous *De generibus* et *speciebus*. According to Roscelin, universals are nothing more than verbal expressions (in Anselm's words, *flatus vocis)*; Roscelin was, therefore, considered as the originator of extreme nominalism (*q.v.*). Again, no one thing can be divided into parts; every "part" is a whole in itself, and the division of "wholes" into "parts" is possible only in words, not in reality. Not even a syllogism is a unity; each proposition in it has a value in its own right without forming a whole with the others. Roscelin's doctrine of the Trinity, as consisting of three essences or substances—a doctrine inappropriately called "tritheism"—is partly based on the accepted Boethian definition of *persona* as *substuntie rationalis;* if God were one substance, all three persons would have been incarnated. It is not clear how this doctrine is connected with Roscelin's nominalism, nor how and whether he retracted it after his condemnation at the council of Soissons (1092).

BIBLIOGRAPHY.—Roscelin's letter to Abelard was first edited by J. A. Schmeller in the *Abhandlungen* of the Royal Bavarian academy, vol. iii (1849–50); for a later edition *see* F. Picavet, *Roscelin philosophe et théologien,* 2nd ed. (1911), the best documented work on Roscelin. (L. M.-Po.)

ROSCIUS (GALLUS), QUINTUS (c. 126–62 B.C.), a Roman actor, so famous that the name "Roscius" became used to designate a successful actor. was born at Solonium, near Lanuvium. He studied the delivery and gestures of the most distinguished advocates in the Forum, especially Q. Hortensius, and won universal praise for his grace and elegance on the stage. He especially excelled in comedy. Cicero took lessons from him. The two often engaged in friendly rivalry to try whether the orator or the actor could express a thought or emotion with the greater effect, and Roscius wrote a treatise in which he compared acting and oratory. Q. Lutatius Catulus composed a quatrain in his honour, and the dictator Sulla presented him with a gold ring, the badge of the equestrian order, a remarkable distinction for an actor in Rome, where the profession.was held in contempt. Like his contemporary Aesopus, Roscius amassed a large fortune, and he appears to have retired from the stage some time before his death. In 76 B.C. he was sued by C. Fannius Chaerea for 50,000 sesterces and was defended by Cicero in a famous speech.

ROSCOMMON, WENTWORTH DILLON, 4TH EARL OF (*c.* 1633–1685) English poet and critic. described by Pope as the only moral writer of Charles II's time. was born in Ireland about 1633, son of Sir James Dillon, 3rd earl of Roscommon, and nephew of the earl of Strafford, then lord deputy of Ireland. He was educated privately at Strafford's house in Yorkshire and, after his uncle's impeachment (1641), at the Protestant university of Caen in Normandy: he then toured Europe. Succeeding to the earldom in 1639, he returned to England in 1660. had his estates restored to him and soon won favour at Charles II's court. It is said that he became an immoderate gambler. After passing some time in Ireland he returned to London in 1662. He planned; together with Dryden and others, to form an academy on the continental model, which was to fix and refine the language and translate classical works into English. The design came to nothing, but Roscommon translated *Ars Poetica* into English blank verse in 1680. In his *Essay on Translated Verse* (1684) he n-as the first critic to praise *Paradise Lost* publicly. Dryden spoke highly of the *Essay*, though Johnson thought it unimportant, and considered Roscommon "elegant but not great." His writings, though they have merit, might not have been so highly commended as they were in his own time had he been of inferior rank. Both Oxford and Cambridge conferred doctorates on him. He died in Westminster, Jan. 17, 1685.

ROSCOMMON, a county of Ireland in the province of Connaught, bounded northeast by Leitrim, northwest by Sligo, west by Mayo, west and south by Galway, east by Longford and east and south by Westmeath and Offaly counties. The land area is 608,540 ac. or 950.8 sq.mi. Pop. (1956) 63,710 Most of the county belongs to the great limestone plain of central Ireland. The land is generally poor and used for grazing, with oats as the principal crop; there are a few small market towns and villages. In the northeast, on the Leitrim border, the Bralieve mountains, consisting of flat-topped ridges, attain an elevation in Cashel mountain of 1,377 ft.; and in the northwest the Curlew hills, of similar formation, between Roscommon and Sligo, rise abruptly to a height of more than 800 ft. In the east the Slieve Bawn range, formed of sandstone, has a similar elevation. The Shannon forms nearly the whole eastern boundary of the county, and on the west the Suck from Mayo forms for more than 50 mi. the boundary with Galway until it unites with the Shannon at Shannon Bridge. The other tributaries of the Shannon within the county are the Arigna, the Feorish and the Boyle. The lakes formed by expansions of the Shannon are Loughs Allen, Boderg, Boffin, Forbes and Ree. Other lakes are Lough Key in the north and Lough Gara (mostly in County Sligo) in the northwest. The county town, Roscommon, has a population of (1961) 1,697.

The district was granted by Henry III to Richard de Burgh, but remained almost wholly in the possession of the native septs. Until the time of Elizabeth I Connaught was included in the two districts of Roscommon and Clare and when these were subdivided, Roscommon was assigned its present limits. All the old proprietors were dispossessed at the Cromwellian settlement: except the O'Connor family headed by the O'Connor Don. Within the county are the ruins of Croghan, the palace of the kings of Connaught. The principal ancient castles are the stronghold of the M'Dermotts on Castle Island, Lough Key, the dismantled castle of the M'Donoughs at Ballinafad and the extensive fortress at Roscommon rebuilt by John d'Ufford, justiciary of Ireland in 1268. The abbey of Boyle, which is in good preservation, has Norman arches. The Irish bard Carolan, who died in 1738, is buried by the ruined church of Kilronan. The Protestant bishopric of Elphin was united with Kilmore and Ardagh in 1833. The Roman Catholic diocese of Xchonry has its seat at Ballaghaderreen, but some parts of the county are included in the dioceses of Clonfert and Elphin.

The administrative county of Roscommon returns four members to *dail eireann.*

ROSE, any of numerous species of wild or cultivated flowering shrubs of the genus *Rosa*. The rose has been closely associated with the culture of many civilizations. Not only is it a favourite flower but it serves as a symbol of perfection, elegance, romance and love. The Greek poetess Sappho in her "Ode to the Rose" first called it "the queen of flowers." No other flower is so universally known and even the name is easily recognized in most languages of Latin or Germanic origin. It is prominent in painting, architecture, music and literature and figures in legends, customs, heraldry and religion. Roses have been used in medicines and during World War II rose hips or fruits were a source of vitamin C. Rose petals can be used in cookery, particularly for confections, and extracts containing the essential oil which gives the fragrance are used for flavouring desserts or for scent in cosmetics and perfume. From the horticultural point of view roses are important plants. Large acreages are devoted to their production for

garden and greenhouse culture in the leading countries of t world. O the subcontinent oi India, in Iran, the Balkans nnd France large quantities oi blooms are grown ior tl production of the perfume attar of roses (*q.v.*). The great variation in habit oi growth makes them useful in almost any landscape situation.

As a garden flower they possess many admirable qualities. The colour ranges from white through various tones f yellow, pink and dark crimson and maon Many varieties with beautl blends of colour including apricot and salmon tones exist. The form of the rose bloom varies from the delicate primitive charm of the species roses to the fully double, high-centred, beautifully sculptured blooms of the modern hybrid. Size ranges from the tiny miniatures not more than one-half inch in diameter to exhibition flowers seven inches or more across. Few persons fail to enjoy the delightful fragrance of most roses. which varies according to the variety and climatic conditions. While the typical rose odour is that produced by the damask and similar roses known as attar of roses, the scent of other kinds may suggest spices. fruits, hay, other flowers or. as in the case of the tea rose. fresh green tea leaves. Many species and varieties have brilliantly coloured hips which are ornamental during the fall and winter. Because of the history and romance associated with them and the scientific challenge of their culture, rose study is an absorbing hobby. There are national amateur and professional rose organizations in several countries.

COMMON WILD ROSE (ROSA HUMILIS) AND DOMESTIC GARDEN ROSE

The rose gives its name to the botanical family Rosaceae, of which it may be considered the type. Most botanists agree that the genus consists of from 100 to 200 species, although thousands of botanical names have been applied. Roses. even from widely separated regions, hybridize readily, giving rise to types which overlap the parental forms and thus make it difficult to determine basic species. Rose species are distributed primarily in the temperate part of the northern hemisphere, but some are found above the Arctic circle and a few at the higher elevations in the tropics.

Roses are erect, climbing or trailing shrubs, never trees (except in grafted sorts) or herbs. generally more or less copiously armed with prickles of various shapes and sizes popularly called thorns. The leaves are invariably alternate. provided with stipules which are often aromatic glandular. and unequally pinnate. the leaflets varying in number from 1 to 11 or more, the odd leaflet always being at the apex. the others in pairs. The flowers are solitary or in loose corymbs or panicles produced at the ends of the shoots. The flower stalk expands into a fleshy vase- or urn-shaped hypanthium, called the receptacle or receptacular tube or hip which ultimately contains the numerous achenes (seeds).

From the edge of the hypanthium proceed five sepals, often more or less compound like the leaves and overlapping in the bud. Within the sepals are five petals. generally broad or roundish in outline. with a very short stalk or none at all. and of various shades of white. yellow or red. The numerous stamens originate slightly above the sepals and petals; each has a slender filament and a small two-celled anther. The carpels are numerous, covered with hairs. Each is provided with a long style and buttonlike stigma. The carpels are concealed within the hypanthium and only the stigmas as a rule protrude from its mouth. Each carpel contains one ovule.

The hips are usually brightly coloured as an attraction to birds, which devour them and thus bring about the dispersion of the seed. The stamens are in whorls and, according to J. B. Payer, originate in pairs, one on each side of the base of each petal so that there are ten in each row; a second row of ten alternates with the first, a third with the second. and so on. By repeated radial and tangential branching a vast number of stamens are ultimately produced. These stamens may become petaloid, giving rise to double flowers so much admired by gardeners. Under natural circumstances rose flowers do not secrete nectar, the attraction for insects being provided by the colour and perfume and the abundance of pollen for food. The stigmas and anthers come to maturity at the same time; consequently, while cross-pollination by insects is common. self-fertilization is not prevented.

Species.—The numerous roses native to North America belong to about 35 species. The smooth rose (R. *blanda*), usually lacking prickles. with flowers about three inches broad, occurs abundantly from Newfoundland to Saskatchewan and southward to New Jersey and Missouri. The prickly rose (R. *acicularis*). with spiny stems, leaves composed of from five to nine leaflets and solitary flowers two and one-half inches broad, ranges from Quebec to Alaska and south to Colorado. The pasture rose (R. *virginiana*), from one-half to six feet high, with few or solitary flowers two to three inches across. sometimes double, occurs from Newfoundland to Wisconsin and south to Georgia. This is the most common wild rose of the eastern states and Canada. The prairie rose (R. *setigera*). a large shrub with a tendency to climb. the leaves usually with three leaflets, bears rose-pink flowers which turn white with age. This handsome rose. which grows wild from Ontario to Wisconsin and south to Florida and Texas, has become naturalized eastward to New England. The California rose (*R. californica*). a sparsely prickly shrub three to nine feet high, flowering nearly the year round. sometimes forms thickets along streams.

The large number of roses described as European may be included under about 12 generally accepted species. R. *spinosissima*, the Scotch rose, is a low bush densely provided with slender prickles and producing white, pale pink or yellowish flowers one and one-half to two inches across. *R. eglanteria*, the eglantine or sweetbrier, is a stiff, erect, branching bush with pink blooms and sweet-smelling foliage. The dog rose, R. *canina*, including numerous subspecies and varieties, is common along the lanes and hedgerows of England and bears white or pinkish single flowers one to two inches across. The large-fruited apple rose, R. *pomifera*, is prized because of its large scarlet hips which may be one inch or more in diameter. R. *arvensis*, the parent of the Ayrshire rose, is a very thorny shrub with more or less decumbent or creeping branches. The French rose, R. *gallica*, a small shrub three to four feet high, is a variable old and familiar garden rose.

The damask rose, *R. damascena,* possibly of hybrid origin, is similar to *R. gallica* but larger. The cabbage rose, *R. centifolia,* has been cultivated since ancient times for its double fragrant flowers. The moss rose, which has a "mossy" pedicel and calyx, is a variant of this species. *R. rubrifolia* is an unusual shrub because of its reddish glaucous stems and foliage. The cinnamon rose, *R. cinnamomea,* is a hardy old garden species common along fences and roadsides and has double fragrant blooms in shades of red, two inches or more across.

Many species important as cultivated plants and for the hybrids produced with North American and European species are of Asiatic origin. The tea rose *(R. odorata)* from western China is nearly evergreen, has five to seven leaflets and blooms more or less continuously through the year. The fragrant tea-scented flowers are one to three inches across, white, light pink or salmon yellow. The China or Bengal rose *(R. chinensis)* is similar to *R. odorata* but the plants are smaller and the flowers odourless. The Austrian briar *(R. foetida)* is a three- to five-foot shrub with deep yellow flowers two to three inches in diameter, usually solitary. *R. multiflora* is an attractive shrub with long, arching branches. The flowers are one-half to three-fourths inches across and borne 25 to roo in dense panicles. The memorial rose *(R. Wichuraiana)* produces long prostrate stems and fine glossy foliage; the slightly fragrant white flowers are one inch across, borne in clusters. *R. rugosa* is a remarkable species because of its bold rugose foliage, its large red, pink or white flowers and its conspicuous fruits. R. *Moyesii* is an attractive ten-foot shrub with two and one-half inch deep red flowers. R. *Hugonis* is a handsome, hardy shrub producing an abundance of light yellow flowers in early spring. The Macartney rose *(R. bracteata),* introduced into England from China, is a stout evergreen shrub producing lopping shoots 10 to 20 ft. long. The Cherokee rose *(R. laevigata)* is a rampant plant climbing over fences and trees. It is widely planted in southern United States, where it has run wild and appears to be indigenous; in fact, the species was first described botanically from American plants. The Lady Banks rose *(R. Banksiae)* is a high-climbing evergreen with few or no prickles and smooth slender twigs. The flowers are about one inch across, single or double, white or yellow, somewhat fragrant and borne in umbellike clusters.

Roses have been cultivated for so many centuries and have been hybridized so extensively that it is difficult to refer the cultivated forms to wild prototypes. It is generally agreed. however, that the present-day garden varieties of bush roses have been evolved through the repeated intercrossing of *R. gallica, R. damascena, R. centifolia, R. chinensis, R. odorata* and *R. foetida.* Certain traits such as continuous blooming and certain fragrances characteristic of modern roses are traceable to the influence of R. *chinensis* and *R. odorata.* The influence of *R. foetida* is shown through the strong yellow hues of many garden hybrids. Vigour, hardiness and other growth, flower and odour characteristics are apparently derived from *R. gallica, R. damascena* and *R. centifolia.* Many climbing roses resulted from crosses between hybrids of bush types with *R. Wichuraiana, R. multiflora* or other species.

The number of cultivated clones is very large and about 100 are introduced into commerce each year. To facilitate grouping varieties (clones) with similar characteristics, a horticultural classification has evolved which is complicated and often inconsistent. In some cases it is based upon origin from mild species, in others upon habit of growth or manner of flowering. There is considerable overlapping and mergence of classes as the result of relentless interbreeding. Among bush roses the main classes include hybrid perpetuals. teas, hybrid teas, polyanthas, floribundas or hybrid polyanthas and grandifloras. Climbing roses are classed as ramblers, large-flowered climbers, everblooming hardy climbers, climbing forms of hybrid teas, floribundas and other bush types and trailing varieties. A comprehensive list is given in J. H. McFarland's *Modern Roses* IV (1952), which includes 6,150 names. Of these *300* are classed as species or botanical varieties; 3,264 as hybrid teas; 215, hybrid perpetuals; 617, polyanthas and floribundas; 32j, climbing hybrid teas; 249, ramblers; and 173, large-floaered climbers. The list. however, represents only a small proportion of the roses hybridized and named during the preceding 250 years.

Propagation. — Roses are propagated by seeds, cutting, layering, grafting and budding. Most rose seed requires a stratification treatment to hasten germination. Commercially, rose plants are produced largely by budding the desired clone onto an understock. In Europe forms of *R. canina* are used extensively while in the U S. forms of *R. multiflora* are commonly used although in some areas Ragged Robbin, Dr. Huey and forms of *R. odorata* are employed. Tree or standard roses are budded from two to six feet above ground level on a tall, straight cane of the understock. For this purpose forms of *R. canina,* R. *multiflora* and R. *rugosa* are commonly used. Plants for greenhouse culture are usually budded on Manetti *(R. Noisettiana* var. *Manetti).*

Cultivation. — It is important to select a proper location for the rose planting or garden. In moderate or cool climates, full sun is desirable. Where summers are hot, shade during part of the day, particularly in the afternoon, is desirable. Good drainage is essential and, if the site has a tendency to become waterlogged, a tile drainage system should be installed or the beds raised well above ground level. Roses should be planted away from trees or shrubs ahose roots may invade the bed and compete for water and nutrients. Protection from strong winds should be provided. Soil that will grow good vegetables is usually satisfactory. Incorporating organic material such as well-rotted stable manure, leaf mould, compost, peat moss or similar substances improves unsatisfactory soil. The optimum soil reaction range is from *p*H 5.5 to 6.5. Lime should be applied to acid or sour soil and alkaline or sweet soil may be acidified with the use of ferrous sulphate, powdered sulphur or other chemicals.

Most roses are set out as dormant bare-root plants in the spring or fall depending upon the climate. Mounding soil around the base of the plants after planting helps to protect the canes from drying out until root action occurs. Bushes for planting at other seasons are available in pots, tin cans or other containers.

Roses respond to the use of fertilizers and the organic types are preferred, although inorganic mixed fertilizers are satisfactory when properly used. Top-dressing with rotted manure or using liquid manure is advantageous. Watering the beds immediately after fertilizer is applied is recommended.

Watering during dry periods is important for successful rose culture. A great deal of water is given off by the leaves and experiments have shown that an average-sized hybrid tea bush may transpire as much as *30* gal. of water during a single growing season. Thorough watering is essential; this means soaking the soil to a depth of from six to eight inches.

Cultivating the beds to eliminate weeds and keeping the surface loose and well aerated is recommended but it should not be so deep as to destroy roots. Mulching with grass clippings, peat moss, buckwheat hulls, ground corncobs, rice hulls, etc., conserves moisture, keeps down soil temperature and eliminates weeds.

Pruning is practised to keep the plants in vigorous condition and to improve their appearance and productivity. The different classes and even different varieties in the same class may respond to different pruning treatment, but in general the practice for bush roses involves cutting out all dead or injured wood in the spring, removing weak, twiggy growth and cutting back the strong canes to a moderate height to give a well-balanced appearance.

The climbers that bloom only once during the season are best pruned immediately after flowering. Withered blooms should be removed promptly from everblooming climbers so that new flowering shoots will be produced.

In cold climates where the temperature normally goes below 5° F., protection during the winter is necessary. This is accomplished by mounding soil around the base of the plants just before the surface freezes and later covering with evergreen boughs, marsh hay, straw or other coarse material. Where climbing roses are likely to freeze they may be removed from their supports, laid on the ground and covered with soil. In the spring the canes are again tied back on the supports.

Diseases. — Roses are infected by a number of diseases, most of them caused by fungi. Powdery mildew is widespread wherever roses are grown and is observed as a grayish-white moldlike growth

on the surface of young leaves, stems and buds. Copper and sulfur fungicides are effective for control when applied either as a spray or dust.

Black spot may occur in humid climates if precautions are not taken. Conspicuous black spots appear on the leaves, which soon drop, defoliating the plants. Spores are formed in the spots on the leaves and are washed from one plant to another by rain or overhead sprinkling. If the surface of the leaf remains wet for a period of about six hours, the spores can germinate and cause infection unless the surface of the leaf is protected by a thin film of fungicide. Fixed or insoluble copper fungicides, finely powdered, or wettable sulfur are standard control materials. There are also a number of organic fungicides such as Ferbam and Captan that are highly effective if applications are timely and thorough. Removing infected leaves as soon as a spot is detected and keeping all fallen leaves removed from the surface of the bed is recommended.

Rust appears on both cultivated and wild roses in the spring, bursting through the bark in the form of masses of orange powder consisting of the spores of the fungus. In summer the spores infect the leaves and produce on them small orange dots and later groups of spores that are able to live through the winter. It is important that all affected leaves should be destroyed in the autumn and the bush sprayed with a copper, sulfur or Ferbam fungicide in the spring to prevent infection of leaves by spores brought from a distance.

Other diseases that are sometimes troublesome are canker, crown or root gall and anthracnose.

There are a number of insects which may prove troublesome. Aphids are common but are easily controlled by nicotine spray or dust and many other insecticides. Various caterpillars, sawfly larvae and similar insects feed on the leaves and young shoots. These are easily controlled, however. by stomach poisons such as arsenate of lead. DDT and other materials. Red spider mites which multiply in great numbers, largely on the undersides of the leaves, are serious pests because they are difficult to see and may cause damage before being discovered. Materials such as Malathion, Aramite and Ovatran are available for their control. Other insects are thrips, earwigs, midge and scale insects.

ROSEBERY, ARCHIBALD PHILIP PRIMROSE, 5TH EARL OF (1847–1929), British statesman, born in London on May 7, 1847, was the son of Archibald, Lord Dalmeny (1809–1851) and Catherine, daughter of the 4th earl Stanhope. Lady Dalmeny married, after her husband's death, the duke of Cleveland. Young Dalmeny was educated at Brighton and at Eton, where he had as slightly junior contemporaries A. J. Balfour and Randolph Churchill. In 1866 he matriculated at Christ Church, Oxford, but went down in 1868, by the request of the dean, rather than abandon the possession of a small racing stud. In the same year he succeeded his grandfather, the 4th earl, in the earldom and the family estates. After some time spent in travel he acquired an English country house called The Durdans, Epsom, which he largely rebuilt and adorned with some of the finest turf portraits of George Stubbs. He had a famous stable, and, later, won the Derby three times, in 1894, 1895 and 1905. In 1878 he married Hannah, only child of Baron Meyer Amschel de Rothschild.

Though impeded in his political career by his exclusion from the House of Commons, Lord Rosebery's reputation as a social reformer and orator was steadily growing. In 1878 he was elected Lord Rector of Aberdeen and in 1880 of Edinburgh University, where he gave an eloquent address upon Patriotism. In 1880 he entertained Gladstone at Dalmeny, and during the "Mid Lothian campaign" he arranged the demonstrations. In August 1881 he became under-secretary at the home office, his immediate chief being William Harcourt. His work was practically confined to the direction of the Scottish department of the office, and he resigned in 1883. He resumed office (1884) as first commissioner of works with a seat in the cabinet.

In the brief Gladstonian government of 1886 Lord Rosebery threw in his lot with the old leader, and was foreign secretary. His views on foreign policy differed materially from those of Granville and Gladstone. His mind was dwelling constantly upon the political legacy of the two Pitts; he was a reader of John Seeley; he had himseif visited the colonies; had predicted that a war would not, as was commonly said, disintegrate the empire, but rather the reverse; had magnified the importance of taking colonial opinion, and had always been a convinced advocate of some form of Imperial Federation. He was already taunted with being an Imperialist, but his independent attitude won public approval. In January 1889 he was elected a member of the first county council of London, and on Feb. 12, chairman of that body by 104 votes to 17. With a view to the impending political campaign he found it necessary to resign the chairmanship of the county council in June. In November of this year. however, Lady Rosebery died, and he withdrew for a period from public business. In January 1892 he again for a few months became chairman of the county council. In October he received the Garter.

In August 1892, upon the return of Gladstone to power, he was induced with some difficulty (for he was suffering at the time from insomnia) to resume his position as foreign minister. He strongly opposed the evacuation of Egypt; he insisted upon the exclusive control by Great Britain of the Upper Nile Valley, and also upon the retention of Uganda. In 1893 the question of Siam came near to causing serious trouble with France, but the crisis was averted, and the lines were laid down for preserving Siam, if possible, as a buffer state between the English and French frontiers in Indo-China. In the spring of 1895 he was clear-sighted enough to refuse to join the anti-Japanese league of Russia, France and Germany at the end of the China-Japan War.

Lord Rosebery's personal popularity had been increased at home by his successful intervention in the coal strike of December 1893, and when in March 1894 the resignation of Gladstone was announced, his selection by Queen Victoria for the premiership was generally welcomed. but the malcontents in his own party, who considered that William Harcourt should have been the prime minister, or who were perpetually intriguing against a leader who did not satisfy their idea of radicalism, made Lord Rosebery's personal position no easy one. The support of the Irish Nationalists was endangered by his insistence that the goodwill of England, the "predominant partner," was essential to the success of Home Rule. On June 24, 1895, the government fell.

For the state of disorganization and discontent in the Liberal Party during the next ten years of opposition see LIBERAL PARTY. The breach between William Harcourt and Rosebery had never been healed, and Rosebery found himself also, to his great grief, at variance with Gladstone. He declined to support Gladstone's demand for intervention on behalf of the Armenians at the risk of a European war, and on Oct. 8, 1896, he announced to the Liberal whip, Thomas Ellis, his resignation of the Liberal leadership. For some time he held aloof from party politics, "ploughing his furrow alone," as he afterwards phrased it.

In 1898, on the death of Gladstone, he paid a noble and eloquent tribute in the House of Lords to the life and public services of his old leader. He gave a general support to the policy of the Salisbury government on the South African War. But the war had brought to the front a section antagonistic to the war and known in the jargon of the day as pro-Boers. These had won the qualified support of Campbell-Bannerman, the leader in the House of Commons. Lord Rosebery maintained for the most part a sphinx-like seclusion, but in July 1901 he at last came forward strongly as the champion of the Liberal Imperialist section of the party, which included Asquith, Grey and Haldane. At a meeting at Chesterfield (Dec. 1901), he spoke of "cleaning the slate" of the old party cries, and eventually spoke of his separation from the "tabernacle" of Campbell-Bannerman. But the main body of the

party stood by Campbell-Bannerman, and a partial reconciliation was effected. Chamberlain's tariff reform campaign helped to bring the Liberal Imperialists nearer to the rest of the party. Rosebery's own pronouncements on the tariff issue were hesitating, and to some extent contradictory. But though he eventually came into line with his colleagues on tariff reform, he finally broke with Campbell-Bannerman on the question of Home Rule for Ireland. On the fall of the Conservative government in Dec. 1905, Campbell-Bannerman was invited to form a cabinet, and Rosebery retired from party politics, though he encouraged his immediate associates to join the new government.

Rosebery continued eloquent and witty addresses on miscellaneous subjects. No public man of his time was more fitted to act as unofficial national orator; none more happy in the touches with which he could adorn a social or literary topic and charm a non-political audience; and on occasion he wrote as well as he spoke, His *Pitt* (1891) was already a classic; his *Appreciations and Addresses* and his *Peel* (containing a remarkable comment on the position of an English prime minister) were published in 1899; his *Napoleon: the Last Phase—an* ingenious, if paradoxical attempt to justify Napoleon's conduct in exile at St. Helena—in 1900; his *Cromwell* in the same year.

Lord Rosebery took an active part in the constitutional crisis in 1910 and 1911. He treated the Parliament Bill as a revolutionary measure. which in effect constituted single-chamber government, and did his utmost to arouse the nation to its danger. In 1914, as lord-lieutenant of Midlothian and Linlithgowshire he promoted recruiting and other war-like activities among his own people. He was chancellor of Glasgow university in 1908, as he had long been chancellor of London university, and he was chosen lord rector of St. Andrew's university for the year of its quincentenary celebration in 1911.

Lord Rosebery's eldest son, Lord Dalmeny (b. Jan. 1882), entered parliament in 1906 but retired in 1910. The younger son, Neil Primrose (1882–1917) was undersecretary for the Foreign Office in 1915 and parliamentary secretary for munitions in 1916. He died in Palestine on Nov 18. 1917.

ROSECRANS, WILLIAM STARKE (1819–1898). Union officer during American Civil War, was born in Kingston. O., Sept 6, 1815, and graduated from West Point in 1842. After 12 years as a regular army officer he resigned to enter business in Ohio until the Civil War brought him back to military service. He served under Gen George B. McClellan and Gen. John Pope and succeeded each when they moved east to larger commands. During 1862 he led the Union forces to victory in the battles of Iuka and Corinth. after which he moved on to Nashville to the command of the Army of the Cumberland. He fought the bloody and indecisive battle of Stone (or Stones) River (Murfreesboro) Dec. 31, 1862–Jan 3, 1863. His aggressive spirit had pleased his Washington superiors, nho mere looking always for a fighting general, but now he began to show other qualities: an excess of caution and hesitancy, a disposition to worry and to argue with his superiors. Finally. on June 23, 1863. after six months of delay in the face of official pressure to take the offensive, he pushed Gen. Braxton Bragg into Chattanooga, then maneuvered him out of the city without a battle. Here his customary caution deserted him and he followed Bragg who turned upon him at Chickamauga (*q.v.*), Sept. 19–20. An ill-advised move opened a gap in his lines and allowed the Confederates to pour through and drive him and a part of his army back into Chattanooga (*q.v.*). Only the stand of Gen. George Thomas on the Union left averted complete disaster. Gen. U. S. Grant, now charged with the defense of Chattanooga, removed Rosecrans, ending any important role for him in the war.

Rosecrans resigned his army commission in 1867. He served for tno years as minister to Mexico (1868–69) and later engaged in mining operations in Mexico and California. He served in congress, 1881–85, from California, and afterward became register of the treasury. He retired to California in 1893 and died there on March 11, 1898. (C. W. TE)

ROSEGGER, PETER (1843–1918), Austrian poet and novelist, known down to 1894 under the pseudonym *Petri Kettenfeier*, was born at Alpl near Krieglach in Upper Styria, on July 31, 1843, the son of a peasant. His work includes novels, poems, religious writings and autobiographical volumes, notably *Waldheimat* (1873) and *Mein Weltleben* (1898).

ROSELLE and **ROSELLE PARK,** boroughs in Union county, N.J., U.S., adjoining Elizabeth on the west, are suburban residential communities of the New York metropolitan area and also have factories whose products include rugs, toys, restaurant equipment, surgical supplies and leather goods. Roselle, incorporated in 1894, is the site of the birthplace of Abraham Clark. one of the Kew Jersey signers of the Declaration of Independence. Thomas A. Edison's experiments there made Roselle the first community to be completely lighted by electricity.

Roselle Park, once named North Roselle, was incorporated in 1901. Guglielmo Marconi. inventor of the wireless, established a plant there in 1913 which during World War I was a leader in the manufacture of communications equipment. KDY, a pioneer commercial radiobroadcasting station, was located there in 1921.

For comparative population figures *see* table in NEW JERSEY: *Population.* (E. R. D.)

ROSEMARY, botanically *Rosmarinus officinalis,* a plant of the mint family (Labiatae), the only representative of the genus and a native of the Mediterranean region. It is a low shrub with linear leaves, dark green above, white beneath, and with margins rolled back on to the under face. The flowers are in small axillary clusters. Each has a two-lipped calyx, from which projects a bluish two-lipped corolla enclosing two stamens. The fruit consists of four smooth nutlets. Rosemary was highly esteemed by the ancients for its aromatic quality and medicinal uses. In modern times it is valued mainly for its perfume; the oil is obtained by distillation. Rosemary plays an important part in literature and folk-lore, being an emblem of remembrance.

ROSENBACH, ABRAHAM SIMON WOLF (1876–1952), U.S. book and manuscript collector and dealer, who combined solid scholarship and exceptional business acumen, was born in Philadelphia, Pa, on July 22, 1876. He attended the University of Pennsylvania (B.S. 1898; Ph.D. 1901) where as a freshman he bought for $3.60 a first edition of Dr. Johnson's prologue at the reopening of Drury Lane theatre in 1747 for which he later refused $5,000. From 1895 to 1901 he was a teaching fellow in the English department, and before 1903 he joined his brother Philip, a book dealer, in launching the Rosenbach company. Upon the death in 1903 of their uncle, Moses Polock, whose bookshop Rosenbach had haunted since his childhood, the brothers acquired a substantial collection of his books and were soon in a position to buy entire libraries, expanding their business into what may well have been the most lucrative book concern in the world. Among his clients were Henry E. Huntington, founder of the library bearing his name at San Marino, Calif., and J. Pierpont Morgan, founder of the library bearing his name in New York city. In 1947, Rosenbach bought a copy of *The Bay Psalm Book* for $151,000, then a record price. A shrewd bibliophile, Rosenbach came to be the most formidable bidder of his time at auctions in the US. and Europe. The total of his purchases was estimated as exceeding $75,000,000. In addition to a wealth of English literature and Americana, Rosenbach acquired a magnificent collection of children's books that he later presented to the Philadelphia Free library; he bought eight Gutenberg Bibles and more than thirty Shakespeare first folios. He published a great many bibliographical and literary articles; his checklist *Early American Children's Books* (1933) is a standard reference. In 1930 he established the Rosenbach fellowship in bibliography at the University of Pennsylvania, and upon his death in Philadelphia on July 1, 1952, willed his estate to the Rosenbach foundation. established in 1950 to foster interest in books. paintings, and *objets d'art.*

His other works include *Books and Bidders* (1927), *The Unpublished Memoirs* (1917) and *A Book Hunter's Holiday* (1936).

See *E* Wolf and J. F. Fleming, Rosenbach (1960).

ROSENHEIM, German town and watering place in Upper Bavaria, at the confluence of the Mangfall and the Inn, 40 mi. S.E. of Munich by rail. Pop. (1950) 29,937. Rosenheim is frequented for its saline and sulfur baths, and there are saltworks.

ROSENKRANZ, KARL (1805–1879), German philosopher of the Hegelian school, was born at Magdeburg on April 23, 1805. He was professor of philosophy at Konigsberg from 1833 until his death on July 14, 1879. Rosenkranz was a loyal Hegelian. In the great division of the school, he, in company with Michelet and others, formed the "centre," midway between Erdmann and Gabler on the one hand, and the "extreme left" of Strauss, Feuerbach and Bruno Bauer. With F. W. Schubert he edited Kant's *Sämtliche Werke* (Leipzig, 12 vols., 1838–42), the last vol. of which contains his *Geschichte der kantischen Philosophie.*

ROSENWALD, JULIUS (1862–1932), U.S. merchant and philanthropist, was born in Springfield, Ill., on August 12, 1862, the son of Samuel Rosenwald and Augusta (Hammerslough) Rosenwald. His father came to the United States about 1854 from Germany and finally established himself as one of the leading clothing merchants of Springfield, Ill. Julius Rosenwald was educated in the public schools of Springfield. At the age of 16 he went to New York city to learn the clothing business. In 1885, together with his brother, Morris S. Rosenwald, and his cousin, Julius Weil, he established the clothing business of Rosenwald & Weil in Chicago. In 1897 he became active as vice-president of Sears, Roebuck & Company. In 1909 Richard W. Sears retired as president of Sears, Roebuck & Company, and Julius Rosenwald succeeded him in that office and held the position until 1924, when he became chairman of the board. In 1916 Rosenwald, aith Albert H. Loeb, treasurer of the company, was instrumental in establishing an employees' savings and profit-sharing pension fund.

In Dec. 1916, at the request of President Wilson, Julius Rosenwald began his service as a member of the advisory commission of the council of national defense, and he served as chairman of the committee on supplies of that body until the summer of 1918. During the period of America's participation in the war he made huge purchases of equipment and materials for the army and navy and for the Allies of the United States.

As soon as he began to acquire a large personal fortune, Rosenwald started to engage in charitable and philanthropic activities on a great scale. He was active in Jewish charities in Chicago and became actively interested in the welfare of the Negro in 1911. The Julius Rosenwald fund was established in 1917 and dedicated to "the well-being of mankind." Rosenwald was firmly opposed to perpetual endowments, and his propaganda against them exercised a creative influence on philanthropy throughout the world.

The chief effort at first of the Julius Rosenwald fund was to better the condition of Negroes through education. It was always one of Rosenwald's principles of public giving to inspire others to give by the example of his own gifts, and frequently he made his offers, large and small, in such form that they had to be matched by other gifts before they were gained.

In addition to his work for Negro education through the Julius Rosenwald fund, Rosenwald served as a trustee of Tuskegee institute. founded by Booker T. Washington in 1881. from 1912 until the time of his death.

During the war Julius Rosenwald donated $1,000,000 to the Jewish War Relief fund. After the war, he pledged $6,000,000 for the effort of the Joint Distribution committee to settle the Jews of Russia in agricultural colonies in that country. He contributed $100,000 in 1920 for the relief of German children.

Rosenwald made gifts of more than $4,000,000 to The University of Chicago, and he gave approximately $6,600,000 for a Museum of Science and Industry in Chicago. He also founded dental infirmaries in the Chicago public schools. He was a large contributor to the work of the Y.M.C.A. in Chicago and elsewhere, and he contributed $25,000 toward the cost of erecting each Y.M.C.A. building for Negroes in 21 cities of the United States. Rosenwald's gifts during his lifetime exceeded $22,000,000 exclusive of the Rosenwald fund, which had assets worth $40,000,000 in 1928.

Rosenwald took an active interest in the civic affairs of Chicago for many years, and he was deeply interested in the improvement of municipal and national government. He was a trustee of The University of Chicago, of the Rockefeller foundation, of the Baron de Hirsch fund and of other organizations. Julius Rosenwald died in Chicago on Jan. 6, 1932. (M. R. W.; X.)

ROSES, WARS OF THE, a name given to a series of civil wars in England during the reigns of Henry VI., Edward IV, and Richard III. Their importance in the general history of England is dealt with elsewhere, and their significance in the history of the art and practice of war is small. They were marked by a ferocity and brutality practically unknown in the history of English wars before and since. The honest yeoman of Edward III.'s time had evolved into a professional soldier of fortune, and had been demoralized by the prolonged and dismal Hundred Years' War, at the close of which many thousands of ruffians, whose occupation had gone, had been let loose in England. At the same time the power of feudalism had become concentrated in the hands of a few great lords, who were wealthy enough and powerful enough to become king-makers. The disbanded mercenaries enlisted indifferently on either side, corrupting the ordinary feudal tenantry with the evil habits of the French wars, and pillaged the countryside, with accompaniments of murder and violence, wherever they went. It is true that the sympathies of the people at large were to some extent enlisted: London and, generally, the trading towns being Yorkist, the country people Lancastrian—a division of factions which roughly corresponded to that of the early part of the Great Rebellion, two centuries later, and similarly in a measure indicative of the opposition of hereditary loyalty and desire for sound and effective government. But there was this difference, that in the 15th century the feeling of loyalty was to a great extent focussed upon the great lords.

It is from the Wars of the Roses that there originated the deep-rooted dislike of the professional soldier which was for nearly four centuries a conspicuous feature of the English social and governmental system, and it is therefore in their results rather than their incidents that they have affected the evolution of war. They withdrew the English army system from European battlefields precisely at the moment of transition when the regimental and technical organization of armies was becoming a science and seeking models, and the all-powerful English longbow at the moment when the early, scarcely effective firearms were, so to speak, struggling for recognition as army weapons. On the other hand, they destroyed the British military organization, which remained for 150 years an aggregation of county levies armed with bills and bows.

The first campaign, or rather episode, of these wars[1] began with an armed demand of the Yorkist lords for the dismissal of the Lancastrian element in the king's council, Henry VI. himself being incapable of governing. The Lancastrians, and the king with them, marched out of London to meet them, and the two small armies (3,000 Yorkists, 2,000 Lancastrians) met at St. Albans (May 22, 1455). The encounter ended with the dispersion of the weaker force, and the king fell into the hands of the Yorkists. Four years passed before the next important battle, Blore Heath, was fought (Sept. 23, 1459). In this the earl of Salisbury trapped a Lancastrian army in unfavourable ground near Market Drayton, and destroyed it; but new political combinations rendered the Yorkist victory useless and sent the leaders of the party into exile. They made a fresh attempt in 1460, and, thanks partly to treason in the Lancastrian camp, partly to the generalship of Warwick, won an important success and for the second time seized the king at Northampton (July 10, 1460). Shortly afterwards, after a period of negotiation and threats, there was a fresh conflict. Richard duke of York went north to fight the hostile army which gathered at York and consisted of Lancashire and Midland Royalists, while his son Edward, earl of March, went into the west. The father was ambushed and killed at Wakefield (Dec. 30, 1460), and the Lancastrians, inspired as always by Queen Margaret of Anjou, moved south on London, defeated Warwick at St. Albans (Feb. 17, 1461), and regained

[1]The name, as is well known, comes from the "white rose of York" and the "red rose of Lancaster"; but these badges, though more or less recognized as party distinctions, by no means superseded the private devices of the various great lords, such as the "falcon and fetterlock" of Richard duke of York, the "rose in sun" of Edward IV., the "crowned swan" of Margaret, the Vere star, and even the **revived** "white hart" of Richard II.

possession of the king's person. But the young earl of March, now duke of York, having raised an army in the west, defeated the earl of Pembroke (Feb. 2, 1461) at Mortimer's Cross (jm. west of Leominster). This was the first battle of the war which was characterized by the massacre of the common folk and beheading of the captive gentlemen — invariable accompaniments of Edward's victories, and notably absent in Warwick's. Edward then pressed on, joined Warwick, and entered London, the army of Margaret retreating before them. The excesses of the northern Lancastrians in their advance produced bitter fruit on the retreat, for men flocked to Edward's standard. Marching north in pursuit, the Yorkists brought their enemy to bay at Towton (see TOWTON, BATTLE OF), 3m. south of Tadcaster, and utterly destroyed them (March 29, 1461). For three years after Towton the war consisted merely of desultory local struggles of small bodies of Lancastrians against the inevitable. The duke of York had become King Edward IV. But in 1464, in the far north of England, the Red Rose was again in the field. Edward acted with his usual decision. His lieutenant Montagu (Warwick's brother) defeated and slew Sir Ralph Percy at Hedgley Moor, near Wooler (April 25, 1464), and immediately afterwards destroyed another Lancastrian army, with which were both Henry VI. and Queen Margaret, at Hexham (May 1 j. 1464). The massacres and executions which followed effectively crushed the revolt. For some years thereafter Edward reigned peacefully, but Warwick the king-maker and all the Neville following having turned against him (1470), he was driven into exile. But at a favourable moment he sailed from Flushing with 1,500 retainers and Burgundian mercenaries, and eluding the Lancastrian fleet and the coast defence troops, landed at Ravenspur (Spurn Head) in Yorkshire in March 1471. His force was hardly more than a bodyguard; the gates of the towns were shut against him, and the country people fled. But by his personal charm, diplomacy, fair promises and an oath of allegiance to King Henry VI., sworn solemnly at York, he disarmed hostility and, eluding Montagu's army, reached his own estates in the Wakefield district, where many of his oid retainers joined him. As he advanced south, a few Yorkist nobles with their following rallied to him, but it was far more the disunion of the Warwick and the real Lancastrian parties than his own strength which enabled him to meet Warwick's forces in a pitched battle. At Barnet, on Easter Eve, April 14, 1471, the decisive engagement was fought. But in the midst of the battle reinforcements coming up under the earl of Oxford to join Warwick came into conflict with their own party, the badge of the Vere star being mistaken for Edward's Rose-en-soleil. From that point all the mutually distrustful elements of Warwick's army fell apart, and Warwick himself, with his brother Montagu, was slain. For the last time the unhappy Henry VI. fell into the hands of his enemies. He was relegated to the Tower, and Edward, disbanding his army, reoccupied the throne. But Margaret of Anjou, his untiring opponent, who had been in France while her cause and Warwick's was being lost, had landed in the west shortly after Barnet, and Edward had to take the field at once. Assembling a fresh army at Windsor, whence he could march to interpose between Margaret and her north Welsh allies, or directly bar her road to London, he marched into the west on April 24. On the 29th he was at Cirencester, and Margaret, engaged in recruiting an army, was near Bath. Edward hurried on, but Margaret eluded him and marched for Gloucester. At that place the governor refused the Lancastrians admittance, and seeking to cross the Severn out of reach of the Yorkists, they pushed on by forced marches to Tewkesbury. But Edward too knew how to march, and caught them up. The battle of Tewkesbury (May 3, 1471) ended with the destruction of Margaret's force, the captivity of Margaret, the death of her son Edward (who. it is sometimes said, was stabbed by Edward IV. himself after the battle) and the execution of 16 of the principal Lancastrians.

This was Edward's last battle. The rest of his eventful reign was similar in many ways to that of his contemporary Louis XI., being devoted to the consolidation of his power, by fair means and foul, at the expense of the great feudatories. But the Wars of the Roses were not yet at an end. For 14 years, except for local outbreaks, the land had peace, and then Richard III.'s crown, struck from his head on Bosworth Field (Aug. 22, 1485), was presented to Henry earl of Richmond, who, as Henry VII., established the kingship on a secure foundation. A last feeble attempt to renew the war, made by an army gathered to uphold the pretender Lambert Simnel, was crushed by Henry VII. at Stoke Field (4m. south-west of Newark) on June 16, 1487.

ROSETTA STONE, the ancient Egyptian stone bearing inscriptions, the deciphering of which led to the understanding of hieroglyphics. It is an irregularly shaped stone of black basalt, 3 ft. 9 in. long and 2 ft. 4½ in. wide, broken in antiquity, which is now in the British museum, London. It was found near the town of Rosetta, or Rashid, on the left bank of a branch of the Nile in the western delta, about 30 mi. from Alexandria.

The modern town was founded by the Arab conquerors of Egypt in the 9th century A.D., when Alexandria was suffering a commercial eclipse, but after the discovery of the sea route to India it gradually declined in importance. The inhabitants of Rosetta include many Greeks as well as Egyptians. Pop. (1947) 23,996.

The Rosetta stone was found in Aug. 1799 by a Frenchman, whose name is given variously as Bouchard or Boussard, during the execution of repairs to the fort of St. Julien, and passed into British hands with the French surrender of Egypt (1801). The inscription records the commemoration of the accession of Ptolemy V Epiphanes to the throne of Egypt in the year 196–197 B.C., in the ninth year of his reign. The decree summarizes the benefactions conferred by Ptolemy upon the priesthood and appears to have been written by the priests of Memphis after a general assembly of religious leaders. The inscription is in two languages and three scripts (hieroglyphics, demotic and Greek) and gave the key to the translation of Egyptian hieroglyphics hitherto undeciphered.

The decipherment of the hieroglyphic inscription was largely the work of Thomas Young and Jean François Champollion (*qq.v.*). Young discovered that the royal names were written within ovals known as cartouches, and he worked out that foreign names, those of Ptolemy and Cleopatra, would probably be written in phonetic values which could be compared to the original group. Out of the total of 13 signs in this name he attributed the correct value to six and partially right value to three. He also discovered in 1814 the way in which the hieroglyphic signs were to be read, by examining the direction in which the birds and animals in this pictorial script faced. His main contribution to Egyptian philology was published in the supplement to the *Encyclopædia Britannica* of 1819.

In 1821–22 Champollion, starting where Young had left off, published memoirs on the decipherment of hieratic and hieroglyphics and went on to establish a whole list of signs with their Greek equivalents. He was the first Egyptologist to realize that some of the signs were alphabetic, some syllabic and some determinative~standing for the whole idea or object previously expressed. He also established that the hieroglyphic text was the translation of the Greek, not the reverse as had been thought. The work of these two men established the basis for the translation of all future hieroglyphic texts. (M. V. S.-W.)

ROSETTE, an ornament, usually circular, oval or polygonal, formed by a series of petals or leaves radiating from the centre and symmetrically placed. The form undoubtedly originated as an attempt to represent, systematically. the corolla of an open flower. Egyptian rosettes were thus, probably, representations of the open lotus. In Assyrian ornament and in the Persian work based upon it rosettes are one of the commonest ornaments and are used, by continuous repetition, to form decorative bands. Although common in archaic pottery of the Greek islands, they were little used in the developed art of Greece itself. The Romans, on the other hand, used the form lavishly and gave it great richness by employing the complex acanthus leaf as the basic radiating form. It was used not only at the centre of each face of the Corinthian capital, but also to decorate the little panels between the modillions or the scrolled brackets of the Corinthian order and as a decoration for the centre of the coffers or sunk panels of

a coffered vault or ceiling. The rosette almost went out of use in the medieval period except as it sometimes occurred as an individual flower in Gothic naturalistic ornament. In the Perpendicular period in England, the popularity of the heraldic Tudor rose gave a new importance to the rosette idea. and rosettes were frequently employed, repeated at regular intervals, to decorate hollow moldings.

Renaissance rosettes in design are based upon those of Rome, but were used even more lavishly, because of the immense development of wooden coffered and paneled ceilings.

In metalwork the idea of the rosette was probably developed independently. because of the ease with which little drops of metal could be soldered or fastened in a circle! to a basic utensil. Such rosettes, formed either of a simple circle of nearly hemispherical shape, or of one large hemisphere surrounded by several smaller ones, are favourite late Bronze and early Iron age decorations in the metalwork of the Celts, Scandinavians and the people of northern Europe generally. (T. F. H.)

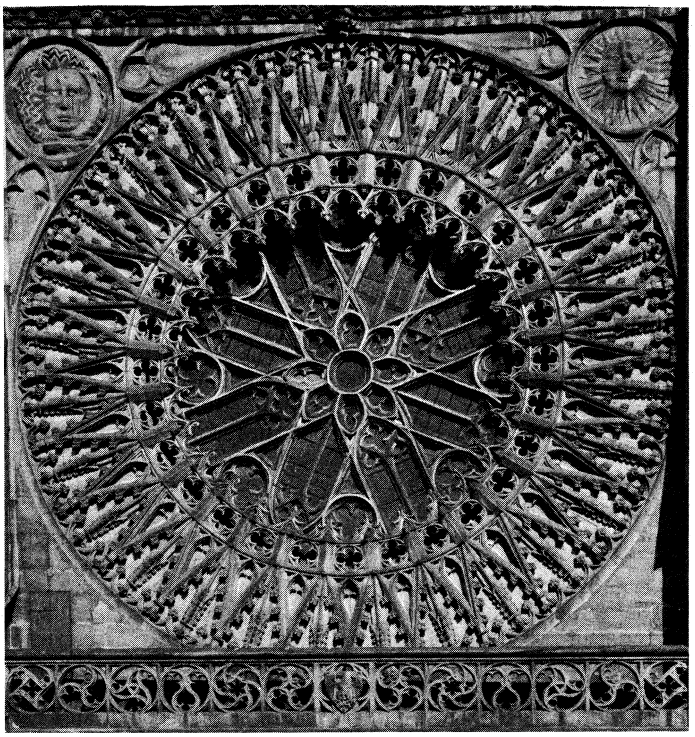
ROSE WINDOW (WHEEL WINDOW), in architecture, is a term applied to any decorated circular window. Cndecorated circular windows are found in certain imperial Roman structures, used especially in the upper portions of rooms or pierced through vaults. as in the tomb of the time of Hadrian known as the Casale dei Pazzi, near Rome, but structural decoration of such forms was apparently not attempted until the Byzantine and Romanesque periods.

One of the earliest decorated circular windows extant is that of the Italian Romanesque church of S. Maria in Pomposa, possibly as early as the 10th century, in which the decoration consists of a pierced marble slab of great richness, with a design of interlaces and birds purely Byzantine. In French Romanesque work circular windows also appear, but in the earlier work. such as the late 11th-century apse of S. Sernin at Toulouse, they are undecorated, like those of the Roman empire. Meanwhile: in Mohammedan work, the cusped circle had been a common form, usually. however, not as a window, but as the outer boundary of a sunk hemisphere, as in the mosque of Ibn Touloun at Cairo. Egy. (876–878).

The crusaders probably saw many examples of'such forms; in any case it is only after the earlier crusades and especially toward the middle of the 12th century that the idea of making a rich decorative motive out of a round window appeared. From then on the simple rose window became more and more common. and was, in fact, a distinguishing characteristic of many transitional and early Gothic cathedrals. It was particularly used at the west end of the nave and the ends of the transepts. An exceptional early use is the round window which lighted the triforium roof space from the nave in the original form of Notre Dame at Paris (before 1177). In the west front of Laon cathedral (completed prior to 1200) there is an enormous rose window with 12 semicircles around the edge and the central foiled and cusped circle separated from the apexes of these semicircles by a considerable distance, the connection between being made by little radiating colonnettes like spokes. This window is remarkably advanced for its date. as the filling, like that of the Paris triforium: is essentially bar tracery. The rose window of the west front of Chartres cathedral (1194–1212) consists, on the other hand. of plate tracery: the circle being filled with a thin plate of stone, through which are pierced many small foiled or cusped holes.

A similar form of plate tracery within a circle is used to cap the twin windows of the clerestory bays.

The introduction of developed bar tracery gave a compelling impetus to rose window design. The general scheme consisted of a series of radiating forms. each of which was tipped by a pointed arch at the outside of the circle. The bars between these forms were joined at the centre by a pierced circle of stone and the forms themselves frequently treated like little traceried windows with subsidiary. subdividing bars, archs and foiled circles The most beautiful examples of this type are those of the west front of Reims cathedral (end of the 13th century) and the transepts of Reims. Amiens and Notre Dame at Paris (all of the last half of the 13th century). The introduction of the navy lines of Flamboyant tracery completely changed the character of French rose windows, but they continued basically radiating in design. The radiating elements consisted of an intricate network of wavy, double curved bars. creating all sorts of interesting circles and flame shapes and, incidentally. furnishing a diagonal bracing to the whole composition which added materially to its structural strength. The rose at the end of the transept at Beauvais (early 16th century) is characteristic.



AUTHENTICATED NEWS

THE ROSE WINDOW (1350), 30 FT. IN DIAMETER, ABOVE THE WEST PORTAL OF ST. LORENZKIRCHE. NÜRNBERG, GERMANY

The influence of the French rose windows was widespread from an early period. Variations of the form appear in a multitude of late Italian Romanesque churches, as in the widely varying type in the late 12th century west front of S. Pietro in Toscanella. and the more normal example in S. Zeno at Verona (late 12th century). In England the rose window has never been so popular as in France. Those in the transepts of Westminster abbey are more characteristically French than English. The most typically English examples are in the transepts of Lincoln cathedral; that on the north from the Early English period is a remarkably delicate example of plate tracery; that on the south from the Curvilinear period of the early 14th century is striking because it is not radiating in design, and therefore completely at odds with the French prototypes.

See TRACERY. (T. F. H.)

ROSEWOOD, the name given to several distinct kinds of ornamental timber, products of various tropical trees native to Brazil. Honduras. Jamaica. Africa and India. The most important commercially are the Brazilian rosenood, principally *Dalbergia nigra,* a leguminous tree of large dimensions, called *cabiúna* and jacaranda by the Brazilians — and the Honduras rosewood. D. *stevensoni* The term jacaranda is also applied to several species of *Machaerium,* also trees of the family Leguminosae; some of the rosenood of commerce is drawn from these sources.

Rosewood earlier was exported in large quantities from Rio de Janeiro, Bahia. Jamaica and Honduras. The heartwood attains large dimensions, but as it begins to decay before the tree arrives at maturity it is always faulty and hollow in the centre; therefore, squared logs or planks of rosewood are never seen. the wood being imported in half-round flitches 10 to 20 ft. in length and from 5 to 12 in in their thickest part. Rosewood, a deep ruddy-brown to purplish-brown in colour, richly streaked and grained

with black resinous layers, takes a fine polish, but because of its resinous nature is somewhat difficult to work. The wood, once much in demand by cabinetmakers and piano makers, is still used to fashion xylophone bars, but waning supplies now restrict its use in the U.S. to the making of carpenters' spirit levels, plane handles and brush backs. (N. TR.)

ROSICRUCIANISM. There are Rosicrucian societies, fraternities, orders, fellowships or lodges in most countries of the modern world. Some of them are very active; others are obscure and highly secret; some seem to be primarily religious in their emphasis, and some categorically deny that Rosicrucianism is a religion, holding rather that it is a philosophy, making use of the most modern scientific methods and techniques, as well as the methods of the occultist, the mystic and the seer, in the quest for truth.

But, while Rosicrucianism is sectarian in character and the various branches are sometimes bitterly critical of each other, they do have common features, the central one being the purported possession of certain secret wisdom handed down from ancient times, through a secret brotherhood, an esoteric wisdom that can only be imparted to the initiated.

Their teachings so far as known seem to combine something of Egyptian Hermetism, Christian Gnosticism, Jewish cabalism, alchemy and a variety of other occult beliefs and practices. While alchemy seems to have been prominent in the movement, modern Rosicrucians affirm that their language must be taken symbolically rather than literally and that they have no interest in such things as the transmutation of metals.

Whether all Rosicrucian organizations can trace their origins back to the main historic stream of Rosicrucianism is a matter of grave doubt. But after all, what is the true Rosicrucianism?

The earliest extant writing which unequivocally mentions a Rosicrucian order appeared in the early 17th century. But even here the actual existence of such an order cannot be affirmed absolutely. Indeed, not a few scholars believe rather that the order had its rise from the publication of this document and that it was written with this definite purpose in mind.

The document was the famous *Fama Fraternitatis,* first published in 1614 but probably circulated in manuscript form somewhat earlier than this. Seven editions appeared during the years 1614–17. It recounts the journey of the reputed founder of the movement, Christian Rosenkreuz, to Damascus, Damcar in Arabia, Egypt and Fez, where he was well received and came into possession of much secret wisdom. He returned finally to Germany, where he chose three others to whom he imparted this wisdom and thus founded the order. Later the number was increased to eight who separated, each going to a separate country.

One of the six articles of agreement they adopted was that the fraternity should remain secret for 100 years. At the end of 120 years the secret burial place and the perfectly preserved body of the founder were discovered by one of the then members of the order, along with certain documents and symbols held in very high esteem by Rosicrucians. The sacred vault was re-covered, the members of the order dispersed, and no one knows its location. The *Fama* ends with an invitation to "some few" to join the fraternity.

According to the *Confessio,* which is bound up with the *Fama* in some of the editions, Christian Rosenkreuz was born in 1378 and lived 106 years, or until 1484. His tomb was then hidden for 120 years, making its discovery fall in 1604. If this is a true account of the founding of the order, it must have come into being sometime in the 15th century.

Some regard the story as a statement of fact and hold Christian Rosenkreuz to have been the founder of the order. More generally it is held to be a mythical explanation of the order and Christian Rosenkreuz not a real person at all, but a symbolic character. R. Swinburne Clymer saw in the travels of Christian Rosenkreuz in the *Fama* an obvious parallel to the travels of Paracelsus, whom he regarded as the real founder of the movement.

H. Spencer Lewis held that it marks only a revival of the order which began in remote antiquity in Egypt, where the great Ikhnaton made significant contributions to it. We listed numerous persons of antiquity, including Solomon, Jesus, Plato, Philo, Plotinus and others, as well as movements such as the Essenes of Jesus' day, the young Christian movement itself and later movements such as Jewish cabalism, as related to the ancient order. These he identified as truly Rosicrucian because he was able to find among their reported teachings ideas which he regarded as Rosicrucian. His conclusions do not seem convincing to objective students. There can be no doubt that there were in ancient times persons whose outlook and thought were similar to that of the Rosicrucians. That there was a continuing order in existence previous to the 15th century or even the 17th is impossible to prove beyond question, on the basis of any sources available to non-Rosicrucian research.

With the publication of the *Fama,* international interest in the order was aroused and it was not long before there were Rosicrucian orders in several European countries. Michael Maier, a learned alchemist, became its chief exponent in Germany. Robert Fludd is thought to have introduced it into England. Thomas Vaughan translated the *Fama* into English in 1652, and though he knew of no existing order in England at that time he remarked that he was not unacquainted with Rosicrucian doctrine and had no doubt concerning the existence of the order.

That it is not always possible to prove the existence of the order in a given country at any particular moment does not disturb the Rosicrucians, for it seems to be recognized that there occur periods when the order is deliberately "in sleep." H. Spencer Lewis reduced these periods to a definite rhythm of 108 years of activity followed by 108 years of silence, in a given country. It was in accordance with this cyclic theory, he said, that he was led at the proper time to seek out the leaders of the order in France in the early years of the 20th century and under their authority to inaugurate a new cycle of activity in the United States in 1915, under the name Ancient Mystical Order Rosae Crucis, usually abbreviated to A.M.O.R.C. It became affiliated with the Fédération Universelle des Ordres et Sociétés Initiatiques, established in Europe in 1934.

R. Swinburne Clymer, head of a rival U.S. order with headquarters at Quakertown, Pa., who as early as 1902 published *The Rosicrucians: Their Teachings,* spoke of the periods of silence, but these were determined by specific conditions rather than by the passage of time. His organization, traced through a definite line of Rosicrucian adepts in the U.S. from revolutionary times, with Paschal Beverly Randolph and Freeman B. Dowd as his more immediate predecessors, is known as the Fraternitas Rosae Crucis. Its foreign affiliation was with La Fédération Universelle des Ordres, Sociétés et Fraternités des Initiés.

Rosicrucianism and Freemasonry have not a little in common. Indeed, there is a degree in masonry known as the Rose Croix degree. Likewise, the *Societas Rosicruciam in Anglia* and its affiliates are held to be more masonic than Rosicrucian.

The symbol of Rosicrucianism is a combination of the cross and the rose, from which the order takes its name. The origin of the symbol is variously given, but there seems to be no one explanation which is completely satisfactory.

ROSIN (COLOPHONY), the resinous constituent of the oleoresin exuded by various species of pine, known in commerce as crude turpentine. The separation of the oleoresin into the essential oil spirit of turpentine and common rosin is effected by distillation in large stills. Rosin (a later variant of "resin," *q.v.*), varies in colour, according to the age of the tree from which the turpentine is drawn and the amount of heat applied in distillation, from an opaque almost pitchy black substance through grades of brown and yellow to an almost perfectly transparent colourless

glassy mass. The commercial grades are numerous, ranging by letters from A, the darkest, to N, extra pale, and X. most pale, W (window glass) and WW (water white) varieties. the latter having about three times the value of the common qualities.

Rosin is a brittle and friable resin. with a faint pinelike odour; the melting point varies with different specimens, some being semifluid at the temperature of boiling water, while others do not melt till 220° F. or 250° F. It is soluble in alcohol. ether, benzene and chloroform. In addition to its extensive use in soapmaking. rosin is largely employed in making inferior varnishes, sealing wax, various cements and as a sizing agent in the manufacture of paper. It is also used for preparing shoemakers' wax, as a flux for soldering metals, for pitching lager beer casks, for rosining the bows of musical instruments, etc. In pharmacy it forms an ingredient in several plasters and ointments.

The chief region of rosin production is the south Atlantic and eastern gulf states of the United States. American rosin is obtained from the turpentine of the swamp pine, *Pinus palustris,* and of the loblolly pine, *P. taeda.* The main source of supply in Europe is the "landes" of the *départements* of Gironde and Landes in France, where the cluster pine, *P. pinaster,* is extensively cultivated.

In the north of Europe rosin is obtained from the Scotch fir, *P. sylvestris,* and throughout European countries local supplies are obtained from other species of pine.

See also TURPENTINE.

ROSKILDE, or ROESKILDE, **a** town of Denmark in the *amt* (county) of Kjøbenhavn (Copenhagen), 20 mi. by rail W. of Copenhagen, on the great lagoonlike inlet named Roskilde fiord. Pop (1960) 31.928.

Roskilde's chief interest is historical. It was the capital of the kingdom until 1443, and the residence of the bishops of Zealand until the Reformation.

The cathedral was consecrated in 1084, but of this early building only foundation walls remain; the present structure of brick was begun in 1215, and enlarged and restored at various later dates. It contains the tombs of most of the Danish kings from Harold I (987).

ROSMEAD, HERCULES GEORGE ROBERT ROBINSON, 1ST BARON (1824–1897), British colonial administrator, was born on Dec. 19, 1824. He was of Irish descent on both sides; his father was Admiral Hercules Robinson, his mother a Miss Wood of Rosmead, County Westmeath, from which he afterward took his title. Passing from Sandhurst into the 87th Foot, he attained the rank of captain; but in 1846, through the influence of Lord Naas, he obtained a post in the board of public works in Ireland, and subsequently became chief commissioner of fairs and markets. His energy in these positions, notably during the famine of 1848, and the clearness and vigour of his reports, secured for him at the age of 30 the office of president of the island of Montserrat. He was governor of St. Christopher from 1855 to 1859, when he was knighted in recognition of his services in introducing coolie labour into the island. Subsequently he was governor of Hong Kong, of Ceylon (K.C.M.G. in 1869), and, in 1872, of New South Wales. It fell to his lot to annex the Fiji Islands to the British empire, and his services were rewarded in 1875 by promotion to G.C.M.G. In 1879 he was transferred to New Zealand, and in 1880 he succeeded Sir Bartle Frere as high commissioner of South Africa. He arrived in South Africa shortly before the disaster of Majuba, and was one of the commissioners for negotiating a peace which was personally distasteful to him. It left him with the task of conciliating on the one hand a Dutch party elated with victory, and on the other hand a British party almost ready to despair of the British connection. He was called home in 1883 to advise the government on the terms of the new convention concluded with the Transvaal Boers in Feb. 1884. On his return to South Africa he found that a critical situation had arisen in Bechuanaland, where Boer commandoes had seized large tracts of territory and proclaimed the "republics" of Stella and Goshen *(see* KRUGER, STEPHANUS JOHANNES PAULUS). They refused to retire within the limits of the Transvaal as defined by the new convention, and Robinson. alive to the necessity of preserving this country—the main road to the north—for Great Britain, took action which led to the expedition of Sir Charles Warren and the annexation of Bechuanaland early in 188;. Robinson won Kruger's confidence by his fair-mindedness, while he seconded Rhodes's efforts to unite the British and Dutch parties in Cape Colony. His mind, however, was that of the administrator as distinguished from the statesman, and he was content to settle difficulties as they arose. In 1887 Robinson was induced by Rhodes to give his consent to the conclusion of a treaty with Lobengula which secured British rights in Matabele and Mashona lands. In May 1889 Robinson retired. and he was made a baronet in 1891.

Early in 1895, when he was 71 and not in robust health, he yielded to Lord Rosebery's entreaties, and went out again to South Africa, in succession to Sir H Loch. L. S. Jameson's *(q* v.) raid into the Transvaal produced a permanent estrangement between Robinson and Cecil Rhodes, and he was out of sympathy with the new colonial secretary, Joseph Chamberlain, who had criticized his appointment, and now desired Robinson to take this opportunity of settling the whole question of the position of the Uitlanders in the Transvaal. Robinson answered that the moment was inopportune, and that he must be left to choose his own time. Alarmed at the imminent danger of war, he confined his efforts to inducing the Johannesburgers to lay down their arms on condition that the raiders' lives were spared, not knowing that these terms had already been granted to Jameson. He went home to confer with the government. and was raised to the peerage as Baron Rosmead. He returned to South Africa later in the year, but was compelled by ill-health, in April 1897, to quit his post, and died in London on Oct. 28, 1897.

ROSMINI-SERBATI, ANTONIO (1797–1855), Italian priest and philosopher, the founder of the Institute of Charity, was born at Rovereto on March 24, 1797. He studied theology at the University of Padua and was ordained priest in 1821. Through his friendship with Niccolo Tommasseo and Alessandro Manzoni and a lifelong concern to reconcile his deep Catholic faith with modern political and scientific thought. Rosmini exerted a considerable influence on the Italian Risorgimento. His dissatisfaction with the spiritual and educational state of the church of his time led him. in 1828. to found the Institute of Charity at Monte Calvario, Domodossola, which was approved by Pope Gregory XVI in 1839 Modeled on the Jesuit rule. it aims at the perfection of its members through the exercise of charity in any torm or field, combined with absolute devotion to the church and to one's superiors in the society.

Rosmini's *Nuovo saggio sull' origine delle idee* (Eng. trans., *New Essay on the Origin of Ideas,* 3 vol., 1883) and *Massime di perfezione* (Eng. trans, *Maxims of Christian Perfection,* 1889, 1949), which contain the essence of his philosophical and religious thought. were published in Rome in 1830, later norks mere *Teodicea* (1845; Eng. trans., *Theodicy,* 3 vol., 1912) and *Psicologia* (1850; Eng. trans.. *Psychology,* 3 vol.. 1884–88). The centre of his philosophical system, which he developed also in education and in law, is ideal being, which is not an idea like other ideas but a reflection of God in man, appertaining in eternal truth, the indispensable means of acquiring, through the senses, all other knowledge. Ideal being is the supreme criterion of truth and certainty in logic and the basis of the concept of the dignity of the human person in law and politics. The synthetic character of Rosmini's system of human knowledge has made its assimilation difficult and led, falsely, to charges of "ontologism" and "pantheism."

Rosmini welcomed the Italian national movement, but was strongly critical of its anticlerical and anti-Catholic tendencies. Looking to the papacy for spiritual and political leadership, he published, in 1848, *Delle cinque piaghe della santa Chiesa* (Eng. trans., *Of the Five Wounds of the Holy Church,* 1883) and *La Costituzione secondo la giustizia sociale.* Both works were placed on the Index in 1849. As the Piedmontese government's special envoy in 1848–49, Rosmini was commissioned to negotiate a concordat with Pope Pius IX *(see* his narrative *Della missione* a *Roma . . . negli anni* 1848–49, 1881); and when the Roman revo-

lution broke out and Pius had to escape to Gaeta, Rosmini, whose counsels he wished to reward with the cardinal's hat, accompanied him into exile. But Rosmini's influence declined under the impact of the Austrian victories in Italy and the pope's rejection of liberal reforms. Compelled by polemics and attacks on Rosmini's doctrines, Pius ordered an examination of all his works. Rosmini at once declared his submission and retired to Stresa where he died, broken in health, on July 1, 1855.

Before his death Rosmini learned that his works had been proclaimed free from censure by the Congregation of the Index (decree *Dimittantur*, 1854); Leo XIII's decree *Post obitum* in 1887 declared 40 propositions from his books to be "not seemingly consonant with Catholic truth"; but this mild form of censure was later regarded as not having theological significance *(see* U. Honan, *II Decreto Post Obitum,* Domodossola, 1949).

The Institute of Charity was established in England by Father Luigi Gentili in 1835 and contributed through its missionary activities to the Catholic revival there. By the middle of the 20th century there were Rosminian foundations in Europe, the British Isles, the U.S. and Africa.

BIBLIOGRAPHY.—*Edizione Nazionale* of Rosmini's works (1934–) was planned to comprise 100 vol. *See* also his *Letters chiefly on Religious Subjects,* Eng. trans. (1901); G. B. Pagani, *The Life oj Antonio Rosmini-Serbati,* Eng. trans. (1907); C. R. Leetham, *Rosmini, Priest, Philosopher, Patriot* (1957); and the periodical *Rivista Rosminiana* (Domodossola). (R. J. H.)

ROSNY, JOSEPH HENRY, a pseudonym covering the collaboration of the French novelists, Joseph Henri Honoré Boex (1856–1940), and his brother Séraphin Justin François Boex (1859–1948). The novels of J. H. Rosny are full of scientific knowledge, of astronomy, anthropology, zoology and, above all, sociology. The stories are approached from the point of view of society rather than of the individual, but the characters, strongly individualized and intensely real, are only incidentally typical. The elder Rosny was the sole author of the earlier novels, and began novel writing as an avowed disciple of E. Zola. Among these earlier works may be mentioned *Le Bilate'ral* (1886), and the "prehistoric" novel, *Vamireh* (1891), a masterpiece of its kind. They were among the writers who in 1887 entered a formal protest in the *Figaro* against Zola's *La Terre,* and were designated by Edmond de Goncourt as original members of his academy. Among their other novels the more famous are *Daniel Valgraive* (1891); *L'Indomptée* (1895), the history of a girl medical student in Paris; Le *Serment* (1896, dramatized 1897); *Les Anzes perdues* (1899), an anarchist novel; *La Charpente* (1900); *Thérèse Degaudy* (1902); *Le Crime du docteur* (1903); *Le Docteur Harambur* (1904); *Le Millionaire* (1905); *Sous le jardeau* (1906); *La Guerre de feu* (1911) and *La Carapace* (1914).

ROSS, BETSY (1752–1836), heroine of one of the most picturesque legends which has grown up around the origin of the American flag, was born at Philadelphia, Pa., on Jan. 1, 1752. She married John Ross, whose uncle. George Ross, was one of the signers of the Declaration of Independence.

The versions of the flag story as told by her descendants, agree in the following main points: Washington, accompanied by Robert Morris and Gen. George Ross, called at the little upholstery shop in Arch street. where she was carrying on the business in which she and her husband had been engaged, and asked if she could make a flag. She said she never had made one, but that she could try. They thereupon produced a design, rather roughly drawn. She examined it and, noticing that the stars were six-pointed, suggested that they should be made with five points. The gentlemen agreed with her that five points would look better, but that the six-pointed stars would be easier to make. She then showed them how a five-pointed star could be made with a single clip of the scissors. Washington then and there changed the sketch and the three gentlemen left. Soon after a new design was sent to her, coloured by William Barrett, a painter of some note. She thereupon set to work to make the famous flag, which was soon completed and approved.

This story was first presented by William J. Canby, grandson of Betsy Ross, in a paper read in 1870 before the Historical Society of Pennsylvania, and it was verified by other descendants of the family who remembered the story as frequently told to them. No contemporary documentary evidence has ever been found to support the story, nor has any, on the other hand, been found which gives the honour to anyone else. All that has been verified is that there was a Mrs. Ross living in Philadelphia at the time of the flag's adoption, and that she was an upholsterer and flagmaker by trade. She died at Philadelphia on Jan. 30, 1836.

BIBLIOGRAPHY.—Canby's claims are ably presented by L. Balderston in *The Evolution of the American Flag* (1909); P. D. Harrison, *The Stars and Stripes* (1914); G. H. Preble, *Origin and History oj the American Flag* (new *ed.,* 1917); S. Abbott, *Dramatic Story of Old Glory* (1919).

ROSS, EDWARD ALSWORTH (1866–1951), U.S. sociologist. one of the early U.S. writers on social psychology, was born Dec. 12, 1866, in Virden. Ill. After studying at Coe college, Cedar Rapids, Ia.. the University of Berlin and Johns Hopkins university. Baltimore, Md. (Ph.D., 1891), he taught economics for brief periods at Indiana, Cornell and Stanford universities. At the last-named institution, beginning in 1895, he centred his attention on sociology. Resigning from Stanford in 1900 in a dispute concerning academic freedom, he spent a few years at the University of Nebraska, Lincoln. before joining the faculty of the University of Wisconsin, Madison, where he taught sociology. for 30 years.

Ross died on July 22, 1951, in Madison.

He was an early major systematizer of sociology; one of his principal contributions lay in creating a comprehensive body of theory. He was a prolific writer with a flair for popular presentation that did much to stimulate interest in problems of social research. His best-known work, *Social Control* (1901), was long regarded as a classic. and his *Social Psychology* (1908) was one of the first American works written specifically on that discipline.

Among his other works are *Foundations of Sociology* (1905); *Sin and Society* (1907); *Russia in Upheaval* (1918); *World Drift* (1928); *New Age Sociology* (1940).

(P. B. G.)

ROSS, HAROLD WALLACE (1892–1951), a revolutionary figure in U.S. journalism, founder and first editor of *The New Yorker,* was born in Aspen, Colo., Nov. 6, 1892. He quit high school to become a reporter, and in World War I edited *Stars and Stripes,* the serviceman's newspaper, in France. When he launched *The New Yorker* in 1925 he quickly toppled many conventional literary forms in his quest for ways to capture the contemporary scene in the magazine's pages.

Young new writers and artists, attracted by the rich odour of innovation, were drawn to the magazine. Under Ross's guidance. satire and parody flourished, reporting became lighthearted and searching, humour was allowed to infect everything, biography achieved bold strokes in the "Profiles." the short story enjoyed a reprieve from the heavy burden of plot, and social cartooning became less diagrammatic and more vigorous. In *The New Yorker,* the unknown writer was on equal footing with the established one; the editor sought good writing, not great names. Restless, noisy, consumed by curiosity, driven by a passion for clarity and perfection, Ross spent himself recklessly on each succeeding issue, and with unabating discontent.

Ross died in Boston on Dec. 6, 1951, having to a notable extent changed the face of journalism in his time. (E. B. W.)

ROSS, SIR JAMES CLARK (1800–1862), British rear admiral and polar explorer, who carried out important arctic and antarctic magnetic surveys, was born in London on April 15, 1800. He entered the Royal Navy in 1812, accompanying his uncle, Capt. (later Sir) John Ross (*q.v.*), on his first arctic voyage in 1818. Between 1819 and 1827 he accompanied Sir W. E. Parry on his four arctic expeditions, and from 1829 to 1833 again accompanied his uncle reaching the north magnetic pole in 1831. From 1835-38 he worked on the magnetic survey of Great Britain. except from Dec. 1835 to Aug. 1836 when he searched for some missing arctic whaling ships *(see* "Polar Record," no. 40, 1950). He commanded H.M.S. "Erebus" and "Terror" during the antarctic expedition of 1839–43, sailing to

Hobart and thence to the antarctic. The ships penetrated the pack ice from Jan. 5 to 10, 1841, in long. 174° E., reaching open water and discovering the Ross sea. The expedition's main object was to conduct magnetic observations in the antarctic and to reach the south magnetic pole. The ships sailed south toward the position assigned by K. F. Gauss to the pole, meanwhile discovering Victoria Land. Progress further south was barred by the Ross ice shelf, along which the ships coasted to long. 167° W. Unable to find suitable winter quarters, Ross returned to Hobart. In Nov. 1841 he sailed south to the barrier from New Zealand, reaching lat. 70° 10' S. in 161° 27' W., probably also sighting Edward VII peninsula. The ships wintered in the Falkland Islands and returned south to chart part of Graham coast. They sailed east along the edge of the Weddell sea ice and south to lat. 71" 30' S., long. 14° 51' W. On the way home Ross tried unsuccessfully to rediscover Bouvetøya (lat. 54° 26' S., long. 3° 24' E.). His *Voyage of discovery . . . in the Southern and Antarctic Regions* appeared in 1847. He was elected a fellow of the Royal society in 1848. From 1848 to 1849 he searched for Sir John Franklin in H.M.S. "Enterprise" and "Investigator."

He died at Aylesbury on April 3, 1862.

See also ANTARCTIC REGIONS; ARCTIC, THE. (A. M. Ss.)

ROSS, JANET ANNE (1842–1927), English writer, daughter of Sir Alexander Cornewall Duff Gordon, was born in London on Feb. 24, 1842. She is the original of Rose Jocelyn in George Meredith's *Evan Harrington*. She married in 1860 Henry Ross, a banker in Egypt and a great traveler, and her life in Egypt, where she spent six years, is described vividly in her *Fourth Generation: Reminiscences* (1912). From 1863 to 1867 she was a correspondent of *The Times*. In 1867 she and her husband settled in Italy, where her house was a centre for the lovers of Italian culture. Mrs. Ross died in Florence on Aug. 23, 1927.

Her publications include *Three Generations of English Women* (2 vol., 1888); *The Land of Manfred* (1889); *Old Florence and Modern Tuscany* (1904); *Lives of the Early Medici* (1910); *Letters of Principal J. M. Lindsay to Janet Ross* (1922).

ROSS, SIR JOHN (1777–1856), Scottish rear admiral and arctic explorer, whose second arctic expedition in search of a northwest passage made important contributions to oceanography, was born on June 24, 1777, at Balsarroch near Stranraer, Wigtownshire, Scot. He entered the Royal Navy in 1786 and fought in the French Revolutionary and Napoleonic wars, during which he captained the Swedish fleet. In 1818 he made his first arctic expedition on which he failed to discover much that was new; but in 1829–33 he made a second, surveying Boothia peninsula, King William Land and the Gulf of Boothia, and achieved important results. In 1850 he undertook a third voyage in unsuccessful search of Sir John Franklin and in 1851 he became a rear admiral. Ross died in London on Aug. 30, 1856.

His publications include *A Voyage of Discovery . . . for the Purpose of Exploring Baffin's Bay . . .* (1819); *Narrative of a Second Voyage in Search of a North-West Passage* (1835); *Memoirs and Correspondence of Admiral Lord de Saumerez* (1838).

ROSS, JOHN (Indian name KOOWESKOOWE or COOWEESCOOWE) (1790–1866), famed chief of the Cherokee Indians in the U.S., was born near Lookout mountain, Tenn., on Oct. 3, 1790. Ross's blue eyes and brown hair indicated that his Cherokee strain was small. His father, a Scottish trader, employed a tutor and later sent Ross to an academy at Kingston, Tenn. In 1813 he married a full-blooded Cherokee woman named Quatie. Some years after her death he married Mary Bryan Stapler, a white woman of Quaker faith.

During the early part of the 19th century there developed considerable pressure to open the Indian lands in Georgia to white settlement *(see* GEORGIA: *History)* and Ross became leader of the Cherokees opposed to westward removal. From 1819 to 1826 he served as president of the national council of the Cherokees. His leadership was strengthened when, in 1823, he exposed machinations of federal commissioners who attempted to bribe him into approving Cherokee land sales. In 1828 he became head chief of the eastern Cherokees under a new constitution he had helped write. His valorous defense of Cherokee freedom and property from land-hungry Georgians utilized every means short of war and included several appeals to the federal government. After all efforts had failed, in 1838–39 Ross led his people to their new home in what is now Oklahoma. There he helped write the constitution of 1839, uniting the eastern and western Cherokees under one government, and was chosen chief of the united tribe. He held this office until his death on Aug. 1, 1866, in Washington, D.C., where he had gone to assist in making the Cherokee treaty of 1866. Ross had his trenchant critics as well as devoted supporters, but he was the ablest leader of his people for almost 40 crucial years.

See Chapman J. Milling, *Red Carolinians* (1940), which includes an authoritative account of the Cherokee removal and Ross's leadership; with bibliography. (W. R. J.)

ROSS, SIR RONALD (1857–1932), British bacteriologist and Nobel laureate, noted for his investigations of malaria, was born at Almora, India, on May 13, 1857. He studied medicine at St. Bartholomew's hospital, London, and in 1881 entered the Indian medical service. In 1892 he began a series of investigations on the subject of malaria (*q.v.*), in 1895 undertook to verify experimentally the theory that the microorganisms of this disease are spread by mosquitoes and in 1897–98 investigated the life history of the parasites. In 1899 he retired from the Indian medical service, and, after a journey to west Africa in 1899 for the study of malaria-bearing mosquitoes, devoted himself to research and teaching, joining the Liverpool school of tropical medicine as lecturer and subsequently becoming professor of tropical medicine at the University of Liverpool. In 1913 he became physician for tropical diseases at King's college hospital, London, and later director in chief of the Ross Institute and Hospital for Tropical Diseases. During World War I Ross was war office consultant in malaria and after the war acted as consultant in malaria for the ministry of pensions. In 1902 he received the Nobel prize for medicine; in 1911 he was created knight commander of the Bath; and in 1918 a knight commander of St. Michael and St. George. He received the royal medal of the Royal society, of which he was a fellow, in 1901.

He was editor of *Science Progress*, and his other publications include *The Prevention of Malaria* (1910); *Philosophies* (1910); *Psychologies* (1919); *The Revels of Orsera*, a romance (1920); and *Memoirs* (1923), as well as mathematical and medical works.

Ross died Sept. 16, 1932.

See *British Medical Journal*, 2:609 *(1932)*.

ROSS AND CROMARTY, a northern county of Scotland. The mainland portion is bounded north by Sutherland and Dornoch firth, east by the North sea and Moray firth, south by Beauly firth and Inverness-shire and west by the strait of the Minch. The land area of the mainland and islands is 3,089.5 sq.mi. with a population (1951) of 60,508. The island portion (for details *see* HEBRIDES, THE) consists of the northernmost part of the Outer Hebrides, called Lewis, and many smaller islands almost all uninhabited and scattered principally off the west coasts of Lewis and the mainland. The only inhabited island off Lewis is Great Bernera, now linked to Lewis by a road bridge. There is a lighthouse on the Flannan Islands, 7 mi. out in the Atlantic. On the east coast, where there is a comparatively fertile strip of land, the chief indentations are Beauly firth and Inverness firth, marking off the Black Isle (actually a peninsula) from Inverness-shire; Cromarty firth, bounding the districts of Easter Ross and the Black Isle; Moray firth, separating Easter Ross from Nairnshire; and Dornoch firth, dividing northeast Ross from Sutherlandshire. On the Atlantic coast the principal sea lochs and bays, from south to north, are Loch Duich, Loch Alsh, Loch Carron, Loch Kishorn, Loch Torridon, Loch Shieldaig, Upper Loch Torridon, Gair Loch, Loch Ewe, Gruinard bay, Little Loch Broom, Loch Broom and Enard bay. Almost all the southern boundary with Inverness-shire is guarded by a rampart of peaks, ranging from 3,400 to nearly 3,900 ft. To the north of Glen Torridon rise the masses of the Liathach, with summits of 3,456 and 3,358 ft. On the northeastern shore of Loch Maree rises Ben Slioch (3,217), while the Fannich group contains at least six peaks of more than 3,000 ft. The isolated mass of Ben Wyvis (3,429) is the most noteworthy feature

in the northeast, and the Teallach group in the northwest with peaks of 3,483 and 3.474 ft. are equally conspicuous, though less solitary. Only a small fraction of western and southern Ross is under 1,000 ft. in height. Easter Ross and the peninsula of the Black Isle are comparatively level. The longest river is the Orrin, which rises in An Sithean and flows mainly east by north to its confluence with the Conon after a run of about 26 mi. during a small part of which it forms the boundary with Inverness-shire. At Aultgowrie the stream forms the Falls of Orrin in a narrow gorge. From its source in the mountains in Strathvaich the Blackwater flows southeast for 19 mi. until it joins the Conon, forming soon after it leaves Loch Garve the picturesque Falls of Rogie. Within a short distance of its exit from Loch Luichart the Conon pours over a series of graceful cascades and rapids and then pursues a winding course of 12 mi.. mainly eastward to the head of Cromarty firth. The Falls of Glomach, in the southwest! are the deepest in Britain (370 ft. sheer). Twelve miles south by east of Ullapool are the three falls of Measach, close to the gorge of Corriehalloch. The Oykell, throughout its course. forms the boundary with Sutherland, to which it properly belongs. The largest and most beautiful of the many fresh-water lakes is Loch Maree (see MAREE, LOCH). Of the straths or valleys the more important run from the centre eastward, such as Strathconon (12 mi.), Strathbran (10 mi.), Strathgarve (8 mi.), Strathpeffer (6 mi.) and Strathcarron (14 mi.). Excepting Glen Orrin (13 mi.), in the east central district. the longer glens lie in the south and toward the west. In the extreme south Glen Shiel (9 mi.) runs between fine mountains to its mouth on Loch Duich. General George Wade's road passes down the glen. Farther north are Glen Elchaig (9 mi.), Glen Carron (12 mi.), through which runs the Dingwall and Skye railway, and Glen Torridon (6 mi.). A large area southwest of Loch Maree forms the Beinn Eighe Nature reserve.

Geology.— The central portion of the county is occupied by the younger highland schists or Dalradian series. On the eastern side of the county the Dalradian schists are covered unconformably by the Old Red sandstone. The western boundary of the younger schist is formed by the great pre-Cambrian dislocation line which traverses the county from Elphin on the north by Ullapool to Glen Carron. Most of the area west of the line of disturbance is covered by Torridonian sandstone, mainly dark reddish sandstones, grits and shales, resting unconformably on the ancient Lewisian gneiss. Within the Torridonian tract the gneiss occupies large areas north of Coigach, on the east of Enard bay, between Gruinard bay and Loch Maree. The Lewisian gneiss is penetrated everywhere by basic dikes, generally with a northwest to southeast direction; some of these are of great breadth. The Torridonian rocks are succeeded unconformably by a series of Cambrian strata which is confined to a narrow belt west of the line of main thrusting. Glacial striations are found upon the mountains up to heights of 3,000 ft., and much boulder clay is found in the valleys and spread over large areas in the eastern districts. Ancient shorelines occur at 100, 50 and 25 ft. above the present sea level; they are easily seen in Loch Carron.

History and Antiquities.— During the first five centuries, and for long afterward, the land was occupied by Gaelic Picts, who, in the 6th and 7th centuries, were converted to Christianity by followers of St. Columba. Throughout the next three centuries the natives were continually harassed by Norse pirates, of whose presence tokens have survived in several place names such as Dingwall and Tain. At that time the county formed part of the great province of Moray. When the rule of the Celtic *mormaors* or earls ceased in the 12th century. consequent on the plantation of the district with settlers from other parts (including a body of Flemings) by order of David I, who was anxious to break the power of the Celts, the bounds of Moravia were contracted and the earldom of Ross arose. At first Ross proper included only the territory adjoining Moray and Dornoch firths. The first earl was Malcolm MacHeth, who received the title from Malcolm IV. After his rebellion in 1179 chronic insurrection ensued, which was quelled by Alexander II, who bestowed the earldom on Farquhar Macintaggart, then abbot of Applecross, and in that capacity lord of the western district. William, 4th earl, was present with his clan at the battle of Bannockburn (1314), and almost a century later (1412) the castle of Dingwall, the chief seat on the mainland of Donald, lord of the Isles. was captured after the disastrous fight at Harlaw in Aberdeenshire. which Donald had provoked when his claim to the earldom was rejected. The earldom reverted to the crown in 1424, but James I soon afterward restored it to the heiress of the line. the mother of Alexander MacDonald, 3rd lord of the Isles, who then became 11th earl. In consequence, however, of, the treason of John MacDonald, 4th and last lord of the Isles and 12th earl of Ross, the earldom was again vested in the crown (1476). Five years later James III bestowed it on his second son, James Stewart. whom he also created duke of Ross in 1488. By the 16th century the whole area of the county was occupied by different clans! the Rosses, Munroes, Macleods, Macdonalds and Mackenzies. The county of Ross was constituted in 1661, and Cromarty in 1685 and 1698. both being consolidated into the present county in 1889. Apart from occasional conflicts between rival clans, the only battles in the shire were those of Invercarron (1650), when Montrose was crushed by Col. Archibald Strachan, and Glenshiel (1719), when the Jacobites, under the earl of Seaforth, aided by Spaniards, were defeated near Bridge of Shiel by Gen. Joseph Wightman.

Stone circles, cairns and forts are found in the eastern district. A vitrified fort crowns the hill of Knockfarrel and there is a circular dun near the village of Lochcarron. Some examples of sculptured stones occur, the finest being at Shandwick. Among old castles are those of Lochslin, in the parish of Fearn. said to date from the 13th century, which, though ruinous, possesses two square towers in good preservation; Balone, in the parish of Tarbat, once a stronghold of the earls of Ross; the remains of Dingwall castle, their original seat; and Eilean Donan in Loch Alsh, which was blown up by English warships during the abortive Jacobite rising in 1719 but restored in 1932.

Population and Administration.— The population at the 1951 census was 60,508; Ross and Cromarty, though the third largest county in size: being the 1 jth in population. There were 1,123 people who spoke Gaelic only and 26,401 speaking Gaelic and English. Of the six small burghs, the chief are Stornoway (pop., 1951, 4,954), Dingwall (3,367). Invergordon (1,514) and Tain (1,600). Gllapool is a fishing port near the mouth of Loch Broom. There are 12 county districts and the county with Inverness-shire returns three members to parliament, for Inverness, Ross and Cromarty, and the Western Isles. Dingwall. Tain and Fortrose are royal burghs, and Dingwall is the county town. Ross and Cromarty with Inverness, Moray and Nairn forms a sheriffdom, and there are resident sheriffs-substitute at Dingwall and Stornoway, the former also sitting at Tain.

There are academies at Dingwall, Fortrose, Tain and Invergordon.

Agriculture and Industries.— Ross-shire embraces wider extremes of farming types than any other county in Scotland. On the fertile soils of Easter Ross there are large and productive holdings given over to rotational cropping and the rearing and fattening of livestock. Heavy yields of cereals and potatoes are obtained, and the cattle and sheep are of outstanding quality. At the other extreme are the crofts of Lewis, where the climate, the type of soil and the size of units are factors unfavourable to progressive agriculture. Between these extremes are the less intensive arable and stock-raising farms on the poorer and higher land bordering the hills. On the hills themselves, which in area comprise the greater part of the county, large-scale sheep farming is practised. Poultry and pig-keeping are mainly sidelines on mixed arable farms; there are relatively few dairy holdings. Dingwall is the principal agricultural market. Because of the unfavourable nature of most of the surface—which offers no opportunity for other than patchwork tillage—the number of small holdings (5 ac. and less) is enormous and the average size is about 18 ac. More than 800,000 ac. of poor and rough grazing land, much of it over 2,000-ft. above sea level, are devoted to deer forests, a greater area than in any other county in Scotland. The natural woodland has largely disappeared, but large-scale afforestation has been undertaken by the forestry commission. Apart from agriculture and forestry, the salmon fisheries in the bays and river mouths, and the herring, cod and ling fisheries are the only considerable industry. There are distilleries near Dingwall, Tain and Invergordon. Considerable employment of a temporary nature was provided

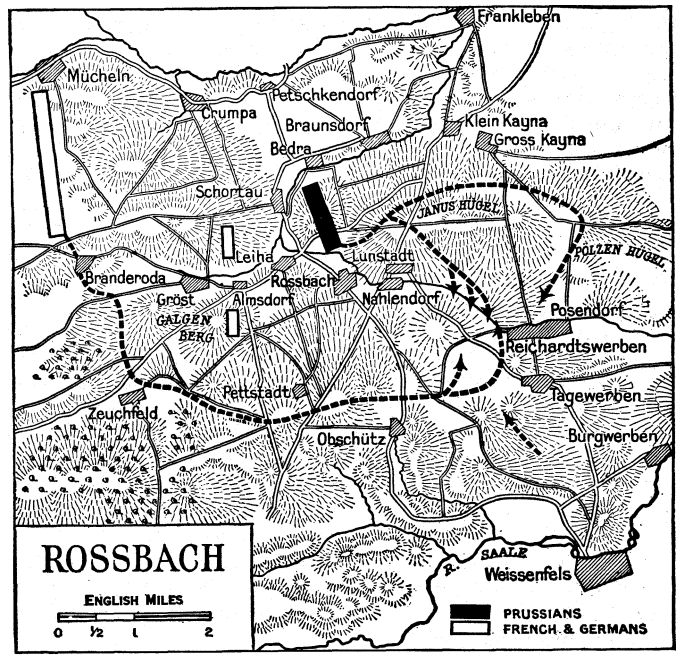
after World War II by the projects of the North of Scotland Hydro-Electric board.

ROSSANO, a city of Calabria. Italy, in the province of Cosenza, 24 mi. N.N.E. from that town direct. with a station 4 mi. distant on the line from Metaponto to Reggio. Pop. (1951) 11,739. It is on a spur of Sila mountain, overlooking the Gulf of Taranto, the highest part of the town being 975 ft. above sea level. Rossano is the seat of an archbishop, and in the cathedral is preserved the *Codex Rossanensis,* an uncial ms. of the Gospels of Matthew and Mark in silver characters on purple vellum. with twelve miniatures, of great interest in the history of Byzantine art. belonging to the 6th century A.D. Rossano *(Roscianum)* was an important fortress of Calabria. Totila took it in 548. In the 14th century it was made a principality for the family of De Baux. Passing to the Sforza. and thus to Sigismund of Poland. it was united in 1558 to the crown of Naples by Philip II. of Spain. During World War II it was bombed by the Allies.

ROSSBACH, a village in the Land of Saxony, Germany, in the district of Merseburg, 8 mi. S.W. of that place and N.W. of Weissenfels, famous as the scene of Frederick the Great's victory over the allied French and the army of the Empire on Nov. 5, 1757. For the preceding events *see* SEVEN YEARS' WAR. The Prussian camp on the morning of the 5th lay between Rossbach (left) and Bedra (right), facing the Allies, who, commanded by the French general, Charles de Rohan, prince de Soubise, and Joseph Frederick William, duke of Saxe-Hildburghausen. General Feldzeugmeister of the Empire, had manoeuvred in the preceding days without giving Frederick an opportunity to bring them to action, and now lay to the westward, with their right near Branderoda and their left at Miicheln *(see* sketch). The advanced posts of the Prussians were in the villages immediately west of their camp, those of the Allies on the Schortau hill and the Galgenberg.

The Allies possessed a numerical superiority of two to one in the battle itself, irrespective of detachments,[1] and their advanced post overlooked all parts of Frederick's camp. They had had the best of it in the manoeuvres of the previous days, and Hildburghausen determined to take the offensive. He had some difficulty, however, in inducing Soubise to risk a battle, and the Allies did not begin to move off their camping-ground until after eleven on the 5th, Soubise's intention being probably to engage as late in the day as possible, with the idea of gaining what advantages he could in a partial action. The plan was to march the Allied army by Zeuchfeld, round Frederick's left (which was covered by no serious natural obstacle), and to deploy in battle array, facing north, between Reichardtswerben (right) and Pettstadt (left). The duke's proposed battle and the more limited aim of Soubise were equally likely to be attained by taking this position, which threatened to cut off Frederick from the towns on the Saale. This position, equally, could only be gained by marching round the Prussian flank, *i.e.,* by a flank march before the enemy. The obvious risk of interference on the exposed flank was provided against by a considerable flank guard, and in fact it was not in the execution of their original design but in hastily modifying it to suit unfounded assumptions that the Allies met with disaster.

Frederick spent the morning watching them from a house-top in Rossbach. The initial stages of their movement convinced him that the Allies were retreating southward towards their magazines, and about noon he went to dinner, leaving Captain von Gaudi on the watch. This officer formed a different impression of the Allies' intentions, for the columns which from time to time became visible in the undulations of the ground were seen to turn eastwards from Zeuchfeld. Gaudi's excited report at first served only to confirm Frederick in his error. But when the king saw for himself that hostile cavalry and infantry were already near Pettstädt, he realized the enemy's intentions. The battle for which he had manoeuvred in vain was offered to him, and he took it without hesitation. Leaving a handful of light troops to oppose the French advanced post (or flank guard) on the Schortau hill, the Prussian army broke camp and moved—half an hour after the king gave the order—to attack the enemy. The latter were marching in the normal order in two main columns, the first line on the left, the second line on the right; farther to the right was a column consisting of the reserve of foot, and between the first and second lines



PLAN OF THE BATTLE OF ROSSBACH, NOV. 5, 1757

was the reserve artillery on the road. The right-wing cavalry was of course at the head, the left-wing cavalry at the tail of the two main columns. At first the regulation distances were preserved, but when wheeling eastward at Zeuchfeld there was much confusion, part of the reserve infantry getting in between the two main columns and hampering the movements of the reserve artillery, and the rest, on the outer flank of the wheel, being unable to keep up with the over-rapid movement of the wheeling pivot. A weak flank guard was thrown out towards Rossbach. When it was seen that the Prussians were moving, as far as could be judged, eastward, it was presumed that they were about to retreat in order to avoid being taken in flank and rear; and the Allied generals thereupon hurried the march, sending the cavalry on ahead.

Frederick had no intention either of forming up parallel to the enemy or of retreating. As his army could move as a unit twice as fast as the enemy's, he intended to make a détour, screened by the Janus Hiigel and the Polzen Hiigel, and to fall upon them suddenly from the east. If at the moment of contact the Allies had already formed their line of battle facing north, the attack would strike their right flank; if they were still on the move in column eastwards or north-eastwards, the heads of their columns would be crushed before the rest could deploy in the new direction—deployment in those days being a lengthy affair. To this end General von Seydlitz, with every available squadron, hurried eastward from Rossbach, behind the Janus Hiigel, to the Polzen Hiigel; Colonel von Moller, with eighteen heavy guns, came into action on the Janus Hiigel at 3.15 against the advancing columns of the Allied cavalry; and the infantry followed as fast as possible. When they came under the fire of Moller's guns, the Allied squadrons, which were now north of Reichardtswerben and well ahead of their own infantry, suffered somewhat heavily; but it was usual to employ heavy guns to protect a retreat, and they contented themselves with bringing some field-guns into action. They were, however, amazed when Seydlitz's thirty-eight squadrons suddenly rode down upon the head and right flank of their columns from the Polzen Hiigel *"avec une incroyable vitesse."* Gallantly as the leading German regiments deployed to meet him,

[1] V. der Goltz (*Rossbach bis Jena,* 1906 edition) gives 41,000 Allies and 21,600 Prussians as the combatant strengths. Berndt's statistical work, *Zahl im Kriege,* gives the respective forces engaged as Allies 43,000, Prussians 21,000. Other accounts give the Allies' total strength as 64,000 and the Prussians' as 24,000.

the result was scarcely in doubt for a moment. Seydlitz threw in his last squadron, and then himself fought like a trooper, receiving a severe wound. The mêlée drifted rapidly southward, past the Allied infantry, and Seydlitz finally rallied his horsemen in a hollow near Tagewerben, ready for fresh service. This first episode was over in half an hour, and by that time the Prussian infantry, in échelon from the left, was descending the Janus Hügel to meet the already confused and disheartened infantry of the Allies. The latter, as their cavalry had done, managed to deploy some regiments on the head of the column, and the French in particular formed one or two columns of attack—then peculiar to the French army—and rushed forward with the bayonet. But Moller's guns, which had advanced with the infantry, tore gaps in the close masses, and, when it arrived within effective musketry range, the attack died out before the rapid and methodical volleys of the Prussian line. Meanwhile the Allies were trying in vain to form a line of battle. The two main columns had got too close together in the advance from Pettstadt, part of the reserve which had become entangled between the main columns was extricating itself by degrees and endeavouring to catch up with the rest of the reserve column away to the right, and the reserve artillery was useless in the middle of the infantry. The Prussian infantry was still in échelon from the left, and the leftmost battalions that had repulsed the French columns were quickly within musket-shot of this helpless mass. A few volleys directed against the head and left flank of the column sufficed to create disorder, and then from the Tagewerben hollow Seydlitz's rallied squadrons charged, wholly unexpectedly, upon its right flank. The Allied infantry thereupon broke and fled. Soubise and the duke, who was wounded, succeeded in keeping one or two regiments together, but the rest scattered over the countryside. The battle had lasted less than an hour and a half, and the last episode of the infantry fight no more than fifteen minutes. (C. F. A.)

ROSSBY, CARL GUSTAF ARVID (1898–1957), Swedish-American meteorologist, whose studies, particularly in atmospheric circulation, had much to do with the rapid growth of the science during his time. Born on Dec. 28, 1898, in Stockholm and educated there, his principal published works appeared after he moved to the United States in 1925. Working first in Washington, D.C., and later as professor and head of the country's first department of meteorology at the Massachusetts Institute of Technology, Cambridge. he made important contributions to thermodynamics of air masses and atmospheric turbulence, including ocean-air boundary problems.

In the late 1930s Rossby turned his attention to the general circulation of the atmosphere, continuing this work after becoming professor and chairman of the department of meteorology at The University of Chicago. He identified the long waves in the upper westerlies, now often called "Rossby waves," and developed the theory for their movement. He is credited with having identified the so-called "jet stream" and with having developed the principal theories for its behaviour. He also worked on models for numerical weather prediction.

After 1948 Rossby was mainly identified with the Institute of Meteorology which he founded in connection with the university in Stockholm. From 1954 until his death on Aug. 19, 1957, in Stockholm, he introduced and led world-wide studies of atmospheric chemistry and radioactivity.

Rossby distinguished himself as a leader of men as well as a scientist. Wherever he worked he had a large and devoted following and generated much enthusiasm for meteorology.

(H. R. B.)

ROSSE, WILLIAM PARSONS, 3RD EARL OF (1800–1867), Irish astronomer and telescope constructor, was born at York on June 17, 1800, a son of the 2nd earl, Lawrence. Until his father's death he was known as Lord Oxmantown. Entered at Trinity college, Dublin, in 1818, he proceeded to Magdalen college, Oxford, in 1821, and in the same year he was returned as M.P. for King's county, a seat which he resigned in 1834. He was Irish representative peer from 1845, president of the British association in 1843, president of the Royal society from 1849 to 1854, being awarded the royal medal in 1851, and chancellor of the University of Dublin from 1862. He died at Monkstown on Oct. 31, 1867.

