dence. A rich profane and apocryphal literature circulated in numerous manuscripts (*Erotocritul, Fiziologul, Istoria lui Archir, Viaţa lui Esop, Halimaua,* etc.); the printing presses of the monastic centres continued to produce beautiful books, but there was no progress in comparison with the past. A great number of liturgical books were printed in all three principalities. In Moldavia a new cultural centre arose at Rădăuţi where there appeared a *Cataaasier* (1744) and a *Ceasoslov* (1745). The achievements of the century are the *Minei* ("The Lives of the Saints") (1776–80) published in Râmnicu-Vâlcea. and the *Minei* (1807–15), each in 12 volumes. published in the monastery of Neamţul. The richness and lucidity of the language, as well as their execution, put these publications alongside the Bible of 1688.

In 1700 a minority of Rumanians of Transylvania joined the Church of Rome with a view to obtaining protection from Vienna against the Hungarians. The disciples of the theological schools of Rome and Vienna amplified the ideas of the Latin origin taken from the Moldavian chroniclers and from the church books in Walachia This ferment. however, was not favourable for literary creation. The representatives of the Latinist school of Blaj, the cultural centre of the Uniate Rumanians, were zealous scholars and great patriots.

Samuil Micu-Clain (1774–1806) wrote *Istoria . . . Românilor* (Buda. 1806) according to western standards and, in collaboration with Gheorghe Sincai (1753–1816), the author of the *Hronica Românilor* (1807), he published the first Rumanian grammar, *Elementa linguae daco-romanae sive valachicae* (1780). The third scholar of Blaj. Petru Maior (1755–1821), fought for the introduction of the Latin alphabet with his *Orthographia romana sive latino-valachica* (1819) and wrote *Istoria pentru începutul Românilor t ?Ðachia* (1812). A collective work of this school is the *Lesicon românesc-latinesc-unguresc-nemţesc* (182 *j*). Many religious books completed the arduous task of these apostles of Latinity. The bishop Ioan Bobb published (1812) Thomas & Kempis' *Imitatio Chrzsti* in a translation by Samuil Clain, who also revised the Bible of 1688 and published it in Blaj (1795).

Lyric poetry was cultivated, toward the end of the century, by Anacreontic love songs of Alecu Văcărescu (1796), one of the writers of the gifted Văcărescu family. His father Ienăchiţă (1720–96?) wrote the first grammar in Rumanian: *Observaţii sau bdgdri de seamd asupra regulilor şi orânduielilor gramaticii româneşti* (1787): his son Iancu (1786–1863) overshadowed his predecessors by his poems, published only in 1848. The lyric tradition was carried on in Walachia by B. P. Mumuleanu *(Rost de poesii,* 1820; *Caracteruri,* 1825), who wrote under the influence of Alphonse de Lamartine, Edward Young and neo-Greek poetry; by Vasile Cbrlova and others. In Moldavia this early versification is represented by Costachi Conachi and Enache Kogălniceanu who versifies historical events.

Epic verse was tried by Ion Budai-Deleanu who wrote a satirical epos *Ţiganiada* (1812), in which the heroes are gypsies. Vasile Aaron (1770–1822) sang, in 10.000 verses, the Passion (*Patima şi moartea Domnului Isus Christos,* 180*j*), an imitation of Milton's *Paradise Lost;* he also wrote *Piram şi Tisbe* (1807), inspired by Ovid's *Metamorphoses.* I. Barac (1779–1848) produced the epic *Risipirea Ierusalimului* (1821), *Arghir şi Elena* (1800) and translated from Homer and Ovid. Foreign plays were adapted and produced in Greek and in Rumanian: Molière. Corneille, Kotzebue, Metastasio *(Ahilefs la Schiro,* 1797), Schiller and also Shakespeare's *Hamlet* in a translation from German by Barac.

Anton Pann (1797–1854) popularized religious and profane folk literature and edited church service books with musical notations. His *Povestea vorbii* (1847–53) is an interpretation of proverbs connected by popular tales.

This period closes with the annexation of Bukovina (1774) by Austria and of Bessarabia (1812) by Russia. These events brought about translations of law codes in Russia and Austria. Also in the principalities law codes were compiled, in Moldavia in 1833 and in Walachia in 1780 and 1817.

The National Renaissance. — The landmark of this period was the rising of Tudor Vladimirescu (1821) and the return of national rulers. Romanticism carried forward the falling wave of the Latinist movement. In the second half of the 19th century a sober literary criticism, whose origins were in German philosophy and in French culture, inaugurated modern literature.

The Transylvanian Latinism crossed the Carpathians and had some beneficial effects on the Hellenized culture of Walachia. Gheorghe Lazar (1799–1823) came as teacher to St. Sava's college in Bucharest and Rumanized the teaching. One of his pupils, I. Eliade Rădulescu (1802–72), developed a prodigious literary activity and exercised a great influence on the literary development. In 1828 he founded the political newspaper *Curierul Românesc,* followed, in 1836. by a literary supplement *Curierul de ambe sexe.* His works include translations from Byron and Lamartine, but he was a pioneer of Italian influence. He founded the Societatea Filarmonică (1833), which afterward created the National theatre in Bucharest, and was the first president of the Rumanian academy (Societatea Academic: Română, 1866).

The Societatea Pentru Cultură (1862) in Bukovina called the Latinist Aron Pumnul (1818–66) from Blaj to Cernăuţi (Czernowitz), where he had among his pupils the greatest Rumanian poet of the 19th century, Mihail (Michail) Eminescu (*q.v.*). He published the *Lepturariu rumînesc* (4 vol., Vienna, 1862–64). The historian Simion Bărnuţiu (1808–64), who pronounced the speech of liberation on the Field of Freedom in Blaj (1848) took refuge to Jassy, where he taught in the university and created a school of lawyers and economists.

Gheorghe Asachi (1788–1869) represented the Italian influence in Moldavia; he created the historical short story, wrote verses in Rumanian and in Italian and founded the periodical *Albina Românească* (1828), with a literary supplement, *Alăuta Românească.*

A galaxy of poets enriched the romantic heritage. The Bessarabian A. Donici. in collaboration with C. Negruzzi. translated from Russian the satires and fables of his countryman Antioch Cantemir; another Bessarabian. C. Stamate, wrote under the influence of French and Russian romantics and translated from Thomas Moore and Sir Walter Scott. Andrei Mureşanu, the author of the revolutionary hymn *Deşteaptă-te, Române,* translated from Young. The Macedo-Rumanian D. Bolintineanu versified historical legends. The outstanding literary personality among them is Grigore Alexandrescu (1812–85). who wrote *Poezii* (1832), *Meditaţii* (1863), fables and satires under the influence of Boileau, Lamartine and La Fontaine. and translated from Voltaire and from Byron. Western romanticism penetrated through translations from French, Italian and German. *Robinson Crusoe* was translated twice about 1830. The learned boyar D. Golescu travelled through western Europe and recorded his experiences in *Însemnare a călătoriei mele* (1826).

The national historian of this heroic period was N. Bălcescu (1819–59), the author of *Românii sub Mihai Viteazul; Puterea armată şi arta militară* and of other historical and literary works. He edited the periodical *Magazinul istoric pentru Dacia* (1845–47). Modern historiography mas inaugurated by Mihai Kogălniceanu (1817–91), who was the leading statesman in the newly organized monarchy under Alexander Cuza (1859–66) and Charles I (1866–1914). He produced the first edition of the old chronicles *(Letopiseţele Moldovei,* 1845–52) and edited the historical review *Arhiva românească* (1840) apd the literary magazine *Dacia Literară* (1840), which marks the beginning of the traditionalist trend in literature. Alecu Russo (1819–59), another leader of 1848, enriched the letters with his biblical poem in prose, *Cântarea României.*

The second half of the century was dominated by Vasile Alecsandri (1821–90) and Mihail Eminescu (1850–89). Alecsandri's rich literary heritage comprises poetry *(Doine şi lăcrimioare,* 1853; *Suvenire şi Mărgăritarele,* 1856). prose *(Buchetiera din Florenţa; Călătorie în Africa)* and plays (*Fântâna Blanduziei; Ovidiu; Despot Vodă*). Helped by A. Russo, he revealed treasures of folklore by publishing *Balade* (1852–53) and *Poezii populare* (1866).

Eminescu, the philosophical lyric poet, created modern Rumanian poetry *(Poezii,* 1884). His genius was influenced by Hindu thought and German philosophy (Schopenhauer), but he remained deeply rooted in the ancestral tradition. He raised poetry to heights not since surpassed, and remained the guiding star of the whole cultural

life. His heritage includes also short stories and political and philosophical essays.

Free from any outside influence, Ion Creangă (1837–89), a peasant by origin from the eastern Carpathians, wrote folk tales and *Amintiri din copilărie* ("Recollections from Childhood"). They are a sincere reflection in the mirror of a literary genius, of unassuming artistry, of the village life and of the peasant mind.

The literary critic under whose aegis literary creation developed up into the first decade of the 20th century was the statesman and eclectic philosopher Titu Maiorescu (1840–1917). He founded in Jassy (1863) the literary circle Junimea, which represented a reaction against form without content in art, and repudiated the extremism of the Latinist school. Its periodical *Convorbiri Literare* (1867) continued to appear till World War II.

C. Negruzzi (1808–69) excelled in prose, especially with his historical short story *Alexandru Lăpuşneanu* under Walter Scott's influence. The archaeologist A. Odobescu (1834–95) created the historical novel (*Mihnea Vodă,* 1858; *Doamna Chiajna,* 1860), but his artistic talent was revealed in *Pseudokinegetikos* (1874), an archaeological mosaic of high aesthetic emotions. I. Ghica (1816–97), the first Rumanian diplomatic representative in London, attempted the same genre in his *Convorbiri economice* (1879) and *Amintiri* (1890). In his short stories Ion Slavici (1848–1915) described the moral conflicts of village life. I. Popovici-Bănăţeanu (1860–93) wrote about the life of the tradesmen in the Banat (*Nuvele,* 1909). N. Gane translated Dante's *Inferno* and wrote short stories (*Domniţa Ruxandra*). The translation of Dante's *Divina Commedia* was undertaken by Gheorghe Coşbuc (1866–1918), the bard of rustic life (*Balade şi Idile,* 1898; *Fire de tort,* 1896; *Cântece de vitejie,* 1904). Eminescu's follower in lyric pessimism, Alexandru Vlahuţă (1858–1919), wrote a masterly description of the Rumanian landscape (*România pitorească,* 1903).

The greatest writer of this period is I. L. Caragiale (1852–1912) who created the social comedy (*O scrisoare pierdută; O naopte furtunoasă; D'ale Carnavalului; Conul Leonida faţă cu reacţiunea*); he also wrote a realistic drama (*Năpasta*), delightful *Moments and Sketches* and short stories of high aesthetic value. With caustic humour and sparkling irony he presented a society in transition from orientalism to occidentalism.

Outside the influence of Junimea, sometimes opposed to its ideology, stood: the creator of the historical national drama Barbu Delavrancea (1858–1918), with his historical trilogy *Apus de soare* ("Sunset"), *Luceafărul* ("The Evening Star"), *Viforul* ("The Storm"), and a number of short stories; the historian-philologist B. P. Hasdeu (1836–1907), with a rich literary activity (*Răzvan şi Vidra,* 1867, a historical drama in verse); and the neoclassicist Duiliu Zamfirescu (1858–1922), whose cycle of novels *Neamul Comăreştilor* described the family life of the old country gentry.

The folklore and the numerous manuscripts of folk literature found their collectors and interpreters in A. M. Marienescu (1859), Urban Iarnik and Andrei Bârseanu in Transylvania; S. F. Marian in Bukovina (1873); G. D. Teodorescu in Walachia (1885); T. T. Burada in Dobruja (1880); and G. Tocilescu (1900). P. Ispirescu's fairy tales, *Basmele Românilor,* emulate those of Creangă. Moses Gaster, the pioneer in research into Rumanian folklore and folk literature, continued his activity in London. I. A. Zanne published *Proverbele Românilor* (9 vol., 1895–1901); A. Gorovei collected the riddles, *Cimiliturile Românilor* (1898).

The traditionalist movement of Dacia Literară was continued in the 20th century by a galaxy of writers whose organ was *Sămănătorul* (1901). The poets S. O. Iosif (1875–1913) and D. Anghel (1872–1914) brought the perfection of their graceful verses in their conjoint creation (*Legenda Funigeilor,* 1907). P. Cerna (1881–1913) attempted with success the philosophical lyric inaugurated by Eminescu. But the poet of this generation was the vigorous national bard of Transylvania, Octavian Goga (1879–1938), whose first volume of poems appeared in 1905.

The prose writers found their inspiration in village life and in history. E. Gârleanu (1878–1914) described the patriarchal life (*Bătrânii*); C. Hogaş (1847–1916) pictured the magic landscapes of his Moldavian mountains (*Pe drumuri de munte; In munţii Neamţului*); A. Sandu-Aldea (d. 1927) described peasant life in the plain of the Bărăgan and in the Danube delta.

A parallel movement to that of *Sămănătorul,* with its romantic background, was that of the periodical *Viaţa Românească* (1906) of Jassy. Its ideology, labelled *poporanism* on the pattern of the Russian populism, had a social and political background. The Russian influence found its way through the literary critic C. Dobrogeanu-Gherea, a disciple of H. Taine and Karl Marx. The aesthete of the group was G. Ibrăileanu, author of the psychological novel *Adela.* The social critic was the Bessarabian C. Stere.

Western modernism penetrated under its various aspects. Symbolism found a great supporter in the learned philologist and gifted writer O. Densusianu (1873–1938), who founded the periodical *Viaţa Nouă* (1905). The poets I. Minulescu (1881–), author of *Romanţe pentru mai târziu* (1908) and of *De vorbă cu mine însumi* (1914), and G. Bacovia (1881–), who wrote *Plumb* (1916), compared favourably with any western symbolist. Impressionism found a worshipper in E. Lovinescu, author of a *History of Contemporary Literature* (4 vol., 1926–28). Outside these schools, N. Davidescu, after publishing a volume of poems (1910), translated Oscar Wilde's *Parables,* produced several volumes of lyric poems and an epic one, *Cântecul omului* ("The Song of the Man"). Cincinat Pavelescu (1872–) was the troubadour of the madrigal and romance. A. Macedonski (1854–1920) ostentatiously opposed his exotic modernism of French origin to the academic discipline of Junimea as well as to the rustic traditionalism of *Sămănătorul;* he also wrote verses in French, as did others of his generation—Julia Hasdeu and Elena Văcărescu. Carmen Sylva (Elizabeth), wife of Charles I, wrote in German and in Rumanian; in the following period Queen Marie, wife of Ferdinand, wrote in English and in Rumanian. Panait Istrati wrote also in French; A. Busuioceanu, the art historian, became a Spanish poet during World War II.

Between World Wars I and II.—In the period of national unity, the novel entered into competition with lyric poetry. Attempts at introducing the novel go back as far as 1863, when N. Filimon (1819–65) produced a social fresco of his period in *Ciocoii vechi şi ciocoii noui* ("Old and New Upstarts"); but only after 1918 did the novel come into the foreground. Liviu Rebreanu described the peasant's thirst for soil and independence in his novel *Ion* (1920); he presented his suffering and his struggle for freedom in the novel of epic breadth, *Răscoala* (1932); in *Crăişorul Horia* (1929) he described the peasant revolution of 1784 in Transylvania; among his psychological novels *Ciuleandră* (1927) is a fascinating clinical description, but the most powerful novel, inspired by Rumanian participation in World War I, is *Pădurea spânzuraţilor* ("The Forest of the Hanged"; 1922), translated into all European languages.

World War I also inspired Cezar Petrescu (1892–) who wrote, among other novels, *Scrisorile unui răzeş* (1922) and *Întunecare* (1927). In his novel *Roşu, Galben şi Albastru,* the symbolist I. Minulescu gave a picture of life under German occupation. The lyric novelist Ionel Teodoreanu (d. 1954) described the melancholy disappearance of the patriarchal life (*La Medeleni,* 1926–27; *Turnul Mileni,* 1928). Victor Ion Popa found the subjects of his novels in village life (*Velerim şi Lerim, Doamne,* 1932; *Sfârleaza cu Fofează*); he also wrote the biography of the pioneer in aviation Aurel Vlaicu (1939) and enriched the theatre with exquisite plays (*Muşcata din fereastră*). E. Bucuţa (1887–), in his *Fuga lui Şefki* (1926), and G. Mihăescu (1894–), in *Rusoaica* (1933) and *Donna Alba* (1935), described the exotic life of the borderlands. Mircea Eliade brought an Indian atmosphere into one of his novels, *Maitreyi* (1933). Matei Luca Caragiale, the son of I. L. Caragiale, in his short-lived literary career produced a refined piece of art with his *Craii de Curtea Veche.*

Gala Galaction (1879–) translated the Bible (1938), in collaboration with Vasile Radu, and wrote mystical prose (*Bisericuţa din Răzoare,* 1914) and novels with biblical subjects (*Roxana,* 1930). Hortensia Papadat-Bengescu is a psychological analyst (*Concert din Muzică de Bach,* 1927). Life in the suburbs of Bucharest found its interpreter in the novelist G. M. Zamfirescu (d. 1939). Humorous prose found able representatives in D. D. Pătrăşcanu (1872–1937) who wittily described political life (*Can-*

didat fără naroc) ; in Damian Stanoiu, the caricaturist of monastic life; in Gheorghe Brăescu. who found his material in military life.

The link with the older generation was assured by two prose writers. I. A. Brătescu-Voinești (1868–1946?) was the kind-hearted representative of the landed gentry, whose stories are mainly centred round the defeated inadaptables in life. Mihail Sadoveanu (1880–1961), whose talent reached maturity between World Wars I and II, tried the historical novel under the influence of Henryk Sienkiewicz (*Șoimii, Frații Jderi, Zodia Cancerului*), but his art was revealed in landscape descriptions and hunting scenes. The Transylvanian writer I. Agârbiceanu (1892–) carried on Slavici's tradition, presenting in his novels and short stories the village and the middle class of his province against a religious background (Dela bard, 1906; *Arhanghelii,* 1914; *În pragul vieții*). He was one of the founders of the Transylvanian periodical *Luceafărul* (1902).

The scholars and philosophers took part in the literary movement of the period as critics and writers. The classical archaeologist Vasile Pârvan (d. 1927), commemorating the sacrificed generation of World War I. wrote Parentalia, inspired by Thucydides. The prodigious historian and cultural animator. Nicolae Iorga (Nicholas Jorga, *q.v.;* 1871–1940), edited *Sămănătorul,* founded several literary periodicals and wrote literary criticism, poetry, numerous plays and travel descriptions. The geographer S. Mehedinfi (Soveja) edited Convorbiri *Literare* and wrote village stories (Oameni dela munte). The philosopher I. Rădulescu-Motru exercised a great influence on intellectual life with some of his works (*Personalismul* energetic, 1927). Lucian Blaga (1895–) is the philosophic essayist (*Filosofia stilului,* 1924; *Etnografie și artă,* 1926) as well as the poet of the generation. He began as a lyric poet (*Poemele luminii,* 1919) under the influence of western expressionism, and developed a philosophical system based on the traditional way of life interpreted as a cosmic mystery (*Trilogia cunoașteri,* 1931–34). His poetic dramas express his philosophic thinking (*Meșterul Manole,* 1927; *Cruciada copiilor,* 1930; Avram Zancu, 1934).

Literary criticism counted among its best representatives the aesthetician M. Dragomirescu, editor of the Convorbiri *Critice;* D. Caracostea. the analyst of Eminescu; G. Bogdan-Duică, the literary historian; A. Busuioceanu. the art historian; and Paul Zarifopol (*Pentru arta literară,* 1934).

The national and the private theatres offered great opportunities for playwrights. Rumanian plays and translations, old and new plays, held the stage. A. Davila's historical drama in verse *Vlaicu Vodă* (1922), Victor Eftimiu's *Cocoșul negru* (1913), M. Sorbul's *Letopiseții* (1914) and *Patima roșie* (1916), Caton Theodorian's *Bujorești,* C. Ciprian's *Omul cu mârțoaga* and Ion Sân-Giorgiu's *Masca* (1922) are among the best.

Lyric poetry was the most cultivated in modern Rumanian literature. Schools and periodicals were numerous indeed (*cf.* Mario Roques, *La poésie roumaine contemporaine,* Taylorian lecture, Oxford, 1934). Nichifor Crainic, the leader of the literary magazine *Gândirea* (1920), represented the religious traditionalist tendency (*Darurile pământului,* 1920); I. Pillat developed under the influence of the French and German lyric and sang the beauty of his native landscape (*Pe Argeș în sus; Satul meu*); V. Voiculescu was a profound mystic poet (*Întrezăriri,* 1940); Adrian Maniu produced the play *Meșterul* (1922) and wrote refined verses inspired by the rustic landscape. The poems of the mathematician I. Barbu evoke the geometric forms of the crystal (*Joc secund,* 1930). Dragoș Protopopescu, the translator of Shakespeare, is an original poet and talented essayist on English literature.

The poet who, after Eminescu, created a new lyric poetry was Tudor Arghezi (1880–). In his poems the language acquires an unexpected expressiveness and magic harmony. His prose (*Cartea cu jucării,* 1935; *Ochii Maicii Domnului,* 1931, *Cimitirul Buna Vestire,* 1936) and his verses (Cuvinte *potrivite,* 1927; *Flori de mucegai,* 1931; *Versuri* de *seară,* 1935) set a new landmark in the development of Rumanian letters.

(G. Ns.)

RUMELIA, a general name formerly used by the Turks to denote their possessions in the Balkan peninsula (Turkish *Rumeli,* the land of the Romans, *i* e., Byzantines). Before 1908 it comprised the vilayets of Istanbul (European part), Edirne, Salonika, Kosovo. hlonastir, Scutari (Usküdar) and Ioánnina (Janina), in addition to the provinces of Eastern Rumelia (now the southern part of Bulgaria between the Balkans and the Rhodopes) and Bosnia and Hercegovina. Eastern Rumelia (capital Philippopolis or Plovdiv) became. by the Berlin treaty of 1878, an autonomous province within the Turkish (Ottoman) empire, but proclaimed its unity with Bulgaria on Sept. 18, 1885 (*see* BULGARIA). Turkish territory in Europe is now known as Trakya (Thrace).

(N. Tu.; S. Er.; E. Tu.)

RUMEX, a genus of the buckwheat family to which belong the well-known weeds known as dock and sorrel (*qq.v.*).

RUMFORD, COUNT VON: see THOMPSON, SIR BENJAMIN.

RUMI: see JALAL-UD-DIN RUMI.

RUMINANT. A very important group of mammals, the Ruminantia constitute one of the three suborders of the artiodactyls (*q.v*). the even-toed hoofed mammals. Hoofs. cud chewing and a diet of grasses or foliage are the most obvious characteristics of this suborder, which includes not only cattle, sheep and goats but also the diverse types of antelopes, giraffes, deer and chevrotains.

Although most of these animals possess either horns or antlers, all have been derived from hornless ancestors and a few, such as the musk deer of central and eastern Asia, have never developed them

Apart from the horns which vary strikingly in shape and construction· not only from family to family but from species to species, the ruminants are a homogeneous group; perhaps the most eccentric member is the long-necked giraffe. and even this is linked with the more normal types by the okapi, an animal belonging to the giraffe family but with a shorter neck and shorter limbs than the true giraffes. In the wild state ruminants, like all hoofed mammals. seek safety from their carnivorous enemies in flight, using their antlers or horns as weapons of defense only if driven to bay. Swiftest of all are the deer, antelopes and gazelles, while the goats and mountain sheep have a marvelous power of rapidly scaling steep heights to which few carnivores can follow them.

It is therefore among the ruminants that there is found a more perfect adaptation to a fugitive life than among any other of the larger mammals. The skeletal and muscular systems of the ruminant together form a perfectly constructed running mechanism; their digestive system is also elaborately planned so that they may hastily snatch a meal in some favourable grazing ground and store the food temporarily in a special compartment of the stomach until they have found a refuge where they can masticate and digest it at leisure.

Limbs and Feet.—In the skeleton, the proportions of the limbs and the structure of the feet are particularly noteworthy. As in all running animals the lower leg and foot are very long compared with the upper segment of each limb; this insures a long stride and at the same time a swift one. The surfaces of the joints are grooved and keeled like pulley wheels, permitting free motion forward and backward but limiting the motion in all other directions. Joints of this type are quite strong, and are admirably adapted for swift locomotion over a smooth surface, though less efficient on rough ground.

The feet are constructed on the artiodactyl plan; in each foot no more than two of the ancestral five toes are used, the rest being either lost or reduced to vestiges. The animal steps lightly on the tip of these two remaining toes, the short terminal segments of which are encased by the hoofs. The upper segments (metapo-

dials) of each toe, fused into a single strong bone (termed the cannon bone), are in contrast very long so that the joints corresponding to the human wrist and ankle are raised high above the ground and are consequently often regarded as elbow and knee. On account of the shortness of the upper segments of the limbs, corresponding to the human upper arm and thigh, the true elbow and knee joints of the ruminant are close against its body, enclosed within the skin of the trunk.

Dentition. — Quite as distinctive as the foot of a ruminant is its skull. and especially its dentition. It will have been noticed how a sheep, when it feeds, seems not so much to bite off the grass as to tear it off by quickly jerking its head. This is because the front teeth in the upper jam are replaced by a horny pad, while those of the lower jaw are directed forward and simply press the grass tightly against this pad on closure of the mouth; when the head is jerked sideways the grass is cut through by the sharp edges of the lower front teeth. It is also a matter of common observation that in chewing its food a ruminant swings its lower jaw to the side: it usually swings it first a number of times to one side and then, reversing the direction, about an equal number of times to the other side, so that the grinding teeth on both sides of the mouth are used in turn. These grinding or "cheek teeth" are admirably adapted for triturating hard grasses and coarse foliage. Viewed from the side, they appear to be made up of a number of columns, but looked at from the grinding surface they are seen to have a crown pattern of four crescents or Vs, sometimes complicated by little additional folds. Each crescent is enclosed by a border of enamel which. as it is a very hard substance, prevents the tooth from wearing down too quickly. Also, as the enamel does not wear down at the same rate as the softer substance within, the surface of the crown is almay rough and therefore all the more effective as a grinding mechanism. The great height of the crown also insures that the tooth will last out the animal's lifetime before it is quite ground away. Similar devices are characteristic of the molar teeth of all herbivorous mammals, a matter of considerable importance since most grasses contain a great deal of silica, which causes hard wear to the tooth.

In those ruminants that feed on soft leaves rather than on grasses, the cheek teeth are much shorter than in the exclusively graminivorous types and have a less complex crown pattern. However high the grinding teeth, the mandible of a ruminant is a slender bone, slung somewhat loosely onto the skull, and the joint between mandible and skull is shaped so as to permit great freedom of movement in grinding.

Digestive Processes. — The following account of the process of rumination is an abbreviation of that given by T. H. Huxley in his *Anatomy of* Vertebrated *Animals*. A ruminant does not masticate its food on first taking it into its mouth but swallows it hastily, well mixed with saliva. Only when its appetite is satisfied does it stop grazing and seek a place of safety where it can lie down and "chew the cud" at leisure. If we closely observe a cow which has just lain down in a field after a period of grazing, its body inclined to one side. we notice that after an interval of quiescence a sudden spasm, rather resembling a hiccough, passes over the animal's flanks; and that at the same time something is quickly forced up the gullet into the mouth. This is a bolus of grass nhich, rendered sodden by the fluids in the stomach, is now returned to be masticated by the grinding teeth. This process is repeated until most of the grass which was originally cropped has been reduced to pulp.

A ruminant's stomach is divided into four compartments. When the food is first hastily swallowed it passes no further than the first and second of these; on second swallowing, it passes along a groove in the roof of the second, directly into the third compartment; chemical digestion takes place in the fourth compartment, which alone has gastric glands in its malls for secretion of digestive jucies.

Horns. — Four main types of horn construction are found among the ruminants.

1. The antlers of deer. These are usually found in the male deer only, but in the reindeer they are present in both sexes. They grow out from the frontal bones of the skull as solid processes which rapidly reach their full size. At first they are covered by soft and hairy skin. Then a circular ridge called the burr appears at a short distance from the base of the antler and divides the latter into pedicel on the skull side of the burr, and beam on the far side.

The circulation in the beam then gradually dwindles, and the skin dies and peels off, leaving exposed the dead bone beneath it. Absorption and sloughing take place at the extremity of the pedicel, beam and burr are shed. and the end of the pedicel scabs over. Fresh skin gradually grows up under the scab so that the pedicel becomes once more smooth and hairy. The antlers are shed and grown anew every year, usually adding additional branches each time. (See DEER.)

2. In the bovine ruminants the bony core formed by the frontal bone is covered by a horny sheath. The core itself is hollow, instead of solid as in the deer. The horny sheath is never shed but persists throughout life and grows with the growth of the core. This type of horn is never branched but may be curved, spirally twisted or compressed; it is often present in both sexes. (See SHEEP; GOAT; ANTELOPE; etc.)

3. In the giraffes (*q.v.*) the horn cores are covered with soft and hairy skin and are never shed.

4. In the North American pronghorn, *Antilocapra,* there is a permanent, unbranched horn core enclosed in a horny sheath as in the Bovidae, but this sheath is forked and furthermore is shed yearly after the rutting season since the development of a new sheath pushes the old one off. (See PRONGHORN.)

These four types of horn are characteristic of the five families into which existing ruminants are classified: the Cervidae or deer; the Giraffidae or giraffe and okapi; the Bovidae or oxen, sheep, goats, antelopes, etc.; the Antilocapridae, solely represented by the North American pronghorn; and the Tragulidae, the chevrotains (*q.v.*), which have no horns or antlers.

Many other forms are extinct. The earliest fossil forms were small with no antlers but a pair of long slender tusks in the upper jaw like those of the musk deer. From such as these were derived not only the modern families but several families now extinct; among them the Lagomerycidae, Amphimerycidae, etc.

See also ARTIODACTYLA and articles on the separate families and genera.

RUMMY (RUM, RHUM, ROMME), the most generally known of all card games and, with its many variants including canasta (*q.v.*) and gin rummy, the most widely played, especially in the United States, where a 1957 survey showed canasta first, rummy itself sixth and gin rummy tenth in popularity among card games. The original version, introduced early in the 20th century, was called conquian *(see* COON-CAN) from the Spanish *con quién* "with whom." The English gave it its lasting name by calling it rum (queer) poker.

Though there are no official rules, the following procedure of the basic game is common to most variants.

From two to six may play, using a standard deck of 52 cards with or without jokers. Cards rank: K (high), Q, J, 10, 9. . . . A (lon). Cards are dealt face down one at a time, clockwise beginning uith the player on dealer's left. For two players, ten cards are dealt to each; for three or four, seven; for five or six, six. The remainder of the deck, the stock, is placed face down; top card of the stock is faced to start the talon or discard pile.

The common goal of all rummy games is to build sets or melds such as three or four of a kind (as four 6s, three 8s) or sequences of three or more cards of the same suit (♠J-10-9-8, etc.). A joker may represent any needed card.

Each player, at his turn, draws the top card of the stock or of the discard pile and may then face upon the table any meld or melds of three cards or more, and may also lay off any cards from his hand that match his own or another player's exposed melds. He must then discard one card face up on the discard pile (except that on the turn when he goes out, no discard is needed).

The deal is won by the first player who goes out (melds or lays off all his cards). Melding an entire hand at one turn is called going rummy and is paid double.

The winner of each deal collects from each of the other players the index value of the cards each holds unmelded (even if matched up). Face cards count 10 each; aces 1 or 11 as previously agreed; jokers, if used, count 15.

Game ends when any player reaches a predetermined score (as plus 100 points) or after an agreed number of deals.

When stock is exhausted, play ends and the hand with the lowest count wins. In some games, each player is permitted an additional turn to take or refuse the top card of the talon.

500 Rum.—This version is also called pinochle rummy; variations include Michigan rum, Oklahoma, Persian rummy and canasta. From two to eight may play. With five players or more, two full packs shuffled together are used. When two play, each is dealt 13 cards; with three or more, 7 cards are dealt to each.

At his turn, each player draws the top card of the stock or any card in the discard pile provided that: (1) he melds such card at once and (2) he puts into his hand (to meld immediately or not, as he pleases) all cards lying above the one he has drawn.

Layoffs are the same as in rummy, except that each player keeps before him the cards he has melded. When the deal ends, each player receives credit for the index value of his melds, minus the index value of all cards remaining in his hand. Aces count 15 if left in hand or if melded as a group of aces; they count but 1 if melded A-2-3.

When any player has scored 500 or more the game ends. There is no bonus for winning the game.

Persian Rummy.—Four play as partners, using one pack plus four jokers which count 20 points and may be melded only in groups of jokers. Aces count 15 and may be used only as A-K-Q or as a group of aces, not as A-2-3. If all four cards of a rank are melded at once, the value of the meld is doubled. When a player has melded all his cards. the deal ends and his side scores a bonus of 25 points. After stock is exhausted, the discard pile is drawn from until no player is able to make a meld with the exposed card of the discard pile.

Two deals constitute a game. The partnership with the higher total wins the difference between the scores, plus a game bonus of 50.

Knock Rummy.—Any player, at his turn and after drawing and discarding, may knock (lay down his entire hand) and declare the total value of his unmatched cards. He does so when he believes he has the lowest total unmatched (not part of a meld). If his assumption is correct, he collects from each opponent the difference in the counts. If another hand is lower than the knocker, the low hand wins from all and collects an extra penalty of 10 points from the knocker. (Some play that the knocker must pay double.) If a player ties for low, he collects the winnings and the knocker neither pays nor collects. If two or more other players tie for low, they divide the winnings.

Gin Rummy.—First introduced in New York in 1909, this game became a nation-wide fad in the U.S. in 1941 after scoring changes were made. Two play; each is dealt ten cards face down, one at a time, beginning with nondealer. The remainder of the pack, placed face down, forms the stock. The top card of the stock is turned up beside the stock to form the first up card.

Nondealer may take the up card or refuse it; if he refuses, dealer has the same option. If both refuse, nondealer draws the top card of the stock. Thereafter, each player in turn takes either the up card or the top card of the stock, then discards one card face up on the up card pile.

Object of play is to form melds as in rummy. Cards that do not form part of a meld are called unmatched. After drawing, a player may knock (go down) if his unmatched cards (less one discard) total 10 or less. Face cards count 10, aces 1, other cards their index value. Upon knocking, a player faces his 10 cards arranged in sets and with unmatched cards to one side, then discards his 11th card. If all his cards are matched, he is gin and he receives, in addition to the index value of his opponent's unmatched cards, a bonus of 25 points.

Opponent of the knocker may lay off any of his unmatched cards upon the knocker's sets, thereby reducing his count. If the knocker has the lower count unmatched, he wins the difference. Should his opponent remain with an equal or lesser count, he has undercut the knocker and receives the difference (if any) plus a bonus of 25 points, but the knocker cannot be undercut if he has gone gin. When only two cards remain in stock and neither player has knocked, the deal is called off with no score.

First to reach 100 points wins the game and receives a 100-point bonus. Each player then adds to his score 25 points for each hand he has won, called a box. If the loser failed to score. the game is a shutout or schneider and the winner's total score is doubled. (R. L. FY.)

RUMPF (RUMPHIUS), **GEORG EBERHARD** (1628–1702), German-Dutch naturalist and explorer, was a pioneer in the study of tropical floras and laid the foundation of knowledge of the vegetation and fauna of Amboina and other islands of the Malay archipelago. Born in May or June 1628 at Hanau, Ger., he was educated in the same city. He entered in 1652 the service of the Dutch East India company and arrived in Amboina, Indon., the next year. In 1657 he was transferred to civilian service and in 1660 became a merchant. About that time he started the systematic studies of the flora and fauna of Amboina which he pursued all the rest of his life under tragic circumstances. In 1670 he became blind but continued his work with such help as he could get. Fire destroyed all of his illustrations and some of his manuscripts in 1687, but his courage was undaunted, and he brought his work to completion in 1690. The manuscripts of six volumes sent to Europe were lost when the ship was sunk by the French, and the work mas reconstructed from the copy of the manuscript in Batavia, Indon. He completed his lifework a few months before his death on Jan. 15, 1702. His *Amboinsche Kruidboek*, or *Herbarium Amboinense*, 6 vol. (1741–55), with the *Auctuarium* (1755), became a standard work.

RUNCIMAN OF DOXFORD, WALTER RUNCIMAN, 1ST VISCOUNT (1870–1949), British parliamentarian, who held many posts in Liberal governments, was born at South Shields, Durham, Eng.. on Nov. 19, 1870. He was educated at Trinity college, Cambridge. In 1899 he was elected to the house of commons for Oldham, Lancashire, but he was defeated in the following year by Winston Churchill. He later sat in the house of commons for Demsbury. Yorkshire, 1902–18; for Swansea, west, Glamorgan, Wales, 1924–29; and for St. Ives, Cornwall, 1929–37. After 1931 he sat as a Liberal National. His first post in the Liberal government was parliamentary secretary to the local government board, 1905–07. He was also financial secretary to the treasury, 1907–08, and president of the board of education, 1908–11, and of the board of agriculture, 1911–14. He served as president of the board of trade, 1914–16, and again in the National government, 1931–37. In 1937 he was created a viscount. In 1938 he went to Czechoslovakia as head of a mission which tried to persuade the Czechs to accept the claims of the Sudeten Germans. He was lord president of the council, 1938–39. He died at Doxford, Northumberland, Nov. 14, 1949.

RUNCORN, a market town, river port and urban district in the Runcorn parliamentary division of Cheshire, Eng., on the southern shore of the Mersey, 16 mi. N.N.E. of Chester by road. Pop. (1951) 23,931. Area 4.6 sq.mi. It is on the Bridgewater canal (1773), which descends there into the Mersey by a flight of locks; it is also on the Manchester ship canal and is a subport of Manchester. with extensive wharfage and warehouse accommodation. Exports include coal, salt and pitch; there is also a large traffic in potters' materials. It is connected with Widnes by a railway and a transporter bridge, which in 1956 was about to be replaced by an archetype high-level road bridge. The town possesses shipbuilding yards. iron foundries, rope works, tanneries and large alkali and heavy chemical works. On a rock which formerly jutted into the Mersey, Aethelfleda erected a castle in 916. The ferry is noticed in a 12th-century charter.

RUNDALE, the name of a form of occupation of land, somewhat resembling the English common-field system. The land is divided into discontinuous plots and cultivated and occupied by a number of tenants to whom it is leased jointly. The system was common in Ireland, especially in the western counties. In Scotland, where the system also existed, it was termed runrig.

RUNDI (BARUNDI, WARUNDI), an east African people of the Interlacustrine Bantu group who inhabit the southern portion of the Belgian trust territory of Ruanda-Urundi. The Rundi, who number about 2,000,000, resemble very closely their northern neighbours, the Ruanda, in language, traditional culture and modern economic and political conditions. Legend links the kingships of the two countries through common ancestry.

The traditional Rundi state, however, was somewhat more loosely organized than that of the Ruanda. Whereas among the latter political and military authority was mainly in the hands of appointees of the *Mwami,* among the Rundi princes of the blood ruled together as a kind of oligarchy, each having authority over a district. The over-all authority of the *Mwami* was frequently challenged by his fellow princes and civil wars were commoner than in Ruanda.

See E. M. Albert, "Socio-Political Organization and Receptivity to Change: Some Differences Between Ruanda and Urundi," *Sthwest. J. Anthrop.,* vol. 16 (1960). (L. A. Fs.)

RUNDSTEDT, (KARL RUDOLF) GERD VON (1875–1953), German army officer, leading field commander in World War II, was born at Aschersleben, near Magdeburg, on Dec. 12, 1875, of a noble Prussian family. He was chief of staff of an army corps in World War I and assisted in reorganizing the Turkish general staff. Later he mas active in the secret German rearmament and on his retirement in Oct. 1938 was the senior German field commander. Recalled to active duty before the outbreak of war in 1939, he commanded army groups in the Polish, French and Russian campaigns and became a field marshal.

Coming into conflict with Hitler on the conduct of the Russian campaign, Rundstedt was relieved of command in 1941. but was soon restored to favour and appointed commander in chief west, with headquarters near Paris; there he prepared the defenses against the Allied invasion. He was replaced by Giinther von Kluge in early July 1944, but again became commander in chief west in September and directed the Ardennes counteroffensive. He mas captured by U.S. troops in May 1945 but was later released because of ill-health. He died in Hanover on Feb. 24. 1953. Rundstedt regarded Hitler and his methods with contempt but never permitted conspiracy against him in his own staff.

Rundstedt's biography, *Von Rundstedt, the Soldier and the Man* (1952), was written by his chief of staff, Gen. Giinther von Blumentritt. (P. N. T.)

RUNE, a character of an alphabet used for the oldest form of Germanic writing. This form of writing was in use in the Scandinavian north in the 3rd century, and in remote districts of Sweden almost down to modern times. *(See* also ALPHABET.)

During the first centuries of their vogue, runes consisted of 24 letters: the so-called older or all-Germanic runic staves (fig. 1).

f u th a r k g w h n i j e p R s t b e m l ng o d

FIG. 1.— ALL-GERMANIC RUNIC STAVES

Their peculiar forms appear first in inscriptions found all over Europe from Rumania and western Russia to the east of France and Friesland, but in greatest number in England and Scandinavia. Runes. which were derived from a subalpine script. differ from it radically in their arrangement, as may be seen from some inscriptions that use the runic staves in their entirety, the most important being the Kylver stone in Gothland (5th century), the Vadstena *braktea* from Ostergotland. Sweden (fig. 2), the Charnay clasp from eastern France and the Thames sword from southern England. Moreover every rune had its special name and these names are known through the oral traditions recorded in Anglo-Saxon manuscripts. The 24 runes were divided into three groups

BY COURTESY OF KUNGL. VITTERHETS HISTORIE OCH ANTIKVITETS AKADEMIEN, STOCKHOLM

FIG. 2.—VADSTENA BRAKTEA

of eight each, each group coming later to be called in Scandinavian an *ætt,* a word which probably meant "number of eight." The runic staves, at least at a later period, were called *futhark,* after their initial letters.

As regards sound values, it may be mentioned that *th* was pronounced approximately as in the English *thing;* d like *th* in the English *this; g* had a sound corresponding to g in German *sagen; b* in the same way, therefore corresponding t *b* in the Spanish *Habana; ng* like *ng* in *England;* and *R,* when final, almost like *s* in the English *is.*

Origin.—The oldest extant decipherable runic writings whose origin is at all certain were discovered at the bogland in southwestern Denmark, at Vi-mose in Fyn and at Torsbjaerg in Schleswig. Most archaeologists date the first-mentioned from the middle of the 3rd century, the second from the 4th. The inscriptions are few in number and brief. Those which can be deciphered contain one or two names of men. These earliest finds of runes in Denmark were supplemented by a whole series of others from the 4th. 5th and 6th centuries—inscriptions on single objects, arms, ornaments and more especially gold *brakteas.* Archaeological research establishes the fact that southwestern Denmark was really the cradle of the knowledge of runes, whence the use of runes spread to Norway and Sweden. It has been ascertained, moreover, that from Schleswig it made its way in the 5th century along the southern coast of the North sea to England and the continent.

If then. Schleswig and Fyn are the original home of the runes in northern and western Europe, the next question is: did the runes originate in Denmark or were they imported from elsewhere? It has been established that a number of runes which are contemporaneous with the oldest of those found in the Danish bogland have been discovered along a line of country passing through Pomerania, Brandenburg, Volhgnia and Rumania. Moreover, these discoveries include archaic objects the primary forms of which do not hail from western Europe but are found in southeastern Europe, on the northern coast of the Black sea and along the lower Danube and in Carinthia. From this fact, and also from the close agreement of the forms of the letters in these texts, especially the Negau helmets, with those of the subalpine alphabets of northern Italy, and the agreement in date (*c.* 250 B.C.), the conclusion was drawn simultaneously by a number of scholars that the runes came to Scandinavia from central Europe and that the script itself was of subalpine origin. It is certain that runes were known and used among the Goths in the first half of the 4th century. In the 3rd and 4th centuries there is no trace of the existence of runes in the western Teutonic world, *i.e.,* southwest of the line Schleswig, Berlin, Bucharest.

Ludwig Wimmer made it clear that they are derived ultimately from a Mediterranean form of alphabet that had its origins in a Western Greek type. The runes have the same signs for the vowels *a,* e, *o,* as the Greek and Latin alphabets; the runes for f, *h* and *r* derive from the Italic alphabets. Since quite a number of runes (as *a, i, b, t, m* and *n)* may be traced typographically to the Greek and Latin alphabets and as it undoubtedly would be natural to seek the source of the runes in a single alphabet, Wimmer sought to trace all the runes back to Latin. In so seeking, however, he was forced into assumptions and deductions which must be regarded as improbable and irrational.

In 1928 the Norwegian, C. J. S. Marstrander, showed that the runes derive from a subalpine Northern Etruscan alphabet which was in use in the eastern Alps among Prae-Italic tribes, and it was from these that the Teutons, probably the Marcornanni who lived in Bohemia, developed the runes. Certain runes are more easily and naturally explained in the light of Marstrander's paper than in that of any other interpretation that has been put for-

ward. Archaeological and chronological facts are not difficult to reconcile with Marstrander's hypothesis, which is now widely accepted.

Actually Marstrander had been anticipated by Hempl, Skeat, C. D. Buck and others. The resemblance between subalpine and runic scripts is great. But it is not the mere similarity that is decisive; the important facts are that the oldest-known Germanic inscription is in a subalpine alphabet, and that the oldest runic texts appear at the eastern end of the Alps, not in Germany or Scandinavia.

The close relationship between the runes and cursive handwriting—the ordinary handwriting used in everyday life—indicates that the art of writing did not come to the Goths by the way of scholarship. Some individual Goths (*e.g.*, mercenaries) from the northwestern coast of the Black sea, in the course of visits to the Roman provinces learned Greek and Latin and the Greek and Latin forms of writing used in state edicts and in private life. In addition, they acquired an imperfect acquaintance with the lapidary and uncial style which was the basis for the ordinary cursive handwriting, wherefore some forms of the better style occasionally appear. Such a Goth, or several such Goths working together, undertook to write out the Gothic language on the basis of the knowledge of Latin and Greek writing thus acquired, and these efforts influenced the runic stave.

Like the letters of the classic alphabets, runes soon came to be used for purposes of magic, a use which continued for a long time. But that the chief purpose of the runes was to give the spoken language a fixed form is demonstrated at an early date by the fact that both Ulfilas and those who used the Old English alphabets drew upon runes when the Greek or Latin scripts failed them. Removed from the sphere of classical culture, runic writing soon came to be used chiefly for inscriptions: it was carved or cut on wood, metal or stone. In the process the individual letters began to undergo a certain kind of symmetrical stylization which gave them a substantially different appearance from that of their prototypes, and at the same time the runes came to be put in an order entirely different from that of the classic alphabets.

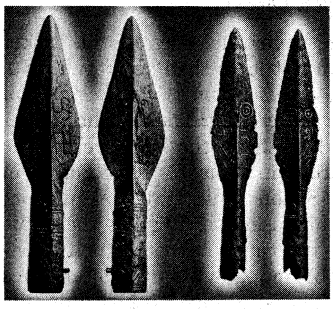

FIG. 3.— SPEARHEADS FOUND NEAR BREST, U.S.S.R.

From the Danubian region knowledge of runes soon spread to distant corners of the great dominion which the Goths established in the 3rd and 4th centuries between the Black sea and the Baltic. From the middle of the 3rd century have been found runic inscriptions on single objects in Gothland, Denmark and Norway.

Runes have been used by the unscrupulous to trick the credulous and the superstitious. Forgeries, sometimes used to victimize the patriotic or as sport for pranksters, have turned up even in North America. The Kensington stone, which was found in Minnesota, contains writing that is 1,000 years out of style. Viking swords, found in southern Ontario and once held to support the Kensington case, are now known to have been "planted."

SPREAD AND DEVELOPMENT

Between the Black sea and the Baltic runic letters have been found from the same period, such as those on the spearheads from Brest (fig. 3); their reading, dialect and interpretation are disputed.

Of the same period are certain Scandinavian runes, among them the Thorsbjaerg chape (metal mounting for scabbard) from Schleswig (fig. 4), which bears the inscription *owlthuthewaR niwajmariR;* these are probably the names of two men *WulthuthewaR* and *NiujamariR,* both names being of the familiar old Germanic binominal compound type, but other interpretations have been advanced.

It has already been pointed out that Schleswig and Fyn constituted a cradle for the runes during the Roman period and the earlier portion of the migration era (A.D. 250–450). There are many signs that runic writing was brought there from the Black sea by the Heruli, a people who played an important part in the history of that period and who seem to have had their origin in Denmark. Schleswig in those early days and until well into the middle ages was of primary importance for the intercommunication and exchange of merchandise between the Baltic regions on the one side and western and southern Europe of the other. In particular, Schleswig had long been the traffic route from the Rhineland and England up to the Scandinavian north.

FIG. 4.—THORSBJAERG CHAPE

A remarkable runic inscription found in Schleswig is that on a golden horn from Gallehus (fig. 5), which dates from the beginning of the 5th century. It reads: ek *hlewagastiR holtijaR horna tawido,* "THlewagast from Holt made the horn." There are altogether about a dozen inscriptions on portable objects, also inscriptions of the older type as well as about 40 runic brakteas dating from between the 3rd and 6th centuries, which were found in Danish soil.

At a very early period (sometime in the 3rd century) runic writing had spread from Denmark into Korway. There as early as the 4th century the custom had begun of equipping stone monuments with runic inscriptions. One of the finest and longest inscriptions is that of the Tune stone from southeastern Norway (see fig. 6).

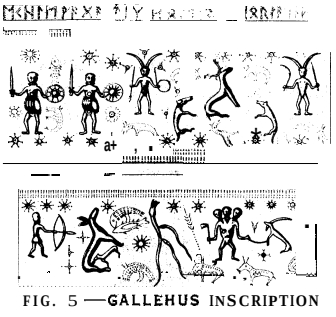

FIG. 5 —GALLEHUS INSCRIPTION

It would seem to date from the earlier half of the 5th century and reads: (*wiwa*)*R* (?) *wodu*-ride staina (satido) *thrijoR dohtriR da*(*i*)*lidun arbija si*(*bi*)-*josteR arbijano,* ek *wiwaR* after *woduride wita*(*n*)*dahalaiban* wo-*rahto*(*runoR*), which perhaps may be translated "Viv (?) raised this stone to Vodurid. Three daughters shared the inheritance as nearest of kin among his survivors. But I. Viv, engraved the runes to my master (=bread-giver, cf. the English lord) Vodurid."

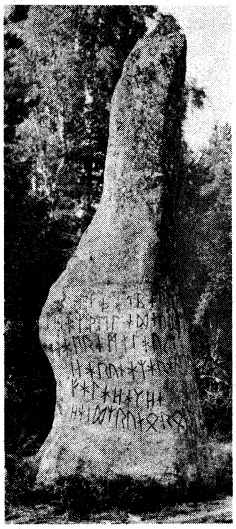
FIG. 6.— TUNESTONE

In Norway the older runic staves had a relatively aide vogue; from the period AD. 250 to A D 800 there are extant, in addition to 10 brakteas with runic inscriptions, about 50 inscriptions, mostly on standing stones or stones inserted in tumuli but also on portable objects.

The runes moved from southwestern Denmark also up the Baltic. The island of Gothland, ancient centre for trade and intercourse in northern Europe, became also a region in which the older runic staves continued to be written throughout the entire period, though not to such an extent as in Norway. The runic inscriptions have been found more sparsely on the mainland of Sweden—in Uppland, Sodermanland and Östergötland. They are more frequent in Västergötland. In all, about 20 runic inscriptions from the migration period have been found in Sweden, as well as few runic brakteas. Of special note among them are the late (7th century) inscriptions from the most western parts of Blekinge which show a continuation of the development of the runic letters that had taken place in southwestern Norway, so

rich in runes, during the early and middle periods of the migration era. Probably these inscriptions also came from Norwegian immigrants. The best-preserved specimen is the Bjorketorp stone (fig. 7) which has its place in a fine stone setting and bears inscriptions on both its sides: *uthArAbAsbA* ("ruin-bringing prophecy") and *hAid runo ronu fAlAhAk hAd(e)rA ginarunAR ArAgeu hAerAmAl-AusR uti AR welAdAude sAR thAt bArutR,* "This is the secret meaning of the runes; I hid here power-runes, undisturbed by evil witchcraft. In exile shall he die by means of magic art who destroys this monument."



BY COURTESY OF KUNGL. VITTERHETS HISTORIE OCH ANTIKVITETS AKADEMIEN, STOCKHOLM

FIG. 7.—BJORKETORP STONE

This inscription constitutes, therefore, a magical protection for the very fine stone setting.

Of these Blekinge stones the runic *k* has the form ᛉ which about the year 500 was developed in Norway, while at the same time the form ᚳ appeared in Denmark, a form which proceeded thence to England.

In the 5th century the runes went to the Germanic continent and to England from southwestern Denmark. On the continent, where the runic *k* retains its original form, there have been found inscriotions from the Rhine province, Hesse, Nassau, Thuringen, Wiirttemberg, Bavaria, Austria, as well as in Charnay, the old Burgundian kingdom in eastern France in what is now the *département* of Saône et Loire. These inscriptions are few and, like the Danish ones, all inscribed on portable objects, and they are quite short. They are all held to belong to the period A.D. 450–550. As an illustration may be cited the inscription on the clasp from Freilaubersheim in Rhenish Hesse (fig. 8): *boso wraet run-ath (i) k dalina godd(a),* "Boso wrote the runes —to thee, Dallina, he gave (the clasp)."

FIG. 8.— FREILAUBERSHEIM BROOCH

England. — If knowledge and use of runes constituted merely a brief episode on the western Germanic continent, it flourished for five centuries in England. Anglo-Saxon rune staves like continental Germanic have two cross-strokes in the letter *h* and differ from it in the form of the k; they differ from the Scandinavian and eastern Germanic, as well as from the continental Germanic runes with their 24 letters, in that new letters were created to render the most important novelties in the rich Anglo-Friese vowel system. Later new consonant letters were added.

Beginning of this development of the system of letters had already been effected on the south portion of the coast of the North sea in Friesland, uhere there are inscriptions belonging to the end of the 5th century and to the 6th with new runic letters for a- and o-sounds In England there developed a runic stave of 28 letters (fig. 9), which in the 9th century increased to 33.

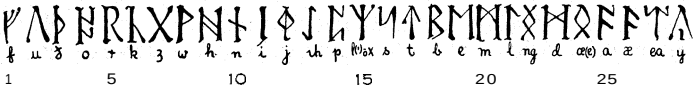

FIG. 9.— EARLY ANGLO-SAXON RUNES

In England are extant about 50 runic inscriptions upon portable objects and standing stones (stone crosses). Among the most remarkable and best preserved are those carved on a casket made of whalebone (Frank's casket, fig. 10). The inscriptions, with illustrations from Biblical history and Roman and Germanic legends, cover the sides of the casket and the lid and are held to be from not later than about A.D. 650. The inscription on one side reads: *hronæs ban fisk flodu ahof on jergenberig warth gasrik grorn thær on greut giswom,* "The whalebone (is this). The flood threw the fish on the firm rock. The monster (?) was stranded on the stone in agony." Reproduced in fig. 11 is the later 33-letter Anglo-Saxon runic stave taken from Cod. Cotton. Otho B. 10 (British museum); it gives the runic names of oldest date. In England the runes persisted for the entire Anglo-Saxon period. Remarkable monuments from later times are the two runic crosses from Bewcastle and Ruthwell on the Scottish border. Because of the tradition kept alive in England from ancient times and the fact that the names borrowed by Ulfilas from the runes to render Gothic letters are indicated in a manuscript (not, indeed, in their original forms) preserved in the National museum at Vienna, it is possible to reconstruct approximately the name which every runic letter seems to have borne from the commencement. Later traditions handed down in Scandinavia are also of value, although the later peculiarly northern runic staves contained only 16 letters and the names of 8 letters therefore have been lost. In the first column below are Anglo-Saxon names of runic letters; in the second, Scandinavian; in the third Gothic reconstructed:

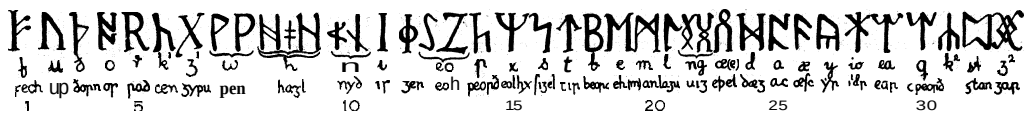

FIG. 11.—LATER ANGLO-SAXON RUNES

Thus the great modification of the Germanic sound system caused by vowel mutation, by breaking and by other sound changes during the migration period resulted in a considerable enlargement of the runic alphabet in England.

Scandinavia.— In Scandinavia it is curious to note the same linguistic development, the Germanic sound shift, produced a result directly opposite to that in England: the number of the runes was reduced from 24 to 16 although the Scandinavian stock of sounds reached 30 or 40 during the later migration period. The explanation of this would seem to lie in the fact that, while the original 24 runes covered adequately the old Germanic sounds, it became the habit later, as the result of the increase in the sound system, to represent different sounds by the same rune. This brought about a simpler alphabet: when a single runic letter could be used to render several sounds, many of the old letters became superfluous. Simultaneously the formation of many of the runes was simplified. This twofold reduction of numbers and forms began in Scandinavia as far back as the 6th century, and at the beginning of the Viking era this had resulted in a special

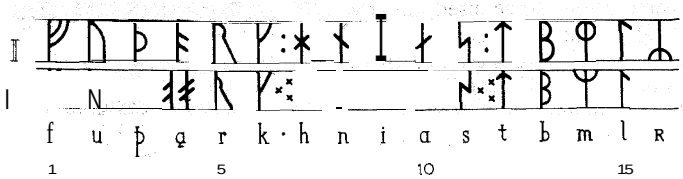

FIG. 12.— DANISH RUNES

16-letter Scandinavian alphabet. This alphabet appears in two distinct forms—Danish (fig. 12) and Swedish-Norwegian (fig. 13). Danish was used also in southwestern Sweden.

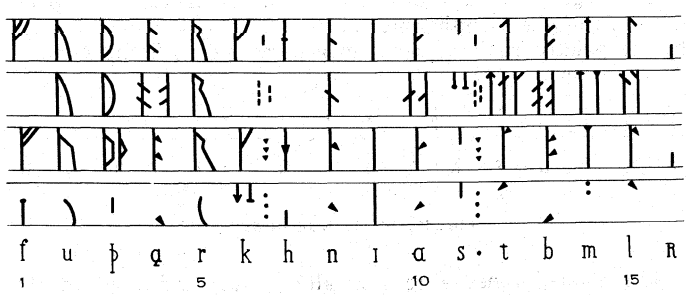

FIG. 13.— SWEDISH-NORWEGIAN RUNES

In Denmark runes seem to have been little used after the close of the 6th century, and the form of the runic *k*, as well as other details, indicates that it was through an impulse from Norway or Sweden that runes came into use again in Denmark at the close of the 8th century.

FIG. 14.— HELNAESSTONE

There are extant about 200 inscriptions upon standing stones. as well as a few upon portable objects. Most of these inscriptions date from between A.D. 800 and the middle of the 11th century. Despite their laconic and often stereotyped wording they are among the most remarkable, both as regards style and matter that have been found in Scandinavia. They give the names of several hundred men and women who lived in Denmark during this important period, from members of the royal house down to the lower grades of society, and they provide data for visualizing the life of the people and of individuals in war and peace.

The runic monuments which date from the beginning of this period are few in number. One of the oldest and most remarkable inscriptions with runes of the later period is the Helnæs stone at Fyn (fig. 14): *rhuulfR sati stain nuRa kuthi aft kuthumut bruthur sunu sin turuknathu (haliR uti) ouaiR fathi.* If it were written in a more adequate phonetic alphabet, *e.g.,* the Early Norwegian Icelandic alphabet which includes ð, this inscription would have run: *"HrólfR setti stein, NóRa goði, aft Guðmund brod urusunu sinn drunknadu haliR uti. ÁveiR fáði,"* "Rolf raised this stone, priest and chieftain of the Helnæs dwellers, in memory of his brother's son, Gudmund. The men were drowned at sea. Aveir wrote (the runes)."

From the earlier half of the 10th century the smaller of the two famous Royal stones of Jallinge in Jutland (fig. 15): *kurmR kunu(n)kR karthi ku(m)bl thusi aft thurui kunu sina tanmarkaR but,* "King Gorm made this monument in memory of his wife, Tyra: he (Gorm) who improved Denmark."

FIG. 15.— EARLIER JÄLLINGE STONE

The great majority of Denmark's 200 runic stones date, however, from the end of the 10th and the beginning of the 11th centuries. It was the period when the Vikings' raids on England were renewed, resulting at last in the conquest of the country by the Danish king, Sven Twybeard, who is mentioned in two of the runic inscriptions, and Canute the Great. The relations between Denmark and England are reflected in the history of the runic inscriptions inasmuch as it was probably due to influence by the Anglo-Saxon runes that the Danish alphabet then began to be enlarged by so-called pointed runes.

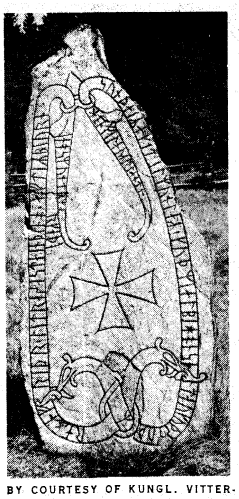
From Denmark the Danish runes spread about A.D. 1000 to Sweden uhere runic inscriptions on standing stones became more numerous than anywhere else. There are known in Sweden about 2.400 runic inscriptions, chiefly from the 11th century and the beginning of the 12th, the majority of them written in Danish runes. No fewer than half of them belong to the central region of the kingdom, Uppland. These monuments make it possible to follow the upward course of the Danish runes through Sweden from Skåne and Vastergotland to the southern part of Norrland, and it may be noted that the inscriptions in the south are, on an average, of earlier date than those in the north. The custom of erecting runic stones was not long-lived anywhere. Generally speaking, it was abandoned whenever a region became definitely Christianized and controlled by the Roman Catholic Church, but it seems to have had a vigorous final revival during the missionary period. The course of the spread of Christianity throughout Sweden during the 11th century—beginning in the south and proceeding to the north—is therefore traceable in a special way in the appearance of the runic stones.

From the beginning runic stones were erected for the most part in village graveyards, and one principal reason for giving up the

custom of erecting them must have been that with the spread of Christianity the dead had to be buried in the cemetery adjoining the parish church, often at a distance from the home. Thereby monuments lost much of their interest for the survivors. In Uppland, more especially, the runic inscriptions were accompanied by cleverly executed ornamental design. the patterns of which were taken from woodcuts—the art of woodcuts having been highly developed during the migration and Viking periods. Not merely the runes themselves but also these ornamental designs needed craftsmanship, and therefore, many runic inscriptions are executed by expert craftsmen.

The oldest and most remarkable (c. AD. 1025–1050) of these Uppland professional writers of runes was Asmund. He is probably identical with Osmundus, who is mentioned by the Bremen ecclesiastical historian. Adam. Osmundus was one of the Englishmen of Scandinavian origin who prepared the way in Sweden for the conquest of Christianity. Other talented masters of the art were Fot and Öpir. Asmund's stones record the names of a number of Swedes who took part in Canute the Great's conquest of England. On the Ängeby stone (fig. 16), one of Asmund's inscriptions reads as follows: *rahnjrithr lit risa stain thina aftiR biurn sun thaiRa kitilmuntaR. kuth hialbi hans ant aukuths muthiR. lzon fil a uirlanti. in osmuntr markathi,* "Ragnfrid had this stone erected in memory of Bjorn, her and Kattilmund's son. God and God's Mother help his soul! He fell in Estland. But Asmund engraved (the stone)."

When the reduction of the runic alphabet from 24 letters to 16 came about, the simplifying of the individual letters was carried furthest in the Swedish-Norwegian runes. These are to be found in Gothland, in eastern Gotaland, in. Svealand and in Norway, dating from the beginning of the Viking era, about A.D. 800. They were displaced on monuments by the Danish runes in the beginning of the 11th century in Sweden, but many circumstances indicate that even after this period they were used for more private purposes. Comparatively few runic monuments have Swedish-Norwegian runes on them but among these few must be mentioned the largest and most original of all, the Rok stone (fig. 17). The top and the four sides are covered with runes. The older forms of runes are also used together with ditierent kinds of secret writing.



BY COURTESY OF KUNGL. VITTERHETS HISTORIE OCH ANTIKVITETS AKADEMIEN, STOCKHOLM

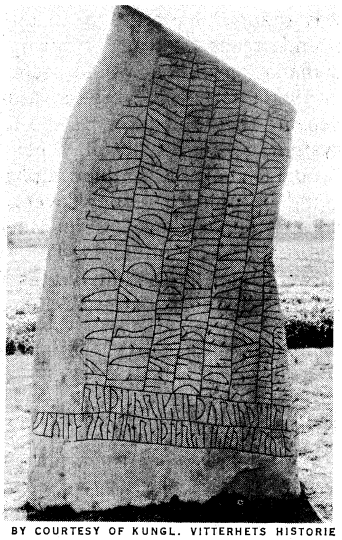
FIG. 16.—ÄNGEBY STONE

The stone was erected by a father in memory of his son and the inscriptions would seem to have in some degree magical purpose: to wreak vengeance on the son's slayers. The beginning of the inscription reads: *aft uamuth stonta runaR thaR in uarin fathi fathiR aft jaikion sunu,* "In memory of Vämod stand these runes. And Varin, the father, made them in memory of his son, overtaken by death."

The Swedish-Norwegian runes take an original form in Sweden. From the start they are characterized by a great reduction in the length of the cross strokes. In order to reduce as much as possible the length of the stroke whether written or incised, the vertical strokes were done away with as far as possible.

Thus came into existence the Halsinge runes (fig. 18), named after the region of Halsingland in which they have been found inscribed on a number of runic stones dating from the 11th century. They were known and used, however, in the central region of Sweden adjoining Lake Mälar, where likely they were invented. The Halsinge runes are a kind of runic shorthand and they give a clear indication that runes were widely used not merely on monuments but for all kinds of announcements: legal provisions, contracts, genealogies and poems. The abbreviated form of the Halsinge runes is clearly due to the need of saving time, trouble and material.

In Norway there appeared in the 11th century a peculiar mixture of Swedish-Xorwegian and Danish runes, which later led to an extension of the 16-letter alphabet to one better adapted to the northern sound system—the pointed runes. The Danes probably got the idea from England at the close of the 10th century. The Anglo-Saxon rune for y was a *u* inside which an *i* was written. This rune was used in Denmark beiore the year A.D. 1000. and after this model there was constructed out of the *i* a special letter for *e* and out of the *k* a special letter for g. These new letters are used generally in the Danish runes during the 11th century, although not consistently. When the Danish and Swedish-Norwegian alphabet came to be blended during the 11th century in Norway, it nould seem that toward the close of the century means were found to employ the wealth of letters thus aroduced to form a systematic representation of all the sounds in the language. The Latin alphabet, nhich had come into use with the introduction of Christianity, must have been of service in the construction of this radical improvement of the runes as symbols for sounds. Thus came into existence the completed pointed runic alphabet (fig. 19).



BY COURTESY OF KUNGL. VITTERHETS HISTORIE OCH ANTIKVITETS AKADEMIEN, STOCKHOLM

FIG. 17.—RÖK STONE (FRONT)

Only in Gothland was the completed runic stave used to any great extent for inscriptions on moruments. But here and there in other parts of Scandinavia are to be found single monuments with inscriptions on them in the pointed runes. In Gothland there are about 250 standing stones adjacent to the churches and also out in the country parts, and the custom of raising such monuments persisted until much later. Gothland, moreover, had to begin with its own pointed runic alphabet built up on the basis of the Danish runes alone. This was displaced later by the pointed runic alphabet in general use in Scandinavia.

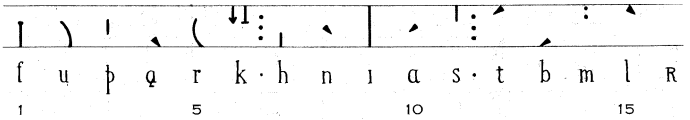


FIG. 18.—HÄLSINGE RUNES

The pointed runes were generally known and used in the whole of the Scandinavian North throughout the middle ages as the writing of cultured laymen. They were mainly used for private

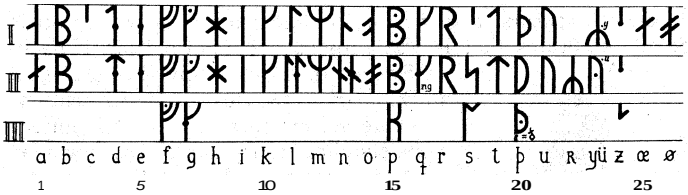

FIG. 19.— COMPLETEDPOINTED RUNIC ALPHABET

records. A Danish legal manuscript, *Codex runicus,* written in runes. dates from the end of the 13th century. There is extant, too, a prayer book of later date. which is evidently intended also for a layman not familiar with Latin. St. Bridget, who was a member of a Swedish family of nobles, spells Swedish. when she comes to acquire the use of the Latin alphabet, in the way in nhich she learned as a child nith runic letters.

There is evidence of the use of runes in Gothland as late as the 17th century.

Runes were kept up longer than elsewhere in outlying Swedish regions like Dalarna and Harjedalen where they were used for

making occasional notes down to modern times.

(O. v. F.; J. WH.)

RUNEBERG, JOHAN LUDVIG (1804–1877), the greatest Finnish poet, whose works expressed the patriotic spirit of his countrymen and also, because they were written in Swedish, exercised great influence on Swedish literature. The son of a sea captain, he was born at Jakobstad (Pietarsaari), on the Gulf of Bothnia, on Feb. 5, 1804, when Finland was still under Swedish rule. He studied at Åbo (Turku) university, graduating in 1827, but his academic career was interrupted by the need to earn a living, and he became a private tutor on an estate in Saarijarvi. At the university he had been inspired by romantic nationalism; in the heart of the Finnish countryside he learned to know and love Finland's landscape and people and heard at firsthand some of the stories of the heroic past which were to be the themes of his best work. He returned to the university, which had moved to Helsinki, in 1830 and became clerk to the council and (1831) lecturer in Latin language and literature. In the same year he married Fredrika Tengstrom, niece of the archbishop of Finland, and received a gold medal from the Swedish academy for his verse romance of Finnish life, Grafven *i* Perho. In 1837 he moved to Borgå (Porvoo), where he was lecturer in classics until 1857 and rector of the college, 1847–50. He continued to live there until his death, on May 6, 1877. For the last 13 years of his life he was partly paralyzed and unable to write.

Runeberg's first book of poems appeared in 1830 and showed the direction of his gifts in their freshness, vigour and sympathy with the Finnish peasant. His two idylls. Elgskyttarne ("Elk Hunters," 1832) and Hanna (1836), won him a place in Swedish literature second only to Esaias Tegnér. In 1844 he published Kung *Fjalar* (Eng. trans., 1904), a noble cycle of unrhymed verse romances derived from old Scandinavian legends. His *Fänrik Ståls* Sagner (2 series. 1848 and 1860; Eng. trans., The Songs *of* Ensign Stal, 1925), patriotic poems describing the war of independence (1808) as experienced by an old soldier, made a tremendous impression. and the first. "Vårt land," became the Finnish national anthem. Other works include Nadeschda (1841), a popular epic based on Russian folklore; a classical tragedy in verse, *Kungarne på* Salamis (1863); and two later volumes of poems, which, u-ith the 1830 volume, made up the collected poems (1830–43).

Runeberg's work shows the influence of classical literature and of Goethe in its high-mindedness and purity of form. His originality consists in his power to combine this classicism with romantic feeling and the realism which distinguishes his understanding of peasant life and character.

Runeberg's Samlade Arbeten were published in eight volumes, with a study by C. G. Estlander (1899–1902). Publication of his Samlade *Skrifter*, with extensive commentary; began in 1933.

RUNNIMEDE or (RUNNYMEDE), a meadow on the south bank of the river Thames, Eng., in the parish of Egham, Surrey. It is celebrated as the scene of the granting of Magna Carta by King John on June 19, 1215. A tradition that the scene was Magna Carta, or Charter, island. higher up the river, probably arose about 1834, when G. S. Harcourt erected on it a castellated cottage in which he placed a stone tablet bearing an inscription to the effect that the charter was sealed there.

Runnimede was presented to the nation by Lady Fairhaven in 1929.

RUNNING. The most primitive form of athletic exercise considered as a sport, running has been popular from the earliest times, and the simple footrace (dromos) run straight away from starting point to goal or once over the course of the stadium (a little over 200 yd.) formed an event in the Greek Olympic pentathlon (*q.v.*) or quintuple contest. There was also the race once over the course and return (diaulos) and the dolichos, a long race run many times (often as many as 12; *i.e.*, about $2\frac{3}{4}$ mi.) up and down the stadium. There was also the dromos *hopliton*, a short race for warriors wearing full armour and carrying sword and shield. Except in the warriors' race, the Greek runners were naked, save occasionally for a pair of light shoes. No records of the times returned have been handed down, but the contests must have been severe since the ancient Olympic chronicles preserve the memory of several men who fell dead at the end of the long course. According to Virgil (Aeneid, v, 286 et seq.) running was practised in circus exhibitions in ancient Italy.

The best runners in the middle ages were most often found among the couriers maintained by potentates and municipalities. The Persian couriers of the Turkish sultans often ran from Constantinople to Adrianople and back, a distance of about 220 mi., in two days and nights. In districts of India and Africa not traversed by railways runners were often employed to carry the mails.

In all parts of Great Britain track, road and cross-country running have been popular forms of recreation for many centuries. Practically all the modern sprint records are held by Americans, while many of those for the middle distances stand to the credit of European athletes.

Modern running is divided into three classes: sprinting, middle-distance and long-distance running.

Sprinting. — Sprinting consists of running over short distances with a full and continuous burst of speed, the chief distances being 100 yd., 220 yd. and 440 yd., and the corresponding metric distances. Distances up to and including 220 yd. are called dashes in the United States. The course for sprint races, when run in the open air, is marked off in lanes for the individual runners. In the modern style of sprinting the result often depends upon the start.

The old method of dropping a handkerchief was the worst way to give the starting signal since the muscles react slowly to the impression of sight, less so to those of touch and most quickly to those of sound, a difference of $\frac{1}{25}$ sec. in reaction amounting to more than 1 ft. in a run of 100 yd. All modern foot races therefore are started by the report of a pistol. Until 1887 all classes of foot runners began their races from a standing position. In that year Charles H. Sherrill, Jr., of Yale university, demonstrated an entirely new method known as the crouch, this method of starting became universal in a short time.

Experiments made with an electrical timing apparatus of his own invention by A. V. Hill of the University of London brought to light many interesting points in connection with the physiological processes involved in severe muscular exercise in man. Hill's experiments indicated that from 90% to 95% of the effort made by a sprinter traveling at top speed is expended in overcoming the frictional resistance of his own muscles. The force exerted by the first-class sprinter at maximum speed is equal to from 80% to 90% of his body weight; in running 100 yd. he does sufficient uork to lift himself from 240 ft. to 270 ft. into the air. He will bring into play approximately 8 h.p. and attain his maximum speed at 60 or 70 yd. from the start, when he may be traveling as fast as 24 m.p.h. Approximately 1 sec. is lost in the starting process. After the 70-pd. mark is reached the runner begins to lose speed through fatigue occasioned by the rapid appearance of lactic acid in the muscles, as much as $\frac{1}{8}$ oz. of such acid being secreted in the muscle substance every second. In the course of a 200-pd. race the speed drops as much as 15% between 70 yd. and 190 yd.

Athletes of the United States and the British Commonwealth have thoroughly dominated sprint events since the inception of

the modern Olympic games in 1896. The 100-yd. and 220-yd. distances (and their metric equivalents, 100 m. and 200 m.) have been the special province of U.S. athletes, among them Bernie Wefers, Archie Hahn, Charlie Paddock, Frank Wykoff, Eddie Tolan, Jesse Owens, Mel Patton, Barney Ewell, Andy Stanfield, Bobby Morrow and Dave Sime. Though his records were later broken, Owens is still regarded as the finest sprinter of all time. His career was climaxed in 1936 when he won the 100 m. and 200 m. at the Olympic games in Berlin. At one time Owens held alone or shared the world's records for all sprint distances recognized by the International Amateur Athletic federation. Owens' times of 9.4 sec. for 100 yd., 10.2 sec. for 100 m.. 20.3 sec. for 220 yd. and 200 m. compare favourably with the latest record list.

All important international races at 400 m. and 440 yd. are run on an elliptical track, each runner being provided with his own lane, to which he must keep throughout the race. The starts are staggered so that each runner will traverse the full distance. As a result. the competitors have no exact knowledge of their respective positions until they have completed the final turn and are within 50 yd. of the finish line. Great emphasis is therefore placed on an athlete's ability to judge his speed as well as upon his speed and endurance.

First of the modern 400-m. stars was Eric Liddell of Great Britain, who lowered the world's record to 47.6 sec. at the 1924 Olympic games. William Carr (1932 Olympic champion). Archie Williams (1936 Olympic champion) and Grover Klemmer of the U.S. took turns lowering the mark until Klemmer ran 46 sec. in 1941. Ben Eastman of the U.S. held the 440-yd. mark at 46.4 sec. until 1946, when the great trio from Jamaica, Herb McKenley, Arthur Wint and V. G. Rhoden, began their assault on the records. McKenley moved the 440-yd. mark to 46 sec. in 1948 and it remained there until Jim Lea of the U.S. ran 45.8 sec. in 1956. Rhoden (1952 Olympic champion) did 45.8 sec. for 400 m. in 1950; this was the record until Lou Jones of the U.S. ran 45.4 sec. in 1955 and then 45 2 sec. in 1956. Glenn Davis of the U S. lowered the 440-yd. record to 45.7 sec. in 1958.

Middle-Distance Running. — This comprises distances ranging from 600 yd. through 2,000 m., with the most popular races being at 880 yd. (or 800 m.) and 1 mi. (or 1,500 m.). The mile is the classic distance for all British and U.S. runners, and for years interest centred in the attempts of man to run the distance under four minutes. This feat was finally achieved on May 6, 1954, by an English medical student, Roger Bannister, who did 3 min. 59.4 sec. in a duel meet at Oxford university. A month later. John Landy of Australia reduced the record to 3 min 58 0 sec. In 1958 another Australian, Herb Elliott, ran 3 min. 54.5 sec. at Dublin, Ire.

In both the 880-yd. and mile distances, strategy and tactics play a far more important role than they do in the sprints. Countless theories have been advanced as to the proper way to run each race, but runners usually fall into one of two classes: pace-setters. who try to finish all opposition with an early rush, and kick-runners, who prefer to follow the leader and use their greater finishing speed to win in the stretch. All other things being equal, the latter runner usually prevails, as in the classic race between Landy and Bannister for the British Empire crown in Aug. 1954. Landy set the pace for the first three laps and more, but Bannister won in 3 min. 58.8 sec.

U.S. and British runners won all the Olympic 800-m. (880 yd.) titles from 1896 through 1956, some of the great stars being Douglas Lowe, Thomas Hampson and Sydney Wooderson of England and John Woodruff, Mal Whitfield, Arnold Sowell and Thomas Courtney of the C.S. After 1939, however, the world's record was held by European continentals, Rudolf Harbig of Germany running 1 min. 46.6 sec. in 1939 and Roger Moens of Belgium clocking 1 min. 45.7 sec. in 1955. The 880-yd. record in 1960 was 1 min. 46.8 sec., set by Courtney in 1957.

The Mile.—Of all track-and-field events, the mile and 1,500 m. have been the most international, with Olympic champions and world's record holders coming from Great Britain, the Gnited States, France, Italy, New Zealand, Finland, Sweden, Australia, Ireland and even Luxembourg.

The most memorable names in mile history have been those of Walter George, Paavo Nurmi. Glenn Cunningham, Jack Lovelock. Gunder Haegg, Sydney Wooderson and, of course, Bannister, Landy and Elliott, Ken Wood, Derek Ibbotson and Jim Bailey. (See Table I.)

George was an English professional star of the late 19th century who set a time pattern for miles that is still employed. This consists of a fast first quarter-miie, when the runner is still fresh; a slower second quarter; a still slower third quarter; and then as fast a final quarter as possible. In 1886 George ran the mile in 4 min. 12.75 sec., and no amateur broke that mark until Norman Taber of the U.S. shaded it with 4 min. 12.6 sec. in 1915.

* Land~face mas on a 400-m. track, therefore intermediate times are only approximated. †Approximate time. ‡Actual time, 3:57.9.

It was Nurmi with his theory of evenly paced quarters who brought the mark down to 4 min. 10.4 sec. in 1923, and another eight years passed before Jules Ladoumègue of France broke the 4 min. 10 sec. barrier with a time of 4 min. 9.2 sec. Around this time, Cunningham began his long career in the U.S., while Lovelock came out of New Zealand to break Ladoumègue's record with 4 min. 7.6 sec. in 1933. There ensued a series of thrilling duels between Cunningham and Lovelock, climaxed by the latter's 3 min. 47.8 sec. victory in the 1,500-m. race at the 1936 Olympic games. Meanwhile, Cunningham had reclaimed the mile record with his 4 min. 6.8 sec. race in 1934 and he later ran 4 min. 4.4 sec. in a specially paced indoor race. Wooderson then did 4 min. 6.4 sec. in 1937, and this time held up until the advent of Haegg.

With Sweden neutral during World War II, Haegg had an opportunity denied his contemporaries from other nations. The most picturesque miler of them all, with his fluid running style, Haegg ran the mile record down to 4 min. 1.4 sec. by 1945 in stiff competition with his countryman Arne Andersson. Both were disqualified from amateur racing while still in their prime and immediately retired.

Haegg's record remained in the books until Bannister's immortal race, but once the English star smashed the 4-min. barrier, such times became almost commonplace. Within two years after Bannister's race, the following also dipped under 4 min. for the mile: Chris Chathaway, Ibbotson and Brian Hewson of England; Laszlo Tábori and István Rózsavölheyi of Hungary; Gunnar Nielsen of Denmark; Landy, Bailey and Merv Lincoln of Australia; and Ron Delany of Ireland. Rózsavölheyi set the 1,500-m. mark at 3 min. 40.6 sec. in 1956, but it was Delany who triumphed at that distance in the 1956 Olympics, setting a meet record of 3 min. 41.2 sec. Elliott lowered the 1,500-m. record to 3 min. 36.0 sec. in 1958.

Long-Distance Running. — This includes all flat races from 3,000 m. upward. as well as steeplechasing, road and cross-country running. Among the great distance runners have been Alfred Shrubb of England, Hannes Kolehmainen and Nurmi of Finland, Haegg of Sweden and Emil Zatopek of Czechoslovakia, but by 1957, most of their records had been broken by a new crop of stars headed by Sandor Iharos and Tábori of Hungary, Gordon Pirie of England and Vladimir Kuts of the U.S.S.R. Before World War II, a premium was placed on simple endurance, an economical running style and the ability to judge pace. Nurmi, who ran with effortless ease and a stopwatch on his wrist, exemplified this style and, in his prime, held all the world's records from 1,500 m, to the one for distance covered in one hour (11 mi. 1,648 yd.)

Kolehmainen and Nurmi initiated the Finnish domination of distance running which lasted from 1912 through 1946, or until Zatopek appeared on the scene. The rule of the "Flying Finns"

ended dramatically in the 1948 Olympic games when Zatopek won the 10,000-m. race in record time. The Czech army officer also placed second in the 5.000 m. with a running style that was the complete antithesis of Nurmi's—a driving, tortuous churning of legs and body, an alternation of fast sprints with steady running and an apparently complete unconcern with pace. Zatopek's success at London was mild compared to his grand slam at Helsinki four years later when he won the 5,000 m., 10,000 m. and the marathon, all in record time.

The years between the 1952 and 1956 Olympics saw one distance record after another fall to Iharos, Táborí, Pirie and Kuts and, at Melbourne, it was Kuts, a Russian naval officer who fell heir to Zatopek's crown when he won the 5,000 m. and 10,000 m. These are the banner events of distance running, though in England and the United States they are usually translated into the 3 mi. and 6 mi., respectively.

Another popular event is the marathon (26 mi. 385 yd.), which, uniike the other two, is run for the most part on the open road. Most races of 10 mi. and over are run on the road and here endurance is the prime requisite.

Steeplechasing.—Originally only a cross-country run over a course plentifully provided with natural obstacles, the modern steeplechase takes place partly on the grass and mainly on the cinder track of the athletic field. A water jump must be included, in addition to which there are four flights of hurdles 3 ft. in height. The championship distance in England is 2 mi.; in the U.S. and at the Olympic games 3,000 m. The U.S. won Olympic steeplechases in 1900 and 1904 at 2.500 m., Great Britain taking two other races at 3,200 m. and 4,000 m.; the distance was stabilized at 3,000 m. in 1920.

Cross-Country Running.—This had its inception with the founding of the Crick run at Rugby school in 1837, followed by many other famous schools that also held annual cross-country races. About 30 years later the Thames Hare and Hounds held cross-country runs and races as a winter sport, and in a few years many other clubs were formed throughout England. Many amateur athletes use this winter sport, often formerly termed paperchasing, as a means of keeping fit and developing stamina for track athletics. English championships over the senior distance of 10 mi. were first held in 1876. The famous Midlands club, Birchfield Harriers. won many of these events thereafter. The number of runners in this event increased from 33 in the first race to 450 by mid-20th century.

In England races are limited for juniors (18 to under 21 years) to 6 mi. and for youths (over 16 to under 18) to 3 mi. The first international race was held in 1898 between England and France and an international championship was instituted in 1903 between England, Ireland. Scotland and Wales. In 1907 France first competed, followed by Belgium in 1923, while Italy, Luxembourg, Spain and Switzerland also competed in 1929.

The sport is also popular in the U.S. The championship distance in that country is 10,000 m.; intercollegiate titles are decided at distances of 4 mi. and 5 mi. Formerly included on the Olympic program, cross-country mas dropped after the 1924 games as not suitable for summer competition.

Relay Racing.—This form of competition has long been practised in the U.S. and has become popular throughout the world. Relay races are usually run by four men, each going a quarter of the distance. From 1911 to 1926 only one relay race was included in the English championships. This was really a medley race in which four men ran 880, 220, 220 and 440 yd., respectively. In the U.S. this race is known as the sprint medley relay and is included in most relay carnivals. England abandoned the event in 1927 and substituted two other relay races, a 440 yd. (4 × 110) and a mile (4 × 440).

The U.S. national championship relays, conducted by the Amateur Athletic union, are at distances of 440 yd. (4 X 110), mile (4 × 440), and $1\frac{7}{8}$ mi. (440, 220. 880, mi.). U.S. indoor championships are held at distances of 1 mi. (4 × 440) and 2 mi. (4 × 880).

This method of racing was started in the United States about 1890, on the model of the Massachusetts firemen's "bean-pot" race. The old method was for the men running the second quarter of the course each to take over a small flag from the first man as he arrived, before departing on their own stage of the race, at the end of which they, in their turn, handed on their flags to the awaiting next runners. The flags, however, were considered cumbersome, and for a time it was sufficient for the outgoing runner to touch or be touched by his predecessor. Nowadays a hollow cylinder of wood, constituting a baton, is carried and must be exchanged between lines drawn at right angles to the side of the track 10 yd. or 10 m. on each side of the starting line for each leg of the relay.

The growth of relay racing stems from the University of Pennsylvania, where in 1893, a relay race was included on a track program for the first time. Pennsylvania raced a team from Princeton university that year and again in 1894.

In 1895 a number of eastern U.S. colleges were invited to compete in a first annual Pennsylvania Relay carnival. By the early 1960s, more than 3,000 athletes participated annually in this two-day event.

For Olympic records in running, see OLYMPIC GAMES. See also TRACK AND FIELD SPORTS.

RUNNING WATER. Water flowing down slopes contributes more than any other external agent to the sculpture of the surface forms of the land. As it flows from higher to lower levels, the potential energy it possesses because of its height above sea level is changed into energy of motion. Most of its work is done in the channels of streams and consists principally of the transportation of weathered rock material toward the sea or toward the enclosed depressions into which the local streams of arid regions flow. Part of this rock waste is transported in solution. Although it often constitutes an appreciable fraction of the load carried by a stream, dissolved matter is mechanically a part of the water and affects its physical behaviour only by making it slightly denser and more viscous. The far larger part of the loads of streams consists of undissolved fragments, to which the water transfers a part of its momentum.

RUODLIEB, a romance in Latin verse by an unknown German poet who flourished about 1030; he was almost certainly a monk of the Bavarian abbey of Tegernsee. The poem is one of the earliest German romances of knightly adventure. and its picture of feudal manners gives it value as a historical document.

RUPEE (Hindustani *rupiya*, from Sanskrit *rupya*), the standard monetary unit of India. Pakistan, Ceylon and, up to 1952. of Burma, each country's rupee being distinct from that of the others and each being referred to by its own country's name; *e.g.*, Indian rupee. Pakistani rupee.

The Indian Rupee.—A silver coin of 175 gr. troy, called tanka, approximating the rupee, was struck by the Muslim rulers of Delhi in the 13th century. but the rupee itself, of 179 gr.. was introduced by Sher Shah in 1542. The English followed various indigenous standards. until in 1835 the silver rupee of 180 gr. (11/12 fine) was made the standard coin throughout British India. Down to 1873 the gold value of the rupee was 2s. (*i.e.*, Rs. 10 = £1); but. after 1873, because of the depreciation of silver. the exchange rate of the rupee in terms of gold currencies fell and at one time sank as low as 1*s*. Realizing the unsuitability of the silver standard, the government brought it to an end in 1893 by closing the mints for the free coinage of silver.

At the turn of the century. the government decided to introduce a gold standard with gold currency under which. nevertheless. the rupee was to continue as the standard monetary unit and would be unlimited legal tender at the rate of Rs. 15 to an English sovereign. But a different currency system, viz.. the gold exchange standard. came to be adopted. While the internal currency consisted predominantly of silver rupees and currency notes (convertible into rupee coins), for external transactions the rupee was linked to gold currencies through a fixed rate of exchange with sterling. The mechanism of this system consisted in the sale by the govern-

ment of rupee drafts (called council bills) in London and of sterling drafts (reverse council bills) in India at rates within the range of 1*s*. $4\frac{1}{8}$*d*. to 1s. $3\frac{29}{32}$d. This system worked well till conditions created mainly by World War I led to its breakdown in 1917. Owing to a rise in the price of silver the rupee ceased to be a token coin in that year; the fixed rate of exchange had therefore to be abandoned, and the rate of exchange for the rupee moved according to the price of silver.

In 1920 an attempt was made to restore the gold exchange standard, this time at a higher rate (R. 1 = as. gold): but it had to be given up after a few months. There followed then a period of "free" or "floating" exchanges. In 1925–26. the whole monetary system was examined by a royal commission (the Hilton-Young commission) which made three main recommendations: (1) the establishment of a gold bullion standard in place of the prewar gold exchange standard; (2) the setting up of a reserve bank for the unified control of currency and credit; and (3) the stabilization of the ratio of exchange at 1*s*. 6d. The government accepted these recommendations and initiated the necessary legislation. The bill relating to the setting up of the reserve bank had, however, to be dropped because of strong opposition to certain provisions. The Currency bill. which sought to fix the ratio of exchange at 1s. 6*d*., was the subject of bitter controversy, academic and business opinion in the country favouring the prewar rate of 1*s*. 4*d*. It finally passed the legislature (as act iv of 1927) and took effect from April 1, 192;. Subsequently, in Sept. 1931, when Great Britain left the gold standard and the government of India decided to continue the link with sterling, the rupee came on the sterling exchange standard.