The first constructor of reflecting telescopes on a large scale, William Herschel, never published anything about his methods of casting and polishing specula, and Lord Rosse had no help toward his brilliant results. His speculum metal is composed of four atoms of copper (126.4 parts) and one of tin (58.9 parts), a brilliant alloy. Chiefly because of the brittleness of this material, Lord Rosse's first larger specula were composed of a number of thin plates of speculum metal (16 for a 3-ft. mirror) soldered on the back of a strong but light framework made of brass (2.75 of copper to 1 of zinc), which has the same expansion as his speculum metal. In Brewster's Edinburgh Journal of Science (1828) he described his machine for polishing the speculum. which in all essential points remained unaltered afterward. In Sept. 1839 a three-foot speculum was finished and mounted, but, though the definition of the images was good, its skeleton form allowed the speculum to follow atmospheric changes of temperature quickly, so Lord Rosse decided to cast a solid three-foot speculum. Hitherto a great difficulty in casting specula was the fact that they generally cracked while cooling. Rosse experimented, ingeniously overcame this difficulty, and successfully cast a solid three-foot speculum in 1840. In 1842 he began a speculum of six feet in diameter, and in 1845 this great reflector was mounted and ready for work.

From 1848 to 1878 it was but with few interruptions employed for observations of nebulae (see NEBULA); and many previously unknown features in these objects were revealed by it, especially the similarity of "annular" and "planetary" nebulae, and the remarkable "spiral" configuration in many of the nebulae. A special study was made of the nebula of Orion, and the resulting large drawing gives an extremely good representation of this complicated object. See TELESCOPE.

See Ball, *Great* **Astronomers (1895).**

ROSSELLINO (ROSSELLINI), the name of a family of stonecutters from Settignano, near Florence, of whom two of five brothers, BERNARDO, an architect and sculptor, and ANTONIO, a sculptor, are the most important.

BERNARDO ROSSELLINO (1409–64), notable early Renaissance architect and sculptor, was born at Settignano in 1409. His earliest recorded work, the upper part of the façade of the Misericordia at Arezzo (1433–35), in which a lunette with the Madonna of Mercy is set between elegant pilasters, reveals the strong influence of Filippo Brunelleschi, as does his masterpiece, the historian Leonardo Bruni's tomb (1445–50) in Sta. Croce in Florence. The Bruni monument has the form of a triumphal arch set against the wall, with the effigy resting on a classical sarcophagus and a relief of the Virgin and Child and two figures of angels above. It inaugurated a new type of sepulchral monument, which assumed great popularity and was imitated by Desiderio da Settignano and other artists. Notable alike for its architectural and sculptural qualities, this tomb ranks with the greatest achievements of Renaissance sculpture. In a tabernacle carved by Bernardo Rossellino in S. Egidio in Florence (1449–50), for which the bronze door was cast by Lorenzo Ghiberti, the influence of Brunelleschi is also dominant. His work as a figure sculptor can also be studied in two figures of the Annunciatory Angel and Virgin Annunciate in the museum at Empoli (1444–47) and the tomb of the Beata Villana delle Botte in Sta. Maria Novella in Florence (after 1451). Much of the effect of the Bruni monument is due to the extraordinarily skillful carving of the decorative ornament. Other examples of Bernardo's use of decorative carving occur in a doorway in the Palazzo Pubblico at Siena (1447) and the tomb of Orlando de' Medici in SS. Annunziata in Florence (1456). Throughout his life Bernardo Rossellino also practised as an architect, executing the Palazzo Ruccellai in Florence and the cathedral and episcopal palace at Pienza (after 1461). Between 1451 and 1453 he was employed in Rome by Pope Nicholas V on the building of St. Peter's, the restoration of S. Stefano Rotondo and other works. Bernardo became superintending architect of the duomo in Florence in 1461, and died in Florence on Sept. 23, 1464.

ANTONIO ROSSELLINO (1427–79), sculptor, the youngest brother,

born in 1427 at Settignano. His earliest authenticated work is a signed bust of the doctor Giovanni Chellini (1456; Victoria and Albert museum, London). This and a considerably later bust of the historian Matteo Palmieri (1468; Museo Nazionale, Florence) show him to have been a portrait sculptor of unusual incisiveness. About 1456 he executed a marble statue of St. Sebastian in the museum at Empoli, in which the style (like that of the portrait busts) is strongly influenced by the antique. Antonio Rossellino's most important and extended work is the chapel of the cardinal prince of Portugal in S. Miniato al Monte outside Florence for which he assumed responsibility after the death of its architect Antonio Manetti (1460), designing the pavement and episcopal throne and the tomb of the cardinal. The effigy of the cardinal rests on a reproduction of a Roman porphyry sarcophagus and is accompanied by two seated children, two kneeling angels and a circular relief of the Virgin and Child, which are some of the most distinguished marble sculptures of their time. A variant of this tomb commissioned for Mary of Aragon, duchess of Amalfi. in Sta. Anna dei Lombardi, Naples, was unfinished at Antonio's death in 1479 and was completed by Benedetto da Maiano. Also for the Piccolomini chapel in the same church he executed an altarpiece of the "Adoration of the Shepherds," in which an attempt is made to invest marble relief with the properties of a painted altarpiece. A circular relief of the "Nativity," carved in the same style, is in the Museo Nazionale, Florence. In this and in Antonio Rossellino's last work, the Nori Madonna in Sta. Croce (before 1478), some deterioration from the high standard of the tomb of the cardinal of Portugal is evident. Antonio's marble reliefs of the Virgin and Child with angels, of which the finest is in the Metropolitan museum in New York, show him at his most felicitous, and enjoyed great popularity in the 15th century.

See L. Planiscig, *Bernardo und Antonio Rossellino* (1942); L. Heydenreich, "Pius II als Bauherr von Pienza" in *Zeitschrift fur Kunstgeschichte,* vi, pp. 105–146 (1937). (J. W. P.-H.)

ROSSETTI, CHRISTINA GEORGINA (1830–1894), English poet, was the youngest of the four children of Gabriele Rossetti. *(See* article on her brother DANTE GABRIEL ROSSETTI.) She was born at 38 Charlotte Street, Portland Place, London, on Dec. 5, 1830. She enjoyed the advantages and disadvantages of the strange society of Italian exiles and English eccentrics which her father gathered about him, and she shared the studies of her gifted elder brother and sister. As early as 1847 her grandfather, Gaetano Polidori, printed privately a volume of her *Verses,* in which the richness of her vision was already faintly prefigured. In 1850 she contributed to *The Germ* seven pieces, including some of the finest of her lyrics. In her girlhood she had a grave, religious beauty of feature, and sat as a model not only to her brother Gabriel, but to Holman Hunt, to Madox Brown and to Millais. In 1853–54 Christina Rossetti for nearly a year helped her mother to keep a day-school at Frome-Selwood, in Somerset. Early in 1854 the Rossettis returned to London, and the father died.

In poverty, in ill-health, in extreme quietness, she was now performing her life-work. She was twice sought in marriage, but each time, from religious scruples (she was a strong high-church Anglican), she refused her suitor; on the former of these occasions she sorrowed greatly, and her suffering is reflected in much of her early song. In 1861 she saw foreign countries for the first time, paying a six weeks' visit to Normandy and Paris. In 1862 she published what was practically her earliest book, *Goblin Market,* and took her place at once among the poets of her age. In this volume, indeed, is still to be found a majority of her finest writings. *The Prince's Progress* followed in 1866. In 1867 she, with her family, moved to 56 Euston Square, which became their home for many years. Christina's prose work *Commonplace* appeared in *1870.* In April 1871 her whole life was changed by a terrible affliction, known as "Graves's disease"; for two years her life was in constant danger. She had already composed her book of children's poems, entitled *Sing-Song,* which appeared in 1872.

After a long convalescence, she published in 1874 two works of minor importance, *Annus Domini* and *Speaking Likenesses.* The former is the earliest of a series of theological works in prose, of which the second was *Seek and Find* in 1879. In 1881 she published a third collection of poems, *A Pageant,* in which there was evidence of slackening lyrical power. She now gave herself almost entirely to religious disquisition. The most interesting and personal of her prose publications (but it contained verse also) was *Time Flies* (1885)—a sort of symbolic diary or collection of brief homilies. In 1890 the S.P.C.K. published a volume of her religious verse. She collected her poetical writings in 1891. In 1892 she was led to publish a very bulky commentary on the Apocalypse, entitled *The Face of the Deep.* After this she wrote little. Her last years were spent in retirement at 30 Torrington Square, Bloomsbury, which was her home from 1876 to her death. In 1892 her health broke down finally, and she had to endure terrible suffering. From this she was released on Dec. 29, 1894. Her *New Poem* were published posthumously in 1896.

In spite of her manifest limitations of sympathy and experience, Christina Rossetti takes rank among the foremost poets of her time. In the purity and solidity of her finest lyrics, the glow and music in which she robes her moods of melancholy reverie, her extraordinary mixture of austerity with sweetness and of sanctity of tone with sensuousness of colour, Christina Rossetti, in her best pieces, may challenge comparison with the most admirable of our poets. The union of fixed religious faith with a hold upon physical beauty and the richer parts of nature has been pointed to as the most original feature of her poetry. Hers was a cloistered spirit, timid, nun-like, bowed down by suffering and humility; her character was so retiring as to be almost invisible. All that we really need to know about her, save that she was a great saint, was that she was a great poet. (E. G.)

See the *Poetical Works* of *C.G.R.,* with Memoir by W. M. Rossetti (1903); Edmund Gosse, *Critical Kit-Kats* (1896); an article by Ford Madox Hueffer in the *Fortnightly Review* (March, 1904); and another in *The Christian Society* (Oct. 1904). The *Family Letters of Christina Rossetti* were edited by W. M. Rossetti in 1908; *Selected Poems* of *Christina G. Rossetti,* edited by C. B. Burke (1913); T. Watts-Dunton, *Old Familiar Faces* (1916); Marjorie A. Bald, *Women Writers* of *the Nineteenth Century* (1923).

ROSSETTI, DANTE GABRIEL (1828–1882), English poet and painter, was born on May 12, 1828, at 38 Charlotte Street, London. He was the second of the four children of Gabriele Rossetti (1783–1854), Italian poet and liberal, a political refugee from Naples, who came to England about 1824, and married in 1826 Frances Mary (d. 1886), sister of Byron's physician, Dr. John Polidori. The elder Rossetti became professor of Italian at King's College. London, and was a subtle and original, if eccentric, commentator on Dante. His other children were Maria Francesca (1827–76), who eventually entered an Anglican sisterhood, and is known to scholars by her valuable *Shadow of Dante;* William Michael (*q.v.*); and Christina (*q.v.*) the poet.

Dante Gabriel Rossetti was educated at King's College School, London. On leaving school he went (1843) to Cary's Art academy (known as Sass's), near Bedford Square, and theh (about 1846) to the Royal Academy Antique school. He did not find the instruction he desired in the Royal Academy schools, and asked Ford Madox Brown to take him as a pupil. Brown remained his friend even after Rossetti had transferred his admiration to Holman Hunt.

Pre-Raphaelite Brotherhood.— The point of Pre-Raphaelite crystallization which had so'great though brief an influence upon Rossetti's life and art was found at a chance meeting, in 1848, between Rossetti, Millais and Holman Hunt in Millais's house in Gower Street, where certain prints from early Italian frescoes were studied. Rossetti proposed the formation of a "Brotherhood" with lofty aims, and they were joined by J. Collinson, F. G. Stephens, T. Woolner and W. M. Rossetti. Brown, though invited, declined to become a **P-R.B.** Rossetti's first effort was "The Girlhood of Mary, Virgin," which in March 1849 was exhibited at the "Free Exhibition," at Hyde Park Corner. The style of this famous picture was jejune, its handling was timid, while its coloration and tonality were dry, not to say thin. Its technique owed something to Brown, but its mysticism was Rossetti's own. Such was his advent in art under the Pre-Raphaelite banner. "Ecce Ancilla Domini!" the smaller picture which is now in the Tate Gallery,

London, was his one perfect expression of the original motive of the "Brotherhood." He chose virginal white and its harmonies as its aptest coloration, and the intense light of morning sufficed for its tonality. There is real grace and sweetness in the figure of the Virgin, for which his sister Christina was the model. This picture was exhibited at the Portland Gallery in 1850 and was violently attacked by the critics at the time.

In December 1850 appeared the first of the four numbers of *The Germ*, the organ of the "Brotherhood," in which Rossetti had a leading place in verse and prose. He contributed to it some of his most famous poems — The *Blessed Damozel*, six sonnets and four lyrics.

The attack on the Pre-Raphaelites by the critics prejudiced their sales, and Rossetti turned to water-colours. His first considerable effort in this medium, which proved well-suited to his talent, was the illustration to Browning's poem "The Laboratory," depicting a lady's visit to an old poison-monger to obtain a fatal potion for her rival in love. This wonderful gem of colour marked the opening of the artist's second period, and his departure from that phase of Pre-Raphaelitism of which "Ecce Ancilla Domini!" was the crowning achievement. Other water-colours followed including the original (pen and ink) of "Hesterna Rosa," a gambling scene (1852), and "Dante drawing the Angel" (1852). "Found" was begun in 1853; but this piece of pictorial moralizing (the analogue of the poet's *Jenny*), vigorous and intensely pathetic as it is, was never really finished.

Marriage to Elizabeth **Siddal.**—Rossetti had now become acquainted with the beautiful Elizabeth Siddal, whose sumptuous and individual type moved Hunt, Millais and Rossetti to paint her. Rossetti painted her innumerable times, and they became engaged to be married about 1851. The friends called her "Lizzy" and "Guggums," though the names ill suited her tragic temperament and ominous beauty. By 1854 the Brotherhood, championed by John Ruskin, was respectable, but at the moment of success the group was broken up. Ruskin became Rossetti's patron and friend; it was rather a onesided friendship, for Rossetti was not prepared to accept Ruskin's pretensions. In May 1860 Rossetti and Elizabeth Siddal were married, but the two years of their marriage were painful years, for she was dying of tuberculosis. She gave birth to a still-born child, and on Feb. 11, 1862, she died of an overdose of laudanum, which she took from time to time to allay her sufierings. In the meantime Rossetti had met William Morris and Burne-Jones, both of them his enthusiastic disciples. To these new friendships are due Rossetti's part in the luckless decorations of the Oxford Union (1857–8). To the exhibition of the Pre-Raphaelites in 1857 he sent many works, including the "Wedding of St. George and Princess Sabra" and "Arthur's Tomb" (both in the Tate Gallery, London). "Bocca Baciata," the portrait (in oils) of a woman, a work of wonderful fire, and the pictures on the pulpit at Llandaff Cathedral, marked the close of the second epoch in Rossetti's art and the beginning of the third, last and most powerful of all the phases of his career. The picture "Dr. Johnson at the Mitre" (Tate Gallery), when the "pretty fools" consulted the lexicographer on Methodism, is a good example of his humour. In 1861 Rossetti published the exquisite translations in *The Early Italian Poets*, later revised as *Dante and his Circle* (1874).

Achievements in Painting.—With Morris he began to take a keen interest in decorative art. He produced several fine designs for stained glass, and had a large share in the revival of stained-glass painting as an art. The practice of designing on a large scale, and employing masses of splendid deep-toned colours, was probably largely responsible for the development of his powers in painting at this period (1862–63). He produced at this time a striking and highly imaginative triptych (Tate Gallery), representing three events in the careers of Paolo and Francesca. The composition of the group of figures with the circular window behind them, is as fine as it was comparatively novel in Rossetti's practice. Other outstanding works are "Beata Beatrix" (Elizabeth Siddal as the blessed Beatrice contemplating the eternal) (1865), now in the Tate Gallery; "Proserpina in Hades" (1874), perhaps the most original, if not the most poetical and powerful of all his output; "Sibylla Palmifera" (1870); "Venus Verticordia," "Lilith," the better of the two versions is now referred to (1873); "Monna Vanna," in the Tate Gallery (1866); "Aurea Catena" (Janey Morris) (c. 1869); "La Ghirlandata" (1878); "Pandora," another study of Mrs. Morris (1871); "The Blessed Damozel" (1877); and the famous "Dante's Dream," now in the Walker Art Gallery at Liverpool. Nearly all Rossetti's last work was exhibited by the Royal Academy and at the Burlington Fine Art Club in 1883, after his death.

Development **As** a Poet.—The literary side of Rossetti developed *pari passu* with his achievements as a painter. After his wife's death he moved from Blackfriars to 16, Cheyne Walk, (The Queen's House), Chelsea, where for a short time A. C. Sninburne, W. M. Rossetti and Theodore Watts-Dunton lived with him. Rossetti had felt his wife's death — and perhaps his own remorse for having so frequently betrayed her — so acutely that in the first paroxysm of his grief he insisted upon his poems (then in manuscript) being burled in her coffin. But in 1869 they were disinterred and published in 1870. The volume contained the poems printed in *The Germ*, the sonnet-sequence *The House* of *Life*, very much enlarged at a later date. From this time to his death he continued to write poems and produce pictures — in the latter relying more and more upon his manipulative skill and less and less upon his inventive faculty. He depended also to some extent on the assistance of an artist whose name was Treffry Dunn.

In 1871 Robert Buchanan, in an unsigned article in the *Contemporary Review* on "The Fleshly School of Poetry," made a fierce attack on Rossetti's poems from a moral point of view, to which he answered by one on the "Stealthy School of Criticism." The attack was deeply felt by him, and his tendency towards gloomy brooding was further increased about 1868, by persistent insomnia. The result of this malady was a nervous shrinking from personal contact with any save a few intimate friends, which aas aggravated by the use of narcotics, and at one time he saw scarcely anyone save his own family and Theodore Watts-Dunton. Fears were felt for his sanity, and in 1872 Re was under medical care. He was frequently away with William Morris at Kelmscott, in Oxfordshire; indeed he was for some time (1872–74) a co-tenant of Kelmscott. This friendship was broken by the disputes arising out of the reorganization of the Morris firm, but Mrs. Morris was still an occasional visitor at Cheyne Walk.

While his *Ballads and Sonnets* was being printed (1881) his health began to give way and he died on April 9, 1882. His *Ballads* and *Sonnets* contained much of his best work, including the completed *House of Life*, and the fine ballads, *Rose Mary*, *The White Ship*, and *The King's Tragedy*.

ROSSETTI, WILLIAM MICHAEL (1829–1919), English author and critic, born in London, second son of Gabriele and Frances Rossetti. In 1845, owing to pressure of family circumstances, he entered the Excise office, afterward the Inland Revenue office, where he remained till 1894, retiring with the rank of under-secretary. He was a founder of the Pre-Raphaelite Brotherhood, and edited its organ *The Germ*, to which he contributed several papers of criticism and some verse. From 1850 onward, he wrote on matters of art and literature for *The Spectator* and other papers, defending the Pre-Raphaelite cause.

W. M. Rossetti is best remembered for his work in connection with Shelley (1869), Blake and Walt Whitman. His edition and

memoir of Shelley (1869). with a carefully emended text and a dispassionate study of the poet's life, was invaluable at the time of its publication.

In 1874 he married Lucy (1843–1894), daughter of Ford Madox Brown, by whom he had five children.

He died at London on Feb j 1919

Rossetti's most important works are blank verse translation of Dante's *Inferno* (186j); *Fine Art, Chiefly Contemporary* (1867); *Aldine Edition of Blake's Poems* (1874); *Lives of Famous Poets* (1878); *Collected Works of D. G. Rossetti* (1886–1904); *Life of Keats* (1887); *D. G. Rossetti: His Family Letters With Memoir* (189j); Memoir of D. G. Rossetti prefixed to *New Poems* (1896); *Ruskin, Rossetti, Pre-Raphaelitism* (1899), the first of a series of family records; *Gabriele Rossetti—a Versified Autobiography* translated and supplemented (1901); *Some Reminiscences* (1906); *Democratic Sonnets* (1907).

ROSSI, PELLEGRINO LUIGI EDOARDO, COUNT (1787–1848), Italian economist, and statesman, was born at Carrara on July 13, 1787. He was educated at Pavia and Bologna. In 181j he supported Joachim Murat, and on his fall left the country and went to Geneva, where he lectured on Roman law. He was made a citizen of Geneva, and as member of the extraordinary diet of 1832, was employed to draw up a revised Constitution, the *Pacte Rossi.* This was rejected, and Rossi went to France, where he was professor of political economy in the College de France, and in 1834 professor of constitutional law at Paris university. In 1839 he was given a peerage and in 1845 sent to Rome, where he became French ambassador. After the revolution of 1848 he stayed in Rome, and became minister of the interior under Pius IX. He was assassinated on the steps of the House of Assembly on Nov. 15, 1848.

As a statesman, Rossi was a man of signal ability and intrepid character, but it is as an economist that his name will be best remembered. His *Cours d'kconomze politique* (1838–54) gave in classic form an exposition of the doctrines of Say, Malthus and Ricardo. His other works were *Traité de droit pénal* (1829); *Cours de droit constitutionnet* (1866–67); and *Me'langes d'économie politique, d'histoire et de philosophie* (2 vols., 1857).

See le Comte Fleury d'Ideville, *Le Comte Pellegrino Rossi, sa vie, ses oeuvres, sa mort* (1887).

ROSSINI, GIOACHINO ANTONIO (1792–1868), Italian operatic composer, was born at Pesaro on Feb. 29, 1792. His father was town trumpeter and inspector of slaughter-houses, his mother a baker's daughter. The elder Rossini was imprisoned by the Austrians in 1796, and the mother took Gioachino to Bologna, earning her living as a *prima donna buffa* at various theatres of the Romagna, where she was ultimately rejoined by her husband. Gioachino remained at Bologna in the care of a pork butcher, while his father played the horn in the bands of the theatres at which his mother sang. The boy learned singing and the pianoforte, and at thirteen appeared at the theatre of the Commune in Paër's *Camilla—his* only appearance as a public singer (1805). He was also able to play the horn. In 1807 he was admitted to the Conservatorio of Bologna, but his insight into orchestral resources was gained rather by scoring the quartets and symphonies of Haydn and Mozart, than from his teachers. At Bologna he was known as "il Tedeschino" on account of his devotion to Mozart. His first opera, *La Cambzale di Matrimonio,* was produced at Venice when he was eighteen. Two years before he had received the prize at the Conservatorio of Bologna for his cantata *Il pianto d'armonia per la morte d'Orfeo.* Between 1810 and 1813, at Bologna, Rome, -Venice and Milan, Rossini produced operas of which the successes were varying. *Tancredi,* produced at the Fenice, Venice (1813) made him famous. The libretto was an arrangement of Voltaire's tragedy by J. A. Rossi. Traces of Paer and Paisiello mere undeniably present in fragments of the music. But the sweetness and clarity of such melodies as "Mi rivedrai, ti rivèdrò" and "Di tanti palpiti," conquered Venice. Italians would sing "Mi rivedrai" in the law courts until called upon by the judge to desist. Rossini continued to write operas for Venice and Milan during the next few years, but without repeating the success of *Tancredi.*

In 1815 he retired to Bologna, where Barbaja, the impresario of the Naples theatre, engaged him as musical director of the Teatro San Carlo and the Teatro Del Fondo at Naples, on the understanding that he compose for each of them one opera a year. His payment was to be 200 ducats (about £35 or $175) per month; he was also to receive a share in the gaming-tables, also owned by Barbaja, amounting to about 1.000 ducats (£175 or $875) per annum. General enthusiasm greeted the court performance of his *Elisabetta regina* d' *Inghilterra,* in which Isabella Colbran, whom Rossini afterward married, took a leading part. The opera was the first in which Rossini wrote the ornaments of the airs instead of leaving them to the fancy of the singers, and also the first in which the *recitatieo secco* was replaced by a recitative accompanied by a quartet of strings. In *Almaviva* (Rome. 1816) the libretto, a version of Beaumarchais' *Barbier de Séville* by Sterbini. was the same as that already used by Paisiello in his *Barbiere,* an opera which had enjoyed European popularity for more than a quarter of a century. But Rossini had created such a masterpiece of musical comedy that the title of *Il Barbiere* di *Siviglia* ("The Barber of Seville") passed inevitably to his opera.

Between 1815 and 1823 Rossini produced 20 operas. Of these *Otello* formed the climax. contrasting interestingly with the treatment of the same subject at a similar point of artistic development by G. Verdi. In deference to the taste of the day the story was made to end happily! *Mose in Egitto* ("Moses in Egypt") was produced at Naples in 1818. In 1821. Rossini married Isabella Colbran. In 1822 he directed his comic opera based on the Cinderella story. *Cenerentola* (1817). in Vienna, where *Zelmira* was also performed. After this he returned to Bologna; but an invitation from Prince Metternich brought him to Verona at the opening of the Congress on Oct. 20, 1822.

In 1824 he became musical director of the Théâtre Italien in Paris at a salary of £800 per annum. and when the agreement came to an end he was appointed chief composer to the king and inspector-general of singing in France. The production of *Guillaume Tell* ("William Tell") in 1829 brought his career as a writer of opera to a close. The libretto was by Étienne Jouy and Hippolyte Bis, but their version was revised by Armand Marrast. The music is free from the conventions discovered and utilized by Rossini in his earlier works, and marks a transitional stage in the history of opera. In 1829 he returned to Bologna on family business. His return to Paris was delayed by the July Revolution of 1830 until Nov. 1830. Six movements of his *Stabat Mater* were written in 1832 and the rest in 1839, the year of his father's death, and the success of the work bears comparison with his achievements in opera; but his comparative silence during the period from 1832 to 1868 makes his biography appear almost like the narrative of two lives—the life of swift triumph, and the long life of seclusion, of which the biographers give us pictures in stories of the composer's cynical wit, his speculations in fish culture, his mask of humility and indifference. His first wife died in 1845, and political disturbances in the Romagna compelled him to leave Bologna in 1847, the year of his second marriage with Olympe Pelissier, who had sat to Vernet for his picture of "Judith and Holofernes." After living for a time in Florence he settled in Paris in 1855, where his house was a centre of artistic society. He 'died at Passy on Nov. 13, 1868.

See Stendhal. *Vie de Rossini* (1823, Eng. trans., London, 1869; mod. ed., Paris. 1922); Lord Derwent, *Rossini* (London. 1934).

ROSSLYN, ALEXANDER WEDDERBURN, 1ST EARL OF (1733–1805), Lord Chancellor of Great Britain, was the eldest son of Peter Wedderburn (a lord of session as Lord Chesterhall). and was born in East Lothian on Feb. 13. 1733. He was educated at Edinburgh university and entered the Inner Temple in 1753. It was alaays his intention to practise at the English bar, but in deference to his father's wishes he qualified as an advocate in Edinburgh in 1754, and practised there for three years. In 1757, following a quarrel with Lockhart, then dean of faculty, he left the Scottish bar. and was called at the Inner Temple. He engaged Thomas Sheridan and Macklin to teach him oratory and to eliminate his native accent. His countrymen, Lords Bute and Mansfield. were also useful to him. and it was he who suggested to Bute

a pension for Samuel Johnson. Bute's influence got him into parliament in 1761, and he took silk in 1763. In 1767 he married an heiress. His political career after this is complicated in the extreme. In 1768 he was a Tory, but the next year he resigned his seat over the government's action against the reformer John Wilkes (*q.v.*), thereby winning enormous popularity in the country, and getting a pocket-borough from Lord Clive in 1770. His new associates, however, distrusted him, and aith reason; in Jan. 1771 he deserted to the North ministry and was made solicitor-general. Throughout the American Revolution he savagely attacked the colonies, and in 1778 he was made attorney general. In 1780 he became chief justice of the common pleas with the title of Baron Loughborough. During North and Fox's coalition he was a commissioner of the great seal, and appears as leader of the Whigs in the lords, with full expectations of the woolsack. The king's recovery, however, blighted their hopes, and in 1792 Loughborough seceded from Fox, and became lord chancellor in Pitt's Tory cabinet. In 1801, Pitt's resignation was the end of him; Addington had no room for him, but he received the earldom of Rosslyn and retired. He died at his country house near Windsor on Jan. 2, 1805, and was buried in St. Paul's.

At the bar Wedderburn was an eloquent speaker. noted for his skill in marshaling facts, but not for his knowledge of the principles and precedents of law. On the bench his judgments were remarkable for their perspicuity, particularly in the appeal cases to the house of lords, and his readiness in debate in parliament was widely acknowledged. In social life, however, he had the reputation of being dull.

ROSS-ON-WYE, a market town and urban district in the Hereford parliamentary division of Herefordshire, Eng , $14\frac{1}{2}$ mi. S.S.E. of Hereford by road. Pop. (1951) 5.399. Area 1.6 sq.mi. The market house (1670) is a restored sandstone building, supported on columns; the upper part is used as a public library. The town owes much to the philanthropist John Kyrle (1637–1724), the "Man of Ross," eulogized by Alexander Pope (*Moral Essay III,* Of *The Use of Riches,* 1732). Ross is an ancient borough and was granted to the see of Hereford by Edmund Ironside, but became crown property in 1559. It is the centre of a highly productive agricultural district. Its industries include the manufacture of agricultural machinery, timber, brewing and milling.

ROSTAND, EDMOND (1869–1918), French dramatist, was born on April 1, 1869, the son of a prominent Marseilles journalist and economist. His first play, a burlesque, Les *romanesques,* was produced on the 21st of May 1894 at the Théâtre Français. He took the motive of his second piece, *La Princesse lointaine* (Théâtre de la Renaissance, 5th April 1895), from the story of the troubadour Rudel and the Lady of Tripoli. The part of Mélisande was created by Sarah Bernhardt, who also was the original Photine of La *Samaritaine* (Théâtre de la Renaissance, 14th April 1897), a Biblical drama in three scenes taken from the gospel story of the woman of Samaria. The production of his "heroic comedy" of *Cyrano de Bergerac* (28th December 1897, Théâtre de la Porte Saint-Martin), with Coquelin in the title rôle, was a triumph. No such enthusiasm for a drama in verse had been known since the days of Hugo's *Hernani.* The play was quickly translated into English, German, Russian and other European languages. For his hero he had drawn on French 17th-century history; in *L'Aiglon* he chose for his theme the unhappy life of the duke of Reichstadt, son of Napoleon I. and Marie Louise, under the surveillance of Metternich at the palace of Schonbrunn. *L'Aiglon,* in six acts and in verse, was produced (March 15, 1900) by Sarah Bernhardt at her own theatre, she herself playing the part of the duke of Reichstadt, one of her most famous later roles. In 1902 Rostand was elected to the French academy. *Chantecler,* produced in February 1910, had Lucien Guitry in the title role. During World War I he wrote chiefly patriotic verse. He died in Paris on Dec. 2, 1918.

His son, MAURICE ROSTAND, author of plays, made a sensation in 1928 by the production of *Napoléon IV,* in which it was sought to ascribe responsibility for the death of the prince imperial to Queen Victoria.

The following works by Edmond Rostand were published posthumously: *La dernière nuit de Don Juan* (1921); *Le cantique de l'aile* (1922); Le *Vol de la Marseillaise* (1922). *See G.* Haraszti, *Edmond Rostand* (1913); J. Suiberville, *Le Théâtre d'Edmond Rostand* (1919).

ROSTOCK, a town of Germany, situated in the district of the same name, one of the most important commercial cities on the Baltic. It is situated on the estuary of the U'arnow, 8 mi. from the port of Warnemiinde on the Baltic, 177 mi. N.W. of Berlin by rail, 80 mi. E.N.E. of Liibeck and 106 mi. S. of Copenhagen. Pop. (1950) 133,109. It is probable that the site was occupied by a village from very early times but the first definite mention of the settlement occurs in the 12th century. The town received its municipal charter in 1218. The earliest signs of commercial prosperity date from about 1260. In the 14th century it joined the Hanseatic league, and was one of the original members of the powerful Wendish Hansa, in which it exercised an influence second only to that of Liibeck. The most prosperous epoch of its commercial history began in the latter half of the 15th century. Rostock never entirely lost the independence which it enjoyed as a Hanse town. In the suburbs was located, after Hitler came to power, the Heinkel aircraft factory, one of the largest in Germany. As a result, the population of Rostock increased by 35,000 between 1933 and 1939. On April 28, 1942, a large British bombing squadron blasted Rostock and the Heinkel works with terrific results. Three more raids followed within a week. The aircraft factory was badly damaged, two large areas of Rostock were laid in ruins, and thousands of frightened citizens fled to the open country.

Rostock had five old churches: St. Mary's dating from 1398 to 1472, one of the most imposing Gothic buildings in Mecklenburg, with two Romanesque towers and containing a magnificent bronze font and a curious clock; St. Nicholas', begun about 1250 and restored in 1450 and again in 1890–94; St. Peter's, with a lofty tower built in 1400, which serves as a landmark to ships at sea; St. James's, completed in 1588; and the church of the Holy Rood, begun in 1270. St. Mary's church contains a monument marking the original tomb of Hugo Grotius, who died in Rostock in 1645, though his remains were afterward removed to Delft. Among other buildings are the curious 14th-century Gothic town hall, the façade of which is concealed by a Renaissance addition; the former palace of the grand dukes, built in 1702; and the university buildings, erected in 1867–70. The University of Rostock was founded in 1419. From 1437 till 1443 it had its seat at Greifswald in consequence of commotions at Rostock, and in 1760 it was again removed, on this occasion to Biitzow. The professors appointed by the city, however, still taught at Rostock, so that there were practically two universities in the duchy until 1789 when they were reunited at the original seat.

Rostock has a considerable trade, being the chief commercial town of the district, and vessels drawing 19 ft. of water are able to get up to the wharves. By far the most important export is grain, but bricks, sugar and salt are also shipped. The chief imports are ordinarily coal, herrings, timber, wine and colonial goods. A train-ferry service to Denmark runs from Warnemiinde, the outpost of Rostock.

ROSTOPTSCHIN, COUNT FEODOR VASSILIEVICH (1763–1826), Russian general, was born on March 23, 1763, in the government of Orel. The tsar Paul made him in 1796 adjutant general, grand marshal of the court, then minister of the interior. He was disgraced in 1801 for his opposition to the French alliance, but was restored to favour in 1810, and was appointed military governor of Moscow. He was charged with its defense against Napoleon. He is alleged to have instigated the burning of Moscow the day after the French had made their entry; it is certain that the prisons were opened by his order, and that he took no means to stop the outbreak. He defended himself against the charge of incendiarism in a pamphlet printed in Paris in 1823, *La Vérité sur l'incendie de Moscou,* but he subsequently made grave admissions. Shortly after the Congress of Vienna, to which he had accompanied the tsar Alexander, he was disgraced. He returned to Russia in 1825, and died at Moscow on Feb. 12, 1826. His *Mémoires écrits en dix minutes* were

posthumously published at St. Petersburg in 1853, his *Oeuvres inédites* in Paris in 1894.

ROSTOV-ON-DON, a seaport of the R.S.F.S.R., U.S.S.R., in the North Caucasian area, in 47° 15′ N., 39° 40′ E., on the Sea of Azov, 25 mi. from the point where the Don river reaches that sea by a number of mouths, only two of which are used, one for shipping and one for rafts. A channel through the former has been dredged with a minimum depth of 14 ft. The river is frost-bound for 100 days per annum on an average. Trade consists of transit from rail or river vessels to lighters or local steamers on which cargoes are carried to Taganrog roads, there to be loaded for foreign voyages. Few vessels from foreign ports reach Rostov itself. Imports and exports are thus practically the same as those of Taganrog (*q.v.*). Rostov is an industrial centre with shipbuilding yards, a dyeing industry, zinc, tobacco, boot and shoe factories and other enterprises. There is a fishing industry. It is linked by rail with the north and west, with the Volga river and with the Caspian sea. Pop. (1959) 597,000. much swollen in summer by seasonal hands coming in for the grain shipping.

During World War II Rostov-on-Don played a considerable role in the Russo-German campaign, being one of the main centres of the Ukrainian front. It changed hands many times and was definitely liberated only after the German retreat of 1943.

ROSTOV VELIKI, a town of the Russian Soviet Federated Socialist Republic, U.S.S.R., in the Yaroslavl *oblast* in 57° 14′ N., 39° 15′ E., near Lake Rostov or Nero. Rostov was founded by the Slavs about 862, and played a great part in early Russian history as the centre of the Rostov principality. Its pink washed Kreml (or citadel) walls have iron doors with quaint legends and paintings in each square; *e.g.,* a crow on a branch with the legend, "I sing only to relieve my sorrow." Its ancient cathedral, with the famous peal of bells, its numerous church domes: its 12th-century shrines and relics, the alleys and closes of its market, give a wonderful picture of medieval Russian life. After the Mongol invasion of 1239–42 it rapidly declined and in 1474 was purchased by Ivan III and annexed to Moscow. It was repeatedly plundered by Tatars, Lithuanians and Poles in the 15th, 16th and 17th centuries. The population (23,305) is mainly employed in the drying of vegetables and medicinal herbs, in coffee and chicory preparation and in flour milling. The district was once famous for its enameled icons.

ROSTRA (beaks), in Roman antiquities, the orators' platform which stood in Rome between the Comitium and the Forum, opposite the Curia. In 338 B.C. it was decorated by Gaius Maenius with the prows of ships captured from the people of Antium. From that time it was called *Rostra,* having previously been known as *templum* (literally consecrated place), since it had been consecrated by the augurs. Here were exhibited the statues of famous Romans, and state documents and memorials (the laws of the Twelve Tables, etc.). Caesar had it pulled down, intending that it should be rebuilt on the west side of the Forum, but it was left for Augustus to carry out his plan. The use of the term *Rostra Vetera* by classical authors makes it doubtful whether the old platform mas entirely demolished, unless the name was simply transferred to the new rostra of Augustus to distinguish it from the *Rostra Iulia.* This consisted of a rectangular platform, 78 ft. long, 11 ft. above the level of the Forum, reached by steps from the back; in front there was a marble balustrade with an opening in the centre where the speaker stood. In the existing remains, the holes in which the beaks of the ships were fastened are visible. *See* ROME: *The Forum.*

BIBLIOGRAPHY.—For results of the excavations *see* C. Huelsen, *Das Forum Romanum,* Eng. trans. by J. B. Carter (Rome, 1906); *see* also O. Richter, "Topographie der Stadt Rom," in I. von Mueller, *Handbuch der klassischen Altertumswissenschaft* (1901); *H.* Thédenat, *Le Forum Romain,* 3rd ed. (1904); J. E. Sandys, *Companion to Latin Studies* (1921).

ROSWELL, a city of southeastern New Mexico, U.S., about 170 mi. S.E. of Albuquerque is the hub for a trade area on a radius of approximately 100 mi. Nourished by an artesian basin, the city with its thousands of trees gives the appearance of an oasis in the semi-arid ranching plains. It lies at an altitude of 3,570 ft. The Pecos river flows 12 mi. to the east.

Roswell began as a trading post founded in 1871 by Van C. Smith. It was incorporated in 1891. Initially a cattle town, Roswell developed agricultural production first in orchards' and alfalfa, later in cotton. Its subsequent growth can be attributed to the establishment of Walker Air Force base in 1941, and to the location of district offices by major oil companies during the decade of the 1950s. Roswell is the seat of Chaves county and the home of the New Mexico Military institute. The Roswell Museum and Art centre has been called a model for museums in small cities. Its major exhibits include a collection of the paintings of Peter Hurd, who was born in Roswell in 1904; the Witter Bynner collection of Chinese art; and the Robert H. Goddard rocket exhibit, commemorating and illustrating Goddard's pioneer work (much of it carried out at Roswell, 1930–41).

For comparative population figures *see* table in NEW MEXICO: *Population.* (PL. HN.)

ROSYTH, a town and naval base of Fife, Scot., on the north shore of the Firth of Forth, 2½ mi. S.E. of Dunfermline (with which it was incorporated in 1911). Plans for the establishment of a large naval base there were drawn up in 1903; 285 ac. of foreshore and 1,184 ac. of land behind were purchased and work was begun in 1909. The scheme included a high-level main basin covering an area of 55 ac., a dry dock. a submarine tidal basin and an entrance channel. A great sea mall was built to form the southern boundary of the three docks. During World War I Rosyth was used as a secondary base to Scapa Flow, particularly for battle cruisers. In 1925 the dockyard was reduced to the basis of a care and maintenance establishment, but on the outbreak of World War II it recovered its former importance. After the end of that war, it continued to function as one of the main dockyards of the United Kingdom and to provide employment for about 7,000 people.

Rosyth has been built as a "garden city" and the number of its inhabitants in 1955 was estimated to be 13,000.

ROTA, COURT OF, one of the departments of the mediaeval papal organization in the Vatican. The Rota was the supreme court of appeal of Christendom. It declined in importance when a special court of appeal for Italy was set above it, and more so as the geographical jurisdiction of the pope was gradually lessened.

After the Council of Trent the old arrangements were replaced by the congregations, permanent committees of cardinals which deal with definite branches of business. The Rota, however, was restored to its functions as supreme court of appeal by Pope Pius X in 1908.

See CURIA ROMANA; and art. "Rota" in *The Catholic Encyclopedia.*

ROTARY CLUB, an organization of business and professional men founded for the purpose of furthering the object of service to others in all relationships. The first Rotary club was founded in Chicago. Ill., on Feb. 23, 1905, by a lawyer. Paul P. Harris. The members met in rotation at the offices or places of business of the various members. This method suggested the name, Rotary club. Similar clubs were organized in other cities of the U.S. and in Aug. 1910, at Chicago, the 16 clubs then in existence formed the National Association of Rotary clubs. In 1912, after the formation of clubs in Winnipeg, Can.; Dublin, Ire.; and London. Eng., the organization became the International Association of Rotary clubs. In 1922 the name was changed to Rotary International.

The object of Rotary is: to encourage and foster the ideal of service as a basis of worthy enterprise and, in particular, to encourage and foster (1) the development of acquaintance as an opportunity for service; (2) high ethical standards in business and professions; the recognition of the worthiness of all useful occupations and the dignifying by each Rotarian of his occupation as an opportunity to serve society; (3) the application of the ideal of service by every Rotarian to his personal, business and community life; and (4) the advancement of international understanding, good will and peace through a world fellowship of business and professional men united in the ideal of service.

The program of Rotary based on this object brings together in an atmosphere of personal friendship men of diverse occupations without reference to religion or politics. Some clubs (such as those in

Cairo, Egy.; Singapore; Hong Kong; Jerusalem) have a membership composed of many different nationalities and races.

Membership in a Rotary club is based upon activity in a business, profession or institution. Basically. there may be one representative of each classification of business, professional or institutional activity in a community. An additional active member from the same concern or establishment as an active member may be elected to membership in the same classification. Men who distinguish themselves by meritorious service in the furtherance of Rotary ideals may be elected to honorary membership. The affairs of each club are administered by a board of directors assisted by various standing committees. The officers (president. vice-president. secretary and treasurer) are elected annually. Clubs hold weekly luncheon or dinner meetings. Membership in the club is forfeited if the required standards of attendance are not maintained. Clubs are grouped in districts for administrative purposes. The club presidents and secretaries in each district meet together each year. Delegates and members of the clubs of each district meet in annual district conferences. , The administrative officer of Rotary International in a district is a district governor. nominated by the clubs in the district and elected by delegates of all Rotary clubs at the annual international convention. The annual international convention elects a president and members of the board of directors, who form the administrative body of Rotary International. The Rotary constitution provides that of the fourteen directors, at least seven must be from countries other than the United States.

A permanent secretariat, consisting of the secretary and his staff, is maintained with offices at Evanston, Ill.; and Zurich. Switz. An office in London serves Rotary clubs in Great Britain and Ireland. The official publications are The Rotarian (English) and *Revista Rotaria* (Spanish), published at Evanston. Other Rotary magazines are published in various languages by districts or groups of districts. In the mid-1950s there were about 8,700 Rotary clubs with a membership of 414,000 business and professional executives in 92 countries and regions.

The Rotary movement in Great Britain and Ireland was started in 1911 with the organization of a Rotary club in Dublin by an Irishman who, while in the U.S., had been a member of the San Francisco Rotary club. About the same time a club was organized in London by Rotarians from Chicago and Boston who had business connections in London. The club in Manchester was formed by London Rotarians and subsequently clubs were formed in Belfast, Glasgow, Edinburgh, Liverpool and Birmingham. In 1914 the clubs in Great Britain and Ireland organized into an association called Rotary International in Great Britain and Ireland. The association is administered by a general council. consisting of a president, immediate past president, vice-president, treasurer, secretary and the Rotary International representatives in the several districts. In the mid-1950s there were almost 800 clubs in Great Britain and Ireland with a membership of 35,000. Each year one member of the board of directors of Rotary International comes from this region. Rotary International in Great Britain and Ireland has a secretariat at London, a number of committees. an annual conference of delegates and members from all clubs in the region, and issues a monthly publication (Rotary Service). The Rotary movement in Great Britain and Ireland differs in no essential way from the movement in other parts of the world. Clubs meet weekly for luncheon or dinner and have a speaker on a topic of general interest, preferably one reflecting in a general way the Rotary ideal of service to others. (G. R. M.; C. R. P.)

ROTARY ENGINE. A type of engine in which the use of reciprocating parts is avoided with the object of saving the energy wasted in converting reciprocal or to-and-fro movement into rotary movement. The rotary principle never had any practical success in competing with the smaller reciprocating engines, but steam turbines (which are really a class of rotary engine) furnished the first solution of the problem for moderate and large size installations. Many rotary mechanisms have been tried. Some have comprised a flap piston rotating within a cylinder, the pressure of the steam causing rotation. Sometimes the flap has a sliding action within the piston, the shaft of the latter being mounted eccentrically in relation to the bore. More or less complicated arrangements of levers and of gears were also patented, with multiple pistons. James Watt's famous attempt was really a semirotary engine, with a radial piston which swung to and fro and actuated a pinion and rack device for working the rods of pit pumps.

In the earlier periods of airplane construction rotary engines were much employed. notably the Gnôme and the Le Rhône. but the radial engine later formed the equivalent of these types. Weaknesses of the rotary aero engine, in use during World War I. were the fact that it could be lubricated with only castor oil and the objectionable gyroscopic action produced by its rotating mass. Yet the rotary principle found great success in certain other directions, such as pumps, blowers and gas-exhausters. The latter are in principle blowers reversed. In a well-known type the piston or drum is set with its axis eccentrically in the cylinder, and radial blades slide in its slots, making a gas-tight fit against the bore. The drum rotates and pumps the gas from the inlet which is at one side of the cylinder to the outlet at the other side.

After World War II there was a continuous development of the gas turbine. In a gas turbine an atomized oil-air mixture burns and produces an expanding gas that serves the same function as steam. Great difficulties were overcome in developing materials that operate under the extremely high temperatures of the gas turbine. Gas turbines are used for stationary power installations particularly where there is a shortage of water for operating a steam plant. See AIRCRAFT PROPULSION; TURBINE: STEAM.

ROTATION OF CROPS refers to the repeated growing of different crops in a specified order. on the same fields. in contrast to a one-crop system or to haphazard crop successions. R'ell-planned cropping practices provide the basis for a smooth-running and effective farm organization. Long before the Christian era crop growers were aware of the influences of crops on each other and of the usefulness of cropping associations. Wherever food crops are produced some kind of rotation cropping appears to be practised. In central Africa the natives use a 36-year rotation. After cutting and burning a 35-year growth of woody shrubs and trees, one crop of finger millet is produced. In the food-producing regions of the world various rotations of much shorter length are widely used. Some of them are designed for the highest immediate returns without much regard for the continuing usefulness of the basic resources. Others are planned for high continuing returns with protected resources. The underlying principles for planning effective cropping systems began to emerge in the mid-years of the 19th century. The subject remains a fruitful field in agronomic research.

The oldest American rotation experiment (begun in Illinois in 1876) reveals a yield decline of 60% by mid-20th century for corn in continucus culture, When corn and oats were alternated the yield of corn declined but at a slower rate. When corn was alternated with oats and clover the yield of corn remained constant. If all crops are accounted for, as in corn-equivalent yields, the yield for a 12-year period at mid-20th century was 20.8 bu. an acre for continuous corn. When corn and oats, a low-profit crop, shared an acre equally the total yield was 22.9 bu. Where corn, oats and; clover shared an acre equally, the total yield for corn and oats on two-thirds of the acre was 29.j bu. and that for all three crops on the acre was 35.5 bu Competing crops provided each other with advantages, and when a complementary crop was added and removed from the land the benefits were greater. If the clover crop had functioned as a rest crop rather than a hay crop its complementary effects would, no doubt, have been much greater, as other experiments have indicated.

Rotation Ratios. — Early experiments, such as those at the Rothamsted Experimental station (*q.v.*), in England. pointed to the usefulness of selecting rotation crops from three classifications: cultivated row. close-growing grains and sod-forming or rest crops. Such a classification provides a ratio basis for balancing crops in the interest of continuing soil protection and production economy. It is sufficiently flexible for adjusting crops to many situations, for making changes when needed and for including go-between crops as cover and green manures. A simple rotation

would be one crop from each group with a 1:1:1 ratio. The first number in a rotation ratio refers to cultivated row crops, the second to close-growing grains and the third to sod-forming or rest crops. Such a ratio signifies the need for three fields and years to produce each crop annually. This requirement would be satisfied with a rotation of corn, oats and clover or of potatoes, wheat and clover-timothy. If green manure or cover crops were desired, three crops could be produced in a 2:1":0 rotation of corn, soybeans and oats (sweet clover). The mark " following a number means that, after a small-grain crop is harvested, a cover crop is on the land for the remainder of the year and until the following spring. Thus a green-manure crop can be grown in rotation without taking the land out of production for a year. Such a rotation could affect soil protection and production economy in a different manner than the 1:1:1 types of rotations. Rotations for any number of fields and crop relationships can be described in this manner. In general most rotations are confined to time limits of eight years or less.

Effects on Production and Soil.—In the interest of high crop incomes some farmers use a 3:0:0 type of rotation such as corn, corn and soybeans that requires annual plowing, seedbed preparation and cultivation. If continued too long such a rotation will bring about unfavourable changes in the soil as sizable reductions in organic matter and nitrogen, development of less desirable physical conditions, accelerated loss of soil and water by surface runoff and lowered nutrient-supplying powers. These changes are often accompanied with greater damage to crops from insects, diseases and weeds. The end results are declining yields, loss of crop quality and reduced incomes. Since World War II rotations of this type have been supplemented with the heavy use of fertilizer with the idea of offsetting the unfavourable effects of such rotations. Whether such a program can be continued satisfactorily will need to be judged in the light of sufficient experience.

In the interest of maximum soil protection with effective production economy. other farmers use 2:1:1 types of rotations as corn, soybeans, wheat and alfalfa for use on four fields. Additional advantages can be provided by doubling this rotation to 2(2:1":1) for use on four fields over an eight-year period as (1) corn, (2) soybeans, (3) wheat or oats (sweet clover), (4) corn, (5) soybeans, (6) wheat or oats. (7) alfalfa and (8) alfalfa, with a moderate use of fertilizer as needed. Such rotations are increasingly effective over long-time periods but may not produce as much cash income in the beginning years as the 3:0:0 type of cropping.

Rotation planning consists essentially in fitting soils and crops together in such ways as to be suitable and desirable for livestock, grain, truck-garden and other types of farming. The acreage devoted to sod-forming and rest crops should be expanded at the expense of row crops on soils of increasing slopes and declining fertility. This mill provide better vegetative covering to protect sloping land from excessive erosion and supply organic matter for improving soil productivity on both sloping and level lands. With lessening slope and increasing fertility the row crops may be expanded, but this should not be done with too much reduction in the sod-forming and rest crops. The differing effects of crops on soils and on each other and in reactions to insect pests, diseases and weeds require carefully planned sequences. Competitive and complementary relations can produce advantageous interactions.

Use of Legumes.—Rotation planning should also include a consideration of crop-handling practices. Sufficient legume residues should be returned to the soil either directly or indirectly in animal manure to supply all or much of the nitrogen required by the rotation. The nonlegume residues (stover straws) should be associated with the legume residues to obtain the greatest benefits from the legumes. Experiments show that association increases the yields of succeeding crops more than the combined yields of the two types of residues when used separately. These benefits cannot be secured if these residues are destroyed or removed from the land.

Broadly speaking, cropping systems should be planned around the use of deep-rooting legumes. If too little use is made of them, productivity will decline; if too much land is devoted to them, wastes may occur and other useful crops displaced. Rotations depending wholly on green-manure legumes should be confined to the more level and fertile lands. It mill be desirable to include legumes alone or in mixtures with nonlegume sod-forming crops as a regular crop in many field rotations. In general this should occur about once in each four-year period. Short rotations are not likely to provide the best crop balances and long rotations on a larger number of fields may introduce complications. With a moderate number of fields, additional flexibility can be provided by split cropping on some fields.

Regional Differences.—The usefulness of individual field crops is affected by regional differences in climate and soil. A major crop in one region may have little or no value in another. In each region, however, there are usually row, grain and sod or rest crops that can be brought together into effective cropping systems. The individual crops may vary much from region to region, but the rotation ratios will be somewhat similar among the regions. Some of the rotation ratios used in practice in differing regions, though not always the most useful or effective, are: 2:0:0; 0:2:0; 0:0:1; 2:1":0; 1:1:1; 1:1:2; 1:2":1; 2:1:1; 2(2:1":1); 2:2:1; 2:1:2; and 1:1:3 or 4.

In addition to the many beneficial effects on soils and crops, well-planned crop rotations also provide the business aspects of farming with advantages. Labour, power and equipment can be handled with more efficiency; weather and market risks can be reduced; livestock requirements can be met more easily; and the farm can be a more effective year-round enterprise.

See also SOIL: Soil Productivity. (F. C. BR.)

ROTH, WALTER RUDOLF VON (1821–1895) German philologist, a noted Sanskrit scholar, was born at Stuttgart on April 3. 1821. He was a student and later a professor at Tdbingen university. His profound studies of the Vedas brought about and clarified western understanding of these difficult religious texts. In 1846 he published *Zur* Literatur und Geschichte *des Weda*, a pioneer work based on manuscript materials. He edited the Atharva-Veda (1856) in collaboration with his American pupil, William Dwight Whitney. In the great Sanskrit lexicon published in St. Petersburg from 1852 to 187j by Otto von Böhtlingk and Roth, the Vedic portion is his. He died at Tdbingen on June 23, 1895. (M. B. E.)

ROTHAMSTED EXPERIMENTAL STATION, at Harpenden in Hertfordshire, Eng., founded in 1843. is the oldest agricultural research station in the world. John Bennet Lawes (*q.v.;* 1814- goo), the founder, started to experiment soon after he inherited the Rothamsted estate in 1834. By 1842 he had discovered and patented a process for making a soluble phosphatic fertilizer (superphosphate) and initiated the fertilizer industry by opening a factory to produce it commercially. He considered 1843 to date the station's foundation because he then invited Joseph Henry Gilbert (1817–1901), a chemist, to mork with him and started the long collaboration that lasted until Lawes's death; also, that year was the first year of the Broadbalk experiment on manuring of wheat. which still continues. It was one of a series designed to find the nutritional requirements of important crops, in which the same crop was grown year after year on the same land, with different plots getting different treatments but each plot getting the same one each year.

Other experiments conformed more to agricultural practice, with different crops grown in rotation. The crops. soils, manures and drainage water were analyzed and balance sheets produced to show the fate of what was added to the soil: whether it remained there, was removed in the crop or was lost. The general pattern of treatments was similar in most experiments: no manure; minerals only (minerals was the term used for the constituents of plant ash); nitrogen only; nitrogen and minerals; farmyard manure. The pattern was partly set by a controversy with the German chemist J. von Liebig, who thought plants could get all the nitrogen they need from the air. The Rothamsted experiments soon showed that Liebig was wrong and firmly established that nitrogenous manures greatly increase yields. The old experiments now provide soils unique in the information they carry about how plant nutrients increase and decrease with different treatments.

Lawes and Gilbert are known most for their work on the manuring of crops, but they studied such problems as the purification of sewage. the advantages and disadvantages of ensiling compared with haymaking and animal nutrition. The last established the value of different components in fodder, showed how the composition of animals changes during growth and fattening and destroyed the belief that animal fat came only from vegetable fat.

A converted barn served as the first laboratory. but the practical value of the work was soon recognized and grateful farmers subscribed to a Lawes Testimonial fund, which was used to build a laboratory in 1855. This served until the numbers of staff began to increase early in the 20th century. Until then the only new appointment was a second chemist. R. Warington, who started the study of soil microorganisms and showed that ammonia is converted to nitrate in soil by their activities. Until 1904, when the Society for Extending the Rothamsted Experiments was instituted, the work was paid for wholly by Lawes, at first directly and after 1889 by the income from the fund with which he endowed the Lawes Agricultural trust, the committee of which forms the governing body of the station. Public money was first provided in 1911, after which government grants were made annually and the work is now mostly financed by grants from the Agricultural Research council. The range of problems studied steadily increased and extended to all those affecting soil fertility and the growth of healthy crops. Rothamsted is the headquarters for the soil survey of England and Wales; it also houses the Commonwealth Bureau of Soils.

In 1934 money raised by public subscription allowed the Lawes Agricultural trust to buy the Manor house (now a residential hostel for workers at Rothamsted), the home farm and other parts of the estate. Of the 600 ac.. about half are suitable for experiments and carry approximately 3.000 plots each year.

Many experiments are also made at the Woburn Experimental station in Bedfordshire. started by the Royal Agricultural Society of England in 1876, and joined to Rothamsted in 1926; the different soil there allows experiments on crops for which Rothamsted farm is unsuitable. Workers at the Dunholme field station. Lincolnshire, study the manuring and the pests and diseases of sugar beet. (F. C. BN.)

ROTHE, RICHARD (1799–1867), Lutheran theologian, was born at Posen on Jan. 28, 1799. He studied theology in the universities of Heidelberg and Berlin (1817–20) under Karl Daub (1765–1836), Schleiermacher and Neander. In the autumn of 1823 he was appointed chaplain to the Prussian embassy in Rome, of which Baron Bunsen was the head. This post he exchanged in 1828 for a professorship in the Wittenberg theological seminary, of which in 1832 he became also second director and *ephorus*. In 1837 he became professor and director of a new clerical seminary at Heidelberg; in 1849 he was professor and university preacher at Bonn. but in 1854 he returned to Heidelberg as professor of theology, and afterward became member of the Oberkirchenrath. a position he held until his death on Xug. 20. 1867. His removal to Heidelberg and the publication of his *Die Anfänge der christlichen Kirche und ihrer Verfassung* (1837). coincide with the attainment of the principal theological positions with which his name is associated. Rothe's most important work is his *Theologische Ethik* (3 vol., 1845–1848; 2nd ed.. 5 vol. 1867–71).

BIBLIOGRAPHY.—F. Nippold, *Richard Rothe, ein christliches Lebensbild,* 2 vol. (1873–74); W. Hönig, *Richard Rothe, sein Charakter, Leben und Denken* (1898); Adolf Hausrath, *Richard Rothe und seine Freunde* (1902).

ROTHENBURG-OB-DER-TAUBER, a Bavarian town of Germany. in Middle Franconia. 49 mi. W. by rail of Nürnberg. Pop. (1910) 11,214. Rothenburg-ob-der-Tauber, mentioned in the chronicles in 804 as Rotinbure, first appears as a town in 942 and in 1108 passed to the family of Hohenstaufen. In 1172 it became a free imperial city and it attained the zenith of its prosperity under the famous burgomaster Heinrich Toppler (1350–1408). It is probably the finest surviving example of a medieval town, flanked by medieval walls, towers and gates. Perhaps the most interesting building is the town hall. one part of which dates from 1240 and the other from 1572. The latter is a beautiful Renaissance structure and contains a grand hall in which every Whit Monday a play. *Der Meistertrunk*, which commemorates the capture of the town by Tilly in 1631, is performed. It has manufactures of toys, soap and agricultural machinery. and breweries. linen weaving establishments, sandstone and limestone quarries.

ROTHENSTEIN, SIR WILLIAM (1872–1945), English artist whose portraits are notable for fine draftsmanship and sense of character. was born at Bradford. Yorkshire, on Jan. 29. 1872. He studied at the Slade school, in London, under Alphonse Legros and in Paris at the Académie Julian. In Paris he was encouraged by Degas and Whistler. He began exhibiting in 1891. He was principal from 1920 to 1935 of the Royal College of Art and served as an official British war artist in World Wars I and II. His paintings include the "Coster Girls" (1894; Graves gallery, Sheffield); "The Browning Readers" (1900; Bradford Art gallery); "The Dolls' House" (1899) and "Cliffs at Yaucottes" (1909, both in Tate gallery, London); "Morning at Benares" (1911); and "Bourlon Church" (1919). His portraits include those of Walter Pater (1894), Xlgernon Swinburne (1895), Auguste Rodin (1897), Henry James (1898) and Joseph Conrad (1905), in the National Portrait gallery. London; G. K. Chesterton (1922), Bernard Berenson (1910), Sir Rabindranath Tagore (1912) and a self-portrait (1900), in the Metropolitan Museum of Art. New York city. He painted one of the historical panels in St. Stephen's hall, Westminster. Knighted in 1931, Rothenstein died on Feb. 14, 1945. A memorial exhibition of his work was held at the Tate gallery in 1950.

His published works include *Oxford Characters* (1893); *English Portraits* (1897); *The French Set, and Portraits of Verlaine* (1898); *Manchester Portraits* (1899); *Liber Juniorum* (1899); a *Life of Goya* (1900); *Plea for a Wider Use of Artists and Craftsmen* (1918); *Twenty-Four Portraits* (1st series, 1920; and series, 1923); *Ancient India* (1925); *Men and Memories* (3 vol., 1931–39).

His son. Sir John Rothenstein, the author of a number of books on painting. was appointed director of the Tate gallery in 1938. Another son. Michael Rothenstein, became a painter.

ROTHERHAM, a county and parliamentary borough in the West Riding of Yorkshire. Eng., 6 mi. N.E. of Sheffield. Pop. (1951) 82.341. Area 14.3 sq.mi. It lies at the confluence of the Don and the Rother, which affords a notable north-south route on the east side of the Pennine upland. Rotherham is connected by the Don canal with Goole and the Humber and is a railway and road junction. There are Bronze and Iron Age barrows, and remains of a Roman fort and settlement in the vicinity. Rotherham was taken by the royalists in 1643. but after the battle of Marston moor it was surrendered to a detachment of parliamentary forces. Its industrial prosperity may be said to have begun when ironworks were established at Masborough on the opposite bank of the Don in 1746. It was incorporated in 1871 and became a county borough in 1902. A museum and art gallery was opened in 1893 and a technical college, art school and a central public library in 1931. On Old Rotherham bridge is a 15th-century chapel. The parish church of All Saints is 13th-century Perpendicular. In the mid-1950s there were four large parks and other open spaces covering about 500 ac. The principal industries are steel, iron. brass, glass. coal and its by-products, general engineering, brewing and corn milling. A cattle market is held on Mondays and retail markets twice weekly.

Wentworth Woodhouse, 4 mi. N.W., is an 18th-century mansion partly inhabited by Earl Fitzwilliam and partly used as a training college for teachers.

ROTHERMERE, HAROLD SIDNEY HARMSWORTH, 1ST VISCOUNT (1868–1940), British newspaper-owner, brother of Lord Northcliffe (*q.v.*), and the commercial brain behind the development of his publishing empire. He was born at Hampstead, April 26. 1868. the second son of Alfred Harmsworth. Largely under his mother's influence. he left the civil service in 1888 to become financial manager of his brother's magazine, *Answers*, which he saved from collapse. Thereafter he was the business genius in all of his brother's enterprises, balancing North-

cliffe's enthusiastic creative exuberance with hardheaded financial realism sometimes bordering on cheeseparing, which, although it infuriated Korthcliffe, ensured the stability essential to success.

Whereas Northcliffe was interested in newspapers for themselves, Rothermere was interested in them as a means of making money. To this end he brought ruthlessness and shrewd judgment. He quickly saw how much newspapers would benefit from controlling their own newsprint supplies, and founded the huge Anglo-Newfoundland Development corporation in 1906. He was created a baronet in 1910, and raised to the peerage in 1914. After a brief period as air minister in World War I, he received a viscountcy in 1919. Although he failed to secure control of the *Times* on Northcliffe's death (1922), he acquired his brother's majority interest in the other Northcliffe papers on favourable terms and began a series of operations which first gave him control of Sir Edward Hulton's Manchester newspaper properties (most of which he later resold at a profit) and then involved him in a bitter conflict, over the acquisition of a chain of provincial evening newspapers, with the Berry brothers (later Lord Camrose and Lord Kemsley) to whom, however, he sold the Northcliffe periodical interests, Amalgamated Press, for £8,000,000.

His journalistic judgment was less shrewd than his business sense. Under him the *Daily* Mail lost its lead and he nearly ruined the *Daily Mirror* before he sold it in 1931. His support for the British Union of Fascists and his attacks on all forms of public expenditure alienated readers and advertisers, and his attempt in 1929 to dictate terms to Stanley Baldnin (including the right to approve ministerial appointments before they were made) in return for his newspapers' support, brought a crushing rejoinder. His attempt to force Baldwin's hand by means of the United Empire party campaign, at first in conjunction with Lord Beaverbrook and then on his own, failed completely. Only abroad did he achieve the political acclaim he felt he deserved, uhen in 1927 his advocacy of a review of the treaty of Trianon brought an offer of the crown of Hungary. This he had the good sense not to accept.

Although ruthless in business and without his brother's personal magnetism, he was generous and both his personal and public benefactions were considerable. At the outbreak of World War II he accepted a mission to Canada, uhere his interests gave him great influence. But his health broke and he died, Nov. 26. 1940, at Hamilton, Bermuda. (F. Ws.)

ROTHES, EARLS OF. The first earl of Rothes was George Leslie, son of Norman Leslie of Rothes in Moray and of Ballinbreich in Fife. In 1445 he was created Baron Leslie of Leven, and about 1458 earl of Rothes in the peerage of Scotland His grandson GEORGE, the 4th earl (d. 1558), whose father, William, the 3rd earl, was killed at Flodden. was accused, but acquitted in 1546, of complicity in the murder of Cardinal Beaton, in which his brother and his two sons were undoubtedly implicated; he was one of the Scottish commissioners who witnessed the marriage of Mary Queen of Scots with Francis, the dauphin of France.

His son ANDREW, 5th earl of Rothes (d. 1611), took an active part with the lords of the congregation, first against the queen-mother, Mary of Guise, when regent of Scotland, and afternard against Mary Queen of Scots in opposing her marriage nith Darnley, and in devising the murder of David Rizzio. He was, however, one of the peers nho acquitted Bothwell of Darnley's murder; and going over to the side of the queen, he fought for her at Langside. He continued to occupy a position of some prominence in Scottish affairs until his death in 1611.

His great-grandson, JOHN, 7th earl of Rothes (1630–1681), held a command in the Royalist army at the battle of Worcester in 1651, and accompanied Charles II to England at the Restoration, when he became lord president of the council in Scotland. He was lord treasurer of Scotland from 1663 to 1667, when he was made lord chancellor of Scotland for life. His estates having been sequestrated by the parliament in 1651, he received a re-grant in 1663 of the earldom of Rothes.

See Sir *R* Douglas, *The Peerage* of *Scotland,* ed. Sir *J.* B. Paul; and *G E. C , Complete Peerage.*

ROTHESAY, a royal burgh and the chief town of the county and island of Bute, Scot. Pop. (1951) 10,141. Lying on Rothesay bay, on the eastern coast, it is a holiday town and conference centre. with a promenade 4 mi. long and a pavilion (1938). It is linked to the mainland by passenger and car ferries to Wemyss bay (Renfrewshire) and Colintraive (Argyllshire). The sheltered bay affords excellent anchorage and is the headquarters of a submarine squadron. In the centre of the town are the ruins of a castle. originally erected *c.* 1098 either by Magnus Barefoot, king of Korway, or by the Scots as a defense against the Norwegians. It is said to have been demolished by Robert Bruce, and the ruins today appear to be of 14th-century date. The village which grew up round the castle was made a royal burgh by Robert III, who in 1398 created his eldest son David duke of Rothesay, a title that became the highest Scottish title of the heir apparent to the throne of the United Kingdom. During the Commonwealth, Rothesay castle was garrisoned by the parliamentarians. It was burned by the followers of Argyll in 1685 and remained neglected until the rubbish was cleared away by the second marquess of Bute in 1816. It was repaired by the third marquess and is now maintained by the Scottish National Trust. Although agriculture is the chief industry, the manufacture of fine tweed cloth is becoming increasingly important. There are cruises from Rothesay to the Kyles of Bute, around Arran and to Campbeltown and Inverary. The town is under the jurisdiction of a provost and council.

ROTHSCHILD, the name of a great European Jewish banking family, the name being derived from a red *(rot)* shield on the house in which the family lived in the ghetto of Frankfurt-on-Main, Germany, during the early part of its history.

MAYER ANSELM ROTHSCHILD (1743–1812), the founder of the house, was born Feb. 23, 1743. He established moneylending branches in Europe and England, with his sons acting as branch managers. ANSELM MAYER ROTHSCHILD (1773–1855), his eldest son, born June 12, 1773, remained nith his father and took over the Frankfurt house. SOLOMON ROTHSCHILD (1774–1855), the second son, born Sept. 9, 1774. settled in Vienna; NATHAN MAYER ROTHSCHILD (1777–1836) settled in London; KARL ROTHSCHILD (1788–1855) in Naples and JACOB or JAMES ROTHSCHILD (1792–1868), born May 15, 1792, in Paris. The founder laid down two maxims for the conduct of the banking operations of his family: conduct all operations in common, and set definite limits to each operation and never aim at exorbitant profits.

The Naples house was discontinued after the annexation of Naples by Italy in 1860.

Nathan Mayer, in London, came to be regarded as the financial genius of the family. The political events of the Napoleonic wars gave the house of Rothschild its historic eminence. During that period, the Rothschilds raised £100,000,000 for the European governments. Anselm Mayer, the eldest brother, became a member of the Prussian privy council of commerce. and in 1820 Bavarian consul and court banker; Solomon, who settled in Vienna, was on terms of intimacy with Metternich; and Jacob, of Paris, negotiated large loans for the Bourbons. All of Mayer's sons received the right to use "von" before their names and mere made Austrian barons in 1812. The Rothschilds controlled European finance for many years.

The important London house, after Nathan Mayer's death in 1836, nas managed by his son LIONEL ROTHSCHILD (1808–79), born Nov. 22, 1808, who became the first Jewish member of parliament. in nhich he served from 1858 to 1874. His son NATHAN MAYER ROTHSCHILD (1840–1915) was born Nov. 8, 1840, inherited a baronetcy from his uncle ANTHONY DE ROTHSCHILD (1810–i6) and was made a peer in 1885, the first Jew to be raised to the British peerage. Nathan's son LIONEL WALTER ROTHSCHILD (1868–1937) succeeded to the title: he was born Feb. 8, 1868. and was famous as a naturalist. His collection of some 280,000 bird skins is now in the American Museum of Natural History in New York city.

The head of the London family has been considered the lay head of British Jewry. The Balfour declaration of Nov. 2, 1917, stating that the British government viewed with favour "the establishment of a national home for the Jewish people" in Palestine. was addressed to Lionel Walter Rothschild. EDMUND JAMES ROTH-

SCHILD (1845–1934), of the French branch of the family, invested more than 70,000,000 gold francs in helping to establish Jewish communities in Palestine.

Three of the Rothschilds have entered politics. LIONEL NATHAN ROTHSCHILD (1882–1942) was a member of the house of commons. 1910–23. JAMES ARMAND ROTIISCHILD (1878–) entered the house of commons in 1929. MAURICE ROTHSCHILD (1881–) was a member of the French senate.

Other eminent members of the French branch of the family have been EDOUARD ROTHSCHILD (1868–1949), who was president of the Chemins de Fer du Nord, and HENRI ROTHSCHILD (1872–1947). physician and playwright.

Two great-great grandsons of Mayer Anselm continued the British house of N. M. Rothschild and Sons: LIONEL DE ROTHSCI-IILD. (1882–), born Jan. 25, 1882, and ANTHONY GCSTAV DE ROTHSCHILD (1887–1961).

It is said that no authentic record of the Rothschild family exists, but the following may be consulted: E. C. Corti, *The Rise of the House of Rothschild* (1928); C. Roth, *The Magnificent Rothschilds* (1939). (J. R. LT.)

ROTHSCHILD, LIONEL WALTER ROTHSCHILD, 2ND BARON (1868–1937), British zoologist who founded the Tring museum of natural history, eldest son of Nathaniel Mayer, 1st Baron Rothschild, was born on Feb. 8. 1868, in London. He was educated at home, at Bonn university and at Magdalene college, Cambridge. He was a trustee of the British museum (1899–1937), a member of parliament (1899–1910), a fellow of the Royal society (1911) and president of the zoological section of the British association (1932'). He is notable as the founder of the Tring museum (subsequently presented as a gift to the British museum), the largest and most valuable collection of natural historical specimens ever assembled by one man, containing the largest collection of butterflies and moths in the world (more than 2,000,000 specimens and many thousands of types), and also a unique library of over 30.000 volumes. He published alone or in collaboration with his museum staff over 800 papers and monographs dealing with zoological and botanical subjects, principally birds, butterflies and moths.

Baron Rothschild died on Aug. 27, 1937. at Tring.

See *Novitates Zoologicae*, vol. xli, pp. 1–41 (1938–39), which includes a list of Lord Rothschild's works. (M. L. RD.)

ROTHWELL, an urban district in the Normanton parliamentary division of the West Riding of Yorkshire, Eng., about 4 mi. S.E. of Leeds. Pop. (1961) 25.360. Area 16.7 sq.mi. Soon after the Conquest. Rothwell was a dependency of the castle of Pontefract. and a baronial residence. of which there are slight remains, was erected there. Coal, stone. sand, clay and gravel are obtained and the town has copper tube. rope. chemical and engineering factories. Forced rhubarb is produced on a large scale. Methley urban and Hunslet rural districts were added to Rothwell in 1937.

Rothwell in Northamptonshire is a small manufacturing town 4 mi. N.W. of Kettering.

ROTIFERA (ROTATORIA), well-defined group of aquatic animals of microscopic size, noteworthy for the diversity of their forms. the vivacity and variety of their movements and the complexity of their structural development. They are often called wheel animalcules because in some species the ciliated bands on the head beat in a manner suggestive of the rotation of a wheel or wheels (see *Corona,* below). In length they range from .05 to 2 mm., but most are between 0.1 and 0.4 mm. In general rotifers are symmetrical in structure, although some are highly asymmetrical.

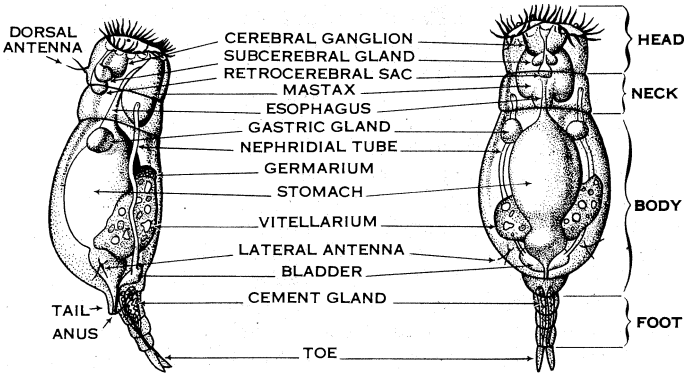
General Features. — The body. which is covered with a thin, flexible cuticle overlying a syncytial epidermis. is, in many species, weakly differentiated into several regions: head. neck, trunk and foot. These regions are separated from each other by folds (often a separate neck is not presentj. The foot may be divided into sections by folds. The sections, often called segments or joints. do not. however; reflect true metamerism.

The foot. an extension of the body posterior or ventral to the anus, bears at its end two conical toes, and contains within two pedal or cement glands which secrete a sticky material through ducts that open at the tips or near the base of the toes. The tail is the fold or prolongation dorsal or anterior to the anus.

At the head end is a flattened ciliated area, the corona, with a mouth near the ventral or posterior edge.

Corona. — Food is collected and swimming is brought about by the action of numerous cilia on an area close to or encircling the mouth, or on fringing lobes protrusible from the mouth. The whole area, including the mouth itself. as seen when the cilia are active. is called the corona. There are many varieties of this organ, differing widely in the arrangement of the cilia and in the presence of accessory structures.

The basic corona type can be regarded as a ciliated band around the head. The corona. prolonged posteriorly on the ventral side, encloses a bare apical area. Some rotifers have tufts of elongated cilia at the sides of the mouth or buccal area. Other species have lateral ciliated ridges, auricles, projecting from the head, the ciliation either being continuous with the buccal area, or limited to the edges, Auricles may be introvertable, in which case they are extended only when the animal is swimming.



FROM WARD AND WHIPPLE, FRESH-WATER BIOLOGY" (1959); REPRODUCED BY PERMISSION OF JOHN WILEY & SONS, INC.

FIG. I. — ANATOMYOF A REPRESENTATIVE ROTIFER SHOWING (LEFT) LATERAL AND (RIGHT) DORSAL VIEWS. GREATLY ENLARGED

Other coronal variations involve reduction of the ciliated band to a very narrow strip and reduction of the ciliation posterior to the mouth. Many actively swimming rotifers have the corona reduced to a thin strip of cilia surrounding the head and enclosing a large apical area. A snoutlike projection or rostrum may be developed from the apical area.

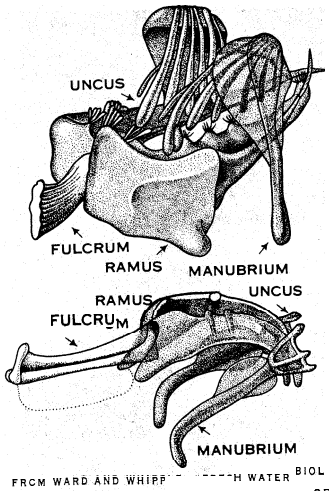
In many species the cilia on the anterior and posterior margins of the ciliated areas are elongated. The anterior line of larger cilia is the trochus, the posterior line is the cingulum. The edges of the corona may be elaborated into lobes. The bdelloids (order Bdelloida), the extreme development of this type, have the dorsal margin so deeply indented toward the ventral side that it has cut through. breaking the trochus into two circles; these are the "rotating wheels" seen in many bdelloids.

The corona of members of the family Collothecidae represents a great modification. The anterior part of the body is drawn out into a wide bowl, the margin of which is usually lobed and covered with very long generally nonvibratile bristles (setae). Within the bowl is a ventral shelflike membrane, usually ciliated. There may be vibratile cilia inside the bowl and, in some species, on the margin as well; however, most do not have coronal cilia. Some adult collothecids lack coronal cilia, except for a small area at the bottom of the bowl.

Foot. — The foot may be highly developed, rudimentary or even absent as in many open-water (planktonic) species. There is often only one toe, representing a fusion of two. The toes of some rotifers are long. unequal, slender filaments. with the cement glands opening at the base. Other species lack these filaments and have a ciliated cup at the end of the foot. In the sessile species the foot usually ends in a stalk attachment or peduncle. The foot, in some species. may be withdrawn into the body.

Body Wall. — In many rotifers the cuticle is thin and pliable; in others it may be thickened in places, forming relatively stiff

plates which together form the lorica. Often the anterior and posterior margins of a lorica have prominent spines. and a few rotifers have spines on the dorsal surface, Some animals have fairly flexible plates, difficult to differentiate from the connecting areas of cuticle. In some rotifers the lorica is simple and consists merely of a general thickening of the cuticle of the body, forming a boxlike structure devoid of obvious differentiation aithin the different regions. More commonly, honever. the lorica consists of an arched dorsal plate and a flat ventral plate fused together at their edges. In such cases the anterior part of the flat plate may be connected nith the arched plate by a pliable cuticular membrane which stretches to accommodate the head when it is retracted. Some have the dorsal and ventral plates joined together by lateral strips of thin cuticle folded inward. forming deep grooves along the sides; others have a dorsal groove



FROM WARD AND WHIPP[illegible]H WATER BIOLOGY" (1959); REPRODUCED BY PERMISSION OF JOHN WILEY & SONS INC

FIG 2 — MAJOR PARTS OF TWO TYPES OF ROTIFER TROPHI

Other modifications of the body wall are movable bristles and paddles, quite different from the spiny extensions of the lorica. They may be long slender filaments, flat paddles or hollow outgrowths of the body furnished with spines and powered by large muscles.

Digestive Tract. — From the mouth a ciliated gullet leads to the mastax. The cuticular lining of the pharynx is thickened, forming the trophi or jaws. Following posteriorly from the mastax, the rest of the digestive tract consists of an esophagus, a thick-walled cellular stomach and a relatively thin-nailed. syncytial intestine, the posterior portion of which is differentiated as a cloaca.

The anus opens on the dorsal surface; however, in genera in which the foot projects from the ventral surface. the anus opens posterior to the foot.

Trophi.—The trophi are very characteristic features of the rotifers. and are found in no other group of animals. There are several major variations of trophi structure associated with food and feeding methods. Some types serve a simple grinding function. Others may be thrust from the mouth to grasp prey. Still others are used for sucking out the contents of organisms

Usually, rotifer trophi consist of seven separate pieces arranged in three sections. An unpaired median ventral fulcrum is attached to a pair of rami (sing. ramus) which move in opposition to each other like a pair of pliers. Altogether these three sections are the incus. The rami are pulled away from each other by muscles attached to the fulcrum and to the outer part of the bases of the rami. Lying adjacent to each ramus is a structure. the malleus. nhich consists of two pieces, a toothed uncus and a manubrium; these tno pieces. hinged together. move in a plane at right angles to the rami.

In addition to these standard parts, there may be others: subunci. rods connecting each ramus to its corresponding uncus: an epipharynx, one or more rods in the wall of the gullet and serving to support the mouth. Other supporting members may be developed elsewhere.

Muscular System. — The muscular system is composed of a group of longitudinal and circular bands in the body wall, a network of muscle in the viscera, and a few muscles betneen the viscera and body wall In some rotifers some of the more powerful muscles are conspicuously cross striped or striated.

Nervous System and Sense Organs. — The chief part of the nervous system consists of a large cerebral ganglion and smaller ganglia associated with the mastax and foot. Numerous nerves lead to muscles and sense organs.

There are three conspicuous touch (tactile) sense organs on the body. two lateral antennae located toward the posterior end and a dorsal antenna on the midline of the head. The dorsal antenna represents the fusion of two antennae and receives two nerves; a few rotifers actually possess two dorsal antennae lying close together. The corona may support stiff cirri (apparently derived from cilia), which are said to serve a tactile function. The foot sometimes has a tactile bristle on the dorsal surface just anterior to the toes.

Excretion. — The excretory system consists of a pair of convoluted tubes (protonephridia) which begin with special end cells called flame bulbs. Most commonly the tubes lead to a bladder from which a duct leads directly to the distensible cloaca; but in some species the protonephridia empty into the cloaca.

Secretion. — In most rotifers the gastric glands are attached to the anterior part of the stomach. In addition, there may be accessory glands elsewhere along the digestive tract.

The adhesive secretion of the cement glands in the foot is used for attachment. for leechlike creeping (alternate attachment of sticky foot and head end) and in the construction of tubes in some sessile forms In sessile species there may be no distinct cement glands, the secretion being produced by swellings of the epidermis.

In the head are located prominent glands of unknown function: an unpaired glandular retrocerebral sac having a long forked duct opening on the apical region of the corona; and a pair of subcerebral glands lying beside the duct of the retrocerebral sac and the ducts leading to the apical area. The sac and glands together compose the retrocerebral organ. Rotifers may have either sac or glands; both, or neither. In some species the ducts are degenerate.

Reproduction. — The reproductive system is of taxonomic importance, the division of the group into classes is made on the basis of the number of ovaries and the development of males. Most rotifers have one ovary, but the bdelloids and seisonids have tno In the former the female reproductive system lies ventral to the digestive tract. The ovary (vitellogermarium) consists of a small germarium that supplies nuclei to eggs, and a massive yolk-gland (vitellarium). An oviduct leads from the ovary to the cloaca

The rotifers ordinarily found are amictic females; *i e*, they reproduce parthenogenetically by diploid eggs (see PARTHENOGENESIS). The eggs may be released free in the nater may be laid on plants or other surfaces ; in most planktonic species the eggs may be attached to the lorica of the mother and carried till they hatch.

Some rotifers bear living young. the mother carrying one or more developing embryos nithin the greatly enlarged oviduct Under adverse environmental conditions special females. (mictic) may lay haploid eggs nhich then become males. When such haploid eggs are fertilized, honever. they are called resting eggs and give rise to females. Resting eggs, having a thicker shell than the parthenogenetic ones, are resistant to drying, and generally take a longer time to hatch. There are reports of resting eggs being produced parthenogenetically, however. Mictic and amictic females usually look alike; they can be distinguished only by the eggs they produce. In a fen species. though, there are observable differences betneen them.

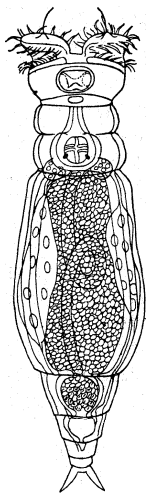


FIG 3 —A BDELLOID ROT"" (PHILODINA ACUTICORNIS)

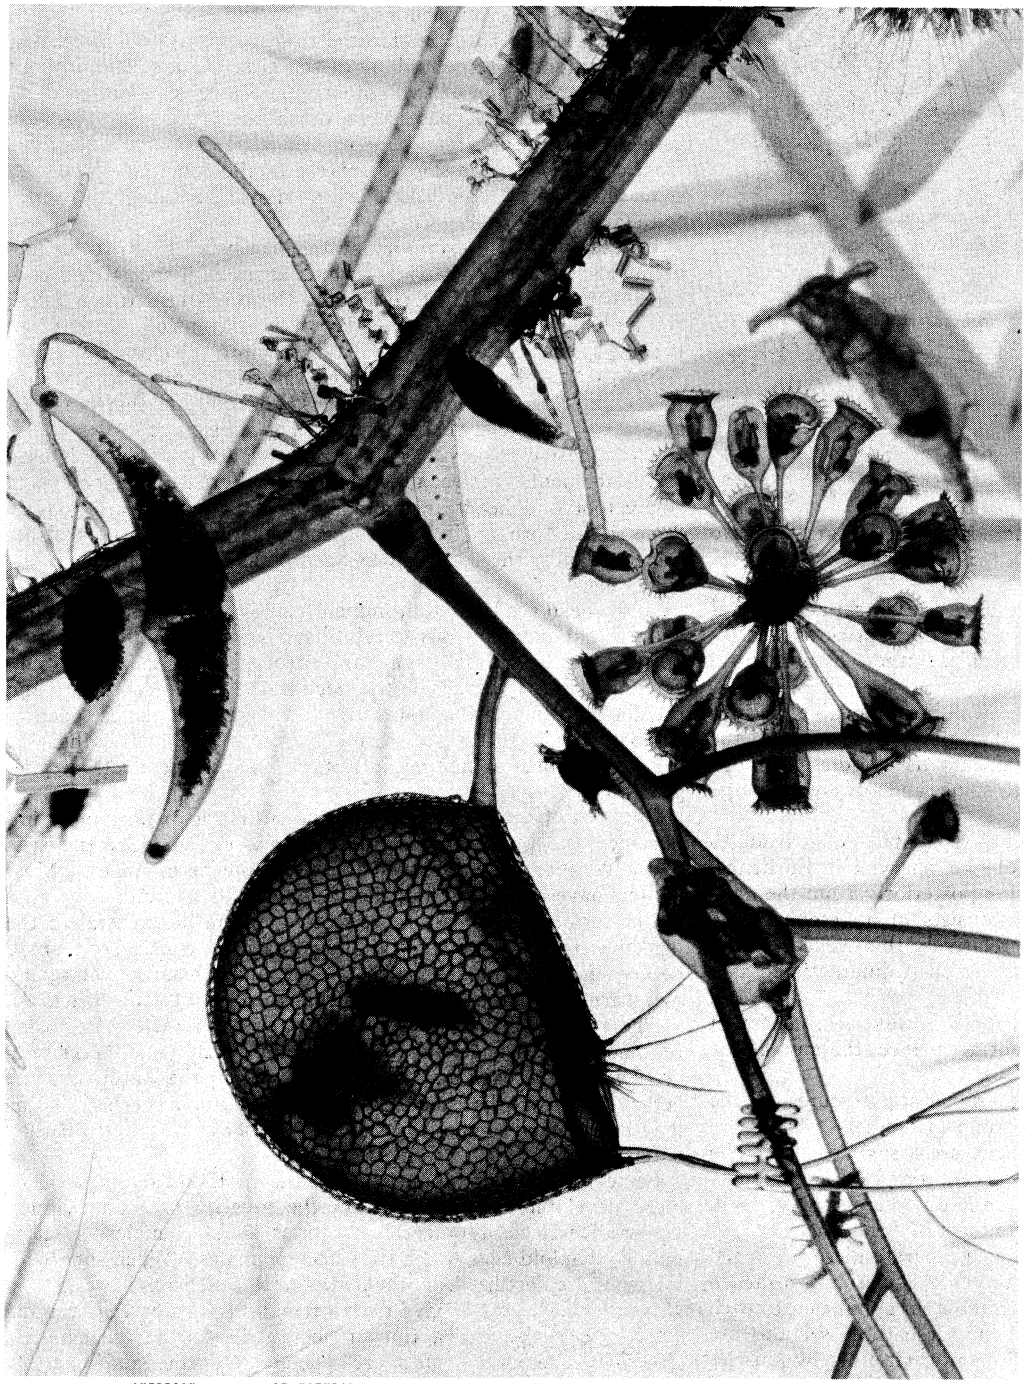
Rlales, undescribed for most species. have been found in many species of the order Monogononta. In the order Digononta, males are apparently absent among the bdelloids, but the seisonids regularly produce them. In a fen genera the males look like miniatures of the females except for the reproductive system. In most genera however. there is great morphological difference betneen the sexes (sexual dimorphism) ; e g , the males lack a digestive system and bear no resemblance to the



BY COURTESY OF AMERICAN MUSEUM OF NATURAL HISTORY

DETAIL OF ROTIFERA GROUP IN ½ IN. OF POND-BOTTOM WATER

At upper left is main stem of a bladderwort (*Utricularia vulgaris*), a water plant, showing at centre bottom bladder (utricle) about size of a pin head in the living plant. At bladder's lower right margin is trap door, with remains of captured rotifers visible inside. Stem is covered with tiny algae. At centre right is a spherical colony of rotifers (*Conochilus hippocrepis*). Above it is *Notommata copeus* With auricles extended. At left centre is crescent-shaped desmid (*Closterium*), an alga

features of that locality, not by its geographical location. Nevertheless, some species show a distinctly limited range. a few, some very common, are found only in North America; others have been reported only from Europe; a number of species are restricted to warmer climates or at least tropical and subtropical locations, while others are not found in the tropics. In general, the fauna of high altitudes and high latitudes is composed of relatively few species of wide distribution.

Rotifers are plentiful in most bodies of freshwater, especially ponds and bogs. Some are restricted to sea water or saline or alkaline lakes, and are tolerant of wide variations in salinity. A few bdelloids live only in places intermittently wet. such as among the parts of land-growing mosses and liverworts. Most species live along the shore (littoral zone) swimming much of the time in close contact with plants and other surfaces. The planktonic species occur in greatest numbers in open water. Some live within the cells of water plants. A few are commensal. living in the gill-chambers of fresh-water crabs and crayfish or attached to the outside of certain aquatic worms (Oligochaetes). The adults of sessile species live attached to the leaves and stems of water plants; their larvae are free-swimming.

While they live mostly in waters of moderate temperature (10° to 20° C). some have been found in hot springs, and others are restricted to arctic and antarctic waters. Some are capable of withstanding freezing or drying for extended periods.

The duration of their individual lives has been little studied; however. some species are known to live a few days only, while others survive more than a month.

Systematic Affinities.—Much uncertainty and dissension has been expressed about the relationships of rotifers. In some works they are regarded as one of a group of related minor phyla, but in a widely used classification (that of Libbie H. Hyman) they are a class of the phylum Aschelminthes. which includes also the following groups: Gastrotricha, Kinorhyncha (Echinodera), Priapulida, Nematoda and Nematomorpha (Gordioidea).

The following is a working classification:

females. The occurrence of males, where they are known, is restricted to short periods. though they may become very abundant while they are present. The male reproductive system of members of the class Monogononta usually consists of a testis and a ciliated sperm duct with glands. The tip of the duct is capable of being turned outward (eversible) and may be lined with thickened cuticle, forming a penis.

Ecology and **Distribution.**—Rotifers have a distribution that is usually regarded as potentially cosmopolitan. Many species. since they are so easily dispersed, are, in fact, nearly world-wide in their distribution. The occurrence of most species in a given locality seems to be mostly the result of specific environmental

CLASS **ROTIFERA**

Order **1.** Seisonaceae (Seisonidea).—Slender with long necks, living on the marine crustacean Nebalia; sexes of equal size and like form; tuo ovaries. Example. *Seison.*

Order **2. Bdelloidea.**—Bottom-dwelling (Benthonic) rotifers

with jointed cuticle; both ends retractile into the trunk; corona of two trochal discs, set on pedicels; two ovaries; mastax ramate; males lacking. Examples; *Philodina, Rotaria, Habrotvocha.*

Order 3. Monogononta.—Sessile or free-swimming rotifers; one ovary, males more or less reduced in size and structure.

Suborder 1. Ploima.—Free-swimming rotifers. with undivided terminal or ventral corona, not consisting of trochal and cingular circlets; foot with usually two toes; one ovary; mastax various. Examples, *Notommata, Proales, Synchaeta, Trichocerca, Euchlanis, Brachionus, Lecane, Asplanchna.*

Suborder 2. Floscullariaceae.—Sessile or swimming rotifers with more or less lobed corona of trochal and cingular circlets; toes lacking; mastax malleoramate; one ovary. Examples, *Floscularia, Conochilus, Limnias, Hexarthra, Filinia, Trochosphaera.*

Suborder 3. Collothecacea.—Mostly sessile rotifers with large funnel-like corona, often lobed, lacking a ciliary border in most forms; mastax uncinate; toes lacking. Examples, *Collotheca, Stephanoceros, Cupelopagis.* (W. T. E.)

ROTOGRAVURE: *see* GRAVURE.

ROTOR *SHIP,* a vessel utilizing revolving cylinders, called rotors, for auxiliary power. Anton Flettner, the German engineer who invented the rotor ship, originally intended to construct ships with metal sails. In 1922, however, experiments at the University of Gattingen, Ger., with revolving cylinders indicated that the pressure exerted upon a cylinder revolving in an air current was considerably greater than had been supposed. When disks of larger diameter than the cylinders mere provided at the ends. moreover, it was found possible to increase the wind effect to nine or ten times the amount of effect in normal sail. To achieve this effect the revolving speed of the cylinders had to be about 3 to $4\frac{1}{2}$ times as great as the speed of the wind.

Though an ordinary sailing vessel is required to take down all canvas in a hurricane, it was claimed that the rotor ship could continue sailing.

Tests were made with a three-masted schooner, the "Buckau." which had a displacement of 960 tons and was fitted with an auxiliary motor of about 200 h.p. The canvas rig of the vessel was dismantled, and in place of the fore and third masts two very strong masts were erected. The new masts were shorter, being 42 ft. in height. They were provided with bearings at the upper and lower ends to allow for the free rotation of the cylinders, which were placed over the masts. The cylinders were fitted at either end with disks of greater diameter than the cylinders that were built as part of them. The cylinders were rotated by means of motors, which could drive the towers at a speed of 125 r.p.m.

Circumferential speed was approximately 60 ft. per second, and the power required to rotate the towers about 9 h.p. By altering the circumferential speed of one or another of the cylinders, it was said, the pressure exerted by the wind could be correspondingly changed and so alter the vessel's course.

Sea tests were claimed to be successful, but little was heard of the subject thereafter. (F. J. D.; X.)

ROTORUA, a town of Rotorua county, North Island, New Zealand. It lies in the midst of a remarkable volcanic district, the Hot Spring district, which covers an area of 660 sq.mi. and extends 160 mi. from northeast to southwest from White Island, an active volcanic cone in the Bay of Plenty, to the mountains of Tongariro. Ngaruhoe and Ruapehu in the interior of the island, southwest of Lake Taupo.

Rotorua attracts many visitors because of the beauty and scientific interest of the locality and the bathing in its various medicinal springs. It is a scattered township lying on the southwestern shore of Lake Rotorua, amid hills reaching 2,600 ft. in the immediate neighbourhood, with a rich growth of forest. Pop. (1956) 12,302.

The springs are principally alkaline, alkaline and siliceous, acidic, or acidic and hepatic (sulfurous). The township includes the Maori village of Ohinemutu, an interesting collection of native dwellings. In the vicinity, on the lake shore, is the government sanatorium. One mile south of the Rotorua is another native village, Whakarewarewa, where there are geysers as well as hot springs.

Four miles from Rotorua, near the centre of the lake. the island of Mokoia rises to 1,518 ft. A short channel connects Lake Rotorua with Lake Rotoiti to the northeast. Both this lake and the smaller ones to the east, Rotoehu and Rotoma, have deeply indented shores and are set in exquisite scenery. The waters of Rotoma are of a particularly vivid blue.

South of Rotoiti is Tikitere, a sombre valley abounding in mud volcanoes, springs and other active volcanic phenomena. Mt. Tarawera (16 mi. S.E of Rotorua) is noted for the eruption of June 1886. which changed the outline of several lakes and destroyed the famous Pink and White terraces on the adjoining Lake Rotomahana

ROTROU, JEAN DE (1609–1650) French dramatist, called by Voltaire the founder of French drama, was born at Dreux in June 1609. More is known of his family than of his own life. He was educated in Paris, arote his first extant play (*L'Hypocondriaque,* publ. 1628) before he was 20. and a few years later emerged as protected by Richelieu and earning an assured income as writer for the chief established theatre of the capital. the Hôtel de Bourgogne.

Rotrou returned to Dreux at the age of 30, married, served for a time as a magistrate, and died, courageously. of the plague (June 28. 1650). He seems to have been a man of retiring disposition, conciliatory and unselfish.

His 35 extant plays shoa the evolution of public taste in drama and the increasing attraction of the theatre for the rising middle class. Nearly half are tragi-comedies, by which was meant a serious play involving peril but not death; the title was in one or two later altered to *"tragédie."* For Rotrou. with Corneille. nhom he admired, and one or two more, invented French classical tragedy. He saw that this new form of social pleasure. both spectacular and declamatory, might achieve emotional effects more powerful and delicate than rough prose drama. With a generous admixture of incident and reversal of fortune he allied discussion of moral issues and portrayal of character under strain. He did much to refine the instrument he had invented, by concentration, omitting extraneous incident and intensifying psychological motivation. His characters are faced with choices: the king's son in *Cosroès* (1648) between power and loyalty; the king in *Venceslas* first condemns his son to execution, and then abdicates in his favour. Racine gratefully borrowed from his study of *Antigone* (1638) and the starkest scene in *Britannicus* is re-worked from Rotrou's *Belissaire* (1644). His sense for comedy was no less keen: in *Les Sosies* (1636 or 1637) he discovered the delicious comic situation which Molière was to perfect in *Amphitryon*

Rotrou is a writer of power. He uses the alexandrine with great effect for resonant expression of stress and violence. He has the

rhetoric, the concentration, the formal structure of the classical manner, together with a baroque sense of surprise, contrast, tension and illusion. The last is most powerfully shown in Le *Veritable Saint-Genest* (1647), showing an actor whose professional martyr's role turns into personal conviction.

BIBLIOGRAPHY.—H. C. Lancaster, *History of French Dramatic Literature in the 17th Century*, Pt. 1, vol. 1 (1929) lists the plays and revises the dating given by other authorities, with detailed references. There are modern editions of *Venceslas* (by T. F. Crane, 1907); *Saint-Genest* (T. F. Crane, 1907; and, with excellent introduction. by R. W. Ladborough, 1954), and *Cosroès* (by J. Scherer, Societé des Testes Français Modernes, 1950). *See* also A. Adam, *Histoire de litterature française au 17e siecle, I* (1949). (W. G. ME.)

ROTTERDAM, the second largest city of the Netherlands, is situated in the province of South Holland, about 15 mi, from the North sea, on both sides of the Maas river (the mouth of the Rhine). It is the largest European port and one of the largest in the world, and is connected with the North sea by a wide canal called New Waterway. The land area of the city totaled about 57.6 sq.mi. in 1956. The population was about 5,000 in 1514; 72,294 in 1830; 309,307 in 1899; 605,733 in 1938; 643,712 in 1947; 722.718 (mun. estimate) in 1957.

Rotterdam takes its name from the Rotte river which in former times flowed through the marshland of South Holland into the Maas river. A strong dike was built on the north bank of the Maas in about 1250, with the result that the Rotte was shut off from the Maas by a system of locks. A small colony that settled on this dam was granted certain charters in 1299 and 1328. In 1340 Count William IV of Holland bestowed city rights on Rotterdam and at the same time gave the citizens the concession to dig an open canal to the Schie, another right-hand tributary of the Maas. This was an important privilege as it gave Rotterdam a communication with Delft and Leyden, whereas the Rotte only provided a link with the still sparsely populated marshland. Its unusually favourable position between the great market town of Dordrecht and the other Dutch towns was a reason for the city's rise to prosperity. Its thriving growth, however, came to a temporary halt when Jonker Frans van Brederode, leader of the nobles who were in revolt against the sovereign, Maximilian of Austria, gained possession of Rotterdam and used it as a base from which he conducted his military campaigns and pillaged the surrounding countryside.

In 1563 a large part of the town was destroyed by fire and it scarcely had time to recover from this disaster before it was occupied and plundered by Spanish troops in April 1572. The Spaniards withdrew, however, after a few months, and Rotterdam ranged itself on the side of the prince of Orange. It was spared further hostilities and before long it was enjoying a period of great prosperity. From the southern Netherlands, where Philip II's authority had been restored, a great many people fled north, for reasons of faith, and a number of merchants and artisans, mainly from Antwerp, settled in Rotterdam. At this time the city council of Rotterdam was very much under the influence of Jan van Oldenbarneveldt, who was later to play an important part in the government of his country and whose life was to end on the scaffold. Under his auspices, in the last quarter of the 16th century, an ambitious plan emerged for the enlargement of the town. Harbours were dug out of the mud flats and the scale of this plan was so immense that for the next two and a half centuries the city was provided with sufficient possibilities of expansion.

In the 17th and 18th centuries the town on the Maas increased steadily in importance. Trade was principally centred on France and England, but there was also shipping to Indonesia and America. The Court of the Fellowship of the Merchant Adventurers had been at Rotterdam since 1635; it was transferred to Dordrecht in 1656, but this circumstance had no detrimental effect on trade relations with England. After the revocation of the Edict of Nantes (1685) many French Protestants came to Rotterdam, where they contributed largely to the city's prosperity. The years of French domination (1795–1813) were lean years for Rotterdam, and it was only long after 1813 that prosperity returned.

Furthermore, trade had shifted; in the 19th century it was the transit trade that grew more and more important, and it took some time before conditions could be adapted to the new situation. After 1850 Rotterdam grew rapidly, chiefly as a result of the German unification in 1870 and the industrialization of the Rhineland in general and of the Ruhr area in particular. With the expansion of the town, a vast network of harbours was made, stretching along the New Waterway (planned by Pieter Caland) and in open communication with the sea, and this made Rotterdam one of the best equipped ports in the world. World War I and the economic depression of the 1930s were severely felt in Rotterdam.

In World War II the city and port suffered tremendously. On May 14, 1940, the German *Luftwaffe* destroyed practically the entire city centre and an extensive part of the east district. About 900 people were killed and approximately 78,000 were rendered homeless. Of public buildings, only the city hall (1920), the main post office (1923), the stock exchange, the famous Boymans museum and some minor buildings escaped destruction. The Boymans museum, rehoused in 1935, contains masterpieces of Flemish and Dutch art, sculpture, glass and Delft porcelain. More than 8,500 yd., or over one-third, of the total length of quayside for seagoing

vessels and about 40% of the port's equipment were destroyed in the autumn of 1944.

Apart from some 18th-century houses, Rotterdam possesses only two buildings of historical interest, namely, the 15th-century St. Laurens church and the Schielandshuis. The former was very badly damaged but it was in the process of restoration in the late 1950s, and the tombs of the famous admirals Cortenaer, Witte de With and Van Brakel were to be reinstated in the church. The Schielandshuis, built in 1662–65 by Jacob Lois, was the meeting place for the *dijkgraaf* and *hoogheemraden* of Schieland, where they deliberated upon everything concerning the dikes of that part of Holland. It now houses the Historical museum. Of historical interest is also Hendrik de Keyser's beautiful statue of Erasmus, the great Rotterdam humanist, which was placed on the Grote Markt in 1622. It was spared by the fire of May 1940 and removed to a place of safety. After the war it was erected again on the

van Hogendorpsplein in the neighbourhood of the Schielandshuis.

Immediately after the bombing of the city centre, the debris was cleared away and the ruins and foundations of bombed buildings were removed Only four days later the city architect, W G Witteveen, was instructed by the municipality to prepare a plan for the reconstruction of the city centre. Meanwhile in order to make central replanning possible, the entire devastated area was expropriated. Witteveen's plan, fragments of nhich were carried out during the occupation. was superseded by a far more radical plan. drawn up under the leadership of C. van Traa, director of town planning and reconstruction, which was accepted in 1946. Without hampering the expansion of the city effected by the construction of new housing estates, the reconstruction of the city centre progressed to such an extent that on Jan. 1. 1957, the undamaged buildings, the new edifices completed and the new buildings then under construction occupied 65.2% of the available building sites. Particularly noteworthy of the new buildings are the Central railway station (1957); the Wholesalers building (1952), which accommodates the offices, stores and showrooms of more than 200 wholesalers and which is said to be the biggest modern business edifice in Europe: the Building centre (1948–55), an international research and information centre for building and interior decoration; the Lijnbaan shopping promenade (1953), which consists of 7j shops and nhich is open only to pedestrians, the Bijenkorf department store (1957); the Dijkzigt City hospital (to be completed in 1960); and some fine housing achievements in the rebuilt city centre and in the new housing estates in the suburbs and around the city proper. A controversial memorial monument of the May 1940 bombing (by Ossip Zadkine) was inaugurated in 1953 and. four years later, a monument to the memory of the fallen (by Mari Andriessen) nas unveiled

The restoration of the port facilities was completed in 1949. Thereafter the port facilities were steadily extended, and gradually maritime traffic returned. After 1946 it rose steadily, to such an extent that in 1957 previous records were broken for the fourth successive year. In 1957 Rotterdam had 22,309 yd of quayside for seagoing vessels and 14.600 yd. of quayside for inland craft The total area of its harbour basins was 1,508 ac.

In May 1940 Waalhaven airport, the first civil aerodrome in Europe. was destroyed. In 1953 the heliport of the city centre (daily connections with Antwerp, Brussels and Paris) was opened. The new Rotterdam airport. north of the city, was opened in 1956. After World War II Rotterdam aimed even more than before at broadening, and thus strengthening, its economic basis by nurturing new business propositions. Its industries comprise the largest oil refineries in Europe, several shipbuilding yards, engineering works, automobile-assembling plants the manufacture of coffee, tea, cocoa, tobacco, margarine, clothes, paper, railway material and all kinds of chemical products. In addition, there are breweries and distilleries. (W. A. H. C.; H RT)

ROUAULT, GEORGES (1871–1958), French painter and engraver, perhaps the greatest religious painter since Rembrandt. was born in Paris on May 27. 1871. the son of a cabinetmaker in working-class surroundings. He was taught to appreciate art by his grandfather Champdavoine, an admirer of Daumier whose work was to influence Rouault decisively. Apprenticed to a glazier from 1885 to 1890, Rouault worked on the restoration of the stained-glass windows of Chartres cathedral; and these awakened his feeling for decorative and architectural values and for the monumental use of colour and line Gustave Moreau, under whom he studied at the Ecole des Beaux-Arts in 1892, introduced Rouault to the work of Leonardo da Vinci and of Rembrandt. but during 1898–1902, influenced by Toulouse-Lautrec and Cézanne. Rouault developed a new style, producing water colours of sober tints (blues predominating) with strong tones and emphatic forms. Hideous prostitutes, terrifying judges. repulsive millionaires. pitiful poor people and tragic clowns (these as the symbol of the anguish of mankind) portray "the dereliction of man without God" Rouault was converted to Roman Catholicism (*c* 1895) and later became the friend of J K Huqsmans and Léon Bloy.

From 1906 to 1910 Rouault took an interest in pottery; and from 1917 onward he practised engraving (some of his later masterpieces were to be in this medium). In oils he began to build up colour. solidity and tension in his compositions of the story of the Passion of Christ. From 1914 to about 1935 he pursued this hieratic style. From 1935 to about 1948, Rouault's painting became more serene and was characterized by the appearance of graceful feminine figures. He now produced small canvases on which the paint was applied thickly and with the glowing lustre of enamel. Tranquillity gave place in 1948 to an impulse of joy. Using greens and yellows (both new to his palette) so thickly as to give the appearance almost of relief, Rouault infused his works, particularly his landscapes, with universal significance and religious grandeur. Such a reawakening in an artist approaching 80 was exceptional. After this swan song he painted little more. but uaited quietly for his death in Paris on Feb. 13, 1958.

Rouault stood apart from his contemporaries. Evoking form by a new use of colour and outline whose very flatness becomes monumental, he drew inspiration from French medieval masters, uniting religious and popular traditions, divorced since the Renaissance. To secular art he brought back craftsmanship and the sense of congruity bet een the sublime and the grotesque. To religious art he restored its concern with both human life and the transcendental. *See* also PAINTING: *20th century: Fauvism.*

ROUBAIX, a manufacturing town in the Nord *département* of France. 6½ mi. N.E. of Lille. lies on the Roubaix canal which links the lower Deule with the Scheldt by way of the Marcq and the Espierre. Pop. (1954) 109.480. Area 5 sq.mi. It unites with Tourcoing (*q.v.*) to form a large industrial centre. The town's more important buildings and institutions include Saint-Martin church, dating from 1471 and restored in 1849; Notre Dame church (1816); the Hotel de Ville (1911) containing a collection of paintings by J. J. Weerts; the Chamber of Commerce (opened 1908); the National Higher School of the Textile Arts and Industries with attached museum containing paintings, sculptures and fabrics; the attractive Barbieux public park: the municipal sports centre and open-air school for boys and girls; and the swimming baths.

Roubaix has been called the Manchester of France. and has a universal reputation and market for its textiles. More than 200 establishments are engaged in the production of woolen, cotton and other fabrics, including spinning. wool combing. dyeing and weaving. There are also rubber and plastic factories. The tonn has a lively trade and is the centre of a network of road services

The prosperity of Roubaix had its origin in the charter granted in 1469 by Charles the Bold, duke of Burgundy, to Peter, lord of Roubaix and a descendant of the royal house of England. This charter permitted the citizens to dress all in wool. In the 18th century the town suffered from the jealousy of Lille. of nhich it was a dependency, and it nas not until the 19th century that its industries acquired importance. During World War I it was occupied by the Germans. and manufacture came to a standstill As the cotton spinning plants were mostly spared. its industry was restarted in 1919 with government aid and bank credits. It was again occupied by the Germans in 1940. After World War II the employers' and workers' associations formed co-operative organizations for professional guidance, health measures and housing. A bold housing policy assisted the construction after 1949 of more than 12.000 dwellings.

ROUBILLAC (ROUBILIAC), **LOUIS FRANÇOIS** (1705?–1762), probably the greatest sculptor at work in England during the 18th century, was born of French parentage at Lyons, probably in 1705. He was apprenticed to B. Permoser and later became assistant to Nicolas Coustou. He came to London about 1732 and was employed by Thomas Carter the elder. His first independent commission was the statue of Handel for Vauxhall gardens in 1737, and a year later he set up for himself in St. Martin's lane. In 1746 he carved the monument of the duke of Argyll in Westminster abbey, one of his greatest works, though

his more dramatic monument of Lady Elizabeth Nightingale in the same building is better known. Other works by him in the abbey include the monuments of Field-Marshal Wade, Admiral Warren and Handel. Outside London his most important monuments are those of Miss Myddleton at Wrexham, Denbighshire, Viscount Shannon at Walton-on-Thames, Surrey, and the duchess of Montagu at Warkton, Northamptonshire.

Roubillac's busts are unsurpassed, for he had the seeing eye as well as the skilled hand, and examples can be seen at Windsor castle, Wilton house, Wiltshire, Trinity college, Cambridge, and the National Portrait gallery, London. Statues by Roubillac include Sir Thomas Molyneux in Armagh cathedral, Lord President Forbes in the Advocates library, Edinburgh, and Sir Isaac h'ewton at Trinity college, Cambridge. G. Vertue, who knew Roubillac well, rightly described his works as "curious and excellent, with great skill and variety, picturesque, so light and easy, as painting." Roubillac died on Jan. 11, 1762, and was buried in the graveyard at St. Martin-in-the-Fields, London.

See K. A. Esdaile, The Life and Works of Louis *François* Roubiliac (1929); Rupert Gunnis (comp.), Dictionary of British *Sculptors 1660–1851* (1953). (R. Gs.)

ROUBLE. The rouble is the monetary unit of the U.S.S.R. It is divided into 100 kopecks. The par of exchange with sterling before World War I was: R.10 = *21s. 2d.* The main currency in circulation between 1863 and 1921 was credit notes issued by the state bank. Toward the end of the 19th century, these depreciated sharply in relation to gold. A law of 1897 stabilized the paper rouble at 66⅔ kopecks in gold. The credit note was maintained at this ratio until World War I.

Under the influence of war and revolution, followed by economic chaos, inflation developed at a terrific pace, and the value of the paper rouble fell catastrophically. In 1921, the Soviet government introduced the "new economic policy," one of the most important achievements of which was the creation of a stable monetary system and the restoration of the state bank. The monetary reform was accomplished in two stages. On Oct. 11, 1922, the state bank created a new currency—the *chervonetz*. The chervonetz was equal to ten prewar roubles, and its fine gold content was established at 7.74234 grams. The obligatory cover was established at 25% gold, platinum or stable foreign currency, and 75% in easily realizable commodities, short-term bills and other short-term bonds. Simultaneously, the old paper currency was maintained in circulation. As compared with the chervonetz, its value fell steadily. On March 10, 1924, the rate of redemption was defined at 50,000,000,000 roubles of the old denomination in one rouble in gold, *i.e.*, one chervonetz rouble. The depreciation of the old rouble created instability in the budget and in the entire economy. Between February and June 1924, a series of decrees was passed constituting the second phase of the monetary reform. The old Soviet rouble was withdrawn from circulation by means of an exchange on fixed rates against the new treasury roubles. The new rouble was made legal tender. The volume of issue of the treasury roubles was limited to no higher than 50% of the chervontsi in circulation. Toward the end of 1924, a ratio of ten new roubles to the chervonetz was established.

After the reform of 1924, the monetary system in the Soviet Union acquired a stable character. Although on several occasions (1926, 1928, 1930, 1933) the stepping-up in the issuing of notes for financing industrialization, collectivization and defense industry caused inflationary fluctuations of the rouble, on the whole, the monetary system remained unshaken and the Soviet government, through relatively speedy control measures, maintained the rate of the rouble. After the monetary reform, there was further established in the U.S.S.R. a system of stable deficitless budget. On April 1, 1936, after the devaluation of world currencies (the dollar and the pound), the Soviet government established the fine gold content of the rouble at 0.1776 grams. The strengthening of the economic system (monopoly of foreign trade, prohibition upon the export of currency, stabilization of the budget system, introduction of domestic checking accounts, strict regulation of the volume of merchandise and money in circulation), and, to a certain extent, the rapid growth of gold production, all contributed to the strengthening of the Soviet monetary system. The commissariat of finance periodically publishes the official foreign exchange rates, according to which it conducts payments on foreign trade. In order to arrest inflation which had developed in the U.S.S.R. during World War II, the Soviet government on Dec. 14, 1947, established a new currency; one new rouble was exchanged for ten roubles of the old currency. Under the revaluation of the rouble of Feb. 28. 1950, the rate of exchange was set at 11.20 to the pound sterling and 4.00 to the U.S. dollar. (See also RUSSIA: Finance.) (A. A. Y.; X.)

ROUEN, a city of France, capital of the *département* of Seine-Inférieure and the ancient capital of the province of Normandy, on the Seine, 87 mi. N.W. of Paris by rail. Pop. (1954) 113,062.

History.—*Ratuma* or *Ratumacos,* the Celtic name of Rouen, was modified by the Romans into Rotomagus, and by the writers of mediaeval Latin into *Rodomum,* of which the present name is a corruption. Under Caesar and the early emperors the town was the capital of the Veliocasses, and it did not attain to any eminence till it was made the centre of Lugdunensis Secunda at the close of the 3rd century, and later the seat of an archbishop. Rouen owed much to its first bishops—from St. Mello, the apostle of the region, who flourished about 260, to St. Remigius, who died in 772.

Under Louis le Débonnaire and his successors, the Normans several times sacked the city, but after the treaty of St. Clair-sur-Epte in 912, Rouen became the capital of Normandy and the principal residence of the dukes. In 1087 William the Conqueror, mortally wounded at Mantes, died at Rouen. The succeeding Norman kings of England tended to neglect Rouen in favour of Caen and afternards of Poitiers, Le Mans and Angers; but it maintained an importance during the 12th century indicated by the building of churches. notably that of St. Ouen. In 1203 Rouen was the scene of the murder of Arthur of Brittany at the hands of King John of England. Ostensibly to avenge the crime, Philip Augustus invaded Normandy and entered the capital unopposed. Philip confirmed its communal privileges and built a new castle.

A convention between the merchants of Rouen and those of Paris relating to the navigation of the Seine was followed by treaties with London, with the Hanseatic towns and with Flanders and Champagne. In 1302 the seat of the exchequer or sovereign court, afterward the parlement, of Normandy was definitely fixed at Rouen. A stubborn resistance was offered to Henry V of England, who after a long siege occupied the town in 1419. The prosperity of Rouen continued under the English domination, and during this period the greater part of the church of St. Ouen was constructed. In 1431 Joan of Arc was tried and burned in the city. From that year the French began attempts to recapture the town, which they did in 1449. During the close of the 15th century and the first half of the 16th, Rouen was a metropolis of art and taste. In 1562 the town was sacked by the Protestants. This did not prevent the league from gaining so firm a footing there that Henry IV besieged it unsuccessfully, and only obtained entrance after his abjuration. The revocation of the edict of Nantes in 1685 greatly affected Rouen. During the Franco-German War the city was occupied by the invaders from Dec. 1870 till July 1871. In World War I Rouen played a great part in the supporting organization of the British army in France.

Monuments. — The old city lies on the north bank of the river in an amphitheatre formed by the hills which border the Seine valley. It is surrounded by the suburbs of Martainville, St. Hilaire, Beauvoisine, Bouvreuil and Cauchoise; 2½ mi. east is the industrial town of Darnétal (pop. 1946, 7,604). and on the opposite bank of the Seine is the manufacturing suburb of St. Sever with the industrial towns of Sotteville (pop. 18.469) and Le Petit Quevilly (pop. 19,9j3) in its immediate neighbourhood. Finally in the centre of the river. northeast of St. Sever, is the Ile Lacroix, which also forms part of Rouen. Communication across the Seine is maintained by three bridges. including a *pont transbordeur,* or moving platform, slung between tuo lofty columns and propelled by electricity. The central point of the old town is the Place de *l'Hôtel* de *Ville,* occupied by the church of St. Ouen and the *hôtel* de *ville.*

The cathedral was built on the site of a previous cathedral

burned in 1200, and its construction lasted from the beginning of the 13th century (lateral doors of the west portal), to the beginning of the 16th century (Tour de Beurre). The western façade belongs, as a whole, to the Flamboyant style. But the northern tower, the Tour St. Romain, is in the main of the 12th century, its upper stage having been added later. The southern tower, the Tour de Beurre, so named because funds for its building were given in return for the permission to eat butter in Lent, is of a type essentially Norman, and consists of a square tower pierced by high mullioned windows and surmounted by a low, octagonal structure, with a balustrade and pinnacles. These contrasted towers are the most striking feature of the wide facade. The portals of the transept are each flanked by two towers. The most remarkable part of the interior is the Lady Chapel (1302–20) behind the choir with the tombs (1518–25) of Cardinal Georges d'Amboise and his nephew, the statuary of which is of the finest Renaissance workmanship. Behind the cathedral is the archiepiscopal palace, a building of the 14th and 15th centuries.

St. Ouen was formerly the church of an abbey dating to the Roman period and reorganized by Archbishop St. Ouen in the 7th century. It was founded in 1318 in place of a Romanesque church which previously occupied the site and of which the only relic is the chapel in the south transept. The choir alone was built in the 14th century. The nave of the church belongs to the 15th century, by the end of which the central tower with its octagonal lantern and four flanking turrets had been erected. The western façade dates from 1846. The large stained glass windows are of the 14th, 15th and 16th centuries. The Portail des Marmousets, the entrance to the south transept. has a projecting porch, behind and above which rises a magnificent rose window. The north facade has no entrance.

The church of St. Maclou, behind the cathedral, begun in 1437 and finished early in the 16th century, is a rich example of the Flamboyant style, and has a rich portal with five arched openings. It is celebrated for carving attributed to Jean Goujon.

The church of St. Vincent, near the Seine, is a building of the 16th century and contains very fine stained-glass windows at the end of the north aisle, by Engrand and Jean le Prince, artists of Beauvais. The stained glass in the churches of St. Patrice (16th century) and St. Godar (late 15th century) is inferior only to that of St. Vincent.

The most important secular building in Rouen is the Palais de Justice, once the seat of the exchequer and, later, of the *parlement* of Normandy. It is in the late Gothic style and consists of a main building flanked by two wings. The left wing, known as the Salle des Procureurs, was built in 1493 and has a lofty barrel-roof of timber. South of the Palais de Justice is the Porte de la Grosse Horloge, an arcade spanning the street and surmounted by a large clock of the 15th century with two dials. The Tour de la Grosse Horloge, which rises beside the arcade, was built in 1389. The tower known as the Tour de Jeanne d'Arc was the scene of her trial, and is all that remains of the castle built by Philip Augustus early in the 13th century. The Porte Guillaume-Lion, opening on to the Quai de Paris, is a handsome gateway built in 1749.

Rouen is the seat of an archbishop, a prefect, a court of appeal and a court of assizes, and headquarters of the III. army corps. Its public institutions also include a tribunal of first instance, tribunals of commerce and of maritime commerce, a board of trade-arbitrators and a chamber of commerce. All the more important nations have consulates in the city.

Rouen is an important centre for trade in wines, spirits, grain and cattle. Grain, wine, coal, timber and petroleum are leading imports. Besides its manufactures it exports plaster and sand. The principal industries of Rouen and its district are the spinning and weaving of cotton, notably the manufacture of *rouenneries* (cotton fabric woven with dyed yarn), the printing and dyeing of the manufactured material and the spinning of other fibres; shipbuilding and the making of various articles of clothing are also carried on, and there are distilleries, petroleum-refineries and manufactories of chemicals, soap, machinery, carding-combs and brushes. The port of Rouen comprises the marine docks below the Boïeldieu bridge, and the river dock, the timber dock and the petroleum dock above it. There is also a repairing dock. The Seine is tidal beyond Rouen. The port is accessible for ships drawing 19½ to 25 ft. of water, and its quays have a superficial area of about 194 acres. It is served by the lines of the Orleans, the Ouest-État and the Northern railways and these, in addition to the waterways connected with the Seine. make Rouen a convenient centre for the distribution of merchandise.

See A. Chervel, *Histoire de Rouen pendant l'époque communale* (Rouen, 1843); id., *Sous la domination anglaise* (Rouen, 1840); C. Enlart, *Rouen* (Paris, 1904); J. Levainville, *Rouen.*

ROUERGUE, formerly a French province, derives its name from the Gallic tribe of the *Rutheni.* It was bounded on the north by Auvergne, on the south and south-west by Languedoc, on the east by Gévaudan and the Cévennes and on the west by Quercy. It included (1) the county of Rodez, (2) Haute and Basse Marche; and it was divided between the dioceses of Rodez and Vabres (province d'Alby after this province had been separated from that of Bourges in 1678). Administratively it formed first a *sénéchaussée,* dependent on Languedoc (capital Villefranche, in the Basse Marche), and later it was attached to the military governments of Guienne and Gascony. It was then part of the departments of Aveyron and of Tarn-et-Garonne.

ROUGE: *see* COSMETICS.

ROUGET DE LISLE, CLAUDE JOSEPH (1760–1836), French author, was born on May 10, 1760, at Lons-le-Saunier, Jura. He entered the army as an engineer, and attained the rank of captain.

The song which has immortalized him, the *Marseillaise,* was composed at Strasbourg, where Rouget de Lisle was quartered in April 1792. He wrote both words and music in a fit of patriotic excitement after a public dinner. The piece was at first called *Chant de guerre de l'armée du Rhin,* and only received its name of *Marseillaise* from its adoption by the Provencal volunteers whom Barbaroux introduced into Paris. and who were prominent in the storming of the Tuileries. The author was a moderate republican, and was cashiered and thrown into prison; but the counterrevolution set him at liberty. He died at Choisy-le-Roi, Seine et Oise, on June 26, 1836.

Rouget de Lisle published *Chants français* (1825), in which he set to music 50 songs by various authors. His *Essais en vers et en prose* (1797) contains the *Marseillaise,* a prose tale of the sentimental kind called *Adélaïde et Monville* and some occasional poems.

See J. Tiersot, *Histoire de la Marseillaise: oeuvres musicales de Rouget de Lisle (1915).*

ROUGH CAST, in architecture, a term used in the United States for the rougher textures of a stucco surface, obtained either by throwing on the finished coat in unequal masses or by sprinkling over the finished surface, while still wet, a coating of coloured pebbles, tile or brick fragments, marble chips, etc. In England the term is used for any stucco or mortar combined with gravel and sand, employed as the finishing coat of covering plaster over a rough structure of masonry and frequently decorated by the addition of pebbles of different colours or even small pieces of glass.

ROUHER, EUGÈNE (1814–1884), French statesman, was born at Riom. Puy-de-Dôme, on Nov. 30. 1814. He entered the chamber in his native *département* in 1848, and held office from 1849, with short intervals, until 1852. Napoleon entrusted him (1851) with the redaction of the new constitution, and made him (1852) vice-president of the council of state. As minister of agriculture, commerce and public works, from 1855 onward. he greatly improved the economic situation of France, and in 1863 became minister president. He resigned in 1867, but shortly afterward resumed office as finance minister.

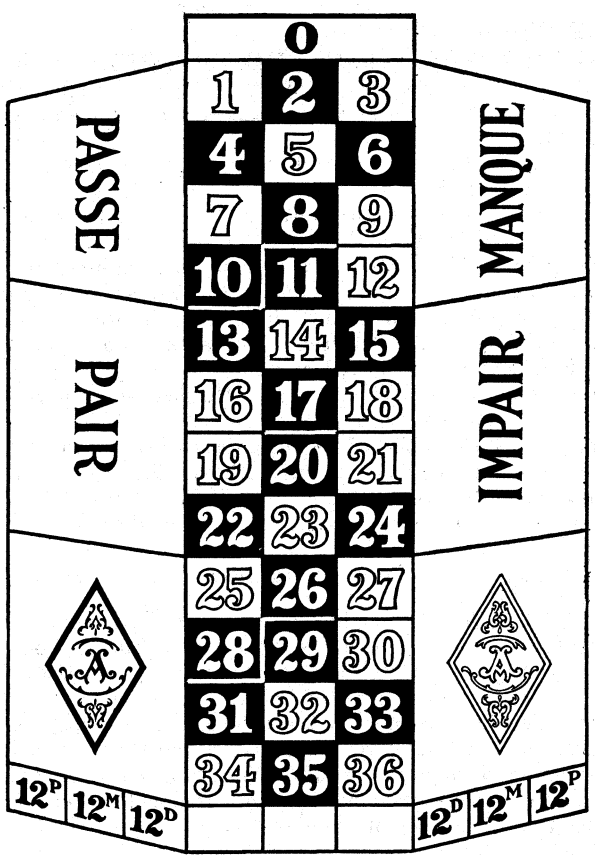
After the fall of the empire he fled to England, but returned to France in 1872 to work for the interests of the prince imperial. He returned to the chamber as deputy of Ajaccio and later sat for Riom. After the death of the prince imperial, Rouher supported the claims of Prince Napoleon, son of the former king Jerome. He died on Feb. 3. 1884.

See the references under NAPOLEON III.

ROULERS, a town in the province of West Flanders, Belgium. 13 mi. N.W. of Courtrai. on the Mandel. Its Flemish name is Roeselare. Pop. (1955 est.) 33,966. Its weavers were already famous in the 11th–12th centuries and the neighbourhood cultivates flax. Lace, carpets and linen are manufactured.

ROULETTE, a gambling game of French origin, is universally played in the gambling casinos of Europe, North and South America, but is especially identified with the gaming rooms at Monte Carlo. It is not very old as games go. dating probably from the late 18th to the early 19th century. In the C.S. its popularity as a heavy-bet game has been superseded by other games, notably craps (see DICE). Roulette is a banking game, and all bets must be placed against the bank (proprietor of the game); as a rule it. is very fairly conducted. As many players may bet as can get near the table.

Equipment for roulette, which is very expensive. consists of an oblong table, 15 ft. × 20 ft., in which is mounted a compartmented wheel and one or two layouts, usually enameled on green cloth. However. small portable wheels of relatively low price are available for home use.



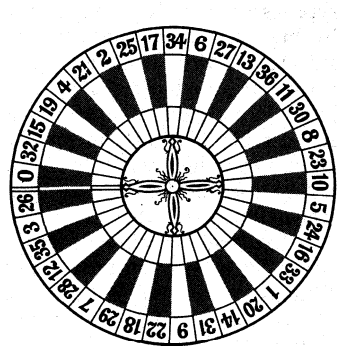
ROULETTE CLOTH OR LAYOUT, EUROPEAN STYLE

The original French terminology of roulette has been replaced in English-speaking countries by equivalent English terms, and both will be used in this description.

The game begins when the *tourneur,* one of the croupiers in attendance nho represents the house. calls. "Make your bets, gentlemen" (Faites *vos* jeux, *messieurs*), whereupon players indicate on the layout their bets on the number, or classification of number, they hope will win. The *tourneur,* by spinning the cross handle at the top, then spins the wheel in one direction and in contrarotation spins a small ivory ball which. when the wheel slows down sufficiently, falls into one of the numbered compartments and thus designates the winning number. When it appears to the *tourneur* that the ball will soon come to rest, he calls. "The betting is closed" (Rzen ne *va plus*). So bet may be placed thereafter.

When the ball rests, the *tourneur* announces the winning number and whether it is red or black, odd or even, low (1 to 18) or high (19 to 36). The bank pays winning bets at the established rates (see below) and collects all losing bets, which a croupier gathers in with a rake.

For a ninning bet on red (rouge), black (*noir*), high (passe), low (*manque*), even (pair) or odd (intpair), the bank pays "even money"—the amount of the bet. For a winning bet on the dozen (1 to 12. 13 to 24 or 25 to 361 in which the number falls, the bank pays 2 to 1; these bets are indicated on the layout as 12^{p}, 12^{m} and 12^{d} (respectively, *première, milieu* and dernibre *douzaine*). Likewise, the bank pays 2 to 1 for a ninning bet on the column in which the number lies.



ROULETTE WHEEL

Numbers above the white panels are red, other numbers are black, except zero, which is green

Other bets, and the rate of payment when they win, are: (1) on a single number (en *plein*), 35 to 1; (2) on two numbers (*á cheval*), if either wins, 17 to 1. Such a bet is placed on the line betneen the two numbers. A bet may be made *à* cheval on two adjacent columns, or two adjacent dozens, and pays $\frac{1}{2}$ to 1. (3) On three numbers (*transversale pleine*), if any wins, 11 to 1. A bet on 4, 5 or 6 would be indicated by placing a coin on the line between 4 and passe, or between 6 and *manque*. (4) On four numbers (en *carré*), if any wins. 8 to 1. A bet on the point of intersection between 14, 15, 17 and 18 would be a bet on those four numbers. (5) On six numbers (*transversale* six), if any wins, 5 to 1. A bet on the point of intersection between 15, 18 and *impair* would be a bet on 13, 14, 15, 16, 17 and 18.

The zero may be played *à* cheval with any adjoining number; or en *carré* (but called *quatre premièrs*) with 1, 2 and 3; or in combination with 1 and 2, or with 2 and 3.

The advantage of the bank arises when the zero shows. Only bets on the zero en *plein* or in combination with 1, 2 and 3 are paid; all other bets are collected. Thus the bank should win one part in 37, or 2.7%, of all bets made against it.

At Monte Carlo, and in a few other casinos, this advantage is reduced by almost one-half in the case of the even-money bets. When the zero occurs, the player who placed such a bet may let the bank take half his bet (partager) or may have the bet put "in prison," to be decided on the next coup; whereon if the player wins he may withdraw his bet but is not paid in any case.

In distinction to this practice, many American gambling houses have roulette wheels with 38 compartments including both a zero and a double zero (00) and if either of them occurs all bets are taken except those involving the winning zero. The bank's advantage is thus increased to 5.26%. Finally, some wheels (seldom seen except in the smaller U.S. gambling houses and in Mexico) have 0.00 and an eagle bird (equivalent to a third zero), giving the bank an advantage of 3 parts in 39, or 7.7%.

There is little possibility of the exercise of skill in roulette, though a certain judgment is advisable in betting; it would, for example, be unwise to place a bet on red and also on the number 17, which is black, for if one bet wins the other must lose.

Many books have been published on roulette. most of them being devoted to demonstration that no system of betting can be expected to win against the bank in the long run.

ROUNDERS, an old English ball game played in Tudor times but not attaining any popularity before 1800. According to some, it was the immediate ancestor of baseball (*q.v.*), but there are several differences, the most radical being that the ball can be hit in any direction. Rounders in its primitive form was more of a romp than a regular game, but it experienced a big revival

in Scotland and England in *1889* when two governing bodies were formed, the National Rounders association of Liverpool and vicinity and the Scottish Rounders association, and later with the Gloucester and Ling Physical Education association when rules similar to the modern ones were drawn up. The National Rounders association was formed in *1943*.

A hard ball weighing 2½ oz to 3 oz. and measuring 73 in. in circumference is used; the rule by which a runner could be put out by hitting him with a thrown ball was abandoned, A round wooden stick is used measuring not more than 6¾ in. round the thickest part. not more than *18* in. in length and not more than *13* oz. in weight.

The playing field is marked in an elongated diamond, home base being at one end and first, second and third post at the other points, while fourth post is situated on the line of third post toward home and 28 ft. from the former, the sides of the diamond being 39½ ft. The bowler stands in a square in the centre of the diamond and tosses the ball to the batsman who must take a good ball, *i.e.,* one that passes over the batting square and is below the head and above the knee; three consecutive bad bowls scores half a rounder for the batsman. The batsman must run to first and second post and so on to home base and scores one rounder if he does so after hitting the ball or half a rounder if he does so without hitting the ball and without having an opposing player touch the post to which he is running. He can be put out if: the ball is caught on the fly; the post to which he is running is stumped or he is touched with the ball while it is in the possession of the fielder. If the ball is hit behind the home base, he can run only to first post until the ball has been thrown across the front line of the batting square or a continuation of it.

Nine players constitute a side and two innings apiece are played in each match. The back stop is placed directly behind the batsman; first, second, third and fourth basemen are stationed at the posts and there are three deep fielders. Two umpires preside over the game: (1) a batter's umpire who attends to balls that are too high or too low, first and fourth post catchers and to the bowler who must have both feet in the square during the bowling action and (2) a bowler's umpire who attends to balls that are too near or too wide and to second and third posts.

ROUNDHEAD, a term applied to the adherents of the parliamentary party in England during the great Civil War. Some of the Puritans, but by no means all, wore the hair closely cropped round the head, and there was thus an obvious contrast between them and the men of fashion with their long ringlets. "Roundhead" appears to have been first used as a term of derision toward the end of *1641* when the debates in parliament on the Bishops Exclusion Bill were causing riots at Westminster. John Rushworth *(Historical Collections)* is more precise. According to him the word was first used on Dec. 27, *1641,* by a disbanded officer named David Hide, who during a riot is reported to have drawn his sword and said he would "cut the throats of those round-headed dogs that bawled against bishops." Baxter ascribes the origin of the term to a remark made by Queen Henrietta Maria at the trial of Strafford; referring to Pym, she asked who the round-headed man was. The name remained in use until after the revolution of *1688*.

ROUND TABLE, the celebrated board of King Arthur (*q.v.*) around which he and his knights sat. The origin of the myth is obscure, and certainly cannot be said to have been yet settled; it has been traced by various scholars to Welsh, Irish and Breton sources. The story was at first independent of the Arthurian saga. The first known trace of it in an Arthurian connection is in the *Brut* of Wace (*q.v.*) in the reign of Henry II. Here the allusion is brief. Arthur made a round table at which, because of its shape, none of the "barons" could claim precedence over others. The size is left indefinite. Wace adds that the "Bretons" told many stories about the table. and this seems to indicate that there was a mass of Breton (or British) tradition about it known to Wace—a probability strengthened by the fact that elsewhere Wace shows signs of knowing many stories unknown to his main authority, Geoffrey of Monmouth (*q.v.*).

Half a century later, Layamon adds considerably to our information, and it would seem almost certain that he was drawing on Welsh tradition. There had been a great slaughter of the knights through disputes as to who should be greatest; and a Cornish carpenter, hearing of it, told Arthur he would make him a table at which more than 1,600 men could sit, so that there would be no more quarrels for the place of honour. Yet Arthur would be able to carry it about with him. It was finished in four weeks. "This," added Layamon, repeating Wace's words, "was the table about which the Britons told many tales." There is no reason to think that the poet was inventing; he makes more than 30 additions to Wace, some of which are certainly not original; nor does he show anywhere a trace of inventive capacity.

Addition to the Legend.—Later romancists added many details. For example, the "Diot" *Perceval (see* PERCEVAL) tells that just after Arthur's coronation Merlin related past history. A round table, said the seer, had been made for Joseph of Arimathaea (*q.v.*) and a new one for Arthur's father, Uther Pendragon; let the king use it for his knights; without it the Romans could not be overcome. The table was also brought into connection with the Holy Grail *(see* GRAIL, THE HOLY) and with the "Siege Perilous" which is so prominent a feature in the Percival legend, and became ultimately an inseparable adjunct of the Arthurian cycle.

Whether the tale reached Wace and Layamon directly from Wales or from Brittany, it is certainly of ancient Celtic origin. A round table seems to have been a feature of primitive Celtic life; a circular form was the rule in primitive Irish architecture, and the primitive Celtic watch house, both in Gaul and in Ireland, was circular. To what this in its turn is to be traced is more doubtful; it is not unlikely that it arose from sun worship or possibly *(cf.* the "four weeks") from the moon. The magical character of the table seems, again, to be of a peculiarly Celtic cast; it resembles that of the enchanted bowls, bushels and horns so often found in Irish and Welsh saga; and it was inevitable that when the attractive force of the Arthurian legend was felt, such a magical table should be assigned to the king along with his sword, boat, lance and shield.

The Table at Winchester.—The famous round table fixed in the wall of the great hall at Winchester is certainly of considerable antiquity. It is a tabletop *18* ft. in diameter, divided into *25* sectors, one for the king and one for each of the knights (whose number had long been reduced from the 1,600 of Layamon). The present colouring of the sections (green and white successively) is due to Henry VIII. Hardying, in his *Chronicle (c.* 1436), differing slightly from *Perceval,* says that it is the very table made by Joseph of Arimathea for the brethren of the Grail, which was transferred to Winchester by Uther to comfort Ygerne. He speaks in a manner that implies a great age for this table.

A good summary of the story is given by A. C. L. Brown in *Harvard* Studies in *Philology and Literature,* vol. vii, where other authorities are referred to. Incidental references will be found in the various works on different aspects of the Arthurian saga. (E. E. K.)

ROUNDWORM, the common name for the parasitic worms of the genus *Ascaris,* and especially for *A. lumbricoides,* which occurs in the intestine of man. Closely allied species inhabit the pig and the horse. The name roundworm is often extended to include all members of the class Nematoda (*q.v.*).

ROUS, FRANCIS (1579–1659), English Puritan, was born at Dittisham, in Devon, in 1579, and educated at Oxford (Broadgates hall, afterward Pembroke college) and at Leyden. For several years he lived in seclusion in Cornwall and occupied himself with theological studies. producing among other books *The Arte of Happines (1619)* and *Testis Veritatis,* a reply to Richard Montagu's *Appello Caesarem.* He entered parliament in 1625 as member for Truro, and continued to represent that or some neighbouring west country constituency in such parliaments as were summoned till his death. He obtained many offices under the Commonwealth, among them that of provost of Eton college. At first a presbyterian. he afterward joined the independents. In 1657 he was made a lord of parliament. He died at Acton in Jan. 1658–59. The subjective cast of his piety is reflected in his *Mystical Marriage . . . Betweene a Soule and Her Saviour* (1635), but he is best known by his metrical version of the Psalms, *(1643).*

ROUSSEAU, HENRI JULIEN FELIX, called LE DOUANIER (1844–1910), French painter famous for his "primitive" or untutored style, was born at Laval, Mayenne, May 20, *1844.*

A soldier in Mexico in 1862–66, he served intermittently till 1871 when he entered the customs service (hence the title Le Douanier or customs official). but retired in 1885, at the age of 41, to professionally adopt his hobby of painting. He then began to exhibit portraits, still-life paintings and views of Paris and its people, such as "Un Soir de Carnaval" (1886; L. E. Stern collection, U.S.), "Myself: Portrait-Landscape" (1890; Prague) and "The Centenary of Independence" (1892). These are deceptively simple and arranged frontally with clear contours separating fields of even, solid, often brilliant colour; but their strength lies in their wholehearted regard for the occasion they represent. Between 1886 and 1890 Rousseau exhibited 20 works at the Paris Salon des Indépendants and was attacked by critics both "advanced" and orthodox. But he was defended by Degas and Toulouse-Lautrec, and later was befriended by Picasso and A. Jarry, the author. After 1890 his work became less static and included jungle and animal scenes. Some landscape studies are unexpectedly tentative and atmospheric; large works such as the "Sleeping Gipsy" (1897; Museum of Modern Art, New York city) have an imaginative, remote lyricism which later recommended them to Jean Cocteau and Guillaume Apollinaire. Some of Rousseau's best work dates from 1900 on; it includes "Jungle With a Lion" (1904–06; Museum of Modern Art) and "The Cart of Père Juniet" (1908; Mme. Paul Guillaume's collection, Paris). He died in Paris, Sept. 4. 1910.

ROUSSEAU, JEAN BAPTISTE (1671–1741), French poet. who enjoyed great renown in his day, was born at Paris on April 6. 1671. of humble parentage. As a young man he began to move in literary circles and received some encouragement from Boileau. Rousseau wrote a number of plays of which *Le Flatteur* (1696) was the most successful, several cantatas (an original genre in France), and many poems, some of them serious and reflective. like his ode to La Fare, others frivolous and even scandalous. The libellous character of some of these involved him more than once in trouble. In 1712, because of defamatory couplets which he denied having written, he was expelled from France. He remained in exile until his death in Brussels on March 16 or 17, 1741. He was a member of the Acadkmie des Inscriptions.

See H. A. Grubbs, *Jean-Baptiste Rousseau* (1941). (RT. S.)

ROUSSEAU, JEAN JACQUES (1712–1778). French-Swiss moralist whose writings are among the most influential of the 18th century in political and social theory and literature. was born at Geneva. Switz., on June 28, 1712. His ancestor. Didier Rousseau, a convert to Calvinism. had taken refuge in Geneva in the middle of the 16th century, and Jean Jacques belonged to the fifth generation of his descendants. His mother. Suzanne *(nde* Bernard) died a few days after his birth. His father Isaac. a watchmaker. an affectionate but irritable and feckless man. looked after him until he was ten years old, giving him no regular schooling but encouraging a precocious taste for Plutarch and for novels. In June 1722, Isaac. after a quarrel with a fellow citizen in which he was probably the aggressor. had to take refuge at Nyon in the Pays de Vaud, leaving his two sons. Jean Jacques and his elder brother Franqois. in charge of their maternal uncle. Gabriel Bernard. Franqois was apprenticed. and Jean Jacques sent to live with Pastor J. J. Lambercier at Bossey. near Geneva. He returned from Bossey to his uncle in Geneva in Sept. 1724 and was soon afterward set to work as a clerk to J. L. Masseron. a notary. with whom he stayed only a fen. n-eeks. In April 1725 he was apprenticed to Abel du Commun. an engraver, with whom he stayed until he fled from Geneva on March 14. 1728. In his *Confessions* Rousseau complains that du Commun treated him brutally, though he admits his own idleness. untruthfulness and dishonesty. which he ascribes to his master's harshness. He felt humiliated and was made rebellious by his master's punishment. but earlier Mlle. Lambercier at Bossey had had to give up beating him because he had enjoyed it too much. Fierce resectment at injustice and masochism were both strong motives with him.

His Formative Years.—From Geneva Rousseau found his way to Annecy, in Savoy, to Mme. de Warens (Louise Éléonore de Latour de Pil), who had left her husband and become a convert to Catholicism, receiving a pension from the king of Sardinia for helping to make other converts. Through Mme. de Warens he was sent to Turin, to the Hospice of the Holy Spirit, which he entered on April 12, 1728. According to the register of the hospice, he abjured the heresies of Calvin on April 21 and was received into the Roman Catholic Church two days later, though in the *Confessions* he describes a much longer resistance to conversion and says that he finally succumbed in order to escape the pernicious moral atmosphere of the hospice. For several months he stayed in Turin working as an engraver and as a lackey. He returned to Mme, de Warens in the spring of 1729 and was sent for a time to a Lazarist seminary, but he soon found that he had no vocation for the priesthood and later went to the choir school attached to the cathedral at Annecy. In 1730, while Mme. de Warens was away in Paris, he returned to Switzerland and set himself up at Lausanne and then at Neuchâtel as a teacher of music (though he had no proper qualifications). After several months of vagabondage and precarious living, he was sent to Paris in the autumn of 1731 by the marquis de Bonac (Jean Louis d'Usson), the French ambassador at Soleure. This first visit to Paris led to nothing and lasted only a few days. Rousseau returned on foot to Mme. de Warens, who by this time had moved to Chambéry. She offered herself to him as his mistress in 1733, saying that she thought it would be good for him, and he accepted. though he continued to feel himself more her son than her lover and knew that he would have to share her favours with her steward: Claude Anet. Except for occasional journeys to Switzerland and France, he stayed with her. either at Chambéry or in the country nearby, at a house called Les Charmettes. until 1740. It was during this time that he became a diligent but unsystematic reader and that he first began to write.

In May 1740 he went to tutor the children of M. de Mably, *prévôt des maréchaux* for the Lyonnais and elder brother of Etienne Bonnot de Condillac and of the abbé de Mably; but when his year's contract was over he was not asked to stay. He returned for a time to Mme. de Warens. who received him coolly. Though she had begun to grow tired of him several years before and had acquired a new and younger lover, she had not lost all maternal solicitude for him. especially as he had been ill several times since 1731. He suffered from uraemia and his condition grew worse as he grew older. In 1742 he went to Paris for the second time. taking with him a new scheme of musical notation, an opera, a comedy and a collection of poems.

Rousseau went to Paris seeking fame and fortune, but for years had no success. He was invited tc read his scheme for musical notation to the Académie des Sciences but nothing came of it; he spent a year. from Sept. 1743 to Aug. 1744, in Venice as secretary to the French ambassador there, but quarrelled so violently with his master that he had to leave; he wrote a ballet, *Les Muses galantes,* which was eventually performed at the Opéra in Paris in 1747 but attracted only slight notice. On two occasions he was so deeply humiliated that he fell ill: once, when he declared his love to Mme. Dupin, his protectress, who left the room and for a long time forbade him her house; and again, when an opera, with words by Voltaire and music by J. P. Rameau, whose score he had been asked to alter for a shortened version, was played at Versailles without his name being mentioned. Rousseau. at this period. devoted more of his energies to music and to the writing of comedies than to social and political matters. He lived in frequent, but not intimate or equal, contact with the rich and the famous. His best, perhaps his only true. friend was Denis Diderot, who commissioned him to write the articles on music for the *Encyclopkdie.* He dined once a week at the Hôtel du Panier Fleuri with Diderot and with Condillac, and these were the happiest moments of an otherwise awkward and anxious period of his life. Early in 1745, soon after his return from Venice. he had taken up with Thérèse le Vasseur. a servant at the hotel where he was staying. He kept her for the rest of his life and had five children by her, who were all sent to a foundling hospital. In disposing of his children in this way, he was doing what was often done at that time and felt, so he says in the *Confessions,* no

shame. He was poor and sickly and for years was heartlessly exploited by Thérèse's mother and some of her relatives. Later, after he had become famous as a moralist, he was morbidly sensitive about his abandoned children, and the emotional burden of a guilt that he would not admit helped in the end to put him out of his mind.

The Citizen and the Moralist (1749–62).—One day, toward the end of July 1749, Rousseau, on his way to Vincennes to visit Diderot who was in prison there, read in the *Mercure de France* that the academy of Dijon offered a prize for an essay on the question whether the revival of the sciences and the arts had helped to corrupt or to purify morals. Rousseau tells us, in his *Confessions,* that when he read that notice "he saw another world and became another man" and that when he reached Diderot he was so excited as to be almost delirious. Diderot urged him to compete for the prize and even (so some of his friends said afterward) suggested to Rousseau that he should treat the subject in an unexpected way, arguing that science and art had corrupted morals. Whether or not it was from Diderot that Rousseau got this idea (and Diderot never said that it was), the idea itself was more congenial to Rousseau than to his friend. It released emotions pent up within him for years. The result of the competition was announced in July 1750, and Rousseau got the first prize. His essay, subsequently known under the abbreviated title of *Discours sur les sciences et les arts,* was published at the end of the year, and he found himself famous. In his *Confessions,* he gives the impression that, soon after the publication of his first *Discours,* he decided abruptly to change his way of life, to give up all hope of fortune and of worldly success and always to remain poor and independent. Though the change was more gradual and hesitant than he afterward remembered it, it is true that he never, for all his fame, was a worldly success. He never sought riches and never allowed himself to be lionized. He resented both indifference and flattery; he wanted to be emotionally independent of others and yet felt a need for their affection and respect. Self-absorbed as he was, he demanded that others should feel toward him as he, though he did not know it, was incapable of feeling toward them.

Whatever he did, whether it was liked or disliked, seemed, for the rest of his life, to add to his fame. In 1752 he composed an operatic intermezzo, *Le Devin du village,* which was first performed at Fontainebleau before the court. Next day he was to be presented to Louis XV to receive a pension, but he refused to go, partly from pride, partly from shyness and partly because of his peculiar illness. That same year his comedy, *Narcisse,* was played at the Théâtre Français. Next year, the *Lettre sur la musique française,* in which he expressed a strong preference for Italian over French music, was widely and hotly discussed. In the summer of 1754 he visited his native Geneva, was well received there, became once again a Protestant and recovered his citizen rights. Early in 1755, he published his *Discours sur l'origine de l'inégalité parmi les hommes,* greatly superior in thought and argument to his first *Discours,* though the academy of Dijon, for which it was also written, gave it no prize; in the same year appeared also his *Discours sur l'économie politique* commissioned by Diderot for the *Encyclopédie.* In April 1756 he moved out of Paris to the Hermitage, a house near Montmorency placed at his disposal by Mme. d'Épinay (*q.v.*), where he began work on his novel *Julie, ou la nouvelle Héloïse.* It was there that he fell genuinely in love, perhaps for the first time in his life. with Mme. d'Houdetot (*q.v.*), nearly 20 years his junior and herself in love with another man. Rousseau did not expect her to return his love but believed in her friendship; and his passion for her deeply affected his novel, which is as remarkable for eloquence and for subtlety as for the artificiality and even absurdity of many of its situations and attitudes. It is the novel of a man who has dreamed of love more than he has known it. Out of this unfortunate passion there arose misunderstandings with Mme. d'Épinay, which quickly, other causes supervening, led Rousseau to break with her, with her lover Baron von Grimm and (saddest of all) with Diderot. It was then that he first gave obvious signs of the persecution mania from which he suffered, intermittently but with increasing severity, for the rest of his life.

In Dec. 1757 Rousseau moved to Montlouis, another house near Montmorency, at which he stayed until June 1762. This shelter he owed to the maréchal-duc de Luxembourg (Charles François de Montmorency) and his wife, who were among the most devoted, tactful and considerate of his powerful friends. At Montlouis he spent his most productive and in some ways his happiest years. In Oct. 1758, there appeared his *Lettre à M. d'Alembert,* commonly known as the *Lettre sur les spectacles,* against the establishment of a theatre at Geneva. This letter, criticizing an article on Geneva written by d'Alembert for the *Encyclopédie,* marks his final breach with the coterie of the philosophers and contains in its preface a quotation from *Ecclesiasticus* deeply offensive to Diderot. At Montmorency he completed *La Nouvelle Héloïse,* which was published early in 1761 and was immediately and enormously popular. Du *contrat social* appeared in April 1762 and the first copies of *Émile,* a long treatise on education in the form of a novel, a month later.

Exile in Switzerland and in England (1762–67).—Both *Du contrat social* and *Émile,* which contains a long profession of faith (the "Profession de foi du vicaire savoyard") equally critical of dogmatic Christianity and of philosophical scepticism, were offensive to authority. An order was issued for Rousseau's arrest, and he was obliged to leave France, taking refuge at Môtiers-Travers in the territory of Neuchâtel, which was then subject to the king of Prussia and governed in Frederick II's name by Marshal Keith, a Jacobite in the Prussian service. Rousseau stayed at Mbtiers from July 1762 to Sept. 1765 and found a good friend and protector in Marshal Keith. In 1763 he published the *Lettre à Christophe de Beaumont,* an attack on the archbishop of Paris who had condemned *Émile.* In the same year he renounced his citizenship of Geneva; and in 1764 he wrote the *Lettres écrites de la montagne* in reply to J. B. Tronchin, procurator-general of the Genevan republic, who had written in defense of the executive council of Geneva (the Petit Conseil) for having ordered the burning of *Émile* and of *Du contrat social.* In Sept. 1764 Rousseau was asked by Matteo Buttafuoco, a friend of Pasquale Paoli, to prepare a constitution for Corsica. He never completed the task, though he did make a rough draft (published in 1861 under the title *Projet de constitution pour la Corse*). On the last day of 1764 he received an anonymous pamphlet, *Le Sentiment des citoyens,* attacking him savagely as a hypocrite, a heartless father and an ungrateful friend. It was written by Voltaire, and its effect on Rousseau was terrible. When he recovered from the shock, he decided to write his autobiography, the *Confessions.*

The *Lettres écrites de la montagne* had turned the Protestant pastors, both in Geneva and in Neuchâtel, even more strongly against him, and in Sept. 1765, after some stones had been thrown at his house, he decided to leave Môtiers, though he still enjoyed Frederick II's protection. He fled to the fle Saint Pierre, on Bernese territory, but was not allowed to stay there and eventually, on the advice of Keith and other friends and with the help of David Hume, went to England, where he arrived in Jan. 1766. Well received in London, he moved in March to Wootton in Derbyshire, to a house let to him at a nominal rent by Richard Davenport, a friend of Hume. Even before his departure for Wootton, he had heard that a mocking letter to himself, supposedly from the king of Prussia but actually written by Horace Walpole, was being circulated in Paris; and he had suspected that Hume might have had a hand in it. At Wootton his suspicions grew stronger, causing him to receive equivocally an offer of a pension from George III, which he badly needed but was loath to obtain through the good offices of Hume, whom he now believed to be a false friend, won over by the "philosophers" into a conspiracy to ruin his name. This fear and Hume's excessive zeal to justify himself publicly at Rousseau's expense led to an open quarrel between them, which excited and amused all cultivated Europe. In May 1767 Rousseau, by this time more than a little mad, fled in panic from England to France, where the order for his arrest, issued in 1762, was still unrevoked.

His Last Years in France (1767–78).—Rousseau went first to stay for a few days with the marquis de Mirabeau (Victor Riqueti)

and then, taking the name of M. Renou, moved to the Chbteau de Trye, near Gisors, lent to him by the prince de Conti (Louis François de Bourbon). While he was at Trye his *Dictionnaire de musique,* which he had been working on for years, was at last published. He left Trye abruptly in June 1768, again in a panic, going first to Bourgoin near Lyon, where he married Thérèse le Vasseur, and then to Monquin, whence he moved to Paris early in the summer of 1770, to defend himself against the "conspirators." There he resumed his own name, but was left unmolested. To justify himself to the world, he read extracts from his *Confessions* in various Parisian drawing rooms until, at the request of Mme. d'Épinay, he was asked by the police to desist. In 1771 Count Wielhorski begged him to advise the Poles how they should reform their institutions, and he wrote the *Considkrations sur le gouvernement de la Pologne,* first published in 1782. Still eager to justify himself, he wrote the *Dialogues: Rousseau juge de Jean-Jacques.* He tried in Dec. 1775 to place his work under God's protection on the high altar of Notre Dame, but was prevented from doing so by the iron grille surrounding the choir, which he had never noticed on his many previous visits to the great church. It seemed to him that God had joined his persecutors, and for a time he was in despair. During the last two years of his life, his madness weighed less heavily on him, and he wrote the most serene and the most delicate of his works, the *Rêveries du promeneur solitaire,* which contains descriptions of nature and of man's feelings for nature of a wonderful freshness and beauty. In May 1778 he moved to Ermenonville, to a pavilion on the estate of the marquis René de Girardin, where he died, about six weeks later, on July 2. He was buried on the fle des Peupliers in the lake at Ermenonville, but his remains were moved to Paris to the Panthéon during the Revolution.

The Importance of his **Writings.**—Rousseau was not a systematic, lucid or rigorous thinker. It has been said that he was not original, that he discovered nothing but merely gave passionate and eloquent expression to other men's ideas. This denial of his originality is probably based on a misunderstanding of the nature of political and social theory. Most of the ideas that the political and social theorist uses have a long ancestry; they do not, of course, always remain the same, for they change imperceptibly as a result of continual discussion and argument. Reputations for originality are more often made by giving names to ideas already coming into circulation than by inventing new ideas. In this way the fruits of many men's thinking are appropriated by the more lucid and articulate among them. The man with a gift for sorting out ideas is apt to be the first to see what new expressions are needed to prevent confusion between old and new ways of thinking, but his having this gift is not enough to make him original. New ideas do not usually get their distinctive names until some time after they have begun to circulate, and so their novelty is often not noticed even by the people who are influenced by them. Rousseau invented no new expressions. not even "the general will," for that phrase was used before him by Diderot. But that does not mean that he lacked originality. On the contrary, he had it in much larger measure than he appeared to have it, for he put a great deal of new wine into old bottles. To the utilitarian and to the positivist he has appeared extravagant and superficial, but the idealist has seen much more that is admirable in him.

Rousseau, when he said that man is naturally good, did not mean that the savage is better than the civilized man; he meant only to deny original sin and to suggest that, if civilized man is now feeble, anxious and unhappy, it is not because of any evil inherent in him but because his social environment is not suited to his nature. Man is born neither good nor bad, but with certain potentialities which he strives to realize; and if he is thwarted, he acquires ambitions and needs which cannot satisfy him, either because they are in themselves insatiable or because they bring him into conflict with other men. Rousseau saw a close connection between the structure of society and the moral and psychological condition of the individual. It seemed to him that society in his own day necessarily set men against one another and also frustrated and bewildered them, preventing them from acquiring the self-knowledge and self-mastery which alone bring happiness and social harmony. He believed that discord and moral confusion are the ineluctable consequences of excessive inequalities of wealth and of the size and complexity of modem society. Man cannot be happy and free, cannot be on good terms with himself and with his neighbours, except in a community simple enough to be intelligible to him and small enough to enable him to take a full and equal part in its government. In a vast community with a complex economy, there must be hierarchy and inequality, and the great majority of passive citizens are inevitably controlled and exploited by the active few. No community, he thought, can be united and strong unless its members share certain fundamental beliefs and loyalties, and men cannot be truly free unless they are emotionally secure, which they will be only in a society of equals, where each man depends, not on the caprice or protection of some person or group stronger or wealthier than himself, but on a system of laws which are the same for all men and are made by the entire community. Though his ideal of the small and simple egalitarian state could not be realized, even in his own day, his criticism of contemporary society went deep. He taught men to think about society and the individual in new ways and to put new questions; and it is here, much more than in the specific solutions which he offered, that his originality and his insight are revealed.

If the reader is not to get a distorted and misleading conception of Rousseau's social and political theory, the *Discours* on inequality, which discusses the probable origins of actual society and government, and *Émile,* which lays down a plan of education to make an ordinary child morally and intellectually self-reliant and therefore well-balanced and free, must be studied as carefully as *Du contrat social,* which only describes an ideal. This outsider, this misfit, this vagabond, who felt that evil was thrust upon him by his position in a society where he could not feel spiritually at home, was the first and the most eloquent of the great radical thinkers, of the men who protested that modem society is rotten even at its roots. That he was sometimes, indeed often, one-sided and extravagant is obvious; what is less obvious, but not less true, is that he was also many-sided and equally passionate on every side. No one insisted more than he did that a people are made what they are by their customs and prejudices, that faith is stronger than reason, that freedom is the fruit of a moral self-discipline as slowly acquired as it is easily lost. He never preached revolution, believing that victims of oppression are so much debased by servitude as to be made unfit for freedom and have therefore to be brought gradually to it, as invalids to food too strong for their stomachs. In the *Projet de constitution pour la Corse* and in the *Considkrations sur le gouvernement de la Pologne,* we find a cautious Rousseau, respectful of fact and of tradition. His influence was revolutionary, not because he approved of violence or of precipitate change (for that he never did), but because he felt the evils of society passionately and denounced them so eloquently that he brought the established order into hatred and contempt. He did not attack religious obscurantism or make fun of the church as Voltaire and the "philosophers" did; on the contrary, his attitude to Christianity was equivocal, for he was as much attracted by it as a moral and spiritual force as he was critical of some of its dogmas and practices. He was more dangerous than the "philosophers" precisely because he struck at the social order rather than at the old religions and because so many of the motives and emotions to which he appealed were of Christian inspiration. Among the great writers of his century, he had most in common, in his notion of society (though not in his feelings toward the established social order), with the baron de Montesquieu and with Edmund Burke (*qq.v.*); and in his notion of freedom and what constitutes the moral dignity of man, with Kant (*q.v.*).

Rousseau was much more than a moralist and a social and political theorist; he was also one of the greatest writers of his age, and the most eloquent. By his descriptions of the beauties of nature, by his idealization of romantic love and also of chastity and of fidelity as virtues that go naturally with that love, by his acute and delicate analysis of introspective moods, by his revealing and essentially sincere (though not always accurate) autobiography,

he greatly enriched European literature. There was about his writings a warmth, an intimacy and a freshness not common in his day. and to these qualities, above all others, he owed his immense contemporary reputation, which was second to none, not even to Voltaire's.

BIBLIOGRAPHY.—Collected editions of Rousseau's works appeared in the 18th and 19th centuries: *See* those by V. D. Musset-Pathay, 22 vol. (1819–25), and by P. R. Augis, 27 vol. (1825), and the Hachette editions, 8 vol. (1856–58) and 13 vol. (1863 and later issues). For his letters *see* the *Correspondence générale,* ed. by *T*. Duiour and P. P. Plan, 21 vol. (1924–53). *See* further L. Ducros. *Jean-Jacques Rousseau,* 3 vol. (1908–18); H. Hoffding, *Jean Jacques Rousseau and his Philosophy,* Eng. trans. (1930); P. M. Wright, *The Meaning of Rousseau* (1929); C. W. Hendel, *Jean-Jacques Rousseau, Moralist,* 2 vol. (1934); E. Cassirer, *The Question of Jean-Jacques Rousseau,* Eng. trans. (1934); and R. Derathe, *Jean Jacques Rousseau et la science politique de son temps* and *Le Rationalisme de Jean Jacques Rousseau* (both 1950).

(J. Pz.).

ROUSSEAU, (PIERRE ÉTIENNE) THEODORE (1812–1867), French landscape painter. a leading member of the Barbizon (*q.v.*) school. was born in Paris on April 15, 1812. The son of a tailor, he began his artistic education in 1826 under a relative, Pau de St. Martin, and then studied landscape with Charles Remond and figure painting with Guillon Lethiilre. Rémond and Lethiilre mere painters in the neoclassical tradition, but the formation of Rousseau's style was based rather on extensive study of such painters as Claude Lorrain, Jan van Goyen, Jacob van Ruisdael and Karel du Jardin.

After a visit to the Auvergne in 1830. he first exhibited at the Salon in 1831, then again in 1833 ("Shores of Granville") and 1831 ("Edge of the Wood, Compiègne," which earned him a third class medal).

In 1836 Rousseau's big work, "Descent of Cattle," resulting from a visit to the Jura mountains, was rejected by the Salon, as were all his entries during the next seven years. He was however vigorously defended by Etienne Thoré and was intimate with such painters as Ary Scheffer. N. V. Diaz and Jules Dupré.

Rousseau first visited the Fontainebleau area in 1833 and, in the following decade, finally settled at Barbizon, where eventually he became intimate with J. F. Millet. Unlike Millet. Rousseau continued to travel widely throughout France in search of subjects. In 1848. with the changes governing the composition of the Salon jury, Rousseau was elected a member, and in the same year received a state commission. Official recognition of his work increased so that he was well represented in the International exhibition of 18jj and became president of the fine art jury for the Exposition of 1867. He died at Barbizon on Dec. 22, 1867.

Rousseau's reaction against the neoclassical landscape puts him midway between the romantics and the realists. He made studies direct from nature ("The Valley of St. Vincent," National gallery, London), but his exhibition pictures were developed over long periods in the studio ("The Marsh in the Landes." Louvre, Paris, begun in 1844 but not exhibited until 1853). A traditional procedure of preparation in grisaille, with 'colour added in the later stages, was used for this painting. Comparison of "Edge of the Forest at Fontainebleau; Sunset" (Louvre) with the nearly identical composition of "A Glade in the Forest of Fontainebleau" (Wallace collection, London) suggests a willful reorganization of nature in the manner of the Dutch tradition and somewhat at variance with the intense analysis of appearances to be found in such works as "Oak at Fontainebleau."

(R. A. Dy.)

ROUSSEAU DE LA ROTTIÈRE, JEAN SIMÉON (b. 1747), French decorative painter, was the youngest son of Jules Antoine Rousseau, "sculpteur du Roi." He studied at the Académie Royale in 1768, winning the medal given to the best painter of the quarter. He appears, with his brother Jules Hugues, to have been employed by his father for the decorative work executed by the family at Versailles. Many of the attributions are fairly determined by dates, Jules Antoine Rousseau having been at work at Versailles for years before the birth of his famous son. There can be little doubt that the "Bains du Roi." the "Salon de la Méridienne," part of the bedchamber of Madame Adelaïde and the "Garde-robe of Louis XVI" were shared in by Rousseau de la Rottière. His most individual and most famous undertaking was, however, the decoration of the lovely "Boudoir de Madame de Sévilly," purchased for the Victoria and Albert museum in 1869.

There is no information as to Rousseau's later life. The last known mention of him is in 1792.

ROUSSEL, ALBERT (1869–1937), French composer, was born at Tourcoing on April 5, 1869. He left the navy in 1894 to study music in Paris, and in 1902 became professor at the Schola Cantorum. The delightful *Rustiques* (1904–06), the first symphony *Le Poème de la Forêt* (1904–06) and the charming ballet *Le Festin de l'Araignée* (1912) were all manifestly the work of a gifted composer. The *Divertissement* (piano and wind instruments, 1906), *Evocations,* three symphonic poems, one with chorus (1910–11), the orchestral prelude *Pour une Fête de Printemps* (1920), the second symphony (op. 23. 1919–20) and the opera-ballet *Padmâvati* (1923) are among his other works.

ROUSSILLON, a former province of France. corresponding geographically to the fertile plain bounded by the eastern Pyrenees. the Corbières and the Mediterranean and to the modern *département* of Pyrenees-Orientales (*q.v.*). It derives its name from a Roman town, Ruscino, near Perpignan, the later capital. It formed part of the Roman province of Narbonensis and. in the jth century. of the Visigothic kingdom that extended over Spain and Aquitaine. Even after the defeat of Xlaric II at Vouillé (507) and the loss of Aquitaine, Roussillon long remained in Visigothic hands, as did the rest of Septimania (from the lower Rhône to the Pyrenees). Only after being overrun by the Arabs, from 719 to 759, was it occupied by the Franks. Under Charlemagne it was incorporated in the Marca Hispanica, but in 86j Charles the Bald detached the districts around Narbonne. Henceforth Roussillon was closely linked with Catalonia and looked mostly southward to Barcelona. In 873 Joffre the Hairy, count of Barcelona. killed the Frankish count, occupied the country and gave it to his brother Miron, who was the head of a line of hereditary counts that lasted until 1172, when Gerard II left his inheritance to the count of Barcelona. King Alphonso II of Aragon. Yet it remained legally part of the French kingdom till 1258, when, by the treaty of Corbeil. Louis IX surrendered it with the countship of Barcelona to James I of Aragon. Under Aragonese rule the province was prosperous; Collioure. the port of Perpignan. became a centre of Mediterranean trade. From 1276 to 1344 Roussillon was part of the ephemeral kingdom of Majorca created by James I in favour of his younger son, James, and the new state had Perpignan as its capital. But in the 1jth century the French king became interested in Roussillon. and in 1462. by the treaty of Bayonne, Louis XI promised to help John II of Aragon against the rebellious Catalans and was to occupy the castles of Perpignan and Collioure as a security for the reimbursement of his expenses. In fact he had the whole of Roussillon and Cerdagne occupied and annexed to France in 1463. French rule was most unpopular, and Roussillon revolted in 1472, but after two sieges (1473 and 1475) Perpignan was retaken by the French and the country subdued. Still, in 1493 by the treaty of Barcelona. Charles VIII gave it back to Ferdinand of Aragon to win his good will for the Italian campaign. However, in 1639 and in 1641 (when Catalonia revolted against Spain) the French invaded Roussillon; Perpignan was taken after a long siege (Jan.–Sept. 1642), and the treaty of the Pyrenees (1659) secured Roussillon and half of Cerdagne to the French crown. During the revolutionary wars, Roussillon was for a short time invaded by a Spanish army (1793–94). The 19th century was marked by the steady growth of left-wing opinion and by a complete transformation of agriculture which made the country a rich producer of early vegetables and fruits, as well as of wines.

(F. Cr.)

ROUTLEDGE, GEORGE (1812–1888), English publisher, was born at Brampton in Cumberland on Sept. 23, 1812. He started in business for himself as a bookseller in London in 1836, and as a publisher in 1843. He was a pioneer of cheap classics; the shilling volumes called the "Railway Library" were a success, including as they did *Uncle* Tom's Cabin. He also published in popular form writings of Washington Irving. James Fenimore Cooper. Edward Bulu-er-Lytton and Benjamin Disraeli. A branch of Routledge's publishing business was established in New York in 1854. Routledge died in London on Dec. 13, 1888.

ROUVIER, MAURICE (1842–1911). French statesman, was born at Aix on April 17, 1842. He supported Léon Gambetta's candidature at Marseilles in 1867, and in 1870 he founded an anti-imperial journal, *L'Egalité*. In July 1871 he was returned to the national assembly for Marseilles at a by-election. He became a recognized authority on finance, and repeatedly served on the budget commission as reporter or president. In 1881 he joined Gambetta's cabinet as minister of commerce and the colonies, and in the 1883–85 cabinet of Jules Ferry he held the same office. He became premier and minister of finance on May 31, 1887, with the support of the moderate republican groups, the Radicals holding aloof in support of Gen. Georges Boulanger, who began a violent agitation against the government. Then came the scandal of the decorations in ahich Pres. François Grévy's son-in-law Daniel Wilson figured, and the Rouvier cabinet fell Rouvier was minister of finance in a succession of ministries between 1889 and 1893.

He was driven out of office by the Panamá scandals; in 1902, after nearly ten years of exclusion from office, he joined the Radical cabinet of Combes; and on the fall of the Combes ministry in Jan. 1905 he became premier. with Theophile Delcassé at the head of the foreign office. Delcasse, reproached with imprudence in the Morocco affair (see ECROPE: History), resigned, and the prime minister took over foreign affairs and came to an agreement with the German government. His ministry fell in 1906 over questions connected with the Separation law. Rouvier died at Neuilly on June 7, 1911.

ROUX, PIERRE PAUL EMILE (1853–1933), French bacteriologist, was born at Confolens. Charente, on Dec. 17, 1853. He studied medicine, and obtained an appointment to the faculty of medicine in Paris, which he held from 1874 to 1878. He then worked for ten years in Louis Pasteur's laboratory. before being appointed to a post in the Pasteur institute. He was director of the institute from 1904 to 1918.

Roux did a great deal of research in collaboration with Pasteur, and studied the treatment of infectious diseases, including hydrophobia. He studied anthrax in conjunction with Pasteur and Charles Edouard Chamberland, and produced vaccines against this disease. He was associated with the Swiss bacteriologist Alexandre Yersin in the study of the diphtheria bacillus and its toxins. With Emil von Behring he introduced the use of an antitoxin in diphtheria. He made a famous communication on this subject to the International Congress of Medicine at Budapest, Hung., in 1894. He claimed antitoxin as of value prophylactically and as a remedy. Figaro opened a public subscription and in a few weeks more than 1,000,000 fr. rolled in. The money was devoted to the preparation and distribution of diphtheria antitoxin by the Pasteur institute.

See *Lancet,* vol. 225, p. 1124 (1933).

ROUYN, a mining city in northwest Quebec, Can., on Lake Osisko, on the Canadian National and Nipissing Central railways, 340 mi. N.W. of Montreal and 320 mi. N. of Toronto. Pop. (1951) 14,633; with its twin city of Noranda (immediately adjoining but under separate administration) the 1951 population totalled 24,305, compared with 13,346 in 1941. The rapid expansion from raw bush in 1923 to modern urban development was a result of the discovery of minerals and the completion in 1927 of a branch of the Canadian National railway. Rouyn lies east, and is on the continuation of the mineral-bearing rocks of the Porcupine gold district and the Cobalt silver district of Ontario. Its chief industry is copper-gold production, and the Noranda mine (with capital expenditure of more than $12,000,000 by mid-century on smelter and concentrator equipment) is the most important in the Rouyn area. It ships copper anodes to Montreal for refining. (C. CY.)

ROVERETO, a town of the province of Trento. Italy, 15 mi. by rail southwest of the town of that name. Pop. (1951) 22,642 (commune). Built on the left bank of the Xdige. in the widest portion of the valley, it is divided into two parts by the Leno torrent. Save in the newer quarter of the town, the streets are narrow and crooked, one being named after the most distinguished native of the place, Antonio Rosmini-Serbati (*q.v.*). The finest church is that of Sta. Maria del Carmine, the old 14th-century church now serving as a sacristy to that built from 1678 to 1750. The church of San Marco dates from the 15th century, and so do the municipal palace and the savings bank. The town is dominated by the castle (containing a war museum), which was reconstructed in 1492 by the Venetians, after it had been burned in 1487 by the count of Tirol. It was very much damaged in World War I, but its industries (silk, cotton. gloves, paper, metals, etc.) later revived.

In 1132 the emperor Lothair found the passage of the gorge above the site of the town barred by a castle, which he took and gave to one of his Teutonic followers, the ancestor of the Castelbarco family. The first record of the town dates from 1154. In 1411 it was taken by the Venetians. In 1509 the town gave itself voluntarily to the emperor Maximilian, to whom it was ceded formally by Venice in 1517, and next year incorporated with Tirol.

ROVIGNO, a seaport of Italy, in Istria, 23 mi. N.N.W. of Pola by rail. Pop. (1936) 9,035 (town), 10,028 (commune). It is on the west coast of Istria. and possesses a cathedral. built on the summit of Monte di Sant' Eufemia. Its campanile, built after the model of the famous campanile in Venice, is crowned with a bronze statue of St. Eufemia, the patron saint of the town, whose remains are preserved in the church. In the neighbourhood are vineyards and olive gardens. Rovigno is the principal centre of the local sardine fishery and cannery.

Rovigno is the ancient Arupenum or Rubinum. It became Venetian in 1283.

ROVIGO, town of Venetia, It., capital of the province of Rovigo. It stands between the lower Adige and the lower Po, 50 mi. S.W. of Venice by rail and 27 mi. S.S.W. of Padua, and on the Adigetto canal. 17 ft. above sea level. Pop. (1936) 14,561 (town), 39.954 (commune). It is a station on the line between Bologna and Padua. with branches to Legnago and Chioggia. The architecture of the town bears the stamp both of Yenetian and of Ferrarese influence. The finest church is the Madonna del Soccorso, an octagon with a lofty campanile. begun in 1594 by Francesco Zamberlan of Bassano, a pupil of Andrea Palladio. The town hall contains a library including some rare early editions and a fair picture gallery. The Palazzo Roncale is a fine Renaissance building by Sanmicheli (1555). Two towers of the mediaeval castle remain (920). Rovigo (Neo-Latin Rhodigium) is mentioned as Rodigo in 838.

ROVNO (Pol. ROWNE), a city of the Ukrainian S.S.R.. capital of Rovno oblast, on a tributary of the Goryn; formerly in Yolhynia province, Poland. Pop. (1931) 40,788. Though it never had the political importance of Luck or Ostrog, Rovno grew to be a larger town than either of these. It is an important railway junction, the centre of an agricultural district, near the Volhynian forests and in a region famous for its horses and cattle. It is on the famous route west from Kiev along which many Russian conquerors. Tatar raiders and foreign armies have passed. It is first mentioned in 1282, and formerly possessed a royal palace. It was taken by the U.S.S.R. in 1939 and by Germany in 1941, and was ceded to the U.S.S.R. in 1945.

ROVUMA, a river, about 500 mi. long, forming the boundary between Tanganyika territory and Portuguese East Africa. The lower Rovuma is formed by the junction of two branches of nearly equal importance, the longer. the Lujenda, coming from the southwest; the other. the Rovuma, from the west. Its source lies on a plateau of Archaean rocks 3.000 ft. high, east of Lake Nyasa. In its eastward course the Rovuma flows near the base of the escarpment of an arid plateau to the north, from

which direction the streams, which have cut themselves deep channels in the plateau edge, have almost all short courses. On the opposite bank the Rovuma receives, besides the Lujenda, the Msenga and Luchulingo, flowing in broad valleys running from south to north.

ROWAN, STEPHEN CLEGG (1808–1890), U.S. naval officer, was born near Dublin, Ire., Dec. 25, 1808, and brought to the United States at the age of ten. Becoming a midshipman in Feb. 1826, he circumnavigated the globe on his first cruise, in the "Vincennes," the first U.S. naval vessel to accomplish this feat. Rowan served in California with great distinction during the Mexican War, as executive officer of the "Cyane." In command of the steam sloop "Pawnee" in 1861, he participated in many of the early operations of the Civil War. He was at the capture of Hatteras inlet, and also at Roanoke Island (where he contributed his most distinguished service), Elizabeth City, Edenton and New Bern, N.C. Under the act of congress of July 16, 1862, he was promoted to captain and, as reward for gallantry, to commodore. In the "New Ironsides" he served in the campaign against Charleston, S.C., being under fire 14 times and having his flagship struck 164 times. He became a rear admiral July 25, 1866, vice-admiral Aug. 15, 1870, and was retired in 1889. Rowan's recollections of the Mexican War were published in the *Proceedings* of the Naval institute, vol. xiv (1888). He died in Washington, D.C., on March 31, 1890. (J. B. HN.)

ROWE, NICHOLAS (1674–1718), English dramatist and miscellaneous writer, was baptized at Little Barford in Bedfordshire on June 30, 1674. Nicholas Rowe was educated at Westminster school under Richard Busby. He became in 1688 a King's scholar, and entered the Middle Temple in 1691. On his father's death he became the master of an independent fortune. His first play, *The Ambitious Stepmother,* the scene of which is laid in Persepolis, was produced in 1700, and was followed in 1702 by *Tamerlane.* In this play the conqueror represented William III, and Louis XIV is denounced as Bajazet. It was for many years regularly acted on the anniversary of William's landing at Torbay. In *The Fair Penitent* (1703), an adaptation of Massinger and Field's *Fatal Dowry,* occurs the character of Lothario, whose name passed into current use as the equivalent of a rake. Calista is said to have suggested to Samuel Richardson the character of Clarissa Harlowe, as Lothario suggested Lovelace. Other plays are: *The Biter* (1704), *Ulysses* (1706), *The Royal Convert* (1707), *The Tragedy of Jane Shore* (1714) and *The Tragedy of Lady Jane Grey* (1715). In 1715 Rowe succeeded Nahum Tate as poet laureate. He died on Dec. 6, 1718.

Rowe was the first modern editor of Shakespeare. It is unfortunate that he based his text (6 vol., 1709) on the corrupt Fourth Folio, a course in which he was followed by later editors. We owe to him the preservation of a number of Shakespearean traditions, collected for him at Stratford by Thomas Betterton. These materials he used with considerable judgment in the memoir prefixed to the *Works.* He divided the play into acts and scenes on a reasonable method, noted the entrances and exits of the players, and prefixed a list of the dramatis personae to each play.

ROWELL, NEWTON WESLEY (1867–1941), Canadian jurist, was born on Nov. 1, 1867, in Middlesex county, Ont. He was called to the bar in 1891, and became head of a law firm in Toronto. He was elected to the Ontario legislative assembly for North Oxford in 1911, and from that year to 1917 was leader of the liberal opposition in the Ontario legislature. In Oct. 1917 he entered the federal government as president of the council and vice-chairman of the war committee of the cabinet, and was a member of the dominion lower house 1917–21. He was a member of the imperial war cabinet and Imperial War conference, 1918; representative at the International Labour conference at Washington, 1919; and a delegate to the first assembly of the League of Nations at Geneva. 1920, subsequently becoming vice-president of the League of Nations society in Canada. He wrote *The British Empire and World Peace* (1922) and *Canada,* a *Nation* (1923). He became a king's counsel in 1902, and was chief justice of Ontario, 1936–38. He died Nov. 22, 1941.

ROWING, the propulsion of a boat by means of oars in a succession of strokes. An oar is a shaft of wood with a rounded handle at one end and a blade at the other. The blade, a thin broadened surface, is either flat or slightly curved to offer increased resistance to the water (spoon oar). The loom or middle portion rests in a notch or rowlock or between tholepins on the gunwale or outrigger of the boat.

Racing oars are provided with leather buttons to prevent the oar from slipping outward. An oar may be regarded as a lever of the first order, the weight to be moved being the water and the fulcrum being the lock or tholepin; or as a lever of the second order, the weight to be moved being the boat, and the fulcrum the water pressing against the blade. Theoretically an oar functions at one and the same time in both capacities, but practically the lock or pin is the fulcrum, and the point at which the oar is buttoned determines the leverage and is a fundamental factor in the mechanics of rowing.

Rowing a boat and paddling a canoe (*q.v.*) have in common the propulsion of a floating craft through the water by muscular power applied to a lever, oar or paddle, in a succession of strokes. But in rowing, the oarsman, seated on a thwart, faces toward the stern and pulls the oar handle toward his body with the tholepin or oarlock as a fixed fulcrum, while in paddling a canoe the canoeist, generally in a kneeling position, faces toward the bow and throws forward the weight of his body, using one arm as a moving fulcrum.

In nautical use sculling is the propulsion of a boat by a single 'long oar worked to and fro from a notch in the stern transom, the blade being turned under water so as to give both projection and direction and acting like the tail of a fish. "Sweeps" and "sculls" are traditional terms for long and short oars.

As rowing developed into a form of competitive sport new terms were introduced and traditional terms acquired special meanings. Technically a stroke includes all the motions of an oarsman from the time he dips his oar for the catch to the time when it is again in the same position. The recovery is the part of the stroke during which the blade is in the air. Feathering is turning the blade by a wrist motion as it is lifted from the water and carrying it toward the bow in a nearly horizontal position until it is squared or bevelled (*i.e.,* the upper edge inclined slightly to the stern) for the next stroke. If the oarsman fails to clear the water with his blade on the recovery, because he has feathered too soon or too much or too little or because the boat has lurched down on his side, he "catches a crab."

Sculling as distinguished from its nautical sense is propelling a light racing craft with an oar in each hand. Oars so used are called sculls. "Singles" and "doubles" are popular entries in all regattas, and champion scullers have won wide acclaim. Rowing in the specialized sense is the art of propelling a racing craft by two or more oarsmen, each of whom handles a single oar, called a sweep. Paddling in boat racing parlance is rowing at reduced speed and at a leisurely pace. Sweep oarsmen row in pairs, fours, sixes (obsolete) and eights. Eights are numbered from the bow, and number eight is known as stroke.

The coxswain (cock, a small boat; swain as in boatswain) not only steers but gives the necessary commands and in a race calls for spurts and in a stern chase informs the captain or the stroke of the position of the competing boats.

History.— Rowing is now confined almost entirely to small boats and racing shells, but in ancient times it was the chief means of propelling vessels of war. As the size of vessels increased, sails gradually displaced oars, in both warships and merchant ships, but large galleys (*q.v.*) continued to be rowed in the Mediterranean until the 18th century. The oarsmen, generally captives of war or criminals, were chained to the benches, whence the term "galley slaves." Ancient galleys were rated according to the number of rowing banks or tiers of oars. The first recorded Roman fleet consisted of triremes (three-bank galleys). The earliest recorded amateur oarsmen were the islanders who entertained Ulysses on his return to Ithaca. Boat races probably formed part of Panathenaic and Isthmian festivals *(see* **BOAT**).

Virgil, in his account of the funeral games instituted by Aeneas for his father Anchises, gives a vivid description of a boat race:

The waiting crews are crowned with poplar wreaths;
Their naked shoulders glisten, moist with oil.
Ranged in a row, their arms stretched to the ***oars,***
All tense the starting signal they await.
Together at the trumpet's thrilling blast
Their bent arms churn the water into foam;
The sea gapes open by the oars up-torn;
With shouts and cheers of eager partisans
The woodlands ring, the sheltered beach rolls up
The sound, the hills re-echo with the din.

The earliest invasions of England were effected with the help of oars. The Britons. paddling wicker coracles. were no match for the legions that Caesar landed on their beachheads from his Roman triremes. Later the Anglo-Saxons, rowing and sailing across the North sea, and after them the Danes. entered the estuaries of the east coast. Sails are mentioned oftener than oars in Old English literature, and rowing had not yet become a sport that could be described in Shakespeare's words:

There be some sports are painful, and their labour
Delight in them sets off.

William of Malmesbury (c. 1080–*c.* 1143) records that Edgar the Peaceful was rowed in state on the river Dee by tributary kings, himself acting as coxsaain.

Boat Racing in England. — The Thames may fairly be called the cradle of rowing as a pastime and competitive sport in modern times. The nobility and gentry who had mansions on the banks of the river relied almost entirely on their elaborately fitted barges as a means of conveyance. As early as 1454 Sir John Norman mayor of London. "built a noble barge. and was rowed by watermen with silver oars." The lord mayor's procession by water to Westminster was an annual event until 1856. From the 15th century on, a considerable body of men lived by "the trade of rowing" as the statutes define the occupation of the watermen. In Queen Anne's time the river was still the highway of London, and there were about 10,000 licensed natermen on the tidal reaches of the Thames above London bridge. There were undoubtedly competitions betneen these in the 16th and 17th centuries. but the first race of which there is record is that for the "Doggett's Coat and Badge." Thomas Doggett. an Irish comedian, in 1715 offered an "orange livery with a badge representing Liberty to be rowed for by six watermen from London Bridge to Chelsea. annually on the same day, August 1. forever '' Except during World Wars I and II, the race was rowed regularly under the administration of the Fishmongers' company.

The first English regatta (Italian *regata,* originally a gondola race in Venice) took place on the Thames in 1775. Though there are numerous instances of professional matches at the beginning of the 19th century, the increased participation in boat racing by amateur oarsmen, after the Napoleonic mars. overshadowed professional rowing, nhich never had the vogue in England which it attained in the United States (see belou) Eton had a ten-oared boat, the "Monarch," and three eight-oars as early as 1811, but there is no record of any formal racing between amateur crews until 1817, the date of the founding of the Leander club. a hich rapidly gained the prestige it maintained from that time, as the oldest and most distinguished rowing club, whose eights, composed mainly of Oxford and Cambridge varsity oarsmen, upheld the highest standards of English rowing and sportsmanship.

The first race betneen Oxford and Cambridge was rowed in 1829 over a 2-mi. course at Henley, but it was not renewed until 1836. In 1845 the race nas rowed over a 4¼-mi. course from Putney to Mortlake, and in 1856 became an annual event except during World Wars I and II, attracting huge crowds along the banks of the river.

The Henley Royul Regatta. — The reaches of the Thames at Henley are not only the most beautiful along the river, but because of a straight stretch of more than a mile immediately below the town, offer an ideal course for racing shells.

The Henley Royal regatta established in 1839. has brought together not only the pick of English crews but. in the open events, has attracted competitors from Europe, America and Australia, Like other comparable events, it was interrupted by World Wars I and II. The course is 1 mi. 550 yd uith its finish near the town bridge in sheltered water, with sunny meadows and the shaded lawns of country houses on each side of the river. The races are rowed in the first week of July and furnish three days of continuous excitement to the spectators that throng the towpath and the enclosures at the finish. Because of the narrowness of the river and the many entries, the races are now rowed in heats of two or more entries. The course is protected by booms on each side. behind nhich spectators in punts and on houseboats moored along the banks obtain an unobstructed and close view of the competing, oarsmen. There have for many years been eight events, four of which are open to all amateurs; viz., the Grand Challenge cup for eight oars (the oldest. established in 1839), the Stewards' cup for fours, the Silver Goblets for pair-oars and the Diamond Sculls for single scullers. In 1939 a ninth event, the Double Sculls, was added. The Grand Challenge cup and the Diamond Sculls have long been the most coveted trophies in the rowing world.

Australia and Canada. — Rowing as a sport began in Tasmania about 1830, and by 1880 eight-oared races between crews representing the various states had become annual fixtures, held alternately in the six capital cities. Interuniversity rowing originated in 1870. In 1893 Old Blues from Oxford and Cambridge presented the magnificent Oxford and Cambridge cup. which thereafter was contested for by the six state universities and like the interstate contest is roned in each capital city by rotation.

In Canada, the 1870s were the heyday of the professional scullers. Purses ran from $50 upward to $1,000 and in international matches from £500 to £2 000. The outstanding norld champion was Edward Hanlan of Toronto. who defeated the best scullers of Canada, the U.S., England and Australia. As the distinction betueen professional and amateur rowing became more sharply drawn, following the lead of England, Canada developed numerous amateur rowing clubs, among them the famous Argonauts of Toronto. There is a Royal Canadian Henley regatta held annually at Port Dalhousie. Ont.

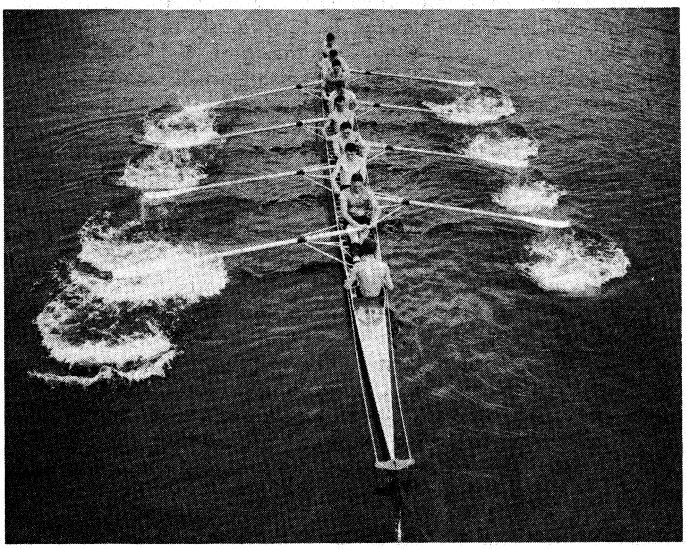
United States. — In the United States, as in England, rowing as a competitive sport originated in contests between "occupational" oarsmen. In 1811 and 1823 the ferrymen of Whitehall in Kew York city defeated their Long Island and Staten Island rivals on the Hudson. In 1823 they outrowed a cren of Thames watermen from the visiting British frigate "Hussar." in a four-mile race finishing at the Battery. This international race aroused tremendous local interest and the betting far exceeded the original stake of $1,000 offered by the captain of the "Hussar." Light keelless racing shells soon displaced the service boats of the early contests. The cleavage betneen amateur and professional, following the organization of the National Association of Amateur Oarsmen (N.A.A.O.) in 1872, inaugurated the golden age of professional sculling. Among the scullers who won national and international fame were James Hamill, J A. Ten Eyck, Wallace Ross. George Hosmer, Fred A Plaisted, Walter Bronn and Joshua Ward. The four Ward brothers had won an international race at Saratoga, N.Y., in 1871. Charles Courtney, who had begun as an amateur, turned professional and became the leading rival of the great Canadian Hanlan for championship honours and rewards. He was defeated by Hanlan in an exciting race at Lachine. Ont., in 1878. A return match for a purse of $6 000 at Lake Chautauqua was never rowed because Courtney's shell was found hacked in two on the morning of the race. This fiasco and the suspicion that betting and shady "deals" influenced the results of races were responsible for the decline of professional sculling in the United States. Courtney's later reputation was based on his striking success as coach of the Cornell crews, as was Ten Eyck's as coach of the Syracuse university crews for 35 years.

Amateur Clubs.—The first organization of amateur clubs was the Castle Garden Boat Club association of New Pork (1834); pleasure boating rather than racing nas the main interest of these early clubs, their membership being based on social rather than aquatic prestige. The Detroit Boat club. 1839, the oldest survivor of these early clubs. became one of the most important members of the N A A O and has entered crens in many regattas. In 1858 the boat clubs along the Schuylkill river. Philadelphia, Pa., were organized as the Schuylkill Navy. The boathouses of the

Navy stretch for nearly a quarter-mile along the banks of the river in Fairmount park, and until the silting up of the river, the Schuylkill course was one of the most popular and picturesque in the U S , during the years when Philadelphia was a centre of the two great English sports of cricket and roning. The first regatta to which only amateur oarsmen were admitted followed the organization of the N.A A O in 1872 and was rowed on the Schuylkill under the auspices of the Schuylkill Navy. The N.A.A.O. thereafter was the chief promoter of rowing among the amateur clubs, holding annual regattas for the championship of the United States in singles, doubles, quadruples, fours and eights.

Intercollegiate Rowing —The first formal intercollegiate boat race was rowed between Harvard and Yale in 1852 on Lake Winnepesaukee. With a few exceptions the race was rowed at four miles after 1876, at Nen London. The Yale-Harvard boat race is the oldest intercollegiate contest in the United States and antedates football by 17 years.

In the 1870s rowing became popular at a number of eastern colleges. In 1875 there was a regatta on Saratoga lake in which 13 colleges participated. When Yale and Harvard in 1878 went to New London for their dual race, Lake George became the scene of college races in fours in which Cornell or Pennsylvania generally won, Wesleyan. Bowdoin, Columbia and Princeton affording good competition. In 1887 eights took the place of fours, and, until the establishment of the Poughkeepsie regatta in 1895, these races



EWING GALLOWAY

AN EIGHT-OARED SHELL AND CREW. THE COXSWAIN SITS IN THE STERN FACING THE OARSMEN

were rowed at New London, Cayuga lake. Lake Minnetonka and one on the Delaware at Torresdale (1894). From the inauguration of the four-mile race at New London Harvard and Yale regarded this as the culmination of their rowing season. Though the record of the Cornell crews in the 1890s, the defeats of Yale and Harvard by Cornell and Princeton crews in the decade 1911–21, and the appearance of California and Washington and the U.S. Naval academy at Poughkeepsie challenged the leadership in college rowing that formerly could fairly be claimed by Harvard and Tale, the picturesqueness of the New London course, the tradition of the race and the prestige of Yale and Harvard among U S. universities continued to surround the Harvard-Yale boat race nith an interest analogous to that surrounding the Oxford-Cambridge race in England, the one rowed on the English Thames at London and the other on the United States Thames at New London. In 1895 Cornell. Columbia. Syracuse and Pennsylvania joined in a rowing association nith annual regattas open to invited crews at Poughkeepsie. The Poughkeepsie regatta continued not only to attract the foremost eastern college crews but also brought to the Hudson winning eights from the universities of California, Sl'ashington and Wisconsin and the United States Naval academy. Because of unsatisfactory water conditions and lack of interest, the Intercollegiate Rowing association (I.R.A.) regatta was moved to Marietta, O.. for 1950 and 1951. Bad water conditions there caused its removal to Onondaga lake. Syracuse, N.Y., where a satisfactory regatta, the 50th anniversity of the I.R.A., was held in 1952 and each year thereafter.

In contrast to the dual race at New London, Poughkeepsie has had as many as twelve starters in the interuniversity race. From 1895 to 191j Cornell led in number of victories. Thereafter the U.S. Naval academy, Washington. California and Cornell were the most frequent winners. Navy set a U.S. record in winning 31 successive races, including the Olympic championship in 1952 and three intercollegiate championships, from 1952 through 1955.

Rowing was established on the Pacific coast in 1899. The first race, in fours, uas between Washington and California. In 1907 eights displaced fours, and the Washington-California race. alternating between Lake Washington and the estuary at Oakland, Calif.. became the roning feature in the far west, and these crews began winning laurels at Poughkeepsie and in Olympic competitions. The favourable climatic conditions of the far west, permitting rowing in the open the year round. the abundance of material in the great state universities and the program of rowing developed in the western universities all contributed to the enviable record of the western crews.

Princeton had abandoned rowing in 1884, but, as a result of Andrew Carnegie's gift of a lake formed by the damming of two streams and affording $3\frac{1}{2}$ mi. of rowing water, resumed the sport in 1910. At this time the only races that college crews trained for uere the long-distance contests at New London and Poughkeepsie. Princeton's revival of rowing was responsible for the inauguration of a series of short-distance races, $1\frac{7}{8}$ to 2 mi., rowed on college waters and during term time, generally participated in by three crens and called triangular races. In 1912 the Childs cup race. next to the Yale and Harvard race the oldest intercollegiate fixture. was revived. This trophy had been given in 1879 by George W. Childs, the publisher of the *Philadelphia Ledger*, to be competed for by Columbia, Princeton and Pennsylvania, but the race had lapsed after 1884. In 1911 Princeton inaugurated intercollegiate rowing on Lake Carnegie with a triangular race between Yale, Cornell and Princeton, in which Princeton defeated Yale and came in as a close second to a fast Cornell crew that later won at Poughkeepsie. The Carnegie cup offered for this race in 1921 came into annual competition. Later races between Yale, Columbia and Pennsylvania for the Blackwell cup, between the U.S. Naval academy, Pennsylvania and Harvard for the Adams cup, between Harvard, Princeton and Massachusetts Institute of Technology for the Compton cup and between Navy. Cornell and Syracuse for the Goes cup became annual fixtures. All these races are alternately rowed on college waters, on Cayuga lake, Carnegie lake, the Charles river, the Housatonic river, the Schuylkill river and the Severn river at Annapolis, and before the close of the spring term. Rutgers, Boston university, Wisconsin, Dartmouth and Stanford are other colleges participating in the major regattas.

An annual regatta conducted by a group of smaller colleges under the name of the Dad Vail Rowing association, in honour of a former coach of Wisconsin, is participated in by Xmherst college, Boston university. Brown university, Dartmouth college. Florida Southern college, La Salle college. Marietta college, Rollins college, Rutgers university and the University of Tampa.

The increased interest in roning at the colleges led to the organization of lightneight crews averaging 150 lb. per man. Some of these crens made up in skill and speed for lack of weight, and in competing at the Royal Henley for the Thames Challenge cup defeated some of the best English college crews.

Roning became a popular sport among both public and private schools particularly by Kent school. Kent, Conn. U.S. schoolboy creus have non the Thames cup at Henley. There are various regattas especially for school crews and attracting numerous entries.

In 1902 the American Rowing association was formed to increase intercollegiate competition by means of short-distance races in the early season, concluding with an annual regatta at the

Henley distance of 1 mi. 550 yd. Thus this regatta became popularly known as the American Henley. This association, with the introduction of short-distance races. did a great deal to stimulate college rowing. It likewise had events at its annual regatta open for club crews who thereby matched their skill against college crews.

G.S. College Crews in Europe.—In 1869 Harvard challenged Oxford and Cambridge to a four-oared race on the Thames from Putney to Mortlake; Oxford accepted and won.

In the only other interuniversity race between English and Americans, Cambridge in 1906 defeated Harvard by about two lengths. There have been many U.S. entries at Henley. In 1878 a four from Columbia university won the Visitors' cup. In 1881 a Cornell four was defeated for the Stewards' cup, and in 1895 a Cornell eight lost to Trinity hall. Cambridge. In 1896 Leander beat a Yale crew coached by Bob Cook. In 1901 a University of Pennsylvania eight lost by a few seconds to Leander in the finals for the Grand Challenge cup. In 1914 the survivors in the finals for the Grand Challenge cup were Harvard and the Union Boat club of Boston, composed of former Harvard oarsmen; Harvard won, bringing the cup to the United States for the first time. Princeton in 1934 was defeated by Leander in the finals of the Grand Challenge; both crews broke the Henley record established in 1891. In 1939 and 1950 Harvard again brought the Grand Challenge cup to the U.S. and in 1955 it was won by the University of Pennsylvania's champion sprint eight. In 1957 Cornell defeated Yale in the first All-American final, breaking the course record. Princeton in 1930 and 1934 and Uale and Harvard in 1938 entered 150-lb. crews for the Thames cup. which was won by Kent school in 1933, 1938, 1947 and 1950, by Tabor academy in 1936, 1937 and 1939 (both schoolboy crews), and by the University of Pennsylvania in 1951 and 1952 and by M.I.T. in 1954 and 195j and Princeton in 1956 and 1957.

Strokes, Styles and Coaches.—Sweep rowing was early differentiated from sculling in England. The so-called "English stroke" was developed by Oxford and Cambridge oarsmen. As exemplified by the best Leander crews and described by Edmond Warre, provost of Eton (A Grammar of Rowing, Oxford, 1909), and R. C. Lehman of Cambridge (The Complete Oarsman, London, 1924), this stroke was based on early fixed-seat rowing, when body swing was the main source of power and the arms were used chiefly as connecting rods to transfer the weight of the body to the oar. When the sliding seat, an American invention, was introduced. the leg drive was added but the main stress was still on the body swing with shoulders carried well beyond the perpendicular at the finish. This required muscles which only years of practice could develop. The first challenge to this "orthodox" stroke came from a Cambridge student, Stephen Fairbairn, who had entered Jesus college from Australia in 1881 and as a member and coach of his college crews upset tradition by winning races in a style taboo to the "rigidly righteous" of the old school. Fairbairn (Rowing Notes; *Chats on* Rowing, Cambridge, 1934) emphasized leg drive and arm pull and considered smooth bladework more important than what he called the "showy style" of body work. If the proponents of the traditional stroke sometimes laid more emphasis on form than on speed, Fairbairn's stroke sacrificed form for speed.

The success of his and foreign crews was responsible for the adoption of innovations from abroad. such as the lengthened slide, the use of the swivel lock in place of tholepins and the seating of crews amidships in straight alignment instead of in the staggered order formerly used to increase leverage.

The British have devoted much time to the technical and theoretic aspects of rowing. A good exposition of the British system is G. C. Bourne's *A* Text-Book of Oarsmanship. R. C. Lehman, a, leading exponent of the British system, was in 1896 invited to coach the Harvard crews. To Yale in 1914 went Guy Nickalls as head coach, and to Pennsylvania his brother Vivian. Though all these men had brilliant records as oarsmen and coaches in England and stimulated interest in rowing at the universities they visited, the English system did not permanently strike root in the U.S. Many of the dons in the English universities assisted in coaching their college crews. Sir Leslie Stephen was an enthusiastic coach in his Oxford days. At Henley may frequently be seen on the towpath coaches who are equally at home among books and boats and who combine reading as a vocation with rowing as an avocation.

In the United States as in England the colleges first popularized rowing as a competitive amateur sport. The first college coaches were former professional scullers. Charles Courtney at Cornell, Ellis Ward at Pennsylvania. James Ten Eyck at Syracuse, Richard Glendon at Annapolis. William Haines at Harvard and M.I.T. were types of "professionals" who instilled into their charges principles of sportsmanship, besides rowing technique and strict conformity to training rules.

The stroke they taught was essentially a sculling stroke adapted to sweep rowing. The first attempt to introduce a stroke differentiated from sculling and based on the scientific principles of the English stroke was made by Robert Cook of Yale, who, as an undergraduate in 1881, when captain of his crew, went to England and studied the system prevailing at Oxford and Cambridge. The Yale crews of the next 20 years coached by him were noted both for speed and form. The "Bob Cook" stroke was characterized by a hard catch with squared shoulders, straight back, straight arms, quick hand shoot and slow slide on the recovery, length in the water and lower beat than the prevailing sculling strokes. After the Cornell experience at Henley in 1895, Courtney, always ready to experiment and improve both rigging and rowing, modified the short sculling stroke his crew had previously rowed, and in the Poughkeepsie regatta of 1896, in which both Yale and Harvard participated. it was difficult to distinguish Cornell from Yale.

In later years Courtney modified the hard catch, shortened the swing at the finish and developed the slow slide and run between strokes that enabled Cornell to defeat crews rowing a much higher stroke. The advocates of the lower stroke say, "If men were machines, the crew rowing the highest stroke would always win, but men are not machines and a lower stroke and smooth form conserve power." Richard Glendon at the U.S. Naval academy taught a stroke with exaggerated swing of the body at the finish. The fine physique of the midshipmen, combined with their finished watermanship, brought victories to this stroke at Poughkeepsie and in the Olympics. The nearest approach to what may be called an "American stroke" was made by Hiram Conibear and his pupils at the University of Washington. Conibear, himself not an oarsman, when appointed rowing coach at Washington in 1907, studied Yale, Cornell and Syracuse methods, and on his return became an expert technician. He developed at the University of Washington, aided by the Pocock brothers, expert builders and riggers of racing shells, a system that by the 1940s dominated college rowing east and west. Edward Leader at Yale, Thomas Bolles and Harvey Love at Harvard, Fred Spuhn and Delos Schoch at Princeton, Russell Callow at Pennsylvania and Navy, Harrison Sanford at Cornell, Walter Raney at Columbia, Gosta Eriksen and Loren Schoel at Syracuse, Norman Sonju at Wisconsin, Alvin Ulbrickson at Washington, Carroll Ebright at California, Robert Mock and James McMillin at Massachusetts Institute of Technology and Charles Logg at Rutgers were all products of the University of Washington and as coaches belonged to what fairly may be called the "Washington school" of rowing. As a matter of fact, there were only a few universities whose coaches were not former Washington oarsmen; viz., James Ten Eyck of Syracuse, Charles S. Walsh of the U.S. Naval academy, Hubert Glendon of Columbia, Allen W. Walz of Wisconsin and Iale, James Rathschmidt of Yale and Joseph W. Burk of Pennsylvania.

While in England college coaches are "invited" by the captains of crews or boat clubs, in the United States intercollegiate athletics became increasingly subject to faculty control, and coaches of major sports such as football and rowing are appointed by college authorities and considered part of the salaried staff of the institution.

Robert F. Herrick at Harvard, Averell Harriman and Mather Abbott at Yale, J. Duncan Spaeth and Gordon Sikes at Princeton and Father Frederick H. Sill at Kent acted as volunteer amateur coaches at their institutions; similar examples among the rowing

clubs could be noted. However, the system of salaried but otherwise nonprofessional coaches described above became prevalent in the United States.