In 1935, the reserve bank of India was established; it took over from the government the functions of issuing currency and maintaining the exchange rate; for note-issue, instead of the existing rigid fiduciary system, the elastic proportional reserve system was adopted: not less than 40% of the total note-issue must be covered by gold or sterling securities, and the balance issued against rupee coin, government of India rupee securities, eligible bills of exchange, etc.

Among the developments which occurred in Indian currency and exchange during World War II, two were of great importance. First. a comprehensive exchange control! parallel to that adopted by the U.K. and other members of the sterling area, was imposed on the outbreak of war. Secondly, while, because of exchange control and large export surpluses, the rate of exchange ceased to be a problem, there arose another, that of inflation. Under the sterling exchange standard, sterling tendered to the reserve bank was automatically exchangeable into rupees at the fixed rate of 1*s*. 6d. So, in exchange for sterling paid and accumulated in the form of sterling balances in London, rupee finance was made available for the huge war expenditure incurred. This led to a large increase in currency circulation and to serious inflation.

After World War II India's membership in the International Monetary fund brought about a fundamental change in its monetary standard. The par value of the rupee was expressed in terms of gold so that its external value became independent of sterling. Accordingly, in April 1947, the Reserve Bank act was amended so that now the bank was required to buy and sell foreign exchange (not sterling only as previously) at rates to be determined by the central government, with due regard to India's obligations to the I.M.F. This standard may be called the I.M.F. or gold parity standard. In 1948 the provisions regarding currency reserves were also modified by substituting "foreign securities" for "sterling securities" for the purpose of the 40% reserve ratio. However, in actual practice, as a member of the sterling area, India keeps a very large part of its foreign exchange reserves in sterling assets.

In Sept. 1949, uhen sterling was devalued, India decided to devalue the rupee to the same extent so that the value of the rupee in terms of sterling remained unchanged at 1s. 6*d*., the par value being 2.88 gr. of fine gold (or 21 U.S. cents).

Silver rupees mere withdrawn during World War II, one-rupee notes and nickel rupees taking their place. There are 16 annas to a rupee. 4 pice or *paisas* to an anna. and 3 pies to a *paisa*. It was decided to decimalize the coinage in 1957 with a rupee divided into 100 *naya paisas*. Large sums of money are expressed in lakhs (Rs. 100,000) and crores (Rs. 100 lakhs).

The **Pakistani** Rupee.—The state bank of Pakistan has the sole right of note-issue; a proportional reserve system similar to that in India is in force. The monetary standard is also similar. Up to Sept. 1949 the Pakistani rupee was equal to the Indian rupee. but when, in that month, sterling was devalued the Pakistani rupee was the only sterling area currency which was not devalued with it so that Pak. R. 1 became equal to about 2*s*. ad. (sterling), and Pak. Rs. 100 became equal to Ind. Rs. 144. However, on Aug. 1, 1955, it was devalued to the same level as sterling and once again Pak. R. 1 became equal to Ind. R. 1 and to 1s. 6d. sterling. Subdivisions of the Pakistani rupee are annas, pice and pies.

The Ceylon Rupee.—From 1869 to 1941 the Indian rupee was Ceylon's monetary unit. In 1941, by a currency ordinance. Ceylon adopted the rupee exchange standard which was operated by the board of commissioners of currency. The rate of exchange was fixed at Ceylon R. 1 = Ind. R. 1. Currency was issued by the board on a 100%-reserve basis. In Sept. 1949, after the devaluation of the Indian rupee (and by that fact of the Ceylon rupee), the Ceylon rupee was given a value independent of the Indian rupee. However, the par value chosen was the same as that of the Indian rupee (Ceylon R. 1 = 2.88 grains of fine gold). In 1950 the central bank of Ceylon was established. It was granted the monopoly of note-issue. No minimum reserve ratio was laid down, the amount of notes issued being left to the discretion of the bank. The only condition laid down in this connection was that the reserves should be "adequate to meet any foreseeable deficit in the balance of payments." In regard to the par value of the rupee, the bank was empowered to make recommendations to the minister of finance for any change that it considered necessary; the actual change, however, was to be made by an act of the Ceylon parliament, having due regard to Ceylon's obligations to the I.M.F. The Ceylon rupee is divided into 100 cents.

See Report of Royal *Commission* on Indian Currency and Finaace, Vol. I report, Vols. II–VI appendices, evidence, etc. (H.M.S.O., London, 1926). (J. D. V.)

RUPERT (HRODBERT), **ST.,** according to the Gesta Sancti *Hrodberti,* which dates from the 9th century, a kinsman of the Merovingian house, and bishop of Worms under Childebert III (695–711). At the invitation of the duke of Bavaria. Theodo II, Rupert went to Regensburg (Ratisbon). where he began his apostolate. He founded the church of St. Peter near the Wallersee, and subsequently, at Salzburg, the church of St. Peter, together with a monastery and a dwelling for the clerks, as well as a convent for women. He died at Salzburg. He is regarded as the apostle of the Bavarians.

RUPERT (1352–1410), German king, and, as Rupert III, elector palatine of the Rhine, was a son of the elector Rupert II and Beatrice, daughter of Peter II, king of Sicily. He was born at Amberg on May 5, 1352, and succeeded to the government of the Palatinate on his father's death in 1398. On Aug. 21, 1400, having helped depose King Wenceslaus at Oberlahnstein, Rupert was elected German king at Rense, and crowned at Cologne on Jan. 6, 1401. An expedition to Italy against Gian Galleazzo Visconti, duke of Milan (1401–2), proved a failure, but he was recognized by Pope Boniface IX in Oct. 1403. After some years of struggle with the anarchy in Germany and the partisans of Wenceslaus. Rupert died at Landskron near Oppenheim on May 18, 1410. He mas buried at Heidelberg. He married Elizabeth, daughter of Frederick IV of Hohenzollern, burgrave of Nuremberg, and left three sons and four daughters. Rupert, who earned the surname of *clemens,* was brave and generous, but his resources were totally inadequate to bear the strain of the German kingship.

RUPERT, PRINCE, COUNT PALATINE OF THE RHINE AND DUKE OF BAVARIA (1619–1682), third son of the elector palatine and "winter king" of Bohemia, Frederick V, and of Elizabeth, daughter of James I of England. was born at Prague late in 1619. A year later his father was defeated at the battle of the White

Mountain, near Prague, and driven from Bohemia. After many wanderings the family took refuge in the Netherlands, where Rupert's boyhood was spent. In 1633 the boy was present at the siege of Rheinberg in the suite of the Prince of Orange, and in 1635 he served in this prince's bodyguard In 1636, during his first visit to England, he was made an M.A. of Oxford and his name was entered as a member of St. John's college. He was also named as the governor of a proposed English colony in Madagascar But this scheme did not mature and Charles I sent his nephew back to the Netherlands, having, however, formed a high opinion of his energy, talent and resolution. In 1637 he was again serving in the wars, and in 1638, after displaying conspicuous bravery, he was taken prisoner by the imperialists at the action of Vlotho (Oct. 17) and held in a not very strict captivity for three years. In 1641 he was released, and rejoined his mother in the Netherlands. Early in 1642 he again visited England but returned immediately as escort to his aunt, Queen Henrietta Maria

Rupert returned to England in July of the same year when the Civil War began. Charles at once made him general of the horse and independent of Lord Lindsey, the nominal commander of the whole army. From this point until the close of the first Civil War in 1646 Prince Rupert was one of the dominant figures of the war. His battles and campaigns are described in the article CIVIL WAR. ENGLISH. He was distinctively a cavalry leader; it was not until the battle of Marston Moor in 1644 that the Royalist cavalry was beaten. The prince's strategy mas bold as well as skilful, as was shown both in the Royalist movements of 1644 which he proposed and in the two far-ranging expeditions which he carried out for the relief of Nenark and of York. In Nov. 1644, in spite of the defeat at Marston Moor, he was appointed general of the king's army But this appointment, though nelcome to the army. was obnoxious to the king's counsellors, who resented the prince's independence of their control to some of the nobility over whose titles to consideration he had ridden roughshod, and to some of the officers whose indiscipline and rapacity were likely to be repressed nith a heavy hand. These dissensions culminated, after the defeat at Naseby and the prince's surrender of Bristol to Lord Fairfax (Sept. 1645), in a complete break with Charles, who dismissed him from all his offices and bade Rupert and his younger brother Maurice seek their fortunes beyond the seas.

Rupert's character had been tempered by these years of responsible command. The parliamentary party accused him not merely of ingratitude for the kindnesses nhich his family had received from English people in the days of the Palatinate War, but also of barbarity in his conduct of the Royalist armies in England. He had, of course, been brought up in the rough school of continental warfare. Moreover, he often had to use force to secure pay and supplies for his troops. But it is clear that he did his best to restrain their licence; and he did on occasion display notable generosity to his enemies. When, after Marston Moor. he became convinced that the king's cause was in a military sense lost, he also became an advocate of peace. In consequence he came to be suspected by Charles's more optimistic advisers such as Lord Digby, while to Charles himself the news of Rupert's capitulation at Bristol came as a thunderbolt. Rupert demanded a court-martial. The verdict of this court smoothed matters for a time, but Rupert was too far estranged from the prevailing party at court to be of any assistance, and after further misfortunes and quarrels they separated. Charles to take refuge in the camp of the Scots. Rupert to stay nithout command in the Oxford garrison. He received at the capitulation a pass from the parliament to leave England. as did also his comrade Maurice.

For some time after this Rupert commanded the troops formed of English exiles in the French army and received a wound at the siege of La Basse in 1647. Charles in misfortune had understood something of his nephew's devotion and wrote to him in the friendliest terms, and though the prince had by no means forgiven Digby, Lord Colepeper and others of the council, he obtained command of a Royalist fleet. The king's enemies were now no longer the Presbyterians and the majority of the English people, but the stern Independent community. with whose aims and aspirations Rupert could not have any sympathy nhatever. A long and unprofitable naval campaign followed, in which Rupert's small fleet was chased by Robert Blake from Kinsale to Lisbon, Cartagena and Toulon. Driven from the Mediterranean, Rupert cruised to the Azores and to the West Indies (1651–52), returning to France in 1653 with a single ship and a few prizes. After this the prince, having again quarrelled with the council, spent six years (1654–60) in Germany. At the Restoration he settled in England again, receiving from Charles II an annuity and becoming a member of the privy council. He never again fought on land but. turning admiral, he played a prominent part in the Dutch Wars. He also took an interest in trading enterprises and was a member of the Royal African company (1663) and of the Hudson's Bay company (1670). He died at his house in Spring Gardens, Westminster, on Nov. 29, 1682.

Prince Rupert is a distinguished figure in the history of art as one of the earliest mezzotinters. One of the most beautiful and valuable of early mezzotints is his "Head of St. John the Baptist." He was also interested in science, experimented with the manufacture of gunpowder, the boring of guns and the casting of shot and invented a modified brass called Prince's metal. Prince Rupert was created duke of Cumberland and earl of Holderness in the English peerage in 1644.

See E Warburton, *Memoirs of Prince Rupert and the Cavaliers including their private correspondence, 3* vol. (London, 1849) ; E. Scott, *Rupert, Prince Palatine* (London, New York, 1899) ; J. Cleugh, *Prince Rupert* (London, 1934). (R. B. WM.; X.)

RUPERT (RUPPRECHT MARIA LUITPOLDT FERDINAND VON WITTELSBACH) (1869–1955), German prince, the eldest son of King Louis III of Bavaria, was born on May 18. 1869. at Munich. In 1906, after extensive travels, he was appointed to the command of the 1st Bavarian army corps. At the outbreak of World War I he was commander of the Bavarian troops (the 6th German army) and later was placed in command on the German front in Artois and southern Flanders. As field marshal he was entrusted with the chief command of the northern group of armies on the western front. In 1900 he married Marie Gabrielle, a sister of the queen of the Belgians, who died in 1912; and in 1921 he married Princess Antoinette of Luxembourg and Nassau. He renounced his rights to the Bavarian crown (although he was later involved in plots to restore the monarchy), on Nov. 8, 1918, and was allowed to reside in his castle near Starnberg, Bavaria, where he died on Aug. 2. 1955. Through his mother, the archduchess Marie-Thérèse of Austria-Este. Prince Rupert was the descendant of the Stuart kings of England and, according to legitimist ideas. in the succession to the British crown.

RUPERT'S LAND, a former district of Canada. The generous charter of Charles II, given in 1670 to the Hudson's Bay company (*q.v.*), was interpreted to include all the country which was drained into Hudson bay. As Prince Rupert was first governor of the Hudson's Bay company his name was given to the concession under the name Rupert's Land. Athabasca. New Caledonia and British Columbia were not included in the grant. They mere held under the title of Indian territories by the Hudson's Bay company by licence terminable every 21 years, the last term closing with 1859. Rupert's Land nas transferred to Canada by the imperial government in 1870, and ceased to exist as a political name. It continued to be used as the title of the Anglican episcopal diocese, in the main coincident with the province of Manitoba; and as a provincial electoral district, the far northern section of the province.

RUPILIUS, PUBLIUS, Roman statesman, consul in 132 B.C. During the inquiry that folloned the death of Tiberius Gracchus, conducted by himself and his colleague Popillius Laenas, he proceeded nith the utmost severity against the supporters of Gracchus. In the same year he was dispatched to Sicily, where he suppressed the revolt of the slaves under Eunus. During 131 he remained as proconsul of the island and, with the assistance of ten commissioners appointed by the senate, drew up regulations for the organization of Sicily as a province. These regulations were known by the fitle of *leges Rupiliae.* Rupilius was subsequently brought to trial (123 B.C.) and condemned for his treatment of the friends of Gracchus. He died soon after.

RURAL EDUCATION. Everywhere, as peoples of the

world seek a larger share in self-determination, education assumes an increasing significance as a means of their achieving stability and self-direction. While many countries of the world may be characterized as rural, social scientists have pointed to the relative decline of the importance of rural life as a major cultural change in the more highly industrialized nations. Advances in the development of mass media communications, rapid transport and migration of labour to jobs are some of the factors in industrialized societies making the distinction between what is urban and what is rural even less sharp. Generalizations about rural education are, therefore, increasingly difficult to make. In the matter of illiteracy (*q.v.*) alone, for example, rates vary from an estimated 1% to 2% in northern and western Europe to over 80% in areas of Africa and south central Asia.

NEWLY DEVELOPING

In many countries education as the key to freedom and independence is a rural problem, two-thirds of the world's population being engaged in agriculture or living in small towns or villages. The relationship between education and the level of living of a people is direct. Nations having an inadequate program of education are also those with the poorest economic conditions. What is going on in the field of education in many parts of the world must be seen against the backdrop of the basic problems of half the people in the world who are chronically hungry, poorly clothed and inadequately housed. Only slightly more than half the world's children are receiving any kind of education in schools. Improved literacy and use of local resources are high priority goals.

There is a growing emphasis upon functional education in most of the newly developing countries, which are basically rural. Educational opportunities are provided through a variety of types of school organization: for example, the *núcleos* in Bolivia, the community schools in the Philippine *barrios*, the tribal schools in Iran, the tent schools of nomadic tribes in Ethiopia and the Second Unit Rural schools of Puerto Rico. All of these programs have a genuine concern for developing basic skills and knowledge in a manner which respects the particular culture, initiating community improvement at a pace acceptable in the community.

Where educational institutions in rural situations have held to the emphasis on the school as a place for formal classes in academic subjects, other agencies have supplemented the work of the school through adult education and community improvement. An increasing number of schools, however, have accepted the responsibility for directing the curriculum toward the needs of all citizens. Education becomes a constant interaction between school and community, a co-operative program that utilizes the skills, the abilities and the efforts of the entire citizenry toward the improvement of community living. The traditional school program does not in itself equip the graduate to participate or take leadership in the community. Participation in community development requires not only the possession of basic skills and knowledge but also the acceptance of personal responsibility toward the community, skill in human relations and the ability to work co-operatively with other persons.

In Asia the traditional concept of education has led, in many places, to the educated person's developing a distaste for manual labour. Economic development has been hindered. Schools were modern, but farmers employed primitive methods of agriculture. In the Philippines the newer concept of the teacher's role now includes both teaching children and leading adults. At every level newer methods of teaching seek to develop skills, impart useful information, inculcate positive attitudes and provide a maximum of carry-over to life situations. Building sanitary latrines, keeping animals corraled, obtaining a pure water supply. growing fruits and vegetables—these represent opportunities to put education to work on people's fundamental problems.

Many agencies other than schools have worked at the task of rural education and have had their influence throughout the world. A few examples are: the Community Welfare centre in Kcora, Africa; the Himayatsagar Extension centre in Hyderabad, India; government workers sponsoring Fundamental Education projects in Ceylon; the Kear East foundation; Crefal centre of the United Nations Educational, Scientific and Cultural organization (UNESCO) in Mexico; and many others. Christian missions from Europe and North America, Buddhists in Asia and Moslems from Egypt have influenced rural education in many sectors of the world. Mass education movements led by James C. Yen in China and by Frank Laubach in the Philippines have helped to lift the sights of people, especially in literacy.

One of the most significant signs of educational progress throughout the world has been the development of rural-school community centres. In these the school leadership assists in teaching both adults and children. The emphasis is on the solution of economic and social problems to bring about improved agricultural practices. sanitation, health, literacy. homes and communities. Among the countries where such developments have made substantial gains are Puerto Rico, Egypt, Korea and the Philippines.

If the gap between where many nations find themselves and their concept of their rightful role is to be bridged in a comparatively short time, the education of adults must proceed apace with that of children. In rural cultures life has not become compartmentalized; therefore, the task of rural education becomes a total community concern. Experience of community educators in the tropics suggests certain guidelines. The most important and lasting results have been achieved by recognizing cultural factors, involving people in learning to help themselves, respecting the opinions of those affected and gaining community acceptance of educational purposes.

The culture of the nations of South America, the West Indies and Central America is derived from the American Indian, Spain, Portugal and France. In general, the educational system has provided tno branches—one for the elite and the other for those of lesser station. In Mexico, Uruguay and Brazil there has been considerable progress toward a single plan for all. The church has been the principal avenue through which the state expressed its interest in education, and church missions have been ardently active in rural regions, church education being public education. The modern period in education has been characterized as one of ferment and one nhich is creating new educational forms. Mexico, Venezuela. Argentina and Cuba are seeking the incorporation of the masses in the educational process, creating an educational profession to do this gigantic task.

The degree of centralization varies widely from country to country (see SCHOOL ADMINISTRATION). In Haiti, as in many other nations, the school system is centralized under the ministry of national education. The rural primary system covers a six-year period divided into three two-year courses. As in Europe the student enters the secondary school by passing a state administered written examination. The five major types of rural elementary schools are farm, rural, village, communal and presbyterial. Schools are often not accessible. Rural secondary schools are few indeed.

In Mexico, there were practically no rural schools before 1920. Within 30 years 80% of the public elementary schools were rural. Of these 70% were supported by the federal government, 24% by state and municipal governments and 8% were private or mixed private and government. All schools are required to adopt a common curriculum related to their particular needs so there is a great variety of programs designed to improve community life. There are still rural regions without elementary schools and many existing schools provide instruction only for two or three grades. The rural normal schools are federally supported. The *misión cultural* is a distinctively Mexican educational invention to promote community education in the fields of public health, agriculture. construction, trades and industry, music, recreation and rural mechanics.

INDUSTRIAL COUNTRIES

Countries that are characteristically industrial, such as the United States and Great Britain, still have rural areas in which schools are faced with special problems of organization, administration and finance. Instruction. in general, has tended to be more or less directly related to agricultural pursuits and domestic

arts, with relatively greater emphasis on terminal education and less on preparation for college.

In the United States there has been a growing movement, through school district reorganization, toward providing centrally located administrative, instructional and purchasing services for rural schools. The C.S. system of universal education has been highly decentralized through local administrative units. However, the number of districts was cut from 127.000 to about 50.000 over a period of 25 years beginning in 1933. Much of this change was the result of improved transportation. Rural schools in the United States generally have a smaller percentage of the school-age children enrolled; teachers have fewer years of college training; supplies, equipment, and buildings are inferior; and teachers are paid lower salaries than those in urban situations. Data from the United States office of education on 101 of the "most rural" counties in the 1950s, selected on the basis of population density and the number of people living on farms, emphasized the wide variety of practices characterizing rural education. For example, one county contained 89 local school districts; another county, only one district. Enrollments in the 101 counties varied from 94 to 7,671; enrollments per school averaged 85.1; and pupils per teacher, 24.7. In contrast to schools in the more sparsely settled areas there were many schools in rural settings which offered children educational opportunities equal to those in the best urban systems. Since 1914 the agricultural extension service has been a great resource for almost every kind of farm problem, channeling consultant help and educational materials into rural communities. The Four-H clubs (*q.v.*) have taught rural children improved approaches to homemaking, family living, farming and citizenship. Many nongovernment agencies, such as church missions and conferences on rural life, have upgraded the quality of rural living. Farmers have had organizations of their own, including the Farm bureau, Farmers union and the Grange —each placing considerable emphasis on educational goals.

Only about 20% of the children of England and Wales attend rural schools. The curricula of these schools give considerable attention to the life and processes of the countryside. The infant stage of the primary schools (ages 5 to 7) is basically the same everywhere. In the junior stage (ages 7 to 11) the field of environmental study is enlarged, application being made through survey measurements and practical exercises. At 11 years children are examined and allocated to secondary education in technical, grammar or modern schools. Rural areas offer secondary education with a vocational emphasis. The country grammar schools emphasize the usual academic subjects. The modern schools are often provided with school gardens and equipped with science and gardening laboratories. Cooking, woodwork, metalwork and agricultural club work take on projects closely related to community life. Children usually are served a midday meal. Those children under eight years living more than two miles from school are transported. The grammar schools are fewer in number than the modern schools and draw pupils from greater distances. (Education in 1952, H.M.S.O., London.)

Those nations with advanced educational programs reaching all segments of their society are taking increasing responsibility for providing technical aid and services to the newly developing nations, in order that the gulf between them be reduced rather than widened. From the world view education is still primarily a rural problem. See also ADULT EDUCATION; AGRICULTURAL EDUCATION AND RESEARCH: AUDIO-VISUAL EDUCATION.

RURAL ELECTRIFICATION. In such technologically and economically advanced countries as the United States among the larger nations, and Sweden and Switzerland among the smaller ones, more than 90% of the farms may have a supply of electricity, while in comparatively undeveloped lands rural electrification may be virtually unknown. Generally, the degree of farm electrification in any country has depended on such factors as (1) available energy sources such as coal or falling water; (2) the general development of the country and particularly the status of its electric power industry; and (3) the relative importance of agriculture in the nation's economy.

Effect on Farming Methods.—Just as the steam engine revolutionized shipping and the gasoline engine highway transportation, electric power revolutionized manufacturing and has largely revolutionized agriculture. Electric power has been substituted for animal and human muscle power, greatly increasing output per man-hour and the efficiency of farm operations. At the same time it has offered advantages and conveniences previously available only in urban areas.

Uses in the *Household.*—Originally, the aim of the farmer in connecting to an electric supply line was the same as that of the city dweller—to secure electric lighting. Electricity was later used for water pumps, washing machines, electric irons, refrigerators, radios, etc. Many farmers installed electric ranges and electric water heaters, electrically controlled central heating and modern bathrooms. Home freezers rapidly came into use on U.S. farms after World War II. The cost of operating a home freezer was relatively low and it made possible the easy storage of meats, fruits and vegetables produced on the farm for use throughout the year. As television became available throughout the country, farmers quickly installed receiving sets. The popularity of home air conditioning also spread from the cities to the farms.

Dairying.—Electric lights proved particularly useful in dairy barns and milkhouses, where much of the work is done before and after daylight hours. Milking machines and milk-cooling equipment also came into wide use to reduce labour, increase production, improve the quality and promote sanitation of the milk. With the use of milking parlours and bulk milk-handling equipment, it became possible to transfer milk directly from the cow through sanitized pipes to electrically cooled, stainless steel storage tanks and then to a dairy tanker for shipment to market. During cold weather, milk production may be increased as much as 25% through the use of thermostatically controlled drinking fountains. In many dairy barns mechanical devices have been installed in the gutters behind the cows to carry the manure outside to a manure spreader or wagon.

Poultry.—Electricity is especially useful in poultry farming. Artificial illumination timed to lengthen the day to 13 or 14 hours during autumn and winter can increase egg production in these seasons as much as 20% to 30%. An automatic water supply is highly desirable and nearly always used by successful poultry farmers. In cold weather, warming the drinking water to prevent freezing is necessary for maximum egg production. Other electrical equipment used on poultry farms includes: electrically heated brooders to keep young chicks warm and dry; electrically operated fans to remove strong ammonia fumes and excessive moisture from the poultry house; automatic feeders; and motor-driven egg cleaners and graders.

General *Farming.*—Farmers have used electricity for more and more operations each year. Some of its major uses are for ventilation, crop drying, conditioning and storing, feed handling, mixing and grinding, automatic feeding and soil heating. (*See* also CROP DRYING AND PROCESSING.)

The heat lamp is extensively used by farmers as a pig brooder, especially in the colder climates where spring pigs are raised. It has been estimated that at least one additional pig per litter can be raised with the proper use of the heat lamp.

Automatic handling of materials with electrically powered equipment has become increasingly important in such operations as livestock feeding, milk production and poultry farm operations. Environmental control of farm buildings in poultry production and in dairy operations has provided increased efficiency. The

electric heat pump was being studied in the 1960s as a means of maintaining uniform environmental conditions.

Rural Electrification in the United States.—Of the more than 3,700,000 farms in the United States in the 1960s. approximately 98% had electric service. The first steps toward rural electrification in the United States were taken only a few years after Thomas Edison's first generating plant began operation in New York city in 1882. Progress in rural areas lagged behind urban development of electric service, however, because of many technical and financial obstacles. For the first 15 years direct current, which could be transmitted only a few miles. was used and most generating plants were located in cities. In addition, the costs of constructing transmission and distribution lines to serve outlying farms were exceedingly high. Various methods were tried by the electric companies to lower costs. In some cases farmers paid for and owned line equipment and furnished the right of way to the power company in return for electric rates comparable to those in nearby towns. Some power companies bore the entire cost of stringing lines. In most cases, however, some form of "shared-cost" plan was adopted.

By 1920 the electric utility companies had built a vast network of transmission lines which provided 24-hour electric service to practically every city and village in the U.S. The steam turbine had been so perfected that the cost of manufacturing electricity had been greatly reduced, and the combined use of alternating current and transformers made possible the long-distance transmission of electric current at high voltages. These developments made it possible, for the first time. to supply rural electric lines radiating from the urban centres with adequate electric power at a price sufficiently low to fit into the farmer's economy. The foundation for farm electrification on a national scale had been built.

In 1921 the National Electric Light association (NELA) organized a rural service committee to determine what was necessary to step up the electrification of rural areas. It was discovered that a high degree of rural electrification would necessarily entail more than the mere construction of transmission lines into farming areas: new farm equipment would have to be developed and farmers would have to be informed of the advantages of increased electrical use.

To assist in solving these problems a joint committee was set up that included representatives of the American Farm Bureau federation, the Kational Grange, the American Society of Agricultural Engineers, the U.S. department of agriculture, electric companies and others. This organization, known as the Committee on the Relation of Electricity to Agriculture (CREA), was active from 1923 to 1939. It promoted research work at universities and among manufacturers and published and distributed publications dealing with applications of electricity to farm operations.

The aggressive efforts of CREA and scores of local electric companies resulted in a substantial increase in the number of farms connected to power lines each year. In 1928, for example, more than 113,000 farms were newly electrified, as compared with only 27,000 in 1924. The depression of the 1930s retarded this rapid expansion and between 1929 and 1935 relatively little progress was made in extending rural electrification in the Cnited States.

REA.—As conditions resulting from the depression eased, the utility companies were once again able to step up their rural electrification programs. In addition, the federal government set up a new program to assist the farm electrification movement by instituting the Rural Electrification administration (REA) in 1935. Through the lending of funds to newly organized REA co-operatives. it became an increasingly important factor in the growth of rural electrification.

By the second half of the 20th century, REA-financed co-operatives were serving about 51% of all farms receiving electric service. while electric companies served about 43% and government-owned systems supplied the remaining 6%. About 40% of all REA co-operatives' power requirements were being purchased from electric companies under wholesale contracts. The average annual use of electric power on farms east of the 100th meridian was about 5.000 kw.hr. per customer. In many areas where intensive farm development programs had been carried on, annual use averaged about 30% higher than the national figure. On farms west of the 100th meridian. where use is affected by requirements of water pumping for irrigation, average annual use totaled more than 9.000 kw.hr. In comparison. the average nonfarm residential customer in the United States used a total of about 3.600 kw.hr.

(R. F. C.)

Great Britain.—The early pattern of electricity supply in Great Britain was such that privately o ned companies and municipalities electrified the urban areas first and then pushed out to the more densely populated parts of the surrounding areas. After the nationalization of the industry in 1948 rural development was rapid. In England and Wales the number of electrified farms rose from 86,500 out of a total of about 281,000 in 1948 to more than 235,000 by the early 1960s and the average annual consumption per farm from about 3.500 to more than 7,600 kw.hr. In 1953 the Central Electricity authority started a ten-year plan aimed at connecting 85% of all farms. Development of the rural load was helped by the establishment of agricultural development departments by the Central Electricity authority and Area boards, by the Electrical Development association—responsible for publicity—and by the Electrical Research association, which had a rural electrification department to investigate possible applications of electricity to agriculture and horticulture. As in the United States the most important were those for crop drying, farm grinding, water heating and sterilizing in dairies. poultry rearing and for horticulture, including soil warming, artificial illumination and the control of the environment in greenhouses.

Other Countries.—While small electric plants. driven by oil engines or windmills, could supply individual premises with power for domestic use, rural electrification depended largely on the existence of main electrical networks. In many underdeveloped countries these were very limited in extent up to the middle of the 20th century. The benefits of electricity for agricultural areas were appreciated after World War II. particularly, and a number of international conferences, *e.g.,* the World Power conferences in New Delhi (1951), Rio de Janeiro (1954) and Belgrade (1957), paid particular attention to this question.

The United Nations made studies of the energy needs. including rural electrification for Latin America, southeast Asia and Europe, and its Economic Commission for Europe published a three-volume report on rural electrification in 1954 and 1958. Substantial progress was reported, for example, for Austria. France, Hungary and Sweden. In the Ketherlands rural electrification was 96% complete by 1957 with an annual increase in rural consumption of 10%. In Ireland rural electrification was not undertaken until 1947 when .5% of rural inhabitants were served and annual consumption was 300,000 kw.hr.; within five years 27% of rural inhabitants were being served and annual consumption reached 127,000,000 kw.hr. Based on abundant water power, rural electrification in Norway was widespread with the highest per capita consumption in the world.

Many farms and rural communities in the U.S.S.R. were electrified. first by small local stations, later from high-voltage networks.

Extensive rural electrification in New Zealand was done under regional power boards co-operating with groups of consumers. Canadian agriculture benefited greatly through the full rural projects of the provinces. Rural projects progressed in the coastal areas of Australia and Tasmania, where water power abounds.

In Central and South America electricity consumption was generally very low except in urban areas, but some countries, *e.g.,* Trinidad, had developed rural electrification. The per capita consumption of electrical energy was also low in most of Asia, except Japan where hydro power facilitated rural electrification. Under the Colombo plan, development in southeast Asia progressed, especially in Ceylon, India and Malaya. though much remained to be done. In the first Indian five-year plan (1951–56) the electrified villages with populations under 5,000 increased from 2,792 to 5,300, and almost 20.000 had been electrified by 1961.

The International bank made loans in the 1950s for the Aberdeen-Laksapana hydroelectric project in Ceylon, a five-year rural development plan in Algeria, a hydroelectric station in Uruguay

and the Kariba gorge hydroelectric project in the Federation of Rhodesia and Nyasaland, where a national electricity grid served most of the settled areas.

Uganda, helped by the Owen falls hydroelectric project, began to electrify rural districts. In South Africa progress was slow, because of great distances between the large farms, but plans in the intensively cultivated areas were successful. (E. W. G.)

RURKI: *see* ROORKEE.

RUSCONI, CAMILLO (1658–1728), the most powerful Roman sculptor of the first quarter of the 18th century, was born on July 14, 1658, at Milan. After an early and brief pre-rococo phase ("Cardinal Virtues," S. Ignazio, 1685) he reverted, perhaps under the influence of his older friend, the painter Carlo Maratta, to the classicism of Duquesnoy and Algardi without entirely discarding Bernini's grand baroque manner. The result can be studied in the heroic "classicist baroque" of his four monumental Apostles in San Giovanni in Laterano (*c.* 1708–18) and in the tomb of Pope Gregory XIII (St. Peter's, 1719–25). The type of the tomb is derived from Algardi's tomb of Leo XI, while in the figure of the pope with the majestic gesture the spirit of Bernini's statues of Urban VIII has come to life again. A whole generation of sculptors was educated in Rusconi's studio. He died at Rome on Dec. 8, 1728. (RF. W.)

RUSE (RUSCHUK; Bulg. RUSSÉ), the capital of the Ruse district, Bulg., on the right bank of the Danube, where it receives the Lom. Pop. (1956) 83,472. It is connected by rail with Varna and Sofia; by boat and rail with Bucharest. It is the chief Danubian port of Bulgaria, and an important commercial centre. It possesses sugar. tobacco and cigarette factories, soapworks, breweries, aerated water factories, dyeworks, tanneries, sawmills, brick and tile works and a celebrated pottery.

In Roman times Ruschuk mas one of the fortified points along the line of the Danube. In the *Tabula Peutingeriana* it appears as Prisca, in the *Antonine Itinerary* as Serantaprista, in the *Notitia* as Seragintaprista and in Ptolemy as Priste Polis. Destroyed by barbarian invaders in the 7th century the town recovered its importance only in comparatively modern times. It played an important part in the Russo-Turkish wars of 1810, 1828–29, 1853–54 and 1877–78. In 1877 it was nearly destroyed by Russian artillery.

RUSELLAE, an ancient town of Etruria, Italy, about 10 mi. S.E. of Vetulonia and 5 mi. N.E. of Grosseto, situated on a hill with two summits, the higher 636 ft. above sea level. It was one of the 12 cities of the Etruscan confederation, and was taken in 294 B.C. by the Romans. In 205 B.C. it contributed grain and timber for the needs of Scipio's fleet. The place was deserted in 1138, and the episcopal see was transferred to Grosseto. The walls, nearly 2 mi. in circumference, are in places well preserved. They consist of large unworked blocks of a travertine which naturally splits into roughly rectangular blocks; these are quite irregular, and often as much as 9 ft. long by 4 ft. wide; in the interstices smaller pieces are inserted.

RUSH, BENJAMIN (1745–1813). U.S. physician and medical educator, designated by his contemporaries as the "American Sydenham" and even as the "Hippocrates of Pennsylvania," one of the major figures in the rise of U.S. medicine, was born of a Quaker family on a farm near Philadelphia. Having obtained his B.A. from the College of New Jersey (later Princeton university) at the age of 15. he spent six years in Philadelphia in medical apprenticeship and completed his studies with an M.D. degree from the University of Edinburgh in 1768. After a year of travel in Europe he returned to Philadelphia, where he was appointed professor of chemistry (1769) in the College of Philadelphia (later merged with the University of Pennsylvania) and subsequently professor of the institutes of medicine and clinical practices at the University of Pennsylvania (1791). He introduced clinical instruction at the Pennsylvania hospital and initiated the Philadelphia dispensary. Rush was also deeply involved in the struggle for independence. As a member of the continental congress he was among the signers of the Declaration of Independence, and he served briefly in the army as surgeon general. Involvement in political intrigues, however, led him to return to Philadelphia, where he resumed the practice and teaching of medicine until, in 1797, he accepted Pres. John Adams' appointment as treasurer of the national mint, which office he held until his death in 1813.

Rush was a prolific writer on a vast variety of subjects which also included numerous social causes. He was a fiery proponent of the abolition of slavery. the death penalty and the use of alcohol, and he fought for prison reforms, higher education for women and free public schools for the poor. He also strongly suggested the establishment of a permanent "peace office.)' His medical interests were equally vast, and his therapeutic opinions tended to be dogmatic.

A strong believer in bloodletting and purging, he was inclined to enfeeble his patients upon whom he expended so much devotion and clinical attention. His *Account of the Bilious Remitting Yellow Fever As It Appeared in the City of Philadelphia in the Year 1793* is outstanding for .its graphic description of the disease, but his untiring efforts and courage in taking care of yellow fever patients, until he himself became a victim of the disease, were frequently offset by his insistence upon debilitating therapeutic measures.

Yet the stubbornness which misled him in certain aspects also helped him to pursue novel and important ideas. His *Medical Inquiries and Observations Upon the Diseases of the Mind* (1812) was the first systematic American book on the subject, and his improvement of the housing of mental patients at the Pennsylvania hospital represented a decisive step toward a rational treatment of mental disease. His description of cholera infantum (1773), of dengue (1780) and of the relation between rheumatism and diseases of the teeth illustrate his unusual powers of observation.

Rush died of typhus at Philadelphia on April 19, 1813.

See *Autobiography* of Benjamin Rush, ed. with introduction and notes by George W. Corner (1948); the *Letters* [of Benjamin Rush], ed. by L. H. Butterfield (1951). (I. V.)

RUSH, RICHARD (1780–1859), U.S. statesman and diplomat, son of Benjamin Rush, was born in Philadelphia, Pa., on Aug. 29, 1780. He graduated at Princeton in 1797, and was admitted to the bar in 1800. He was attorney general of Pennsylvania in 1811; controller of the treasury of the United States, 1811–14; attorney general in the cabinet of Pres. James Madison, 1814–17; acting secretary of state from March to Sept., 1817; minister to Great Britain, 1817–25; secretary of the treasury in the cabinet of Pres. J. Q. Adams, 1825–29; and candidate for vice-president on the Adams ticket in 1828. In 1818, while minister to Great Britain, he, in association with Albert Gallatin, concluded with British plenipotentiaries the important treaty which determined the boundary line between the United States and Canada from the Lake of the Woods to the Rocky mountains and provided for the joint occupation of Oregon for ten years. He also conducted the negotiations with Canning in 1823 relating to the South American policy of the Holy Alliance. He followed the Adams-Clay faction of the Democratic-Republican party in the split of 1825–28, but returned to the Democratic party about 1834 on the bank issue. In 1835 he and Benjamin C. Howard, of Baltimore, Md., were sent by President Jackson to prevent an outbreak of hostilities in the Ohio-Michigan boundary dispute. In 1836–38 Rush was commissioner to receive the Smithson legacy (*see* SMITHSONIAN INSTITUTION), and in 1847–49 he was minister to France. He died in Philadelphia on July 30, 1859.

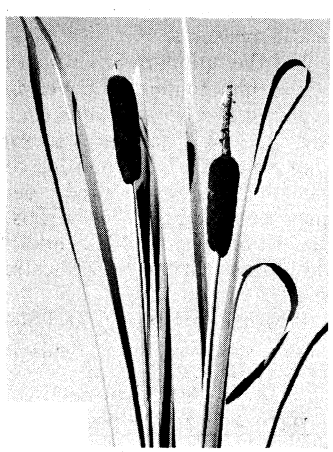
He published *A Narrative of a Residence at the Court of London from 1817 to 1825* (2 vol. 1833–45; all editions after the 1st ed. of the first vol. are entitled *Memoranda of a Residence*, etc.); *Washington in Domestic Life* (1857), compiled from letters

written by Washington to his private secretary in **1790-98;** and *Occasional Productions, Political, Diplomatic and Miscellaneous* (**1860**).

RUSH, WILLIAM (1756–1833), **U.S.** sculptor and wood carver, considered to be "the first native American to devote himself seriously and successfully to sculpture" (Henri Marceau. *William Rush, The First Native American Sculptor*, Philadelphia Museum of Art, 1937), was born in Philadelphia. Pa.. on July 4 1756. He was trained as a maker'of ornamental ship carvings and figureheads During the Revolution he served in the American army and shortly after the close of the war he set up a shop in Philadelphia. He was one of the founders of the Pennsylvania Academy of Fine Arts (1805) and served for many years as a member of the Philadelphia city council. A number of his wood carvings are preserved in various Philadelphia institutions, among the most interesting of which are his vigorous self-portrait (Pennsylvania Academy of Fine Arts), the "Water Nymph and Bittern" (Fairmount park), two allegorical figures, "Comedy" and "Tragedy" (Philadelphia museum), and a statue of George Washington (Independence hall). Few, if any. of his ship carvings and figureheads survived. Rush died at Philadelphia on Jan. **17, 1833.**

See Henri Marceau, *William* Rush, ***The First*** *Native American Sculptor (1937).* (A. T. G.)

RUSH, the name of any of a variety of flowering plants distinguished by cylindrical stalks or hollow, stemlike leaves. The common rushes of the genus *Juncus* in the family Juncaceae (*q.v.*) are used in many parts of the world for chair bottoms, mats and basketwork, and the pith serves as wicks in open oil lamps and for tallow candles—hence the term rush light. The fibrous stems and leaves of the bulrush, reed mace or cattail, *Typha angustifolia,* are used in north India for ropes; mats and baskets. *Scirpus* and other Cyperaceae are used for chair bottoms, mats and thatch; the rush mats of Madras are made from a species of *Cyperus.* The sweet rush. yielding essential oil, is a grass, *Cymbopogon citratus*, known also as lemon grass. Quantities of the horsetail, *Equisetum hyemale,* are used under the name of Dutch or scouring rush for scouring metal and other hard surfaces because of the large proportion of silica the plant contains. Flowering rush is *Butomus umbellatus;* wood rush is the common name for *Luzula (see* JUNCACEAE). *Acorus calamus* (family Araceae), sweet flag, is also known as sweet rush.



RUTHERFORD

BULRUSH OR CATTAIL (TYPHA ANGUSTIFOLIA)

RUSHDI PASHA (c. 1864–1928), Egyptian statesman, was born about **1864,** and educated in France. In April 1914 he was made prime minister, and at the outbreak of World War I, when Turkey entered the war on the side of Germany, he agreed to the proclamation of a British protectorate.

After the armistice Rushdi pressed the British government for a definition of Egypt's position and asked to be received in London to discuss the question. This proposal was not accepted, and on March 1, 1919, he and his cabinet resigned. A few days later Zaghlul Pasha was arrested by the British authorities and deported to Malta. This step led to serious rioting, and he was soon released. The British government had to appeal once more to Rushdi Pasha, who consented, after the release of Zaghlul, to form a ministry again. The treatment which he had received had, however, greatly diminished his prestige, and he was obliged to resign again ten days later. He retired until the Milner commission (1919) had made its report.

An Egyptian cabinet was required which should have sufficient support in Egypt to undertake negotiations in London toward an agreed settlement. Adly Pasha was made prime minister, and Rushdi became president of the council, being chosen to accompany him to England. He died on March **13, 1928.**

RUSHMORE, MOUNT, MEMORIAL: *see* BORGLUM, GUTZON.

RUSHWORTH, JOHN (c. 1612–1690), the compiler of the *Historical Collections* commonly described by his name, was the son of Lawrence Rushworth of Acklington Park, Warkworth, Northumberland. In **1638** he was appointed solicitor to the town of Berwick. He was enrolled in Lincoln's Inn in **1641,** and was called to the bar in **1647.** He attended all public occasions of a political and judicial character, such as proceedings before the Star Chamber or the council, and made shorthand notes of them. On April 25, **1640,** he was appointed an assistant clerk to the house of commons. He became secretary to Fairfax, and then, for a short time, to Cromwell. He was afterward employed by the council of state and during the protectorate, and sat in Cromwell's parliament for Berwick.

He made his peace with the government of Charles II, and though he was threatened with trial as a regicide he was not seriously molested. During the reign of Charles II he continued to act as agent for the town of Berwick, and he sat for it in parliament. He was also for a time agent for Massachusetts. From **1684** till his death on May 12, 1690, he was a resident in the king's bench prison.

RUSKIN, JOHN (**1819–1900**), English writer and critic, was born in London, at Hunter street, Brunswick square, on Feb. **8, 1819,** being the only child of John James Ruskin and Margaret Cox. They were Scots, first cousins, the grandchildren of a certain John Ruskin of Edinburgh (1732–1780). John Ruskin, the author's grandfather, was a wine merchant in Edinburgh, who ran through his fortune, and ended his days in debt. His son, John James Ruskin (1785–1864), father of the author, was sent, on leaving Edinburgh High School, to London to enter the wine trade. There, in **1809,** he founded the sherry business of Ruskin, Telford and Domecq; Domecq being proprietor of a famous vineyard in Spain, Telford contributing the capital of the firm, and Ruskin having sole control of the business. Ruskin built up a great business, paid off his father's debts and formed near London a most hospitable and cultured home, where he maintained his taste for literature and art.

Margaret Ruskin, the author's mother, was a handsome, strong, stern, able, devoted woman of the old Puritan school, Calvinist in religion, unsparing of herself and others, rigid in her ideas of duty, proud, reserved and ungracious. The child was brought up under a rigid system of nursing, physical, moral and intellectual; kept without toys, not seldom whipped, watched day and night, but trained from infancy in music, drawing, reading aloud and observation of natural objects. When he was four the family removed to a house on Herne Hill, then a country village, with a garden and rural surroundings. The father, who made long tours on business, took his wife, child and nurse year after year across England as far as Cumberland and Scotland, visiting towns, cathedrals, castles, colleges, parks, mountains and lakes. At **14** the child was taken through Flanders, along the Rhine, and through the Black Forest to Switzerland, where he first imbibed his dominant passion for the Alps. His youth was largely passed in systematic travelling in search of everything beautiful in nature or in art. And to one so precocious, stimulated by a parent of much culture, ample means and great ambition, this resulted in an almost unexampled aesthetic education. In childhood also he began a systematic practice of composition, both in prose and verse. His mother trained him in reading the Bible, of which he read through every chapter of every book year by year; and to this study he justly attributes his early command of language and his pure sense of style. His father read to him Shakespeare, Scott, Don Quixote, Pope and Byron, and most of the great English classics; and his attention was especially turned to the formation of sentences and to the rhythm of prose. He began to compose both in prose and verse as soon as he had learned to read and write, both of which arts he taught himself by the eye. He wrote enormous quantities of verse, and began dramas, romances and imitations of Byron, Pope, Scott and Shelley.

His schooling was irregular and not successful. At 15 he was sent for two years to the day-school of the Rev. T. Dale of Peckham, and at 17 he attended some courses in literature at King's college, London. In painting he had lessons from Copley Fielding and afterwards from J. D. Harding. But in the incessant travelling, drawing, collecting specimens and composition in prose and verse he had gained but a very moderate classical and mathematical knowledge when he matriculated at Oxford; nor could he ever learn to write tolerable Latin. As a boy he was active, lively and docile; a good walker, but ignorant of all boyish games, as naïve and as innocent as a child; and he never could learn to dance or to ride. He was only saved by his intellect and his fine nature from turning out an arrant prig. He was regarded by his parents, and seems to have regarded himself, as a genius.

At the age of 17 he saw Adèle, the French daughter of Monsieur Domecq, Mr. Ruskin's partner, a lovely girl of fifteen. John fell rapturously in love with her; and, it seems, the two fathers seriously contemplated their marriage. The young poet wooed the girl with poems, romances, dramas and mute worship, but received nothing except chilling indifference and lively ridicule. To the gay young beauty, familiar with Parisian society, the raw and serious youth was not a possible *parti*. She was sent to an English school, and he occasionally saw her. His unspoken passion lasted about three years, when she married the Baron Duquesne. Writing as an old man, long after her death, Ruskin speaks of his early love without any sort of rapture. But it is clear that it deeply coloured his life, and led to the illness which for some two years interrupted his studies and made him a wanderer over Europe.

As the father was resolved that John should have everything that money and pains could give, and should one day be a bishop at least, he entered him at Christ Church, Oxford, as a gentleman-commoner — then an order reserved for men of wealth and rank. Ruskin's Oxford career, broken by the two years passed abroad, was not very full of incident or of usefulness. Both he and his college took kindly the amazing proceeding of his mother, who left her husband and her home to reside in Oxford, that she might watch over her son's health. The one success of his Oxford career was the winning the Newdigate Prize by his poem "Salsette and Elephanta," which he recited in the Sheldonian Theatre (June 1839). Two years of ill-health and absence from home ensued. And he did not become "a Graduate of Oxford" until 1842, in his 24th year, five years after his first entrance at the university. In fact, his desultory school and college life had been little more than an interruption and hindrance to his real education — the study of nature, of art and of literature. Long before Ruskin published books he had written for various periodicals on architectural and other subjects.

After leaving Oxford, Ruskin set to work steadily at Herne Hill on the more elaborate defence of Turner, which was to become his first work. *Modern Painters*, vol. i., by "a Graduate of Oxford," was published May 1843, when the author was little more than twenty-four. It was vehemently attacked by the critics, and coolly received by the painters. Even Turner was somewhat disconcerted; but the painter was now known to both Ruskins, and they freely bought his pictures. The family then went again to the Alps, that John might study mountain formation and "Truth" in landscape. In 1845 he was again abroad in Italy, working on his *Modern Painters*, the second volume of which appeared in 1846. He had now plunged into the study of Bellini and the Venetian school, Fra Angelico and the early Tuscans, and he visited Lucca, Pisa, Florence, Padua, Verona and Venice, passionately devoting himself to architecture, sculpture and painting in each city of north Italy. He wrote a few essays for the *Quarterly Review* and other periodicals, and in 1849 (*aet.* 30) he published *The Seven Lamps of Architecture*, with his own etchings, which greatly increased the reputation acquired by his *Modern Painters*.

On April 10, 1848, a day famous in the history of Chartism, Ruskin was married at Perth to Euphemia Chalmers Gray, a lady of great beauty, of a family long intimate with the Ruskins. The marriage, we are told, was arranged by the parents of the pair, and was a somewhat hurried act. It was evidently ill-assorted, and brought no happiness to either. They travelled, lived in London, saw society, and attended a "Drawing-room" at Buckingham Palace. But Ruskin, immersed in various studies and projects, was no husband for a brilliant woman devoted to society. No particulars of their life have been made public. In 1854 his wife left him, obtained a nullification of the marriage under Scots law, and ultimately became the wife of John Everett Millais. John Ruskin returned to his parents, with whom he resided till their death; and neither his marriage nor the annulling of it seems to have affected seriously his literary career.

Ruskin's architectural studies, of which *The Seven Lamps* was the first fruit, turned him from Turner and *Modern Painters*. He planned a book about Venice in 1845, and *The Stones of Venice* was announced in 1849 as in preparation. After intense study in Italy and at home, early in 1851 (the year of the Great Exhibition in London) the first volume of *The Stones of Venice* appeared (*aet.* 32). It was a concrete expansion of the ideas of *The Seven* Lamps — that the buildings and art of a people are the expression of their religion, their morality, their national aspirations and social habits. It was, as Carlyle wrote to the author, "a sermon in stones," "a singular sign of the times," "a new *Renaissance.*" It appeared in the same year with *The Construction of Sheepfolds* — a plea for the reunion of Christian churches — in the same year with the essay on *Pre-Raphaelitism*, the year of Turner's death (19th December). *The Stones of Venice* was illustrated with engravings by some of the most refined artists of his time. The author spent a world of pains in having these brought up to the highest perfection of the reproductive art, and began the system of exquisite illustration, and those facsimiles of his own and other sketches, which make his works rank so high in the catalogues and price-lists of collectors. This delicate art was carried even farther in the later volumes of *Modern Painters* by the school of engravers whom Ruskin inspired and gathered round him. And these now rare and coveted pieces remain to rebuke us for our modem preference for the mechanical and unnatural *chiaroscuro* of photogravure — the successor and destroyer of the graver's art.

Although Ruskin was practised in drawing from the time that he could hold a pencil, and had lessons in painting from some eminent artists, he at no time attempted to paint pictures. He said himself that he was unable to compose a picture, and he never sought to produce anything that he would call a work of original art. His drawings, of which he produced an enormous quantity, were always intended by himself to be studies or memoranda of buildings or natural objects precisely as they appeared to his eye. Clouds, mountains, landscapes, towers, churches, trees, flowers and herbs were drawn with wonderful precision, minuteness of detail and delicacy of hand, solely to recall some specific aspect of nature or art, of which he wished to retain a record. In his gift for recording the most subtle characters of architectural carvings and details, Ruskin has hardly been surpassed by the most distinguished painters.

In 1853 *The Stones of Venice* was completed at Heme Hill, and he began a series of *Letters* and *Notes* on pictures and architecture. In this year (*net.* 34) he opened the long series of public lectures wherein he came forward as an oral teacher and preacher, not a little to the alarm of his parents and amidst a storm of controversy. The Edinburgh Lectures (November 1853) treated Architecture, Turner and Pre-Raphaelitism. The Manchester Lectures (July 1857) treated the moral and social uses of art, now embodied in *A Joy for Ever*. Some other lectures are reprinted in *On the Old Road* and *The Two Paths* (1859). These lectures did not prevent the issue of various *Notes* on the Royal Academy pictures and the Turner collections; works on the *Harbours of England* (1856); on the *Elements of Drawing* (1857); the *Elements of Perspective* (1859). At last, after prolonged labour, the fifth and final volume of *Modern Painters* was published in 1860 (*aet.* 41). This marks an epoch in the career of John Ruskin; and the year 1860 closed the series of his works on art strictly so called.

The last forty years of his life were devoted to expounding his views, or rather his doctrines, on social and industrial problems, on education, morals and religion, wherein art becomes an incidental and instrumental means to a higher and more spiritual life.

And his teaching was embodied in an enormous series of lectures, letters, articles, selections and serial pamphlets. These are now collected in upwards of thirty volumes in the final edition. The entire set of Ruskin's publications amounts to more than fifty works having distinctive titles. For some years before 1860 Ruskin had been deeply stirred by reflecting on the condition of all industrial work and the evils of modern society. His lectures on art had dealt bitterly with the mode in which buildings and other works were produced. In 1854 he joined F. D. Maurice, T. Hughes and several of the new school of painters, in teaching classes at the Working Men's College. But it was not until 1860 that he definitely began to propound a new social scheme, denouncing the dogmas of political economy. Four lectures on this topic appeared in the *Cornhill Magazine* until the public disapproval led the editor, then W. M. Thackeray, to close the series. They were published in 1862 as *Unto this Last.* In the same year he wrote four papers in the same sense in *Fraser's Magazine,* then edited by J. A. Froude; but he in turn was compelled to suspend the issue. They were completed and ultimately issued under the title *Munera Pulveris.* These two small books contain the earliest and most systematic of all Ruskin's efforts to depict a new social Utopia. They contain a vehement repudiation of the orthodox formulas of the economists; and they are for the most part written in a trenchant but simple style, in striking contrast to the florid and discursive form of his works on art.

In 1864 Ruskin's father died, at the age of 79, leaving his son a large fortune and a fine property at Denmark Hill. John still lived there with his mother, aged 83, infirm, and failing in sight, to whom came as a companion his cousin, Joanna Ruskin Agnew, afterwards Mrs. Arthur Severn. At the end of the year 1864 Ruskin delivered at Manchester a new series of lectures — not on art, but on reading, education, woman's work and social morals — the expansion of his earlier treatises on economic sophisms. This afterwards was included with a Dublin lecture of 1868 under the fantastic title of *Sesame and Lilies* (perhaps the most popular of his social essays), of which 44,000 copies were issued down to 1900. He made this, in 1871, the first volume of his collected lectures and essays, the more popular and didactic form of his new Utopia of human life. It contains, with *Fors,* the most complete sketch of his conception of the place of woman in modern society.

In the very characteristic preface to the new edition of 1871 Ruskin proposes never to reprint his earlier works on art; disclaims many of the views they contained, and much in their literary form; and specially regrets the narrow Protestantism by which they were pervaded. In the year 1866 he published a little book about girls, and written for girls, a mixture of morals, theology, economics and geology, under the title of *Ethics of the Dust;* and this was followed by a more important and popular work, *The Crown of Wild Olive.* This in its ultimate form contained lectures on "Work," "Traffic," "War" and "The Future of England." It was one of his most trenchant utterances, full of fancy, wit, eloquencd and elevated thought. But a more serious volume was *Time and Tide* (1867), a series of twenty-five letters to a workman of Sunderland, upon various points in the Ruskinian Utopia. This little collection of "Thoughts," written with wonderful vivacity, ingenuity and fervour, is the best summary of the author's social and economic programme, and contains some of his wisest and finest thoughts in the purest and most masculine English that he had at his command. In 1869 he issued *The Queen of the Air,* lectures on Greek myths, a subject he now took up, with some aid from the late Sir C. Newton. It was followed by some other occasional pieces; and in the same year he was elected Slade professor of art in the University of Oxford.

He now entered on his professorial career, which continued with some intervals down to 1884, and occupied a large part of his energies. His lectures began in February 1870, and were so crowded that they had to be given in the Sheldonian Theatre, and frequently were repeated to a second audience. He was made honorary fellow of Corpus Christi, and occupied rooms in the college. In 1871 his mother died, at the age of 90, and his cousin, Miss Agnew, married Arthur Severn. In that year he bought from Linton, Brantwood, an old cottage and property on Coniston Lake, a lovely spot facing the mountain named the Old Man. He added greatly to the house and property, and lived in it continuously until his death in 1900. In 1871, one of the most eventful years of his life, he began *Fors Clavigera,* a small serial addressed to the working men of England, and published only by George Allen, engraver, at Keston, in Kent, at 7d., and afterwards at 10d., but without discount, and not through the trade. This was a medley of social, moral and religious reflections interspersed with casual thoughts about persons, events and art. *Fors* means alternatively fate, force or chance, bearing the *Clavis,* club, key or nail, *i.e.,* power, patience and law. It was a desultory exposition of the Ruskinian ideal of life, manners and society, full of wit, play, invective and sermons on things in general. It was continued with intervals down to 1884, and contained ninety-six letters or pamphlets, partly illustrated, which originally filled eight volumes and are now reduced to four.

The early years of his Oxford professorship were occupied by severe labour, sundry travels, attacks of illness and another cruel disappointment in love. In spite of this, he lectured, founded a museum of art, to which he gave pictures and drawings and £5,000; he sought to form at Oxford a school of drawing; he started a model shop for the sale of tea, and model lodgings in Marylebone for poor tenants. At Oxford he set his pupils to work on making roads to improve the country. He now founded "St. George's Guild," himself contributing £7,000, the object of which was to form a model industrial and social movement, to buy lands, mills and factories, and to start a model industry on co-operative or Socialist lines. In connection with this was a museum for the study of art and science at Sheffield. Ruskin himself endowed the museum with works of art and money; a full account of it has been given in E. T. Cook's *Studies in Ruskin* (1890), which contains the particulars of his university lectures and of his economic and social experiments. It is unnecessary to follow out the history of these somewhat unpromising attempts. None of them came to much good, except the Sheffield museum, which is an established success, and is now transferred to the town.

In *Fors,* which was continued month by month for seven years, Ruskin poured out his thoughts, proposals and rebukes on society and persons with inexhaustible fancy, wit, eloquence and freedom, until he was attacked with a violent brain malady in the spring of 1878 (*aet.* 59); and, although he recovered in a few months sufficiently to do some occasional work, he resigned his professorship early in 1879. The next three years he spent at Brantwood, mainly in retirement, and unhappy in finding nearly all his labours interrupted by his broken health. In 1880 he was able to travel in northern France, and began the *Bible of Amiens,* finished in 1885; and he issued occasional numbers of *Fors,* the last of which appeared at Christmas 1884. In 1882 he had another serious illness, with inflammation of the brain; but he recovered sufficiently to travel to his old haunts in France and Italy — his last visit. And in the following year he was re-elected professor at Oxford and resumed his lectures, but increasing brain excitement, and indignation at the establishment of a laboratory to which vivisection was admitted, led him to resign his Oxford career, and he retired in 1884 to Brantwood, which he never left. He now suffered from frequent attacks of brain irritation and exhaustion, and had many causes of sorrow and disappointment. His lectures were published at intervals from 1870 to 1885 in *Aratra Pentelici, The Eagle's Nest, Love's Meinie, Ariadne Florentina, Val d'Arno, Proserpina, Deucalion, The Laws of Fesolé, The Bible of Amiens, Tlze Art of England* and *The Pleasures of England,* together with a series of pamphlets, letters, articles, notes, catalogues and circulars.

In the retirement of Brantwood he began his last work, *Praeterita,* a desultory autobiography with personal anecdotes and reminiscences. He was again attacked with the same mental malady in 1885, which henceforth left him fit only for occasional letters and notes. In 1887 it was found that he had exhausted (spent, and given away) the whole of the fortune he had received from his father, amounting, it is said, to something like £200,000; and he was dependent on the vast and increasing sale of his works, which produced an average income of £4,000 a year, and at times

on the sale of his pictures and realizable property. In **1872** a correspondent had remonstrated with him in vain as to taking "usury," *i.e.*, interest on capital lent to others for use. In **1874** Ruskin himself had begun to doubt its lawfulness. In **1876** he fiercely assailed the practice of receiving interest or rent, and he henceforth lived on his capital, which he gave freely to friends, dependants, public societies, charitable and social objects. The course of his opinions and his practice is fully explained in successive letters in *Fors*.

Until **1889** Ruskin continued to write chapers of *Praeterita*, which was designed to record memories of his life down to the year **1875** (*aet.* **56**). It was, in fact, only completed in regular series down to 1858 (*aet.* 39), with a separate chapter as to Mrs. Arthur Severn, and a fragment called *Dilecta*, containing letters and early recollections of friends, especially of Turner. These two books were published between 1885 and **1889**; and except for occasional letters, notes and prefaces, they form the last writings of the author of *Modern Painters*. His literary career thus extends over fifty years. But he has left nothing more graceful, naïve and pathetic than his early memories in *Praeterita*—*a* book which must rank with the most famous "Confessions" in any literature. The last ten years of his life were passed in complete retirement at Brantwood, in the loving care of the Severn family, to whom the estate was transferred, with occasional visits from friends, but with no sustained work beyond correspondence, the revision of his works, and a few notes and prefatory words to the books of others. He wished to withdraw his early art writings from circulation, but the public demand made this practically impossible.

The close of his life was one of entire peace and honour. He was loaded with the degrees of the universities, and membership in numerous societies and academies. "Ruskin Societies" were founded in many parts of the kingdom. His works were translated and read abroad, and had an enormous circulation in Great Britain and the United States. He died suddenly after only two days' illness on Jan. 20, 1900. He was buried in Coniston churchyard by his own express wish, the family refusing the offer of a grave in Westminster Abbey.

Ruskin's life and writings have been the subject of many works composed by friends, disciples and admirers. The principal is the *Life*, by W. *G*. Collingwood, his friend, neighbour and secretary (2 vols., 1893; 2nd ed., 1900). His pupil, E. T. Cook, published his *Studies in Ruskin in* 1890, with full details of his career as professor, and a *Life of Ruskin* in 1911. J. A. Hobson, in *John Ruskin, Social Reformer* (2nd ed., 1899), has elaborately discussed his social and economic teaching, and claims him as "the greatest social teacher of his age." An analysis of his works has been written by Mrs. Meynell (1900). His art theories have been discussed by Professor Charles Waldstein of Cambridge in *The Work of John Ruskin* (1894), by Robert de la Sizeranne in *Ruskin et la religion de la beauté* (1897), and by Professor H. J. Brunhes of Fribourg in *Ruskin et la Bible* (1901). The monumental "library edition" of Ruskin's works (39 vols., 1903–12), prepared by E. T. Cook, with A. Wedderburn, is the greatest of all the tributes of literary admiration. *See* also *Centenary Addresses* (1919) ed. J. H. Whitehouse; J. R. Morley, *John Ruskin and Social* ***Ethics*** (1917); A. Williams-Ellis, *The Tragedy of John Ruskin* (1928). (*F.* HAR.)

RUSSELL (FAMILY). The great English Whig house of the Russells, earls and dukes of Bedford, rose under the favour of Henry VIII. Obsequious genealogists have traced their lineage from "Hugh de Rozel," *alias* "Hugh Bertrand, lord of le Rozel," a companion of the Conqueror, padding their fiction with the pedigree of certain Russells who are found holding Kingston Russell in Dorset as early as the reign of King John. But the first undoubted ancestor of the Bedford line is Henry Russell, a Weymouth merchant, returned as a burgess for that borough in four parliaments between 1425 and 1442. He may well have been the son of Stephen Russell, another Weymouth merchant, whose name is just before his in the list of those men of substance in Dorsetshire who, in 1434, under the act of parliament, were to be sworn not to maintain breakers of the peace. Stephen Russell, having served the office of bailiff of Weymouth, was returned as burgess to the parliament of 1395, and one William Russell was returned for King's Melcombe in 1340. Both Stephen and Henry were in the wine trade with Bordeaux, and in 1427 Henry Russell was deputy to the chief butler of England for the port of Melcombe. In 1442 a pardon under the privy seal significantly describes Henry Russell of Weymouth, merchant, as *alias* Henry Gascoign, gentleman, and it is therefore probable that the ducal house of Bedford springs from a family of Gascon wine-merchants settled in a port of Dorsetshire, a county remarkable for the number of such French settlers.

Henry Russell of Weymouth made a firm footing upon the land by his marriage with .Elizabeth Hering, one of the two daughters and co-heirs of John Hering of Chaldon Hering, a Dorsetshire squire of old family, heir of the Winterbournes of Winterbourne Clenston and of the Cernes of Draycot Cerne. John Russell, eldest son of this match, born before 1432, and returned to parliament for Weymouth in 1450, had his seat at Berwick in Swyre, he and his son and heir, James Russell, being buried in the parish church of Swyre.

JOHN RUSSELL, son and heir of James, on the accession of Henry VIII. advanced rapidly serving the crown as soldier and as diplomatic agent. At the crowning of Edward VI. he was lord high steward, and after his defeat of the western rebels was raised, in **1550**, to the earldom of Bedford. Queen Mary, like her brother, made him lord privy seal. He died in **1555**. He left an only son, FRANCIS, second earl of Bedford, K.G. (c. 1527–1585), who, being concerned in Wyatt's plot, escaped to the Continent and joined those exiles at Geneva whose religious sympathies he shared. He returned in **1557**, and was employed by Queen Mary before her death. Under Queen Elizabeth I he governed Berwick, and was lord lieutenant of the northern counties.

Three of his four sons died before him, the third, killed in a border fray, being father of Edward, third earl of Bedford, who died without issue in **1627**. The fourth son, William, created Lord Russell of Thornhaugh in **1603**, was a soldier who fought fiercely before Zutphen beside his friend Sir Philip Sidney, whom he succeeded as governor of Flushing, and was from **1594** to **1597** lord deputy of Ireland. He died in **1613**, leaving an only son, FRANCIS, who in **1627** succeeded his cousin as fourth earl of Bedford. He died of the smallpox in **1641**. WILLIAM, the eldest surviving son, succeeded as fifth earl, Edward. the youngest son, being father of Edward Russell (1653–1727), admiral of the fleet, who, having held the chief command in the victory of La Hogue, was created in **1697** earl of Orford. The fifth earl of Bedford, after fighting for the parliament at Edgehill and for the king at Newbury, surrendered to Essex and occupied himself with completing the drainage of the Bedford Level. He carried St. Edward's staff at the crowning of Charles II., but quitted political life after the execution of his son, Lord Russell, in **1683**. In **1694** he mas created duke of Bedford and marquess of Tavistock, titles to which his grandson, WRIOTHESLEY RCSSELL, succeeded in 1700. Lord Russell had added to the family estates by his marriage with Rachel. daughter of Thomas Wriothesley. the fourth earl of Southampton. Her son, second duke of Bedford, married the daughter of John Howland of Streatham. The third duke, WRIOTHESLEY (1 708–1732), died without issue, his brother JOHN (1 **710-1771**) succeeding him.

His son Francis, styled marquess of Tavistock, was killed in **1767** by a fall in the hunting field, and Lord Tavistock's son FRANCIS **(1765-1802)** became the fifth duke. This was the peer whom Burke, smarting from a criticism of his own pension, assailed as "the Leviathan of the creatures of the crown," enriched by grants that "outraged economy and even staggered credibility." Dying unmarried, he was succeeded by his brother JOHN, the sixth duke (1766–1839), whose third son was the statesman created, in **1861**, Earl Russell of Kingston Russell, better known as Lord John Russell. Lord Odo Russell, a nephew of "Lord John," and ambassador at Berlin from **1871** to his death in **1884**, was created Lord Ampthill in **1881**. HERBRAND ARTHUR RUSSELL (1858–1940), the eleventh duke and fifteenth earl, succeeded an elder brother in **1893**. (O. B.)

See also BEDFORD, EARLS AND DUKES OF.

RUSSELL, BERTRAND ARTHUR WILLIAM RUSSELL, 3RD EARL **(1872-)**, English philosopher, famous also for his eloquent championship of individual liberty, which made his

position in the intellectual life of his time comparable with that of Voltaire in the 18th century or with that of J. S. Mill in the 19th, was born on May 18, 1872. His grandfathers were Lord John Russell (afterward Earl Russell) and the second Lord Stanley of Alderley. His godfather (in a purely social sense) was J. S. Mill. At the age of three he was left an orphan. His father, Lord Amberley, had wished him to be brought up as an agnostic; to avoid this he was made a ward of court and brought up by his grandmother at Pembroke lodge, in Richmond park. Instead of being sent to school he was taught by governesses and tutors and thus acquired his perfect knowledge of French and German. In Oct. 1890 he went into residence, as a shy undergraduate, at Trinity college, Cambridge. After being a high wrangler and obtaining a first class with distinction in philosophy he was elected a fellow of his college in the autumn of 1895. But he had already left Cambridge in the summer of 1894 and for some months was attaché at the British embassy in Paris.

In Dec. 1894 Russell married Alys Pearsall Smith. After spending some months in Berlin studying social democracy *(German Social Democracy,* 1896), they went to live near Haslemere. where he devoted his time to the study of philosophy and wrote *A Critical Exposition of the Philosophy of Leibniz* (1900). He published *The Principles of Mathematics* in 1903 and then. with his friend A. N. Whitehead, proceeded to develop and extend the mathematical logic of Giuseppe Peano and Gottlob Frege. The three volumes of their joint book, *Principia Mathematica,* were published in 1910, 1912 and 1913. During all this period Russell lived simply and worked hard. He was elected a fellow of the Royal society in 1908 and was appointed lecturer at his old college in 1910.

After World War I broke out he took an active part in the No Conscription fellowship. He was fined £100 as the author of a leaflet criticizing a sentence of two years on a conscientious objector. His library was seized to pay the fine; it was bought in by a friend, but many valuable books were lost. His college deprived him of his lectureship. He was offered a post at Harvard university, but was refused a passport. He intended to give a course of lectures (published in the U.S. as *Political Ideals* in 1918) but was prevented by the military authorities. In 1918 he was sentenced to six months' imprisonment for a pacifist article he had written in the *Tribunal.* His excellent *Introduction to Mathematical Philosophy* (1919) was written in prison. *The Analysis of Mind* (1921) was the outcome of some lectures that he gave in London, a few friends having raised a subscription for the purpose. *The Practice and Theory of Bolshevisnz* (1920) was written after a short visit to Russia.

In the autumn of 1920 he went to China to lecture on philosophy at the Peiping university. On his return in Sept. 1921, having been divorced by his first wife, he married Dora Black. He then earned a livelihood by lecturing, journalism and writing popular books such as *The A.B.C. of Atoms* (1923), *The A.B C. of Relativity* (1925) and *On Education* (1926). Other publications of this period were the introduction to the second edition of *Principia Mathematica* (1925); *The Analysis of Matter* (1927); *An Outline of Philosophy* (1927); *Mysticism and Logic* (1929); *Marriage and Morals* (1929). In 1927 he and his nife started a school for young children, which they managed until 1932. He succeeded to the earldom in 1931. Divorced by his second wife in 1935, Russell the following year married Patricia Helen Spence, with whom he published *The Amberley Papers* (1937). In 1938 he went to the United States, where he taught at many of the leading universities. When his appointment to teach philosophy at the College of the City of New York (1940) was cancelled because of his views on morality Russell accepted a five-year contract as a lecturer for the Barnes foundation, Merion, Pa, but cancellation of this was announced in Jan. 1943.

After 1944 Russell lived mostly in England, becoming well known to large audiences through his broadcasts. which included the first series of Reith lectures *(Authority and the Individual,* 1949). He received the Order of Merit in 1949 and the Nobel prize for literature in 1950. In 1952 he was divorced for the third time and married Edith Finch. A collection of five short stories appeared under the title *Satan in the Suburbs* in 1953.

Apart from those already mentioned, Russell's writings include *The Conquest of Happiness* (1930); *The Scientific Outlook* (1931); *Education and the Social Order* (1932); *Freedom and Organisation, 1814–1914* (1934); *Power: a New Social Analysis* (1938); *An Inquiry Into Meaning and Truth* (1940); *A History of Western Philosophy* (1946); *Human Knowledge, Its Scope and Limits* (1948); *Unpopular Essays* (1950); *New Hopes for a Changing World* (1951); and *Human Society in Ethics and Politics* (1954). (C. P. SA.; W. C. K)

Philosophy. — What is fundamental in Russell's philosophy is his logic: his views on metaphysics and ethics, on the nature and relations of matter and mind. changed profoundly in the course of his life, but these changes all proceeded from successively deeper applications of his logical method. He. therefore, preferred to classify his philosophy not as a species of idealism or realism but as "logical atomism," since what distinguishes the whole of his work is his use of logical analysis as a method and his belief that by it we can arrive at ultimate "atomic facts" logically independent both of one another and of being known.

First Russell tried to free logical analysis from the domination of ordinary grammar by showing that the grammatical form of a sentence often fails to reflect the logical form of its meaning. In his *Principles of Mathematics* he insisted that relations could not be reduced to qualities of their terms and that relational facts were not of the subject-predicate forms. but he still thought that any descriptive phrase nhich could be made the subject of a sentence must stand for a term which had being, even if like "the round square" it were self-contradictory, In his article "On Denoting" *(Mind,* 1905) and in subsequent writings, he put forward his theory of descriptions, nhich is perhaps the most important and influential of his innovations in logic. According to this theory "the present king of France" is not a name for a nonexistent entity but an "incomplete symbol" which only has meaning in connection with a context. The meaning of such a statement as "the present king of France is bald" is first that there is someone who is at present both king of France and bald and secondly that there are not at present tno kings of France; and when such statements are analyzed in this nay the need to believe in entities such as "the present king of France" (which are said by some philosophers to have "being" but not "existence") is altogether removed. Similarly when it is said that "unicorns are not real," this does not mean that certain animals. namely unicorns, lack the characteristic of reality but that there are no horselike animals with one horn.

Russell applied similar methods to classes and to numbers and argued that each of these categories consists of what he called "logical constructions." In saying, for instance, that classes are logical constructions, he did not mean that they are entities constructed by the human mind, but that when we express facts by sentences which have for subject such a phrase as "the class of men," the true analysis of the fact does not correspond to the grammatical analysis of the sentence. When, for instance. we say "the class of men includes the class of criminals," the fact asserted by us is really about the characteristics of being a man and being a criminal and not about any such entities as classes at all. This notion of a logical construction was much employed by Russell in his work in mathematical logic, and he also used it extensively in the philosophy of matter and mind, and even adopted as a fundamental principle that constructions (in his special sense of the word) are to be substituted for inferred entities wherever possible.

By applying this method he was led to a view of the world on which the ultimate constituents of mind and matter are of the same type, the difference between minds and bodies lying in their structure and not in the elements of nhich they are composed. A man's mind is composed of sensations and images, which are identified by Russell with physical events in his brain, and the difference betneen physics and psychology lies not in the events which they study but in the kind of laws about those events which they seek to establish, physics being concerned with structure and psychology with quality. This theory was worked out in connection with physics in *The Analysis of Matter.*

In the theory of knowledge Russell's earlier rationalism was considerably modified in a pragmatist or behaviourist direction, and in *The Analysis of Mind* he rejected consciousness as a fundamental characteristic of mind and adopted a form of "neutral monism" about perception. which he. combined with representationism in regard to memory and judgment.

Russell's logical atomism was the starting point for the *Tractatus Logico-Philosophicus* (1921) of his pupil L. Wittgenstein and so one of the sources of logical positivism. Then, after a period between World Wars I and II when it dominated the philosophy of the English-speaking world. his program was brought into doubt by the later teaching of Wittgenstein, according to which philosophical difficulties arise not from any inadequacy of ordinary language but from failure to respect the limits of normal usage. In his own later writings Russell showed some misgivings about logical atomism, but for different reasons. He came to think, for example, that there might be necessary connections between distinct events.

Mathematics. — Russell maintained that mathematics and formal logic are one and that the whole of pure mathematics can be rigorously deduced from a small number of logical axioms. He argued this in outline in *Principles of Mathematics* and then tried to give a detailed demonstration of his thesis in *Principia Mathematica*, written with A. N. Whitehead. In this colossal work the deduction is carried so far as to include all the essential parts of the theory of aggregates and real numbers. Besides this the great advances made by Russell in the analysis of logical concepts allowed the deductions to be carried not only much farther forward but also much farther backward toward first principles. Above all he appeared to solve the notorious paradoxes of the theory of aggregates by means of the theory of types. In this connection. however; he found it necessary to introduce an "axiom of reducibility" which has never won general acceptance, so that his work cannot be regarded as a final solution of the problem.

RUSSELL, CHARLES TAZE (PASTOR RUSSELL) (1852–1916), founder of the International Bible Students association, forerunner of the modern Jehovah's Witnesses (*q.v.*), was born at Pittsburgh. Pa., on Feb. 16. 1852. Of Presbyterian and Congregationalist background, Russell renounced the creeds of orthodox Christian denominations and in 1872 organized an independent Bible study class in Pittsburgh. From 1877 he preached that Christ's second advent would be invisible, that the end of the Gentile times would come in 1914. followed by war between capitalism and communism or socialism, after which God's Kingdom by Christ would rule the whole earth. Russell (who, though popularly called Pastor Russell, mas never ordained) dedicated his life and his considerable fortune to preaching Christ's millennial reign. In 1879 he started a Bible journal later called the *Watchtower*. His wife disputed editorship and eventually sought legal separation. which was granted; she never sought nor obtained absolute divorce. The *Washington Post* and *Chicago Mission Friend* charged marital promiscuousness, but Russell sued both papers for libel and won both cases.

Russell's religious stand opened the door for a number of controversial incidents publicized during his life. One such incident in 1911 involved a gift to Russell's organization of a quantity of "miracle wheat" (so named by its discoverer). which, at the donor's request, was sold, the proceeds (about $1,800) to be applied to charitable work. Russell in 1884 founded the Watchtower Bible and Tract society. which became a flourishing publishing business. His own books and booklets (notably six volumes of *Studies in the Scriptures*) reached a circulation of 16,000,000 copies in 35 languages, and 2,000 newspapers published his weekly sermons. Russell died on a train in Pampa, Tex., on Oct. 31. 1916. while on a speaking tour.

See M. Cole, *Jehovah's Witnesses—the New World Society* (1955).

RUSSELL, GEORGE WILLIAM (1867–1935), Irish writer and painter, known as Æ, was born at Lurgan, Co. Armagh, April 10, 1867. Educated at Rathmines school, Dublin, he entered an accountant's office, but in 1897 joined the Irish Agricultural Organization society, and became an organizer of agricultural societies. From 1904 to 1923 he was editor of *The Irish Homestead*, the organ of the agricultural co-operative movement. In 1923 he became editor of *The Irish Statesman*.

Russell's publications include *Homeward: Songs by the Way* (1894); *The Earth Breath* (1897); *Literary Ideals in Ireland* (1899), a collection of essays written in collaboration with W. B. Yeats, W. Larminie and John Eglinton; *Ideals in Ireland* (1901), another book of collaborative essays; *The Nuts of Knowledge* (1903), a selection of lyrics. In 1904 appeared two books of verse, *The Divine Vision* and *New Poems*, an anthology of verses by young Irish poets; and a collection of mystical tales, *The Mask of Apollo*. Other books of verse include *By Still Waters* (1906), *Collected Poems* (1913), and *Gods of War* (1915). *The Hero in Man* (1909) and *The Renewal of Youth* (1911) were imaginative musings, as was *Imaginations and Reveries* (1915). In 1906 appeared *Some Irish Essays*, and in 1907 *Deirdre*, a three-act play. *Co-operation and Nationality* and *The Rural Community*, published in 1912 and 1913 respectively, were pamphlets embodying co-operative ideals, which are further developed in his *The National Being, Thoughts on an Irish Polity* (1916). *The Candle of Vision*, an attempt to discover the element of truth in the mystical imagination, appeared in 1918. This was followed by *The Interpreters* (1920), a symposium in the Platonic fashion.

RUSSELL, HENRY NORRIS (1877–1957), U.S. astronomer, the inventor (with the Danish astronomer Ejnar Hertzsprung) of the "Hertzsprung-Russell diagram," was one of the most important influences in the development of 20th-century astrophysics and stellar astronomy. He was born at Oyster Bay, N.Y., on Oct. 25, 1877, and died in Princeton, N.J., on Feb. 18, 1957. After attending Princeton university he went to Cambridge, Eng., where he was engaged in the determination of stellar parallaxes by photography — a method which at that time (1903–05) was in its infancy.

Russell returned to Princeton in 1905 to embark on a long and brilliant career in astronomy. Russell's work included investigations in almost every field of modern astronomy, as well as in spectroscopy. He developed a method for the determination of the dimensions of double stars whose components periodically eclipse each other; in addition, he and Hertzsprung independently discovered a way to determine the distances from the solar system of double stars which are observed through the telescope to be in revolution about their common centre of gravity. The diagram known variously as the Russell diagram or Hertzsprung-Russell diagram was formulated in its modern form by Russell in 1913. The information which it gives about the stars is fundamental and its uses are varied. The diagram illustrates the relationship between the spectral types (that is to say, surface temperatures) and absolute magnitudes of the stars. (The absolute magnitude is a measure of the true brightness — as distinguished from the apparent brightness — of a star.)

The theory of stellar evolution advanced by Russell in 1913 was favoured almost universally for many years thereafter; although it is no longer supported, its importance in the development of the subject was great. Russell was one of the most active workers in the analysis of the line spectra of the elements and he utilized the new developments in studies of the characteristics of stellar atmospheres.

Among Russell's writings may be mentioned, *Modifying Our Ideas of Nature: the Einstein Theory of Relativity* (reprinted in the *Smithsonian Report for 1921*); *The Constitution and Evolution of the Stars* (reprinted in the *Smithsonian Report for 1923*); *The Composition of the Stars* (1933); *The Atmospheres of the Planets* (reprinted in the *Smithsonian Report for 1935*); and *The Solar System and Its Origin* (1936).

(W. W. M.)

For a description of the spectral type-absolute magnitude diagram, *see* H. N. Russell, R. S. Dugan and J. Q. Stewart, *Astronomy*, 2 vol. (1926–27; vol. I rev., 1945; vol. II, 2nd ed., 1938).

RUSSELL, JOHN RUSSELL, 1ST EARL (1792–1878), British statesman, third son of the 6th duke of Bedford, by Georgiana

Elizabeth Byng, second daughter of the 4th Viscount Torrington, was born in London on Aug. 18, 1792. He was a frail, puny child; as a consequence he attended Westminster school, the traditional school of the Russells, for one year only, 1803–04. In 1809 he was sent to Edinburgh university. His contacts there with such men as the mathematician and philosopher John Playfair with whom he resided and Dugald Stewart for whose teaching he expressed gratitude in a sonnet, and his membership of the Speculative society of which he became president in 1811–12 had a profound effect in directing his thoughts and teaching him the art of debate. While at the university and after leaving he travelled in Spain and Portugal.

His political career began when in 1813 he was returned to parliament in the Whig interest for the family borough of Tavistock. He was still regarded as delicate and his short stature and air of frailty were to prove, throughout his political life, in the nature of a gift to the cartoonists, notably John Leech in Punch. His first notable speech, in 1817, showed the trend of his mind. He spoke in opposition to the proposal to suspend the Habeas Corpus act. one of the measures designed to repress the prevailing industrial unrest. To Russell, bred in the Whig tradition, the proposal was an infringement of civil liberty. The suspension went through. But behind the troubles which culminated in the Cato Street conspiracy—a plot to murder the cabinet (1820)—new ideas were making their way. Young Russell was aware of them. In 1818 he was re-elected for Tavistock. In 1819 he began his advocacy for the reform of parliamentary representation by moving an inquiry into the corruption of one particular constituency, Grampound in Cornwall, the disenfranchisement of which he secured in 1821 when he had transferred as member to the county of Huntingdon. It was a sign of what was coming. In the meantime Russell turned his attention to another issue. On the matter of Catholic emancipation, now to the fore, the Whigs stood solid. Toleration was part of their creed. As one of their foremost spokesmen Russell lost his seat for Huntingdon in the 1826 election. Another was found for him in the Irish constituency of Bandonbridge. In Feb. 1828 when Wellington had replaced Liverpool as prime minister, Russell led the attacks on the Test acts which resulted in their repeal, a triumph which was followed by the government's recognition of the necessity for the Catholic Relief act, passed the next year.

June 1830 saw the death of George IV. In November Wellington resigned and King William sent for Earl Grey. Russell was made paymaster-general. Grey had determined on the immediare drafting of a Reform bill and appointed a committee of four. of which Russell was one. Although not yet a member of the cabinet, he was chosen to move the first reading in the house. March 31, 1831. When the bill was finally passed in the house of lords on June 4, 1832, Russell, who had been given a seat in the cabinet the previous June. was justly regarded as its chief architect. He had revealed the characteristics that informed his entire political career. He was a true Whig, as opposed to the radical wing of the party. when he described himself as "an enemy to extensive reform."

The passing of the Reform bill was followed by a general election in which the Whigs were again returned. Russell. elected for both Tavistock and South Devon, chose the county constituency, continuing as paymaster-general. In May 1834. when Ireland was in turmoil and Daniel O'Connell active, he intervened in the debate on the Irish Tithe bill in favour of diverting part of the revenues of the Irish church to other purposes, an ill-timed suggestion which caused much perturbation among his own party and called forth the remark by Lord Stanley, then Irish secretary, that "Johnny Russell has upset the coach." Russell had indeed displayed a trait that was to become more marked; a habit of expressing his own opinion without considering the effect on the government of which he was a member. Nevertheless. after Sir Robert Peel. he was the most commanding figure on the political stage. In April 1835, with Lord Melbourne as prime minister, he became home secretary and leader of the house of commons, a position grudgingly accepted by William IV who both disliked and distrusted him. It was a weak government whose life was only prolonged first by the death of William IV (June 1837) and then by the struggle between the young queen and Peel over the ladies of her household. In May 1839 Russell quitted South Devon for the borough of Stroud. In September he became secretary for war and the colonies. But the fall of the Whigs was at hand. One of the few bright spots in their collapse at the general election of 1841 was the return of Russell, although only in the fourth place, for the City of London. It was to his. constituents there that he addressed from Edinburgh in Nov. 1845 the letter, that "blast from a trumpet," which announced his conversion to the repeal of the corn laws. unaware that Peel, as prime minister! had already decided they must go. The act for the repeal, which passed that year. was therefore the work of Peel with the support of John Russell. When in 1846 Peel resigned Lord John, "our little giant," became, at the age of 54, prime minister and remained so for six years.

They were not easy years in either home or foreign affairs. Russell was only moderately successful in dealing with the problem of the Irish famine, 1847 But in the next year, 1848, that year of revolutions, his skilful handling of Chartism saved England from the threat of anarchy. The letter of 1850 to the bishop of Durham with its attack on the Roman hierarchy, occasioned by the papal bull creating Roman Catholic bishops in England. was one of his worst mistakes. Abroad. the struggle in the kingdoms of western Europe for liberty, the aftermath of 1848, commanded the sympathy and approval of Russell and no less of Lord Palmerston as foreign secretary. But Palmerston often made the situation difficult for the prime minister. Queen Victoria resented, not without reason, the foreign secretary's high-handed habit of acting on his own responsibility. Her resentment mas the deeper because her sympathy was with the European dynasties. The climax came in Dec. 1851 when Palmerston. without reference to either queen or prime minister, sent a dispatch to Paris approving Louis Napoleon's coup d'etat. Russell dismissed Palmerston. The next month the latter had his revenge when he brought about, over the Militia acts, the fall of the government.

In Lord Aberdeen's compromise ministry of Whigs and Peelites Russell remained in the cabinet, first as foreign secretary, then without office, and in 1854 as lord president. In 1853–54 he drew up the draft for a new Reform bill, which was brought to nothing by the outbreak of the Crimean War. Russell then fell into two errors, the first, his resignation in 1855 over the Crimean inquiry, an act pronounced by the queen, and not by her only, as completely selfish; the second his mistaken handling of the negotiations at the Vienna conference whither he was sent as British representative after his resignation. But at least one brilliant moment in his career was still before him. In 1859 he became foreign minister with Palmerston as prime minister, at the moment when the national struggle in Italy was moving toward its climax. Russell's Italian diplomacy was wise and resolute. He had the complete support of his chief but not of the queen. But though he had to endure with ill grace the clipping of his dispatches he carried out triumphantly the main lines of his policy. United Italy owed the English minister much. It was his last great consistent effort in the cause of liberty, embodied in the historic dispatch of Oct. 27, 1860. to the ambassador at Turin. He was less successful in his handling of the Civil War in the U.S. and the Schleswig-Holstein controversy. In Oct. 1865, having four years previously accepted an earldom, he again became prime minister, but for no more than a few troubled months. The irony of fate brought about the defeat of his government on a new Reform bill.

Russell retired from politics to spend his time at Pembroke lodge, Richmond. a residence presented for life to him by the queen in 1847, in writing his recollections and editing documents. He died on May 28, 1878.

Russell married first in 1835 Adelaide. daughter of Thomas Lister and widow of Thomas, second Lord Ribblesdale, and secondly in 1841 Frances Anne Maria Elliot, daughter of Gilbert, 2nd earl of Minto.

BIBLIOGRAPHY.—Russell's most important contribution to historical literature is his edition of the *Correspondence of* John, *Fourth Duke of Bedford*, 3 vol. (London, 1842–46).

The chief biography is that by Sir Spencer Walpole, 2 vol. (London,

1891). The volume by Stuart J. Reid (London, 1895, "Prime Ministers of Queen Victoria" series) should also be consulted. A valuable survey of his career from 1840 onward is given by G. P. Gooch (ed), in his edition of *The Later Correspondence of Lord John Russell, 1840–1878* (London, New York, 1925). (G S T.)

RUSSELL, THOMAS (1762–1788), English poet, was born at Beaminster, early in 1762. He was educated at Winchester under Joseph Warton, and at New college, Oxford. In 1789 was published a thin volume, containing his *Sonnets* and *Miscellaneous Poems*, now a very rare book. It contained 23 sonnets, of regular form, and a few paraphrases and original lyrics. The sonnets are the best, and by right of these Russell takes his place as a precursor of the romantic school His sonnet, "Suppos'd to be written at Lemnos," is his masterpiece.