Governing Bodies. — The first duty of the governing bodies for rowing in each nation is to establish an amateur rule specifying the qualifications necessary for anyone to engage in amateur rowing competition. The governing body's authority and rulings must be respected by the organizations and individuals participating in the sport, and it must have power to disqualify and suspend those who violate the amateur status or other rules prescribed for rowing competition.

It is also the responsibility of the national governing body in each nation to hold a championship regatta each year which shall be open to all classes that are eligible under the amateur rule. It is also the duty of the governing body, which in the U.S. is the Olympic Rowing committee, to conduct tryouts every four years to select those who are to compete in the international Olympic regatta.

The National Association of Amateur Oarsmen is the governing body in the U.S. for the clubs. For college rowing the Intercollegiate Rowing association and the Eastern Association of Rowing Colleges are the governing bodies in all regattas. In Canada it is the Canadian Association of Amateur Oarsmen, and in Great Britain it is the British Amateur Rowing association.

For international competition, the International Rowing federation, whose exact name is the Fédération International Societes d'Aviron (F.I.S.A.), is composed of the recognized national rowing organization in each nation. The International Rowing federation is the only organization that is recognized by the International Olympic committee; it is given charge of organizing and conducting the rowing competition in the Olympic games which are held every four years. In addition to this the international federation conducts a European championship regatta every year. At this regatta entries are accepted only from the nations whose governing bodies are members of the international federation. For the Olympic regatta, entries from any nation are acceptable providing that the amateur status of the oarsman entered is in accordance with the Olympic rules.

The National Association of Amateur Oarsmen was organized in **1872** in order to make a necessary distinction between amateur and professional competition. There was much professional rowing up to that time; amateurs and professionals were competing together and it was necessary that some means be found to meet this situation.

Outstanding Oarsmen. — Records indicate that the three most outstanding English oarsmen were Guy Nickalls, Sr., who won the Diamonds five times and stroked pairs, fours and eights to victory many times at Henley; F. S. Kelly, a great sculler who won the Diamonds three times; and J. Beresford, Jr., who won the Diamonds four times and competed in five Olympic regattas, being a victor in three and second in two.

Among the oarsmen of the United States, perhaps the most outstanding were James Ten Eyck, John B. Kelly, Paul Costello, Walter M. Hoover, William G. Miller, Joseph W. Burk, Joseph Angyal and John B. Kelly, Jr. The elder Kelly was the most versatile. In addition to winning three Olympic championships, he stroked pairs, fours and eights to victory many times. Burk made a most remarkable record in single sculling. In four years, 1937–40 inclusive: he won a total of **46** races in single sculls. These included the United States national championship four times, the Canadian championship four times, the Diamond Sculls twice and the Philadelphia Gold Challenge cup. He was voted the most outstanding athlete in the United States in 1939 when he was awarded the James E. Sullivan trophy.

In Canada, the dean of rowing and the most outstanding was Joseph Wright, Sr., of the Argonaut Rowing club, who won many races as stroke of pairs, fours and eights and as such competed at Henley five times. Other outstanding Canadian oarsmen were Lou Scholes, first Canadian to win the Diamonds, Robert Dibble, Joseph Wright, Jr., and later H. R. Pearce; the last represented Australia in his first Olympic competition in 1928 and thereby under the rules was required to represent Australia in 1932, although he had in the meantime transferred his residence to Canada.

Australia produced many good crews and scullers. An Australian crew won the Grand Challenge cup at Henley and the Diamond Sculls. In single sculling, the most outstanding was H. R. Pearce, who won the Olympic single sculls championship in 1928 and 1932, and Mervyn Wood, who was world champion single sculler for nearly a decade until his defeat at the XVth Olympiad in 1952 by J. Tjukalov of the U.S.S.R. Stuart MacKenzie won the Diamond Sculls in 1957.

See OLYMPIC GAMES. (J. D. S.; H. P. B.; C. Gs.; A. DA.)

ROWLAND, HENRY AUGUSTUS (1848–1901), U.S. physicist, was born at Honesdale. Pa., on Nov. **27, 1848.** He graduated as a civil engineer at Rensselaer Polytechnic institute at Troy in 1870, and two years later returned there as instructor in physics, becoming assistant professor in 1877. While at Troy he made investigations on magnetic induction, permeability and distribution, which established fundamental results. In 187j he was chosen to occupy the chair of physics in the newly founded Johns Hopkins university, a position which he held until his death, at Baltimore, on April 16, 1901. Before beginning his work at Johns Hopkins he went to Europe, to visit the various physics research centres of the continent, and to purchase laboratory apparatus. He studied under Helmholtz in Berlin: where he carried out experiments proving that an electrostatic charge carried at a high rate of speed had the same magnetic action as an electric current. At Johns Hopkins he carried on a long series of experiments in which he computed the accepted value of the mechanical equivalent of heat, experiments which necessitated more careful thermometric and calorimetric methods than had ever been used before. Similar refined apparatus and technique enabled him to make a more nearly accurate determination of the value of the ohm. than had been calculated before. Becoming interested in the study of spectrum analysis, he realized the importance of securing more accurate diffraction gratings, and to this end constructed a dividing engine which allowed from 14,000 to **20.000** grating lines to be ruled to the inch on a plane surface of either glass or speculum metal. He next investigated the action of a grating ruled on a spherical concave surface, and, discovering the advantages proceeded to rule them. These gratings came to be used in physics laboratories the world over, and the modern study of spectroscopy as an exact science dates from this work. With these gratings Rowland studied and photographically mapped the solar spectrum for the first time. He then undertook the systematic study of the arc-spectra of all the elements so far as possible, and published his results between **1895** and 1900. In his last years he became interested in alternating currents and their practical application to motors, measuring instruments, etc. He devised a system of multiplex telegraphy depending upon synchronous motors which received a grand medal at the Paris Exposition of 1900. He was the recipient of many honours, including the Rumford and Draper medals. His *Physical Papers* **(1902)** contains a bibliography of his writings.

ROWLANDSON, THOMAS (1756–1827), English caricaturist, was born in Old Jewry. London, in July 1756, the son of a tradesman or City merchant. On leaving school he became a student in the Royal Academy, but at the age of **16** he went to study in Paris and afterward made frequent tours on the continent. In 1775 he exhibited at the Royal Academy a drawing of "Delilah Visiting Samson in Prison." He took to drawing caricatures as a means of livelihood. His Academy drawing of Vauxhall **(1784)** had been engraved by Pollard, and the print was a success. Rowlandson was largely employed by Rudolph Ackermann, the art publisher, who in 1809–11 issued in his *Poetical Magazine* "The Schoolmaster's Tour" — a series of plates with" verses by William Coombe which became very popular. Again engraved by Rowlandson himself in **1812**, and issued under the title of the "Tour of Dr. Syntax in Search of the Picturesque,"

they had reached a fifth edition by 1813 and were followed by "Dr. Syntax in Search of Consolation" (1820) and by the "Third Tour of Dr. Syntax in Search of a Wife," (1821). The same collaboration of designer, author and publisher resulted in the English "Dance of Death" (1814–16) and the "Dance of Life" (1822). Rowlandson also illustrated Smollett, Goldsmith and Sterne. Other designs are in *The Spirit of the Public Journals* (1825). *The English Spy* (1825) and *The Humourist* (1831). He died in London on April 22. 1827.

Rowlandson's designs were usually executed in outline with a reed pen and delicately washed with colour. They were then etched by the artist on copper and afterward aquatinted — usually by a professional engraver, the impressions being finally coloured by hand. As a designer the quality of his work suffered from haste and overproduction.

See J. Grego, *Rowlandson the Caricaturist, a Selection From His Works,* etc., 2 vol. (1880).

ROWLEY, WILLIAM (*c.* 1585–*c.* 1642), English actor and dramatist, collaborator with several of the dramatists of the Elizabethan period, especially with Thomas Middleton (*q.v.*). He is not to be identified with the "Master Rowley" whom Francis Meres described in his *Palladis Tamia.* William Rowley is described as the chief comedian in the Prince of Wales's company. He joined the King's Servants in 1623 and retired from the stage about four years later. He is supposed to have died about 1642. The following plays attributed to his sole authorship are extant: *A New Wonder, A Woman Never Vext* (printed 1632), *A Match at Midnight* (1633) and *A Shoomaker a Gentleman With the Life and Death of the Cripple That Stole the Weathercock at Paules* (1637). They are distinguished by effectiveness of situation and ingenuity of plot. It is recorded by Langbaine that he "was beloved of those great men Shakespeare, Fletcher and Jonson." With George Wilkins and John Day he wrote *The Travailes of the Three English Brothers* (1607); with Thomas Heywood he produced *Fortune by Land and Sea* (printed 1655); he was associated with Thomas Dekker and John Ford in *The Witch of Edmonton* (printed 1658); *A Cure for a Cuckold* (printed 1661) and *The Thracian Wonder* (printed 1661) are assigned to the joint authorship of Webster and Rowley, while Shakespeare's name was unjustifiably coupled with his on the title page of *The Birth of Merlin: or, The Childe Hath Found His Father* (1662). Rowley also wrote an elegy on Hugh Attwell, the actor, and a satirical pamphlet describing contemporary London entitled *A Search for Money* (1609).

SAMUEL ROWLEY (d. 1633?), the dramatist, described without apparent reason by J. P. Collier as William Rowley's brother, was employed by Henslowe as a reader of plays. He wrote some scriptural plays. now lost. with William Borne (or Bird, or Boyle) and Edward Juby. His only extant pieces are: *When You See Me, You Know Me, or the Famous Chronicle Historie of King Henry the Eighth, With the Birth and Vertuous Life of Edward Prince of Il'ales* (1605), of interest because of its possible connection with the Shakespearean play of *Henry VIII;* and *The Noble Souldier, or, A Contract Broken, Justly Reveng'd* (1634), which. however, was entered in the Stationers' Register as the work of Thomas Dekker, to whom the major share is probably assignable.

ROWLEY REGIS, a municipal borough (since 1933) in the Rowley Regis and Tipton parliamentary division of Staffordshire. Eng.. in a hilly district 7 mi. W. of Birmingham. Pop. (1951) 49,402. Area 6 sq.mi. The word Regis was added to Rowley (Roughlea) in 1140. Dud Dudley at Cradley forge first used coal instead of charcoal for smelting iron (patented 1620). The oldest and biggest industries are nail making (17th century) and chain making. By 1820 "Rowley rag." a basaltic stone, was being quarried extensively for roads and Rowley was thoroughly industrialized. Heavy engineering, enamelled hollow ware, brickworks at Blackheath and clay mines at Netherton are other industries. Haden Hill park was given to the council in 1921 and the Elizabethan house is used as a restaurant.

ROWLOCK (pronounced in England *rollock),* a device, on the gunwale of a boat, in or on which an oar rests, forming a fulcrum for the oar in rowing. The word is a corruption due to "row" of the earlier "oarlock," O.E. *ārlōc,* a lock or enclosed place for an oar. The simplest form of rowlock is a notch. square or rounded. on the gunwale. in n-hich the oar rests; other kinds are formed by two pins or pegs. tholepins ("thole" being ultimately the same word as Norw. *toll,* a young fir tree). and by a snivel with two horns of metal, pivoted in the gunwale or on an outrigger. (*See* ROWING.)

ROWTON, MONTAGUE WILLIAM LOWRY-CORRY, BARON (1838–1903), is remembered as the originator of the scheme known as the Rowton houses. Son of Henry Corry. a prominent Conservative: he was born in London on Oct. 8, 1838, educated at Harrow and at Trinity college. Cambridge. and called to the bar in 1863. In 1866 Corry became private secretary to Disraeli. When Disraeli resigned in 1868 Corry declined various offers of public employment to continue his services, now given gratuitously. to the Conservative leader; and when the latter returned to power in 1874. Corry resumed his position as his official private secretary. On the defeat of the Conservatives in 1880, Corry was raised to the peerage with the title of Baron Rowton, of Rowton castle, Shropshire. After Beaconsfield's removal to the house of lords. Rowton assisted him in keeping in touch with the rank and file of the party, and on Beaconsfield's death he was put in charge of his correspondence and papers. Consulted by Sir Edward Guinness, afterward Lord Iveagh (*q.v.*) about his projected endowment of a trust for the improvement of the dwellings of the working classes. Rowton made himself familiar with the conditions of the poorest inhabitants of London. and determined to establish "a poor man's hotel." which should offer better accommodation than the common lodginghouses at similar prices. The first Rowton house was opened at Vauxhall in Dec. 1892, the cost (£30,000) being defrayed by Lord Rowton. and it proved so successful that in 1894 a company. Rowton Houses (Limited). was incorporated to extend the scheme which was imitated throughout Great Britain, Europe and America. Lord Rowton died in London on Nov, g, 1903. As he was unmarried, the title became extinct.

ROXANA or ROXANE, daughter of the Bactrian king Oxyartes and wife of Alexander the Great. After the latter's death she gave birth at Babylon to a son (Alexander IV), who was accepted by the generals as joint king with Arrhidaeus. Having crossed over to Macedonia and thrown in her lot with Olympias, mother of Alexander the Great. she was imprisoned by Cassander in the fortress of Amphipolis and put to death (310 or 309 B.C.). The marriage of Alexander and Roxana was the subject of a famous painting by Aetion.

See Plutarch, *Alexander,* 47, 77; Arrian, *Anab.,* iv, 18, vii, 27; Diod. Sic. xviii, 3, 38, xix, 11, 52, 105; Strabo xi, p. 517, xvii, p. 794.

ROXAS CITY (formerly CAPIZ), in the province of Capiz, Phil. Is.. is an important town and port on the north side of Panay Island. at the mouth of the Panay river. The town is 11° 33' N. and 122° 45' E.; the port, 2½ mi. away, is 11° 36' N. and 122° 43' E. The town is the terminus of a railway from Iloilo and has an aeroplane field. The population of the municipality steadily increased for several decades and was 32,353 in 1948. The town is on the border of a region of rich tropical agricultural products— principally rice, sugar cane and coconuts on the plain, abaca in the mountains.

The harbour, in Capiz bay, protected from the open water. of Jintotolo channel by Culasi hill on the north and strong moles on the west and south, can accommodate vessels of a draught of ten feet. Typhoons occur from time to time and do considerable damage. The villages of Culasi and Libas are on the harbour, the landward vicinity of which has dense growths of nipa and other swamp vegetation. The port does a coasting trade with Manila, Iloilo and other Philippine ports and has a fishing industry and fish canneries. Two roads connect the port with the town of Roxas City.

The town is celebrated for weaving abacá and pineapple fibre.

With the province of Capiz, Roxas City suffered heavily during World War II, but later recovered considerably. It was named after Manuel Roxas y Acuna, first president of the Philippine republic. (J. W. CR.)

ROXAS Y ACUNA, MANUEL (1892–1948), first president of the Republic of the Philippines, was born at Cadiz, Panay Island, P.I., on Jan. 1, 1892. He studied law at the University of the Philippines, entered politics, and in 1917 was appointed to the municipal council of Capiz (now Roxas City). He was governor of Capiz from 1919 to 1921, when he was elected to the house of representatives in the Philippines, later becoming speaker of the house. He was a member of the Philippine constitutional convention in 1934 and secretary of finance from 1938 to 1940.

During World War II he served as a colonel under Gen. Douglas MacArthur and later was captured by the Japanese. He helped to co-ordinate underground resistance to the invaders for three years, however. In 1945 he mas president of the senate when, as a Liberal candidate, he was elected president of the Philippine commonwealth. When the country achieved its independence, July 4, 1946, Roxas became the first president of the new republic. He died at Clark field, Pampagna, on April 15, 1948.

ROXBURGHE, EARLS AND DUKES OF. ROBERT KER, 1st earl of Roxburghe (c. 1570–1650), was the eldest son of William Ker of Cessford (d. 1606) and the grandson of Sir Walter Ker (d. c. 1584), who fought against Mary queen of Scots both at Carberry hill and at Langside. He was descended from Sir Andrew Ker of Cessford (d. 1526), who fought at Flodden and was killed near Melrose in Jan. 1jz6 by the Scotts of Buccleuch. After a turbulent life on the border Robert Ker became a Scottish privy councillor in 1599 and was made Lord Roxburghe about the same time; he accompanied King James to London in 1603 and was created earl of Roxburghe in 1616. He was lord privy seal for Scotland from 1637 to 1649, and in the Scottish parliament he showed his sympathy with Charles I; but he took no part in the Civil War, although he signed the "engagement" for the king's release in 1648. His titles and estates passed by special arrangement to his grandson. WILLIAM DRUMMOND id. 1675), the youngest son of his daughter Jean and her husband John Drummond, 2nd earl of Perth. William took the name of Ker, became 2nd earl of Roxburghe and married his cousin Lord Ker's daughter Jean.

JOHN, 5th earl and 1st duke of Roxburghe (c. 1680–1741), received the dukedom in 1707 for his services in connection with the union. This was the last creation in the Scottish peerage. The duke was a representative peer for Scotland in four parliaments; George I made him a privy councillor and keeper of the privy seal of Scotland. and he was loyal to the king during the Jacobite rising in 1715. He was again a secretary of state from 1716 to 1725.

His grandson JOHN, 3rd duke of Roxburghe (1740–1804), was a famous bibliophile. The duke's library, including a unique collection of books from Caxton's press and three rare volumes of broadside ballads. was sold in 1812, when the Roxburghe club was founded to commemorate the sale of Valdarfer's edition of Boccaccio. Roxburghe's cousin William. 7th Lord Bellenden (*c.* 1728–1805), who succeeded to the Scottish titles and estates, died childless in Oct. 1805, and for seven years the titles were dormant.

Then in 1812 SIR JAMES INNES, Bart. (1736–1823), a descendant of the 1st earl, established his claim to them, and, taking the name of Innes-Ker, became 5th duke of Roxburghe. In his family the dukedom remained. Its holder has a seat in the house of lords as Earl Innes in the peerage of the United Kingdom.

ROXBURGHSHIRE, a border county, Scotland, bounded north by Berwickshire, east and southeast by Northumberland, south by Cumberland, southwest by Dumfriesshire and northwest by Selkirkshire and Midlothian. It has an area of 425,564 ac. or 664.9 sq.mi. The only low ground is in the north and in the valleys of the larger rivers, and the whole of the south is markedly hilly, though the Cheviots, forming for a considerable distance the natural boundary with England, mostly belong to Northumberland. The Tweed flows through the north of the shire for 26 out of its total run of 97 mi., though for about 2 mi. (near Abbotsford) it is the boundary stream with Selkirkshire, and for 10 mi. lower down with Berwickshire. On the right its affluent is the Teviot with its tributaries, and on the left the Allan and the Eden. The Teviot is the principal river entirely in Roxburghshire. From its source near Causeway Grain Head on the Dumfriesshire border, it follows mainly a northeasterly direction of 37 mi. to its confluence with the Tweed at Kelso. The Liddel is the main stream in the south. The Kershope and Liddel, during part of their run, serve as boundaries with Cumberland. Excepting the Liddel. which drains to the Esk, much the greater portion of the surface is drained. by the Tweed, to the North sea Teviotdale, Liddesdale, Tweedside and Jedvale are the principal valleys. The county contains a considerable range of sedimentary rocks from the Ordovician to the Carboniferous systems, and with these are associated large tracts of volcanic rocks. The Ordovician and Silurian rocks occupy the northwest and west part of the county. Two divisions of the Old Red Sandstone occur; the lower is confined to the Cheviots; the strata are unconformable upon the upturned Silurian beds. The upper division, which in its turn is unconformable upon the lower, occupies about one-third of the county, being well developed in the north, where volcanic rocks come in. An interesting section about half a mile south of Jedburgh exposes the meeting of the Old Red Sandstone with the Greynacke. Carboniferous rocks are represented by the Calciferous sandstone series in the southwest in Liddesdale and on the uplands of Carter Fell. etc. An interesting series of volcanic "necks" belonging to the Carboniferous period is exemplified in Dunain Law, Black Law. Maiden Paps, Ruberslaw and other hills. Glacial deposits are represented by boulder clay and beds of sand and gravel.

History and Antiquities. — Among the more important remains of the original inhabitants are the standing stones and circles at Plenderleath between the Kale and Oxnam: on Hownam Steeple, a few miles to the northwest; and at Midshiels on the Teviot. The stones on Ninestane Rig, near Hermitage castle, and on Whisgill are supposed to commemorate the Britons of Strathclyde who. under Aidan, were defeated with great slaughter by Aethelfrith of Bernicia, king of Northumbria, at the battle of Daegsastan in 603. There are hill forts in Liddesdale on the Allan. in the parish of Oxnam, and on the most easterly of the three Eildons. This last is said to be the largest example of its kind in Scotland. One of the most important and most mysterious of British remains is the Catrail. or Picts' Work Dyke. In its original condition it is supposed to have consisted of a line of double mounds or ramparts, with an intervening ditch 6 ft broad. It is now far from perfect and in places has disappeared for miles. Beginning at Torwoodlee, northwest of Galashiels, it ran southwest to Yarrow church. where it turned first south and then southeast. following a meandering course to Peel Fell in the Cheviots, a distance of 48 mi. Roman remains are also of interest. Dere street crossed the border north of Brownhart Law in the Cheviots, then took a mainly northwestern direction across the Kale. Oxnam. Jed and Teviot to Newstead. near Melrose, where it is conjectured to have crossed the Tweed and run up Lauderdale into East Lothian. Another so-called Roman road is the Wheel Causeway or Causey, a supposed continuation of the Maiden way which ran from Overburgh in Lancashire to Bewcastle in Cumberland, and so to the Border. It entered Roxburghshire north of Deadwater and went (roughly) north as far as Wolflee, nhere its direction becomes a matter of surmise. Of Roman camps the principal appear to have been situated at Cappuck, to the southeast of Jedburgh, and near Newstead, at the base of the Eildons. the alleged site of Trimontium. After the retreat of the Romans the country was occupied by the Britons of Strathclyde in the west and the Bernicians in the east. It was then annexed to Northumbria for more than four centuries until it was ceded. along with Lothian, to Scotland in 1018.

David I constituted it a shire, its ancient county town of Roxburgh (see KELSO) forming one of the Court of Four Burghs. The castle of Roxburgh, after changing hands more than once, was captured from the English in 1460 and dismantled. Other towns were repeatedly burned down. and the abbeys of Dryburgh. Jedburgh, Kelso and Melrose ultimately ruined in the expedition of the earl of Hertford (the Protector Somerset) in 1544–45. The Border freebooters — of whom the Armstrongs and Elliots were the chief — conducted bloody frays on their own account. Of the ancient castles, that of Hermitage, though now only a shell, is still the most striking. Dating from the 13th century, it is one of the oldest baronial buildings in Scotland.

Agriculture and Industries.— The soil is chiefly loam in the level tracts along the banks of the larger streams, where it is also very fertile. In other districts a mixture of clay and gravel is mostly found, but there is besides a considerable extent of mossy land. Many districts on the Tweed and Teviot are beautifully wooded.

More than half the county is under rough grazings carrying flocks of the smaller south country Cheviots and, to a less extent, the hardier and thriftier Blackface Highlands. On the intermediate ground, where there is some cropping, the larger north country Cheviot is crossed with the Border Leicester to produce half-bred lambs. On the lower-lying fertile farms half-bred ewes crossed with Oxford or Suffolk rams produce large quick-fattening Down cross lambs. In September the largest outdoor ram sales in Scotland are held at Kelso and are attended by buyers from all parts of the country and from overseas. Great numbers of sheep are sold at the autumn sales at Hawick. Arable farming is important in the rich low-lying areas around Kelso, where wheat, barley and some sugar beets are grown in addition to oats and roots, which are the common crops on upland stock iarms.

On the hills herds of Galloway cows are increasingly common. On arable farms Blue Grey cows are much favoured. Dairying, however, is not an important feature. The arable farms are highly mechanized. In some parts of Tweedside and Jedvale several kinds of fruit are successfully grown.

The "Common Ridings," celebrated each year with much pageantry at Hawick, Selkirk, etc, date from the time when the community grazed their stock on common land which had to be held against encroachment.

The county is a principal seat of the tweed and hosiery manufactures in Scotland. Iron founding and dyeing are also carried on at Hawick and tanning at Jedburgh, and agricultural implements, chemical manures and fishing tackle are made at Kelso. The salmon fisheries on the Tweed are of considerable value.

Population and Administration.— Thepopulation in 1951 was 45,557 and there were 92 persons who spoke Gaelic and English, but none Gaelic only. The small burghs are Hawick (1951 pop 16,717), Kelso (4,119), Jedburgh (4,083), the only royal burgh and the county town. and Melrose (2,146). The four county districts have the same names.

The county returns one member to parliament with Selkirkshire and Peeblesshire. The shires of Roxburgh, Berwick and Selkirk form a sheriffdom, and a resident sheriff-substitute sits at Jedburgh and Hawick. The county offices are at Newton St. Boswells. There are secondary schools at Hawick and Jedburgh.

ROXBURY, since 1868 a section of Boston (*q.v.*), Suffolk county, Mass.. and previously a town of Norfolk county situated between Boston and Dorchester. Earliest spellings included Rocksbury, Roxburie and Rocsbury.

The town was founded in 1630 by Puritan immigrants who came with Gov. John Winthrop. The early settlers were led by William Pynchon, who in 1636 led a party from there and founded Springfield. Mass. Anne Hutchinson (*q.v.*) was held in custody during the winter of 1637–38 at the home of the first minister, Thomas Welde. John Eliot, the apostle to the Indians, moved to Roxbury in 1632 and died there in 1690. Roxbury was the home of Thomas Dudley (*q.v.*), of his son Joseph and of his grandson Paul; of Robert Calef (d. 1719), the leader of the opposition to the witchcraft craze; of Gen. Joseph Warren (*q.v.*); and of William Eustis (1753–1825): U.S. secretary of war (1809–12) and governor of Massachusetts (1823–25). Theodore Parker (*q.v.*) was the pastor of the Unitarian Church of West Roxbury from 1837 to 1846.

The Roxbury Latin school, a boys' preparatory school, was founded in 1645 by a group of town fathers, among them John Eliot; it was first known as the Free School of Roxburie.

West Roxbury was the scene of the Brook Farm (*q.v.*) experiment. (J. F. Co.)

ROY, WILLIAM (*fl.* 1527), English friar, studied at Cambridge university and later joined the Franciscan order at Greenwich as a friar observant. As secretary to William Tyndale (c. 1492–1536), Roy assisted him in the translation of the New Testament at Cologne and later at Worms, 1625–26.

Roy's works included *A lytle treatous or dialoge very necessary for all Christen men to learne and to knowe* (1526; 1527–28; reprinted at Vienna, 1874); *Rede me and be nott wrothe, for I say no thynge but trothe* (Worms, 1526; Strasbourg, 1528; London, 1546); *An exhortation to the diligent studye of scripture, made by Erasmus Roterodamus, and translated into English, to which is appended an exposition unto the seaventh chapter of the first epistle to the Corinthians* (Marburg, 1529); A *proper dyalogue betwene a gentillman and a husbandman, eche complaynynge to other their miserable calanzitie through the ambicion of the clergy* (Marburg, 1530; London, 1863); and A *corn-pendious olde treatyse howe that we ought to have ye Scripture in Englysshe* (Marburg, 1530; Bristol, 1863).

ROYAL AIR FORCE COLLEGE: *see* MILITARY, NAVAL AND AIR ACADEMIES.

ROYAL CANADIAN MOUNTED POLICE. This organization. Canada's federal police force, was originally the North-West Mounted Police instituted in 1873 to establish law and order between the Manitoba border and the Rockies. Three hundred members assembled at Dufferin. Man., in the summer of 1874 and on July 8, with freight wagons, oxcarts, cattle for food. field guns, mortars and an assortment of farm machinery, struck out across the plains to the Old Man's river, in what is now southern Alberta, where they built Ft. Macleod and took up the task of policing 300.000 sq.mi. of wilderness. As the only authority in the region the force inherited a variety of work in caring for the stream of settlers that followed in its wake. It abolished the whisky traffic that had been ruining the Indian, tracked and brought to justice murderers, horse thieves and desperadoes and contained the warlike Sioux who had fled to Canada to escape U.S. wrath at the annihilation of General Custer's command in 1876. Just treatment of the Indian by the force resulted in the neutrality of the powerful Blackfoot Confederacy during the Northwest Rebellion of 1885. and under its vigilance the western extension of the Canadian Pacific railway was completed. Anticipating the gold rush of 1898. the North-West Mounted Police preceded the vanguard of prospectors to the Yukon and in 1904 the prefix "Royal" was added to its title in recognition of its services. In 1905 the provinces of Saskatchewan and Alberta were formed and retained the services of the Royal North-West Mounted Police. In 1920 the force received its present title, undertook the enforcement of federal legislation throughout Canada, and transferred its headquarters from Regina to Ottawa.

The 1930s saw the inception of the present "marine" and "air" divisions of the force, the-dog section and the first of three crime detection laboratories. R.C.M.P. patrols emphasized Canada's claim to arctic sovereignty, ranging far and wide from detachments in the northland, and between 1940–42 the R.C.M.P. vessel "St. Roch" became the first ship to complete the west to east journey through the Northwest Passage.

The Royal Canadian Mounted Police employs several thousand uniformed personnel, special constables, civilians and civil servants in its 17 divisions across Canada; its operations are directed by a commissioner from headquarters at Ottawa. As well as the federal statutes throughout Canada, it is responsible for the enforcement of the provincial statutes and the criminal code in all provinces except Ontario and Quebec and polices some 128 municipalities. It is charged with the internal security of the country and is the only police force in the Yukon and Northwest Territories where on behalf of other government departments it performs numerous administrative duties. The facilities of the national police services of the R.C.M.P., comprising the crime detection laboratories and the identification branch of the force, including scenes of crime, single fingerprint. crime index, ticket-of-leave and other sections, are available to all authorized police forces. The R.C.M.P.–sponsored Canadian Police college is attended by selected members of the force and outside forces. The R.C.M P, holds membership in the International Criminal Police organization and maintains liaison officers at London, Eng., and Washington, D.C. Contingents from the force have gone to the South African War and World Wars I and II.

Applicants for the Royal Canadian Mounted Police are required to be British subjects or Canadian citizens and if accepted must engage for an initial term of five years. Recruits are trained at Regina, Sask.. and Ottawa, Ont., and upon completion of training may be posted to any point in Canada excepting the extreme northern regions where service is voluntary.

The dress of the force has several variations, but symbolic of the R.C.M.P. is the broad-brimmed hat. scarlet tunic, blue breeches with wide yellow stripe, brown top boots, spurs and Sam Browne equipment. Horses, long ago supplanted by the patrol car, find their only application to the modern force at the training centres, on ceremonial occasions and in the world famous R.C.M.P. musical ride.

ROYAL FERN, the common name for *Osmunda regalis,* a fern native to Asia. Europe, North America and South America,

growing along lakes, in bogs or in marshy woods. It is a showy plant with bipinnate fronds (bisymmetrical, feathery leaves) two to six feet long and one foot or more broad; the apical portions, or tips, of the fronds are fertile. the fertile pinnae being cylindrical and densely covered with spore cases, giving the appearance of a dense cluster of flowers. whence the name flowering fern There are several varieties. some of which are cultivated This fern belongs to an ancient group of plants that originated during or before the Permian period.

Two related species, *O cinnamomea* (cinnamon fern) and **O.** *claytoniana* (interrupted fern), native to North America, are known in Great Britain as handsome greenhouse ferns *See* also FERN (*W*. R. Bs)

ROYAL NAVAL COLLEGE: *see* MILITARY, NAVAL AND AIR ACADEMIES.

ROYAL OAK, a city of Oakland county. Mich. C.S, 11 mi. N. of Detroit, has backed its slogan, "city of homes." by zoning three-fifths of its area for single dwellings. The population has grown rapidly from 25.087 in 1940 to 80,612 in 1960. The site of early settlement, which dates from the 1820s, was originally surrounded by marshlands. The name is credited to Gov. Lewis Cass, who rested there in 1818 under a giant oak tree which he supposedly likened to the "royal oak' in Scotland whose foliage once concealed Prince Charles from the Roundheads Royal Oak was chartered in 1921; the commission-manager government, in effect since 1917, includes a full-time planning director and municipal court.

Cultural life (literary, historical, dramatic and musical activities for all age groups) centres on the public library The Detroit zoo lies partly within Royal Oak. The Shrine of the Little Flower has become well known mainly because of the former radio activities of the church pastor, Father Charles E. Coughlin Industry, which is of minor importance, includes tools, paint. hydraulic mechanisms and automotive parts. (E. R. I)

ROYAL OBSERVER CORPS: *see* OBSERVER CORPS *IN* AIR DEFENSE

ROYAL PALM (*Roystonea*), a small genus of tropical American palms formerly known as *Oreodoxa.* They occur in southern Florida and the West Indies. *Roysfonea regia* is much planted as an ornamental, especially in avenues. *See* PALM.

ROYAL SOCIETY, THE, the oldest scientific society in Great Britain and one of the oldest in Europe. The Royal society (more fully. The Royal Society of London for Improving Natural Knowledge) is usually considered to have been founded in 1660, but a nucleus had been in existence for several years before that date. As early as the year 1645 weekly meetings were held in London of "divers worthy persons. inquisitive into natural philosophy and other parts of human learning, and particularly of what hath been called the *New Phzlosophy* or *Experzmental Philosophy*," and there can be little doubt that this gathering of philosophers is identical with the "Invisible college" of which Robert Boyle speaks in sundry letters written in 1646 and 1647.

Some of these "Philosophers," resident in Oxford about 1648 formed an association there under the title of the Philosophical Society of Oxford, and used to meet. most usually in the rooms of John Wilkins, warden of Wadham college A close intercommunication was maintained between the Oxford and London philosophers; but ultimately the activity of the society was concentrated in the London meetings, which were held principally at Gresham college.

On Nov. 28, 1660. the first journal book of the society was opened with a "memorandum," from which the following is an extract. "Memorandum that Novemb. 28, 1660, These persons following, according to the usuall custom of most of them, mett together at Gresham Colledge to heare Mr. Wren's lecture, viz., The Lord Brouncker, Mr. Boyle, Mr. Bruce, Sir Robert Moray, Sir Paul Neile, Dr. Wilkins Dr. Goddard. Dr. Petty, Mr Ball, Mr. Rooke Mr Wren, Mr. Hill. And after the lecture was ended, they did. according to the usuall manner. withdrawe for mutuall converse. Where amongst other matters that were discoursed of, something was offered about a designe of founding a Colledge for the promoting of Physico-Mathematicall Experimental Learning." It was agreed at this meeting that the company should continue to assemble on Wednesdays at three o'clock; an admission fee of 10*s*. with a subscription of 1*s*. a week was instituted; Wilkins was appointed chairman; and a list of 41 persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray (or Murray) brought word that the king (Charles II) approved the design of the meetings; a form of obligation was framed, and was signed by all the persons enumerated in the memorandum of Nov. 28 and by 73 others. On Dec. 12 another meeting was held at which 5j mas fixed as the number of the society—persons of the degree of baron, fellows of the College of Physicians and public professors of mathematics, physics and natural philosophy of both universities being supernumeraries.

Gresham college was now appointed to be the regular meeting place of the society. Sir Robert Moray was chosen president (March 6, 1661) and continued from time to time to occupy the chair until the incorporation of the society, when Lord Brouncker was appointed the first president under the charter. In Oct. 1661 the king offered to be entered one of the society, and next year the society was incorporated under its present title. The name "Royal society" appears to have been first applied to the "Philosophers" by John Evelyn, in the dedication of his translation of a book by Gabriel Naudé, published in 1661.

The charter of incorporation passed the great seal on July 15, 1662, to be modified, however, by a second charter in the following year. repeating the incorporating clauses of the first charter but conferring further privileges on the society. The second charter passed the great seal on April 22, 1663, and was followed in 1669 by a third, confirming the powers granted by the second charter, with some modifications of detail, and granting certain lands in Chelsea to the society. The council of the Royal society met for the first time on May 13, 1663.

At this early stage of its history the "correspondence" which was actively maintained with continental philosophers formed an important part of the society's labours, and selections from this correspondence furnished the beginnings of the *Philosophical Transactions* (a publication now of world-wide celebrity). At first the publication of the *Transactions* was entirely "the act of the respective secretaries." The first number, consisting of 16 quarto pages, appeared on Monday, March 6. 1664–65, under the title of *Philosophical Transactions: giving some Accompt of the present undertakings, studies and labours of the Ingenious in many considerable parts of the world,* with a dedication to the Royal society signed by Henry Oldenburg, the first secretary of the Royal society. The society also from its earliest years published, or directed the publication of. separate treatises and books on matters of philosophy, most notable among these being the *Philosophiae naturalis principia mathematica Autore Is. Newton. Imprimatur: S. Pepys, Reg. Soc. Praeses. Julii j, 1686, 4to Londini 1687.*

In 1887 the *Philosophical Transactions* were divided into two series, labelled A and B. respectively, the former containing papers of a mathematical or physical character and the latter papers of a biological character. More than 480 quarto volumes had been published by 1955. In 1832 appeared the first volume of *Abstracts of papers, printed in the Philosophical Transactions from the year 1800.* This publication developed in the course of a few years into the *Proceedings of the Royal Society,* which has been continued up to the present time.

It is, however. certain that one of the most important functions of the society at its inception was the performance of experiments before the members. In the royal warrant of 1663 ordering the mace n-hich the king presented to the society, it is described as "The Royal Society for the improving of Natural Knowledge by experiments"; and during its earlier years the time of the meetings was principally occupied by the performance and discussion of experiments. The society early exercised the power granted by charter to appoint two "curators of experiments," the first holder of that office being Robert Hooke, who was afterward elected a secretary of the society.

Another matter to which the society gave attention was the formation of a museum, the nucleus being "the collection of rarities formerly belonging to Mr. Hubbard," which, by a resolution of council passed in 1666, was purchased for the sum of £100. This museum, at one time the most famous in London, was presented to the trustees of the British Museum in 1781, upon the removal of the society to Somerset house. A certain number, however, of instruments and models of historical interest have remained in the possession of the society. and some of them, more peculiarly associated with its earlier years, are still preserved at Burlington house. The remainder have been deposited in the Victoria and Albert museum, South Kensington.

After the Great Fire of London in Sept. 1666 the apartments of the Royal society in Gresham college were required for the use of the city authorities, and the society was invited by Henry Howard (later duke of Norfolk) to meet in Arundel house. At the same time he presented them with the library purchased by his grandfather Thomas, earl of Arundel, and thus the foundation was laid of the important collection of scientific works, exceeding 140,000 volumes, which the society possesses. Of the Arundel manuscripts the bulk was sold to the trustees of the British Museum in 1830 for the sum of £3,559, the proceeds being devoted to the purchase of scientific books. These manuscripts are still kept in the British Museum as a separate collection. The society, however, still possesses a valuable collection of scientific correspondence. official records and other manuscripts, including the original manuscript. with Newton's autograph corrections, from which the first edition of the *Principia* was printed.

Under date Dec. 21, 1671, the journal book records that "the lord bishop of Sarum proposed for candidate Mr. Isaac Newton, professor of the mathematicks at Cambridge." Newton was elected a fellow Jan. 11, 1671–72, and in 1703 he was appointed president, a post which he held till his death in 1727. During his presidency the society moved to Crane court, its first meeting in the new quarters being held on Nov. 8, 1710. In the same year they were appointed visitors and directors of the Royal observatory at Greenwich, a function which they continued to perform until the accession of William IV, when by the new warrant then issued the president and six of the fellows of the Royal Astronomical society were added to the list of visitors.

In 1780, under the presidency of Sir Joseph Banks, the Royal society removed from Crane court to the apartments assigned to it by the government in the new Somerset house, where it remained until its removal to Burlington house in 1857. The policy of Sir Joseph Banks was to raise the status of the fellowship. A step in pursuance of the same policy was taken in the year 1847, when the number of candidates recommended for election by the council was limited to 15, and the election was made annual. This was augmented to 20 in 1938, and seven years later the number was raised to 25. Concurrent with the gradual restriction of the fellowship was the successive establishment of other scientific bodies. The founding of the Linnean society in 1788 under the auspices of several fellows of the Royal society was the first instance of the establishment of a distinct scientific association under royal charter; and this has been followed by the formation of the large number of societies now active in the promotion of special branches of science.

From the time of its royal founder onward the Royal society has constantly been appealed to by the government for advice in connection uith scientific undertakings of national importance. The following are some of the principal matters of this character upon which the society has been consulted by, or which it has successfully urged upon the attention of, the government: the improvement and equipment of the Royal observatory. Greenwich, in 1710, when it was placed in the sole charge of the society; the change of the calendar in 1752; ventilation of prisons; protection of buildings and ships from lightning; measurement of a degree of latitude; determination of the length of a pendulum vibrating seconds; comparison of the British and French standards of length; the Geodetic survey in 1784. and the General Trigonometrical survey begun in 1791; expeditions to observe the transits of Venus in 1761. 1769 (commanded by Capt. James Cook). 1874 and 1882; the antarctic expeditions of 1772 (under Captain Cook, whose voyage extended to the circumnavigation of the globe), 1839 (under Sir James Clark Ross) and 1900; help with the reports of the British Antarctic expedition of 1910–13; observations for determining the density of the earth; arctic expeditions of 1817 (in search of the northwest passage), of 1819 (under Sir William Parry), of 1827 (Parry and Ross), of 1845 (under Sir John Franklin), of 1875 (under Sir George Nares); numerous expeditions for observing eclipses of the sun; 1822, use of coal tar in vessels of war; best manner of measuring tonnage of ships; 1823, corrosion of copper sheathing by sea water; Charles Babbage's calculating machine; lightning conductors for vessels of war; 1825, supervision of gasworks; 1832, tidal observations; 1835, instruments and tables for testing the strength of spirits; magnetic observatories in the colonies; 1862, the great Melbourne telegraph; 1865, pendulum observations in India; 1866, reorganization of the meteorological department; 1868, deep-sea research; 1872, "Challenger" expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; cruise of the "Triton" in Faeroe channel; 1883, borings in delta of Nile; 1884, Bureau des Poids et Mesures; international conference on a prime meridian; 1888, inquiry into lighthouse illuminants; 1890, the investigation of colour blindness; 1895, examination of the structure of a coral reef by boring; 1896, inquiry into cylinders for compressed gases; the establishment of an International Geodetic bureau; 1897, determination of the relations between the metric and imperial units of weights and measures; an inquiry into the volcanic eruptions in the West Indies; international seismological investigation; international exploration of the upper atmosphere; measurement of an arc of the meridian across Africa. During 1913–17 the society completed a magnetic survey of the British Isles. In 1920 it sent two expeditions to observe the total solar eclipse of May 29, and to note any deflection of rays of light by the sun's gravitational field, as required by Albert Einstein's general theory of relativity. In later years also the society, acting at the request of the government, has taken the leading part in investigations, in the course of which important discoveries have been made: in relation to various tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever and sleeping sickness. In 1924 the society received a bequest of £10,000 for medical research on tropical diseases, etc., and sent an expedition to study kala azar in north China. The society has also shown an active interest in problems of respiration and circulation in high altitudes (Peru expedition, 1921), and in investigations into glassworkers' cataract. It has taken a leading part in the promotion of the *International Catalogue of Scientific Literature* and of the International Association of Academies.

In addition to the occasional services enumerated above, the Royal society has exercised, and still exercises, a variety of important public functions of a more permanent nature. It still provides seven of the board of visitors of the Royal observatory, has 11 representatives on the Joint Permanent Eclipse committee and has a Solar Research committee of its own. From 1877 until the reconstitution of the meteorological office in 1906 the society nominated the meteorological council, which had the control of that office. The Gassiot and other committees of the society continued to co-operate with the meteorological office. Since 1919, when the meteorological office was attached to the air ministry, the society has two representatives on the Meteorological committee. The society has the custody of standard copies of the imperial standard pard and pound. The president and council have the scientific control of the National Physical laboratory, an institution established in 1900 in pursuance of the recommendations of a treasury committee appointed by H.M. government in response to representations from the Royal society (the financial control was transferred to the Department of Scientific and Industrial Research in 1918). It also appoints the British delegates to the meetings of the International Research council.

One of the most important duties which the Royal society performs on behalf of the government is the administration of an annual grant of (in 1955) nearly £60,000 for the promotion of scientific research and the assistance of scientific publications. This grant originated in a proposal by Lord John Russell in 1849

that at the close of the year the president and council should point out to the first lord of the treasury a limited number of persons to whom the grant of a reward or of a sum to defray the cost of experiments might be of essential service. The majority of these grants are utilized to provide apparatus, and they are made with the advice of nine scientific boards of eight experts each.

A proposal for bursaries to assist investigators of proved ability to work in other parts of the commonwealth for short periods when this would augment their capacity to advance knowledge was put forward by Sir Edward Salisbury in 1952. This was implemented as the Royal Society and Nuffield Foundation Bursaries scheme, and is mainly financed by the Nuffield foundation and contributions from various countries of the commonwealth.

A statement of the trust funds administered by the Royal society will be found in the *Year Book* published annually, and the origin and history of these funds will be found in the *Record of the Royal Society*.

Five medals (the Copley medal, two royal, the Davy and the Hughes) are awarded by the society every year, the Rumford and the Darwin medals biennially, the Sylvester triennially and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1709), and is awarded "to the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford medal originated in a gift from Count Rumford in 1796 of 1,000 3% consols, for the most important discoveries in heat or light made during the preceding two years. The royal medals were instituted by George IV and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year before the date of the award. The Davy medal was founded by the will of John Davy. F.R.S., the brother of Sir Humphry Davy. and is given annually for the most important discovery in chemistry made in Europe or Anglo-America. An enumeration of the awards of each of the medals and the conditions of the awards are published in the *Year Book*. In 1953 the Royal society and the Nuffield foundation jointly provided funds for a scheme of commonwealth bursaries.

Six special lectures endowed by the benefactors named are delivered to the society, namely the Croonian (William Croone, 1684), the Bakerian (Henry Baker, 1775) and the Ferrier (Sir David Ferrier, 1928), to be delivered triennially, on the advances in knowledge of the structure and function of the brain; the Wilkins (J. D. Griffith Davis, 1947) on the history of science; the Leeuwenhoek (George Gabb, 1948) on some microbiological subject; and, in 1952, lectures in memory of Lord Rutherford.

Under the existing statutes of the Royal society every candidate for election into the society must be recommended by a certificate in writing signed by six or more fellows, of whom three at least must sign from personal knowledge. From the candidates so recommended the council annually selects 25, and the names so selected are submitted to the society for election by ballot. Princes of the blood, however, and not more than two persons selected by the council on special grounds once in two years, may be elected by a more summary procedure. Foreign members, not exceeding 50, may be selected by the council from among men of the greatest scientific eminence abroad, and proposed to the society for election.

The anniversary meeting for the election of the council and officers is held on St. Andrew's day. The council for the ensuing year, which includes the president, treasurer, two scientific secretaries (one for the biological and one for the physical sciences) and a foreign secretary, must consist of 11 members of the existing council and ten fellows who are not members of the existing council. These are nominated by the president and council previously to the anniversary meeting. The president and foreign secretary normally hold office for five years, the two scientific secretaries and the treasurer for ten years. There is also a permanent assistant secretary who is not usually a fellow. The session of the society is from November to June; the ordinary meetings are held on Thursdays during the session, at 4:30 P.M. The selection for publication from the papers read before the society is made by the Committee of Papers, which consists of the members of the council for the time being aided by committees appointed for the purpose. The papers so selected are published either in the society's *Philosophical Transactions* (quarto) or *Proceedings* (octavo).

(R. W. F. H.; A. Wo.; E. J. S.)

ROYALTIES. This article deals chiefly with authors' royalties for literary works. For the rights of authors of literary, musical and artistic works and international agreements providing copyright protection, *see* COPYRIGHT. (For a detailed account of laws protecting rights to make, sell or use products that are the result of invention or discovery, *see* PATENTS.) *See* also BOOKSELLING; PUBLISHING; and BROADCASTING: *Broadcasting* as a *Business*.

Payment by royalties based on a percentage of the published price is the customary method of sharing receipts between publisher and author from sales of a book. The amount of royalty agreed upon depends on the cost (including advertising) and the estimated sale of the book, as well as on the respective bargaining powers of publisher and author. Most contracts for fiction in the U.S. and Great Britain contain a provision for publication in cheaper editions and reprints.

Another phase of royalties is the advance. When it became apparent that the royalty system was fairer to publisher and author than the old system of payment outright for all rights, the author was prompt to point out that he might starve while waiting for his money—hence the publishers' custom of paying an advance on account of royalties. Authors whose previous sales had been large commanded proportionately large advances. When advances are paid to the author before any royalties are earned they are customarily made (1) upon the signing of the agreement, (2) upon delivery of the complete manuscript ready for publication and (3) on the publication date.

The usual practice of publishers is to sell the reprint edition rights, when possible, to firms who specialize in such editions, giving the author half of the royalties.

A compromise between the percentage royalty on the retail price of every copy sold and the outright payment for the copyright was extensively adopted by European publishers, the system being the payment of an outright sum for every 1,000 copies printed. The advance on such payment usually covers the number of copies printed in the first edition.

The royalty system underwent notable changes in the 20th century. It was formerly customary for the publisher to contract for the world rights of his author, reselling on a basis of half receipts to himself and half to the author such rights as he could not use—*e.g.*, foreign rights, serial rights, dramatic rights and, at first, motion-picture rights. But such contracts became rare, the author selling each right separately.

The same tendency was observable in play sales. If the play is sold first in England, the English manager claims a share in the U.S. rights and the film rights—and vice versa if the play is sold in the United States. If the author is in a strong position he claims and gets a separate royalty in each country for each right, with somewhat lower royalties for translation rights on account of the cost of translation and possibly adaptation. He also reserves the royalties obtainable on his amateur rights, broadcasting rights, and book publication rights.

In the United States the American Society of Composers, Authors and Publishers (ASCAP) was founded in 1914 to collect performing right royalties for allocation to members whose copy-

righted musical works are used in public performances for profit. Dissension between radio broadcasters and ASCAP led to the formation of Broadcast Music, Inc.. by broadcasters in the early 1940s; thereafter the two organizations competed.

Earlier Systems. — The royalty system became general only in the 19th century, although before that authors were occasionally paid a stipulated sum for the first impression of a book, and a further sum if a further impression were called for. Samuel Simmonds paid Milton £5 for *Paradise* Lost and agreed to pay a further £5 at the end of the sale of each of the first three impressions. Richard Baxter records that he arranged with Thomas Underhill and Francis Tyton to publish his *Saints' Everlasting Rest,* a quarto of nearly 1 000 pages, for a payment of £10 for the first impression and £20 for every subsequent impression up to 1665.

Sidney Lee records that the highest price known to be paid before 1599 to an author for a play by the manager of an acting company was £11. "A small additional gratuity, rarely exceeding 10s., was bestowed on a dramatist whose piece on its first production was especially well received, and the author was customarily awarded. by way of benefit, a certain proportion of the receipts of the theatre on the production of a play for the second time. The 19 plays which may be set to Shakespeare's credit between 1591 and 1599 combined with such revising work as fell to his lot during those nine years cannot consequently have brought him less than £200 or some £20 a year. Between 1599 and 1611 his remuneration as both actor and dramatist was on the upward grade. The fees paid dramatists rose rapidly. The exceptional popularity of Shakespeare's work after 1599 gave him the full advantage of the higher rates of pecuniary reward in all directions. The 17 plays that were produced by him between that time and the close of his professional career could not have brought him less on an average of £25 each, or some £400 in all." Later prices improved and Fielding, for example, received £1,000 from Andrew Millar for Amelia, while Gibbon received two-thirds of the proceeds on his history.

Edward Chapman, of Chapman and Hall, in a letter to Forster (1837) said: "There was no agreement about *Pickwick* except a verbal one. Each number was to consist of a sheet and a half, for which we were to pay 15 guineas, and we paid him for the first two numbers at once: as he required the money to go and get married with. We were also to pay more according to the sale, and I think *Pickwick* cost us altogether £3,000." Forster adds: "I had always pressed so strongly the importance to him of some share in the copyright that this at last was conceded in the deed above mentioned (though five years were to elapse before the rights should accrue) and it was only yielded as part consideration for a further agreement entered into on the same date (Nov. 19, 1837) whereby Dickens engaged to write a new work (*Nickleby*) the first number of which was to be delivered on the 15th of the following March and each of the numbers on the same day of each of the successive 19 months. which was also to be the date of the payment to him by Chapman and Hall, and 20 several sums of £150 each for five years' use of the copyright, the entire ownership in which was then to revert to Dickens.!'

On July 2, 1840, Dickens wrote to Chapman and Hall: "Your purchase of *Barnaby Rudge* is made upon the following terms: It is to consist of matter sufficient for ten monthly numbers of the size of *Pickwick* and *Nickleby,* which you are. however, at liberty to divide and publish in 1j smaller numbers if you think fit. The terms for the purchase of this edition in numbers and for the copyright of the whole book for six months after the publication of the last number are £3,000. At the expiration of six months, the whole copyright reverts to me." (C. BN.; X.)

ROYALTIES, IN MINING. In some countries (*e.g.* France) minerals are owned by the state which may grant concessions to private individuals or corporations. In others (*e.g.* the United States) they belong to the landowner.

Until the coming into force of the Coal Mines act of 1938 all minerals in Great Britain — apart from special customs and excepting mines of gold and silver, which are the property of the Crown (*i.e.* "Royal" metals, hence the term "royalty")—were privately owned. But under the Coal Mines act the coal and associated mineral substances (fireclays, stratified ironstone) pass to the state under a system of compulsory purchase, the total amount of the compensation payable being £66,450,000. A Central Valuation board was appointed in Sept. 1938 to divide this amount as between the coal "regions" in accordance with the terms of the act. which specified that the amount allocated to each "valuation region" should bear the same proportion to the global figure as the value of all the principal coal hereditaments in the said region bears to the value of all such hereditaments in Great Britain.

The valuation of the individual ownerships, region by region, commenced in Jan. 1, 1939, the date determined by the act. from which date the coal was held as if all existing owners had entered into a contract for the sale of the coal to the Coal commission (a body set up by parliament to control the nationalized coal property, and clothed with certain other powers), the contract being completed on the "vesting date," July 1. 1942.

The royalty rent was made payable either (1) as a tonnage rate pure and simple. (2) a sum per acre per foot thick of coal in the seam, (3) simply a sum per acre as a proportion of the value of the mineral raised, or (4) by way of a sliding scale. The first two proved to be the methods most commonly adopted. In the case of metalliferous ores. both in Great Britain and in other countries, the royalty is assessed as a proportion of the .'dressed' ore (*i.e.* as ready for smelting) : *e.g.* 1/20th to 1/30th. China clay, ganister, and other "clays." oil shale, slate! building stone, and stratified ironstone are also subject to royalty.

In the Cnited States the royalty payable on coal is usually based upon a fixed rate per ton, which in the case of bituminous coal would be a uniform rate for all coal sold; but in the case of anthracite the rate per ton frequently varies with the size, a higher royalty being paid upon larger sizes; and. in some instances, the royalty is a sliding scale varying with the sale price. Royalties vary from a few cents per ton in the case of bituminous. to as much as $1.00 per ton for the highest grades and largest sizes of anthracite.

Natural petroleum does not occur in commercial quantity in Great Britain, but in the United States, where it is produced in vast quantities, oil lands are usually leased on a royalty basis, the royalty being paid to the owner of the land on a percentage of the oil produced. In the case of natural gas, royalties are rarely paid on a percentage basis, but usually as a stipulated amount for the right to pipe and sell the gas.

Crude oil for royalty purposes usually means crude oil after deduction of water, foreign substances, and oil consumed in production. (R. R.; X.)

ROYAN, a town of W. France, in the department of Charente-Maritime, on the right bank of the Gironde at its mouth 63 mi. below and N.N.W. of Bordeaux. Pop. (1954) 11,256. It belonged to the family of Trémoille. in whose favour it was made first a marquisate and then a duchy. During the first half of the 15th century it was held by the English. During the wars of religion it was the centre of Calvinism and in 1622 was besieged by Louis XIII. At the end of the 18th century it had about 1,000 inhabitants and was noticeable only for its priory. Its prosperity dates from the Restoration, when steamboat communication was established with Bordeaux.

ROYCE, JOSIAH (1855–1916), American philosopher and teacher, mas born at Grass Valley, a California mining town, on Nov. 20. 1855. At 16 he entered the newly-opened University of California. inclined to the study of engineering. But the teaching of Joseph LeConte, the geologist, and of Edward Rowland Sill, the poet, roused his extraordinary speculative power; and on receiving his baccalaureate degree, 187j, he gave himself to the study of philosophy, first in Leipzig and Gottingen (under Lotze) and then. as one of the first fellows of Johns Hopkins university, with William James and Charles Peirce. Here he received the degree of Ph.D., 1878. After teaching English for four years in

the University of California he was called to Harvard university as lecturer in philosophy, becoming assistant professor in 1885, professor in 1892 and succeeding George Herbert Palmer as Alford professor in 1914. He received various honorary degrees and was made in 1916 Honorary Fellow of the British Academy. He died at Cambridge. Mass., Sept. 14. 1916.

His effect as teacher and writer was profound: no previous American thinker had so united moral energy with wide historical learning, command of scientific method and intense interest in logical technique. His versatile mind concerned itself effectively with a wide range of subjects; he contributed to mathematical logic, psychology, social ethics. literary criticism and history as well as to metaphysics. His thought was massive and intimately human; yet it was sustained with a dialectical skill of such evident virtuosity as, on the one hand, to excite the critical opposition first of pragmatic and then of realistic schools, and, on the other hand, to set a new standard in the systematic treatment of philosophy. In this latter respect, Royce did for American philosophy what his older contemporary, F. H. Bradley. did for British philosophy: in many ways the views of these thinkers are akin. Like Bradley, Royce teaches a monistic idealism. Scientific laws he describes — anticipating certain developments of recent physics — as statistical formulae of average behaviour. His absolute idealism is supplemented, not corrected, by the ethical and social teachings of his later years and, in particular, by the conception of the world of human selves as the Great Community, the literally personal object of moral loyalty.

BIBLIOGRAPHY—Among his more important publications (selected from a far greater number) are: *The Religious Aspect of Philosophy* (1885); *The Spirit of Modern Philosophy* (1892); *The Conception of God* (1895), with Supplementary Essay (1897); *Studies of Good and Evil* (1898); *The World and the Individual* (Gifford Lectures), vols, i , ii. (1900–01); *The Conception of Immortality* (1900); *Outlines of Psychology* (1908); "The Relation of the Principles of Logic to the Foundations of Geometry," in *Transactions of the American Mathematical Soc.,* vi., 3 (1905); *The Philosophy of Loyalty* (1908); *The Sources of Religious Insight* (1912); "Prinzipien der Logik," *Enzyklopädie der Philosophischen Wissenschaften,* Bd. i. (1912), English translation in *Encyclopaedia of the Philosophical Sciences,* vol. i. (1913); *The Problem of Christianity* (lectures delivered at the Lowell Institute, Boston, and at Manchester college, Oxford), vols. i., ii. (1913); "The Mechanical, the Historical and the Statistical," *Science,* n.s. xxxix. (1914); *Lectures on Modern Idealism* (1919). For a bibliography (exclusive of posthumous publications) *see* B. Rand, *Philosophical Rev.,* xxv. (1916). (M. W. C.; W. E. H.)

ROYDEN, AGNES MAUDE (1876–1956), one of the first British women preachers and pastors, was born in Liverpool, Nov. 23, 1876. After social and pastoral work, in 1908 she became a member of the executive of the National Union of Suffrage societies. In 1914 she decided to prepare for the ministry, and as women were not allowed to preach in the Anglican church, in 1917 became assistant at the Congregational City Temple. London, although remaining an Anglican. In 1920 she started undenominational services at Kensington and in 1921 founded the Guildhouse, Eccleston square, where she remained until 1936, gathering a large following by her magnetic personality, zeal for social reform and power as a preacher. Her books included Prayer as a *Rorce* (1923); *Sex and Commonsense* (1922); *Here—and Hereafter* (1933); and *A Threefold Cord* (1947), the story of her love for Rev. W H. Shaw (1859–1944), whom she married in 1944. She died in London, July 30, 1956

ROYER-COLLARD, PIERRE PAUL (1763–1845), French statesman and philosopher, was born on June 21, 1763, at Sompuis, near Vitry le Français (Marne), the son of Antoine Royer, a small proprietor. He was sent to the college of Chaumont of which his uncle, Fr. Paul Collard, mas director. He folloued his uncle to St. Omer, where he studied mathematics. At the outbreak of the Revolution he was practising at the Parisian bar. He was returned by the Island of Saint Louis to the Commune, of which he was secretary from 1790 to 1792. After the revolution of Xug. 10, 1792, he was replaced by J. L. Tallien. His sympathies were now with the Gironde, and after the insurrection of 12 Prairial (May 31, 1793) he was in danger of his life. He returned to Sompuis, and was saved from arrest possibly by the protection of Danton. In 1797 he was returned by his *département* (Marne) to the Council of the Five Hundred. He made one great speech in the council in defense of the principles of religious liberty, but retired into private life at the coup d'état of Fructidor (Sept. 4, 1797).

From that time until the restoration Royer-Collard devoted himself to the study of philosophy. His opposition to the philosophy of Condillac arose from the study of Descartes and his folloners. and from his early veneration for the fathers of Port Royal. He desired to establish a system which should provide a moral and political education consonant with his view of the needs of France. From 1811 to 1814 he lectured at the Sorbonne.

Royer-Collard was the moving spirit of the "Doctrinaires," led by Guizot. P. F. H. Serre, Camille Jordan and Charles de Rémusat, who met at the house of the comte de Ste. Aulaire and in the salon of the duchesse de Broglie. In 1820 Royer-Collard was excluded from the council of state by a decree signed by his former ally Serre. In 1827 he was again elected; in 1828 he became president of the chamber, and fought the reactionary policy which precipitated the revolution of July. In March 1830 he presented the address of the 221. From that time he took no active part in politics, although he retained his seat in the chamber until 1839. He died at his estate of Chbteauvieux, near Vitry, on Sept. 2, 1845. He had been a member of the Academy since 1827.

Fragments of Royer-Collard's philosophical work are included in Jouffroy's translation of the works of Thomas Reid. The standard life of Royer-Collard is by his friend Prosper de Barante, *Vze politique de M. Royer Collard, ses discours et ses écrits* (2 vols., 1861). *See* E. Faguet, *Politique et morale du xix^e siècle* (1891); *H.* Taine, *Les Philosophes français du xix^e siècle* (1857); L. Séché, *Les Derniers Jansénistes* (1891); and Lady Blennerhasset, "The Doctrinaires" in the *Cambridge Modern Hzstory* (vol. x. chap. ii., 1907).

ROYSTON, a market town and urban district in the Hitchin parliamentary division of Hertfordshire, Eng., 13½ mi. S.S.W. of Cambridge by road, where Icknield way crosses Ermine street. Pop. (1961) 6,160. Its industries are agricultural, the Wednesday produce market being of ancient origin. Royston priory stands where a house of Austin canons was founded by Ralph of Rochester. The hooded or Royston crow is said never to winter south of Royston.

ROYTON, an urban district in the Heywood and Royton parliamentary division of Lancashire, Eng., to the north of Oldham, with which it is contiguous. Pop. (1961) 14,476. It owes its rise to the cotton trade

ROZAS, JUAN MARTINEZ DE (1759–1813), the earliest leader in the Chilean struggle for independence. was born at Mendoza in 1759. In early life he was a professor of law, and of theology and philosophy at Santiago.

He was acting governor of Concepción at one time, and was also colonel in a militia regiment. In 1808 he became secretary to the last Spanish governor, Francisco Antonio Carrasco, and used his position to prepare the nationalist movement that began in 1809. After resigning as secretary, Rozas was mainly responsible for the resignation of the Spanish governor, and the formation of a national Junta on Sept. 18, 1810, of which he was the real leader. Under his influence many reforms were initiated, freedom of trade was established, an army was organized and a national congress was called in July 1811. Rozas died at Mendoza March 3, 1813.

RUANDA-URUNDI, a former United Nations trust territory in east-central Africa which, from July 1, 1962, became two independent states with the official names of Rwanda and Burundi. The area is bounded on the north by Uganda, on the east and south by Tanganyika and on the west by the Republic of the Congo (Kivu province). Area 20,916 sq.mi. (Rwanda 10,169 sq.mi.; Burundi 10,747 sq.mi.). Pop. (1960 est.) 4,941,000.

The greater part of the country is mountainous and lies at a high altitude. The Luvironza river in southern Urundi is considered to be the remotest headstream of the Nile. Most of the people are Hutu (Bahutu) peasants, of Bantu stock, but 10%–15% are Tutsi (Watutsi), of Hamitic origin, who were the former ruling caste. There are a small number of pygmy Twa (Batwa). In the early 1960s there were still about 3,000 Europeans (chiefly Belgians), though many of these were leaving the area, and about 2,500 Asians.

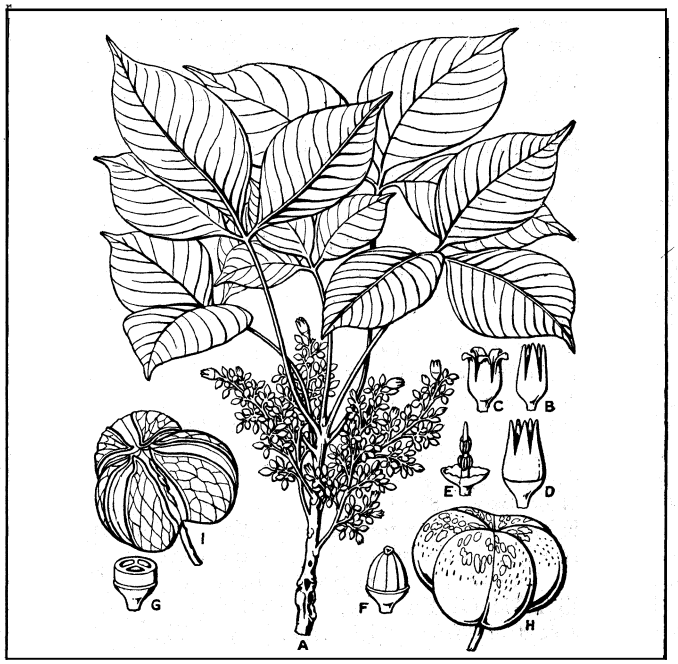
As a result of the distance from the sea and lack of cheap transport, trade developed slowly. The only major cash crop is coffee,

with an average annual production of 32,000 tons, though this fell substantially with the breakdown in organization following the departure of Belgian officials. Most of the people live by subsistence farming with a low standard of living, and in the early 1960s both countries were overpopulated and underdeveloped. With independence, it was decided to retain a degree of economic interdependence, in customs, telecommunications and foreign exchange. in order to make the two states viable.

The new state of Burundi is a constitutional monarchy and has its capital at Usumbura (pop. [1959 est.] 45,714). The new state of Rwanda is a republic headed by a president and a premier. Its capital is Kigali (pop. [1959 est.] 4,173). There are no railways. Roads totaled 4,803 mi., including 216 mi. of principal roads.

After World War I Belgium assumed administration under a mandate of the League of Nations. Ruanda-Urundi had previously been a part of German East Africa. In Dec. 1946 the United Nations placed it under CN trusteeship. Under the law of Aug. 21, 1925. Ruanda-Urundi was organized as an integral part of the Belgian Congo. from which it was separated in 1960 when the Belgian Congo gained its independence It continued under Belgian administration until the formation in 1962 of the two independent states. (P. W. I.; X.)

RUBBER: BOTANY, CULTIVATION AND CHEMISTRY. During his second visit to South America, Columbus was astonished to see the native Indians amusing themselves with a black, heavy ball made from a vegetable gum. Later explorers were equally impressed by these balls, and an historian of the time remarked that they rebounded so much that they appeared alive. Three centuries elapsed before the material was brought into commercial use in Europe, and it was then marketed not for its elastic properties but to rub out lead pencil marks—hence the name indiarubber or rubber. Since then the principal constituent (caoutchouc) of this material has been found as a vegetable product in many parts of the world, sometimes mixed with as little as one twentieth and sometimes with eight times its own weight of other substances. Some of these mixtures are strong and elastic, others are weak and brittle, but they are all classified as rubber. In addition, the term has been broadened by common use to include a wide range of vulcanised products derived from rubber by heating with sulphur, generally after mixing with large proportions of powders and plastic solids.



FROM "MEDIZINAL PFLANZEN" (KOEHLER)

FIG. 1—HEVEA BRASILIENSIS

(A) Sprig bearing trifoliate leaves and several inflorescences, (B, C, D) detached naked unisexual flowers, (E) androecium, (F) gynaecium, (G) section through the trilocular ovary, (H) ripe, (I) dehiscent capsule, showing the large oleaginous seeds

Although raw rubber is a coherent, elastic solid, it is obtained from a milky liquid known as *latex,* which occurs in special tubes in the roots, stem, branches, leaves and fruit of a wide variety of trees growing for the most part in the tropics. Rubber latex consists of a watery solution (serum), in which float small globules of rubber visible under a microscope. Although neither the rubber nor the serum is definitely opaque in thin layers, the many reflecting surfaces presented by these globules cause the latex to have the appearance of cows' milk, but whereas cows' milk contains only about 12% solid matter, rubber milk contains 30–40%. When rubber milk is suitably treated the globules unite (coagulate) and float in the serum as a soft, doughy mass (coagulum), which can be easily rolled to a sheet or other convenient form. On drying the coagulum loses its doughy character and becomes the firm, elastic solid known as raw or crude rubber.

Sources of Supply.—The numerous varieties of trees which contain rubber latex belong to many different botanical families, but nearly the whole of the world's rubber supply is obtained from a tree known as *Hevea brasiliensis* belonging to the family Euphorbiaceae. The rubber obtained from the latex of this tree usually contains over 90% caoutchouc of excellent quality. Few other trees furnish rubber of a purity and quality approaching this. In some cases the latex yields a product which consists chiefly of resin. Jelutong rubber, for example, obtained from *Dyera costulata,* a large tree growing in the East Indies, is very resinous, as also is the rubber produced from shrubby species of *Euphorbia* indigenous to South Africa.

Certain tropical African plants yield rubber of good quality, but the methods of preparation employed by the natives are crude and tend to degrade the product. The most important are *Funtumia elastica,* a tall and stately tree, and various species of *Landolphia,* which are big woody climbers.

A tree which is well known because it is cultivated in Europe as an ornamental plant under the name of the indiarubber tree is *Ficus elastica,* indigenous to Assam and Burma, where it grows to a considerable size. It yields moderately resinous rubber.

Guayule rubber from *Parthenium argentatum*—*a* silvery-leafed shrub found in north Mexico and is also moderately resinous.

The tropical American rubbers include Ceara rubber from *Manihot Glaziovii,* a tree of moderate size growing in Brazil, and Caucho rubber from *Castilloa elastica,* a large tree found in Central America and portions of Brazil. In both cases tlie rubber is of fairly good quality. The purest and best, however, is undoubtedly the Para rubber obtained chiefly from *Hevea brasiliensis* and to a lesser extent from *Hevea Benthamiana.* Both these trees are found in the Amazon valley. the former around the southern and the latter around the northern tributaries. *Hevea Benthamiana* is not so widely distributed as *Hevea brasiliensis,* but both yield rubber which is classed as "hard fine para'—the highest grade on the market.

Origin of Plantations.—At one time the trees in the Amazon valley were the only source of *Hevea* rubber, but as early as 1834 Thomas Hancock (the English rubber manufacturer who, after examining samples made by Charles Goodyear, discovered that sulphur alone is sufficient to efiect the vulcanization of rubber) called attention to the high price of rubber and the possibility of growing it in the East. The requisite climate conditions appeared to be a heavy, well-distributed rainfall (about 100ins. per annum) and a temperature of 70°–90° F. These conditions are obtained over wide areas in the East. Eventually Sir Joseph Hooker, Director of the Royal Botanical Gardens, Kew, London, interested himself in the problem, and in 1873 2,000 Hevea seeds from the Amazon were delivered to Kew by a Mr. Farris. Only a dozen germinated, and six sent to the Royal Botanical Gardens, Calcutta, did not thrive. Arrangements were then made for further supplies of seeds. The most successful collector was H A. Wickham (now Sir Henry Wickham) who displayed much enterprise and care in successfully bringing to Kew a consignment of 70.000 seeds of *Hevea brasiliensis.* Hot houses were summarily emptied, and within two weeks of the arrival of

the seeds in England there were over 2,000 young plants, nearly all of which were despatched to Ceylon, where they proved very successful.

After the establishment of Hevea trees in Ceylon steps were taken to distribute plants and seeds to other countries. Difficulties were experienced in exporting seeds in a sound condition, and the problem was studied by H. N. Ridley in the Botanical Gardens at Singapore. He found that seeds packed in moist, powdered charcoal retained their fertility for a long time, and when shortly after the beginning of the twentieth century planters began to take an increasing interest in rubber, large quantities of seeds were distributed by this means from Malaya.

The countries producing the largest quantities of plantation rubber are Malaya, the Dutch East Indies, and Ceylon. Smaller amounts are also obtained from India, Sarawak, Borneo, French Indo-China, Siam and various parts of Africa. Owing chiefly to the demands of the motor car industry the production of plantation rubber has made phenomenal progress. The first occasion on which a considerable amount of plantation rubber was offered on the market was in 1910, when the output reached 11,000 tons. By 1920 it was nearly 317,000 tons and in 1927 it amounted to 567,000 tons. In this period there were wide fluctuations in price, ranging from 12s. od. per lb. in 1910 to 7½d. per lb. in 1921.

While the production of plantation rubber has continued to increase that of wild rubber has decreased until in 1927 the world's production of all grades of wild rubber was only 6% of that produced on plantations. The reason for this is that not only is plantation rubber of good quality, comparable with that from the Amazon, but it is put on the market in a clean, dry condition.

Description of Principal Rubber **Tree.**—*Hevea brasiliensis* is a large tree which on occasions grows to a height of over 100ft. with a well developed trunk more than 12ft. in circumference. The usual height on plantations is from 60 to Soft. The leaves are three-lobed, the segments being long and narrow and tapering at each end. The flowers are usually pale green and inconspicuous, separate male and female flowers being borne on the same tree. The fruit is a capsule containing three seeds which are oval and have a mottled brown, smooth coat. When ripe the capsules explode violently and eject the seeds to a distance of 20yd. or more, well beyond the shadow cast by the parent tree.

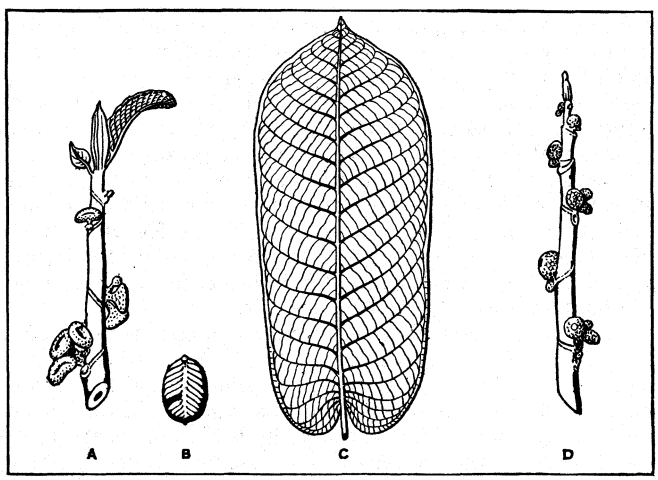


FIG. 2.—CASTILLOA ELASTICA
(A) Sprig bearing **male** flowers, **(B)** a **seed, (C)** a leaf, **(D)** twig bearing female flowers

The structure of what is popularly known as the bark is of considerable importance in Hevea *brasiliensis*, because, as already indicated, the latex vessels in this part of the tree are the chief source of the world's rubber supply. The trunk of a tree may be divided roughly into an inner portion of wood and an outer portion of bark. At the junction of the bark and the wood is a layer of cells about the thickness of a sheet of paper, known as the cambium, which appears as a slimy layer when the bark is torn away from the tree. This layer is the seat of growth, on the one hand adding new cells to the wood and on the other new cells to the bark. Next to the cambium and in the soft portion of the bark are found the latex tubes. Outside the soft bark is a hard portion where there are comparatively few latex tubes. The whole is protected by an external layer of cork. The diameter of the latex tubes is considered to be about 0·0015 inch.

Cultivation.—*Hevea* brasiliensis is planted on many types of soil and thrives remarkably well as long as reasonable precautions are taken to avoid swampy, undrained or exposed lands. It is sometimes grown at an altitude of over 2,000ft., but the trees do not flourish so well at this altitude as at a lower level.

In opening up a new plantation the land is cleared of all growth as soon as possible not only to make room for the rubber trees but also to avoid the possibility of disease from rotting timber.

At one time it was the practice on rubber plantations to remove all weeds and leave bare the ground between the trees, but this is no longer regarded as an attribute of a well-kept estate. It is still the practice to remove the weeds, but heavy tropical rains have caused such loss of top-soil, particularly on sloping land, that many estates find it necessary to plant cover crops. Shrubby types of plants such as species of *Crotalaria* and *Tephrosia* which are periodically lopped and mulched into the soil, or herbaceous types such as *Centrosema pubescens* and *Vigna oligosperma* are among those used.

On sloping land cover crops are not sufficient to prevent the loss of valuable top-soil. In Ceylon for example stone walls are sometimes built across the hills. As a general rule however it is considered better to level the land in a series of contours about 15 to 20ft. apart, cutting into the side of the hill at a slight gradient to a depth of about six feet.

The loss of top-soil can also be reduced by drains which prevent the accumulation of a continuous stream of water during heavy rain. In Ceylon a series of lateral drains empty into main drains (herring-bone drains) which carry the water away, but in Malaya and Sumatra the water is trapped in blind drains (silt pits) from which it ultimately percolates into the soil.

Where considerable erosion has taken place or the soil has been impoverished by previous cultivation it is sometimes possible to effect great improvement in the health of the trees by the addition of manures, particularly those containing nitrogen and phosphorus. This increased health is reflected in a more vigorous canopy of leaves, better replacement of bark removed for collection of latex, and a greater yield of latex.

The number of trees planted per acre on estates is largely dictated by local conditions, such as the quality of the soil and the contour of the land. Most estates plant out more trees than will eventually be required and thin them out, removing weak ones or those which prove low yielders, leaving about 90 trees per acre.

The rubber tree is by no means free from disease but a careful watch is kept by scientific officers, and nowhere in the East have the diseases assumed serious proportions. The most troublesome are an abnormal leaf-fall (not to be confused with that which occurs while the trees are wintering) and a pathological condition of the bark often associated with heavy tapping. Measures have been devised to counteract both, but they still occur.

Selection of Planting Material.— Most trees on estates yield 4 to 5lb. of rubber per annum, but there are a few which yield as much as 30lb. growing by the side of others which yield only 2-lb. As yield capacity is partly hereditary, it seems probable that the yield per acre may be greatly increased by propagating from high-yielding trees only. For this purpose two methods of propagation have received considerable attention. In one the plants are raised from seeds from carefully selected high yielding mother-trees. In the other a bud from a high yielding mother-tree is grafted on to a vigorous young plant grown from seed. Unless special care is taken a high yielding mother tree is liable to be fertilised by pollen from neighbouring low yielders, so that the daughter trees grown from seed may not be particularly good yielders. On the other hand it is to be expected that the budded material will have the vegetative characteristics of the mother tree.

Tapping.— The trees are ready for tapping for latex when about five years old, but the yield of latex and the quality of rubber obtained are not so good as when the trees are a few years

older. Tapping is a very delicate and important operation, consisting in the removal of a shaving of bark with a sharp knife. The cut passes through the latex tubes and there is a flow of latex in consequence. If the cut is too deep, it penetrates into the cambium and bark renewal is hindered, but if it is not deep enough only a portion of the latex tubes are pierced and the yield of latex is reduced. For perfect tapping it is necessary to cut within $\frac{1}{25}$ in. of the wood, an operation requiring practice and skill.

The only tapping tools in general use on the plantations are a gouge (straight or bent) and the ordinary farrier's knife (or its modification).

It is the usual practice to make the first cut at between two and four feet from the ground. A shaving is then taken at definite intervals of time from the lower edge of the exposed bark. The thickness of the shaving removed is so arranged that the consumption of bark is between half an inch and one inch per month, some districts, such as Ceylon,. preferring thin shavings while others, such as Malaya, prefer thicker shavings.

The length of the shaving varies from one-half to one-quarter of the circumference, some estates employing a single spiral cut at an angle of about 30° to the horizontal and some a V cut. In Ceylon it is the practice to change the tapping panel every six or twelve

months, but elsewhere it is customary to continue tapping on one panel down to the ground before commencing a fresh panel. Tapping is generally carried out every alternate day, one portion of an estate being rested while the other is tapped.

After the bark has been cut away, it is regenerated complete with latex vessels in a few years. With the most conservative system it is eventually necessary to tap on renewed bark. As the replacement of bark becomes more difficult each time a panel is tapped, there is a limit to the economic life of the tree, but the industry is too young for definite information on this point.

Tapping operations are always carried out in the early morning when the flow of latex is greatest. The latex from each tree is collected in a cup, transferred to a pail and taken to the factory as quickly as possible. Sometimes sodium sulphite is added to prevent premature coagulation. When the latex has ceased to drip there remains on the bark a thin film which dries in the sun leaving a strip of rubber. This is collected, washed in the factory and sold as "tree scrap"—an inferior grade.

Preparation.- he details of the methods employed in the preparation of plantation rubber depend upon the shape and appearance of the product to be put on the market, but in nearly all cases the outlines of the procedure adopted are the same. The sieved and diluted latex containing 15–25% rubber is treated with a coagulant such as acetic or formic acid or sodium silicofluoride. This causes the rubber to rise to the surface as a wet, white, doughy coagulum leaving in solution a smail quantity of mineral and organic matter. The coagulum is then pressed between rollers until it is the required consistency, thickness and shape. After that it is hung to dry and eventually packed in wooden cases and shipped to its destination.

The two most important forms of plantation rubber are sheet and crêpe. Sheet is generally dark brown in colour because it is dried in smoke, whilst crêpe is a straw colour and is dried in air.

Sheet is obtained from latex coagulated in shallow tanks divided into compartments of suitable dimensions, each piece of coagulum being pressed by light machinery to the required thickness.

In the preparation of crêpe the coagulum is machined much more drastically, heavy rollers being necessary. During this process the coagulum is torn and pressed until it is sufficiently thin to dry in air without artificial heat. The rubber is dried by hanging on racks in well ventilated sheds for about a week.

Sheet is thicker than crêpe and requires artificial heat to dry it in a reasonable time. It is therefore exposed to the smoke of a wood fire for about 14 days. It was at one time presumed that smoking had a beneficial effect on quality because the highest grade rubber was obtained from the Amazon where the latex is coagulated with smoke, a wooden paddle being repeatedly dipped into the latex and exposed to the smoke of burning Urucuri nuts until a fairly large sized ball of rubber is built up. Experimental evidence does not support this view however and it is probable that as firewood becomes more difficult to obtain other means of drying sheet rubber will be developed on estates.

Both crêpe and sheet are sold largely on appearance. It is customary therefore to add sodium bisulphite to latex when preparing crêpe so that the rubber may be as pale as possible, and p-nitrophenol to latex in the preparation of sheet so that the development of mould may be prevented. Sheet rubber contains more mechanically enclosed serum substances than crêpe and is therefore a more suitable medium for the growth of mould. Not even drying in smoke entirely prevents this when conditions are favourable, but p-nitrophenol is an effective safeguard.

A considerable proportion of plantation rubber is prepared on native estates without machinery of any kind. In these cases the latex is coagulated with a convenient coagulant, not necessarily a suitable one. Sulphuric acid and alum have been used for this purpose although they affect adversely the behaviour of the rubber during manufacturing processes. The coagulum is lightly pressed by hand and whilst still wet is sent to a central factory where it is milled to crêpe and sold as an inferior grade of rubber.

Chemistry.— The microscope has been particularly useful in yielding information concerning the structure of rubber latex. The array of globules dancing here and there (Brownian movement) are easily seen at moderate magnifications, and it is possible to measure them and show that they vary in shape and size. In Hevea latex the globules are shaped like a pear and vary in length from 0·00002in. to six times that size. In spite of their minute size the expert has been able to ascertain that the globules in Hevea latex consist of an outer skin of non-rubber material, enclosing a viscous rubber shell surrounding semifluid rubber.

When Hevea latex is treated with any but very weak acids, the Brownian movement of the globules ceases, and they unite to form a coherent coagulum. Dehydrating agents such as alcohol and pro-

tein precipitants such as tannic acid also cause Hevea latex to coagulate.

In the presence of suitable proportions of an alkali such as ammonia or caustic soda, Hevea latex retains its liquid condition for many years, but in the absence of such additions bacterial action occurs, acids are developed and the latex quickly coagulates. Disinfectants also have a preserving effect on latex.

As already indicated, undiluted Hevea latex usually contains 30–40% of rubber. There are also present a number of other substances, amongst which by a remarkable chance are small quantities of compounds essential to the commercial applications of the product. When latex is coagulated with an acid only a portion of the accessory substances are coagulated with the rubber. The rest remains in the serum. The active non-rubber substances still mixed with the rubber are ample, however, to satisfy commercial requirements. For this reason methods of preparing rubber by evaporating latex have not met with general approval. In such cases the pure rubber may only amount to 85% of the solid material, whereas commercial crêpe and sheet prepared by acid coagulation may contain as much as 95%.

The following table shows the average percentage of the different non-rubber substances in dried Hevea latex in comparison with the amounts present in crêpe and sheet.

Non-rubber constituent	*Amount present in*	
	Dried latex per cent	*Crêpe and Sheet* per cent
Protein and nitrogenous matter	4–5	2
Constituents soluble in acetone	4–5	3
Mineral matter (ash)	1½	0·3
1-methyl inositol	1½	traces
Sugars	½	traces

Some of the constituents of the accessory substances are particularly active in accelerating vulcanisations and are therefore of great importance to the rubber manufacturer. A similar effect may also be produced by another of the accessory substances, viz., the ash which consists chiefly of potassium compounds.

Constituents soluble in acetone (a solvent which does not affect the rubber portion of the product) contain an appreciable amount of fatty acids such as oleic and stearic which dissolve and disperse some of the mineral powders mixed with rubber during commercial operations. The acetone-soluble material also contains a substance (allied in chemical composition to the sterols) which is particularly useful in preserving vulcanized rubber goods against the effects of atmospheric oxidation, so that they remain supple and elastic for a longer period than they otherwise would.

Pure rubber (caoutchouc) is a compound containing carbon and hydrogen only, in the proportion corresponding to five atoms of carbon and eight of hydrogen (C_5H_8). It belongs to the class of bodies known as terpenes and is related in chemical composition to the constituents of turpentine.

The specific gravity of rubber is a little less than that of water. It decreases regularly with increase of temperature except between 30 and 35° C when the decrease is greatly accelerated. At the temperature of liquid air rubber is transparent and brittle like glass. At 0–10° C it is hard and opaque, but quickly reverts to a soft and translucent condition above 20° C. As the temperature increases the rubber becomes softer, stickier, weaker and less elastic. These changes are greatly accelerated at temperatures of 50–60° C. At a little below 200° C rubber decomposes yielding liquid hydrocarbons of the terpene series.

When rubber is repeatedly pressed between rollers it becomes more plastic and sticky and less elastic. While in this condition large quantities of powders and plastic solids may be mixed with the rubber merely by repeatedly passing through rollers.

Rubber is insoluble in water and is unaffected by alkalis or moderately strong acids, but these substances may react with the non-rubber accessory substances present. Rubber is dissolved by benzol, petrol, carbon disulphide, chlorinated hydrocarbons, etc. It forms compounds with halogens, halogen acids, ozone, certain oxides of nitrogen, chromyl chloride and certain metallic halides. It is oxidized by nitric acid, potassium permanganate and hydrogen peroxide. It is also slowly affected by atmospheric oxygen, particularly in the presence of copper salts. It is reduced by hydrogen in the presence of a catalyst.

When rubber is heated at 120–160° C with sulphur it forms a product known as vulcanized rubber, which is stronger, more elastic and less affected by changes of temperature than the raw material. It is also insoluble in all the usual solvents. These changes are considerably modified by the amount of sulphur and heat applied and also (although to a lesser extent) by powders and other substances which may have been mixed with the rubber.. With suitable adjustments it is possible to obtain from the raw materials a product which is as soft and elastic as an inner tube or as hard and brittle as a piece of vulcanite.

RUBBER: PRODUCTION AND MANUFACTURE.

Columbus and Spanish explorers who followed him to the new world found the natives playing games with a ball made from latex, the fluid exudate of a tree. The first written reference to this gum was by Gonzalo Fernandez de Oviedo y Valdes in *La historia natural y general de las Indias*, published in Seville, 1535–57. The natives of tropical America referred to rubber by the names *Hevea*, "Olli" ("Ule"), "kik" and "cauchuc" (Spanish adaptation). In ancient Peru "cauchos" was regarded as one of three substances with magical properties. Charles Marie de la Condamine, who was dispatched by the French government in 1731 on an expedition to study the shape of the earth, sent back from the Amazon a dark-coloured resinous material from *Hevea* trees called caoutchouc, and reported: "Linen is covered with this material and used like oil-cloth at home; the natives make shoes of it which are waterproof. They also cover molds of earth, in the shape of bottles, with this material and when the resin is dry they smash the mold, take the pieces of earth out through the bottle neck, and have an unbreakable bottle which is useful for preserving all kinds of liquids." Some of the crude rubber found its way to England, where Joseph Priestley, discoverer of oxygen, observed that it rubbed out pencil marks and gave it the name rubber. By 1825 "gum boots" of native make were imported into the United States. These were soon to be made on wooden lasts supplied by Yankee traders. This business reached a volume of 462,230 pairs in 1842. In 1831 similar shoes, made in a factory in the United States by coating fabric with a solution of rubber in turpentine, proved unsatisfactory as the rubber became soft in summer and stiff in winter and was degraded by turpentine. People in Europe and America who had taken an interest in rubber became disgusted with its limitations. The German F. Ludersdorff, 1832, and the American Nathaniel Hayward had found sulphur effective in lowering the tendency of rubber to grow sticky. Yet, it was Charles Goodyear's experiment (Jan. 1839) in cooking a mixture of rubber, white lead and sulphur on a kitchen stove that pointed the way to the commercial use of rubber. Thomas Hancock in England, working on the same problem, was shown samples made by Goodyear. The sulphur bloom on these samples prompted him to heat raw rubber in molten sulphur which effected "vulcanization" of the rubber as his friend William Brockedon termed the operation. Hancock patented his discovery in England in 1843, while Goodyear's U.S. patent was issued in 1844.

The discovery of hot vulcanization led to great activity in the manufacture of rubber in Europe and the U.S. In the United States, rubber footwear, waterproofed clothing, bumpers for railway cars, rubber balls and other articles were made until, by 1858, 10,000 workers, located mainly in New England and New Jersey, were engaged in making rubber goods valued at nearly $5,-

000,000. In 1870 rubber manufacturing was started in Akron, O., by The B. F. Goodrich Co., followed in the late 1890s by the Diamond Rubber Co. (purchased by The B. F. Goodrich Co. in 1912), the Firestone Tire and Rubber Co. and the Goodyear Tire and Rubber Co. By 1910 Akron had become the greatest centre of rubber manufacture in the world. The manufacture of rubber articles at mid-20th century was being conducted on every continent and in all parts of the world, but most extensively in the United States, United Kingdom, France, Canada and Germany. Important types of manufactured rubber goods include transportation items (used in the assembly of automobiles, aeroplanes, farm machinery, bicycles and other vehicles; see TIRE); industrial products (belting, hose, packing, jar rings, typewriter platens, shock absorbers, sponge rubber and a host of other items); footwear and clothing; sports items (rubber balls, shoes and wearing apparel); druggists' sundries (hot-water bottles. bulbs, syringes and gloves); novelty items (toys. balloons, aprons, stationers' bands. etc.); and latex foam products (mattresses, cushions for furniture and automobile seats).

TABLE I.—Consumption by Countries of Natural and Synthetic Rubbers

*Excluding the U S.S.R. and satellite countries. †Previous to 1950, data exclude sole crepe.

Rubber Consumption. — The world consumption of natural rubber in Iong tons was 100,000 in 1910, 297,500 in 1920, 710,000 in 1930, 1,110,000 in 1940, 1,705,000 in 1950 and 1,867,500 in 1955. The increased rate of consumption was caused mainly by the development of automotive transportation. In each of the years 1910 to 1950 (except 1944) 40% to 75% of the crude rubber used was consumed in the United States. In the period 1950 to 1955 U.S. consumption dropped to 33% because of increased usage of synthetic rubbers. The importance of synthetic rubber for general-purpose uses began to be recognized after 1940.

Two basic developments anticipated the growth of the modern rubber industry — the discovery of the hot vulcanization of rubber by Charles Goodyear of New Haven, Conn., 1839, and the noteworthy contributions of Thomas Hancock, England, 1820–56, who invented processes and machines the basic principles of which have continued to find widespread use in the industry. Hancock invented the masticator for kneading tough natural rubber into soft masses; the calender, a set of squeeze rolls to sheet rubber or coat it on fabrics; and he used moulds, 1846, to form rubber articles under heat and pressure. Hancock was also among the first to recognize the advantages of forming articles from natural rubber latex. Both these pioneer inventors were unusually productive of new ideas. Between them they anticipated the use of rubber in making hundreds of new articles and laid the groundwork for almost every important development made by the industry. Contemporary with these two men were Charles Macintosh of London who introduced the practice of spreading fabrics with rubber solutions and doubling the plies to give the mackintosh raincoat fabric, and Edwin M. Chaffee of Massachusetts who introduced the smooth roll mill for mixing rubber batches in 1835, and the first set of calender rolls for the frictioning of rubber masses onto fabric in 1836.

Other prominent technical advances in the rubber industry were the development of the applied science of compounding; the introduction of reclaimed rubber made from discarded rubber articles by a number of methods: the development of reinforcing pigments such as the fine particle size carbon blacks which impart to cured rubber marked improvement in resistance to tear and abrasion; the advantageous use of rubber in composite structures with materials such as textiles. metals, wood. glass, asbestos and other components; the invention of many ingenious machines for use in the assembly of rubber articles; and the development and extensive use of synthetic rubber. The discovery of organic accelerators by George Oenslager of Akron. O., in 1906, benefited the industry by speeding up the vulcanization step and by making possible products of better quality and higher uniformity. The discovery of age resisters, chemicals which retard the deterioration of rubber goods without affecting the state of vulcanization, was announced by Herbert Winkelmann and Harold Gray in 1923 and by Sidney Cadwell in 1924.

Crude Rubber. — (See RUBBER: BOTANY, CULTIVATION AND CHEMISTRY.) The source of natural rubber is the latex of certain plants, mainly the tree Hevea *brasiliensis*. In plantation practice coagulated latex may either be washed and air dried to make "pale crepe," or sheeted and cured to form "smoked sheets." These two grades are the standard types of commercial rubber. Commercial grades include various types of ribbed smoked sheets, latex crepes, brown crepes, remilled crepes. flat bark crepes. fine Para, central scrap. Congo and guayule rubbers. Crude rubber is usually shipped in rectangular bales wrapped in sheets of similar rubber. The weight of a bale is about 224 lb. Originally, rubber came from wild trees and vines and was collected by natives of the region where these grew. Great variability and scores of different grades prevailed even for some time after the advent of plantation rubber, about 1910. Washing and drying operations formerly uidespread in the manufacturing industry are most extensively practised near the source of the rubber. A great deal of the rubber used by the factories is cleaned by straining in a screw-fed machine in the head of which is mounted a screen to retain foreign matter.

Synthetic Rubber. — After 1941 the use of synthetic rubber was necessary in the manufacture of rubber articles; first, because Japan captured Malaya, Indo-China and Indonesia — source of more than 90% of the world's rubber — and withheld crude rubber from world markets until its defeat in 1945; and, second, because the world production of crude rubber was inadequate to supply the demand after World War II. Scientists from mid-19th century had envisaged the possibility of getting from chemical reactions a product like rubber. The idea started when Michael Faraday, at the request of Hancock, made a chemical analysis of natural rubber and reported. 1826. the empirical formula C_5H_8; the German, C. Himly, in 1838 named the volatile distillate which he derived from rubber "Faradayine." a tribute to the pioneer chemist in the field of rubber; the French chemists, A. Bouchardat. 1837, and G. Bouchardat, 1875, starting from this type of distillate, made resinous products from it. C. Greville Williams in England. 1860, found that isoprene. key to the puzzle, was the probable main component in Faradayine and that rubbery masses could be made from isoprene. His countryman, W. Tilden. 1892, reported that isoprene from turpentine gave rubberlike yellowish masses on standing. But none of these products was rubber. The intense nationalism and bickering which marred the progress of scientific discovery in the search for

synthetic rubber during the 1900–40 period virtually vanished in the years after World War II. Three Russian scientists made significant early discoveries. I. Kondakow in 1900 made leatherlike plastic masses from 2.3-dimethyl butadiene-1,3, the substance which about 1910 was to serve as the basis of the earliest chemical rubber made independently both in the United States and in Germany. S. V. Lebedev in 1910 converted butadiene-1,3 to a rubberlike product, which later became the most important molecule with which to start in the making of chemical rubbers; Lebedev also originated one of the simplest methods ior obtaining butadiene from alcohol. A third Russian scientist, I. Ostromislensky, not only contributed valuable information on the source of butadiene. 1915, but also worked on the polymers of vinyl chloride, 1916. new giant molecules which by 1940 had proved of great industrial importance in supplementing rubber.

The German attempts to make synthetic rubber from dimethyl butadiene, 1910–18, led to a production of only 2,350 tons of the "methyl" rubbers — grades "W" for use in soft rubber goods and "H" in hard rubbers—but these rubbers were not competitive with natural rubber. Parallel with this early German effort, L. P. Kyrides (Kyriakides) and Richard Earle. 1910–13, worked out three processes for synthetic rubber for the Hood Rubber company near Boston. Mass. The most promising of these depended upon dimethyl butadiene from acetone and gave rubber from which satisfactory footwear was made at a high cost. C. Harries in Germany and F. E. Mathews and E. H. Strange in England independently in Oct. 1910 found metallic sodium an excellent catalyst for polymerization of butadiene and isoprene. This type of rubber was rnade commercially in the U.S.S.R. after 1928 under the designation SKB (based on alcohol) or SKA (based on petroleum).

The first commercially important and successful synthetic rubber, neoprene. was announced in 1931 for sale by E. I. du Pont de Nemours and company. Xeoprene (first called Duprene) stemmed from the work of the Rev. Julius Arthur Nieuwland, C.S.C.. and was perfected by the work of du Pont chemists, Wallace Carothers. Elmer K. Bolton and others. which was started about 192j. Neoprene, made from 2-chlorobutadiene-1,3 (chloroprene), resembles natural rubber more closely than any of the other chemical rubbers made prior to 1954. Its finished products resist oil, sunlight and ozone, and are used widely. Production of neoprene in the U.S. rose from 2.469 long tons in 1940 to 50,067 long tons in 1950 and to 91,357 long tons in 1955.

In December 1954 Goodrich-Gulf Chemicals. Inc., announced the synthesis oi a new rubber, a cis-1,4-polyisoprene, using a Ziegler type catalyst and isoprene. In August 195j The Firestone Tire and Rubber Co. announced the synthesis of a cis-1,4-polyisoprene using metallic lithium dispersion and isoprene. Both of these synthetic rubbers closely resemble *Hevea* rubber and heavy-duty truck tires made of each of these rubbers were successfully road tested. Each type performed as well as the *Hevea* rubber control tires. These two examples of directed polymerizations (referred to as stereo-specific) are indeed notable achievements in high polymer chemistry. The Goodrich-Gulf announcement reported also the synthesis of trans-1,4-polyisoprene, a polymer essentially like natural gutta percha or balata. Subsequently, directed polymerizations of butadiene were announced.

In July 1956, Dr. Howard J. Teas, U.S. department of agriculture: and Dr. Robert S. Bandurski. Michigan State university. announced the test tube synthesis in small amounts of natural rubber from C^{14} (radioactive carbonj–labelled acetate by the activity of enzymes that had been separated by centrifugation from freshly tapped *Hevea* latex.

Buna Rubbers. — German chemists of I. G. Farbenindustrie A. G. began an intensive search for a commercial synthesis of rubber about 1925. The numbered Buna rubbers. such as Buna 8j and Buna 115, were made by Lebedev's method from Butadiene and sodium (*Na*trium) whence the name "Buna," but these rubbers which ranged from a rubbery to a pitchy consistency were not of good enough quality to replace crude rubber in general use. Hence, the search was continued and led to the emulsion copolymerization of butadiene and styrene, two chemicals which the German industry could provide abundantly from grain alcohol and coal, respectively. The copolymer Buna S was made by charging the butadiene and styrene into a pressure vessel with soap, water and minor ingredients. The emulsion thus formed was transformed overnight into a suspension of rubbery particles, an opnque latex from which Buna S rubber was derived by coagulation with salts and acids. When washed and dried Buna S resembled crude rubber. By a similar method Buna N was formed from the reactants butadiene and acrylonitrile. The first large factory, capacity 24,000 metric tons, for the synthesis of these "lettered" Buna rubbers by the emulsion process mas subsidized by the Nazi government and began operation about 1939. Those who were required to use Buna S to make rubber goods complained that it took two to three times as much milling capacity as natural rubber. but reports indicated that tires made from it gave good mileages. During the shortage of neoprene in 1937, Buna N from Germany was sold in the United States under the name Perbunan Manufactured articles made from it gave good service in withstanding oil exposure.

After 1925 several polymers other than neoprene with properties akin to rubber mere perfected and produced mainly in the United States. Some of these. such as the plasticized polyvinyl esters (Koroseal. Vinylite, Geon). are of the nonvulcanizing type and arc often listed as plastics. but their performance in uses once rendered only by cured rubber entitles them to rate as rubbery materials. The noncuring polyisobutylene and polyethylene were also used commercially to supplement rubber. Thiokol. 1928, a polyalkylene polysulphide, had a limited use, mainly for articles required to nithstand lacquer solvents.

Perbunan, Hycar. Chemigum and Butaprene, all nitrile-butadiene rubbers of the oil-resistant type, not only replaced natural rubber in parts exposed to various oils but were used extensively in new fields such as compounding with synthetic resins to replace plasticizer (polyblends) in making films for food packaging or as latex in paper impregnation. Silicone and Silastic rubbers, organic polymers containing silicon, support loads at temperatures in the range from −50° F. to 550° F. without loss of shape or insulating properties. At temperatures somewhat lower than 500° F the sun-resistant Hycar P.A. (acrylate type) rubbers impart good elasticity under both compression and elongation.

In June 1940 the B. F. Goodrich company announced the Ameripol tire in which more than 50% of the rubber consisted of a butadiene copolymer, and the Standard Oil Development company announced butyl rubber for inner tubes. Butyl rubber is a polymer made at temperatures about — roo° F. from isobutylene with only about 2%–5% of a diene such as isoprene.

GR-S.—In 1940 the United States began to recognize the threat of war to the world's supply of rubber The Rubber Reserve company of the Reconstruction Finance corporation was created June 28. 1940, to build up domestic stocks of crude rubber from the alarmingly low level of 125,000 long tons at the end of 1939. The National Defense Advisory committee in Aug. 1940 held meetings with informed men in the rubber industry and drew up a program for 100 000 long tons a year capacity of synthetic rubber since private companies appeared unwilling to risk the capital needed to go ahead on this scale. Even the government at that time was reluctant to approve such a large operation, and in May 1941 scaled it donn to about 40,000 long tons with plans for four plants, each of 10,000 tons capacity. Meantime, privately financed plants of 30,000-ton capacity were in prospect by 1942. After the attack by Japan on Pearl Harbor this government program was increased tenfold, and again doubled after the fall of Singapore. With relatively slight alterations these programs when completed had a capacity of 1,000,000 long tons a year of synthetic rubber. Even after their authorization the public was not convinced that they could be completed in time to supply the needs of the United Nations in a global war. Hence, on Aug. 6. 1942, Pres. Franklin D. Roosevelt appointed the Rubber Survey committee to study the rubber situation and make recommendations, with Bernard M. Baruch as chairman. The specific recommendations of the committee. Sept. 1942, were quickly enforced. These were rationing of motor fuel and tires,

limiting driving speeds to 3j m.p.h., and reorganizing and consolidating the government agencies then dealing with rubber in order to expedite the gigantic synthetic program. The president in Sept. 1942 created the Office of Rubber Director under the War Production board. Among the chemicals required each year to effect this synthetic program were 600.000 tons of butadiene. 220,000 tons from alcohol and the balance from petroleum feed stocks; 187,500 tons of styrene; about 100,000,000 pounds of soap. and smaller amounts of auxiliary chemicals, catalysts and solvents. Besides the plants to make these starting materials there were polymerization plants for GR-S (government rubber, styrene type, the general purpose rubber) and plants of entirely different design for the manufacture of butyl (GR-I) and neoprene (GR-M). Fifty-one plants were designed, built and operated by 49 rubber, chemical and industrial companies under the supervision of the Rubber Reserve company The estimated plant investment exceeded $700.000,000. These operations involved full co-operation of the industry with the pooling of patents and the exchange of technical information under an agreement which extended from Dec. 19, 1941, to March 31, 1949. Plants were located mainly in Connecticut, Pennsylvania, Ohio, West Virginia. Kentucky, Louisiana, Texas, Arkansas and California. The Canadian plant at Sarnia, Ont., under the dominion government, had a designed yearly capacity of 30,000 long tons of GR-S and 7,000 tons of butyl, with facilities for butadiene, styrene and isobutylene manufacture.

From 1945 on disposal of government-owned plants was actively studied by government agencies and by industry. U.S. public law 469 (1948) prescribed a minimum consumption of GR-S of 200,000 long tons a year with stand-by plant capacity up to 600,000 long tons to ensure national security, and with 65,000 long tons capacity for specialty rubbers, including those suitable for inner tube manufacture. The president of the United States, Jan. 1950, recommended the policy of selling government-owned plants to the industry under conditions that would ensure adequate supplies of the needed rubbers, encourage developments designed to improve their quality and restrain monopolistic ownership of the plants. These conditions were met and on May 1, 1955 the bulk of the GR-S plants for manufacture of monomers, polymers and ancillary materials together with inventories of rubber and raw materials on hand nere sold to private industry. Including $91,000,000 cash on hand in the Synthetic Rubber office of the Federal Facilities corporation, the government realized $401,565,000. The Baytown plant (with 447 pressurized tank cars for monomer shipment) was sold July 1S, 1955 for $10,923,700. In early 1956, the plant at Institute, West Virginia was sold for $11,000,000 leaving only the laboratory in Akron in government hands at the end of 1956. Transfer to private hands proceeded smoothly, drawing to a close an episode of magnificent co-operation knitted together by the fears, privations and urgencies of war.

*Known as GR-S during government operation of the plants. S-type rubbers are copolymers of butadiene and styrene. Designation changed, 1955, to SB (styrene-butadiene) rubber.
†N-type rubbers are copolymers of butadiene and acrylonitrile.
‡Excluding German production in 1945.

The year 1948 marked the introduction of "cold" rubber made from the same basic ingredients as GR-S in an activated recipe at 41° F. compared with the temperature 122° F. ordinarily used. The road wear of tires made from cold rubber was improved over those from crude rubber by 10% to 25%. In 1955 GR-S plants produced 520,353 long tons of cold rubber, 66% of the total U.S. synthetic rubber production.

MATERIALS USED IN THE INDUSTRY

Rubber Materials. — The new rubbers consumed by the industry, including natural and synthetic, comprise the largest tonnage of any material used.

Reclaimed Rubber. — Vulcanized rubber scraps (tires, tubes, footwear, etc.) are plasticized and are available for reprocessing by the ordinary methods of rubber goods manufacture. The process of scrap treatment is known as reclaiming and the product as reclaimed rubber, reclaim or shoddy. The two methods most extensively used are the alkali process, patented by A. H. Marks, 1899, and the heater process, in which pans of scrap rubber, softeners and caustic are exposed to steam at about 350° F. Reclaim originates in at least 23 countries with an aggregate reclaiming capacity estimated as of 1945 at 530,000 long tons. Reclaim blends readily with crude rubber and GR-S to give compositions which process smoothly and is of great economic importance as a supplement to the new rubber consumed by the industry. In 1955 the tonnage of reclaim consumed by the C.S. manufacturing industry amounted to 312,781 long tons or just over 20% of the total new rubber consumption. Proportionate consumption in 1939 was 29% and in 1942 was 65%.

Scrap.—Unvulcanized trimmings containing no fabric or other materials are not waste. They map be blended with fresh stocks of the same composition and utilized with no loss of material value. Unvulcanized waste containing fabric may be treated to pulverize the fabric and utilized in rubber compositions with some reduction in value. Even vulcanized waste is incorporated in certain goods.

Dry Pigments. — Reinforcing and *Filling* Pigments. — Powdered materials are blended with rubber materials in order to modify the stiffness, strength and resistance to abrasion or chemical action of the vulcanized rubber. Reinforcing pigments possess the property of stiffeningand strengthening rubber compositions so that the total energy necessary to extend a strip of the compound to its breaking point is greater than that necessary to stretch a similar mix containing only rubber, sulphur and accelerator. Fillers, though they may stiffen the vulcanized compound, do not increase the total energy of rupture. Carbon blacks of two types (impingement and furnace), zinc oxide, certain clays, calcium silicate and magnesium carbonate are common reinforcing pigments. Whiting and barytes are extensively used as fillers.

Colours.—Most of the colours for rubber goods are useful in powdered form, and few colours soluble in rubber are used. For white goods, zinc oxide, lithopone, titanium oxide and zinc sulphide are used. Reds, blues, yellows and other colours and shades are secured with pigments such as ferric oxide, ultramarine blue and zinc chromate. The utilization of certain organic dyestuffs (phthalocyanine colours) and certain salts of azo dyes has enhanced the aesthetic appeal of rubber articles.

Other Compounding Ingredients. — Softeners. — For modifying the characteristics of the vulcanized rubber mixtures and for improving their properties for ease in processing, many kinds of softening materials are incorporated in rubber stocks. Petroleum products from oils to paraffin wax, tars, oxidized petroleum residues (mineral rubber); rosin, pine tar, fatty acids or their zinc salts, and many others are common to the industry. For use with the synthetic rubbers, resins derived from coal by distillation and by ensuing chemical treatments of distillates have been highly regarded.

Vulcanizing Agents.—By far the commonest vulcanizing agent is sulphur, used in the form of ground brimstone. The proportion used depends upon the character of the product required. Soft rubber goods carry from 2 to 10 parts of sulphur, but in most compounds not more than 34 parts per 100 of rubber are used. Synthetic rubber articles in general require about four-fifths as much sulphur as those made from crude rubber. Compositions unusually resistant to natural deterioration are produced containing less than 1% of sulphur. Hard rubber compositions carry 20% to 50%. Some organic sulphur compounds which liberate sulphur at vulcanizing temperatures have been used in special cases without addition of sulphur itself. Selenium and tellurium will produce vulcanization also, and have been used to some extent, usually, however, with some sulphur. Benzoyl peroxide, dinitro- and trinitro-aromatic compounds, dioximes, diisocyanates and dinitroso-compounds also vulcanize rubber.

Accelerators of *Vulcanization.*—Vulcanization of rubber by sulphur alone proceeds at a slow rate and almost invariably suitable materials, called accelerators, are added to the rubber mixes to hasten the process.

From the time of Goodyear's experiment, in which he used white lead, until 1906, the only accelerators used were inorganic oxides or hydroxides—litharge, white lead, quick or slaked lime, magnesia. Organic accelerators shortened the time of vulcanization and enhanced the tensile and other properties of the vulcanizate. The early accelerators (1906)—thiocarbanilid and para-amino dimethyl aniline—gave way to diphenyl guanidine, mercaptobenzothiazole, the aldehyde-amines, thiuram sulphides and many newer chemicals. The activity of accelerators is improved by secondary ingredients such as zinc oxide, litharge or magnesia, and even by other organic accelerators. They are often further assisted by acid materials, such as oleic or stearic acids or pine tar. Pneumatic tires, formerly requiring three hours for vulcanization without accelerators, are vulcanized by the action of organic accelerators in less than an hour. Deterioration of rubber may be greatly retarded by the use of certain accelerators.

Age Resisters.—Deterioration of vulcanized rubber in storage or in service may be retarded also by incorporating in the mixture, before vulcanization, 0.5% to 6% of certain organic chemicals which have practically no effect on the vulcanization rate hut greatly retard the rate of oxidation or change in properties of the vulcanized product. Some age resisters also impart to rubber comnounds resistance to deterioration by heat and resistance to cracking under repeated flexure. The age resisters used in largest volume are secondary amino compounds. The term "antioxidant" is widely used in referring to the behaviour of chemicals which retard the deterioration of rubbers While crude rubber from most sources contains a natural antioxidant, it is necessary to stabilize synthetic rubbers by the incorporation of 1% to 2% antioxidant in their manufacture to keep these rubbers fresh during storage. Usually, additional antioxidant is used in compounding these rubbers.

Other Materials.—The rubber softener and filler Factice is made either by the action of sulphur chloride on vegetable oils—white substitute—or by heating these oils with sulphur—broun substitute. White substitute is used in cold vulcanized articles (see below) and brown substitute in hot vulcanized goods.

TECHNOLOGY

"Compounding" is that branch of technology concerned with systematic study of the composition and physical properties of natural and synthetic rubbers and their vuicanizates in relation to the performance of rubber articles. Compounding, as an applied science, has contributed to the growth of the industry by testing and specifying those composi-

tions which perform best under severe service. As a result of these technical advances by anonymous compounders, rubber has come to be properly regarded as a state oi matter rather than the specific hydrocarbon analyzed by Faradap in 1826 In the United States during World War II the consumption of new rubber changed from 96% natural in 1942 to 80% synthetic in 1944. The fact that the performance of rubber products remained without interruption at a very high level during this period is a tribute to the compounders. (The term "compounding" is also used to refer to the weighing of the various ingredients in preparation for the factory mixing of rubber batches, but in this article "compounding" will be used only in the technological sense.) Certain physical properties of compositions based upon natural and synthetic rubbers are shown in Table III and Table IV.

Properties of Vulcanized Rubber.—Typical uses of rubber in the unvulcanized state are for cements, surgical adhesive tape, insulating tape and crepe soling. Nearly all rubber depends upon vulcanization and compounding for the properties which make it useful The primary properties which lead to the wide use of rubber comprise high elongation with rapid recovery over a wide range of temperatures, the cohesive strength with flexibility needed to cushion shocks and impacts, impermeability to gases and to water, and low specific gravity. Moreover, rubber compositions are relatively unaffected by oxygen, acids, bases, many organic solvents and other chemicals, and show good electrical properties. Outstanding among other materials is the performance of rubber against abrasive wear which accounts for many of its applications such as in transportation, conveyor belts, chutes, linings and air hose Among the various rubbers, natural rubber compounds have relatively the lowest hysteresis and the best resistance to cutting, chipping and crack growth. Of the compounded synthetic rubbers, butyl has the lowest permeability by gases, GR-S (cold rubber) shows the best tread wear, the nitrile rubbers show the least swelling in oils and most solvents, the acrylate rubbers (consisting mainly of polyethyl acrylate) are remarkably resistant to dry heat and sunlight, and neoprene is notably unaffected by ozone.

Laboratory Controls and Specifications.—Incessant technological changes within the industry have been made possible only by vigilant control over quality at every step in manufacture. Chemical and physical tests on the raw materials. the rubber mixtures in process and on the end products of manufacture have become routine. For example. tread mixings are tested for specific gravity, for plasticity and for cured hardness to ensure uniform performance on the road. More accurate testing methods have led to rigorous specifications governing the selection of materials, the operations of processing and assembly and the performance of finished products.

Cleaning and Straining.—See section on Crude Rubber above.

Washing and Drying.—See section on Crude Rubber above.

Mastication.—Unvulcanized rubbers are soitened by the influence of temperature, oxidation and mastication. Crude rubber breaks down and loses toughness when masticated. This type of softening is due to oxidation. As of the latter 1950s it was thought that under the shearing forces generated by milling the long rubber molecules are broken, forming free radicals, that is, chemically reactive ends. These reactive ends can recombine to reform the original molecule or they can combine with other free radicals to form new molecular shapes when the milling is done in inert atmospheres. But inasmuch as commercial milling is done in air, these free radicals at the ruptured ends of the molecule react with oxygen thus producing, for example, two shorter rubber molecules instead of the originally long one—and hence a more plastic rubber. Both crude and synthetic rubbers are more quickly masticated for large production operations at temperatures around 350° F. in which process temperature is the important variable. Since much heat is generated in the process the mill rolls are often chilled to keep the temperature down to that desired. Chemical softeners usually of the thio-aromatic type may be incorporated in amounts customarily under 1% to facilitate mastication, but these are not used in most batches. Rubber is often

plasticized on two-roll mills and in internal mixers, but by far the largest tonnages are passed through poweriul extrusion type (Gordon) plasticators in preparation for the subsequent steps.

Mixing.— Mixing mills vary in size from 24 in. to 84 in. in width. The 84-in. mills consist of two parallel, horizontal rolls set close together side by side and revolving in opposite directions. The back roll is fixed in position and geared directly to a drive shait, the front roll is floating. The clearance between the rolls is adjustable. Rolls are made of cast iron mith chilled surface. The rolls of 84-in. mills are 24 in. or 26 in. in diameter, cast hollow and fitted for service mith internal perforated pipes for the introduction of cooling water The procedures for mixing batches containing crude rubber, reclaim or one of the chemical rubbers will differ somewhat from each other. It is essential, however, in all cases, that all parts of the batch be uniformly blended. This blending is secured by cutting the sheet on the mill roll with a sharp knife, beginning at one end and rolling it on itself until the sheet has been cut almost entirely across. The roll thus formed is permitted to sheet out again on the mill and the process repeated in the opposite direction. This is repeated six or seven times to secure uniform mixtures Internal (Banbury) mixers have been used extensively since about 1927 for nearly all large tonnage formulations These closed mixers operate at higher temperatures than roll mills and may do the mixing in a time interval as short as five to eight minutes. A typical large Banbury mixer, three stories in height, is provided with a hydraulic ram which is lifted as soon as the rubber is sufficiently soitened and jammed home after the charge of carefully weighed pigments has been added. Two irregularly shaped opposing rotors knead the contents together by a powerful smearing action

Calendering.— The calendering operation produces sheeted stock by pressing the rubber between rolls to iorm sheets of predetermined size and thichness. The usual type, a three-roll calender, consists of a heavy vertical trame holding adjustable horizontal rolls The rolls can be driven either at even speed or at odd speed, and heated or cooled by internal circulation. Footwear calenders are four-roll machines with engraved or embossed rolls so mounted that they are quickly detachable. Frictioning calenders for rubberizing iabrics are run so as to squeeze the rubber into the meshes of the fabric. The driven middle roll bears the rubber and delivers the sheet at a slightly faster speed than the bottom roll which supports the fabric. The frictioning process map be repeated on the opposite face of the fabric Coating calenders of the three-roll type operate with the lower two rolls at even speed The rubber sheet is firmly pressed against the prepared fabric as it passes through the calender but is not forced through the meshes as in frictioning Successive operations of irictioning and coating are frequently employed The use of the four-roll calender to coat both faces of the prepared iabric simultaneously has found wide acceptance, particularly in the tire industry. In a typical operation, parallel cords delivered from a creel are treated with latex, dried and fed between the squeeze rolls of the coating calender where uniform coats of rubber from the second and third rolls are compressed so as to join and surround the cords, thus forming a single ply of cord tire iabric.

Tubing Operations.— Tubing machines, or extruding machines, are devices ior forcing continuous strips of rubber from a die. These strips may be tubular, rectangular or any one of a great variety of irregular cross-sectional shapes. The tubing machine consists of a horizontal cylinder in which a power-driven screw rotates, forcing the rubber stock through a die inserted at the end of the machine They are used for the production of tubing, hose tubes, pneumatic tire treads, solid tire treads, inner tubes for pneumatic tires, channel rubber slides for the windows of automobiles and many other articles.

Cements.— Among the oldest of all operations in the industry is the preparation of solutions of rubber in organic solvents (cements) For each rubber variety the solvent must be properly chosen. Cements are usually prepared in enclosed churns with stirring. The relative importance oi cements to dry mixing operations and to latex applications has lessened since about 1930.

Spreading.— The fabric is drawn over a roller under a spreader kniie, which can be set at varying distances from the roll, carrying from a cement feed a thin layer oi the cement, and then over steam-heated pipes to evaporate the solvent. This process is repeated until the required thickness of rubber coating is built up. By this method the rubber surfacing is applied to shoe cover and backing cloth, balloon iabrics, printers' blankets for offset work and similar products Thin coatings similarly applied are used to improve the adhesion to fabric of rubber layers later applied on a calender.

Vulcanization (Curing).—Before vulcanization, rubber is weak, softened by moderate heat, rendered stiff by cold, soluble in gasoline or other solvents and easily plasticized and sheeted between narm rolls. After vulcanizing it is strong, not greatly softened by heat nor stiffened by cold, insoluble in gasoline, and will crumble if run between rolls. Unvulcanized rubber is easily deformed to assume new shapes permanently; vulcanized rubber returns to its original form after deformation Hot vulcanization, the process most generally used, is conducted in a number of ways.

Press Curing in *Molds*.—Many articles are given their final form and vulcanized at the same time by application of heat and pressure to the rubber material in metal molds The presses used consist of parallel-faced, steam-heated plates between which are placed metal molds in which the articles are formed. Pressure between the plates (platens) is secured hydraulically with the article receiving its heat only by conduction through the plates and mold faces, not by contact with steam. Most presses in production are provided with more than two platens to accommodate the work scheduled ior them. Hollow articles like syringe bulbs, tennis or toy balls are vulcanized in molds under inflation either by air or by nitrogen generated by the action of heat upon such a mixture as sodium nitrite and ammonium chloride in pelleted form. Special presses are made for curing long flat belts, a section of 20 to 36 ft. being cured at one time. Heavy conveyor belts, made in this fashion, may weigh 30,000 lb.

Tire Curing.—The trend toward automation in the rubber industry is illustrated by the general adoption of automatic tire curing presses of the Bag-0-Matic and Autoform type. Once the uncured drum-built tire (at this stage it is barrel-shaped) is placed in the open press the hinged halves of the steam-heated mold (which forms the outer shape of the tire) closes and at the same time a rubber bag in the centre is inflated with steam to press against the inside of the tire (like an inner tube) and so forces the tread and sidewall oi the tire into the design cut in the metal mold. Passenger car tires become fully vulcanized in 20 to 30 min. at temperatures of 300" to 320" F.

Lead Coating *for* Curing.—Garden hose made in long lengths is run through a lead press and covered with a lead sheath. A 500-ft. length thus covered is wound on a drum, placed in a cylindrical vulcanizer, and water connections leading outside are made to each end of the hose. Hot water is run through the hose while steam is admitted to the vulcanizer. In this manner, heat is applied simultaneously on both sides of the rubber structure and the internal water pressure compacts the hose against the lead sheath. Aiter cure, the lead covering is stripped, melted and used again for covering.

Open *Steam* Curing.—Articles mhich require no further forming than is produced in building operations may be vulcanized without enclosure in molds. Steam is permitted to come into contact either with the bare goods or with met iabric wrappings around them. For example, air brake hose is built on mandrels, wrapped tightly with wet cloth and vulcanized by steam directly surrounding the wrapped hose.

Continuous Curing of Insulated Wire.—Wire covered with a rubber insulation compound which cures rapidly is passed continuously through superheated steam in long steel pipes to effect vulcanization of the rubber in about one minute. The nipples ior passing the wire in and out of the vulcanizer are sealed by a slip fit between the rubber cover of the wire and the wall of the nipple.

Water Curing.—Some rubber goods are cured immersed in hot water under pressure. The pressure may be equal to or greater than that of saturated steam at the same temperature. Rubber sheet to be cut into thread is wrapped with wet cloths on drums, covered mith a vulcanized rubber sheet and cured under water. To secure a smooth surface on sheets of hard rubber the unvulcanized stock is rolled on sheeted tin, a number of these slabs piled together and vulcanized under water.

Air *Curing*.—Varnished footwear and shoes containing wool fabrics are cured by heating in air, which is used most effectively under pressure and circulated by pumps.

Sulfur Chloride *Curing*.—The process of cold vulcanization was discovered in 1846 by Alexander Parkes in England. It is conducted by exposing rubber surfaces to sulfur monochloride as vapour or in solution. The method is practical only with thin goods like surgeons' gloves or dental dam and is not much used commercially any more.

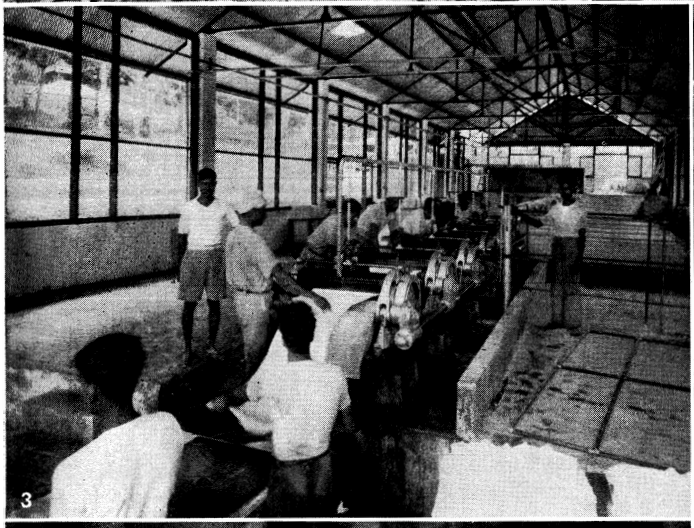
Radio-Frequency Heating to Effect *Vulcanization*.—In ordinary commercial practice, steam is used as a cheap source of heat for curing rubber stocks. Rubber stocks can also be heated by placing them in an intense field of radio waves of 5 to 30 mc. Thick rubber articles are thus heated throughout more quickly than with steam heat but the equipment needed is very costly.

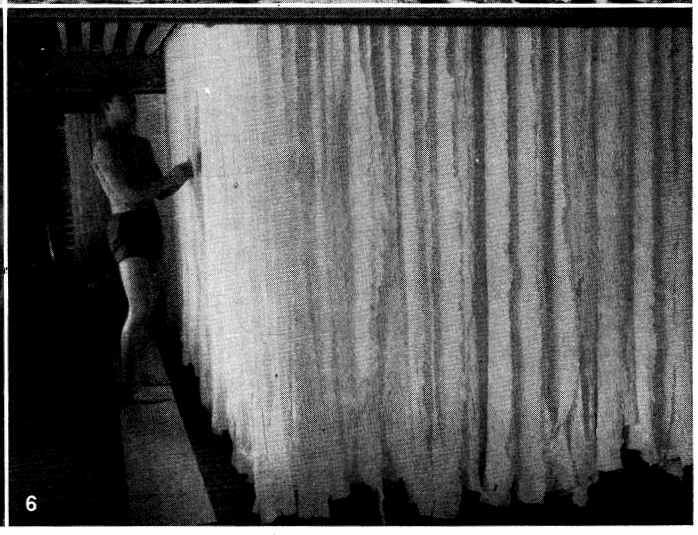
Vulcanization by *High-Energy* Radiation.—In 1927 E. B. Newton discovered that Hevea rubber could be vulcanized by high energy radiation. Sheets of rubber 0.20 in. thick exposed in a nitrogen atmosphere to high-speed electrons from a Coolidge tube operating with 1 milliampere at 250,000 volts became fully vulcanized in about 20 sec. With the advent of stronger beta and gamma ray sources in recent years, renewed interest in this type of curing has developed. No sulfur is required. Saturated polymers like polyethylene can also be cross-linked by this method.

Hard *Rubber* Vulcanization.—The commercial heating of rubber with large proportions of sulfur was first actively studied by Nelson Goodyear, who patented in 1851 a process for making hard rubber (ebonite). Articles of hard rubber are ordinarily formulated with 30% to 50% sulfur on the weight of the rubber, often with numerous other ingredients. Typical cures for these articles are carried out at higher temperatures and over longer periods than for soft rubber articles. Extensive heat evolution, and volume shrinkage and the generation of some hydrogen sulfide gas accompany ebonite vulcanization. Hence, cures are most frequently conducted in steam or water. Small masses of hard rubber can be cured in molds.

Latex.—*Hevea* latex from far eastern and Liberian plantations usually reaches the market in concentrated form of about 60% total solids with ammonia as the preservative. Various synthetic rubbers, mainly oi U.S. production, including the nitrile rubbers, are also available as latices. Suitably compounded with ingredients in finely divided aqueous dispersions, these latices find extensive use commercially in the treatment of tire cord for improved adhesion and

RUBBER: PRODUCTION AND MANUFACTURE





BY COURTESY OF (1) GOODYEAR TIRE AND RUBBER CO.; (2-4) THE B. F. GOODRICH CO.; PHOTOGRAPHS, (5, 6) EWING GALLOWAY

PREPARING **RUBBER** FOR COMMERCIAL USES

1. Native tapping a rubber tree for latex
2. The latex, after being sieved and diluted, is placed in tanks containing acetic acid or other coagulant. The rubber rises to the surface in the form of white coaaulum
3. The coagulum is passed through a series of sheeting rolls which press out most of the moisture. Following this operation, the sheets are cut to length and sent to the smokehouse
4. A plantation smokehouse, where the rubber sheets are hung on long racks. A fire is kept burning continuously in the lower part of the building. The smoke passes over baffles into the upper chamber, where it comes into contact with the sheets before it passes out through vents in the top. The smoking process takes from one to two weeks
5. Making crêpe rubber from coagulum. The roils rotate at different speeds, thus giving the typical crêping action
6. Crêpe rubber is air-dried in sheds in order to preserve the natural light colour. This drying process takes from four to five weeks

RUBBER MANUFACTURE AND PRODUCTS

1. Rubber conveyor belt elevator, 14 stories high, lifts 100 tons of rock every hour
2. GR-S polymerizers in a U.S. government rubber plant, Port Neches, Tex.
3. Two-roll mixing mill. The batch shown is white sidewall stock for passenger-car tires
4. Mould curing. Dome-type vulcanizers are hinged like waffle irons. The tire is shown before (right) and after cure. Internal curing bags transmit both heat and pressure
5. The creel starts about 3,000 parallel cords on their way to form the sandwich between sheets of rubber at the coating calender. Such a sandwich makes up one ply in a passenger-car tire
6. Butadiene row, in Port Neches, Tex. Still columns which separate butadiene from cracked petroleum feed stock

in numerous novel applications whereby articles are formed by coating, dipping, casting inside or outside of porous forms, by ionic coagulation and by electrodeposition. The largest tonnage of both *Hevea* latex and synthetic S-type latex in the 1950s was consumed in the manufacture of foam latex cushions for automobile seat topper pads, for furniture upholstery and for mattresses. S-type latex having sufficient fluidity at 60% dry rubber content must be a large particle size variety which can be grown in the polymerization vessel or more recently by a freeze-agglomeration process of the Sponge Products Division of the B. F. Goodrich Co. starting with ordinary S-type latex. Most latex foam articles are manufactured either by the Dunlop process of mechanically frothing a heat-sensitized (by addition of sodium silico fluoride) latex mix, followed by vulcanization (in the met state), washing and drying or by the Talalay process of frothing the latex mix with the enzyme catalase (from live yeast) and hydrogen peroxide. followed by freezing the foam, coagulation of the frozen foam with carbon dioxide, then vulcanization in the wet state, washing and drying.

Prevulcanized latex compounds are available in most countries made by a process originated by Philip Schidrowitz, of London, Eng. For the most part latex compounds have been made available both to industry and to artists and craftsmen by the large manufacturers of rubber. Those latices which require vulcanization give sheets of tensile strengths in excess of 5,500 psi. while sheets made from prevulcanized latex test over 4,000 psi. Because of rapidly increasing consumption, natural and synthetic latices had become substantial items of commerce by the latter 1950s.

RUBELLZTE, a red variety of tourmaline used as a gemstone. It generally occurs crystallized on the walls of cavities in coarse granitic rocks, where it is often associated with a pink lithia-mica (lepidolite). The most valued kinds are deep red; the colour being probably due to the presence of manganese. Some of the finest rubellite is found in Siberia. Other localities include the island of Elba, the Urals, Burma and Minas Gerais, Braz. Fine rubellite is found in the United States, notably at Paris. Me., where the crystals are often red at one end and green at the other. Mt. Rubellite near Hebron and Mt. Apatite at Auburn are other localities in the same state from which fine specimens are obtained. Chesterfield, Mass., also yields red tourmaline. frequently associated with green in the same crystal. Pink tourmaline also occurs, with lepidolite and kunzite. in San Diego county, Calif. For discussion of composition, crystal forms, electrical and optical properties, etc.. *see* TOURMALINE.

RUBENS, PETER PAUL (1577–1610), Flemish painter and diplomat, was born at Siegen, Westphalia, June 28, 1577. His father Jan Rubens, although born a Roman Catholic, had appeared on a Calvinist list as early as 1566. After the decapitation of the counts of Egmont and Horne in Brussels in 1568, Jan fled from Antwerp to Cologne with his wife Maria Pypelincx and their four children, there to become agent and adviser to Anne of Saxony, second wife of William the Silent. An unfortunate pregnancy revealed in this princess of Orange the extent of her relationship with Jan, for whom however she obtained some clemency from her husband. Jan was nevertheless under house arrest at Siegen when both Peter Paul and his elder brother Philip were born.

These boys had their grounding in the classics from their exiled father, a *doctor utriusque juris.* But Jan died in 1587, after he had been allowed to go back to Cologne. Maria then thought it prudent to bring her four surviving children to Antwerp, where their father had been an alderman.

Antwerp Training. — At the age of ten, Peter Paul was sent with Philip to the Latin school of Rumoldus Verdonck, where the future painter befriended a contemporary who was to be a future patron, as head of the Plantin press, Balthasar Moretus. In 1590 shortage of money, and the need to provide a dowry for his sister Blandina, forced Maria to take Peter Paul away from school and make him a page to the countess of Lalaing. Soon tired of courtly life, he was allowed to turn to his real vocation. He mas sent first to his kinsman Tobias Verhaecht, a painter of mannerist landscapes in the stale tradition of Joos de Momper. Having quickly learned the rudiments of his profession he was apprenticed for four years to an abler master. Adam van Noort, and subsequently to the most distinguished of the Antwerp Romanists, Otto van Veen Vaenius, as he called himself, had been in Italy an active admirer of Federigo Baroccio as well as of the strictly Roman tradition in painting, and was learned in emblems. His culture and vision impressed Rubens, whose earliest independent works are known to have resembled his style.

Italian Period. — In May 1600, with two years' seniority as a master in the Antwerp Guild of St Luke, Rubens set out with Deodati del Monte, his constant traveling companion and first pupil, for the visual and spiritual adventure of Italy. Reaching Venice in about a month, he had early the fortune to meet a gentleman in the service of Vincenzo I Gonzaga, duke of Mantua. He nas offered employment in Mantua, which duchy held the largest and finest collections outside the Vatican of works from all Italian schools. Its capital, moreover, was ideally placed for sightseeing in Lombardy. Emilia and the Veneto. During the eight years that Rubens was to call Vincenzo his lord he had unmatched opportunities of fulfilling his expressed intention "to study at close quarters the works of the ancient and modern masters. and to improve himself by their example in painting." Andrea Mantegna and Giulio Romano were his admired predecessors in Gonzagan service. The abundant achievement in decoration and architecture of Giulio Romano. artistic heir of Raphael, had a lasting and highly productive effect on him.

Recommended to Cardinal Montalto in Rome, Rubens nas sent (1601–02) to paint copies for the duke. There, through his Flemish connection, he obtained his first public commission, three altarpieces for the crypt chapel of St. Helena in Sta. Croce in Gerusalemme, formerly titular church of the cardinal Archduke Albert, who was by this time consort to Isabella, regent of the Spanish Netherlands. In Rome, Annibale Carracci and his school were at work in the Farnese gallery. From their bold scale in drawing and characteristic working methods Rubens formed the decisive habits of his life. Through Annibale's exnmple he mas first enabled to digest the power of Michelangelo. Raphael and Leonardo da Vinci were his other High Renaissance heroes for nobility and energy of design. He assimilated Venetian colour, light and application of paint first through the works of Tintoretto, then through those of Veronese, long before he could penetrate the inward meaning of Titian's art. His copies, and his renorking of drawings, offer the most complete conspectus of 16th-century achievement in a pungently personal revision.

In 1603 he was entrusted with his first embassy, to bring Philip III and the Spanish court costly presents from Mantua. This mission gave him a first view of the Habsburg treasures, including more than 70 works by Titian. Two paintings in the groups of copies offered to Philip's favourite, the duke of Lerma, being rain-sodden beyond repair, mere promptly replaced by him with a "Democritus and Heraclitus" of his own invention. His resource, and his tact nith the regular llfantuan agent at Valladolid, whither the Spanish court had moved, raised him in Vincenzo's estimation and prepared him for future diplomatic voyages. His equestrian portrait of the duke of Lerma initiated his masterpieces in this genre: its pattern of presentation inspired Van Dyck. His fruitful association with the banking patriciate of Genoa began with his return voyage and his meeting with Nicolb Pallavicini, Vincenzo's banker, in order to recoup expenses.

His only major work for Mantua, a conspicuous challenge to the memory of Michelangelo, Raphael and Tintoretto, was the threefold decoration for the Jesuit church of SS. Trinità. Nothing of his but portraits of court beauties mas commissioned for the Gonzaga gallery itself, although he induced Vincenzo to buy for the gallery Caravaggio's rejected "Death of the Virgin." and he negotiated the purchase of a Cristofero Koncalli for the duchess. After his work for SS. Trinità (1604–05) and for the high altar of the Jesuit church in Genoa (1605), he obtained leave to continue

his studies in Rome. There he shared a house with his brother Philip, then secretary and librarian to Ascanio Cardinal Colonna. Daily contact with Philip, the most brilliant pupil of Justus Lipsius and the hope of classical studies, added zest to his personal renascence of the antique world. The combined fruits of their learning were strung into the text and illustrations of *Electorum Libri II* (1608), published by the Plantin press. Apart from a summons in 1607 to accompany the Gonzagan court on a summer progress to the seaside resort of San Pier d'Arena, where he invented splendid means to portray the Genoese aristocracy, Rubens was left largely undisturbed. But chronic arrears in payment of his salary, and ambition to establish himself as a metropolitan, not just a Mantuan painter, caused him to seek the backing of a Genoese patron, Jacopo Serra, in obtaining the coveted commission at the Chiesa Nuova. The protracted difficulties of this work for the Roman oratory, during which he brought off at speed a superb altarpiece for the Oratorians of Fermo, still occupied him when, in Oct. 1608, his brother Philip, already back in Antwerp, summoned him to their mother's death bed.

Return to Antwerp.— Riding irom Rome in haste, Rubens was nevertheless too late to see his mother alive. His first altarpiece for the Chiesa Nuova, which had been offered in vain to Mantua, became at last her monument. Although soon "bound with golden fetters" to the service of the Habsburg regents in Flanders (Sept. 23, 1609), then and for long after Rubens contemplated a return beyond the Alps to re-enter the lists of the Roman painters. As late as the 1620s he supplied cartoons to Genoa. Of six languages which he used with ease, Italian remained his favourite for correspondence. The house which he built for himself, the pride of Antwerp, had a model Pantheon which he enriched with statuary, cameos, coins and jewels. *Palazzi di Genova* (1622) was his published souvenir of civilized modern architecture. He practised the spirit of his preface in the magnificent new church of the Antwerp Jesuits. St. Charles Borromée, where he, assisted in the execution of ceiling paintings by Van Dyck, was the master decorator and, with Peter Huyssens, the chief designer of the facade, tower and all architectural detail. This building. with the almost contemporary banqueting house designed by Inigo Jones at Whitehall, London, where Rubens was to achieve his long-cherished ambition to fill the huge ceiling with paintings (delivered 1634), was the architectural sensation of northwest Europe.

He settled in Flanders. marrying Isabella, daughter of Jan Brandt, the Antwerp lawyer and humanist (Oct. '1609). and establishing himself not only as court portraitist but, by a trilogy of altarpieces: as the leading painter of his country. These altarpieces were: the fully baroque "Erection of the Cross" for St. Walpurga's. Antwerp (1610), a mature criticism of his treatment of the subject in Sta. Croce in Gerusalemme; the more classical "Descent from the Cross" for Antwerp cathedral; and for the cathedral of St. Bavo, Ghent. "The Miracle of St. Bavo," which. although conceived as a triptych like the others. was much modified to fit a single field. Relieved of the obligation to live at the Brussels court he was also exempt from guild regulations, and so free to engage pupils or collaborators nithout having to have them enrolled. By 1611 he wrote that he had to refuse more than 100 applicants to join his studio. As his international reputation grew, in part through careful organization of printmaking to advertise his designs, numbers of large-scale works issued from his studio which were only in certain areas, or generally retouched. by his hand. But to almost the last year of his fabulously productive life he painted unaided a superior class of very large works, as well as of cabinet pieces, oak panels being favoured for their supports. During 1606–07 he used small panels prepared with gesso for the various categories of oil sketches required to facilitate his manifold activity. sketches to work out his pictorial ideas. to present models to clients or to instruct engravers, sculptors, tapestry weavers and painting assistants They are small works in inches only, marvellous drawings in paint. whether *en grisaille* or fully coloured But he never entirely abandoned the Renaissance practice of evolving compositions in chalk and ink.

ALINARI

THE CHILD JESUS AND ST. JOHN. DETAIL FROM "THE HOLY FAMILY" BY PETER PAUL RUBENS. IN THE PITTI GALLERY. FLORENCE. ITALY

Diplomatic Activity.––Archduke Albert died in 1621, the year in which the 12 years' truce between Spain and the Netherlands ended. Rubens became adviser to the widowed archduchess, of whom he was to write (1628): "Long experience has taught her how to govern these people and not to be taken in by ialse theories which every newcomer brings irom Spain." She. like him, desired to prolong peace France grew suspicious. The French ambassador wrote from Brussels (1624). "Rubens is here to take the likeness of the prince of Poland, by order of the infanta I am persuaded he will succeed better in this than in his negotiations ior the truce" Early in 1622 Rubens had been summoned by Marie de Médicis, whose wedding by proxy he had attended in Florence in 1600. for his first visit to Paris. After six weeks of discussion he returned to Antwerp to begin nork on the *Histories of Marie de Médicis* for the walls of the first of two great galleries to be decorated by him in her new Luxembourg palace. This cycle of 21 canvases, his most important secular commission. was completed in two years. Being again in Paris for their installation in 1625. he met the duke of Buckingham, to whose persistence in bidding high for his iamous collection of antiquities and paintings he was eventually to accede for diplomatic reasons. Buckingham was in Paris for the marriage by proxy of Charles I and Henrietta Maria of France. With him was his master of the horse, painter and agent. Sir Balthasar Gerbier. Secret correspondence between Rubens and Gerbier was maintained even after the fresh outbreak of war between England and Spain, which led to Buckingham's disastrous expedition to Cádiz. Not until the assassination of the Stuart favourite was the way reopened for Rubens to negotiate peace on behalf of the sorely tried Spanish Ketherlands. He described Antwerp to Louis XIII's librarian as "languishing like a consumptive body, declining little by little." Unfortunately Philip IV's minister, the count of Olivares and duke of San Lucar, known as the *conde-duque,* had persuaded his master to make a close pact with France to reconquer England for Catholicism. In 1628 Rubens had therefore to travel in secret haste to Madrid. The papal nuncio reported of his arrival. "It is considered certain that Rubens, the Flemish painter, is the bearer of a negotiation. for we hear that he often confers in secret with the *conde-duque,* and in a manner very different from that which his profession permits. They say that he left England a short time ago; and since he is said to be a great friend of Buckingham, it is believed that he comes with some peace treaty between the two crowns. Others think his main object is the truce of Flanders, and that he has received this commission as one who enjoys the confidence of all that country."

During nine months in Madrid, besides negotiations and royal portraiture. Rubens set himself to school again before Titian's masterpieces, revisiting the Escorial with Velázquez. He overcame Philip IV's prejudice against him as a suitable negotiator, and was named secretary of the privy council of the Netherlands to conduct a special mission to England. He hastened across

France, past the hostile Richelieu, to report to Archduchess Isabella. News awaiting his return to Brussels made his mission yet more urgent and difficult. England had made a treaty with Frsnce (April 24, 1629). Charles I wished to treat with Rubens as a plenipotentiary, without waiting for the exchange of regular envoys. The Dutch alliance and the restitution of the Palatinate were crucial to Anglo-Spanish relations. Rubens succeeded, however, in laying the groundwork for the peace treaty (Nov. 15, 1630). For this he was knighted by Charles I and given an honorary degree by Cambridge university. "The Blessings of Peace," (National gallery, London), featuring Gerbier's children, is his painted proclamation of success. He discussed painting with Charles I, the only prince to whom he vouchsafed a self-portrait (Windsor castle), and, in particular, projects for the Whitehall ceiling. He was struck by the beauty and peacefulness of the English scene. The "Landscape with St. George" (Buckingham palace) was his private souvenir of the Thames view from his lodgings, with the royal pair envisaged in masquerade as patron saint and rescued princess. But a general peace was far away. His letter of March 12, 1638, explains "The Horrors of War," a late masterpiece sold to the Medici in Florence. He identifies the figures of the allegory: "that grief-stricken woman clothed in black, with torn veil, robbed of all her jewels and other ornaments, is the unfortunate Europe, who for so many years now has suffered plunder, outrage, and misery."

Later Works.—On his return to Flanders in 1630 Rubens mas rewarded with exemption by the archduchess from further diplomacy. "This favour I obtained with more difficulty than any other she ever granted me," he was to write. "Now, for three years, I have found peace of mind, having given up every sort of employment outside my beloved profession."

Having been four years a widower he married (Dec. 1630) the 16-year-old Helena Fourment, whose charms recur frequently among his later figure subjects. Many of his grandest and most romantic interpretations of landscape belong to this decade of his retirement from court affairs, when he owned the Château de Steen. But his active interest in landscape had been unbroken since at least the drawings of his Roman period. Long-established interests were revived also in his co-ordination of the work of every Antwerp painter for the stagings designed and partly executed by him to welcome the Infante Ferdinand, successor to Archduchess Isabella, in 1635. Thirty-six years before, he had assisted Vaenius to convert their city into a theatre. The great commission of Rubens' last years was, however. for the infante's brother Philip IV, the provision of models for about 120 scenes from Ovid to decorate the Torre de la Parada near Madrid.

Rubens died at Antwerp on May 30, 1640, when gout, which had for months troubled his painting arm, reached his heart.

Achievement.— Rubens remains unchallenged even by the longer-lived Picasso as the most methodically assimilative, the most prodigiously and variously productive among European artists. Schooled in the congested traditions of Xntmerp mannerism, he educated himself to be heir of the full range of Renaissance design to be seen both north and south of the Alps. And he saw the masterpieces of the Renaissance as yet undisturbed from their intended places. The abundant energy and warmth of his nature not only fired him to emulate the masters both of antiquity and of the 16th century in Rome, Venice and Parma, but made him responsive to the artistic revolutions being worked by living artists: to Adam Elsheimer's plein *air* study of nature and times of day in the Roman campagna; to Federico Barocci's colour combinations and delicate appreciation of warm and cool tones vibrant on flesh; to Michelangelo da Caravaggio's emotive exploitation of strong chiaroscuro; and, most profoundly and lastingly, to Annibale Carracci's impassioned yet strenuously disciplined approach to the practise of figure composition.

Robust powers of comprehension nourished his limitless resource in invention. The larger the scale of the undertaking the more congenial it was to his spirit. The success of his public performance as master of the greatest studio organization in Europe since Raphael's in Rome has obscured for many the personal intensity of his vision as evinced in such works as his oil sketch for "All Saints" and in his deeply felt study for the head of St. John in the Antwerp "Descent from the Cross," as well as in portraits of his family and friends and in his treatment of the mood and grandeur of landscape. Not only Van Dyck, Jacob Jordaens and his immediate following in Flanders, but artists at almost every period have responded to the force of his genius. Giovanni Lorenzo Bernini, the other seminal mind of the early baroque, developed in his Roman altarpieces figurative ideas and the dramatic handling of light instituted by Rubens. And in the fulfillment of the Italian baroque Domenico Feti, Castiglione and Bernardo Strozzi are in individual ways Rubensians. Watteau, Fragonard, Delacroix and Renoir are only the four most distinguished in the long succession of French painters who were attracted after the late 17th century to some aspect of his production. Reynolds, Gainsborough, Constable and Etty are outstanding among his active admirers in England. In the history of western art he is a central figure.

His own deepest love as a painter, consummated by his second visit to Spain, was for the poetry, the control of glowing colour and the sheer mastery in handling of oil paint that excelled in the art of Titian. In these qualities Rubens himself became supreme, whether with the brilliant play of fine brushes over the white reflecting surface of a small panel. or with masterful gestures often more than six feet long, sweeping a richly loaded brush across some huge canvas.

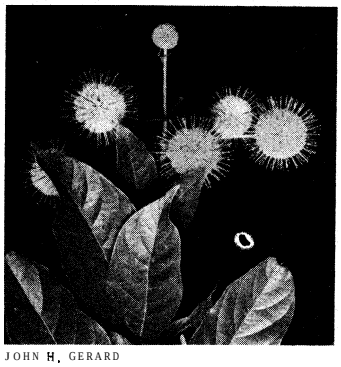
RUBIACEAE, the madder family, a large family of angiospermous flowering plants, dicotyledons. belonging to the sympetalous order Rubiales and containing about 450 genera with approximately 5,500 species. The Rubiaceae have a world-wide distribution with centres in the tropics of the old and new worlds. They vary in form from herbs to trees, but most of the species are inconspicuous and subordinate elements of the vegetation. Some, such as coffee and quina bark trees, have attained major economic importance.

Well-known British and North American examples of Rubiaceae are species of *Galium* such as bedstraw (*q.v.*), woodruff, cleavers (*q.v.*), etc.

Rubiaceae are characterized by opposite (or whorled), entire stipulate leaves, rotate sympetalous flowers, mostly with four or five lobes to the corolla and the same number of alternate stamens. The ovaries are nearly always inferior with a single style. The Rubiaceae have probably been derived from ancestors closely allied to recent Loganiaceae (Contortae) by gradual submergence of the superior ovary.

The taxonomy of the Rubiaceae is still a matter of some debate. Six subfamilies with many tribes may be recognized: Cinchonoideae, Crophylloideae, Ophiorrhizoideae, Guettardoideae, Ixoroideae and Rubioideae. The general phylogenetic trends nithin the family are manifold. Their form varies from woody trees and shrubs, predominant in the tropics. to dwarf shrubs. perennial and annual herbs, mostly found in subtropic, temperate 'and arctic-alpine regions. The leaves are mostly large and evergreen in tropical groups, often deciduous in temperate groups and needle- or scalelike in xeromorphic groups. The stipules tend to merge to medium stipular regions which in the Rubioideae develop from one to many leaflike stipules. In primitive groups of Rubiaceae the flowers are relatively large, single and situated in leaf axils; in derived groups they are reduced in size and combined into various kinds of inflorescences. From monomorphic hermaphrodite floners the development is to dimorphic (long- and short-styled), or unisexual and eventually dioecious flowers. Further phylogenetic trends include shortening of corolla tubes, loss of calyces, reduction in the number of carpels from five and six to two, and of



JOHN H. GERARD

BUTTONBUSH (CEPHALANTHUS OCCIDENTALIS), WIDELY DISTRIBUTED IN MARSHES OF NORTH AMERICA

the number of ovaries per ovary chamber to one. Each chamber contains, depending on species, from one to numerous ovules. The fruits vary in form from dry capsules and drupes to schizocarpous nutlets which are sometimes covered with hooked hairs and similar devices for epizoöic dispersal (*e.g.*, "cleaver" species of *Galium*).

Pollination is effected by insects or birds (very rarely by the wind) or by self-pollination. Some fluctuations of the basic chromosome number and especially polyploidy (multiplication of basic chromosome number) have played an important role in the evolution of the family. Of biological interest are the tropical epiphytes (*Myrmecodia* and *Hydnophytum*), which develop swollen stems inhabited by ants. Other genera have leaves with symbiotic, nitrogen-binding bacteria.

Rubioideae species with whorled leaves and leaflike stipules are widespread in temperate regions; *e.g.*, common species in Britain are *Galium mollugo* (hedge bedstraw), G. *verum* (lady's bedstraw) and G. *aparine* (cleavers or goosegrass); in North America species of *Cephalanthus* (buttonbush), *Mitchella* (partridge berry), Houstonia (bluets, innocence), Kelloggia and *Galium* are found.

Some of the Rubiaceae are of economic importance. The bark of Cinchona (*q.v.*) and some other tropical South American genera contain quinine (*q.v.*). Coffee is produced from the seeds of Coffea, particularly *C. arabica* and C. *liberica*. The ipecacuanha root (Uragoga) contains vomitive glucosids. Other species provide tanning and dyeing (*e.g.*, madder, Rubia *tinctorum*) substances. Some tropical trees furnish timber. Members of the genera *Ixora, Manettia, Bouvardia,* Rondeletia, Gardenia, *Phuopsis, Galium, Asperula* and others are of horticultural value. (F. EH.)

RUBICON, a small stream of ancient Italy, which flowed into the Adriatic between Ariminum and Caesena and formed the boundary between Italy and Cisalpine Gaul in republican times. Hence Caesar's crossing of it in 49 B.C. meant a declaration of war against Pompey and the senate. The importance of this event gave rise to the phrase "crossing the Rubicon" for a step which definitely commits a person to a given course of action.

Its upper course is represented by that of the Pisciatello and its lower portion by the Fiumicino.

RUBIDIUM, a rare chemical element of the alkali metal group, the most reactive of all metals except cesium (*q.v.*). The uses of rubidium and its compounds are limited but noteworthy. Its natural radioactive isotope, Rb^{87} (half life, 53,000,000,000 years), has been used to determine the age of the solar system. An estimated age of 4,500,000,000 years, based upon the decay of Rb^{87} to strontium (Sr^{87}) in a stony meteorite, is consistent with results based upon the decay of uranium to the final end product, lead. For the opposite extreme of precision, an atomic clock whose ticks are the natural vibrations of rubidium atoms has been proposed; ammonia clocks and cesium clocks are now in use. The purpose of such devices is to establish an invariant standard for time units, quite independently of the earth's rotation, which would be accurate to 1 part in 10.000.000.000 or more.

The discovery of rubidium (and of cesium), the first of many new elements to be detected by the spectroscope, was a crucial step in the development of the science of spectroscopy (*q.v.*). R. W. Bunsen and G. R. Kirchhoff. who perfected the spectroscope, used it to study alkali metal compounds extracted from the mineral lepidolite. They obtained a chloroplatinate whose flame spectrum had two unusually prominent red lines which did not match those of any known element. In their report, made in 1861, Bunsen and Kirchhoff told how they named the new element:

> The magnificent dark red colour of these rays of the new alkali metal led us to give this element the name rubidium and the symbol Rb from *rubidus,* which, with the ancients, served to designate the deepest red.

Although ranking 16th (0.031%) in the estimated abundances of the elements in the earth's crust; rubidium is widely dispersed among minerals (lepidolite, carnallite and some feldspars) and mineral waters containing other alkali metals. The highest concentration of rubidium is found in lepidolite (lithium mica), the deposits of South-West Africa containing as high as 3% of Rb_2O. To extract rubidium, the finely ground calcined mineral is treated with sulfuric or hydrochloric acid. Rubidium and cesium are then separated from the solution by fractional crystallization, generally of their alums, which are less soluble than those of lithium, sodium and potassium. The rubidium may be partially separated from cesium by precipitation as chloride from a hot HCl solution to which is added ethyl alcohol; or, by precipitation as carbonate in ethyl alcohol. Rubidium may be quantitatively separated from the other alkali metal ions and from those of other metals in a column of cation exchange resin.

Metallic rubidium can be prepared by heating the carbonate, hydroxide or chloride with a suitable reducing agent; magnesium, aluminum, calcium, barium azide, $Ba(N_3)_2$, and calcium carbide have been used.

Rubidium is a silver-white metal which inflames in air, reacts vigorously. with cold water liberating hydrogen and forming the hydroxide, RbOH, a very strong base. Other properties are summarized in the Table.

Physical and Atomic Properties

Atomic number	37
Chemical atomic weight	85.48
Outer electron configuration	$4s^2, 4p^6, 5s^1$
Density of solid at 20° C., g. per c.c.	1.53
Melting point, ° C.	38.5
Boiling point, ° C.	696.
Ionization potential, volts	4.18
Potential for $Rb \rightleftarrows Rb^+ + e$, volts	2.99
Specific heat at 0 C., cal. per g.	0.080
Metallic radius, A	2.16
Ionic radius, A	1.48

The salts of rubidium resemble those of potassium and cesium; they are mostly ionic and those of the common acids, chloride, sulfate, nitrate, carbonate and phosphate, are soluble in water. The perchlorate, acid tartrate, picrate, the hexafluorosilicate, hexanitrocobaltate, hexachlorostannate, hexachloroplatinate and the tetrachloroantimonite are relatively insoluble. Some of the rubidium salts are used in microchemical analysis.

For bibliography *see* POTASSIUM. (J. B. Ps.)

RUBINSTEIN, ANTON GRIGORIEVICH (1829–1894), Russian pianist, was born of Jewish parentage on Nov. 28, 1829, at Vykhovatinets, Volhynia. Besides his mother Anton had but one teacher. the piano master Alexander Villoing, of whom he declared at the end of his own career that he had never met a better. In July 1839 Rubinstein appeared in the theatre of the Petrovsky park at Moscow; and in the following years in the principal centres of Europe, including London. He then studied in Berlin and Vienna. The years 1848 to 1854 were spent in St. Petersburg in performing and composing. His opera *Dmitry* Donskoy was produced there in 1852, and Tom the Fool in 1853. The Siberian Huntsmen, written about the same time: was produced at Weimar in 1854. In 1857 he paid his second visit to London where, at a Philharmonic concert he introduced his own concerto in G. In 1858 he was appointed concert director of the Imperial Russian Musical society and in 1862, in collaboration with Carl Schuberth, he founded the St. Petersburg conservatory, of which he was director until 1867, and again from 1887 to 1890. For 20 years from 1868 he made prolonged concert tours in Europe and the United States, enjoying prodigious success wherever he went and being accounted by some the superior even of Liszt. He died on Nov. 20, 1894. Rubinstein left compositions in almost every known form, but it is as one of the greatest of all pianists that he will be remembered. His autobiography was published in an English translation in 1890.

His brother NIKOLAY GRIGORIEVICH RUBINSTEIN (1835–1881) was also a fine pianist and teacher. He founded the Russian Musical society in 1859 and the Moscow conservatory in 1864, and was

the latter's director until his death. Tschaikovsky wrote his pianoforte *Trio in A minor* in memory of him, although he had quarreled with him on the B-flat minor concerto.

RUBRUQUIS (or RUBROUCK), **WILLIAM** OF (c. 1215–1270; *fl.* 1253–55), Franciscan friar, one of the chief medieval travelers and travel writers. Nothing is known of him save what can be gathered from his own narrative, and from Roger Bacon, his contemporary and brother Franciscan. The name of Rubruquis ("Fratris Willielmi de Rubruquis," probably meaning "of Rubrouck," Flanders) is found in the imperfect manuscript printed by Hakluyt in his collection, and followed in his English translation, as well as in the more complete issue of the English by Purchas. (*Itinerarium fratris Willielmi de Rubruquis de ordine fratrum Minorum*, Galli, *Anno gratiae* 1253, *ad partes Orientales.)*

Friar William went to Tartary under orders from Louis IX (St. Louis). That king, at an earlier date, viz., December 1248, when in Cyprus, had been visited by alleged envoys from Elchigaday (Ilchikadai, Ilchikdai), who commanded the Mongol hosts in Armenia and Persia. The king then despatched a return mission consisting of Friar Andrew of Longjumeau or Lonjumel and other ecclesiastics, who carried presents and letters for both Ilchikadai and the Great Khan. They reached the court of the latter in the winter of 1249–50, when there was no actual khan on the throne; they returned, along with Tatar envoys, bearing a letter to Louis from the Mongol regent-mother which was couched in terms so arrogant that the king repented sorely of having sent such a mission. The envoys reached the king at Caesarea, between March 1251 and May 1252. But not long after the king, hearing that the Tatar prince Sartak. son of Batu, was a "baptized Christian," felt moved to open communication with him, and for this purpose deputed Friar William of Rubrouck. The former rebuff had made the king chary of sending formal embassies, and Friar William on every occasion, beginning with a sermon delivered in St. Sophia's on Palm Sunday (*i.e.*, April 13) 1253, disclaimed that character.

Friar William apparently received his commission at Acre, but he traveled by way of Constantinople and there received letters to some of the Tatar chiefs from the emperor, Baldwin de Courtenay, the last of the Latin dynasty.

Rubrouck and his party landed at Soldaia, or Sudak, on the Crimean coast, then a centre of intercourse between the Mediterranean world and what is now S. Russia. Equipped with horses and carts for the steppe, they traveled successively to the courts (*i.e.*, the nomad camps) of Scacatai (Kadan?), Sartak and Batu, thus crossing the Don and arriving at the Volga; of both these rivers Friar William gives vivid and interesting sketches. Batu Khan (*q.v.*) kept the travelers for some time in suspense, and then referred them to the Great Khan himself, an order involving the enormous journey to Mongolia. The actual traveling of the party from Crimea to the khan's court near Karakorum cannot have been, on a rough calculation, less than 5,000 mi., and the return journey to Lajazzo in Cilicia would be longer by 500 to 700 mi. The envoys embarked on the "Euxine" on May 7, 1253. They were at the camp of the Great Khan from Dec. 27, 1253, to about July 10, 1254. They reached Tripoli on the way home on Xug 15, 1255.

Roger Bacon, in the geographical section of the *Opus Maius* (c. 1262), cites the traveler repeatedly and copiously. Add to this William's own incidental particulars as to his being—like his precursor. Friar John de Plano Carpini—a very heavy man, and we know no more of his personality, except the abundant indications of character afforded by the story itself. These paint for us an honest, pious, stouthearted, acute and most intelligent observer, keen in the acquisition of knowledge, the author of one of the best narratives of travel in existence. His language indeed is dog-Latin of the most un-Ciceronian quality; but it is in his hands a pithy and transparent medium of expression. In spite of all the difficulties of communication, and of the badness of his *turgemannus* or dragoman, he gathered a mass of particulars, wonderfully true or near the truth, not only as to Asiatic nature, geography, ethnography and manners, but as to religion and language.

The narrative of Rubrouck, after Roger Bacon's copious use of it, seems to have dropped out of sight, though five manuscripts are still known to exist: the chief of these are (1) Corpus Christi College, Cambridge, no. 66, fol. 67 v.–110 v. of about 1320; (2) No. 181 of the same library, fol. 321–98, of about 1270–90; (3) Leiden University Library, no. 77 (formerly 104), fol. 160 r.–190 r. of about 1290. *See* the two editions in the Hakluyt Society's publications, (i) *William of Rubrouck . . . John of Pian de Carpine,* trans. and ed. by William W. Rockhill (1900); (ii) *Texts and Versions of . . . Carpini and . . . Rubruquis . . .*, edited by C. Raymond Beazley (1903).

RUBY, the valued gem stone, is a red transparent variety of corundum, or crystallized alumina. It is named from the Latin *rubeus* ("red"). It is sometimes termed oriental ruby to distinguish it from the spinel (*q.v.*) ruby, which is a stone of inferior hardness, density and value. The blue variety of corundum is sapphire (*q.v.*).

The ruby crystallizes in the rhombohedra1 system *(see* CORUNDUM); the crystals have no true cleavage, but tend to break along certain gliding planes. The colour varies from deep cochineal to pale rose-red, in some cases with a tinge of purple, the most valued tint being that called pigeon's-blood. The ruby is a mineral of very limited distribution. Its most famous localities are in Upper Burma, principally in the neighbourhood of Mogok, in the Katha (*q.v.*) district, 90 mi. N.N.E. of Mandalay. It occurs in ruby-bearing earth and in bands of a crystalline limestone, associated with granitic and gneissose rocks, some of which are highly basic; the limestone also contains spinel, garnet, graphite, wollastonite, scapolite, feldspar, mica, pyrrhotite and other minerals. The ruby, like other kinds of corundum, suffers alteration under certain conditions, and passes by hydration into gibbsite and diaspore, which by further alteration and union with silica, etc., may yield margarite, vermiculite, chlorite and other hydrous silicates.

Rubies and sapphires have been produced artificially with success. It mas once the practice to make "reconstructed rubies" by fusing together small fragments of the natural stone; but this process gave way to the Verneuil method of forming artificial ruby from purified ammonia-alum with a certain proportion of chrome-alum. The finely powered material is caused to fall periodically into an oxyhydrogen flame, the heat of which decomposes the alum, and the alumina thus set free forms liquid drops which collect and solidify as a pear-shaped mass. When of the characteristic pigeon's-blood colour, the synthetic ruby contains about 2.5% of chromic oxide. The manufactured ruby possesses the physical characters of corundum, but may generally be distinguished by microscopic bubbles and striae. *See* also GEM: *Synthetic Gems.*

RŪDAGĪ (d. 954). Farīd-eddīn Mohammed ʿAbdallāh, the first great literary genius of modern Persia, was born in Rūdag, a village in Transoxiana, about 870–900. Most of his biographers assert that he was totally blind. but the accurate knowledge of colours shown in his poems makes this very doubtful. The fame of his accomplishments reached the ear of the Sāmānid Nasr II bin Ahmad, the ruler of Khurāsān and Transoxiana (913–42), who invited the poet to his court. Of the 1,300,000 verses attributed to Rūdagī, there remain only 52 kasidas, ghazals and rabāʿīs; of his epic masterpieces we have nothing beyond a few stray lines in native dictionaries. But the most serious loss is that of his translation of Ibn Mokaffa's Arabic version of the old Indian fable book *Kalilah and Dimnah*. Fragments are preserved in the Persian lexicon of Asadi of Tus (ed. by P. Horn, 1897).

RUDD (*Scardinius erythrophthalmus),* a Cyprinid fish of Europe and western and northern Asia, deep-bodied. with reddish fins, and with the dorsal fin farther back than in the roach. It reaches a length of 18 in. and a weight of 3½ lb. It is called pearl roach in the Gnited States where it has been introduced.

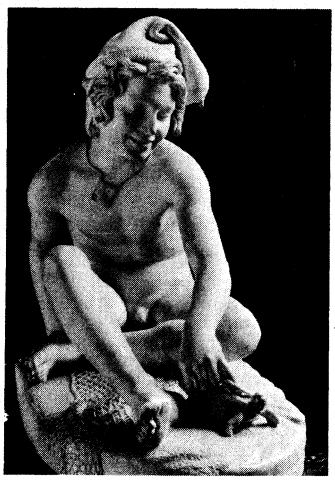
RUDDER, that part of the steering apparatus of a ship which is fastened to the stern outside, and on which the water acts directly (O.E. *rother, i.e.,* "rower"). The word may be found to be used as if it were synonymous with "helm." But the helm (A.S. *hillf,* "a handle") is the handle by which the rudder is worked. The tiller, which is perhaps derived from a provincial English name for the handle of a spade. has the same meaning as the helm. In the earliest times a single oar, at the stern, was used to row the vessel round. In later times oars with large blades were fixed on

the sides near the stem. In Greek and Roman vessels two sets were sometimes employed, so that if the pitching of the ship lifted the after pair out of the water, the foremost pair could still act. As these ancient ships were, at least in some cases, sharp at both ends and could sail either way, steer (or steering) oars were fixed both fore and aft. The steer oar in this form passed through a ring on the side and was supported on a crutch, and was turned by a helm, or tiller. Norse and medieval vessels had as far as we can judge, one steer oar only placed on the right side near the stern —hence the name "starboard," *i.e.*, steerside, for the right side of the ship looking forward.

In the case of small vessels the steer oar possesses an advantage over the rudder, for it can bring the stern round quickly. Therefore it is still used in whaling boats and rowing boats which have to work against wind and tide, and in surf when the rudder will not act. The side rudder was generally displaced by the stern rudder in the 14th century.

RUDE, FRANÇOIS (1784–1855), French romantic-realist sculptor, was born in Dijon on Jan. 4, 1784. After the death of his father, whom he had assisted in his metalworker's shop, he went to Paris determined to perfect himself in the art of sculpture. He won the Prix de Rome in 1812, but could not go to Rome because of the condition of Europe. He was an enthusiastic Bonapartist.

The attention of the public was first attracted to Rude by the Mercury attaching his winged sandals (1828; Louvre). This shows his training as a neoclassicist, but Rude was obviously uncomfortable within the restrictions of the classical canon and might be called rather a romantic-realist. In his Neapolitan fisherboy playing with a tortoise (1833; Louvre) the unusual pose and the open mouth both break with tradition. In the statue of Marshal Ney in the Avenue de l'Observatoire in Paris, the hand with the sword raised above the head and the open mouth again violated neoclassic principles. The group of "Volunteers" (for the revolutionary campaign of 1792) on the Arc de Triomphe, although classical in detail, is romantic and impetuous in feeling. The reclining figure of Bonaparte (1847) at Fixin near Dijon (plaster cast in the Louvre). where he is represented as reclining on a rock awakening from sleep and shaking off his campaign cloak, is a famous failure. Toward the end of his life Rude returned to his early classical style.



GIRAUDON

"NEAPOLITAN FISHERBOY PLAYING WITH A TORTOISE" BY FRANÇOIS RUDE. IN THE LOUVRE, PARIS

Rude died in Paris on Nov. 3, 1855.

See J. Calmette, *François Rude* (1920). (A. K. McC.)

RUDINÌ, ANTONIO STARABBA, MARQUIS DI (1839–1908), Italian statesman, born at Palermo on April 6, 1839, joined the revolutionary committee in 1859. After spending a short time at Turin as attaché to the Italian foreign office he was elected mayor of Palermo. In 1866 he quelled a separatist insurrection. He was then appointed prefect of Palermo, and put down brigandage throughout the province; in 1868 he was prefect of Naples. In Oct. 1869 he became minister of the interior in the short-lived Menabrea cabinet. On the death of Minghetti in 1886, he became leader of the Right. Early in 1891 he succeeded Crispi as premier and minister of foreign affairs by forming a coalition cabinet with a part of the Left under Nicotera; his administration initiated the economies by which Italian finances were put on a sound basis, and also renewed the Triple Alliance. He was overthrown in May 1892 by a vote of the chamber and succeeded by Giolitti.

Upon the return of his rival, Crispi, to power in Dec. 1893, Rudini resumed political activity, allying himself with the Radical leader Cavallotti.

The crisis consequent upon the disaster of Adowa (March 1, 1896) brought Rudini back to power as premier and minister of the interior in a cabinet formed by the veteran Conservative, General Ricotti. He concluded peace with Abyssinia, but endangered relations with Great Britain by the unauthorized publication of confidential diplomatic correspondence in a Greenbook on Abyssinian affairs. To satisfy the Anti-Colonial party he ceded Kassala to Great Britain, provoking thereby much indignation in Italy. He was overthrown in June 1898. His conduct of affairs had gravely divided his party.

Rudini died on Aug. 6, 1908.

RUDOLF (otherwise known as BASSO NOROK and GALLOP), a large lake of eastern equatorial Africa, forming the centre of an inland drainage system, occupying the south of the Abyssinian highlands and a portion of the great equatorial plateau. The lake itself lies towards the north of the great east African rift valley, between 2° 26′ and 5° N., while the meridian of 36° E. passes through the lake. The lake is in part in Uganda, in Kenya, in Ethiopia and in Sudan. The length along the curved axis is 154 mi., the maximum width 20 mi. Its altitude is 1,230 ft. Towards the south it is deep, but comparatively shallow in the north. Its water is brackish, but drinkable. The country bordering the lake on almost every side is composed of Archaean metamorphic rock and is sterile and forbidding. The southern end is shut in by high cliffs—the escarpments of a rugged lava-strewn country, which shows abundant signs of volcanic activity. In particular, the great Teleki volcano stands at the southern end of the lake. The highest point of the southeast side of the lake is Mt. Kulal. 7.520 ft., while the culminating height within the basin of the lake is Mt. Nyiru, 9,203 ft., which lies about 20 mi. S. of Lubburua. Farther north, on the west side, sandy plains alternate with lines of low hills. Lagoons cut off from the lake are the haunt of great numbers of water birds. In 3° 8′ N. the dry bed of the Turkwell approaches the lake. Near the northern end mountains again approach the shores, the most prominent being Mt. Lubur (5,334 ft.), an extinct volcano with a well-preserved crater. At the extreme northwest a bay some 35 mi. long (Sanderson gulf) is almost separated from the rest of the lake by two long points of land. On the east side, open arid plains, with few trees, occupy most of the north country. One hill, in 3° 20′ N.. has a height of 3,470 ft., and at the northeast end, separating the lake from Lake Stefanie, is a hilly country, the highest point between the lakes being 3,524 ft. Immediately north of these hills rises the Hummurr range, with one peak exceeding 7,000 ft. Near the south end is the volcanic island of Elmolo, 10 mi. long, and there are a few small islets. Just north of 4" N. is a small volcanic island with highest point 2,100 ft. At the north end of the lake a level swampy plain is traversed by various arms of the lake and by the Nianam river (identical with the Omo). Lake Rudolf was discovered in 1888 by Count Samuel Teleki and Lieut. Ludwig von Hohnel.

RUDOLPH II (1552–1612), Roman emperor, son of the emperor Maximilian II by his wife Maria, daughter of the emperor Charles V, was born in Vienna on July 18, 1552. In 1563 he was sent to Spain, where he was educated. In 1572 he was crowned king of Hungary, in 1575 king of Bohemia; and in Oct. 1575 he was chosen German king, at Regensburg, becoming emperor on his father's death in Oct. 1576.

The more active part of the emperor's life was the period from his accession to about 1597. During that time he attended the infrequent imperial diets, and took an interest in the struggle in the Netherlands and the defense of the empire against the Turks. He was at times suspicious of the papal policy, while his relations with Spain were somewhat inharmonious. He forwarded the progress of the counterreformation, and in general the tolerant

policy of Maximilian II. was reversed. Political as well as religious privileges were attacked; and discontent became very pronounced about the opening of the 17th century. Meanwhile Rudolph had become increasingly subject to attacks of depression, which bordered on insanity. In 1604, after a war with Turkey had been in progress since 1593, many of the Hungarians rebelled against Rudolph and chose Stephen Bocskay as their prince. In April 1606 the Habsburg family declared Rudolph incapable of ruling, and recognized one of his younger brothers, the archduke Matthias, afterwards emperor, as their head; and in the following June Matthias, having taken over the conduct of affairs, made peace by granting extensive concessions to the rebellious Hungarians, and concluded a treaty with the sultan in November of the same year. Then shaking off his lethargy Rudolph prepared to renew the war with the Turks, a move which Matthias met by throwing himself upon the support of the national party in Hungary. Matthias also found adherents in other parts of his brother's dominions, with the result that in June 1608 the emperor was compelled to cede to him the kingdom of Hungary together with the government of Austria and Moravia. Rudolph now sought the aid of the princes of the empire, and even of the Protestants; but he had met with no success in this direction when trouble arose in Bohemia. Having at first rejected the demand of the Bohemians for greater religious liberty, the emperor was soon obliged to yield to superior force, and in 1609 he acceded to the popular wishes by issuing the Letter of Majesty (*Majestätsbrief*), and then made similar concessions to his subjects in Silesia and elsewhere. A short reconciliation with Matthias was followed by further disorder in Bohemia, which was invaded by Rudolph's cousin, the archduke Leopold (1586–1632). The Bohemians invoked the aid of Matthias, who gathered an army; and in 1611 the emperor, practically a prisoner at Prague, was again forced to cede a kingdom to his brother. Rudolph died at Prague, his usual place of residence, on Jan. 20, 1612, and was succeeded as emperor by Matthias.

Rudolph was greatly interested in chemistry, alchemy, astronomy and astrology; he was a patron of Tycho Brahe and Kepler, and was himself something of a scholar and an artist. He was the greatest collector of his age, his agents ransacking Europe to fill his museums with rare works of art. His education at the Spanish court and an hereditary tendency to insanity, however, made him haughty, suspicious and consequently very unpopular.

The sources for the life and times of Rudolph II. are somewhat scanty, as many of the official documents of the reign, which were kept at Prague and not at Vienna, were destroyed, probably during the Thirty Years' War. The best authorities, however, are: *Rudolphi II. epistolae ineditate*, edited by B. Comte de Pace (Vienna, 1771); M. Ritter, *Quellenbeiträge zur Geschichte des Kaisers Rudolf II.* (Munich, 1872); and *Deutsche Gesclzichte im Zeitalter der Gegenreformation und des dreissigjährigen Krieges* (Stuttgart, 1887 fol.); L. von Ranke, *Zur deutscken Geschichte: Vom Religionsfrieden bis zum 30-jährigen Kriege* (Leipzig, 1868); A. Gindely, *Rudolf II. und seine Zeit* (Prague, 1862–68); F. Strieve, *Die Verhandlungen über die Nnchfolge Kaiser Rudolfs II.* (Munich, 1880); in the *Allgemeine Deutsche Biographie*, Band xxix. (Leipzig, 1889); and *Der Ursprung des dreissigjährigen Krzeges* (Munich, 1875); F. von Bezold, *Kaiser Rzidolj II. und die Izeilige Liga* (Munich, 1886); J. Janssen, *Geschichte des Dezitschen Volks seit dem Ausgang des Mittelalters* (Freiburg, 1878 fol.), of which there is an English translation by M. A. Mitchell and A. M. Christie (1896 fol.); and H. Moritz, *Die Wahl Rudolfs II.* (Marburg, 1895).

RUDOLPH or RAOUL (d. 936), king of the Franks and duke of Burgundy, was a son of Richard duke of Burgundy, and was probably a member of the Carolingian family. He succeeded his father in 921, married Emma, daughter of Robert duke of the Franks, and assisted his father-in-law to drive the Frankish king, Charles III. (the Simple), from his throne. Robert then became king of the Franks, but was killed in battle in June 923 and was succeeded by Rudolph. At Limoges Rudolph defeated the Normans, the Aquitanians and Herbert of Vermandois. Rudolph died at Auxerre, leaving no sons, on Jan. 14, 936.

See W. Lippert, *König Rudolf von Frankreich* (Leipzig, 1886).

RUDOLPH (d. 1080), German king, and duke of Swabia, was a son of Kuno, count of Rheinfelden, who possessed estates in both Burgundy and Swabia. He received the duchy of Swabia from Agnes, regent and mother of the young king, Henry IV., in 1057, and two years later married the king's sister Matilda, and was made administrator of the kingdom of Burgundy. When Henry was excommunicated and deposed by Pope Gregory VII., the princes met at Forchheim, and elected Rudolph as German king. He renounced the right of investiture, disclaimed any intention of making the crown hereditary in his family, and was crowned at Mainz, on March 27, 1077. He found no support in Swabia, but, uniting with the Saxons, won two victories over Henry's troops, and, in 1080, was recognized by the pope. On Oct. 1j, 1080, Rudolph was severely wounded at Hohenmolsen, and died the next day. He was buried at Merseburg, where his beautiful bronze tomb is still to be seen.

See O. Grund, *Dze Wahl Rudolfs von Rheinfelden zum Gegenkonig* (Leipzig, 1880).

RUDOLPH I. (1218–1291), German king, son of Albert IV. count of Habsburg, and Hedwig, daughter of Ulrich count of Kyburg, was born at Limburg, on May 1, 1218. At his father's death in 1239 Rudolph inherited the family estates in Alsace, and in 1245 married Gertrude, daughter of Burkhard III. count of Hohenberg. A partisan of the emperor Frederick II. and his son Conrad IV., he was richly rewarded by them, but in 1254 was excommunicated by Pope Innocent IV. In the general disorder after the fall of the Hohenstaufen, he increased his estates largely at the expense of his uncle, Hartmann of Kyburg, and the bishops of Strassburg and Basle, becoming the most powerful prince in south-western Germany. His election as German king at Frankfurt (Sept. 29, 1273) was largely due to the efforts of his brother-in-law, Frederick III. of Hohenzollern, burgrave of Nuremberg. The support of Albert duke of Saxe-Lauenburg, and of Louis II. count palatine of the Rhine and duke of upper Bavaria, had been purchased by betrothing them to two of Rudolph's daughters; so that Ottakar II. king of Bohemia, a candidate for the throne, was almost alone in his opposition. Rudolph was crowned at Aix-la-Chapelle on Oct. 24, 1273. To win the approbation of the pope Rudolph renounced all imperial rights in Rome, the papal territory and Sicily, and promised to lead a new crusade; and Pope Gregory X., in spite of Ottakar's protests, not only recognized Rudolph himself, but persuaded Alphonso X. king of Castile, who had been chosen German king in 1257, to do the same. From 1274–78 Rudolph mas engaged in an intermittent struggle with Ottakar, which ended with the latter's death. (See AUSTRIA, EMPIRE OF.) Rudolph then set about consolidating his authority in Austria and the adjacent countries, where he met much opposition. At length in Dec. 1282 Rudolph invested his sons Albert and Rudolph with the duchies of Austria and Styria at Augsburg, and so laid the foundations of the greatness of the house of Habsburg.

In 1281 Rudolph compelled Philip I. count of upper Burgundy to cede some districts to him, forced the citizens of Berne to pay tribute, and in 1289 marched against Philip's successor, Otto IV., and compelled him to do homage. He was much less successful, however, in maintaining order in Germany, although in 1289 he led an expedition into Thuringia and destroyed some robber castles. In 1281 his first wife died, and on Feb. j, 1284 he married Isabella, daughter of Hugh IV. duke of Burgundy. In 1291 he attempted to secure the election of his son Albert as German king; but without success, although Albert, the only son who survived him, was crowned German king after Rudolph's death. Rudolph died at Spires on July 1j, 1291 and was buried in the cathedral of that city. His reign is memorable rather for the house of Habsburg than for the kingdom of Germany.

See K. Hagen, *Deutsche Geschiclzte von Rudolf von Habsburg bis auf die neueste Zeit* (Frankfort, 1854–57); 0. Lorenz, *Geschichte Rudolfs von Habsburg und Adolfs von Nassau* (Vienna, 1863–67); A. Redlich, *Rudolf von Habsburg* (Innsbruck, 1903). *See* also GERMANY; AUSTRIA, EMPIRE OF; HABSBURG.

RUDOLPH or RAOUL, known as RUDOLPH GLABER (Rudolph the Bald) (d. *c.* 1050), French chronicler, was born in Burgundy

about 985, and was in turn an inmate of the monasteries of St. Leger at Champeaux and St. Bénigne at Dijon, afterward entering the abbey of Cluny, and becoming a monk at St. Germain at Auxerre before 1039. He also appears to have visited Italy. His Historiarum sui *temporis* libri *V*, dedicated to St. Odilon, abbot of Cluny, purports to be a universal history from 900 to 1044; but is an irregular narration of events in France and Burgundy.

The *Historiarum* was first printed in 1596, and published by A. Duchesne in the *Historiae Francorum Scriptores*, tome iv (1639–49). Extracts are printed in the *Monumenta Germaniae historzca*, Band vii; but perhaps the best edition of the work is the one edited by M. Prou in the *Collection de textes pour servir à l'étude et l'enseignement de lhistoire* (1886). Rudolph also wrote a *Vita* S. *Gulielmi, abbatis S. Benigni*, published by J. Mabillon in the *Acta Sanctorunz*, tome vi (1668).

See A. Molinier, *Les Sources de l'histoire de France*, tome ii (Paris, 1902); and A. Potthast, *Bibliotheca historica* (Berlin, 1896).

RUDOLPH OF HABSBURG (1858–1889), crown prince of Austria, was born on Aug. 21. 1858, the only son of the emperor Francis Joseph I of Austria (*q.v.*) and his wife Elizabeth. Great hopes centred on the boy, who possessed unusual talents. Although his father was chiefly intent on his military education, Rudolph's own chief interests were natural history and literature. The monumental description of the Austro-Hungarian monarchy. *Oesterreich-Ungarn* in *Wort und* Bild, was truly his conception and in part his work; he also wrote some minor works of his own. He early developed an interest in modem literature and thought; became known as a freethinker, and even a revolutionary. and made no secret of his anticlerical views. He thus drifted into increasing opposition to his father, which was accentuated by his notoriously easy morality. His marriage with Stephanie, daughter of the king of the Belgians, took place on May 10, 1881, and was at first happy, although its only fruit—unfortunately for the Austrian succession—was one daughter, Elizabeth (afterward Princess Windischgratz). Later he developed a deep passion for the young and beautiful Baroness Marie Vetsera, and on Jan. 30, 1889, the sudden and appalling news reached Vienna that the bodies of the two lovers had been found in Rudolph's hunting lodge of Mayerling, near Vienna. It was at once officially announced that the pair had committed suicide. All persons in any way connected with the story were sworn to secrecy, and the official dossier was excluded from the state archives. Numerous extraordinary rumours naturally arose, connecting the death with the Jesuits, the Hungarian nobles, or an injured husband; but it is generally accepted that the crown prince actually shot his lover, and afterward committed suicide in a fit of despair, partly due to his father's order to break off the liaison. (C. A. M.)

RUDOLSTADT, a town of Germany, in the district of Gera, on the left bank of the Saale, 18 mi. S.W. of Jena, by the railway to Saalfeld. Pop. (1950) 28,234. The name of Rudolstadt occurs in an inventory of the possessions of the abbey of Hersfeld in the year 800. After passing under various rulers, it came into the hands of the counts of Schwarzburg in 1335. Its civic rights were confirmed in 1404, and from 1599 it was the residence of the ruling house of Schwarzburg-Rudolstadt. The town is a favourite tourist resort. The former residence of the prince is the Heidecksburg, a palace which was rebuilt after a fire in 1735 on an eminence 200 ft. above the Saale. The Ludwigsburg is another palace in the town built in 1742. The town also has a hydropathic establishment. The industries of the place include the manufacture of porcelain, chemicals, machinery, dyestuffs and thermos flasks.

RUDRA, a minor god in Vedic India who doubtless personified lightning (the "red" one, probably), but also protected cattle against it. In the Rig Veda he is identified with Agni (*q.v.*), but in the later Vedas he is called an archer and his malevolence emphasized. Best known as father of the storm-gods (Maruts, *q.v.*), in the Epic period he becomes many Rudras and in modern Hinduism is identified with Siva (*q.v.*).

RUE, the name of a woody or bushy herb, belonging to the genus Ruta (family Rutaceae). especially R. graceolens, the common rue, a plant with bluish-green spotted leaves and greenish-yellow flowers, native to Europe and sparingly naturalized in eastern North America. It has a strong pungent smell and the leaves have a bitter taste. The plant was much used in medieval and later times as a stimulative and irritant drug. It was commonly supposed to be widely used by witches. From its association with "rue" (sorrow, repentance), the plant was also known as "herb of grace" and was taken as the symbol of repentance.

RUEDA, LOPE DE (1510?–1565), Spanish dramatist, was born at Seville, where, according to Cervantes, he worked as a metal beater. His name first occurs in 1554 as acting at Benavente, and between 1558 and 1561 he was manager of a strolling company. Rueda's more ambitious plays, such as Eufemia, *Armelina* and Los *Engañados*, are mostly adapted from the Italian. They follow the original so closely that they give no idea of his talent; but in his *pasos* or prose interludes he displays an abundance of riotous humour, great knowledge of low life, and a most happy gift of dialogue. Rueda, with his strollers, created a taste for the drama which he was able to gratify, and he is admitted by both Cervantes and Lope de Vega to be the true founder of the national theatre.

RUEIL-MALMAISON, a town of north France, in the *dé*partement of Seine-et-Oise, at the west foot of Mt. Valérien, 6 mi. W. of Paris. Pop. (1954) 25,795. Rueil has a church rebuilt by Napoleon III in the original Renaissance style and containing the tombs of the Empress Josephine and her daughter Hortense de Beauharnais. Rueil has important photographic works and manufactures of lime and cement, etc. Close to the town is the 18th century château of Malmaison, the residence of the Empress Josephine.

RUFA'A: see ARABS.

RUFF, a limicoline bird, taking its name from the frill of elongated feathers round the neck of the breeding male, to which the name is properly confined; the female, a much smaller bird, is termed the reeve. The plumage of the male is extremely variable, but the same markings are reproduced after every moult in each individual bird. The ruff (Machetes pugnax) no longer breeds in Britain, but its range extends across the whole of N. Europe and Asia, and it migrates south to India, Ceylon and Africa in winter. Except for its remarkable frill and its polygamous habit, the ruff does not differ in any marked manner from the ordinary sandpipers.

The extraordinary courtship antics of the cock bird are described in Montagu's Ornithological Dictionary, Stevenson's Birds of *Norfolk*, Selous' Realities of *Bird* Life (Constable & Co., London, 1926), and elsewhere.

The nest is made on the ground and, as in almost all polygamous animals, the male takes no interest in his offspring.

RUFFO, FABRIZIO (1744–1827), Neapolitan cardinal and politician, was born at San Lucido, Calabria, on Sept. 16, 1744. His father, Litterio Ruffo, was duke of Baranello, and his mother, Giustiniana, was a Colonna. Ruffo was placed by pope Pius VI among the chierici di camera—the clerks who formed the papal civil and financial service. He was later promoted to be treasurer-general, a post which carried with it the ministry of war. In 1791 he was removed from the treasurership, but was created cardinal on Sept. 29, though he was not in orders. He never became a priest. Ruffo went to Naples, and, when in Dec. 1798 the French troops advanced on Naples, he accompanied the royal family to Palermo. He was chosen to head a royalist movement in Calabria, where his family exercised large feudal powers. He was named vicar-general on Jan. 25, 1799. On Feb. 8, he landed at La Cortona with a small following, and began to raise the so-called "army of the faith" in association with Fra Diavolo.

Ruffo had no difficulty in upsetting the republican government established by the French and by June had advanced to Naples. (See NAPLES, KINGDOM OF and NELSON, HORATIO NELSON.) But he lost favour with the king by showing a tendency to spare the republicans. He resigned his vicar-generalship to the prince of Cassero, and during the second French conquest and the reigns of Joseph Bonaparte and Joachim Murat he lived quietly in Naples. During the revolutionary troubles of 1822 he was consulted by the king. and was even in office for a very short time as a "loyalist" minister. He died on Dec. 13, 1827.

The account of Ruffo given in Colletta's *History of Naples* (English trans., Edinburgh, 1860) is biased. *Cf.* the duca de Lauria, *Intorno alla storia del Reame di Napoli di Pietro Colletta* (Naples, 1877). Ruffo's own side of the question is stated in *Memorie Storiche sulla vita del Cardinale Fabrizto Ruffo,* by Domenico Sacchinelli (Naples, 1836). *See* also Baron von Helfert, *Fabrizio Ruffo: Revolution and Gegen-Revolution von Neapel* (Vienna, 1882).

RUFIJI, a large river of Tanganyika Territory, East Africa, entering the sea by a delta, between 7° 45' and 8" 13′ S. Its upper basin is drained by three main branches, of which the two southern, the Luwegu and the Ulanga, though shorter than the northernmost (the Ruaha), carry more water, as they come from a more rainy region, and by their junction in 8 35′ S., 37° 25′ E., the Rufiji proper may be said to be formed.

The Luwegu rises 10° 50′ S., 35° 50′ E., and flows in a narrow wooded valley and in its lower course it is 100 to 150 yd. wide. The Ulanga is formed by a number of streams descending from the escarpment which runs north-east from Lake Nyasa and in Uhehe becomes broken up in ranges of mountains. The most important head-stream is the Ruhuje. As a whole, the Ulanga valley is broad, level and swampy, the meandering river sending off many diverging arms. It is navigable throughout the greater part of its course, having in the dry season a general depth of 3 to 12 ft, with a width of 40 to 120 yd. In April and May nearly all the streams overflow their banks. Below the junction of the Luwegu and Ulanga, the Rufiji flows through a narrow pass by the Shuguli falls, and continues to the junction of the Ruaha, in 7° 55′ S., 37° 52' E The most remote branches of the Ruaha rise in the Livingstone Mountains. The united stream sweeps round the N. of the Uhehe Mountains, finally flowing to the Rufiji. Below the junction the Rufiji is broken by the Pangani falls, but is thence navigable by small steamers to its delta, receiving no large tributaries but sending out divergent channels The country on either side is a generally level plain, inundated, on the south. in the rains, and the river varies in width from 100 to 400 yd. The main mouth of the river is that known as Simba Uranga, the bar of which can be crossed by ocean vessels at high water, but all the branches are very shallow as the apex of the delta is approached. Much of the delta is suited for rice-growing. (For geology see TANGANYIKA.)

RUFINUS, TYRANNIUS, presbyter and theologian, was born at or near Aquileia at the head of the Adriatic, probably between 340 and 345. In early manhood he entered the cloister as a catechumen, receiving baptism about 370. About the same time a visit of Jerome to Aquileia led to a close friendship between the two, and shortly after Jerome's departure for the East Rufinus also was drawn thither (in 372 or 373) by his interest in its theology and monasticism. He first settled in Egypt. There, if not even before leaving Italy, he had become intimately acquainted with Melania, a wealthy and devout Roman widow; and when she removed to Palestine, taking with her a number of clergy and monks on whom the persecutions of the Arian Valens had borne heavily, Rufinus (about 378) followed her. While his patroness lived in a convent of her own in Jerusalem, Rufinus, at her expense, gathered together a number of monks in a monastery on the Mount of Olives, devoting himself at the same time to the study of Greek theology. When Jerome came to Bethlehem in 386, the friendship formed at Aquileia was renewed. Another of the intimates of Rufinus was John, bishop of Jerusalem, and formerly a Nitrian monk, by whom he mas ordained to the priesthood in 390. In 394, in consequence of the attack upon the doctrines of Origen made 'by Epiphanius of Salamis during a visit to Jerusalem, a fierce quarrel broke out, which found Rufinus and Jerome on different sides; and, though three years afterwards Jerome and John were reconciled, the breach between Jerome and Rufinus remained unhealed.

In the autumn of 39; Rufinus embarked for Rome, where he published a Latin translation of the Apology of Pamphilus for Origen, and also (398–99) a somewhat free rendering of the περὶ ἀρχῶν (or De *Principiis*) of that author himself. In the preface to the latter work he referred to Jerome as an admirer of Origen, and as having already translated some of his works with modifications of ambiguous doctrinal expressions. This led to a bitter dispute between Jerome and Rufinus. At the instigation of Theophilus of Alexandria, Anastasius (pope 398–402) summoned Rufinus from Aquileia to Rome to vindicate his orthodoxy; but he excused himself from a personal attendance in a written Apologia pro fide sua. The pope in his reply expressly condemned Origen, but left the question of Rufinus's orthodoxy to his own conscience. He was, however, regarded with suspicion in orthodox circles (cf. the Decretum *Gelassii,* § 20) in spite of his services to Christian literature. In 408 we find Rufinus at the monastery of Pinetum (in the Campagna?); thence he was driven by the arrival of Alaric to Sicily, being accompanied by Melania in his flight. In Sicily he was engaged in translating the *Homilies* of Origen when he died in 410.

The original works of Rufinus are—(I) *De Adulteratione Librorum Origenis—an* appendix to his translation of the *Apology* of Pamphilus, and intended to show that many of the features in Origen's teaching which were then held to be objectionable arise from interpolations and falsifications of the genuine teat; (2) *De Benedictionzbus XII. Patriarcharum Libri* 11.—an exposition of Gen. xlix.; (3) *Apologia* s. *Invectivarum in Hieronymum Libri II.; (4) Apologia pro Fide Sua ad Anastasium Pontificem;* (5) *Hzstorza* Eremttzca—consisting of the lives of thirty-three monks of the Nitrian desert; (6) *Expositio Symboli,* a commentary on the creed of Aquileia comparing it with that of Rome, which is valuable for its evidence as to church teaching in the 4th century The *Historiae Ecclesiasticne Libri XI.* of Rufinus consist partly of a free translation of Eusebius (10 books in 9) and partly of a continuation (bks. x. and xi) down to the death of Theodosius the Great.

See W. H. Freemantle in *Dict. Chr. Biog.* iv. 555–60; A. Ebert, *Allg. Gesch. d. Litt. d. Mittelalters im Abendlande,* i. 321–27 (Leipzig, 1889); G. Krüger in Herzog-Hauck's *Realencyk. für prot. Theol.,* where there is a full bibliography.

RUFUS, LUCIUS VARIUS (c. 74–14 B.C.), Roman poet of the Augustan age. He was the friend of Virgil, after whose death he and Plotius Tucca prepared the Aeneid for publication, and of Horace, for whom he and Virgil obtained an introduction to Maecenas. Horace and Virgil speak highly of his epic poetry. From Macrobius (Saturnalia, vi. 1, 39; 2, 19) we learn that Varius composed an epic poem De *Morte,* some lines of which are quoted as having been imitated or appropriated by Virgil. But his most famous literary production was the tragedy Thyestes, which Quintilian (*Inst. Orat.* x. 1. 98) declares equal to any of the Greek tragedies. It was presented at the games of 29 B.C.

Fragments in E Bährens, *Frag. Poetarum Romanorum* (1886); monographs by A. Weichert (1836) and R. Unger (1870, 1878, 1898); M Schanz, *Geschichte der römischen Literatur* (1899), ii. *1;* Teuffel, *Hist. of Roman Literature* (Eng. trans., 1900), 223.

RUGBY, a municipal borough (1932) in the Rugby parliamentary division of Warwickshire. Eng., south of the Warwickshire Avon, 1; mi. E N E of Warwick by road. Pop (1951) 45,428. Area 10.9 sq mi. Rugby was originally a hamlet of the adjoining parish of Clifton-upon-Dunsmore. and is separately treated as such in Domesday Book (where it is called Rocheberie). It became a separate parish in the reign of Henry III, who granted the town a meekly market and a yearly fair.

Oliver Cromwell was quartered there in 1645, and William III passed through on his way to Ireland. The town was not of great importance until the 19th century, its rise being mainly due to the advent of railways. It is an important railway junction with extensive engineering and electrical works, and a very large cattle market

Rugby boys' school was founded and endowed under the will (1567) of Lawrence Sheriff of Rugby. The endonment consisted of the parsonage of Brownsover. Sheriff's mansion house in Rugby and one-third (8 ac) of his estate in Middlesex, which, being let in building leases. gradually increased in value. The full endowment was obtained in 1653 The school originally stood opposite the parish church. and nas removed to its present site on the south side of the town between 1740 and 1750. In 1809 it was rebuilt from designs by Henry Hakewill (1771–1830); the chapel was rebuilt in 1872.

The Temple observatory, containing an equatorial refractor by Alvan Clark. was built in 1877 and the Temple reading room and the art museum were built in 1878. The Temple speech room was opened in 1909, the science schools in 1914 (enlarged in 1940) and

the music schools in 1925 (enlarged in 1939). The rebuilding enabled the school to expand rapidly and become one of the largest in the country.

Tom Brown's Schooldays by Thomas Hughes is a chronicle of the period of the headmastership of Thomas Arnold (1828–42). Rugby football originated at the school *(see* FOOTBALL).

RUGE, ARNOLD (1802–1880), German philosopher and political writer, was born at Bergen, on the island of Rügen, on Sept. 13, 1802. He studied at Halle, Jena and Heidelberg, and became an adherent of the party which sought to create a free and united Germany. For his zeal he was confined for five years in the fortress of Kolberg, where he studied Plato and the Greek poets. On his release in 1830 he published *Schill und die Seinen*, a tragedy, and a translation of *Oedipus in Colonus*. Ruge settled in Halle, where in 1837 with E. T. Echtermeyer he founded the *Hallesche Jahrbucher* fir *deutsche Kunst und Wissenschaft*. In this periodical he discussed the questions of the time from the point of view of the Hegelian philosophy. The *Jahrbiicher* was detested by the orthodox party in Prussia; and was finally suppressed by the Saxon government in 1843. In Paris Ruge tried to act with Karl Marx as co-editor of the *Deutsch-Französische Jahrbiicher*, but had little sympathy with Marx's socialistic theories, and soon left him.

In the revolutionary movement of 1848 he organized the Extreme Left in the Frankfurt parliament, and for some time lived in Berlin as the editor of *Die Reform*. The Prussian government intervened and Ruge soon afterwards left for Paris, hoping, through his friend Alexandre Ledru-Rollin, to establish relations between German and French republicans; but in 1849 both Ledru-Rollin and Ruge had to take refuge in London. Here, in company with Giuseppe Mazzini and other advanced politicians, they formed a "European Democratic Committee." From this Ruge soon aithdrew, and in 18jo went to Brighton, where he supported himself by teaching and writing. In 1866 and 1870 he vigorously supported Prussia against Austria, and Germany against France. In his last years he received from the German go\ernment a pension of 1,000 marks. He died on Dec. 31, 1880. After the publication of his *Gesammelte Schriften* (10 vols., 1846–48) he wrote, among other books, *Unser System, Revolutionsnovellen, Die Loge des Humanismus*, and *Aus früherer Zeit* (his memoirs). His *Letters and Diary* (1825–80) were published by Paul Nerrlich (1885–87).

RUGELEY, a market town and urban district in the Lichfield and Tamworth parliamentary division of Staffordshire, Eng., in the Trent valley, 9 mi. E.S.E. of Stafford by road and on the Grand Trunk canal. Pop. (1951) 8,525. Area 4.5 sq.mi. To the S.W. is Cannock Chase. A grammar school was founded in 1611. There are iron foundries, tanneries and collieries; electrical equipment is made. The urban district included Brereton after 1934.

RÜGEN, an island of Germany, in the Baltic, immediately opposite Stralsund, 1½ mi. off the northwest coast of Pomerania in Prussia, from which it is separated by the narrow Strelasund. or Bodden. Its shape is exceedingly irregular, and its coast line is broken by numerous bays and peninsulas, sometimes of considerable size. The general name is applied by the natives only to the roughly triangular main trunk of the island, while the larger peninsulas, the landward extremities of which taper to narrow necks of land, are considered to be as distinct from Rügen as the various adjacent smaller islands which are also included for statistical purposes under the name. The chief peninsulas are those of Jasmund and Wittow on the north, and Mönchgut, at one time the property of the monastery of Eldena, on the southeast; and the chief neighbouring islands are Ummanz and Hiddensöe, both off the northnest coast Rügen is the largest island in Germany. Its greatest length from north to south is 32 mi.; its greatest breadth is 25½ mi.; and its area is 358 sq.mi. The surface gradually rises toward the west to Rugard (298 ft.) —the "eye of Rugen"—near Bergen, but the highest point is the Hertaburg (528 ft.) in Jasmund. Erratic blocks are scattered throughout the island, and the roads are made with granite. The most beautiful and attractive part of the island is the peninsula of Jasmund, which terminates to the north in the Stubbenkammer (Slavonic for "rock steps"), a sheer chalk cliff, the summit of which, the Konigsstuhl, is 420 ft. above the sea. The east of Jasmund is clothed with an extensive beech wood called the Stubbenitz, in nhich lies the Borg, or Hertha lake. Connected with Jasmund by the narrow isthmus of Schabe to the nest is the peninsula of Wittow, the most fertile part of the island. At its northwest extremity rises the height of Arcona, with a lighthouse.

A ferry connects the island with Stralsund, and from the landing stage at Altefähr a railway traverses the island, passing the capital Bergen to Sassnitz, on the northeast coast. The other chief places are Garz, Sagard, Gingst and Putbus, the last being the old capital of a barony of the princes of Putbus. Sassnitz, Gohren, Sellin, Binz and Lauterbach-Putbus are favourite bathing resorts. Schoritz was the birthplace of the patriot and poet, Ernst Moritz Arndt. The inhabitants of Riigen are distinguished from those of the mainland by peculiarities of dialect, costume and habits; and even the various peninsulas differ from each other in these particulars. The inhabitants raise some cattle, and Rügen has long been famous for its geese; but the chief industry is the herring fishery.

The original Germanic inhabitants of Rügen were dispossessed by Slavs; and there are still various relics of the long reign of paganism that ensued. In the Stubbenitz and elsewhere Huns' or giants' graves are common; and near the Hertha lake are the ruins of an ancient edifice which some have sought to identify with the shrine of the heathen deity Hertha or Nerthus, referred to by Tacitus. On Arcona in Wittow are the remains of an ancient fortress, enclosing a temple nhich was destroyed in 1168 by the Danish king, Waldemar I. when he made himself master of the island. Rügen was ruled then by a succession of native princes, under Danish supremacy, until 1218. After being for a century and a half in the possession of a branch of the ruling family in Pomerania, it was finally united with that duchy in 1478, and passed with it into the possession of Sweden in 1648. With the rest of western Pomerania Riigen has belonged to Prussia since 1815.

Arndt, *Fairy Tales from the Isle of Riigen* (London, 1896).

RUGS AND CARPETS. "Carpet" (M.E. *carpete* or *carpette*, from O. Fr. *carpite* or direct from Med. Lat. *carpita*) was used until the 19th century for any cover made of a thick material, especially a table cover, but now it means almost exclusively a floor covering. This may be of felt, tapestry, a shuttle-woven material or a pile fabric, but the last is the most frequent and typical. Some kind of covering for the floor is indispensable for comfort, especially for the beaten-earth floors in the ancient and primitive orient. Even in the west the advantages of a fabric underfoot are so obvious and even imperative that carpets of some kind have been an almost universal adjunct of civilization, and in both the east and west their manufacture finally developed into a prodigious industry. Such floor coverings offer most interesting opportunities for ornamentation, and in the orient, where both the craft and the art originated, carpet-weaving and design attained, over a period of at least 2.500 years, a remarkable degree of excellence which warrants ranking the finest specimens with man's most notable artistic achievements.

Felt (*q.v.*) is almost certainly the most ancient of the carpet techniques for it probably originated as bark felt, even as early as the Upper Palaeolithic period, about 25,000–30,000 years ago. It is noteworthy that the earliest existing specimen (4th or 3rd century B.C.) which might be classed as a carpet is felt: a rectangle of black wool or hair felt, about 3½ x j ft., with a white border along one side, to which are appliquéd with split-stitch, silhouettes of feline heads about. 6 in. high. cut from red or blue felt and evenly spaced in a straight row. This piece, now in the

Hermitage museum, Leningrad, together with saddle (cushion) covers in the same technique and style, was found in a tomb at Pasyryk in the Altai mountains.

Floor coverings of plaited rushes were also very ancient. Evidences of basket plaiting also appear in the Upper Palaeolithic period, and archaeological finds in Iraq indicate by the jth or 4th millennium floor coverings of plaited rushes, such as grea in the Mesopotamian swamps. These made stout, durable, portable mats, and even at an early period they were probably handsomely ornamented, judging from the competence in decorative pattern shown on contemporary painted pottery and on the decorated walls of the Chalcolithic village at Persepolis. The weaving of rush mats has continued to the present in the near east, which had reached a high degree of artistic perfection and prestige by mediaeval times.

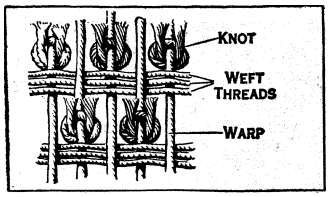

FIG. 1.— SPANISH OR SINGLE-WARP KNOT

Rug design, however, in western Asia at least, had long since evolved beyond the rudimentary scheme of the applique felt or the hypothetical iconographic geometry of plaited mats, for a threshold rug, represented in stone carving (now in the Musee du Louvre). from the Assyrian palace of Khursabad (8th century B.C.) has an all-over field pattern of quatrefoils, framed by a lotus border, completed by guard stripes. Other Assyrian stones of the period also show rich and handsome patterns that have survived in the repertoire of carpets ever since.