RUSSELL, LORD WILLIAM (1639–1683), English politician, was the third son of the 1st duke of Bedford and was born on Sept. 29, 1639. About 1654 he was sent to Cambridge with his elder brother Francis (on whose death in 1678 he obtained the courtesy title of Lord Russell). On leaving the university, the two brothers travelled abroad, visiting Lyons, Geneva, Augsburg, and Paris, but returned to Woburn in December 1659. At the Restoration he was elected for the family borough of Tavistock. He appears to have indulged in the follies of court life and intrigue; for both in 1663 and 1664 he was engaged in duels, in the latter of which he was wounded. In 1669 he married Rachel (1636–1723), second daughter of the 4th earl of Southampton, and widow of Lord Vaughan, thus becoming connected with Shaftesbury, who had married Southampton's niece. With his wife Russell always lived on terms of the greatest affection and confidence. She corresponded with Tillotson and other distinguished men, and a collection of her admirable letters was published in 1773.

On the formation of the "country party," in opposition to the Cabal and Charles's French-Catholic plots, Russell began to take an active part in affairs. He then joined Cavendish, Birch, Hampden, Powell, Lyttleton and others in vehement antagonism to the court. With a passionate hatred and distrust of the Catholics. and an intense love of political liberty, he united the desire for ease to Protestant Dissenters. He inveighed (Jan. 22, 1673) against the stop of the exchequer, the attack on the Smyrna fleet, the corruption of courtiers with French money, and "the ill ministers about the king"; he supported the proceedings against the duke of Buckingham, and against Danby (*see* LEEDS, THOMAS OSBORNE); and in March 1678 he seconded the address praying the king to declare war against France. The country party hated Danby and James more than they hated Louis. The French king formed a temporary alliance with Russell, Hollis and the opposition leaders, on terms. Russell in particular entered into close communication with the marquis de Ruvigny (Lady Russell's maternal uncle), who came over with money for distribution among members of parliament. By the testimony of Barillon, however, it is clear that Russell refused any part in the intended corruption.

By the wild alarms which culminated in the Popish Terror Russell was apparently deeply affected. He threw himself into the party which looked to Monmouth as the representative of Protestant interests, a grave political blunder, though he afterwards was in conndential communication with Orange. On Nov. 4, 1678, he moved an address to the king to remove the duke of York from his person and councils. At the dissolution of the pensionary parliament, he was, in the new elections, returned for Bedfordshire. Danby was at once overthrown, and in April 1679 Russell was one of the new privy council formed by Charles on the advice of Temple. Only six days after this we find him moving for a committee to draw up a bill to secure religion and property in case of a popish successor. He does not, however, appear to have taken part in the exclusion debates at this time. In June, on the occasion of the Covenanters' rising in Scotland, he attacked Lauderdale personally in full council.

In January 1680 Russell, along with Cavendish, Capell, Powell, Essex and Lyttleton, tendered his resignation to the king, which was received by Charles "with all my heart." On June 16, he accompanied Shaftesbury, when the latter indicted James at Westminster as a popish recusant; and on Oct. 26 he took the extreme step of moving "how to suppress popery and prevent a popish successor"; on Nov. 2, now at the height of his influence, he seconded the motion for exclusion in its most emphatic shape, and on the 19th carried the bill to the House of Lords for their concurrence. The limitation scheme he opposed, on the ground that monarchy under the conditions expressed in it would be an absurdity. On December 18 he moved to refuse supplies until the king passed the Exclusion Bill. The prince of Orange having come over at this time, there was a tendency on the part of the opposition leaders to accept his endeavours to secure a compromise on the exclusion question. Russell, however, refused to give way a hair's-breadth.

On March 26, 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire. In the wild schemes of Shaftesbury after the election of Tory sheriffs for London in 1682 he had no share; upon the violation of the charters, however, in 1683, he began seriously to consider as to the best means of resisting the government, and on one occasion attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Hampden, Sidney and Howard of Escrick were the principal of those who met to consult. On the breaking out of the Rye House Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Refusing to attempt to escape, he was brought before the council, when his attendance at the meeting referred to was charged against him. He was sent on June 26, 1683, to the Tower. Monmouth offered to appear to take his trial, if thereby he could help Russell, and Essex refused to abscond for fear of injuring his friend's chance of escape. Before a committee of the council Russell, on June 28, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. He reserved his defence, however, until his trial. He would probably have saved his life but for the perjury of Lord Howard, who expressly declared that Russell had urged the entering into communications with Argyll in Scotland. Howard's perjury is clear from other witnesses, but the evidence was accepted. Russell spoke with spirit and dignity in his own defence, and, in especial, vehemently denied that he had ever been party to a design so wicked and so foolish as that of the murder of the king or of rebellion. The legality of the trial, in so far as the jurors were not properly qualified and the law of treason was shamefully strained, was denied in the act of 1 William & Mary which annulled the attainder. Hallam maintains that the only overt act of treason proved against Russell was his concurrence in the project of a rising at Taunton, which he denied, and which, Ramsay being the only witness, was not sufficient to warrant a conviction.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bedford offered £50,000 or £100,000, and Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the influence of Burnet and Tillotson, who endeavoured to make him grant the unlawfulness of resistance, although it is more than probable that compliance in this would have saved his life. He drew up, with Burnet's assistance, a paper containing his apology, and he wrote to the king a letter, to be delivered after his death, in which he asked Charles's pardon for any wrong he had done him. A suggestion of escape from Lord Cavendish he refused. He behaved with his usual quiet cheerfulness during his stay in the Tower, and spent the last morning in devotion with Burnet. He was executed at Lincoln's Inn Fields on July 21, 1683.

A true and moderate summing-up of his character will be found in his *Life*, by Lord John Russell (1820).

RUSSELL, SIR WILLIAM HOWARD (1821–1907), English war correspondent, was born at Lilyvale, near Tallaght, Co. Dublin, on March 28, 1821, being one of the Russells of Limerick, whose settlement in Ireland dates from the time of

Richard II. He entered Trinity college in 1838. Three years later he was thrown very much on his own resources, but a relative, R. W. Russell. who had been sent to Ireland by *The Times*, deputed him to report the Irish elections at Longford, and his success definitely turned his attention to journalism. Coming to London in 1842, he went to Cambridge, but left before taking a degree. He was special correspondent for *The Times* in Ireland in 1845, in Denmark in the war of 1849–50, and in the Crimean War. His letters written from the Crimea were published in book form as *The War, 1855–56*. The exposure made by Russell of the mismanagement in the Crimea contributed to the fall of the Aberdeen ministry. Russell also served as correspondent in India in 1858, in America in 1861–3, in the Seven Weeks' War of 1866, in the Franco-German war of 1870; and he was with Wolseley in South Africa in 1879 and in Egypt in 1882. In 1860 he founded the *Army and Navy Gazette*. Russell was knighted in May 1895, and was the recipient of numerous war medals and various foreign orders. He died on Feb. 11, 1907.

His works include: *My Diary in India in 1858–59* (1860); *My Diary, North and South, during the Civil War in America*, 1862 (1862); *My Diary during the Last Great War* (the Franco-Prussian War of 1870) (1873); *Hesperothen*, a description of a tour in the United States and Canada (1882); and *The Great War with Russia* (1895).

RUSSELL OF KILLOWEN, CHARLES RUSSELL, BARON (1832–1900), lord chief justice of England, was born at Newry, County Down, on Nov. 10, 1832, the son of Arthur Russell. The family was Roman Catholic. Educated first at Belfast, afterward in Newry and finally at St. Vincent's college, Castleknock, Dublin, he was articled in 1849 to a firm of solicitors in Newry. In 1854 he was admitted and began to practise his profession. In the legal proceedings arising out of Catholic and Orange disturbances young Russell distinguished himself in the cause of his co-religionists.

After practising for two years he determined to seek a wider field for his abilities. He went to London in 1856 and entered Lincoln's Inn. In 1858 he married Ellen, daughter of Joseph Mulholland of Belfast, and in 1859 he was called to the bar and joined the northern circuit. He possessed immense personality, an embodiment of energetic will that riveted attention, dominated his audience and bore down opposition. In his early years Russell's practice was mostly at the passage court at Liverpool, and he published a book on its procedure in 1862.

In 1872 Russell took silk, and his success as a queen's counsel during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he said, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail.

In 1880 Russell was returned to parliament as an independent Liberal member for Dundalk. From that time forward until 1894 he sat in the house of commons: for Dundalk until 1885, and afterward for South Hackney. From 1880 to 1886 as a private member, and as the attorney general in Gladstone's administrations of 1886 (when he was knighted) and 1892, he worked in and out of parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed coercion, voted for compensation for disturbance, advocated the release of political prisoners and voted for the Maamtrasna inquiry. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. When he warmly advocated the establishment of a subordinate parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of the kingdom.

Russell rapidly became in London what he was already in Lancashire, a favourite leader in nisi prius actions (those held for trial on the issue of facts before a jury and single judge). More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of note in British history. The first of these was the Parnell commission of 1888–90, in which Russell appeared as leading counsel for Parnell. In April 1889, after 63 sittings of the commission, Russell. who had already destroyed the chief personal charge against Parnell by a brilliant cross-examination in which he proved it to have been based upon a forgery, made his great opening speech for the defense, lasting several days. This speech, besides its merit as a wonderful piece of advocacy. possesses permanent value as a historical survey of the Irish question during the 19th century from the point of view of an Irish Liberal. The second was the Bering sea arbitration, held in Paris in 1893. Russell, with Sir Richard Webster (afterward Lord Alverstone), was the leading counsel for Great Britain. The award was, substantially, in favour of Great Britain.

In 1894, on the death of Lord Bowen, Russell accepted the position of a lord of appeal and was raised to the peerage. A month later he was appointed lord chief justice of England in succession to Lord Coleridge. Brief as was his tenure of the office, he proved himself well worthy of it. He had dignity without pomposity, quickness without irritability, and masterfulness without tyranny. In 1896 Lord Russell presided at the trial at bar of the leaders of the Jameson raid. His conduct of this trial, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely. his share in the Venezuela arbitration in 1899. Lord Herschell, a British representative on the commission, died before the beginning of the proceedings, and Lord Russell took his place.

Lord Russell contributed to the reform of the law by his advocacy of improvement in the system of legal education, and in promoting measures against corruption and secret commissions, though the bills he introduced did not become law. He died on Aug. 10, 1900. Few English lawyers have ever excited the admiration abroad that Lord Russell did, both in Europe and America.

See R. B. O'Brien, *The Life of Lord Russell of Killowen* (1908).

RUSSELL SAGE FOUNDATION, an institution established by Mrs. Russell Sage in memory of her husband. The initial endowment was $10,000,000, to which $5,000,000 was added by her will. It was incorporated by an act of the legislature of New York in April 1907, "for the improvement of social and living conditions in the United States of America." The charter further states: "It shall be within the purposes of said corporation to use any means to that end which from time to time shall seem expedient to its members or trustees, including research, publication, education, the establishment and maintenance of charitable or benevolent activities, agencies and institutions, and the aid of any such activities, agencies or institutions already established." The income only may be spent.

The management of the foundation is vested in a board of twelve trustees, which is self-perpetuating. The staff of the foundation study social conditions and methods of social work, interpret the findings, make the information available by publications, conferences and other means of public education, and seek in various ways to stimulate action for social betterment. Departments exist for dealing with charity organization, industrial relations, consumer credit, family welfare, social statistics, etc. The foundation does not relieve individual need and it avoids duplicating the work of existing agencies. In 1922 the foundation organized the Committee on Regional Plan of New York and its environs, providing the funds and office space and some staff assistance in preparing a plan for the future development of the New York region, an undertaking which took about seven years to complete.

RUSSIA, the name given to territories of the Eurasian continent which once constituted the Russian empire and which after World War I were included nithin the Union of Soviet Socialist Republics. Occupying almost one-seventh of the land surface of the world, it is the world's largest state and has the third biggest population. including many races, religions and nationalities. The name "Russia" (Rossiya) comes from the Slavonic Rus, possibly derived from *Ruotsi* (a Finnish name for the Swedes), which seems to be a corruption of the Swedish *rothsmenn* "rowers" or "seafarers."

After an account of the political divisions of the U.S.S.R. and a description of its geographical limits, this article is divided into 15 main sections as follows:

The U.S.S.R. was formally organized on Dec. 30, 1922, and originally consisted of the Russian Soviet Federated Socialist Republic (*q.v.*), the Ukrainian Soviet Socialist Republic (see UKRAINE), the Byelorussian S.S.R. (see BELORUSSIAN SOVIET SOCIALIST REPUBLIC) and the Transcaucasian S.F.S.R. In 1924 it was decided that the Turkistan Autonomous Soviet Socialist Republic. a component part of the R.S.F.S.R., should be divided on a nationality basis and transformed into five component republics of the U.S.S.R. This process took 12 years to complete: Uzbekistan and Turkmenistan (*qq.v.*) were officially admitted to the union in Jan. 1925, Tajikistan (*q.v.*) was admitted in Dec. 1929. and Kazakhstan and Kirghizia (*qq.v.*) were admitted in Dec. 1936. In Dec. 1936, too, the Transcaucasian federation was dissolved and Georgia. Armenia and Azerbaijan (*qq.v.*) became direct members of the union. To the above 11 republics five others were added during World War II, namely Karelia. Estonia. Latvia, Lithuania and Moldavia (*qq.v.*), the first being admitted in March 1940 and the remaining four in Aug. 1940. (See Table I.) On July 16. 1956, Karelia (Karelo-Finnish S.S.R.) was included into the Russian S.F.S.R. as the 13th A.S.S.R.

In 1956 the R.S.F.S.R. included 13 self-governing towns; 53 regions or *oblasti;* 6 territories or ***krai*** (Krasnodar and Stavropol in Europe and Altai, Krasnoparsk, Primorsky and Khabarovsk in Asia); 12 autonomous soviet socialist republics or A.S.S.R., namely Bashkiria, Chuvashia, Daghestan. Kabarda, Komi (Zyryania), Marii (Cheremisia), Mordvinia, North Ossetia, Tataria, Udmurtia (Votyakia), Buriat Mongolia and Yakutia (see Table II); 6 autonomous regions or A.O., namely 2 in Europe (Adyghei and Cherkess) and 4 in Asia (Gorno-Altai, Jewish, Khakass and Tuva) (see Table III); and 10 national districts or N.O., namely 2 in Europe (Nenets or Samoyed and Komi-Permyak) and 8 in Asia (Yamalo-Nenets, Taimyr or Dolgano-Nenets, Khanty-Mansi or Ostyak-Vogul, Evenki or Tungus, Chukot, Koryak, Ust-Orda and Aghin (see Table IV).

TABLE I.—Union of Soviet Socialist *Republics* after World War *II*

Republic	Capital	Area (sq.mi.)	Population (1940 est.)	Population (1956 est.)
Russian S.F.S.R.	Moscow	6,523,524*	108,800,000†	112,600,000
Ukrainian S.S.R.	Kiev (Kyiv)	232,618	40,525,000‡	40,600,000
Byelorussian S.S.R.	Minsk	80,154	9,000,000	8,000,000
Kazakh S.S.R.	Alma-Ata	1,063,242	6,146,000	8,500,000
Uzbek S.S.R.	Tashkent	157,336	6,282,000	7,300,000
Georgian S.S.R.	Tiflis (Tbilisi)	29,488	3,542,300	4,000,000
Azerbaijanian S.S.R.	Baku	33,089	3,209,700	3,400,000
Lithuanian S.S.R.	Vilnius (Wilno)	25,174	3,000,000	2,500,000
Moldavian S.S.R.	Kishinev (Chisinau)	13,050	2,700,000	2,700,000
Latvian S.S.R.	Riga	24,903	1,950,000	2,000,000
Kirghiz S.S.R.	Frunze	76,023	1,459,300	1,900,000
Tajik S.S.R.	Stalinabad	55,958	1,485,100	1,800,000
Armenian S.S.R.	Yerevan	11,506	1,281,600	1,600,000
Turkmen S.S.R.	Ashkhabad	187,181	1,252,000	1,400,000
Estonian S.S.R.	Tallinn (Reval)	17,413	1,117,300	1,100,000
Karelo-Finnish S.S.R.	Petrozavodsk	68,919	606,300	600,000
Total		8,598,678	192,357,000	200,200,000

Sources: Areas and population estimates for 1940 are taken from the *Bolshaya Sovietskaya Entsiklopedia: S.S.S.R.* (Moscow, 1948); population estimates for 1956 irom *Narodnoye Khozyaistvo* S.S.S.R. (Moscow, 1956).

*Excluding the Crimea which from Feb. 19, 1954 was part of the Ukraine.

†According to the 1939 census the population of the R.S.F.S.R. was 109,278,614; its reduction was explained by the fact that the Karelian A.S.S.R. (469,145 inhabitants in 1939) iormed with the areas ceded by Finland in 1940 a Karelo-Finnish S.S.R.

‡Excluding the population of Sub-Carpathian Ruthenia (725,000) which was incorporated with the Ukraine in 1945.

TABLE II.—*Autonomous Soviet* Socialist Republics, Jan. 1, *1956*

Name	Date of formation	Area (sq.mi.)	Population (1939)	Capital
In the R.S.F.S.R.:				
Bashkiria	March 23, 1919	55,405	3,144,713	Ufa
Chuvashia	1920	7,066	1,077,614	Cheboksary
Daghestan	Nov. 13, 1920	14,749	930,527	Makhachkala
Kabarda*	Sept. 1, 1921	4,556	359,236	Nalchik
Komi (Zyryania)	July 22, 1921	156,216	319,469	Syktyvkar
Marii (Cheremisia)	Nov. 4, 1920	8,919	579,466	Yoshkar Ola
Mordvinia	Jan 10, 1930	10,077	1,189,000	Saransk
Nortli Ossetia	July 7, 1924	3,552	328,885	Ordzhonikidze
Tataria	May 27, 1920	26,100	2,919,423	Kazan
Udmurtia (Votyakia)	Nov. 4, 1920	16,293	1,220,007	Izhevsk
Buriat Mongolia	May 30, 1923	135,676	542,170	Ulan Ude
Yakutip	1922	1,182,300	400,544	Yakutsk
In Georgia:				
Abkliazia	March 4, 1921	4,359	259,100	Sukhnmi
Adzharia	June 16, 1921	1,120	153,800†	Batumi
In Azerbaijan:				
Nakhichevan	Feb. 9, 1924	2,008	125,000‡	Nakhichevan
In Uzbekistan:				
Kara-Kalpakia	May 11, 1925	61,467	373,500†	Nukus

*Until April 1944 the officialname was Kabardino-Balkar A.S.S.R. At that timeabout 43,000 Balkars were deported to central Asia and the name was changed to Kabardinian A.S.S.R. †1933. ‡1936.

TABLE 111.—Autonomous Regions (A.O.)

Name	Date oi formation	Area (sq.mi.)	Population	Capital
In the R.S.F.S.R.:				
Adyghei	July 27, 1922	1,699	241,773 (1939)	Maikop
Cherkess	April 26, 1926	1,544	80,800 (1933)	Cherkessk
Gorno-Altai	June 1, 1922	35,733	161,400 (1939)	Gorno-Altaisk
Jewish	May 7, 1934	13,822	108,400 (1939)	Birobidzhan
Khakass	Oct. 20, 1930	23,707	270,655 (1939)	Abakan

Nagorno-Karabakh	June 7, 1923	1,737	153,900 (1933)	Stepanakert
In Tajikistan:				
Gorno-Badakhshan	Jan. 2, 1925	23,591	35.700 (1933)	Khorog

TABLE IV.—*National* Districts (N.O.) of the R.S.F.S.R.

Name	Date of formation	Area (sq.mi.)	Population	Capital
Nenets (Samoyed)	July 15, 1929	67,297	28,100 (1937)	Naryan-Mar
Komi-Permyak	Feb. 26, 1925	12,046	160,100 (1939)	Kudymkar
Yamalo-Nenets	1930	258,841	12,800 (1926)	Salekhard
Taimyr (Dolgano-Nenets)	1930	316,680	29,100 (1939)	Dudinka
Khanty-Mansi (Ostyak-Vogul)	1930	215,482	102,200 (1933)	Khanty-Mansiysk
Evenki (Tungus)	1931	285,907	...	Tura
Chukot	1925	274,517	15,000 (1926)	Anadyr
Koryak	Dec. 10, 1930	151,737	21,000 (1939)	Palana
Ust-Orda	1937	7,954	...	Ust-Orda
Aghin	Sept. 26, 1937	9,382	...	Aghinskoye

The four A.S.S.R. outside the R.S.F.S.R. are Abkhazia and Adzharia, which are parts of Georgia; Nakhichevan, which is part of Azerbaijan; and Kara-Kalpakia, which is part of Uzbekistan. The three A.O. outside the R.S.F.S.R. are the Nagorno-Karabakh (part of Azerbaijan), the South Ossetia (part of Georgia) and Gorno-Badakhshan (part of Tajikistan).

The area of the Russian empire before 1914 was about 8,674,000 sq.mi. As a consequence of the proclamation of Finland. Estonia. Latvia and Lithuania as independent states; of the restoration of Poland; and of the recovery of Bessarabia by Rumania and of the Kars-Xrdahan-Artvin area by Turkey, by 1921 the area of the U.S.S.R. was reduced to 8,333,000 sq.mi.

Between 1939 and 1945 the U.S.S.R. annexed the following territories. the formerly Polish western Ukraine and western Byelorussia, the formerly Finnish Karelia and Petsamo (Pechenga), Estonia. Latvia, Lithuania, the formerly Rumanian Bessarabia and northern Bukovina, the formerly Czechoslovakian Sub-Carpathian Ruthenia. the formerly German northeast part of East Prussia

(renamed the Kaliningrad region and part of the R.S.F.S.R.), the formerly Japanese Karafuto (southern Sakhalin) and Kurile (Kurilskyie) Islands and the formerly "independent" republic of Tuva. (*See* Table V.) The total area of the Soviet Union including these new territories mas 8,598,678 sq mi.

The Soviet Union extends over the eastern part of Europe and the northern and central parts of Asia, stretching north and south from Cape Chelyuskin (77° 43' N. lat.) to Kushka on the Afghan frontier (35° 08' N. lat.). East and west the country extends approximately from a point on the Gulf of Danzig near 19° 38' E. long. to Cape Dezhnev (East cape) on the Chukchi (Chukotski) peninsula at 169° 40' W. long.

The western frontier of the U.S.S.R. runs from the shores of the Barents sea down to the Black sea. On the west the Soviet Union borders on Norway, Finland, Poland, Czechoslovakia, Hungary and Rumania. The southern frontier runs from the Kiliya mouth of the Danube and proceeds along the shores of the Black sea. Thence it extends eastward along the southern limit of the Armenian highland to Nakhichevan, along the Araks river. south along the Talysh range and across the Caspian sea. The frontier from the eastern shore of the Caspian sea follows approximately along the crest of the Kopet Dagh range and east onto the Pamir highland. Thence it extends along the Tien-Shan. the Altai, the Tannu Ola and the Transbaikalia mountains. From the Manchurian frontier the boundary runs along the Argun river to its confluence nith the Shilka and thence along the Amur river to its junction nith the Ussuri, where it turns south to follow the Ussuri river to Lake Khanka whence it runs to the shore of the Sea of Japan. On the south the Soviet Cnion borders on Turkey, Iran, Afghanistan, China (Sinkiang). Mongolia, China again (Manchuria) and Korea. The eastern frontier is entirely a sea border.

More than two-thirds of the Soviet borders are maritime. The northern frontier on the Arctic ocean is maritime in its entire length, but apart from Murmansk. which is washed by the warm Atlantic drift, this frontier is frozen for nearly ten months of the year.

The island possessions of the Soviet Union are numerous, but the majority are in the Arctic ocean and are of little use. The Aleutian archipelago and Alaska were sold to the United States in 1867 The Kurile Islands, ceded to Japan in 1875, were recovered by the Soviet Union in Sept. 1945. A group of small islands in the gulf of Finland. given up after the revolution of 1917, were recovered from Finland in 1940. The Komandorskyie Islands off Kamchatka. the Shantar Islands near the Pacific coast and from Aug. 1945, the whole of the island of Sakhalin are Soviet possessions. The chief Soviet islands off the arctic coast are Kolguyev Island. Novaya Zemlya and Vaigach Island, the Severnaya Zemlya (formerly Nicholas II Land) north of the Taimyr peninsula, the New Siberian Islands (north of Laptev sound) and Wrangel Island Franz Josef Land is Soviet territory, but Spitsbergen and Bear Island were recognized in 1920 as being under Norwegian sovereignty. (I. GY.; K. SM.)

I. PHYSIOGRAPHY AND STRUCTURE

In very general terms Russia may be described as a wide amphitheatre open to the Arctic but bordered to the east, to the south and to the west by the high mountain and plateau belt that forms the middle zone of the Eurasian land mass. The great inner lowland can be divided into four regions: viz., the east European plain, the west Siberian plain, the Aralo-Caspian basin and the central Siberian plateau. The first two of these regions, both plains of low relief. are similar in most of their geographical features but are separated by the Ural mountains; the third is a southward extension of the west Siberian plain separated from it by a belt of low hills and lying east of the Caspian sea. The central Siberian region is an ancient plateau with a gently undulating surface but deeply dissected by streams draining to the Yenisei and Lena. The mountain border includes, from nest to east, the following highlands, all on or near the U.S.S.R. frontiers: the Carpathians, the Caucasus, the Kopet Dagh, the Pamirs and Tien-Shan, the Altai and Sayan mountains, and the East Siberian highlands.

East European Plain. — This immense lowland forms almost the nhole of European Russia. It rises almost imperceptibly eastward toward the Urals. Underlying it is a relatively undisturbed floor or platform of Archaean and Palaeozoic rocks. Though usually buried beneath later deposits, this platform is exposed in the northnest and southwest. In the former area the Fennoscandian shield extends into Karelia and the Kola peninsula as far as the great lake belt between the White sea and the Gulf of Finland. In the southnestern area the Azov-Podolian shield underlies the Volhyno-Podolian upland of the Ukraine. The platform surface is not quite horizontal throughout for it suffered warping and some dislocation as a result of Huronian and Caledonian earth movements. Still more important deformations resulted from the pressures set up by Hercynian folding. The more recent Tertiary folding had little effect outside the highland borders.

Much more important in the geological history of the country than these violent crustal movements were the alternating advances and retreats of the surrounding seas over the land. In the wide shallow basins so formed were laid down, age after age, the sedimentary rocks nhich now cover most of the platform. In general these rocks are of decreasing age from northwest to southeast and are still almost as horizontally disposed as when they were first laid donn.

The major relief features of the plain are thus of ancient origin but the detailed topography is nearly everywhere the result of more recent happenings. Chief among these were the invasion of the Pleistocene ice sheets — mainly from Scandinavia but also from the northern Urals — and the marine transgressions and regressions in the north and the southeast. The separation of the Aralo-Caspian depression from the Arctic was completed only after Oligocene times. The breaking of its former link with the Black sea through the Manych depression was still more recent.

The rivers of the east European plain are slow and minding, with almost insignificant gradients. The main divide is the morainic ridge which forms the Lithuanian-Byelorussian and Valdai hills and extends northeastward to the middle Urals. Its maximum height, in the Valdai area, is 1,053 ft. In spite of its low altitude, this ridge separating the northward and southward draining areas is the most significant feature of the plain.

The Northern Plain. — This includes the Russian section of the Fennoscandian shield. From the line from the White sea to the Gulf of Finland via Lakes Ladoga and Onega (discussed in the article on Europe, *q.v.*) eastward toward the northern Dvina. Palaeozoic, Devonian. Carboniferous and Permian rocks succeed

TABLE V.—*Areas Annexed by the U.S S.R., 1939–45*

Area	Date and form of incorporation		Population (est)
In Europe:			
Estonia	Decision of the supreme soviet of the U.S.S.R. Aug. 6, 1940	18,357	1,134,000
Latvia	Aug. 5, 1940	25,395	1,994,000
Lithuania (including both Klaipeda and Vilnius)	Aug. 3, 1940	25,174	3,032,000
From Finland (Karelia and Petsamo-Pechenga)	Soviet-Finnish treaty of March 12, 1940; Finnish-Allied armistice of Sept. 19, 1944	17,598	54,000*
From Poland (excluding the Vilnius area)	German-Soviet agreement of Sept. 28, 1939; Polish-Soviet treaty of Aug. 16, 1945	65,610	10,315,000

*In 1940 425,301 Karelians left to resettle in Finland.

one another. Beyond that river the lower levels are mainly alluvials with Pleistocene glacial deposits between the river lines. The basin of the Pechora is divided from the land farther west by a minor fold belt bringing up Devonian and some crystalline schist along the line of the Timan hills that may be traceable as,a branching of the mid-Urals northwestward to Cape Kanin. The whole northern region has a very low relief. Apart from the Timan hills it is all below the 600-ft. contour. The chief rivers are the Pechora (1,150 mi.), the Mezen (500 mi.) and the Northern Dvina (470 mi.). All are frozen for long periods (seven months on the lower Pechora) each winter. The Neva carries the abundant lake outflow to the Gulf of Finland, and the Western Dvina and Niemen flow into the Baltic.

The Pleistocene glaciation had its most marked effects on the northern plain. The Scandinavian sheets reached their maximum extension in the Riss period when they penetrated to the edge of the Volhyno-Podolian and central Russian uplands with two great lobes into the Dnieper and Oka-Don lowlands and thence along the foot of the Volga upland to the mid-Urals. The later Würm glaciation left most of the existing effects. its terminal moraine forming the main divide. Over Finland and Karelia these effects were mainly erosive, removing surface soils and leaving bare rock surfaces with many lakes in irregular shallow hollows. Long, low, sandy ridges (eskers) cross the region. Beyond this belt to the limit of the ice sheets is the accumulation belt covered mainly with boulder clays as far as the main end moraine. Many great channels (German *Urstromtäler*) run parallel to but within the moraine, such as that followed by the two great headwaters of the Northern Dvina.

The Southern Plain.—Although never covered by the continental ice sheets the southern section of the European plain has been much affected by them. Boulder clay deposits were left in the Dnieper and Oka-Don lobes. After the final retreat of the ice fine-grained clay and sand were washed southward by the melting water and, as they dried, carried still farther by wind. These form a covering of loess and *limon* over vast unglaciated areas. Much of the ravine and gully country of the southern plain has been created by erosion in this easily weathered material. Where coarser material formed outwash plains as in the Pripet, Dnieper, Oka and Tsna valleys these are now covered by swampy woodlands (polesye).

The main structural features underlying the southern plain are slight undulations, anticlines and synclines with axes northwest to southeast; the down-faulted Donets basin in which rich coal measures have been preserved; the up-thrusted Kursk-Voronezh horst, forming part of the central Russian upland. Other areas of eroded uplift include the Volga heights on the right bank of the middle Volga, the horst of the Ufa plateau west of the middle Urals, and the Stavropol plateau along the northern foot of the Caucasus. The exposed platform area already referred to contains the Ukrainian iron ores of Krivoy Rog and the manganese ores of Nikopol.

The Dnieper from Kiev to Dnepropetrovsk follows the northern edge of the platform to the latter town and then cuts across it to the sea. To the north of the middle Dnieper is the faulted syncline of the Donets basin with wide areas of Tertiary rocks, though Palaeozoic rocks come to the surface in the higher country near the Sea of Azov. Next to the north is the central anticline along whose axis the Don flows to the southeast. The rocks there are mainly Cretaceous capped interfluvially by early Tertiary here and there.

The Moscow Basin.—Northeast of this anticlinal zone is the immense "Moscow basin," floored by Palaeozoic rocks mainly still horizontal, with some Triassic deposits; but there are patches of Jurassic and Cretaceous strata as, for example. around Moscow and in the great bend of the Volga and also farther north from Kostroma to Syktyvkar (Ust-Sysolsk) on a tributary of the Vychegda. There was an intrusion of the sea in Jurassic times which became much more extensive in the Cretaceous period; no upper Cretaceous is known, honever, in northern Russia. Around the Moscow basin in the southwest and west the Lower Carboniferous system (with poor coal at Tula, etc.) outcrops in a great curved belt from the region of Tula almost to the White sea Beyond this belt northnestnard is the area of Devonian rocks toward Latvia and Estonia and across to the White sea. They rest unconformably on Silurian rocks which outcrop along the southern shore of the Gulf of Finland and of Lake Ladoga. The Devonian rocks are partly lacustrine (old red sandstone) and partly marine in origin, and the two types are often interstratified: a basal red sandstone is covered by a dolomitic limestone which in turn has a sandstone over it. The Timan hills on the northeast may be said to be an upfold bordering the Moscow basin.

The main axis of the basin is parallel to the course of the Volga above Gorki (Nizhny-Novgorod), continued northwestward by the Mologa; i e., rivers running broadly parallel to the sections of the Dnieper, Donets and Don already noted. Permian rocks outcrop over large areas on the north. The dips of the strata are small, and anticlines and synclines there are really slight undulations which might be folloned right across Russia from the Dniester to the Timan hills, always nith lines roughly northwest to southeast (or west-northwest to east-southeast) well marked in geology and drainage, though not much indicated in relief save that there is a marked low line of the Dnieper valley above Dnepropetrovsk, the Pripet marshes or Rokitno swamps and the upper Bug, where it continues the line of the Dnieper and Pripet into Poland. This belt of lonlands is of special importance because of the great marshes just named; they form the historic barrier between Russia and peninsular Europe.

The main rivers of the southern plain are the Dnieper (1,400 mi.) and Don (1,100 mi.) both of which flow southeastward for a considerable distance and then turn sharply southward to the Black sea, probably as a consequence of the recent dominance of flow toward the Aegean following the sinking of the latter. Before that sinking the Danube may for a time have made its way eastward across the lowland to the Caspian area via the curious Manych depression. The Volga (2,300 mi.) is the longest river of Europe, flowing broadly east-southeast parallel to the axis of the Moscow basin and meeting the Kama as it turns south below Kazan. On its course southnard it has a sharp eastward loop with Kuibyshev at the head opposite the southward bend of the Don. Below Stalingrad the Volga bends southeast, thus continuing the previous line of the Don and so reaches its delta on the Caspian sea. The Volga is Russia's principal waterway. It is linked through its headstreams to Moscow, by the Mariinsk canal system between the Rybinsk reservoir and the Baltic sea at Leningrad, and thence by the Baltic-White sea canal to the Arctic. The Volga-Don canal gives a connection to the Black sea. Hydroelectric power schemes have been developed on a great scale, particularly on the Dnieper and Volga and the latter river has also been used for the irrigation of considerable areas north of the Caspian.

The **Urals.**—In the Urals the Palaeozoic strata are folded on the west of a longitudinal axis nhich exhibits crystalline rocks and is faulted on a large scale. The Devonian rocks in this area are of marine origin. Its greatest heights are chiefly in the regions of folded Palaeozoic rocks and the folds die away into the Russian platform westward in small parallel chains known as Parma. Though there is much copper in the Permian rocks on the west the main metalliferous veins of the area are in the faulted zone of crystalline rocks to the east. The greatest heights reached in the Urals are Mt. Narodnaya (6.184 ft.) and Mt. Tel-pos-iz (5,545 ft.), both in the northern section of the range. The passes are often low, that on the way from Molotov (Perm) to Sverdlovsk being only 1,245 ft. above sea level. The range is continued to the Arctic coast, Vaigach Island and Novaya Zemlya. (See further NOVAYA ZEMLYA; URAL MOUNTAINS.) On the south the Urals finger out in a plateau region dissected by feeders of the Ural and a few feeders of the Volga. The Ural river drains the southern Ural mountains, turns west and then south to the Caspian sea, which it reaches after a course of 1,477 mi.

The West Siberian Plain.—This plain, practically coincident with the basin of the Ob, extend, eastward from the Urals for about 1,250 mi. and southward from the Arctic for 1,500 mi. It is probably the largest area of unbroken lowland in the world. River gradients are all low, the fall on the Ob being only 350 ft. in its

last 1,250 mi. Ridges between its major tributaries seldom rise more than 30 ft. above the surrounding country. The river rises in the westward prolongations of the Sayan mountains and is 3,200 mi. long. Its great tributary, the Irtysh. rises much further south near the Dzungarian gate. The ancient Russian platform is assumed to extend beneath the lowland but it is covered by a great thickness of horizontal sedimentary beds varying in age from very early to Quaternary. The surface rocks are mainly Tertiary and post-Tertiary with glacial deposits as far south as the 60th parallel. The ice sheets were much thinner than on the European plain and in the northern areas their deposits were largely removed by an advance of the sea in postglacial times or covered by the deposits left during that advance. Mesozoic limestones occur at the surface at some points in the lower Ob basin and in a narrow extension of the plain which runs eastward between the Arctic shores and the central Siberian plateau. Older rocks emerge where the plain approaches the Yenisei and on its southeastern margins.

The Aralo-Caspian Basin.—This region is separated from the west Siberian plain by the higher ground of Karaganda and the Turgai plateau. The former is structurally related to the Altai. It is floored by Palaeozoic and igneous rocks and includes an important coal basin. The Turgai is a series of low plateaus 300 to 650 ft. in height and consisting of horizontal Tertiary and Quaternary sediments. The basin itself is a vast extent of dry steppe and clayey or sandy deserts surrounding the shallow Aral sea. Surface rocks are mainly of Tertiary or later age laid down in the great Pontic lake after its separation from the Tethys sea of Mesozoic times. Continuations of the Tien-Shan folds to the northwest sink below these beds. The area, except on its mountain margins, was not subject to glaciation but the erosive action of winds is very evident. The Kyzyl Kum (Turkish, "red sands") desert near the Syr Darya is a dry alluvial plain with scattered dunes; its central area is deeply buried in loose sands. In the Kara Kum (Turkish, "black sands") low sandy ridges separated by stony depressions are characteristic of the northern area; the southern part is more irregular with sands covering a surface formerly modelled by river action. The two great rivers of the area are the Amu Darya (Oxus), and the Syr Darya, both about 1,500 mi. long and both entering the Aral sea. Utilization of their waters for irrigation purposes was being extended in the 1950s.

Central Siberian Plateau.—East of the Yenisei the character of the land changes abruptly: a sharp edge rises rapidly to more than 600 ft. and in one place to about 3,300 ft. above sea level, and east of this edge is a great dissected plateau of ancient rocks. Archaean rocks with granites. etc., are exposed near the Yenisei and away to the northeast, but there are larger areas of Cambrian and Silurian rocks and these are covered over a vast stretch of country by Permo-Carboniferous rocks. The plateau extends eastward to the Lena, along the valley of which is found evidence of an invasion of the sea in Cretaceous times. The plateau is an ancient block to which E. Suess gave the name of Angara land. Large areas on this plateau rise somewhat above the 1,600-ft. contour, and the diversities of surface are largely the result of river dissection. There is evidence in the Taimpr peninsula of a fold axis with a general direction from west-southwest to east-northeast but apparently no heights reaching above the 1,500-ft. contour.

The Yenisei is the collecting stream beneath the western edge of this old block, and it rises in the Sayan mountains receiving nearly all its tributaries from the eastern side. Of these the Upper Tunguska or Angara comes from Lake Baikal, the Middle or Stony Tunguska and the Lower Tunguska from the block itself. The river is 2,800 mi. long.

The mountain ranges which border the Russian lowlands on the south were uplifted at various periods. those to the west being generally younger than those to the east. In central Asia they show a characteristic arrangement in echelon from southwest to northeast.

Eastern Siberia.—This area has a most irregular surface. It is a complex of great blocks and rifts, of plateaus separated from one another by steep scarps as they rise in tiers toward ridges crowned with snow-clad peaks of Alpine appearance. Side by side are features obviously of great age and others, such as gorges and rapids, indicative of recent change. In the northeast the Verkhoyansky and Kolpmsky ranges form a great semicircle facing the Arctic and encircling parallel ranges such as the Chersky mountains (Mt. Pobeda 10,326 ft.), all drained northward by the Kolyma. Indigirka and Yana rivers. The Anadyr mountains continue the Kolymsky ranges. but parallel to the Xrctic shores as far as the Bering strait. A similar arc to that of the Verkhoyansky-Kolymsky is formed by the Stanovoy ranges. The area between them is drained by the Lena (2,800 mi.) and its Aldan and Vilyui tributaries. Below their junction the Lena follows a deep trench along the eastern edge of the Angara block. The Stanovoy ranges rise to 8,000 ft. and stretch south and west from the junction of the Verkhoyansky and Kolymsky mountains. They mere originally uplifted by Caledonian movements, then covered by later deposits and again faulted and folded. The Kamchatka peninsula is followed by two parallel ranges, both with volcanic cones (see KAMCHATKA). Southeast of the Stanovoy is a region of broken plateaus with parallel ranges, of which the Sikhote Alin is the highest and nearest the coast. Tectonic movements there occurred mainly during the Mesozoic and Tertiary periods. The Amur river (2,900 mi.) crosses the region in a great southward curve.

The area east of Lake Baikal is marked by severe dislocation. The ancient rocks which underlie the surface have been faulted to form great blocks, uplifted into horsts separated by rift valleys. Lake Baikal covers the floor of what is perhaps the finest example of such a rift. The lake is over 5,700 ft. deep. The horsts form flat-surfaced plateaus at heights of around 3,000 ft. separated by deep and wide valleys. The Yablonovoy mountains (8,000 ft.) mark the limit of this region and stretch in a great arc parallel to the general direction of the lake.

The Central Asiatic Ranges.—These ranges stretching from Lake Balkhash to Lake Baikal are sometimes grouped together as the Sayanid system. They form the border country between the U.S.S.R. and Mongolia, a barrier difficultto cross. Though sometimes described as of Tertiary origin, all the ranges were first formed at a much earlier date. After a long period of erosion which had almost reduced many of them to peneplains they were again uplifted by Alpine movements. Thus the Sayan mountains west of Lake Baikal, formed during the Caledonian period, were later raised without sufferingmuch other disturbance to heights of 8,000 to 10,000 ft. yet still show flat eroded surfaces on their summit areas. The Altai on the other hand were heavily faulted in this later uplift, while the Tien-Shan were intensely folded, especially to the south. Between the two latter series is the relatively low Dzungarian gate, the historic highway from China across Mongolia to the Kazakh steppes and so to the Volga. The southern Tien-Shan have peaks reaching over 20,000 ft., wide snowfields and glaciers which rank among the greatest outside the polar regions. The Tien-Shan proper extend westward in the Kirghiz ranges north of the Syr Darya and the Alai chain between the headstreams of that river and of the Amu Darya. The latter range is notoriously difficultto cross because of the infrequency and the great height of its passes (over 11,000 ft.). The Alai valley, eroded along a great fracture zone, marks the southern limit of the Tien-Shan and was followed by the ancient caravan route to Kashgar (Shufu). The Trans-Alai is a great barrier range of red sandstones 5,000 ft. higher than the Alai (Mt. Stalin 24,589 ft.; Mt. Lenin 23,383 ft.) and with greater snowfields. Next to the south is the Pamir, a region of high plateaus separated from one another by low ridges. It is a high-level desert where low precipitation has severely limited both erosion and vegetation. The Kopet Dagh and associated ranges on the borders of Turkistan and Iran reach heights of about 9,000 ft. They are composed of Cretaceous and Tertiary beds folded and fractured in late Tertiary times.

The main value of the central Asiatic ranges lies in the waters they supply to the neighbouring lonlands. All the great rivers of western Asiatic Russia have their sources there, many of them in high-level glaciers. The finer soils brought down from the higher slopes and the narrow belt of loess which generally marks the meeting of highland and plain are generally fertile and the

mountain streams provide water for their irrigation. Rain and snowfall, especially on slopes facing north or west, are heavier than that on the plains and so good pastures occur almost to the snow line.

The Caucasus and **Transcaucasia.**—This includes the whole area between the deep basins of the Black sea and the southern Caspian. Its main features date from the Alpine uplift. The chief elements are, from north to south: (1) a gently rising foreland reaching about 2,500 ft. in the Stavropol plateau; (2) a narrow downfold, with Quaternary deposits, crossed by a minor uplift toward the west which separates the Terek and Kuban river basins; (3) the Great Caucasus, parallel ranges with heights up to 18,500 ft. (Elbrus) and a maximum width of 100 mi. (the central range includes ancient crystalline rocks but the flanking ridges are of later formations); (4) the tectonic depressions drained to the west by the Rion and to the east by the Kura and Araks (see Caucasus).

The Yaila ridge (5,000 ft.) is the highest of several parallel ridges forming a mountain belt 20 mi. wide which runs across the southern Crimea. They form a short link in the line of the Alpine-Himalayan uplift.

II. CLIMATE

The climate of the U.S.S.R. has two outstanding characteristics: its uniformity and its continentality. They are results of its low relief and compact form. Its great plains present over immense distances the same monotony of climate as of level. It is possible, of course, to recognize areas whose climates differ significantly one from another, but the transition from one such province to its neighbours is, practically everywhere, accomplished by almost imperceptible gradations.

Maritime influences are extremely feeble, which is not surprising because 75% of the area is more than 250 mi. from the surrounding seas, several of which, moreover—the Baltic, the Black and the Caspian seas—are land-enclosed. The frozen Arctic ocean obviously can have little effect; the mountain barrier shuts out monsoonal winds from the south; and offshore ninds and high coastal ranges limit Pacific influences to a narrow coastal belt on the east. Hence the Soviet lands almost everywhere show to a high degree the features of a continental climate: great extremes of temperature, both diurnal and annual; abrupt change from winter to summer and vice versa; low rainfall with summer maximum and largely convectional in character; violent windstorms. The south coast of the Crimea and Transcaucasia (both sheltered by high ground on the north and with winter rains drawn from the Black sea) and the area between the lower Amur and the Pacific (feebly monsoonal in character) are the only areas to which this general description does not apply.

The climate of the U.S.S.R. is dominated by the polar continental air mass which extends over the whole land for the greater part of the year. In the summer it shrinks to a narrow belt along the arctic coasts of Asiatic Russia. It is characterized by its low temperature and low humidity. Disturbances are infrequent and local. Thus, dry, still days with clear skies, very low temperatures and slight snowfall are characteristic of the nine months or so during which it covers the land—conditions which though harsh are by no means unhealthful but do severely limit human activities.

In winter, pressures are high over the whole of Siberia, especially so near Lake Baikal where in January they exceed 30.j in. Outblowing winds are therefore normal over Asiatic Russia. A narrow extension of this high-pressure area spreads westward, roughly along lat. 50° N., as far as central Europe. On its northern side southwest and west winds blow, while to the south the winds are generally between north and east. The feeble low pressures experienced during the brief summer give a much more irregular air circulation.

Rainfall is generally less than 20 in. except in coastal and mountainous areas and the middle and western areas of European Russia. It is almost entirely derived from Atlantic sources, being brought by cyclonic disturbances, more frequent in summer. The total precipitation decreases eastward along a middle zone from Moscow to Lake Baikal and, much more rapidly, both to the northeast and to the southwest of this zone. The arctic northeast has a rainfall as low as that of the desert Aral basin.

The summer isotherms follow the latitudinal lines with remarkable regularity. In January their direction is rather from northwest to southeast, with the pole of cold in the region of Verkhoyansk (January mean −58° F., minimum recorded near −100°). Temperature ranges thus increase toward the east. from 31° at Batum to more than 100° northeast of Yakutsk. In the Siberian arctic only 60 days, on the average, are frost-free, and even in European Russia it is only in the Ukraine that the surface is snow-covered for fewer than 100 days. Both the Sea of Azov and the northern half of the Caspian are frozen over in January.

Siberia.—All the features of the Russian climate already outlined are particularly sharply shown in Siberia. Its northerly situation, its isolation from Atlantic and Pacific, the increasing altitude of the land toward the south (offsetting in part the decreasing latitude) and its openness toward the arctic all tend to bring down its temperatures. By reason of its winter high pressures, bitterly cold winds blow out from it over the surrounding lands. Its low atmospheric pressure in summer drams in warmer and more humid air from beyond its borders, thus producing its summer maximum rainfall. Snow lies long, but the depth of fall is slight—in the northeast so slight in many parts that the sledge is not usable. On the whole the weather is dry, the sky generally cloudless. Temperature ranges are unequalled in any other land. Verkhoyansk is generally credited with the lowest recorded temperature (about −100° F.), but it has also recorded 100° F. The Siberian summer, though short, is hot rather than warm.

Winter is clearly the dominant season, as much by its unchangeableness during many weeks as by its severity. The general absence of wind alone makes the cold bearable. When the buran (Siberian blizzard) blows, only shelter from its blast mill save the life of the traveller. In the absence of heavy snow the soil and subsoil are deeply frozen. Over nearly all Siberia east of the Yenisei "permafrost" obtains: the subsoil is frozen all the year and the surface soil thaws only for a brief period and only to shallow depths in summer. The depth of this thaw has important effects in determining the nature of the vegetation.

Spring arrives in April. The ice on the rivers breaks up rapidly and, as the thaw begins in the south, the flowing waters cause floods over the still frozen northern channels. As the snow melts, village streets become apparently bottomless seas of mud. For several days outdoor movement of man or beast becomes almost impossible. The surface soon dries, however, and a brief period of delightful spring weather is experienced, though often interrupted by the return of severe cold for a short time. Summer follows quickly. The days are warm or hot and the hours of daylight long. Its monotony is broken by sudden storms, sometimes accompanied by hail, or there may be short burning spells with dust storms. In any case one can be sure of the return of clouds of voracious mosquitoes. By August, however, or by early September in the south, night frosts are experienced and in two or three weeks winter has returned.

Over such a vast expanse there are naturally variations in climatic conditions, and these make possible a division into climate provinces or regions.

The polar or tundra province includes a narrow belt along the Arctic shores from the Kola peninsula to the Bering strait. Its southern limit may be taken at the 50° July isotherm, which is also near the limit of tree growth. The chief characteristics are its very long winters (about ten months), short summers (temperatures as high as 80° F. have been recorded): low precipitation and strong winds. Both temperature and precipitation decrease eastward, the latter falling as low as four inches near the Lena delta. Winter temperatures are higher near the coast than in the interior.

The far eastern province is characterized by a monsoonal reversal of wind direction—land to sea in winter, sea to land in summer. Winter conditions are severe (even Vladivostok, in the extreme south, has 110 days of frost and a January mean temperature of 7° F.). It is sharply distinguished from other Siberian regions by its humidity. Fogs are frequent, snowfall heavy (par-

ticularly near the Sea of Okhotsk) and rainy days numerous in summer.

Eastern Siberia is notably dry and cold. Precipitation varies from 14 in. near Lake Baikal to 4 in, in the north. Days with snow are few (nine at Blagoveshchensk, none in some years and in some sections). Immense areas have mean annual temperatures below freezing point. On the other hand, the July isotherm of 68" F. does not reach so far north in any other part of the world.

Central Siberia is also very dry. The number of snowy days is higher, though the total fall is still slight. Temperatures remain very low (Irkutsk. January mean −5° F.). Lake Baikal reduces temperature ranges considerably in its immediate vicinity.

In western Siberia the winters are still harsh (Tomsk, January mean −3° F.). Heavy snow is often brought by violent storms and piled in great drifts. Tomsk has an average of about 120 snowy days. The snow cover limits the depth to which the soil is frozen, so that it is quickly fit for cultivation after the spring thaw. Its thorough soaking at this time is also favourable to seed germination. During the warm-to-hot summer, rain falls in heavy showers, though the total precipitation is still only moderate (Tomsk 20 in.. Omsk 12 in.).

European Russia.—The climate of European Russia is controlled by the same major influences as that of Siberia: its northerly latitude and openness toward the arctic, the absence of any barrier on the Asiatic side and the shutting out of marine influences (except to a limited degree) by the Scandinavian highlands, the Carpathians and the Balkans. It is accordingly both continental and uniform, in marked contrast to that of the rest of Europe. Nevertheless, the Baltic depression and the north German plain do permit, if only in attenuated form, the penetration of Atlantic influences.

As has been seen. the Siberian anticyclone in winter throws west across central Russia an arm of high pressure bringing cold Asiatic winds to the east, centre and south of the country. The lower pressures to the northwest permit the entry of humid and relatively mild air from the west. In summer, while the east and south still receive hot, dry continental winds, the north, northwest and centre experience cooler and moister oceanic air. Precipitation therefore decreases from northwest to southeast (Riga 22 in., Moscow 21, Saratov 15, Astrakhan 6). Snowfall! fairly heavy in the lake region, becomes quite light toward the Black sea and the lower Volga, a reminder that winter is the season of least precipitation (Moscow 16%). The summer, though it has often long periods of drought interrupted by brief but heavy rainstorms, is the season of greatest precipitation (Moscow 36%, Kaluga 40%).

Latitude has a marked effect on summer temperatures (Archangel July mean 60° F., Astrakhan 78° F.) but has less effect in winter when distance from the sea becomes a more important factor (Leningrad January mean 15°, Moscow 12°, Orenburg 3° F.). But it is the length of the seasons rather than their mean temperatures that has most influence on Russian life. In the far north at least six and one-half months of frost can be expected, Leningrad, Nizhny-Novgorod (Gorki) and Orenburg (Chkalov) have from five to six, Moscow and Kuibyshev from four to five, Odessa and Kherson from one to three. Unlike the Siberian winter, however, conditions are liable to violent changes: blizzards, sudden falls in already low temperatures, or brief thaws.

Spring. coming in April or May, sets free the frozen rivers and puts an end to all outdoor movement. In a couple of months, except in the far north, summer has arrived, bringing hot days everywhere. Evaporation is then intense, the soils dry quickly and river levels fall considerably. Dry winds from the east bring dust storms that may cover and often scorch the growing crops. Harvest follows seedtime with but a brief interval for festival between. By early October the first snow showers have fallen in Moscow. From mid-November winter tightens its grip on the whole country once more.

The southern shores of the Crimea and the northeastern coast of the Black sea have a Mediterranean climate. There the winters are generally mild and rainy, the summers dry and rainless. Frosts are experienced only in a few days in January and February. High ground to the north provides shelter in each case.

Transcaucasia has a subtropical climate. The Rioni valley, open on the west to the Black sea, has a milder winter than even the Crimea and a cooler summer. Precipitation is heavy with a slight winter maximum. Winds from the Caucasus produce foehn effects.

Turkistan.—Across the lower Volga, in Kazakhstan, the climate becomes yet drier and more extreme. Wild blizzards sweep it in winter, though the total snowfall is slight. Autumn and spring are virtually nonexistent, a grilling summer (July mean 77°) following immediately on a bitterly cold winter (January mean 5°).

Further south, in the Aralo-Caspian basin, conditions are still more severe. Precipitation varies between 3 in. and 8 in. a year, except along the mountain margins (Tashkent 14 in.). Most of it falls in spring and the rest near the end of the year. Temperature ranges, both annual and diurnal, are large. Cold waves from the north sweep across the basin in winter. while the cloudless summer skies and dry air give full play to a burning sun. The Aral sea is frozen for five months; in summer eggs can be cooked in the sands near its shores.

III. SOILS AND THEIR INFLUENCE

The science of pedology or soil study owes much to the work of Russian investigators. This might perhaps have been expected in a land for so long almost wholly dependent on agriculture. Uniformity of level and of climate over nide areas naturally emphasized the importance of soil variations in the choice of crops and in their productivity. The derivation of the soil from the underlying surface rocks by processes of denudation was of course widely recognized. The main value of Russian work arose from its emphasis placed on regarding the soil as an evolving thing.

Among the first of Russian workers in this field mas V. V. Dokuchayev (1846–1903). It was the publication in 1928 by the department of agriculture of the United States of a translation of K. D. Glinka's classic *The Great Soil Groups of the World and Their Development* that first made the work of the Russian school known to English-speaking students.

The soils of Russia fall into three main groups. Those of the north are derived from the drift left on the final recession of the ice sheets. To the south lies the belt of loessic soils produced by uind action on the drying surface of the newly uncovered glacial deposits. Over the areas formerly covered by the Aralo-Caspian sea the surface consists of marine deposits. Since their formation, all have been changed by the action of the weather and soil water. The growth and decay oi the vegetation that covered them and the action of burrowing animals, of cultivators and especially of bacteria all helped to determine the nature of the soil cover. The rise of temperature, decrease of rainfall and increase of evaporation from northwest to southeast are evidently largely responsible for the soil changes.

The soil is clearly "alive" in the sense that it is still developing. The humus produced from decaying vegetation largely determines soil colour and is of great importance because of its water-holding property. In suitable conditions bacteria rapidly reduce the organic content of the soil to inorganic forms which then become available for new plant growth. These salts are normally dissolved in the soil water and so carried to the lower soil layers. In this way is produced the soil profile, which in a well-developed soil consists of three horizons: the upper or A horizon, usually loose in texture and being robbed of its mineral content by the soil water; the B horizon, more compact and containing most of the salts leached from A; and the C horizon, consisting mainly of fragments of the underlying mother rock.

In arid regions the soils naturally contain little humus. Excessive evaporation brings soil water to the surface where it leaves behind its dissolved mineral contents. Frost, with the check that it places on plant growth and on bacterial activity, prevents development. The steepness of mountain slopes also checks development.

Tundra Soils.—This most northerly group of soils is found beyond the tree line (the word "tundra" implies the absence of trees)

to the shores of the Arctic ocean. Their outstanding characteristics are due to the rigorous climate. In the brief summer only the upper layers are thawed, the subsoil remaining permanently frozen and therefore impervious. Marsh conditions are widespread over all the lower areas in this warmer period. Vegetation is shallow-rooted and scanty. Its decaying remains accumulate on the surface to form a black acid layer. This bog soil is, almost entirely, partially decomposed vegetable matter. The subsoil. on the other hand. is almost wholly inorganic. Low temperatures limit bacterial activity and the frozen subsoil prevents earthworms from carrying on their beneficent work.

Where the subsoil is sandy there is some leaching from the surface soil. and tundra soils approach the podsol type. In the tundra of the far northeast of Siberia the very low precipitation is accompanied by an almost total absence of vegetation, and the land surfaces are often of bare rock. with little soil of any kind.

Under such conditions agriculture is clearly impossible. The few inhabitants are pastoral nomads dependent on their reindeer herds. on summer fishing and on winter hunting in the forest fringe. Transition from tundra to forest gives rise to a narrow belt where scattered examples of dwarf species of birch and spruce are typical. These first become evident in the river valleys, where there is some shelter from winds.

Forest Soils.—Soils of this group cover more than half the U.S.S.R. All are podsols or modified podsols; that is to say, soils of an ash-gray colour typical of cool, humid climates. They are best developed in the taiga or coniferous forest region. There temperatures are high enough to prevent the permanent freezing of the subsoil and, in dry periods, to cause some rise of water to replace the slight loss from the surface by evaporation. These conditions are favoured by the forest cover, for it prevents heavy leaching while maintaining fairly constant humidity of the soil. The shelter it gives from winds also reduces losses by evaporation. On the other hand, leaf transpiration keeps the subsoil fairly dry.

Coniferous Forest Type.—The decay of the resinous needle leaves of the conifers proceeds slowly. It produces a very acid type of humus and the soil water passing through it is therefore capable of bringing about almost complete decomposition of the mineral constituents of the underlying layer, leaving behind little but silica or fine clay. The A horizon in a typical podsol is thus frequently sandy and grayish but sometimes almost nhite. Since almost all the plant food it contained has been removed, these soils are agriculturally of little value. Horizon B shows two distinct layers. The upper of these is brownish yellow or coffee coloured and contains most of the products of humus decomposition. The lower section is usually rusty brown in colour and heavily impregnated with iron hydroxide.

Coniferous trees form the major part of the vegetation except on the northern edge of the forest; there a belt of birch occurs, at first dwarf but increasing in size and number southward. Where the A horizon is sandy the Scotch pine is prevalent, on the clays some variety of spruce. In Siberia the silver fir and Siberian larch are the commonest trees.

Mixed Forest Soils.—From central Europe across European Russia to the Urals near Molotov (Perm) there extends a wedge of mixed forest where deciduous trees mingle with and ultimately almost replace the northern conifers. Beyond the Urals this forest occurs again in a narrow belt as far as the Ob. This is the area in which Atlantic influences upon the Russian climate are evident in the heavier precipitation. The soils in general show a transition from the podsolized soils of the coniferous forest to the black earth of the steppe.

Heavier precipitation causes a continuance of the leaching of the A horizon. Higher temperatures encourage more complete decomposition with greater activity of earthworms and bacteria. The horizon is darker in colour, gray rather than white, as the humus content of the upper layer rises to from 3% to 6%. This upper layer accounts for the greater agricultural productivity of this zone as compared with the region to the north. The colour of this horizon is generally brown. grayish in the upper layers but reddish in the lower. Very fine clay particles and some calcareous material occur at the lower levels. The origin of these grayish soils is disputed. Some hold that they represent a degraded form of the black earth, caused by a southward spread of tree growth over the steppe, others that they are mainly the result of forest clearing and the improvement by long-continued cultivation of a formerly podsolized soil.

The gray soils occur in a narrow but irregular band across European Russia and in the still narrower zone of the wooded steppe of western Siberia. Though still essentially forested, this country allowed its early inhabitants to maintain themselves by agriculture in the clearings. As settlement increased these were extended by cutting and burning. The longer frost-free period makes possible the growth of deciduous trees. The heavier leaf fall increases the supply of humus to the surface layer of soil. The richer undergrowth, mainly perennial grasses, contributes to the same result and encourages the rearing of farm animals.

In the narrow west Siberian area the trees are mainly aspen and birch. West of the Urals the forest is much richer in species. The most important of these are the oak, lime, maple and ash. The last-named is most abundant in the more southerly areas. Conifers are still common, more particularly on the sandy outwash soils.

The mixed forest zone has played a great part in the history of Russia. Groups fleeing from the Asiatic invaders of the steppes there found shelter. Under the influence of a settled agricultural life they were welded into groups which later coalesced to form the first Russian state. All the suitable land has long been cultivated and the hardier cereals—barley, rye and oats—grown. Flax and hemp provided fibres for early industrial use, and the potato was soon widely grown after its first introduction. Forage crops—hay and lucerne—also do well and support the growing dairying and cattle-breeding industry.

Bog and **Marsh** Soil.—This is common north of about the 60th parallel of latitude in Europe, in the wide, ill-drained northern parts of the west Siberian lowland and in the Pripet area of western Russia. It is especially common on surfaces of glacial clay. Decomposition of vegetation is incomplete because of lack of aeration, so that peaty surface layers are common. The remains of dwarf birch and alder and of marsh plants and mosses accumulate slowly, giving an acid surface soil. Peat is worked extensively and is used for power production in some areas.

Black **Earth.**—Soils of the black earth type (chernozem) underlie about 12% of the U.S.S.R. and form in European Russia the largest continuous area of the type anywhere. They occur south of the forest soils and north of the arid and mountain areas. Their essential characteristics are the high humus content and the presence of calcium salts, especially the carbonate. They evidently represent a modification of an earlier soil enriched by the decay of animal and plant remains. Loess and the *limons* found over calcareous rocks are particularly favourable to their development. Sandy subsoils, too, carry thicker coverings of chernozem than do clayey subsoils. The better drainage is probably the reason in each case.

The humus content of the black earth varies from 6% to about 16%. It increases to the south and east. Thus the percentage varies from 6 to 10 in the Ukraine, but increases to 1 j or 16 east of the Volga and in western Siberia. The black earth is thickest in the Ukraine.

The principal factor leading to the development of chernozem is climate. It occurs in regions with a long and severe winter but with summer conditions of high evaporation leading to a virtual desiccation of the surface soils. Snow accumulates during the winter, and the spring thaw provides the moisture necessary for an abundant growth of grass. This water supply, however, is exhausted by late May or early June. Rain falls during the summer months but the total amount is small. The intervening periods of drought stop the growth of the steppe grasses. They also prevent the growth of trees. The blackness of the surface layer is due to the long-accumulated products of the decomposition of grass roots. The droughts of summer and the frosts of winter both slow down the rate of decomposition. Leaching of the A horizon is largely prevented by the low summer precipitation and rapid evaporation. These also lead to a concentration of mineral salts just

below the humus level, another factor inimical to the growth of trees.

The typical soil profile in a black earth region shows two major horizons. The upper portion of the A horizon is normally neutral, not acid. The surface soil is crumbly and black or deep chocolate in colour because of the high humus content. The lower portion of the horizon, which has a total thickness of 18–40 in., is grayish black to yellowish brown. It is in this portion of the profile that calcareous concretions occur, the carbonates formed in the humus horizon being carried down by leaching.

The black earth lands practically coincide with what are sometimes called the tillable steppes. These have produced grain for many centuries without any great loss of fertility. The main handicaps to their utilization are climatic. Recurrent drought has given rise to terrible famines. The dry soils in the summer months are particularly liable to wind erosion and to loss of topsoil in heavy rain showers. Modern cultivation by machines on a large scale, as in the United States, tended to accentuate these difficulties. Diversification of crops, the construction of tree belts as windscreens and the utilization of Volga waters for irrigation were developed to offset them. For further information on the region *see* UKRAINE.

Arid Soils.—Beyond the black earth zone to the southeast, climatic conditions rapidly approach desert character. The decrease in total rainfall, its increasing uncertainty and the rapid rise in the evaporation rate produce marked changes. The cultivation of the steppe becomes more and more uncertain, though it is perhaps no longer true to speak of the whole region as untillable steppe. The chestnut soils are fertile when, or where, sufficient moisture is available, the brown soils less so and the gray desert soils only occasionally and then with great difficulty. The humus content decreases rapidly and salinity increases as the chernozems are left behind. A fertile belt, however, lies along the foot of the bordering ranges.

Chestnut and Brown Soils.—These extend from the Crimean steppes across the Volga delta and through Kazakhstan and the extreme south of western Siberia. The chestnut soils are the result of extreme temperatures accompanied by a low rainfall and high summer evaporation. The grass cover is much less rich than on the chernozem, with the result that the humus content of the surface soils falls to 5%. Increasing aridity produces the brown soils with only 3% humus. Insufficient leaching of the surface soils causes an increase of their soluble salt content. limiting vegetation. The A horizon in the chestnut soils seldom exceeds 25 in. (with a humus zone 12–18 in. thick) and in the brown soils falls to 12 or 15 in. Both types show a prismatic structure. The rising soil waters cause the concentration of soluble salts in the upper layers. Calcareous concretions often form an almost continuous layer quite near the surface. Because of the poverty of vegetation the nature of the mother rock has more influence on the soil character than is usual.

All arid soils show a tendency toward salinity. This is particularly evident in surface depressions or where there is poor drainage or a high water table. Under such conditions the ground water is often brackish. This is most marked in soils resting on argillaceous rocks. Saline soils of the type known as *solonchak* are found in these areas. Their salinity is harmful to vegetation. A white crust sometimes appears if the concentration of soluble salts is excessive. An alkaline soil known as *solonets* is produced by the leaching of *solonchak; e.g.,* if it is irrigated or if its drainage is improved in any way. The flocculated clay particles of the *solonchak* are dispersed so that the *solonets* is sticky and plastic when wet but sets into hard clods when dry. It is thus practically unworkable.

The chestnut soils are very fertile when supplied with enough water. but their irrigation must be carefully controlled. Raising of the water table is liable to produce alkalinity at the surface and thus bring about the formation of *solonchak* or *solonets*.

Gray Soils.—These are found chiefly in the inland drainage areas of Asiatic Russia. They underlie the shifting sands of the deserts and cover the loessic deposits of their southern mountain margins. Under desert conditions neither water nor vegetation is sufficient to play much part in soil production and the evolution of the soil has not proceeded far. In the areas where drifting sand forms the surface one can say it has not begun. Along the northern edge of the basins occur *solonets* clay.

The gray soils are alkaline and clayey with a humus content seldom more than 1%. Their colour results from the presence of sodium salts and their bleaching effect. Where the gray soils cover the southern loess they are rich in calcium carbonate, the content being sometimes as high as 15% at the surface and increasing to 25% at lower levels. Where they are well watered, as where mountain streams emerge, they may be very fertile.

Mountain Soils.—In general these vary with altitude wherever the slopes are gentle enough to permit their development and stream or ice erosion does not remove them. As temperatures fall and humidity increases with height, the succession of soils closely parallels that seen in travelling from southeast to northwest across the plains. Thus, in the Altai, chestnut soils at the foot pass into black soils and then to podsolized forest soils at higher levels. The gray desert soils of the Turkistan lowlands similarly pass into chestnut and then into black earths on the mountain slopes. In eastern Siberia, where the soil generally is of the coniferous forest podsol type, the mountain ranges are capped with tundra-type soils.

IV. FLORA AND FAUNA

A general account of the flora and fauna of Asiatic Russia will be found in the article ASIA; for details of the different regions, see the articles on the individual Asiatic republics, European Russia only is dealt with here; *see* also EUROPE.

Flora and Vegetation.—The flora and vegetation of most of European Russia are, in accord with the climate, continental in character. The flora has approximately 3,500 species of seed-bearing plants and is thus poor in relation to the area covered. The principal families (with number of species in parentheses) represented in it are: Compositae (438), Gramineae (298), Cruciferae (212), Cyperaceae (190), Caryophyllaceae (183), Scrophulariaceae (147), Umbelliferae (141), Rosaceae (135), Leguminosae (128) and Labiatae (116). Among the largest genera may be mentioned: *Carex* (141), *Salix* (58), *Astragalus* (52), *Hieracium* (46), *Centaurea* (42), *Potentilla* (40), *Allium* (40), *Euphorbia* (38) and *Silene* (37).

There are four main botanical zones: the tundra, the forests, the steppes, and the desert and semidesert. The boundaries between them are neither sharp nor straight but the zones differ markedly from one another in both flora and vegetation as well as in economic values.

The northernmost zone of the tundra occupies a belt along the shores of the Arctic ocean and extends inland for about 100 mi. to the margin of the forest zone. The tundra is treeless, except for some wooded "islands," and consists of moss- and lichen-covered flats and areas of low-growing shrubs. Among the mosses, species of *Sphagnum* and *Polytrichum* are important. Most of the ground is permanently frozen below a few inches that thaw out in the short summer. There are numerous peat ridges and water pools. The plant constituents of the vegetation include shrubs of birches, junipers, heather and other members of its family, and willows, dwarf cornel, cloudberry, sedges, cotton grasses. rushes, sundew and louseworts. Toward the southern limit of the tundra there is often a belt of birches.

The forest zone is a much wider one and has several divisions. In the north, conifers predominate, forming what is often called the taiga. Spruce *(Picea obovata)* and Scotch pine (*Pinus silves-*

tris) are the dominant trees, especially in the western portion, the latter on sandy soils. In the eastern part Siberian trees, especially Siberian larch (Larix sibirica). Siberian fir (Abies sibirica) and Siberian pine (*Pinus* sibirica) are mixed with the spruce and Scotch pine. The southern part of the forest zone has much oak which, however, is still frequently intermingled with spruce and pine. In the oak region other west European trees and their associated shrubs and herbs reach the eastern limit of their ranges. These include the hornbeam and the yew. Much of the broad-leaved forest has been destroyed and many of the interspersed marshes have been drained or have dried out. The southern limit of the forest zone is in the southwest about 50° N. and in the northeast approximately 55° N.

The steppe zone follows to the south of the forest zone and largely coincides with the area of the black earth which. it has been stated, owes its origin to past steppe vegetation. Most of the steppe zone, with one of the richest soils in the world, is now cultivated and remnants of the natural plant life are restricted to river valleys and ravines and relatively small areas not yet converted to the carrying of crops. The steppe zone is largely, but not entirely, treeless. The natural vegetation consists of herbs resistant to cold and drought and among these grasses of tufted habit are prominent. Feather grasses (Stipa spp.) characterize the true steppes but with these are associated tall-growing herbs such as wormwoods (Artemisia spp.), ragworts (Senecio spp.), buttercups, sages and other labiates, various legumes, composites and umbellifers. In the spring, bulbous plants form a conspicuous feature. Low shrubs are sometimes frequent and include dwarf almond, dwarf plums and cherries, brooms and roses. Some areas have salt marshes with a halophytic vegetation with numerous chenopods, including seablites (Suaeda spp.) and glassworts (Salicornia spp.).

The desert zone in European Russia is limited to the area immediately to the northwest of the Caspian sea and is an extension westward of the larger desert region of the Aralo-Caspian basin. Much of it is semidesert rather than extreme desert. The flora consists mainly of drought-resistant herbs and shrubs, such as various grasses, wormwoods, labiates, composites, and bulbous plants and also, in many places, of plants favouring habitats with high salt content, such as chenopods of various genera (Campkorosma, Kockia, *Salicornia,* Anabasis and others). The vegetation is often sparse and mostly very open.

Special mention must be made of the southern portion of the Crimea. The flora and vegetation there are more Mediterranean than continental. Many of the trees, shrubs and herbs belong to genera and even species characteristic of the evergreen macchia and include olive, laurel and junipers besides a rich herbaceous flora. (W. B. T.)

Fauna. — The most characteristic phenomenon of animal distribution within Russia is the latitudinal zonation, continuing far into Asiatic Russia. These zones begin in the north with the arctic tundra, followed southward by the taiga, the deciduous forests, the steppe and in the far southeastern corner of Europe by the desert. No high mountains interrupt the flat lowlands until the Ural mountains in the east, and the Caucasus mountains in the southeast.

Most animals of European Russia, such as the common and the water shrew (*Sorex* araneus and Neomys fodiens), a number of bats, the wolf (*Canis* lupus), the red fox (*Vulpes* vulpes). the brown bear (*Ursus* arctos), the red squirrel (Sciurus vulgaris) and many other small carnivores and rodents, have a wide palaearctic distribution. The most characteristic animals of the tundra are the wild and the domestic reindeer (Rangifer tarandus). In the taiga the glutton (Gulo *gulo*), the elk (Alces alces), the European flying squirrel (Pteromys volans) are found. Typical of the deciduous forest are the red deer (Cervus *elaphus*), the roe deer (*Capreolus capreolus*), the lynx (*Felis* lynx). The steppes were, until relatively recently, populated by herds of the European tarpan (*Equus caballus*) and of the European wild ass (*Equus hemionus*). In mid-20th century, a few remainders of the saiga (Saiga tatarica) were maintained in a few reservations. Rodents abound in all zones of Russia, but are nowhere as conspicuous as in the steppes. Of its peculiar forms, mention may be made of the great jerboa (*Allactaga*), some species of suslik (Citellus), the bobak (*Marmota* bobak). the migratory hamster (*Cricetulus* migratorius) and the mole rat (*Spalax microphthalmus*). In the basins of the Volga and the Don lives the peculiar desman shrew (Desmana moschata). The following animals are typical of the Caucasus: the Asiatic mouflon (Ovis orientalis), the Caucasian tur (*Capra caucasica*), the chamois (*Rupicapra rupicapra*) and forms of the golden hamster (*Mesocricetus* nuratus).

Domestic animals include the sledge dogs in the north and the bactrian camel in the south. The small peasant horse still has many traits in common with its tarpan ancestors. Fur-bearing animals. such as hermelin, zobel, mink, etc., are mainly derived from Asia; but the breeding of various fur animals spread into European Russia. (F. S. BR.)

V. HISTORY

The great east European plain which was united, together with Siberia, under the Russian tsars, presents in spite of its general uniformity two contrasting geographic aspects which profoundly influenced the trend of its historical development. the northern and the southern. A primitive forest extending over the northern part of Russia reminds one of that described by Tacitus in his *Germania.* It was indeed its continuation and connected Russia uith the western part of the European plain It was comparatively late that this part of Europe was set free from its prehistoric ice cover. It is still full of lakes and great rivers which for long remained the only ways of communication for a scanty population scattered in distant glades. The primitive settlers added a few patches of cultivated land to their habitual means of litelihood — river fish, wild beehives and fur-bearing animals in the forests.

Quite different is the southern Russian landscape. It is the steppe. the prehistoric seat of nomad hordes which inhabited it from time immemorial until quite recently. These lived on horseback and in tents, used mare's milk as their food and throve on the booty taken in regular incursions against northern sedentary tribes. There the most ancient traces of aborigines are found, of the Palaeolithic stage, followed by the Neolithic, with traces of Aegean culture in its primitive form. There also we learn, by the intermediary of ancient Greek colonies on the northern Black sea shore, the names of ancient peoples of southern Russia; we are unable, however, to identify their nationality. The most ancient of them, the Cimmerians, are said to have been replaced by the Scyths (see SCYTHIA) and these by Sarmatians (see SARMATAE). Some patriotic Russian historians (I. Y. Zabelin, D. I. Ilovaisky, D. Y. Samokvasov) tried to prove that these populations were Slavs, but later research pointed to an Iranian origin; for instance, the modern representatives of the Sarmatae-Alani are found to be the Ossetes. who are not Slavs but a Caucasian people.

The original home of all Slavs is not to be sought in the steppe, but in the forest. Lubor Niederle stated that. originating in the marshy land between the Vistula and Dnieper, the southern Slavs (Serbs) descended to the Danube as early as the 1st century AD. The first federation of eastern Slavonic tribes (Russians) appears in the 3rd–4th centuries A.D. as a powerful and numerous people called Antae. living between the Dnieper and Dniester. They were involved in the wars of the Goths and Huns and were defeated by the Avars in the 6th–7th centuries. In the 7th century appears a new conquering nomad nationality in the steppe, the Khazars (*q.v.*), possessing a certain degree of civilization. They brought under their subjection some eastern Slavonic tribes whose names are given in the ancient Russian annals (Severyane, Radimichi, Vyatichi, Polyane). Khazar domination lasted until the beginning of the 10th century. when other nomads of Turkic descent and wilder habits—Hungarians (middle 9th century) and Pechenegs (end of 9th century) — overran the steppe and broke for long the connection between Slavonic settlements and the Black sea shore.

Origin **of the Rus.**—The Slavonic forest tribes were obliged to adapt themselves to the new situation. As a reply to the invasion of the steppe by the Turkic hordes there appears a new organization of defense from the north. The defenders are the

"Rus"—a Varangian tribe, in ancient annals considered as related to the Swedes, Angles and Northmen. Both Rus and Varangians are also knonn to Byzantine chroniclers (*Rōs, Varaggoi*), first as Norse pirates, then as warriors serving in the imperial guard and finally (10th century) as chiefs of the caravans of traders coming yearly to Constantinople by the "Great Waterway." the *Austrvegr* of northern sagas, through the waterfalls of the Dnieper, whose names are given by the emperor Constantine Porphyrogenitus both in "Russian" (Scandinavian) and in "Slavonic" (Rossisti and Sklaviusti). Arabian writers represent the original seat of the Rus as an island covered with woods and marshes; this brings us to the source of the waterway mentioned—Lake Ilmen, near the ancient tonn of Novgorod, and Lake Ladoga, where the river Neva has its origin. Excavations of 9th–10th century tumuli confirm the presence of Norse warriors, buried (or burned) with their horses and arms, in that very tableland where four chief waterways of Russia, the Neva basin, Volga, Dnieper and Dvina, converge and form outlets to the Baltic, the Caspian and the Black seas and thus determine the direction of ancient trade routes. Numerous finds of Arabian, Byzantine and Anglo-Saxon coins (9th–11th centuries) along all these routes testify to a flourishing trade which corresponds exactly to the period of foundation of new states by Vikings at the one end and the florescence of Arabian and Persian caliphates before the Mongol invasion at the other end of these trade routes.

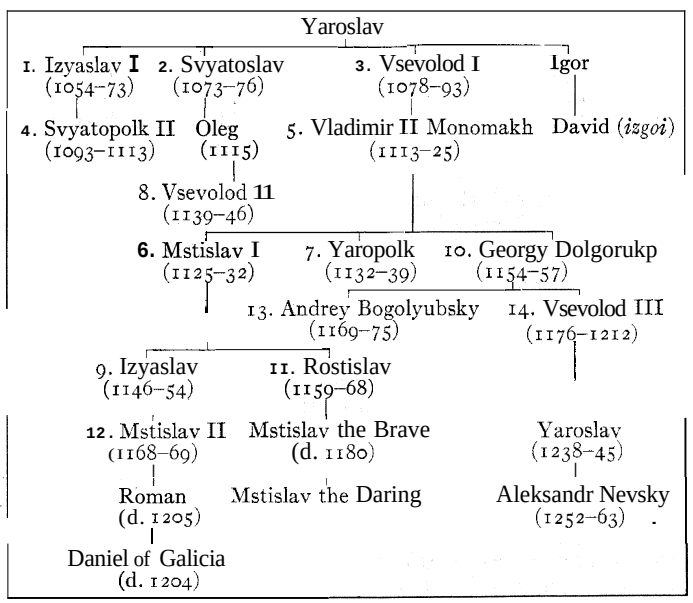
A. KIEV

Russian legend says that the Rus were first asked to come to Novgorod by the local population to put an end to their internal feuds. Rurik (Hrorekr) was the first (semilegendary) *knyaz* (*koning*, prince) of Novgorod, but his companions wished to descend the Austrvegr, nearer to Byzantium, and Oleg (Helgi) settled in Kiev. The Russian annals date the arrival of Rurik in Novgorod A.D. 862. But the first reliable datum is Oleg's commercial treaty with the Byzantines (911). A subsequent treaty was concluded in A.D. 945 by Oleg's successor, Igor (Ingvar), together with his companions, whose signatures contain 3 Slavonic names among 50 Norse. Constantine Porphyrogenitus gave a very picturesque description of this trade which still remained the chief business of the Rus dynasty. During winter the princes and their *gesiths*, who distributed among themselves the towns in the basin of the Dnieper. were busy making circuits among neighbouring tribes in order to force them to pay annual tribute. Their booty consisted of furs, money and slaves. As spring came they loaded their small boats "made of one single tree" (*monoxulos*) and convoyed their caravans down the Dnieper ready to ward off the attacks of nomad steppe tribes. In the treaties mentioned their rights of trading in the capital were strictly defined. The *konings* extended their power over local tribes and, to defend the land from nomad incursions, they constructed earthen walls on the frontiers of the steppe. The local aristocracy joined the ranks of their *druzhina* (*gesith*, cornitatus) and the process of assimilation began. The term "Rus" was now used to designate the southern outpost of the whole system of defense; *i.e.*, Kiev with the surrounding country. The son of Igor and his wife Olga (Helga) had already a Slavonic name, Svyatoslav. However, he remained part northern Viking as well as part southern nomad. Svyatoslav did not yet feel at home in Kiev. He wanted to come still nearer to Byzantium and chose Pereyaslavets on the Danube in the Bulgarian land, because. he said "there was the centre where all goods gather from all parts: gold, clothes, wine, fruits from the Greeks, silver and horses from the Czechs and Hungarians, furs, wax, honey and slaves from the Rus." Svyatoslav also defeated the Khazars and the Volga Bulgars, but he was defeated by the emperor John I Tzimisces and slain on his way back home by the Pechenegs (972). With him died the Scandinavian tradition of the Kiev dynasty.

From the reign of Svyatoslav's youngest son. Vladimir, the Norman dynasty was definitely settled in Kiev. It still preserved its connections with other parts of Europe, attempted distant military expeditions against its Slav neighbours and ruled the large territory from the northern lakes to the steppe and from the then uncertain Polish frontier to the river Volga and the Caucasus. This was the most brilliant period of southern Russian history. but its brilliance rested on an extremely unsafe base, as the connection between the newly built state and the country inhabitants remained very loose. The only link which unified the subdued tribes was the power of the grand duke of Kiev. The people paid their tribute to the prince's tax collectors, but otherwise they were left to themselves and preserved their ancient tribal organization and habits.

Another element of union of enormous importance was added by the acceptance of Christian faith in **988** by Vladimir the Saint. He took his religion from Byzantium, but the service was in the vernacular as the prayer books and Bible had been translated into Slavonic by the apostles of the Slavs, Cyril and Methodius, in the 9th century. From 1037 the Russian church was subject to the Constantinopolitan patriarchate; for two centuries nearly all metropolitans and most bishops mere Greeks. Eventually the Slavonic and Russian element prevailed. After Vladimir's death (1015), his son Svyatopolk the Damned assassinated his brothers (Boris and Gleb, canonized as saints) but was defeated by another brother, Yaroslav, elective prince of Novgorod, who reunited all territory under the grand duchy of Kiev and embellished his capital with a cathedral in Byzantine style. He also founded the monastery at Pechersk, which became a famous seat of faith and learning; he collected books and had them translated. Under Yaroslav the earliest document of Russian lam was revised under the name of *Russkaya* pravda ("Russian right"). He gave refuge to two sons of Edmund of England who fled from Canute. to Olaf II of Norway and also to Harald III Haardraade, who married his daughter; he gave his other daughter to Andrew I of Hungary; his third daughter married Henry I of France. His sons married Polish. Greek and German wives.

Yaroslav died in 1054. In order to prevent feuds among his numerous descendants he introduced an order of succession to the grand duchy of Kiev which was based on the principle that all territory as a whole belonged to the family, and different parts of it were distributed among them in temporary possession according to seniority and to the profitableness of the seat of administration. The most profitable towns on the main trade route were Kiev, Pereyaslavl (on the steppe frontier), Novgorod (the first Norman residence), then Smolensk (on the upper Dnieper) and Chernigov (on its confluent, the Desna). All brothers of the first generation were considered as senior to the following generation. As soon as Kiev passed to another brother all the members of the family changed their seats and approached one step nearer to Kiev. If one died before reaching Kiev, his descendants were called izgoi and excluded from "mounting the scale." In the accompanying chart are numbered the successive reigns in Kiev during seven



generations after Yaroslav.

The order of succession from brother to brother was kept only in the two first generations (1 to 5). Numbers 9 and 12 show preference given to nephews over uncles. And indeed, as early as 1097, at a conference held by the dukes at Lyubech it was decided that the sons should keep their fathers' heritages. The direct succession from father to son prevailed in all dukedoms. Kiev was seen to be losing its former significance. Its great importance was based on trade; but southern trade was destroyed by the appearance in the steppe (1054) of the Polovtsy (Cumans), nomads far more dangerous than the Pechenegs. It will also be seen that of all Yaroslav's sons only one line survived: that of Vsevolod and his brilliant son Vladimir Monomakh. Monomakh's line was then divided into two: the elder one (6, 9, 12) remained in Kiev and in its turn it mas subdivided in two—Roman and Daniel preferred to move west from the then unsafe Kiev to Halicz (Galich; see GALICIA), while two Mstislavs, the Brave and the Daring. as their nicknames show. remained to the end the knights errant of the chivalrous south. The cadet branch of Vladimir Monomakh (10, 13, 14) opened a new period of Russian history. The centre of influence changed then to northern woodland, far from the steppe. It was a far poorer but safer and, in the long run, more profitable settlement. In 1169 Xndrey's troops stormed Kiev. This was the end of southern brilliance, though Kiev was not definitely destroyed till 1240 by a last and most terrible invader, the Mongol Batu, Jenghiz Khan's nephew.

The title of grand duke of Kiev thus lost its importance and with it broke down the unity of Russia. Ducal appanages became independent dukedoms; Russian territory was split in a dozen separate units which waged endless wars against each other. The old Kiev centre suffered the most from these internal dissensions and from incursions from the steppe. The frontier population was nearly exterminated and mixed with Turkish ethnic elements. However, the ancient tribes remained untouched to the west and north of the river Dnieper. In their midst, about the 14th century, appeared new branches of Russian people, speaking their separate dialects: the Ruthenians (later known as Ukrainians) and the Byelorussians (the old Krivichi).

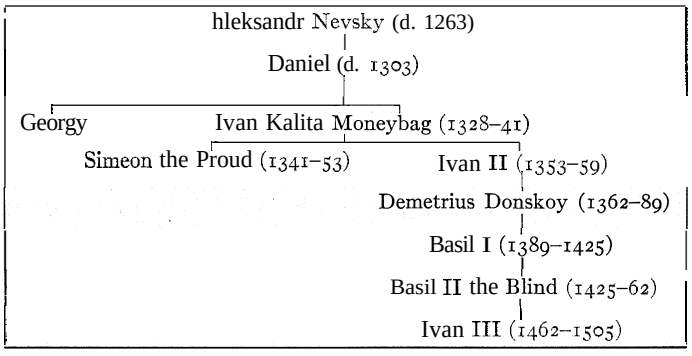
B. NOVGOROD AND MOSCOW

By and by three distinct centres emerged from the chaos: Halicz, Novgorod and Moscow. Each was characterized by the prevalence of one of three main features of the political life of Russia during the Kiev period. These three features are: (1) the popular assembly (veche), which represented the ancient tribal organization and which met in towns thus consisting chiefly of townsfolk; (2) the princes; (3) the boyars and the druzhina (*comitatus*), a landed aristocracy, partly of ancient tribal descent, partly the military companions of the prince at the conquest. This aristocracy developed especially in Halicz, where the social structure approximated to western feudalism. On the northwestern frontier it was, on the contrary, the democratic element that prevailed. The chief city, Novgorod, became a republic. "Lord Novgorod the Great" was ruled by a popular assembly (veche) which elected its mayor (*posadnik*) and its commandant (tysyatsky) and concluded treaties with the dukes who were invited only to watch over the defense. Novgorod had a largely developed trade and large dominions extending from its gates and from the mouth of the Neva over the whole Russian north up to the White sea and the Urals. That country was rich in furs, the chief export. The higher class of citizens was here formed of capitalists and rich merchants, who were to form the aristocratic element in Sovgorod.

Another element existed in the political structure of central Russia: the backwoods of the Oka and upper Volga. This country was cut off from all European connections. Its population consisted exclusively of agricultural colonists settled on ducal land. Thus, the duke appeared there as a proprietor and as the organizer of social life. Towns were scarce and the population scattered in clearings. The few veches in the chief towns had no influence; noble landed proprietors were completely absent. Thus. the poner of the duke was there practically unlimited Ducal psychology was framed accordingly; unlike the valiant knights of the south, they formed a dynasty of great appropriators, stingy and acquisitive, ruling their dukedoms as private estates. They thus accumulated elements of strength which as time went on aided them to become masters of the nhole of Russia.

After the conquest of Kiev by Andrey Bogolyubsky the title of grand duke passed from Kiev to a northern town, Suzdal, and from there to Vladimir on the Klyazma. But as early as 1147 Moscow is mentioned in the annals. Its situation was exactly at the centre of Rassia between the Oka and the upper Volga. It had long been a great centre of continental river trade, far from the southern area of Tatar devastation. The line of dukes of Moscow starts from Aleksandr Nevsky's younger son Daniel. Their genealogy during the domination of the Golden Horde (1240–1480) is shown in the accompanying table.

All these princes had to ingratiate themselves with the khans of the Golden Horde to receive from them the yarlyk (investiture) as grand dukes. They regularly journeyed to Sarai, the capital of the khans at the mouth of the Volga, and underwent every kind of humiliation. But they returned as chief collectors of the Tatar tribute, which gave them power over neighbouring dukedoms. Only the dukedom of Tver competed with them very stubbornly.



The dukes themselves involved the Tatars in their feuds and brought punitive expeditions on Russia. The khan's protection gave the Muscovite dukes the upper hand over their enemies. They soon succeeded in increasing their possessions. Ivan I extended his domains, by purchase and by violence, over the whole province of Moscow. Demetrius (Dmitry) added to it the upper Volga region (excepting Tver and Uaroslavl). Tula and Kasimov; Basil (Vasily) I the remaining part of Oka and Suzdal, Vladimir, Murom and Nizhny-Xovgorod; Basil II Elets in the south, Vologda and Ustyug in the north. A religious sanction was given to Muscovite unionist tendencies by the metropolitans of the Russian church who in the persons of Peter, Theognost and Alexius settled in Moscow. Accordingly, the grand dukes of Moscow added to their title: "of all Russia." Demetrius won a great name by his brilliant victory over the Tatars of the Golden Horde led by Mamai in a bloody battle on Kulikovo plain (1380). He thus appeared as a leader of all the national forces (excepting the grand duke of Ryazan) against the oppressors, and he received the blessings of the church at the hand of St. Sergius of Radonezh. the prior of the convent of the Holy Trinity. However, two years later Moscow was sacked and burned by another conqueror, Toktamish, who in his turn was defeated by Timur, his former protector. The Mongolian yoke lasted for another hundred years. although in milder forms. While Moscow mas steadily growing in importance in comparison with the rival grand dukedoms of Tver and Ryazan. the boyars and other "men of service" came in crowds to serve the grand duke of all Russia. The institutions of Moscow, which up to then resembled very much those of a large private estate, began to evolve into a system of state administration.