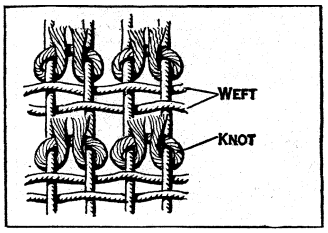

FIG. 2.— TURKISH OR GHIORDES KNOT, ONE OF THE TWO TYPES OF KNOTS USED IN ORIENTAL CARPETS

The general layout of the Assyrian type is more or less followed in the next oldest surviving carpets, embroidered felts found by Kozlov at Noin Ula in northern Mongolia, preserved by the frozen subsoil in chieftains' tombs (C. Trever. *Excavations in Northern Mongolia* [Leningrad, 1932]; W. P. Yetts, in *The Burlington .Magazine,* 1926), likewise now in the Hermitage museum. One, *e.g.* (originally *c.* 6 ft. 5 in by 8 ft. 6 in.). had the field filled with a spiral meander; a broad border with animal-combat groups (alternately tiger and yak, and griffon and elk), alternating nith a tree; an inner guard stripe of geometrical units; and a nide margin of Chinese lozenge-patterned silk. The patterns were executed with quilting (field), and couched cord on a quilted ground (main border; inner guard stripe solid couched cord), and the colours as reconstituted by chemical tests (\'. Komonov, bloscow-Leningrad, 1937) were vivid; yellow quilting on a red field; a red border with blue and green figures outlined with white; and green, red, yellow and blue in varying succession in the guard stripes.

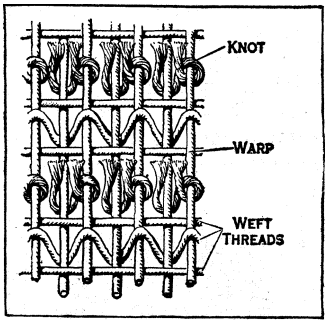

FIG. 3.—PERSIAN OR SEHNA KNOT, THE OTHER TYPE OF KNOT USED IN ORIENTAL CARPETS

Another piece embroidered in wool on wool in stem-and-satin stitches, was still more complex in organization: on the field, a diagonal lattice defined by scrolling stems. with a cross-treflé at each intersection and a tortoise alternating with a fish in each unit, in blue, purple and tans on a red ground; a diagonally-hatched field margin; beyond, an inner border system. aith double guard stripes on both sides; then the main wide border filled nith a concentric-lozenge diaper, with an inner guard stripe; and an outer binding of red and brown checked flax and wool material. These pieces are datable by a lacquer bowl found with them which is inscribed with the equivalent of A.D. 3. Some of them are of genuine beauty; their intricate patterns are clearly delineated and well co-ordinated.

Among these fragments and technically the most interesting are the earliest extant specimens of pile carpets They are woven of fine, lustrous, still-elastic wool. of deep indigo blue. The pile is very thick and dense, the knots or loops having been firmly compacted, though the strands are merely wrapped round one warp thread, a simple technique that later made its way to Spain. (A. U. Pope, in Pope [ed.], *A Survey of Persian Art,* Oxford, 1938. III, pp. 2272–73.) This same technique is also used in a number of fragments found by Sir Aurel Stein in Loulan, Niya and Tun-Huang in Chinese Turkistan, assignable to the first three centuries of our era *(see* Stein. *Serindia* [1921], Pls 3. 7, 8; and *Innermost Asia* [1928]), and was continued in this region at least into the 7th or 8th century, as is proven by a fragment discovered by A. von LeCoq at Kizil.

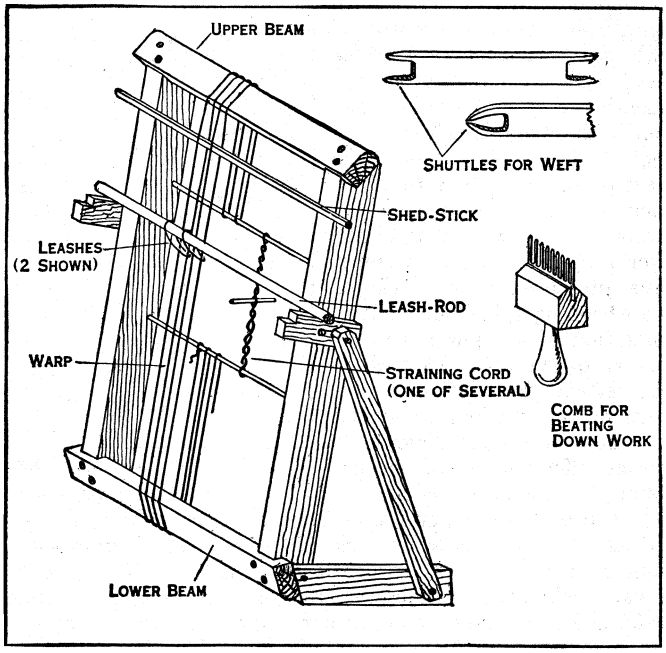

FIG. 4 —LOOM WITH FIXED BEAMS; SUITABLE FOR SMALL WORK AND ILLUSTRATES CHIEF PARTS OF LARGER LOOMS

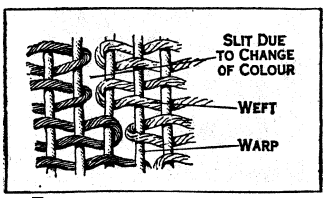

FIG. 5.—TAPESTRY WEAVING

By historic times thr carpets of the near east had attained fame and great magnificence. Classical authors speak nith admiration of the luxurious Babylonian carpets *(see* A. U. Dilley, *Rugs and Carpets,* p. 11), and in the tomb of Cyrus, Alexander the Great found the gold funeral couch resting on carpets of very fine fabric. Both Athenaeus and Xenophon indicate that some of these were thick and resilient, but whether pile woven or embroidered felt we cannot be sure, though some were evidently gold-enriched. Moreover certain types were reserved for court use, and so costly that they were important items in the royal treasury Carpet weaving nas always a kingly concern in near eastern lands

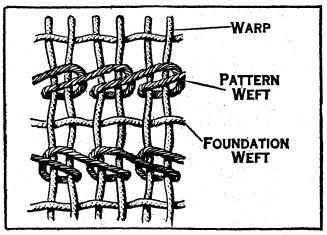

FIG. 6.—SHEMAKA WEAVING, A MODIFIED FORM OF THE TAPESTRY METHOD

By late Sassanian times (6th–7th century A D) carpet weaving in Persia had non international prestige, and according to the Sui annals noollen rugs mere being exported to distant China (*Sui-šu,* chap. 83; Berthold Laufer. *Sino-Iranica,* p. 493). The carpets of this period were of several kind:,: woollen or silk, either pile or tapestry aoven, embroidered. or even of shuttle-noven silk (*dibaj*) (Pope, *A Survey of Persian Art,* III, p. 2273).

Carpets made for the royal palace exceeded in cost and magnificence anything created or imagined either before or since. Surpassing them all was the so-called Spring or Winter carpet of Khusraw, made for the vast audience hall of the palace at Ctesiphon. It represented a formal garden with its water courses, paths, rectangular beds filled nith flowers and blossoming shrubs and fruit trees. The body of the rug was silk, the yellow gravel was represented by gold, the blossoms, fruit and birds were worked with pearls and every kind of jewel. The wide outer border representing a green meadow was solid with emeralds. The rug was about 84 ft. square, and when the great portal curtains were draan back and the sun flooded the sumptuously decorated and lofty interior (121 ft. high), it must have presented a spectacle of overwhelming splendour, a demonstration of the power and resources of the great king which was certainly not lost on ambitious nobles, restless provincial governors or foreign envoys. It was an effective use of the national treasure which would otherwise have been unproductively locked in dark vaults, and in addition to its political significance and its self-justifying beauty, happily alleviating the grim ninter months, such an eternal garden, forever at the perfection of its vernal loveliness, played another role obvious to all at the time; it affirmed with unmistakable authority the divine role of the king, the surrogate on earth of the Almighty on high, for it was the king's primal task to regulate the seasons, to guarantee and compel the return of the spring, thus renewing the earth's fertility and assuring the livelihood and prosperity of his subjects. This gorgeous carpet was the sympathetic call to nature to conceive and deliver the longed-for spring. Moreover the carpet had still further religious significance: it prefigured paradise, was a foretaste of the glory that is to come and the substance of things hoped for. For paradise is a Persian word meaning "walled park," and for the Persians. with its flowers. birds and water, so happily contrasting with the asperities of the desert, it was the abode of all felicity, the reward for struggle and suffering, the symbol of the perfect eternal moment. The whole notion of paradise seems to have entered into Jewish and Christian theology via the Babylonian captivity, and the Persian restoration of the Jens to Palestine.

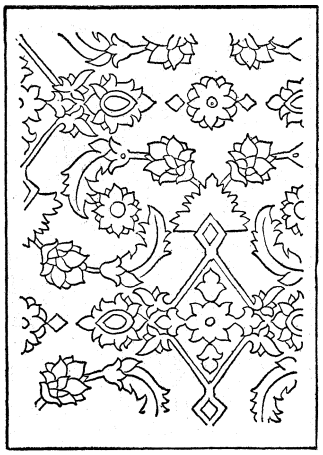

FIG. 7.— THE HERATI PATTERN

FIG. 8.— THE MINA KHANI PATTERN

The carpet was part of the fabulous booty of the Arabs, captured when they defeated the Persians and took Ctesiphon (635). It was cut up into small fragments; one-fifth went to the Caliph Omar, one piece to Ali, the prophet's son-in-law and the rest nas distributed to the 60,000 victorious soldiers, who in turn sold their pieces to a jeweller's syndicate in Baghdad for an average of $3,000 each, counting the drachma as worth only 25 cents This is on the authority of Tabari, one of the ablest of the Arab historians, whose account is confirmed by others and by certain internal and supplementary evidence as well. The originai value of the carpet mas thus certainly in excess of $200,000,000.

This most sumptuous of all fabrics made a profound impression on all, especially the Persians. It entered as a living, legendary power into history. poetry and art; and for centuries it served to sustain Persian morale. For more than 1,000 years it furnished the model and inspiration for subsequent carpets, though the most ambitious attempts of later years could no morr than hint at the general design of this fabulous creation. Of the subsequent renderings of the garden scheme the oldest is a printed cotton pane! to be dated between the 9th and 11th century (O. Wulff-W. F. Volbach, *Spätantike und* koptische *Stoffe,* Berlin. 1926, pl. 130) which shons in miniature essentially the same scheme, and this has persisted down to the present as one of the best defined carpet designs (fig. 9). The carpets for another of the royal palaces depicted the four seasons, also still a theme of carpet designing down to recent times.

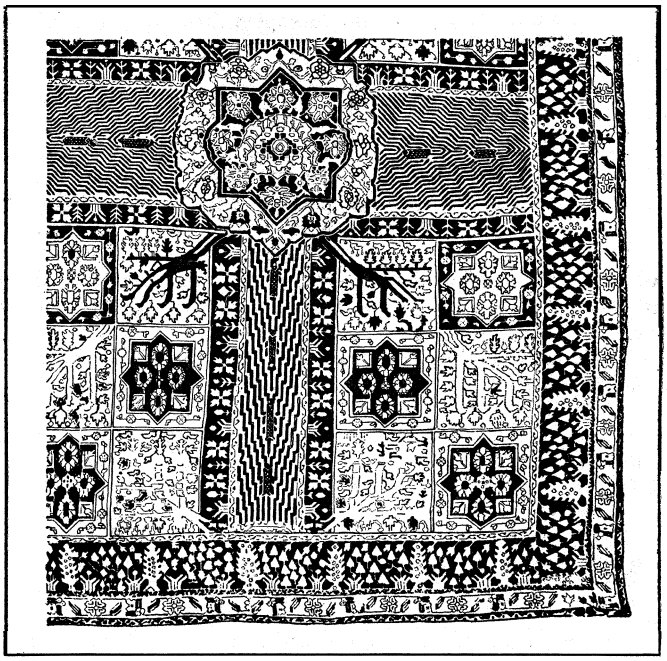

FIG. 9.— GARDEN CARPET, NORTHERN PERSIA, 18TH CENTURY

The carpets of the Abbasid caliphate at Baghdad (Haroun al-Rashid and his successors) seem almost to have rivalled the carpet of Khusraw Caliph Hashim, nho died in 743, had a silk, gold-enriched carpet that was approximately 150 x 300 ft. The history of this carpet can be traced for more than a century. It was finally inherited by Caliph Mutawakil about 850. Gorgeous carpets are mentioned in all the contemporary descriptions of the period. We know little about their actual appearance, but some had inscriptions; some actually attempted symbolic portraiture of the Sassanian kings; carpets decorated with all kinds of animals were made in Numaniya and Hira, showing a growing mastery of pictorial effects Dark blue was probably the commonest colour. but the Caliph El Mahdi owned a rose coloured carpet.

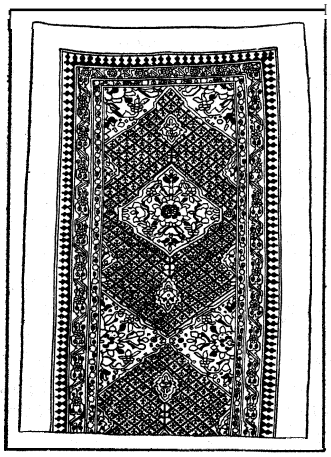

FIG. 10.— HAMADAN

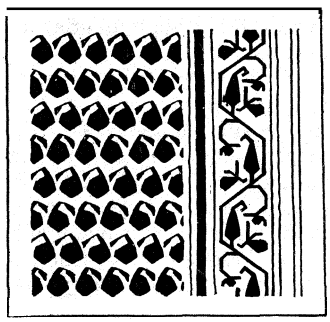
Whether these Sassanian and early Islamic carpets were pile-knotted or tapestry-woven is impossible to say. There is no evidence to support the usual assumption that they nere all done in some kind of flat stitch, but tapestry (*q.v.*) [Lat *tapes*—covering for floors, walls, etc.; Gr. ταπες —carpet. rug; Fr. *tapisserie,* and also tapis-—carpet, cover] nas already by that time a much used technique as well as an old one, for it was well developed by 1500 B.C. (Ackerman, *Tapestry,* p. 12, New Pork. 1933.) Fragmentary examples, dating from the 7th to the 14th century. have been found on the rubbish heaps of Fustat (ancient Cairo), including some so stiff and heavy that they could only have been floor coverings. Many of these pieces are of genuine beauty, nith rich and harmonious colours and ingenious but rational patterns.

Various of the Arabic geographers give valuable though meagre

information about carpet weaving in the near east from the 8th to the 14th century. Armenia was certainly one of the most productive districts. Here were found good wool, clear water and fine dyes, especially a fine scarlet made from the *Coccus ilicis* called *kermez* and widely exported. Armenian rugs were famous in the 8th century, and we know that by the 10th such cities as Devin, Van, Kalikala (Ezerum), Bitlis, Vartan, Aklat and Tiflis, all produced famous rugs. Marco Polo credited the Armenians and Greeks in the towns of central Asia Minor (Konia, Sivas and Caesarea) with weaving the most beautiful carpets in the world (*Marco Polo,* Yule trans. p. xxx). But unfortunately have no description of these carpets.



PATTERN

In northwest Persia, the towns of Khoi, Bargari, Arjig, Nachshirvan and Mukhan are all credited with rug production. The south Caspian coast, Gilan dnd Mazanderan, evidently supported an immense industry. Its prajer carpets were exported everywhere, and in the 8th century 600 rugs were sent at one time as tribute to the Caliph hlamun.

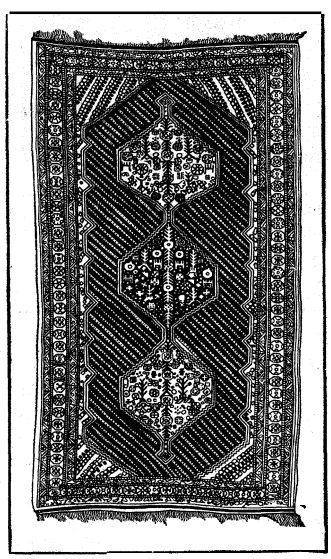


FIG. 12.—SHIRAZ RUG WITH PATTERN OF HEXAGONAL PANELS, LATE 19TH CENTURY

Rugs were an important part of the equipment of palaces and homes in northeast Persia and in Afghanistan. It is probable that there was local production, but we have no real knowledge of it. In the 8th and 9th centuries, Turkistan, according to contemporary literature. was famous for its carpets which were exported all over the world, particularly to China. Bukhara, Tashkent and Darzangi are all mentioned as producing fine rugs. Darzangi was especially noted for its tapestry rugs. The designs were probably all geometrical, as in the so-called Bukhara rugs of the day. Wall paintings from the Turfan oasis. from Kizil, and fragments of Manichaean book illustration depict floor coverings with hexagonal and other simple geometric designs.

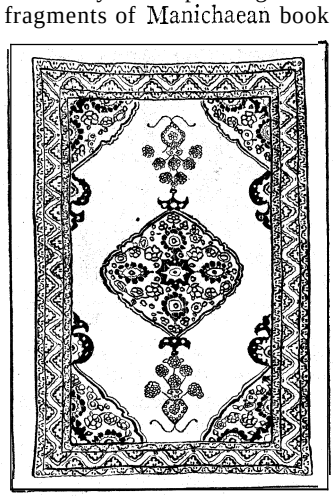

FIG 13.— MESHED CARPET, 19TH CENTURY, PATTERN BASED ON THE "CLASSICAL" MEDALLION CARPETS

Southern Persia, Khuzistan and Fars were also noted for carpet weaving. Basinna and Shustar were active centres of production. Gundigan. Fass, Darabjird, Jahrarn, all produced rugs, and the kilims are specially mentioned as of precious quality.

In the 13th, 14th and 15th centuries Asia Minor and the Caucasus were producing rugs, rather coarse in weave, of strong colour and simple geometric design—stars. polygons. entrelacs often nith border patterns of stylized Kufic writing. and a special group of rugs with simple, highly conventionalized animal forms. The most important of these are a group of three somewhat fragmentary carpets of strong repeating geometric patterns in somewhat harsh colours, red. yellow and blue. which mere found in the mosque of Ala-ud-Din in Konia and are now treasured in the Ewfkaf museum at Istanbul. Local tradition assigns them, reasonably enough, to the period of the Seljuks of Rum, cousins of the Persian Seljuks, who maintained their authority in Asia Minor through the 13th century. In the Berlin museum and in the National museum at Stockholm are a pair of rugs of very primitive design, the former a highly conventionalized dragon-and-phoenix combat, the latter stylized birds in a tree, both patterns that were later richly developed in the Caucasus, which warrants attributing them to the Caucasus of the early 13th century.

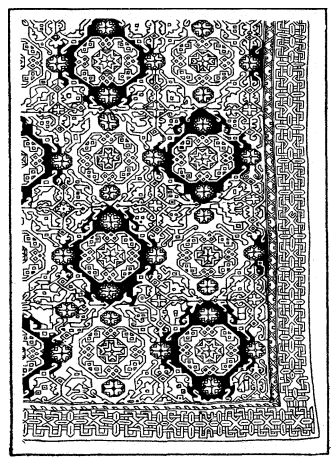

FIG. 14.— SO-CALLED "HOLBEIN" RUG, BLUE, RED, GREEN AND WHITE. ASIA MINOR, 16TH CENTURY

A little later there began to appear in Europe, coming from the same as yet unspecified region, a considerable number of rugs of finer weave, more delicate patterns and richer colours. These also are almost wholly geometrical in pattern. They were depicted by the Flemish painters such as Hans Memlinc, Van Eyck, Petrus Cristus, with such skill and loving care that the separate knots are sometimes visible, and the full artistic character of the rugs, which was considerable, is adequately presented. The designs of many of these rugs have been quite faithfully repeated in the later weavings from the Bergamo district in Asia Minor and from the southern Caucasus almost to the present day—an impressive evidence of the conservatism of rug design which so complicates the problem of dating.

CLASSIFICATION

Because of the difficulty of classification it has been customary to name the great court carpets of the 16th century in accordance with their presumed themes, and me read of "Hunting carpets," "Garden carpets." "Medallion carpets." "Compartment carpets," "Vase carpets" (so-called because of the presence of a vase in the design), "Praver carpets," "Animal carpets.;' This classification is hardly more than a temporary convenience, and really evades the problem. These various themes were embodied in the carpets of many different regions and over long periods. A more serious classification attempts to connect a given carpet style with some dominant cultural unit; the court of a great monarch; the locality in which the patterns mere developed: the actual place where the carpet was fabricated. including the sources of design elements. This method is difficult because of the dearth of contemporary documents, and because in a court-supervised art, material was often gathered in one place and shipped to some court-subsidized loom, while court-approved cartoons also were apparently supplied to the various weaving centres, and the provinces also copied the cosmopolitan styles in vogue at the capital On the other hand, we know from an actual document of Shah Abbas that even at his time nhen the imperial dominion was formally established, in all matters cultural as well as political and economic. the integrity of the local weaving centres was not only respected but the officers of the crown mere charged to see that they were preserved. The majority of the more important carpets of the 16th century, in colour, pattern, materials and

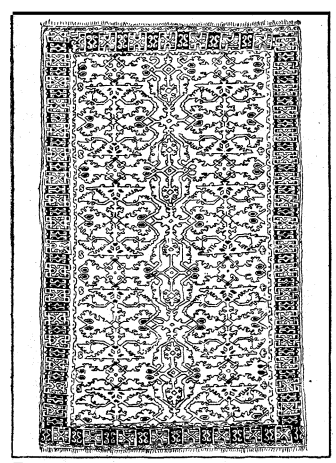

FIG. 15.— SO-CALLED "LOTTO" RUG. CONVENTIONALIZED ARABESQUES IN YELLOW ON RED GROUND. ASIA MINOR, 16TH-17TH CENTURIES

technique fall into groups of such marked individuality and integrity that we can be sure that in most cases we are in the presence of a real school. The finest of them are almost all now in museum collections. The complex designs are thought out with perfect lucidity controlled by a rigorous decorative logic, with imagination and frequently with deep feeling for a genuinely noble effect. They are in the proper sense a monumental art. Their very size is impressive. The more important of them may be from 20 to 40 ft. long, and in the 17th century, more than 50 ft., though such a size somewhat exceeds the power of unified comprehension.

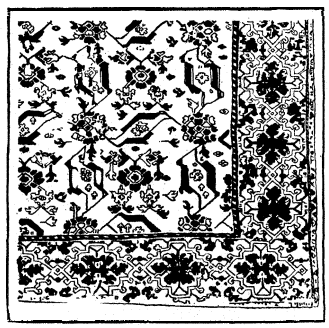

FIG. 16.—SO-CALLED "BIRD" RUG, ASIA MINOR, 17TH CENTURY

The materials, both dyes and wool, were of the finest that the unlimited power and wealth of the shah could command. Sheep were specially bred and tended; dye plantations cultivated like flower gardens; aspiring designers and weavers, could by submitting cartoons or finished work win a court appointment which conferred arestige and nrivileges which were greatly prized. The 15th and 16th centuries were the heirs to the slowly accumulated artistic tradition of a deeply artistic people. The ambition was there; the material and means were present; and a passion for perfection, which was a special attribute of the Timurid period, where "artists had no other thought than to make their work the most perfect possible," brought about just that unique combination of favourable circumstances which alone supports supreme artistic achievement.

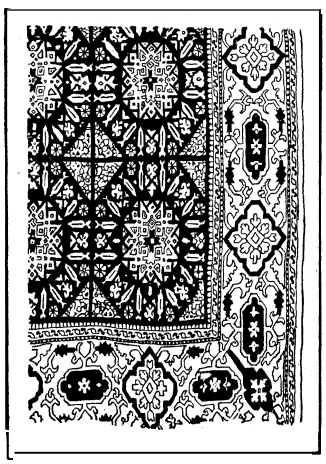

FIG. 17.— TURKISH COPY OF A CAIRENE RUG, 17TH CENTURY

The rugs of this period can with a certain confidence be divided into six well defined groups.

The stately Medallion carpets of northwest Persia, judging by the tonality, the materials and the subsequent history of the type seem to have been done in the vicinity of Karabagh in northern Azerbaijan. At the same time a special court atelier, possibly located at Sultaniya, as an elusive contemporary document hints, translated into carpets the most gorgeous and varied creations that the illuminators could devise. A dozen or more pieces of this group have survived. Each one is a separate masterpiece, and if they do form a class, it is first of all on the basis of outstanding artistic quality, superb design, majestic size, colours of great purity and depth, and perfection of detail. They all use a fine, crisp, very white wool, probably from Ahar in the extreme northwest, which today furnishes the most brilliant wool found in Persia, a wool which takes dyes most beautifully.

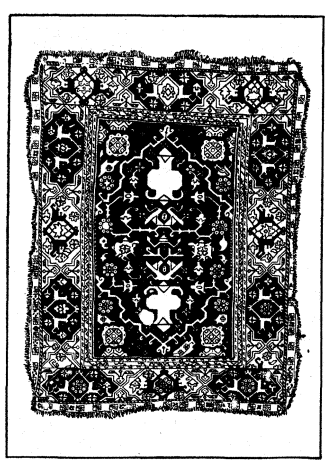

FIG. 18.— SO-CALLED "TRANSYLVANIAN" RUG. ASIA MINOR, 17TH CENTURY

This group includes the world's most famous carpets. The great pair of carpets from the mosque at Ardabil. dated 1539 (one owned by Paul Getty, the other by the Victoria and Albert museum, London), are the best known carpets of the period.

The ornamentation consists of an extremely rich and intricate system of stems and blossoms on a velvety glowing indigo field, which in turn is dominated by a complex golden star medallion. (The colour-quality designations belong only to the Getty piece, as the Victoria and Albert piece was still [1944] in grievous need of cleaning.)

The Ardabil weaving has a near rival in the Anhalt carpet, named for the duke of Anhalt who once owned it, now also onned by Duveen. An intricate star medallion dominates a brilliant yellow field covered with an ingenious system of scrolling arabesques and fluttering cloud bands, framed by a scarlet border. Another pair of carpets from the same region has a scarlet medallion on a white field, which is interspersed with lively animal forms and framed by a dark blue arabesque border. One belongs to the Berlin museum and the other to Paul Getty, the American collector. An impressive pair, one in the Musée des Tissus at Lyons, and the other in the Metropolitan museum in New York (the Lyons piece sadly wrecked, and the New York piece mutilated by reduction) is composed entirely of cartouche patterns enclosing in their irregular spaces brilliant little arabesque compositions. The effect is somewhat incoherent but the pair rise to greatness by virtue of the superb finesse of detail and the magnificent colour.

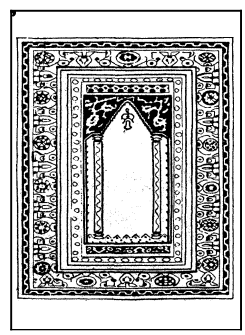

FIG. 19.—GHIORDES PRAYER RUG OF FINE TEXTURE AND SHORT PILE

One of the most beautiful in the series is the animal carpet half in the cathedral of Cracow and half in the Musee des Arts Decoratifs in Paris, by the same designers and weavers as the Anhalt carpet. It has the same glowing scarlet and gold, but with more subtle halftones (buff on yellow, gray on taupe) and a more pictorial presentation of the paradise park. One of the most striking of the series is the great Tree carpet, also somewhat reduced, that belongs to the estate of C. F. Williams, now in the Philadelphia museum. Like the Cracow-Paris carpet it is a garden scene, with cypresses and flowering trees of glowing vernal splendor.

Historically more important and in beauty a rival of any is the great Hunting carpet in the Poldi-Pezzoli museum in Milan, which carries the precious historical inscription: "It is by the efforts of Giyath-ud-din 'Jami that this renowned carpet was brought to such perfection in the year 1522–23." Again a rich scarlet and gold medallion dominates a field of deep blue, covered with an angular network of blossoming stems, across which in every direction hunters dash after their prey.

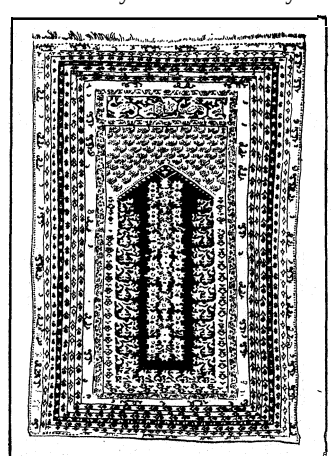

FIG. 20.—KULAH PRAYER RUG

This small group, in the opinion of many, represents the supremest achievement in the whole field of carpet desinning. None the less, other ateliers under royal direction were also producing many beautiful specimens. One type, also under the domination of the court and possibly done at Tabriz (possibly also at a little town near Hamadan, called Derguzin, in western Persia) reflects even more precisely the art of the illuminator. Some of these are in small size, all with medallions dominating the field which is covered with very intricate systems of two-toned arabesques beautifully co-ordinated and subordinated one with another, with inscription cartouches in the border. More than a score of these have survived and they are like pages from a 16th century manuscript. A few beautiful prayer rugs discreetly illuminated with silver and gold belong to the same group. Most of these rugs have come out of Istanbul

and may be part of a famous gift of rugs that Shah Tahmasp made in 1665 to the sultan of Turkey. The largest and best-known single example is a beautiful multiple-medallion carpet in the Victoria and Albert museum (London) which Dr. Bode mas inclined to ascribe to the end of the 15th century and to rank as the finest carpet extant.

But rug weaving was also the concern of other parts of Persia. In Kashan, in the second half of the 16th century, superlative silk animal rugs were woven, of which three large specimens survive. The finest—some think the finest of ail known carpets—is the silk, gold and silver enriched Hunting carpet which is one of the principal treasures in the Austrian state collection. It is a *tour* de *force* of both designing and weave. The cartoon was obviously the work of a master painter. Another large piece from the same looms is owned by the king of Sweden and a similar one belongs to the government of Poland. About a dozen smaller pieces of the type are known, each worth many times its weight in gold. The famous so-called Isfahan carpets, which were not from Isfahan at all, were made in east Persia in the vicinity of Herat and Sabzawar. They are the most abundant and most familiar of the so-called classical carpets. The typical field is a very rich claret or dark *rose* du *Barry,* covered with a delicious pattern of tendrils and graceful lanceolate leaves, framed by a broad border either in deep emerald green or dark blue, carrying magnificently constructed palmettes alternating with lotus or peony blossoms.

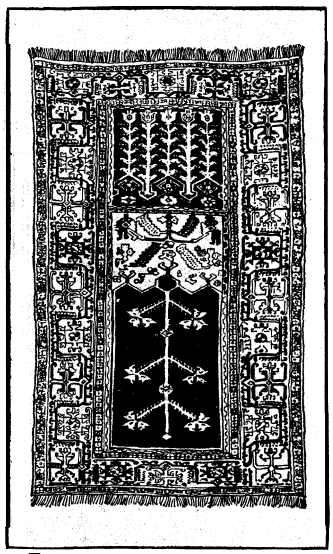

FIG. 21.—LADIK PRAYER RUG

North of Isfahan in the picturesque hill town of Joshaghan a strikingly beautiful and highly individual class of carpets was produced that has been called Vase carpets. The pattern structure is generally a series of ogival latticelike systems which carry a profusion of blossoms interspersed with foliage. Only a few of these whole carpets have survived, of which the pair divided between Lady Baillie and the Berlin museum is typical. The glowing blue of the background and the very finely divided clear colours are scarcely to be caught on a colour plate. There are a scant 20 whole pieces of this splendid type, though many very fine fragments still exist. These rugs were apparently not exported from Persia but used almost exclusively for court and mosque. They are woven on a solid double narp, which gives them a boardlike stiffness that holds them flat to the floor—a desirable feature for a carpet. They are still called in Persia "Shah Abbas carpets." The style (which was indigenous. very ancient and characteristically Persian), reinforced by the prestige of the court, exercised a nide influence, and derivatives show up in Kurdistan, the Caucasus and even in the embroideries of Bukhara, as well as in the court carpets of India.

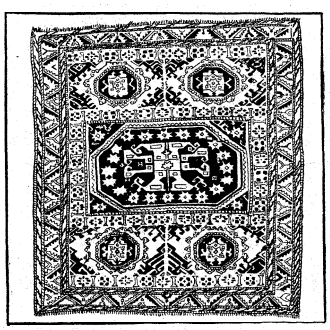

FIG. 22.—BERGAMO SQUARE RUG

There are other beautiful carpets of the 16th and early 17th centuries for which the Provenance is still doubtful. Magnificent rugs were, we know, woven in Kerman, Tazd and Fars, and perhaps Khuzistan, but just what they were like we can only guess, as we have no extant example that can with any surety be assigned to any of these places.

From time immemorial, the rugs of Persia had been enriched by gold and silver thread, a device that was discreetly used in some of the 16th century carpets from east Persia, but by the time of that mighty monarch, Shah Abbas, the scheme was carried to a most sumptuous perfection and many carpets of sheer opulence made of silk with great masses of interwoven silver and gold were made to delight the monarch and to dazzle the astonished ambassadors and travellers from Europe. The most gorgeous of these carpets is the so-called "coronation carpet," still preserved in its pristine splendor in the Rosenborg castle in Copenhagen. The gold background gleams as brightly as the day it uas woven and the velvetlike pile, aith its accurately drawn arabesques is no less perfect.

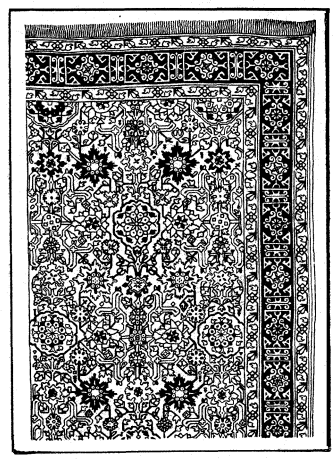

FIG. 23.— KUBA CARPET

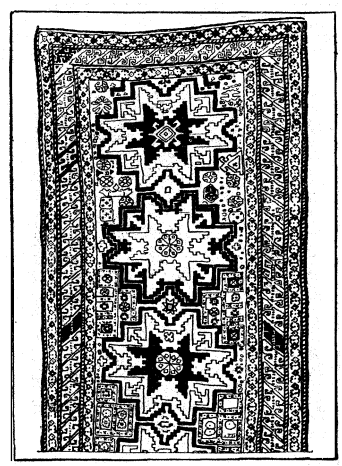

FIG. 24.— SHIRVAN RUG

As the 17th century wore on, both the demand for more luxury and the increasing wealth that sustained it, multiplied the manufacture of these carpets until they mere not only available for purchase to ordinary civilians in the bazaars, but were exported in great numbers to Europe, where more than 200 of them have been found. They are closer to the European Renaissance and baroque idiom, with their high-keyed fresh colours and demonstrative opulence, and the finest of them are indeed beautiful. A large number of these pieces were found in possession of some of the great families in Poland, for Poland had very close relations with Persia in the 17th century. and Polish royalty and nobility ordered gold-threaded rugs of this type from the looms in Kashan. There had been a rug-neaving industry in Poland in the 18th century and a silk-weaving industry also which used gold thread. So when these Polish rugs were first exhibited at the Paris exposition in 1878 it was natural to think that they were really Polish, for nothing quite like them had at the time been found in Persia. They were accordingly labelled *Tapis Polonazs,* and the name has stuck to the type ever since. Actuaily, they were primarily a product of the looms of Kashan but were probably also woven in the royal shops in Isfahan. The style degenerated rather rapidly. By the second half of the 17th century materials were cheapened. weaving coarser and more careless, the designs clumsy and confused.

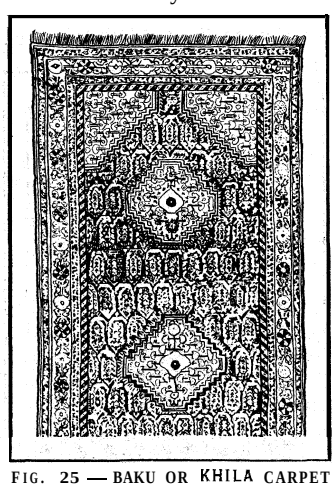

FIG. 25 — BAKU OR KHILA CARPET

Similarly the east Persian Herat carpets which came into the European market by way of India and the gulf export trade, partly in Portuguese control. partly in English, became known in Europe as the typical Persian carpet. The demand was furious and the competition among the great of the land to acquire them even had international political consequences, as when the duke of Buckinghain delayed signing a treaty with Spain until the Spanish ambassador could procure some of these carpets for his new

palace, Hampton Court. Many of the European artists of the period owned them, and Van Dyke and "Velvet" Breughel, particularly, rendered them with such complete fidelity in dated paintings that we can with a little care and stylistic analysis date these so-called Isfahan carpets to within a couple of decades.

FIG. 26.— DAGHESTAN PRAYER RUG

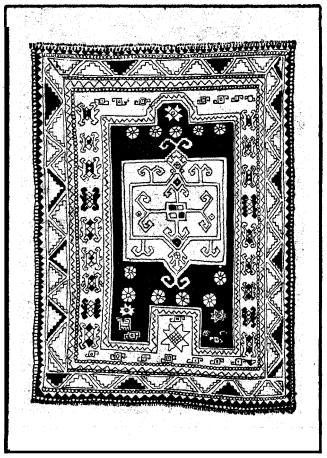

FIG. 27.— KAZAK PRAYER RUG

The Indian princes also were enamoured of them and acquired them by plunder and purchase alike. The result was mass production with the inevitable consequence of a rapidly deteriorating art. Designers were no longer employed. cartoons were wearily repeated ad *infinitum*, the weavers had little interest or pride in their work, the pressure for speed and for economy deteriorated every process, and the style finally expired in a repulsive mediocrity, painful proof of how and why a great art can be brought to ruin.

During the 17th century there was an increasing emphasis, where the court could afford it, on refinement and luxury, but on the whole a steadily slackening inspiration. Routine increasingly displaced invention. But in 1666, a set of silk carpets was woven to surround the sarcophagus of Shah Abbas II in the shrine at Qum, of such finesse that even orientalists have mistaken them for velvet. The drawing is beautiful, the colour varied, clear, brilliant and harmonious, and the set has the important merit of being dated and signed by a master artist, Nimat'ulla of Joshaghan. This set marks the last really high achievement in Persian rug weaving, although handsome carpets were woven throughout the century and even in the 19th century, and these, despite the increasing poverty of the time and the decline of all the arts, still surpass any floor covering ever conceived or rendered in the western world.

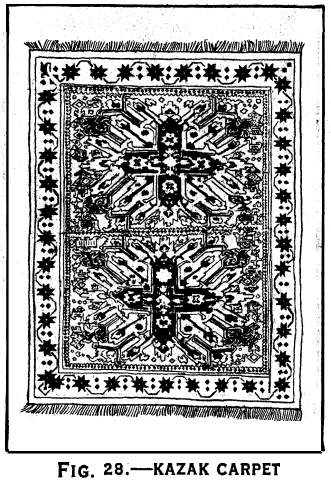

FIG. 28.—KAZAK CARPET

The carpets so far described were all specially made for the court or for the great nobles. They could afford to concentrate on perfection and disregard expense, which was often considerable. Indeed, a carpet like the Ardabil or the Austrian Hunting carpet cost as much as a small palace. Such rugs could be of silk, gold and silver, almost too fragile for anything but contemplation or the most lavish ostentation. They were cared for by special custodians. brought out only as actually needed, often for state occasions only. and even when the king sat on them they were generally partly covered with a lighter fabric for completest protection. The mosque carpets had severer and more continuous use. Carpets that reached Eurcpe were for the most part treasured with equal solicitude. They were precious items in royal treasuries like the Austrian Hunting carpet, which Peter the Great gave to the emperor of Austria, the Danish Coronation carpet or the Anhalt carpet, which are all almost as fresh and perfect as the day they were taken off the loom.

Persia. — Little is known of carpet weaving of the 13th and 14th centuries in Persia, but by the 15th the art was rapidly moving toward an artistic climax. The horrors and devastation of the Mongol invasion certainly depressed the artistic life of most of the 13th century, which was only partly restored by the magnificence of the architecture and miniature painting of the Ilkhan renaissance (1290–1335). The bloody conquests of Tamerlane were disastrous to Persia. but he spared and favoured artisans, who were removed in large numbers to work on his great palaces in Turkistan, particularly at Samarkand and Bukhara, where they were chiefly responsible for a new school of painting and decorative design.

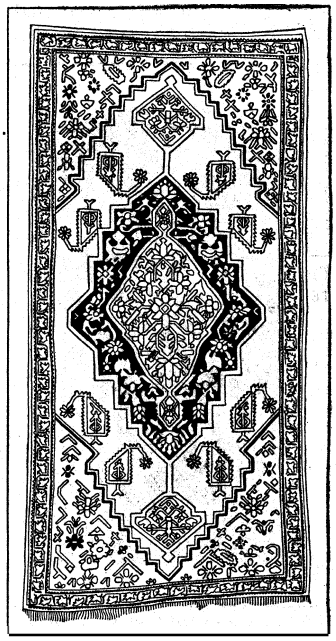

FIG. 29.— KARABAGH CARPET. BLUE AND MAGENTA

Out of this, under the enlightened and cultivated rule of Tamerlane's successors, particularly Shah Rukh (1377–1447) and Baizangur (1396–1433), literature and art in all its branches were brought to magnificent floriation. Out of this matrix came the supreme achievement of the carpets of the 16th century.

These great carpets of Persia, like most of the finest art of the times, were produced in the palace ateliers or on court-subsidized looms and this made for unity and integrity of style. while a sensitive and exacting clientele imposed the highest standards, and the lavish royal support guaranteed supreme technical proficiency, the most perfect materials and the utmost in skill. All these conditions obtained under the Timurids through the 15th century and under the Safavids (1501–1723).

Authoritative at court and generally supervising all artistic enterprises were the miniature painters, illuminators and book binders, for the art of the book had long been considered the supreme accomplishment and a genuinely great calligrapher outranked weaver, architect or even poet. The art of the book in the 15th century, nhich already had behind it centuries of superb achievement, reached a degree of elegance and sophistication that it has never known either before or since. Bindings, frontispieces, chapter headings, and in the miniatures themselves, canopies, panels, brocades and carpets, furnished the spaces, mostly rectangular, which by the taste of the time, called for the richest and most elegant patterning.

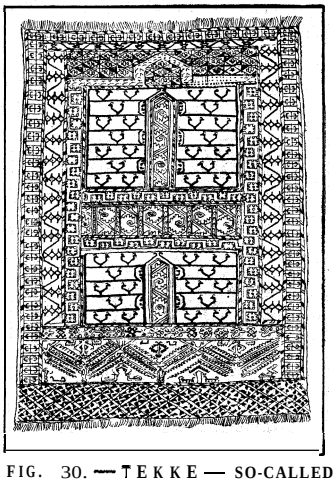

FIG. 30.— TEKKE — SO-CALLED KHATCHLI (CROSS) DESIGN

The beautiful designs thus conceived were in various degrees appropriated by the other arts and the illuminators were given authority over the weavers whom they tended to regard as mere assistants — at best only colleagues.

This domination of outstanding artists accounts in no small measure for the special character of the court carpets of the period, the variety of colour, the ingenuity and imaginative range of pattern schemes. the superlative draftsmanship which is both lucid and expressive, as well as the intensity of artistic percep-

tion which raised these products to the rank of great painting. Indeed, John Sargent and Sir Charles Holmes, both independently used almost the same words referring to two different 16th century carpets: "There is more art in a really great carpet than in any picture ever painted." *(See* Pope, *A Survey* of *Persian Art,* vol. I, p. 2.)

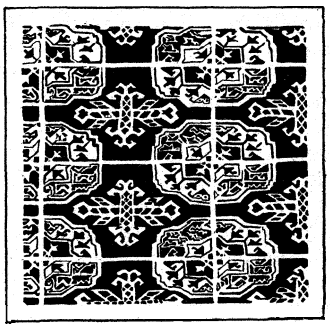

FIG. 31.— TEKKE RUG, FIELD PATTERN

FIG. 32.— YOMUD TENT BAG OF MEDIUM FINENESS

India.—Very little is known of early and indigenous carpet weaving in India where it was apparently a late development, for in a tropical country carpets are not so necessary as in northern climates where their warmth is an asset. As an art it was brought in from Persia by the Mogul princes in the 16th and 17th centuries. Akbar set up royal looms that were thought to surpass Persia's finest although, as his biographer Abul Fazl tells us, rugs were still imported from various centres in Persia. The Herat carpet-weaving establishments that made the so-called Isfahans, being nearest, furnished models and apparently weavers were brought thence to continue the style in India, where it was rapidly crystallized, with the elements reduced and formalized, the drawing rigid and meagre. Colours and wool also deteriorated and there were few compensating additions from Indian sources.

The carpets made for the courts of the Grand Moguls, however, were of extravagant and luxurious beauty. Shah Jehan, for example, had made for the palace of Amber a set of rugs from the most precious wool, imported from Kashmir and from remote Himalayan valleys. With the Mogul princes, expense was never

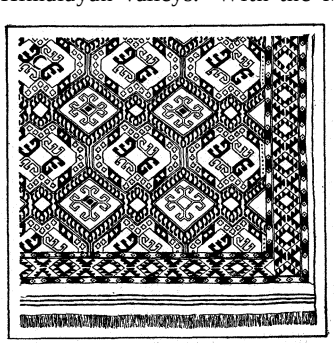

FIG. 33.— ERSARI PATTERN. CHIEFLY A BROWN RED

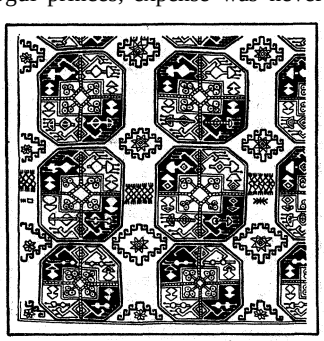

FIG. 34.— AFGHAN RUG, FIELD PATTERN

any object. The cost of fine weaving was quite ignored and a series of carpets turned out with 800 to 1 200 knots to an inch, which provided a luscious velvety texture. Special carpets were of even finer weave and a fragment of a prayer rug has survived (Metropolitan museum) which has the incredible fineness of nearly 2,400 knots to an inch. Master draftsmen, designers and dyers were, of course, employed and no obvious beauty neglected.

But the art was young and its sources nere in imitation, not deep in the life roots of the people. The standards of taste were too recent and too personal, and despite the magnificent models they worked from, despite the limitless subsidies which they could command, these wonderful fabrics never reached the artistic height that characterized many periods of Persian weaving. Their beauty is too obvious, there is no deep and significant organization of pattern, there is a want of imagination and a want of feeling for the possible and the appropriate. The aim was too pictorial, the stately palmettes and curving leaves of Persian carpets which were in themselves noble and significant compositions, are reduced in Indian carpets to a meticulous botany, faultless in detail but lacking in meaning, much too photographic to sustain any poetic fancy.

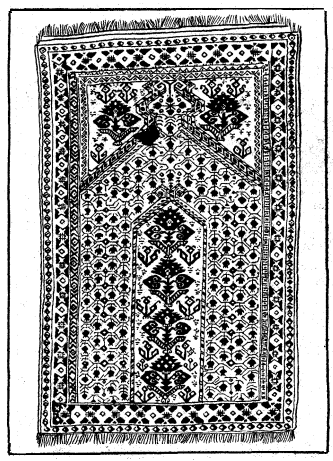

FIG. 35.— BESHIR PRAYER RUG

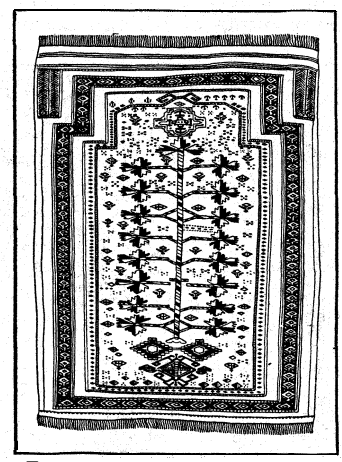

FIG. 36.— BELUCHI PRAYER RUG

The rug industry, once established, continued down to the present. It became a jail industry, particularly in the Punjab. The designs were increasingly meagre and the art could not longer sustain comparison with the Persian weaving.

The later Indian carpets are mostly very inferior, largely on account of the difficulty of obtaining good wool. Many still have the designs of Persia and of other countries but purely Indian patterns are also common. From time to time better carpets have been made in the factories and during the 19th century the government established a fairly successful manufacture in the jails, but it is rarely that in both design and quality they rival the better products of Persia. The best come from Agra and Warangal, the latter producing some good silk rugs. Carpets from Masulipatam, Mirzapore and Tanjore are very cheap and very substantial but the wool is so harsh and the colours so dull and gray that they are quite unattractive. Cotton rugs are made in Multan, and tapestry-woven ones, called *daris,* in many places. During the 20th century carpets of good quality, with any desired pattern. are being made in Kashmir, where some handsome reproductions of famous classical carpets have been made.

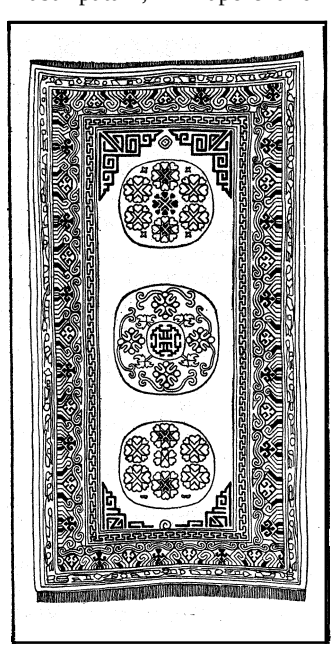

FIG. 37.—CHINESE TURKISTAN CARPET WITH THREE MEDALLIONS

Turkey.— Turkish rugs, after the 16th century, were of two markedly contrasting types, those made on court looms following Persian designs and possibly the work of imported Persian and Egyptian neavers. Exquisite cloud bands, feathery lanceolate leaves in white on grounds of pale rose relieved by blue and a deep emerald green, carry the rug-weaving art to a special type of perfection. These rugs are somewhat like Persian poetry which was so much admired and copied by the upper classes. The more indigenous Turkish styles are embodied in large and handsome carpets made for a clientele of mosques and nobles; styles best illustrated in the Oushak carpets, ornamented complex star medallions in gold and yellow and dark blue centring on a field of rich red. The so-called Holbein carpets (fig. 14) with Caucasus-like polygon on a

ground of deep red often with green borders and a conventionalized interlacing Kufic such as is shown in Holbein's famous portrait of George Gyscze. A handsome carpet of interlacing yellow arabesques on a ground of deep red appears so often in the paintings of Lorenzo Lotto that the rugs are now designated

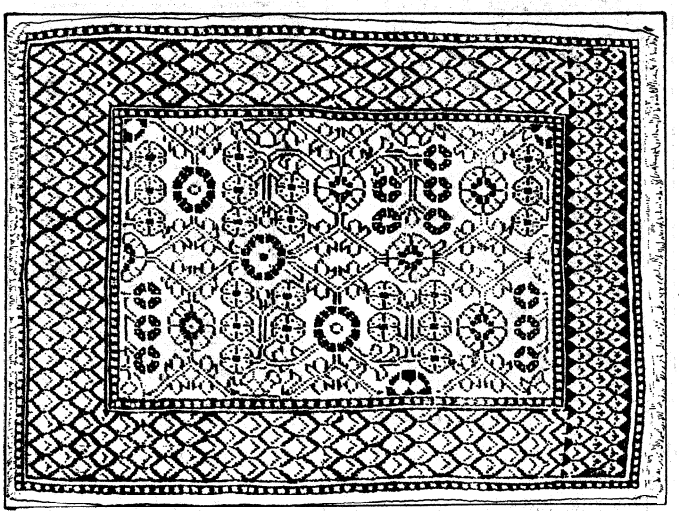

FIG. 38.—KHOTAN CARPET WITH "FIVE BLOSSOM" PATTERN

as "Lotto" rugs (fig. 15). From some unidentified region, perhaps Bergamo. come rugs again on a ground of deep muffled red of wonderful depth and intensity, also focused on small medallions. This type developed in the 17th century into carpets known as Transylvanian (fig. 18), because so many of them have been found in the churches of Transylvania. But they are purely Turkish in feeling and have the Turkish merits of rich and quiet colour and placid designs, aside from prayer panels, vases and conventionalized foliage, ultimately of Persian derivation. Many of these are prayer rugs. The majority are dominated by a fine red but a few use a wool that is now approximately the colour of old parchment.

The 17th century saw the development of another characteristic type, erroneously called Bird rugs (fig. 16) as the highly conventionalized pair of arabesque blossoms on stems enclosing a leaf does suggest a bird. The few rugs that have survived are of serene and quiet beauty, the field is of soft ivory white and all the colours discreet and modest.

The Turkish rugs are distinguished above all things by their rich and harmonious colours and their broad and spacious designs. They have none of the lively and intricate movement of the Persian carpets, none of the adroit differentiation of pattern, none of the fuguelike counterpoint where primary, secondary and tertiary patterns are played against one another in subtle rhythms, dissonances and resolutions, Persian qualities unsurpassed and unapproached in these respects by the weaving of any other region.

The Caucasus.—Fine rugs have been woven in the Caucasus from earliest times, for this region provides every facility for the art. The enormous prestige of Persia, the dominant political and cultural power in this region through many centuries and the magnificent carpets produced at the court furnished models for the more serious Caucasus weavings that were made for the local nobles or khans. But the Caucasus has its own individual character and while it took motives from other sources, like the dragon and phoenix fighting (so common in Persian illuminations), sunburst medallions, latticelike field divisions derived from the Vase carpets and other sources, or repeating lotus forms often in huge scale, all these contributory elements were completely transformed, and were used only as indications or design material to be refashioned. The Caucasus rugs. perhaps because of questions of expense (for the little Caucasus kingdoms could never compete in luxury with sultans or shahs) were of coarser weave, the famous Kuba Dragon carpets being not infrequently less than 80 knots to the square inch, and hence the designs were much simplified; but the taste that controlled these virile and powerful designs was genuine and original and warrants classifying the rugs of this region as one of the principal types.

One of the most famous of the Caucasus weavings, the Dragon carpets, concerning which there has been a heated controversy, seems to hdve come from the town of Kuba, which was one of the great weaving centres. These carpets are of a prodigious scale and furious vigour of design that has no rival in the textile world

(A. U. P.)

Central Asia—As the carpets of western Turkistan are made by nomadic Turcoman tribes living in tents and constantly moving about, it is not to be expected that very old ones can still exist. Probably in fact few go back more than 100 years, though it is almost certain that similar rugs have been made for centuries. Turcoman rugs are easily identified, for they all, excepting the Beluchis, have a dark red colouring and geometric designs. Many of the older pieces are not in reality rugs at all though those intended for hanging in tent doorways have that appearance. Many are just bags used for storage in the tents or on the pack animals. Those called camel bags measure about five by three feet, and the tent or wall bags three by one or more. Saddle bags consist of two squares of about two feet, joined together. There are also long bands about a foot wide and perhaps 60 yards long, which are for wrapping round the large tents. The small squarish rugs and larger ones of about ten by seven feet seem to be later in date and were perhaps made chiefly for sale. The Turcoman carpets (wrongly called Bukhara) have woollen warp, weft and pile, two lines of weft and nearly always the Sehna knot. They are surprisingly well woven for nomads nith none but the most primitive appliances. After the predominant red, the chief colours are blue, white and a natural black that tones to a very pleasant brown. The characteristic design is the octagon—or so-called elephant's foot—arranged in rows and columns, often with diamond-shaped figures in between The doorway hangings—called Tekkes (see fig. 30)—have cross shaped panelling and the smaller pieces often have a rectangular diaper. Woven end webs and tassels are freely used as embellishments. The best classification is on a tribal basis.

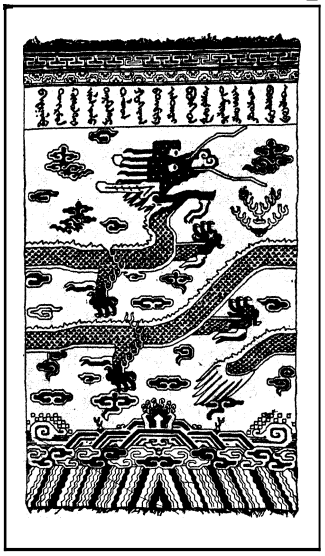

FIG. 39.—PILLAR CARPET. DRAGON DESIGN

Tekke.—These are often very finely woven, sometimes with 400 knots to the square inch. The principal colour is a deep muffled red (fig. 31).

Yomud.—Of medium fineness, mostly with the Ghiordes knot. The chief colour is a purple red, and there is a good deal of white, especially in the border. In the pattern diamonds often displace the usual octagon (see fig. 32). The long tent bands, which have the pattern in pile on a woven ground, belong to this group.

Saryk.—Like the Tekkes but with an almost black-purple or very deep crimson colouring, together with some very prominent white. Not very common.

Ersari.—These are rarely large pieces. The chief colour is a bronn-red; dark green and a little bright yellow are characteristic. The patterns are very varied, with a tendency to zigzags, diagonal lines and spotted effects (see fig. 33).

Afghan.—Mostly large rugs with long pile and a pattern of large octagons almost touching in columns (see fig. 34), and akin to the Ersaris.

Beshiv.—A rare type apparently made near Bukhara, with rich colouring including a lot of yellow, and patterns apparently based on the Persian Many are prayer rugs with a characteristic pointed arch (see fig. 35). Large carpets are more common.

Beluchi—These differ from the other Turcomans in that they have a black weft, and dark purple and red colouring, sometimes

with natural camel-colour and very staring white. The patterns are almost geometrical but the prayer rugs often have tree forms (*see* fig. 36). Most of them come from eastern Persia in the vicinity of Khaf near the Afghan border.

Chinese **Turkistan.**—The earliest rugs of Chinese Turkistan date from the 17th century and mostly have a silk pile and some metal and gilded thread. The patterns are formal floral ones, based on the Persian but with unmistakable Chinese treatment of the detail. The later carpets are loosely woven with the Sehna knot, wool, or more rarely silk pile, and a cotton warp. The 18th century examples have rich but dark colouring, which during the 19th century gets gradually more vivid until at last it becomes excessively crude. There are two important types of design.

Medallion.—These usually have three medallions suggesting in shape a square with well-rounded corners (see fig. 37). One border almost invariably has a conventional Chinese pattern of foam-crested waves. This pattern is mostly called Samarkand in the trade, but the rugs themselves come from Kashgar and Yarkand.

Five Blossom.—These have a floral diaper with characteristic groups of five blossoms (see fig. 38). The colouring is often richly red and orange with a little clear blue.

China.—The rugs of China proper are easily recognized by their characteristic Chinese ornament. They are of coarse texture and are woven with the Sehna knot on a cotton warp: the pile is thick with a very smooth surface. A peculiar feature is the clipping of the pile so as to form a furrow at the contours of the pattern. The prevailing colour is yellow, sometimes intentional but often resulting from the fading of shades of red and orange. Blue and white are also freely used but there is little true red, brown or green.

Some of the carpets have repeating scrolling plant forms. Others have, scattered about, flowers, medallions of frets and the countless symbols that are so familiar in Chinese art. Frets of the Greek type are very common in the border. Pillar carpets are peculiar to China. They are designed (see fig. 39) so that when wrapped round a pillar the edges will fit together and give a continuous pattern, which mostly is a coiling dragon. Many small mats, seat covers and the like are found. The dating of Chinese rugs is an almost impossible task, as patterns have varied very little with time, and internal evidence is almost nonexistent. During the 20th century numbers of large carpets have been made for export.

Morocco.—Large carpets, twice as long as wide, are made in Morocco. They are loosely woven with very bright but mostly faded colours. The field is often cut up into rectangular panels filled with ornament taken directly from Turkish carpets.

Spain.—Carpets seem to have been made in Spain as early as the 14th century. They are made entirely of wool. The knot is tied, or rather twisted, on one warp thread instead of on two, and the weft passes several times after each row of knots. The colours are bright and few in number, little being used but yellow, blue, red and green. The designs fall into two groups, being based either upon oriental models, such as the geometrical Turkish one or upon purely Spanish ornament. The latter type of carpet frequently introduces heraldry. One early type of long rug has shields of arms on a field with a honeycomb pattern introducing plant forms and birds. A common design is a succession of foliated wreaths; another is a diaper of ogee compartments containing the floral device known as the "artichoke." Few knotted pile carpets seem to have been made after the 17th century, but small rugs woven in narrow breadths with a looped pile were common until very recently. They come principally from Alpujarras in the Pyrenees.

England.—The art of making hand-woven carpets in England soon followed their importation from Turkey, though actual specimens of the 16th and 17th centuries are so rare that only about a dozen complete rugs are known. They have a hempen warp and weft and a noollen pile of medium fineness, tied with the Ghiordes knot. The ground is usually green and there are so many shades of the other colours that the whole number of tints is greater than in oriental carpets. The designs may be divided into two groups. In the first are found typical English patterns resembling contemporary embroidery, and often introducing heraldic devices and, fortunately, dates. The earliest known carpet of this type belongs to the earl of Verulam and is dated 1570. Large numbers of pieces of carpet knotting—called at the time "Turkey-work"—were made for covering chairs and stools. As the demand for carpets increased in the 18th century small factories were started at Paddington, Fulham, Moorfields, Exeter and Axminster, and the home production was stimulated by premiums offered by the Society of Arts in 1756. The designers continued to adopt the decoration of the time or to copy eastern carpets. The famous Axminster factory worked on well into the 19th century and then became merged into the Wilton factory, which is still in operation, With the advent of machinery the industry dwindled and almost disappeared until, about 1880, the craft was revived by William Morris. Quite late in the century a successful factory was opened in Donegal and during the 20th century many small rugs have been knotted by handicraft societies, though their products can scarcely compete commercially with the machine or with the oriental rug. (C. E. **TA.**)

THE UNITED STATES

The first carpet factory in the United States was established in 1791 by W. P. Sprague at Philadelphia. From that time the development of carpet-weaving machinery has progressed rapidly, especially in the line of broadlooms. One of Sprague's earliest Axminster carpet designs represented the arms and achievements of the United States. This attracted the attention of Alexander Hamilton, who recommended the imposition of a small duty on imported carpeting, thus initiating the policy of a protective tariff. While in the early days of carpet manufacturing in the United States, looms were imported from Great Britain and the continent, it uas not long before looms were invented and constructed in the different carpet mills which had come into existence in several cities in the United States. The Jacquard pattern device was put into use in the United States shortly after its introduction in Europe. At Medway, Mass., in 1825, a small ingrain carpet mill, owned by Henry S. Burdett and managed by Alexander Wright, was started with hand looms brought- from Scotland. In 1839 Erastus B. Bigelow began experimental work at Lowell, Mass., which resulted in the perfection of the first power loom ever made for weaving carpets. This wove an ingrain type, and was followed by Mr. Bigelow's development of the Brussels power loom in 1848. John Johnson of Halifax, England, undertook tapestry and velvet weaving (*q.v.*) in Newark, N.J., producing the pattern by printing the dyestuff on the individual strands of yarn. In 1876, after several years of research, Halcyon Skinner invented the moquette or spool Axminster at West Farms, N.Y. James Dunlap, in Philadelphia, developed a method of printing tapestry and velvet carpeting in the finished fabric. Imitation Smyrna rugs were made in considerable quantity by many factories during the latter part of the 19th century, the process being of the chenille Axminster type, but double faced. The three-quarter width or 27 in. was the limit of weave in the several types for long periods after invention, but in the closing years of the 19th century a movement to widen the looms began in the United States. The ingrain carpet and Smyrna rugs gradually lost favour, while the tapestry, velvet, Axminster, Wilton and chenille rapidly grew in demand as the processes were perfected and the looms widened. Rugs were first formed by sewing carpet strips together. Later the corners of a border pattern strip were mitred to form the framed design effect. Slowly the necessary changes were made to allow weaving the border patterns in the straight strips and avoid the mitred corners. (See CARPET MANUFACTURE.) To eliminate the seam through the centre of rugs and in the medallion designs, popular at the time, required a wider strip and loom to weave it. Looms nine feet in width followed this trend in tapestry, velvet and Axminster in the early years of the 20th century and Wilton broadlooms followed after many years of experimental work and became popular about 1926. All these weaves are commonly woven up to 15 ft. in width and even wider looms were developed. The chenille weave, developed in Great Britain

in 1839, was not introduced into the United States until 1909 and was not produced in quantity until 1916. It has had a steady growth since because it is the only woven floor covering that can be woven to special order up to 30 ft in width, any reasonable length, any shape. design or colour arrangement and an inch or better in thickness. (X)

France. — There are early records of carpet weavers in France, but nothing is known of their nork until the foundation of the famous Savonnerie factory near Paris in 1626. There many large carpets were made, mostly with flaxen warp and neft and a woollen pile tied with the Ghiordes knot. The designs accord with contemporary French decoration and few if any nere based on oriental carpets. In 182j the factory nas closed and the manufacture transferred to the Gobelins tapestry factory. During the 18th century and afterwards many tapestry-woven carpets were made at Aubusson and in other tapestry factories.

Other Countries. — A few carpets are still in existence that were made in Poland in the 17th century, with floral patterns in light colouring. Loosely woven rugs have been much made by the peasants of Finland. They often have human figures and dates and seem mostly to have formed part of the bridal dowries Kilims are made in the Balkan states and in southern Russia; they resemble the Turkish pieces but have, especially the Russian, more naturalistic floral patterns. Those from Rumania generally include birds in the design.

PRACTICAL CONSIDERATIONS

It is perhaps more important that a carpet for use should be soundly made than beautiful and certainly better that it should be beautiful than that it should accord with any particular scheme of decoration. Oriental carpets. on account of their depth of tone, rarely go badly with other objects. Accordingly when buying, the first thing to ascertain is that the foundation threads are sound and strong and that the pile is not unduly worn anay. If a rug is held up to the light, holes and thin places are often revealed that were quite unnoticed when it lay on the floor. Holes that have been properly repaired are of little consequence. It should be noticed nhether it is of good shape and whether it lies flat on the floor. Few rugs have the sides perfectly parallel but an excessive distortion is unsightly. A rug that is not flat tends to wear badly in the baggy places, but certain good rugs, such as the Shiraz, are rarely quite free from this defect. A guarantee should be asked that the rug has not been chemically treated. as is too often done with the object of effecting a supposed improvement in colour. Such treatment usually results in a hopeless deterioration of the yarns. Undesirable though less destructive, is the process of hot rolling, nhich gives to inferior wool a silky gloss that is only transitory.

The Care of Carpets. — Carpets will give remarkably long service if treated nith proper consideration. Their tno great enemies, apart from the inevitable destructive effect of uear, are moth and damp. The former is best kept at bay by frequent moving or handling and by regular exposure to light and air If rugs must be stored, then inspection at intervals is essential. A carpet in use is rarely in danger. There seems to be a great future for certain chemical applications that render the wool uneatable by moth, but the method appears not fully established. Damp will in time rot the threads and destroy the fabric, but it can be avoided by obvious means. If any mechanical injury is suffered, such as a cut or burn, the damage should be dealt with as soon as possible by a competent repairer, for such lesions get worse very quickly. In ordinary use, quite apart from accident, the ends and sides often tend to wear and fray out, in nhich case the parts should be re-overcast — a very simple operation if done in time. Places in the middle locally worn or damaged can have new knots inserted and even large holes can be restored so as to be almost as good as new, though such work is rather expensive. In carpets of lesser value, instead of new knotting, patches cut from a suitable rug can often be inserted at less cost, and sometimes a serviceable small rug can be made from a larger worn one by cutting auay the bad parts.

From time to time but not more often than necessary carpets should be cleaned and the improvement in their appearance is often astonishing. If there is any doubt as to the stability of the dyes of the carpet, it should be entrusted to one of the many firms who specialize in this kind of work. In many cases, however, surface nashing with a limited supply of hot water and carpet soap applied with a stiff brush may be done at home, though drying the fabric afterwards is often a difficulty. as a clean and airy place must be available for some days at least It is most important to wash out all traces of soap Some of the nen cleaning compounds using irium as a base are superior to soap. In ordinary use carpets are properly kept free from dust by brushing, or by means of a vacuum cleaner, but in all cases where a brush is employed it is most important that it is not used against the lie of the pile. (See also EMBROIDERY; TEXTILES; TAPESTRY.)

(C. E. TA.)

Uses of Carpets. — The carpets so far mentioned have been practically all special productions for a wealthy clientele but at the same time, although few have survived, the common people also had their rugs.

Throughout the near east rugs have from the beginning been for commonest use and an affair of the whole population. This very universality was one of the reasons for their excellence. The traveller Herbert from England. writing in the 17th century, said there was no house too poor but what it was furnished with carpets. From immemorial time they covered the floors of house and tent as nell as mosque and palace, and serred many other uses besides. They made handsome portieres and were sometimes hung on the wall like tapestries. They were a convenient, portable and durable form of uealth. served as tribute money, and were frequently gifts of one state to another. They were used as blankets, canopies and tomb covers. In past times they were also handy for committing and concealing murder. The last caliph of Baghdad (1357) made his tragic exit via a carpet in which he nas rolled up and beaten to death. a not uncommon mode of execution, quite the reverse of Cleopatra's dramatic entrance to the presence of a Caesar (Mark Antony) nhen she stepped out of an unrolled rug Woven nith an apex that could be pointed to Mecca. they served as prayer rugs for an individual, or, given sufficient size and reduplicate prayer panels, they could serve simultaneously for a whole family or some religious fraternity They made excellent saddle covers and carryall bags as nell. These modest rugs had their onn merits. They were closer to the life of the people; the best of them have an air of genuineness and respect for the limits of the craft. On them were lavished loving care. into them nere noven life-protecting symbols which in early times people understood and took seriously — even now the meanings of the more obvious patterns are dimly remembered.

Size and Shape. — Rugs — a term understood to include all carpets for use on the floor — are mostly rectangular, though occasionally pieces are seen made to fit into irregular spaces, and a few round carpets are known, probably woven for tents. The rectangle may vary from a square to a strip at least six times as long as it is wide. A very usual ratio is about three to two. The strips, called runners or *kanara,* made in pairs to go along the sides of a Persian room, are very useful in corridors. A very common size for small rugs is about $6\frac{1}{2}$ ft. by $4\frac{1}{2}$ ft., while large ones may reach 25 ft. in length or occasionally more.

A very common room size for modern carpets is 10 ft. by 14 ft. but not for old carpets which are much narrower in proportion to length, owing primarily to their use in combinations in the oriental house. Some old carpets are nearly three times as long as uide, for example. the famous McCormick Vase carpet non in the Metropolitan museum is 10 ft. by 29 ft. Some of the palace carpets woven in the early 17th centun (especially of the Herat type) are 50 ft. long. There are recently woven fine quality hall carpets in the ministry of foreign affairs in Tehran that are approximately 6 ft. by 125 ft.

The Low School **Rugs** of Persia. — By the end of the 17th century the summit of the rug-neaving art was past. The impoverishment of the court and the general slackening of cultural energy throughout the near east are clearly reflected in the

steady decline of the court art. None the less the conditions out of which this art arose continued to operate in more humble circumstances throughout most of western Asia. The wandering nomads and the settled town dwellers alike continued to design and neave carpets which if Increasingly stereotyped and of steadily diminishing artistic vigour, none the less maintained genuine artistic character until within a few generations ago. They used dye methods that had been developed and tested through centuries Each group stuck to its own characteristic pattern content to maintain the artistic tradition intact with little addition or embellishment. These carpets were not made for a greedy impatient western market and could with oriental respect for time and perfection continue to embody traditional merits of high quality. Most of the indigenous rug weaving centres have been corrupted by western demand and the commercial organization of weaving centres, but these various humble rugs. the so-called Low School type, are frequently of a very high artistic character, beautiful in colour, design, of fine material and excellent technique. They are worthy of the collectors' enthusiasm of the last jo years and deserve a more serious study as works of art than they have received.

The identification of the localities in which these humble rugs were woven is by no means certain. Russian investigators have identified about 40 or 50 weaving centres in the Caucasus but the results are not yet published. Names are attached to rugs frequently in the international markets at Istanbul, Smyrna and Tabriz, and do not fully correspond to the actualities. Different and contrasting rugs are often woven in closely related districts, such as Bijar and Sehna, where similar appearing rugs may be woven in districts far apart. The nomadic wanderings, the forcible transfer of populations several times in the 18th century, tribal intermarriages and many other factors have tended to confuse the type and conceal their true origins. **A** few of the better known types may be briefly designated.

Kashan was noted for its fine textiles as early as the 12th century, and by the 16th it mas producing the sumptuous velvets rivalled by even more sumptuous silks and in the 17th by the silver and gold-threaded rugs called "Polonaise" carpets. The skill and tradition survived and Kashan has produced the finest woven, most elaborately designed, richly coloured rugs of recent times. Their high cost restricted the output and the best of them were finally crowded out of the market.

Joshaghan, 60 mi. northwest of Isfahan, wove the great Vase carpets of the Sefavid period and like Kashan and Tabriz continued fine weaving down to the present day. During the 19th century the most characteristic Joshaghans were distinguished by flower sprays, very precisely drawn. on a field of soft red.

The finest rugs made today come from special looms in Meshed and Birjand which have been especially favoured by court orders. The materials are excellent, the weaving leaves nothing to be desired, the colours are beautifully toned and need no chemical washing as do most contemporary eastern carpets, though the designs still lack the spaciousness, the originality and expressive poner of earlier days.

These less pretentious rugs, the product of tribal nomads or of sedentary tonnfoiks, maintained their standards down to the latter half of the .19th century when their near ruin as art was completed by western commercialism with its insatiable demand for quantity, cheapness and speed.

Western taste also intruded destructively, and European importers began to supply designs with confused or meaningless patterns, and to order shapes and colours that nere in conflict with the oriental tradition. Competition was intensified and the weaver reduced to an animated machine. Aniline dyes, harsh and fugitive, displaced the older, far more costly dyeing processes. Poor wool was cheaper than good, and various processes of chemical washing temporarily concealed the deficiencies and imparted an enticing sheen to the carpet which the unsophisticated thought charming.

However, the more intelligent European importers were aware of the destructiveness of such practices and made real efforts to arrest the deterioration of the craft and to restore something of the old quality, though the factory system was now too well established ever to be displaced. The Persian government made several sporadic attempts to contest commercialization, imposed severe penalties for the use of aniline dyes, but the commercial tide was not so easily checked. In recent years the government, however, has made a much more systematic effort to revive the art, with considerable success. A school of design. under Taherzadeh Behzad in Tehran based its work on faithfully studied 1 jth and 16th century models. Sound methods of dyeing, wool selection and testing are taught and the school graduates go into the various rug producing districts to improve their standards. In various places the original. indigenous methods have been maintained, and particularly in Meshed and Birjand, carpets are woven which for technical competence and in beauty of colour stand comparison with the 17th century weavings. The art of designing great carpets, however, is not so quickly recovered. The tendency to over-elaboration needs to be curbed by a more sympathetic study of the early models with their aristocratic restraint and the fundamental strength of their designs.

The principal weaving centres in the 19th century were Tabriz in the northwest, Joshaghan in central Persia. Kerman and Ravar in the southeast and Meshed in the northeast. These centres have all woven large carpets, Meshed, Kerman and Tabriz utilizing the medallion schemes of early classical time, Joshaghan and some Kerman carpets repeating various interpretations of the garden motive.

The province of Azerbaijan in the extreme northwest of Persia is ideally fitted for rug weaving. Excellent wool, water and dye plants are readily available, and hence it is natural that the region has produced some of the finest rug types. Among the more important are those from Karadar and Karajar, where the weavers remained faithful to the highest ideals until they were no longer producing. The region around Ardabil produced many handsome nomadic rugs difficult to identify. South of Ardabil the principal types have been the so-called Heriz, Gorevan and Serapi carpets that make liberal use of tan and blue and hold to bold and simple patterns.

The Kurdish region in northaest Persia produced many fine medium-sized rugs in thick lustrous wool of fine colours, repeating the designs of other parts of Persia. Curiously enough, in the heart of the Kurdish district from the immediate vicinity of the town of Sehna (now Senandaj) have come finely woven carpets and kilims. The patterns are exquisitely rendered medallions or the *bouté* (the so-called pear or palm leaf motive), with imbrications.

A great rug industry was developed in western Persia in the Sultanabad district. From individual towns come beautifully woven rugs like the Sarouks. nith their ancient medallion pattern; the Sarabandes, nith their repeating *bouté* patterns on a ground of silvery rose, the Ferraghan, with their so-called Herati pattern — an all-over, rather dense design with a light green border on a mordant dye that leaves the pattern in relief. The earlier Ferraghans (two are known. dated at the end of the 18th century) are on fields of dark lustrous blue and a pattern delicately draw-n and clear and open. Later, toward the end of the 19th century, Ferraghans degenerated in colour and material; the pattern became clumsy and crowded.

The Kerman rugs were made of brilliant wool, finely and skilfully woven, and beginning about 1870, they became the most favoured of all the Persian weavings. They are lighter in tone, thanks to the discreet use of light ivory and pale rose, and were particularly adapted to western drawing rooms in the late 19th century, with their over-emphasis on elegance.

From the province of Fars come a large number of semi-nomadic rugs and a few large-scale carpets, reflecting ancient models. The Bahtiari region west of Isfahan turned out a few large double-warp stoutly woven carpets and a few smaller rugs that occasionally attained very great merit. Northeastern Persia from Meshed down to Birjand and Ghayian produced large carpets predominantlv violet or purplish in tone with wide multiple borders and very soft and not too durable wool.

Throughout Persia in the 18th and 19th centuries, probably

about 50 to 100 different types of rugs were woven. Occasionally large carpets of quite individual design, but all with their roots in the classical past, appear to baffle the students seeking for precise classification. Extensive studies are required for their identification and interpretation.

Caucasus — Low School. — The Low School rugs of the Caucasus region are among the most individual and satisfactory. Their patterns are practically all geometrical densely juxtaposed generally without organic connection and without implied movement, but they are clear, ingenious, logical and entirely suitable for floor decoration. The more recent examples seem a little dry in colour but many of them, like the rugs woven by the Kazaks, Suruks and other nomads, are sometimes of flaming brilliance, and the older rugs from Daghestan, Kuba and Shirvan are done in beautifully clear, discreet and well balanced tones.

Kilim or tapestry rugs were woven all over the near east, but the most artistic come from the Caucasus. The Shirvan kilims, with their broad horizontal stripes, have bold and clearly defined motives that are harmoniously assembled by virtue of their perfect colour balance.

A more important type of flat-stitch carpet, embroidered and with a mass of loose threads at the back, which comes from the region of the ancient fortified city of Shemakha, has been improperly called cashmere because of its superficial resemblance to cashmere shawls. The design is most often composed of large, beautifully articulated mosaic tile patterns in rich and sober colour. In design they are descendants of the carpets that so delighted Memlinc and the Van Eycks.

Turkish — LOWSchool. — The Low School rugs of Asia Minor of the 18th and 19th centuries continue the earlier qualities of quiet and sober patterns and luxurious colour. Some of the 18th century weavings still faithfully follow the simple geometrical patterns of the 15th century. But the chief output of the Turkish weavers are prayer rugs, with which the Turks were more lavishly supplied than any other of the faithful. Melas, Konia, Ladik, Kirsher and Sivas all wove handsome carpets, those of Ladik being the most brilliant, both in pattern and colour. The most famous prayer rugs came from the towns of Ghiordes and Kula, mostly of the 18th and 19th centuries, and in the United States, the first passion of the collector. Regions like Smyrna produced a great many utility carpets for the western world.

Knotted-Pile Technique. — The technique used in the earliest extant pile fragments is logically also the most primitive, for the pile yarn is wrapped round only a single warp, the warps being held together by two or more wefts woven the full width in ordinary cloth binding (alternately over and under), after each line of knots. Such a technique was most probably invented among the nomads of the central Asiatic steppes and may well have evolved out of a still more rudimentary weave still practised in the Kerghiz tribes whereby a simulated fleece is made on a straw mat by catching in bits of wool in the course of the plaiting (A. U. Dilley, Rugs and Carpets, p. 1).

The simple pile looping around a single warp had travelled, by the early middle ages, to the east Mediterranean for it is found in pile carpet fragments recovered from the Fustat refuse heaps. A fine example (Musée Arabe, Cairo) bears on a dark blue ground an inscription in white Kufic letters which makes it datable in the late 9th or early 10th century. Not long thereafter the technique was carried into Europe and was used in Germany, at Quedlinburg, at the end of the 12th century, for a hanging illustrating an allegory centred on Mortian's Marriage of Mercury and Philologia (Ackerman, Tapestry, p. 33). Moreover, by the beginning of the 14th century *tapisserie sarrazinoise* is discussed in industrial statutes, and clearly differentiated from both *tapisserie nostre* and haute-lisse (true tapestry). Evidently looped-pile weaving continued in Europe (zbid., pp. 312–313). The same technique was still in use in Spain in the 17th century.

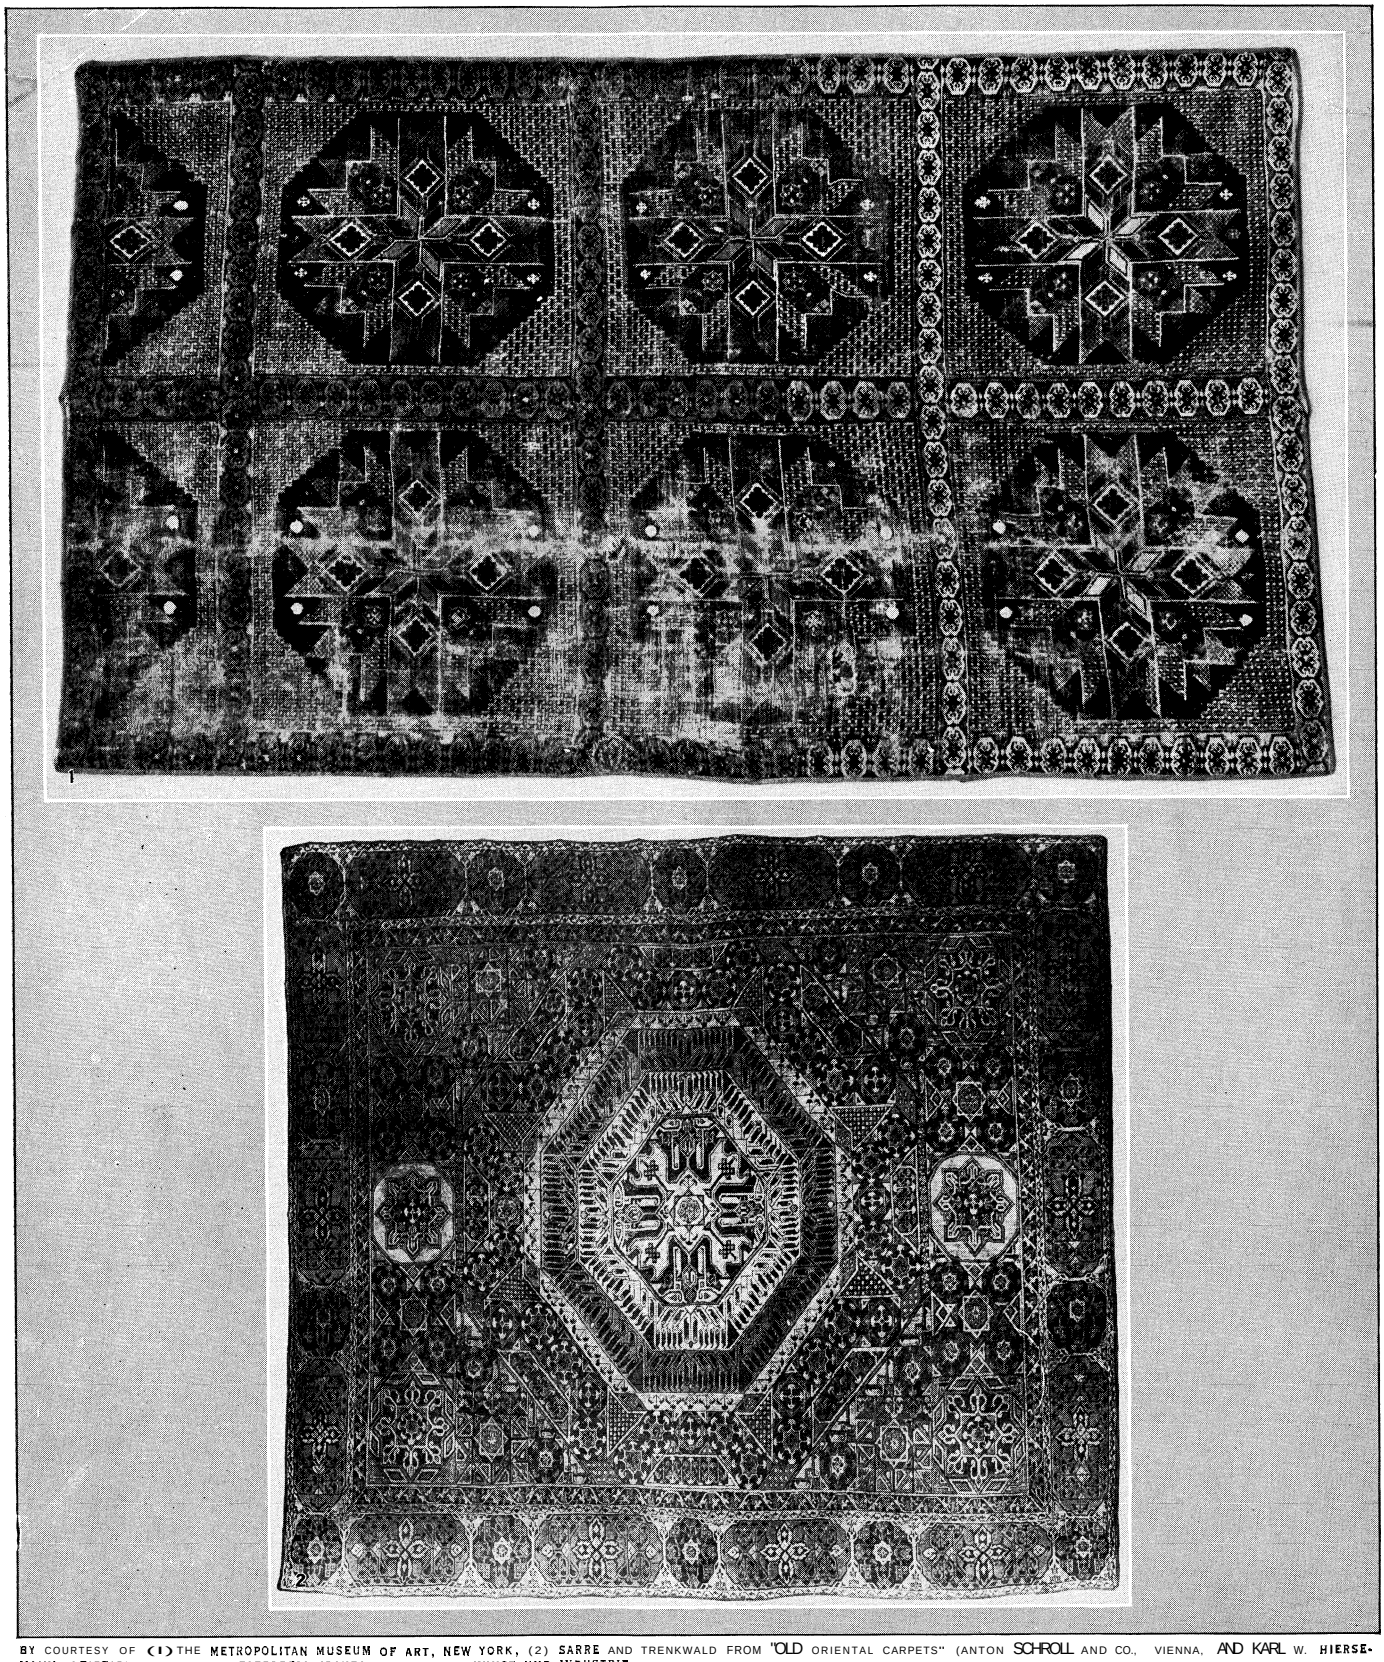
Meanwhile in Egypt and probably other east Mediterranean centres also, two other forms of looped weaving were being developed which made either a potential pile (uncut pile) or actual long-ended pile surface. One of these practised in two variants, was a forerunner of velvet. In this a supplementary weft for the pile is carried on top of regularly spaced foundation wefts (from the fifth to the ninth in general) and passes under a certain number of warps to hold it firm (from three to six overpassed warps, as a rule), then is deeply looped over a single warp, and so repeated; or alternatively, it is deeply looped between two warps. But the second of these loop weaves contains the germ of the development of true rug-knotting form. This, the supplementary weft after passing under a certain number of overpassed warps in the same way (*e.g.*, two), is then floated over a certain number of them (*e.g.*, two or three), and is carried back under the same number of warps. This leaves a cut end at the beginning of the unit (of say seven warps in all), and another in the middle thereof — a coarse version of the knot which came to be known as the Persian knot. The two techniques were used equally for garments and wall hangings but the latter was used also for carpets as is shown by a good-sized specimen in the Metropolitan museum from Antinoe, datable c. A.D. 500–600, with a broad conventional polychrome design (M. Dimand, in Metropolitan Museum Studies, iv, pp. 159–61 [1932–33]).

But the earliest true knotted pile carpets are not in the knot related to this form of looped weaving, but the alternative, so-called Turkish knot, which had been developed by the 14th century at least, as the Ala-ud-Din carpets show. Moreover by the end of the 15th it had penetrated Europe for a fragment of an Annunciation, probably Flemish, possibly French, is in this technique (E. B. Saxe, in Metropolitan Museum Studies, I).

In these fully evolved forms of the technique the pile yarn, instead of being wrapped round a single warp (fig. 1), is knotted round two. These warp threads — most often cotton, but in both Spanish and near eastern nomad rugs sometimes wool, or in some finer qualities, silk — are stretched vertically on a loom (fig. 4), and a length of the pile yarn is tied on every two threads the full width of the loom; then two or more weft threads likewise of any of the materials cited, or of a combination thereof, are cloth woven (alternately over and under), back and forth across the full width, two or more times, and the process is repeated. There are thus three sets of threads involved, each with its specific function: warp, weft, pile. The pile is usually wool but may be silk or cotton, though the last is not desirable except for very small areas where the crisp accent of an unfadeable white is wanted. In the Turkish pile knot (fig. 2) the yarn is passed under one warp, back over two, and back again under the second so that both ends come up together between the two warps on the same side of the overpass loop. In the other type (fig. 3) the yarn passes under one warp, over and back under the next, so that the two ends stand on the surface with one warp between them. The pattern is obtained by changing the colour of the pile yarn. When a row of knots is tied it is beaten down with a heavy malletlike comb against the preceding rows, so that the pile completely conceals on the front both the warp and weft; and when a certain area is woven the pile ends are sheared to an even height, which varies according to the character of the rug from very close to, on some nomad rugs, a depth of about an inch, which produces a shaggy effect.

The fineness of the weave depends on the number of knots to the square inch which varies according to the weight and spacing of the warps and also, though to a lesser extent, of the wefts, and the thickness of the pile yarn. The permissible range is from about 80 to the square inch, used for instance in some of the Kuba Dragon carpets of the late 16th or 17th century, to more than 2,400, found in a fragment of a Mughal (Indian) prayer carpet of the 17th century, obviously an emperor's property (Altman collection, Metropolitan museum, N.Y.). But the most finely woven carpets are not by any means those of greatest artistic or historic importance. Thus, *e.g.*, the beautiful and famous pair of carpets from the mosque of Ardabil, dated by an inscription 1539, have only about 325 to the square inch.