Ivan **III and Basil** 111.—Ivan III's acquisitions of Novgorod and Tver (1471 and 1485) enlarged Russian territory up to the limits of settlement of the Great Russian branch of the nation and brought Russia into direct contact with other countries. Livonia, Lithuania and the Tatar khanate of Crimea The title "of all Russia" became a reality. and systematic foreign relations

were started. The all-Russian potentate proffered historical claims against Lithuania, which possessed the Byelorussian territory.

The successful wars which followed extended the western frontier to Chernigov and Novgorod Seversk, while leaving further claims for Smolensk, Kiev "and all Russian patrimony" to Ivan's successors. Ivan also built the fortress Ivangorod close to the Gulf of Finland, thus opening the chapter of Russian pretensions on the Baltic. The Crimean khan Mengli Ghirai accepted his friendship and helped him to put an end to the Golden Horde. As early as 1480 Ivan refused the Tatar tribute and threw off the yoke.

The title of grand duke seemed inadequate after all these successes; more pretentious claims were based on a new theory suggested by southern Slav and Greek divines. According to this theory the Muscovite duke was a successor of the Byzantine emperors and the only representative of the Orthodox Church in the world. Indeed, the Greek Orthodox Church had accepted the "union" with the Catholics as early as 1439, at the council of Florence, while Constantinople. "the second Rome," had been taken by the Turks in 1453. Obviously, the Greeks had been punished by God for their apostasy, and their succession had to pass to the third Rome. which was Moscow, and to the Russian grand duke, who remained the only faithful and really Christian prince in the world.

The realization of this new scheme began with the marriage of Ivan III with Zoe (in Russia, Sophia). the only niece of the last Byzantine emperor, Constantine Palaeologus (1472). With her arrival ne habits appeared at the Muscovite court intended to magnify the new autocrat (a title used by Ivan in foreign relations). The church that gave its sanction to that change claimed a reward: the prince had to help it against all heresies and internal dissensions. The prior of Volokolamsk convent, Joseph, insisted on burning some rationalistic heretics in Novgorod. He also defended the principle that wealth gives power to the church, and he mercilessly crushed monastic and ascetic tendencies of the reformer Nil Sorsky, the "abstainer from property." Thus, the official theory on Russian church and state was formed as early as the end of the 15th century. Under Basil III the unification of Russian territory was consummated by the acquisition of another republic, Pskov (1510); by the final annexation of Ryazan, the last independent grand dukedom; and by a new extension at the expense of Lithuania—the acquisition of the frontier city of Smolensk (1514). The minority of Basil's son Ivan, who was three years old when his father died (1533), and subsequent disputes over the regency between rival factions. lasting 14 years, did not interrupt the growth of the Muscovite state. The reign of Ivan the Terrible marks the beginning of a new period of Russian history.

Ivan IV the Terrible (1533–84).—The reign of Ivan IV the Terrible was an epoch of great and systematic reform. It gave its final shape to the Muscovite tsardom which it preserved until the epoch of Peter the Great. At the age of 17 Ivan demanded to be crowned as tsar (shortened from Latin Caesar), and he connected this official assumption of title with a legend according to which the imperial regalia had been handed over to his predecessor Vladimir Monomakh by a Byzantine *basileus*. The Constantinopolitan patriarch was induced to confirm that legend, but he substituted Vladimir the Saint for Vladimir Monomakh in order to make good a chronological error. Popular songs preserved the memory of Ivan IV as a democratic tsar, who "ferreted out treason [*i.e.*, the boyars] from Russian land." And, indeed, he definitely deprived the "little dukes" nho gathered at his court of their remaining sovereign rights and forced them to exchange their hereditary possessions for other landed estates, while their service to Moscow was made obligatory. To pass over to foreign countries was qualified as treason. The same measures were extended to boyars. Both dukes and boyars tried to recompense themselves by assuming political power in the duma of the tsar, and the most powerful of them formed a "selected rada" (a sort of privy council) through which they ruled the state. They summoned the first Russian *zemsky sobor* or "assembly of the country" in 1550, at which representatives of the people revised the criminal code of Ivan III. They also took part in a church council of 1551, where this code was signed and certain traditional rites in church and private life were sanctioned as specifically national. At two previous synods of 1547 and 1549 about 40 new Russian saints were canonized.

However, the regime of the selected rada did not last long. Ivan IV resented it as an interference with his own power, and he broke with the counsels of his youth. He grew nervous and suspicious and began systematically to extirpate ducal and boyars' families. To show his wrath against his enemies he left Moscow (1564) and settled in Aleksandrovskaya Sloboda. He then divided the kingdom into two parts: his private *oprichnina* which he ruled personally, and the remaining "land" (*zemshchina*) which he handed over to a christened Tatar, Prince Simeon Bekbulatovich. Far from suspending reconstruction, this curious division helped to reorganize the Russian ruling class—the men of service—on more democratic lines. Ivan IV imitated for this purpose Byzantine patterns. He strictly regulated the connection between possession of landed estates and military obligations. His foreign policy—his long and successful war nith Poland, Lithuania and Sweden in order to break through to the Baltic—also forced him to adopt reforms in the army and the financial system. Russian fusiliers (streltsy) and foreign mercenaries first appeared under Ivan IV. He also introduced new military taxation and ordered a first general description of taxable land (*pistsoviya* knighi) in order to make the levies proportionate to the record of lots of taxed land; here too he borrowed his system from Byzantium. At the same time he centralized the receipts of the state in a "great treasury" while separating them from his own income, which was concentrated in the "great palace." Through its four boards (the fourths) the great treasury collected taxes chiefly from the north, while the peasants of the Muscovite centre had to work for men of (military) service. The nobles received the honorary title of "courtiers" (dvoryane), to distinguish their upper section—the tsar's guard—from the "sons of boyars," who formed the lower section—the provincial gentry. Both courtiers and sons of boyars were yearly sent to defend the western and the southern frontiers—especially the latter, which was fortified by walls and hedgerows (*zaseki*)—against the Tatar incursions. The posts of commandants for each campaign were distributed by the central board.

Theodore (1584–98).—The son and heir of Ivan IV, Theodore (Fedor, Fyodor), was a weak man whom Ivan called more fit to be a bell ringer in a convent than a tsar. The direction of affairs fell to his brother-in-law Boris Godunov, an able man who continued Ivan's policy. The Church of Russia received its independence and equality with other Orthodox churches by the granting to its head, the metropolitan Job, of the title of patriarch at the hands of Jeremiah, patriarch of Constantinople (1589). Another important measure was intended to strengthen economically the middle landlord class created by Ivan IV as against the boyars. Peasant labourers were forbidden to leave their estates or migrate to other landowners. All such fugitives who fled from their masters after 1592 (the time of the completion of government registers) were ordered back in 1597. This was the origin of legal serfdom.

Boris Godunov and Basil Shuisky.—In 1598 Theodore died; after some hesitation Boris had himself elected tsar by a *zemsky sobor*. He pursued Ivan IV's policy of weakening the boyars, but he met with opposition on their part. The only legal heir of Theodore, Demetrius, had been killed in Uglich, the place of his exile, in 1591. But the boyars with the help of the Poles opposed to Boris a "Pseudo-Demetrius," a young and well-educated man of obscure origin. Boris died (April 1605) soon after the appearance of this pretender (autumn. 1604), who was accompanied by Polish volunteers and aided by the Cossacks.

On June 19 Old Style (New Style, June 29), 1605, the impostor entered Moscow.[1]

[1]After 1582 the Gregorian calendar came into general use in Europe but was not adopted in Russia until 1918. Consequently, from 1582 to 1699 hates of the month in Russia were 10 days earlier; from 1700 to 1799, 11 days earlier; from 1800 to 1899, 12 days earlier; and from 1900 to Feb. 1, 1918, 13 days earlier. In this article the Old Style dates peculiar to Russia are given first; the New Style dates are given in parentheses.

On May 17 (27), 1606, Pseudo-Demetrius I was killed in a popular outbreak caused by the boyars, who took advantage of the popular dislike of his free habits of life and the Catholic tendencies of his Polish protectors. The old dynasty was completely extinguished. The throne of the tsar passed to an influential boyar, Basil (Vasily) Shuisky (1606–10). He gave a formal promise to the boyars "not to repeat the policy of Ivan IV" against them; *i.e.*, not to exterminate them by capital punishment or by exile and the confiscation of estates, without resorting to their court.

However, the power of the boyars could not be restored; much more influential now was the rising class of small landlords, men of service. Still more dangerous for Basil were the Cossacks and the fugitive serfs in the nenly colonized south of Russia. A real social uprising was started in the south by a former serf, Bolotnikov. The ferment was rife over the south and the east A second false Demetrius appeared and in the spring of 1608 marched on Moscow. He established his camp at Tushino, near Moscow. The boyars wavered between the tsar Basil and the "thief of Tushino"; there were many flittings. Basil turned to Sweden for help, but as soon as he received aid from Charles IX of Sweden Charles's rival, Sigismund III of Poland, also entered Russia as Basil's adversary and as pretender also to the Russian throne. In Sept. 1609 Sigismund appeared before Smolensk. In July 1610 Basil was dethroned by the boyars and the men of service. The throne remained empty through internal dissensions. and a real time of troubles set in nhich lasted for three more years (1610–13).

The "Time of Troubles."——The boyars preferred a Polish candidate, and together with the men of service they offered the Muscovite throne to Sigismund's son Wladyslaw. A delegation was sent to Srnolensk, and Moscow voluntarily received Polish troops under Stanislaw Zolkiewski. A treaty was concluded with Wladyslaw which secured the rights of the duma and the privileges of the landed gentry. A Polish dynasty might have settled in Moscow but for Sigismund's desire to keep the throne for himself. Sigismund's pretension woke up the spirit of national opposition. The second Pseudo-Demetrius at once won popularity, especially among the Cossacks and the loner classes. But in Dec. 1610 the impostor was killed by a Tatar of his suite. The middle landlord class then took action on the urging of the patriarch Hermogen. The men of service under Prokopy Petrovich Lyapunov and the Cossacks under Prince Dmitry Timofeyevich Trubetskoy and the ataman Ivan Martynovich Zarutsky blockaded Moscow; inside the town a popular uprising forced the Poles to retreat to the Kremlin. But here again dissensions arose among the besiegers. Lyapunov was killed by the Cossacks, and the men of service returned to their homes. The south of Russia was in complete disorder; crowds of Cossacks and Polish marauders dispersed all over the north. This finally decided the gentry to make a new effort and to gather a new national army which would "exclude the Cossacks and stand firm until a new sovereign is elected by all the land." Prince Dmitry Mikhailovich Pozharsky was made commander in chief of the army and Kuzma Minin, a butcher from Nizhny-Novgorod, the treasurer. All northern towns and districts sent their detachments and their representatives to the army as it advanced up the Volga. In April 1612 it stopped at Taroslavl. As Novgorod had been taken by the Swedes, Pozharsky offered the throne to Charles Philip, brother of Gustavus Adolphus. In August Pozharsky's army moved southnard to Moscow. On Oct. 26 (Nov 5) the Poles capitulated in the Kremlin, and a national candidate was set free: the young Michael Romanov, whose father, the metropolitan Philaret (Theodore Nikitich Romanov), a nephen of the first wife of Ivan IV, was at that moment a prisoner in Poland. All votes were at the disposal of a national tsar, more acceptable to the gentry as he did not belong to an old princely family and mas young enough (he was 17) to secure the boyars against overbearing conduct. Michael was unanimously elected by a regular *zemsky sobor* on Feb. 21 (March 3), 1613.

C. THE ROMANOV (ROMANOFF) DYNASTY

Michael and Alexius.— The *zemsky sobor* which elected Michael (1613–45) continued its session for three years, helping the new tsar to restore the disorganized and ravaged country. A second zemsky *sobor* was then summoned, which pursued for three more years the work of pacification. The co-operation of the tsar with the representatives of different social groups was becoming a regular system. But as the third year's session began (1619), Michael's father Philaret, now patriarch, came back from Polish captivity, and until his death in 1633 he ruled Russia as the "second lord" at the side of his weak son. Peace was concluded with the Swedes, who gained the Finnish seashore, at Stolbova in 1617 and with the Poles, who gained Smolensk, at Deulino (1618). But the struggle on the western as nell as on the southern frontier was far from being finished. Anticipating new conflicts the government entirely reconstructed the army; it invited foreign commanders and hired whole regiments of mercenary infantry. To cover the increased expenses it had to introduce new heavy taxation. New registers of lots of cultivated land which had survived the devastation of the troubled times were established. However, an attempt to take back Smolensk from the Poles (1632–34) proved unsuccessful and the government did not feel strong enough to wage war with the Turks to retain Xzov, nhich had been taken by a Cossack raid in 1642. The Russian colonization at that time nent no farther than the lines of Byelgorod and those of Simbirsk of Zakamsk. which were fortified in the period 1636–56. To the south of the Byelgorod line there developed at that very time a crosscurrent of Ukrainian colonization from the western bank of the Dnieper. The new Cossack settlers (Poltava, Kharkov) felt the more independent from the Poles the farther they went east, and in 1654 their hetman Bogdan Chmielnicki (Khmelnitsky) voluntarily surrendered the Ukraine to the protectorate of the Eastern Orthodox tsar. A large autonomy of the Ukraine was acknowledged by Alexius (Aleksey), Michael's son and successor (1645–76). A war with the Poles ensued in which the Russians finally took Smolensk, occupied Vilnius and Kaunas and forced Lublin to surrender. But before finishing with the Poles Moscow mas implicated in a war with Sweden. By the peace of Kardis (1661) Russia gave Livonia to Sweden; by the peace of Andruszovo it resigned Byelorussia to Poland but kept for itself Smolensk, the eastern Dnieper bank and Kiev (166;).

European Influences.—The reigns of the tsars Michael and Alexius are closely connected in home as well as foreign policy. Moral and intellectual development was steadily influenced by the increasing intercourse with western Europe. Since the time of troubles foreigners had come in crowds to Moscow. The clergy objected to too-close relations with these foreigners as having their reflection in a change of habits and even of religion. Consequently, about 1652, foreigners mere relegated to a suburb called "the German suburb." Honever, this proved still worse for the old Russian tradition, as the European culture now formed a single and undiluted unit which strongly influenced the court and the upper social classes. Russian boyars—such as A. L. Ordyn-Nashchokin, Artamon Sergheyevich Matveyev and Prince V. V. Golitsyn—began to learn foreign languages. to acquire foreign books, to wear foreign clothes and to furnish their apartments with foreign household goods. Translations of foreign books increased in number from 24 in the first half of the 17th century to 94 in the second half. Alexius was especially accessible to the allurements of foreign comfort and pastime. going so far as to enjoy in private "English comedy" in German adaptations.

The *Raskol.*—The national religious tradition of the 16th century appeared antiquated. The patriarch Nikon found that certain rites of the national church which distinguished it from Greek orthodoxy, far from proving Russian superiority in faith, were based on ignorant distortion of ancient Greek originals of the books of service. He asked some scholars of the theological academy of Kiev (founded by Peter Moghila about 1625) to prepare a revised edition. The majority of the clergy declared this attempt sacrilegious. as the old Russian saints had saved their souls according to the old books and rites. Nikon insisted on his corrections. He invited two patriarchs (of Alexandria and Xntioch) to come to Moscow, and at a council of 1665 the schismatics were excommunicated. A long struggle began between the faith of the

Old Believers and the Nikonianism, as the official church was now generally called. Masses of the people followed the schism (*raskol*), and as hopes for reconciliation passed they began to believe that the end of the world was approaching.

Peter I the Great (1682–1725).—The reign of Alexius' invalid son Theodore (1676–82) was a sort of prologue to Peter the Great's reform. The leading part fell, under Theodore as well as during the minority of Peter (1682–89), to a well-educated boyar. Prince Vasily Vasilyevich Golitsyn. He was the favourite of Theodore's energetic sister Sophia, who broke the tradition of seclusion of Russian women. After Theodore's death Sophia, with the help of the streltsy, made her brother Ivan a second tsar as Ivan V (resigned 1689) at the side of Peter and assumed the regency. Peter (ten years old) was left to himself and amused himself in the neighbouring village of Preobrazhenskoye with technical and mechanical arts as applied to military games. He surrounded himself with boys of his age who soon became his first regular soldiers. The ill success of Golitsyn's much-vaunted expeditions to Crimea (1687 and 1689) gave Peter the chance to overthrow Sophia, to send her to a convent and to exile Golitsyn. However, as tsar, Peter continued his free life of sport. He now became a habitué of the German suburb, where he made acquaintance with many foreign specialists. A Swiss adventurer, François Lefort. initiated him into the pleasures of debauchery and became his best friend. He also encouraged Peter to extend his playing at soldiers to a real campaign against Azov. During two difficult campaigns (1695–96) Peter learned chiefly the insufficiency of his knowledge. and Lefort urged him to complete his military and naval education abroad. Peter followed the advice; he joined his embassy in the capacity of a private norkingman and visited Germany, Holland and England (1697–98). He nas forced to return speedily to Russia to stifle the new rebellion of the streltsy fostered by Sophia's agents.

He then made peace with the Porte (1699) and on the following day declared war on Sweden and invaded Livonia. This Northern War lasted until 1721, and it proved to be the chief factor in Peter's military, financial and administrative reforms. Independently from these reforms made necessary by the war. Peter directly after his return from western Europe forced his subjects to shave their beards (which was felt as an unbearable religious offense) and to dress as foreigners. The Old Believers (schismatics) especially saw in it a proof that Peter was the expected Antichrist.

Peter's army was crushed by Charles XII at Narva (1700). But while Charles was engaged in defeating Peter's allies, Denmark and Poland, Peter called up the yearly levies, created a new standing infantry, cavalry and artillery, and occupied Livonia, Estonia and the mouth of the Neva, where he founded his new capital, St. Petersburg, on May 16 (27), 1703. The "nindow to Europe" was thus opened. To cover his new and enormous expenses, he acquired the habit of taking money nherever he found it. He thus completely destroyed the old system of central administration, the *prikazy;* instead, he distributed the financial resources of Russia directly among his generals by dividing Russian territory into eight "governments." Each government (gubernya) had to pay for the upkeep of a certain number of regiments. Russia thus received in 1708–12 its first regular division into provinces.

Charles XII made the mistake of advancing from Poland to the south of Russia, instead of proceeding straight against Moscow. The Cossack hetman Mazepa (Ivan Stepanovich Mazepa-Koledinsky) promised to help him. but was unable to raise the Ukraine He joined Charles nith an insignificant force. At Poltava (June 27 [July 8], 1709) Charles was defeated by Peter and fled to Turkey. The Poltava battle produced a strong impression abroad; Russia was becoming a European state. Russian soldiers restored Augustus II on the Polish throne, drove the Swedes from Pomerania and appeared in the middle of Germany. The young Russian fleet won a naval victory over the Swedes at Hanko Head. Peter married his niece, Anne, to the duke of Courland (1710) and another niece, Catherine, to the duke of Mecklenburg (1716). He favoured Prussia at the expense of Denmark and Hanover. A Russian army landed near Stockholm (1719 and 1720). In 1721 peace was concluded at Nystad; Russia received Ingermanland, Estonia and Livonia, and parts of Karelia and Finland. After that Peter accepted the title "emperor" (imperator), which gave him a claim to equality with the Holy Roman emperor.

Peter was now free to pay more attention to internal reforms. He had to restore the central administration which he had destroyed and to bring it in harmony with his new provincial organization. In the absence of Peter, who only once a year, at Christmas, appeared in his capital (since 171 j in Petersburg), the only central institution which ruled Russia was the senate. From 1711 Peter engaged foreign advisers (Baron Johann Ludwig Luberas and Heinrich Fick) to introduce into Russia the colleges on Swedish pattern (1718–22). Three colleges managed finance: *Kammer-*, Staats- and Revision-collegia. Three others were to increase the productive forces of Russia: Kommerz-, *Manufactur-* and Berg-collegia. Three chief colleges stood above the others, on an equal footing with the senate, as they represented the tsar's prerogatives: foreign affairs, army and navy. In the provinces all the colleges were supposed to be represented, but as this proved too expensive the whole government of a gubernya was reduced to the single voyevoda of former times and to his office.

Peter was not a social reformer, but his reforms brought about great changes in the social composition of Russian society. All strata of men of service now melted definitely into one unified class of dvoryanstvo (gentry), uhich had to pass a uniform time (the 14 ranks of the "Table" of 1722) of obligatory service. Possession of landed estates lost all trace of being a remuneration for service. At the same time the different groups of land labourers, half-free and unfree, on the gentry's estates became a unified class of serfs, subject to the poll tax, introduced by Peter in 1718–22 and collected by the landlords. Peter also tried unsuccessfully to differentiate the burgesses from other classes by organizing them in merchant guilds and introducing a kind of municipal self-government under the German name of *Rathaus* and burgomaster (1699–1721).

Peter's educational reforms proved premature. There had been already founded, under Sophia, a Slavo-Greek-Latin theological academy in Moscow (168 j–87), where the influence of Kiev amalgamated with the more orthodox Greek tendencies. Peter added a navigation school, led by an English mathematician, Farquharson (1701; transferred to Petersburg as the naval academy, 1715). Both academies soon became centres of two sets of lower schools, clerical and lay, in the provinces. But they were few—about 40 of each for the whole of Russia—and they had to secure their pupils almost by force. A few hundred pupils only finished their studies there. Peter also ordered the publication of useful books—mostly translations—and he introduced the Russian lay alphabet that remained in use till the Soviet reform. But Peter's books proved too specialized for Russian readers and the language of the translations was nearly unreadable; a literary language had first to be created.

Peter's reforms did not leave untouched the sphere of religion. As the clergy was mostly opposed to his reforms, he deprived the Russian church of its spiritual head—the patriarch, a second monarch. Aided by an educated bishop, Theofan Prokopovich, Peter abolished the patriarchate and put in its place the holy synod (1721). The beheaded church was thus deprived, in the opinion of adversaries of that reform, like Stepan Yavorsky, of its legislative authority in questions of dogma.

From Peter I to Catherine II (1725–62).—Peter met with opposition in his own family; his son Alexius (Aleksey Petrovich) gre up under the influence of the clergy and obviously disapproved of Peter's reform. He fled abroad from Peter's menaces, was brought back by fraud and imprisoned on suspicion of a conspiracy against his father's life and died by torture (1718). There remained only two daughters, Anne and Elizabeth. from the second marriage of Peter with a Livonian prisoner, Martha Skovronskaya, renamed Catherine. In 1722 Peter reserved for the monarch the right to designate his successor. But at the moment of death on Jan. 28 (Feb. 8), 1725, he failed to do so. Peter's creatures, like Aleksandr Danilovich Menshikov (*q.v.*), who had everything to fear from the survivors of old nobility, resorted

to the guards and with their help proclaimed Catherine. The legitimate heir, the son of Alexius. Peter, was thus put aside. The Russian throne became "not hereditary and not elective, but *occupative*." The period from Peter's death to Catherine II's accession (1725–62) was an eclipse. Male members of the Romanov dynasty (that is to say, Peter's grandsons Peter II and Peter III, the sons of his son Alexius and of his daughter Anne of Holstein, respectively) were frail and feeble of mind. The momen—both Peter's niece Anne (Ivan V's daughter) and his daughter Elizabeth—were stronger in mind and body. But they shared their power with favourites, and their choices were not always happy. Court life flourished under these women's reigns and it became very luxurious and expensive. A special school was founded by Anne (the corps of nobles) to teach the noble guards foreign languages, dances and good manners. Balls, theatrical plays. musical entertainments—chiefly by foreign artists—became regular pastimes. The country was badly ruled; foreign policy was venal. Russia took part in European wars with little benefit for itself. From reign to reign the noble guards gained in idfluence, as they practically disposed of the throne. Catherine I (1725–27) was followed by the rightful heir Peter II (1727–30), thanks to a compromise between Menshikov and the representatives of the old nobility. His reign was fraught nith struggle between the two. But Anne, the nidowed duchess of Courland, possessed a bad title. The aristocrats offered her the throne on the condition of limiting her power by the supreme council (created under Catherine I) in questions of her marriage, succession. war and peace, taxation, military appointments, etc. Anne signed, but profiting by the guards' dissensions tore up the signed charter and reigned as an autocrat (1730–40), aided by her favourite, Ernst Johann Biron. She tried to secure the succession in the lineage of her sister, the deceased Catherine of Mecklenburg, by designating as successor under the regency of Biron the baby Ivan VI. just born to her niece, Anna Leopoldovna, duchess of Brunswick. Anna Leopoldovna herself succeeded Biron as regent. but after a fen months the guards showed their hatred of the rule of the "Germans" by overthrowing her regency and enthroning Elizabeth. Peter the Great's daughter, who was expected to return to Peter's national policy (1741–62). Indeed, the first fruits of Peter's reforms ripened during Elizabeth's reign: national poetry, a theatre and the first Russian university (Moscow, 1755), all auguring a deeper culture and knowledge for the next generation.

Elizabeth wished to secure the throne 'for the lineage of her sister Anne of Holstein, and she invited her nephew Peter, educated in the Lutheran religion and in the ideas of Prussian drill, to come to St. Petersburg to learn Orthodoxy and Russian habits. He came and was married (1745) to princess Sophia of Anhalt-Zerbst, the future Catherine II. He was no mate for her. As fast as he lost Russian sympathy by his open aversion to everything Russian, Catherine ingratiated herself by exactly opposite behaviour. After half a year of the reign of Peter III, Catherine mas raised by the guards officers to the throne. The brother of her favourite Count Grigory Orlov. Alexis, assassinated Peter as soon as he was banished to Ropsha by Catherine.

For a representation of the succession to the throne of Peter the Great see the genealogical table in the article ROMANOV. Consult also the articles on the several emperors, empresses and regents just mentioned: ANNA (Anna Leopoldovna); ANNE; BIRON, ERNST JOHANN; CATHERINE I; ELIZABETH (Elizaveta Petrovna); IVAN VI; PETER II; and PETER III.

Catherine 11 (1762–96).—The long reign of Catherine II was a turning point in Russian history. She received the fruit of half a century's evolution since Peter the Great's reforms. A prolific writer herself, in regular correspondence nith the foremost men of her age, with Voltaire, Diderot, Jean le Rond d'Alembert, Baron Friedrich von Grimm, etc.. not to speak of fellow potentates such as Frederick II, Maria Theresa and Joseph II, she nished to make her reign brilliant and herself an ideal enlightened monarch. She began her reforms by compiling from Montesquieu and Cesare Bonesana, marchese de Beccaria, an instruction (*nakaz*) on the basis of which a new code of laws was to be composed. In order to discuss it she gathered an elective assembly of 564 deputies chosen from all classes except the clergy and the serfs, and from all parts of the empire. However. she met with opposition on the part of the gentry to her schemes to fix within definite limits their power over the serfs. Far from engaging in a struggle with the ruling class she yielded to their desires; their power was increased and a number of crown estates were distributed among the ranks of her favourites, thus turning their peasant population into serfs.

Catherine then began to search for glory in foreign politics. She conceived a bold scheme: (1) to recover from Poland the western provinces with an Orthodox Byelorussian and Ukrainian population and (2) to take possession of the Black sea shore, drive the Turks from Europe and found in their place a series of new states in Moldavia and Walachia, in the Balkans and in Greece. She wished to take Constantinople and to place there her second grandson, Constantine, as the emperor of a new Greek empire. His very name was chosen to symbolize this project. Catherine was favoured in accomplishing at least a part of these designs by discords between two German states, Prussia (under Frederick II and Frederick William II) and Austria (under Joseph II, Leopold II and Francis II). In her first Turkish war (1768–74) she had Prussia on her side and Austria against her; after P. A. Rumyantsev's victories she concluded a peace at Kuchuk Kainarji, the beginning of the Eastern Question (*q.v.*), as by it Russia received the right to protect Turkish Christians. Moreover, in 1772 she took part in the first partition of Poland, proposed by Frederick II in order to consolidate his territory and to compensate Russia for its war expenditure. In the second Turkish war (1787–91) Catherine had Austria on her side and Prussia against her. She had to content herself, after the victories of Suvorov (Aleksandr Vasilyevich Suvorov, Count Rimniksky) and Prince N. V. Repnin, with the acquisition of Ochakov and the steppe between the Dniester and the Bug. But she consoled herself with new annexations from Poland (the second partition, 1793, and the third partition, 1795; *see* POLAND), while Prussia and Austria were busy fighting against the French Revolution. Catherine also annexed Courland (1795). Her numerous lovers Battered her imperial ambitions: the bold Grigory Orlov in her early years (1762–74), the ingenious Prince Grigory Potemkin in the midst of her reign (1775–91) and the young Platon Zubov, handsome but insignificant, in her declining years (1791–96).

Between her two Turkish wars (1775–85) Catherine returned to the legislative mania of her early years. Made wise by her experience with the commission of the code of 1767, she turned from Montesquieu to Blackstone and profited by the administrative knowledge of J. Sievers, a skilful adviser of German Baltic origin. She then published in 1775 her statute of provinces, a good piece of organic legislation. Here for the first time in Russian history a local unit of administration, judiciary and self-government was created. The statute introduced a regular system of courts of justice, separate financial and administrative offices and—last but not least—corporations of local gentry meeting every three years to discuss their affairs and to elect their marshals. This system lasted until the reforms of Alexander II. The reform of 1775 was completed by two charters granted in 1785 to nobility and to burgesses. The charter of nobility served to perpetuate the power of the ruling class until the liberation of the serfs in 1861, while the burgesses' charter laid the basis for real municipal self-government.

The protection extended to the gentry inevitably created a growing disaffection on the part of the serfs, who impatiently awaited their turn for emancipation. In 1773 the Yaik (Ural) Cossacks revolted under E. I. Pugachev, who called himself Peter III. He roused the Bashkirs and the serfs allotted to the factories in the Urals, assailed Kazan on the Volga and sacked it. Through the whole empire the peasants only awaited his coming to rise, but he did not feel equal to the task, nor could his bands stand against regular troops. He therefore suddenly returned to Cossack country. where he lost his army; he was extradited by his associates, tried and beheaded in Moscow.

Catherine definitely turned her back on the liberal ideas of

her youth after the beginning of the French Revolution. She began to persecute representatives of the advanced opinion which she herself had helped to create. A. N. Radishchev, the author of a spirited book, A Journey from *Petersburg* to *Moscow,* was sentenced to death as a Jacobin in 1790, but the sentence was commuted to ten years' exile in Siberia. N. I. Novikov, a freemason who accomplished admirable educational and editorial work, was sent to Schlusselburg prison in 1792.

Paul I (1796–1801).—Catherine's son and successor, Paul, mounted the throne when he was 42, barely sane and with a bitter feeling of having been deprived by his mother of his right to succeed his assassinated father Peter III. He hated Catherine's favourites and her policy, both internal and external. He stabilized the succession of the Russian throne by his imperial family statute (1797; in force until 1917). He sent Suvorov to Italy to fight against the French Revolution, and he ended his reign while preparing with Napoleon an expedition to India against England. In social questions Paul's policy was also inconsistent: he alleviated the serf's obligatory work for his landlord by reducing it to three days in a week, but he gave away the peasants of the crown to noble proprietors as serfs in an even larger number than Catherine (120,000 yearly). This did not make him, however, popular among the nobility, as his exalted idea of the divine right of the tsars caused him to treat them in a purely oriental way. He used to say that a person could be reputed of importance only as long as he was permitted to converse with his majesty. His ill-balanced mind and tyrannical proclivities inspired fear in his associates, and in the sixth year of his reign he was assassinated by court conspirators.

Alexander I (1801–25).—Paul's son and successor began his reign, as had Catherine (whom he professed to imitate), with attempts at liberal legislation (1801–05), which gave place to active foreign policy and wars (1806–09). There followed a new attempt at a constitutional reform (1809), hampered by the nationalist opposition, which urged and approved the annexation of Finland (1809) and of Bessarabia (1812). The invasion of Napoleon (1812) brought the national feeling to extreme tension. The following years (1813–18) were devoted to the assertion of Russia's influence in Europe. The last years of the reign (1819–25) mere marked by a reactionary policy, which provoked the first revolutionary movement in Russia

Alexander received a careful education at the hand of his grandmother. who wished him to inherit the throne instead of Paul, his father. The Swiss republican F. C. de la Harpe had a strong influence on him in his early years (1784–95). But this education was interrupted by Alexander's marriage (at 16) and did not go beyond imparting to him some general ideas unsustained by exact knowledge. His sentimental feelings mere cooled by the court intrigues, by the hidden enmity between his grandmother and father and finally by the harsh system of Paul's reign, which Alexander was expected to approve and obliged to share in. The consequence was that he grew up a past master in dissimulation and self-restraint. His evasiveness in face of other people's strong opinions was often taken for weakness. But he knew how to promote his own views and if impeded in his designs he was capable of violent explosions of wrath.

Initial Liberalism.—In the first year of his reign Alexander surrounded himself with a few friends of his youth—N. N. Novosiltsev. P. A. Stroganov, Prince Adam Czartoryski, Prince V. P. Kochubey—a "private committee" uhom he wished to help him in drafting large schemes of reforms. He at once cancelled a series of reactionary measures of Paul and declared his desire to abolish arbitrariness and to inaugurate a reign of law. Public opinion received him with enthusiasm. But the private committee, which met regularly for about a year, found dangerous and untimely both a formal declaration limiting the autocrat's power and the abolition of serfdom. The most important fruit of these good intentions was the introduction of ministries instead of the colleges of Peter the Great, which had been practically abolished by Catherine. A new senate statute was intended to make this institution the highest legal authority (1802). A very cautious ukase of 1803 permitted noble landowners to liberate their serfs, granting them at the same time lots of land. Only 47,000 serfs were thus liberated and became "free agriculturists" Somewhat larger measures limited the power of landowners over the serfs in Livonia and Estonia (1804–05). A new and important impulse mas given to public education, which was considered to be a preliminary condition to all substantial reforms. Three new universities were created.

Since 1801 Alexander had feared the consequences of Napoleon's ambition, and he took upon himself, although it had no relation to Russian national interest, to organize a new coalition against France. In 1805 and 1806 he was involved in wars which ended in crushing defeats at Austerlitz and Friedland. He then changed his policy and concluded an accord with Napoleon directed against England, whose commerce with the continent had to be forbidden in all countries which adhered to this continental system. At his personal meeting with Napoleon at Tilsit (1807) Alexander played a part which made Napoleon call him a "northern Talma" (a renowned actor) and a "Byzantine Greek." But he was in part genuinely under Napoleon's influence and was entangled into new wars: with Sweden, which finished with the annexation of Finland (1809), and with Turkey, which lasted for six full years (1806–12) and ended with the annexation of Bessarabia. A year later (1808) Alexander again met Napoleon at Erfurt, but Napoleon's intention to raise the Polish question did not please Alexander. while Napoleon was offended by the refusal of the tsar to give him his sister in marriage. Relations were very strained by the end of 1810.

Conservative opinion was very much incensed against Alexander's alliance with the "Corsican usurper," especially as at that very time another and more serious attempt was made to introduce in Russia a constitutional government. Mikhail Mikhailovich Speransky, a prominent statesman, whose views were favoured by the emperor at that time, prepared a scheme based on the introduction of self-government in four stages, beginning with electoral assemblies (dumas) in the cantons and ending at the top with the duma of the state. Each lower duma elected deputies to the upper one: cantonal dumas to district dumas, district dumas to provincial ones; these latter sent all their members to the state duma, a legislative assembly, deprived of legislative initiative but enjoying the right to make motions concerning the interest of the state. the responsibility of functionaries and the violation of fundamental laws. The senate retained only judicial power, while the newly reformed ministries remained organs of the executive. The council of state, composed of high dignitaries and presided over by the tsar, was to prepare drafts of lams. In fact nothing except the council of state and the reformed ministries was realized (1810). Conservative opinion, as represented by nobility and bureaucracy, was furious with Speransky, and the tsar did not choose to defend him. On a futile pretext Speransky was dismissed from his office of imperial secretary and sent to exile (1812). His successor was an extreme nationalist and conservative, Adm. A. S. Shishkov.

Nationalism and Reaction.—When the war of 1812 began, the nationalist feeling reached its pitch. It was to be a Scythian war—a war of retreat. Time and space were to be the chief allies of Russia, whose military forces were one-half or one-third the size of Napoleon's. And, indeed, the deeper Napoleon penetrated into Russia's endless plain the more equal the chances became. Alexander named another conservative, M. I. Kutuzov, commander in chief in the place of M. Barclay de Tolly, and a third conservative, Count Feodor Vassilyevich Rostopchin, general governor of Moscow, which was the final aim of Napoleon's strategy. After the bloody but undecided battle at Borodino (Aug. 26 [Sept. 7]) Moscow surrendered to Napoleon. For five weeks of his stay in Moscow he waited in vain for a peace proposal. Moscow was burned by the inhabitants. His army was in process of dissolution, and winter was approaching. Then followed the famous retreat, during which the Grand army was nearly annihilated, and the wars of liberation of 1813 and 1814, which brought Alexander and his army to the walls of Paris. At the Congress of Vienna (181j) he figured as a saviour of Europe, and he continued to play a leading part at Aix-la-Chapelle (1818),

Troppau and Laibach (1820) and Verona (1822). All these events produced an enormous impression on the sensitive temperament of Alexander. "The fire of Moscow," he said later to the German pastor R. F. Eylert, "lit up my soul, I then got to know God and became another man." Alexander now found in the Bible the proofs of his mission and proposed to his allies to establish a Holy alliance, a monarchs' league based on the precepts of the Scriptures. His intention was liberal, but Metternich made use of the idea for his policy of repressing all liberal movements in Europe.

The Revolutionary Movement.—Quite different were the impressions which the younger generation of officers who took part in the Napoleonic wars brought with them back to Russia. Many of them while abroad read political newspapers and were present at the debates of representative assemblies. They learned to quote the books of J. L. Delolme, Count Destutt de Tracy, Benjamin Constant, Gaetano Filangieri, Baron Bignon, etc. After their return to Russia they were shocked by the contrast of arbitrary rule, the abuses of bureaucracy, the venality and secrecy of the courts, the sufferings of the serfs and the indifference to popular education. Two secret political societies were formed by the most active of these officers in 1816–18: one by Pavel Ivanovich Pestel in the southern army and the second by a group of guard officers in Petersburg headed by N. M. Muraviev and Nikolay Ivanovich Turgenev. The former society—more radical—imitated the organization of the Carbonari; the latter borrowed its principles from the Tugendbund. Later on Pestel drafted a republican and strongly centralized constitution, while Muraviev composed a monarchical and federal constitution on the basis of those of Spain of 1812 and of the United States. Pestel's tactics were revolutionary, while the Petersburg group intended to help the government openly in questions of education, philanthropy, economics and improvement of justice. thus preparing Russia for a constitutional regime. They expected Alexander to sympathize with them, as in 1815 he gave a constitution to Poland and mentioned at the opening of the sejm that he was preparing one for Russia. He also acknowledged the old institutions of Finland. However, Alexander soon ceased to distinguish between "the holy principles of liberal institutions" and "destructive teaching which threatens a calamitous attack on the social order" (his expressions in the speech mentioned). He entirely agreed with Metternich (in 1820) that the liberal principles themselves were destructive. A period of reaction began in Russia. The transition to it was marked by an attempt to impart to Russia Alexander's religious enlightenment. The ministry of public education was united, for that purpose, with a new ministry of spiritual affairs, where all religions including the Russian Orthodox were treated equally (1817). Prince A. N. Golitsyn, the procurator of the holy synod and the president of the Russian branch of the Bible society founded in 1812, was made the chief of the united ministries. The consequence was that in 1819–21 the young universities recently opened were entirely destroyed—especially by the curators of Kazan and Petersburg circuits, M. L. Magnitsky and D. P. Runich. They removed the best professors and prohibited good textbooks on natural law, morals and logic, on the ground that the teaching must be based exclusively on Holy Scripture. For Russian church dignitaries even their mystical pietism was heresy: Golitsyn was forced to leave his office, after he had been anathematized by the archimandrite Photius. a fanatic protected by Alexander's favourite Aleksey Andreyevich Arakcheyev. During the last part of the reign Arakcheyev, an ignorant and brutal man, enjoyed the power of prime minister.

Under these conditions secret societies changed their character. The measures of Alexander convinced them that monarchs' promises are not to be relied upon. They were also impressed by military pronunciamentos in Spain and Naples (1820). Nikolay Turgenev recorded in his diary in 1820: "We formerly asked, every time we met the readers of newspapers in the club, whether there was a new constitution. Now we ask whether there is a new revolution." One may judge of the impression produced on the officers of the guard when they learned that they had to stifle the Neapolitan uprising, by orders of the Laibach congress.

The former secret society of welfare, imitating the Tugendbund, was officially closed in 1821, as being too moderate. Two societies appeared instead: the northern and the southern constitutionalists and republicans. The constitutionalists were losing ground; radical elements even among them (like the poet K. F. Ryleyev) began to prevail. Proposals of regicide were heard from P. G. Kakhovsky and A. I. Yakubovich but were rejected or indefinitely postponed. In any case, revolutionary tactics were considered inevitable, but no definite scheme was in preparation. Suggestions were made for forcing the tsar, at some favourable opportunity, to nominate a liberal ministry under Speransky and N. S. Mordvinov, who would convoke a great council (later, Russian revolutionaries called it a constituent assembly) which should decide on the form of the government.

A favourable occasion presented itself quite unexpectedly. Alexander died in Taganrog on Nov. 19 (Dec. 1), 1825. The order of succession happened to be undecided. Constantine, the elder of Alexander's surviving brothers, had renounced the throne in 1823, but Nicholas, the younger, did not wish to acknowledge this and swore allegiance to his brother. Constantine would not accept the throne. Nicholas threatened to leave Russia. The correspondence between Warsaw and Petersburg was thus protracted for about two weeks. The Decembrists, as they were called later, decided finally to raise the guard regiments for Constantine against Nicholas and to force Nicholas—in case he survived that day—to appoint a liberal ministry which would do the rest. The rising was a failure (see NICHOLAS I). The last of Russian palace revolutions was spoiled by too much idealism, but it served as an ominous prognostication of the coming democratic revolutionary movement.

Nicholas I (1825–55).—Nicholas was quite unlike Alexander. With a rough nature of limited understanding, he was conscious of his inferiority and sincerely disliked the idea of becoming tsar. But once tsar, he was sure that he would be enlightened from above for the accomplishment of his divine mission, and he conceived an exalted idea of his personal dignity and infallibility. But he was no mystic. Cold and reserved, he inspired fear and hatred and he consciously made use of these feelings as the instrument of his power. His aim was to freeze every germ of free thought and independent moral feeling, as disturbing agents of the order of things entrusted by God to his personal care.

Nicholas' reign is divided into three parts by two European sets of revolutions: those of 1830 and those of 1848. During the first five years (1825–30) he did not feel quite sure of himself and he appealed for help to advisers of Alexander's liberal period, such as Kochubey, Speransky and E. F. Kankrin (Count Georg Cancrin). In Dec. 1826 he even instructed a special committee to collect for him all useful hints about necessary reforms. While punishing severely the Decembrists (five of them were hanged, others sent to Siberia), he wished to make use of all their good ideas. But he reserved for himself the control over public opinion and confided to Count A. K. Benckendorff the organization of a new secret police of gendarmes controlled by the "third section" of his personal chancery. He adopted Alexander's policy of protecting the kings from their peoples, but he made an exception for Christian Turkish subjects (in the first place the Greeks). He thus carried on a war against Turkey (1827–29). By the treaty of Adrianople Greece was liberated; the hospodars of the Danubian principalities were to be appointed for life and free from Turkish interference in internal affairs. The straits and the Black sea were to be open.

Nicholas especially attended to education; he wished to clear it of everything politically dangerous and confine it to the upper class. He abolished the liberal university statutes of Alexander (1804); by the new statutes of 1835 he detached the primary education intended for the lower classes from the gymnasiums and universities, where only children of gentry and of officials were to be admitted.

The expulsion of Charles X from France and the Polish insurrection of 1830–31 determined the legitimist tendency of Nicholas' foreign policy; he wished to become a real "policeman" of Europe, and at Miinchengratz he renewed relations with Metter-

nich. But his excessive interest in the "sick man" in Constantinople finished by rousing Europe against him. In 1833 Nicholas saved the sultan from the Egyptian rebel Mohammed Ali, and by the treaty of Unkiar-Skelessi received for that service free passage for Russian ships to the Mediterranean, while to all other powers the Dardanelles were to be closed during wartime. This concession drew the attention of the European powers, and in 1841 all the five great powers agreed that the Dardanelles should be closed to warships of all nations.

Slavophils and *Westernizers*.—In sharp contrast with Nicholas' educational policy, a new generation grew up which was bred by Russian universities, especially Moscow university, between 1830 and 1848. They were not politicians or liberals of a Franco-English type. They were idealists and students of the philosophy of F. W. J. von Schelling, J. G. Fichte and G. W. F. Hegel. In Moscow literary salons they did not discuss the form of the government, but dug deep into the very foundations of Russian history and the Russian national mind. Most of them declared that Russia was unlike Europe and its type of civilization potentially far higher than the European one. They thought to discover Russia's peculiarity in its old peasants' commune (mir), which, they said, revealed the socialistic soul of Russia as unlike the individualist western soul. They execrated Peter the Great's Europeanization of Russia as a fatal deviation from the genuine course of Russian history, and they wanted Russia to come back to the forsaken principles of the Eastern Church and state—to orthodoxy and autocracy. The majority of public opinion, led by A. I. Herzen, V. G. Belinsky, Mikhail Bakunin, T. N. Granovsky and others, revolted against this Slavophil doctrine. They opposed to it their own doctrine of the western origin of Russian civilization. Herzen and Bakunin emigrated from Russia on the approach of the revolutions of 1848. They became the originators of Russian socialism, which however did not frighten Nicholas so much as Russian liberalism—an applied doctrine whose dangers he had experienced at the hands of the Decembrists.

Nicholas was not insensible to the chief social question in Russia—that of serfdom. How could he be when peasants' uprisings were steadily growing in frequency? They numbered about 41 in the first four years of his reign, and there were 378 between 1830 and 1849 and 137 during the last five years. Nicholas formed a series of secret committees which, after many failures, prepared the law of 1842 on voluntary accords, which abolished personal serfdom and fixed the amount of peasant lots and payments. Through P. D. Kiselev's energy, the same changes were obligatorily introduced in Poland (1846) and in some western provinces (1847). A real persecution of intellectuals began after the revolutions of 1848. A secret committee, presided over by D. P. Buturlin, was founded to punish press offenses. S. S. Uvarov himself was found too liberal and resigned. His successor, Prince P. A. Shirinsky-Shikhmatov. wished to "base all teaching on religious truth." The university chairs of history and philosophy were closed, the number of students limited; many writers were arrested, exiled or otherwise punished. The private circle of followers of M. V. Butashevich-Petrashevsky, a young socialist, was sent to forced labour in Siberia (including Theodore Dostoievsky) for having read and discussed prohibited literature.

The *Crimean* War.—Nicholas also wished to dictate his will to Europe. "Submit yourselves, ye peoples, for God is with us": thus ended his manifesto published on March 27 (April 8), 1848. He sent a Russian army to subdue Hungary when it had revolted against the Habsburgs. A few years later he inadvertently provoked a conflict with Turkey, because of a special question on the distribution of holy places in Jerusalem between Catholic and Orthodox priests, which he involved with the question of the general protectorate of Russia over Christian subjects of the sultan. European powers would not admit this protectorate, and Nicholas found against himself not only Napoleon III and England but also "thankless Austria." In Nov. 1853, Turkish forces attacked the advanced Russian troops in the Danubian principalities; France and England declared war on Russia on March 16 (28). 1854. The courage displayed in the defense of Sevastopol proved useless, as the whole fabric of Russian bureaucratic and autocratic government appeared incapable of competing with European technique. Corruption and lack of communication, feeble development of industry and financial deficiency deprived the valiant soldiers of the most necessary means of defense. (See CRIMEAN WAR; TURKEY: History.) Nicholas died in St. Petersburg on Feb. 18 (March 2), 1855, feeling that all his system was doomed to destruction. A wholesale change of regime was indicated to his son and successor, Alexander II.

Alexander II (1855–81).—Alexander, a man of weak character but good-natured, possessed no steadfast views on politics. During the reign of his father he had sometimes surpassed Nicholas in reactionary intentions. But the Crimean War proved too clearly the danger of Nicholas' martinet system, and public opinion was too impetuous for Alexander to resist. He swam with the current, and this period coincides with the great reforms which made his reign a turning point in Russian history. But Alexander was always conscious of his power as unlimited monarch, and his liberalism ended as soon as his reforms brought with them a revival of political or autonomous tendencies. He then began to waver; the reforms were left unachieved or curtailed. Public opinion grew impatient, extremist tendencies won the ground, and the gap between the government and advanced opinion finally became insuperable. As a consequence, the original impulse for reform was exhausted as early as 1865. There followed a period of faltering which turned into a sheer reaction as the revolutionary movement grew.

Emancipation of the Serfs.—The greatest achievement of the era was the liberation of peasants. It paved the way for all other reforms and made them necessary. It also determined the line of future development of Russia. The chief motive which decided Alexander is clearly expressed in his words to the Moscow gentry: "The present position cannot last, and it is better to abolish serfdom from above than to wait till it begins to be abolished from below." However, Alexander met with passive opposition from the majority of the gentry; their very existence as a class was menaced. The preparatory discussion lasted from 1857 to March 1859 when the drafting commissions of the main committee were formed, composed of young officials—such as N. A. Milyutin and Y. A. Soloviev and their Slavophil friends Y. F. Samarin and Prince V. A. Cherkassky—enthusiastically devoted to the work of liberation. Y. I. Rostovtsev, an honest but unskilled negotiator enjoying the full confidence of the emperor, was mediator. The program of emancipation was very moderate at the beginning, but was gradually extended under the influence of the radical press and especially Herzen's Bell. But Alexander wished that the initiative should belong to the gentry and exerted his personal influence to persuade reluctant landowners to open committees in all the provinces, while promising to admit their delegates to discussion of the draft law in Petersburg. No fewer than 46 provincial committees containing 1,366 representatives of noble proprietors were at work during 18 months preparing their own drafts for emancipation. But they held to the initial program, which was in contradiction with the more developed one. The delegates from the provincial committees were only permitted—each separately—to offer their opinions before the drafting committees. Unfortunately, Rostovtsev died in Feb. 1860. Alexander, who already feared that he had gone too far in his concessions, appointed as his successor Count V. N. Panin, a reactionary. Under his influence the proposed allotments of land to peasants were diminished and the rents were increased. However, it was impossible to change the main lines of the draft. By the law of Feb. 19 (March 3), 1861, the peasant became personally free at once, without any payment, and his landlord was obliged to grant him his plot for a fixed rent with the possibility of redeeming it at a price to be mutually agreed upon. If the peasant desired to redeem his plot, the government paid at once to the landowner the whole price (in 5% bonds), which the peasant had to repay to the exchequer in 49 years. Although the government bonds fell to 77% and purchase was made voluntary. the great majority of landowners—often in debt—preferred to get the money at once and to end relations which had become insupportable. By 1880 only 15% of the peasants had not made use of

the redemption scheme, and in 1881 it was declared obligatory. The landowners tried, but in vain, to keep their power in local administration. The liberated peasants were organized in village communities governed by elected elders.

Administrative Reform.—After the emancipation of the peasants. the complete reform of local government was necessary. It was accomplished by the law of Jan. 1 (13), 1864, which introduced the district and provincial zemstva (county councils). Land proprietors had a relative majority in these assemblies. They were given (in all Russia) 6,204 seats (48%) while the peasants were entitled to choose only 5,171 delegates and the town inhabitants 1,649 (12%). The competence of *zemstva* included roads, hospitals, food, education, medical and veterinary service and public welfare in general. Before the end of the century services in provinces with zemstvo government were far ahead of those in provinces without.

A third capital reform touched the law courts. The law of Nov. 24 (Dec. 6), 1864. put an end to secret procedure, venality, dependence on the government, etc. Russia received an independent court and trial by jury. The judges were irremovable; trials were held in public with oral procedure and trained advocates. Appeals to the senate could take place only in case of irregularities in procedure.

A little later came the reforms of municipal self-government (1870) and of the army (1874). Gen. D. A. Milyutin (the brother of N. A. Milyutin) reduced the years of active service from 25 to 16 and made military service obligatory for all classes. The only exemptions admitted were for reasons of education. Military courts and military schools were humanized.

The *Revolutionary Movements.*—The only branch of public life exempted from reform was the press. The press profited indeed by the new spirit of Alexander's reign. While in the last ten years of Nicholas' reign only 6 newspapers and 19 (mostly specialist) monthlies were permitted, during the first ten years of Alexander's there were 66 newspapers and 1j6 monthlies. The general tendency of the press, very moderate at the beginning, soon became very radical. The leading spirits were the nihilists N. G. Chernyshevsky, N. A. Dobrolyubov and D. I. Pisarev, the last of whom preached extreme individualism. As early as 1862 temporary measures were applied against radical periodicals. Instead of a law on the liberty of the press there appeared in 1865 new temporary rules (which remained in force for fully 40 years) compiled from Napoleon III's law of 1852. They set free from "previous censure" books of more than ten sheets, but the censors continued to seize printed books before their issue.

A new wave of revolutionary movement set in. It proceeded from the young generation of university students, who expected an agrarian revolution directly after the liberation of peasants. They were busy preparing for it workingmen, soldiers and peasants through popular education. Secret circles were formed, proclamations issued and even a revolutionary movement was attempted in connection with the Polish uprising of 1863. Finally, an attempt was made by a student. D. Karakozov, to assassinate the tsar in April 1866. All these attempts were extremely naive; a few young revolutionaries were executed or sent to Siberia and the nhole movement was stifled in its primary stage. But Alexander was frightened. Gradually he dismissed his liberal advisers, and conservatives took their place. The home office was given (1861) to P. A. Valuyev, who tried to paralyze the introduction of the emancipation law and formally prosecuted its faithful adherents. University troubles brought about the removal of the liberal minister of public instruction, A. V. Golovnin, the author of a model university statute of 1863. His successor was a reactionary, Count Dmitry Andreyevich Tolstoy, who found the means of salvation in the classics. The old chief of gendarmes, Prince V. A. Dolgorukov, had to give place, after Karakozov's attack, to Count Peter Shuvalov, who became the soul of reaction. The government-general of St. Petersburg was abolished and the martinet Gen. F. F. Trepov made grand master of the police. D. N. Zamyatnin, minister of justice, under whom the reform of tribunals was carried through, fell a victim to his defense of this reform against an imperial whim; he had to yield to an ignorant reactionary, Count K. I. Pahlen (1867), who nearly annihilated the reform. The same was done for the press by A. Timashev who superseded Valuyev as home minister in 1868. Two radical monthlies, the Contemporary and the Russian *Word,* were closed (1866). M. N. Katkov, a former European liberal who now inclined to extreme nationalism and reaction, became the most influential journalist.

All this contributed to uphold and to increase the disaffection of educated public opinion. About 1869 a new young generation appeared which gave expression to that state of mind. Russian emigrants in Switzerland discussed at that time a new revolutionary doctrine later called populism (narodnichestvo). P. L. Lavrov was giving it a scientific basis, but Mikhail Bakunin found this too learned and plainly invited the youth to give up the study and go straight to the people with the aim of inducing disorder. He found this easy, since Russian peasants with their communes were born socialists. The youth of Russia, chiefly the young girls who went to study abroad as there were no female institutes of learning in Russia, listened to these discussions in Ziirich and, of course, mostly preferred Bakunin's active optimism to Lavrov's learning. In 1873 they were all ordered back to Russia by the government, and they met. when at home, with many student circles which were busy distributing books and revolutionary pamphlets among their provincial branches and workingmen. N. V. Tschaikovsky, Prince P. A. Kropotkin and Sergius Stepniak (S. M. Kravchinsky) were among the leaders of that educational and (later on) revolutionary work. They decided, in the spring of 1874, to go to the people—a naive crusade by inexperienced youth, hardly out of their teens—in order both to teach the people and to learn from them their socialistic wisdom. Of course they were not acknowledged by the people, in spite of their peasant attire, and were easily ferreted out by the police; 770 were arrested and 21j sent to prison. They then decided to change their tactics. A regular secret society was founded in 1876 under the name of Land and Liberty (or "Will"). They still hoped to provoke a mass uprising according to the ideals of the people, but their village settlements proved useless for revolution while in the towns they soon got engaged in a lively conflict with the police. As a result the terrorist side of their activity came to the forefront. In the autumn of 1879 the terrorist group formed a separate party, the People's Will, while the remaining members led by G. V. Plekhanov—under the name of Black Partition (*i.e.,* agrarian revolution)—remained inactive. A series of terrorist acts then followed, beginning with that of Vera Ivanovna Zasulich, who fired on Trepov for his having flogged a prisoner and was acquitted by the jury (1878). In 1879 A. Solovyev fired five shots at the tsar. On Feb. 5 (17), 1880, a workman, S. N. Khalturin, blew up the imperial dining room at the Winter palace. The police seemed powerless against the famous executive committee which directed the blows, and the government asked the loyal elements of public opinion for support. The answer was given, in the name of the Chernigov zernstvo, by Ivan Petrunkevich: he said that no cooperation was possible with the government as long as public opinion was stifled. The Tver zemstvo, led by F. I. Rodichev, asked the tsar to "give us what he gave to Bulgaria" (*i.e.,* constitution and political freedom).

After the Winter palace explosion a supreme commission was appointed under the chairmanship of M. T. Loris-Melikov, who was given a sort of dictatorial power. Loris-Melikov's design was to isolate revolutionary elements by concessions to the liberals and, after exterminating the revolutionaries, to summon a sort of consultative assembly, thus renewing certain projects of aristocratic landowners in 1861–63. He submitted to the tsar, on Feb. 9 (21), 1881, a proposal to appoint two drafting committees for administrative and financial reforms and to submit their drafts to a general commission. where experts chosen by the zemstva and municipalities should also be heard (two from each of them). The respective laws would be issued in the ordinary way by the council of state. but 1j delegates should be admitted to its session. It did not at all look like a constitution, but it might have served as an introduction to it. Fate decided otherwise: on the very day when Alexander signed Loris-Melikov's project, on March 1 (13), 1881, he was assassinated by revolutionaries, led by Sophia Lvovna

Perovskaya, on his way back home.

Foreign Policy.—Alexander II was more successful in his foreign policy. He ascended the throne at a moment of great exhaustion and humiliation for Russia. The Paris treaty (1856) substituted European control for a Russian protectorate over Turkish Christians; the Russian fleet in the Black sea ceased to exist; the portion of Bessarabia nearest to the Black sea was given to the Danubian principalities. However, Russia did not permit Napoleon III to make an international question of the Polish uprising of 1863; Alexander then approached his relative William of Prussia and helped him against France in the foundation of the German empire. Russia made use of the Franco-German War to repudiate the provisions of the Paris treaty forbidding Russia to construct naval arsenals and to keep a fleet in the Black sea (1870). In 1872 the German, Austrian and Russian emperors met at Berlin and concluded the Three Emperors' league (uithout any formal treaty being signed; see EUROPE). However, Russia did not wish to strengthen Germany too much at the expense of France. In 1875 thanks to Russia's insistence a Franco-German conflict was averted, to the great dissatisfaction of Bismarck, who threatened the Russian foreign minister, Prince A. M. Gorchakov, with revenge. In the same year the Eastern Question was reopened by a rising of Christian Slavs in Bosnia and Hercegovina (see EUROPE and TURKEY). In 1876 (summer) began the Bulgarian uprising. Russia proposed co-operative action to the powers, but, meeting with hidden aid to Turkey from Disraeli, Alexander decided to act alone. When Serbia and Montenegro declared war on Turkey he met Francis Joseph at Reichstadt and on June 26 (July 8), 1876, concluded an agreement in which all possibilities of defeat, victory or the collapse of Turkey were anticipated. Austria was to receive Bosnia and Hercegovina for occupation and administration; Russia was permitted to take back the lost portion of Bessarabia. A last attempt to formulate a European program of pacification of the Balkans was made by the poners at the Constantinople conference (Nov., 1876). After its failure Count Nikolay P. Ignatiev visited the European capitals to discuss the possibility of war. Austria and England put as conditions of their neutrality: no attack on Constantinople; no Russian territorial acquisitions; no thrusting Serbia into war; Bulgaria, in case of its liberation, not to be under direct Russian control. Thus, Russia was in advance deprived of possible gains in case of victory; as a matter of fact, Disraeli looked for its defeat. Nevertheless, Alexander went to war (see RUSSO-TURKISH WARS). Close to the walls of Constantinople the Russian army was stopped by the British fleet, and the treaty of San Stefano (March 3, 1878), favourable to the Bulgarians, was emasculated at the Congress of Berlin (*q.v.*). Russian public opinion, ignorant of the agreements concluded before the war, was much incensed against Bismarck. "the honest broker." Russia received the lost part of Bessarabia and Kars, Ardahan and Batum in Transcaucasia. Far more important were the acquisitions of Alexander in central Asia. From 1864 his generals were active against Kirghiz and Turkmen tribesmen who raided the unprotected frontier of Siberia. Russian soldiers marched up the Syr Darya, subjugated Bukhara and from there, through the desert of Khiva, reached the Caspian shore. In 1867 the territory between Issyk-Kul and the Aral sea was constituted into a province called Turkistan, and in 1874 another province under the title of Transcaspia was formed of territories between the Amu Darya and the Caspian sea. Russia reached the frontiers of Afghanistan and Chinese Turkistan. while in the far east by the treaty of Aigun (1858) it obtained from China territory running east from the rivers Amur and Ussuri to the Pacific seaboard, and the naval base of Vladivostok was founded. Japan ceded Sakhalin in 1875 in exchange for two Kurile islands. In 1867 Alaska was sold to the United States for $7,200,000.

Industrial Progress.—Under Alexander II Russia made decisive steps toward industrialization. The length of railway increased from 644 mi. (1857) to 2.260 (1867) and to 11,070 (1876). Factory production grew from 352,000,000 (1863) to 909,000,000 roubles (1879); the number of workingmen from 419,000 to 769,000; the export of grain from 52,800 bu. (1860–62) to 125,600 (1872–74). In 18jo and 1857 Russia (for the second time since 1819) tried the experiment of free trade, but as it brought with it an excess of imports—a thing unusual in Russia—M. K. Reutern, the minister of finance in 1862–78, returned to the protectionist system of Kankrin (1823–44). He also favoured the organization, for the first time in Russia, of private credit institutions. The 10 land banks which were in existence at the end of the 19th century were all founded in 1871–73; there were also 28 commercial banks (founded 1864–73), 222 municipal banks (1862–73) and 71 societies of mutual credit (1877).

Alexander III (1881–94).—Alexander III succeeded his father and was at first expected to continue his tradition. But the quasi-constitutional scheme of Loris-Melikov, discussed in March in the Winter palace, met with the opposition of Konstantin Petrovich Pobedonostsev, the former tutor of Alexander and his most trusted adviser. On April 29 (May 11), 1881, appeared a manifesto written by Pobedonostsev without the ministers' knowledge, in which the tsar described himself as "chosen to defend" autocratic power. At the same time a promise was made to continue Alexander II's reforms. Loris-Melikov, with D. A. Milyutin, at once resigned and was replaced by N. P. Ignatiev, a friend of the Slavophils, who promised to leave untouched the powers of the zemstva and municipalities and to alleviate the burdens of the peasants. And indeed, in June and September 1881, Ignatiev summoned the experts selected by the government among liberal zemstvo men. With their help he drafted a scheme for lowering the redemption prices, abolishing the poll tax and regulating internal colonization and land rents. The new minister of finance, N. K. Bunge, assisted by opening a peasants' bank and also enacted the first factory acts (1882) and appointed special factory inspectors to enforce their application. A special commission under M. S. Kakhanov (1881–84) prepared a reform of peasant self-government based on the principle of the equality of peasants with other social classes. In May 1882 Ignatiev proposed to Alexander to summon a zemsky *sobor* in Moscow of about 3,000 representatives from all classes, on the day of the coronation.

Here Katkov and Pobedonostsev won their victory. Ignatiev resigned; the reactionary Count Dmitry Tolstoy took his place as home minister. His tool I. D. Delyanov enacted in his former ministry a new reactionary statute for the universities (1884). He now became the mouthpiece of the nobility and gentry, a decaying class that tried to preserve as much as possible of their vanishing power and property. In 1885 a special Bank for the Nobility mas opened with the aim of preserving the landed property of the gentry from final liquidation (for debt). Then Tolstoy proposed to A. D. Pazukhin—a sworn defender of noble privileges—to revise the zemstvo institution with the aim of making the nobles' influence paramount in the countryside. As a result two important laws were published. on July 22 (Aug. 3), 1889, on land captains and on June 12 (24), 1890, on zemstva. The composition of district assemblies was changed from the figures given above to 5,433 representatives of landed owners (57%), 1,273 municipal representatives (13%) and 2,817 representatives of village communities. However, the chief aim of the government was, rather than to favour the gentry, to incorporate both the land captains and the executive boards of the zemstva in its civil service by making them subordinate to the provincial governors and destroying their representative character.

An outstanding feature of Alexander III's reign was an increased persecution of everything dissimilar to the officially accepted national type. Dissenting sects, the Uniates and the Lutherans in the western provinces, Lamaist Kalmucks and Buriats and especially Jews suffered a systematic persecution. The press was definitely muzzled, revolutionary organizations were destroyed and revolutionary movement was stifled. Public opinion was silent until the great famine of 1891; from that year symptoms of a revival appeared. The new movement was entirely different from the populism of the '60s and '70s. The Russian socialists became Marxists. Russia, they argued, was becoming an industrial country and the numbers of the industrial proletariat were speedily increasing. In fact, I. A. Vyshnegradsky, minister of finance since 1887, not only continued Reutern's policy in developing the railway (14,900 mi. at the beginning, 24,000 mi. at the end of Alex-

ander's reign) and in protecting industry (prohibitive tariff, 1891), but tried to influence the foreign market and to stabilize the rate of exchange of the Russian rouble. He also resorted to foreign capital. In 1889–94 its influx was 5,300,000 roubles, as compared with 1,500,000 of 37 years before (1851–88). However, the position of the Russian consumer nho had to pay about 34% ad valorem for imported goods, instead of 13% as before the tariff of 1891, was much worsened. The peasants especially suffered, as the price of grain, their only article for sale, fell from 1.19 roubles per *pud* (1881) to 0.59 in 1894, while their allotments, which had been insufficient at the moment of liberation, further diminished (1861–1900) to 54.2%. As a result, their arrears of taxes increased more than five times compared with 1871–80. Vyshnegradsky tried to relieve the treasury by increasing enormously the customs and excise. In the decade 1883–92 taxation increased 29% while the population increased only 16%. Thus, elements of an agrarian crisis were increasing as the 19th century was nearing its end.

Alexander III's foreign policy was peaceful. He wished to be his own foreign minister; Gorchakov gave place to a submissive Germanophil, N. K. von Giers. Bismarck profited by this and, in spite of his alliance with Austria (1879) which was avowedly concluded against Russia, contrived to renew, as early as 1881, the Three Emperors' league of 1872. In 1884 it was renewed for three following years and in 1887, as Austria seceded, Bismarck concluded his famous "reinsurance" treaty with Russia. All these treaties fettered Russia in its Balkan policy but secured the country against the opening of the straits to England and even permitted to it, by a secret protocol, the military occupation of the straits in case of necessity. As at the same time the Triple alliance with Italy was concluded (1882), Bismarck's policy proved too complicated for his successor, and in 1890 a Russian proposal to prolong the treaty for the next six years mas rejected by Count Caprivi. Thus the way was opened to a Franco-Russian *rap*prockement, while Germany was courting England, Russia's competitor in Asia (where Alexander in 1885 took Merv. thus establishing Russia on the frontiers of Afghanistan). France opened to Russia its market for loans and its factories for armaments in 1889; a French squadron was enthusiastically received in Kronstadt in 1891; and the subsequent *rapprochement* culminated in a military convention worked out in Aug. 1892 and definitely ratified by the tsar in March 1894.

Alexander III died on Oct. 20 (Nov. 1), 1894, in Livadia. 50 years old. His robust constitution had been sapped by constant fear of the revolutionaries, which made him live at Gatchina like a prisoner, surrounded by a cordon of police agents.

Nicholas 11, to 1917.—There can hardly be imagined a more tragic contrast than that of the extremely complicated situation inherited by Nicholas II and the complete nullity of the man who had to solve the problem. Like his father, Nicholas was not prepared to reign: like Alexander III, he would have preferred to live as a private man in his family circle, and he hated his exalted position which clashed with his modesty and bashfulness. However, like Alexander III, he felt it a duty to bear the burden of autocratic power and, moreover, to preserve autocracy untouched for his successor. He had to wait long for this heir, as his marriage (1894) with Princess Alix of Hesse, known as the empress Alexandra Feodorovna. brought him first four daughters, and when finally a son (Alexius) was born (1904), the parents had constantly to tremble for his life, as he inherited through his mother the dangerous disease of haemophilia. In their wish to save him at any cost they put their confidence in every kind of quack, beginning with M. Philippe, the spiritist from Lyons, and ending with the famous Grigory Rasputin. Her relations with them finally brought the nervous Alexandra to a state of religious exaltation and mystic faith in her predestined mission to save the tsar and her son from evil by obeying the precepts of God's elect.

The initial hopes of the liberals that the "leaden coffin lid" of Alexander III's reign would be raised by the new tsar were soon dispelled. When messages of congratulation on his marriage were brought to the tsar by innumerable deputations at a reception (Jan. 17 [29], 1895) the delegates asked the tsar "that the voice of the people should be heard" and "that the law should henceforth be respected and obeyed not only by the nation but also by the ruling authorities." The tsar, instructed by Pobedonostsev, answered: "I am aware that in certain zemstvo meetings voices have been lately raised by persons carried away by senseless dreams of the participation of *zemstvo* representatives in internal government. Let all know that I intend to defend the principle of autocracy as unswervingly as did my father." The liberals answered next day in an open letter: "'Senseless dreams' concerning yourself are no longer possible. If autocracy proclaims itself identical with the omnipotence of bureaucracy, its cause is lost. . . . It digs its own grave. . . . You first began the struggle, and the struggle will come."

The struggle had come. In June 1896 St. Petersburg saw the first strike of 30.000 workingmen. The evolutionary wing of the Marxist socialists triumphed; here at last the masses had come forward with purely economic demands. In 1898 the Russian Social Democratic Workers' party mas formed. However, the old leaders did not approve of this peaceful and legal economism of the young generation. In their "orthodox" organ *Iskra* (Spark), published abroad, they defended the political and revolutionary side of Marxism. In 1903, at a conference in London, their tendency, represented by V. I. Ulyanov (N. Lenin), obtained the majority and bolshevism (*Bolsheviki*=majoritarians) was created. On the other hand, the People's Will party was revived under the name of Social Revolutionaries with a new program in 1898. They remained true to their two leading ideas, agrarian revolution and terrorism. Agrarian riots began two years later in southern Russia. In 1899 began also student disorders which were answered by the minister of public instruction, N. P. Bogolepov, by the menace of military service for delinquents. On Feb. 27 (March 12), 1901, Bogolepov was killed by the student P. V. Karpovich. On April 15 (28), 1902, the home minister, D. S. Sipyaghin, was killed by S. V. Balmashev. Pobedonostsev recommended V. K. Plehve for his successor. Plehve had to struggle not only against the agrarian uprisings but also against moderate elements—the zemstvo liberals and the radicals of the liberal professions (professors, lawyers, journalists, engineers, the so-called third element, officials of the zemstva, etc.). They formed a secret Union for Liberation and from July 1902 published their weekly, Liberation, abroad. The number of persons accused of political crime rose from 919 (1894) to 1,884 (1899) and 5,590 (1903). The minister of finance, Serghey Yulyevich Witte, tried to oppose Plehve's policy but mas dismissed in Aug. 1903.

Tlze Russo-Japanese War.—Witte's removal proved especially fatal for Russian policy in the far east. William II of Germany suggested to Nicholas the idea that Russia's true mission was in Asia, not in Europe. The Trans-Siberian railway (begun 1891) presented new facilities for penetration. especially when a treaty with Li Hung-chang (May 1896) secured its extension by the East China railway; and in May 1898 a new lease was received to construct a branch through Mukden to Port Arthur, which six months before had been occupied by the Russian fleet. A chauvinistic guard officer, A. M. Bezobrazov. profited by Nicholas' confidence to cover with the tsar's protection his concession for cutting wood on the Yalu river. Many "patriotic" courtiers, grand dukes and the tsar himself acquired the bonds of the Eastern Asiatic Industrial society. Japan objected to the occupation of the left bank of the Yalu. As Prince Hirobumi Ito received no satisfaction in Petersburg, he went to London and concluded (1902) a five-year alliance with England. Russia was then obliged to withdraw its troops from Manchuria and promised to do so before Oct. 8 (21), 1903. The promise was not fulfilled. The war party, led by Bezobrazov and Plehve, decided against Witte for war. They knew nothing of Japan's readiness for war and were stupefied by the famous night attack of Jan. 26 (Feb. 8), 1904, on the Russian fleet in Port Arthur (see RUSSO-JAPANESE WAR).

The Revolution of *1905*.—The revolutionary movement found new substance in Russian military defeats. Patriotic feeling began to turn against the government. The war grew extremely unpopular. Plehve, who had wished to divert public attention from the internal situation by war, was blown up with his carriage on

July 15 (28), 1904. After much wavering Nicholas appointed on Aug. 26 (Sept. 8), 1904, Prince P. D. Svyatopolk-Mirsky as successor to Plehve. Public opinion was delighted. The liberal zemstvo men met in Petersburg, on Nov. 19–22 (Dec. 2–5), 1904, in private and worked out a petition to Nicholas asking for inviolability of the person, freedom of conscience, of speech, of meeting, of press, of association and equal civil rights. The majority also asked for a regular popular representation in a separate elective body which should participate in legislation, in working out the budget and in controlling the administration. The professional groups organized banquets to support the zemstvo program. Nicholas still wavered. His ukase of Dec. 12 (25) did not go beyond general promises and kept silence over the representative assembly. The chance of peaceful compromise with moderate constitutionalists was passing by. The revolution began.

On Sunday. Jan. 9 (22), 1905, many thousand workingmen, led by the priest Georgy Gapon, marched with icons, singing religious songs, to the Winter palace to speak to "their tsar." But the tsar was absent; the troops fired on the defenseless crowd and killed about 1,000 people. Svyatopolk-Mirsky resigned. A. G. Bulyghin, a bureaucrat, was appointed his successor. As a reply, on Feb. 4 (17), Grand Duke Sergius was blown up in the Kremlin by the Social Revolutionary Ivan Kalyayev. The tsar still wavered. He issued a promise merely to summon "the worthiest persons" to share in the drafting and discussing of laws.

Public excitement was growing, fanned by the news of Tsushima (May 14–15 [27–28]). The constitutional and the revolutionary movements began to separate. Constitutionalists (zemstvo men and Liberation union) held their congresses and prepared drafts of constitutional laws. After Tsushima they sent to Nicholas a deputation which repeated the demands of the November petition of 1904 and received (June 6 [19]) the answer that the "tsar's will was unshakable." Two weeks later Nicholas promised to another delegation of the nobility that he would keep the tradition of the past. On Aug. 6 (19) a law conceded a duma of the empire. But it was to be a consultative chamber, composed of class delegates, representing peasants (43%), landed proprietors (34%) and burgesses (23%). This, "Bulyghin's constitution," provoked general indignation. Its only result was to give the upper hand to revolutionary elements. There was no end to meetings, strikes, agrarian uprisings, which finally, Oct. 10–14 (23–27), united in one general strike all over Russia. Communication with the provinces was interrupted; Kicholas was isolated in his summer residence at Peterhof. On Oct. 13 (26) a soviet (council) of workmen's delegates was formed whose vice-chairman was L. D. Trotsky. On Oct. 1j (28) the Constitutional Democratic (Kadet) party was founded, which included the radical wing of the *zemstvo* men and the moderate elements from the Liberation union. The common aim of the left wing of public opinion was a democratically elected constituent assembly leading to parliamentary government.

Nicholas thought of abdication. But he was saved by Witte, who had concluded (Aug. 23 [Sept. 5]) peace with Japan at Portsmouth, N.H., and was generally expected to become a peacemaker inside Russia. On Oct. 17 (30) Nicholas signed the manifesto prepared by Witte (now a count). The manifesto promised inviolability of person. freedom of thought, speech, meetings and associations. No law was to be enacted without consent of the duma But the word "constitution" was not used; the tsar retained his title of autocrat (samoderzhets). He openly favoured the newly formed reactionary organization, the Union of the Russian People. Then a wave of absolutist demonstrations and Jewish pogroms organized by the police followed, in a few days, the short-lived outbreak of enthusiasm elicited by the tsar's concessions.

Witte was made prime minister of a unified cabinet. But he could not persuade liberal leaders to enter his cabinet as the situation remained extremely uncertain. His minister of the interior, P. N Durnovo, was a reactionary. Pobedonostsev resigned (Nov. 1 [14]), but Gen. D. F. Trepov mas retained in proximity to the tsar. Agrarian troubles reached their height in November, and Count Witte proposed to his minister of agriculture, N. N. Kutler, to prepare a draft of law on the basis of the expropriation of the landowners. It roused against Witte the nobility, who also founded a union. On the other hand, Witte had to fight against the revolutionary movement which found its headquarters in the Petersburg soviet of workmen's delegates. The soviet published decrees and tried to play the part of a second government. Trotsky, backed by Lenin, preached a permanent revolution. However, the policy of the Socialist parties definitely alienated the sympathy of the possessing class. On Dec. 3 (16) the soviet with all its members present was arrested. Its substitutes replied by an armed uprising in Moscow (Dec. 7 [20]). Until Dec. 13 (26) there was shooting in the streets; then the guard regiments came down from Petersburg and the rebels were dispersed. There followed the so-called punitive expeditions which exterminated with ruthless cruelty what remained of the revolutionary movement.

This decisive blow at the revolution weakened also the constitutional movement. Witte was losing ground. A certain extension of electoral right, especially in the towns (Dec. 11 [24]) was his last success. The predominance of peasant deputies remained untouched as the peasantry was considered more conservative and reliable than the nobility. Witte promised to the tsar a pliant duma. He dismissed Kutler, but he refused to promise to dissolve the duma if it raised the agrarian question, a measure proposed by his competitor, the former home minister I. L. Goremykin. Nicholas was encouraged to resistance by the repression of the revolutionary movement. He assured the deputations of the Union of Russian People that "the sun of Truth will shine bright over the Russian land" (Jan. 1906) and that his "autocracy will remain unchanged as it had been of old" (March).

The First Duma.—Witte's fate was sealed when the elections, which he left comparatively free, gave the majority to the Constitutional Democrats (the Kadets) together with peasants (Trudoviki) who wanted a radical land reform. The Social Revolutionaries, who still hoped for a revolution resulting in a constituent assembly, decided to boycott the elections. Witte resigned after having rendered the tsar his last service: he concluded a loan in France, which made the tsar free to deal with the duma as he liked. Just before the duma met (April 27 [May 10], 1906) new fundamental laws were published which curtailed its power while leaving to the tsar an extensive prerogative and to the council of empire equal rights in legislation and the budget.

Under these conditions the struggle was unequal. The dissolution of the duma was assured when in its address to the throne it proposed its own program of embodying into laws and enlarging the liberal promises of the October manifesto. After much delay Goremykin declared the program inadmissible. He received a vote of censure, which was, however, of no consequence. Then a debate began on the agrarian project introduced by the Kadets, on the basis of partial expropriation of big landed estates. The government published a sort of counterproject and warned the country not to believe in the duma's promises. The duma replied by a declaration which was interpreted by the government as an illegal appeal to the country and served as a pretext for dissolution. On July 9 (22) the delegates found the Taurida palace locked and surrounded by army detachments. About 200 of them moved to Viipuri in Finland in order to protest and to invite the people to passive resistance should no new duma be convoked. On the other hand, the congress of the United Nobility demanded the changing for their benefit of the electoral law by the mere will of the tsar. P. A. Stolypin, who had dissolved the first duma and taken the succession of Goremykin, did not dare to do so. But he tried instead to solve the agrarian question by means of emergency legislation. His scheme was to increase the lots of the well-to-do peasants at the expense of the poorer ones, by dividing the communal land at the first request of the former and thus to avert the danger of expropriating the estates of the nobles (edict of Nov. 9 [22]). He also set up field courts-martial to pronounce death sentences against the revolutionaries (Aug. 19 [Sept. 11]).

The Second Duma.—The second duma, convoked Feb. 20 (March j), 1907, in spite of all pressure on electors proved much more radical than the first. The Kadets' representation sank from 179 to 123, while the Socialists, both the Social Revolutionaries and the Social Democrats, rose from 18 to 102 and the Labour group

(mostly peasants) rose from 94 to 104. Both extremist groups of urban and agrarian socialism thus nearly formed the majority, while on the right ning there were only 32 Octobrists (a party of landlords and rich merchants, formed soon after the Kadets with the government's connivance—they professed to be constitutionalists) and 63 nationalists and avowed autocratists. However, the new majority was not so confident as had been the first duma and shared the cautious tactics of the Kadets. The United Nobility was afraid of that moderation. They now induced Stolypin to prepare a new electoral law and only sought for a pretext to dissolve the duma. They found it in the duma's lack of desire to denounce revolutionary terrorism and in the propaganda of the Social Democratic party. On June 3 (16) the duma was dissolved and at the same time a new electoral law was published which partly disfranchised the nationalities (especially the Poles) and gave predominance to the representatives of the gentry.

The Third and Fourth Dumas.—Extreme pressure was used during the elections to the third duma (Nov. 1907–June 1912), as well as to the fourth (Nov. 1912–March 10, 1917). However, the government did not succeed entirely in stifling the opposition groups.

TABLE VI.—*Party Composition of the Four Dumas*

Parties	First	Second	Third	Fourth
Right wing:				
Extreme right	26	63	52	65
Nationalist	—	—	93	120
Centre:				
Conservative (Octobrist)	17	32	133	98
Progressive	—	—	39	48
Left wing:				
Constitutional Democratic (Kadet)	179	123	53	59
Peasant-Labour (Trudoviki)	94	104	14	9
Social Revolutionary (S.R.)	—	37	—	—
Social Democratic* (S.D.)	18	65	14	15
National minorities:				
Poles	51	47	18	13
Others	93	47	8	8
Total	478	518	424	435

*Including Communists; for instance, they won 4 seats in the third and 6 seats in the fourth duma.

At the beginning of the decade of duma activity Stolypin worked with the leading group of Octobrists and their leader Aleksandr Guchkov. By that co-operation Stolypin was able to pass his agrarian laws and the nationalist bills depriving Finland of the last remains of autonomy. Russian Poland was deprived of the Kholm territory. Measures were taken against the Ukrainian national movement and against the Jews, with the acquiescence of the duma. However, on the questions of the reconstruction of the army and navy Guchkov took a sharp line against the government and the grand dukes. It made Stolypin go to the side of the Nationalists—a party newly created with the pecuniary aid of the government and thus very submissive, led by Count Vladimir Bobrinsky and Pavel Krupensky. On the other hand, the Octobrists approached somewhat the Kadets and worked together on questions of foreign policy and the budget. As soon as Stolypin lost his credit with the duma he was no more needed by the tsar, who still cherished the hope of complete freedom from the duma. The assassination of Stolypin (Sept. 1 [14], 1911) by a revolutionary, Dmitry G. (Mordka) Bogrov, elicited no expression of regret from the tsar and was ascribed by rumour to a police plot.

The elections of the fourth duma were so arranged by the government as to give an overwhelming majority of Nationalists, who would then ask for the transformation of the duma into a consultative chamber. However, the results of the elections were a disappointment: the opposition increased in number and authority; the right wing of autocratists was merely equal to it; and there was no strong centre to lead the duma.

The beginning of World War I brought nearly all parties together in a patriotic cry for a sacred union. But the government did not know how to make use of this disposition of mind. It continued its exasperating internal policy and tried to do without the duma. The situation was so much the worse when the Russian retreat began and the army proved unprepared. The war minister, V. A. Sukhomlinov, and other reactionary ministers were then dismissed, and the duma was summoned for Aug. 1 (14), 1915. It was empowered to control the supply of munitions through its members in a special committee together with the Union of the *zemstva* led by Prince G. E. Lvov. The duma found finally its majority, but it was the majority of a Progressive bloc which proposed to the tsar a national coalition government "possessing the confidence of the country" and a program of reforms necessary to appease the country (Aug.–Sept. 1915). Unhappily there was no Witte to advise the tsar. Goremykin was only a courtier and he made the tsar answer by a prorogation of the duma (Sept. 3 [16]) and by the expulsion of all liberal ministers who favoured the idea of a national cabinet.

Thus the last chance of a peaceful solution was lost. The duma could no more lead public opinion. which turned to revolution. The chiefs of the army were this time on the side of the duma and public opinion, as they did not believe in the possibility of victory as long as the regime lasted. The universally hated Goremykin had to resign when the duma met (Feb. 2 [15], 1916); but his successor—the old master of ceremonies of the court, B. V. Stürmer, an ignorant and comic figure, especially when he was made successor of S. D. Sazonov in foreign affairs (July)—only helped to discredit the nhole system and to demonstrate its weakness. As the tsar had made himself commander in chief instead of the grand duke Nicholas and was absent at headquarters, the tsarina took the lead in Petrograd (the new wartime name of the capital). She surrounded herself with an adventurous crowd of irresponsible advisers. the friends of her great confidant Rasputin. The duma was at last summoned on Nov. 14 (27). She poured her wrath on Stiirmer, who had to go, and on A. D. Protopopov. her former vice-president. nho passed through the antechamber of Rasputin to get the post of home minister. Stiirmer's successor, A. F. Trepov, was hissed by the duma. On Jan. 9 (22) Prince N. D. Golitsyn became prime minister. Warning on warning came to the tsar even from grand dukes and foreign diplomats, insisting on serious concessions to the people in order to prevent revolution. But the tsar, influenced by the tsarina, would not listen. On Dec. 18 (31) Rasputin was assassinated by Prince F. F. Yusupov, husband of the emperor's niece, and V. M. Purishkevich, an extreme right deputy. Not even that blow could change the obstinacy of Alexandra Feodorovna. The duma had been postponed until Feb. 14 (27), 1917. Disorders began in Petrograd during its session, and on Feb. 26 (March 11) the duma was prorogued. The following day was the first day of the revolution.

(P. M.; X.)

D. THE REVOLUTION, 1917

The Russian Revolution of 1917 had two sharply contrasted phases. There were, indeed, two revolutions, those of February and of October in the old Russian calendar (which is preserved in the traditional historiography of the period), or of March and of November in the western calendar (which the Russians adopted on Feb. 1 [14], 1918). The former was the product of the discontent of the democratic forces with the conduct of war, the latter exploited war weariness in the interests of the international revolutionary doctrines of Marxism. The former revolution overthrew Russian tsardom and, through its liberalism, gave scope to those who were preparing for the latter.

The attack made by the Progressive bloc of the duma on the autocracy was in fact animated by its conviction of the double danger in which the country stood from defeat in the field and from revolution following on such defeat. It demanded the establishment of a government "invested with the people's confidence," and an underlying aim was to forestall more radical changes.

By the end of 1916 the attempt to bring down the government by constitutional means had obviously failed. This failure compelled the more active and impetuous of the liberal patriots to consider whether it was possible to realize their aims by a military coup d'état and a court revolution. The initiative in this matter was notoriously taken by prominent officers at the front who were in close touch with the headquarters staff. The propaganda in favour of a court revolution was started by Gen. A. I. Krymov.

The complete scheme of the Krymov conspiracy was revealed by Aleksandr Guchkov, the war minister in the provisional govern-

ment. in the evidence which he gave before the tribunal set up for investigating the criminal record of the ministers of the old regime. The idea according to Guchkov nas to seize the tsar as his train was proceeding from headquarters to Tsarskoye Selo, to compel him to abdicate in favour of the tsarevich with the grand duke Michael as regent, to arrest the tsar's ministers with the help of the Preobrazhensky guards and then to proclaim the abdication simultaneously with the names of the new duma ministers. This court revolution, planned to take place in the early months of 1917, was first postponed by the strikes and unrest which prevailed at that time in the capital and was finally rendered abortive by the success of the March revolution.

The Bolshevik party, which had been consistently against the war from the beginning, took no part in the preparations for the March revolution. Lenin and other leaders, who were at that time abroad. were formulating views as to the possibilities of revolution which were subsequently acclaimed as prophetic. But the international antiwar conferences organized by Lenin at Zimmerwald and Kienthal had no obvious effects, and as late as Jan. 1917 Lenin, then aged 46, told a Swiss audience that it was doubtful whether "we the old would live to see the decisive battles of the coming revolution." The few Bolshevik agitators remaining in Petrograd (including G. A. Shlyapnikov, the representative of the central committee of the party), were as little aware as the Mensheviks or the Liberals that the strikes, started early in March 1917, were likely to bring about the revolution. On the contrary, as far as they could, they discouraged the idea of a revolution as premature and likely to lead to disaster and gave it their official support only after it had actually broken out.

The March Revolution and First Provisional Government. — Strikes for higher wages at some of the factories had been occurring sporadically for some time, and on March 8 (21) no fewer than 130,000 men are said to have been out. To this number must be added a considerable figure to account for the women workers who were demonstrating on that day (the Women's day). But though the number of the strikers and of their sympathizers was large, and though several bakers' shops were demolished by the mob, neither the leaders of the duma on the one hand nor the government and the police on the other gave the matter any particular attention. The only precaution taken by the authorities was to prevent the demonstrators from reaching the centre of the city. The next day the strikers were still more numerous and probably amounted to 30% of all the workers in Petrograd. Some sections of the crowd succeeded in reaching the centre of the city and their mood soon became sinister and threatening. On that day, too, the university students joined the movement, and though the watchword of the strikers remained "bread," it is asserted that a few cries were raised denouncing the autocracy and the mar.

The third day (March 10 [23]) proved the critical day. The strike became general and the strikers assumed an aggressive demeanour, raiding the police stations in the Viborg (factory) district and disarming the police. In this suburb the police practically disappeared and the political demonstration began to assume the character of an armed rising. That night Gen. S. S. Khabalov, military governor of the capital, received a telegram from the tsar, then at the front, ordering him to suppress the strike movement.

The attempt to use fosce to put down the disorders in the capital was temporarily successful, but one regiment after another mutinied on March 11 and 12 (24 and 25) and the situation became clearly untenable. The duma refused to disperse on March 11 (24) when it received the prorogation order. and there were discussions among the Progressive and Labour leaders about the possibility of forming a new government. On the same day M. V. Rodzianko, the speaker of the duma, sent an urgent telegram to the tsar ending with the words "May the blame not fall on the wearer of the crown." But the tsar put it aside. Rodzianko also got into touch with the generals holding the main field commands, asking for their support.

When the tsar and his advisers at last learned that the revolt of the Petrograd troops had endangered the existence of the monarchy they immediately ordered a number of regiments from various parts of the front to proceed to the capital. The first detachments under Gen. N. Ivanov were prevented by the railwaymen from approaching Petrograd, while the picked regiments were never sent because before they could actually be moved the revolution had developed such impetus and had gained such support even at the front that the attempt to crush it by military force was recognized as hopeless.

The critical day was March 12 (25). While the city was largely in the hands of the mutinous regiments and the mob, news came to the duma that elections were in progress by show of hands for a new soviet or council of workers' delegates such as had seized power in the capital during the revolution of 1905. The leaders of the different political groups meeting in the duma building were informed that a large crowd was on its way there and that decisive action was necessary. On the initiative of V. V. Shulgin a provisional committee was set up with the leaders of all the parties presented upon it except those of the right. A. F. Kerensky, a Trudovik leader, took charge of events and improvised some kind of guard. The cabinet met during the evening and, failing to get a definite reply from the tsar to a suggestion for the appointment of a new prime minister, simply dispersed. It was only on March 14 (27), after prolonged discussions and with considerable reluctance, that the members of the duma committee made up their minds to constitute a government. It was set up on March 15 (28). Three considerations were obviously instrumental in leading them to this decision: first, a clear consciousness of the elemental force of the revolution; second, the apprehension that the Petrograd soviet might be tempted to assume power; and, third, the hope that by constituting themselves the ruling authority they might be able to cope with the increasing anarchy and to save the monarchy and even the dynasty.

The Soviet. — Meanwhile, the revolutionary workers had succeeded in setting up a soviet. Its first session opened in the evening of March 12 (25) with an attendance of approximately 250 members consisting of Socialist deputies of the duma, the Worker group of the munition committee, a number of prominent worker leaders representing the various shades of revolutionary opinion, and members of strike committees who had been active during the few previous days. It managed to appoint a strong executive committee which immediately took over the business of food supplies and the defense of Petrograd against any possible attack from the autocracy.

From this very moment, enlisting as it did the support of the workers and of the Petrograd garrison, the soviet executive committee was the depository of real power. It had its headquarters in the duma building. and one of its vice-presidents was Kerensky, who constituted a link with the duma committee and subsequently with the provisional government. Its members had been conscious of this power and probably overestimated rather than underestimated their authority. But they made no overt or covert attempt to constitute a revolutionary government, and when the duma committee decided at last to assume the responsibility of forming the new government its decision was unanimously welcomed by the leaders of the soviet. Why the Petrograd soviet refused immediately to proclaim itself the government of revolutionary Russia can only be a matter of surmise. Speaking in the first All-Russian Conference of Soviets, which was held early in April 1917, G. Steklov, one of the Bolshevik members of its first executive committee, ascribed the refusal to the prevailing uncertainty as to the attitude of the army. But this explanation scarcely covers the whole of the ground. An orderly government, representing a compromise between the insurgent masses and the bourgeois classes, was obviously the sole bulwark against counterrevolution, and the desire for the establishment of such a government must undoubtedly have constituted the main factor in the unopposed assumption of power by the duma. Still, fear of the outbreak of a counterrevolution cannot be regarded as an adequate explanation of the uillingness of the Bolshevik leaders to delegate power to the duma. Their decision to step aside and to leave the formation of a government to the bourgeoisie, the class determined to arrest the onrush of the revolution, would be unintelligible unless the fact is recalled that most of them accepted the Menshevik view that the aim of the revolution was solely to establish a democratic regime

and that any attempt to associate the movement with socialist experiments or the dictatorship of the proletariat would ruin it and so repeat the disastrous failure of 1905.

Among the members of the soviet's first executive committee were a few Bolsheviks who accepted Lenin's dictum that the Russian Revolution was the vanguard of the world socialist revolution. But so unprepared were they for taking action that when Lenin arrived in Petrograd three weeks later he found that his most difficult task was to inspire his own party with the necessary enthusiasm for deepening the revolution. The Bolsheviks, however, were in such an insignificant minority both in the Petrograd soviet and outside that their views could not possibly carry much weight.

The members of the duma committee were not only willing to form a government with the consent of the soviet but insisted on the latter's issuing an open proclamation of support. The program of the provisional government published on March 16 (29) was indeed largely dictated by the soviet leaders and was accepted in full by the duma committee. The status of the government created as a result of this compromise was necessarily precarious in the extreme. Nominally invested with full powers and sovereign authority, the provisional government—whose principal figures were Prince G E Lvov (prime minister), P. N. Milyukov (foreign affairs). M. I. Tereshchenko (finance), Aleksandr Guchkov (war) and A. F. Kerensky (justice)—was in reality powerless and the mere creature of the soviet. Its position was bound to be unstable because the basis of the compromise which established it was vague and uncertain. But the revolutionary impetus of the masses and the constant changes in the constitution of the soviet and hence in the point of view of its leaders soon combined to render this basis even more unstable. Every day fresh groups joined the soviet and new leaders replaced old ones, with the consequence that new adjustments had constantly to be made and even relative stability became difficult to maintain.

Arrest of *the Imperial* Family.—While negotiations between the soviet and the duma were still proceeding and before the provisional government formally took over the administration (March 16 [29]), the extremely delicate question of the position of the tsar and of the dynasty came up for settlement. That the tsar Nicholas could no longer remain autocrat was a foregone conclusion, but the leaders of the duma, dreading the idea of Russia's becoming a republic, mere determined to save the monarchy and even the dynasty. They accordingly dispatched Guchkov and Shulgin, two Conservative members of the duma, to the tsar's headquarters at Pskov with the mission of obtaining the tsar's abdication in favour of the tsarevich and the appointment of his brother the grand duke Michael as regent. But the tsar declared that the illness of his son made it impossible for him to contemplate being separated from him and changed the instrument of abdication so as to provide for the succession of his brother as tsar. Such a solution was unacceptable. and, when the members of the duma committee visited the grand duke on March 16 (29), Kerensky strongly appealed to him not to accept in the name of national unity. Despite Milyukov's strong pleas that he should ascend the throne, the grand duke refused. The dynasty that had ruled Russia for three centuries came to an end.

A few days later the question of the dynasty came up again in a dramatic fashion ahich incidentally demonstrated both the strength of the soviet and its determination when necessary to use it in defiance of the government. The tsar had requested the new ministers to arrange for the departure of himself and his family to Great Britain, a request which the leaders of the soviet heard of by mere accident. At once they called on the government to put the tsar and his family under arrest and gave orders to the railwaymen to stop the imperial train. The actual usurpation of power in this instance, however, proved unnecessary: the new ministers themselves proceeded to put the tsar Nicholas and his family under arrest.

The Army and the War, March–May.—The struggle for support that took place between the duma and the soviet was the paramount business of the next few weeks. The battle was fought out in the main on two planes, one the question of the new status of the army, the other the question of continuing or terminating the war. The leaders of the soviet championed the civil rights now claimed by the soldiers, while the duma appealed to them in the name of national safety. That the harsh conditions uhich had hitherto prevailed in the barracks had to be modified was obvious enough, and Guchkov was preparing an official declaration to this effect. But, while he was for confining the liberties of the soldiers within the strict limits of discipline, the leaders of the soviet declared that these liberties must be vindicated unconditionally. This resolve to gain the adherence of the soldiers by supporting their claims at all costs was responsible for the issue on March 14 (27) of the notorious *prikaz* (order) number 1[1], which helped in the disintegration of the already badly shaken Russian army.

But despite all the privileges which the Petrograd soviet had granted to the soldiers, the devotion of the army at the front and even at the capital had to be secured. At first the provisional government seemed to be the body which had won the support of the army. When the ministers proclaimed the necessity of a more vigorous prosecution of the war, the army seemed to be rallying to their support. For about a fortnight regiments stationed at Petrograd as well as delegations sent by those in the provinces and at the front marched to the duma commanded by their officers, proclaimed their readiness to serve the revolution and offered the government their allegiance and joyful support. But the army's enthusiasm for prosecuting the war soon began to cool, while the propaganda made by the soviet for the clarification of the Russian war aims as a sure promise of terminating hostilities became increasingly popular.

On March 27 (April 9) the soviet issued a manifesto to the world declaring that Russia sought no gains from the war and was ready to conclude peace on the basis of "no annexations, no indemnities." From this time onward the question of peace terms became the main bone of contention between the government and the soviet, the government adhering to the secret treaties made by the Allies, and the soviet insisting on the denunciation of these treaties and agreeing to continue the war only for purposes of self-defense. The pressure put on the government to identify itself with the principles laid down in the soviet's manifesto became at last so strong that ministers felt compelled to make a public declaration (April 9 [22]) in which Russia's mar aims were formulated as the establishment of a permanent peace on the basis of the self-determination of the peoples. This declaration was hailed as a great victory by the soviet, which thereupon demanded that the provisional government take the next step and communicate this declaration to the Allied powers, with a view to their adopting its principles. After some hesitation Milyukov on May 1 (14) transmitted the text of the declaration, but in the covering letter which he dispatched to the Russian ambassadors he asked them to reassure the governments to which they were accredited by informing them that Russia's position with regard to the war remained unchanged.

Milyukov's note became known in Russia on May 3 (16) and caused great indignation on the left. For two days Russia seemed to be on the brink of civil war, the outbreak of which was finally prevented only by the action of the soviet, which prohibited all meetings and demonstrations for three days and ordered the garrisons to remain in the barracks. The strength and discipline shown by the masses at this time finally convinced the soviet leaders that the real power was in their hands.

The Second Provisional Government.—Discredited and disheartened by this proof of ministerial impotence, Prince Lvov, the prime minister, issued a proclamation in which he expressed his conviction that a reconstruction of the government on a wider basis, with the inclusion of soviet representatives, was essential to

[1] *Prikaz* number 1 was composed by a commission of the Petrograd soviet headed by N. D. Sokolov. In the name of the Soviet of Workers' and Soldiers' Deputies it ordered that committees of soldiers were to he formed in all military and naval units in Petrograd and to send one representative each to the Taurida palace next morning. In their political actions units were to be subject to their committees and to the soviet. Orders of the military commission oi the duma were to be obeyed only when they did not contrailict those of the soviet. Arms were to he under the control of the committees and on no account to be given up if demanded by the officers. Strict discipline was to be preserved when on duty. Salutes, ets., when off duty were abolished. Special titles used in addressing officers, "Your excellency" and references to the officer's noble birth, were abolished. Officers were forbidden to use the second person singular in addressing soldiers.

the safety of the state. The soviet at first (May 12 [25]) refused to entertain the idea of making a coalition with the bourgeois parties; but after the resignations of Milyukov and Guchkov and when the danger of a complete breakup of the government seemed imminent, it reconsidered its decision and agreed to enter the government (May 18 [31]).

The soviet was allotted five portfolios in the reconstructed cabinet, those of justice, agriculture, labour, food supplies and post and telegraphs. The last-mentioned ministry was created specially to make room for Irakly G. Tsereteli, a Georgian Menshevik member of the second duma who had been banished to Siberia and was now the most popular and powerful member of the soviet. Kerensky was now promoted to the all-important ministry of war, while Tereshchenko replaced Milyukov.

The fall of the first provisional government resulted from two main reasons. The first was its assumption of responsibility without the backing of power. The second was its equivocal foreign policy of balancing between the pledged war aims of the Allies and the soviet's policy of limiting the war to a revolutionary defense with a view to an immediate peace. The new government occupied a more favourable position, for it represented both the *bourgeoisie* and the masses. It mas confronted, however, by formidable difficulties; not only had the crucial question of peace or war to be settled but also the growing unrest in the villages and the dissolution of the empire into separate national units called urgently for solutions which the government was totally unable to furnish. The consequence was that the coalition lasted only two months and was finally brought down by the resignation of four Liberal (Kadet) ministers, who adopted this method of protesting against the concessions made to the Ukrainian autonomist movement. The new government crisis coincided with the greatest crisis which the revolution had so far had to face, in the disastrous failure of the offensive in Galicia and the first Bolshevik rising in the capital.

Sound strategy demanded that, while a most determined effort should be made to increase the fighting morale of the army, it should not be submitted too early to the test of challenging the enemy on the military front. But the offensive which the Kerensky government so blindly and so enthusiastically adopted was obviously undertaken more for political than for military reasons. 'The effect of renewing the offensive, it was believed, would be either to prove in case of victory that Russia had still to be taken into account and so to compel the Germans to come forward with the offer of a democratic (nonannexationist) peace, or, in the event of defeat, to compel the German Socialists definitely to take their stand either in defense of the Russian revolution or in support of German militarism. The offensive was launched on July 1 (14). At first it proved successful; the Austrian lines were broken and many prisoners and guns were taken. But in less than a fortnight after operations opened not only were the Russian armies destroyed but Russia had ceased to exist as a great power.

Meanwhile, the Bolsheviks were becoming a major factor in the development of the situation. Lenin had arrived from Switzerland on April 16 (29) via Sweden, having travelled across Germany in the famous sealed train with the connivance of the German military authorities, who had nothing to lose, it seemed, by facilitating the movements of such a declared opponent of the Russian war effort. Lenin immediately took the view that the soviet's support of the bourgeois revolution had been overtaken by events and that the time was ripe for a proletarian revolution in Russia as the signal for a world-wide socialist revolution. Whereas he had previously vacillated on the value of the soviets in such a revolution, he now came out in his "April Theses," published in *Pravda* (the Bolshevik organ) on April 20 (May 3), in favour of the soviet as the "*one possible* form of revolutionary government." He made it clear that it was first necessary for the Bolsheviks to become the dominant element in the soviet, and that as soon as this was achieved the moment to strike mould have come.

Soviets had by now been formed all over the country, and the first All-Russian Congress of Soviets was held in June. The Bolsheviks accounted for 105 of its 822 delegates and secured 3j seats out of the 250 on the central executive committee which it set up. At the conference the Bolsheviks made it plain that they were prepared to take power as a party.

After street demonstrations in June had shown the growing influence of the party, thanks largely to its opposition to the war, a popular rising broke out in the capital on July 16 (29). This rising was a strange demonstration, the most marked characteristic of which was its lack of leadership. The members of the central committee of the Bolshevik party hesitated to identify themselves with it beforehand for fear it might prove unsuccessful. Ostensibly a demonstration in favour of the transference of power to the soviet, it was in essence an attempt to stampede that assembly, a fact which its leaders were prompt to recognize. For nearly t o days the gunmen were in occupation of the capital, but their lack of objective and of leadership perplexed them and paralyzed their efforts. The Bolshevik leaders in the capital (Lenin did not return from a convalescence in Finland until July 17 [30]) were forced to assume some kind of control of the movement and to channel it toward bringing pressure on the Petrograd soviet and the central executive committee to take power.

During the two days that the rising lasted the coalition government was absolutely quiescent. But Kerensky on the very first day proceeded to the front and procured picked troops. which arrived in the capital on the day after the movement had fizzled out. Meantime, any attempt to renew disturbances was rendered hopeless by the publication of documents which purported to prove that Lenin mas a spy and a paid agent of the German general staff. The result of the disturbances was the practical suppression of the Bolshevik party. L. B. Kamenev was arrested. Lenin and G. E. Zinoviev went into hiding, to the considerable dismay of their friends.

Kerensky's Provisional Government.— These events coincided with the failure of the Galician offensive and made yet another change of government inevitable. Prince Lvov was presented by the soviet members of the government with an ultimatum which required him, in accordance with the decisions of the Congress of Soviets, to declare Russia a republic without waiting for the convocation of a constituent assembly, to suppress finally the duma and the council of state and to accept the congress's policy of forbidding any sale of land before the meeting of the constituent assembly. The prince refused to comply with these demands, regarding them as a usurpation of the rights of the constituent assembly, and promptly sent in his resignation. The ministry was reconstructed on July 21 (Aug. 3), Kerensky becoming prime minister as well as minister of war and Tsereteli succeeding Prince Lvov as minister of the interior. With the formation of the new ministry, not completed until Aug. 6 (19), the Russian revolution entered on a new phase—a phase of inaction. The record of Kerensky is indeed singularly barren. He failed to put new vigour into the prosecution of the war. He left the question of concluding peace just as he found it. He made no attempt to settle the various difficulties involved in the labour question. And he was so incapable of handling the agrarian problem that he allowed the peasants to settle it as best they could by local initiative.

In fact, the only achievements of Kerensky's administration were the declaration of Russia as a republic and the convocation on Aug. 25 (Sept. 7) of a spectacular state assembly representing all classes in the country and all political groups. The actual purpose which this assembly was meant to serve is obscure, but its composition and the choice of Moscow for its sittings seem to show that it was convoked with some vague hope of investing Kerensky's government with that moral authority and sanction which it had hitherto conspicuously lacked. Nothing remarkable, however, resulted from its three meetings save a series of hysterical speeches in which the prime minister announced his determination strenuously to support the revolution and ruthlessly to suppress its enemies, whether they came from the right or from the left.

After the failure of the July rising, Trotsky, who had been taking an independent line since his return to Russia on May 17 (30), joined the Bolsheviks with his supporters. On Aug. 6 (19) Trotsky and A. V. Lunacharsky were arrested. The Bolsheviks themselves had recast their tactics. Lenin had decided that the soviets had proved themselves unsuitable for the task allotted to

them, and the slogan "All power to the soviets" was replaced at the sixth party congress (held in the second week of August) by a recognition that it mas the task of the proletariat and of the poorer peasantry to liquidate the dictatorship of the counter-revolutionary bourgeoisie, as the provisional government was now styled by the Bolsheviks.

Meanwhile, the generals at the front and the members of the general staff in the capital began to think that their time had come. Taking stock of the anarchy prevailing in the country and of the disorganization of the army, they began to be more and more inclined to favour the creation of a military dictatorship. Kerensky supported Gen. L. G. Kornilov, the commander in chief, in the preliminary steps for establishing one. He quarrelled with him only when he realized that the general himself was aspiring to become dictator. Suspecting Kornilov's designs, he promptly declared him a traitor and an enemy of the revolution; to which the general replied by sending on Sept. 9 (22) picked Cossack regiments under the command of Gen. A. I. Krymov against Petrograd with the object of intimidating Kerensky and forcibly suppressing the soviet. Thereupon Kerensky, turning his back on the right, appealed to the left for support, and the central executive committee of the soviets appealed in its turn to the workers to fight the threatened counterrevolution. The Bolshevik leaders, now released from prison, took up the challenge with enthusiasm and, recognizing that their opportunity had arisen, proceeded to arm the workers, in anticipation of the arrival of Krymov's troops. Deputies from the Petrograd workers and soldiers went to meet the Cossacks and persuaded them that they had been sent on a false errand. Kornilov, A. I. Denikin and three other generals were arrested and imprisoned. and Krymov shot himself after frankly avowing his hostility to Kerensky.

Just as the failure of the Bolshevik rising in July proved to be the opportunity of the right, so now the collapse of Kornilov's raid gave the extreme left its chance. The first result of this revival of revolutionary fervour was a renewal of the hatred of the officer class; a new wave of massacre swept over the country, taking peculiarly ugly form in Finland, where sailors killed their admirals and officers by throwing them overboard and beating them to death in the water. The moderates mere speedily losing their hold on the masses. Lenin's supporters were now rapidly increasing their forces, so much so that by the middle of September both the Petrograd and the Moscow soviets for the first time passed Bolshevik resolutions; while the moderate leaders, who had presided over them since their creation, were soon replaced by Trotsky at the new capital and by V. P. Nogin at the old. It now became possible for Lenin to revive the slogan "All power to the soviets."

Kerensky's last improvisation was a Democratic conference, which met in Petrograd on Sept. 27 (Oct. 10). Unlike the state assembly. this was confined to left-wing parties and organizations. The Bolsheviks took part against Lenin's wishes, but the impunity with which they were allowed to shout Kerensky down showed the weakness of their opponents, as did the failure of the latter to agree on the continuation of a coalition including non-Socialist elements. The existing central executive committee. though it continued to support Kerensky, nho formed a new cabinet including the Kadets on Oct. 6 (19), withdrew its representatives from his government. The pnited front of soviet democracy, which had seemingly been re-established by the challenge thrown out by Kornilov, was now finally broken. The Bolsheviks proceeded to declare the members of the central executive committee traitors to the revolution and at last worked openly for their overthrow and for that of the bourgeois government.

The provisional government was formally invested with full and sovereign power and was responsible neither to the Petrograd soviet nor to the recently convoked council of the republic or preparliament, which was a consultative body representing all the main parties. But actually it possessed no power at all. The real authority, then more than at another time in the revolution, was held by the soviets in the capitals and in numerous provincial towns, which openly defied the government and exercised, each in its area. legislative as well as executive powers. In many of the provincial soviets as well as in those of Petrograd and Moscow the Bolsheviks now counted on solid majorities; and in most cases the Bolshevik provincial soviets constituted themselves quasi-independent republics.

The various nationalities, which had long been clamouring for autonomy, now began openly to secede from the state and to organize their own armies by withdrawing their nationals from the army under the plea of defending their newly created frontiers and their national flags. The whole country, town and village alike, was in a state of feverish unrest which soon developed inta riots and anarchy. In the towns bread riots broke out; but the most destructive of these revolts were those of the peasants, who began to solve the land problem in their own way by expropriating the land, driving off the cattle, burning down the landowners' dwellings and barns, demolishing agricultural machinery, felling wood in the forests and wantonly destroying trees in the orchards. Landowners who delayed their flight were captured, tortured and murdered. Yet the ministers were inactive and helpless. They lacked the necessary military backing to put these disturbances down by force; even the Cossacks refused to obey orders, remembering how they had been repudiated by Kerensky in the Kornilov episode.

At the front the army still preserved on the surface a certain degree of discipline; but the mutual distrust and hatred of soldiers and officers was so profound that at any time an open clash might be expected, especially since a shortage of food and supplies, and in some cases actual famine, made the preservation of military subordination increasingly difficult. It became obvious that the army was likely to withdraw from the field either in the autumn or at any rate before the winter had passed.

Meantime, the Germans had been penetrating farther and farther into the Baltic provinces. On Oct. 12 (25), with the support of their fleet, they occupied the island of Oesel and so secured the command of the Baltic. Petrograd was now obviously menaced, and ministers declared their intention of transferring the seat of government to Moscow. To dream of continuing the war after abandoning Petrograd, the biggest arsenal in the country, was denounced as sheer treason, and the proposal furnished the Bolsheviks with an admirable lever for stirring up the masses. Another mistake which the ministers made, an attempt to replace the Petrograd garrison by more reliable troops from the front, was used by their enemies as a pretext for openly organizing military forces for an attack on them. The Petrograd soviet accordingly, under Trotsky's command, promptly came forward and countermanded the movement of troops. On Oct. 20 (Nov. 2) a body known as the "preparliament" was constituted in Petrograd; it was composed partly of delegates from the Democratic conference and partly of nonproletarian elements. On Oct. 26 (Nov. 8) the leaders of the soviet constituted a military revolutionary committee which declared itself the highest military authority in the capital and province of Petrograd. This step was ostensibly taken for the defense of the capital against the enemy, but actually it was a movement for the creation of a general staff for the Bolshevik revolution. Three days earlier, after much debate, the central committee of the Bolshevik party had pronounced in favour of an armed uprising. Trotsky openly organized his forces without meeting with the slightest interference from the government.

The November (Bolshevik) Revolution. — The Bolshevik revolution was inseparably connected with the convocation of the second Congress of Soviets. The central executive committee, which consisted entirely of Mensheviks and Social Revolutionaries, supporters of Kerensky, was reluctant to convene a second congress and postponed doing so from day to day. But when finally the Petrograd soviet threatened to convene the congress itself the committee fixed Nov. 7 (20) as the date of convocation. It was obvious that the congress would have a Bolshevik majority. The convocation of the All-Russian Congress of Soviets was preceded by the holding of a number of regional congresses, all of which declared for a terminatipn of the coalition and for the establishment of a Soviet government, the aim of which would be immediately to propose terms of peace, to give the land to the peasants, to establish a complete workers' control of the factories and to deal with the famine by expropriating the hoards of food-

stuffs supposed to have been accumulated by the capitalists and landlords.

Meanwhile, ministers waited patiently on events, believing that nothing could happen till Nov. 7 (20). But Trotsky gave battle two or three days before the appointed date. On h'ov. 3 (16) he confronted the general staff with a demand that all its orders should be countersigned by the military revolutionary committee. When the general staff refused this demand he ordered the Petrograd garrison to stand at arms in defense of the committee. On Nov. 4 (17) a meeting attended by delegates from all the troops passed a resolution refusing obedience to commands of the general staff and recognizing the committee as the sole organ of power. This resolution was immediately circulated over the government telephones to all the regiments in the capital.

To these proceedings Kerensky replied on the follorving day by issuing an ultimatum to the committee requiring it to withdraw the resolution. The ultimatum was ignored by the committee, which promptly called out parts of the garrison and organized worker detachments (Red guards) for the defense of the Smolny palace. headquarters of the soviet and of the committee. Kerensky tried to counteract these measures by adopting the traditional method of defense, the raising of the bridges, to prevent communication between the left and right banks of the Neva. He then proceeded to the Mariinsky palace, where the preparliament was holding its sessions, and demanded that it should invest him with dictatorial powers to cope with the Bolshevik revolt. They debated all night before refusing. Meanwhile, the Bolsheviks quietly and systematically took over, without firing a shot, the telegraph, the telephone and all government offices with the exception of the Winter palace and the offices of the general staff. The same night Lenin, who had been in hiding since July, appeared at the meeting of the Petrograd soviet and in glowing language congratulated the delegates on inaugurating a new era. The new regime, which established the soviet as the embodiment of supreme power in the state, was thus established one day in advance of the meeting of that soviet congress which had been proclaimed by the Bolsheviks as the sole authority competent to make such a decision. But nobody present at the meeting of the soviet seemed to care, for Lenin announced that the first step taken by the new government would be to offerall belligerents a just peace.

Early in the morning of Nov. 7 (20) Kerensky left for the front, in order to bring back troops to crush the revolt. The other members of the government decided to await his return at the Winter palace. But when they were informed that the guns of both the cruiser "Aurora" and the Peter and Paul fortress were trained on the palace, they decided to surrender. When next day the Congress of Soviets formally opened, the non-Bolshevik members and the old executive committee registered a vigorous protest against the unconstitutional methods of the Bolsheviks and withdrew from the congress to join the committee of public defense which had its headquarters at the municipal buildings.

Kerensky meantime made frantic efforts to move the troops from the front to the capital. He succeeded only in persuading the Cossack Gen. P. N. Krasnov to move. On Nov. 11 (24) Krasnov's troops were reported outside Gatchina, about 10 mi. from the capital. Encouraged by this news and definitely expecting a crushing defeat of Trotsky's Red guards, the committee of public defense gave orders to the cadets of the military schools to arrest the military revolutionary committee and to make a general attack on all the soviet strongholds. The attack was made in the morning; but by three o'clock in the afternoon the Bolsheviks, supported by some of the cruisers of the Kronstadt fleet, decisively repelled it and occupied the military schools. In the report of the events of the day which he sent to the Petrograd soviet Trotsky made the following declaration: "We hoped to establish a compromise without bloodshed. But now when blood has been shed there is only one way left, a ruthless fight." With these words Trotsky proclaimed the approaching civil war. The same night he proceeded to the Gatchina front. Next day he reported the repulse of Krasnov's advanced detachments, and a day later he announced that the Cossack forces had been completely defeated. Kerensky fled, and the Bolshevik regime was now for a time immune from military menace. (M. FA.; M. BF.)

E. CIVIL WAR AND INTERVENTION, 1917–21

The Petrograd revolution of Nov. 7 (20) swept Russia. There were a few days of street fighting in Moscow and sporadic resistance elsewhere, but by the end of the month the soviets held power throughout the country. In the urban centres the victory was won under the red flag of class warfare, with the watchword "All power to the workers' soviets." The words "land," "bread" and "peace" gave the Bolsheviks the support of the soviets of peasants and soldiers.

The soviets were the only strong political force in a social structure whose disintegration was nearly complete. They were the organs of the proletariat, upon which the Bolsheviks, taught by the Marxist doctrine of revolution, were resolved to build their state. They challenged not only the weakened capitalism of Russia but the capitalist system throughout the world. In the first days of success they exaggerated the effect of war weariness upon the masses of western Europe and underestimated the effect of war hatred. Their dream of a new proletarian utopia and their appeals to fellow workers of the world to throw off the burdens of capital and war prepared the way for the conflict that was soon to plunge the new state into a three-year fight for life.

In an all-night session on Nov. 7–8 (20–21) the Congress of Soviets in Petrograd declared the power of government to be vested in the council of people's commissars, appointed mainly from the ranks of the Bolshevik central committee, with Lenin as premier and Trotsky as commissar of foreign affairs. The first act of the Soviet government on Nov. 8 (21) was to decree that all land belonged to those who worked it, without rent or other payment. This satisfied the peasants, who had been expropriating landlords' estates for several months, and their chief political organization, the Left Social Revolutionary party, decided to collaborate with the Bolsheviks. Vigorous measures were taken to ensure a supply of food for Petrograd and other urban and industrial centres. To reinforce the victory of the industrial proletariat a universal eight-hour day was instituted on Nov. 11 (24), and the control of the factory soviets over industry was established by successive decrees in the next two months.

The peace campaign began on Nov. 9 (22), when Trotsky sent out a wireless invitation to all the belligerent powers to conclude an immediate armistice. The Allied governments at once protested, and their representatives in Russia tried to enlist the commander in chief of the army, Gen. N. N. Dukhonin, against the council of commissars. Dukhonin was replaced by N. V. Krylenko, a member of the Bolshevik central committee, by a soviet decree of Nov. 22 (Dec. 5). Soon afterward, the former commander was tom to pieces by a mob of soldiers. This deed showed that Lenin had gauged the temper of the army and that the Allied insistence that Russia should go on fighting would be fruitless.

The German government accepted the armistice proposal. After brief negotiations within the German lines a ten-day truce was signed on Dec. 5 (18), 1917. The Central Powers agreed not to transfer troops from the eastern front to the western, but they moved several divisions to France before the end of the year.

Meanwhile the Soviet government was facing serious internal difficulties. The bourgeois classes, at first stunned by the success of the revolution, began to rally, Instead of armed resistance they used the more dangerous weapon of sabotage, hoping to paralyze the Bolshevik regime. With no civil service, no personnel trained in finance, transport and the management of industry, the new government was suddenly called upon to undertake the administration.

Lenin met the bourgeois offensive with characteristic energy. Banks and some factories were nationalized, and a supreme economic council was created to manage the latter. Other decrees followed in rapid succession. Some of these were measures of immediate necessity rather than a part of the Bolsheviks' deliberate program. In a sense they were the beginnings of the later War Communism, but all the responsibility for their adoption cannot be laid upon Bolshevik shoulders. Some form of centralization was necessary to prevent economic collapse, and Lenin

had previously published a pamphlet demanding nationalization of transport and state control of the means of production to save the country from chaos.

The nationalization of industries was legalized in Dec. 1917. At first it was applied haphazardly. No entire industry was nationalized until May 1918, when a department of the supreme economic council was organized to supervise the monopoly production of sugar. The following month oil production was centralized in the same way, and various other commodities were declared state monopolies. It was not until June 28. 1918, that all industrial and commercial enterprises of more than 1,000,000 roubles capital were declared the property of the state.

The Treaty of **Brest-Litovsk.**—While the Soviet government was trying to cope with sabotage and weld local soviets into an administrative machine. relations with Germany were still unsettled. Peace negotiations began on Dec. 22, 1917 (Jan. 4, 1918), at Brest-Litovsk. On behalf of the soviet, Trotsky put forward the principles of no annexation or indemnity and self-determination of subject races. At first the Germans seemed willing to accept, with certain reservations. They demanded the independence from Russia of Poland, Finland and the Baltic states on Dec. 28 (Jan. 10) and the independence of the Ukraine Jan. 8 (21), 1918. On Feb. 10 Trotsky announced the Soviet refusal to sign a "peace of annexation," but declared the war between Russia and the Central Powers at an end—the celebrated formula "No war: no peace." A week later the German general staff ordered an immediate advance.

When the Germans advanced. Lenin at once decided for peace, but acceptance of the German terms was not reached without a struggle in the central committee. Lenin still believed that a general European revolution, as the result of war exhaustion, was not far distant. His prime object, therefore, was to gain time, a breathing space, as he called it. His associates argued that to yield mas to betray the revolution. It was only by a threat of resignation that Lenin beat down the adverse majority. On March 3 a new Soviet delegation accepted the German terms on behalf of the Soviet government. The so-called government of the Ukraine had already signed a separate peace treaty. which meant virtual German control, and this the Russians were forced to confirm. The Soviet government further agreed to pay a large indemnity or its equivalent in raw materials. Poland and the Baltic states were left in the hands of the Germans. and the armies of Count Rudiger von der Goltz and Baron C. G. E. Mannerheim soon crushed the revolutionaries in Finland.

Lenin had won his breathing space, but the agricultural and mineral resources of the Ukraine and the oil of the Caucasus were at the disposal of the Germans, and the German general staff was now free to concentrate its forces against the Allied front in France. Two days after the signature of the Brest-Litovsk treaty Trotsky approached Raymond Robins of the American Red Cross and the unofficial British representative R. H. Bruce Lockhart as to the attitude of the Allied governments should the soviets not ratify the treaty or the German advance continue for any other reason. But nothing came of the feelers. The Congress of Soviets ratified the treaty March 16 by a majority of 523.

Lenin used his breathing space to patch up the administrative and economic machine and to drill an army to defend the revolution. The fight against sabotage was not yet won. and the adversaries of the new regime were growing bolder. Trouble was brewing in the Cossack provinces and in Manchuria, where a hostile army was assembling on Chinese soil. The German threat against Petrograd had driven the Soviet government in flight to Moscow. The fact that the Allied ambassadors, instead of accompanying the government, had preferred to go to Vologda, junction of the trunk lines of escape eastward to Siberia and northnest to the coast, was no good omen for future relations with the powers they represented.

In the field of foreign affairs the Soviet government had two severe handicaps. From the first the Allies suspected complicity with Germany and were inclined to regard the peace of Brest-Litovsk as a betrayal of the Allied cause. Second, neither they nor the Central Powers believed that a Soviet government in Russia could endure. The Allies declined to recognize the treaty of Brest-Litovsk, which they held responsible for Gen. Erich Ludendorff's victory in March. Their missions in Russia reported that trainloads of war supplies, leather, copper, oil and food were being shipped into Germany. Although the Bolsheviks claimed that this was part of the indemnity imposed by the treaty, the Allies saw it as aid to the enemy. to be prevented if possible. It was suspected that some of their representatives in Russia cooperated with anti-Bolshevik elements to hamper the transfer of supplies.

The Social Revolutionary Revolt.—The breach betw-een the other political parties in Russia and the Bolsheviks had been widened by the suppression of the long-awaited constituent assembly, which met in Moscow on Jan. 18 (31), 1918. About 62% of the votes were cast for moderate Socialists of all kinds. Most of these had gone to the Social Revolutionaries, whose lists had been made up before the Left Social Revolutionaries broke away to collaborate with the Bolsheviks in Lenin's government. The Bolsheviks had got 25% of the votes and the Kadets and other "bourgeois" parties about 13%. The election of a Right Social Revolutionary, Viktor M. Chernov, as president convinced the Bolsheviks that they had nothing to gain from the assembly, and it was closed by Red soldiers on Jan. 19 (Feb. 1).

The Left Social Revolutionaries continued for a time to collaborate with the Soviet government, but broke away completely after unsuccessful opposition to the ratification of the Brest-Litovsk treaty. The strength of the Social Revolutionary party was mainly drawn from the villages, which were growing increasingly restive as the Bolsheviks developed their basic program of a workers' government, class warfare and socialism. The peasants had thought that the revolution gave the land to them. They now found it was the property of the state and that its surplus produce over their needs was required for state purposes. The bourgeois groups had become more hostile still, as they realized that their very existence was menaced by the new regime.

Led by Boris Savinkov, Kerensky's former war minister, the Right Social Revolutionaries became the pivot of patriotic and anti-Bolshevik sentiment, eager to co-operate with military representatives of the Allies to nullify the effects of the treaty of Brest-Litovsk. From attempts to blow up depots of stores, railway bridges and trains carrying supplies westward, the Social Revolutionaries proceeded to the desperate coup of assassinating the German ambassador in Moscow, Count Wilhelm von Mirbach-Harff, on July 6, 1918, in the vain hope of provoking Germany to break with the Soviets. The Social Revolutionaries then tried to incite the country to rebellion.

Savinkov captured the town of Yaroslavl. 180 mi. N. of Moscow on the railway to Vologda and Archangel. with a disciplined force which he had hoped to make the nucleus of an army of insurrection. The Red troops from Moscow and Petrograd converged on Yaroslavl too swiftly, however, and retook the town after two weeks. Savinkov escaped, but the possibility of overt resistance by the Social Revolutionaries vanished.

The Czechs.—About 30.000 Czech deserters from the Austrian forces had been formed into an army to fight for their country's freedom beside the Russians on the Austrian front. When the Russians collapsed they remained a fighting force, and plans were made in Paris to move them round the world to the western front. In early March 1918 the Soviet government agreed to provide transport across Russia, but the Czech legionaries had continual trouble with local soviets over food supplies and right of way for their trains.

By the middle of May the entire force, moving eastward to the Pacific, was strung out in detachments across 5,000 mi. of railway from Kazan to Vladivostok, a natural prey to anxiety and rumour. On May 14 one of their detachments met a trainload of Austro-German prisoners being repatriated in accordance with the treaty of Brest-Litovsk. A fracas ensued, with bloodshed which involved the local Red forces.

Moscow at once demanded that the Czechs fulfil their pledge to surrender their arms. They refused and. on May 29, forcibly resisted attempts to carry out the disarmament order. In June

they fought the Bolsheviks openly throughout Siberia, and the local soviets were powerless against their disciplined troops. At the end of the month their Vladivostok contingent overthrew the soviet there and set up an anti-Bolshevik government with the approval of the Allies. By July 31 almost all Siberia was changed from Red to White and the Czech forces were moving westward to attack the Soviet state.

Death of the Tsar.—The advance of the Czech and White Russian armies brought death to the former Tsar Nicholas II, who with his family had been held for several months at Ekaterinburg. The local soviet professed to believe that the imperial family planned to escape to Omsk, where the White Adm. A. V. Kolchak had established a counterrevolutionary government. Without a trial the soviet voted to execute "Citizen and Citizenness Romanov" and their family and did so on the night of July 16–17, 1918.

Intervention.— The month of August saw intervention in full swing. On Aug. 2 the British, who had already landed forces at Murinansk to prevent war supplies from falling into German hands, disembarked several thousand Allied troops at Archangel; they overthrew the local soviet and set up a provisional government of the north. A few days later British and French contingents landed at Vladivostok, followed by a Japanese division on Aug. 12 and by two U.S. regiments on Aug. 15 and 16. Western Siberia was already in the hands of the Czechs and a number of anti-Soviet governments. On Aug. 24 Anglo-Japanese troops crushed Red resistance in the maritime provinces in a battle on the Ussuri river. Chita was captured on Sept. 6, and organized soviet government beyond the Urals disappeared. The Czechs had seized the chief cities of the northern Volga and an anti-Soviet army was marching from the Cossack provinces of the Don.

At the beginning of the autumn the tide turned. The Bolsheviks threw back the Czechs at the end of Sept. 1918 and halted the White advance from the Don. As Germany weakened on the western front, the Baltic provinces, Finland and the Ukraine lost its support. Turkey was on the verge of capitulation, and Turkish and German control over the Caucasus was vanishing. Lenin's prediction was coming true; the Central Powers and the treaty of Brest-Litovsk were crumbling together, and the European revolution appeared to be at hand. When the German sailors in Kiel raised the red flag on Nov. 9, 1918, the Soviet government saluted the event with triumph.

The Bolsheviks had still to reckon with the Allies. The autumn of 1918 saw the reinforcement of foreign forces on Russian soil. By the end of the year there were approximately 15,000 British and U.S. troops occupying a fan-shaped area in northern Russia, at least 70,000 Japanese holding the important strategic points of eastern Siberia and the maritime provinces, 7,000 Americans protecting the Trans-Siberian and Chinese Eastern railways, and about the same number of British supporting and instructing the armies of Adm. A. V. Kolchak, who had become dictator of the so-called all-Russian government of Siberia by a coup d'état at Omsk on Nov. 18. The French had occupied Odessa with a powerful fleet and a mixed force from Salonika.

The abandonment of the campaign by the Czechs, eager for home, counterbalanced the accession of foreign anti-Soviet forces, and the Whites were not yet in a position to strike an effective blow. When the new year began neither side could show much gain, except that the revolution had reached the Baltic by the establishment of a Soviet government at Riga on Dec. 26.

The Red Terror.— During these months of pressure the Bolsheviks had hardened. Troops were called up, grain and cattle requisitioned, property confiscated. In the summer of 1918 to external dangers was added a deadlier enemy in their midst. After his defeat at Yaroslavl, Boris Savinkov revived against the Soviet the Social Revolutionary terrorist centre which he had formed years before to combat tsardom by assassination. On Aug. 30, 1918, one of his agents, a girl named Fanny (Anna) Kaplan, shot and wounded Lenin as he left a workers' meeting in Moscow. The following day M. S. Uritsky, chief of the Petrograd Cheka, was shot dead by Social Revolutionaries. The Bolsheviks met Savinkov's terrorism with their own Red terror. The Cheka had been organized in Dec. 1917 to deal with sabotage and other counterrevolutionary manifestations. (The word "Cheka" was formed from the initials of the Russian words meaning "extraordinary commission.") Its power grew to include summary arrest, judgment and execution. In revenge for the wounding of Lenin 500 of the most prominent figures of the old regime were shot that night in Moscow. The killing of Uritsky led to similar reprisals in Petrograd. A veritable reign of terror began.

War Communism.— The effects of this period were momentous. On the one hand it stamped deep into the minds of western countries the belief that Russia had relapsed into Mongol savagery. On the other it confirmed the Soviet leaders in their hatred of the non-Bolshevik world.

Intervention gave impetus and coherence to the work of nationalization, which had been proceeding sporadically. In some cases factories had been nationalized in order to fight sabotage by their owners or managers, in others to legalize confiscation already accomplished by the workers. Under the pressure of war the important industries were given control boards. The attempt to fix prices in a period of acute currency inflation had produced the inevitable flight of commodities from the market. As the situation grew more difficult it became necessary to control not only industry and transport but the supply and distribution of food. From that stage the step to the control of all production and distribution was not a long one for a Marxist government.

At first, in the early summer of 1918, restrictions were not so harsh as to prevent much private trade and speculation. It happened that the beginning of the Red terror coincided with the period of greatest food shortage, before the harvest. The extraordinary powers given to the Cheka to suppress internal enemies were quickly directed against speculators seeking for profits.

From the outset an influential section of the central cammittee of the Bolshevik party had been advocating a full Communist program rather than Lenin's more cautious policy. Circumstances were now on their side, and by Aug. 1918 the period of War Communism which lasted nearly three years may be said to have begun. Private buying and selling were prohibited by law and offenders were severely punished. Cash wages lost their importance. Workers and other employees were given cards for food, clothing and other necessities, free lodging and free transport on trams and railways. All nonworking elements of the population were disfranchised. The peasants were subjected to requisitions of all their crops save what was needed lor their households. They obtained nothing but promises in exchange, and the breakdown of distribution and the difficulties of transport in a country ravaged by war progressively diminished their return from their labour. Extreme Communists declared that money would soon be wholly abolished. This hope was perhaps a screen for the conventional motives for inflation and the unavoidable fall in the value of the currency.

Money did not become wholly worthless, and a host of bagmen and hucksters, too numerous and unimportant to be imprisoned, continued private trade. The government tried to eliminate them by entrusting distribution to the co-operatives, which had had an extensive network in Russia for many years. In spite of these efforts much of the lesser retail trade remained in private hands.

Attempts at Peace.— Representatives of every section of anti-Bolshevik Russians, from the Social Revolutionaries Kerensky and Savinkov to the grand duke Nicholas (Nikolay Nikolayevich), former commander in chief and uncle of the former tsar, went to Paris to enlist the support of the peace conference. But the Allies were chiefly concerned with Germany. They feared that circumstances might induce Germany and Russia to make common cause, and their first impulse was to neutralize the Bolshevik danger.

On Jan. 12, 1919, the commissar for foreign affairs, G. V. Chicherin, asked the U.S. state department to open peace negotiations. On Jan. 16 the representatives in Paris of Great Britain, France, Italy and the United States discussed a general truce plan for Russia put forward by David Lloyd George. Pres. Woodrow Wilson suggested that representatives of all Russian groups including the Bolsheviks should hold a meeting on the island of Prinkipo in the Sea of Marmora under the auspices of the Allies.

The anti-Bolshevik governments in Russia refused to participate and the project was dropped.

In spite of continued hostility on the part of the French another attempt was made to reach a peaceful settlement. William C. Bullitt, attached to the U.S. delegation in Paris, was sent to Petrograd in March 1919. After a week's discussion he brought back peace terms which the Soviet government pledged itself to accept if the Allies agreed not later than April 10. The most important features of this document mere a plan for the pacification of Russia on the basis of its several existing governments, a willingness by the said governments, including the Soviet. to recognize responsibility for the financial obligations of the former Russian empire, an exchange of official representatives between the Soviet government and the foreign powers and an immediate withdrawal of foreign troops. In spite of warm support by Col. Edward House and the approval of Lloyd George and V. E. Orlando this project also was shelved, perhaps because of the rapid advance of Kolchak's army, which once more strengthened the belief that the Soviet government was doomed to extinction.

Renewed Intervention. — The White armies of Kolchak in Siberia, of Denikin in southwestern Russia and of Gen. N. N. Yudenich in Estonia had been amply supplied by the Allies with money, equipment and instructors. Kolchak threatened Kazan and Samara, on the Volga, in May and planned to reach Moscow before the end of June, but strategic co-ordination was lacking; neither Denikin nor Yudenich was ready. Kolchak could not withstand the full weight of the Red army, which had now been welded into a competent fighting force. An attempt at diversion by the British in the north came too late to help him.

The next stage of the White campaign was more dangerous. Denikin made rapid progress northward in the summer, and in mid-October had taken Orel, within 200 mi. of Moscow, and was threatening the capital. Simultaneously Tudenich drove at Petrograd. His English tanks broke the weak resistance of the Reds, whose main forces were concentrated against Denikin. Yudenich's advance guard was within 10 mi. of Petrograd before the Soviet troops rallied. Then the tide ebbed. Yudenich was thrown back, and Denikin's offensive, heavily repulsed at Orel, fell to pieces. In December he was making a last stand at Novorossiisk in the Kuban, and by April he had fled to Constantinople. Kolchak lost his capital, Omsk, in November and he finally resigned command a month later. The Czechs betrayed him to the Red army at Irkutsk. He was put on trial as a traitor, condemned to death and shot on Feb. 7, 1920. The bewildering collapse of the White armies was caused by the hostility of the masses in the territory they controlled no less than by military defeat.

Kolchak's execution marked the end of the intervention period; nearly all the Allied troops had been withdrawn late in 1919. Japanese troops were still in occupation of Vladivostok and the maritime provinces. however, and Gen. P. N. Wrangel was reforming the shattered army of Denikin in the Crimea. Later, during the war with Poland, Wrangel had some successes on the mainland, but the armistice released overwhelming forces against him, and in Nov. 1920 the remnants of his army were transported by the Allied fleet to Constantinople.

The Soviet army had been progressively demobilized as the enemy weakened, but the internal economy of the country was in a chaotic state. The peasants, irritated by requisitions, had reduced the production of grain, and industry, which had been harnessed everywhere to war, had to be reconstructed on a peace basis. Trotsky, the commissar of war, proposed that the army should be utilized directly for production. The "labour army" helped to reorganize transport and some sections of heavy industry, but discontent was generated among the workers.

War with Poland. — Before the situation became critical an emergency, war with Poland, settled the problem. The Soviet government proposed peace to Poland in Jan. 1920 on terms similar to those offered Finland and Estonia. The Poles at first seemed willing to agree, but their circumstances improved as supplies of war material from France and a food loan of $50,000,000 from the United States strengthened their country. At the end of March they demanded all the territory west of the Polish frontier of 1772, a large cash indemnity and the occupation of the Russian town of Smolensk as guarantee. The Bolsheviks refused, and the Polish army occupied Kiev early in May. Within a month the Bolsheviks struck back. The Soviet cavalry retook Kiev in June, while the main force advanced from Smolensk through Vilnius and along the German border. The Red armies, marching forward almost without combat, converged upon Warsaw. The Polish retreat became a rout, and by the middle of August the Russians had reached the outskirts of the city.

France and Great Britain were appalled; a sovietized Poland would mean bolshevism in the heart of Europe. However, the Polish army under Marshal J. Pilsudski began a successful counter-offensive on Aug. 15, and almost overnight, with little fighting, the Red armies were in retreat. A great part of the troops on the German border gave up their arms. On Oct. 11, after Polish territory had been entirely cleared, an armistice agreement was concluded at Riga. On March 18, 1921, peace was signed on terms favourable to Poland, with a new frontier which placed 4,000,000 Ukrainians and Byelorussians under the Polish flag. Again the Soviet government had paid a heavy price for peace. (See Russo-POLISH CAMPAIGN.)

De Facto Recognition. — An improvement of relations with the new Baltic states followed the collapse of Denikin and Yudenich. In the autumn of 1919 M. M. Litvinov was sent by the Soviet to Tartu (Dorpat) in Estonia to negotiate peace with Estonia and Finland. Peace treaties with both states were signed early in the following year on reasonable terms. A settlement with Latvia was delayed by the Latvian claim to the province of Latgale. The Latvians refused to negotiate and in a three-week campaign, Jan. 3–24, 1920, drove the Red troops from the province. Peace with Latvia was signed on Aug. 11, 1920. In the previous January the Allied blockade had been lifted. Anglo-Russian negotiations began in the winter of 1919–20 but were interrupted by the Polish war, and it was not until March 16, 1921, that a trade agreement according de facto recognition to the Soviet was signed in London. In the same year similar agreements were made with Germany (May 6), Norway (Sept. 2), Austria (Dec. 7) and Italy (Dec. 26).

F. SOVIET AFFAIRS TO 1941

The new regime was faced with the constitutional problem of blending together the real authority of the council of people's commissars with the nominal sovereignty of the soviets. This was possible because of the prominence, in both council and soviets, of the Bolsheviks, who took the title of All-Russian Communist party (of Bolsheviks) in March 1918. The task of constitution making was fulfilled in the constitution of July 10, 1918, which remained the fundamental document of Soviet constitutionalism. It applied only to the Russian Soviet Federated Socialist Republic, which consisted essentially of the Great Russian core of the old empire together with Siberia; its federative form reflected the exploitation by the Communists of the national grievances of the non-Russian peoples embedded within it. In addition, the course of the civil war had finally resulted in the setting up of Soviet governments in the Ukraine and in Byelorussia and also in Georgia, Armenia and Azerbaijan — which were formed into a Transcaucasian federation in Dec. 1922. In form, the Ukraine, Byelorussia and Transcaucasia were independent states, linked with the Russian Soviet Federated Socialist Republic only by treaties of a peculiarly intimate kind; but their governments owed their existence to the Red army and were firmly under the control of the Communist party, which remained a single centralized unit.

Early in 1922 Joseph Vissarionovich Stalin (*q.v.*), the general secretary of the Communist party, was instructed as commissar of nationalities to draw up a plan of federation between these governments. In Dec. 1922 the first Congress of Soviets of the U.S.S.R. met at Moscow and confirmed the pact for the formation of a union. The Far Eastern Republic, a quasi-independent buffer state closely affiliated to the R.S.F.S.R., had been merged with the latter in the preceding November.

The constitution of the new state, the Cnion of Soviet Socialist Republics, was accepted by the central executive committee on

July 6, 1923, and became effective from that date.

As in other federal constitutions, the powers of government in the U.S.S.R. were nominally divided between the centre and the constituent republics. But the division of functions left to the central power not only the usual ones relating to external relations and defense but most of the major economic ones.

The centre's overriding authority was guaranteed in a number of mays. Indeed the whole process was little more than an extension of the R.S.F.S.R. constitution to cover the whole area under sovereign control. No real importance could be attached to the affirmation of the right of the republics to secede from the federation.

The most important unifying force of the new state, which contained so many races, creeds and languages. was not mentioned in the constitution. The Communist party, with its rigid discipline and centralized authority, was destined to control each of the constituent states and to cement them more firmly together.

The Peasants and the Famine, 1921–22.—War Communism pressed heavily upon the peasants. Difficulties of transport and distribution prevented them from receiving manufactured goods in exchange for their requisitioned food products, and although their contribution to the national budget decreased proportionately as the currency emission to cover deficits grew greater, their position showed no corresponding improvement. Administrative confusion, red tape and contradictory instructions made the requisitions more onerous. Gradually the peasants reduced the area sown and concealed the harvested grain. The total harvest in 1921 was only about 40% of the average yearly harvest in 1909–13.

The Bolsheviks tried to counter this passive resistance by an extension of class warfare to the villages. They divided the rural population into rich (or kulaks), middle and poor peasants. The poor were their protégés, they said, the middle their friends and the rich their enemies. In 1918 "committees of village poor" were organized to supervise the grain requisitions and to take the part in village management which had hitherto belonged to the prosperous peasants. These were soon replaced by the village soviets, over which the Bolsheviks had established control.

Events showed that the rural communities were no favourable terrain for class warfare. The ties of family and religion, a common dislike of tax collectors, towns and townsmen, and a sullen distrust of any central authority which took their young men as soldiers and requisitioned their grain and cattle proved stronger than arbitrary distinctions. Many of the middle peasants were the kulaks' young relatives, whose chief aim was to become kulaks themselves; many of the poor were dependent, ignorant and shiftless.

Peasant delegates to the eighth and ninth congresses of the Communist party in 1919 and 1920 had expressed the murmurs of the villages, and there were signs that the army, largely recruited from the middle peasant class, was growing restive. The Polish war brought a new spirit of patriotic ardour and this restiveness was for a time forgotten, but early in 1921 it burst forth. In February the garrison of the naval fortress of Kronstadt, near Petrograd, demanded the abolition of the grain monopoly, and a mutiny followed which was suppressed only after heavy fighting. Almost simultaneously the peasants of Tambov, one of the central provinces of Russia, refused to yield their grain to requisition. Troops sent to enforce obedience made common cause with the peasants. Resentment had become revolt.

Lenin realized the danger and induced the tenth Communist congress in March 1921 to sanction a decree substituting a graduated food tax for the system of requisitions. Commodities demanded by the peasants, kerosene, salt, tools and leather, were rushed to Tambov, to be sold or bartered on a free trading basis. Those measures quickly ended the revolt. The source of trouble had been economic discontent rather than political unrest or counterrevolutionary agitation.

It is significant that both these outbreaks occurred at the end of winter, when climatic conditions had caused a failure of the autumn-sown grain and the peasants, whose reserves were depleted by requisitions, mere beginning to fear one of the famines that had devastated Russia periodically. Their anxiety was well founded. A prolonged drought in the early summer ruined the spring-sown grain throughout the black earth districts of the Volga, north Caucasus and Ukraine. By the middle of July 1.000.000 peasants were in flight from their parched fields toward the centres of urban and river transport. where they were huddled in refugee camps infested with cholera and the epidemics caused by malnutrition. The crop failure was reckoned to have affected an area inhabited by 20,000,000 to 30,000,000 people. Unless help was forthcoming, at least 10,000,000 seemed doomed to die from starvation before spring.

In July the Soviet government permitted an appeal by the writer Maxim Gorky to Herbert Hoover. then chairman of the American Relief administration (A.R.A.), which had kept alive millions of hungry children in Belgium and northern France during the war and had been at work later in central and eastern Europe. Hoover agreed to help, and a method of operation was soon arranged between the A.R.A. and the Soviet authorities. This example was followed by a number of European charitable organizations. but the brunt of the work was done by the A.R.A., which at the peak of its activity. in March 1922, was giving daily rations to 10 000,000 children and adults. Altogether foreign aid fed probably 12,000,000 persons, and the Soviet Relief administration maintained at least an equal number.

It was difficult to estimate the number of famine deaths because of confusion between disease and starvation in vital statistics. Deaths from actual hunger probably did not exceed 500.000. Foreign relief for the famine rendered two other important services. It allayed much of the fear of foreigners provoked by intervention and thus paved the way for a renewal of normal relations between Russia and the outer world. It also helped the Soviet cope with the problem of disease, especially cholera and typhus, which had been epidemic in Russia for centuries; after 1922 there was no widespread recurrence of either pest.

The New Economic Policy.—It is customary to regard the New Economic Policy instituted by Lenin in the spring of 1921 as a more or less temporary abandonment of Communism to mollify the peasants. There is no question that an influential section of the Communist party saw it in that light. Lenin himself may not have shared this view. He was above all a realist. alive to the practical necessities of the moment. He had shown that he was well aware of the anomaly of an industrial proletarian revolution in a country where 85% of the people were backward peasants. By force of circumstance and the exigencies of war he had been compelled to adopt a program of socialist centralization which many of his followers welcomed as the correct and natural policy of a socialist state.

Before the Communist party reached a new decision in its protracted discussion of agrarian policy in 1920 and 1921, Lenin found himself advocating not merely a change with regard to requisitions and the grain monopoly but also a general readjustment of the economic framework. The reform of industry for peace purposes mould require effort and expenditure which the state was unable to provide, and finance and transport were also in a desperate position.

Lenin's influence and insistence won. His critics had no valid alternative to offer. The New Economic Policy (called N.E.P.) was confirmed by a decree published Aug. 9. 1921. It permitted freedom of trading within the country. sanctioned overtime and piecework payment for workers, offered encouragement to foreign capitalists and concessionaires and recognized by implication the rights of private property which had been abolished under War Communism. The state continued its monopoly of foreign trade into the N.E.P. period, but later a number of the more important trusts into which Soviet industry was divided were allowed to trade abroad directly.

During the period of civil war and War Communism the financial tools of capitalist states had been laid aside. Private banks, cheques, securities—all had gone. Money had depreciated rapidly as more and more of the national budget was covered by inflation; 85% of the 1920 budget was provided by the emission of notes.

If the New Economic Policy was to succeed it clearly had to have banking facilities and a more convenient medium of ex-

change. The shift of policy was quickly made. The state bank was established in the autumn of 1921 and given the authority to issue bank notes as well as to serve as a credit institution. On Nov. 16, 1921, it began credit operations. By a year from that time the essentials of currency reform had been prepared, and the bank began to issue notes. (See *Finance,* below.)

The reform of the currency required in turn the establishment of the state budget on a solid foundation, since the government could no longer print notes to meet the deficits. Agricultural taxation, which had been substituted for requisitions early in 1921, was again revised. In May 1922 a single tax in kind was established by decree, and the peasants were permitted to pay in specified commodities the graduated taxes imposed. In May 1923 a more extensive reform was made. Cumbrous miscellaneous taxes were swept aside, a single agricultural tax was substituted and money payments gradually replaced commodity payments. Meanwhile, urban taxation had been developed by indirect taxes and income and property taxes, so that the peasants, instead of forming the principal taxpaying body of the state. came to furnish only a small fraction of its revenue.

The most radical change involved in the New Economic Policy was the restoration of the whole internal economy of the country, industry, commerce, transport, housing and employment, to a straight money basis. Instead of the vague system of accounting prevalent under War Communism, every state enterprise was compelled to issue a regular balance sheet and to show profit and loss in the old-fashioned way. Employees received a regular wage paid in cash. Housing committees were entitled to charge rent on a graduated scale in accordance with the social position and earnings of the tenant. The railways and tram companies were allowed to charge fares for passengers and freight.

Communist critics of the New Economic Policy were perhaps justified in declaring it a reversion to capitalist methods. In any case, the Soviet government could not avoid the process of decentralization which was a phase of postwar reconstruction in all the belligerent countries of World War I. For them, no doubt, wartime centralization and control boards were matters of necessity rather than choice. For the Bolsheviks, choice and necessity coincided. But if centralization proved unwieldy in the advanced industrial countries of the west, it was a yet heavier burden upon the backward economy of Russia. Under the New Economic Policy a great many nationalized enterprises were released, not to former proprietors or private owners, but to face competition in the open market. The financing of such corporations was carried out by the Industrial and Commercial bank and by other new banking establishments.

As the New Economic Policy developed, industry was divided into "trusts," as they were called, such as the Oil trust, the Coal trust and the Flax trust, at first horizontal in character, but gradually becoming vertical also. With the trusts, which were organs of production, were associated syndicates, organs of sale and purchase, handling both foreign and internal trade. The trusts were later divided into sections; for example, the Oil trust subdivided into Azneft (Azerbaijan Oil), Grozneft (Grozny Oil) and Embaneft (Emba Oil).

The New Economic Policy stimulated the foreign trend toward establishing commercial relations with the Soviet, and in the spring of 1922 an international conference was held at Genoa, It., where the Soviet envoys for the first time met foreign statesmen on equal terms. The atmosphere was at first cordial and a proposal was made to provide financial assistance to the Soviet on condition that the debts of the tsarist government were recognized. A period of haggling followed, but on April 16, 1922, Germany and the Soviet government privately signed an agreement at Rapallo, It., shelving the debt question, affirming mutual friendship and re-establishing full diplomatic relations. This unexpected event revived fears of a Russo-German combination to upset the treaty of Versailles, and the Genoa conference ended without reaching a solution. There were obvious limits to Soviet-German co-operation in the political field; but there was henceforth a silent collaboration in military matters by which the Russians received help for the reorganization of the Red army and gave Germany facilities for circumventing the disarmament clauses of the Versailles treaty. Although a meeting of experts to discuss financial matters was held in the summer at The Hague, Neth.. prospects of a settlement were never bright and little was accomplished.

The Soviet government took the position that the western powers had tried to enforce a humiliating abandonment of the principle of the repudiation of tsarist debts and of the monopoly of foreign trade, which it had now come to regard as one of the main pillars of its economic system. If the stability of the new currency was to be maintained, rigid control over exports and imports was imperative. But in the first years of the New Economic Policy foreign trade was somewhat hampered by the attempt to force it all through the bottleneck of an untrained bureaucratic department. With growing experience there was a tendency to transfer the placing of orders and sales abroad to the trusts directly concerned, while the foreign trade department continued to act as control. Soviet trading corporations were established in London, Berlin, New York city and other centres. French and U.S. businessmen hesitated to allow long-term credits, but the English and Germans found them possible, and the volume of trade steadily increased. Some trade was still carried on by the Russian co-operatives, which, since they were a pre-Soviet organization, had been allowed by some western countries to trade with them in the pre-N.E.P. period. But it was much less important. The policy of industrial and mining concessions to foreign businesses was unproductive and not of long duration.

The growth of exports was the most striking change after the introduction of the New Economic Policy. Total trade expanded, and imports, following the Soviet policy of rigid control, fluctuated widely; but exports were multiplied two and one-half times between 1922 and 1923 and were nearly doubled again in the newly established fiscal year ending Sept. 30, 1924.

The first years of N.E.P. showed a corresponding improvement in internal trade and production. Indications that turnover was multiplied by four between the summer of 1922 and the spring of 1924 were probably not far wrong. In the autumn of 1923 prices of agricultural products fell to 60% of the prewar level. Meanwhile, stimulated by the necessity for showing profits which the New Economic Policy required, the trusts and other industrial enterprises had raised the prices of manufactured goods to 80% above that level. The disproportion was so great that the peasants refused to sell grain or buy goods. Warehouses were glutted and industrial stagnation was threatened. Trotsky used the word "scissors" to describe the crisis which followed, because the graph illustrating the ratio of industrial and agricultural prices to the prewar average had the form of opened scissors, with industrial prices forming the upper blade.

To close the scissors was imperative. It was done in six months by the sale of goods below cost price, which swept away most of the paper profits of the trusts but removed the danger of industrial stagnation, and by the progressive increase in the price of food products. Although this serious crisis was past, the task of keeping the scissors closed remained one of the major problems of the Soviet state.

The comparative liberty given to private trade under the New Economic Policy had produced a host of prosperous nepmen, as they were called. They were largely middlemen, retail traders and small manufacturers, for the state continued to hold the principal sources of production and wholesale business in its own hands. They doubtless served their purpose in getting the commercial machine back into running order and furnishing new accumulations of capital; but they were peculiarly repugnant to the extreme Communists and to the organized workers.

By thebeginning of 1924 the New Economic Policy may be said to have justified itself as a practical measure. Currency had been restored to a gold basis, production was approaching prewar standards and agriculture had recovered from the effects of the famine and civil war. Much of the improvement had been caused by the nepmen and the kulaks.

For a further discussion of the New Economic Policy see *Economic Conditions,* below.

Foreign Relations, 192428. — The outer world seemed ready

by 1924 to believe that Russia had now entered upon an evolutionary process similar to that which followed the French Revolution under the Directory and was eager to share in the development of the country's vast resources. But it misunderstood the determination of the Soviet leaders to retain their position and their conviction that the regime could not afford to allow the growth of bourgeois elements or the survival of a landowning peasantry. Nor was the ultimate expectation of the world revolution absent at any time from the calculations of Soviet leaders of any group. Such differences of policy as emerged were concerned with means rather than ends. During Lenin's lifetime his authority served to settle most issues that arose; but already during his long last illness important fissures in the Communist party revealed themselves, and his death on Jan. 21, 1924, precipitated a struggle for the succession which lasted for several years and in the course of which the remnants of democracy in the party vanished as they had already long vanished in the organs of the state.

The effect of Lenin's death had been discounted abroad because of his long illness and absence from public affairs. The growing prosperity of the Soviet state had stimulated the interest of foreign businessmen, who were beginning to feel that trade would be improved by the establishment of regular diplomatic and consular relations with Russia. Germany had taken this step two years before. The new Labour government in England had promised to do the same as one of the means of diminishing unemployment, and the Fascist government of Italy was seeking new fields for commercial expansion. France was still preoccupied with the memory of its lost loans to the tsarist government and with its own reconstruction problems, but French hostility to the Soviet had to some extent diminished.

On Feb. 1, 1924, the British government recognized the Soviet de *jure*. Other countries followed in rapid succession, and by the beginning of 1925 all the great powers except the United States had established diplomatic relations with the Soviet Union. The order was as shown in Table VII.

TABLE VII.—*Recognition of the Soviet Government*

Country	Date	Country	Date
Great Britain	Feb. 1, 1924	Sweden	March 15, 1924
Italy	" 7, "	Denmark	June 18, "
Norway	" 13, "	Mexico	Aug. 4, "
Austria	" 20, "	Hungary	Sept. 18, "
Greece	March 8, "	France	Oct. 28, "
Danzig	" 13, "	Japan	Jan. 1, 1925

Japanese recognition had been delayed by their claim to compensation for a massacre of Japanese soldiers by Red partisans in the Siberian town of Novo-Nikolayevsk (later Novosibirsk) in May 1920. Although the Japanese had evacuated Vladivostok and the mainland in Nov. 1922, they retained northern Sakhalin until their claim should be satisfied. After two failures negotiations were resumed in Aug. 1924, and recognition was granted on Jan. 1. 1925. A supplementary agreement on Jan. 20 pledged the Japanese to withdraw from northern Sakhalin before the end of May and gave them important oil and coal concessions in the Russian half of the island.

The establishment of normal diplomatic relations led to an increase of foreign trade, but the absence of a settlement of tsarist debts, war debts and private claims prevented any extension of loans to the Soviet. Nevertheless, short-term credits were soon arranged in many countries, and the regularity with which Soviet bills were met gradually overcame distrust. A number of important English firms gave terms of credit running from three to five years. In 1925 Germany provided a state-assisted credit of 300,000,000 marks for a period of three years. The French and Americans were more cautious, but heavy annual purchases of cotton in the United States on a short-term credit basis were made possible by longer credits elsewhere and by the general improvement of Russia's economic situation.

Another factor, however, hampered not only financial but political relations between the Soviet and the rest of the world. It was interference in the internal affairs of foreign countries by the Third or Communist International, known as the Comintern. Founded by Lenin in March 1919, the Third International was pledged to the cause of world revolution, which had, Lenin declared, been betrayed by the Second International of Amsterdam. Its establishment completed the split which had taken place in the socialist movements of most countries during World War I. The Russians insisted that the choice be made, and almost every advanced country came to have a Communist party looking to Moscow as well as a Socialist party still affiliated to the Second International.

The Comintern was an aggregation of Communist parties, and in theory, at least, the successful Communist party of Russia was no more than the first among a group of equals. The avowed purpose of the Comintern to overthrow their regimes and institutions by violence caused foreign powers to take a different point of view. Declining to regard casuistic distinctions, they considered the Comintern and the Soviet government as vassals of one lord, the Russian Communist party.

Moreover, the Comintern extended its activities to the colonies of foreign powers and to "semicolonial" countries or spheres of influence, such as China. This caused ill feeling between Russia and the foremost colonial power, Great Britain, and in May 1923 Lord Curzon, as foreign secretary in the Conservative government, addressed to Moscow a note on the subject so sharply worded as to be the equivalent of an ultimatum. There were a number of points at issue, but the question of Communist propaganda in Great Britain and its colonies was the principal grievance. The Soviet government acceded to the British demands, under protest; but the propaganda ghost was not laid, and it continued to trouble Anglo-Russian relations.

The British Labour government of 1924 took steps toward a friendly settlement with the Soviet Union. An agreement was reached in the autumn of 1924 whereby the Soviet promised to repay old debts over a long term of years in return for immediate financial aid. Before the accord could be signed there was a general election in England, in which no small role was played by a letter said to have been written by G. E. Zinoviev, president of the Communist International, giving instructions about the Communist attitude toward the election and Communist activities in the British army. The Labour party was decisively beaten, the Conservatives returned to power and the agreement with the Soviet was shelved. The stir caused by this incident might have been forgotten but for events in Asia and other colonial regions.

Asiatic Interests.—In 1919 Russia's influence was a negligible factor in Turkey and the near east, Persia, Afghanistan and China. England, on the contrary, had never held so strong a position and seemed on the verge of obtaining permanent control over what had formerly been the buffer states between its empire and the tsar's.

Three years later, however, the Soviet had signed treaties of friendship with Turkey, Persia and Afghanistan, as states independent of external influence, and established a virtual protectorate over Outer Mongolia. The central Asian principalities of Khiva and Bukhara were firmly under Soviet rule, and the new Russian republic was now ready to challenge Britain in China.

The Soviet government and the Comintern achieved this result jointly, under Lenin's guidance. The former disavowed unequal treaties, capitulations, treaty ports, protected areas and unilateral tariffs, while the latter devoted its energies to fostering not Communism but nationalism, by virtue of the Leninist doctrine of colonial slaves. This doctrine was Lenin's answer to the question which had long perplexed orthodox Marxists; namely, why the working masses of western Europe had failed to revolt, as Marx had predicted, against their capitalist masters. Lenin argued that the surplus profits from the exploitation of tolonies and semicolonial countries such as China had enabled the European capitalists to maintain their "wage slaves" above the starvation level which would make revolution inevitable. To free such countries from capitalist exploitation would therefore be a long step toward the proletarian world revolution. Lenin thus reconciled three apparently contradictory forces, the nationalist aspirations of colonial and semicolonial countries, the spirit of Marxist Communism and the reborn desire of new Russia for expansion.

The Mongolian treaty of Nov. 1921 caused irritation in Peking

and helped delay a full accord between the Soviet and Chinese governments until May 31, 1924. In a manifesto issued in July 1919 and formally repeated in Sept. 1920, the Soviet had affirmed in the most categorical manner its renunciation of previous pacts infringing Chinese sovereignty in any way, its abandonment of all claim to the Boxer indemnity and its willingness to treat with China on terms of full equality.

The treaty of 1924 put a Soviet ambassador, L. M. Karakhan, in the old tsarist embassy in the Legation Quarter of Peking. Meanwhile, the Communist International was at work in south China, where both Russian and Chinese Communists supported the Nationalist slogan, "China for the Chinese!" As the Nationalists advanced northward from Canton, the influence of their Russian advisers. Mikhail Markovich Borodin in political afiairs and B. K. Galen (Blücher) in the army, grew stronger. By March 192; the Nationalists were masters of south China, including the Yangtze valley, and the Chinese section of the greatest treaty port, Shanghai.

At this moment Chang Tso-lin, the anti-Nationalist dictator of Peking, raided the premises of the military attaché in the Soviet embassy there. with the knowledge and permission of the foreign diplomatic corps. A mass of documents was seized and a number of arrests made, including subordinate members of the Russian staff and Chinese Communists who had sought refuge in the embassy compound.

The documents published immediately showed a financial connection between the Soviet embassy in Peking and the Comintern or unofficial activities of Borodin and Galen in south China. A rupture of relations between Moscow and Peking followed. The foreign powers, especially Great Britain, began to realize the danger of the position.' Strong military and naval forces enabled the foreigners to retain the treaty ports and the Legation Quarter of Peking, but they were compelled to abandon their privileges at Hankow on the middle Yangtze, which for a time became the Nationalist headquarters.

In 1927, however, there was a break between the Nationalists and the Russians. The Communists were pressing for a more radical agrarian policy with which the Nationalist leadership had no sympathy. They were also trying to direct the whole force of the Nationalist drive against European and, particularly, British interests in China. By the end of the year, the Russian advisers had left, the Chinese Communists were being vigorously suppressed and relations between the Chinese Nationalists and the Soviet government had been severed.

Relations with the West, 1927–28.—Events in China had increased anti-Soviet feeling in Great Britain, already aggravated by Russian financial contributions to the British coal miners on strike in 1926; and in May 1927 the premises of the Soviet trading corporation in London, Arcos, were raided by the police. In this case no seized documents were made public, but the result was similar to that in Peking. Diplomatic relations between England and the Soviet were severed on May 24, 1927. This caused a reduction of English credits and imports and thus affected the internal economic situation, which had now come to depend in no small measure upon smooth relations with foreign capital and business.

The rupture with England did not. however, prevent the Soviet from taking part in international disarmament conferences at Geneva, Switz., in the autumn of 1927 and the spring of 1928. Disarmament had long been advocated by the Soviet government, which in the winter of 1922–23 had attempted to arrange a scheme of armament limitation in a conference with its neighbours, Poland, Finland and the Baltic states. At Geneva the Soviet government proposed to begin immediately the progressive reduction of land. sea and air forces. The other European powers were distrustful and unprepared for such sweeping action, and the conferences ended without result.

Although the Geneva conferences did little to improve the relations of the Soviet uith the leading powers of western Europe, and although the Soviet was excluded from the number of original signatories to the Kellogg World Pact of Non-Aggression signed at Versailles in the summer of 1928, there were signs in the following autumn that the United States, which had become a reservoir of capital for European postwar reconstruction, was beginning to modify its aloof or even hostile attitude toward the Soviet.

In the autumn of 1928 a contract between the Soviet trading corporation in New York city and the General Electric company in the United States, giving the former five years' credit on purchases, was the first real breach in the "credit blockade." as it was called, which had hampered business relations between Russia and the United States.

Internal Politics, 1924–28.—Lenin's death occurred at a time when the growing prosperity of the nepmen and the new *bourgeoisie* had begun to raise fears in the minds of many Communists that the New Economic Policy might become a surrender to capitalism. It was felt, moreover, that the state business organizations were now sufficiently strong to take the place of private enterprise and that the restoration of the currency to a sound basis would permit their being financed by the newly created state banking organizations. In the first half of 1924, therefore, private trade was loaded with heavy taxes and other restrictions. The nepmen were unpopular with the masses and the measures taken against them were not unwelcome, but the reduction of private enterprise in the towns led the extremist section of the Communist party to demand a similar suppression of "capitalist elements" in the villages. The struggle between the forces of capitalism and socialism thus provoked a sharper struggle within the Communist party itself. In the first part of the controversy, 1925–26, the opposition, led by Trotsky, tried to force the socializing process, which was the avowed aim of the Communist party, at too swift a pace.

In the cities the state might now hope to supplant the nepmen without economic disorganization, but in the villages it was still dependent upon the kulaks, who produced the grain surplus needed for export and to feed the urban centres. When Trotsky demanded their repression the majority of the Bolshevik leaders did not yet see how they could be replaced, and the Communist party congress of April 1925 confirmed the rights of "individual peasant producers," despite a screen of antikulak phrases to cover this compromise with Marxist principles.

A good crop in the summer of 1926, however, strengthened national food resources and brought forward a demand that the village capitalist be curbed. He was becoming dangerously strong, and the state had begun to feel, as it had about the nepman two years before, that it could do without him. The opposition platform, therefore, was in accord with prevailing Communist sentiment, and by 1927 it had attracted such prominent figures of the Bolshevik regime as Zinoviev, the president of the Third International, and L. B. Kamenev, one of Lenin's closest associates. But Trotsky's adherents declared that their arguments were perverted in the official press and that they were not given proper opportunity to state their case. They had recourse to underground methods, u-hich the majority denounced as an attempt to split the party. The adherents of Trotsky refused to abandon their tactics and, after a hot discussion at a joint meeting of the party's central committee and control commission in Nov. 1927, were expelled from the party. At the 1 jth party congress in December Zinoviev and Kamenev capitulated to the majority and asked to be readmitted into the party as rank-and-file members. Trotsky was sent into exile in central Asia in Jan. 1928 (he was later allowed to go abroad). Soon afterward, it became clear that the majority had adopted the opposition's program of repressing the "capitalist elements" in the villages.

The immediate reason for this step was the failure in the summer of 1927 of the state grain collections. This was the name given to the system of state purchases of grain to provide for the needs of the urban population and the army and for export. In the previous year the state had collected approximately 10,000,000 tons of cereals, of which more than 2,000,000 were exported, and it was planned to collect an equal amount in 1927–28. A renewal of the "scissors" disproportion between the prices of grain and manufactured goods caused difficulty. The peasants preferred to keep the grain for themselves and their stock, rather than sell it. Communist sentiment was already prepared for a drive against

"anti-socialist forces" in the villages. During the spring and summer of 1928 vigorous measures, reminiscent of the War Communism period, were employed to extract surplus grain from the richer peasants, who were described as class enemies.

The quota was attained, but the growing needs of the towns left only a small margin for export, which fell to less than 500,000 tons. This reacted unfavourably upon the foreign trade balance. which had now become most important because in 1928 the state embarked upon an ambitious five-year program of industrialization (that is, an attempt to build up a self-sufficient industrial production) which required heavy purchases of machines and raw materials abroad. The enforced collections of grain caused much discontent in the villages, and in July 1928 the central committee of the Communist party announced their abolition and promised that they should not be repeated. Once again Communist insistence upon class warfare in the villages had overemphasized the distinction between kulaks and the rest of the peasants.

For an account of the first five-year plan, introduced in 1928. see *Economic Conditions,* below. (W. DY.; M. BF.)

The Rise of **Stalin.**—Joseph Vissarionovich Stalin emerged as the outstanding leader of the Soviet regime during this period. Although he held no state office until the spring of 1941, when he succeeded his faithful adherent Vyacheslav Mikhailovich Molotov as premier, after being hitherto simply general secretary of the central committee of the Communist party, his power in every field, political and economic, was absolute and unquestioned. It became almost a matter of course to ascribe every Soviet achievement, political, military, economic or social, to his genius and initiative.

Stalin's personal power was further confirmed by the political elimination and, in many cases, by the physical execution of most of the leading "Old Bolsheviks," the men who, along with Lenin and Trotsky, had played prominent roles in the first years of the revolution. Trotsky himself had first been banished to Turkistan and then sent into exile, finally taking up residence in Mexico. There he was murdered in the summer of 1940. Meanwhile, there had been three spectacular trials of prominent revolutionaries in Russia, in Aug. 1936, Jan. 1937 and March 1938. The defendants confessed various acts of treason and sabotage. and almost 50 persons were sentenced to death. Among the victims of these trials were some of the most famous names of the revolution and of the early phases of the Soviet regime. They included a former premier, A. I. Rykov; two former presidents of the Communist International, Zinoviev and Nikolay Ivanovich Bukharin; the once-dreaded chief of the O.G.P.U. (successor of the Cheka as political police), G. G. Yagoda; and many former diplomats, cabinet ministers and prominent economic executives. Marshal RI. N. Tukhachevsky, one of the most gifted leaders of the Red army in the civil war, and seven generals of the Red army were shot after an alleged secret trial in June 1937. Throughout these years there were many secret executions, some of which were and others were not subsequently reported, and a far greater number of incarcerations in labour camps and administrative banishments.

The trials and the accompanying purge were a dark and debatable subject. Foreign critics emphasized the factual discrepancies in certain details of the trials which were subject to verification in foreign countries; they interpreted the whole purge as a method of ensuring Stalin's personal power and the confessions as the false self-incriminations of exhausted and broken men, who were influenced by threats against their families. Stalin's power certainly remained unshaken, and the regime stood up to the shock of war without the internal disintegration which had been predicted as a result of the purges. It is, of course, quite possible that the masses of the Russian people who were not involved in the purge viewed with relative indifference this ruthless destruction of one part of the ruling class by another.

The Constitution of 1936.—The All-Union Congress of Soviets adopted a new constitution for the U.S.S.R. on Dec. 5, 1936. This instrument provided for direct, instead of the formerly indirect, election to the new bicameral national legislature, the supreme soviet, with representation in one house based on population, in the other on nationality (there were at that time 11 soviet republics in the union).

Politically, the new constitution brought little if any change in practice. Stalin remained a dictator of unlimited powers. Only one political organization, the Communist party, remained legal, and its dominant role mas for the first time given constitutional sanction. Nor was any opposition permitted to manifest itself in speech or writing after the promulgation of the constitution.

Socially, however, and in everyday life, there were considerable changes in Russia after the end of the first five-year plan. There was no reversion to private capitalism, but in the overriding interests of productivity there was toleration and even encouragement of much more material inequality than would have been found during the bleak, austere period of the first five-year plan, when the acute shortage of food and consumers' goods almost enforced a kind of equality of privation. The discrepancy between the incomes of the higher members of the bureaucracy, army and O.G.P U. officers, industrial executives, popular authors, engineers, etc., and those of the masses of workers and peasants became greater, as also did the difference in wages between skilled and unskilled workers.

There were significant changes of emphasis in education, in literature, in cultural life. The state set the tone in all these fields; there was no tolerance for the dissenter. But the Soviet school, experimental and loosely disciplined for more than a decade after the revolution, became much stricter in its methods, with marks and examinations, uniforms for students and more authority for teachers. Middle and higher education, formerly free, was paid for from 1940.

Up to the middle 1930s it was fashionable and, indeed, almost compulsory to deprecate the Russian past extravagantly and uncritically. But subsequently the nationalist note was often struck in newspapers and literature: tsars of outstanding personality such as Ivan the Terrible and Peter the Great were referred to with respect, instead of being indiscriminately abused.

There was an important change of attitude toward family life. Early Soviet legislation practically eliminated all restrictions on intercourse between the sexed. Divorce could be had immediately for the asking by either partner, and there was no distinction between legitimate and illegitimate children. Abortions were frequent and permitted. In the middle 1930s there was a severe tightening of restrictions on divorce; the performance of abortions was made illegal and women were urged and encouraged to bear many children.

During the period from 1929 to 1933 there was a good deal of persecution of children whose class origin was suspect. Sons and daughters of priests, former aristocrats and well-to-do families were barred from universities and found it hard to get employment. After 1933 there was more social equality, more feeling that class lines within the state had been ironed out. It was perhaps not accidental that these changes of a moderate and conservative character coincided with the decimation of the ranks of the veteran revolutionaries who were identified with the more active destructive period of the revolution.

Foreign Relations, 1928-41.—Between 1928 and 1941 the U.S.S.R. passed through three fairly well-differentiated stages of foreign policy, as follows:

1. Collaboration to some extent with Germany, antagonism to Great Britain and France. This had been the general course of Soviet foreign policy after the revolution, and it continued until Adolf Hitler's rise to power in Germany in 1933. There were occasional variations in this policy, periods of coolness between Moscow and Berlin. But Soviet policy in the main was to support the German demand for disarmament, as opposed to the French thesis of security, to abstain from co-operation with the League of Nations, to depict Great Britain and France as the chief potential enemies. Soviet support of the British general strike and of the Nationalist revolutionary movement in China aggravated relations with Great Britain, and there was a suspension of British-Soviet diplomatic relations from 1927 until 1929.

2. Collective security, antifascism, united front. Hitler's rise to power on an outspokenly anticommunist program and the ob-

viously militarist, aggressive character of the nazi regime caused a change of orientation. Karl Radek, the publicist, who was often an unofficial spokesman for the government until his arrest in connection with the treason and sabotage trials, heralded this shift in the spring of 1933 when he wrote a series of articles about the undesirability of violent change in the territorial settlement. The U.S.S.R. joined the League of Nations on Sept. 18, 1934, the year when Germany left it. Military alliances were concluded with France and Czechoslovakia and pacts of nonaggression, elaborately worded so as to exclude every form of disguised aggression, were concluded with Russia's western neighbours—Poland, Latvia, Lithuania. Estonia and Finland. The regular Soviet representative at important sessions of the League of Nations, Maxim Maximovich Litvinov, repeatedly advocated the ideas that peace was indivisible and that security must be organized on a collective basis.

The Communist International, fully in the service of Soviet policy, changed strikingly the character of its propaganda. Extreme revolutionary demands were pushed into the background, and political alliances were sought not only with Socialists but with Liberal and Radical parties and in China with Chiang Kai-shek. One result of this policy was the formation in 1936 of left-wing popular front governments in France and Spain. During the Spanish Civil War which broke out in 1936, the Soviet government, although represented on the "nonintervention committee" in the beginning, sent a limited amount of aid in tanks, planes and military specialists to the Republicans.

3. Abandonment of the west. aggression. A tremendous change in foreign policy occurred on Aug. 23, 1939, when Stalin and Hitler signed a pact of nonaggression. There had been signs earlier in the year that the Soviet government, which had been rebuffed and cold-shouldered at the time of the Munich conference in Sept. 1938, was considering a change of policy. Stalin in his important speech to the 18th party congress in March 1939 had spoken of unwillingness to pull foreign chestnuts out of the fire. Litvinov, apostle of collective security, had been summarily dropped from the cabinet on May 3, 1939, and replaced by Molotov. The Soviet-German agreement broke upon the world at a time when the negotiations were still proceeding between the G.S.S.R. and Great Britain and France with the object of bringing the union into a common front against Germany. In the course of these the Soviet government had made demands concerning the Baltic states and Poland which the governments of those countries found unacceptable.

During this third phase, the Soviet government pursued a policy of independent aggression, endeavouring to strengthen its strategic position and to derive benefit from the war in which the other major European powers were involved. By a secret protocol (revised on Sept. 28) to the treaty of August, Germany had agreed not to oppose Russian action in the areas in which the Soviet government declared itself to be interested. Soviet troops crossed the Polish frontier on Sept. 17, 1939, and the partition of that country with Germany was effected. Finland was attacked on Nov. 30. The Finnish resistance was unexpectedly strong. but on March 12, 1940, a peace treaty was concluded which gave the U.S.S.R. the isthmus of Karelia, the naval base of Hango and other concessions. The Baltic republics, Latvia, Lithuania and Estonia. which had been obliged to accept "mutual aid" treaties with the U.S.S.R. admitting Soviet garrisons in their territory in Sept.–Oct. 1939, were annexed outright and organized as soviet republics in the summer of 1940. At the same time, Rumania was forced to cede Bessarabia, a former Russian province, and northern Bukovina. With some internal reorganization the number of soviet republics was now 16. (W. H. Ch.; M. Bf.)

By the autumn of 1940 the Soviet Union was becoming anxious at the extent of Germany's successes, and Molotov was sent to Berlin in November to attempt to strike a new bargain. But he failed to get agreement to Russian demands concerning the Balkans and the straits. The Russians had taken part in the Montreux conference of 1936, which had revised the Lausanne straits convention of 1923 much in their favour; but now they wished for physical guarantees of their security in this area. Thereafter, despite various appeasing gestures, the die was cast, and on June 22, 1941, Hitler attacked without warning. Warnings from the west that such an attack was being prepared had apparently been taken lightly.

The major success of Soviet diplomacy in the period immediately before the German attack was a nonaggression treaty with Japan, signed on April 13, 1941. By aggression in Manchuria in 1931, Japan had become a neighbour of the U.S.S.R. and of its satellite Outer Mongolia on a much wider front. The Soviet government, preoccupied by the European threat. had done its best to appease Japan by selling it in 1935 the rights in the Chinese Eastern railway that the Soviet Union had recovered in 1924 and defended against China in 1929. By helping to bring about a temporary united front of the Chinese Nationalists and Communists and by signing a nonaggression treaty mirh the Chinese Nationalists, it had also helped to stiffen Chinese resistance toward Japan. Nevertheless, there had been some fairly severe fighting—almost an undeclared war—along parts of the Manchurian frontier in 1938 and 1939. The nonaggression pact with Germany's ally thus removed some of the Soviet fear of a war on two fronts.

G. WORLD WAR II

The first five months of the war were almost fatal to the Russians. The Germans advanced rapidly, encircling great Russian forces and conquering about 500,000 sq mi. of territory. By November all southern Russia, including the Crimea except the naval base of Sevastopol, had been overrun, and Rostov had fallen. In the Ukraine Kharkov had fallen. and further north Tula was almost surrounded. The Germans mere within 20 or 30 mi. of Moscow, whence much of the administration had been evacuated, with the foreign embassies, to Kuybyshev (Samara). Leningrad was virtually encircled—the beginning of a siege that was to take a heavy toll through famine and to rob Russia of historic monuments of its past.

The winter brought relief; Rostov was retaken and a counter-offensive in December relieved the pressure on Moscow. By the time the spring thaw of 1942 came the Russians had made deep penetrations into several sections of the German front. The summer of 1942, however, was almost as disastrous as the preceding one. The new offensive in the south carried the Germans to the Don along most of its length and across it to the Volga at Stalingrad. Meanwhile Rostov. Sevastopol. Novorossiisk and the Maikop oil fields as well as the rich agricultural lands north of the Caucasus had all been lost, and the southeastward thrust of the German armies in this sector had almost reached the major oil centre of Grozny. In 15 months it was reckoned that the Red army had sustained 5,000,000 casualties.

The defense of Stalingrad marked the turning of the tide. Again winter came to the rescue of the Russians, and a great counter-offensive cut off a huge German army outside Stalingrad where it eventually surrendered in Feb. 1943. In the summer a new German offensive was defeated and the Soviet armies went over to the offensive, freeing Orel and Belgorod on the central front, liberating Kharkov and the Donets coal field. as well as Novorossiisk and the eastern shore of the Black sea. A sudden advance to the Dnieper cut off large German forces in the Crimea. By the beginning of November. the Red army was back in Smolensk, Gomel and Kiev. This offensive merged without a break into the winter offensive of 1943–44, in which, in addition to further gains in the south and centre the Russians at last broke out in the north, clearing the Leningrad area and driving on toward the Baltic states. With the reconquest of the Crimea in May, the Russians had cleared most of the pre-1939 Soviet Union.

In the summer of 1944 a series of new offensives began. Finland agreed to an armistice in September, but the Germans refused to leave the country and fighting continued. In the far north the retreating Germans were pursued over the Norwegian border. Farther south big gains were made in the Baltic republics, Byelorussia and Poland. But the Russians failed in much-debated circumstances to relieve the Polish home army which had risen in Warsaw, and both there and on the Baltic front. where the Red army had suffered a reverse, the advance came to a halt in August.

The most spectacular gains were obtained in the south. An offensive against Rumania led to the Rumanian government's accepting armistice terms and declaring war on Germany on Aug. 25; in September war was declared against Bulgaria (hitherto neutral as regards the war on the eastern front), and on Sept. 8 Bulgaria, too, changed sides and declared war against Germany. In their pursuit of the Germans into Yugoslavia. the Russians on Oct. 20 entered Belgrade simultaneously with Tito's (Josip Brozovich or Broz) partisans; in Hungary, Budapest was encircled by the end of the year and a rival Hungarian government was set up in Debrecen under Russian sponsorship. The Russians had also crossed into eastern Czechoslovakia.

A new winter offensive on all fronts began in Jan. 1945, and by the time of Germany's collapse in May, Russian armies were deep into the heart of the reich with Warsaw, Budapest, Vienna and (by inter-Allied agreement) Berlin and Prague among the capitals taken by the Red army.