In certain types of pile rugs, both wool and silk, some areas are'brocaded with gold or silver thread, usually cloth woven but with a surface float over several warps (basket-weave) to obtain the maximum richness. In these the weft is carried forward over four of the warp threads and then backwards behind two (see

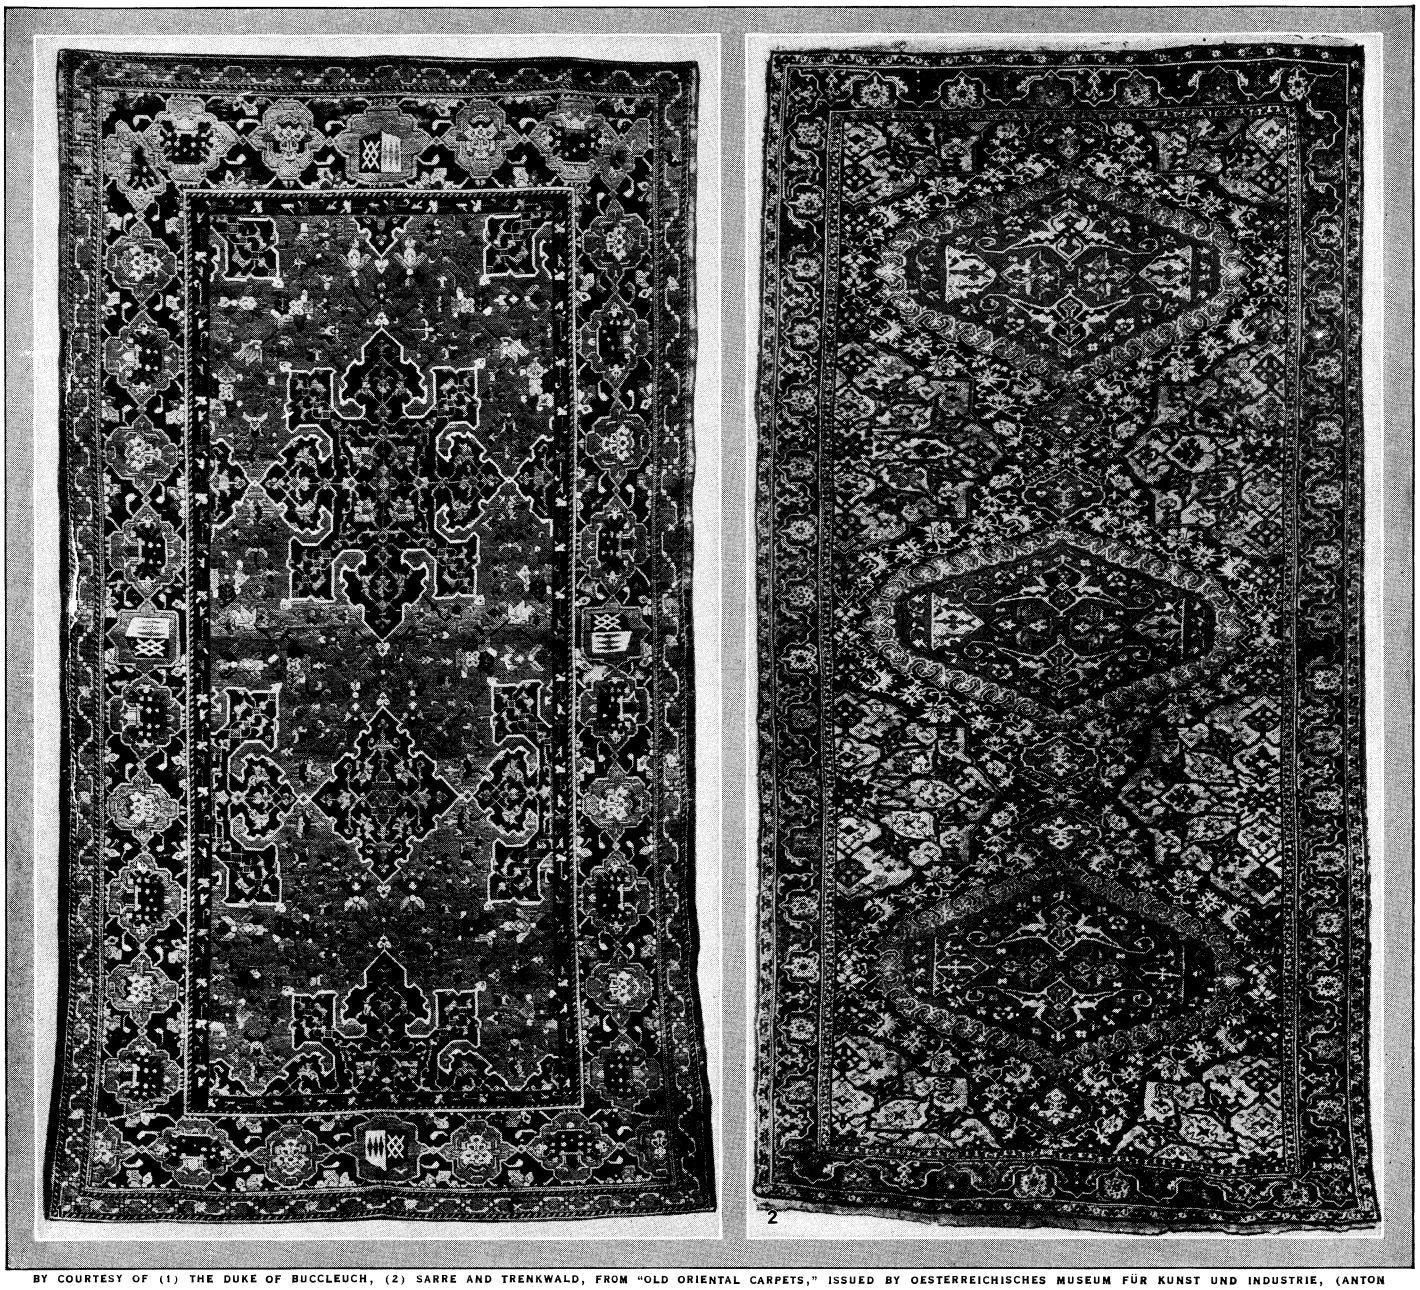


BY COURTESY OF (1) THE METROPOLITAN MUSEUM OF ART, NEW YORK, (2) SARRE AND TRENKWALD FROM "OLD ORIENTAL CARPETS" (ANTON SCHROLL AND CO., VIENNA, AND KARL W. HIERSEMANN, LEIPZIG), ISSUED BY OESTERREICHISCHES MUSEUM FUR KUNST UND INDUSTRIE

SPANISH AND TURKISH RUGS, 15TH-16TH CENTURY

1. Spanish rug, 15th or 16th century. Wool; principal colours: red, yellow, blue
2. Cairene carpet, 16th century. About 10 ft. x 9 ft. 6 in. Wool; the colours are: ground tone, a deep cherry red with patterns in sky-blue and yellowish green

RUGS AND CARPETS



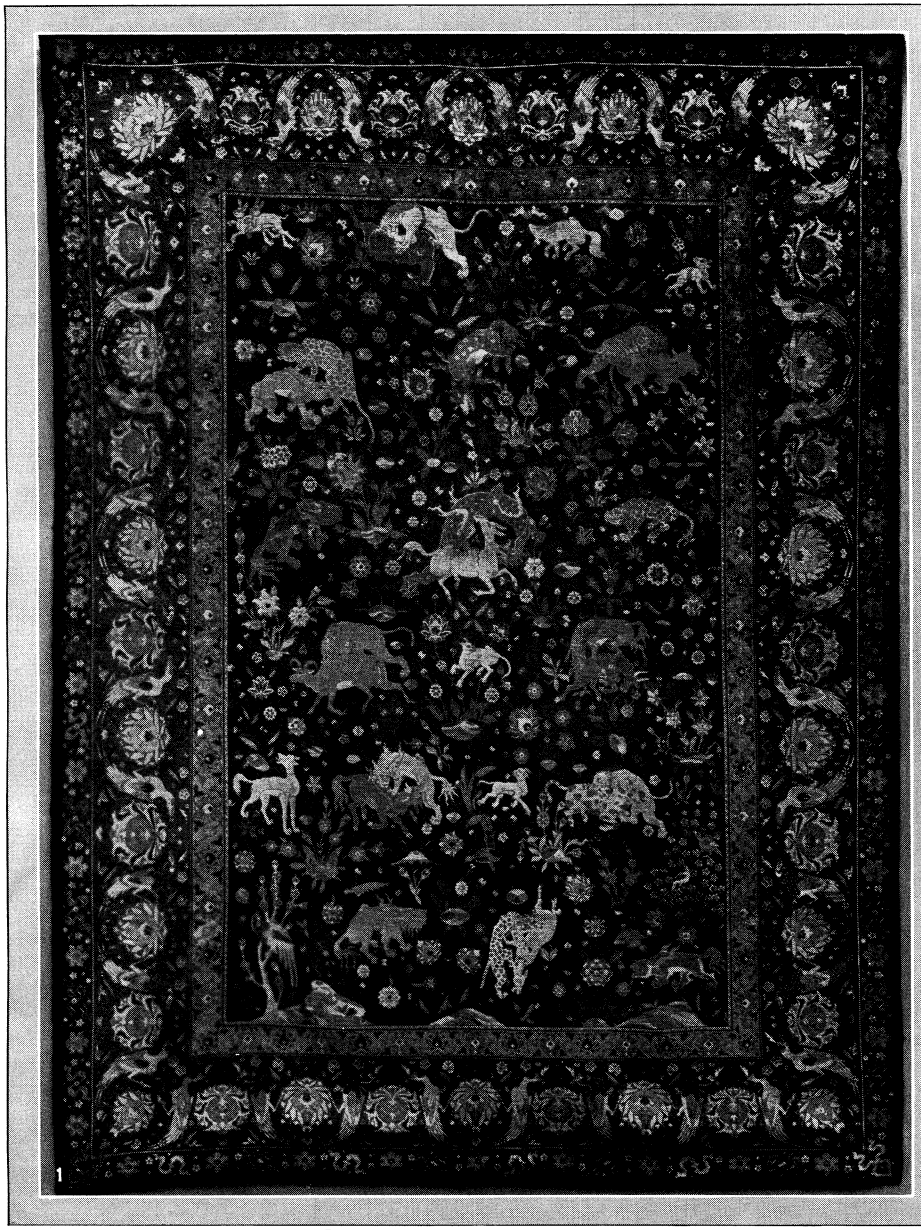
BY COURTESY OF (1) THE DUKE OF BUCCLEUCH, (2) SARRE AND TRENKWALD, FROM "OLD ORIENTAL CARPETS," ISSUED BY OESTERREICHISCHES MUSEUM FÜR KUNST UND INDUSTRIE, (ANTON SCHROLL AND CO., VIENNA, AND KARL W. HIERSEMANN, LEIPZIG)

TURKISH CARPETS, 16TH CENTURY

1. Ushak, with Buccleuch armorial escutcheon and dated 1584. Made in Turkey to British order
2. Ushak carpet, c. 1600. 15 ft. 9 in. x 8 ft. The pattern shows red panels and flattened hexagons, with serrated borders, and floral forms and arabesaues. The colours used are red, light blue, dark blue, yellow, black (brown in places), white and rose

TURKISH COURT CARPET, 16TH CENTURY

Section of Turkish carpet, court manufactory. 16th century. Dimensions of whole, about 18 ft. x 10 ft. The warp is of yellow silk, the weft of dyed red silk, the pile and cotton in seven colours. The pattern, of cartouches and conventionalized flowers and leaves and Chinese cloud bands, gives the effect of graceful movement



PERSIAN AND TURKISH RUGS, 16TH CENTURY

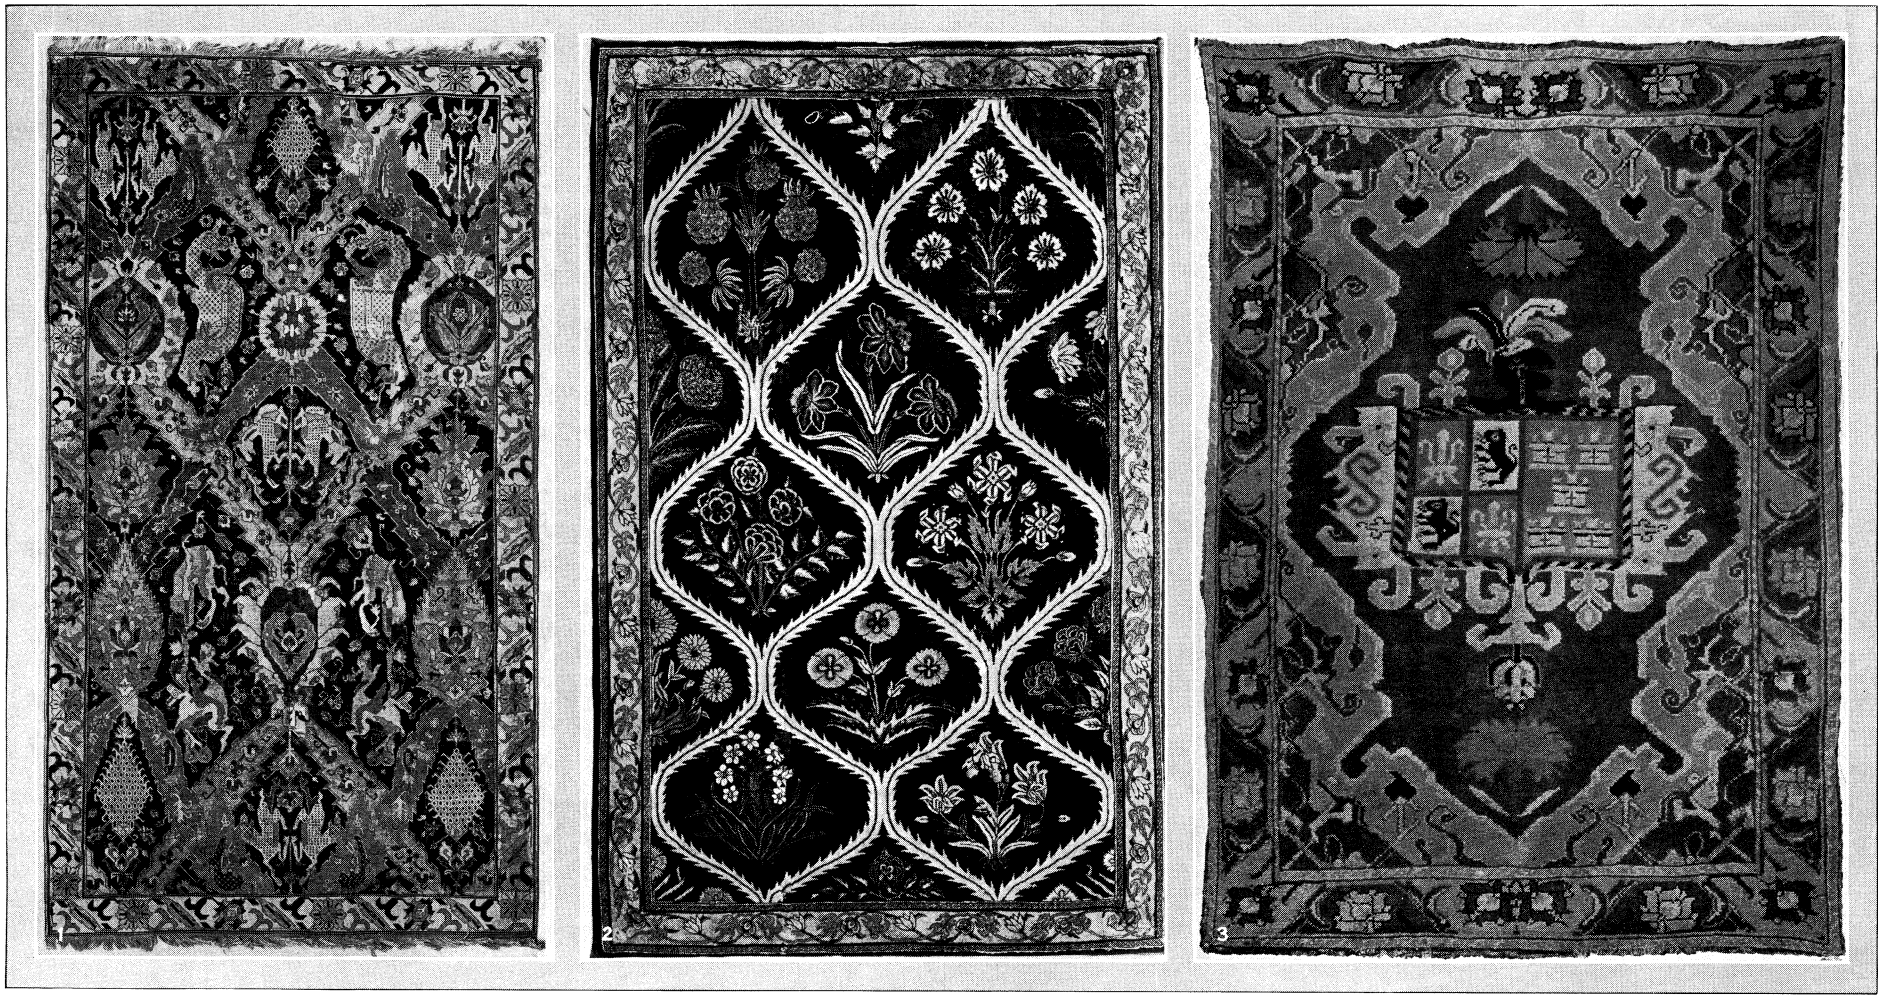
1. Silk rug, showing animal combat, probably Kashan, 2nd half of 16th century. The colour of the inner field is a deep rose-red. The central border is blue-green. The patterns are in yellow, green and tan

2. Turkish rug, court manufactory, 2nd half of 16th century. The foundation colour is a soft red, with green, blue and yellow prevailing in the design, with accents in cotton white

BY COURTESY OF MR. AND MRS. WILSON-FILMER

PERSIAN VASE CARPET, EARLY 17TH CENTURY

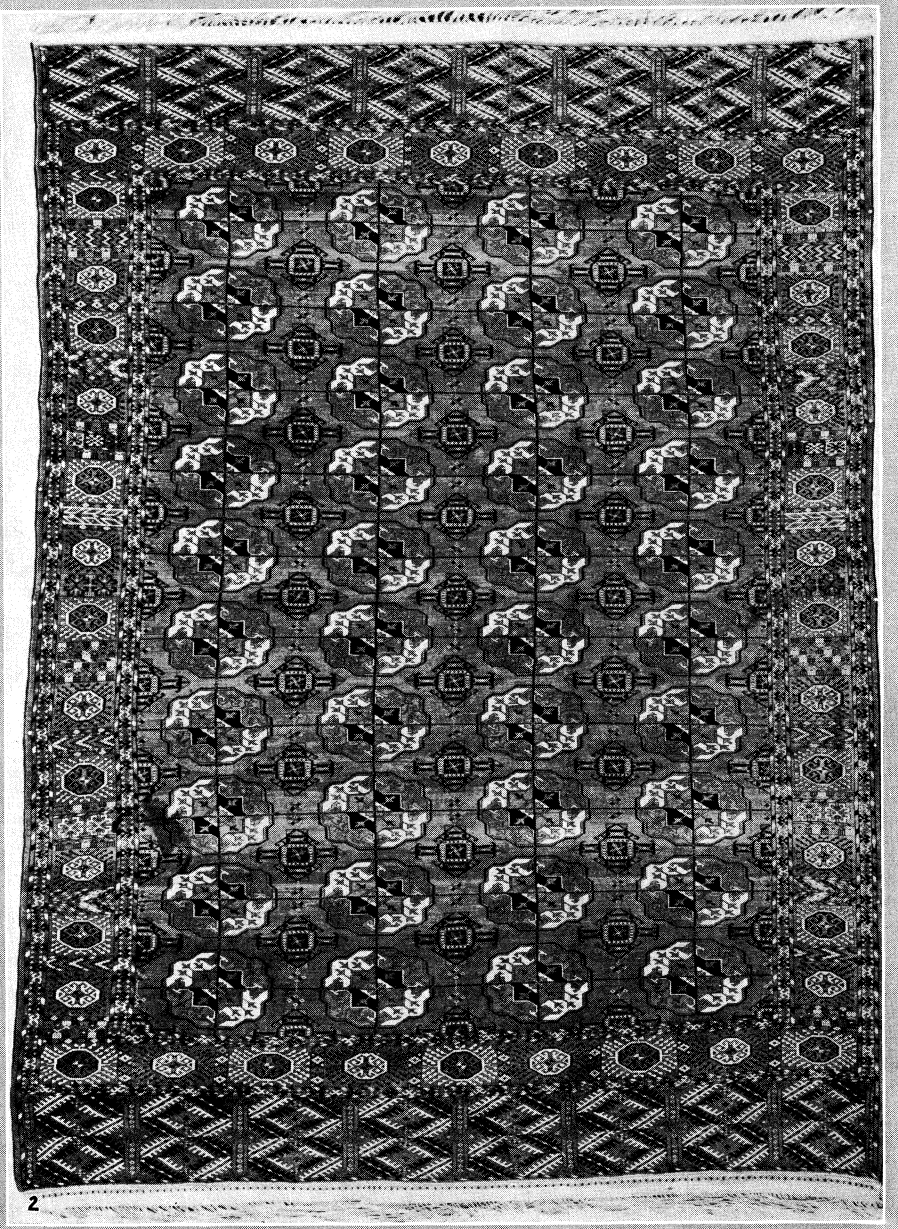
Vase carpet, so-called because of the vases of flowers in the pattern. Court looms of Shah Abbas, probably Joshaghan Ghali



BY COURTESY OF (1, 2) THE DIRECTOR OF THE VICTORIA AND ALBERT MUSEUM, (3) THE SPANISH ART GALLERY, LONDON

THREE CARPETS

1. South Caucasian Dragon carpet, probably woven at Kuba, 17th century. 11 ft. x 6 ft. 4 in., with diamond-shaped compartments in the field, and conventionalized representations of the dragon and phoenix. The colours are brown, white, blue, yellow, red and purple
2. Indian carpet, late 16th or early 17th century. 4 ft. 8 in. x 2 ft. 11 in. This shows a type of pattern exclusive in Indian carpets with the field divided into ogee compartments, each containing naturalistic flowers or floral patterns. The colours are: crimson ground, with the design in yellow; the floral forms are in red, white, rose, blue, green, yellow and purple
3. Spanish carpet, with design derived from Asia Minor models, with Spanish armorial escutcheon for medallion, 18th century



BY COURTESY OF THE DIRECTOR OF THE VICTORIA AND ALBERT MUSEUM

ORIENTAL CARPETS, 18TH AND 19TH CENTURIES

1. Chinese carpet, late 18th century. The colour of the inner field is ivory, with the pattern in blue. The outer border is a deep blue, with the design in ivory and yellow. 11 ft. 8 in. x 8 ft. 4 in. Knotted in woollen pile on a cotton warp

2. Tekke-Turcoman carpet, 19th century, 9 ft. 7 in. x 7 ft. 2 in., made of silky wool. Sometimes erroneously called Bokhara, the carpets are often very finely woven; the principal colour is a deep, glowing crimson

BY COURTESY OF A. SCHROLL AND COMPANY FROM FRIEDRICH SARRE AND HERMAN TRENKWALD, "OLD ORIENTAL CARPETS" (TRANS. BY A. F. KENDRICK, 1926), ISSUED BY THE AUSTRIAN MUSEUM FOR ART AND INDUSTRY, VIENNA

CAUCASIAN CARPET, 17TH CENTURY

So-called Armenian carpet, Caucasus region, end of 17th century. About 11 ft. 6 in. x 6 ft. 6 in. The ten colours are strong in tone; the ground colours, deep-blue, white and red. The warp and weft of white cotton, the knotting is of sheep's wool, with the pile slightly to the right. The pattern of large stems and cartouches includes floral motives angularly conventionalized. The border, narrow in relation to the field, shows leaf-motives and blossoms

CARPET-WEAVING

Indian workers at a loom in one of the factories for the manufacture of hand-made carpets at Jaipur, Rajputana, in northern India. Between the two rollers which, with the supporting framework, constitute the loom, are stretched the vertical warp threads. The coloured wools (or silks) are knotted in horizontal rows on the warp threads, the knots being cut to form the pile of the carpet. The weft threads are passed alternately under and over the warp threads, lines of weft alternating with lines of knots. Carpets are known with as few as 15 and as many as 2,400 knots to the square inch, from 60 to 80 knots being considered a moderately fine texture

fig. 6). This gives a kind of herringbone texture at the front and a series of ribs at the back of the fabric. Because a weft looped round the warp threads as described has much less than the usual binding effect, alternate wefts are cloth-woven, but these are concealed in compacting the loop-woven wefts, which are changed in colour according to pattern as in straight tapestry weaving.

Dyes.—Red is most often obtained from madder root *(rubia tinctorum)*. Thus the red of the Noin Ula carpets is madder with the usual alum mordant. The shade which runs through the gamut of reds and pinks to reddish brown and orange varies with the age of the plant, and also other components, including the mordant, the density of the solution and the duration of the immersion. Some reds, however, are obtained from the *coccus ilicis* which breeds on oaks in the near east, related to but not identical with, the cochineal (q v.) (*coccus cacti)* of Mexico. Blues are made from indigo. The yellow of the Noin Cla carpet is rhamnetin, the dye obtained from unripe berries of various bushes of the Rhamus family. The famous saffron (*q.v*) dye. made from the dried stigmas and part of the style of a crocus *(Crocus sativus)* is too expensive to use to any extent. Greens are usually blue plus yellow; violets (only rarely used), red plus blue. Black, when not the natural wool, is done with iron filings in citric acid, a corrosive dye whose destructive effect on wool especially is often conspicuous in old rugs. White is the natural wool, but occasionally when a sharper white is desired, a little cotton is introduced

The time required for weaving rugs has been very greatly exaggerated. They are often spoken of as having required lifetimes, but a careful check made by Heinrich Jacoby *(A Survey of Persian Art,* vol. III, p. 2464) shows that the finest carpets would hardly have taken three years. Even the huge Ardabil carpet, with its 33,000,000 knots. could have been woven, from the preparation of the cartoon through all the processes to its completion, within four years. Great carpets like the Milan Hunting carpet probably only required a year and a half

Another common fallacy concerning rugs is that they were designed to be seen on the floor. This is only partly true; most of them were worked on vertical elements and the designs are traditional and derivative and not very often planned in relation to the destined environment of the carpet Moreover, the great court carpets of the 16th century, for example, were the work of illuminators who were accustomed to think of the book page and a vertical design The designs of the great carpets, nhen seen on the floor from a normal eye height, are compressed and distorted Their full effect comes only when hung nhere they can be viewed so that the eye is nearly equidistant from all points.

Carpets in museums are almost all underlighted. Oriental fabrics were all woven and used in regions of high illumination and their colours are only at their maximum and in proper relation to one another when the illumination is strong.

Design.— Both the pile carpet technique and the flat techniques. whether straight tapestry or the looped Shemakha weaving, permit unlimited variation within the design—in sharp contrast to all shuttle weaving which necessitates regularly recurring repeats But nhile the rug designer thus has unrestricted liberty, needs of the eye and the mind, further defined by habits of tradition and discipline, guide invention. A division into field and border is the basis of all rug design. The border serves, like the cornice on a building or the frame on a picture, to emphasize the limits, isolate the field. concentrate attention on it, and sometimes control the implied movements of the interior pattern. The value of a border had already been recognized by pottery painters in 4000 B.C and is fully developed in rug patterns from Assyrian times on. Its function is so fundamental, logically and psychologically, that it cannot be successfully omitted

The field may be decorated with an all-over pattern, a panel composition. or a medallion system The all-over pattern may be of identical repeats. either juxtaposed or evenly spaced though the latter nhile common on textiles. is rare on carpets; or it may be of varied motives in a unified system, ***e.g***, different plant forms of about the same size and in the same relation to each other, but even in this freest type of design it almost invariably includes bilaterally balanced repetitions which agreeably, almost necessarily reflect the human bilateral equilibrium. The latter type of design is found most typically in formalized representations of the paradise parks or woods which are a feature of Persian palace plans. Another type of allover design appears entirely free but is actually organized on systems of scrolling stems, notably on the east Persian carpets of the 16th–17th centuries.

The value of panel subdivisions for controlling patterns had been discovered by the Upper Palaeolithic period (*c*. 25.000 B.C) in a simple rectangular version. and panel systems have been a basic form of design since 4000 B.C., when pottery painters were already devising varied systems. On carpets the lattice provides the simplest division of the field. often a diagonal lattice as on the embroidered carpet from Noin Ula a scheme that appears on Sassanian capitals and in Coptic tapestries But a characteristic field design of the court carpets of the Shah Abbas period. the so-called Vase carpet, is constructed from the ogee, a motive that becomes prominent in near eastern textile design in the 14th century. Simple rectangular panelling—really a large-scale check—is typical of one style of Spanish rugs of the 15th–16th centuries.

The most frequent medallion composition consists of a central panel of more or less elaborate construction in the centre of the field superimposed on an allover design. but this is also often complemented with corner pieces, which are typically quadrants of the central medallion.

But multipie medallion systems also are developed, either a succession or a chain of medallions on the vertical axis; or two or more forms of medallions alternating in bands, a scheme typical of the Turkish ("Ushak") carpets of the 16th–17th centuries; or systematically spotted medallions which may or may not be interconnected, or may interlock when the scheme logically becomes an elaborate lattice.

Persian carpets of the great period (15th–17th centuries) commonly have multiple design schemes, that is, composition systems on two or more "levels." The simplest is the medallion superimposed on an allover design, but more typical are subtler inventions such as two or three spiral stem systems, sometimes overlarded with large-scale cloud bands, the nhole intertwining and mutually supplementary, but each independently conceived and individually carried to completion. The finer Vase carpets have double or triple ogival lattices set at different intervals ("staggered"), each with its own centre and tangent motives which also serve other functions in the other systems. What at first sight appears to be a great multiplicity of independent motives thus proves on careful exploration to be firmly controlled and logically distributed.

Occasionally stripe systems are used, either vertical or diagonal, but this conception is more natural to shuttle-woven fabrics, and probably, when employed in the free techniques of rug weaving, are imitations of textiles.

The border invariably consists of a minimum of three members: the main band which can vary greatly in width in accordance with both the size of the rug and the elaborateness of the field design, and the guard stripes, a decidedly subordinate band on either side, really the borders of the border These may be the same on both sides or different. But multiple border systems also are quite common, as on one of the Noin Ula carpets, very elaborate schemes having been developed in mosaic floors of the Roman period. Some of the greatest carpets, however. have the simplest border arrangements. while on certain types of commercially produced carpets of the late 19th and early 20th centuries meaninglessly multiple and complex compositions were developed. The court designers of the 16th century developed many beautiful correlations of rhythm and accent between border and field.

Patterns.— Four main classes of motives are used: geometrical, conventional, plant and illustrative The geometrical repertoire is built up from variations and combinations of meanders, polygons. crosses and stars Meanders. chiefly for borders range from the simple serration which is ageless (actually already much used in the Upper Palaeolithic) to fairly complex hooked forms, characteristically the angular "running-wave" or "Greek-key,"

which is also very ancient. Such meanders typically constitute reciprocals, *i.e.,* designs which form the identical shape in the positive and negative areas, and so when executed in contrasted colours can be alternatively interpreted; or differentiated reciprocals, the negative space created by the main motive having a different but destructive form, a type of narrow border well developed in early mediaeval textile design. Little trefoil reciprocals are used for guard stripes in the Caucasus, central Persia (so-called Polonaise) and in India. Chief among the polygons employed are the lozenge and the octagon. The Maltese cross is frequent, and the gamma cross (or swastika) is frequent. The purely geometrical stars are usually based on the cross or the octagon. Many of these motives, which are rudimentary and very ancient, may have originated in basket-weaving and the related reed-mat plaiting, for they are natural to both techniques; but in rug weaving they have survived chiefly in the work of central Asia, Asia Minor and the Caucasus, pile-knotted and flat-woven, uhether tapestry or of the Shemakha type:

One of the principal motives in the 16th and 17th century Persian carpets is the so-called arabesque, an ambiguous term that generally implies an intricate scrolling vine system that in Persian ornamental schemes (12th to 18th centuries) usually terminates in a lilylike blossom of two uneven and asymmetrical members meeting at a narrow acute angle, generally with a rounded lobe on one side underneath, and describing two curves in opposite directions which continue readily into further scroll systems. This highly individual form was well begun in China in the late Chou period (c. 600 B C.), notably on a few bronze mirrors, and is beautifully developed during the Han dynasty (220 B.C.–A.D. 220). It does not appear in Persia, however, until the 12th century (on pottery and architectural stucco ornament), and its intermediate history has not been traced in either country, yet when it does emerge in Persian design the essential forms are so close to those that had been current in the far east more than 1,200 years before, a hiatus and reinvention seem improbable.

Directly traceable to China, on the other hand, are the cloud knot (or 'tchi) and cloud band or ribbon—both begun by the Han period at least and with a continuous history thereafter. The cloud ribbon first appeared in western Asia in Syrian silk design of the 7th century but was sporadic until the 13th century when it was reintroduced as an aftermath of the Mongol invasion and at this time it became associated with the three-ball motive, an astral symbol that goes back to Babylonia of the second millennium B C. and referred to the sun, moon and planet Venus, decisive astral bodies in the aest Asiatic cults. The combination moved from Syrian textile design into Asia Minor textile design with the Ottoman Turkish conquest in the 15th century and became typical of one group of 16th–17th century Turkish carpets.

The cloud band or ribbon, already skilfully used on book covers, manuscript illumination and in architectural faïence, became important on 16th century carpets and was employed with especial elegance and skill by the Persian designers, and perhaps most beautifully in the Turkish court carpets which owed much to Persian inspiration, while the cloud knot or *'tchi,* a feature of the court carpets of the time of Shah Abbas, was continued to the end of the 18th century.

A second major class of conventional motives dominant in a considerable range of carpet designs from Asia Minor to India, the palmettes, are of plant derivation, and are justifiably named in that they originated in Assyrian design as stylizations of the palm, a symbol of the vitalistic power, often, if not always, in relation to the moon. Moreover, many of the almost uncountable variations that developed through the centuries continued to refer directly to the palm. Others. however. also beginning early in the first millennium B.C., derived from the lotus blossom, a complementary figure since it was connected primarily with the fertility repertoire in relation to sun symbolism. Still others involved the symbolically closely related pomegranate, utilizing primarily the fruit while still others presented the general vitalistic emblem, the vine, this last built on the single leaf The forms of all these four main types of palmettes found in the rug designs are directly descended from styles current in textile designs from the 4th century, and are more or less modified by Chinese influences. These patterns in the 16th and early 17th centuries were beautifully and realistically elaborated, and blossoms like the Chinese peony sometimes compete with the more conventional lotus. The lanceolate leaf often associated with palmettes especially in east Persian designs, is also largely conventional.

Outstanding among the more naturalistic plants are the cypress and blossoming fruit tree, typically shown thus combined in Persian designs, still suggesting the ancient meaning of life eternal and resurrection. Willows are especially favoured in the Shah Abbas Vase carpet, as are jasmine flowers, and in Turkish court carpets, tulips. Many minor foliate and floral forms had no specific botanical identification though they give a realistic effect. Naturalistic red or pink roses, as on Karabagh and Kerman rugs from the 18th–19th centuries, are imitated from French patterns or English chintz and had no place in the old Persian repertoire, despite the importance of the rose in Persian poetry life and even economy, and its ancient symbolic importance throughout western Asia as an alternative to the lotus blossom.

In one uidely distributed class of design some of the plant forms grow out of a vase, a residue of an old symbolic complex, a cosmological tree, usually the Tree of Life, sustained by the Water of Life as implied by the "cloud-jar," a design already well developed in Babylon.

Of the illustrated motives, in addition to the naturalistic plants, the most importact are those connected with the garden and the hunt: many small songbirds of which the nightingale meant most to the Persian; the *feng huang* (pheasant) taken over from China and much favoured in the 16th century and occasionally the peacock, which further west in Asia had had considerable symbolic value; the great felines—lions and the semiconventional lion-mask, sometimes used as the centre of a palmette; tigers; cheetahs; bear; fox; deer of numerous species; goats, sometimes picturesquely prancing; or the wild ass, a fleet prey; ferocious looking Chinese dragons and the gentle *kilim,* a fantastic equine likewise imported from China. Fish sometimes swim in pools or streams, or are conventionally paired to suggest an escutcheon in the borders of one type. Huntsmen, usually mounted, are the major human figures, though musicians and angels also occur. (A U.P.)

RUHR, a river of Germany and an industrial region. The Ruhr river is 146 mi. long, an important right-bank tributary of the lower Rhine. It rises on the side of the Winterberg in the Sauerland, at about 2,000 ft. above the sea. It flows north and then west in a deep. well-wooded valley past the town of Arnsberg. Shortly after reaching Neheim it bends southwest, and skirts the southern border of the coal-mining district in a tortuous course that passes Witten, Steele, Kettwig and Mülheim, and joins the Rhine at Ruhrort. The river is navigable from Witten downward, by the aid of 11 locks. Its chief affluents are the Mdhne (right) and Lenne (left). The river has given its name to the largest single industrial area in the world. The Ruhr area comprised about 2,000 sq.mi. and in the 1950s it had a population of more than 5,200,000. Five towns—Essen, Dortmund, Duisburg, Gelsenkirchen and Bochum—each had a population of more than 300,000.

The Ruhr coal field is the second largest in the world. In the 1950s its production was about 92% of the coal output of the German Federal Republic. The Ruhr district also supplied about 90% of western German steel production. Many kinds of chemical industries developed in the area.

Before World War I most of the Lorraine iron and steel works were owned by or closely affiliated with concerns in the Ruhr. The low-grade iron ore of Lorraine went mostly to the blast furnaces of the Ruhr. On the other hand the coke of the Ruhr was needed for the smelting of Lorraine ores.

World War I and After.—The return of Alsace-Lorraine to France and the retirement of Luxembourg from the German customs union reduced Germany's home supply of iron ore by 80%. German coalmasters, however. held the winning hand. Compensation from the German government enabled them to erect new iron and steel works on the Ruhr, which could be run with high-grade Swedish or Spanish ore or with war scrap.

As early as the conference of Spa (1920) when Germany had

fallen short on coal deliveries, the Allies presented Germany with an ultimatum which threatened the occupation of the Ruhr in the case of nonacceptance. Though this extension of the area of occupation was an arbitrary act, the German government gave way, and France began to use this threat of an extension of the occupation as a weapon in the struggle about reparation. When the German government refused the proposals (Jan. 29, 1921) of the Paris conference, they occupied Düsseldorf, Ruhrort and Duisburg, and continued the occupation after Germany had accepted the London ultimatum of May 5, 1921.

On Dec. 26, 1922, the Reparation commission announced that Germany had fallen short on certain deliveries of boards and telegraph poles; a few days later a similar shortcoming in coal deliveries variously estimated at 11% to 15.6% was declared. The Reparation commission concluded that Germany's shortcomings had been "intentional," which permitted the Allied and associated powers to take "such other measures as the respective Governments may determine to be necessary in the circumstances." The French and Belgian governments decided to send a technical mission to the Ruhr, accompanied by a military force.

When the French and Belgian troops entered the Ruhr on Jan. 11, 1923, the German coal syndicate had transferred their seat to Hamburg. The German government issued a protest (Jan. 12, 1923); all reparation payments especially the delivery of coke and coal to France and Belgium ceased. Civil servants and railway officialswere forbidden to obey orders from the occupying powers. The French expelled German officials and heavily fined or imprisoned recalcitrants. They erected a customs frontier, dividing the occupied district from the rest of Germany.

The struggle for the Ruhr completely destroyed German finance and with it German currency. Passive resistance in the long run meant the withdrawal of all workers, starting with the railway men, from such productive and distributive processes as might help the army of occupation. This involved the maintenance of all persons out of work at the public expense. The Ruhr occupation was the deciding factor in the collapse of the mark.

At last the new German government, presided over by Stresemann, gave up passive resistance on Sept. 26. The French government continued to refuse negotiations and strongly supported the separatist movement all over the left bank of the Rhine.

In Nov. 1923, the industrial concerns in the occupied districts negotiated an agreement with the Mission Interalliée de Contrôle des Usines et des Mines (called Micum) with the object of freeing the huge iron and coal stocks which had accumulated, as the French government mould not negotiate with the German government. It demanded the payments of the German coal tax and the coal on the dumps, while the new output could be sold by the works against payment of a duty; the delivery of reparation coal and coke was to be resumed on a percentage basis of the total output. Iron and steel might be sold by the works against payments. The German government acknowledged its obligation to refund the cost of payments of delivery to the industries concerned.

These provisional arrangements paved the nay for a settlement, after British and U.S. pressure had induced the French government to agree to the appointment of the Dawes committee by the Reparation commission.

The nen French government agreed to accept the Dawes plan, to free the prisoners and to leave the Ruhr. The plan was formally signed on Aug. 30. The evacuation of the Ruhr ended on July 31, 1925, when the French troops left Essen and Miilheim. On Aug. 25 Dusseldorf. Duisburg and Ruhrort were given back.

World War II and After. — Much of the Ruhr industrial area was in ruins by the end of World War II, and more than one-third of the coal mines had discontinued operations completely or were heavily damaged. The capture in April 1945 of 325.000 German troops who were trapped in the Ruhr pocket by the U.S. 1st and 9th armies was one of the outstanding successes of the Allied campaign in western Europe (*see* WORLD WAR II).

After the war Great Britain occupied the Ruhr. As a safeguard against the growth of German military and economic power in Europe, the Allies set up the International Authority for the Ruhr on April 28, 1949. The I.A.R. was dissolved after the European Coal and Steel Community treaty — ratified by France, the German Federal Republic, Italy, Belgium, Luxembourg and the Netherlands — came into force on Aug. 10, 1952. (M. Bo.; X.)

RUHRORT, after 1305 a part of Duisburg, formerly in the Prussian Rhine province, west Germany, and after 1945 in North Rhine-Westphalia at the junction of the Ruhr and the Rhine.

Ruhrort is first mentioned in 1379 and obtained civic rights in 1551. Having been in the possession of the counts of La Marck, it passed into that of Brandenburg in 1614. Ruhrort has one of the largest river harbours in the world, and it is the principal shipping port for the coal of the Westphalian coal field. *(See* DUISBURG.)

RUISDAEL (RUYSDAEL, RUIJSDAEL), **JACOB** VAN (c. 1629–1682), Holland's greatest landscape painter, was born at Haarlem about 1629. He was probably the pupil of his father, the frame maker Izack de Gooyer, who later styled himself Ruysdael. There is no truth in the statement that his uncle Salomon van Ruysdael (*q.v.*) influenced his artistic development, let alone was his teacher. The influence of Cornelisz Vroom, another Haarlem landscapist, is often noticeable in his early works of the 1640s; the earliest dated pictures are of 1646. Two years later he became a member of the Guild of St. Luke in Haarlem. Around 1650–52 he traveled extensively in Holland and the neighbouring parts of western Germany (several views of the castle of Bentheim). About 1655 he settled in Amsterdam, of which he became a free citizen in 1659. Meindert Hobbema must have been his pupil before 1660. Ruisdael's name was entered on the list of Amsterdam doctors in 1676, but later his name was deleted. Whether he ever practised as a doctor is not known, but his artistic work was relatively well rewarded. He died in Amsterdam but was buried in Haarlem on March 14, 1682 (the Jacob van Ruisdael who died in 1681 in the almshouse of Haarlem was another painter. the son of Salomon).

The early works of Ruisdael, mostly with motifs from the surroundings of Haarlem, are very accurately drawn and executed. Around 1650 his art developed toward a heroic-pathetic style of well-composed romantic landscapes. Unlike most of the Dutch landscape painters, he did not care for a topographical rendering of special scenes. As few of his pictures are dated after 1655, it is hard to place them in exact chronological order. It seems that the many "Waterfalls," varying a theme by A. van Everdingen (who had been in Sweden), belong to his later period, as do the few townscapes nhich exist. His main motifs are derived from forest scenery ("The Pool in the Wood," Leningrad). Beaches and stormy seas with magnificent clouds had never been painted before with such a power of expression, feeling for atmosphere and space.

The works of Ruisdael are spread over all the great galleries, the National gallery, London, possessing many good examples. I-lis famous paintings also include: "The Jewish Burial Ground" (Dresden and Detroit). based on drawings made at Ouderkerk near Amsterdam; the "View of Haarlem" (Rijksmuseum, Amsterdam); "The Pool" (Berlin and Worcester college, Oxford); "The Wood" (Kunsthistorisches museum, Vienna); two "Views of Egmond" (Philips collection, Eindhoven. and Art gallery, Glasgom); "The Cornfield" (Metropolitan museum, New York); "Mill at Wijk Near Duurstede" (Rijksmuseum, Amsterdam); "The Winter" (Staedel, Frankfurt), "The Burst of Sunshine" ("Le Coup du Soleil," Louvre, Paris). Sometimes, but by no means always, the small figures in his pictures are added by other artists. such as **A.** Van de Velde, Philips Wouwerman and Kicolaes Berchem.

As can be seen from the subjects, Ruisdael's landscape vision had a wide range. His understanding for the beauty and inner life of the landscape is nowhere hampered by the fact that his poetic and romantic vision transformed the simple Dutch scenery sometimes into unnaturalistic but powerful compositions. Moreover, the rendering of the details — the trees, the water and the ground —is full of careful, sensitive observation. There are several fish markets in white. black and grayish colours. and there is a surprising church interior of the Nieuwe Kerk at Amsterdam (marquess of Bute collection; drawing in Print room, Berlin).

Rosenberg, Jacob *van* Ruisdael (1928). (H. K. GN.)

RUISLIP-NORTHWOOD, an urban district (1904) in the parliamentary division of the same name, Middlesex, Eng., 16 mi. W.N.W. of London. Pop. (1961) 72.541. The manor of Ruislip was in French possession from Norman times for about 200 years. The district contains the former villages of Ruislip, nith the priory and parish church of St. Martin containing 15th-century mural paintings, and 17th-century almshouses opposite the Elizabethan manor farm; Northwood, with the ancient grange now used for community purposes; and Eastcote, nith the Elizabethan Eastcote house, in timbered grounds, that was acquired by the council in 1936, and Haydon hall dating from *c.* 1700. Nearly 600 ac. of woodland was originally part of the great forest of Middlesex and is now part of London's green belt. Close to Park wood is the playground known as the Ruislip lido including a lake covering 46 ac. Tile and brickmaking were carried on from the 14th century until comparatively recent times and forestry was a major industry until the 19th century. In South Ruislip are factories making organs, metallic films, precision and electrical instruments, etc.. and a large milk-bottling depot.

RUIZ, JUAN (*c.* 1283–*c.* 1350), Spanish poet, became archpriest of Hita. It may be inferred from his writings that he was not an exemplary priest, and one of the copies of his poems states he was imprisoned by order of Gil Albornoz, archbishop of Toledo. He finished his *Libro* de *buen amor* in 1343, while in jail. and he was no longer archpriest of Hita in Jan. 1351; it is assumed that he died shortly before. Ruiz had a considerable knowledge of colloquial (and perhaps of literary) Arabic; he knen by heart the *Disticha* of Dionysius Cato, and admits his indebtedness to Ovid and to the *De Amore* ascribed to Pamphilus; his references to Blanchefleur, to Tristan and to Yseult, indicate an acquaintance with French literature, and he utilizes the *fabliaux* with remarkable deftness; lastly, he adapts fables and apologues from Aesop, from Pedro Alfonso's *Disciplina clericalis,* and from mediaeval bestiaries. All these heterogeneous materials are fused in the substance of his versified autobiography, into which he intercalates devout songs, parodies of epic or forensic formulae, and lyrical digressions on every aspect of life. Ruiz. in fact. offers a complete picture of picaresque society in Spain during the early 14th century. From his Don Furón is derived the hungry gentleman in *Lazarillo* de *Tormes,* in Don Melón and Doña Endrina he anticipates Calisto and Melibea in the *Celestina,* and Celestina herself is developed from Ruiz' Trotaconventos. Moreover. Ruiz was justly proud of his metrical innovations. The *Libro de buen amor* is mainly written in the *cuaderna via* modelled on the French alexandrine, but he imparts to the measure a variety and rapidity previously unknown in Spanish. (J. F.-K.)

RUIZ DE ALARCÓN (Y MENDOZA), JUAN (*c.* 1581–1639), greatest Mexican writer of the colonial era and principal dramatist of early 17th-century Spain after Lope de Vega and Tirso de Molina, was born at Mexico City and educated there and, after 1600. at Salamanca. Spain. Having returned home in 1608 to practise law, he re-emigrated definitively to Spain in 1613 and began to write. A spinal deformity savagely ridiculed by his literary contemporaries isolated him from society and was thus perhaps as responsible as his colonial origin for the atypical character of his work, with its formal polish (with 20 published plays, he is the least prolific major Spanish dramatist) and ethical bias. His finest works are La *verdad sospechosa* (adapted by Corneille as Le *menteur)* and Las *paredes* oyen. He died at Madrid on Aug. 4, 1639.

BIBLIOGRAPHY.—*Teatro,* ed. by E. Abreu Gómez (1951); A. Reyes, in Cuadernos de literatura *contemporánea* (1955); O. Green, in Bulletin of Hispanic *Studies* (1956). (F. S. R.)

RUIZ ZORRILLA, MANUEL (1834–1895), Spanish politician, born at Burgo de Osma. Deputy in 1856, he soon attracted notice among the most advanced Progressists and Democrats. After the military movement in Madrid of June 22, 1866, he had to flee to France, returning only at the revolution of 1868. In 1569 he became minister of grace and justice under Serrano: elected president of the House of Deputies in 1870, he seconded Prim in offering the throne to Amadeus of Savoy In 1871 he formed a cabinet. and continued to be the king's chief councillor until his abdication (Feb. 1873), when Ruiz Zorrilla advocated a republic. On the restoration of Alphonso XII (1875), he went to France. where for nearly 18 years he was the soul of the republican conspiracies. He was eventually allowed to return to Spain and died at Burgos on June 13, 1895.

RULE OF THE ROAD: see TRAFFIC REGULATIONS.

RULE OF THE ROAD AT SEA. The present article is a summary of the regulations that came into force on Jan. 1. 1954, following the International Conference on Safety of Life at Sea, 1948. The regulations apply to all vessels on the high seas. A "power-driven" vessel means any vessel propelled by machinery. When under sail only she is considered a sailing vessel and under sail and power is considered a power-driven vessel. The rules for seaplanes apply when they are water-borne. Vessels and seaplanes are "under way" when not at anchor, moored or aground.

Lights and Shapes.—The word "visible" when applied to lights means visible on a dark night with a clear atmosphere. The rules concerning lights must be complied with in all weathers from sunset to sunrise. No other lights which might be mistaken for the prescribed lights, impair their visibility or interfere with the keeping of a proper lookout must be exhibited. Shapes shall be not less than two feet in diameter.

Power-Driven Vessels Under Way.—(1) *Masthead light:* in the fore part of the vessel a white light visible over an arc of 225°, *i.e.,* from right ahead to 22½° abaft the beam on either side for five miles; (2) a second white light of similar character either forward or abaft the above light (not compulsory for vessels less than 150 ft in length or when towing). These two lights must be in line with the keel, one 15 ft. higher than the other. The horizontal distance between them must be at least three times the vertical distance. The lower light shall not be less than 20 ft. above the hull. (3) *Side lights:* (*a*) on the starboard side a green light clearly visible over an arc of 112½°, *i.e.,* from right ahead to 22½° abaft the beam for two miles; (*b*) on the port side a similar red light. These side lights must be fitted with screens projecting three feet forward of the light. (4) *Seaplanes:* (a) in the fore part amidships a white light visible over an arc of 220°, *i* e., from right ahead to 20° abaft the beam on either side for three miles; (b) on the starboard wing tip a green light visible from right ahead to 20° abaft the beam for two miles; (*c*) on the port wing tip a similar red light. (5) Stern *light:* (*a*) vessels under way shall carry at their stern a white light visible over an arc of 135°, *i.e.,* from right astern to 67½° on each side for two miles; (b) small vessels unable to carry this light must have ready an electric torch or lighted lantern to show to an overtaking vessel; (*c*) a seaplane shall carry a white light on her tail visible over an arc of 140°, *i.e.,* from right astern to 70° on each side for two miles.

Towing Lights — (1) (a) A power-driven vessel towing or pushing another or seaplane shall carry in addition to her side lights two white masthead lights vertically, not less than six feet apart; if the tow exceeds 600 ft. an additional white light to be carried six feet above or below them; (*b*) a stem light or a white light abaft the funnel on aftermast for the tow to steer by. (2) A seaplane towing in addition to her under way lights. shall show a second white light six feet above or below the forward white light.

Not *Under* Control —(1) A power-driven vessel shall carry in lieu of the masthead lights, where best seen, two red lights vertically, not less than six feet apart and visible all round for two miles. By day, the red lights shall be replaced by two black balls. (2) A seaplane may carry, where best seen, two red lights vertically. not less than three feet apart, visible all round for two miles. (3) A vessel working telegraph cables, navigation marks, surveying or on underwater operations and unable to manoeuvre shall carry in lieu of masthead lights three lights vertically, thus—red, white, red—visible all round for two miles. By day, similarly placed. she shall carry three shapes vertically, the highest and lowest globular in shape and red in colour, the middle diamond in shape and white. (4) Vessels and seaplanes not under control shall only carry side lights when making way through the water.

Sailing vessels under *way,* vessels and seaplanes towed shall carry the same lights as prescribed for a power-driven vessel or seaplane but not the masthead lights. Small vessels unable to fix the *side*

lights must have them ready for immediate display on nearing another vessel.

Power-Driven Vessels of Less Than 40 Tons.— (I) In the fore part, not less than nine feet above the gunwale, a white light constructed and screened as a masthead light visible for three miles. *(2)* Side lights constructed and screened as described above visible for one mile, or a combined lantern showing green and red lights from ahead to 22½° abaft the beam on their respective sides. Small power-driven boats may carry the white light lower than nine feet but it must be higher than the side lights.

Vessels of less than 20 tons under oars or sails if without side lights shall carry a lantern fitted with a green and red light visible for one mile. *Rowing boats under oars or sails* shall show a white light from an electric torch or lantern in time to prevent collision.

Pzlot Vessels.— (I) Sailing pilot vessels under way on station shall carry a white all-round light at the masthead visible for three miles and exhibit a flare-up light at intervals not exceeding ten minutes, and also show their side lights on the approach of or to other vessels. *(2)* Power-driven vessels on station duty under way shall carry the above lights and flares and eight feet below the white masthead light a red light visible all round for three miles and side lights. *(3)* When on station duty at anchor, pilot vessels will exhibit the above lights and anchor lights but not side lights. (4) When not on station duty, they shall carry the same lights as other vessels of their class and tonnage.

Anchor Lights and Shapes.—(1) Vessels less than 150 ft. in length shall carry forward a white light showing all round for two miles. *(2)* If 150 ft. or more, the above light not less than 20 ft. above the hull, and at the stem at least 1*j* ft. lower than the forward light. another such light. both to be visible all round for three miles. *(3)* Between sunrise and sunset every vessel at anchor shall carry forward one black hall. (4) Working telegraph cables, navigation marks. surveying or on underwater operations, a vessel at anchor shall carry the lights and shapes previously described for such vessels and also anchor lights. *(5)* A vessel aground shall carry by night anchor lights and the two red lights prescribed for a vessel not under control; by day three black balls, vertically not less than six feet apart. *(6)* Seaplanes less than 150 ft. long, a white light visible all round for two miles. If more than 150 ft., a white light forward and one aft. each visible all round for three miles. If more than 150 ft. in span, a white light on each side to indicate the maximum span. visible all round for one mile. If aground, they shall carry anchor lights and may carry t o red lights vertically three feet apart, visible all round.

Fishing Vessels.— (I) When not fishing they shall show the lights and shapes for similar vessels of their tonnage. When fishing only the prescribed lights and shapes must be shown visible for two miles. *(2)* With trolling (towing) lines: as for a power-driven or sailing vessel under way. *(3)* With nets or lines (not trolling') extending less than 500 ft. into the seaway, an all-round white light and on the approach of or to another vessel, another white light six feet below it and at least ten feet horizontally from it in the direction of their gear. By day, display a basket. which must; if at anchor, be shown in the direction from the anchor ball toward the gear. If the gear extends more than *joo* ft.. three white lights in a vertical triangle. three feet apart, visible all round. Side lights must be shown only when making way through the water. By day, a basket must be shown close to the stern not less than ten feet above the rail: also, conspicuously, one black conical shape apex upward. At anchor with gear out they shall show the basket to approaching vessels in the direction from the anchor ball toward the gear. *(4) (a)* A power-driven vessel trawling shall carry in lieu of the masthead light, a tricoloured lantern showing a white light from right ahead to 22½° on each bow and green and red lights showing from 22½° on each bow to 22½° abaft the beam on the starboard and port sides respectively, and not less than 6 nor more than 12 ft. below the lantern a white all-round light and also a stem light; *(b)* sailing vessels trawling shall carry a white light showing all round and on approach of or to another vessel show a white flare-up light; (cj by day, vessels trawling shall display a basket in a conspicuous position. (5) Fishing vessels may in addition to the above lights show a flare-up light in order to attract attention, and use working lights. *(6)* Vessels fishing at anchor shall show anchor lights and shapes and an additional white light six feet below the forward anchor light and ten feet horizontally from it, in the direction of the gear. (7) *(a)* If a vessel when fishing becomes fast by her gear to an obstruction, she shall in daytime haul down the basket and show the shape required for a vessel at anchor, by night show anchor lights; (b) in bad visibility whether by day or night sound the signal for a vessel not under control which signal shall also be used on the approach of another vessel in good visibility.

Special Lights and Signals.— (I) Vessels and seaplanes may, to attract attention, show a flare-up light or use detonating sound signals which cannot be mistaken for any signal authorized elsewhere. *(2)* Ships of war, convoys and merchant ships may operate station or signal lights or recognition signals adopted by shipowners, duly authorized by their respective governments.

Vessels under sail and power in daytime shall display one black conical shape. point upward. carried forward.

Fog *signals* by whistle, siren, foghorn and bell. A "short blast" means one of one second; a "prolonged blast", one of four to six seconds. Signals prescribed shall be given by vessels: if power-driven, on the whistle; if sailing vessels, on the fog horn; if towed, on the whistle or fog horn.

In fog and restricted visibility, by day or night, the following signals shall be used. (1) Power-driven vessel making way: every two minutes a prolonged blast. *(2)* Stopped and not making way: every two minutes two prolonged blasts with one second between them. *(3)* Sailing vessel under way: every minute, on the starboard tack one blast; port tack two blasts; wind abaft the beam, three blasts. *(4)* A vessel anchored shall ring her bell rapidly for five seconds every minute. If more than *3jo* ft. in length: sound the bell forward, and aft sound a gong or similar instrument. She may also sound to approaching vessels, one short, one prolonged and one short in succession. (5) Towing or unable to manoeuvre: one prolonged and two short in succession every minute. (6) The last vessel of a tow: one prolonged and three short in succession every minute, after the towing vessels signal. (7) Vessel aground: three strokes on the bell immediately before and after ringing the bell as prescribed in (4). (8) Vessels less than *20* tons, rowing boats and seaplanes: an efficient sound signal every minute. (9) \-essels fishing of *20* tons upward: a blast followed by ringing the bell every minute.

Speed in Fog.— (1) Every vessel or seaplane shall in conditions of restricted visibility go at a moderate speed. *(2)* A power-driven vessel hearing, apparently forward of her beam, the fog signal of a vessel the position of which is not ascertained shall, circumstances permitting, stop her engines and navigate with caution until danger of collision is over

Steering and Sailing Rules.— Sailing vessels approaching one another with risk of collision shall take action as follows. (1) A vessel running iree shall keep out of the way of the vessel close-hauled. *(2) A* vessel close-hauled on the port tack shall give way to the vessel close-hauled on the starboard tack (3) When both are running iree with the wind on different sides, the vessel with the wind on the port side shall keep clear of the other. (4) When both are running free with the wind on the same side, the vessel to windward shall keep clear of the one to leeward. (5) The vessel with the wind aft shall keep clear of the other, vessel.

Power-Driven Vessels.— (1) When meeting end on or nearly end on with risk of collision, each shall alter course to starboard so that they pass port to port. This applies only to cases when by day each vessel sees the masts of the other in a line or nearly so with her own and by night to cases in which each vessel is in such a position as to see both the side lights of the other. For these purposes a seaplane shall be included as a power-driven vessel. *(2)* When two power-driven vessels are crossing so as to involve risk of collision, the vessel which has the other on her starboard side shall yield the right of way.

Power-Driven and ***Sailing*** *Vessels.— (I)* When risk of collision is involved the power-driven vessel shall keep out of the way of the sailing vessel. (2) A seaplane shall in general keep well clear of all vessels and avoid impeding their navigation. However, where risk of collision exists she shall comply with these rules.

General.— (1) Where by these rules one of two vessels is to keep out of the way of the other, the other shall keep her course and speed. When from any cause the latter vessel finds herself so close that collision cannot be avoided by the action of the giving-way vessel alone, she also shall take action as will best aid to avert collision. (2) Every vessel which is directed by these rules to keep out of the way of another vessel shall. if the circumstances of the case admit, avoid crossing ahead of the other. (3) Every power-driven vessel shall, on approaching another vessel which she is directed by these rules to keep clear of, if necessary slacken her speed, stop or reverse.

Vessels overtaking shall keep out oi the way of the overtaken vessel. An overtaking vessel is one coming up with another from any direction more than 22½° abaft her beam, *i.e.*, a position from which by night she would be unable to see the side lights of the vessel she is overtaking and no subsequent alteration of the bearing between them shall make the overtaking vessel a crossing vessel within the meaning of these rules or relieve her of the duty of keeping clear until she is finally past and clear. If the overtaking vessel is doubtful whether she is forward or abaft this direction from the other vessel, she shall assume that she is an overtaking vessel and keep clear.

Narrow Channels.—(1) Every power-driven vessel proceeding along the course of the channel shall, when it is safe and practicable. keep to that side of the fairway or mid-channel which lies on the starboard side of such vessel. (2) A power-driven vessel nearing a bend in a channel when another vessel approaching from the other direction cannot be seen shall give a prolonged blast when within one-half mile of the bend, which signal shall be answered by a similar blast by any approaching power-driven vessel within hearing around the bend. The bend shall be rounded with alertness and caution.

All vessels not engaged *in* fishing shall keep out of the way of vessels fishing with nets, lines or trawls. This rule shall not give to any vessel engaged in fishing the right of obstructing a fairway used by vessels other than fishing vessels.

Navigational Dangers and Proper Precautions.—Due regard shall be had to all dangers of navigation and collision and special circumstances, including the limitations oi the craft involved. which may render a departure irom the rules necessary in order to avoid immediate danger. Nothing in these rules shall exonerate any vessrl, owner, master or crew thereof from the consequences of any neglect to carry lights or signals or to keep a proper lookout or of the neglect of any precaution required by the ordinary practice of seamen or by the special circumstances of the case.

Sound Signals *for Vessels in Sight of One Another.*—(1) When vessels are in sight of one another. a power-driven vessel in taking any course authorized or required by these rules shall indicate that course by the following signals: one short blast to mean "I am altering my course to starboard"; two short blasts, "I am altering my coursr to port"; three short blasts, "My engines are going astern." (2) A power-driven vessel which is the stand-on vessel finding herself in doubt through the keep-out vessel not taking sufficient action to avert collision may indicate such doubt by giving at least five short and rapid blasts on the whistle. but this does not relirve her of any obligation under these rules or of her duty to indicate any action taken under them of giving the appropriate sound signals laid down under (1).

Reservation *of* Rules *for Harbours and* Inland *Navigation.*—Nothing in these rules shall interirre with the operation of a special rule dilly made hy local authority relative to the navigation of any harbour, river or inland water, including a reserved seaplane area.

Distress **Signals.**—Vessels and seaplanes in distress and requiring assistance from other vessels or the shore shall use or display the following signals either together or separately: (1) a gun or other explosion signal fired at intervals of about a minute: (2) a continuous sounding with any fog-signal appa-atus; (3) rockets or shells throwing red stars fired one at a time at short intervals; (4) a signal made by radiotelegraphy or by anv other signalling method consisting of the group SOS in the Morse code; (5) a signal sent by radiotelephony consisting of the spoken word "Mayday"; (6) the international code signal of distress SC: (7) a square flag having above or below it a ball or anything resembling a ball; (8) flames on the vessel (as from a burning tar barrel, etc.); (9) a rocket parachute flare showing a red light. (L. F. H.)

RULES OF **ORDER,** as the term is ordinarily used in the United States, embodies the generally accepted rules, precedents and practices commonly employed in the government of deliberative assemblies. Its function is to maintain decorum. ascertain the will of the majority, preserve the rights of the minority and facilitate the orderly and harmonious transaction of the business of the assembly. While it had its origin in the early British parliaments. the modern system of general parliamentary law is. in many respects, at wide variance with the current systems of procedure of both the English parliament and the U.S. congress. These legislative systems are designed for bicameral bodies. generally with paid memberships. meeting in continuous session. requiring a majority for a quorum and delegating their duties largely to committees. Their special requirements and the constantly increasing pressure of their business have produced highly complex and remarkably efficient systems peculiar to their respective bodies but which are as a whole unsuited to the needs of the ordinary assembly. As a result there has been simultaneously developed through years of experiment and practice a simpler system of procedure adapted to the wants of deliberative assemblies generally and which, though variously interpreted in minor details by different writers, is now in the main ctandardized and authoritatively established.

Organization.-Assemblies convene with the implied understanding that they will be conducted and governed in accordance with these fundamental principles. The routine ordinarily followed in the preliminary organization of an assembly includes the call to order by any of those present with a request for nominations for temporary chairman, The temporary chairman having been elected and having taken the chair, a temporary secretary is chosen and those addressing the chairman are recognized to explain and discuss the purposes of the meeting. If the assembly has convened for a single session only or is in the nature of a mass meeting a presiding officer and recording officer will suffice. If permanent organization is contemplated a committee is usually appointed to draft a constitution and bylaws and on the adoption of its report, with or without amendments, the assembly proceeds to the election of the permanent officers thus authorized. In a permanent organization such officers commonly consist of a presiding officer known as the president. chairman. speaker or moderator: a vice-presiding officer; a recording officer, known as the secretary or clerk. who keeps the records. attends to the clerical work of the organization and in the absence of the presiding ofiicers calls for the selection of a temporary president; a treasurer or bursar who receives and disburses its funds; and a sergeant at arms who preserves order and carries out the wishes of the assembly through the presiding officer.

It is the duty of the presiding officer to call the assembly to order at the appointed time. cause the journal or minutes of the preceding meeting to be read. call up the business of the assembly in the order provided by its rules and conduct its proceedings in accordance with parliamentary law. He is especially charged with the responsibility of ascertaining the presence of a quorum. the minimum number of members prescribed by the rules of the assembly as competent to transact business. In legislative assemblies a quorum is presumed to be present unless the question is raised. but where the bylaws of an ordinary assembly require a quorum it devolves upon the presiding officer to ascertain that a quorum is present before proceeding with business.

Motions.—The will of an assembly is determined and expressed by its action on proposals submitted for its consideration in the fcrm of motions or resolutions offered by members recognized for that purpose. In order to make a motion a member must rise and address the chair and secure recognition. If the motion is in order and is seconded by another member it is "stated" by the presiding officer and is then subject to the action of the assembly. A second is not required in legislative assemblies but is requisite under general parliamentary law. Motions may be classified as main or principal motions, introducing a proposition; and secondary or ancillary motions. designed to affect the pending main motion or its consideration. A main motion is in order only when there is no other business before the assembly, and yields in precedence to all other questions. Secondary motions may be subdivided into subsidiary. incidental and privileged.

Subsidiary motions are applicable to other motions for the purpose of modifying the main question or affecting its consideration and disposition. They have precedence of the motion to which applied but yield to privileged and incidental motions. They take precedence among themselves in the following order: to lay on the table; for the previous question; to close or extend dehate: to postpone to a day certain; to commit. recommit and refer; to amend; and to postpone indefinitely.

Motion to Lily on the Table.—The motion to lay on the table is in effect a motion to suspend consideration of the question and, if agreed to, also suspends consideration of all pending questions relating to the motion to which applied until such time as the assembly may determine to take it from the table for further consideration. The motion is not debatable and may not be amended, postponed. committed. divided or reconsidered.

Motion for the Previous Question.—The purpose of the motion for the previous question is to close debate peremptorily and bring the assembly to an immediate vote on the pending question. It may be ordered on a single question. a group of questions or any part of a pending question, as on an amendment. It precludes both debate and amendment and requires a majority vote only for passage. It yields to the motion to table. to the question of consideration and to privileged and incidental motions and may

be reconsidered, but takes precedence of motions to postpone, amend and commit.

Motion to Close or Extend Debate.—The motion is not admitted in either house of the U.S. congress when not sitting as committee of the whole but is in order under general parliamentary law and insofar as applicable is subject to the rules governing the previous question.

Motion to Postpone to a Day Certain.—This applies to the main motion and its pending amendments and is debatable only as to the advisability of the postponement proposed, and does not open to debate the subject matter of the motion to which applied. It is subject to amendment and reconsideration, to privileged and incidental motions, to motions for the previous question and to lay on the table but has precedence of all other subsidiary motions.

Motion to Commit, Recommit and Refer.—The motions to commit, recommit and refer are practically equivalent and provide for reference of the pending proposition to a committee. While the motion to recommit ordinarily applies to the whole subject including pending amendments, it may apply to certain features only. It may be amended as by adding instructions to the committee as to time and manner of report. Debate on the motion is limited to the question of reference and instructions. It takes precedence of motions to amend and indefinitely postpone but yields to other subsidiary motions and to all incidental and privileged motions. It may be tabled or postponed with the main question but no subsidiary motions except the motions to amend and for the previous question may be applied separately. It is subject to reconsideration at any time before the committee begins consideration of the question submitted to it but after that time the subject matter may only be reclaimed by a motion to discharge the committee

Motion to Amend.—Changes in the text or terms of the proposition require a second and must be reduced to writing if requested by the chairman. There is no limit to the number of amendments which may be proposed and new amendments may be offered as rapidly as the pending amendment is disposed of. Amendments in the second degree. that is. amendments to amendments, are admissible but amendments in the third degree. that is amendments to amendments to amendments, are not in order. Only four amendments in the first and second degrees may be pending simultaneously. as follous: (1) amendment; (2) amendment to the amendment; (3) substitute for the amendment (*i.e.*, when it is desired to replace the entire pending amendment); and (4) amendment to the substitute. The amendment must, of course, be offered first and the substitute before the amendment to the substitute. but otherwise there is no rule governing the order in which the four amendments may be presented. They must. however. be voted on in the following order: first, amendments to the amendment; second. amendments to the substitute; third. the substitute; and last, the amendment. Debate on an amendment is in order only when the main motion is debatable, and is then limited to the proposed modification. An amendment which has been rejected may not be offered the second time in identical form, and no amendment may be proposed reversing the operation of an amendment previously adopted. Motions to amend will not be entertained unless germane or relevant to the main question, and no proposition different from that under consideration will be admitted under guise of amendment. This motion yields to all privileged, incidental and subsidiary motions except indefinite postponement. It is subject to amendment, to the operation of the previous question and to reconsideration. and when laid on the table carries with it the proposition proposed to be amended. Likewise, nhen the main question is laid on the table, postponed or recommitted, all pending amendments accompany it. The motion to amend is not applicable to the motion to lay on the table or for the previous question, to adjourn or to suspend the rules.

Motion to Postpone Indefinitely.—The motion to postpone indefinitely provides for final adverse disposition for the session and amounts to summary rejection. It is debatable and opens to debate the question to which applied but is subject to no subsidiary motion except the motion for the previous question.

Incidental Motions.—Incidental motions include questions arising incidentally in the consideration of other questions and decided before disposition of the one to which they are incident. They have no relative rank and merely take precedence of the pending question in the consideration of which they have arisen. All are undebatable with the exception of appeal. They comprise motions to suspend the rules, withdraw motions, read papers, raise the question of consideration, questions of order and appeal, reconsider, take up out of order, determine method of procedure, divide pending questions and questions relating to nominations.

The motion temporarily to suspend the rules may not be debated or reconsidered and is not subject to the application of any subsidiary motion. The vote required to pass the motion is ordinarily fixed by the rules of the assembly and in the absence of such provision is two-thirds of those present and voting.

Withdrawal or modification of a motion after it has been "stated" by the presiding officer is usually effected by unanimous consent but in event of objection by any member must be submitted to the assembly. Consent of the seconder is not required but if .modified the seconder may withdraw the second. When applied to the main motion it includes all adhering motions but when applied to amendments or adhering motions the main question is not affected. The reading of papers on which a vote is to be taken may be demanded by any member as a matter of right. Papers on which a vote is not required are usually read by unanimous consent but if objection is made the question must be submitted to the assembly.

The question of whether the assembly desires to take up a proposition regularly presented for its consideration may be tested by raising the question of consideration, which may be moved at any time before actual consideration commences and does not require a second. It is not in order after debate begins or after a subsidiary motion has been applied. When the question is properly raised the assembly may by a two-thirds adverse vote decline to take up any business it prefers not to consider.

Points of **Order** may be made while another has the floor, and when the question concerns the use of unparliamentary language the member so called to order must be seated pending disposition of the matter. The question must be raised at the time the proceeding giving rise to the objection occurs and will not be entertained after the assembly has passed to other business. If the point of order is overruled the member resumes the floor but if the objection is sustained he may proceed only by consent of the assembly. Debate on questions of order is for the information of the chair and may be closed by the presiding officer at any time. Any member may appeal from a decision by the chair and such appeal is debatable unless arising out of an undebatable question.

The motion to reconsider must be made by one who voted with the prevailing side but may be seconded by any member. It is only in order on the day or the next calendar day after the vote proposed to be reconsidered is taken. The motion is of the highest privilege and map be entered for record on the minutes nhile another has the floor, but cannot be called up for consideration until the pending question is disposed of, nhen it takes precedence of all new business. If applied to a debatable question it reopens the entire subject to debate. The motion may not be amended, committed or indefinitely postponed and requires a majority vote for passage. If agreed to, the motion reopens the entire question for further action as if there had been no final decision. The motion to take up out of order is merely another form of the motion to suspend the rules and requires a two-thirds vote for enactment. It is not amendable and debate is limited to the specific question presented.

A motion to divide the question is in order where the pending question includes propositions so distinct that, one being taken away, a substantive proposition will remain. Such motions are applicable to main questions and their amendments only and no subsidiary motion except the motion to amend is admitted. The rules of the U.S. house of representatives provide that any member may demand the division of a question as a matter of right, but under general parliamentary procedure the question must be submitted to the vote of the assembly.

Nominations do not require a second. Where the rules of an assembly fail to provide a method of nomination a motion for such provision is in order. The motion to close nominations is subject to none of the subsidiary motions save the motion to amend, and is decided by a two-thirds vote.

Privileged Motions relate to the needs and interests of the assembly and its members in matters of such urgent importance as to supersede temporarily pending business. They take precedence of all other motions and may be offered while other questions are pending. In this class of motions is the motion to fix the time to which to adjourn, to adjourn, to take a recess. raising questions of privilege and the call for the orders of the day, all of which are undebatable.

Other motions variously referred to as supplementary, miscellaneous and unclassified are the motions to take from the table, to. discharge a committee. to accept the report of a committee, to rescind, to repeal, to annul, to expunge and to permit a member to resume the floor after having been called to order for words spoken in debate.

Rules for Debate. — In order to debate a question, a member must rise and address the chair and be recognized by the presiding officer for that purpose. The presiding officer should first recognize the mover of a proposition or the member of a committee presenting a report and should endeavour to alternate recognitions between those favouring and those opposing a question. It is also customary, though not necessarily incumbent upon the chair, to permit the proponent of a proposition to close debate. A member may speak but once on the same question at the same stage of the proceedings if others desire recognition, but is entitled to speak on the main question and on each amendment as presented. Under general parliamentary procedure a member securing the floor may speak without limit and this practice still obtains in the U.S. senate, but the house of representatives by rule limits speakers to one hour in the house and to five minutes in the committee of the whole. Most assemblies and all legislative bodies provide a limit for debate and in conventions it is customary to adopt a rule at the opening session limiting debate to a specified number of minutes. In debate a member must confine himself to the question under consideration, must avoid personalities and must not arraign motives. Members should be silent and respectful while another has the floor and in questioning the speaker should first address the chair, who will in turn inquire if the speaker desires to yield. Where the presiding officer is a member of the assembly he has the right to debate and to participate in the proceedings but should call another to the chair before taking the floor and should not resume it again until the pending question has been decided.

Voting. — Voting may be by ballot; by division, that is a rising vote; viva voce, that is by acclamation, the presiding officer deciding by the volume of voices; by show of hands; by tellers. the members passing between tellers appointed from opposite sides to count them as they pass through; and by yeas and nays, the clerk calling the roll and recording each vote as given. If there is doubt as to the result of a viva voce vote any member may request a division and the presiding officer thereupon proceeds to take a rising vote. A member may change his vote at any time prior to announcement of the result. Only members in attendance may vote and voting by proxy is never permissible unless by operation of law.

A tie vote defeats an affirmative motion. The presiding officer if a member of the assembly votes to break a tie but not to make one.

Committees. — Much of the work of assemblies and especially of legislative bodies is transacted by committees. The committee system provides for a better division of labour and for a more detailed consideration than the assembly as a whole is ordinarily prepared to give. Committees are classified as standing committees with fixed terms of office and rendering continuous service; and special committees serving temporarily and assigned to limited service. In the absence of a rule making other provision, committees are selected by the assembly. Frequently the chair is authorized to appoint committees. Or selection may be made by ballot, by resolution or by designation in motions of reference. If no chairman is designated the member first named acts as chairman until the committee elects a chairman. As far as applicable the rules of the assembly govern its committees. The chairman of the committee submits its report to the assembly and unless it is of elementary character is required to present it in writing. Members who do not concur in the report may submit minority views over their signatures. When called up for consideration in the assembly such minority report is read in connection with the majority report unless there is objection. in which event the question of reading the minority views is submitted without debate to the vote of the assembly.

The committee of the whole consists of the entire assembly acting as a general committee. In legislative assemblies it affords greater freedom of consideration but in nonlegal bodies is rarely used.

Parliamentary Practice. — Use of motions to effect a purpose in the assembly or its committees when applicable may be summarized as follows: The body may protect itself against business which it does not wish to consider by invoking the motion to lay on the table, by raising the question of consideration or by voting to postpone indefinitely. If it is desired to suppress debate, the motion to limit debate and the demand for the previous question are available. Modification of a proposition may be secured through amendment or reference to a committee with or without instructions. Action may be deferred by postponement to a day certain, by providing a special order or by the motion to table. A question may be brought up a second time for consideration in the assembly by voting to take from the table, by reconsideration or by the motion to rescind, repeal or annul.

(C. CA.)

RULHIERE (or RULHIÈRES), **CLAUDE CARLOMAN DE** (1735–1791), French poet and historian, was born at Bondy, near Paris, on June 12, 1734. He served Marshal Richelieu in the Hanoverian campaign of 1757, and during his government at Bordeaux in 1758. At St. Petersburg (Leningrad) where he was sent as secretary of legation, he witnessed the revolution which seated Catherine II on the throne. In 1773 Rulhiitre became secretary to the future Louis XVIII; in 1787 he was admitted to the academy. He lived chiefly at Paris, where he held an appointment in the foreign office.

Rulhiitre died at Bondy on Jan. 30, 1791. He befriended J. J. Rousseau in his old age.

Rulhière's historical works include *Histoire de l'anarchie de Pologne* (4 vols., 1807), edit. P. C. F. Danon, and *Éclaircissements historiques sur les causes de la révocation de l'edit de Nantes* (2 vols, *1788).*

RULLUS, PUBLIUS SERVILIUS, a Roman tribune of the people in 64 B.C., well known as the proposer of one of the most far-reaching agrarian laws brought forward in Roman history. This law provided for the establishment of a commission of ten, empowered to purchase land in Italy for distribution amongst the poorer citizens and for the foundation of colonies. The commission was to be invested with praetorian powers. and Pompey, then in the East, was excluded by a provision that personal attendance was necessary to election. In fact, the commission as a whole was intended to act as a counterpoise to his power. There were provisions for the purchase of further land by the sale of recently conquered territory and the use of the revenues from Pompey's provinces. The places to which colonies were to be sent were not specified, so that the commissioners would be able to sell wherever they pleased, and it was left to them to decide what was public or private property. Cicero delivered four speeches against the bill, of which three are extant. It was not greeted with enthusiasm and was dropped before the voting. The whole affair was obviously a political move, probably engineered by Caesar, his object being to make the democratic leaders the rulers of the state. Although Caesar could hardly have expected the bill to pass, the aristocratic party would be saddled with the odium of rejecting a popular measure, and the people themselves would be more ready to welcome a proposal by Caesar himself, an expectation fulfilled by the passing of the *lex Julia* in 59, whereby Caesar at least partly succeeded where Rullus had failed.

See the orations of *Cicero* De *lege agraria,* with the introduction in

G. Long's edition, and the same author's *Decline of the Roman Republic,* iii, p. 241; Mommsen, *Hist. of Rome,* bk. v, ch. 5.

RUM or ROUM, an indefinite term in use among Muslims at different dates for Europeans generally and for the Byzantine empire in particular. At one time it was used for the Seljuk empire in Asia Minor and now for Greeks inhabiting Ottoman territory (Arab. *ar-Rūm*).

When the Arabs met the Byzantine Greeks, these latter called themselves Romaioi, or Romans; so the Arabs called the people "the Rūm" as a race-name (already in Qur. xxx, 1), their territory "the land of the Rūm," and the Mediterranean "the Sea of the Rūm."

Later, inasmuch as Muslim contact with the Byzantine Greeks was in Asia Minor, the term Rūm became fixed there geographically and remained even after the conquest by the Seljuk Turks, so that their territory was called the land of the Seljuks of Riim.

RUM is a spirit obtained by distillation of the fermented products of sugar cane. Although it is produced in most sugar-growing countries of the world (United States: Cuba, Australia and South Africa) for local consumption, the world demand for rum is mainly supplied by the West Indies, where it originated. Types of rum are legion, for they depend upon the quality of the ingredients, upon methods of fermentation and distillation and upon subsequent treatment and maturation.

The manufacture of rum was developed in the British West Indies in the 17th century, soon after the settlement of the islands. After Columbus had discovered Cuba in 1492 the Spaniards introduced sugar cane there, whence it spread to the other West Indian islands; the sugar industry has been paramount ever since. In Barbados, rum was certainly produced as early as 1647, 23 years after the island's settlement: and probably earlier. At first it was known as "kill-devill"; three years later it mas referred to as "rumbullion" and by 1667 it was called simply rum.

Rum is made out of either pure cane sugar or, more frequently, molasses. The main territories that produce rum for export are Barbados, Trinidad. Jamaica and British Guiana; Puerto Rico and Cuba also export considerable quantities to the United States. Most of the other West Indian islands produce rum in small quantities. Where the sugar industry is undeveloped, pure sugar cane juice is used rather than molasses. Rum can be made, however (as in the United States and Germany), from imported molasses.

Molasses, the commonest ingredient for fermentation. is the treacly residue left after sugar crystals have been crushed from sugar canes; sometimes skimmings from the purer cane juice are also added. Fermentation can be of either the Demerara or the Jamaican type. In the Demerara method either sugar cane or molasses is prepared into a liquid known as the "wash," and diluted to a low specific gravity (1.060); usually a little sulfuric acid is added to assist the saccharomyces, or alcohol yeasts. and sometimes also a small quantity of ammonium sulfate, as food for the yeast. The fermentation thus encouraged is completed in 48 hours. This method produces a high alcohol yield but a low ester content; thus the spirit is comparatively lacking in bouquet, although it is sometimes subsequently flavoured.

In the Jamaican method, the fermentation lasts for about 10 or 12 days with a wash of between 1.078 and 1.096 specific gravity. Apart from introducing into the wash some of the waste, known as dunder, from a previous distillation, no special encouragement is given to the alcohol yeasts; it is thus possible for esters to develop more easily and this is one of the origins of the distinctive flavour possessed by Jamaican rum. Certain special Jamaican rums have such a high ester content that they are used exclusively for blending.

The flavour of a rum also is affected by the distillation method. Two methods are available: the pot still and the continuous still. In the first: a single distillation is insufficient for it produces a spirit too weak for consumption; a second distillation is necessary to bring the spirit to the required strength. In the alternative method the spirit can be brought to any strength in one "burning"; it is thus far more economical. As the separation of alcohol from water can be very quick and almost complete in the continuous still, the spirit so produced has less flavour (and is less heavy) than that produced by the pot still. A third of the stills in British Guiana and all those in Jamaica are pot stills. while the remainder of the stills in British Guiana and all those in Barbados and Trinidad are continuous.

After the rum has been distilled it is colourless, but it will pick up colour from the casks in which it is stored (no rum less than three years old may be sold). It may be further coloured with caramel or burnt sugar to suit public taste.

In Cuba the distilled spirit is purified by passing through charcoal so as to obtain a flavourless alcohol, which is later flavoured independently; it has a characteristic taste, the rum flavour being weak. U.S. rum is mostly heavy-bodied; it develops an excellent aroma when aged. (C. C. H. F.)

RUMANIA or RŎMANIA, a nation of southeast Europe to the north of the Balkan peninsula. Its area within the boundaries established after World War I covered 113.889 sq.mi., with a population of 18,025,237 in 1930. In 1940 Rumania lost about a quarter of its territory. The present area of the country is 91,699 sq.mi. and the population (1960 est.) 18,403,414.

RUMANIA AFTER WORLD WAR II AND THE PEACE TREATY OF 1947

PHYSICAL FEATURES

Rumania is a land of great contrasts and contains within its boundaries examples of most of the physiographical regions characteristic of the European continent. Of the total area (1947 boundaries), mountains occupy 26%, hills 39% and plains 35%.

The Carpathians form the predominant feature of Rumania. They run in a great arc from the junction of the Hungarian and U.S.S.R. frontiers in the north. in the districts of Maramures and Bukovina, to the junction of the Yugoslav and Bulgarian frontiers in the south. Within the arc lie the related Bihorului mountains, forming the core of Transylvania and distinguishing it from the plains of Hungary. These great ranges of alpine-fold mountains, which run in a continuous zone from the Danube river at Bratislava in Czechoslovakia to the Danube at the gorge of the Iron Gate in Rumania, forrn a link betn-een the Alps proper and the Balkan ranges of Yugoslavia and Bulgaria.

In Rumania the mountains are characterized mainly by their penetrability. The rivers, which drain entirely toward the Danube, by cutting back into the numerous upland basins (*e.g.,* that of Brasov) provide routes linking the hills and plains on either side. Most of the summits are remarkably uniform in height, and the formation of what is almost a plain has resulted in gently rounded plateaus, forming the *plaiu* (way) or high alpine meadows above the deep forest-shrouded upper valleys. Sharp mountain peaks, such as those of the Fagaras mountains, are more the exception than the rule. One Danube tributary, the Olt, has, by cutting a narrow gorge: succeeded in crossing from the Transylvanian to the Walachian side of the Carpathians. Apart from the Olt, the other tributaries that drain southward to the Danube are the Jiu, the

Dambovita on which stands the capital Bucharest (Bucuresti) and the Ialomita. The eastern slopes of the Carpathians drain into the Siret (with its tributary, the Bistrita) and the Prut which join the Danube a little above its delta. The interior basins of Transylvania, together with the inner slopes of the Carpathians and the Bihorului mountains, are drained westward by a complicated network of headstreams which feed the Tisza (Tisa) and two of its major tributaries, the Somes and the Mures. One other river, the Timis, makes its way independently of the Tisza reaching the Danube at Belgrade.

Two crystalline massifs, composed mainly of granite and schist, form the northern and southern ends of the Carpathians in Rumania. They are, in the north, that of Bukovina-Maramures running northwest to southeast with summits usually reaching from 5,400 ft. to 6,400 ft. (Pietros is 7,568 ft.); in the south that of Banat-Transylvania, generally known as the Transylvanian Alps, running east-west and reaching over 7,400 ft. at many points. The highest peak in Rumania is Negoi (8,346 ft.) in the Fagaras mountains. Between these two terminal bastions, and linking them, is a somewhat lower north-south group, the Moldavian Carpathians, in which the so-called Flysch (folded and fractured sandstones, etc.) predominates. Along the inner edge of the ranges there are numerous examples of volcanic intrusions; *e.g.*, the rocks forming the Caliman mountains in Maramures. The Bihorului mountains (about 6,000 ft.) are composed of both crystalline and volcanic rocks and show the rounded characteristic of the Rumanian ranges.

Within the arc of the Carpathians and abutting against the hard core of the Bihorului mountains lie the Tertiary rocks of the Transylvanian basin, a much-folded upland basin of sandstones and clays eroded into a country of hilly relief by the mountain-fed streams, the soft banks of which are much given to landslides. The outer edge of the mountain belt is ringed by the sub-Carpathian foothill zone bordering Moldavia and Walachia. The latter is subdivided into two smaller divisions by the Olt river, Oltenia to the west, Mutenia to the east. The foothills, composed of folded sedimentary rocks which provide the famous oil-bearing strata, afford one of the most verdant regions of the whole country.

The general accessibility of the Carpathians, which are crossed by numerous passes provided usually by low cols between the gently rounded mountain summits and often approached by upland basins, provides a contrast to the alpine-fold mountains elsewhere. In Rumania the mountains are not only crossed at many points, but actually form a well-populated region; with Transylvania they formed the cradle and refuge of the Rumanian nation above the tides of conquest that swept back and forth along the Danube plains and across the plains of northern Europe.

The most important passes—those followed by railway lines—are: (1) the Caransebes corridor leading from Timisoara to Orsova at the Iron Gate by way of the Porta Orientalis; this is an alternative to the Orient Express route; (2) the Olt gorge and the Red Tower (Turnu Rosu) pass leading from Oltenia to Transylvania; (3) the Predeal pass (3,445 ft.) linking Brasov with Ploesti and Bucharest, joining Muntenia (Greater Walachia) and Transylvania—the Orient Express route; (4) the Ghimes pass linking lower Moldavia and Transylvania and (5) the Bargau pass (3,940 ft.) linking Jassy (Iasi) in northern Moldavia and Chernovtsky (Cernauti), U.S.S.R. (a Rumanian city until 1940), with northern Transylvania.

The lowlands of Walachia and Moldavia consist in reality of plateaus of various elevations composed of horizontal or slightly tilted sedimentary strata of the Tertiary period, overlaid by a covering of recent deposits. These recent deposits, particularly in Moldavia, consist largely of the wind-borne loess, from which the rich black earth, or chemozem, soils are derived. The plateaus are crossed by the rivers descending from the Carpathian mountains. These streams are often deeply entrenched into the general level and are usually dry in the late summer when acute droughts are common. The Danube itself flows in a broad flood plain known as the Balta, characterized by numerous swamps and abandoned arms of the river, between bluffs marking the edge of the plateaus and the edge of the sub-Balkan platform of Bulgaria.

The Dobruja (Dobrogea), a unique region forming part of the sub-Balkan platform, consists of a core of folded crystalline rocks which are exposed in the northern hills (up to 1,300 ft.), but mainly concealed by a layer of chalk and recent deposits of loess. Dry valleys resembling the wadies of northern Africa dissect this hill region, which by its northward projection accounts for the diversion of the Danube in its lower course.

Climate.—Because Rumania is one of the more southerly European countries—the 45° N. parallel dissects the Danube delta—it is to be expected that it would experience high temperatures and much sunshine in summer. Atlantic influences, however, are remote (Bucharest is 26° E.). A great diurnal and seasonal range of temperature and a continental distribution of precipitation (with a marked early summer maximum) are characteristic of the whole country. The marked variations of relief have a great effect on climate; the plains of Moldavia and Walachia are essentially steppelike with less than 20 in. of rainfall a year, cold winters and hot summers, while the Carpathian foothills have enough rainfall to support verdant forests and enjoy slightly more temperate conditions. The Carpathian zone receives a much greater precipitation than the other highland districts of the country, and is much cooler. It has some of the heaviest snowfalls of Europe. Transylvania, although higher and mountain-fringed like the Hungarian basin, has a noticeably harsher climate than the other hill regions, and is not so suited to the ripening of maize and the warmer fruits.

The year is divided into three seasons—winter, summer and autumn. The winters are long, often with much snow, and unpleasant when the northeast wind (the *crivat*) brings severe conditions from the Russian steppes. Summer can be of tropical intensity; a feature of this season is the southwest wind (the *austru*) which sometimes brings oppressive weather. Late summer is occasionally accompanied, especially in the Moldavian and Walachian plains, by severe drought; if this is combined with excessively low winter temperatures it produces famine conditions like those that arose in 1947. Autumn is the most temperate and enjoyable season of the year.

Data for Bucharest taken from a representative year illustrate these general conditions: with a mean annual range of temperature between 26.6° F. (January) and 71.6° F. (July), Bucharest recorded absolute extremes of −11.2° F. and 102.2° F. There were 78 days with frost and an equal number with tropical heat; one-third of the days were cloudless, one-third partly overcast and one-third sunless.

Fauna.—In its fauna, Walachia has far more affinity to the lands lying south of the Danube than to Transylvania, although several species of *Claudilia*, once regarded as exclusively Transylvanian, are found south of the Carpathians. Moldavia and the Baragan steppe resemble the Russian prairies in their variety of molluscs and the lower kinds of mammals. More than 40 species of fresh-water mussels (Unionidae) have been observed in the Rumanian rivers. The lakes of the Dobruja likewise abound in molluscs—parent forms, in many cases, of species which reappear greatly modified, in the Black sea. Insect life is somewhat less remarkable; but besides a distinctive genus of Orthoptera (*Jaquetia* hospodar), there are several kinds of weevils (Curculionidae) said to be peculiar to Rumania. Birds are numerous, including four varieties of crows, five of warblers, seven of woodpeckers, eight of buntings, four of falcons and five of eagles, while among the hosts of waterfowl which inhabit the marshes of the Danube are nine varieties of ducks and four of rails. Roe deer, foxes and wolves find shelter in the forests, where bears are not uncommon. Chamois frequent the loftiest and most inaccessible peaks.

(G. W. S.)

HISTORY

The early history of the lands which constitute modern Rumania, down to the end of the period of Roman domination, is traced in the article DACIA. Roman rule in Dacia lasted for 163 years. The legions were finally withdrawn south of the Danube in 271 A.D. by the emperor Aurelian. From the 3rd to the 12th century wave after wave of barbarian invaders from the east passed over the undefended country—first came the Goths and

Gepidae, then Slavs, followed by the Avars (*q.v.*), and in the second half of the 7th century by the Bulgars. The Bulgarian domination. lasting for two centuries, allowed a rudimentary civic life to take shape, and it was the Bulgars who, after the conversion of their tsar Boris in 864, brought Christianity in its eastern form to the ancestors of the Rumanians, building on earlier Latin foundations (see *Religion* below.) At the end of the 9th century the Bulgars were overcome by the Magyars; later came a brief incursion by the now almost vanished Petchenegs and Cumans (*qq.v.*).

One school of historians maintains that the Daco-Roman population north of the Danube was obliterated during these invasions and that the Rumanians of today are descended from Vlach tribes south of the river who pushed northward in the early 13th century. The Rumanian view, supported by linguistic and other evidence is that the Roman withdrawal affected only the military and official classes, while the body of the Daco-Roman inhabitants were driven by the invaders into the Carpathians, becoming the Vlachs of Transylvania. The Macedo-Romans south of the Danube, later knonn as Kutso-Vlachs, similarly sought shelter in the Pindus mountains. The controversy is considered in the article VLACHS.

Transylvania, regarded by Rumanians as the cradle of their nation. was conquered in the 11th century by King Stephen of Hungary, but all records of its early inhabitants were destroyed in the Mongol invasion of that country in 1241. The authentic history of the Vlachs does not begin until the end of the 13th century, when they are found establishing themselves south of the Carpathians in two distinct groups, one settling in the area later known as Walachia (called Muntenia by the chroniclers) and the other to the east in Moldavia. The incoming Vlachs fused with a population that already contained a Vlach element, but consisted mainly of Slavs and Tatars with an admixture of Petchenegs and Cumans.

The two regions thus colonized became the principalities of Walachia and Moldavia, whose annals remain distinct until 1774, but can thereafter be combined in one narrative. the Turkish administration being uniform. In 1859 the two principalities were formally united under the name of Rumania. The historical narrative which follows is therefore arranged under four headings, *Walachia, Moldavia, The Danubian Principalities* and *Rumania.*

WALACHIA

Tradition, embodied in a local chronicle of the 16th century entitled "History of the Ruman land since the arrival of the Rumans" (*Istoria tierei Românesci decându au descălicati Românii*) gives 1290 as the date of the founding of the Walachian state, asserting that in that year a voivode (prince) of Fagaras in southern Transylvania crossed the mountains with a body of followers and established himself at Campulung in the foothills, moving later to Curtea de Arges. The name given for this first leader. Radu Negru (Ralph the Black), is probably a confusion with that of a later Walachian voivode, but the southward movement at that period of Vlach peoples from the mountains to the Danubian plain can be affirmed with certainty. Walachia itself was known to its own people as Muntenia, land of the mountains, after their former home. Historians who deny the continuity of Daco-Roman (Vlach) settlement in Transylvania have to postulate a northnard migration of Vlachs from across the Danube to the Carpathians at the beginning of the 13th century to account for the indisputable southward movement at its close. The seeking of a new home in the south was due to the consolidation of Hungarian feudal power in Transylvania and of the feudal system, to the arrival of German settlers and to the growing proselytizing zeal of the Hungarian kings as faithful servants of the papacy. The Vlachs, since the introduction of organized Christianity under Bulgarian influence, had belonged to the Eastern Orthodox Church, taking the Byzantine side against Rome in the schism of 1054, though later some of their leaders came under Roman influence. (*See* also *Religion* below.)

The new principality remained at first under the domination of Hungary, but the voivode Bassarab defeated the Hungarian king Charles Robert in 1330 and secured independence. Vladislav (*c.* 1360–74), although again defeating the Hungarians. accepted a form of Hungarian suzerainty in return for investiture by Louis the Great, Charles Robert's successor, with the banat (frontier province) of Severin and the duchy of Omlas.

The early days of the principality were conditioned by the struggle against Hungary, but with the reign of Mircea the Old (1386–1418) a new period began, that of the struggle against the Turks. The first voivodes of Walachia, in search of help against Hungary, had contracted matrimonial and military alliances with the two Slav states south of the Danube, Bulgaria and Serbia, but both empires were already at the point of extinction at the hands of the Turks. Tradition recounts that a Walachian contingent helped the Serbs at the battle of Kosovo in 1389; it is a fact that the sultan followed up his victory by invading Walachia, which first appears in 1391 as a tributary of the Sublime Porte. The final overthrow of Bulgaria in 1393 left Walachia open to further Turkish advance but Mircea succeeded in holding the invaders back on the Danube marshes in 1394, and in the following year made an alliance with Hungary. The joint Christian forces, which included French and Burgundian contingents. were defeated in 1396 at the battle of Nicopolis (Nikopoli). Mircea had thrown over an earlier alliance with Poland in order to secure one with Hungary; accordingly the Poles, taking advantage of the defeat at Nicopolis, intrigued for his deposition and replaced him by his son Vlad, who accepted Polish suzerainty. Mircea later returned, re-established, and for a time increased, his power by exploiting the quarrels between the sons of the sultan Bayazid. In 1417, however, Walachia was forced to capitulate to Turkey under Sultan Mohammed II, though its dynasty, territory and Christian religion were left intact. Mircea died a year later.

Early Years of Turkish Rule.—After Mircea's death, Walachia, convulsed by internal struggles, could take no active part against the Turks, but they were for a time again driven back by the Hungarians under the brilliant John Hunyadi (*q.v.*), a Rumanian by race though enrolled in the Hungarian nobility. He deposed one of the weak Walachian voivodes and nominated Vlad IT.'—who in 1456 acknowledged Hungary as suzerain—a man whose unbelievable cruelties earned him the name of "the Impaler" (Tepes). Vlad (1455–62 and 1476–77) was able briefly to defy the Turks; with his death, resistance crumbled rapidly, Walachian voivodes succeeding one another after very short reigns.

The instability of the throne was in part due to the mixture of the hereditary and elective principles in the system of succession; the council of boyars (nobles), which came under Turkish rule to be known as the divan by analogy with the Turkish institution of that name, chose the prince from legitimate and illegitimate heirs of his dead predecessor.

The only voivode of the 16th century deserving mention is Neagu Bassarab (1512–1521), who founded cathedrals at Curtea de Arges (*q.v.*) and at Targoviste, which had become the Walachian capital. and endowed monasteries in Walachia, besides making noble contributions to Mount Athos. The patriarch of Constantinople honoured the dedication of the Arges monastery with his presence.

Neagu's son and successor was imprisoned by the Turks who proceeded to nominate Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately. They elected Radu, a kinsman of Neagu, as voivode and defeated the Turkish commander Mahmud Bey with Hungarian help at Grumatz in 1522. The continuance and extension of Turkish control became inevitable, however, after the crushing defeat of Hungary in 1526 at the battle of Mohacs.

Walachia thereafter became a line of communication for Turkish expeditions against Hungary and Transylvania. The voivode Alexander, who succeeded in 1591, actually farmed out his possessions to his Turkish supporters, and it seemed that Walachia must succumb to direct Ottoman rule.

Michael **the Brave, 1593–1601.**—The Turkish advance was once more to be halted. though for the last time, under a new voivode, Michael, son of Petrusko, ban of Craiova. He secured the deposition of Alexander and his own election by raising a loan at Constantinople of 400,000 ducats to make the customary presents to the Porte and was supported by Sigismund Bathory (*q.v.*), prince of Transylvania, and by the English ambassador at Con-

stantinople, Edward Barton. Michael was to prove a thorn in the flesh to the Turks, but was much criticized for making Walachia once more subject to Hungarian princes in return for their help. In concert with the Moldavian voivode Aaron, Michael organized a massacre of Turkish guards and settlers (Nov. 1594) and with the support given by Bathory in return for the acknowledgment of his suzerainty proceeded to invade Turkish territory, taking Ruschuk, Silistra and other places on the right bank of the Danube. A simultaneous invasion of Walachia by a large Turkish and Tatar host mas defeated at the battle of Mantin (1595). The sultan next sent Sinan Pasha the Renegade to invade Walachia with 100,000 men. Michael withdrew to the mountains, but with aid from Bathory and a Transylvanian contingent resumed the offensive and stormed Bucharest, pursuing the main body of Sinan's forces to the Danube. In 1597 the sultan, wearied with these defeats. reinvested Michael for life.

Walachia's subjection to Hungary was not permanent. On the abdication of Sigismund Bathory, Michael, with the support of the emperor Rudolf II, attacked and defeated his successor Andreas Bathory in Oct. 1599 and had himself proclaimed prince of Transylvania, being acknowledged by the emperor as his lieutenant and having his position ratified by the diet. The Vlach peasant population of Transylvania was encouraged to revolt against the Magyars by having an overlord of their own race, but Michael, whose support in Walachia rested on the boyars, helped the Magyar nobility to suppress the peasant rising. Despite this the Magyars distrusted Michael, both as a despised Vlach and as a Habsburg agent, and he found his position in Transylvania insecure while Moldavia remained as a centre for Magyar and Polish intrigue. In May 1600 he invaded that principality, deposed the voivode and without waiting for the emperor's sanction had himself proclaimed "prince of all Ungro-Vlachia, of Transylvania and of Moldavia."

Though Rudolf confirmed Michael in his appointment he grew suspicious of his vassal's progress and determined to undermine his position. The imperial commissioner, Gen. George Basta, was instructed to give support to the disaffected Magyar element in Transylvania, and Michael was driven out by a successful revolt. At the same time the Poles invaded Moldavia, and restored the unseated voivode, while Walachia itself was also attacked. Michael appealed to the emperor, who restored him to favour, and in conjunction with Basta he defeated the Transylvanian forces at Goroslau in 1601. Basta, however, jealous of Michael's returning prosperity, procured his murder almost immediately after their joint victory.

Michael the Brave (Mihai Viteazul) is the leading Rumanian national hero, partly because it was he who made the last stand before the era of Turkish and Greek domination, but chiefly because for the first time since Dacian days he brought all the Rumanians, scattered in three principalities, under one rule, thus weaving the stuff of the national dream which was not to become reality until 1918.

The Period of Greek Penetration, 1634–1711.—After Michael's death Radu Serban of the Bassarab dynasty was appointed voivode of Walachia by the emperor's wish, but was deposed by the Turks in 1611. A succession of insignificant puppet princes followed him, the Greek element becoming increasingly apparent. There was a temporary rally in the second quarter of the 17th century under Matthias Bassarab, who succeeded in holding the throne for 22 years—warding off repeated attacks from his rival Basil the Wolf of Moldavia—and did much for the arts and the endowment of churches. He founded a printing press at the Govora monastery which issued a compendium of canon law, *Pravila sea mica,* the first Rumanian book to be printed in the principalities (Gospels in Rumanian had been printed in the preceding century by the Protestants in Transylvania).

The successor of Matthias, Constantine Serban, was the last Bassarab to rule in Walachia. On his death the Turks, who in 1698 moved the capital to Bucharest—at a safer distance from the Transylvanian frontier—began to exercise a more direct influence over the ruling families. who were now frequently of Greek origin. Serban Cantacuzino (1678–88), the first important Greek voivode, was an able man; forced to assist the Turks at the siege of Vienna, he opened up secret communications with the emperor, who granted him a diploma creating him a count of the empire and recognizing his descent from the imperial house of Cantacuzino. In 1688, the year of Serban's death, the first Rumanian Bible was printed.

Serban's successor was his nephew Constantine Brancovan (Brancoveanu), descended on his mother's side from the Bassarabs, who pursued a policy of cautious balancing between the Porte, the emperor, Poland and the rapidly westward-thrusting Russia. Brancovan sent congratulations to Peter the Great on his victory at Poltava and asked for help for the Christian cause. Finally falling a victim to intrigues, Brancovan was deposed and executed at Constantinople in 1714.

The Phanariot Regime, 1714–1821.—At the beginning of the 18th century Turkish power was in obvious decline and the strength of Austria and Russia growing. Alarmed by the intrigues of Brancovan of Walachia and Cantemir of Moldavia with Vienna and Moscow, the Porte decided to exercise direct control over the principalities. Instead of reducing them to mere pashaliks, however, the Turks employed Greeks from the Phanar district of Constantinople as their agents. The new princes, or hospodars, insecure of tenure, had to extract the maximum from the country in the minimum of time—the average duration of a reign was only two and a half years—and thus the word Phanariot has come to stand for bribery, exaction and corruption, though the hospodars themselves were often men of culture and intelligence.

Under this oppressive regime many peasants emigrated; in 1741 there were 147,000 peasant families in Walachia, but four years later their number was reduced by half. In the face of this, the enlightened hospodar Constantine Mavrocordato decreed the abolition of serfdom in 1747, but after numerous rises and falls from favour he was finally imprisoned in 1763 after efforts at reform had proved abortive.

The tide of Ottoman domination was now ebbing fast under Russian pressure; after defeating the Turks at Hotin in 1769, Russian troops occupied both principalities, the bishops and clergy taking an oath to the empress Catherine. At Focsani in 1772 Catherine demanded that the Porte recognize the independence of Walachia and Moldavia under Russian guarantee, but she was deterred by Austrian opposition, and temporarily satiated by the partition of Poland.

MOLDAVIA

Moldavia took shape in circumstances similar to those of its sister state but somewhat later: according to chronicles, more plentiful than those dealing with Walachia, Dragos, founder of the principality, emigrated southward with his followers from Maramures in the northern Carpathians (the dates given vary from 1299 to 1342). An independent state first emerged about 1349 under Bogdan. One of the early voivodes, Peter Musat (1375–90) was a member of the Bassarab family of Walachia and. in pursuance of the interests of his kinsman, Mircea the Old, recognized the suzerainty of the king of Poland whose sister he married. From this period date Poland's ambitions to control the new state, which had hardly emancipated itself from Hungarian tutelage. The first important voivode, Alexander the Good (1401–35), acknowledged Polish overlordship and laid the foundations of organized life in the principality. Civil war reigned among Alexander's successors, but a new era in Moldavian history opened with the reign of his grandson Stephen the Great (1457–1504), who was to prove one of the greatest champions of Christendom against the Turks. Patriotic and religious. Stephen was doubly affected by the fall of Constantinople four years before his accession; the cutting of the trade route through the Bosphorus was disastrous for the commerce of the principalities and the desecration of St. Sophia was a blow to Christian feeling. Stephen's whole reign was devoted to the attempt to rally the west against the infidel; he appealed for help to Poland. Hungary and Venice as well as to the pope Sixtus IV, who gave him the title "athlete of Christ."

Stephen inflicted a crushing defeat on the Turks at Rahova in 1475, and again repelled them the following year. Poland and Hungary, however, never gave him the solid support for which he

had hoped; in 1484 the Turks captured his key fortresses of Chilia and Akkerman (later Belgorod-Dnestrovski), and the following year burned the Moldavian capital Suceava. Once again Stephen rallied and defeated the Turks in 1486 at Scheia near Roman. As early as 1484, after the loss of his fortresses, he had been compelled to do public homage to King Casimir IV of Poland, but in 1499 he was able to draw up a treaty on equal terms. Poland, however, once again failed to honour its pledge to give help. On his deathbed Stephen, realizing the hopelessness of securing united action from Christendom; advised his son to submit to the Turks if they would respect the framework of church and state.

Stephen encouraged the arts, gave generous grants of monastic lands and built more than 40 stone churches. and the great monastery of Putna. Stephen's son Bogdan III, the "one-eyed" (1504–17), at feud with Poland over Pokutia, which his father had annexed, and lacking support from the already shaken Hungary, was forced in 1513 to pay annual tribute to the sultan while securing guarantees for the Christian religion and Moldavian institutions. In the anarchy following on the battle of Mohacs a strange figure ascended the Moldavian throne. Peter Rares (1527–38 and 1541–46), an illegitimate son of Stephen. Allying himself with the Turks. he made war on the imperial forces in Transylvania and on Poland, attempting to recover the lost Pokutia. Later he allied himself with the emperor against Poland and the sultan, but was defeated and deposed in 1538. In 1541 he returned to the throne with Turkish help, but concluded a secret treaty with the emperor against the Turks. His successors could no longer oppose Turkish power.

Turkish Penetration — Peter's son actually accepted Islam; the sultan strengthened his hold on Moldavia by occupying a series of fortresses and increased the tribute. From the middle of the 16th century each aspirant to the illoldavian throne had to buy the consent of the Porte. and the may was thus open to adventurers. The most dramatic was Jacob Basiliscus Heraclides who seized Moldavia from the voivode Alexander Lapusneanu with Turkish support. A Greek by birth, he had travelled over Europe and had become the friend of Philipp Melanchthon; he attempted to found an educational system in Moldavia, but his heavy taxation led to revolt and he was assassinated in 1563. Under the restored Lapusneanu and under Bogdan IV (1568–72), Moldavia relapsed into obscurity. Bogdan's successor John the Terrible (1572–74), provoked by the Porte's demand for increased tribute, rose against the oppressor, but was defeated and slain in 1574. Moldavia did not rally until the victories of Michaei the Brave at the turn of the century when it was actually inccrpcrated for a year in Michael's Great Dacian realm. After Michael's murder, the Poles again asserted supremacy, but the Porte resumed its domination in 1618. No voivode of any importance occupied the throne untii Basil the Wolf (1634–53), a brave soldier of Albanian origin. He might have achieved success against the Turks. bdt chose instead to attack his neighbour Walachia. coveting its throne. He married one of his daughters to Timothy. son of the celebrated Ukrainian hetman (general) Bogdan Chmielnicki and raided Walachia with the help of his son-in-law, but mas routed by the veteran Matthias Bassarab. He was overthrown by a conspiracy of Moldavian boyars, and after his death Greek influence became paramount. One of the Greek hospodars. Demetrius Cantemir, attempted to exchange Turkish for Russian sovereignty, and proving unsuccessful went into exile in St. Petersburg. He was a scholar whose *Descriptio Moldaviae* is a valuable historical source.

The Phanariot regime in Moldavia is generally reckoned from the reign of Nicholas Mavrocordato. Cantemir's successor; it was similar to that in Walachia, and indeed the hospodars were frequently shifted by the Turks from one throne to the other. Moldavia was perhaps more prosperous than Walachia at this period and had a considerable export trade in timber, salt, wine and foodstuffs.

THE DANUBIAN PRINCIPALITIES

The treaty of Kuchuk Kainarji which ended the Russo-Turkish war in 1774 altered the situation in both Walachia and Moldavia. Russia restored the principalities which it had occupied, to the sultan (Moldavia. however, Iost its northern tip, Bukovina, which Austria. profiting by the situation, annexed) on conditions which included provisions favourable to the territories themselves. The tribute was to be reduced. and the agents of Walachia and Moldavia at the Porte were to have diplomatic status; Russia was accorded a virtual protectorate. In view of Turkish attempts to evade fulfilment of the treaty. Russia secured a more precise definition of its rights in the convention of Ainali-Kavak (1779) and strengthened its position in 1782 by appointing a consul in Bucharest. Austria countered by dispatching an "agent" Ignaz Rajcevic, whose *Osservazioni storiche intorno la Valachia* (1788) is one of the best sources for the period. In the Russo-Turkish fighting which broke out again in 1787 the principalities once more provided battlefields, and Prince Potemkin made his headquarters at Jassy (Iasi). In 1791, when peace was imminent, a group of Walachian boyars, fearing the effects of renewed Ottoman rule, addressed an appeal to Austria and Russia which, though it achieved no results, is of interest as an early sign of the awakening of national feeling. The boyars asked for the ending of Phanariot rule, the return of native princes and the creation of a national army. By the peace of Jassy (1792) Russia had to evacuate the principalities, the Dniester (Dnestr) being recognized as its frontier, and the privileges of the principalities accorded in earlier treaties were confirmed. In defiance of treaties the Porte continued to change the hospodars almost yearly, until in 1802 the Russians obtained a fresh convention under which every prince was to hold office for at least seven years and could not be dispossessed without Russian consent.

The two new hospodars were strongly under Russian influence. Constantine Ypsilanti of Walachia, encouraged by the convention, refused some Turkish requisitions, acted as intermediary between the Serbs and Russia in the Serb revolt of 1804 and tried to embroil the French and the Porte. Napoleon's envoy at Bucharest denounced both hospodars as traitors and influenced the Porte's decision to dethrone them in 1806 without consulting Russia. Russia occupied the principalities and the Turks declared war in Dec. 1806; Moldavia and Walachia had become pauns in the intrigues betneen the tsar, the Porte and Napoleon. The Russian occupation. which lasted six years, reduced the country to a desert; produce was carried off, the coinage debased and labour requisitioning was enforced by the deportation of recalcitrants to Siberia. The Christian populations exchanged hope and confidence in a liberator for a profound suspicion and fear of Russia which remained rooted in Rumanian minds.

Russia's design to incorporate the principalities in its empire was frustrated by the peace of Bucharest (1812), but it secured the cession of southeastern Moldavia, known as Bessarabia (q *v.*). The two hospodars who were appointed after the peace in 1812, Ion Caragea in Walachia and Scarlat Callimachi in Moldavia were masters of extortion. The former increased the taxation eightfold, partly by creating 4,000 new boyars. Both were strongly Greek in feeling. and were supported by some of the boyars, who. disappointed in Russia, dreamed of a new Graeco-Rumanian Byzantium. Caragea was in secret relations with the Greek revolutionary movement, Philike Hetairia, which was being fostered at Odessa under Russian auspices. The way was thus prepared for the adventure of Alexander Ypsilanti, son of the Walachian hospodar Constantine and *azde-de-camp* of the tsar, who marched into Moldavia at the head of the Hetairists in 1821. He received the support of the Moldavian hospodar Michael Sutu (Sutzu), but the boyars were hostile in Moldavia and still more so in Walachia where a national popular movement led by Tudor Vladimirescu (q *v*) turned not against the Turks but against the Phanariots. Turkish troops which invaded to crush Ypsilanti were not finally withdrawn until 1824 The Turks, anxious to divide the Rumanians from the Greeks, thought it wise to heed the former's demands and the Rumanians took advantage of this to secure a number of reforms in the national interest. The retorms included the promulgation of laws in Rumanian and the appointment of native princes, the first of whom were Ion Sturdza in Moldavia and Gregory Ghica in Walachia. Ghica's family, though of Albanian extraction and settled at the Phanar, was entirely rumanized.