In the far east the U.S.S.R. entered the war only on Aug. 8, 1945, on the eve of Japan's collapse, and rapidly overran Manchuria and northern Korea.

.Internal Affairs, 1941-45.—The war provided the biggest test to date of the capabilities and stability of the Soviet regime. But any opportunity the Germans had to exploit political discontent in the occupied areas was soon thrown away by the ruthless exploitation of their resources and by the brutality which the Germans showed toward their populations. The ill treatment of the civilian population was completed by large deportations for slave labour in the reich and by massacres of the Jews. Hatred of the invader proved a powerful welding force in adversity.

On June 30, 1941, a new state committee of defense was set up which for the period of the war was the supreme governing body under Stalin's leadership. The general line was to stress even more strongly than in the preceding period the patriotic elements in the Soviet ideology and to call upon the people to resist in the name of Russia's heroic past rather than in that of the revolution. A new measure of toleration for the Orthodox Church was part and parcel of this process. The Communist party itself, on the contrary. was allowed to fall into the background, and its ranks were widely opened to soldiers in the field and outstanding workers in the arms factories. Its membership rose from 3,876,000 in 1941 to 5,700,000 at the end of the war, despite the heavy losses in battle. The nation's gaze was concentrated on the army, of which Stalin (now commissar for defense) was in supreme control; and after the early failures of the survivors of the old guard of Communist generals, K. E. Voroshilov. S. M. Budenny and S. K. Timoshenko. new ones came to the fore: G. K. Zhukov, I. S. Konev, R. Y. Malinovsky, K. K. Rokossovsky, F. I. Tolbukhin, A. M. Vasilevsky. Until 1943 when illness caused his replacement by Vasilevsky, the chief of staff was the former tsarist officer B. M. Shaposhnikov.

In March 1944 the "Internationale" was replaced as the national anthem by a new patriotic song.

Stern measures were meted out after the German retreat to those minorities that had collaborated with them. The Volga German Autonomous Republic was abolished early in the war and its population deported into Siberia. The same fate now befell the Kalmuck, Chechen-Ingush and Crimean (Tatar) Autonomous Republics and the Karachay Autonomous Region. In 1944 the hitherto nominally independent republic of Tannu Tuva entered the Soviet Union as an autonomous region of the R.S F.S.R.

By constitutional amendments of Feb. 1944, the republics of the U.S.S.R. were given the right of entering into direct relationships with foreign countries and of having their own defense formations. For this purpose they were to have the right to set up commissariats of foreign affairs and defense. The only practical consequence of these changes seems to have been the seats allotted to the Ukraine and to Byelorussia in the United Nations.

Foreign Relations, 1941–45.—Foreign policy during the war naturally gave the same overwhelming priority to the direct defense of the Soviet Union as was manifest in every other sphere of national life. The Communist parties abroad, which only yesterday had been sabotaging the "imperialist war" against Germany, were ordered to take a patriotic line in all countries fighting the axis and henceforth devoted themselves to trying to influence Allied strategy in such a way that the maximum burden should be lifted from Soviet shoulders. This was the origin of the clamour for the second front, and Soviet diplomacy was largely directed to the same end. In a further effort to reassure foreign opinion, the announcement was made on May 22, 1943, that the Communist International had been formally dissolved on May 15.

The Soviet Union signed a number of treaties with the Allied governments (including a 20-year treaty of alliance with Great Britain on May 26, 1942) and with Allied governments in exile. It entered into diplomatic relations with certain countries for the first time: Canada, South Africa, the Netherlands. But although the prior consideration was the immediate war crisis, the Soviet government was concerned from the beginning to safeguard its own postwar position. Unsuccessful efforts were made to get from Great Britain and the United States formal recognition of its recent annexations in the Baltic. With regard to Poland, the agreement signed with the Polish government in exile on July 30, 1941, recognized the abrogation of the territorial changes resulting from the Soviet-German pact and the rebirth of an independent Polish state. There followed a brief period of apparent Polish-Soviet friendliness during which the surviving Poles who had been deported into the Soviet Union were allowed to form an army. But relations were not cordial, and between March and April 1942 most of the Poles were withdrawn from Soviet territory to the middle east. The Russians also formed a Communist Polish army which took a part in the later campaigns. Relations with the London Polish government were envenomed by constant controversy over the frontier question, and relations with it were broken off after it had appealed in April 1943 to the International Red Cross to investigate German allegations that the bodies of large numbers of Polish officers who had been interned in Russia but of whom no account had hitherto been given had been found in circumstances that pointed to the Russians' having massacred them. (A subsequent Russian commission naturally retorted that the Germans were responsible for the murders.)

Poland remained the main source of difference between the Allies until the end of the war, particularly when it became clear that the Russians were determined to have the new Poland governed by a regime chosen by themselves and ready to grant the U.S.S.R. its territorial demands in return for compensation at Germany's expense. This question, however, was only part of the general planning of the postwar world carried out by negotiations with the United States and Great Britain, in particular at the tripartite conferences of Tehran (Nov.–Dec. 1943); Yalta (Feb. 1945) and Potsdam (July 1945).

The three main questions involved were the treatment of the defeated countries; the new territorial settlement; and the nature of the new United Nations organization, planned at the Dumbarton Oaks conference in Aug.–Sept. 1944 and brought into being at the San Francisco conference in May–June 1945.

In regard to the first of these, the original Russian point of view was in favour of the partition of Germany into separate states; but this was not maintained at Potsdam, when a decision to treat Germany as a single economic unit was reached despite the quadripartite nature of the occupation. The Russian insistence on the punishment of war criminals was largely met by the Allies, and the Russians co-operated in the Nuremberg trials; but it was soon made clear, both in regard to "denazification" in Germany and "democratization" in Japan. that the Russians meant far greater transformations of the social structure of these countries than had been contemplated. Under Russian occupation, eastern Germany was rapidly sovietized. Of more immediate concern was the difference in the attitude toward reparations from Germany, which manifested itself at Yalta and was bridged neither by the Potsdam agreement nor by the subsequent conference of foreign ministers held in Moscow in Dec. 1945. The Russians held that the restoration of Russia through reparations in kind from Germany should be given absolute priority, whereas the western powers considered that nothing should be done to the German economy that would make the occupation a drain on their own

resources. No agreement was reached on Japanese reparations either. On the other hand, the Russian war against Japan, which began only on Aug. 8, 1945, enabled them to seize as war booty much of the industrial wealth that the Japanese had built up in Manchuria. The Soviet Union also made much use of the labour of prisoners of war for reconstruction purposes.

On the territorial side, the Russians achieved their demands in Europe, acquiring part of East Prussia, including Konigsberg, as well as the Baltic states, eastern Poland, Bessarabia and Bukovina. To these acquisitions a treaty with Czechoslovakia on June 29, 1945, added Sub-Carpathian Ruthenia. All independent efforts at co-operation between the eastern European states were frowned on during and after the war. In addition, of course, the Russians acquired zones of occupation in Germany and Austria and the right to garrison troops to guard their lines of communication in Poland, Hungary and Rumania. Since Aug. 1939 the effective boundaries of Russian power had shifted about 750 mi. to the west and about 600 mi. to the southwest. Russian troops in the Thuringian forest were within 100 mi. of the Rhine. There was strong pressure against Turkey for territorial concessions and for bases on the straits.

In Asia, the negotiations for Russia's entry into the war against Japan had led to the promise of concessions in Manchuria which had the effect of replacing it in the position from which it had been ousted as a result of the Russo-Japanese war of 1904–05. Port Arthur again became a Russian naval base. By a treaty revealed Aug. 14, 1945, these positions were confirmed by the Chinese government of Chiang Kai-shek, which also accepted, subject to the formality of a plebiscite, the abandonment of claims over the Soviet satellite Outer Mongolia. Soviet influence in Sinkiang, dominant in the 1930s but relaxed in the war years, was gradually reasserted.

On the side of international organization, the Russian position was that matters should be handled in the postwar world by the continued co-operation of the three great powers, as during the war. The Soviet Union was eventually persuaded to give a formal position of equality to France, with whom a treaty of alliance had been signed on Dec. 10, 1944, and to China. The special position given to the permanent members of the Security council and the demand for their unanimity on all decisions other than purely procedural ones reflected the Soviet attitude in the drafting of the charter of the United Nations.

H. POSTWAR POLICY TO THE DEATH OF STALIN, 1953

There was little change in the political structure of the Soviet Union in the years immediately after World War II. The domination of Stalin and his immediate associates in the Politburo and the council of ministers was beyond question, and apart from the death in Aug. 1948 of A. A. Zhdanov and the disappearance of N. Voznesensky there was little change in its composition. From the dozen leading figures, the names of Vyacheslav M. Molotov (whose appointment as vice-premier was announced on March 4, 1949, when he was replaced as foreign minister by A. Y. Vishinsky), of G. M. Malenkov and of L. P. Beria gradually became the most prominent. The supreme soviet and the soviets of the republics resumed the regular elections and sessions that had been abandoned in the war years. The chief task of the former was still the ratification of the annual budget. The chairman of the presidium of the supreme soviet, the elderly Mikhail Ivanovich Kalinin, died in 1946 and was replaced by N. M. Shvernik, till then head of the trade union organization.

In Oct. 1952, the 19th congress of the party met, the first such meeting since 1939. It was preceded by the publication of a booklet by Stalin, *The Economic Problems of Socialism in the U.S.S.R.*, which stressed the division of the world market between the two *blocs* and indicated that the possibility of internecine hostilities between non-Communist powers was still to be reckoned with alongside their hostility to the Soviet Union. The congress itself made certain changes in party organization and dropped the word "Bolshevik" from the party's title. The choice of G. M. Malenkov to make the principal report suggested that he was in the direct line of the succession. At this time there were a number of calls for internal vigilance, and on Jan. 13, 1953, revelations were published about the alleged activities of a group of Soviet doctors, who were said to have tried to murder various prominent Soviet personalities for the ultimate benefit of U.S. and British imperialism. Although much was made at the time of the fact that seven of the nine doctors were Jewish and though the revelations about the "plot" were accompanied by vigorous anti-Zionist propaganda, later events made it seem probable that the whole affair was part of an obscure internal struggle for power.

There was a sharp reversal, beginning even before the end of the war, of the emphasis laid on the state and on the army and its leaders at the Communist party's expense. This represented, on the top level, part of the process by which the links between east and west, built up perforce during the war, were broken down again. Anxiety was shown as to the effect that contact with the higher standards of living of central Europe might have on the Soviet troops in occupation, and propaganda for their re-education was undertaken. The party itself was subjected to a purging process to get rid of persons who had entered during the war and who did not show sufficient political aptitude for its peacetime tasks; the old standards of indoctrination were demanded once more.

A new emphasis, foreshadowed during the war, was laid on the Russian element in the Soviet Union. It became official doctrine that even prerevolutionary Russia had been a progressive force in relation to the subordinate nationalities absorbed within the Russian empire, and the histories of the latter were rewritten in accordance with this. The language policy exalting the role of Russian, for which a theoretical basis was given in Stalin's attack on the philological theories connected with the name of Nikolay Marr, must also be noted in this connection.

The most effective antidote to the survivals of "bourgeois nationalism" which were regularly castigated in the Soviet press was biological rather than cultural. The policy of large-scale population movements for economic and political reasons would tend to break up the national homogeneity of all the republics and in the long run to create a single undifferentiated Soviet type.

In cultural matters, the same general trend toward Russian self-sufficiency was seen. Much emphasis was laid on the priority of Russian scientists in discoveries in all important fields. Zhdanov began a campaign against all signs of "servility" toward western cultural models in 1946, and this continued in subsequent years. Science also was forced to conform to the dominant ideology, a high light in the process being the formal proscription in 1948 of all theories of genetics other than those of the I. V. Michurin–T. Lysenko school.

Foreign Policy, 1945–53.—The disagreements between the Soviet government and its wartime allies which had become apparent before the end of the war were soon to assume a shape that made further co-operation impossible. Although the Soviet representatives continued to take part in the work of the United Nations (except for the period Jan.–Aug, 1950 when they absented themselves as a result of the dispute over the membership of Communist China), that organization was in fact little more than a forum where the disagreements between the Soviet Union and its associates on the one hand and the rest of the world on the other could be aired. On the matter of disarmament, both conventional and atomic, no agreement was reached. The fact that the Soviet Union was experimenting with atomic bombs was admitted by Stalin in Oct. 1951; and in later developments the Soviet claimed to be keeping abreast of the west.

In Europe, a conference in Paris was held in 1946 for discussion of the draft treaties with Italy, Rumania, Hungary, Bulgaria and Finland; these were finally signed in the following year. But there was no agreement either on Austria or on Germany. Continued friction with the western powers over policy in the occupied countries, particularly in Germany, culminated in the effort to dislodge them from Berlin in 1948 through an economic blockade that was frustrated by the air lift. An attempt to deal with the outstanding issues led to a long, fruitless four-power conference of foreign ministers' deputies at Paris in the spring of 1951.

The U.S. offer of support to Greece and Turkey and of economic aid to Europe in 1947, and the refusal of the Soviet Union

to participate in the organization for its distribution or to allow either Poland or Czechoslovakia to do so marked the turning point of the postnar period The success of the European Recovery program made the triumph of Communism in western Europe unthinkable without direct Soviet aid. In eastern Europe the result was to accelerate the Soviet effort (nhich had already gone a long way) to convert the nhole area into a series of Communist-ruled satellites that would be totally dependent on the Soviet Gnion economically politically and militarily as well

The symbol of the new situation was the creation in Sept. 1947 of the Communist Information bureau or Cominform with its headquarters in Belgrade, Yugos.. linking together the Communist parties of Europe and being the successor to some extent to the defunct Comintern. Its formal and overt expression was the series of treaties between the Soviet Union and the eastern European countries Czechoslovakia. Dec. 12, 1943; Yugoslavia. June 8, 1946; Albania, July 1947; Poland Jan. **26, 1948;** Rumania, Feb. **4,** 1948; Hungary Feb. **18.** 1948; Bulgaria, March **18** 1948; Finland April 6, **1948.** Treaties between many of these states were also concluded. The eastern German government set up by the Russians in Oct. 1949 belonged to the same grouping.

In **1948** two crucial developments took place. Czechoslovakia. which (though less independent than Finland) had retained a democratic form of government. was forced in a crisis in February to accept Communist rule and rapidly began to travel the same Soviet path as its neighbours. In June the friction betneen Marshal Tito of Yugoslavia and the Russians over the methods of control adopted by the latter broke into the open. The Soviet-Yugoslav treaty was denounced by the Soviet government and Yugoslavia was expelled from the Cominform. which moved its headquarters from Belgrade to Bucharest. Rum.

For the purposes of propaganda, a Soviet-inspired world peace movement nas set up in March 1950.

The *Far* **East** — The end of World War II saw Russia entrenched in Manchuria and North Korea facing the United States as the occupying power in Japan and South Korea. The presence of Soviet troops in Manchuria was used in such a way as to give certain advantages to the Chinese Communist forces when they advanced into it from their strongholds in the north. For a long time, as the Chinese civil war developed, the Russians gave no outward indication of a change in their formal relations with the Chinese government. perhaps calculating that they could not hope for more than that the Chinese Communists should become strong enough to force Chiang Kai-shek to abandon his alignment with the United States, the country that was increasingly regarded as the Soviet Union's main enemy in the postwar world. The picture was changed by the Communist victories in 1948–49. On Oct. 2, 1949 the U.S S R. broke off relations with the Chinese Nationalists and recognized the government set up at Peking by Mao Tse-tung. The Chinese leader went to Moscow in December, and on Feb. **14,** 19**jo,** a series of new agreements was signed

Elsewhere in Asia the Russians showed full sympathy with all movements against restoring the prewar position of the main colonial powers. When national independence had been wholly or largely achieved, they expressed doubts as to its reality and gave support to local Communist movements. These Communist movements had gained ground particularly in southeastern Asia and took to open violence in Indochina, Burma, the Philippines and Malaya. When North Korea attacked South Korea in June 1950, the Russians proclaimed that the attack had in fact been launched by the South Koreans at U S. instigation; but in June 1951 they took the initiative which ultimately led to an armistice agreement two years later.

I. AFTER STALIN'S DEATH

The death of Stalin on March 5, 1953, was followed, after some hesitation, by the emergence of a new pattern of collective rule. Stalin's position as head of the government was occupied by G. M. Malenkov. while N. S. Khrushchev rapidly rose to the summit of the party hierarchy. V. M. Molotov returned to the foreign office and the veteran Marshal K. E. Voroshilov became chairman of the presidium. The "doctors' plot" was exposed as a falsehood and there were indications that the new regime intended to relax tension at home and abroad and to concentrate on the provision of a better life for Soviet citizens. On July 10, 1953, it was announced that L P. Beria had been expelled from his post at the head of the political police organizations; he was later executed. On the other hand, there were no important developments in the Soviet attitude toward concrete external problems. A series of long-range exchanges about Germany led to an abortive conference in Berlin from Jan. to March 1954. The far eastern conference at Geneva from April to July showed that the Soviet Union was determined to preserve its close links with Communist China as the basis of its Asian policies. The Soviet Union showed its increased confidence in the Chinese regime by agreeing. on Oct. 11, 1954, to return to China the naval base of Port Arthur, to give China further credits and to abandon its share of the joint stock companies set up in 1950. In November, the Soviet Union called a European Security conference in Moscow (attended in fact only by the "satellites") and this was clearly a reply to the west European London and Paris agreements. An initial burst of greater cultural liberalism had been rapidly checked, but in April **1954** the Soviet Gnion rejoined UNESCO and thereafter the promotion of cultural exchanges with the non-Soviet world became an increasing feature of Soviet propaganda.

In 1955 there was a renewed shift away from concessions to the consumer and toward concentration on heavy industry and defense. On Feb. **8** Malenkov was replaced by N. A. Bulganin as prime minister; and Marshal G. K. Zhukov succeeded the latter as defense minister, thus symbolizing the re-emergence of the professional soldiers which had begun with Stalin's death. The conclusion of an Austrian peace treaty on May 1j suggested that the Russians might be willing to try again for a united Germany, but the Geneva conference in July and its sequel, the foreign ministers' meeting in Oct.–Nov. 1955, registered no important changes. More important were Soviet moves to win over the "uncommitted countries." Relations with Yugoslavia were normalized; and with J. Nehru's visit to the U.S.S.R. in June, a Soviet propaganda offensive began in Asia, signalized by the Asian tour of Bulganin and Khrushchev in November, and Mikoyan's visit to Pakistan and India in March **1956.** In the autumn of 1955, increased activity in the middle east was noted. At the 20th congress of the party in Feb. 1956, Khrushchev showed himself to be the dominant figure in the regime; major interest at the congress was concentrated on his denunciation of the personal rule and cult of Stalin.

In foreign affairs, the attempt to create a better atmosphere in relations with the west continued. Bulganin and Khrushchev visited Great Britain in April **1956** and the French prime minister and foreign secretary visited Moscow in the following month. In neither case. however, did the Russians show willingness to depart from their essential positions in foreign policy. The British visit was chiefly notable for friction between the Russian visitors and the leader of the Labour party, Hugh Gaitskell, arising out of the latter's enquiry about imprisoned Social Democrats in eastern Europe. On June 1 Molotov resigned from his post of foreign minister on the eve of a visit to Moscow by Marshal Tito. Molotov nas succeeded by Dmitry Trofimovich Shepilov, but on Feb. 15, **1957,** Shepilov was replaced in turn by Andrey Andreyevich Gromyko.

Tito's talks with the Soviet leaders resulted in their guarded acceptance of the right of other Communist parties and countries to pursue their own paths to "Socialism."

The Soviet Union's relations with the eastern European people's democracies deteriorated seriously during the second half of **1956,** and Russian military and economic control of the area was endangered. Revolt broke out in Poland in June and in Hungary in October. Polish army tanks quelled the rioters in Poznan, but Soviet divisions had to be sent to Hungary to maintain control. In Poland an alternative Communist leadership under Wladyslaw Gomulka gained concessions while preserving the Soviet alliance. In Hungary no similar ready alternative was found.

Despite these setbacks in eastern Europe, Soviet foreign policy became increasingly active in the middle east. The supply of

arms to Egypt, which was one of the causes of the Suez crisis: was follow-ed up later by the threat to despatch "volunteers" in reply to the British-French action there. Soviet influence extended to other middle eastern countries, notably Syria. In 1957 Molotov attempted to challenge Khrushchev's party leadership while the latter was temporarily out of the country, but he was defeated and expelled from the central committee. The following year Khrushchev consolidated his position by becoming chairman (premier) of the Council of Ministers of the U.S.S.R. as well as first secretary of the party.

Soviet scientists, on Oct. 4, 1957, put the first man-made satellite (Sputnik) into orbit around the earth. It mas followed by others and in 1959 a Soviet space vehicle reached the moon and another photographed the far side of the moon.

In Sept. 1959 Khrushchev visited the C.S. where he addressed the U S general assembly on Sept. 18, and late in March and early in April 1960 he conferred with Pres. Charles de Gaulle in France.

On May 1. 1960, a U.S. high-altitude reconnaissance airplane. designated a U-2, crashed in the U.S.S.R. and its pilot was captured. This led to the revelation that the United States had been conducting photographic missions over the U.S.S.R. for at least three years. In Paris, where the heads of the U.S.S.R., Great Britain, France and the U.S. convened for a "summit" conference in May, Rhrushchev demanded that President Eisenhower apologize to the U.S.S.R. for the U-2 incident and that the U.S. punish those responsible for the flight. His demand was refused and the conference collapsed before it began. Two weeks later the UN security council rejected the U.S.S.R.'s motion to censure the U.S. for the espionage flights. On Aug. 19 Francis G. Powers, the U-2 pilot, was sentenced by a Soviet military court to ten years imprisonment for espionage.

VI. POPULATION

The population of the U.S.S.R. is shown in Table VIII. Although the population is the third largest of any state in the world, it is small in comparison with the vast area over which it is spread. According to the census of 1939, two-thirds of the country was occupied by only 6% of the population. while 48% of the population was concentrated in 6% of the territory.

Population Trends, 1897–1956.—The first Russian census was taken on Feb. 9 (N.S.), 1897, and recorded a population of 129,800,000 (including autonomous Finland and the protected states of Khiva and Bukhara). Within the reduced frontiers of 1921, this population was estimated at 106,080,000. The Russian statistician E. Z. Volkov estimated that in 1914, within the 1921 frontiers, Russia had a population of 142,389,000, an increase of 36,309,000 or 34.3% in 17 years.

The first Soviet census of Dec. 17, 1926, revealed a population of 147,027,915, an increase of only 4,639,000 or 3.5% in 12 years. If Russia had not been involved in World War I and the revolutionary upheaval that followed, its population in 1926 would have been about 175,000,000. The deficit of 27,600,000 is explained by the following estimates: war losses 2,000,000; decrease in the number of live births during the war and revolution 10,000,000; killed during the civil war, and deaths from famine and epidemics 13,600,000; refugees abroad 2,000,000.

The results of a second Soviet census in 1937 were never published. The third census of Jan. 17, 1939, recorded a population of 170,467,186, but two Soviet statisticians, S. A. Novoselsky and V. V. Payevsky, estimated in 1934 that the expected population of the U.S.S.R. in 1939 should be about 191,102,000. The deficit of 20,635,000 can be explained only by the assumption that during the period of forced collectivization of agriculture. of rapid industrialization and of the dissolution of family life by voluntary and compulsory migrations within the Soviet Union, mortality and the decrease in live births were much higher than statisticians expected.

Nevertheless, if the U.S.S.R. had not taken part in World War II, its population in 1945, within the prewar frontiers, would have been about 190,000,000. In fact, it was about 168,500,000, because of war losses, direct and indirect. The only official estimate of the number killed in fighting was given in 1946 as 7,000,000. Gen. Augustin Guillaume. chief of the French military mission to the Soviet Union, estimated this number at 7,500,000, to which he added 3,000,000 who died from wounds; he also estimated the number of civilians killed or dead from hunger and exhaustion, as well as the decrease in live births during the war, at a total of 11,000,000. On the other hand, as a result of Soviet annexations in the years 1939–45, the total population rose, at least theoretically, by 22,780,000. In *Pravda* of Jan. 23, 1946, the total population of the U.S.S.R., in its enlarged territory. was officially estimated by G. F. Aleksandrov: then propaganda chief of the Communist party, at 193,000,000. L. P. Beria said in 1951 that for several years the annual population increase had exceeded 3,000,000. N. S. Khrushchev revealed in 1956 that between 1950 and 195j the population increased by 16,300,000. In June 1956, however, the Soviet government estimated the population of the U.S.S.R. at 200,200,000. This figure suggested that Aleksandrov's estimate of 1946 was not true and that the total population was

TABLE VIII.—*Population of the U.S.S.R. according to the Census of Dec. 17, 1926, and Jan. 17, 1939*

*According to an official Soviet computation (1939).

then not 193,000,000 but about 175,000,000.

Vital Statistics. — Before World War I the rate of increase of the population in European Russia was high. However, between 1900 and 1913 the birth rate fell. although only from the high rate of 51.0 to 47.0 per thousand. The death rate also fell from 32.3 to 30.2 per thousand and the rate of natural increase therefore fell from 18.7 to 17.4 per thousand.

Between 1927 and 1938 the estimated birth rate fell from 45.0 to 38.3 per thousand. the death rate fell from 26.0 to 17.8 per thousand; but the rate of natural increase rose from 19.0 to 20.5 per thousand. The birth rate was lower than in pre-1914 Russia, but so was the death rate and the latter change was due to improvements effected by the Soviet government, particularly through the provision of medical services and of instruction in hygiene. Unsatisfactory living and working conditions helped, however, to make the death rate higher than in western Europe and North America. In 1939, for instance, the death rate was 12.2 per thousand in the United Kingdom and 10.6 per thousand in the United States. The infant mortality rate in Russia was 266 per thousand live births in the years 1909–10 and 187 in the years 1926–27; it was then still one of the highest in the world, as compared (for 1926–30) with 70 per thousand in the United Kingdom and 68 per thousand in the United States. In 1951 Beria said that between 1940 and 1951 the death rate had been halved and infant mortahty had been even more greatly reduced. In 195j the birth rate was said to be 25.6 per thousand and the death rate 8.4 per thousand, which suggested a natural increase of 17.2 per thousand.

Ethnic Groups. — In ethnographic character the population of the U.S.S.R. is remarkably varied. The Soviet Academy of Sciences represented the country as being inhabited by 169 ethnic groups, divided into ten major divisions as follows: Indo-European 36 groups. Caucasian (Japhetic) 40, Semitic 6, Finno-Ugrian 16, Nenets (Samoyed) 1, Turkic 48, Mongol 3, Tungus-Manchurian tribes 6, Palaeo-Asiatic 9 and groups of tribes from the far east with an ancient culture 4. (See Table IX.)

The 1926 census took place at a time when the official approach to the problem of nationality was unbiased, while that of 1939 was taken in an atmosphere of struggle against "bourgeois nationalism," especially in the Ukraine and the Turkic republics. This helps to explain why the number of Russians rose by 21,229,000 (from 52.9% to 58.2%) while the number of Ukrainians fell by 3,125,000 (from 21.2% to 16.5%). According to 1939 estimates, the annexation in the west increased the number of Ukrainians by 5,743,000 and, as the natural increase among them was high, their total number in 1955 was estimated at 36,657,000, 18.31% of the total. The number of Byelorussians increased as a result of the annexation by 1,458,000 (1939 est.) and their total number in 19jj was estimated at 7,067,000 (3.53%). These annexations, as well as the annexation of Estonia, Latvia and Lithuania, of Rumanian Bessarabia and northern Bukovina, resulted in a reduction of the percentage of the Russian population: in 1954 they were 52.31% of the total. The number of Poles, both Polish and Soviet citizens, scattered throughout the Soviet Union in its new frontiers, was estimated in 194j at 3,400,000; 1,503,816 had returned to Poland by June 30, 1949, when re-emigration was stopped. Including the small number of Czechs, Slovaks and Bulgars, the total proportion of Slavs among the population of the U.S.S.R. is more than 75%.

TABLE IX.—*U.S.S.R.: Population by Nationality*

Nationality	1926*		1939*		1956*	
	In 000	%	In 000	%	In 000	%

*Numbers for 1026 and 1939 according to the Soviet censuses: those for 1956 are estimates for an area increased by annexations.

†Mordvinians, Udmurtians, Marii, Komi, etc.

‡Incl. Uzbeks, Tstars, Kazakhs, Azeris, Kirghiz, Turkmen, Bashkirs, Chuvashes, etc.

§Iranian nationalities of the Caucasus (Ossetians, Lezghians and 32 other groups), Mongols (Buriats, Kalmyks, etc.), Siberian nationalities (Tungus, Ostyaks, Nentsy, Chukchi and 21 other groups), as well as Greeks, Koreans, Chinese, Arabs, etc.

After the Slavs the Turkic peoples are the most numerous and important. The Turkic race (Uzbeks, Turkmen, Kirghiz, Kazakhs, etc.) is most continuous in the central Asiatic republics. The Yakuts of the Lena represent a northeastern spread of the Turkic element, now much intermingled with Slavonic blood. In 1943–44. as a result of their alleged collaboration with the Germans, the Turkic peoples of the Crimea (Tatars) and the northern Caucasus (Karachays and Balkars), numbering together about 378,000, were deported to central Asian republics. Between 1926 and 1939 the total number of the Turkic peoples rose by 2,260,000, although that of the Kazakhs decreased by 869,500. It was assumed that their percentage remained the same as in 1939 and this gave 23,023,000 as an estimated number of Turkic peoples in 19jj. (See TURKS OR TURKIC PEOPLES.)

The Finno-Ugrian aboriginal population, Karelians, Mordvinians, Udmurtians (Votyaks), Marii (Cheremis), Komi (Zyryans and Permyaks), and the allied Samoyedes or Nentsy, were increasingly pushed outward by the Slavonic settlement. Finns are to be found mainly in the north and west and also in a belt of Finnish settlement in Asiatic Russia, lying north of the main Slavonic belt and extending to the Yenisei, again much intermingled with the incoming Slavonic population. With the exception of the Finns of Karelia and of Estonians, the number of Finno-Ugrian nationalities was estimated in 195j at 3,824,000 (1.91% of the total).

The relatively high number of Rumanians (Moldavians) within the new frontiers of the Soviet Union is explained by the annexation of Bessarabia. The Volga German A.S.S.R. was dissolved on Sept. 24, 1941, and about 406,000 Germans were transferred to Kazakhstan. The reduction of Jews by 1,118,000 was the result of the extermination policy during the German occupation of the Ukraine and Byelorussia, where the Jewish population mas mainly concentrated.

The Mongol peoples were estimated in 1939 at about 450,000. The 325,000 Buriats are to be found west, south and east of Lake Baikal. They form the chief population of the Buriat Mongol A.S.S.R., as well as of the Ust-Orda and Aghin national districts included in the Irkutsk and Chita regions respectively. The 135,000 Kalmyks (or Kalmucks) who in the 18th century settled in the steppe northwest of the Caspian and south of the lower Volga were deported to Siberia in Dec. 1943 on allegations of pro-German sympathies during World War II. For similar reasons the Chechens and the Ingush, two aboriginal peoples living on the northern slopes of the central Caucasus, followed the Kalmyks in March 1944.

Movements of Population. — The institution of serfdom restricted the tendency of the people to wander and to colonize, and after the abolition of serfdom in 1861 movements of the population greatly increased. The existence of large areas that were unsettled or sparsely populated encouraged colonization, but in the 19th and early 20th centuries political discontent was so great that large numbers of non-Russians emigrated abroad. In the period 1891–1900, for instance, 594,000 Russian subjects (mainly Poles and Jews) emigrated to the United States, and between 1900 and 1909 the number rose to 1,400,000. There was also a considerable movement of people inside Russia from the more thickly populated regions of European Russia. in particular from the black earth belt and from the western and southwestern Ukraine, to the south and southeast and — beginning in the last quarter of the 19th century — to the Urals, Siberia and the far east. The government's policy of encouraging migration to the Urals, initiated at the end of the 19th century, resulted in the following increases: 300,000 in 1861–8j, 450,000 in 1886–94, 1,440,000 in 1895–190j and 3,274,000 in 1906–13.

The problem of populating Siberia was difficult. By the end of

the 19th century a policy of exile as a means of colonization had gained acceptance and, like the convicts transported to the British colonies in the 18th and 19th centuries, men were sent to Siberia for trifling offenses. Old Believers, after the great schism in the Russian Orthodox Church, the rebel palace guards under Peter the Great and. after the Northern War, Swedish prisoners of war were sent to Siberia. The Polish confederates under Catherine II, the Decembrists under Nicholas I, nearly 50,000 Poles after the insurrection of 1863 and whole generations of Socialists, including 45,000 political exiles after the 1905 revolution, were also exiled to Siberia. In the early days they were driven in herds from village to village and often left to die of starvation on the road. In the 19th century the conditions were slightly improved, but the hardships of the journey and of climatic and living conditions continued to cause many deaths. Between 1823 and 1898 no fewer than 700,000 exiles with 216,000 voluntary followers went to Siberia. In 1900 exile as a means of political persecution was abolished, but it was restored again in 1904 because of the increasing political unrest.

The Soviet government continued the policy of sending political and criminal prisoners to Siberia, but on a far greater scale than before. It was officially stated that "forced labour is one of the basic measures of punishment of Soviet Socialist criminal law" (*Bolshaya* Sovietskaya *Entsiklopedia* [The Great Soviet Encyclopaedia], vol. 47, p. 36 [Moscow, 1940]), and the Corrective Labour code of the R.S.F.S.R. of Aug. 1. 1933, provided that political opponents of the regime and "class-hostile elements" be punished by forced labour. In addition to the penal and political motives of Soviet policy there are also the economic motives. V. M. Molotov, as chairman of the council of people's commissars, stated in 1931 that forced labour was employed in "high ay construction, in the building industry, in peat exploitation, in timber works, in mining, stone quarries, gravel and stone crushing, on transportation projects." These projects resulted in the organization of large forced labour camps in regions, such as the extreme north of Siberia and the Kazakh desert, where the climate is too severe for normal colonization and the work under primitive conditions is too arduous to attract voluntary labour. Evidence on the size of the population of forced labour camps in the Soviet Union is conflicting. The British undersecretary of state for foreign affairs gave on May 3, 1949, an estimate of this population on the basis of evidence in the hands of the British government as between 5,000,000 and 12,000,000.

The Soviet policy of planned resettlement, which was a part of the intensive policy of industrialization and of collectivization of agriculture, resulted in considerable movements of population. Between 1926 and 1939 more than 3,000,000 people were resettled in the Urals, Siberia and the far east. In certain areas the population increased by 33%. In the Sverdlovsk and Novosibirsk regions the increase was 53%, while in the Khabarovsk territory the population increased by 136%. In 1926 there were 14,747,000 inhabitants east of the Urals, excluding the central Asian republics; by 1939 their number had risen to 21,891,000. (See also SIBERIA.)

Simultaneously with the settlement of the east there was a flow of people to the industrial regions. In the period 1926–39 about 3,500,000 moved to the Moscow region, 1,300,000 to the Leningrad region and 350,000 to the Gorki region. In the Ukraine the population of the Staliqo region increased by 91% and of the Voroshilovgrad region by 37%. The republics of central Asia received about 1,700,000 settlers, thus increasing their population by 38%.

The third migratory stream in the Soviet period flowed north. Though on a smaller scale, this settlement of the extreme north, where in the past the population had been negligible, was important. The Murmansk region up to 1917 had a population of about 10,000; in 1928 it was about 22,000 and in 1939 it was 291,200. This growth of the population in the north was accompanied by industrial development.

Following World War II the continued policy of intensive industrialization in the Moscow region, the Ukraine, the Urals and Siberia undoubtedly led to further increases in the urban population and to further movements of population to industrial areas, particularly in the east. Figures were not, however, available after 1939.

Towns and Settlements. — The census of 1926 showed that there were 30 towns with populations of more than 100,000. All these had grown considerably since the census of 1897, with the exception of Odessa. which had declined because of the diminished trade in the Black sea and the loss of Bessarabia to Rumania. Two cities had more than 1,000,000 inhabitants according to the census of 1926: Moscow (2,029,425) and Leningrad (1,690,065). Kiev, Baku, Odessa and Kharkov had more than 400.000 inhabitants, while Gorki (Nizhny-Novgorod), Tbilisi (Tiflis), Dniepropetrovsk, Saratov, Tashkent and Rostov-on-Don had more than 200,000 inhabitants.

The census of 1939 showed that 11 cities had a population of more than 500,000. In 1956 it was estimated that there were 21 cities with a population of more than 500,000. (See Table X.)

The growth of the town population in Russia in the 20th century was striking. Between 1897 and 1914 it increased from 15,825,600 to 24,686,600; *i.e.*, from 14.8% to 17.7% of the total population. From 1926 to 1939 it rose from 26,314,100 to 55,909,900; from 17.9% to 32.8% of the total. In 1956 the total population of 3,991 cities and towns of more than 10,000 inhabitants was estimated at 87,000,000 (43.5%).

The most rapid growth took place during the first two five-year plans (1928–32 and 1933–37) when the number of towns with 50,000 or more inhabitants increased almost four and one-half times. The number of towns with a population of 100,000 or more increased almost six times, while 10 new towns with a population of more than 100.000 and 20 with a population of more than 50,000 appeared.

The source of this new urban population between 1926 and 1939 was estimated as follows: from country to town, 18,500,000 (62.5%); natural growth of population, 5,300,000 (17.9%); villages converted into towns, 5,800,000 (19.6%).

In certain areas the growth of the town population was especially noteworthy. The Donets basin in 1926 contained a large number of small mining settlements and only 8 towns. By 1939 the region had about 60 towns, of which 13 had more than 50,000 inhabitants and 5 more than 100,000. Similarly, in the Urals the town population in 1926 was 1,251,000, concentrated in 27 towns of which only 3 had more than 50,000 and 2 had more than 100,000 inhabitants. By 1939 the town population had grown to 3,513,200, living in 47 towns of which 11 had more than 50,000 and 5 more than 100.000 inhabitants.

The rate of colonization of Siberia is illustrated by the growth of the towns. The population of Novosibirsk, for instance, was 5,000 in 1897 and had grown to 405,589 by 1939 and 731,000 in 1956; Omsk increased from 37,470 to 280,716 in 1939 and 1005,000 in 1956, and Vladivostok from 28,896 to 206,432 in 1939 and 265,000 in 1956. An even more striking illustration was the creation of new towns in the Kuzbas coal basin, some of which had populations of more than 100,000 in 1956: Stalinsk (Kuznetsk) 347,000, Kemerovo 240,000 and Prokopyevsk 260,000. Karaganda and Magnitogorsk did not exist in 1926, but in 1956 had 350,000 and 284,000 inhabitants, respectively.

The pattern of the old Russian towns reflected something of the long struggle against invaders, particularly against Asiatic nomads. This pattern was concentric with radiating streets and at the centre a *kreml,* kremlin or fort, built originally of timber, but later of stone. Another feature of Russian towns was the low wooden house on the outskirts of the same type as the peasant *izba* or hut. The smaller towns were distinguished by a single broad main street which in spring and autumn was a sea of mud. A few of the cities in the west, notably Kiev in 1499, obtained the Magdeburg rights (a civic constitution) under Polish rule and traces of western influence still remain in some towns. The influence of Byzantium was, however, far stronger throughout European Russia, and evidence of it may be found in all the older towns. The modern Soviet towns were planned with a water supply, electricity and sanitation. In the centre, at least, of these towns roads are laid and the houses no longer follow the old Russian pattern but are of brick and are severely utilitarian in design. But in both new and old towns the overcrowding is serious and the living con-

TABLE X.—*Population of Major Cities in the U.S.S.R. by Censuses of 1897, 1926, 1939 and 1956**

ditions of the people are often primitive.

VII. EDUCATION

In tsarist Russia schools were few and education was possible for only a small proportion of the population. Illiteracy was widespread: in 1897 about 76% of the people could neither read nor write. Successive governments had paid scant attention to the improvement of education. In 1895 there were in Russia only 9 universities with 13,976 students and 29,241 primary schools with 1,937,076 pupils.

During 1895–1904 some development of educational facilities, mainly in technical training, took place. These were years of industrial expansion, and the new industries created a need for technicians who could handle machinery. The plentiful unskilled peasant labour which had served Russian needs in the past was no longer adequate. In this period the numbers of medium and primary technical institutes increased from 51 to 93, of handicraft schools from 91 to 237, of communal schools from 6 to 139. But these and other developments directly concerned the technical needs of the new industries and did not greatly affect the general problem of illiteracy in Russia. The Soviet government found itself confronted with this problem and achieved in many respects remarkable success toward solving it.

By 1955 there were in the U.S.S.R. 213,000 primary (four- to seven-year) and secondary (ten-year) schools with a total of 30,070,000 pupils and 1,733,000 teachers. In 1939, within the frontiers of 1921, there had been 31,517,000 pupils. In 1914, within the same frontiers, there had been 7,260,000 pupils in 93,311 elementary and 764,600 in 459 secondary schools. The totals for 1955 included about 3,757 secondary technical schools with 1,960,500 pupils. In 1914 there had been only 295 schools of this type with a total of 35,800 pupils.

There were, by 1956, 31 universities and 734 other institutions of higher education (V.U.Z.), including 375 teachers' colleges, with 1,867,000 students, including 639,000 taking correspondence courses. The teaching staff numbered more than 100,000. In 1938 there had been 23 universities and 727 V.U.Z. with 602,900 students. In 1914 there had been 10 universities and 81 institutions of higher education with a total of 112,000 students. A further illustration of the Soviet government's achievement is to be found in the figures for illiteracy: the percentage of illiterates had been reduced to 48.9% by 1926 and to 18.8% by 1939. This latter figure was further reduced after 1939, universal education at least to the extent of the elementary four-year school being achieved.

Early **Soviet** Measures.—The Bolshevik revolution of 1917 was followed by the destruction of all tsarist institutions and systems. The old ministry of education was replaced by two new bodies, the people's commissariat for education and the state commission for education, the latter being headed by Anatoly V. Lunacharsky. Within a week of the revolution Lunacharsky summarized the tasks in education as folloxvs: abolition of illiteracy as quickly as possible; introduction of universal, compulsory and free education; establishment of institutes and seminaries for the train-

ing of "people's teachers." A fourth point might have been added concerning the association of the church with education. Militant atheism was proclaimed by the Communist leaders as part of their policy. In Dec. 1917 the people's commissariat for education issued an ordinance bringing under its authority all church schools, seminaries and academies, and on Jan. 21 (Feb. 3), 1918, a decree of the council of people's commissars disestablished the church and introduced secular education. Another important innovation was the introduction of coeducation by decree dated May 31, 1918.

A decree of Oct. 16, 1918, codified the educational measures introduced after the revolution. The declaration of the state commission for education attached to this decree gave the name "united labour school" to all schools under the people's commissariat for education. The new school was divided into two grades: grade I for children 8 to 13 years of age, and grade II for children 13 to 17 years of age. Education was free and compulsory, although in practice the great shortage of schools and of qualified teachers made it impossible for more than a small proportion of children to attend. Further innovations were the abolition of the old forms of discipline and punishment, of homework and examinations. Schools were to be run by school soviets in which senior pupils took part. Teachers were to be known as school workers and were to concentrate on breaking away from the old tsarist methods and on practising Communist methods of teaching.

The "liquidation of illiteracy" was recognized by the new regime as one of its basic tasks, and on Dec. 26, 1919, the council of people's commissars directed that "the entire population of the republic between the ages of 8 and 50, unable to read or write, be obliged to become literate in either their native or the Russian language, according to their preference." But implementation proved difficult, particularly in a country rent by civil war. Finally on Jan. 26, 1930, the central executive committee of the party and the council of people's commissars issued a joint ordinance setting up special local committees for the liquidation of illiteracy to be attached to each regional and district executive committee.

University education also received close attention. On Aug. 2, 1918, a decree of the council of people's commissars opened all institutions of higher education to all citizens over 16. In Sept. 1919 universities were directed to provide special courses, known as "worker's facilities," to prepare workers and peasants for higher education.

The Educational Reform.—It was soon found that most of these innovations were unsatisfactory. Teachers were unable to enforce discipline, and conditions in schools were chaotic. Nor were the new teaching methods found to equip the young Russian or non-Russian citizen to assist in the reform and development of the country along the lines laid down by the party.

An order of the central committee of the party issued on Sept. 5, 1931, contained the first suggestion of change. The order pointed to "certain serious defects" in Soviet education and specified changes to be made in the syllabus for schools. An order of Aug. 25, 1932, called for a recasting of the programs of schools and a revision of the syllabuses. The brigade system of teaching was abandoned and teachers were directed to give individual instruction. Examinations and discipline were revived.

An order of May 16, 1934, replaced the united labour school with the general educational school, divided into three stages. The elementary school contains four classes and is known as the four-year school. Until the ordinance of the council of people's commissars on Sept. 8, 1943, compulsory education began in the four-year school at the age of eight years, but the ordinance changed it to seven. The second stage is the seven-year school or the incomplete secondary school, containing seven classes. The third stage is the secondary school proper, knoan as the ten-year school and containing ten classes. The government in its attempts to achieve universal compulsory education was faced with many difficulties, particularly the shortage of teachers and of school accommodation. It was nevertheless claimed by Stalin at the 16th party congress in 1930 that compulsory education had been introduced throughout the G.S.S.R. It would seem, however, that only four-year education, the equivalent of European elementary education, had been introduced. The 18th party congress, held in 1939, proclaimed that the aim must be to achieve ten-year or complete secondary education in towns and workers' settlements and seven-year education in the country. World War II prevented the realization of this aim and it was made one of the tasks of the fourth five-year plan (1946–50). The Soviet government released little factual information after World War II on the success or failure of these plans, but an announcement on Aug. 17, 1949, stated that the school year 1949–50 would see in the R.S.F.S.R. "seven-year education on a very wide scale." This suggested that even in the towns of the most highly developed of the republics the ten-year school was not common, while in the less well-developed areas even the seven-year school was not always found.

An important amendment to the strongly proclaimed Communist principle of free education as a right of all citizens was the introduction in 1940 of fees in the senior classes of secondary schools and in higher educational establishments of the U.S.S.R. The fees were made payable in the three senior classes of the complete secondary school and in higher educational establishments. Free education and stipends were allowed in these grades only to students of outstanding ability. Subsequently students in military academies, in national theatrical. musical and ballet schools, children of noncommissioned members of the army and navy and, in certain circumstances, children of persons drawing invalid pensions were also exempted. The reasons for this change in the government's policy were not clear. It was suggested that it was due to anxiety to divert the younger generation from higher education to factory work and to military training and to meet the urgent need for medium-grade experts. In his report to the 20th congress of the Communist party in 1956, Khrushchev announced that it had been decided to abolish these fees, beginning with the school year 1956–57.

Mention should also be made of the abolition of coeducation by the ordinance of July 16, 1943, which called for separation of the sexes in secondary schools as rapidly as facilities would permit.

Higher *Education*.—The educational system includes the specialized secondary educational establishments and the higher educational establishments. The former serve to train technicians and specialists of the middle grade, which includes elementary school teachers. Pupils who have completed the seven-year school are eligible for these establishments, at which they receive stipends, free training and subsistence allowances.

The higher educational establishments comprise the universities and certain institutes which train top-grade specialists. These institutions are charged uith the task of training intellectuals and in particular technicians whom the party can entrust with the carrying out of its policies and above all its policy of intensive industrialization. The two most important pronouncements affecting higher education were the resolution of the party central committee of July 17, 1928, on improving the training of new specialists and the joint ordinance of June 23, 1936, issued by the party central committee and the council of people's commissars on the work of the higher educational establishment. The former devoted considerable attention to the development of new cadres and specified that by 1932 the number of engineering and technical specialists in heavy industry should be doubled. The ordinance of 1936 in many respects produced a reorganization of higher education. Students to be eligible for higher educational establishments had to complete the full ten-year school and also to pass a special entrance examination. The ordinance then laid down the conditions applying to the professorial staff, the examining of students and the granting of grade I and grade II diplomas.

A further change nas made by a joint ordinance of Dec. 1935 abolishing the ban against the admission of people of undesirable social origin and of the children of parents with "limited social rights" to higher educational establishments. This reform was part of the general abolition of proletarian class privileges which came with the introduction of the new Stalin constitution of 1936.

In 1956 Khrushchev revealed that during 1951–55 more than 1,120,000 specialists graduated from institutions of higher education, as compared with 651,000 during 1946–50. In addition, 1,561,000 specialists graduated during 1951–55 from secondary technical schools. He added, however, that quantity was not enough and the

quality of specialist training was not always adequate. A big shortcoming was that the institutions of higher education were "divorced from practical work, from production, and lagged behind the present-day level of technology." He also mentioned that the time had come to put some of these institutions, particularly agricultural colleges, in the centres of production instead of in big cities.

The Content of Education. — All education in the Soviet Union is permeated by the ideology and directed by the needs of the Communist party. The Communist party program laid down that the task of Soviet education was to "transform the school from being a weapon of bourgeois class rule into a weapon of Communist society." The *Bolshaya Sovietskaya Entsiklopedia* (Great Soviet Encyclopaedia, 1st ed., vol. *44)* said: "Pedagogy is a true science only if it is based on the teachings of Leninism-Stalinism." In the special volume devoted to the U.S.S.R. (1948), it defined the tasks of Communist education as follows:

To develop in children's minds the Communist morality, ideology and Soviet patriotism; to inspire unshakeable love toward the Soviet fatherland, the Communist party and its leaders; to propagate Bolshevik vigilance; to put an emphasis on atheist and internationalist education; to strengthen Bolshevik will-power and character, as well as courage, capacity for resisting adversity and conquering obstacles; to develop self-discipline; and to encourage physical and aesthetic culture.

Such a creation of a new man is brought about not only by the teachers in the course of the schooling period, but also by the whole system comprising the Pioneer and Youth organizations, as well as by the Pupils' and Parents' committees. Of basic importance are: good conduct of the pupils; observance of a strong discipline; respectful attitude of the pupils toward the teachers; good comradeship; protection of public property and energetic suppression of every manifestation of hooliganism and anti-social behaviour among the children.

An important development was foreshadowed in Khrushchev's statement that it was desirable to start building, in picturesque suburban localities, boarding schools at which children should be enrolled only at the request of their parents and which should be staffed by teachers equal to the high calling of "engineers of the souls" of the growing generation. Fees should be graded according to the parents' earnings.

VIII. RELIGION

The Orthodox Church. — Under the tsars the Orthodox Church was the established church to which the vast majority of the people belonged. Other religions were permitted but did not enjoy the same freedom as the established church, and adherents of certain religions, as, for example, the Uniate rite of the Roman Catholic Church, Islam and Judaism, were at times actively persecuted. At no time, however, had religion in Russia been subjected to such organized persecution as under the Soviet regime. The reason for this is that the Communist party is based on an ideology materialistic in character and militantly atheistic in action.

Both World War I and the democratic revolution of March 1917 produced a certain revival among the Russian Orthodox followers and also a tendency toward independent enquiry. On Nov. 1, 1917, the holy synod of 12 principal hierarchs suppressed the office of chief procurator, a layman described as the "tsar's eye" in church affairs. The patriarchate. which had been abolished by Peter I in *1721,* was restored and Tikhon (Vasily Belyavin, 1865–1925), the archbishop of Moscow, was enthroned on Dec. *4, 1917,* with the historic title of patriarch of Moscow and all Russia. The Soviet government reacted strongly and their first campaign of persecution lasted until 1923. On Feb. *j, 1918,* the Orthodox Church was disestablished; church property was seized and confiscated; divine service was allowed only under certain highly restrictive conditions; religious instruction was prohibited in schools and for groups of children under the age of *18* years. In an attempt to weaken the Orthodox Church the government sought to create a schism by supporting a new religious organization, the so-called "Living Church," but this collapsed through lack of popular support. In May *1922* the patriarch was imprisoned, with a large number of bishops and priests; his release in June 1923, the result of popular protests, marked the end of the first campaign.

The second period of persecution lasted from 1923 to 1930. It differed from the first period in that direct attacks on the clergy more or less ceased and the party concentrated on antireligious propaganda. A special publishing house called Bezboahnik ("The Godless") had been set up in Feb. *1922* to print and disseminate antireligious material. An antireligious seminary was opened. and the celebration of Christmas and Easter in 1923 was marked by mock processions and services designed to hold religion up to ridicule. The foundation of the League of Militant Atheists on Feb. 7, *192;*. which became the centre of violent antireligious propaganda, was the most important step in the government's campaign. When Tikhon died on April *7, 1925,* his funeral was made the occasion for an immense demonstration of popular affection. Metropolitan Pyotr Krutitsky took over as locum tenens (temporary patriarch) but he was soon exiled to Siberia. He was succeeded in *1926* by Metropolitan Serghiy (Ivan N. Stragorodsky, 1867–1944). As the holy synod was forbidden to elect a successor to Tikhon, Serghiy mas only the acting patriarch.

In the third period the persecution took the form of a renewal of attacks on churches and on the clergy. Hundreds of priests were arrested and many were sent to the dreaded Solovetsky concentration camp on the White sea. But despite the innumerable restrictions, the imprisonment of the clergy and the wide use of antireligious propaganda, the church retained its large following, and it was apparent that the campaign for atheism had failed. The persecution seems to have been most intense in 1937 and *1938,* when the church leaders were denounced officially as "the implacable enemies of social reconstruction" and arrested in large numbers.

During World War II Stalin evolved a new religious policy. At home it was necessary to exalt the spirit of national solidarity; abroad the new policy was expected to bear fruit not only in English-speaking countries but also in the areas of eastern and southeastern Europe where the Orthodox religion predominated, areas which — it was hoped — were soon to come under Soviet control. In Sept. 1943, the acting patriarch Serghiy was officially installed as patriarch of Moscow and all Russia. He died on May 15, 1944, and was succeeded in Feb. *1945* by Aleksey (Serghiy V. Simansky, *1877–*), who assured Stalin of the "feelings of profound love and gratitude" with which all "church workers," guided by him, were inspired. Under his guidance the Moscow patriarchate took active part in--forcing all Uniates in the annexed western territories and the people's democracies to renounce their allegiance to Rome and to join the Orthodox Church. The Soviet government on Oct. 8, 1943, re-established the chief procurator's office in the form of a Committee for the Affairs of the Orthodox Church with Grigory G. Karpov as its head. In 1949 the *Journal of the Moscow Patriarchate* declared that in supporting the foreign policy of the Soviet government the Russian Church was fulfilling "a holy duty of religion and love." At the beginning of Sept. 1950 Aleksey sent a telegram to the U.N. Security council to protest against "U.S. aggression in Korea" and gave full support to the Soviet "peace" campaign.

Nevertheless, the profession of atheism continued to be a condition of membership of the party. Religious instruction continued to be prohibited in schools, although antireligious propaganda formed much of the teaching — a situation in accordance with article *124* of the constitution; namely. "In order to ensure to citizens freedom of conscience, the church in the U.S.S.R. is separated from the state, and the school from the church. Freedom of religious worship and freedom of antireligious propaganda is recognized for all citizens." The party continued to pay particular attention to the promotion of atheism in the Young Communist league. The party's policy was summed up in the injunction published in June 1947 in the *Komsomolskaya Pravda,* the official organ of the league: "Young Communists must be not only convinced atheists and opposed to all superstitions, but must actively combat the spread of superstitions and prejudices among youth."

New antireligious propaganda was launched by *Pravda* on July *24,* 1954. The editorial of the chief party organ urged the "agitators" to wage an "unrelaxing and persistent struggle against religious prejudices." In a few weeks many antireligious excesses were committed. On Nov. *11,* 1954, however, Khrushchev directed that some of the cruder forms of attack on religion and the clergy should cease, although atheistic propaganda was to be continued more subtly.

In 1914 there were in Russia 55,173 churches and 29,593 chapels, 112.629 priests and deacons. jjo monasteries and 475 nunneries with a total of 95,259 inmates. By 1933 there were 4,225 churches with 5,665 priests. 28 bishops and 37 monasteries. By 1955 the Russian Orthodox Church maintained two training academies and 10 seminaries with about 1.500 theological students; there mere about 100 bishops, 32,000 clergy, 20,000 churches and jo monasteries and nunneries.

Other Religions.— In 1954 the number of Roman Catholics was estimated at about 4,400,000 and that of Protestants at 5,000,000. The Roman Catholics were mainly Lithuanians and Poles; Protestants (Lutherans) were mainly Latvians, Estonians. Germans and Finns. The Roman Catholic hierarchy in Lithuania suffered much by arrests and deportations. Information about the Roman Catholics outside Lithuania is much scarcer than about any major Christian group in the U.S.S.R. The Lutheran bishops of Estonia and Latvia were Soviet-appointed.

The Evangelical-Baptist movement. led in the 1950s by Y. I. Zhidkov, was encouraged as an opposition to the Lutheran churches.

The Georgians have their own autocephalous Orthodox Church, although after the death of Patriarch-Katolikos Kallistrat (1869–Feb. 3. 1952) no successor was elected. The Gregorian Armenians were more fortunate, for when their Patriarch-Katolikos Gheorg VI (Cheorekchian) died in May 1954, they had to wait only 16 months to see a new katolikos, Vazghen I (Baldjian). a Rumanian subject, elected by the ecclesiastical synod (Sept. 29, 1955).

The largest religious group after the Orthodox is that of Moslems which was estimated in 1955 at about 24,500,000. They are overwhelmingly Sunni and only those of Azerbaijan are Shia. Administratively they are divided into four muftiates: Tashkent. with jurisdiction covering the five central Asian republics; Ufa. with jurisdiction for the R.S F.S.R.. except for Daghestan, for which there is a mufti at Buynaksk; Baku, with jurisdiction in Azerbaijan.

Judaism is the next largest non-Christian religion after Islam, although between 1939 and 1945 the number of Jews in the U.S.S.R. was reduced by German massacres from 3,020,000 to 1,902 000. Religious Judaism. however, received another serious blow through Russification of Soviet Jewry and through half-voluntary, half-compulsory migration from the Ukrainian. Byelorussian and Lithuanian ghettos to the industrial centres of the interior.

There were also in 1954 about 500,000 Lamaist Buddhists. mainly Buriat Mongols and Kalmucks. Many small Siberian nationalities, the largest among them being the Takuts, are nominally Orthodox but in fact pagan.

IX. GOVERNMENT AND ADMINISTRATION

The Constitution.— The first Soviet constitution was adopted in 1918 by the All-Russian congress of the soviets. At that time the official name of the whole state was the Russian Soviet Federated Socialist Republic. Between 1920 and 1922 treaties of incorporation were concluded between the R.S.F.S.R. and the Byelorussian and Transcaucasian S.F.S.R.'s and on Dec. 30. 1922, Russia, the Ukraine. Byelorussia and Transcaucasia formed together the Union of Soviet Socialist Republics. On July 6, 1923, the central executive committee (or Ts.I.K.) of the C.S.S.R. promulgated a new, federal constitution. In its first article it reserved to the competence of the central government the conduct of foreign policy. the direction of foreign trade, the planning of state economy. the administration of public finance, transport and justice as well as the organization and direction of the armed forces. Article 3 added that the "sovereignty" of the united republics was restricted only within the limits stated in the constitution, and article 4 stipulated: "Each republic retains the right of free withdrawal from the union." The supreme organ of authority of the U.S.S.R. was the congress of the soviets, a kind of parliament composed of delegates elected by the provincial congresses. During the intervals between sessions of the congress of the soviets the supreme authority was represented by the central executive committee consisting of the council of the union (Soviet Soyuza) and the council of nationalities (Soviet Katsionalnostiey). The council of the union was composed of 371 members elected by the congress of the soviets? in proportion to the population of each republic. The council of nationalities was formed of representatives of four allied republics as well as autonomous republics (A.S.S.R.) of the R.S.F.S.R., five delegates from each. and of representatives of autonomous regions (A.O.), one delegate from each. The executive organ was the council of the people's commissars.

TABLE XI.—Elections to *the Supreme* Soviet *of the U.S.S.R.*

Item	1950	1954
Number of registered electors	111,116,373	120,750,816
Electors who went to the polls	111,090,010	120,727,826
Percentage of the total electorate	99.98%	99.98%
Electors who voted against the official candidates	300,146	247,897
Percentage of electors who so voted	0.27%	0.21%
Number of deputies		
Council of the union	678	708
Council of nationalities	638	639

The 1923 constitution was replaced on Dec. 5, 1936. by the so-called Stalin constitution. This changed the name of the congress of the soviets to that of supreme soviet (Verkhovny Sovietj and gave it a formally democratic character. Thenceforward all citizens over 18 who were not insane and had not been deprived of their civil rights were entitled to vote in the election of deputies, to take place every four years. Citizens over 24 were eligible for election as a deputy.

The Supreme *Soviet.*—The supreme soviet consists of two chambers, the council (soviet) of the union and the council (soviet) of nationalities. Election to the council of the union is by electoral districts on the basis of one deputy for every 300.000 of the population. At the elections of March 14. 1954. there were 700 territorial electoral districts and 8 special military constituencies. Election to the council of nationalities is by union republics, A.S.S.R., A.O. and N.O. (national districts) on the basis of 25 deputies from each union republic, 11 deputies from each A.S.S.R., five deputies from each A.O. and one deputy from each N.O. At the 1954 election there were 631 territorial electoral districts and 8 military constituencies.

The supreme soviet is not a parliament in the western sense, nor does the periodical election correspond to western democratic practice. Candidates are picked by the central committee of the Communist party. There is only one official candidate in each electoral district and the only way for citizens to express dissatisfaction is to vote against him. According to the published results, only 0.81% of all electors who went to the polls in 1946 voted against the official candidates; in 1950 this percentage was reduced to 0.27% and in 1954 to 0.21%. The percentages of registered electors who went to the polls were: 96.8% in 1937, 99.7% in 1946, 99.98% in 1950 and 1954. (See Table XI.)

The Presidium of the *Supreme* Soviet.—The two chambers of the supreme soviet have equal rights and all bills must be passed by a majority in both chambers. Amendments to the constitution require a two-thirds majority. The legislative power of the supreme soviet is, however, so widely delegated that it can only be regarded as nominal. The supreme soviet is convened twice yearly by its presidium, which is elected at a joint session of the two chambers and which exercises the supreme authority between the sessions. The presidium consists of a chairman, whose position is similar to that of a president of the republic, 16 vice-chairmen, a secretary and 1j members.

The functions of the presidium, as defined by article 49 of the constitution, are that it

(1) convenes the sessions of the supreme soviet of the U.S.S.R.; (2) issues decrees; (3) gives interpretations of the laws of the U.S.S.R. in operation; (4) dissolves the supreme soviet of the U.S.S.R. in conformity with article 47 oi the constitution of the U.S.S.R. and orders new elections; (5) conducts nation-wide referendums on its own initiative or on the demand of one of the union republics; (6) annuls decisions and orders of the soviet of ministers of the U.S.S.R. and of the soviets of ministers of the union republics if they do not conform to law; (7) in the intervals between sessions of the supreme soviet of the C.S.S.R. releases and appoints ministers of the U.S.S.R. on the recommendation of the chairman of the soviet of ministers of the U.S.S.R., subject to subsequent confirmation by the supreme soviet of the U.S.S.R.; (8) institutes orders and medals and titles of honour of the G.S.S.R.; (9) awards orders and medals and confers titles of honour of the U.S.S.R.; (10) exercises the right oi pardon; (11) institutes military titles, diplomatic ranks and other special titles; (12) appoints

and removes the high command of the armed forces of the U.S.S.R.; (13) in the intervals between sessions of the supreme soviet oi the C.S.S.R. proclaims a state of war in the event of military attack on the U.S.S.R. or when necessary to fulfil international treaty obligations concerning mutual defense against aggression; (14) orders general or partial mobilization; (1;) ratifies and denounces international treaties of the U.S.S.R.; (16) appoints and recalls plenipotentiary representatives of the U.S.S.R. to foreign states; (17) receives the letters of credence and recall oi diplomatic representatives accredited to it by foreign states; (18) proclaims martial law in separate localities or throughout the U.S.S.R. in the interests of the defense of the U.S.S.R. or of the maintenance of public order and the security of the state.

The Council of Ministers.—At its first session after election the supreme soviet appoints the council of ministers (until March 1946 called the council of people's commissars). It consists of a chairman, a number of vice-chairmen, the ministers of the U.S.S.R. and the chairmen of some state committees. Members appointed to the council of ministers need not necessarily be deputies of the supreme soviet.

The council of ministers is the highest executive and administrative organ in the Soviet Union and is answerable only to the supreme soviet or, when it is not in session, to its presidium. The ministries of the Soviet Union are of two types: all-union ministries and the union-republican ministries. The all-union ministries are common to all federal republics. The union-republican ministries junction in Moscow and in the capitals of the federal republics. Both types are almost annually merged, divided or suppressed by decrees of the presidium of the supreme soviet, the supreme soviet approving the changes and Promulgating the necessary amendments to the constitution. By May 10, 1957, therewere 11 all-union ministries, 14 union-republican ministries and j state committees. With few exceptions the heads of both types of ministry were Russians. In Moscow, capital of the C.S.S.R. and of the R.S.F.S.R., many union-republican ministries existed in duplicate, one Soviet and one Russian. There were. however, no Russian ministries of internal affairs, defense or foreign affairs.

Article 68 of the constitution (revised in May 1957) defines the functions of the council of ministers as being that it

(1) co-ordinates and directs the work of the all-union and union-republican ministries of the U.S.S.R. and of other institutions under its jurisdiction and governs the economic councils of the economic administrative areas through the council of ministers oi the union republics; (2) adopts measures to carry out the national economic plan and the state budget and to strengthen the credit and monetary system; **(3)** adopts measures for the maintenance of public order, for the protection of the interests of the state and for the safeguarding of the rights of citizens; (4) exercises general guidance in the sphere of relations with foreign states; (5) fixes the annual contingent oi citizens to be called up for military service and directs the general organization of the armed forces of the country; (6) sets up, whenever necessary, special committees and central administrations under the soviet of ministers of the U.S.S.R. ior economic and cultural affairs and defense.

Soviet Federalism. — The constitution of 1936 says that "the U.S.S.R. is a federal state, formed on the basis of a voluntary union of equal soviet socialist republics." It repeats the stipulations of the 1923 constitution that the "sovereignty" of the union republics is limited only in certain spheres. These are enumerated in article 14 and include all the matters stipulated in the first article of the 1923 constitution, adding state security and decisions on the basic principles of education. "Outside these spheres (says article 15) each union republic exercises state authority independently." Article 17 stipulates again that "the right freely to secede from the U.S.S.R. is reserved to every union republic."

The union republics and the X.S.S.R. have parallel organs of government and administration. Each has a constitution which contains little that is not already included in the constitution of the U.S.S.R., each has a supreme soviet and a council of ministers. From Feb. 1, 1944, the union republics acquired a nominal right to have foreign ministers and defense ministers of their own. It was known that most of them had a minister of foreign affairs, but he had no direct contact with foreign countries. Two of them, the Ukraine and Byelorussia, are members of the United Nations, but no answer was received when the British government in 1947 asked the Soviet government to transmit to the governments of these two republics a proposal that the United Kingdom should exchange diplomatic representatives with them. The 1944 amendment to the constitution regarding union-republican ministers of defense and the creation of national military units was never put into effect. Most of the ministries of the union republics and the A.S.S.R. are local agencies of the central administration. The autonomous regions have a special statute adopted by the regional soviet and confirmed by the supreme soviet of the republic to which they belong. The national districts generally cover huge but sparsely populated areas. (See Tables II, III and IV above.)

TABLE XII.—*Communist Party and Government of the U.S.S.R.**

Members of the key bodies oi the central committee		Council of Ministers†
Party Presidium	Party Secretariat	
Members: K. E. Voroshilov (1926) A. I. Mikoyan (1935) N. S. Khrushchev (1939) N. A. Bulganin (1948) A. I. Kirichenko (1955) M. A. Suslov (1955) A. B. Aristov (1957) N. I. Belyayev (1957) L. I. Brezhnev (1957)‡ E. A. Furtseva (1057) N. G. Ignatov (1957) F. R. Kozlov (1957) O. V. Kuusinen (1957) N. M. Shvernik (1957) N. A. Mukhitdinov (1957) Candidate members: J. E. Kalnberzins (1957) A. P. Kirilenko (1957) D. S. Korotchenko (1957) A. N. Kosyghin (1957) K. T. Mazurov (1957) V. P. Mzhavanadze (1957) M. G. Pervukhin (1957) P. N. Pospelov (1957)	First secretary: N. S. Khrushchev (1953) Secretaries: M. A. Suslov (1948) A. B. Aristov (1955) N. N. Belyayev (1955) L. I. Brezhnev (1956) E. A. Furtseva (1956) N. G. Ignatov (1957) A. I. Kirichenko (1957) N. A. Mukhitdinov (1957) O. V. Kuusinen (1957)	Chairman of the council: N. S. Khrushchev (1958) First Deputy chairmen: A. I. Mikoyan (1940) F. R. Kozlov (1958) Deputy chairmen: A. N. Kosygin (1958) A. F. Zasyadko (1958) I. I. Kuzmin (1958) D. F. Ustinov (1958)

*As of April 1, 1958. Years of appointment in parentheses.
†In addition there were 19 ministers, 9 chairmen of committees of the council of ministers, 4 vice chairmen and 3 department heads of the state planning commission, a chairman of the commission of state control of the council, the chairman of the board of the State Bank of the U.S.S.R., and the chief of the Central Statistical board. In addition, from May 10, 1957, the chairmen oi the councils of ministers of the union republics are members of the council of ministers oi the U.S.S.R.
‡Also chairman of presidium of supreme soviet of the U.S.S.R., or nominal head of state.

The Communist Party. — Article 126 of the constitution describes the All-Union Communist Party of the Bolsheviks (renamed in 1952 the Communist Party of the Soviet Union. *Kommunisticheskaya* Partia Sovietskogo *Soyuza*) as both "the vanguard of the working people" and the "leading core" of all its organizations. Because all real or potential opposition was removed after the Communist coup d'état of Nov. 7 (20). 1917, the party has the monopoly of political power. The freedoms formally guaranteed by the constitution — of speech. of the press, of assembly — exist only in theory. The party wields its powers through its central committee and through the Politburo (renamed presidium in 1952) and the secretariat. The central committee is elected at the party congress and its membership is constantly increasing. The 20th congress. which assembled in Moscow in Feb. 1956, elected a central committee of 133 members and 122 candidates. The central committee meets on an average three times a year when it receives reports from the presidium on past and future work. The presidium exercises power over every aspect of public policy, including foreign affairs: it governs the Soviet Cnion. (See Table XII.)

From Oct. 1917, when the first Politburo was constituted, to June 1957, 34 Communist leaders had at one time or another been full members. Of these, Y. M. Sverdlov, Lenin, V. V. Kuybyshev, M. I. Kalinin, A. A. Zhdanov and Stalin died naturally; S. M. Kostrikov-Kirov and Trotsky were assassinated (allegedly on Stalin's orders); M. P. Tomsky (Yefremov) and G. K. Ordzhonikidze committed suicide to avoid trial and probable death; G. E. Zinoviev. L. B. Kamenev, Y. E. Rudzutak, N. I. Bukharin, A. I. Rykov, S. V. Kossior, V. Y. Chubar, N. A. Voznesensky and L. P. Beria were sentenced to death and shot (all but Beria on Stalin's orders); A. S. Bubnov and G. Y. Sokolnikov were deported; A. A. Andreyev and A. N. Kosyghin were dismissed; and the remaining 11 (in order of seniority: K. E. Voroshilov, V. M. Molotov, L. M. Kaganovich, A. I. Mikoyan, N. S. Khrushchev, G. M. Malenkov, N. A. Bulganin, M. G. Pervukhin, M. Z. Sahurov, A. I. Kirichenko. M. A. Suslov) were until June 1957 the rulers of the Soviet empire.

The secretary-general (renamed first secretary in 1953) is the

most powerful member of the presidium. Stalin occupied this position from 1924 to his death. On March 6, 1953, Malenkov became secretary-general, but eight days later had to yield that position to Khrushchev. On Feb. 27, 1956, the central committee increased the number of secretaries from 6 to 8; it also elected 6 candidate-members of the presidium. the most significant among the last-named being Rfarshal G. K. Zhukov. A far-reaching change in the composition of the presidium was announced on July 3, 1957, when Molotov. Kaganovich and Malenkov were excluded from the presidium and central committee. They were accused of "factional activities." At the same time Saburov was not re-elected to the new presidium. while Pervukhin was downgraded to the rank of candidate member.

The Communist party greatly increased in size, although its membership was limited. From 240,000 members in July 1917 it had grown by its 18th congress in March 1939 to 1,588,852 members and 888.814 candidates. The 19th congress assembled in Oct. 1952. At that time the party had 6,013,259 members and 868,886 candidates. On Feb. 14. 1956, Khrushchev reported to the 20th congress 6,795,896 members and 419.609 candidates. While the 1939 rules had described the party as "a section of the Third International, a shock detachment of the working class of the U.S.S.R.," the 1952 rules defined it as "a voluntary militant union of like-minded Communists consisting of people from the working class, the working peasants and working intelligentsia." The nursery of the party rank and file is the All-Union Lenin League of Communist Youth (Vsesoyuzny Leninsky Kommunistichesky Soyuz Molodezhi or Komsomol) which by July 16, 1954, its 30th anniversary, had a membership of 18,829,327.

The Police. — The task of eliminating political opposition to the Communist party in the Soviet Union was originally in the hands of the All-Russian Extraordinary Commission for Repression of the Counterrevolution and Sabotage (V.Ch.K. or Cheka). On Feb. 6, 1922, the Cheka became the United General Political administration (O.G.P.U.). On July 10. 1934, the people's commissariat of internal affairs (N.K.V.D.) replaced the O.G.P.U.

The first chief of the Cheka and later of the O.G.P.U. was Felix E. Dzierzynski (Dzerzhinsky) ; in 1924 he was succeeded by Vyacheslav R. Menzhinsky, who died in 1934; the next chief of the N.K.V.D. was G. G. Yagoda, who mas dismissed in Sept. 1936 and shot in March 1938; N. I. Yezhov was the chief of the N.K.V.D. until Dec. 1938 when he, too, was shot and L. P. Beria was appointed his successor.

On Jan. 31, 1941, the N.K.V.D. was itself divided, the N.K.V.D. to deal mith internal affairs and the N.R.G.B. mith state security. In March 1946 the commissariats became ministries and Beria supervised both the ministry of the interior (M.V.D., headed by Serghey N. Kruglov) and that of state security (M.G.B., headed by V. S. Abakumov). On March 6, 1953. the two ministries were reunited under Beria; in July, after Beria's arrest, Kruglov became minister of the interior. The two component parts of the ministry were again separated. and on March 14, 1954, a committee of state security of the council of ministers was formed with Ivan A. Serov as chairman.

As head of all the forces of the interior, 700,000 strong, excluding 400.000 frontier guards and 350,000 militiamen (or ordinary policemen), Beria was extremely powerful. He was disliked by his colleagues of the presidium and the army leaders resented the fact that the forces of the interior, although (together with the frontier guards) part of the armed forces, were not under the ministry of defense. Whatever the truth, he was accused of having acted as an agent for the western powers and was tried by a special tribunal presided over by Marshal Ivan S. Konev. On Dec. 23, 1953, he was sentenced to death and shot. His friend Vsevolod Merkulov, minister of state control, suffered the same fate; Abakumov, another Beria man, was shot on Dec. 19, 1954. In July 1953 Kruglov became minister of the interior but it was announced on Feb. 1, 1956, that he had been replaced by N. P. Dudorov.

In April 1956 the presidium set up a committee to check the activities of Soviet security organs, and abolished their powers to deal with sabotage and terrorism, powers deriving from two decrees issued in 1934 and 1937, which authorized the political police to conduct trials or pass sentence without trials. For this purpose a special judicial and punishment department (Osob) was created within the old N K V D. It was abolished in 1953, shortly after Stalin's death, but this decision was not publicized at the time.

The Bureaucracy. — The structure of the Soviet state rests on three pillars — the leadership of the Communist party, the bureaucracy (*chinovniki*) and army, and political police.

Under state ownership and management, a large civil service is unavoidable. The rapid increase in the number of state employees — or *sluzhashchiye*, as they are called — mas a by-product of industrialization. In 1926 there were 2,500,000 civil servants. in 1939, 10,916 000. By 1956 their number was estimated at 15,000,000. In his report to the 20th congress of the Communist party (1956) Khrushchev said that since 1954 the administrative and managerial staffs had been reduced by 750,000.

There were about 500.000 top executives of the federal, republican and regional state administration. about 400.000 directors and other executives in state-controlled industry, collectivized agriculture. transport and trade. and about 100,000 party leaders in key positions. This new Clite was more numerous than were the high *chinovniki* and army officers under the tsarist regime.

The **Judicial** System. — An early result of the revolution was the decree of Dec. 7, 1917, abolishing all existing general legal institutions and sweeping away the imperial legal system. Two new types of courts were created in their place. the ordinary courts and the revolutionary tribunals. The ordinary courts had jurisdiction in civil and criminal cases. The revolutionary tribunals had special jurisdiction in matters of counterrevolution. sabotage, abuses of officials. etc. This system proved unsatisfactory and was replaced in 1922 by a new hierarchy of courts headed by a supreme court in each republic and with the supreme court of the U.S.S.R. at the apex. Article 104 of the constitution charged the supreme court of the U.S S.R. "with the supervision of the judicial activities of all the judicial organs of the U.S.S.R. and of the union republics."

The ordinary courts in the new hierarchy fall into four groups: (1) the people's courts; (2) the regional, provincial, territorial courts, the courts of the autonomous regions and the supreme courts of the autonomous republics; (3) the supreme courts of the union republics; (4) the supreme court of the U.S S.R. The judges in all courts are either permanent judges or people's assessors. Judges of the people's courts are elected by all the citizens within the jurisdiction of that court. The respective soviets of the autonomous republics or other areas appoint the judges to the courts of the second group. The supreme soviets of the union republics and of the Soviet Union appoint the judges to the courts in groups 3 and 4.

Article 112 of the constitution states that "judges are independent and subject only to the law," but this does not mean that they are independent of government policy; in practice they must follow and seek to enforce that policy whether explicit in published laws or not. Judges may be relieved of their duties if recalled by their electors. An appeal lies from all courts, except from the supreme courts of the U.S.S.R. and of the union republics, to the court next above.

A judicial office of great power is that of the procurator-general, which was established in June 1933. Article 113 of the constitution states that "supreme supervisory power to ensure strict observance of the law by all ministries and institutions subordinated to them, as well as by officials and citizens of the G.S.S.R. generally. is vested in the procurator-general of the U.S.S.R." It is noteworthy that the procurator-general, who is appointed for a term of seven years by the supreme soviet of the U.S.S.R., and the procurators, appointed by him for a five-year period throughout the republics and regions of the Soviet Union, are independent of the supreme court and of other courts.

Certain special courts exist in addition to the ordinary courts referred to above. These include the military tribunals, which have jurisdiction over criminal matters in the Soviet armed forces, and the water-transport courts and railway-transport courts, which deal with crimes involving obstruction of the efficiencv of the service or of labour discipline. There are also comrade's courts

set up primarily in large industrial undertakings at which fellow workers sit as judges in cases of petty crimes. (I. GY.; K. SM.)

X. DEFENSE

The prerevolutionary Russian army was strong in manpower but otherwise reflected all the weaknesses of the political, social and economic order of the imperial regime. Although traditionally the Russian soldier is a hard fighter. with exceptional powers of endurance. the quality of the recruits was lowered by the fact that four in five were illiterate. Despite some progress in industrialization at the end of the 19th and at the beginning of the 20th century, the country in 1913 produced only 30 kg. of pig iron per capita as compared with 254 kg. in Germany; the army had only 60 batteries of artillery against Germany's 380; the extent of the railway system in European Russia alone was 1 mi. of railway to 60 sq.mi. of territory, or one-tenth the German figure. Though there was no lack of talented generals and patriotic officers, both alike were helpless under a system undermined by corruption and nepotism. Participation in World War I led to appalling losses and ultimately to the complete collapse of the old army. Imperial Russia had a peacetime army of 1,100,000 and 42.000 officers; from 1914 to 1917 it mobilized 12,000,000 men. of whom 1,700,000 were killed, 4,950,000 wounded and 2,500,000 taken prisoners of war.

The revolution of March 1917 in the midst of war resulted in a rapid dissolution of all fundamental institutions. The minister of war in the provisional government, Aleksandr Guchkov, strove to stop the decline of discipline in the army but in May resigned in despair. He was succeeded by Kerensky, an eloquent speaker who assumed that by personal magnetism he mould be able to counteract the progress of defeatist Communist propaganda (see *History,* above). The Communists alone were unequivocally against the continuance of the war, and this attitude greatly contributed to the success of their revolution of Nov. 1917.

Formation of the Red Army.—On Jan. 15 (28), 1918, the council of people's commissars issued a decree creating a Workers' and Peasants' Red army on a voluntary basis. The first units distinguished themselves against the Germans at Narva and Pskov on Feb. 23. 1918, which became the Soviet Army day. By April 22, 1918, the Soviet government felt strong enough to decree compulsory military training for workers and peasants who did not employ hired labour. This was the beginning of the Red army. Trotsky, from March 1918 people's commissar for war, was its founder and Mikhail Frunze, Mikhail Tukhachevsky and S. M. Budenny were among the most successful of its commanders in the field. It was an army based on the class principle; people who belonged to the *bourgeoisie* were ineligible for combatant service.

The problem confronting every revolutionary army, that of creating a competent and reliable officers' corps. was solved by Trotsky by mobilizing former officers of the imperial army, allowing them tolerable material conditions and warning them that their families would be held as hostages in the event of treason or desertion. Altogether about 50,000 such officers served in the Red army up to 1921 and the overwhelming majority remained loyal to the Soviet regime. To ensure the officers' reliability a political adviser, *politichesky rukovoditel* or *politruk,* was attached to every unit. These officials. who were Communists, not only kept the officers under observation but also carried out political propaganda in the ranks to stimulate morale. As the war went on, a more reliable type of young officer began to emerge from the short-term officers' training schools that were set up.

After the Riga peace treaty with Poland the Red army was demobilized and reduced to a more efficient and manageable force. At the end of 1920 it had 5,300,000 effectives; the number was reduced to 1,800,000 by Sept. 1921 and to 825,000 a year later. In 1923 the permanent strength of the Soviet armed forces was 562,000, and for nine years it remained at this level. Trotsky, losing his contest for power with Stalin, had to resign as people's commissar for war in Nov. 1924 and was succeeded by Frunze. On the latter's death Oct. 31, 1925, K. E. Voroshilov, trusted friend of Stalin, became commissar for war, remaining in this post until May 8, 1940.

Between 1925 and 1933 the percentage of All-Union Communist party members among the ranks increased from 19% to 49%; the percentage of party members among the officers was much higher. By this time only a few officers from the imperial army remained on active service. All the commanders nere graduates from Soviet military academies and officers' training schools, where only candidates recommended by the Komsomol or Communist Youth league, by the Communist party and by the security services could be accepted as pupils.

The fight against all who were critical of Stalin's leadership extended also to the army, where a drastic purge took place in May 1937. On June 12 Marshal Tukhachevsky. first deputy people's commissar of war, and seven other prominent generals of the Red army were shot, having been accused of spying to betray the Soviet Union to the Japanese and Germans. Gen. Ian Gamarnik, second deputy people's commissar in charge of political education, was said to have committed suicide. Many other generals were either sent to forced labour camps or cashiered.

Gen. B. M. Shaposhnikov, a graduate of the Imperial academy of the general staff. who had served in the Red army from May 1918 and been chief of the general staff in 1929–31, was again appointed to that position in 1937. The Japanese intervention in China and the German rearmament compelled the Soviet Union to increase its peacetime armed forces; it had 940,000 men in 1934, about 1,300,000 in 1936 and about 1,600,000 under arms at the beginning of 1939. The country nas then divided into 13 military areas and the army was composed of 87 infantry divisions and 32 cavalry brigades.

The Red Army in World **War** II.—When the German armies attacked the Soviet Union on June 22, 1941, their early successes caused general surprise. By October they had covered three-quarters of the distance separating Moscow from the German frontier and had taken more than 2,050,000 prisoners of war and a vast haul of war material. A hard winter, as well as Russian heroism, halted them at the gates of Moscow. Nevertheless, in 1942 they were able to push as far as Stalingrad. The epic resistance of Stalingrad should not hide the fact that when the Soviet armies started their counteroffensive there were 800.000 Soviet citizens, former prisoners of war, serving in the German army, the most prominent of them being Lieut. Gen. Andrey Vlasov, one of the two army commanders (the other being K. K. Rokossovsky) who had stopped the Germans before Moscow but who, defeated by the Germans east of Leningrad, had surrendered in Aug. 1942. Although for years Soviet propaganda had denounced them as "fascist beasts," the Germans were welcomed as liberators in many parts of the Soviet Cnion, especially in those with a non-Russian population. Without underestimating the resilience of the Soviet regime and of the Soviet army, it should be recorded as a historical fact that one cause of the German defeat in Russia was Hitler's blunder in maintaining the *kolkhozy* ("collective farms") detested by the peasants, and in discouraging the non-Russian nationalisms, in particular that of the Ukrainians.

By the end of World War II the Soviet armed forces were estimated at 11,000,000 men and 360 divisions. According to N. A. Voznesensky, they had 5 times as much artillery, 1 j times as many tanks and 5 times as many aircraft as in 1941. Demobilization started by the end of 1945, but by 1952 the postwar armed forces were about three times as strong in numbers as they were in 1939. On Oct. 3. 1946, the word "Red" was officially discarded from the title of the Soviet armed forces.

Allied Aid to the Soviet Union.—The Soviet government was always unready to acknowledge the extent of Allied aid in weapons, munitions of war, strategic raw materials and foodstuffs received from the United States and Great Britain during World War II. Voznesensky maintained that the Allied deliveries were only 4% of the domestic production during the war. Lend-lease to the Soviet Union amounted to $10,982,089,000 from the United States and to £428,000,000 from Great Britain. From Oct. 1941 to Aug. 1945 the United States delivered 375,883 trucks, 51,503 jeeps, 7,056 tanks, 8,075 tractors, 35,170 motorcycles, 2.328 ordnance service vehicles. 14,795 aircraft, 189,000 field telephones with 670,000 mi. of wire, considerable railway equipment (1,900

steam locomotives, 66 diesel locomotives. 9,920 flatcars, 1,000 dump cars. 120 tank cars and 3j heavy machinery cars), 4,478,116 tons of foodstuffs. 2.670,371 tons of petroleum products and quantities of boots, aluminum, copper, explosives, etc.

Great Britain likewise, between Oct. 1941 and March 1945, shipped 7 410 aircraft. 5,218 tanks. ram materials, machinery, industrial plant, foodstuffs and medical supplies, which mere sent to the U.S.S.R. in 40 convoys by the northern route. Despite considerable risks and hardships involved, 92.6% of the supplies arrived safely in Russian ports.

The Soviet Forces after World War 11.—A British estimate of July 1951 placed the Soviet armed forces at 4.600 ooo men. The army comprised 2,100,000, the forces of the interior 1,100,000, the air force and antiaircraft defense 800.000 and the navy 600,000. There were 17j divisions, excluding 40 artillery and antiaircraft divisions.

In his report (*NATO:* The First Five Years *1949–1954,* Paris. 1954) Lord Ismay, secretary-general of NATO, stated that since 1947 the numerical strength of the Soviet ground forces had remained fairly constant, but their mobility and fire-power had greatly increased through mechanization and modernization of equipment. There were 6j armoured and mechanized divisions; many infantry divisions had been motorized and equipped with modern tanks and additional artillery and the Soviet potential in airborne troops was considerably enlarged. In addition, the number of divisions of the European satellite states had almost doubled. It was estimated that in spring, 1956, there were 87 satellite divisions.

During 19jj the Soviet and the satellite governments announced that they had reduced their armed forces. In the U.S.S.R. this reduction amounted to 640,000. Including the satellites, the total reduction nas 808,000, but the armies of the Soviet bloc remained the world's largest military force. A collective treaty of mutual assistance was signed on May 14, 1955, in Warsaw, Pol., by the premiers of the U.S.S.R. and of the seven European people's democracies, and a joint command under Marshal Ivan S. Konev was established. (See Table XIII).

In May 1956 the Soviet government announced that it would reduce the armed forces by a further 1,200,000 men within 12 months, demobilize 63 divisions and brigades of the land army, 3 air divisions and take 37j ships of the Soviet navy out of active fleets. There was every indication that Soviet tactics and strategy were in transition. The government and general staff mere apparently veering away from the use of great masses of infantry; they were equipping their forces nith modern arms, including atomic weapons, nhich would permit a reduction of armed manpower without diminishing military strength. Another reason for this "disarmament" was lack of manpower for building new industrial plants in Asiatic Russia.

The armed forces of the Soviet Union in the 1950s were divided into the army, the air force, the antiaircraft defense, the navy and the forces of the interior. The army was composed of four types of division: (1) the infantry division. consisting of three rifle regiments on foot, one horse-drawn artillery regiment of 72 guns and howitzers and one tank regiment (full strength, 11,000 men); (2) the motorized division, that is, an infantry division with truck-borne infantry and motorized artillery; (3) the armoured division, designed for short-range combat in co-operation with infantry, consisting of three mediuin tank regiments of about 200 tanks, one mixed regiment of about 50 heavy tanks and 25 heavy self-propelled guns, and a motorized rifle regiment (full strength. 10,500 men); and (4) the mechanized division, designed for more independent action, comprising three regiments of motorized infantry. two tank regiments (medium and heavy), one howitzer regiment and rocket. antiaircraft and reconnaissance battalions (full strength, about 13,000 men). There were also mountain and cavalry brigades. The typical Soviet artillery division (150 guns and howitzers, 10,000 men) was controlled directly by army headquarters.

TABLE XIII.—*The Armed Forces of the Soviet Bloc, April 1956*

Country	Effectives		Reductions announced in 1955	Effectives after the reductions	Divisions	
	Armed forces	Forces of the interior			1947	1956
U.S.S.R.	3,500,000	1,100,000	640,000	3,960,000	175	175
Poland	370,000	100,000	47,000	423,000	16	24
Czechoslovakia	180,000	50,000	34,000	196,000	8	14
German Dem. Rep.	85,000	50,000	—	135,000	—	7
Rumania	280,000	50,000	40,000	290,000	8	15
Hungary	175,000	40,000	20,000	195,000	4	12

The air force in the Soviet organization was not an independent arm but was divided between the army and the navy, about 88% of the first-line air strength belonging to the former.

The numerical strength of the Soviet air force after 1947 was constant at about 20,000 aircraft, excluding 3 ooo naval aircraft. In 1951 about 20% of Soviet fighters were jet types. By 1956 all of their fighters nere jets. In 1951 jet light bombers had not been introduced into operational units: by 19j6 all this bomber force was jet-powered. Moreover, the medium and heavy bomber units were equipped with jet aircraft. Up to 1951 the combat value of the satellite air forces was insignificant, and their aircraft mere obsolete. By 1956 the five satellite states. German Democratic Republic and Albania excepted, had 32 tactical air divisions, that is. about 3,500 aircraft, all jets. The highest formation of the Soviet air force was an air army composed of a number of air divisions, each division being three regiments of three squadrons of 11 aircraft. A fighter division comprised 110 aircraft. During 1951–54 the number of major airfields in eastern Europe had almost trebled and special attention mas being directed to the provision of long runways. There were two air armies. each of about 1,000 operational aircraft, attached to each of the army group headquarters of Leningrad, Minsk, Odessa, Tbilisi, Tashkent and Chita. In addition, there were air divisions in eastern Germany and an independent long-range air force.

The antiaircraft defense or P.V.O. (Protiv-Vozdushnaya Oborona) was an independent arm composed of antiaircraft artillery divisions and fighter divisions.

The Workers' and Peasants' navy was created by a decree of the council of people's commissars on Feb. 14, 1917. Until Dec. 31, 1937, the navy was administered by the common people's commissariat for war and navy. On that date a navy commissariat was created; but on Feb. 25, 1946. it disappeared when by a decree of the presidium of the supreme soviet a people's commissariat of the armed forces was organized. (In March 1946 the name "people's commissariat" was dropped in favour of "ministry.") Although *Pravda* commented that this decision emerged from the whole experience of World War II, a navy ministry was restored on Feb. 25, 1950. Adm. I. S. Yumashev, the first minister, was succeeded on July 23. 1951, by Xdm. N. G. Kuznetsov. who had been people's navy commissar from 1937 to 1946. In March 1953 the navy ministry was again absorbed by the ministry of defense. In April 1956 it was reported that Kuznetsov had been dismissed and replaced by Adm. S. G. Gurshkov. The Soviet navy consisted in 1956 of 3 old battleships, 31 cruisers, 140 destroyers, 200 frigates and escort vessels and about 450 submarines, mostly modern and ready for immediate service. The annual production of submarines was estimated at 85.

There were also remarkable developments in nuclear and guided missiles research. On Aug. 20, 1953, the Soviet government announced the successful explosion of a hydrogen bomb; on Sept. 27, 1955, another announcement claimed an explosion of a hydrogen bomb set off at a high altitude.

The forces of the interior were divided into frontier guards and security troops administered by the ministry of the interior. They were not intended for the front. although equipped in every way, down to tanks, artillery and aircraft.

Military service extended for two years in the army (three years for noncommissioned officers), three years in the air force and antiaircraft defense, four in the navy and 27 mcnths in the forces of the interior. Conscription age was 18 for men with secondary education and 19 for all others. From 1946 about 1,200,000 men were conscripted yearly.

Up to Oct. 1946 described as "Red army man" (*krasnoarmeyets*), a Soviet soldier was afterward termed a "ranker" (*ryadovoy*). Discipline in the Soviet army was strict and punishments were severe. transgressors being sent to penal battalions, which in World War II were set almost suicidal tasks. Pay and privileges rose rapidly with rank. Thus, while in the U.S. army a general's pay was in the ratio 1 j to 1 to a private's, in the Soviet army a marshal's pay was in the ratio of 114 to 1 to a private's. The officer's corps was a separate caste. and the times when a private could address a colonel simply as *tovarishch* ("comrade") were long forgotten; he would now say *tovarishch polkovnik* ("comrade colonel") and give the once-outlawed salute not only to officers but also to noncommissioned officers.

Until Sept. 1951 there existed three organizations for premilitary training. one for the army. one for the air force and one for the navy. It was then announced that the three organizations had merged into one All-Union Association for Voluntary Assistance to the Army, Air Force and Navy (D.O.S.A.A.F.) ; this provided military training from the age of 1 j.

The proportion of the total estimated expenditure allocated to defense decreased between 1952 and 1956 from 23.641, to 18%. This declared expenditure was. however, not the whole picture; a great proportion of the military expenditure mas detectable under the guise of investment in national economy, while the cost of military academies and schools was included in expenditure on education.

The nominal head of the Soviet land and air forces was the minister of war. After K. E. Voroshilov had ceased to be people's commissar in May 1940, this post was occupied by Marshal S. K. Timoshenko (May 8. 1940–July 20, 1941), Marshal Joseph Stalin (July 20, 1941–March 3, 1947), Marshal N. A. Bulganin (March 3, 1947–March 24, 1949) and Marshal A. M. Vasilevsky (from March 24. 1949). On March 6. 1953, Marshal Bulganin was appointed minister of defense. When he became premier on Feb. 9, 1955, he was succeeded as minister of defense by Marshal Gheorghy Konstantinovich Zhukov. The minister had under his command the chief of the general staff. After B. M. Shaposhnikov's resignation in the summer of 1940 on the ground of ill health, the post was occupied for a few months by Marshal Kiril Meretskov, then by Marshal G. K. Zhukov (Feb. 24–Oct. 31. 1941), then again by Shaposhnikov till he was replaced in Nov. 1942 by Marshal Vasilevsky. From Nov. 12, 1948. Gen. Serghey M. Shtemenko was chief of staff, but in Feb. 1953 he was succeeded by Marshal Vasily Danilovich Sokolovsky.

There were six deputy ministers of defense, each in charge of an arm or a service. The post of commander in chief of the air force was occupied during World War II hy Marshal A. A. Novikov, from 1946 by Marshal K. A. Vershinin and from July 1950 by Chief Marshal Pavel F. Zhigarev.

XI. ECONOMIC CONDITIONS

Russia is richly endowed with natural resources, one of the three basic elements of economic development. the others being manpower and capital. Until state-planned industrialization began under the Soviet government. the country had large reserves of unskilled manpower in the overpopulated countryside. It was, however, poor in capital equipment. Vast areas were either too cold or too dry for human settlement, coal reserves were often hundreds of miles from the nearest deposits of iron ore, the navigable rivers ran in directions unsuitable for trade and forests were far from populated areas.

Before World War II it was estimated that the U.S.S.R. had at its disposal 1,654,000,000,000 metric tons of coal or 21% of known world reserves; 267,000,000,000 tons of iron ores or 53% of world reserves; 55% of world reserves of manganese. 23% of phosphates and 85% of potash salts (18,400,000,000 tons). It also had sufficient supplies of copper, zinc, lead. mercury, cobalt and, probably, uranium. It was, perhaps, short of nickel. tin and wolfram; it had no natural rubber. and the insufficient wool and cotton it produced were not of the best quality. Russia ceded its premier place as producer of crude petroleum before World War I on the discovery of rich oil fields in the Americas and the middle east. Before World War II it was believed that the G.S.S.R. possessed about 3,877,000,000 tons or 56% of world reserves of crude petroleum, but in 1955 it was estimated that the middle east alone had about 30,600,000,000 tons or 75% of world reserves outside the Soviet empire. Russian potentialities in hydroelectric power, always great. began to be harnessed only before World War II.

Until the 1930s the Russian economy was predominantly agrarian. According to the 1926 census, only 15% of the population was supported by industry, transport and trade. Agriculture was organized on a low level of efficiency. Of the immense Russian territory only about 5% (on the average 107,360,000 ha. in 1909–13) were lands under cultivation. The amount of grain harvested from 1 ha. amounted to 730 kg. as compared with 2,912 kg. in Denmark and 1,322 kg. in France. In 1909–13 only 6.9 kg. of artificial fertilizers per 1 ha. of sowed land was used in Russia, as compared with 57.6 kg. in France and 236 kg. in Belgium. Russian peasants were using in 1910 about 7,800,000 primitive plows called sokha, 2,200,000 wooden plows, 4,200,000 iron plows and 17,700,000 wooden harrows. Among other agricultural implements used in Russia there were 752,400 horse-driven reaping machines, 323,700 horse-driven sowing machines and only 27,000 steam threshing machines.

Before World War I Russia was a classic example of a country with an over-populated countryside. This halted economic development, reduced almost to nothing any possibility of savings. kept the standards of living low and discouraged the introduction of more efficient techniques in rural economy. Emigration, land reform and industrialization began to be applied in Russia in the second half of the 19th century, albeit haphazardly and inadequately, as methods of combating rural overpopulation. As the remaining virgin lands in the southern part of European Russia were occupied, there was the possibility of a massive internal colonization of Siberia and Turkistan, but it only began to be encouraged in the last decade of the 19th century. The building of the Trans-Siberian and Tashkent railways helped migration. Emigration to the United States and Canada in the years 1897–1913 was estimated at about 1.740,000: this excluded Poles and Finns but included 1,072,000 Jews. (For the slow progress of land reform see *Agriculture,* below.) The number of industrial workers in Russia in 1913, within the existing frontiers (that is, including the Polish industrial areas) was 2,282,000 or 1.41% of the total population, including 918,200 workers in the textile industry, but only 325,000 in the extraction of fuels. 171.800 in the extraction of other minerals and 150,900 in metallurgy. (See Table XIV.)

TABLE XIV.—*Russian Heavy Industry in 1913 Compared with that of Three Major Industrial Powers*

	Coal		Pig Iron	
	Total (Million tons)	Per capita (Kg.)	Total (Million tons)	Per capita (Kg.)

Germany*	173.3	2,872	12.3	
United Kingdom	292.0	6,396	10.4	
United States	516.8	5,356	31.5	

*In post-1921 frontiers.

There was little capital equipment in the form of manufacturing industries, transport and modern agricultural implements. Of the two ways of increasing it, either by a planned economy or by help from abroad, the first was unthinkable under the tsarist regime. Politically an autocracy, tsarist Russia, especially from the second half of the 19th century, was to some extent a country of free enterprise. This, however, was hampered by a vexatious bureaucracy whose interference, in turn, was tempered by the fact that corruption was rife. The privileged classes either invested their money in light industries or spent it abroad.

Foreign investments. therefore, were encouraged. French, British. German, Belgian and U.S. capitalists found it profitable to invest in Russian coal, iron, oil and other heavy industries. After the conclusion of the Franco-Russian alliance in 1891. Russian loans, state and municipal, found a ready market in France. In the years 1900–13 the annual inflow of foreign capital in Russia was estimated at 200,000,000 gold roubles ($102,400,000). On the

eve of World War I the total capital invested in Russian stock companies amounted to 5,000,000,000 rb. of which 34% was foreign; 37.2% of foreign capital was invested in mining. 17.5% in metallurgy, 11.5% in real estate and 10.6% in banking. Between 1887 and 1913 the dividends paid abroad from these investments amounted to 1,783,000,000 rb. ($912,900,000). The national debt of Russia. state or state-guaranteed, amounted on Jan. 1. 1914, to $6,568,000,000, of which from 44% to 50% was in foreign holdings. Of the total interest, about $199,000,000, paid annually on the external part of this debt, from 62% to 79% was remitted to France. Dividends and interests paid abroad were a heavy burden on the Russian balance of payments; but foreign investments stimulated the pace of industrial advance.

Although the Russian economy was growing, the outbreak of World War I found it wholly inadequate. Help from the western Allies was made exceedingly difficult by the inaccessibility of the Baltic and the Black sea Russian ports. Russian industries and the transport system could not support a long war and an army which, at the beginning of 1917, had 11,000,000 in its ranks. The production of pig iron in 1916 was 10% smaller than in 1913 and only 115 blast furnaces out of 151 were working. Industrial production for civilian use declined sharply and about 80% of the output of textile mills was earmarked for the armed forces. Inflation set in and the note circulation between July 1, 1914, and Oct. 1, 1917, rose from 1,600,000,000 rb. to 17,000,000,000 rb. While Russia was normally self-sufficient in staple foodstuffs and exported large quantities of cereals to western Europe. overloading of the railway system and the tendency of the peasants to hold back products from the market as they found that they could not buy a normal equivalent in manufactured goods led to food shortage in the towns, where the population had swelled because of the growth of the munitions industry. Food riots in Petrograd were the beginning of the overthrow of the imperial regime in 1917.

The national economy deteriorated rapidly during the eight months between the March revolution of 1917 and the Bolshevik revolution of Oct. 25 (Nov. 7). The bases of social and economic order were shaken to their foundations. The peasants began to seize the land of the larger owners. There were continual workers' strikes and demonstrations, partly political. partly because of a continual rise in the cost of living. A good deal of class hatred entered into the strikes and in some cases unpopular employers and engineers were driven away from the factories, which the workers undertook to operate themselves. The council of people's commissars immediately nationalized the land and expropriated all large holders. A decree of Nov. 14 (27) subjected industry to a system of workers' control. The banks were nationalized on Dec. 14 (27).

War Communism. — It was not the immediate purpose of the Bolsheviks to nationalize all industry and trade. Lenin recognized Russia's technical backwardness and the difficulties of abruptly instituting full-fledged socialism in a land where the peasants constituted the great majority of the population. For a few months after the conclusion of the treaty of Brest-Litovsk with the Central Powers on March 3, 1918, Lenin was inclined to emphasize the necessity for labour discipline and skilled management.

But as the civil war became more intense, the Soviet government found itself driven to establish complete control over industrial plant, manpower and labour. The factory owners were naturally hostile to the new regime; many of them fled. The sugar industry was nationalized on May 2 and the petroleum industry on June 17, 1918. Decrees of June 28, 1918, and Nov. 29, 1920, provided for the nationalization of all enterprises that employed more than ten persons, or more than five if motor power was employed.

Foreign trade was nationalized (it practically ceased to exist during the years of civil war and blockade) and on Nov. 21, 1918. private trade within the country was forbidden. In theory, Russia was supposed to live under a gigantic rationing system, with city dwellers receiving food products and manufactured goods on ration cards and the peasants delivering up their surplus produce in exchange for manufactured goods from the towns. In practice, this system could not and did not work because the government lacked both the goods and the technical organization to make it function. There was a good deal of surreptitious barter between city and village, and town dwellers obtained about as much food from theoretically illegal operations as on their ration cards.

Sen organizations came into existence to administer this new system. One of the most important was the supreme economic council. established on Dec 5 (18). 1917. Originally, it had been conceived as a body which would supervise the nhole economic life of Russia. but its functions were gradually restricted to the management of industry.

The council of labour and defense (S.T.O.) assumed considerable powers; it may be described as a kind of war economic cabinet. The food commissariat, which took charge of the distribution not only of food but also of manufactured goods, occupied a key position in the scheme of War Communism. The commissariat of transport operated the railways and waterways on semimilitary lines; the commissariat for agriculture, especially in the later phases of the War Communism period, tried to direct the peasants as to their selection of crops and their sowing.

Money tended to lose all value under this system. The rouble had declined considerably in buying power when the Bolsheviks came into power. Cnchecked use of the printing press and the fact that the distribution of both food and manufactured goods was supposed to be on a rationed basis soon led to an inflation as sweepingly destructive as that of Germany. A new currency had to be built up when a new policy was adopted. Toward the end of the period of War Communism. such things as housing, transport and public services were supposed to be free for all citizens. Another feature of the period was the attempt of 1920 to use armies, under military discipline, for labour tasks. This was a pet idea of Trotsky, who believed that the terrific jam in production could he broken by mobilization of labour under conditions of stern discipline, accompanied by fiery emotional appeals. The labour armies, however, proved a fiasco.

Considered as an economic experiment, War Communism was a disastrous failure. There are few parallels in history for the collapse that overtook Russia's productive forces. By 1920 the big industries were producing 18%, the small industries 43%, of their prewar output. The prostration was most complete in the heavy industries. Pig iron was down to 2.4%, iron ore to 1.7%, of the prewar figure. The output of copper ceased entirely. The railways, which suffered from the depredations of both sides during the civil war. crawled along with an ever-increasing percentage of damaged and disused locomotives and freight cars. In Jan. 1917 there were 537.328 freight cars in the country, of which 4.2% were out of use; by the end of 1919 the number of freight cars had diminished to 244,443, of which 16.6% were damaged. There were 20,394 locomotives (16.5% out of commission) in Jan. 1917 and 8,955 (47.8% unfit for use) at the end of 1918.

Wages and productivity of labour declined tremendously. while a large part of the city workers dispersed to the villages in search of food. The average wage of the Russian worker during these bleak years was little more than one-third nhat it had been under the tsars. Productivity of labour in 1920 was only 26% of the average of 1913.

Agriculture was also hard hit by the crisis, although the peasants, until actual famine devastated a great area of the Volga valley and of the Ukraine in 1921–22 (see History, above). suffered less from hunger than did the city dwellers. The grain harvest declined by 37.5% to 50,300,000 metric tons in 1922. The tendency of the peasants was to concentrate on food crops and to cease planting other market crops. or at least to cut donn the acreage substantially. By 1920 the area under flax had declined by 50% as compared with the prewar average, that under sugar beets by 74%, that under cotton by 87% and that under tobacco by 90%.

The cities of northern and central Russia lost more than one-third of their population between 1916 and 1920. Many Russian town dwellers, especially among the labouring classes, had friends and relatives in the country, and there was a widespread impulse to go back to the villages, where, in spite of the requisitions, there was more chance of getting food.

The effect of War Communism was temporarily to frustrate the realization of almost every Communist economic ideal. Lenin

and his associates believed in a state order based on the industrial proletariat as the ruling class and were eager to see Russia overtake and surpass the leading capitalist countries in quantity and efficiency of production. They were also convinced, as Marxists, that large industrial units would supplant small and medium ones. The actual circumstances of life under War Communism tended to contradict all these ideals. The working class was dispersing and a good many of the workers who remained in the factories turned into small speculators, making little objects of daily use which could be sold or exchanged for food. The big factories in many cases stood idle or worked at a fraction of their normal capacity for lack of machinery and raw material. The Communists in theory were worshippers of modern efficiency. of the machine. But the storm of social revolution and civil war had destroyed most of what little efficiency and mechanization had formerly existed in Russia and threatened to throw the country back into extremely primitive forms of economic life.

It would be incorrect to regard War Communism as an experiment undertaken entirely for its own sake. Many of its features were almost inseparably associated with the hard exigencies of civil war. It was impossible, for instance! for the Soviet government to give the peasants any adequate supply of manufactured goods when the factories, often cut off from sources of raw material, a-ere unable to work at normal capacity and when war needs took precedence over everything else. Requisitioning evoked much bitterness in the villages and was accompanied by many abuses. But the army and the cities could not have been given even a minimum food ration without requisitioning.

The New Economic Policy.—An uprising of sailors in the important naval base of Kronstadt in March 1921 sounded the doom of War Communism. There had already been sporadic peasant revolts in the Ukraine, in Tambov province, in Siberia. But the Anarchist revolt at Kronstadt, a fortress so close to Petrograd, a fortress which had always been considered a stronghold of Communism, was interpreted by Lenin as a definite warning that other economic methods must be tried. The tenth congress of the Communist party, which met in Moscow in March 1921, adopted without opposition Lenin's proposal that a tax in kind, of about one-tenth of the peasant's produce. should be substituted for the former arbitrary requisitioning of all the peasants' surplus. This was the cornerstone of the New Economic Policy, or N.E.P., as it was generally called; a number of other changes inevitably followed.

Since the peasant was given the right to sell his produce, private trade within the country automatically became legal. A whole new class of so-called nepmen, shrewd and cunning speculators who had survived all the rigours and repressions of War Communism, emerged from hiding and began to play a conspicuous part in Soviet life. Small private business was again permitted. The slack accounting and financial methods of War Communism were revised, and the trusts or organs of management for the state industries were required to balance their budgets and, if possible, show a profit. Payment of rent and taxes and charges for public services were restored. The rouble was stabilized at its old value of U.S. 51.2 cents and for a short time this new Soviet currency was freely interchangeable for foreign currencies. This situation soon came to an end, however; both export and import of roubles were forbidden and the Soviet currency remained strictly reserved for internal use. There was a vast discrepancy between the official value of the rouble and its quotation on the black market.

The adoption of the New Economic Policy, coinciding with the end of the civil war, broke the many vicious circles in which Soviet economy had become entangled. The curve of industrial production, of agricultural output, of wages and of productivity turned upward. Houses were repaired and made habitable. The cities again filled up. The light industries which produced goods for everyday use were first to recover; but in time the coal and iron mines of the Donets basin and Krivoy Rog, the oil wells of Baku, the metal and machine factories of Leningrad and Kharkov and other industrial centres were again able to set their wheels in motion to work up to normal productivity.

The chief economic organizations of this period were the trusts and the syndicates. **A** trust, which was entirely state-owned, administered an industry or part of an industry. and in some cases a number of trusts combined and vested selling functions in a syndicate. The supreme economic council continued to function as a general state board of direction for industry. A body that began to acquire more importance in the late 1920s was the Gosplan, or State Planning commission. Originating as a commission attached to the council of labour and defense, it assumed the function of endeavouring to plot the graph of the national economic development by publishing so-called control figures, in which the output of the coming year in every branch of national economy mas laid down. There mere distinct limits to this planning under the N.E.P., because the peasants, the private traders and small businessmen were outside its scope. But it acquired increased significance in the third phase of Soviet economic life, that of planned economy.

It had been a part of the New Economic Policy to grant concessions to foreign capitalists and businessmen. While the Soviet government. by a decree issued on Feb. 3, 1918, repudiated all the internal and foreign debts of its predecessors, and refused either to restore the properties of foreign business firms which it had seized or to pay compensation for their seizure. it came to realize that foreign capital could be useful if the devastations of war, revolution and civil war were to be quickly repaired. The government therefore professed willingness to lease to foreign concessionaires various mines and factories which, lacking resources, it was unable to operate itself.

A decree of the council of people's commissars of Nov. 23, 1920, contained elaborate regulations concerning these concessions. The government guaranteed that property invested by a concessionaire in an undertaking within the territory of the Soviet Union would not be subject to nationalization, confiscation or requisition. By Oct. 1, 1927, 2,200 applications for concessions from different foreign countries were received, but only 144 agreements were concluded, and only 99 were in operation. At that time the total amount of foreign capital invested in concessionary enterprises amounted to $101,400,000. Almost half of the investments were in mining. 36% in manufacturing and the rest in forestry, trade, transport, fishing and other concessions. The two largest concessions were that for the exploitation of the Lena gold fields obtained by an Anglo-U.S. group and that of the manganese mines at Chiatura, Georgia, obtained by the Averell Harriman interests. During the N.E.P. period these concessions flourished, but they never played an important part in Soviet economic development. They mere all wound up and liquidated during the first five-year plan. Russia's industrialization was financed entirely by sacrifices imposed on the Soviet peoples.

Although the New Economic Policy was a period of industrial and agricultural progress and of a rising standard of living after the appalling depression of War Communism, it contained some features that were disquieting to the Communist party. There was a feeling that capitalism was undermining the bases of socialist economy. Elbowed out in the struggle for power that went on behind the scenes after Lenin's death, Trotsky directed criticism against the alleged compromising of socialist principles by Stalin, who emerged more and more as the outstanding leader of the Communist party and, consequently, of the Soviet regime.

While the New Economic Policy was an immense improvement, from the peasants' standpoint, over War Communism! it did not prove able to adjust satisfactorily the relations between city and village. The theoretical buying power of the peasant was considerably increased, for two reasons. With the recent memory of inflation and worthless paper money, he had little incentive or desire to save. He could not use his money to buy land and enlarge his farm, for the purchase and sale of land remained forbidden. Consequently, the peasant's instinct was to spend his surplus money for consumers' goods. and the light industries were never able to satisfy his needs. Shortage of manufactured goods, high prices and poor quality became constant peasant complaints, and by 1928 there was already a tendency for the peasants to carry out a kind of slowdown strike, to raise less for the city market, which did not seem able to give them a fair equivalent in exchange.

Perhaps the basic cause of the liquidation of the N.E.P. was the fundamental incompatibility between socialist industry for the towns and small peasant proprietorship in the villages. One system or the other had to be greatly modified. and Stalin decided that it would be possible both to cut the ground from under the feet of his critics within the party and to find a way out of the economic crisis by driving toward the double goal of a highly industrialized state and an agriculture that would be mechanized and placed under strong state control. (For a political account of the N.E.P. see *History* above.)

Pre-World War II Five-Year Plans.—Industrialization and collectivization of agriculture dominated Soviet life during the first five-year plan. which was shortened to four and a quarter years and ran from Oct. 1928 until the end of 1932. The task which the government had set was a formidable one and could probably only have been realized by a regime which possessed absolute political power and the will to use that power with utter ruthlessness. Labour under the N.E.P. had been free and there were between 1,000,000 and 2,000,000 unemployed who received state and local relief. The effect of the first five-year plan. with its new factories and tremendous demand for labour, was to create a labour shortage. This led to a growing tendency to attach the worker or the engineer to his job. to forbid him to leave under threat of legal penalties. Forced labour on a large scale was introduced for the classes which were doomed to economic extinction under the new policy. the *kulaki* (or rich peasants) and the nepmen. The political police were constantly carrying out round-ups of suspected elements in the cities, a familiar penalty being an administrative sentence to work on one of the new enterprises; and there were mass deportations of kulaks and their families from their native villages to timber camps and new industrial plants, where they were set to work at unskilled labour for bare subsistence rations.

A marked characteristic of Russia throughout the first five-year plan was the acute shortage of foodstuffs and of manufactured goods. There were several reasons. Agriculture was in a state of turmoil and upheaval. The dispossessed kulaks. being the better farmers, had produced a larger than normal share of food and other crops. Their elimination left a vacuum that was not immediately filled. Moreover, everything was subordinated to the needs of the heavy industries. Foodstuffs that were very short in Russia were shipped abroad to obtain foreign exchange to finance the purchases of machinery and equipment for the new industrial plants. Transport was under a heavy strain. and food products were often not equitably distributed. There was a vast influx of peasants into the cities and new industrial towns, and this meant an increased demand on all sources of supply.

Rationing, unknown since the end of the civil mar, was reintroduced. Money became devalued. The insufficient supplies in the state and co-operative shops were distributed on a rationed basis and a system grew up under which every institution or factory had its own shop or its own restaurant. exclusively for the use of its own employees. Private trade again became illegal. in fact if not in law, the supply of goods in the private markets diminished and prices soared. The purchasing power of the rouble in free trade shrank by 90% or more. How much money a man earned became less important than what type of shop or restaurant he was permitted to patronize.

However, the Soviet planned economy developed under more favourable auspices than the primitive experiment of 1918–21. There was no distraction by war and all the mobilized energy of the country could find expression in new industrial construction. A younger generation had grown up under the influence of the Soviet schools and the Young Communist league. willing to endure hardship and to smash pitilessly any opposition. The Soviet Cnion was no longer blockaded and cut off from the outside world. It was possible to engage the services of thousands of foreign engineers and technicians, mostly Americans and Germans, to direct the building and the first stages of operation of the factories, mines and electrical power plants which were part of the scheme of industrial development.

So, although the human and material costs of this experiment in planned economy were prodigious (there were millions of deaths from famine and related diseases in the Ukraine and in the northern Caucasus in 1932–33, and the casualties among the deported kulaks and other "class enemies" of the Soviet regime mere considerable). the political structure successfully withstood the strain. By the time the first plan was completed a considerable stride had been taken toward the goal of making the Soviet Union industrially self-sufficient.

*Russia before World War I in 1921 frontiers.
†Hard coal, anthracite and lignite on a ton-for-ton basis.

Some industries that had been nonexistent or negligible before the five-year plan, such as the manufacture of tractors, automobiles and motor trucks. were put on a mass production basis. Indeed, the advance of the tractor and agricultural machinery industries was intimately bound up with the Soviet scheme for the collectivization of agriculture.

The degree of realization of the first five-year plan was mixed and spotty. Heavy industry certainly received a powerful impetus and the ground had been prepared for further progress by the erection of such large factories and hydroelectric power installations as the Magnitogorsk iron and steel works, the Kuznetsk iron and steel plant, the tractor factories at Stalingrad and Kharkov, the Moscow and Gorki automobile plants, the agricultural machinery works at Sverdlovsk, the chemical plants at Berezniki and Stalinogorsk and the Dnieper dam and power plants, which mere designed to supply power to several newly built factories. On the other hand. the desired figures of agricultural production were not realized and the parts of the plan which had provided for an increased standard of living. even specifying the increased amounts of meat, eggs and butter which should be available. were entirely unfulfilled. General iiving conditions during the first five-year plan were bleak and hard, more suggestive of war than of peace.

The second five-year plan, covering the years 1933–37, was followed by a third plan for 1938–42 which was interrupted by World War II. During the first five-year plan, 1; new blast furnaces. 4; open-hearth furnaces and many rolling mills were built. During the second five-year plan, 20 blast furnaces, 86 open-hearth furnaces and 49 rolling mills were built. Although, except in coal production, none of the aims of heavy industry was fulfilled, the U.S.S.R. began to appear as a major industrial power. (See Table XV.) In 1937 it extracted 949 kg. of coal per capita as compared with 2.716 kg. in Germany. 3,476 kg. in the United States and 5,198 kg. in the Cnited Kingdom. In the same year the Soviet production of steel per capita amounted to 108 kg. as compared with 281 kg. in the United Kingdom, 294 kg. in Germany and 399 kg. in the United States. Speaking in Moscow on Feb. 4, 1931, Stalin said: "We are 50 or 100 years behind the advanced countries. We must make good this distance in 10 years. Either we do it, or they crush us." From the point of view of defense and also in order to establish a necessary base for light industry, it was sound to insist that heavy industry should be developed first. The existence of heavy industry, especially in the Urals and in the Kuznetsk basin, was an important contributory factor of the successful Soviet resistance when the U.S.S.R. was attacked by Germany. (W. H. CH.; K. SM.)

Collectivization of Agriculture.—The position of the peasantry in the tsarist empire was anything but idyllic, but after 1861 it began to improve. Personal serfdom was abolished and the gentry were compelled to sell half their lands to the peasants. The peasants received the land for which the state advanced the money to the country squires or *pomeshchiki* and in turn expected to recover it from the peasants by payments extending over 45 years. Progress was slow, however, The government did little

to improve agricultural production, the country squires showed little initiative, and no enlightened activity could be expected from illiterate peasants.

On the eve of World War I, the total agricultural land in Russia was 367,200,000 ha., of which 152,500,000 ha. (41.7%) belonged to about 30,000 country squires (each having on the average 2,530 ha.). to the church or to the crown, and 214,700,000 (58.3%) belonged to the peasants. Of the latter land about 84,000,000 ha. belonged to 3,400,000 rich peasants or *kulaki*. There were about 18,600,000 poor (biedniaki) and medium (*serednіaki*) peasants who possessed together 130,700,000 ha. of land, an average of 7 ha. per household. In addition there were about 11,000,000 landless agricultural workers or *batraki*. Among the latter and the poor peasants land hunger was great and this was a major reason for the success of the Communist revolution. Lenin's explosive slogan "Land to the peasants" was enough to disrupt the front and to provoke immediate chaos. A few hours after he seized power. Lenin published his decree of Oct. 26 (Nov. 8), 1917, "socializing" all the land; which meant that it became state property. The peasants had only one thing in common with the Communists, namely, their dislike for the landed gentry. They seized the land of the *pomeshchiki* and parcelled it among themselves, and by 1920 there mere in Russia about 24,200,000 peasant holdings. This situation was "illegal," but it lasted until 1929. The Communist propaganda for collective farms or kolklzozy (kolkhoz, short for *kollektivnoye khozyaystvo*) had little effect and at the beginning of 1929 only 1.7% of peasant holdings joined them.

In 1929 Stalin started to enforce the collectivization of agriculture and by 1932 there were 211.100 kolkhozy grouping 14,900,000 (61.5%) individual peasant holdings and 77.7% of the agricultural land. By Jan. 1939 about 215,000 kolkhozy included 18,800,000 (93.5%) peasant holdings occupying 370,800,000 ha. of land. There were also 3,998 state farms or *sovkhozy* (*sovkhoz*, short for sovietskoye *khozyaystvo*) occupying 51,100,000 ha. of agricultural land.

As a result of the civil war the production of grain had fallen from 80,100,000 tons in 1913 to 50,300,000 tons in 1922, but in the years preceding collectivization it was nearly as high as before World War I. When starting the second agrarian revolution (the signal for the first having been Lenin's decree of Nov. 8, 1917), Stalin wrote in Pravda on Nov. 7, 1929, that Soviet agriculture was expected to display "miracles of growth," for, instead of individual farms, "large grain factories" were to be created. In fact, the production of grain declined. While in 1928 the grain harvest amounted to 73,300,000 tons with 490 kg. per capita, the 1932 harvest was 66,400,000 tons with 410 kg. per capita. An even more dramatic outcome of collectivization was the mass slaughter of livestock. The peasants preferred to eat their cattle, pigs and sheep, or to sell them on the black market, rather than to hand them over for collective ownership. This explains why between 1928 and 1932 the number of cattle fell from 66,800,000 to 38,300,000, the number of pigs from 27,700,000 to 10,900,000 and the number of sheep and goats from 114,600,000 to 47,600,000. This catastrophic fall in turn caused severe famine. The famine and the deportation of recalcitrant peasants to Siberia brought about a loss of population estimated at 5,500,000.

However, Stalin continued to enforce collectivization. On Feb. 17, 1935, the council of people's commissars approved the model statute of the kolklzoz prepared by the second congress of shock *kolkhoz* workers, the only concession to the peasants' attachment to private property being that every household was entitled to possess a small plot from 0.25 ha. to 0.5 ha. with some livestock. This private household plot was later guaranteed by the 1936 constitution.

The constitution created two forms of property, state and collective. The kolklzoz was an inalienable unit and its boundaries could not be changed. The main work of the collective farmers was to be for the collective farm and they were paid, partly in kind, partly in cash, on the basis of the quantity and quality of the work performed. The chairman of the kolklzoz was theoretically elected by the members, but the local Communist organization picked the right candidate. The larger machines, tractors, harvesting combines, threshing machines, were not sold directly to the kolklzozy. They were placed in machine-tractor stations (M.T.S.), state-controlled organizations which undertook to cultivate the land of the kolkhozy within a given radius. Between 1934 and 1938 the number of M.T.S. rose from 2,900 to 6,350, when they had together 394,000 tractors, 153,500 harvester combines and 195,800 lorries (trucks). Payment for the M.T.S. was made in kind. Receipts from the M.T.S., and from the fixed quantity of grain, cotton, sugar beet and other produce as well as of livestock, were supposed to ensure the food supply of the cities, industrial centres and the armed forces. The state resold the foodstuffs at a great profit by adding the so-called turnover tax, which during 1951–55 constituted about half the budget revenue.

Reporting on March 10, 1939, to the 18th congress of the C.P.S.U., Stalin boasted that Soviet agriculture was the most mechanized in the world. To hide the inadequacy of grain crops, he ordered in 1933 that in published statistics these crops should appear not in actual barn yield, but in "biological" estimates determined in the field prior to harvest. However, because of inevitable harvest losses, crops available for use were at least from 16% to 20% less than the estimates. The numbers of livestock increased, but were smaller by one-fifth in 1938 than in 1928, while the total population rose during the period from an estimated 150,000,000 to 167,000,000. (For agricultural production and the livestock position between World Wars I and II *see* Tables XVI and XVII.)

World War II and **the Soviet Economy.**—Soviet economic losses during World War II were staggering, for the German armies rapidly overran the most productive areas of the country. According to figures given by N. A. Voznesensky, head of the State Planning commission, about 40% of the population of the Soviet Union lived in the areas overrun by the Germans in 1941; these areas also accounted for about 66% of Soviet heavy industries, 38% of its grain and 30% of its cattle. In the following year, the loss of the Maikop area involved an important centre of high-grade fuel ex-

traction, and in general it was estimated that the output of oil fell from 31,000,000 tons to 18,000,000 tons between 1940 and 1942. Between one-fifth and one-quarter of the capacity of the heavy and light mechanical industry and 40% of the capital equipment of the food industry were also reckoned as lost.

According to Voznesensky the number of workers in the occupied areas was reduced by the end of the war to 17% of the former figure and the number of industrial plants to 13%. Almost two-thirds of the cattle and four-fifths of the horses had been lost. Productive resources destroyed included 31,850 factories employing 4,000,000 persons, 98,000 collective farms, 137,000 tractors, 49,000 combines, 13,000 railway bridges. In addition, the homes of perhaps 25,000,000 people, together with schools, hospitals, cultural and scientific establishments and every form of material wealth. had been totally destroyed; in all, about two-thirds of the entire capital of the-occupied areas.

The evacuation at high speed of much industrial plant to the eastern regions away from the war fronts was a fundamental factor in the Soviet war achievements. The population evacuated to work in the new and expanded industries, which may even have numbered more than 12,000,000 persons, suffered terrible hardships from the severe climatic conditions and from the lack of housing as well as from food shortages. Such, however, was the lot of the civil population throughout the U.S.S.R. The industrial and agricultural output in the Urals, Siberia, central Asia and the Volga area rose sharply.

Postwar Five-Year Plans.—The major task of the Soviet Union in the postwar years was that of reconstructing its internal economy. The advances made in the eastern areas were not abandoned and were indeed extended, much importance being attached particularly after 1950 to new projects for hydroelectric works and irrigation. But the overrun European provinces of the Soviet Union had also to be restored. During the postwar period the methods of economic organization pursued were not substantially different from those of the 1930s. A new five-year plan (1946–50) was adopted by the supreme soviet in March 1946.

*Including 26,000,000 tons of lignite. †Including 49,900,000 tons of lignite. ‡Including 75,900,000 tons of lignite. §Including 114,900,000 tons of lignite.

After the Allied victory of 1945, and after the destruction of the German and Japanese war machines, there were many people even in the Soviet Union who hoped that the postwar five-year plans would insist less on armaments and military preparedness and more on reconstruction and on increasing the standard of living. But the stress was still on heavy industry and national defense. In a speech of Feb. 9, 1946, Stalin directed that in the shortest possible time the Soviet Union must heal the wounds inflicted by the enemy and not only recover the prewar level but even surpass it in the near future. "We must," he said, "achieve a situation wherein our industry is able to produce annually up to 50,000,000 metric tons of pig iron, up to 60,000,000 tons of steel, up to 500,000,000 tons of coal, up to 60,000,000 tons of oil. Only under such conditions can we regard ourselves as guaranteed against any accidents. This will require perhaps three five-year plans, if not more. But this task can be accomplished, and we must accomplish it."

Home propaganda insisted that the fatherland was still encircled by the capitalist enemies preparing for aggressive war. The fourth plan was followed by the fifth (1951–55) with similar aims. After the death of Stalin (1953) under Malenkov a "new course" was introduced in industrial policy, aiming at a greater production of consumer goods and the slowing down of the expansion of heavy industry. Malenkov's replacement by Bulganin in Feb. 195; meant the abandonment of the "new course." In July 1955, Bulganin referred with contempt to certain Soviet economists who maintained that the time had come to fix equal rates of growth for heavy and light industries. "Such anti-Leninist views." Bulganin went on, "if applied in practice, would disarm the Soviet Union facing the enemy capitalist camp and would weaken the defensive power of our fatherland."

As can be seen from Table XVIII, Soviet progress in heavy industry after World War II was rapid and spectacular. The Soviet Union in 1955 produced 11 times more coal, 6 times more crude petroleum, 27 times more electricity and 10 times more steel than in 1928 when planned industrialization began. In addition, there was the industrial production of the seven Soviet-controlled European people's democracies where the pace of industrialization was directed by the Council for Mutual Economic Aid (C.M.E.A., *Soviet Ekonomicheskoy Vzaimnopomoshchi*), which was created in Moscow in Jan. 1949 with Bulgaria, Czechoslovakia, Hungary, Poland, Rumania and the U.S.S.R. as original members, joined by Albania in February and the German Democratic Republic in Oct. 1950.

The year 1955 was a turning-point in eastern European plan-

ning. It marked the completion of the fifth Soviet five-year plan as well as of the Polish six-year plan and of the German Democratic, Rumanian and Albanian five-year plans. The Czechoslovak five-year plan ended in 1953 and the Bulgarian five-year plan was claimed to have been completed in 1952; after that these two countries worked on the basis of annual plans, marking time in order to start a series of co-ordinated and synchronized five-year plans for 1956–60. During 1955, under the supervision of the C.M.E.A., the experts of the U.S.S.R. and seven people's democracies were preparing their plans for industrial development and still closer integration of the whole area. The chief Communist planners said that, whereas in the past the satellite countries were developing their industries without sufficient co-ordination within the "camp of Socialism." now the whole planning would be based on "a new international Socialist division of labour." The solution to the problems facing the area lay in the further development of heavy industry, particularly of the machine-building industries, and the general use of advanced techniques and modern equipment. As can be seen from Table XIX, there were considerable increases in industrial production in eastern European countries between 1938 and 19*jj*. Table XX shows that in 19*jj*, for every 100 tons of coal and lignite produced by the U.S.S.R., the people's democracies added *53* tons to the pool; for every 100 tons of steel they contributed *31* tons; for every 100,000 kw.hr. of electric power generated in the U.S.S.R. the satellite states produced 42,940 kw.hr., and for every 100 tons of cement they added *64* tons.

These achievements, even if the additional production of the Soviet satellites was taken into account, were still behind those of the free world in general and of the United States in particular, especially if output per capita is taken into consideration. (*See* Table XXI.)

Soviet Agriculture After World War II.—To the Russian, Ukrainian, Turkic and other peasants of the U.S.S.R. the idea of collectivization was obnoxious and it mas opposed in many ways with great ingenuity. Already before World War II, instead of working the land by big "brigades," collective farm workers preferred the smaller "links," consisting of members of one household, which to a certain extent meant the restoration of the individual farm within the collective. During World War II some relaxation of agricultural collectivism was inevitable and in many cases the peasants "illegally" increased their private plots to the detriment of the *kolkhoz* property. At the end of 1949 measures were taken not only to restore the prewar system, but also to transform the collective farms into "large grain factories." Khrushchev was made responsible by the Politburo for carrying out the enlargement of *kolkhozy* by amalgamation. At that time, as the collectivization of agriculture was completed in the western annexed lands, the number of *kolkhozy* had increased to 254,000 and that of *sovkhozy* to 4,540. By Dec. 1950 the number of the former had been reduced to 121,400. In Dec. 1955 there were 85,700 *kolkhozy* and 5,134 *sovkhozy*.

Not only were the small *kolkhozy* merged into bigger ones, but also "agro-towns" *(agrogorody)*, or barracks for proletarianized peasants, were planned and a few were actually built. All this was being done with a triple aim: first, to crush the passive resistance of the peasantry who were undermining "Socialist construction" by their "slowdown" methods; secondly, to release more manpower for industry; and, thirdly, to increase agricultural production by new methods. However, resistance to *agrogorody* within the Communist party must have been great because all propaganda for them had ceased by spring 1951.

The fifth five-year plan (1951–5*j*) fixed the production "target" for grain at 186,700,000 tons, still "biologically" estimated. However, the actual annual barn yield of grain harvested in 1951–53 averaged only 103,700,000. In Feb. 1954 Khrushchev produced an entirely new proposal for dealing with the problem. This mas to form new *sovkhozy* in northern Kazakhstan and western Siberia, where there were millions of hectares of virgin or neglected, but fertile, land. In the' following two years about 500,000 skilled and unskilled young workers were sent to the virgin lands, equipped with tractors and modern agricultural implements. On Jan. *20*, 1956, Rhrushchev revealed that *30,000,000* ha. of land had been reclaimed in Kazakhstan and Siberia and 33,000,000 ha. in the country as a whole. There were *j61* new *sovkhozy*, including 425 in Kazakhstan and Siberia.

The sixth five-year plan called for a total grain crop of 180,000,000 tons in *1960* and this figure was almost certainly based on barn yield; it was therefore up to one-fifth higher than that of 1955. However, the actual crop in 1955, a good year, was 129,000,000 tons *(see* Table XXII). The sixth five-year plan also stated that livestock would be extensively developed but no absolute figures were published. In animal husbandry the achievements of the postwar plans not, on the whole, reach the standards fixed *(see* Table XXIII).

The reclamation of virgin lands was a bold and imaginative

enterprise, the results of which would be known only after a few years. But if a balance-sheet of Soviet agriculture up to 1955 (see Table XXIV) is analyzed. two things are clear: first, that the annual production of grain per capita in 1951–55 was only slightly higher than in tsarist Russia or under the Soviet regime in the precollectivization period (500 kg. per capita in 1909–13, 477 kg. in 1925–28 and 568 kg. in 1951–55); secondly. that in 1955, apart from pigs, there mas proportionately less livestock in the Soviet Union than in tsarist Russia in 1913 or in the Soviet Union in 1929 (for instance, there were 22 cows per 100 inhabitants in 1913, as compared with 15 in 1955).

The Soviet Union is the largest state of the world and its area covers 15% of the land surface of the earth, but its population was only 8% of the world total. Only about 19.4% of the Soviet territory was in agricultural use (436,000,000 ha. in 1955) and only about 10% was arable land. The total area sown amounted in 1955 to 84% of the Soviet territory and that under grain to 5.7%. The amount of arable land could, of course, be increased, not only by reclaiming virgin lands, but also by irrigation. Both ways nere applied, but both were slow and costly. Among the decisions of the central committee of the C.P.S.U. and the council of ministers published on March 10, 1956, one of the most far-reaching recommended the reduction of the private plots to the size of small vegetable gardens and also a reduction in the amount of privately owned livestock. As can be seen from Table XXV, in 1954 almost 43% of all Soviet cattle. 58% of pigs and 31% of sheep were privately onned by the collective farmers, industrial workers and office employees.

Forestry. — The Soviet Union has the largest forest reserves in the world It has been estimated that in 1952 forests covered about 655 300,000 ha. or 29.3% of the country's area. They mainly extended across the northern half of European Russia and almost the whole of Siberia south of the Arctic circle, but there uere no forests east of Okhotsk, except in the southern part of Kamchatka. Four-fifths of the forests are coniferous. Siberia contains about 78% of the U.S.S.R.'s forests but its population

*Estimated. †From 1940 state industry only. ‡In *kolkhozy* and *sovkhozy*, in whole milk equivalent. In 1938 the total milk production amounted to 28,861,000 tons. §Excl. home-produced butter. ‖1937.

was estimated in 1955 at 12% of the total. The marketable timber production rose between 1940 and 1955 from 119,000,000 cu.m. to 197,000,000 cu.m., and samn timber during that period increased from about 30,000,000 cu.m. to 58,000,000 cu.m.

Fisheries. — Under the Soviet regime the fishing industry was developed and, like agriculture, collectivized. In 1913 the total catch amounted to 1,018,000 metric tons, including 662,700 tons (65.5%) from the Caspian sea. 107,200 tons (10.5%) from far eastern waters and 77,800 (7.6%) from the Arctic. In 1937 the total catch was 1,608,900 tons; the Caspian share fell to 369 600 tons (25%), but that of the far east rose to 404,800 tons (25.2%) and that of the Arctic to 335.800 tons (22.1%). On the eve of World War II the fishing industry employed 220.000 fishermen and about 130,000 workers in freezing and canning plants. After World War II the fishing industry made further progress. In 1955 the total catch rose to 2,740,000 tons and it was planned to increase it to 4,200 000 tons by 1960.

Hunting. — Hunting in the Soviet Union was regulated by a decree of Feb. 11. 1930. Trading in furs was state-controlled. While in 1913 furs represented 1.8% of Russian exports, by 1928

this percentage had risen to 15%. Between 1921 and 1935 furs to a total value of 1.000.000.000 rb. (in the 1926–27 prices) were exported. Furs of greatest importance in order of export value were Siberian squirrel, skunk, hare, fox, Arctic fox, sable and marten.

XII. SOCIAL CONDITIONS

Foodstuffs and Consumer Goods. — The progress of industrialization caused a considerable increase in urban population. By 1955 this population was estimated at about 87,000,000, leaving the rural population at about 113,200,000. In normal conditions these country dwellers would produce enough food for a population at least five times as large. Seven million farmers fed the U.S. population of 165,000,000 and produced a surplus, while about 50,000,000 collective farm workers and workers on the state collective farms were needed to supply the Soviet population of 200,200,000 little above the pre-1914 level. (See Table XXVII.)

The standard of living of the Soviet peoples considerably improved in comparison with conditions in 1945, but on the whole was only slightly better in the late 1950s than before World M'ar II. Assuming that the population of the U.S.S.R. in 1933 was 165,000,000, the annual per capita production of cotton fabrics for clothing and household goods rose between 1937 and 1955 from 20.86 m. to 29.5 m. The production of woollen fabrics rose from 64 cm. to 1.25 m. per capita, the latter being one-fifth of the amount supplied in Great Britain for the home market. Annual production of leather shoes was one pair per inhabitant in 1937 and 1.5 pairs in 1955, as against three pairs a person in the United States. (See Table XXVIII.)

In 1955 about 151,000 refrigerators were produced and it was planned to produce 635,000 in 1960. For washing machines the respective figures were 87,000 and 528,000. By 1960 then one refrigerator would be produced for about 71 households and one washing machine for 85 households. (See Table XXIX.)

Wages and Prices. — No reliable statistical data concerning wages and prices in the Soviet Union are published and figures occasionally given must be accepted with reserve. According to Voznesensky, the average monthly wage of industrial workers in-

creased between 1940 and 1944 from 375 rb. to 573 rb. By 1955 monthly wages in industry, in Moscow and nine other towns, varied from 450 rb. earned by a factory sweeper to 1,200 rb. earned by a foreman; a factory manager earned 5.000 rb. or more.

During World War II rationing of foodstuffs and consumer goods had been introduced. This officially ended on Dec. 14. 1947, simultaneously with the introduction of the monetary reform (see *Finance,* below); retail prices in state shops were reduced. Other reductions followed and by 1955 the average real wage of workers was said to have increased by 80% as compared with 1947. *(See* Table XXX.) Every reduction in prices mas accompanied by an estimated amount which would be "saved" by the consumers as a result of the cut during the year following its introduction. The price cuts did not, however. imply that goods were available in state shops. There was also a "free" market for agricultural and dairy produce supplied by the collective farmers from their private plots and sold at higher prices. Since consumer goods of daily use were still scarce in the late 1950s, there was a flourishing black market. The necessity to buy commodities on all three markets severely reduced the alleged increase in real wages.

National income, which in the Soviet Union means simply net material product, is said to have risen between 1929 and 1940 from 28,900,000,000 rb. to 128,300,000,000 rb. In 1955 it allegedly amounted to 359,240,000,000 rb. These figures suggested that the national income per capita, expressed in the so-called 1926–27 prices, rose between 1929 and 1955 from 190 rb. to 1,796 rb.

Knowing that the supply of foodstuffs and consumer goods was inadequate, every year the government was reducing the amount of money in the hands of the population by floating a more or less compulsory state loan.

TABLE XXXI.—*Medical Personnel and Hospital Beds*

	1913	1941	1955
Medical personnel	19,800	130,400	294,200
Inhabitants per one medical aid	7,071	1,477	681
Hospital beds: In towns	93,223	491,543	...
Hospital beds: In the countryside	49,087	169,888	...
Hospital beds: Total	142,310	661,431	1,110,000
Inhabitants per bed	986	291	180

In spite of seven successive price reductions after World War II, rye bread in Moscow was dearer in 1955 than in 1940 (1.24 rb. instead of 1.00 rb. per kg.); the respective prices of butter were 29.40 rb. and 23.00 rb. per kg.; the price of a man's suit in the autumn of 1955 in Moscow was from 1.000 rb. to 1,800 rb.; that of a pair of shoes was from 550 rb. to 775 rb., and a woman's silk dress was from 400 rb. to 725 rb.

Social Insurance and National Health. — In pre-1914 Russia a rudimentary social insurance legislation covered only sickness and employment injuries and only about 10% of workers and employees participated in the benefits. The Soviet Labour code promulgated on Nov. 9, 1922, introduced a comprehensive system of social insurance comprising medical aid, sickness and maternity benefits, old age and disability pensions, and family alloaances covering all persons gainfully employed. Insurance contributions were to be paid by employers only. A decree of April 12, 1923, fixed the social insurance contributions at 16% to 22% of earnings, according to the degree of danger or detriment to health of the work. On Aug. 25, 1925, new rules on pensions were issued for (1) persons incapacitated at work or by occupational diseases, to receive the full amount of previous earnings; (2) persons over 50 years of age with a working record of at least eight years, to receive not less than 50%; (3) dependents, to receive between one-third and three-quarters of the insured and deceased person's previous earnings. All this legislation was generous mostly on paper. The state was too poor to carry the burden of social security, and state enterprises mere either unable or unwilling to pay their contributions in full and punctually. A decree of Dec. 28, 1927, while reaffirming the payment in full of all the benefits granted previously, added a proviso "except in cases of acute shortage of insurance funds."

Article 120 of the 1936 constitution declared that the citizens of the Soviet Union have the right to old-age pensions and also to sickness and disability benefits. Under the budget for 1951 state expenditure on social security, social insurance and family allowances amounted to 40,000,000,000 rb.; in 1956 this sum was 53,600,000,000 rb.; *i.e.,* 9.1% and 9.4% of the total expenditure, respectively. A new law on state pensions published on May 9, 1956, provided 100% pensions for persons earning 350 rb. monthly, 85% for those earning 350 to 500 rb., 75% for salaries of 500 to 600 rb., 65% for salaries of 600 to 800 rb., 55% for 800 to 1,000 rb. and 50% for 1,000 rb. and more. The new law applied chiefly to 60-year-old men after 25 years' service and jo-year-old women after 20 years' service.

Medical assistance improved considerably under the Soviet regime. In 1955 the medical personnel (*i.e.,* physicians, dentists and pharmacists) was said to be 14.8 times bigger than in 1913, while the number of beds in hospitals, maternity homes and sanatoria increased 7.8 times during the same period. The number of 180 inhabitants per hospital bed in 1955 compared with 86 inhabitants per bed in the United Kingdom. *(See* Table XXXI.)

Housing. — The housing situation in the Soviet Union remained in the 1950s the most acute problem of social policy. Between 1923 and 1939 housing floor space in towns decreased from 6.4 sq.m. per capita to 4 sq.m. (42 sq.ft.). Of 2,567,000 dwelling houses in German-occupied towns, 1,209,000 were destroyed or badly damaged. In 1950, when wartime destructions had been made good, the amount of living-space was estimated at 41 sq.ft. for each member of the urban population. The 1955 figure was 46 sq.ft. By 1960, if the sixth five-year plan were fulfilled, Soviet citizens could look forward to 56 sq.ft. each of housing space. In 1951–55 about 46,500,000 sq.ft. of floor space (the equivalent of 130,000 one-, t o- and three-room flats) were built in Moscow. In 1956–60 it was planned to build 102,258,000 sq.ft. which would amount to about 270,000 to 300,000 flats, that is 360 sq.ft. per flat on the average. In fact, only a minority of Soviet families could enjoy the exclusive use of a bed-sitting room.

Labour Conditions. — On Oct. 29 (Nov. 11), 1917, the council of people's commissars published a decree stipulating a maximum of 8 working hours a day and 48 hours a week; night work was banned for women and juveniles under 18; overtime for male workers over 18 was permissible only in exceptional cases and it was not to exceed 4 hours in 2 days for each worker. On Jan. 19 (Feb. 1), 1918, another decree, issued by the people's commissariat of labour, banned all strikes. On Oct. 15, 1927, the government replaced the 7-day week of 8-hour days by a 6-day week of 7-hour days. This was described as a measure against "slavish habits and a slavish tempo of work." The truth was that at that time there were 1,374,000 unemployed out of a total labour force of 11,800,000 and the 6-day week of 7-hour days was devised as a means to fight unemployment. Instead of having Sunday as a day of rest, Soviet workers were resting every sixth day.

By 1930, however, Soviet industry had begun to experience a shortage of manpower. From 1932 onward "intensification of the working day" became a regular feature of home propaganda. During Sept.–Oct. 1935 great use was made of the achievement of Aleksey Stakhanov, a miner who allegedly in one night-shift dug 102 tons of coal. A Stakhanov movement of "Socialist emulation" was organized and an All-Union Conference of Stakhanovites was held in Moscow. Addressing it, Stalin said on Nov. 17, 1935, that the movement was destined to produce a "revolution in Soviet industry." It was necessary to work hard and he who worked well and gave society his best was a hero: The 1936 constitution declared work not a right but "an obligation and a matter of honour." The constitution maintained the 7-hour day. In practice, however, the workers had to put in an extra hour "in order to improve their technical proficiency." On Dec. 20, 1938, to stop workers from moving from place to place seeking better conditions and pay, compulsory labour books were introduced. Without such a book, lodged with the management, no one could get new work anywhere. On June 26. 1940, the 7-day week of 8-hour days was reintroduced. At the same time strict "labour discipline" was promulgated. Absence from work without a valid reason meant trial before a people's tribunal and sentence to correctional

labour, to be performed at the ordinary place of work, for up to six months. with a 25% reduction of salary. If absenteeism were repeated the culprit could he sent to a forced labour camp.

This system was maintained after World War II. On July 23, 1951, Vasily V. Kuznetsov, chairman of the All-Union Central Council of Trade Unions, said that 90% of workers were taking part in the movement of Stakhanovist "Socialist emulation." Payment by piece-work was the basic form of wage because this permitted the checking of the workers' performance and stimulated working intensity. The trade unions. which by 1955 had an estimated membership of 33,000,000, were an instrument of state coercion and not of protection of workers against employers.

On March 8. 1956. the working week was cut from 48 hr. to 46 hr. On April 25, the government revoked some of the most stringent labour regulations, including the prosecution of workers for ahsenteeism, but factory and office managers retained the right to take disciplinary action against absentees.

Between 1930 and 1940 the number of workers and employees in the national economy outside agriculture rose from 14,500.000 to 31.500,000; these figures included respectively 3,900,000 (26.7%) and 11,370,000 (36.1%) women. By 1950 the total number was 39,900,000 and in 1955 it averaged 48,400,000. In 1960 it was expected to increase to 55,000,000.

Forced Labour Camps.—As early as May 1919 the Soviet government published its first decree on organization and administration of the forced labour camps. They were in the hands of the Cheka and later of the N.K.V.D. Their organization varied. but from 1934 there existed a Main Administration of Labour Camps (*Glavnoye Upravlenye Lagherey* or GULAG), an all-union organization subordinated to the N.K.V.D. From 1930 Soviet planners formally incorporated work performed by forced labour into the five-year plans. Forced labour was used in the gold mines. in the coal mines. especially those in the far north, in the construction of new canals, railways and highways, and in timber cutting.

In a report published in 1953 by the Ad *Hoc* Committee of Forced Labour, set up jointly by the United Nations and the International Labour organization. it was said that the Soviet penal legislation constituted "the basis of a system of forced labour employed as a means of political coercion or punishment for holding or expressing political views." In the committee's opinion. the system of forced labour also constituted "an important element in the economy of the country." An independent committee set up under the authority of the I.L.O. confirmed in 1956 the continued existence of forced labour camps in the Soviet Union and the satellite countries. According to official British and U.S. estimates, there were in 1953 between 8,000,000 and 14,000,000 people in Soviet forced labour camps.

XIII. FOREIGN TRADE

Between World Wars I and 11.—The management of foreign trade, a state monopoly, is in the hands of the Soviet government. When not yet a developed country. the Soviet Union had little to export. Early in the 1930s, when it was necessary to pay for machinery and heavy equipment imported from the United States, Germany and other industrial countries of Europe. the U.S.S.R. exported crude petroleum and products, but, with the progress of industrialization. home consumption increased and the exportable surplus became negligible. Other main items of export were timber, grain, furs, flax and caviar. From its great forest wealth the Soviet Union theoretically could export any quantity of timber, but there was acute domestic need of this, the shortage being caused by lack of essential machinery, of skilled lumberjacks and of transport.

Even in 1930, when Soviet exports reached the highest level, their value was only 3.5% of the total Soviet production: in 1938 the proportion fell to 0.8%. Imports were strictly limited to raw materials and machinery necessary to equip expanding industry. Items described as machinery, apparatus and parts, nonferrous metals and goods, iron and steel goods and electrical equipment formed 34.7% of imports in 1929, 66.1% in 1933 and 57% in 1938. (*See* Table XXXII.)

Among the trading partners of the U.S.S.R., Germany was predominant up to 1933; in that year it supplied 42.5% of Soviet imports and took 17.3% of Soviet exports. In 1938 the chief suppliers were the United States (28.5%) and Great Britain (16.9%). The latter was also the best customer, taking 17.6% of Soviet exports in the year 1933, 32.7% in 1937 and 28.2% in 1938.

After World War 11.—After World War II the Soviet Union was able to exploit the economic resources of the annexed territories and of the satellite states, buying frorn them at cheaper rates and selling to them at higher rates than the world market prices. The Soviet and the satellite governments declared the statistics of foreign trade a state secret: presumably because publication of the value of exports and imports by every trading partner of the "Socialist market" would inform the world at large about Soviet home shortages and would tell the Soviet people that Soviet grain was being sold to foreign countries. when they themselves were short of food. Such data would also expose erratic Soviet purchases and sales and erratic price policies practised for political purposes. Moreover, they would illustrate the degree to which the satellite countries were being exploited.

Table XXXIII gives the estimated distribution of the Soviet trade turnover for the vears 1937–54, based on data published bv the U.N. Economic Commission for Europe. It shows that, while in 1937 Soviet trade with the countries of eastern Europe, then independent, amounted to only 6.4%, in 1948 it was 34% and in 1954, 52.8% of the total turnover. Soviet trade with the so-called capitalist countries, which amounted in 1937 to 91.7%, fell by 1954 to 21.6%.

In 1954 Soviet foreign trade represented only about 7% of world trade; this proportion was 16% for the whole Socialist market; *i.e.*, including the European satellite countries and Communist China. Excluding trade among the Communist countries, their exchanges of goods with the rest of the world amounted in 1954 to about $3,500,000,000; *i.e.*, 3.9% of the total world trade.

The trade turnover of the Socialist market (that is, of one-third of the world's population) with the free world was about 75% of that of Belgium and the Netherlands together; the similar trade turnover of the U.S.S.R. alone was about 84% of that of Italy.

On April 10, 1956, at the session of the U.N. Economic Commission for Europe, Ivan G. Kabanov. Soviet minister of foreign trade. said that in 1955 the Soviet trade turnover was more than 25,000,000,000 rb., almost double that of 1950. He offered glittering opportunities to western Europe if it would overcome its

fears and suspicions and take off the "strategic" controls on trade with the Socialist market. When dollar aid ended, he said. western Europe could turn eastward to feed its growing industrial production.

One member of the Socialist market. namely China, was still an industrial infant. Its production was less than that of Poland. although its population was 22 times larger. The U.S.S.R. and other European satellites were under political obligation to help China. They therefore needed more modern machinery and industrial equipment from the west and they were also short of rubber. nool, high-quality cotton and nonferrous metals. This explained the allegation that great commercial opportunities behind the "iron curtain" were being neglected.

XIV. TRANSPORT AND COMMUNICATIONS

Railways. — The vast and generally flat surfaces of European and Asiatic Russia lent themselves to railway construction which, however, began later than in western Europe. Although the first railway from St. Petersburg (later Leningrad) to Tsarskoye Selo (later Pushkin) was laid in 1837, it was not until 1851 that the first main line, from St. Petersburg to Moscow, was completed. The two great periods of railway expansion were 1868–74 and 1891–1900. Many trunk lines were built in European Russia, the most important being: St. Petersburg–Warsaw (1862), Moscow–Nizhny-Novgorod (later Gorki) (1862), Moscow–Kozlov (later Michurinsk) (1864). Moscow–Kursk (1868), Moscow–Minsk–Warsaw (1871), Moscow–Vologda (1872) and Moscow–Riga–Vindava (Ventspils) (1904). The Moscow–Kozlov line was extended to Rostov (1870) and that from Moscow to Kursk was extended to Kharkov and Sevastopol (1870). The two last-named lines passed through the Donets basin (Donbas) and promoted the development of the coal industry. In 1884 Donbas was connected with the rich iron ore deposits at Krivoy Rog, thus giving impetus to the development of metallurgy. Many smaller branches were constructed in the Donbas which in the 1890s was also linked with Tsaritsyn (Stalingrad) on the Volga. The Urals metallurgical line Perm (Molotov)–Ekaterinburg (Sverdlovsk), built in 1878. was joined with the rest of the Russian network only in 1896, when the first section of the Trans-Siberian trunk line, from Samara (Kuybyshev) to Ufa and Chelyabinsk, was laid.

The first railway built in Asiatic Russia mas, however, the Trans-Caspian, from Krasnovodsk to Samarkand (1888) and later to Tashkent (1899). It was joined to the main system in 1905 when the Tashkent–Orenburg (Chkalov) trunk line was completed.

The construction of the Trans-Siberian. the most important Russian railway and the longest railway in the world, began in 1891 but was completed only in 1916, when the Chita–Khabarovsk section was open to traffic.

On the eve of World War I the total length of Russian railways within the pre-1914 frontiers was 70,500 km.; but within the frontiers of 1921 it mas only 58,500 km. The density of network averaged 0.28 km. per roo sq km. of territory, as compared with about 12 km. in Germany. The length per 100.000 inhabitants was about a quarter of that of central and western Europe. The weakness of railway transport in tsarist Russia was revealed during World War I nhen on many trunk lines forced to carry exceptionally heavy loads, piles of freight accumulated at railway junctions, paralyzing the national economy.

TABLE XXXIV.—*Volume of Freight Traffic by Types of Transport*
(In million ton-kilometres)

Type	1940		1950		1955	
	Total	%	Total	%	Total	%
Railways	415,000	85.92	601,860	85.28	969,000	84.62
Motor transport	9,000	1.85	20,700	2.93	43,470	3.80
Inland waterways	36,000	7.47	45,360	6.42	66,679	5.82
Sea transport	23,000	4.76	37,950	5.37	66,033	5.76
Total	483,000		705,870		1,145,181	

Sources: *Bolshaya Sovietskaya Entsiklopedia* (1948) for the year 1940 and estimates calculated from percentages given in the reports of the fulfillment of the fourth and fifth five-year plans.

After the revolution and civil war the Soviet government concentrated on developing and extending the railway system while modernizing its rolling-stock and equipment. By 1937 the total length of the Soviet network increased to 85,000 km. Goods hauled amounted to 517,000,000 tons, almost four times as much as in 1913; 1,143,000,000 passengers were carried, 6.5 times as many as in 1913. Among the most important trunk lines built before 1937 were: a double-track Moscow–Donbas line, a Kazan–Sverdlovsk line and a Petropavlovsk–Karaganda line with branches to Balkhash and Dzhezkazgan, as well as the Turkistan–Siberian (Turksib) railway completed in 1930, linking Novosibirsk with Alma-Ata and Tashkent. Many shorter railway links were built in the Urals, especially the Troitsk–Orsk–Chkalov line: with a branch from Kartaly to hlagnitogorsk (a new steel centre)! while the Trans-Siberian line was double-tracked from Ufa to Omsk.

After 1937 the construction of a new South–Siberian (Yuzhsib) line was begun; the difficult section crossing the southern Urals was still under construction in the late 1950s. The total length of Soviet railways in 1950 amounted to 112.530 km. By then the whole of the Trans-Siberian was double-tracked, and some shorter lines were electrified.

During the fifth five-year plan (1951–55) 3,100 km. of new railways were built, including the Akmolinsk–Artyshta (near Stalinsk) section of the Yuzhsib; 4,700 km. of second track were laid and 2.300 km. were electrified. The sixth five-year plan (1956–60) comprised the construction of 6,500 km. of new railway track, mainly in eastern Siberia: the laying of 6,600 km. of second track and the electrification of a further 6.100 km. Nothing was said of the North Siberian railway planned before World War II which, passing north of Lake Baikal. was to link Tayshet with Sovietskaya Gavan. By 1945, however. the last-named port on the Sea of Japan was linked by rail with Komsomolsk-on-Amur and with Khabarovsk.

In 1955 the Soviet railway system averaged 0.52 km. per 100 sq. km. of territory and 54 km. per 100,000 inhabitants. These figures compared with 4.7 km. of rail per 100 sq.km. and 222 km. per 100,000 inhabitants in the United States. In 1940 Soviet railways carried 415,000,000,000 ton-km. of goods; and in 1955 an estimated 969,000,000,000 ton-km. of goods. (See Table XXXIV.) This compared with 910,428,000,000 ton-km. of goods carried in 1955 by L.S. railways, but with two differences: first, the area of the United States was slightly more than one-third of the U.S.S.R., which meant that Soviet goods had to cover longer distances and thus increase production costs; secondly, the proportion of the railway goods traffic in the United States represented 52% of the total, while in the U.S.S.R. the proportion was 84.62%. It was estimated that in 1955 steam locomotives consumed about 30% of the year's coal production; only 10% of traction was by electric or diesel locomotives. In 1955 the Soviet railway system employed about 2,300,000 railwaymen.

Roads.—Before World War I Russia had 23,500 km. of hard-surfaced roads. The situation improved under the Soviet regime and in 1938 there mere 87,500 km. of roads. There was only one modern motor highway from Moscow to Minsk; there were good hard-surfaced roads from Moscow to Leningrad, from Moscow to Kiev, and from Minsk to Kiev; all these were strategic roads. Other strategic roads were the Georgian military highway from Vladikavkaz (Ordzhonikidze) to Tbilisi and Erivan, and the Pamir highway running from Osh. Kirghizia, to Khorog. Tajikistan. There were also 936,400 km. of dirt roads, impassable during thaw or heavy rains.

Through the 1939–45 annexations in the west the Soviet Union more than doubled its length of hard-surfaced roads. Under the fourth five-year plan (1946–50) 16.000 km. of hard-surfaced roads were built and the Moscow–Simferopol motor highway was opened. In the period 1951–55 the ?.loscow–Minsk motor highway was extended to Brest (Brzesc) on the Polish frontier, and the Kiev–Kharkov–Rostov–Ordzhonikidze motor highway was completed.

There were 8.800 motor vehicles in Russia in 1913, 19.000 in 1929 and 760,000 in 1938. By mid-1953 there were about 2,500,000 motor vehicles in service. including 300.000 passenger cars. In 1940 the Soviet motor industry produced 147,000 motor vehicles. in 1955 the output was 445,000 and it was planned to produce

650,000 by 1960.

Waterways. — In 1937 the Soviet Union had 320,000 km. of waterways of which two-thirds were usable only as rafting routes. The two main disadvantages of Soviet river transport were that all the rivers are frozen for from four to six months of the year, and in Asiatic Russia even from five to seven months, and that the most important rivers, especially in Siberia, flow in economically unsuitable directions.

The Soviet government did much to improve the capacity of the waterways by the construction of new canals and dams, generally linked nith irrigation and hydroelectric schemes. Before World War II two great canals were completed. In 1933 the Baltic–White Sea canal was opened. It extends from Povenets on Lake Onega to Byelomorsk (Soroka) on the shore of the White sea. This canal, however, freezes from November to May.

In 1937 the Moscow–Volga canal was opened to traffic. The Soviet capital became a major river port accessible to self-propelled barges with a load capacity of 22,000 tons.

After the construction of the Moscow–Volga canal the reconstruction began of the Volga–Baltic route allowing small vessels to pass from the Volga to Leningrad. The reconstruction of this waterway was interrupted by World War II but resumed in 1947.

After World War II the Volga–Don canal mas opened to traffic in July 1952. It is only 101 km. long but because the Don at Kalach is from 33 m. to 39 m. (according to the season) higher than the Yolga at Stalingrad, and because the divide between the tno rivers rises to 80 m. above sea level, it was necessary to build 13 navigation locks. Besides the ship canal. accessible to sea vessels of 2.000 tons, the Tsimlyansk hydroelectric station was built and schemes for irrigating 100.000 ha. of arid land in the Rostov region were carried out.

In Sept. 1950, the Soviet government decided to build the Great Turkmenian canal linking the Amu Darya river with the Caspian sea, a more formidable project than the Yolga–Don canal Its total length was to be 1,100 km. and it was expected to irrigate 1,300 000 ha of desert. Work on it was stopped after Stalin's death in 1953.

Three great Siberian rivers, the Irtysh, the Ob and the Yenisei. are navigable almost throughout their entire course within the U.S S R All three are crossed by the Trans-Siberian railway, at Omsk. Novosibirsk and Krasnoyarsk, respectively. Until the late 1950s no railway reached the Lena and the only access to this river was a highway built before World War II from Nizhneudinsk to Ust-Kut Under the fifth five-year plan (1951–55) work started on a railway from Tayshet to the upper Lena and a new river port was being built at Osetrovo.

Pipelines. — The oil pipelines in use by 1955 were: Baku–Batum (two one laid in 1906 and another in the 1930s), Grozny–Tuapse (1928), Makhachkala–Grozny–Donbas (1936). Orsk–Guryev (1936), Ishimbay–Ufa (1936). Tuymazy–Ufa (1947) and Reni–Odessa (1947). There were also natural gas pipelines Saratov–Moscow (1946), Buguruslan–Kuybyshev (1947), Dashava–Kiev (1947), Kohtla Jarve–Leningrad (1948) and Kohtla Jarve–Tallinn (1953). In 1955 the annual capacity of all these pipelines was estimated at 13,800,000,000 ton-km. In Dec. 1956 the natural gas pipeline Stavropol–Moscow was completed.

Maritime Transport. — Although about two-thirds of the Soviet boundaries are sea coasts, the country is the most continental among the great powers of the world. Only Murmansk in the Kola peninsula and Yladivostok in the far east are ice-free throughout the year. Navigation between them is possible along the shores of the Arctic ocean for only from 70 to 90 days and at a great cost, because the help of icebreakers and aircraft for ice observation is indispensable. With the exception of Odessa, Nikolayev and Kherson, the Black sea ports are ice-free all the year; and in the Baltic so too are Liepaja (Libava) and Kaliningrad (Konigsberg). The Caspian ports of Astrakhan and Guryev are icebound for more than three months.

Climatic conditions and geography combine to explain why neither tsarist Russia nor the Soviet Union were able to use maritime transport to any great extent.

In 1914 Russian merchant shipping totalled 1,770,000 gross registered tons, but by 1927 the tonnage fell to about 300,000 gross registered tons. A reorganization of the merchant navy started in 1928 and by mid-1939 it comprised 716 ships with a total tonnage of 1,315,766 (1.89% of the world total). By Dec. 31, 1954, the Soviet merchant navy had 664 ships totalling 2,247,000 g.r.t. This total represented 2.5% of the world total, but it included 83 U.S. lend-lease vessels of 518,000 tons. Sea transport was responsible for 4.76% of total goods traffic in 1940 and was estimated at 5.76% in 1955.

Air Transport. — Immense distances and a relatively poor system of rail, road and river transport favoured the development of air transport. It started in 1921 with the creation of the Deruluft (*Deutsch-Russische Luftverkehrsgesellschaft*) whose aircraft flew between Berlin and Moscow, and later between Konigsberg and Leningrad. This company ceased to operate in 1936. The Soviet air transport corporation. the Aeroflot (official name: *Grazhdansky Vozdushny Flot* or Citizen's Air Fleet), began in 1928 a series of unconnected air lines of which the most important were: Moscow–Rostov–Tbilisi; Chardzhou–Tashkent–Frunze–Alma-Ata; Irkutsk–Yakutsk; Tashkent–Kabul. Afgh.; and Verkhne-Udinsk (Ulan Ude)–Ulan Bator, Mong. In 1929 the Moscow–Sverdlovsk–Irkutsk line was opened; in 1930 the Moscow–Chkalov–Tashkent line was inaugurated; Leningrad was linked with Moscow by air in 1931, Stalingrad in 1933 and Kiev and Minsk in 1934. In 1938 the total length of air lines was 106,100 km. and in that year the Aeroflot transported 234,000 passengers and 28,050,000 ton-km. of cargo and mail.

After World War II the Soviet air transport system was considerably extended and by 1955 the total length of regularly operated lines was 1; 5 000 km . the longest being that of Moscow–Yladivostok (8,200 km.). All the capitals of the European and Asiatic people's democracies were linked with Moscow by Soviet aircraft, but until 1956 no foreign air line was allowed to fly to Moscow.

Until 1949 aircraft employed by Aeroflot were two-engined IL-12 and four-engined IL-18, similar in design to the U.S.-built DC-3 and DC-4 respectively. From 1949 the TU-70, a four-engined aircraft, was also in service; in 1956 a two-engined jet TU-104 began to serve Soviet air lines.

XV. FINANCE

The different economic system of the Soviet Union makes the national budget distinct in character and far wider in scope than the budgets of countries where private enterprise prevails. Investment in the national economy, that is. in industry, collectivized agriculture, transport and communications, is the heaviest item of expenditure.

During the first five-year plan (1928–32) the budget revenue totalled 90,200,000,000 rb. of which 59.7% was used for the development of heavy industry, mechanization of agriculture and construction of new railways.

During the second five-year plan (1933–37) the budget revenue totalled 369,800,000,000 rb. and investment in the national economy absorbed 48.9% of this sum. The biggest item of revenue was the turnover tax, levied on the proceeds of retail trade in grain, fats, sugar, meat, alcohol, cotton fabrics, petroleum products and other commodities. In 1931–34 this tax averaged 57% annually; in 1935–37 it rose to 69.5% and in 1938–40 it was 61.1%.

After World War II the pattern of Soviet budgets remained the same, but, during the period 1951–55, the turnover tax averaged annually 46% of all revenue, while dividends from profits by nationalized industry increased. In 1935–37, for instance, the latter brought 6.4% of the total revenue; in 1955 their part amounted to 21%. Investment in the national economy remained, of course, the main item of expenditure and in the period 1951–55 it averaged annually 39.6%. Defense expenditure allegedly amounted to 12.7% in the years 1933–37, to 26.2% in the years 1938–40 and to 21.2% in the period 1951–55. It was not possible, however, to estimate even approximately what percentage of the Soviet national income this represented, since real expenditure on defense (see *Defense,* above) was not confined to the ministry of defense. *See* also ROUBLE.

RUSSIAN ARCHITECTURE. The recorded history of Russian art and architecture may be divided into four main periods: the Byzantine, from the 10th to the beginning of the 16th century; the National or Muscovite, from the 16th to the 18th century; the Petersburgian or European, from the 18th to the beginning of the 20th century; and the Soviet, from 1918 to the present. The centre of artistic and architectural activities shifted several times, generally following the political fortunes of the land—moving from Kiev, via Novgorod and Vladimir-Suzdal, to Moscow; from Moscow to St. Petersburg; and from St. Petersburg again to Moscow.

Materials and Style.—The vast forests. which for many centuries were the setting of Russian life, profoundly influenced the development of Russian architecture. For generations the entire utilitarian and artistic environment of the Russian peasant was fashioned of wood, and it was this constant, close contact with the forests that contributed so much to the arts of woodcraft and the great skill of the Russian carpenter. Building in wood acquired a very special place in the history of Russian architecture; its distinctive and most typical forms were closely bound up, in their origin, with the characteristic virtues and limitations of wood. Because of these limitations the old palaces of the tsars, the mansions of the boyars and the churches never attained the imposing dimensions of the castles of France or England and the Rhenish cathedrals.

In the masonry architecture of Russia, which was mostly brick, the architect utilized the lay and bond of the brick, or stucco and polychrome-tile revetments, for decorative effect. The brick patterns and the coloured tiles and faience paneling of the 17th-century Moscow region form a bright chapter in the history of Russian architecture.

Because of the geological formation of Russia's vast plains, stone was relatively scarce and, in the architecture of pre-Petrine Russia, was used mostly for decorative purposes. It was only after the 18th century, when the rich quarries of Siberia, Finland and the Ukraine became available, that stone architecture began to flourish. Variegated marble, fine-grained granite, glistening labradorites, malachites and porphyries were used with dazzling effect in the construction and interior decoration of the great cathedrals and imperial palaces.

In the formation of its architectural style Russia mas subjected to many foreign influences. The Russians borrowed much from the east and the west, but always showed discrimination in selection, proving themselves to be clever adapters and thorough assimilators. The borrowed elements were consciously and unconsciously modified and transfigured, resulting in a style distinguished by a quality of monumentality, vertical continuity, picturesqueness of mass and rich decoration. The heritage from the Greco-Roman world through Byzantium was merged with the native building tradition, and this proved itself capable of diverse expression, from naked functionalism to the fantasy of the Church of St. Basil in Moscow and the multidomed churches of Kizhi and Vytegra in the north.

THE BYZANTINE PERIOD

With the Christianization of Russia in 988. Byzantine thought and art—permeated with the proselytizing spirit of its missionaries, artists and architects—soon spread throughout the Kievan, Novgorodian and Suzdalian principalities. The emphasis of the Byzantine church on the physical splendour of its edifices was a cardinal factor in determining the characteristics of ecclesiastical architecture. Everything connected with the design and decoration of the new churches in Russia followed the Byzantine pattern; and the standard scheme of the Greek church—the cross inscribed in a rectangle, and the dome supported on piers or on pendentives—became the accepted type for Orthodox churches. The design and support of the central dome or cupola, together with the number and disposition of the subsidiary cupolas, remained for a long time the principal theme of Russian architecture. (See BYZANTINE ARCHITECTURE.)

Kiev.—The main monuments of Kiev were the Desiatinnaia church (989–990), the Cathedral of St. Sophia (1037) and the Church of the Assumption in the Monastery of the Caves (1073–78). All of these churches were built in the Byzantine tradition, though certain influences which came from Bulgaria, Georgia and Armenia can be discerned. The Cathedral of St. Sophia. the mother church of Russia, is the only structure of the Grand-princely period which still stands and retains, at least in the interior, something of its original form. The central part of the cathedral was in the form of a Greek cross. It had a nave and four aisles terminated in semicircular apses, and 13 cupolas (symbolizing Christ and his apostles). It nas reconstructed and enlarged at the end of the 17th century when the vogue of the Ukrainian, or so-called Cossack, phase of the baroque style nas at its height. It was later obscured by additional bays and stories to its lateral galleries, a new tower and many bizarre baroque cupolas. Only five apses and the central interior portion survive from the 11th century.

Novgorod and **Pskov.**—Novgorod was the centre of a unique and quite original Russian art that lived on long after the political death of the city; it was there that the fundamental features of Russian architecture were developed. As in Kiev, the ecclesiastical architectural history of Novgorod began with the Cathedral of St. Sophia. It was built in 1045–52, replacing a nooden 13-dome church of the same name. The new cathedral followed its Kievan namesake in plan, but the divergences from the Byzantine pattern are quite apparent; it has double aisles but only three apses. Externally the church differs even more from its southern prototype. it has only five cupolas, its walls are austere. the buttresses are flat and bare and the windows are small and narrow. There is something genuinely Russian in the silhouette of its helmeted cupolas and in the vigour and verticality of its masses.

The churches of the 12th century resemble St. Sophia only in the general tendency toward simplicity and verticality; they were small, cubic in form and modest in decoration. The severe climate and heavy snowfalls of the north necessitated various modifications of the Byzantine architectural forms. In the course of time windows were narrowed and deeply splayed; roofs became steeper; and flat dome profiles assumed the bulbous form which, in different varieties, eventually became the most notable feature of Russian church architecture.

The churches of Pskov were relatively tiny and squat and usually had three low apses. The cupolas. roofs and decorative elements were similar to those of Novgorod. Because these churches were too small to contain interior columns for the support of the cupola. the Pskov builders developed the structural device of recessive rows of corbeled arches for the support of cupola drums and cupolas. This feature—the *kokoshnik*—was to become a favourite Russian structural and decorative element. The church porches, the exterior mailed-in galleries and the arcaded bell towers were Pskov's other outstanding contributions to Russian architecture.

Vladimir-Suzdal.—Vladimir, as a centre of early Russian culture, was a iactor in a creative fusion of Byzantine, Roman-

esque and Caucasian influences. The 12th- and early 13th-century structures were a further modification of the earlier Byzantine style, leading toward the innovations at Moscow in the 15th century.

Among the outstanding monuments are: the Cathedral of the Assumption (1158–89) which was to serve as a model for its namesake in the Moscow Kremlin; the Church of the Intercession on the Nerl, one of the loveliest creations of Grand-princely Russia (1165); and the Cathedral of St. Dmitri (1194–97). These churches as a group represent the continuation of the Kievo-Byzantine tradition in their ground plan, but the old scheme was given a new interpretation. From Byzantium the Suzdalians adopted the general features of the square plan with semicircular apses, and the four columns supporting a cupola with its circular drum. But instead of brick, so characteristic of Byzantine and Kievan ecclesiastical architecture, they used cut stone and instead of polychrome revetments they used carved stone embroideries. The treatment and decoration of the walls, the deeply splayed portals and windows suggest the articulation of Romanesque architecture; the character of the carved ornament is analogous to that of the Caucasus; hut the organization and arrangement of the forms and patterns is unmistakably Russian.

THE MOSCOW PERIOD

With the fall of Constantinople (1453), Byzantine influences gradually subsided, and the hegemony in the world of Orthodoxy shifted to Muscovite Russia. Moscow, having become the new city of Constantine — the "third Rome" — and aspiring to rival the older centres of culture, launched a building program commensurate with her international importance. The Kremlin, the Acropolis of Moscow, and two of its important churches were rebuilt by invited Italian architects between 1475 and 1510. These churches. the Cathedral of the Assumption and the Cathedral of Archangel Michael, were largely modeled after the churches of Vladimir. The Italians were required to incorporate the basic features of Byzantine planning and design into the new cathedrals. It was only in the exterior decoration of the Archangel that the architect succeeded in introducing Italian decorative motifs. The Archangel cathedral thus marked the beginning of a new art form: the contribution of Italian-Renaissance to Russian architecture. A third church, the modest Cathedral of the Annunciation (1484–89) with its warm beauty, was the work of Pskov architects. There the kokoshnik was introduced in the treatment of the roof. This element, similar in outline to the popular Russian ogee-shaped (bochka) roof, foreshadowed a tendency to replace the forms of the Byzantine arch by more elongated silhouettes. Ecclesiastical architecture began to lose the special features associated with the Byzantine heritage, becoming more national in character and increasingly permeated with the taste and thought of the people. The most important change in Russian church design of the 16th century was the introduction of the staged tower and tent-shaped roof developed by Russia's carpenters in her wooden age. Next was the substitution of the tent spire for the traditional Byzantine cupola. This affected the design of masonry architecture by transforming its proportions and decoration and even its structural methods. The buildings acquired a dynamic, exteriorized articulation and specifically Russian national characteristics.

The boldest departures from Byzantine architecture were the churches of the Ascension at Kolomenskoe (1532), St. John the Baptist at Diakovo (c. 1532) and, above all, of the Cathedral of St. Basil on the Moscow Red square (1555–60). In St. Basil the academic architectural concepts, as understood by the western world, were ignored; the structure is uniquely medieval Russian in content and form, in technique, decoration and feeling. St. Basil, like its predecessors the churches at Kolomenskoe and Diakovo, embodies the characteristic features of the wood churches of northern Russia, translated into masonry.

An effective finishing touch was given to the ensemble of the Kremlin's Cathedral square by the erection of the imposing bell tower of Ivan the Great, begun in 1505. The colossal white stone "column of fame," with its golden cupola gleaming above the Kremlin hill, was the definite expression of an era, reflecting the tastes and grandiose political ambitions of the rising Russian state.

The basic types and structural forms of the Russian multi-columned and tented churches were fully developed in the 16th century. It remained for the next century to concentrate its efforts on the refinement of those forms and on the embellishment of the façades. The tent spires degenerated into mere decoration; they were used as exterior ornamental features set loosely in numbers over gabled roofs and on top of roof vaulting (Church of the Nativity in Putinki street, 1649–52). This decorative use of the formerly functional element was combined mith the liberal employment of the kokosknik. The latter, in converging and ascending tiers and in diversified shapes and arrangements, was used as a decorative screen for the drumlike bases of the spires. and sometimes as parapets over the cornices. At the same time the formerly large expanses of unbroken wall surfaces (of the Novgorod-Pskov architectural traditions) were replaced by rich decorative paneling. Polychromy asserted itself: coloured and glazed tile and carved stone ornament, used in combination with brick patterns, were employed extensively. This was especially evidenced in a large group of Yaroslavl churches.

The baroque appeared on the Russian scene toward the end of the 17th century. But again the Russians imaginatively transformed its modes into a clearly expressed national style which became known as the Naryshkin baroque. A delightful example of this style is the Church of the Intercession of the Virgin at Fili (1693) on the estate of Boyarin Naryshkin, whose name had become identified with this phase of the Russian baroque. *See* also BAROQUE ARCHITECTURE.

THE PETERSBURGIAN PERIOD

The founding of St. Petersburg (1703) marked the beginning of a new era in Russian art and architecture; it was at this city, later renamed Leningrad, that the spirit of western-European art broke through in a decisive manner. The heavy influx of foreign influences — Dutch, German, Italian and French — markedly affected architecture because the new capital offered a fresh field in which the wealth and adamant will of Peter the Great made it possible to obtain the best professional talent from abroad for the realization of his ambitious projects.

The western Europeans brought over the prevailing baroque art characteristics of their own countries, but the very different artistic and physical setting produced a new expression, embodying Russia's peculiar sense of form. scale. colour and choice of materials. The transformed baroque spread all over Russia and, with its vast register of variations. developed many regional idioms.

In the second half of the 18th century the baroque gave way to the rococo, and then to the rediscovered beauty of classicism, initiating a trend toward restraint and refinement. The new architectural current entered the stream of Russian art from different directions: from France. Italy and Germany. Its beginning practically coincided with the founding of the Academy of Fine Arts in 1757. and it lasted for nearly a century. It continued its existence largely through a number of foreign and foreign-trained Russian architects, who brought the classicism of the 18th century to maturity, culminating in the Russianized empire style and producing an architecture notable for its monumentality, integration of mass and space, use of colour and sculptured decoration.

The three long reigns of Peter I, Elizabeth and Catherine II denote the main successive stages of an intense architectural activity which, though principally concentrated in St. Petersburg and its vicinity, radiated from there to many parts of Russia. The impulse continued into the reign of Alexander I, especially after 1812, during the postwar years of awakened national pride. Baroque, rococo, classicism and neoclassicism all came to he represented at St. Petersburg by striking examples in close proximity to one another. Among the best are: the Cathedral of the Smolny convent (1748–64) and the Winter palace (1732), both designed in a rich Russian high-baroque style by Bartolomeo Rastrelli; the Academy of Fine Arts (1764–88) by Vallin de la Mothe and A. F. Kokorinov, a masterpiece of the so-called "Louis XV classique"; the Admiralty (1806–23), designed by Andreian Zakharov in the

empire style with a strong Russian flavour; the Synod and Senate buildings (1829–34), by K. Rossi; and the new Hermitage (1840–50) by the neoclassicist Leo von Klenze.

Moscow went its own way architecturally; it yielded to St. Petersburg in range and scale of construction but outstripped St. Petersburg in picturesqueness, originality and intimacy. At a time when St. Petersburg was engaged mainly in building monumental palaces and public and government buildings, Moscow more often was building private residences and small palaces. Classicism in Moscow was less severe and more homely; the forms of the empire style was softened by giving them a freer and more colourful treatment. Outstanding examples are the old building of the Moscow university (1817–19) by D. Gilardi and the Bolshoi theatre (1821–24) by O. Beauvais.

In the 1830s classicism began to seem something foreign, or imported. Official nationalism and the growing tide of Slavophilism were instrumental in turning the Russian architect away from alien classicism toward the interrupted development of national art. Official nationalism found its expression in the projects of K. Thon, who sought to create a genuine Russian style based on old motifs derived from Russian-Byzantine architecture (the Church of Christ the Saviour, 1837, razed in the 1930s; and the Grand Kremlin palace, 1839–48). The Slavophiles' nationalism was based on the artistic activities of 16th- and 17th-century Russia and on the originality of the construction methods peculiar to that period (*e.g.*, the Historical museum in Moscow, 1875–81, by V. Sherwood). The tendency to revive the forms of the Russian past and to rework old traditions in the spirit of a neo-Slavonic age continued for several decades. At the beginning of the 20th century the new western-European trends—the art *nouveau,* the "Vienna secession" and the "international style"—made their appearance and Russian architecture became increasingly affected by all that was extreme and modern in western architecture.