Both princes were anti-Greek and unacceptable to the Russians; Sturdza was accused of subversive tendencies because he cherished plans for constitutional reform, including an elected assembly.

Kiselev and the "Règlement Organique". — Russia and Turkey resumed relations in 1825 and by the convention of Akkerman signed by them in 1826 the privileges of the principalities were once more confirmed, and Russia was again allowed a voice in elections to the two thrones. On the outbreak of hostilities between Russia and Turkey again in 1828, Russia once more occupied Walachia and Moldavia. The peace of Adrianople in 1829 left them still tributary to the sultan, but wholly under Russian protection. The two hospodars were thenceforth elected for life.

Russia secured a continuation of its occupation by making evacuation conditional on the payment of an impossibly high indemnity by Turkey. The occupation, which. had again been exceedingly onerous during the war, became more enlightened after the signing of the treaty. a change which was largely due to the Russian administrator, Count Pavel Kiselev. The boyars, under Kiselev's supervision, drew up a constitution known as the *Règlement organique,* promulgated in Walachia in 1831 and in Moldavia in 1832. It was wholly oligarchic in character, but was an advance in that legislative and administrative powers were vested in a native elected body. The economic provisions of the *Règlement,* however, deepened the cleavage between the boyars and the peasant class and were censured by Kiselev. The *Règlement* was ratified by the Porte in 1834, whereupon Russia withdrew its troops.

The National Movement and 1848.—The new hospodars, Alexander Ghica (1834–42) in Walachia and Michael Sturdza in Moldavia, a-ere, however, strongly under Russian influence. Ghica's successor George Bibescu (1842–48) had been educated in Paris and was influenced by the new spirit of romantic nationalism. In agreement with Sturdza he removed the fiscal barriers between the principalities. Meanwhile a new generation of Rumanians was growing up, educated in Paris or looking to France for inspiration; these came rapidly to the front in the great crisis of 1848 which in the principalities took a form partly national and partly social. The national movements in Moldavia and Walachia were spurred on by the dramatic upsurge among the downtrodden Rumanian peasants of Transylvania, which culminated in the "field of liberty" demonstrations at Blaj in May 1848. Sturdza in Moldavia proved able to quell popular agitation; Bibescu, although he had some sympathy with the movement, lacked courage to lead it and fled, leaving in power a provisional government largely controlled by Ion C. Bratianu (*q.v.*), first head of the great Liberal family which for so long dominated Rumanian politics. The Turks, under Russian pressure, were forced to put down the new movement; joint Russo-Turkish military intervention restored the *Règlement organique.* The Balta-Liman convention of 1849 laid down that the hospodars should again be appointed for seven years only; the assemblies.were replaced by so-called *divans ad hoc.* Gregory Alexander Ghica was appointed hospodar in Moldavia, and Barbu Stirbey, brother of George Bibescu, in Walachia.

Crimean War and Treaty of Paris. — Russian troops did not evacuate the principalities until 1851, and during the Crimean War they were occupied in turn by Russia and Austria. Although they suffered severely, the Austrian occupation brought material benefits and opportunities of contact with the west. The treaty of Paris (1856) placed the principalities with their existing privileges under the collective guarantee of the contracting powers, thus ending the Russian protectorate, though retaining the suzerainty of the Porte. The Russian frontier was withdrawn from the mouths of the Danube by the return of a strip of southern Bessarabia to Moldavia. The existing statutes were revised in 1857 by a European commission with a Turkish member meeting at Bucharest, assisted by two *divans ad hoc* called together by the Porte.

Union of the Principalities. — The divans voted unanimously for autonomy, union of the principalities under the name of Rumania, a foreign hereditary prince and neutrality. The divans were dissolved by the Porte in Jan. 1858 and in August the convention of Paris accepted their decisions with modifications. There were still to be two princes and two assemblies, but a central commission at Focsani was to prepare measures of joint concern. The two assemblies, meeting at Jassy and Bucharest respectively, then elected a single prince in the person of Alexander Cuza (*q.v.*) on Jan. 17, 1859. The de *facto* union of Rumania was thus accomplished.

RUMANIA

A new conference met in Paris to discuss the situation and in 1861 the election of Prince Cuza was ratified by the powers and the Porte. In Feb. 1862 a single ministry and a single assembly replaced the divans and central commission. Cuza, in May 1864, promulgated by plebiscite a new constitution providing for a senate as well as an assembly and extending the franchise to all citizens, with the reservation of a cumulative voting power for property. An important agrarian law of the same year emancipated the peasantry from forced labour. Prince Cuza's agrarian and educational reforms were progressive, but his methods of enforcement were despotic. He alienated the boyars by abolishing forced labour, and the clergy by confiscating monastic estates (see *Religion* below), while the agrarian reform was not radical enough to satisfy the peasantry.

In Feb. 1866 Cuza was compelled to abdicate and the principalities by referendum elected as prince, almost unanimously, Charles (*see* CAROL I), second son of Prince Charles Anthony of Hohenzollern-Sigmaringen, the candidate of Ion Bratianu, who had secured the veiled support of Napoleon III. The new prince reached Bucharest on May 22, 1866, and in July took the oath to a new constitution modelled on the Belgian charter of 1831, which provided for upper and lower houses and gave the prince an unconditional veto on all legislation. Turkish assent was secured in October; Prince Charles was recognized as hereditary ruler and was allowed to maintain an army of 30,000 men.

Internal Politics, 1866–75.—Prince Charles's policy was to avoid all political adventures and to give Rumania a sound administration. The internal situation was at first unsettled; ten governments held office in five years. The dominant figure was the Liberal leader Ion Bratianu.

In 1869 Prince Charles paid a series of state visits to consolidate his position, and married Princess Elizabeth of Neuwied, the poetess later known as Carmen Sylva, who earned great popularity in her adopted country. Prince Charles was a Roman Catholic and his wife a Protestant. but he agreed to bring up his successor in the Eastern Orthodox faith.

Tension arose between the German prince and his pro-French politicians on the outbreak of the Franco-German War in 1870 and there was an abortive attempt to overthrow him in a revolutionary outbreak at Ploesti. Anti-German feelings were increased by a scandal in the new Rumanian railways; the German contractor failed to honour the coupons of the bonds, mainly held by influential Germans. and the Prussian government attempted to coerce the Rumanian government into payment. Indignation in Rumania culminated in a mob attack on the German colony in Bucharest in March 1871, and Prince Charles contemplated abdication. 4 Conservative government formed under Lascar Catargiu succeeded in restoring order, however. and retained office for five years. After another crisis threatening Prince Charles, the Liberals again took office in 1876 and Bratianu became premier; he enjoyed almost absolute power for the next 12 years.

The Russo-Turkish War, 1877–78, and the Treaty of Berlin. — Domestic problems were temporarily eclipsed by the reopening of the Eastern Question in 1877. Russia rejected Rumania's offer of co-operation on equal terms against Turkey and threatened occupation. On April 16, 1877, Rumania signed a secret convention allowing free passage to the Russian armies, while the tsar promised to respect Rumanian territory. The Russians crossed the Rumanian frontier in April, and on May 11 Rumania declared war on Turkey. Rumanian troops contributed materially to the joint victory at Plevna in September, which left the Russian army free to march on Constantinople. Nonetheless Russia refused to admit Rumanian representatives to the peace negotiations at Adrianople rind later at San Stefano. The Russians insisted on the handing back of southern Bessarabia which had been restored

to Moldavia after the Crimean War, and despite bitter Rumanian protests this provision was incorporated in the treaty of Berlin; Rumania received an alternative outlet to the mouths of the Danube in northern Dobruja, a territory with little or no Rumanian population, the possession of which later caused discord with Bulgaria.

The treaty recognized Rumanian independence and guaranteed absolute freedom of worship without loss of political rights. The latter article (44) caused indignation in the country and could not be implemented without constitutional revision. Article 7 of the 1866 constitution stated that "only Christians can become citizens of Rumania," thus excluding Jews from civic rights. Jews had not been numerous in the principalities until the early 19th century, but their influx after the treaty of Adrianople had caused the safeguard to be put into the constitution. Under pressure from the poners, article 7 was finally repealed.

Independence of Rumania: the Kingdom.—The independence of Rumania was recognized by Italy in Dec. 1879 and by Great Britain. France and Germany in Feb. 1880. Prince Charles, having no children, regulated the succession in 1880 in favour of his nephew Prince Ferdinand of Hohenzollern, and the idea of making Rumania a kingdom was mooted. The Liberal government, accused by the Conservatives of republican tendencies. itself took the initiative in proclaiming the kingdom. This action was hastened by the general fear of revolution consequent on the assassination of Tsar Alexander II. Charles was crowned king on May 22, 1881, and secured the immediate recognition of the powers.

Internal Politics, 1878–1912.—Since 1876 Bratianu had exercised almost dictatorial power. His Liberals stood for the rapid development of a strong middle class able to control the Jews, and were mainly Francophil. The Conservatives were divided into the old boyar group, which tended to look to Russia, and the so-called Young Conservatives, the Junimists, led by Petre Carp, who had studied in Germany rather than France and favoured the Central Powers. Bratianu retired after electoral defeat in 1888, and died three years later. Thereafter various Conservative and Junimist administrations held office, the Liberals under Sturdza returning to power in 1895.

The country was in considerable financial difficulties and there was much discontent, particularly in the countryside where the peasants, though emancipated in 1864, were forced by poverty into the hands of Jewish moneylenders. A serious peasant rising in 1907, stimulated by the Russian upheaval of 1905, attacked first the Jews and then the large landowners. The Conservative ministry had to resign and it was a Liberal government which restored order. In 1909 the Liberal leader Sturdza resigned and was succeeded by Ionel Bratianu, eldest son of the great statesman, who continued to base his policy on the expansion of the urban middle class. though some of his younger colleagues concentrated on the agrarian problem. The Conservatives under Carp came to power again in 1911, but were violently attacked by the Liberals and a group of Conservative dissidents formed after the peasant rising under Take Jonescu. Under the pressure of foreign events the cabinet was reconstituted in 1912 with Titu Maiorescu as prime minister and Jonescu as minister of the interior. In Jan. 1914 Ionel Bratianu succeeded Maiorescu and formed a Liberal administration; together with the party theorist Constantine Stere, a Bessarabian boyar who had been banished to Siberia for his radical views, he worked out a program of agrarian reform.

Foreign Affairs, 1878–1912.—The foreign political situation remained comparatively calm between the treaty of Berlin and the outbreak of the Balkan wars, though Rumania's relations with its neighbours could not be cordial. Bulgaria, a traditional friend, was embittered by the loss of northern Dobruja; against Russia the Rumanians were incensed by the forced retrocession of southern Bessarabia. The resentment aroused against Austria at the end of the 18th century by its seizure of Bukovina, the first home of the Moldavian principality and repository of its chief artistic and ecclesiastical treasures, had died down, but ill feeling was aroused by the commercial treaty of 1875, which Rumania considered unfair, and was intensified by Austria's insistence on having a delegate on the Danube commission, though the commission's writ only ran from Galati (Galatz) to Orsova and did not reach Austrian soil. The oppressed Rumanians of Transylvania had been increasingly conscious of grievance against Hungary since 1848 and their feelings were shared in Rumania. With Greece there mas a constantly reviving dispute in which Bulgaria was also involved, concerning the status of the Vlach (*q.v.*) communities in Macedonia over which Rumania claimed the rights of a protector; this caused a diplomatic rupture between Rumania and Greece from 1905 to 1911.

King Charles had a natural and pronounced preference for the Central Powers, and in this he was supported by Ion Bratianu, whose fear and dislike of Russia after the treaty of Berlin outweighed his Francophilia. It was Bratianu, with Sturdza as foreign minister, who signed the secret treaty of 1883 with Austria and Germany. The treaty. remaining a close secret, was formally renewed under a Conservative administration in 1892. It was, however, the first signatory, Sturdza, leader of the Liberals since 1893, who was most active in support of the claims of the Transylvanian Rumanians against Hungary. The Bosnian crisis of 1908 alarmed Rumania because it showed that Austria was prepared to further the fortunes of Bulgaria in order to destroy Serbia. Ionel Bratianu, however, on succeeding Sturdza in 1909, remained faithful to the secret treaty.

First Balkan War, 1912.—The outbreak of war between the Balkan league and Turkey in 1912 found the Conservatives in office. Rumania's sympathies were at first uncertain; the secret Serbo-Bulgarian military convention of March 13, 1912, had provided against a possible Rumanian attack. The rapid success of the Bulgarians caused Rumania to abandon its original profession of disinterestedness and to stake a claim. Rumania intimated to Bulgaria that in the event of a partition of European Turkey it would, in the interests of the balance of power in the Balkans, require a frontier rectification in the Dobruja. Danev, president of the Bulgarian house of deputies, returning through Bucharest from a visit to Vienna and Budapest, offered only minor frontier rectifications, excluding Silistra, which was the kernel of Rumania's claims. He did, however, consider the renunciation of Bulgaria's claim to northern Dobruja and the giving of a guarantee for the Vlachs of Macedonia. No agreement was reached in Bucharest or in London in Jan. 1913. The case was finally submitted for arbitration to the conference of St. Petersburg (May 1917) which assigned Silistra to Rumania. Bulgaria regarded the concession as excessive and Rumania no longer looked on it as a satisfactory price for neutrality.

Second Balkan War, 1913.—Bulgaria's attack on its allies in July 1913 mas used by Rumania as a pretext for intervention. The Rumanian army, 500.000 strong and commanded by the crown prince, crossed the frontier (July 10), occupied southern Dobruja and advanced on Sofia. Negotiations were immediately opened at Bucharest, where an armistice was signed on July 31, 1913, between Rumania, Serbia, Greece and Bulgaria. By the treaty of Bucharest, signed on Aug. 10, Rumania obtained southern Dobruja mhich it had already occupied.

Rumania's position mas now precarious in view of the growing tension between Vienna and St. Petersburg. The king renewed the secret treaty with the Central Powers at the beginning of 1914 and Austria made great efforts to win Rumanian friendship, but popular sentiment ran the other way. The feeling of kinship with Transylvania grew steadily among the younger generation, while Austria's continued diplomatic support of Bulgaria aroused resentment. The growing feeling of the need for a policy covering the interests of the entire Rumanian nation, within and without the national frontiers, led to a new inclination toward Russia. Though Russia held Moldavian Bessarabia, Austro-Hungary, as arbitrator of the destinies of the much more highly developed Rumanian communities in Transylvania, was the greater obstacle to the realization of dreams of unity. The visit to St. Petersburg of Prince Ferdinand. heir to the throne, in March 1914 and of the tsar to Constanta in June, did not bring about a definite change of policy, however.

Rumania and World War I.—On the outbreak of war in 1914 Ionel Bratianu and his Liberal party were in office. The poli-

ticians were divided in their views, not along party lines, and Rumania at first maintained armed neutrality, though tempted by the Central Powers with the promise of the return of Bessarabia and by the Allies with the offer of Transylvania. Grief at the country's failure to honour the secret alliance hastened King Charles's death in Oct. 1914. His successor Ferdinand had married Marie of Edinburgh, granddaughter of Queen Victoria and of Alexander II, stronger in character than her husband and a staunch lover of England and Russia. Her influence, Allied promises, and alarm at the extent of German victories finally brought Rumania into the war. By a treaty of Aug. 17, 1916, Great Britain, France, Russia and Italy guaranteed Rumania the Banat, Transylvania, the Hungarian plain up to the Tisza (Theiss) river and Bukovina as far as the Prut river. Rumania declared war on Austria-Hungary on Aug. 22; its troops at once crossed the passes into Transylvania, but were expelled by mid-November. Bucharest was occupied by the Central Powers on Dec. 6, 1916. The king and his ministers and parliament had already retired to Jassy and were followed by the army, which reorganized in Moldavia under the shelter of the Russian forces. The Russian Revolution of Feb. 1917 led to the collapse of the front and left the German Field Marshal August von Mackensen free to throw all his forces against the Rumanian army, which was rendered incapable of further resistance after a prolonged stand at Marasesti in August. After the October revolution the Russian army disintegrated into pillaging bands, hostilities were suspended and an armistice was concluded on Dec. 6. 1917.

During this period the parliament in exile at Jassy was busy with projects of agrarian and electoral reform. Bratianu had already been considering these topics in 1914, and in Dec. 1916 he made a coalition with Take Jonescu and his dissident Conservatives, who had been concerned with the peasant question since the 1907 rising. The effects of the Russian Revolution in the Ukraine and Bessarabia (*q.v.*), where the peasants had appropriated the land, made the question urgent. King Ferdinand was personally concerned and induced the Conservatives to agree to a project of radical expropriation, which was passed in July 1917.

The Treaty of Bucharest. — After Bratianu resigned on Feb. 9, 1918, Gen. Alexandru Averescu was charged with the peace negotiations at Buftea, near Bucharest. The Dobruja was ceded as far as the Danube, Bulgaria taking over the southern half which it had lost in 1913, while the Central Powers administered the northern half conjointly. Rumania was to have a trade route to the Black sea via Constanta. The frontier of Hungary was advanced in the Carpathians. The Central Powers secured such terms on the Danube, in the Rumanian oilfields and over the railways. as would have placed Rumania in a state of economic slavery to them for many years. Averescu's cabinet hesitated to sign and resigned on March 12 in favour of the pro-German Alexandru Marghiloman ministry, which signed the treaty at Bucharest on May 7, 1918.

Marghiloman's ministry struggled against almost unsurmountable difficulties throughout the succeeding months. The Central Powers forced the Banque Générale to issue 2,500,000,000 lei in paper money. This disorganized the finance of the kingdom, while economic ruin was ensured by the forced export of sheep and cattle, the cutting down of forests and the dismantling of factories. The population meanwhile was starving, and the morale of the working class was being perverted by revolutionary propaganda.

On Nov. 8, 1918, when the defeat of the Central Powers was assured, the king called to power General Coanda, who repealed all laws introduced by the Marghiloman ministry and decreed universal, obligatory and secret suffrage for all male voters over 21 years of age. War was declared again on Nov. 9. The king re-entered Bucharest (Nov. 30) after the German troops had evacuated Rumania under the terms of the Armistice. Bratianu again became prime minister on Dec. 14.

GREATER RUMANIA

The dream of greater Rumania was realized, but it was no easy task to unite provinces which had been under the domination of different alien states. Bessarabia (*q.v.*) was already incorporated in the old kingdom, having abandoned an earlier idea of autonomy. Its council voted for unconditional union on Dec. 9, 1918. The incorporation of Transylvania (*q.v.*) followed in virtue of a resolution passed by a Rumanian assembly at Alba Julia on Dec. 1, and that of Bukovina (*q.v.*) on Nov. 28. The government had to carry on difficult diplomatic negotiations for the recognition by the Allies of the new frontiers. Those fixed by the agreement of Aug. 1916 were drawn back in places to give the Hungarians a part of the hinterland of Oradea Mare, and the Yugoslavs the western half of the Banat. A line of demarcation was fixed in Hungary, and Rumanian troops occupied the country up to this line, pending final settlement by treaty. In March 1919 a further neutral zone was established and Rumania was given the right of occupying it. Bela Kun's Communist government which then came into power in Hungary started a campaign as a result of which the Rumanians advanced to the Tisza river, where they were stopped by the Allies on May 9. On July 22 Kun started a new offensive, but the Rumanian army defeated his troops, crossed the Tisza — despite the interdiction of the Allies — and occupied Budapest on Aug. 4. There they remained, in the face of numerous protests, until Nov. 14. The treaties of St. Germain and Trianon recognized as Rumanian the predominantly Rumanian territories of the old dual monarchy, and the treaty of Neuilly sanctioned Rumanian possession of southern Dobruja.

Domestic Politics, 1919–1930. — The political scene was transformed after 1918; the old Conservative party was swept away because of its pro-German policy and the impoverishment of its chief supporters, the boyars. The Liberals became the party of the business and professional classes, while the peasants, who gained new status through the land reform, founded a party of their own in the old kingdom headed by Ion Mihalache. More radical elements came in from Transylvania, notably the National Popular party headed by Iuliu Maniu and Alexandru Vaida-Voevod. The Socialists were not influential as more than 80% of the population of Rumania were peasants; in the old kingdom the Socialists were mainly Marxist and supported the Russian Revolution, but in Transylvania they looked to the west.

The new parties had their chance as early as Dec. 1919 in a coalition cabinet headed by Vaida-Voevod, the Bratianu government having resigned in protest against the minorities clause of the treaty of Trianon (article 60), but their tenure of office was short. General fear of Communist propaganda and the alarm of the landowners at the proposed expropriation led to the government's resignation in March 1920 and the return of a new People's party containing many former Conservatives, led by General Averescu, hero of two wars.

He secured the able Take Jonescu as minister of foreign affairs. The general, despite personal sympathy with the peasants, had to take strong measures to restore order. A revolutionary movement was breaking out on the Dniester and securing support among extremists in the old kingdom, and social tension reached a climax in the general strike of Oct. 1920. The failure of the strike split the Rumanian socialist movement. The more moderate leaders were imprisoned, and the Communists, who had kept underground, gained the upper hand. They voted for the affiliation of the party with the Comintern at a congress in May 1921, whereupon 70 leaders were arrested.' The Social Democrats thereafter kept separate, and the Communist party was outlawed in 1924.

Meanwhile Averescu had to put through the promised land reform. The bill was introduced in the spring of 1921 by the minister of agriculture, Constantin Garoflid, himself a large landowner. After impassioned controversy, expropriation was put through on the lines agreed in July 1917, estates being limited to 500 ha. in the old kingdom, and to much smaller areas in Bessarabia and Bukovina. The peasants were not wholly satisfied; the holdings allotted were often unduly small and there was no adequate arrangement for the granting of credits for the purchase of seed and tools.

The Liberals came to power at the beginning of 1922, remaining in office with one short break until 1928. Bratianu dominated

the scene until his death in 1927 and thus had the satisfaction of being in office for the coronation of King Ferdinand as sovereign of united Rumania at Alba Julia on Oct. 15, 1922.

A new constitution was adopted in March 1923 based on that of 1866 but with the addition of manhood suffrage. The Jews were given citizenship rights, but their inflow in large numbers after World War I provoked violent hostility. In the financial sphere the Liberal government pushed through the difficult policy of coupling industrialization with the exclusion as far as possible of foreign capital, which bore heavily on the peasants who had to pay for it by export duties. The chief cause of Liberal unpopularity, however, was the centralization of administration. All the new provinces, even including backward Bessarabia, had hoped for a measure of autonomy, and this feeling was strongest in Transylvania where bitter hostility was aroused by the arrival of officials from the old kingdom. The minorities problem was to prove troublesome to all Rumanian administrations in the years following World War I, and none succeeded in finding a solution.

Bratianu proceeded in 1926 to push through an electoral law giving great advantages to the party in power at election time. By this law those who secured 40% or more of the votes were given half the seats in the chamber, plus a share in the remainder in proportion to the number of votes obtained. When a ministry fell as a result of an adverse vote in the chamber, the king could call on the leader of the next largest party to form a cabinet and hold elections. Until 1937 no party in charge ever failed to secure the necessary 40%. The Liberal party's popularity was slowly waning at the end of 1925, and in the face of growing discontent King Ferdinand again called on General Averescu to form a cabinet. His party, with some peasant support, secured four-fifths of the seats in the chamber in the elections of March 1926, largely because of successful pressure at the polls. Though the Liberals only had 16 deputies it was clear that the new administration governed largely with their support. Meanwhile the opposition was greatly strengthened by the fusion, in Oct. 1926, of Maniu's National Popular party with Mihalache's Peasant group to form the National Peasant party, which was to represent the majority of the Rumanian people. Averescu resigned in June 1927 and Bratianu was again returned; the newly formed National Peasant party, despite universal popularity, polled only 20% of the votes in the obviously manipulated elections.

The political situation was complicated by the dynastic position. In Dec. 1925 Crown Prince Carol had left Rumania, renouncing all his rights in favour of his young son Michael. In view of King Ferdinand's precarious health a council of regency was formed in Jan. 1926 consisting of the patriarch Miron Cristea, the president of the supreme court Gheorghe Buzdugan, and the king's second son, Prince Nicholas.

King Ferdinand died on July 20, 1927, and Bratianu died in November of the same year. The Liberal party, thus weakened, was faced with an economic crisis and peasant demonstrations. The regency council in May 1928 entrusted Maniu with forming a cabinet and holding elections: his National Peasant party was returned with a majority of more than 75%. The new government abolished censorship and martial law, mitigated the police regime, promised concessions to the minorities and in June 1929 introduced, to the great satisfaction of the Transylvanians, an administrative reform bill aiming at extensive decentralization. The peasants were helped by the repeal of the export duties; cooperatives were encouraged and free sale of land allowed, a measure which unfortunately led to an increase of the rural proletariat rather than to a consolidation of prosperous peasant holdings as had been intended. The economic situation was greatly eased by the entry, at last allowed, of foreign capital.

Foreign Policy, 1920–1937.—Rumania's foreign policy after Trianon was necessarily based on an endeavour to maintain the status quo and to protect itself against aggression. Rumania mas from the first a consistent member of the League of Nations, but built up a careful system of regional pacts to buttress collective security. The first such pact was concluded with Poland in March 1921, when Take Jonescu and Prince Eustachy Sapieha signed a treaty providing for mutual assistance in the event of unprovoked attack on the eastern frontier. Both countries were threatened by the U.S.S.R., which had not recognized Rumania's right to Bessarabia and seemed little satisfied with Poland's possession of its former Ukrainian and Byelorussian territories.

Take Jonescu had hoped to form a Baltic-Aegean bloc to act as a buffer between Germany and the U.S.S.R., but had to be content with joining the little entente (*q.v.*) system. An agreement with Czechoslovakia for mutual protection against Hungary was signed in April 1921 and with Yugoslavia for similar protection against Hungary and Bulgaria in June. He sought further to cement Balkan friendships by dynastic alliances. Marriages were concluded between Crown Prince Carol and Princess Helen of Greece (March 10, 1921), between his elder sister Princess Elizabeth and the crown prince of Greece (Feb. 1921) and between Princess Marie and King Alexander of Yugoslavia (June 6, 1922).

General Averescu, in his 1926–27 administration, extended Rumania's system of pacts to include its "Latin sisters." A treaty of alliance and nonaggression was signed with France in June 1926 and another in September of that year with Italy. The Italians, after long hesitation, recognized the incorporation of Bessarabia in Rumania in March 1927. Relations with the U.S.S.R. remained in a state of tension; during 1924 the Soviet Union kept up continuous agitation and threats of war, even setting up a three-day Communist republic at Tatar Bunar in southern Bessarabia. A conference held in Vienna in April 1924 between Rumanian and Soviet representatives led to no results. The situation was eased when Nicolae Titulescu became foreign minister in 1927. In 1933 both countries signed the convention of London defining the aggressor, and with the U.S.S.R.'s entry into the League in 1934 and the exchange of letters between Titulescu and Maxim Litvinov later that year it was hoped that the Bessarabian question was settled. Rumania entered into diplomatic relations with the U.S.S.R. in 1934, but the Bessarabian question remained open and was raised again by the Russians after Titulescu had been dropped from the Rumanian cabinet in 1936.

Agreement with Bulgaria, resentful at the loss of southern Dobruja to Rumania and at the inclusion of parts of Macedonia in Yugoslavia and Greece, proved out of reach; nonetheless, the Balkan pact, signed in 1934 between Rumania, Yugoslavia, Turkey and Greece, was left open to Bulgaria.

Rumania under King Carol.—Maniu, dissatisfied with the regency, arranged for the return of Carol from exile with the agreement of all the major parties. Carol was proclaimed king on June 9, 1930, his son Michael becoming crown prince (grand voivode). Conflict soon arose between the king and Maniu, who had exacted a promise that Carol would leave his Jewish mistress Magda Lupescu abroad if he resumed the throne and would seek reconciliation with Queen Helen. On the king's breaking this promise Maniu resigned the prime ministry in Oct. 1930, though his party remained in power under Gheorghe Mironescu. King Carol was from the first determined to secure absolute power and to break up the old political parties. Maniu's resignation and the world economic crisis helped to bring down the National Peasants in 1931. After Mironescu's resignation the foreign minister Titulescu attempted to form a cabinet, and on his failure the king appointed one of his own choice headed by his former tutor Nicolae Jorga. The elections of June 1931 gave the government a majority of 291 seats out of 387, but it resigned a year later. The National Peasants had a brief return to power and it fell to Vaida-Voevod to deal with the serious Communist-inspired railway strike at Grivita in Feb. 1933, but the party, split through King Carol's intrigues, could no longer keep itself in power. The Liberal opposition was also split; the leaders Ionel Bratianu and his brother Vintila a-ere dead and the third brother Constantin (Dinu) had not their grip over the party, while their nephew Gheorghe was on the king's side. Nevertheless the Liberals returned to power in 1933 under an anti-Carol leader Ion Duca.

Rise of the Iron Guard.—The king mas helped in his disruption of the older parties by the rise of a new group of fascist type which was taking shape in Moldavia, feeding on endemic Rumanian anti-Semitism and the economic crisis. The leader, a young man named Corneliu Zelea Codreanu, first called his group

the legion of the archangel Michael; later it had many names, the best known being the Iron Guard. Priests, officers and students flocked to Codreanu's standard; the party had a mystical appeal and its leaders wore the trappings of romance. Its slogan was the Christian and racial renovation of Rumania: in foreign affairs it opposed co-operation with France, the U.S.S.R. or the League of Nations and sympathized with Germany and Italy and later with Francisco Franco in Spain; at home it tempted the peasants with the slogan omul *si* pogonul—"one man, one acre."

The Iron Guard gained its first four seats in parliament in 1932; its policy of violence, which had already been demonstrated by the murder of the prefect of Jassy, was carried forward by the assassination of the prime minister Duca, on Dec. 30, 1933, a month after he had assumed office. Unlike the neighbouring Balkan states Rumania had not in modern times been prone to political murders and the country was profoundly shocked. The new Liberal premier Gheorghe Tatarescu proscribed the Iron Guard, but reappearing under another name—*Totul Pentru Tara* (everything for the fatherland)—it succeeded in securing Titulescu's removal from the foreign ministry in Aug. 1936.

In the 1937 elections, presided over by Tatarescu, the government for the first time failed to secure the necessary 40% of the votes. It was highly unpopular, and the opposition was unexpectedly consolidated by the conclusion of an electoral pact between the National Peasants and the Iron Guard, which led to much criticism of Maniu. The Guard secured 16% of the votes. King Carol, alarmed at this success and not wishing to have Codreanu as a rival dictator, dropped his earlier policy of covert support and called on the elderly Transylvanian poet Octavian Goga, leader of the right wing anti-Semitic National Christian party, to form a government. After a few weeks of violent anti-Semitic action, at which the British and French ministers protested, Goga was dismissed by King Carol, who then proclaimed a personal dictatorship. A new constitution of corporative type was published on Feb. 20, 1938, and "accepted" in a plebiscite. The patriarch Miron Cristea was made prime minister with Tatarescu as his deputy. In April Codreanu and other guardists were sentenced to ten years' imprisonment. The guard replied with a renewed terror campaign, and in November King Carol, returning from a post-Munich visit to the western capitals, had Codreanu and 13 of his followers "shot while trying to escape."

On Dec. 16 the king founded a monopoly party, the National Renaissance Front, to support his government, and announced certain concessions to the minorities, who accordingly joined the front. Miron Cristea, the patriarch and prime minister, died in March 1939 and was succeeded by Armand Calinescu, minister of the interior in the former government. Elections on a corporative basis were held in June, the electorate under the new constitution being 2,000,000 compared with 4,500,000 in 1937. The senate was designed to include old parliamentarians, and the leading political figures, Maniu and Mihalache of the National Peasant party and Dinu Bratianu, head of the National Liberals who disapproved of the Tatarescu faction, automatically became members. They refused, however, to take the oath to the new constitution, and were suspended. Women could vote and, for the first time in Rumanian history, stand as candidates, but only for the senate. The Iron Guard continued to foment unrest during the summer of 1939 with German backing and on Sept. 20 murdered the prime minister, Calinescu; after the brief premiership of Gen. Gheorghe Argesanu, who was able to secure some degree of public order, Constantin Argetoianu became prime minister for two months and was then succeeded by Tatarescu.

Foreign Policy, 1938–39.—The anschluss and the Munich agreement overthrew the whole system of Rumanian foreign policy. Relations with Italy were already embittered through Rumania's adopting sanctions at the League's bidding during the Abyssinian war, and the pact with Italy had lapsed in 1936. Rumania had been ready to fulfil its obligations under the little entente and to come to the aid of Czechoslovakia during the Munich crisis, even secretly agreeing to allow Soviet troops to cross its territory. The Polish alliance stood, even after Munich, but Rumania refused Poland's offer of a slice of Czechoslovak territory in Ruthenia in Oct. 1938. Confidence in the west had been shaken by Munich, and in March 1939 a trade treaty was signed with Germany designed to put the whole of Rumania's economic life at German disposal. The new foreign minister, Grigore Gafencu, made a last attempt to seek support in the west, securing a Franco-British guarantee of Rumanian territorial integrity on April 13, 1939. Rumania's only real hope, however, lay in German-Soviet antagonism, and that was shattered by the Ribbentrop-Molotov pact in August.

World War II.—The invasion and dismemberment of Poland in Sept. 1939 found Rumania powerless to help its ally; Rumania declared neutrality on Sept. 4. The collapse of France in the summer of 1940 removed the last prop of Rumanian morale; nonetheless, King Carol made efforts to put the army on a war footing and announced that the country's frontiers would be defended at any cost. Under German pressure the foreign minister, Grigore Gafencu, was forced to resign and was succeeded by the strongly pro-German Ion Gigurtu. On June 21 the king agreed to turn the National Renaissance Front into a still more totalitarian national party which included Iron Guardists, under Horia Sima, released on German orders.

The first blow fell on June 27 when in agreement with Germany the U.S.S.R. occupied not only Bessarabia, but northern Bukovina, which had never been in Russian possession. Rumania was forced to accept, renounced the British guarantee on July 2 and on July 4 appointed a new pro-German cabinet with Gigurtu as prime minister and Horia Sima as minister of culture. On July 16 Germany was "invited" to send a military mission. Hungary now had to be conciliated; on Aug. 30 Germany and Italy imposed the Vienna award whereby Hungary was to be given northern Transylvania, an especially bitter blow to Rumanian patriotism. The people wished to fight and looked for a lead to Maniu, the grand old man of Transylvania. While he hesitated the Iron Guard. despite their pro-German attitude, led the national protest and demanded the abdication of King Carol, who was made the scapegoat. The king left on Sept. 6 with Magda Lupescu, leaving his 19-year-old son Michael on the throne as Mihai I. Before his departure he entrusted power to a general, Ion Antonescu, who formed a government consisting largely of Iron Guardists, with Horia Sima as vice-premier. The constitution was suspended and Antonescu given full powers. Meanwhile Bulgaria, with German support, had been agitating for the return of southern Dobruja; the agreement for its cession was signed at Craiova the day after Carol's departure. Rumania lost about 3,500,000 subjects to the U.S.S.R., 2,400,000 to Hungary and 360,000 to Bulgaria. There were rumours that Germany intended also to separate the Banat (*q.v.*) from Rumania, but in the end that territory was merely accorded semiautonomy under the large local German minority. Germany and Italy guaranteed rump Rumania. Rumania was declared a "national legionary state" on Sept. 15 and joined the Tripartite pact on Nov. 23.

German troops had been pouring into the country since September, but as the Germans had decided to reduce Rumania to complete subservience by playing off the Iron Guard against Antonescu, the Wehrmacht stood by when the guardists staged a St. Bartholomew's night on Nov. 28 in which 64 prominent members of the old regime were assassinated, including Jorga and the peasant leader Virgil Madgearu. Antonescu now secured German support in putting down the Guard, which staged a more serious rising at the end of Jan. 1941 under the leadership of Sima, vice-premier in Antonescu's cabinet, and Ion Codreanu, father of Corneliu. The revolt was finally suppressed with about 6,000 casualties; Sima escaped. The new administration formed at the end of January was mainly military, all guardists being excluded. Some 500,000 German troops were in the country by February, and on Feb. 10 Great Britain broke off diplomatic relations. Antonescu refused to join Adolf Hitler in smashing Rumania's ally Yugoslavia in April 1941, but the country was behind him in entering the war against the U.S.S.R. as Germany's ally on June 22. Great Britain declared war on Rumania on Dec. 7 and on Dec. 12 Rumania declared war on the United States. Rumania's recovery of Bessarabia in the summer of 1941 was

highly popular in the country, but the opposition leaders underground, in particular Maniu, strongly disapproved of the army crossing the Dniestr into Soviet territory in 1942 and of the organization of a new Rumanian province beyond the river known as Transnistria. The nation, however, did not become thoroughly war-weary until the disastrous casualty lists came in from Stalingrad.

The Communist Regime.— Although Rumania had not had a parliamentary government since 1938, the chief political parties had kept their organizations intact; the National Peasants under Maniu and the Liberals under Dinu Bratianu formed a rallying point for popular discontent with the fruits of Antonescu's pro-Axis policy, and undertook secret negotiations with the Allies during 1943. The traditional parties were supported in the desire for an armistice by the pro-Soviet left-wing groups, the Social Democrats under Titel Petrescu and the Communists under Lucretiu Patrascanu. The Communists, whose organization had long been illegal, were relatively few in number in 1944; they had no war record of partisan activity to give them prestige and few of the leaders were of Rumanian origin, the majority being Russian-trained Jews, Ukrainians or Hungarians. The party gained reinforcement in its lower ranks after 1941 from among the leaderless and disillusioned Guardists, ready for any violence. In the spring of 1944 these four parties agreed to form a national bloc to bring the country out of the war.

The coup d'état of Aug. 23, 1944, which overthrew Antonescu and brought Rumania into the war against Germany, was largely the work of King Michael himself, supported by the National Peasants and Liberals, but the Social Democrats and Communists were given representation out of proportion to their numbers in the first postarmistice administration. The armistice was signed in Moscow on Sept. 12. Soviet troops having been in occupation of Rumania since the end of August. The peace treaty subsequently provided for their remaining until after the conclusion of the Austrian treaty, a period which would ensure their presence while Rumania was being remodelled on the Soviet pattern. The Russians had prepared during the war a division of indoctrinated Rumanian prisoners named after the hero of 1821, Tudor Vladimirescu; these marched into Rumania beside the Red army.

Until elections could be held, three short-lived governments of a mainly military character took office, the first two headed by Gen. Constantin Sanatescu (1885–1947), and the third by the chief of staff Nicolae Radescu (1874–1953), an open anti-communist. The Soviet deputy foreign minister. Andrei Vishinsky, went in person to Bucharest to insist on Radescu's removal and the installation as premier of Petru Groza, head of a splinter left-wing country party known as the Ploughmen's Front which, though not forming part of the national bloc, had been included under Soviet pressure in the last Sanatescu administration.

The Groza government, which took office in March 1945, excluded the National Peasants and Liberals and proved highly unpopular. In August of that year the Potsdam conference proposed the resumption of diplomatic relations with Rumania provided that the government mas "recognized and democratic." The U.S.S R immediately resumed relations, but Great Britain and the United States refrained on the ground of the unrepresentative nature of the administration. King Michael then appealed to the three powers who, meeting in Moscow in Dec. 1945, advised that a government, broadened by the inclusion of a National Peasant and a Liberal member, should hold elections.

The 1923 constitution had been restored after the armistice, but before the elections a law aas passed abolishing the senate. The government bloc announced that it had polled 71% of the votes in the elections held on Nov. 19, 1946. The Communists secured the key portfolios in the new government, excepting that of foreign affairs which was given to Tatarescu, and split the Social Democrats, the bulk of the party remaining aloof under its leader Petrescu. who was later imprisoned. The elections were followed by a wave of arrests of former prominent politicians and their followers, including Maniu himself (Antonescu was shot as a war criminal in 1946). The National Peasant party, which had the allegiance of the majority of Rumanians. was declared illegal in Aug. 1947 and Maniu himself tried and condemned to life imprisonment on Nov. 11. (He died in prison in 1952.) Evidence given at the trial was used as a pretext for removing Tatarescu from the ministry of foreign affairs. Ana Pauker, a Moscow-trained Jewess, taking his place.

In Dec. 1947 King Michael was forced to abdicate. In Feb. 1948 the remnant of the Social Democrats under Lothar Radaceanu (d. 1955) merged with the Communists to form the Rumanian Workers' party (Partidul Muncitoresc Roman) which, together with the Ploughmen's Front and the Hungarian People's union, presented a single list as a People's Democratic Front in the ensuing elections. The front claimed 405 out of 414 seats in the grand national assembly elected on March 28. A constitution of Soviet type was adopted in April and the Rumanian People's republic proclaimed, uith Constantin Parhon as first president. The Communist party purged itself by 18% during 1949; by the middle of 1950, after the admission of new members, the total membership was put at 720,000. The wartime Communist leader Lucretiu Patrascanu, dismissed from the ministry of justice and arrested in Feb. 1948, was tried and executed in 1954. In May 1952 three leading communist ministers, among them Ana Pauker, were purged. Gheorghe Gheorghiu-Dej then became premier, Groza retiring to the presidency vacated by Parhon. A revised constitution, still closer to that of the U.S.S.R., was adopted on Sept. 24 and a new assembly elected on Nov. 30. On Oct. 3, 1955, Gheorghiu-Dej abandoned the premiership to Chivu Stoica, himself reverting to the first secretaryship of the Rumanian Workers' party. By the end of 1955 the party had 595,398 members and 56.583 candidates.

By the peace treaty, ratified on Sept. 15, 1947, the cession of Bessarabia and northern Bukovina to the U.S.S.R. and of southern Dobruja to Bulgaria was confirmed; in exchange the Vienna award was cancelled and northern Transylvania restored by Hungary.

The Rumanian People's republic now had no independent foreign policy. A treaty of friendship, collaboration and mutual assistance was signed with the U.S.S.R. on Feb. 4, 1948, and Rumania later entered into the network of alliances with different people's republics. On May 14, 1955, in Warsaw, Rumania joined a treaty of mutual assistance concluded by the U.S.S.R. with its seven European satellite states. **A** united command for the eight armed forces was created. (B. BR.)

POPULATION

The total population fluctuated with the various territorial changes which Rumania underwent. In 1914, before the addition of Transylvania and Bessarabia, the figure was 7,600,000; at the 1930 census the population was 18,025,237; in 1940, before incurring the losses arising out of the Vienna award and the Soviet and Bulgarian seizures (see History, above), it was estimated at 19,930,000; the 1948 census, reflecting the eventual peace settlements, with Bessarabia and northern Bukovina remaining in Soviet hands, southern Dobruja under Bulgaria but the former Hungarian frontier restored, gave a total of 15,872,624 inhabitants. The 1956 census revealed a population of 17,489,450 (190.7 per sq.mi.). The population was distributed among the various historic provinces as follows: Muntenia (the most densely settled region), 31.4%; Transylvania, 21.6%; Moldavia, 16.4%; Oltenia, 13.8% and 16.8% shared by the border provinces of Crisana, Banat, Maramures, Bukovina and Dobruja.

The country's area before World War I was 50,715 sq.mi. (131,353 sq.km.) and after it 113,918 sq.mi. (295,049 sq km.). By losing Bessarabia (17,151 sq.mi.), northern Bukovina (2,096 sq.mi.) and southern Dobruja (2,970 sq.mi.) Rumania was reduced to 91,699 sq.mi. (237,500 sq.km.).

The rural character of much of Rumania's population is illustrated by the fact that according to the 1956 census only 31.3% of the total lived in urban centres. Rumania is essentially a nation of peasants. The largest town, the greatest manufacturing centre and the capital of the country, is Bucharest (*q.v.*).

The two next largest towns, Kishinev (Chisinau) (190,000 in 1956) and Chernovtsy (Cernauti) (142,000 in 1956) became part of the U.S.S.R. Next to Bucharest in size in 1956 was Cluj (Kolozsvar), the important route centre in Transylvania. Six

other towns had reached the 100,000 mark by 1956—Timisoara, Brasov, Ploesti, Iasi (Jassy), Arad and Braila. The expulsions of Germans, Magyars and Jews changed the ethnic composition of the urban population, but detailed figures of the changes are'not available. The big increase in Bucharest is partly accounted for by changes in administrative boundaries. (See Table I.)

TABLE I. —Cities in Rumania, 1900–56

Town	1900 (est.)	1930 (census)	1939 (est)	1948 (census)	1956 (census)
Bucharest	300,000	631,288	648,162	1,041,807	1,222,874
Cluj	46,670	96,866	100,272	117,915	154,723
Timisoara	53,033	91,866	89,872	111,987	142,257
Brasov	34,511	56,234	61,827	82,984	123,834
Ploesti	50,000	77,325	77,376	95,632	114,544
Jassy	80,000	102,595	104,471	94,075	112,977
Arad	53,903	77,225	75,725	87,000	106,460
Braila	60,000	68,310	68,561	95,514	102,500
Oradea Mare	47,018	82,355	80,872	82,282	98,950
Galatz	66,000	101,148	102,232	80,411	95,646

Not only did the total population of the country decrease as a result of the territorial losses, but the ethnic composition was considerably modified between 1920 and 1948. In 1920, 70% of the total population were Rumanians; according to the 1956 census, they formed 86% of the total. In 1956, there were 1,589,543 Magyars (9.1% of the total); the actual number was only slightly less than in 1920, the post-1945 expulsions from Transylvania having been suspended later. The third largest element in 1920, the Jews, had then numbered 900,000; in 1956, there were only 144.236, as they had suffered considerably under the Iron Guard and Antonescu regimes—though less severely than the Jews of Poland and Germany—and many of the survivors emigrated to Israel. The fourth largest group, the Germans, declined from 792,000 in 1920 to 382.400 in 1956; they were affected by the wartime schemes of repatriation to Germany and by deportations to the U.S.S.R. in the period immediately after 1944. The Slavonic group in 1920 was large and included 792,000 Ukrainians and Russians in Bessarabia; 440,000 Poles. Czechs and Ruthenians in Bukovina and Maramures; and 290,000 Bulgars in the Dobruja. The Slavs were much reduced by the Soviet and Bulgarian acquisitions of territory. and the 1956 census recorded their combined total as 135,352. Finally, smaller ethnic groups, such as Turks, Greeks. Albanians, Armenians and gypsies, numbered 217,-211 persons in 1956.

It is generally accepted that the Rumanians are partly the descendants of Roman merchants and veterans who settled in Dacia, even as far north as the modern Polish border, before and after the campaign of Trajan. and partly of the native Dacians. Archaeological and historical evidence shows that there was a long and thorough period of penetration of the Carpathians by Roman commerce and after the Roman withdrawal the various established Roman elements remained in the country.

The very word *batran* in Rumanian, meaning "old," is derived from the Latin veteranus and the word biserica (church) indicates the western origin of Christianity in these parts (*biserica* = basilica) and so the western connections with Italy and the Roman culture. The Rumanian physical type, in many cases, seems more definitely Latin than the Italian and the language is in many respects closer to Latin than is Italian. Slavonic elements are clear in some of the prevalent types but it is by no means the preponderant influence.

The Magyars are found for the most part in the towns of Transylvania. By training, education and tradition they associate themselves more happily with the German elements than with the Rumanian and they take only a small part in the agricultural development of the land. They are industrious but in the past were regarded as politically unreliable since they were encouraged by their fellow Magyars in Hungary to oppose in every way the rule under which they lived. A branch of the Magyars known as Szeklers were military colonists planted by the kings of Hungary to guard the frontier passes at the head of the Mures and Olt rivers. A Hungarian autonomous region, with its centre at Targu Mures, was established in 1952.

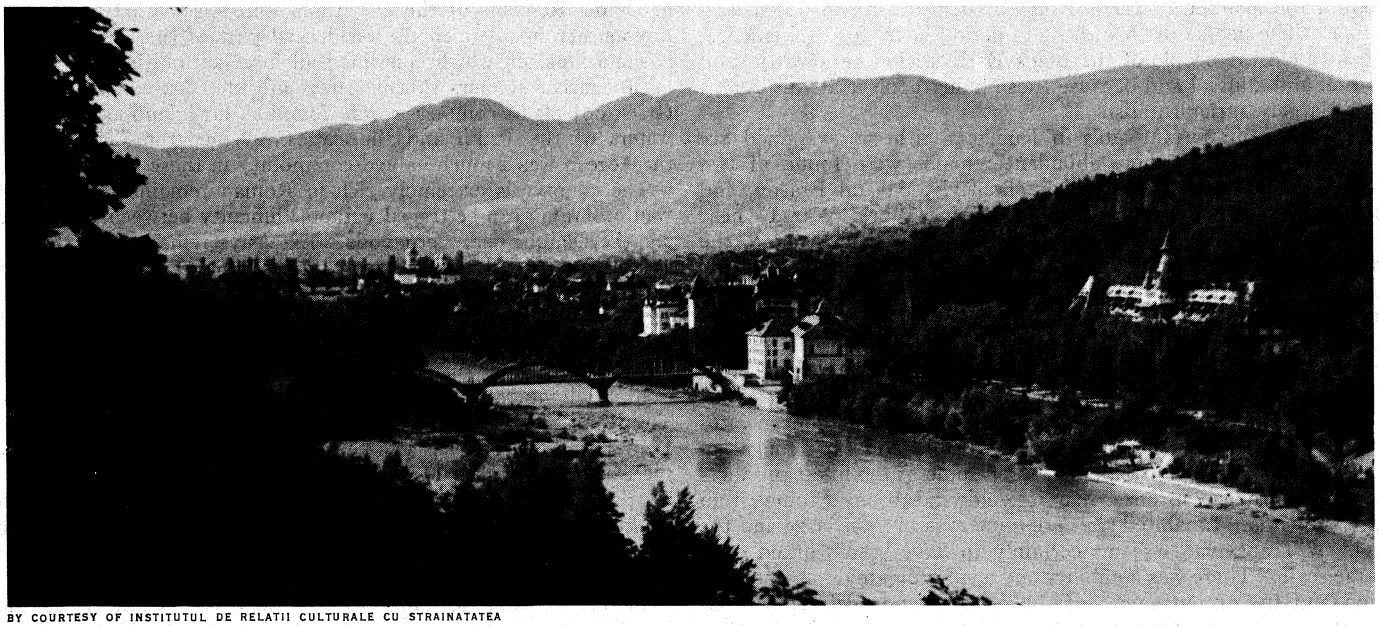
Germans settled in Rumania from time to time for various reasons. The earliest were knights and their companies, perhaps crusaders, in the 12th century, who were persuaded by the Hungarians to settle in towns that commanded the main passes of the Carpathians and so prevent inroads of barbarians into Europe. Gradually they developed their settlements and in 1224 their position and independence were recognized. Alsatians and Saxons together with some groups from the Rhineland were settled in these early times. Until 1944 they still lived an exclusive and separate life, largely with their own institutions and local government. They are mainly of the Lutheran religion. It is remarkable to see in their churches the one hint of the orient, which they were brought there to combat, in the shape of fine Turkish carpets of the 16th century, survivals of the period when the Turks overran the Transylvanian plateau but left the German settlements still independent. They formed a very useful element in the state and, if rather an isolated enclave in a foreign land, yet were loyal subjects of whatever regime controlled them. The Germans of the Banat are of ,a different type. They colonized the waste plains of this fertile region in the 18th century and are mostly Rhinelanders and Alsatians. Their activities are almost entirely agricultural and their wealth and industry is considerable.

(G. W. S.; X.)

Religion. — The great majority of Rumanians belong to the Orthodox Eastern Church (*q.v.*). No firm evidence of the first coming of Christianity to their ancestors survives, but the fact that most of the basic words of church observance in the Rumanian language are of Latin origin suggests that the first missionaries belonged to the Church of Rome. Dacia was separated from the empire before the conversion of Constantine, but the Daco-Romans later had contact with their kinsmen in Moesia south of the Danube. The beginnings of Christian life were submerged in the barbarian invasions, and an organized church was not founded until the 9th century, when the Bulgarians, then masters of the former Dacia, became Christian and introduced to the province the Slavonic alphabet and liturgy that they had received from SS. Cyril and Methodius. This Slavonic rite. maintained in the Rumanian Church until the 17th century, helped to keep the Ilach Christians in Transylvania apart from their neighbours, so that, unlike the strongly propapal Hungarians, they followed eastern Christendom against the papacy in the schism of 1054. When the principalities of Moldavia and Walachia took shape in the 14th century the people were staunchly Orthodox and attached to their Slavonic rite, though some of the early princes, intermarrying with Poles and Hungarians. temporarily took the Roman Catholic side. Orthodox bishoprics were at once founded in the new states, depending at first on the Bulgarian Church and later on the patriarchate of Constantinople but having a large measure of autonomy. (See also CYRIL AND METHODIUS, SAINTS.)

In Transylvania Orthodoxy was oppressed, not being one of the four "received religions" and the Orthodox bishop there was dependent on the Walachian metropolitan. Hence the title of the Rumanian primate — mitropolit Ungro-Vlahia si exarhul *plaiurilor* (metropolitan of Ungro-Walachia and exarch of the mountains [*i.e*, the Carpathians]). The Moldavian and Walachian princes and boyars were exceptionally generous in their endowments to monasteries; in order to protect them in the unsettled conditions under Turkish rule the practice arose of dedicating them to one of the patriarchates of the east or to the Holy Places. This led to an infiltration of Greek monks. As the source of Slavonic teaching dried up and the village priests knew no Greek, Rumanian gradually became the liturgical language in the 17th century, particularly in the villages. The first Gospels in Rumanian were printed in Transylvania in 1561 under Protestant influence, and the first Rumanian Bible appeared in 1688. The work of Rumanian printers was helped in Moldavia by the metropolitan of Kiev, Peter Mogila, himself of Moldavian origin and one of the leading theologians of the Eastern Church. In Phanariot times, from the 18th century onward, Greek influence spread rapidly, the bishops frequently being Greek and the liturgy being celebrated in Greek in the richer churches.

With the union of the principalities in 1859 the churches of Walachia and Moldavia were united and anti-Greek reaction had full swing. In 1863 the dedicated monasteries, whose lands cov-



BY COURTESY OF INSTITUTUL DE RELATII CULTURALE CU STRAINATATEA

SPA AND RESORT TOWN OF CALIMANESTI AT THE FOOT OF THE CARPATHIAN MOUNTAINS ON THE RIVER OLT

ered more than one-fifth of the area of the new state and most of whose revenues left the country, were expropriated, and the use of Greek in all churches and monasteries was forbidden. In 1865 an autonomous Church of Rumania was set up, which in 1872 was given an organic statute, and shortly after Rumania had been proclaimed a kingdom (1881) the Orthodox Church was declared autocephalous and arranged to consecrate its own holy chrism instead of procuring it from Constantinople. The oecumenical patriarch protested, fearing that complete ecclesiastical independence in Rumania would lead to an undue growth of Russian influence, but finally agreed.

With the formation of greater Rumania in 1918 the Orthodox Church received many new adherents. In Transylvania there was only one Orthodox bishopric, at Sibiu, which had been granted autonomy in 1869 after former dependence on the Church of Serbia. The majority of Transylvanian Orthodox, soon after the province had come under direct Habsburg rule, had signed an act of union with Rome in Oct. 1698, whereby they kept their own rite but acknowledged the Holy See's jurisdiction. .The Orthodox had suffered severe disabilities under Calvinist control and looked on the union as a way of escape. In Bukovina, which had been Austrian since 1775, the people remained Orthodox and had had their own metropolitanate at Czernowitz since 1873. In Bessarabia, the majority of the people were Orthodox and had been under the jurisdiction of the Russian Holy Synod. All these churches united after 1918, and in 1925 the enlarged Church of Rumania was elevated to a patriarchate with the consent of Constantinople, the first patriarch being a Transylvanian, Miron Cristea. With the collapse of the Russian Church in the Revolution the Rumanian Church, with 13,000,000 members, became a leading force in the Orthodox world and took the initiative in many matters of general ecclesiastical interest. In 1936 it recognized Anglican orders

The old kingdom of Rumania had been relatively homogeneous in religion, but the new provinces brought in a big influx of other denominations. More than 3,000,000 owed allegiance to Rome in 1930, half being Uniates from Transylvania, all of whom were Rumanian by race. and the other half Latin Catholics, mainly Hungarians of Transylvania and Swabians of the Banat. Many of the Hungarians were Calvinist or Unitarian, while the Saxons of Transylvania were Lutheran. In Bukovina and Bessarabia there were many Jews, and in the latter province and in Dobruja there were Moslem Turks.

Under the constitution of 1923 the Orthodox Church and the Uniate Church of Transylvania were declared Rumanian churches, the former being dominant and the latter having precedence over all other denominations. Liberty of conscience was established, but the Jews, the Baptists and other sects suffered under considerable disabilities. A concordat with the Vatican was concluded in 1929. Under the Antonescu regime a decree on the recognition of cults was issued (Sept. 12, 1940) suppressing a number of sects and putting restrictions on Jeuish worship.

After the armistice of Sept. 23, 1944, relations between the churches of Rumania and the U.S.S.R.. interrupted since 1918, were resumed. The second patriarch of Rumania, Nicodim, died in Jan. 1948 and was succeeded in June by a young bishop, Justinian. Government nominees did not cease to vote for the patriarch or for the bishops now that the government was officially atheist. The Communist constitution of April 1948 removed the special privileges of the Orthodox Church. Laws on religion and education in Aug. 1948 ended all church control in schools and laid down that all denominations must submit a statute before being allowed to function. Under the Orthodox Church statute, 1949, several of the old dioceses were suppressed.

In Oct. 1948 the Uniates of Transylvania were reincorporated in the Orthodox Church and their five bishops were arrested. By 1952 the Roman Catholic Church had not secured approval for a statute. The concordat with the Vatican was denounced on July 17, 1948, and the five Latin-rite bishops put under arrest. The Lutherans, Calvinists and Unitarians secured approval for their respective statutes and the Baptists formed a federation with the other neo-Protestant sects. The different Jewish sects were also amalgamated into a federation of the Mosaic cult, and the Moslems were put under the muftiate in Constanta. All these recognized religions expressed full loyalty to the Communist government. Apart from the Catholic hierarchy many priests of the Orthodox Church and of other denominations were imprisoned.

(B. BR.)

ANTIQUITIES AND EARLY SETTLEMENT

Rumania is rich in antiquities of all periods from the Neolithic to the Roman but no scientific archaeological work can be said to have been done before 1900 when G. Tocilescu published the results of his surveys of Roman Dacia. Excavation by Rumanians did not begin before 1914.

The Neolithic period is hard to distinguish from the Chalcolithic but in general it is abundantly clear that Rumania in the first half of the third millennium B.C. formed part of a homogeneous region in which Bulgaria, Thrace, Thessaly and the Ukraine as far north as Kiev were included. This culture is distinguished by a

remarkable painted pottery of high artistic quality in design and shape. The people of this area and period have, for convenience. been called the people of the Black Earth region because the soil is rich and alluvial and because those living upon it at this period were largely agriculturalists.

The most important sites in Rumania hitherto examined are Cucuteni near Iasi where abundant remains were found of two periods of this culture, Erosd in Transylvania and Brasov, and some sites (excavated by Germans during World War I) near Cernavoda on the Danube. The culture so revealed is one of the most remarkable that developed in Europe in the early prehistoric period. It is thought by some to have oriental affinities with regions as far afield as Turkistan and Honan in China, where remarkably similar pottery is found. In any case the Black Earth culture came to an abrupt end about 2000 B.C. and was replaced by a culture coming from the northeast, whose people had war weapons.

The Bronze Age that ensued develops rapidly and concentrates mainly in the western half of Transylvania and the Hungarian plains. It is of great artistic merit and some of the finest products of the European Bronze Age in gold and bronze come from Transylvania. Inhabited sites are numerous but not large and the gold of Transylvania seems certainly to have been worked on a large scale. There was a nobility and a subordinate or serf population and the accoutrement of the nobility and their gold ornaments and plate form an outstanding feature of the civilization they represented. The *floruit* of this Bronze Age seems to have been about the 15th century B.C. and the Hungarian plain seems to have been the breeding place for movements that extended far and wide. Bronze swords of Danubian type from these regions are found during the 14th and 13th centuries B.C. penetrating, perhaps more as signs of invasion than as elements of trade, as far afield as Mycenae, Egypt. Cyprus and Crete. The makers of the swords seem to have been the peoples who were gradually pressing down southward into the Mediterranean and who subsequently were responsible for the northernization of the Minoan world. Their gold may have reached the wealthy cities of the Mycenaean mainland. Certainly they were in close touch with Troy and Anatolia.

Toward the close of the second millennium before Christ the Bronze Age culture of Rumania was modified by external influences and at the dawn of the Mediterranean Iron Age, Italy played a preponderant part in the commerce of the Carpatho-Danubian regions. Villanovan culture from north Italy sent its wares (particularly its fine bronze work), far and wide into Transylvania and western influences predominated. Rumania proper is almost out of touch with the Hallstatt Iron Age and its Bronze Age does not end until the 8th century when devastating invasions from Scpthia entered from the northeast. Scythian graves are found in three large areas—in north Hungary, in south Transylvania and in Walachia. They are never rich and they indicate the intrusion of large bodies of well-armed warriors who for a time controlled the country. They were. however, soon absorbed by the native population. But the wealth and prosperity of Rumania was checked, and never really recovered until Roman times.

Hellenic penetration was marked but never very effective and the Daco-Getic peoples of Rumania were never Hellenized as were the Balkan Thracians. But of the Greek period there are many archaeological evidences. The important Milesian settlement of Histria near the Danube mouth on a lagoon island facing the modern village of Karanasuf has been uell excavated Over 150 inscriptions illustrate the life over many centuries of this remote Hellenic tonn. The wealth of the inhabitants, as is evident from two large and important inscriptions of the Roman period, had at all times come from the fishing in the delta, over which the Histrians had immemorial rights.

Kallatis, an old Dorian settlement on the site of the modern Mangalia in the Dobruja, was partly excavated. Inscriptions there indicate that the population was strongly Dorian and that the city. with others along that coast, was largely subject to the Thraco-Scythian kings of the interior. Kallatis was evidently one of the great grain-exporting emporiums of the Black sea. Constanta has been identified as the ancient Tomi, the place of exile of Ovid. Remains of the city walls were discovered across the promontory upon which the residential part of the town is built. A small museum which contained all local antiquities was looted by Bulgarian soldiers during 1917 and the contents dispersed. Greek objects of commerce were found as far inland as the headwaters of the Pruth and the Arges. Wine from Thasos and the Aegean was a much valued commodity in these regions.

The country is extremely rich in Roman remains. The great wall of Trajan can be traced without difficulty between Constanta and the Danube near Cernavoda. Extensive remains of Axiopolis at its western end can be seen on the Danube, and excavations were carried out there. The most impressive of all the Roman monuments is the Tropaeum Trajani at Adamklissi. It stands in a wild and desolate region in the rolling steppeland between the Danube river and Constanta with much of its sculptured decoration still lying round the massive concrete core which survives. The Roman town of Ulmetum midway between Harsova on the Danube and the coast has also been explored and excavated. Along the Danube the traces of Trajan's campaigns are numerous. The inscription recording his construction of the road along the south bank near the Iron Gate is still visible in the cliff face near the island of Ada Kalesi. Some of the piles of the bridge he built across the Danube still survive.

In Transylvania inscriptions are found as far north as the Polish border and elements of the various fortifications built at different periods can be made out. At the village of Verespatak, near Cluj considerable traces of Roman gold mining are to be seen and a series of important inscribed wax tablets was found there, bearing record to the manner and method by which the mines were worked. Of the Dacians who opposed the Romans there is much evidence but the archaeological discoveries are not of the first importance. The site of Sarmisegetusa has been identified in the mountains a little south of Deva in Hunedoara. It is a powerfully fortified hill city and was the metropolis of the Dacians.

Post-Roman remains of the time before the Rumanians came under the influence of Byzantium are rare, and little or nothing is known about the country at this time. The great gold treasure of Petroasa, however, which was transported to Moscow during World War I, is certainly of Hunnish or semioriental origin. It consists of two superb chalices of pure gold, inset with large garnets and with handles shaped like panthers, a large necklet of the same material, several large gold ewers elaborately chased and some superb toraues.

Byzantine remains are not of importance until the 14th century when the Byzantine church and monastery of Curtea de Arges mas built. The frescoes there rank as the finest and oldest Byzantine works of art in the country.

A special architectural style grew up after this, particularly in Moldavia, based upon the Byzantine, but of a very marked character and of great beauty. It flourished mostly in the 16th and early 17th centuries. The Church of Trei Erarchi (Three Saints) at Iasi. founded in 1639, is one of the finest examples. The style of architecture so evolved is purely Rumanian and owes little or nothing to Greek or Slavonic tradition in matters of decoration, though the structure is in essence Byzantine. Byzantine traditions in painting dominated the artists of the churches and monasteries down to the 18th century. (S. CA.)

EDUCATION

Elementary education in Rumania, both before and after World War II, was described officially as free and compulsory. The remark of the old Rumanian academician, I. Simionescu, describing pre-1939 conditions, remains apposite: "In reality. it is not so free as one would think. because the committees charge a fee for each child: it is not compulsory because the state budget never allows for the setting up of enough schools to accommodate all the children of school age."

A national educational system was a comparatively late development in Rumania, partly because of the lack of a literary form of the language; a system began to take shape in the 19th century but development was most rapid after World War I. In regard to

the state-provided schools, in the year 1937–38, 120,516 children were said to be in attendance at infant schools, 2,358,059 at primary schools, 164,603 at secondary schools; the numbers at private schools were much smaller, being respectively 8,922 (infant). 133,184 (primary) and 35,922 (secondary). By 1950, the numbers attending approximately 14,000 primary schools were 2,079,357, secondary schools 365,310.

In 1952, Rumania possessed four universities, the same number as in 1939, that at Cernauti (founded in 1875), noted as a centre of Germanization, having been lost to the U.S.S.R. and replaced in 1945 by a new foundation at Timisoara. The other three are at Bucharest (founded 1864), Iasi (1860) and Cluj (1872). The university of Cluj was formerly a Magyar institution. but after its nationalization in 1919 had both Rumanian and Hungarian colleges. The superior learned society, the Academia Romana of Bucharest, was founded in 1866 by C. A. Rosetti.

The Communists paid a great deal of attention to the problem of providing an adequate elementary education for the Rumanian people. Their great interest lay in complete control of the young mind and the implantation therein of their particular political beliefs, and the exclusion of other concepts, interpretations of history and so forth that tended formerly to influence the nation in the direction of western thought. Political instruction, in fact, became compulsory at each stage of education. Education was rendered completely secular in 1948, with the abolition of private schools, of religious teaching in school hours and of all the religious orders.

The other great concern of the party was the provision of skilled personnel to carry through the ambitious program of industrial development envisaged in the five-year plan. Four colleges of engineering were founded at Bucharest, Timisoara, Craiova and Iasi. In 1951 there were in all 11 institutions of higher education with about 57,000 students.

The comparatively recent emergence of Rumania as a political entity together with the continuing instability of frontiers and of internal politics are factors which tended to exaggerate the lack of economic balance. Resources were exploited rather than husbanded, the more so as German economic imperialism began to dominate the scene in the 1930s. During World War II the Rumanian oil resources and surplus grains were of supreme importance to the German war machine. After the Soviet occupation in 1944, Germany's position was taken by the U.S.S.R.. and Rumanian industries, especially oil, mining, timber, textiles and heavy industries were at the disposal of the Soviet Union. The transfer to the U.S.S.R. of German assets in Rumanian industries and commerce was made law by a Rumanian decree of April 1946. Thus, for example, the largest iron and steel concern, Resita, passed to the Soviet Union and the Soviet State Insurance company took over German assets in Rumanian insurance. Other foreign assets passed to the Soviet Union; *e.g.,* the Hungarian holdings (amounting to 62% of the total) which accounted for about three-fourths of the total Rumanian output. Special Soviet-Rumanian or "Sovrom" joint-stock companies, with the Soviet Union as the controlling partner, were set up to exploit these assets, and became dominating features of the Rumanian economv.

On Sept. 18, 1954, an agreement was signed for the "sale and transfer" to Rumania of the Soviet share in 12 joint-stock companies; it provided that the Soviet share would be "reimbursed by Rumania on favourable terms, in instalments over a number of years." Nevertheless, four "Sovroms" continued to function. namely, *Sovromasigurare* (insurance). *Sovromfilm, Sovromcuartit* (uranium ore) and—the most important of all because it controlled the largest oil industry in Europe outside Russia—*Sovrom*-petrol. The Soviet shares of *Sovrompetrol* were transferred to Rumania on Dec. 13. 1955, and those of *Sovromcuartit* on Oct. 22, 1956.

In Jan. 1949, Rumania joined the Moscow Council for Mutual Economic Aid, and the annual trade agreements signed in Moscow, as well as the first five-year plan (1951–55), all contributed to the further development of the new trend in the Rumanian economy. Pronouncements by the Rumanian Communist leaders confirmed that the trend toward closer integration with the U.S.S.R. was continuing undiminished.

Rumania follo ed closely the pattern of economic reform set after 1944 throughout the Soviet-dominated sphere of Europe.

In agriculture, the road to collectivization had already been prepared by the land reform of 1945, and collectivization itself put into operation fully after the 1949 reform. After 1947, privately owned industry, commerce and finance, and western types of trade-union organization, social welfare and cultural activities were gradually destroyed by Communist reforms. By 1952, industry, transport and communications were the property of the state, controlled directly by it or by the various Sovrom companies.

In June 1948, a law was passed nationalizing the subsoil rights, industry, banking, insurance, mining, transport and telecommunication undertakings. This was followed immediately by the establishment of a supreme State Planning commission and the reorganization of the existing industrial boards into state industrial centres for each industrial group.

A survey of industry and housing was carried out in Nov. 1948. The yearly plans of economic rehabilitation which covered development from July 1947 to Dec. 1950 eventually culminated in the first five-year plan, for 1951–55. The lack of coal as a source of power to supplement the oil and wood supplies, and the existence of a considerable hydroelectric potential, encouraged the planners to undertake a special ten-year electrification plan for 1950–60.

The cumulative effects of such planning were to be noticed in the continuing scarcity of food and other consumer goods. Rationing was carried out according to the Communist interpretation of political and economic "usefulness" of various classes of consumer. The cost of living increased enormously after 1944.

Agriculture.— Farming and forestry continue to be of great economic importance. In 1948 more than 75% of the total population was still engaged in rural pursuits.

The farming areas fall into several natural regions: (1) the Carpathians are given over mainly to forestry, but are noted for the old-established summer pastures—the *plaiu*—above the timber line. Under settled conditions, transhumance—the seasonal migrations of men and animals—was also practised by the peasants of the Danubian plains who sought out the hill pastures of northern Dobruja. The mountain sheep pastures are the basis of the home wool production which is usually enough to provide for the manufacture of the coarse woollen garments worn by the Rumanian peasants. The Carpathian settlements are of the characteristic line type, often strung out for five or six miles along the valleys; the houses have high-pitched roofs and thick carved beams. (2) Transylvania, an upland, hilly country with a harsh climate and forest, has mixed farming, producing the cooler grains. oats and rye, and much cattle and other livestock. (3) The piedmont zone

TABLE II.—*Agricultural Production*
(In *ooos* of metric tons)

verdant country with mixed farming, vineyards, plain orchards, groves of walnut trees and market gardens. (5) The Moldavian and Walachian plains slope gradually down to the Danube, and are steppelike and in part even semiarid. This is the region of concentrated settlement, of extensive farming, of occasional famine and outbreaks of pellagra, of large-scale wheat production, maize, sunflowers, rape, soya, tobacco, cotton and hemp. The largest areas of oilseed and industrial fibre production were lost when Bessarabia was annexed by the U.S.S.R. (6) The Danube flood plain produces a certain amount of rice. The lower Danube, in the shallows and lagoons below Giurgiu and in the delta itself, has an important fishing industry, specializing in carp, sturgeon, the black caviare from sturgeon, crayfish, etc.

The principal categories of land utilization are as follows (in thousand hectares, 1948): arable, 9,751; forests, 6,705; pastures, 2,820; meadows, 1,696; farmyards, 618; vineyards, 227 and orchards, 221. (See Tables II and III.)

Land Reform.—As in other countries of eastern Europe, the rapid growth of the peasant population, the survival of feudal systems of tenure and servitude, and the new demands for export foodstuffs arising from the industrialization of western Europe, combined to produce in Rumania in the latter part of the 19th century an acute agrarian problem.

After the emancipation of the peasants in 1864, they were granted from time to time allotments from crown lands, but such grants were never sufficient to satisfy the general land hunger. Distribution was equally unsatisfactory in the case of Bessarabia under the Russian and Transylvania under the Austro-Hungarian empire, but the Bukovinan peasants had been more fortunate in obtaining possession of a considerable share of the land. In 1920 an expropriation law was passed for Bessarabia, which was rapidly followed by similar laws for the old kingdom (1921) and for Transylvania and the Bukovina (also 1921), whereby provision was made for the total expropriation of absentee landlords, foreigners, mortmain estates and for partial expropriation of large landed properties. By the end of 1927 about 16,500 estates totalling 6,055,863 ha. had been broken up; of this land reserve 3,421,000 ha. had been handed to 1,368,978 poor or landless peasants, but 590,100 peasants were still without land.

Under the Communist regime, two further land reform acts were passed, that of March 22, 1945, mainly concerned with the expropriation of private properties in excess of 50 ha. and the properties of certain categories of individuals, such as Germans, war criminals, etc., and that of March 2, 1949, when the remaining property of 15,000 larger landowners was confiscated. The 1945 act was followed by the distribution of land to the landless and the poorer small landholders; but the whole aim of the Communist reforms was to replace the old system by one not of peasant ownership but one of collective farming on the Stalinist model. The liquidation of the kulak (*chiabur* in Rumanian), or larger peasant farmer, went hand in hand with the development of collective farms. The large estates of the past and the small peasant holdings still in existence were being gradually converted into the large state farms and collectives, the *sovkhozy* and the *kolkhozy,* which were the ultimate objectives of the Communist agrarian policy.

TABLE IV.—*Number of Holdings of a Given Area as a Percentage of Total Number**

Area (ha.)	1907	1941	1948
0–½	0.34	12.0	7.3
½–1	0.93	9.3	9.5
1–3	7.31	33.0	35.9
3–5	17.16	10.2	23.3
5–10	14.55	19.5	17.8
10–20	8.89	5.1	4.7
20–50			
More than 50	51.02	0.7	0.4

The 1907 figures apply to the old kingdom; the 1941 and 1948 figures exclude northern Transylvania; but although covering the same regions the 1941 figures apply to some 2,300,000 holdings covering more than 10,000,000 ha. 'three-quarters of which was arable land, while the 1948 figures apply to 2,600,000 holdings covering 17,000,000 ha., less than half of which was arable. The table does, however, serve as a guide to the process of "parcellation" prior to the commencement of the collectivization drive.

However, by Jan. 1, 1954, the private farmers still owned 83% of the agricultural land.

The forests of the Carpathian ranges and foothills, of the Transylvanian uplands and of the better-watered lowlands provide Rumania with one of its most valuable resources. In 1938, about 10% of the country's workers were connected with forestry, and timber exports were the third most important after oil and grain. It provides an important source of fuel, supplementing the oil supply and the scanty coal resources. Associated industries, such as furniture-making, pulp and paper, and cellulose are to be found at a number of suitably located centres such as Stalin (Brasov), Busteni, Bacau and Timisoara.

Industry.—The oil-bearing strata are found in a crescent-shaped belt running along the edge of the Carpathian foothills zone in Muntenia and Moldavia. Even before oil became the leading industry, this belt was one of the most populous in Rumania, and many peasants supplied seasonal labour to the oil producers. The chief producing regions are Bacau, Buzau, Prahova and Dambovita. Most of the refineries are situated in Ploesti, the oil capital, from which pipelines go to Constanta and Reni, in Soviet territory. The last-named was the former pipeline Ploesti-Giurgiu, dismantled and rebuilt by the Russians in Oct. 1945–Feb. 1946.

Natural gasoline had been used locally, but it was not until 1854 that the extraction of petroleum began on a commercial scale. Production increased steadily, except during World War I, until a peak of 8,700,000 tons (3.5% of the world production) was reached in 1936. Lack of technical skill and equipment held up production after World War II, although prospecting and drilling were carried out with increasing vigour especially after the five-year plan started in 1951.

REFINERY AT PLOESTI, CENTRE OF THE RUMANIAN PETROLEUM INDUSTRY

In addition to oil, Rumania possesses the largest source of natural gas in Europe, with a production in 1947 of 1,176,000,000 cu.m. This methane gas, found near Medias, Copsa Mica and Sarmasel in the Transylvanian basin, is widely used for lighting and heating purposes.

Rumania has no large resources of coal and iron, and heavy industry was therefore on a restricted scale. The most important coal field is in Oltenia, in the upper Jiu valley in the southern Carpathians centring on Petrosani, producing anthracite and lignite. The hard coal, some of which is suitable for coking, is found toward the western end of the Carpathians in the Anina-Resita area of the Banat. Other fields of brown coal are found in the foothills in Muntenia (Filipesti), Transylvania and Moldavia (Comanesti).

The deposits of iron ore, mainly limonite (47% to 54% iron)

and siderite (28% to 35%), are small and are found chiefly in the vicinity of the metallurgical centres of Resita and Hunedoara. Imported scrap was also a vital necessity. The centres of heavy industry are Bucharest (machinery, machine tools, agricultural

equipment, locomotives, railway cars, pipes, etc.); Resita (iron and steel, armaments); Hunedoara (iron and steel) and Brasov (tractors, aircraft, armaments, machinery, locomotives, etc.). Under the five-year plan, a new steel centre was set up at Campia Turzii near Cluj.

In 1948, as part of the Communist plan for nationalizing industry, the mining of precious and nonferrous metals was put in charge of a state centre, with divisional headquarters at Bai Mare, northern Transylvania, and Brad, in the Bihor mountains of central Transylvania. The first district has gold, silver and lead mines as well as processing and refining plants, the second possesses gold, silver. lead, zinc, bauxite and mercury mines, with plants for processing, refining and distilling, and for the manufacture of chemicals.

Rumania was normally self-sufficient in lead, but needed to supplement zinc supplies by imports from Poland. Gold production in 1947 was 71,728 fine troy ounces, Rumania ranking with Sweden as one of the leading producers in Europe. Bauxite production was never on a large scale, and aluminum production was on an experimental basis, at least until 1939. Other products are mica, chrome and manganese.

The Tertiary rocks of the Transylvanian basin and the foothills of the Carpathians in Oltenia and Moldavia contain vast reserves of salt; extraction is carried on at Ocnele Mari on the Olt Slanic in the Prahova valley, and Targu Ocna.

Communications.— Compared with those of western Europe, transport and communication standards are low. Up to the 1950s political and economic conditions had prevented a great development of roads and railways; the former were few indeed, and the oxcart and unmetalled track were a more familiar sight than the motorcar and surfaced highway; most railways were single track, nith the exception of certain sections of the Orient Express route, notably from Bucharest to Brasov, and parts of the Bucharest-Braila line.

The Germans attempted during World War II to improve certain road and rail communications in order to make Rumanian resources, petroleum, minerals and timber, more easily accessible; to enlarge facilities on the Danube at minor ports to relieve congestion at the bigger centres; and to aid the flow of military traffic across the Danube into Bulgaria. In the period after 1945 similar operations were undertaken with the difference that trade was now directed not toward Germany and the western European countries but mainly toward the U.S.S.R. and the other Soviet bloc countries. The new railways were extended into the Jiu coal field and into the forests of the Moldavian Carpathians.

The Danube is navigable throughout its whole length in Rumania, but there are two distinct sectors for traffic—seagoing vessels of 2,000 to 3.000 tons go upstream as far as Braila and Galatz, and river vessels ply on the rest. Heavy-draught shipping does not enter the Danube but docks at Constanta, as the Sulina bar needs constant dredging to maintain a depth of water of 22–23 ft. In the Iron Gate gorge, between Turnu Severin and Orsova, specially skilled pilots and smaller tows of barges are required to navigate the reefs and rapids, but below Calafat the current is slight. Ice blocks the river during about three winters out of every four, the blockage lasting sometimes from mid-December to March; occasionally late summer droughts close the Danube for a period in the autumn.

The Danube river has a steep bank on the Bulgarian side but on the left bank below the Iron Gate gorge the flood plain, with its marshes and lagoons. is several miles wide. The railway bridge carrying the Bucharest-Constanta line across the Danube at Cernavoda is $7\frac{1}{3}$ mi. in length. A new road and railway bridge, between Giurgiu and Ruse. Bulg., was inaugurated in June 1954. Another project, the Danube–Black sea canal, first publicized in 1949, was reported to have been begun soon after but in Aug. 1953 work on it had stopped. This new waterway would save the long detour of the delta and the Sulina bar by linking Cernavoda to a point a short distance north of Constanta on the Black sea coast. (See also DANUBE.)

Traffic remained at a very low ebb between 1945 and 1948, but increased subsequently with the development of trade between the Soviet-bloc countries. The goods carried consist mainly of Soviet iron ore destined for Czechoslovakia, Hungarian bauxite and Rumanian timber, oil and cement for the U.S.S.R.

The ports have tended to specialize according to their hinterland and harbour facilities. Thus Constanta is the chief oil port, Braila is the chief grain port, and Galatz, besides being the main port of entry and principal naval base, handles most of the timber which is floated down the Siret or comes by rail from Bukovina and Moldavia.

The length of Rumanian railways was estimated in 1949 at 7,363 mi.. and that of roads at 43.163 mi., including 1,150 mi, modernized. The number of telephones was estimated at 140,000 in 1953, and that of wireless receiving sets at 226,000 in 1949.

Finance.— The economic and political conditions peculiar to Rumania have been nowhere more apparent than in the financial sphere. Although the country possesses considerable man power and natural resources, a certain lack of balance and an emphasis on exploitation rather than conservation always characterized the country's economy.

During the 1930s, the financial situation was dominated by the sharp drop in world agricultural prices, and the mounting foreign debt which by 1935 had risen to 80% of the total national debt of 139,000,000,000 lei. A temporary improvement was more than offset by the deterioration caused by general rearmament in the late 1930s.

After 1945, and before reparations payments were reduced by the U.S.S.R., a serious degree of inflation resulted. Two currency reforms ensued. the first in Aug. 1947 nhen 20,000 old units were made exchangeable for one new leu, and the second in Jan. 1952. The latter pegged the Rumanian currency officially to the Soviet rouble, and one new leu was exchanged for 37 old ones. After the 1947 reform the exchange rate for the leu (plural lei) nas fixed at U.S. $1 = 150 lei. On Jan. 28, 1952, new rates were fixed: 1.50 lei to the rouble, 6 lei to the U.S. dollar and 16.80 lei to the pound sterling.

In carrying out these reforms, not only was Rumanian economy made entirely dependent upon that of the U.S.S.R.. but class warfare inside Rumania was furthered. Private financial power was destroyed. and the independent farmer, craftsman, manufacturer and professional man was reduced to a position of complete dependence upon the state. At the same time, the real value of wages was not increased; scarcities and rationing were the order of the day. The most Rumanian banks were dissolved in Aug. 1948, and a few months later the National Bank of Rumania was transformed into the Bank of the Rumanian People's Republic.

DEFENSE

After 1945, Rumania formed an integral part of the Soviet defense system in eastern Europe. The country was occupied by a large Red army force until the signing of the peace treaty in 1947, and certain numbers were maintained there subsequently.

BY COURTESY OF INSTITUTUL DE RELATII CULTURALE CU STRAINATATEA

WINDMILLS IN THE DELTA OF THE DANUBE RIVER AT THE BLACK SEA

The ne Rumanian army was rebuilt around the three divisions of Rumanian prisoners of war who had been trained in the U.S.S.R. and crossed the frontier as liberators alongside the Soviet troops.

The peace treaty laid down that the Rumanian armed forces should be restricted to the following: (1) land forces (including frontier guards) of up to 120,000 men; (2) antiaircraft artillery with 5.000 men; (3) an air force with 150 aircraft. of which not more than 100 might be for combat, and a personnel of 8,000 and (4) a navy of up to 15,000 tons and 5,000 men.

By 1955 the total numbers under arms including security forces had risen to about 400,000 or more than three times the peace treaty level. In addition, Soviet forces occupied certain positions in Rumania.

Rumania continued to keep small naval forces in the Black sea and on the Danube. (G. W. S.; X.)

RUMANIAN LANGUAGE, one of the Romance languages (*q.v.*), in the main is derived from the Latin of the province of Dacia, which roughly corresponds to modern Rumania. Four principal dialects may be distinguished: (1) Daco-Rumanian, or Rumanian par excellence, spoken by about 18.000.000 persons in modern Rumania, the Banat (Yugoslavia), and in some villages of Bulgaria and Hungary near the Rumanian border, that is, mostly on the left bank of the Danube; (2) Macedo-Rumanian, or Arumenian, spoken by some 350,000 persons scattered in various regions of the Balkan peninsula (Thessaly, Epirus, Albania, Macedonia, Bulgaria); (3) Megleno-Rumanian, or hleglenitic, spoken by a few thousand persons northwest of Salonika; (4) Istro-Rumanian, spoken by a few thousand persons on the Istrian peninsula around Monte Maggiore

Although these dialects are sufficiently different from one another to make communication difficult if not impossible, they may all be classified together because of their similarity in structure.

Dacia was conquered by the Romans during the reign of Trajan in hard-fought campaigns of A.D. 101 and 105–107; it was named after the vanquished Dacians, of whom little is known. The inhabitants were virtually exterminated, and the province was colonized by settlers from all parts of the empire, especially Syria and Asia Minor, who romanized the land. It should be noted that in this romanization of Dacia the substratum population had a small part. if any. But only 170 years later, between 271 and 274, the old province of Dacia north of the Danube was abandoned under the emperor Aurelian, who established a new Dacia Ripuaria south of the Danube at the expense of Moesia and Thrace. Eventually the region became part of the Eastern empire and was the battleground and the gateway into the empire for successive Germanic tribes and nations moving southward and westward from the Baltic countries. From the early 7th century, this part of the Romance-speaking world has remained cut off from the remainder by intrusions of Slavonic peoples (the Slovenes to Pannonia, that is, Hungary and eastern Austria, the Serbs and Croats to the northwestern Balkans).

Linguists are faced with the paradox that in the older Dacia (abandoned by the Romans in 271) Latin speech was preserved, whereas in the newer Dacia Ripuaria south of the Danube (which remained much longer in Roman hands) Slavonic dialects are spoken. Unfortunately, the social and ethnic history of the area during the dark ages is too little known to provide a good explanation. As far as the Romance language of Rumania is concerned, linguists seeking a reason for its presence have proposed two principal theories: (a) Latin speech was continued throughout the ages in Rumania; indeed, the withdrawal of the Romans under Aurelian to regions south of the Danube was not complete, and later non-Romance-speaking invaders were absorbed, at least linguistically, by the tenacious colonists; (b) the retreat of the Romans under Xurelian was indeed total, but Romance-speaking people later recrossed the Danube when onrushing Slavs forced them out of their homes. Some of them moved into other regions, where they planted the various dispersed Rumanian dialects now lying outside of Rumania proper. Since the first report of Neo-Latin speech in Rumania dates only from the 13th century and since the first Rumanian text available stems from the early 16th century, the

belief in remigration and noncontinuity of speech seems confirmed. But this is an *argumentum ex silentio* and therefore not conclusive.

The truth lies probably between these extremes: the Aurelian withdrawal was not complete. and a remigration did occur after the 6th century. Some linguists are eager to prove not only an uninterrupted continuity of Romance speech in Rumania but also an ethnic continuity which would make Rumanians the true descendants of the Romans, a notion dear to the heart of many patriots. Linguistic continuity. however, is not dependent on ethnic or local continuity. In the absence of other proofs, therefore, a Romance language in Rumania is no proof of the ethnic Roman-ness of modern Rumanians.

The historical development of the Rumanian language from Latin is quite regular, that is to say, the operation of the rules of phonemic development and substitution (the so-called sound laws) is not greatly disturbed by other factors. One of the most important such interferences is analogy, which restores paradigmatic orderliness that the strict obeisance to sound laws is apt to obliterate. Consequently, in view of the small part played by analogical leveling in Rumanian, it is from the descriptive point of view, and for the learner, a somewhat irregular language.

The following are the most important changes and features of Rumanian linguistic history. (For earliest developments from Latin *see* ROMANCE LANGUAGES)

Phonology.— As in other Romance languages, Latin *ē* and *ĭ* coincide as *e: credo* > *cred, lĭgo* > *leg.* Unlike most others. but like Sardinian. Corsican and Dalmatian. Rumanian continued the distinction between Latin *ō* and *ŭ: cōco* > *coc, fŭrcam* > *furcă.* The other Latin vowels have the same proto-Romance developments as they had in other Romance languages. Latin *-ct-* > *-pt-, -ks-(-x-)* > *-ps-, -gn-* > *-mn-: ŏcto* > *opt, coxam* > *coapsă, cognatum* > *cumnat.* A similar labialization changes *-qu-* and *-gu-* to *p* and *b: aquam* > *apă, linguam* > *limbă;* but before front vowels they become *ts* and *dz: quinque* > *cinci, sanguinem* > *sânge.* Rumanian has two high mid vowels, spelled *ă* and *â* or *î*, the first from Latin *a* in unstressed position. the second from *a* before nasal consonant: *carbonem* > *cărbune, aqua* > *apă, canto* > *cânt.* When stressed *e* or *o* is followed by a syllable containing *e* or *a (d)*, diphthongization occurs (through metaphony): *nigram* > *neagră* (but *nigrum* > *negru*), *mollem* > *moale.* Dental and velar consonants if followed by front vowels are palatalized: *diem* > *zi* [*dzi*]; *caelum* > *cer* [*tšer*]; *terram* > *ţeară, ţară* [*tseara, tsarə*]; *gelu* > *ger* [džer]. Intervocalic *-l-* rhotacizes: *solem* > *soare.*

Morphology and Syntax.— The noun has: (a) one singular and one plural form without article *(domn, domni* [masc.]; *soare, sori* [masc.]; *casă, case* [fem.]; *carte, cărţi* [fem.]); (b) two singular and two plural forms with the article (direct case, *domnul, soarele, casa, cartea; domnii, sorii, casele, cărţile;* oblique case: *domnului, soarelui, casei, cărţii; domnilor, sorilor, caselor, cărţilor*), where the forms of the article are derived from *illu, ille, illa, illi, illae, illui* (classical dative *illi), illaei (illi),* and *illorum,* respectively. Note that the article in Rumanian is postposited. A number of nouns have different gender in the singular and plural: *câmp* (masc.); *câmpuri* (fem.). The infinitive of the verb is shortened, a *cântà* < *cantare,* but the long form *cântare* serves as a verbal noun. The future is formed by means of *uolēre* (classical *uelle*) "to wish" followed by the infinitive: *voiu cântà* or *cântà-voiu* "I shall *(cf.* 'will') sing"; an alternative way is a form of *a avea* (< habēre) + să + subjunctive: *am să cânt;* in the latter case the auxiliary verb may be used in an invariable form *o: o să cânt.* (Similar formations exist also in Albanian, Bulgarian, Greek and Serbian. which induced some linguists to postulate a general Balkan linguistic area.) Characteristics of syntax are: the repetition of the personal pronoun in nonsubject case forms—*pe mine nu m'a văzut* "(me) he hasn't seen me": the replacement (not obligatory) of the infinitive direct object by a subjunctive construction (also Albanian, Greek, Bulgarian, Serbian)—*vreau să spun* "I should like to say"; the replacement of the possessive pronoun (when the possessor is not emphasized) by the dative of the personal pronoun — mi-ai *luat cartea* "you took me the book" = "you took my book" (not uncommon in other Romance languages. especially Italian and Portuguese); the use of the preposition *pe* with the direct object if this is a person — am *vdzut pe vecinul nostru* "I have seen our neighbor" *(cf.* the use of *a* in such cases in Spanish).

Vocabulary.— Among words of Latin origin in Rumanian there are a number which do not occur in other, especially the western, Romance languages. This is, of course, due to the isolation of Rumanian. (One hundred and twenty such words, or 6% of the total Romance lexicon, have been counted — but such counts must, for a variety of reasons, be taken with reservations) It is only natural that Rumanian should contain many loanwords from non-Latin languages, especially Slavonic, but also from Turkish, Hungarian, Albanian, depending on the geographic location of a given dialect and the cultural prestige or propagating power of the donor language at a given time. On the whole, the number of Latin words in the dictionary is smaller than that of the others all together, even smaller than that of Slavonic words alone. But in a count of frequency of occurrence the percentage of Latin would be much higher.

The Rumanian literary language is based mainly on the Daco-Rumanian dialect of Walachia. It assumed importance only at the end of the 18th and the beginning of the 19th centuries. Before that all literary output was dialectal. With the literary language came also, for a time, a purist movement favoring the exclusion of all non-Romance words; this, of course. could only have crippled the language. The change-over from Cyrillic to Latin nriting and the establishment of a more etymological orthography, advocated about the same time, were successful.

RUMANIAN LITERATURE. The nritten literature in Rumanian is paralleled by a rich folklore, lyric. epic, dramatic and didactic, nhich has continued till modern times. The lyric poetry consists of *doine* (love songs songs expressing an undefined longing). *bocete* (dirges), *colinde* (carols) *cântece* (lyrics) The epic genre is represented by ballads in verse *(ccintece bătrâneşti)* and by folk tales in prose. The dramatic genre has its representatives in mystery plays, scenes of the nativity. new year plays (*Vicleim, Irozi*). The didactic literature shows a great richness in proverbs, riddles, satiric songs.

The geographical position of Rumania enabled its folklore to mediate the transfer of folklore themes from the Balkans to the east (Ukraine. Russia). The religious homogeneity of the region, situated between Byzantium and Kiev. favoured. on the other hand, the circulation all over this area of the literature written or printed in the Rumanian principalities Western influence reached the Rumanian lands through Hungary, Transylvania and Poland, uhen the first political organizations were founded, east and south of the Carpathian range, in the 12th–14th centuries. In the next centuries the Reformation prompted the first translation of church literature from Slavonic into Rumanian (1 jth century) Up to the 17th century. Church Slavonic was the language of the church and of the chanceries. In 1600 Prince Michael of Walachia issued. in Alba Iulia. Transylvania, the first state paper in Rumanian. In the 18th century the autochthonous ruling princes were replaced by Greek rulers from Constantinople (in Moldavia in 1711, in Walachia in 1714), and for more than a century the culture of the principalities was mainly Greek, Rumanian and Slavonic playing a secondary role. As after the fall of Constantinople and the disappearance of the Slavonic states south of the Danube, the Rumanian principalities became the haven of the Slavo-Byzantine culture so in the 17th and 18th centuries they became the centre of Greek Orthodox culture, which spread from there over all Orthodox countries. The French Revolution and the ideas of the romantic movement shook off the domination of the Phanariotes and, under uestern influences, began the national revival.

The development of Rumanian literature may be divided into four periods: (1) from the first Rumanian texts, written in the 1 jth century and preserved in copies of the 16th century, to the Phan-

ariote period; the activity of this period is crowned by the translation of the whole Bible (1688); (a) the 18th century up to the national movement of Tudor Vladimirescu (1821); (3) the national renaissance under western influences, from 1820 to World War I: (4) the national unity and the literary integration.

The Old Period. — The oldest translations from Slavonic are Rumanian interlinear verses or interpolations in religious texts of the 15th century From the same period date the so-called rhotacizing texts. preserved in copies of the 16th century, written in Maramureş (northern Transylvania), under the impetus of the Hussite movement. or according to another opinion under the influence of the Reformation. Such texts are: *The* Psalter of *Şcheia,* The Psalter of Voronef, The Acts of the Apostles. Their characteristic feature is the change of intervocalic *n* into *r* in words of Latin origin (bire for bine < Lat. *bene*).

The printing press was introduced in Walachia in the first years of the 16th century from Venice. On this press was printed in 1508. in Tbrgoviste, a Slavonic liturgical book. Toward the end of the century a certain Deacon Coresi moved from Tbrgoviste to Braşov and printed, in 1560–61, a translation of the Gospels. Of a Rumanian Lutheran catechism. printed in 1544, no copy has so far been found. Coresi. assisted by local clergy, revised. completed and printed the existing translations. Among those printed are found. the *Acts of* the Apostles (Lucrul Apostolesc, 1563); Sermons and Book of Prayers (*Tâlcul Evangheliilor şi* Molitvenic, 1564); Psalters (1568, 1570); Interpretation of the Gospels (Evnnghelie *cu învăţătură,* 1581). Coresi's prints enhanced the spreading of the Rumanian language in the churches of the three principalities Other centres which supported this movement by their printing activity were: *Sas-Sebeş* (produced probably Coresi's *Slavo-Rumanian* Psalter, 1577); Alba Iulia (Evanghelia *cu învăţătură,* 1641; The Gospels, 1579); *Orăştie* (Palia, printed in 1582 for the Calvinist Rumanians).

This activity, enhanced by the ferment of the Reformation in Transylvania, continued in the 17th century. In 1648 there appeared in Alba Iulia the Gospels translated by the metropolitan Simion Stefan (*Noul* Testament dela *Bălgrad*), a version collated with the Greek, Latin and Slavonic texts. The first Rumanian book printed with Latin characters is a Calvinist hymnbook of 1570.

The religious literature printed in the first half of the 17th century in Walachia and Moldavia came partly as a reaction to this activity stirred up by the Reformation. South of the Carpathians, in Walachia. the most important centres in which books were printed are. Câmpulung (*Învăţături* preste *toate zilele,* 1642); Govora (*Pravila,* 1640; Evanghelie *învăţătoare,* 1642); Mănăstirea Dealului (Evanghelze *învăţătoare,* 1644); Tbrgoviste (*Mystirio* sau *Sacrament,* 1651; *Îndreptarea Legii,* 1652 = Nomokanon); Râmnicu-Vâlcea (Antologhion, 170j); Bucharest (Bucureşti) (Cheia *Înţelesului,* 1678); Buzău (*Octoih,* 1700); Snagov (Carte sau *lumină,* 1699).

In Moldavia, whose monasteries were centres of theological studies, the reaction against the Reformation found its expression in the metropolitan Varlaam's Reply (1645) to the Calvinist catechism printed in Alba Iulia (1642). In 1643 Varlaam published in Jassy (Iaşi) *Cartea Românească* de *învăţătura* ("Sermons"). In 1646 was printed in Jassy the *Pravila lui* Vasile *Lupu* ("Laws of Vasile Lupu, Prince of Moldavia"). The Walachian *Pravila lui* Matei *Basarab* (1652) incorporated in its texts also the Moldavian code of 1646. This collection of canonical and civil laws remained in force, with some additions, up to the middle of the 19th century.

The Moldavian metropolitan Dosoftei, a great scholar and theologian, published in 1673 in Uniejów (Uniev). Pol., where he was in exile, the first book of poetry, The *Rhymed* Psalter. In 1679 he translated the liturgy from the Greek. At this time the Orthodox see of Kiev was occupied by Peter Movila or Mogila (*q.v.*), a countryman of the two former hierarchs. At his request, Vasile Lupu convoked in Jassy the last pan-Orthodox synod, 1642, to counteract Roman Catholic propaganda. The Confessio Orthodoxa, drawn up in that synod. remained the dogmatic charter of all Orthodox churches. A Rumanian translation from Greek by Radu Greceanu (*Pravoslavnica Mărturisire*) was printed in Buzău.

Toward the end of the 17th century the monastery of Snagov. near Bucharest, became the centre of a pan-Orthodox literary activity, and on the initiative of a monk, Antim Ivireanu, books were printed not only in Rumanian but also in Greek, Slavonic and Arabic. A Rumanian printer, Mihai Stefan, introduced the press into the Caucasus where he printed the first Georgian books: The Gospels (1709) and The Georgian *Liturgy* (1710).

The religious literature, common to all three principalities, reached its climax with the edition of the complete Bible (1688) translated from the Septuagint by Radu and Şerban Greceanu. This Bible was the basis for all successive translations. With the fall of the principalities under the Phanariote rule begins the downfall of Rumanian culture.

Early historiography is represented by Slavonic annals and commemorative tables of the monasteries (*Letopiseţul* dela *Bistriţa,* 1359–1506). It reached its climax with the humanist historiographers of 17th-century Moldavia. The Italian Rinascimento, through the Polish humanism, finds its expression in the slogan of Grigore Ureche. the father of Moldavian historiography: "We descend from Rome. and our language is made of Latin words." This creed will be echoed through the following centuries. Miron Costîn (1633–91), a student of Polish schools, who also wrote in Polish a chronicle of Moldavia and composed a poem on the history of his country, is the leader of this historiography. He took up the thread of the history of Moldavia where it was left by his predecessor G. Ureche (*Letopiseţul Tării Moldovei 1359–1595*), and continued its tale (1595–1661). Costîn's son, Niculae Costîn. amplified the chronicle of his father; Ion Neculce carried it forward up till 1743. He is a pioneer in folklore with his collection of legends (*Ocsamă* de *cuvinte*) The learned Demetrius Cantemir (q v), prince of Moldavia. wrote in Latin the history of the Rumanians (1698), which was translated into Rumanian in 1710 (Hronicul *Românо-Moldo-Vlahilor*). His Latin Descriptio *Moldaviae* (1716) was translated into Russian (1786), German (1769), Greek (1819) and Rumanian (1825). He took his place among the western historiographers, as member of the Academy of Berlin and as a knight of the Roman empire, with his Hzstoria *incrementorum* atque decre*mentorum* aulae othomanicae (1715–16), translated into French. (1743), German (1745) and English (1734–35 and 1756) by the care of his son Antioch, Russian ambassador in London.

A special place among the Moldavian historians is occupied by the great polyglot Spatharius Niculae Milescu who wrote theological, historical and travel works. As envoy of Tsar Alexius Mikhailovich he undertook a journey across Siberia to China. (His description of this journey was published by J. F. Baddeley, Russia, Mongolia, China, 1919).

The Walachian chroniclers are less original and more personal. Stoica Ludescu compiled from earlier annals a History of Walachia up to 1688. He was chronicler of the Cantacuzinos. Radu Popescu wrote a history of the rulers of Walachia (Cronica *Ţării Românești*) from the point of view of a boyar party headed by the Băleanu family. Radu Greceanu carried the history of Walachia up to 1714, when Constantin Brâncoveanu (Brancovan), his four sons and his son-in-law were beheaded in the market place of Constantinople. The *stolnic* (steward) Constantin Cantacuzino, a student of the University of Padua, the political mentor and the cultural patron of his country, wrote a history of Walachia (*Istoria Ţării Românești,* c. 1710).

The profane literature is represented by numerous translations from Greek or Slavonic of historical or apocryphal books. The last category was uritten mainly under the influence of the Bogomils. **A** collection of such texts is contained in the Codex Sturdzanus. Many Byzantine and oriental popular books found their way into the Rumanian literature. Fiore di *virtù* was translated, in the 16th century, from Italian. The most important didactic works of this period are the Teachings (*Învăţăturile*) of the prince Neagoe Basarab, written in Church Slavonic in the 16th century and translated into Rumanian c. 1654. This is a treatise on policy based on Christian morals.

The 18th Century. — The Phanariotes counted among them some well-meaning rulers who patronized Christian culture in the Rumanian principalities. However, politically and economically this period presents a sad picture of social oppression and deca-