THE SOVIET PERIOD

In 1918, after a lapse of two centuries, Moscow resumed its role as the capital of Russia and once more became the political and artistic centre of the land. The Bolshevik revolution occurred at a time when the ferment of the international style and other avant-garde architectural theories was already widespread in Russia. During the early years of militant Communism (1918–22) the left school of Soviet architecture, in its desire to embody the dynamic of the revolution in plastic forms, resorted to a symbolism supposedly inherent in the geometrical or engineering forms of architecture. Afterward it was carried away, first by Constructivism, and later by Functionalism and the theories of the German Bauhaus school. The echoes of these theories showed themselves in the works of K. Melnikov, P. Golosov, A. Gintsberg, the Vesnin brothers (Leonid, Viktor and Aleksandr) and others. Experimentation with the modern idiom continued into the 1930s, but without any conspicuous success. The chief handicap of modernism was that its strangeness and cold, functional look were distasteful to those in power and incomprehensible to the masses, whose tastes had been formed by the examples of the Russianized baroque and empire styles. A return to classicism was preferred because it was felt that the dramatization of the ideals of the new life could be best expressed by a humanized architecture based on native traditions of classical forms. The official emphasis on classicism initiated a trend toward monumentalism and florid ornamentation which affected almost every type of building. In Moscow the classic expression showed a leaning toward Palladianism (especially in the works of Ivan Zholtovsky and Zinovi Rozenfeld); in Leningrad it acquired a freer, more modernized look (as in the works of E. Levinson, I. Fomin and N. Trotsky); while in Kiev, Minsk and other cities of the various republics it was tinged with local traditions. On the whole its qualities were those of an architecture in search of forms to express the idea of socialist realism—the uniqueness of the new society.

With the growth of Russian nationalist sentiment in the late 1930s came a perceptible shift toward the expression of nationalism in architecture. The emphasis on the Russian heritage was intensified at the time of the drive against cosmopolitanism in the second half of the 1940s. Extensive use was made of national forms in some of the Moscow subway stations and especially at the All-Union Agricultural exhibition at Moscow (1939–40), where the pavilions of the Uzbek, Georgian, Armenian and Ukrainian Soviet Socialist republics were among the most attractive. The originality of form and richness of ornament reflected the architectural traditions as well as the folk arts of the various republics.

After World War II.—The mania for the monumental and for lavish decoration reached its peak in the last six or seven years of the Stalin era. It was during these years that eight skyscrapers were erected in Moscow. Since they were conceived as "prestige" buildings in the ambitious program for rebuilding and beautifying the capital, their architectural requirements were formulated by government decree; their design was to be in harmony with Moscow's historically developed architecture, and therefore modernistic tendencies were to be shunned. The buildings included the new Moscow State university, two hotels, several office buildings and apartment houses. In the general scheme of their distribution each building was to be the focal point and main theme in the composition of its immediate neighbourhood, either reflecting the architectural features of the nearby historical monuments or setting the tone for the neighbourhood to be developed around it. Rising 20 to 32 stories, they were strategically located in various districts, along the principal boulevards, squares and river embankments, so that their height and bulk would bring into greater relief the beauty of the natural terrain and affect the skyline for a distance of many miles. All of them are adorned with conventional trappings and carry tall, slender, star-topped spires. The decorative motifs are strongly reminiscent of those of the Kremlin.

The massive ensemble of the Moscow State university (Lev Rudnev, chief architect), located on the summit of the Lenin hills, is the largest and tallest of the Moscow giants. It overlooks the city and the great Lenin Central stadium, with its recreation fields, and is the dominating structure in the southwestern district of Moscow. The main building, whose central tower reaches a height of 32 stories, is flanked to the right and left by two 18-story wings. The colonnade to the main entrance is almost pure classic, while the connecting wings to the right and left of the main building have an English Renaissance flavour. The design of the entrance hall, staircases and principal auditoriums is reminiscent of the interiors of the Russian imperial palaces with their classical columns, rich marbles and mosaics, producing an impression of grandeur and opulence.

The university and the other skyscrapers can be seen for miles around and, although deceptive in scale, they are tremendously impressive. On close inspection their decorative details may seem Victorian to western eyes but, as elements in the city landscape, Moscow's skyscrapers have an undeniable dramatic impact.

The Transitional Period.—The end of the Stalin regime (1953) ushered in a period of limited liberalism in Russian artistic life. A number of rigidly Stalinist "socialist-realist" officials in the Union of Architects were replaced by less doctrinaire and more cosmopolitan leaders, who wanted to rid Soviet architecture of the classical clichés of the Stalin era and re-enter the contemporary European and international field. hforeover the vast demand for buildings of all types and the increasing tensions between the building industry's engineers and administrators on the one hand and the architects and theoretical aestheticians on the other, resulted in a widespread demand for a re-examination of the approach to style. In 1955 the government launched a program for revising the design of every type of building with a view to industrializing and standardizing the building industry. The problems posed by the need for economy, standardization and prefabrication both of components and complete buildings forced a thorough reformation in architectural practice.

Particular attention was given to the development of new building materials, especially synthetic plastics and light metals; to exploiting the full structural potential of reinforced, precast and prestressed concrete elements; and to exploring the decorative possibilities of the unconventional shapes that can be achieved

with these malleable and expressive materials. Much research was devoted to the problem of reducing building weight and to saving steel and wood by replacing them with precision-engineered, prefabricated concrete and plastic elements.

In the light of their new experience Soviet architects ,began to reinterpret the principles of modern architecture, reconciling the old and the new. Evidence of the changing outlook is most noticeable in the planning of the satellite towns for both Moscow and Leningrad; in the fresh and imaginative approach to the design of the experimental residential blocks in the Moscow suburb of New Cheremushki; and particularly in the design of the U.S.S.R.'s hangarlike pavilion at the 1958 Brussels Universal and International exhibition, with its glass walls and trussed cantilevers. (AR. V.)

RUSSIAN ART may be divided into four historical periods: the Byzantine, from the 10th to the early 16th century; the Moscow or h'ational, from the 16th to the 18th century; the Petersburgian or European, from the 18th fo the beginning of the 20th century; and the Soviet, from 1918 to the present.

THE BYZANTINE PERIOD (988–1530)

From the 10th century until the end of the 17th century painting in Russia was virtually confined to icon painting: an art introduced to the newly converted nation in the 10th century in the form of models sent to Kievan Russia from Byzantium. This art limited itself to the reproduction of traditional representations of the deity, the saints and scriptural events without ever using the living model.

The conversion of Russia (988) took place during the Byzantine Renaissance, and therefore the two distinct sources of Byzantine art traditions — the classical and the eastern — became the basis of early ecclesiastical art in Russia. The style and manner of Byzantium, once established at Kiev, spread from there to the northern centres and their influence persisted for several centuries.

The art of the Kievan period is revealed especially in the mosaics and frescoes of the Kiev cathedrals and in the applied arts such as filigree and enamels. Of the icons of that period few are preserved. All outstanding example that has survived is the mid-11th-century Vladimirskaia Bogomater ("Our Lady of Vladimir") brought to Russia from Constantinople in the 12th century. It played an important role in the development of the Russian iconographic type of the Virgin known as Umilenie ("Our Lady of Tenderness"), depicting the Virgin and Child as an intimate group radiating the warmth of motherly love.

The Novgorod School. — The civilization of the Kievan epoch was swept away in all of central Russia by the Mongol invasion about the middle of the 13th century. But in the northern regions of Russia — in Vladimir-Suzdal and particularly in the Novgorod district — the end of the 13th century and the whole of the 14th were marked by important developments in architecture and painting.

The city of Novgorod, free from subjugation to the Asiatic hordes, became virtually the metropolis and cultural centre of Old Russia after the fall of Kiev (1240). Together with the city of Pskov and other northwestern communities it harboured many Greek artists, most of whom were monks. They were instrumental in preserving the traditions of Byzantium. But though the latter were also zealously guarded by the Russian church, the evolution of icon painting — in Novgorod, Pskov, Suzdal and other centres — was manifesting local tendencies and characteristics. The rigid Byzantine patterns, the dark colours and the austere lines gradually became graceful, bright and less solemn. As early as the second half of the 12th century Novgorod's own style, which combined the severity of Byzantium with a folkish picturesqueness, was reflected in the frescoes of the Church of St. George in Staraia Ladoga (c. 1180) in the Church of Nereditsa (1199). The frescoes give an idea of the tendencies in the pictorial art of that period. The draftsmanship is spirited, the brush strokes are incisive and the general effect is vivid and sparkling.

The influence of Byzantine models continued to be felt more in the icons than in the frescoes. However in the course of the 13th century Novgorod's style of icon painting gradually strengthened and took shape: the severity of faces was softened, composition was simplified: the silhouette became bold and ever more important and the palette was lightened by bright cinnabar, snow-white, emerald-green and lemon-yellow tones.

The final brilliant stage of Byzantine art — the Palaeologus Renaissance — reached its highest point in the last quarter of the 14th century and is reflected, in works at Novgorod and Moscow, by the highly gifted Theophanes the Greek, a Byzantine emigrant from Constantinople, who seems to have assimilated the characteristics of the country of his adoption. His paintings, though marked by a close adherence to Byzantine standards, show the features that distinguish Russian art: notably, elongated proportions, delicacy of detail and rhythmical composition. These features can be seen in his Novgorod frescoes and especially in the central part of the *deesis* range of the iconostasis in the Cathedral of the Annunciation in the Moscow Kremlin.

Among the immediate followers and collaborators of Theophanes was Xndrei Rublev (c. 1360–1430)—the creator of religious types with a new spiritual expression in them. He painted the frescoes of the cathedrals of the Annunciation at Moscow (1405) and of the Assumption at Vladimir (1408). But his best-known work is the icon "The Old Testament Trinity" painted (c. 1410) for the Trinity-Sergiev monastery near Moscow. The subject—popular in Byzantine iconography — is the visit of the three angels to Abraham and Sarah. But the severe symbolism of the old Byzantine tradition is transformed into something new, more humanistic and intimate; even more important is the novel, peculiarly Russian mood of dreamy sublimation. It is one of the great creations of medieval Russian painting.

Another inspired artist of the 15th century was Dionisi (c. 1440–1508). He left an outstanding monument in the frescoes of the Ferapont monastery in the Novgorod district, and there are several icons ("The Metropolitan Aleksei." "The Crucifixion" and others) attributed to him. His art is marked by the extreme elongated stylizing of his figures combined with a subtle and glowing colour scheme. He and his predecessor Rublev succeeded in expressing the essence of the Russian icon as a reflection of a spiritual otherworldliness—the icon's highest merit.

THE MOSCOW OR NATIONAL PERIOD (1530–1700)

With the fall of Constantinople (1453) the hegemony in the world of Orthodoxy had shifted to Muscovite Russia. Profound changes began to take place in Russian icon painting, leading to the birth of a national art. This evolution first became noticeable in the gradual elimination of the Hellenistic setting of the icon—landscape and architecture. Greek basilicas with their porticoes and atria were replaced by Russian churches with their cupolas, "tents" and *kokoshniki.* Russian saints and episodes from their lives furnished subjects for the Russian artists; Muscovite types and native costumes began to appear in icon painting. The palette acquired an extraordinary brilliance and the emphasis on outline was particulary stressed. Thus the Russian icon gradually became the great national art form of medieval Russia.

Close ties between the Novgorod and the early Moscow schools were maintained for a long time, since many of the great icon and fresco painters in the 16th century worked first at Novgorod and later at Moscow; thus the features characteristic of Byzantine and Novgorodian traditions appear interwoven with the Moscow trend. The literary movement of the 16th century strongly influenced contemporary painting. New subjects appeared: some illustrated the mystical interpretation of the church dogmas or ex-

pressed the rites of the church in symbolic images; others represented parables and legends.

At the end of the 16th century the Stroganov school made its appearance introducing a particular manner of icon painting in diminutive size. Its masters became famous for the elegant attitudes of their figures, the eastern flavour of their colouring and elaborate treatment of detail. Some of them—Prokofii Chirin, Nikofor and Istoma Savin—were later to join the ranks of the icon-painting studios in the Kremlin armory in Moscow.

Moscow icon painting of the 17th century forms the last chapter in the history of Russian painting prior to the Petersburgian period. At the beginning of the century the majority of the icons still retained a strong national feeling and elements of real style. But by about 1650 little remained of what had once been so distinct in the Russian icon; not only had the original style disappeared, but also the character. By the end of the century western European influences began to spread rapidly over Russia, and Russian art entered upon a new historical period.

THE PETERSBURGIAN OR EUROPEAN PERIOD (1703–1917)

The foundation of St. Petersburg (1703) by Peter the Great marked the beginning of a significant change in Russian art—the substitution of western for Byzantine influence. The trend toward westernism was incipient before Peter was born, and went on after his death, but the turning point—when the outlook and taste of the upper classes ceased to be Muscovite and became European—took place during the reign of Peter the Great. Foreign artists and architects began to come to Russia in increasing numbers, while groups of young Russians were sent to Italy, France, Holland and England to study painting and architecture. The influx of Western influences affected all spheres of Russian cultural life and determined the character of its art for more than two centuries.

The art of Peter's age shows almost no trace of Byzantine influence. Only in iconography did the old style persist for some time. Early in the 18th century religious painting began to give way to secular painting, and the church prohibition of sculpture in the round became ineffective.

The reign of Elizabeth (1741–62) ushered in an era of aristocratic culture and art. The empress had French inclinations and a taste for luxury. In her reign a great number of vast and luxurious rococo-style palaces were built; painting was primarily devoted to their interior decoration—ceilings and walls—while sculpture was employed to adorn the gardens and parks. The work was carried on mostly by Italians and Frenchmen.

In 1757 the Academy of Fine Arts was founded in St. Petersburg, and foreign artists—mostly French—were invited to direct the new school. These trained some remarkable native portraitists such as Ivan Argunov (1727–97), A. P. Losenko (1731–73) and Fedor Rokotov (1735–1808). Their works reflected the ceremonial character of Elizabeth's tastes, but showed little evidence of native Russian sensibility.

The advent of classicism in Russia is identified with Catherine the Great (1762–96), whose cultural interests were infinitely wider and more refined than those of Elizabeth. She was not only a prolific builder but a great art collector; much of the credit for the fabulous art treasures of Russia belongs to her. The number of foreign artists that she brought to Russia or encouraged—by ordering their paintings, statues and all sorts of art objects—is truly impressive; and though she mostly favoured foreign artists and architects. principally French and Italian, Russian art profited indirectly.

Russian painters extended their range during the latter half of the 18th century, adding genres of interior decoration and landscape to that of portraiture. At the same time. however, they devoted increasing attention to portraiture. Dmitri Levitsky (1735–1822) painted the aristocratic ladies and gentlemen of the court and the eminent men of letters. as well as the adolescent schoolgirls of the Smolny institute. His portraits are largely of an intimate nature, concentrating on the psychological character of the model. Vladimir Borovikovsky (1757–1825) also painted aristocratic society figures and members of the imperial family. His early work is permeated by a romantic melancholy mood. Later his portraits acquired a realistic quality

Napoleon's invasion of Russia (1812) had far-reaching consequences. It marked the revival of national consciousness and the beginning of a widespread cult of Russian separateness from Europe, thus precipitating the long controversy between "westerners" and "Slavophiles" which ran through so much of Russian 19th-century literature and thought. At the same time Russia shared the European romanticism which marked the era of the Napoleonic Wars. This is reflected in the works of Orest Kiprensky (1782–1836) and Vasili Tropinin (1776–1857). The most notable contribution to the romantic spirit was made by Karl Briulov (1799–1852) with his monumental painting "The Last Days of Pompeii" (1833). A completely different trend appears in the work of Alexander Ivanov (1806–58), the first Russian painter to express religious emotions in the western manner. Other outstanding artists of that period were the painters Alexei Venetsianov (1780–1847) and Paul Fedotov (1815–52), the forerunners of realist painting in Russia, and the sculptors I. Martos (1752–1835), I. Vitali (1794–1855) and F. Tolstoi (1783–1873), representatives of Russian classicism.

The second half of the 19th century marked the coming of age of realism in Russia. A popular outlook and a sympathetic attitude toward the hard life of the people is reflected in the works of most of the painters and sculptors of that time. The new trend in art had as its basis the populist revolutionary ferment prevalent toward the end of the 1850s and the beginning of the 1860s, much of it inspired by the writers Nicolas Dobrolyubov (1836–1861) and Nikolai Chernyshevski (1828–1889). Chernyshevski's dissertation *The Aesthetic Relations of Art to Reality* (published in 1855), the main thesis of which mas that art must not only reflect reality but also explain and judge it, provided a starting point for the contemporary artists.

From the last third of the 19th century onward the history of Russian art is the history of a series of school struggles: the Slavophiles against the westerners; the Academy against the Peredvizhniki ("Society of Wandering [or Traveling] Exhibitions"); and later the joint effort of the last two against a new movement. born in the 1890s and directed by the art review *Mir Iskusstva* ("The World of Art").

The Peredvizhniki society was formed in 1870 by a group of realist artists who seceded from the Academy in 1863 in protest against alien dogmatic formulas and the constricting programs of the Academy's annual competitions. Most prominent among the members of the Peredvizhniki were Ivan Kramskoy (1837–87), Ilya Repin (1844–1930), Vasili Surikov (1848–1916), Vasili Perov (1833–82) and Vasili Vereshchagin (1842–1904) The society attached far more importance to the moral and literary aspects of art than to aesthetics. Its artistic creed was realism. national feeling and social consciousness. Art was to be placed at the service of humanitarian and social ideals; it was to be brought to all the people. The society therefore organized mobile (*peredvizhnye*) exhibitions, hence the name.

The outstanding paintings by the members of this society are: "The Morning of the Execution of the Streltsy" (1881) and "Boyarina Morozova" (1887) by Surikov; "The Volga Bargemen" (1873) and "The Arrest of the Propagandist" (1878) by Repin; "After Igor's Battle with the Polovtsi" (1880) by Victor Vasnetsov (1848–1926); "The Hermit" (1889) by Mikhail Nesterov (1862–1942); and "Still Waters" (1892) and "Golden Autumn" (1895) by Isaak Levitan (1861–1900). In sculpture the best-known norks are "Ivan IV" (1870), "Peter the Great" (1872) and "Mephistopheles" (1882) by Mark Antokolski (1843–1902).

The influence of the Peredvizhniki spread throughout the country and it dominated the scene for nearly 30 years. But by the end of the century (1898). when the *Mir Iskusstva* made its appearance under the editorship of Sergei Diaghilev (1872–1929), Konstantin Somov (1869–1939) and Alexandre Benois (1870–1928), the prestige of the Peredvizhniki had greatly declined. The infatuation with problem pictures and civic themes was over.

Mir Iskusstva did not proclaim any new theories, but it attacked the low artistic standards of the Peredvizhniki, as well as

the deadening influence of the Academy. Individualism and artistic personality were placed first, regardless of any school. Much of the creative work of this group tended to be based on historical themes. Such artists as Benois, Somov and Leon Bakst (1866–1924) were under the spell of the 18th century and the romantic 1830s. Others like Nikolai Roerich (1874–1947), Vasnetsov and Ivan Bilibin (1876–1942) were attempting to evoke the spirit of ancient Russia. They all aspired to achieve a synthesis of new western-European trends and certain elements of traditional Russian folk art.

The important achievements of the *Mir Iskusstva* were in the fields of the artistic book (format and illustrations) and stage designing. But perhaps the greatest contribution of this group to Russian art was the revival of the sense of tradition. It is noteworthy that nearly all that Russia exported to western Europe in the way of artistic values during the early part of the 20th century (ballet, opera, stage scenery, costume and graphic arts) was the work of this group.

In the European artistic ferment of ideas of the early 1900s Russia played a significant role. A large part of ultramodernism was born and developed there during the second decade of the century. The new ideas were taken up by the group called Bubnovyi Valet ("The Jack of Diamonds"), the work of whose members—Peter Konchalovsky (1876–1956), Ilya Mashkov (1881–1944), Aleksandr Ruprin (1870–1935), Aristarkh Lentulov (1882–1943) and others—once regarded as followers of the extreme French trends, made itself felt in Soviet Russia. This group was succeeded by several "leftist" groups, consisting of Cubists, Constructivists, Suprematists and Expressionists—all of them attempting to combine the native and foreign theories under the slogan "pure form," and most of them professing to serve the Revolution with the higher forms of abstract art.

THE SOVIET PERIOD (1918–)

The Bolshevik Revolution broke out at the time when Russia had at last caught up with western Europe in the artistic sphere. At first the Soviet regime appeared to look favourably upon avant-garde art. Extreme modernists like Vasili Kandinsky (1866–1944), Kasimir Malevich (1878–1935), Marc Chagall (1887–), Vladimir Tatlin (1885–), Naum Gabo (1890–) and El Lissitzky (1890–1941) were given official positions. But the teachings of these Abstractionist and Nonobjective artists—their professed indifference to subject matter and their hostility to popular ideas—soon proved to be their undoing, thus changing the direction of Soviet art.

The intellectuals who had any appreciation of modern art represented only a small minority of the population. Lenin himself had no sympathy for the extreme forms of modernism. He and a number of his latter-day disciples apparently sensed that the Suprematist paintings of Malevich or those of the Expressionist Kandinsky were addressed not to the common man but rather to a small coterie of connoisseurs and dilettanti, and that modernism, with its rarefied atmosphere of pure aesthetics, was incomprehensible to the masses. The hostility toward the abstract and nonobjective schools of art—accused of "capitalist cosmopolitanism"—was further intensified by the desire to establish a "people's" art answering, both in form and in content, the strivings of the new political and economic system.

To accomplish its objectives the Soviet regime adopted a program of measures aimed at the democratization and humanization of art. The extreme-left art groups (the "formalists," as they were labeled) were dissolved, and their conflicting aesthetics mere replaced with the aesthetics of "socialist realism." Art was to be realistic enough to be comprehensible to the people without being merely a copy of external reality—an art socially useful and educational. This implied the exclusion of "subjectivism," "abstractionism" and all the other "antihumanistic" trends in art as practised by those who seemed not to care whether they mere understood or not. The ban on formalism (a term that covered all nonobjective art) and the insistence on representational realism led to a frank revival of the "purpose" painting of the *Peredvizhniki* epoch, which soon developed into a lifeless academicism dominating every phase of art throughout the regime of Joseph Stalin.

The active role in the promulgation of socialist realism was played by the writer Maksim Gorki (1868–1936), whose views on aesthetics were based on the principles enunciated by Nikolai Chernyshevski; the doctrine was introduced by Gorki in a speech before the first congress of the Union of Soviet Writers held in 1934; shortly afterward it spread to all the other arts. According to Soviet art theoreticians. socialist realism permits of an infinite variety of stylistic methods, of the use of many expressive forms. The term "socialist" in the designation signifies that realism in Soviet art is based on the principles of philosophic materialism, appraising all phenomena of the past and present from the standpoint of that ideology. This view of the substance of art implied thematic painting and sculpture, but also implied that art is a part of the socialist dynamic. The artist therefore should not dwell on the negative, static characteristics of society, but must portray the positive, revolutionary-romantic side of socialist life by representing the inner world and the deeds of its outstanding workers and leaders: *i.e.,* by bringing into salient relief a deliberately magnified image of the "typical."

An outstanding part in the development of Soviet art was played by Lenin's "plan for monuments," the purpose of which was to honour the memory of the great revolutionists, the men of science, art and literature by monuments, paintings and statues. Aside from portraying Soviet leaders, the artist was urged to select his subject matter from the drama of daily life and toil of the country, stressing the theme of the "new Soviet man." As a result many statues and paintings were produced depicting scientific and industrial workers and farmers—singly or in groups, at labour or at rest—in homely realism, but often tinged with imagination. Examples of socialist realism are the sculptured stainless-steel group "Worker and Farmerette" by Vera Mukhina (1889–1954), and the paintings "Steelworker of the Hammer and Sickle Factory" by Gavriil Gorelov (1880–), "Farm Festival" by Sergei Gerasimov (1885–) and "Supper of the Tractor Drivers" by Arkadi Plastov (1893–).

Another feature of this trend was the scope it gave to monumental art works in which sculptors and painters collaborated with the architect. Hundreds of artists, associated with different genres, contributed to the decoration of the new buildings—the concourses of the Moscow Subway, the halls and auditorium of Moscow university and the pavilions of the Agricultural exposition—tying in the substance of genre activities with the architecture of the structure. Some of these works are distinguished by a sense of composition, monumentalism and a sense of history; very often they display technical virtuosity and fine workmanship but they suffer from an excess of realism.

The end of the Stalin era (1953) ushered in a more liberal climate in the arts. The pressure of the tutelage system imposed from above was considerably relaxed, with the result that the artist regained a measure of freedom of expression. *See* also Index references under "Russian Art" in the Index volume.

RUSSIAN LANGUAGE. The Russian language has more than 110,000,000 speakers, a majority of the population of the Soviet Union. It is the chief administrative language of that country. It is sometimes called Great Russian to distinguish it from the closely related Byelorussian or White Russian and "Little Russian" (an obsolescent term) or Ukrainian, with which it makes up the eastern branch of the Slavonic languages (*q.v.*).

The slavonic scripts devised by Saints Cyril and Methodius and disseminated among the West and South Slavs in the 9th century must have found their way to the East Slavs quickly. Russian

chronicles preserve in later copies treaties made by Kievan princes with Byzantium in 911, 944 and 971, but it was only after the official baptism of Prince Vladimir in 988 that schools were opened and writing began to flourish. The chronicles mention intensive cultural activity under Yaroslav the Wise (1036–54), and the oldest surviving dated manuscript, the opulent Ostromir Gospel of 1056, was quickly followed by a number of other texts which testify to a high cultural level. Epigraphical materials, including graffiti and inscribed objects (whorls, bricks, jars), demonstrate a general knowledge of writing at the same epoch. In 1951 archaeologists working in the ancient north Russian city of Novgorod unearthed a hitherto unknown type of source — short texts, mostly private letters and agreements, written on birchbark. Several score grancoty of this type came to light, the oldest from the late 11th century; their importance for the history of language and culture is comparable with that of papyri for the classical studies.

The overwhelming majority of the writing represents Church Slavonic (Ch.Sl.) of the Russian recension, that is, a standardized written language based on a South Slavonic type of speech but adapted to local conditions. This is the language of the church and the culture connected with it, and the texts are mostly translations from the Greek. The Ch.Sl., although differing in many particulars from the local speech, was probably readily comprehensible to the East Slavs in the early centuries and not too difficult for them to master. Present knowledge of the everyday language comes chiefly from the scanty birchbark granzoty and the occasional slips made by scribes who undertook to add notes or colophons in the Ch.Sl. manuscripts they were copying. Original compositions such as the chronicles and law codes survived in later copies in which it is not easy to distinguish older and newer linguistic habits. It seems, however, that the business language of the laws and letters used more of the East Slavonic elements, particularly in vocabulary, than did annalistic and hagiographic works which had some literary pretensions. This is a common phenomenon; diffe'rent genres are usually couched in diflerent linguistic styles and it is natural that everyday matters are treated in everyday terms. The annalists made skillful stylistic use of the various linguistic elements; the contentions of Soviet critics that there were two different written languages, the foreign ecclesiastical Ch.Sl. and the vernacular secular Russian, are clearly exaggerated.

A number of the earliest texts exhibit some evidence of a difference between a northern and a southern dialect, but on the whole the language until the 13th century is best described as Old East Slavonic. The conventional term Old Russian, which is too firmly established to be discarded, is to be understood as referring to the language of Rus', the whole East Slavonic area, and not to the modern national group called Russians.

Specifically southern dialect features warrant the identification of some texts from the late 13th century as Ukrainian, but it was not until the 16th and 17th centuries that Byelorussian became clearly defined.

The use of local business languages for practical purposes in different areas long had no effect on the pre-eminence of Ch.Sl., which remained a unifying literary language for centuries. In the early period it had adopted consistently a number of East Slavonic features, but during the 14th century it was reformed as a result of the prestige of Bulgarian and Serbian scholars who fled to Russia when the Turks overran the Balkans. This "second South Slavonic influence" (which also affected literary style, art and architecture) was decisive in establishing an archaic and partially foreign type of spelling and grammar as the only suitable vehicle for literary composition. Not until the 17th century, a time of turmoil and incipient change in all realms of Russian life, did this authority weaken. The business language of the Moscow chancelleries, which had steadily gained influence with the growth of the political power of the Muscovite state, then began to be used in more and more significant works; like the Code (*Ulozhenie*) of 1649, which was particularly important for the development of a linguistic standard because it was one of the first printed secular books.

At the same time the beginnings of a style intermediate between Ch.Sl. and business usage can be discerned, and some texts in real colloquial Russian appeared (especially the autobiography of the dissident priest Avvakum, 1673).

The radically westernizing policies of Peter I (1682–1725) and his successors made necessary new means of expression. At first the effort to catch up with Europe was manifested by a flood of translations, chiefly of practical works. Foreign words were introduced into Russian almost indiscriminately, despite the efforts of such talented writers as V. Trediakovskii (d. 1769) who preferred to create new words from Russian and Slavonic materials. Persistence of the traditional view that the vernacular was not suited for literature clashed with a recognition of the fact that Ch.Sl. was too foreign a vehicle for the new culture. The problems were most clearly posed by the brilliant scientist and writer Mikhaylo Lomonosov (d. 1765), who distinguished three styles: a predominantly Ch.Sl. type was to serve for the most "elevated" literature (ode, tragedy), strictly colloquial Russian for the "low" genres (fable, comedy) and an intermediate type for other writings. His suggestions were largely followed, at least in principle, but there was a steady process of rejecting the most unfamiliar and archaic words and constructions of Slavonic and constant imitation of French and German models. About the beginning of the 19th century journalists and educators had elaborated a flexible intermediate style in writing about science and practical affairs, an exemplary moderate form of high style was used by N. Karamzin in his History of the Russian State (published 1818), and hitherto despised colloquial elements were made respectable by the comedies of Fonvizin (esp. The *Minor,* 1782) and the fables of Krylov (1809–20). But there was still an appreciable distance between the different types of language, and influential voices were still to be heard vigorously insisting on a Slavonic purism. It remained lor Alexander Pushkin (1799–1836) to achieve a final synthesis.

Pushkin's poetry ranged from playful romance to the serious epic, from Byronic narratives to classical epigrams, from imitations of folk-songs and fairy tales to poignantly personal lyrics and high tragedy. In prose he wrote history, literary criticism, travel accounts, stories and novels. Whatever the genre, Pushkin's language remained throughout essentially the spoken Russian of an educated man, flavored by pungent peasant proverbs or elegant allusions to French classics, by solemn Slavonic phrases or official chancellery clichés as demanded by the subject matter and tone of his approach. The brilliant success of Pushkin's works put an end to the linguistic controversy, and the history of the Russian literary language subsequently is an account of the refinement of details, of the extension of special types of vocabulary, and of the elaboration of special styles in keeping with changing literary fashions.

In modern times three groups of Russian dialects are distinguished: the northern. which stretches from Leningrad all across Siberia. the southern, including most of central and southern Russia, and a central group occupying a relatively narrow band between the other two. There is no clear boundary between Russian and Byelorussian or between the latter and Ukrainian, for the major dialect types are everywhere united by zones of transition. It is only in the east, where relatively recent settlers brought Ukrainian from the south and Russian from the north, that there is a fairly distinct linguistic frontier. Viewed historically, it seems that in the Old Russian period the chain of dialects from south to north represented closely related types. with a broad intermediate area separating the extreme north from the extreme south. The southernmost dialects soon (13th–14th centuries) became sufficiently differentiated to be identified as Ukrainian, while the central belt, first developing along the same general lines as the north, gradually split into an eastern and a western sector.

The central west, though maintaining some close contacts with Ukrainian, established its identity as Byelorussian (16th–17th centuries), while the central east eventually became southern Great Russian.

Great Russian dialects differ from one another in an enormous number of details, and yet they have retained an overall struc-

tural similarity which makes them on the whole mutually comprehensible. A major difference between the northern and southern (and also Byelorussian) types is in vocalism; the northern (called o-dialects) have on the whole ,maintained all vowel distinctions regardless of position, while in the southern (called a-dialects, with *akanie*), unstressed vowels have changed quality; *o* > a, and often there are complex further changes. This akanie is reliably attested from the 14th century. The oldest northern texts have a confusion of the letters *č* and c, reflecting a typical feature of the north, where there is no functional difference between the two sounds. Ukrainian, Byelorussian and south Russian have a fricative γ (velar) or *h* (laryngeal) for Common Slavonic and northern *g;* this doubtless is a prehistoric change.

The basis of standard Russian is the dialect of Moscow, the cultural centre from the 15th century. The city was originally within the northern dialect zone, but as the mutual influences between north and south created a growing central dialect type, Moscow found itself in the central zone. Thus it has on the whole the consonants of the north (though keeping separate *č* and *c*) and the vowels of the south. The word for "mountain!" spelled *gorá* and so pronounced in the north, is *gará* in standard pronunciation and yard to the south.

The comparative table at the end of SLAVONIC LANGUAGES illustrates some E.Sl. characteristics. In the oldest texts some Common E.Sl. features already appear: *č ž* < C.Sl. *tj *dj; l* < **tl* *dl; u < **ǫ;* a < **ę;* the extra vowel developed in words like *zóloto* "gold" < **zolto* (O.Ch.S. zlato) and *molokó* "milk" < **melko* (O.Ch.S. *mlěko*), initial *o-* for *je-* (R. *ózero* "lake" < **jezero*), and initial *u-* < **ju-* (OR. *ugŭ* "south" has been displaced by the Ch.Sl. form *jug*). In the early historical period the reduced vowels *ŭ ĭ* were lost in "weak position" and became *o* e in "strong position." C.S. *ě* merged with e in R. and BR., but became *i* in Ukr. All E. Sl. languages oppose a series of palatalized consonants to plain (or labialized) corresponding series, although the details vary from language to language. BR. has no palatalized labials before j or in final position (R. *s'em'* "seven," *p'ju* "I drink," BR. *s'em, pju*), no soft *r* (R. *kur'ú* "I smoke," BR. *kurú*), and soft *t'* and d' have become affricates *c'* and *dz'* (R. *d'ét'i* "children," BR. dz'ec'i).

Byelorussian, spoken by about 7,000,000 persons, has two major dialect groups, northeast and southwest. Since Minsk. the capital, is on the latter's territory, the modern literary language, essentially a creation of the Soviet period, is southeastern in character.

A great many variations in phonology and morphology are still permitted, however, for usage has not yet been stabilized. BR. uses a strictly phonetic system of spelling which makes it look a great deal more different from R. than it sounds when spoken.

RUSSIAN LITERATURE. The natural divisions in the history of Russian literature are formed by the two great landmarks of the reforms of Peter I and the effects of the Soviet Revolution. There are thus three main periods, though these inevitably overlap. They are: old Russian, from the conversion to Christianity of St. Vladimir in 988 to the foundation of Peter the Great's new capital in 1703; modern Russian, from 1703 to the October Revolution of 1917; and the postrevolutionary literature of the U.S.S.R. For historical reasons, including particularly the relative isolation of Russia from western Europe until the 16th century, the middle ages lasted for Russian literature until Peter's time (so that the old Russian period might almost as well be called mediaeval), and many of those features which are commonly associated under the term Renaissance do not begin to appear in Russia till the 17th century. The Russian language, too, largely because of the prolongation in it of Church Slavonic elements, did not assume its modern character till well on in the 18th century. The fundamental changes in mental climate wrought by the October Revolution are in themselves sufficient to explain the beginning of a third literary period with that event.

OLD RUSSIAN LITERATURE (988–1703)

Historically this may be subdivided conveniently into four main epochs: (1) Kievan, with Kiev in the Ukraine as its cultural centre, from the earliest documents of the 11th century to the Mongol conquest in 1240; (2) regional, during which a number of cultural centres such as Novgorod, Pskov and Tver were variously dominant, to the end of the Tatar suzerainty in 1480; (3) Muscovite, in which the Moscow grand dukes became tsars of a strong centralized Russian state which caused Moscow to become the vital literary centre, to the beginning of the "time of troubles" with the death of Ivan the Terrible's son Theodore I in 1598; and (4) transitional, in which the first marked contacts with and influences from the west prepared the way for the beginnings of modern Russian literature, from the end of the "time of troubles" with the accession of Tsar Michael Romanov in 1613 to the beginnings of St. Petersburg in 1703.

Kievan Period (988–1240).—In the days of its greatness, Kiev had a heterogeneous culture, intellectually and aesthetically advanced and powerful. It drew its inspiration from Byzantine Christianity, but was from the outset modified and vitalized by native Slavonic impulses. At the same time it had real contacts with western Europe, and yet had already assimilated something from the culture of contiguous and often closely associated Asian peoples. It had too something of that special quality which runs all through Russian literature expressed by the Russian word *narodnost* (roughly to be translated as "peopleness"), an element which makes a literature retain some intimate and vital relationship to people and soil despite foreign influences and urban sophistication. Kiev of the late 10th century was a peak of European culture, sharing the most valuable developments of east and west, of Byzantine and Latin civilization.

As a result of the Mongol devastations of the 13th century, much was lost and much preserved only in manuscripts of the 16th century. There were the usual types of early Christian religious literature—lives of saints, homilies, books of instruction. There were, too, the expected kind of translated works from Byzantine Greek. But there were also creative writings which, while employing the artificial Church Slavonic of the old Rus, show genuinely literary qualities as well as throw light on the life of the times. Such were the chronicles, for example The Tale of *Bygone* Times (*Povest vremennykh* let) with its account of the beginnings of Rus; and the *Instruction* (Pouchenie) of Vladimir Monomakh in which the early 12th-century revered ruler of Kiev sets down his wisdom and practical experience. *The Discourse on Law and Grace* (*Slovo o zakone i blagodati*) by the metropolitan Ilarion shows intellectual ability as well as rhetorical skill. The probably 12th-century

adaptation of the Byzantine romantic tale of *Digenis Akritas* (*Devgenievo Deyanie*) reveals marked native folk elements which give it something of the air of a Russian heroic prose epic.

Though these short, balladlike heroic pieces in unrhymed verse for singing by trained minstrels have not survived in manuscripts of earlier than the 17th century. this most important type of poetry of oral tradition evidently arose in the Kievan epoch. Much of its subject matter concerns the doings of the Kiev princes and their noble retainers, treated in a truly heroic yet natural style, in which the work of court poets has been handed down in the mouths of the people. Some of these *byliny* or pieces of the olden days (more traditionally termed *starmy* till the folklorists coined *byliny* in 1830) were copied donn for the first time by the Englishman Richard James early in the 17th century in a manuscript preserved in the Bodleian library at Oxford. They are the finest representatives of Russian oral poetry, and this tradition of an oral poetry independent of books has lasted into the 20th century, in which pieces of the *bylina* type continue to he composed and recited on contemporary happenings in parts of northern Russia. Those fairy folktales and collections of vivid proverbs which are a marked feature of Russian popular literature throughout its history also began to appear in the Kievan age.

But the supreme literary achievement of the Kiev period was the heroic poem in rhythmic epic prose known as *The Lay of Igor's Campaign (Siovo o polku Igoreve),* composed. very soon after the events it makes so memorable. to celebrate the glories of a tragic expedition made by Prince Igor of Novgorod-Seversk against the Polovtsy (Cumans, or Kipchak Turks) in 1185. This poem survived in an early 16th-century manuscript discovered in 1795 by Count Aleksey Musin-Pushkin and published in 1800, but it perished in the Moscow fire of 1812. It is the one old Russian work that clearly merits a place among the world's masterpieces. Its heroic spirit harmonizes perfectly with the sheer poetic beauty of its language and nith its blending of Christian and pagan feeling.[1]

Regional Period (1240–1480).—The fall of the Kievan state and the Tatar conquest of so much of Russia led naturally to the regionalization of culture, and the Eurasian cultural atmosphere was not propitious to literature in general. Much the same chronicles and lives of saints and sermons continued to be produced as in the previous age, with many translations of well-known European works of edification and adventure; but the isolation, not only from western Europe but even from Bysantium. was unfavourable to literary progress, and the output of original writing was small. Much of this latter was of the quality of the *Petition of Daniel the Captive (Molenie Daniila Zatochnika),* in which an unknown exile begs aid and patronage from the prince of Pereyaslavl in a fantastic medley of varied learning and rhetoric while voicing a practical complaint against the boyars; interesting to social historians, it scarcely reaches the level of literature. To Suzdal belongs the stirring and warlike *Life of Prince Alexander Nevsky,* with its forceful account of the famous victory of 1242 on the ice of Lake Peipus over the Teutonic Knights. Each centre had its regional chronicle, and there was a good deal of narrative and lament over the Mongol wars. Quite entertaining is the curious and imaginative *Tale of the Indian Empire (Skazanye ob indizskom tsarstve)* with its picture of a mighty Christian Indian ruler, Ivan. who goes into battle with vast armies led by a huge wooden crucifix and vaguely suggests Prester John.

But there are two works of the 15th century which are, in different ways. on a more strictly literary plane. the *Zadonshchina* or *Deeds Across the Don* of the early part of the century, and the *Travels Beyond the Three Seas (Khozhdenie za tri morya)* of Afanasy Nikitin. The *Zadonshchina* celebrates the glorious victory of Dimitri (Demetrius) Donskoy of Moscow over the khan Mamai on Kulikovo plain (1380); it has heroic vigour of a somewhat highly wrought kind. The travel narrative of Nikitin, a merchant of Tver, on the other hand, is colloquial and simple, without the usual Church Slavonic adornments though often introducing oriental words for effect. He describes his own journey for trading purposes to Persia and India which lasted for nearly six years (1466–72), giving a vivid and naïve picture of his life in India especially. Nikitin's *Travels* is the first European account of India.

Muscovite Period (1480–1598).—The 16th century was especially a period of the written expression of the organization of the Muscovite state as it steadily and consciously consolidated itself. The discovery that Moscow was a "third Rome" at its beginning was followed by the production of numerous and often effective encyclopaedic works aimed at a combined religious and secular teaching which would form the kind of society desired by Moscow. Ivan the Terrible, himself no mean polemical letter writer, took a hand in setting out his own kind of political philosophy. His chief epistolary opponent, Xndrey Kurbsky, a descendant of Kievan princes. defended the rights of the oppressed nobility with even greater literary skill. Ivan's principal literary apologist, Ivan Peresvetov, with his western political training, produced a remarkable kind of allegorical historical defense of Ivan's terror in his *Tale of Sultan Mahomet (Skazanie o Magmete Saltane),* in which the cruel severities of the Ottoman conqueror of Constantinople are lauded as an implied justification of the tsar's conduct. Books such as the *Hundred Chapters (Sto glav),* which sets out a kind of *disciplina clericalis* by ecclesiastical conciliar authority. and still more the *Ordering of the Household (Domostroy),* are valuable as social documents throwing often clear light on modes and manners which remained the Orthodox Russian way of life for centuries.

This period also marked the beginnings of that kind of western contact which later was to change the whole pattern of Russian literature. Queen Elizabeth I had many dealings with Tsar Ivan which went beyond the mere opening up of active trading. Printing began in Moscow in 1564, though it was little used save for religious. legal and didactic books till the time of Peter the Great. A new impetus was given to the study of learning and theology by the coming of Greek scholars and accomplished men of letters such as Maxim the Greek. There was some interest in literary or rhetorical style stimulated by contacts with Poles.

But native Russian features began at this time also to grow into new life. This is indicated, for instance: by the composition of historical pieces of the *bylina* type on the events of the time. Heroic pieces were written in poetic prose in honour of Ivan the Terrible's conquests; at least one such work, the *Story Concerning the Empire of Kazan (Istorya o kazanskom tsarstve),* contains passages of poetic quality reminiscent of ballad or *bylina.*

Transitional Period (1613–1703).—The literary tendencies begun in the 16th century became increasingly powerful in the 17th. As the century advanced. it became ever more clearly an age of transition. though Peter's reforms greatly hurried and enforced developments which otherwise mould have been much slower. Especially notable was the development of prose in secular directions such as satire. romance (though mostly only through translations) and the use occasionally of spoken Russian side by side with Church Slavonic. There were significant developments too in poetic style and metre through Polish and Ukrainian influences. But most marked of all was the increasing multiplying of western literary contacts of all kinds, though the tangible results of these were for long not visible.

The "time of troubles" which filled the period between what have been termed the Muscovite and transitional periods (1598–1613) showed many conflicting tendencies. It was rich in popular literary expressions (including *byliny*) of the miseries of the times, but its chief significance lay in the greatly increased foreign influences which it let into Russia. Ivan the Terrible had often encouraged foreigners; but Boris Godunov (1598–1605) went much farther at times: and the Polish rule in Moscow which followed his reign brought in a whole host of Latin western influences from Poland and from the Ukraine, which was then part of Poland. Kiev, too, was once more becoming a source of literary influence which, as in its ancient glory, blended Latin with Byzantine culture. This Ukrainian, hence partly Latin, influence was greatly reinforced wher. in 1654 much of the Ukraine was united with

[1] In his book Le *Siovo d'Igor* (Paris, 1940) André Mazon, professor at the College de France and director of the Institut d'Études Slaves of Paris, considered that the *Slovo* was a forgery and that Musin-Pushkin produced it. Roman Jakobson defended the authenticity of the *Slovo* in the composite volume edited by H. Grégoire, La *Geste du Prince* Igor (New York, 1948).

REPRESENTATIVE RUSSIAN WRITERS, 18TH–20TH CENTURIES

1. Mikhail Lomonósov (*c.* 1711–65)
2. Ivan Krylov (1768–1844)
3. Mikhail Lermontov (1814–41)
4. Alexander Pushkin (1799–1837)
5. Nikolai Gogol (1809–52)
6. Fëdor Dostoevski (1821–81)
7. Nikolai Nekrasov (1821–77)
8. Ivan Turgenev (1818–83)
9. Leo Tolstoy (1828–1910)
10. Anton Chekhov (1860–1904)
11. Maxim Gorki (Alexey Peshkov, 1868–1936)
12. Dmitri Merezhkovsky (1865–1941)

Russia. It was thus that Simeon Polotsky came to bring his syllabic metre (an entire innovation) from the then recently Polish Kiev to Moscow, and though this was not in the long run the most suitable metre for Russian poets, its introduction undoubtedly served as a stimulus.

It was toward the close of this traditional period that the crude beginnings of a Russian theatre appeared. under the influence of the learned Simeon Polotsky and of Johann Gottfried Grigory (Gregori), a German Lutheran pastor in Moscow. Polotsky introduced didactic drama of the Renaissance grammar-school type, and Grigory inspired the production of biblical narrative and of a morality play on Adam and Eve in a manner reminiscent of English "coniedies" in which serious and edifying matter is made to alternate with the buffoonery and clowning of fictitious characters interpolated from low life. The first wooden theatre was built in 1672. but it served merely the court circle of Tsar Alexius. Polotsky's play on the *Prodigal Son,* with its humane and dignified speeches, has a good deal of vitality. But the treatment of *Judith* from the scriptural story is a mixture of exaggeratedly rhetorical declamation with crude comic relief from such characters as a frightened soldier of Holofernes and Judith's maidservant. Theatre proper had to wait for Peter I.

The outstanding achievement of this period was in Russian prose, in the vivid and masterly use for the first time of colloquial Russian as distinct from Church Slavonic in the pioneering *Life* of *the Archpriest Avvakum* written by himself (*Zhitie Protopopa Avvakuma*) in 1672–73. Avvakum (a form of Habbakuk) was the fanatical but inspiring leader of the Old Believers, who opposed all the major reforms of the patriarch Nikon and all the modern changes which they foreshadowed in the days of Tsar Alexius. Combining intense spiritual pride with the fiercest realism in style, he sought to bring the church and its people back to the ancient traditional piety. In a life of suffering and material hardship which his rebelliousness against the church and state brought upon him, culminating in his being burned at the stake. he exalted with a vivid fury of plain speaking all that the reforms were, as he thought, seeking to obliterate in the loved ancient ways of "Holy Russia." Keeping the Church Slavonic for scriptural citation and formal compliment, he wrote the details of his life in a dynamic colloquial Russian of the people he loved which hitherto had been unknown (except for occasional passages) in any educated writing. As he says of the *Life:*

> And if it be plainly told, do not, for God's sake, condemn our plain speech, for I love my natural Russian, and am not accustomed to ornament my talk with the poetry of philosophers; for God does not hearken to fine language, but looks to the matter in hand.

Polemical political and religious writing had been developed in the previous century. but the naturalness and air of spontaneity of Avvakum's descriptions of Russian daily life, in language which springs from a natural genius. make the *Life* a landmark in the history of Russian as well as its leading literary masterpiece of the 17th century.

Avvakum's *Life* was the first Russian autobiography, and indeed the 17th century was essentially a time of first products in new ways of writing, a time of experimental preparation. Rhyme first came to be used (apparently through the influence of the Polish-dominated Ukraine) at its beginning, and the efforts of Polotsky and his disciples combined rhyme with a syllabic pattern with feminine endings as in Polish, in a way which; though not destined to flourish among the best Russian poets. yet did much to prepare the way for more truly Russian creative metres. Satires and moral fables in prose. too, distinctly foreshadowed Radishchev and Krylov. in such pieces as *The Tale of the Trial by Judge Shemyak (Povest o Shemyakinom sude)* and *The Tale of the Cock and the Fox (Povest o kure i lisitse),* which are both versions of traditional legendary and folk material retold with Russian 17th-century life in view. Avvakum, with his vivid blend of iconoclasm and conservatism, is perhaps the most typical as well as the most important figure of this transitional period.

In an appraisal of the whole extent of old Russian literature in its four periods, it can be realized that literary output throughout was continuous, though varying much in value. From a strictly literary point of view only a few masterpieces stand out: the *Slovo,* the *Travels* of Nikitin, the writings of Kurbsky and of Peresvetov. Avvakum's *Life* and the best of the *byliny.*

MODERN RUSSIAN LITERATURE (1703–1917)

With the building of St. Petersburg and the strongly conscious and determined beginning of the process of assimilation into Russian literature of all the knowledge and potentialities of western Europe ahich this "window into Europe" symbolized. modern Russian literature is usually held to begin. The flood of foreign influences which consciously were sought by the authorities and men of letters alike in the 18th century mas more definitely formative than the sporadic western influences of the 17th; and. equally, the national consciousness seen in the writings of Avvakum and others of his time was something far less "literary" than the deliberate seeking to make the Russian language a great literary vehicle, uhich was characteristic of Lomonosov a century later. It is also true that western contacts were beginning to be noticeable as early as the reign of Ivan the Terrible; and, indeed, even under the Tatar yoke Italian merchants formed a slender cultural bridge betneen Russia and the west. Some again would call the modern Russian period by some such name as the "St. Petersburg age," in view of the central influence of Russia's modern capital and the fact that Moscow once again became the metropolis after the October Revolution when all are agreed that a new period must be taken as beginning. The pioneers of modern Russian in the 18th century, Lomonosov and Karamzin. were conscious and deliberately formative artists, whereas Avvakum. who did so much for Russian as a vivid vehicle for realism and controversy and thus prepared the ground for the modem period, was not consciously concerned with literature at all. He was, in a sense. a gifted barbarian with a dynamic power of language. There was plenty of native virility renascent in the 17th century; and it has been proposed by a Soviet writer to begin the contemporary period with the new consolidation of the Russian state and the resurgence of patriotism after the "time of troubles" with the accession of Tsar Michael Romanov in 1613 But, as has been shown, the 17th century is best regarded as an epoch of transition which prepared the way for modern Russian literature rather than began it.

It was in the 18th century that the chief literary genres. already experimentally or crudely handled in the previous century, first took on shapes that can be recognized as modern. Polotsky and others had combined rhyme with syllabic verse in the preceding epoch, but it was Vasily Tredyakovsky (1703–69) uho first proposed the replacing of the syllabic metres imitated from Poland and France by those tonic and accentual measures which have been the accepted mediums of all Russian poetry (except the *byliny,* which retained the intonation of the people) ever since. Polotsky and the German Grigory had made beginnings with artificial and foreign-type plays. but it was Aleksander Sumarokov (1718–77) and Denis I. Fonvizin (1745–92) who first made plays that had some claim to be accounted literature. Tsar Alexius had a little wooden theatre built for the court circle. but it was not till 1756 that Russia had its first regular theatre. with Sumarokov as director. Avvakum and others had written keenly satirical prose, but it was not till the reign of Catherine II (1762–96) that literary satire made its appearance in the periodicals edited by Nikolai I. Novikov (1744–1816) and in Aleksander N. Radishchev's (1749–1801) powerful social satire of the *Journey From Petersburg to Moscow (Puteshestvye iz Peterburga v Moskvu)* which was published in 1790 (and burned by the hangman in the same year). There had been much translating of western romances. and popular fiction of the chapbook variety in the 17th century; but Karamzin's sentimental tale *Poor Liza (Bednaya Liza),* which was the first that can be called something like a novel proper, did not appear until 1792. Avvakum had appealed for natural colloquial Russian as against pomposity and Church Slavonic for secular writing; it was Lomonosov who wrote the first *Russian Grammar* (1757), and discussed the question of forming truly Russian literary styles suited to various and differing literary compositions.

Inevitably, as modern and more complicated times are ap-

proached, the attempt to divide and classify Russian literary epochs becomes more difficult and less effective, and there is far more continuity and overlapping than before. The 19th century stands out as Russia's great classical period of literature. It is primarily the work of this century (with a little in the 20th) that has caused Russian literature to be recognized as among the greatest. It seems best therefore to divide the modern Russian period into two parts: the 18th century, which was especially a time of the deliberate cultivation and imitation of the classicism of the French and those they influenced most; and the 19th century and first years of the 20th, in mhich Russia produced its greatest creative literature. It was the age of the great Russian classics of literature. Krylov's *Fables* did not appear in volume form until 1809, and he is the first. chronologically. of the Russian classics; so that 1809 is a convenient year to mark the line between the period of classicism, as the 18th century may be termed and the period of the classics.

Period of Classicism (1703–1809).—This was the period of constructive foreign influence, of literary imitation of French and other foreign models, and latterly to some extent of that assimilation of foreign types which was to lead to the full and creative self-realization of Russian literature in the 19th century. Peter I was mainly utilitarian in his reforms, but inevitably the spate of translating and importation of foreign techniques and the sending of Russians abroad for study opened the may to the influences of the west, and especially of the literature of France. Antiokh Kantemir *(see* CANTEMIR) (1708–44), a Rumanian by birth, an aristocratic and leading poet in the earlier part of the century, was a deliberate imitator of French models. Saturated with classical and French literature, he wrote the best of the poems of the fashionable French type, combining rhyme with syllabic metre, though he sympathized with the reform of Lomonosov which a little later was to make Russian poetry adopt the more natural method of tonic accent. So great became the French influence in fashionable culture that French continued to be the language of fashion among the upper classes till far into the next century. But, in addition to the German influence that was to be expected. English literature also had an important role in this period. Pope was translated and strongly admired, the periodical essayists Joseph Addison and Richard Steele were followed by Moscow works imitative of the *Spectator,* and Laurence Sterne's *Sentimental Journey* and the cult of "sensibility" found favour. as did Samuel Richardson's *Pamela,* which was not without its influence on Karamzin's *Poor Liza.* Shakespeare's *Hamlet* was adapted in French classical style, and the social satirical comedies of Fonvizin owed something also to English Restoration comedy as well as to Molière. The influence of classical Greek and Latin, which had begun with Polotsky in the previous century, now became potent, and was so well assimilated that it brought to birth the best work of the greatest Russian poet of the 18th century. G. R. Derzhavin (*q.v.;* 1743–1816). His best poems show solemn baroque splendour blended with some simple realism. He was far more of a poet proper than Lomonosov. whose reforms he followed.

From the point of view of literary history. hon-ever. the greatest names of this epoch are Lomonosov and Karamzin. though neither is of such intrinsic literary quality as Derzhavin. Mikhail V. Lomonosov (*q.v.;* 1711–65) absorbed all the then obtainable knowledge and became poet, grammarian. scientist, literary critic and reformer, all in a comparatively short life. His *Russian Gramnznr* was a landmark in the development of the language and in the criticism of style; his poetry gave effect lastingly to the metrical reform of Tredyakovsky; his heroic poem *Peter the Great* is a fine piece of rhetoric no longer read; his eulogy of the Russian language (in his *Grammar*) is characteristic of the man and shows the literary breadth of his approach, as compared with. say, the simple praise of Avvakum cited above. Lomonosov wrote:

> The Ruler of the Holy Roman Empire, Charles V, used to say that Spanish was fitted for speech with God, French with friends. German with enemies. and Italian with women. But if he had known Russian, he would certainly have added that it mas fitted for speech with all of these. For he would have found in it the magnificence of Spanish, the vivacity of French, the vigour of German, the tenderness of Italian and moreover the copiousness and forceiul succinctness of expression characteristic of Greek and Latin.

Nikolai M. Karamzin (*q.v.;* 1766–1826), the other important figure of the period (whose work overflowed into the 19th century in which he achieved his greatest fame as the first scholarly writer of a history of Russia), carried on the task of literary and social periodical editing begun by Novikov and Radishchev Alive to every classical and foreign influence he marks something like the beginning of the Romantic movement in Russia, but also significantly carried a stage farther the reforms in Russian literary style planned by Lomonosov. Besides his *Poor Liza,* he scored something like a triumph with his *Letters* of *a Russian Traveller* (*Pisma russkago puteshestvennika*) in 1790, in which Sterne's *Sentimental Journey* is imitated but in an attractive and quite Russian manner.

The period of classicism was a time of artificial and imitative literary development. but beside the following of everything French by men of letters there was at the same time a growing pride in things Russian which found expression in the frequent satire on bogus French behaviour in the comedies of Fonvizin Under the guidance of Lomonosov and later of Karamzin, prose developed a freer and more natural variety of styles and liberated itself from most of its remaining traces of Church Slavonic. Poetry, by the close of the period. was ready for the "Golden Age" which was to follow. A beginning had been made with social comedy and less successfully with tragedy, and a national theatre had been established. Comic opera too made a notable start with Aleksander O. Ablesimov (1742–83). whose opera *The Miller, Wizard, Quack and Matchmaker* (*Melnik, koldun, obmanshchik i svat*) was written in 1779. Satire. especially under the influence of the French Encyclopaedists Voltaire and Rousseau. had established itself, and in the hands of Radishchev terrified the formerly liberal Catherine II into sending its author to Siberia for his violent exposure of serfdom and autocracy. (Radishchev was sentenced to death in 1790, but the sentence was commuted to ten years' deportation.) The influence of Shakespeare, which later was to become so effective, began in this epoch. Karamzin's translation of *Julius Caesar* (1787) marked its beginning, though it was not until 1806 that an authentic translation (Vasily Velyaminov's *Othello)* was acted in St. Petersburg freed from the French classical adjustments which had become the rule.

The 18th century was indeed Russia's great formative period in literature. It was also the time when Russian literary figures such as Derzhavin and Karamzin became known in Europe generally. It was a time in which Russia responded, though only through a small educated class, to every literary movement abroad; but, save for a few outstanding poems such as some of Derzhavin's odes, it was not a great creative period.

Period of the Classics (1809–1917).—This period is characterized by the growth of that typically modern Russian class, the intelligentsia (the word seems to have been first used by the Poles and then taken over by the Russians). After Pushkin, the literary lead seemed to be passing from the hereditary upper class to this new intelligentsia, which perhaps had found its beginnings as a literary force with Novikov. who is often said also to have first made for literary journalism a reading public in the 18th century. In the age of Pushkin, poetry was at its very greatest. Later in the 19th century prose, in the form of the novel especially, was Russia's special contribution to world literature. At the close of the epoch, beginning with the 1890s, there was something like a rebirth of poetry under the inspiration of the French Symbolists and their followers Though they were far from numerous, the epoch had its great dramatists in Griboyedov, Gogol, Ostrovsky and Chekhov. Indeed all the principal forms of literature became of European importance.

Poetry.— *At* the beginning of this "Pushkin's Golden Age," the conflict between the conservatives of letters (led by Adm. Aleksander Shishkov, 1754–1841) and the Romantic westernizers who followed Karamzin was at its height; into this, Krylov had entered with satiric force by mocking at the critical Slavophils in some of his fables, such as *Parnassus.* Yet I. A. Krylov (*q.v.;* 1768–1844) was a lover of the virtues of Russian peasant life. He began by adapting some of La Fontaine's *Fables,* but even in these he had added to the French originals a peculiar folk quality which

was to become one of the chief delights of Krylov's Fables (Basni). He had the gift to exploit to the full the realist possibilities of blending the technique of traditional fabulists (he had had several Russian predecessors in the 18th century) with something of that rich fairy tale folk element which is especially characteristic of Russia. Much of the charmingly natural and freshly childlike wisdom and wit of the Fables has passed into proverbial speech, and children have never ceased to memorize and enjoy them. Historically, the Fables are important as in some sense anticipating that blending of Europe with the Russia of its own people which was to be the glory of Pushkin.

A considerable poet was V. A. Zhukovsky (*q.v.;* 1783–1852). In addition to writing romantic poems and imitations of older ballads, he translated in verse from German and English especially, as well as from Homer. His version of Gray's "Elegy Written in a Country Churchyard," published first in 1802 in Karamzin's literary periodical Vestnik *Evropy* (Messenger *of* Europe), is a magnificent poem and perhaps comes nearer to conveying the qualities of its original than any other known translation.

Though the long struggle between Slavophils and westernizers was to continue indefinitely in political and international matters, the best of the two points of view, so far as the literary language was concerned, were superbly and finally reconciled in Aleksander Pushkin (*q.v.;* 1799–1837). His early love for the French Encyclopaedists, for French classical drama as well as for Shakespeare and Byron. shared his heart with the native linguistic vitality and folk wisdom he had learned from his peasant nurse. In his Evgheny Oneghin he makes Tatyana, the girl who had lived only in a country house, confess: "I did not read our journals, I knew Russian badly, and I expressed myself with difficulty in my own native language." Such was the "Frenchifying" of the upper classes. Yet Pushkin made the Russian language do everything with assured inspiration and naturalness, both in prose and verse. In his short and tragic life he showed the "myriad-mindedness" which has been attributed to Shakespeare, and the Greek economy of words and lyric restraint of a truly great poet. His best lyrics are unequalled in their kind since the ancient Hellenes; yet his prose shows almost as much mastery, and he never loses the power of structural beauty. His heroic social long poem of contemporary Russian life, *Evgheny* Oneghin (1823–31), has all the virtues of Byron's Don Juan but lacks its unevenness and many lapses of style. His narrative poems, such as *Mazepa* and The Caucasian Captive (Kavkasky *plennik*), far outdo Byron in poetic quality of the same kind. His prose tales, such as The Captain's Daughter (*Kapitanskaya* dochka), are a landmark in the art of Russian prose. They have become the subjects for all kinds of artistic performance. His verse play Boris Godunov, which is markedly influenced by *Hamlet,* has much Shakespearean quality. Pushkin is at once the most Russian of modern poets and the most European, the simplest and the most moving, the most natural and the most artistic. His influence as the supreme Russian classic has remained and widened with time.

At this time St. Petersburg was a veritable "nest of singing birds," among them Evgheny Baratynsky (1800–44) (see BARATYNSKI, YEVGENIY ABRAMOVICH), the metaphysical lyric poet especially liked by Pushkin; Nikolai Yazykov (1803–46), the master of startlingly vivid rhythmic and visual effects; and, above all, Mikhail Lermontov (*q.v.;* 1814–1841). Like Pushkin, Lermontov wrote'narrative prose, notably his *A* Hero of Our Time (Gheroy nashego *vremeni*), published in 1840, which is one of the most vivid psychological studies of a frustrated "superfluous man" ever written. Its hero, Pechorin, like Pushkin's Oneghin, owes something to Byron as well as to the poet's own violent life, but Lermontov never reached anything like that spiritual harmony which at his greatest moments one perceives in Pushkin. His narrative poem Demon has never lost its appeal because of the wonderfully musical quality of its verse and the descriptions of that magical Georgian scenery which has inspired Russian poets from Pushkin to Pasternak.

After the middle of the 19th century, poetry, though continuing even more plentifully, generally ceased to be original or creative till it was revitalized by the Symbolist movement and kindred trends toward the close of the century. Yet it may be said that a simple and profound realism, the outstanding gift of Russian poetry to the world. went on putting forth new growths; and always while Russian soil was watered by western movements—*i.e.*, Romanticism, the work of Edgar Allan Poe (who has been a markedly potent influence) or Symbolism—the resulting poetic plants have been essentially Russian. It is particularly in this last respect that the 19th century contrasts with the mainly imitative poetic qualities of the 18th.

One new type which flowered in this era, though first discovered in the 18th century, was the literary folk song or *pesnya,* which has affinities with the bylina and the ballad, yet is sweeter and more profoundly musical. Aleksey V. Koltsov (1808–42) was the first master of this art of Russian song, and he is the nearest thing to Burns of his country. Lermontov's "Cossack Cradle Song," with the exquisite, untranslatable, onomatopoeic refrain bayushki bayu, is perhaps the most widely known of this kind. The most representative poet of the century, and probably the greatest after Pushkin, was Fyodor Tyutchev (1803–73), whose lyrics are among the most beautiful. It is characteristic of the upper classes of the time to which Tyutchev belonged that all his nonpoetical writings, often brilliant and critical, were in French. But the intelligentsia had become too interested in social problems to produce works of pure poetry, or they sought to build a Slavophil poetic philosophy as did Aleksey Khomyakov (1804–60) and Ivan Aksakov (1823–86) (see AKSAKOV, SERGEI TIMOFEYEVICH). And from the middle of the century poetry began to produce "realism" and "naturalism" in the form of descriptions of the lives of the peasants and passionate pleas in verse for their betterment. Tyutchev, however, with outstanding originality, produced his "Dream at Sea" (Son na more), which has something of the weird, profoundly fantastic qualities of Coleridge's "Ancient Mariner."

Of the "poetic realists," the best in literary quality was Count Aleksey Konstantinovich Tolstoy (*q.v.;* 1817–75); the most moving Ivan Nikitin (1824–61), in such poems of the people's lives as his "Kulak"; but the most truly creative and original was Nikolai A. Nekrasov (*q.v.;* 1821–77), who combined real *narodnost* with vigour and vividness in descriptions of the lives of the Russian people. His greatest long poem, Who gets the Good Life in Russia? (Komu *na* Rusi *zhit* khorosho), with its folk-song style, its truly Russian humour and its varied descriptions of Russian types met on a journey through the country in search of the man who gets the "good life," has been loosely compared with Chaucer's Canterbury Tales. His realistic idealization of the Russian peasant woman, Red-nose Frost (Moroz krasny nos), and his Pedlars (Korobeynzki) are unsurpassed for poetic realism; and he was a master of the literary folk song. Count Aleksey Tolstoy, besides his poems of realism, wrote well in many other genres, including the ballad, as evidenced by his haunting "Prince Mikhaylo Repnin" which describes the slaying in a moment of temporary fury of a faithful prince by his master Tsar Ivan the Terrible. M. E. Saltykov (*q.v.;* 1826–89), a prominent satirist, also belongs to this generation of writers.

In poetry, the conflict between westernizers and Slavophils was to some extent paralleled in the latter half of the century by one between aesthetes or "art for art's sake" poets and those who sought to make their work have primary social relevance. Of these aesthetes, or poets in the stricter sense. the greatest was A. A. Fet or Foeth (*q.v.;* 1820–92). His conservative ways of thought and his following of the poet's craft, often far away from the lives of the people, produced an excellence of form and sometimes a serene tranquillity which offended many of the revolutionary intelligentsia. Yet he could write love lyrics at times as moving as those of Tyutchev. Even in the period of poetic decline, when Fet was long silenced by adverse criticism, the song held its own; so that a now almost forgotten poet like Dimitry N. Sadovnikov (1846–83) could write the balladlike poem on the 18th-century Cossack rebel "Stenka Razin" which has never ceased to be overwhelmingly popular and to be sung in Russia among all types of people.

During this century much of the poetry appeared first in literary periodicals or miscellanies, such as the famous Sovremennik (the

Contemporary), first edited by Pushkin and later resuscitated by Nekrasov. This method of publication enabled some of the more philosophical poetry to appear. There was a strong tendency to express philosophic doubts and beliefs in verse. Tyutchev's nature poems are at times a reminder of Lucretius, and Khomyakov was often more a philosophic theologian than a poet. Beside the personal lyric of love and subjective emotion there thus developed types of short poems of philosophic meditation called *dumy*. This poetry of thought was a parallel to the realistic poetry of life.

In the last decade of the century there began something like a renaissance in Russian poetry with the coming of the Symbolists, followed by minor movements such as the Imaginist, Acmeist and Futurist. With these searchings for a new poetry and the resultant creative experiments came many poets who lived on into the 20th century; and some of those who soon followed, such as Boris Pasternak and Vyacheslav Ivanov, continued to write long after the results of the October Revolution had become settled. Indeed the period between the accession of Tsar Nicholas II in 1894 and the revolution of 1917 was one of a creative strength and variety comparable in several respects with the Golden Age. This poetic renaissance continued to show outstanding results well into the postrevolutionary period.

The decline to mere popular versifying of sentimental nostalgia or the like. represented by successful poets such as Semen Nadson (1862–87) and Aleksey Apukhtin (1841–93), was relieved in the years before this revival by only two things: first, the humorous and nonsense verse inaugurated by Count Aleksey Tolstoy with the creation of his imaginary comic literary author Kuzma Prutkov. followed by the brilliant occasional light versifying of Soloviev; and, second, some reflective or philosophical religious poetry of which the mystical poems of Soloviev were again the best exemplars. In this time of weakened poetic creativeness and lowered intellectual vitality which was to herald the renaissance, Vladimir Soloviev (*q.v.;* 1853–1900), as thinker. literary humorist and poet, was the most permanently important Russian writer. It was to some extent the force of his Neoplatonic visionary poetry which gave tone and vitality to the Symbolists, notably Blok, who now suddenly gave a new life to Russian poetry. Philosophers were turning in dissatisfaction from materialism and artists from mere imitation to the recovery of past values of sheer beauty and at the same time the freeing of the artist to be frankly modern. In poetry, whose revival was closely linked with that of painting, the Symbolist movement, led by Konstantin (Constantine) Balmont (1867–1943) and Valeri Yakovlevich Bryusov (1873–1924) (*qq.v.*), sought to use all that seemed best in the French Symbolists and visionary or fantastic English poets to find a new technique and a new meaning and aim for Russian poetry. Balmont's first poems and Bryusov's pioneer collection *The Russian Symbolists* both appeared in 1893; there followed a series of outstanding poets and poetic impulses which in some measure retained their vitality for some time after the October Revolution. both in Russia and among poets in exile.

But the greatest Russian poet of this Symbolist renaissance was undoubtedly Alcksandr (Alexander) Blok (*q.v.;* ISSO–1921). His mystical experiences carried him at his best into a poetry in which inspiration and form fused in a way unmatched since the days of Tyutchev. His poem "The Twelve." which symbolically celebrates in the guise of vivid realism the first flush of the 1917 Revolution. somehow combines rhythmical genius with the language of the people in a realistic picture of revolutionary soldiers who yet have symbolic significance related to a mystical vision. This truly great poem was written in 1918. and with it the period of modern Russian prerevolutionary poetry may be said to close.

One of the poets who began work at this time, at first as a Futurist, was Vladimir Mayakovsky (1893–1930), who was to become the idol of the Communist Revolution and its official poetic exponent. Another, perhaps the most profound and intellectually and spiritually developed of the Symbolists. was Vyacheslav Ivanov (1866–1949), who continued to write in Rome (though some of his best work remained unpublished till after his death). But Boris Pasternak (1890–1960) began as a Futurist, absorbed all that was best in the various movements, and had produced outstanding poetry by the time the Revolution began. Alone among the greater poets he remained in Russia, though after 1932 his published work was largely restricted to translations. With Pasternak. as with Anna Akhmatova. who also remained in Russia. there is an overlap between the prerevolutionary and the postrevolutionary periods.

Prose.—The period under review, which had begun with Krylov, included Pushkin and Tyutchev and ended with Blok. could not but be reckoned a great poetical age. But it was also the great age of the Russian novel. Partly because of the relative untranslatability of poetry and the far greater effectiveness and accessibility of translated novels, it is inevitable that to the world in general the period is primarily that of the great Russian novelists. Moreover the influence of novelists whose work has had world significance, such as Gogol. Turghenyev, Tolstoy, Dostoyevsky and Gorky, has been an intellectual and spiritual force in European literature in a way that that of even the greatest of poets could never be. At the same time a period which produced political. social and philosophical thinkers writing in prose. such as Vissarion Belinsky (*q.v.;* 1811–48), Aleksander (Alexander) Herzen (*q.v.;* 1812–70), Khomyakov, Dmitri hlerezhkovsky (*q.v.;* 1865–1941), Ivan Bunin (*q.v.;* 1870–1953), who in 1933 was awarded the Nobel prize for literature, Leonid Andreyev (1871–1919) and Mikhail Artsybashev (1878–1927) could not but be one in which Russian literature in a wider sense became an outstanding influence in the development of world thought.

Whereas, however, the work of intellectual journalists and political thinkers belongs rather to the history of thought than to that of literature proper, this period is rightly regarded as that in which the Russian realist novel flourished and became a world force. Many writers, such as Turghenyev and Merezhkovsky, wrote verse as well as prose; and indeed it was not uncommon for writers to try their hands at all types of literature and journalism before finding their true *métier*. But the fact remains that in this period Russia in several respects led the world in the novel, despite phases of relative decline such as the wave of pessimism and reaction which followed the assassination of Tsar Alexander II in 1881.

This was also the great age of the Russian short story. Both the poets Pushkin and Lermontov had written masterly tales which might well be regarded as short novels. respectively in *The* Captain's *Daughter* and A Hero of *Our* Time (this latter consisting of five tales or episodes all interconnected to produce an unforgettable picture of Pechorin who is one of the great Russian psychological masterpieces). This was in 1840. Within little more than two years Nikolai Gogol (*q.v.;* 1809–52) had published his Dead *Souls* (*Mertviya dushi*), the first and only complete part of his long satirical prose epic (*poema* as he called it). This set of caricatures of Russian provincial types, reminding the reader in some ways of both Dickens and Ben Jonson, together with Gogol's short stories. made him the first Russian prose writer to have a delighted and influenced public outside his own country. In 1857 Ivan Goncharov (*q.v.;* 1812–91) published his *Oblomov,* which is a study of a type of the "superfluous man" of a declining gentry class, whose devastating realism blended with imaginative sympathy has caused the Russian language to adopt the word *oblomovshchina* to connote this group of immediately recognizable qualities.

In the development of the novel and of its influence outside Russia. Ivan Turghenyev (1818–83) (see TURGENEV, IVAN SERGEYEVICH) stands apart for his unique sense of form and construction, somewhat French in quality. combining a genuine "Russianness" with a European appeal in his characterization and descriptions. His group of tales *A Sportsman's* Sketches (1852) was followed by A Nest of Gentlefolk (1858) and by Fathers and Sons (1862), in which the classical nihilist hero Bazarov makes his appearance. He continued to write outstanding novels and to produce short stories and plays. Absence of a sense of form and construction is characteristic of most Russian novels, so that Turghenyev is in a special sense classical.

Tolstoy and Dostoyevsky, however, are by far the most valued and influential novelists of their period. Each has been a dynamic force in the history of thought as well as in literature of world-

wide significance. Count Lyev Nikolayevich Tolstoy (*q.v.; 1828–1910*) completed his two great novels *War and Peace* and *Anna Karenina*, respectively, in 1869 and 1877. *War and Pence* combines the highest art with social realism and a philosophy of history in a way mhich has made it the world's masterpiece of its kind; *Anna Karenina*, less vast in size, is found by many to he even more readable if less profound. Tolstoy's *Diaries* and his *Confession* enable the reader to follow the development of his innermost mind. Fyodor Dostoyevsky *(1821–81) (see* DOSTOEVSKI, FEDOR MIKHAILOVICH) was the master of the compelling presentation of psychological — often psychopathic — types. who could "get inside" the human mind in its moments of crisis as no other novelist has done. He was a Slavophil. as contrasted with Turghenyev who was for long the literary leader of the westernizers. He was a religious thinker and prophet, while Turghenyev studied social types and problems without plumbing their philosophic implications. Dostoyevsky's greatest novels were *Crime and Punishment* (1866), *The Idiot* (completed *1869*). *The Possessed (Byesy) (1871)* and *The Brothers Karamazov (1880)*.

Anton Chekhov (*q.v.;* 1860–1904) is perhaps to be regarded as a master of short stories and a dramatist rather than a novelist. His pictures of Russian life combine a meticulous exactness with an art which conceals the labour of the task. Some have even thought that his work as an influence, both within and outside Russia, has been as important as that of Tolstoy and Dostoyevsky.

Maxim Gorky (*q.v.;* 1868–1936) is a short-story writer. novelist and dramatist who, like Boris Pasternak in poetry, bridges the October Revolution. though. unlike Pasternak, he became in his later years the recognized literary lender of the Soviet Union. His descriptions of the very lowest and most suffering human beings. and his immense vitality and confidence in the ultimate triumph of revolutionary Socialism made him the pioneer of that "Socialist Realism" which has been the aim of all officially acceptable Soviet literature. But his literary gifts in themselves were not enough to give him a high place and influence abroad. A natural bolshevik, he yet did much to maintain artistic standards and to encourage genuine literature after the Revolution. His *Creatures Who Have Been Human* (*Byvshiye Lyudi;* 1897), *Twenty-Six Men and a Girl* (1899) and *Mother* (1907) are among his most impressive nondramatic works. They bring the Russian peasant and industrial worker to life in a nay previously unparalleled. His autobiographical works, beginning with *Childhood* (1913), along with *Mother,* formed the material for most effective films after the Revolution. (*See* also NOVEL.)

Drama.—The literary drama proper begins with the one great play of Aleksander (.Alexander) Griboyedov (*q.v.; 1795–1829*), whose *The Mischief of Being Clever (Gore ot uma)* became public in *182j*. It is a Molièresque comedy in a rhymed irregular metre reminiscent of that of some of Krylov's *Fables*, and while brilliantly witty in dialogue, it is also lively in its characterization. It has become almost a'collection of sources for quotations. Several novelists were also playwrights. but the only great novelist (apart from Gogol) who also did outstanding work for the stage was Turghenyev. whose *A Month in the Country* (1850) has rightly achieved European popularity in translation as an example of psychological insight controlled by a sense of form and subtle comic play of personalities. But till the Moscow Art theatre which he did so much to inspire brought Chekhov to the fore. the theatre was dominated by Aleksander (Alexander) Ostrovsky (*q.v.;* 1823–86), who wrote many successful plays, mostly in prose, satirizing the middle classes and the still unwesternized merchants, in such vividly realistic if less well-formed plays as *The Bankrupt* (1850) and *The Poor Bride* (1852). Gogol's one brilliant dramatic masterpiece. *The Government Inspector* (*Revizor*), stands quite by itself in its appeal alike to Russia and Europe. It shows the best qualities of his *Dead Souls* dramatized, and. along with certain of Chekhov's plays, has retained universal popularity.

Chekhov's *The Seagull* (*Chayka*) was triumphantly acted under the great Stanislavsky at the then new Moscow Art theatre in *1898*, and there followed under the same production in quick succession *Uncle Vanya, The Three Sisters* and *The Cherry Orchard.* Though the meaning of Chekhov's plays is often in dispute, their profound and subtle reality and theatrical craftsmanship never are. With Chekhov's death in 1904 the great age of the Russian drama came to an end. though the theatre continued to grow in popularity and plays to be written successfully. (*See* also THEATRE: *20th Century: G.S.S.K.)*

POSTREVOLUTIONARY LITERATURE

A good deal of writing mhich carried on existing trends went on for some time in Russia after the Revolution, though some distinguished writers, such as Vyacheslav Ivanov, continued only as *emigrés.* Some outstanding authors, such as Maxim Gorky and Vladimir Mayakovsky, wrote to aid the Soviet regime, while others, such as Boris Pasternak and Anna Akhmatova, either sought to retain their artistic integrity by developing their personal qualities in comparative isolation from state "Socialist Realism" or ceased to produce almost entirely. But the dissolution of the Russian Association of Proletarian Writers (R.A.P.P.) in 1932, and the formation of the state-controlled Union of Soviet Writers in 1934, followed by the death of Gorky in *1936,* with the rigorous subordination of art to the needs of Marxism-Leninism under Stalin, made for uniformity and creative sterility. In general it may be said that all forms of literature after Gorky's death tended to be primarily subordinated to the needs of the Soviet state for reconstruction, patriotism and the "struggle for peace," and most of even the more impressive works deliberately served these ends.

Mayakovsky had a vigour and command of proletarian language combined with real poetic sensitiveness which Pasternak was among the first to recognize. But the tension between his unconscious artistic self and his need to support the Revolution as a kind of poet laureate of bolshevism finally led to his suicide. Somewhat similarly ended the young peasant lyric imaginist Yesenin and the *emigrée* poetess Marina Tsvetayeva (1892–1941). Anna Akhmatova, whose intense and profound lyrics of love and personal feeling were outstanding in the early days of the Revolution. afterward wrote only rarely for publication; and indeed subjective lyric poetry was strongly deprecated in Russia till the needs of the "Great Patriotic War" of 1941–45 brought back the lyric and song — at least in popular form, with such graceful and often moving poems as the war songs of Konstantin Simonov *(1915–*). Simonov illustrates. along with Ilya Ehrenburg (1891–), the really talented poet and man of letters who has turned his pen to whatever the needs of the state happened to be — novels, plays, films, poems or essays came with equal competence from their hands, though neither ever showed clear creative genius.

In the novel, the best work has continued with developments of the historical romance, which had first come to Russia through the influence of Scott and had found its earliest masterpiece in Pushkin's *The Captain's Daughter.* Mikhail Sholokhov (1905–) and Aleksey Nikolayevich Tolstoy (1882–1945) wrote historical novels of real merit in their respective masterpieces, *And Quiet Flows the Don* (*Tikhy Don*) and *Peter the First.* There were scarcely any plays of genius. yet often quite effective political dramas. such as Gorky's *Yegor Bulichev* against bourgeois capitalism and Simonov's *The Russian Question* (*Russky vopros*) against U.S. capitalist newspapers. Novelists and playwrights and poets sought to express the new Soviet hero of factory and collective farm. But one valuable feature of Soviet literary practice was its keen encouragement of poetry for the people, not merely in the writing of verses to stimulate the masses, but in the deliberate and highly successful popularization of the Russian classics. Pushkin and Chekhov found noble and scholarly editions but also cheap reprints which were bought by the million; and factory workers listened to university teachers on the literature of the Golden Age. Folklore was encouraged too, and it is to be remembered that the Russians had never lost that popular receptiveness of poetry which has almost disappeared from western Europe.

Boris Pasternak *(1890–1960)* remained the greatest and at once the most truly European and truly Russian of contemporary poets. He excelled in a subtly fantastic poetic prose in his *Tales (Rasskazy)* and in the autobiographic fragment of his *Safe Conduct* (*Okhrannaya Gramota)* with its moving account of the discovery

of the suicide of hlayakovsky, but perhaps even more in the analytical psychological insight into a young girl's mind seen in his *The Childhood of Lyuvers.* As a poet. despite some eccentricities of vocabulary caused by his early association with the Futurists and his intense seeking after the right tone of music (he was the son of a painter and a musician). he carried on the traditions of Pushkin and Lermontov in original imaginative n-ays and covered all the assimilated European movements. He has been compared in varying ways with T. S. Eliot, with John Donne and with R. M. Rilke. but he is in fact *sui generis.* As a translator. he did the best versions of some of Shakespeare's plays in Russian, as well as of *Faust.* Though he may miss some of the humour of Shakespeare. in tragic passages he makes the reader or audience feel that here (in *Hamlet* for instance) a great poet is rendering great poetry. Pasternak wrote a small amount of war poetry in which he simply shared the patriotism of the hour. and his little volume of 1945. *Earth's Spaciousness* (*Zemnoy* prostor), shows his simpler manner at its best.

The Soviet government greatly encouraged the study of the art of translation, and others. such as Samuil Marshak (1887-), translated foreign poetry with a poet's inner exactness, as may be seen in Marshak's versions of *English Songs and Ballads,* his Shakespeare's Sonnets and his Burns. Marshak. like Pasternak. also did well in some of his prose, notably in children'a fairy tales. Soviet Russian literature by the 1950s had become very consciously national, with deliberate searching after the literary expression of the mind of the people in *narodnost* and often markedly isolationist tendencies. Its greatest writers were not representative. nor had the quantity of literature of permanent artistic merit been great. Yet it had been regaining some of the old Russian virtues after a time'of sheer didacticism, and a renascence of creative work did not seem impossible. In 1943 Pasternak wrote:

To drramer and to midnight wanderer
Moscow is dearer than the whole wide world:
There he's at home, and at the primal source
Of all with which the century shall flower

RUSSIAN SOVIET FEDERATED SOCIALIST REPUBLIC is the official name of Russia proper and of the largest member of the Union of Soviet Socialist Republics, extending from the Finnish frontier and the Baltic to the Bering sea and the Sea of Okhotsk. Originally this was the name of the whole state until it was officially changed on the basis of the agreement of Dec. 30, 1922, for the formation of the U.S.S.R. Thereafter its area changed many times. In 1923 it covered about 7,945,900 sq.mi. or 94.6% of the whole. Later it was successively reduced by the creation of the Uzbek and Turkmen republics in 1924, of the Tajik republic in 1929 and of the Kazakh and Kirghiz republics in 1936. On the eve of World War II the R.S.F.S.R. had an estimated area of 6,374,700 sq.mi. (*i.e.,* 77.3% of the U.S.S.R.); about 24% of the R.S.F.S.R. was then in Europe and the rest in Asia.

The total population of the R.S.F.S.R. was 93,457.996 in Dec. 1926 and 109,278,614 in Jan. 1939. The number of Russians in the R.S.F.S.R. revealed by these two censuses rose from 77,791,-124 (52.9% of the totalj to 99,019,929 (58.3% of the total). In 1926 the R.S.F.S.R. included 72,848,280 Russians who formed 78% of its total population; no similar data were published for 1939.

The annexations of 1939–45 and certain changes in the administrative divisions within the U.S.S.R. caused new variations in the area of the R.S.F.S.R. In 1940 it was further reduced when the Karelian X.S.S.R., with the area ceded by Finland. became the Karelo-Finnish S.S.R. In 1944 the Tannu Tuva People's Republic, formerly part of China, was included in the R.S.F.S.R. In 1945 the northern part of East Prussia, southern Sakhalin and the Kurile Islands were added to the R.S.F.S.R., while in 1946, when the Karachay Autonomous Region and the Chechen-Ingush A.S.S.R. were suppressed, parts of them were included in Georgia; finally, in 1954, the Crimea was "ceded" by Russia to the Ukraine. At that time the total area of the R.S.F.S.R. was 6,523,524 sq.mi., or 76% of the U.S.S.R. In Dec. 1953 a new region (*oblast*), Magadan, was formed from part of the Khabarovsk territory (*krai*); in Jan. 1954 five new *oblasts* (Arzamas, Balashov, Byelgorod, Lipetsk and Kamensk) were formed in European Russia by revising the boundaries of the existing ones. At that time the R.S.F.S.K. comprised 13 self-governing towns, 51 *oblasts,* 6 *krais,* 12 autonomous republics and 6 autonomous *oblasts.* On July 16. 1956, the Karelo-Finnish S.S.R. was re-established as the Karelian A.S.S.R. and incorporated into the R.S.F.S.R. This action. along with other annexations since 1940, increased the area to 6,592,812 sq.mi. by 1960.

According to the 1959 census, the total population was 117,534,315 of which 62,059,713 was urban.

Moscow was the capital of both the U.S.S.R. and the R.S.F.S.R. It was also the seat of two governments. the Soviet and the Russian. Many ministries existed in duplicate, one being Soviet and one Russian. There were, however, no Russian ministries of foreign affairs, of deiense. of internal affairs or of state security. Although the Russians constituted only slightly more than half the total population of the U.S.S.R., their strength within the Communist party of the Soviet Union was about three-quarters. (K. SM.)

RUSSIAN THISTLE, a common name applied especially to *Salsola* knli var. *tenuifolia,* a close relative of *Salsola* knli, the saltwort. which is also known as Russian thistle. Both plants are annuals of the goosefoot family, introduced from Eurasia, and are widespread along railway rights of way and in prairies and plains regions of the United States, forming bushy annuals that break off in the autumn to form tumbleweeds that may he carried long distances by wind, dropping seeds as they go. With good tillage and short rotations, however. they cause little damage in field crops. (J. M. BL.)

RUSSKY, NIKOLAI (1854–1918), Russian general, was educated at the infantry military school in St. Petersburg, graduated from the academy of the general staff in 1881, and by 1896 had reached general's rank. During the war with Japan (1904–oj) he was the head of the staff of the 2nd army. and planned the offensive carried out by General Grippenberg which led to the prematurely abandoned offensive of Sandepu. In 1914 he commanded the 3rd army. which attacked in Galicia and advanced to Lvov (Lemberg), through which it passed in the further advance to the San-Dniester line. The dramatic entry of the 3rd army into Lvov created for General Russky a prestige out of proportion to the real importance of his success. In Oct. 1914 he was appointed commander in chief of the northwestern and afterward of the northern armies. He continued to hold the command in spite of ill health, and it was at his headquarters that the final scenes of Nicholas II's reign and his abdication took place in March 1917. Soon after the Revolution General Russky retired, and in 1918 he was reported killed by the Bolsheviks.

RUSSO-JAPANESE WAR (1904–05). The seizure by Russia of the Chinese fortress of Port Arthur, which it had a few years previously, in concert with other powers, compelled Japan to relinquish, was from the Russian point of view the logical outcome of its eastward expansion and its need for an ice-free harbour on the Pacific. The extension of the Trans-Siberian railway through Manchuria to Port Arthur and a large measure of influence in Manchuria followed equally naturally. But the whole course of this expansion had been watched with suspicion by Japan, from the time of the Sakhalin incident of 1875—when the island power, then barely emerging from the feudal age, had to cede its half of the island to Russia—to the Shimonoseki treaty of 1895, when the powers compelled it to forego the profits of its victory over China. The subsequent occupation of Port Arthur and other Chinese harbours by European powers, and the evident intention of consolidating Russian influence in Manchuria, were again and again the subject of Japanese representations at St. Petersburg (Leningrad), and these representations became more vigorous when, in 1903, Russia seemed to be about to extend its Manchurian policy into Korea. No less than ten draft treaties were discussed in vain between Aug. 1903 and Feb. 1904, and finally negotiations were broken off on Feb. 5.[1] By the fourth negotiation Japan had decided to use force, and its military and naval preparations kept pace with its diplomacy.

This was in fact an eventuality which had been foreseen and on which the naval and military policy of Japan had been based for ten years. It, too, had its projects of expansion and hegemony, and by the Chino-Japanese War it had gained a start over its rival. The reply of the western powers was first to compel the victor to maintain the territorial integrity of China, and then within two years to establish itself in Chinese harbours. From that moment Japanese policy was directed toward establishing its own hegemony and meeting the advance of Russia with a *fait accompli*. But its armaments were not then adequate to give effect to a strong-handed policy, so that for some years thereafter the government had both to impose heavy burdens on the people and to pursue a foreign policy of marking time, and endured the fiercest criticism on both counts, for the idea of war with Russia was as popular as the taxes necessary to that object were detested. But as the army and the navy grew year by year, the tone of Japanese policy became firmer. In 1902 its position was strengthened by the alliance with England; in 1903 its army, though in the event it proved almost too small, was considered by the military authorities as sufficiently large and well prepared, and the arguments of the Japanese diplomatists stiffened with menaces. Russia, on the other hand, was divided in policy and consequently in military intentions and preparations. In some quarters the force of the new Japanese army was well understood, and the estimates of the balance of military power formed by the Russian minister of war, Alexei Kuropatkin, coincided so remarkably with the facts that at the end of the summer of 1903 he saw that the moment had come when the preponderance was on the side of the Japanese. He therefore proposed to abandon Russian projects in southern Manchuria and the Port Arthur region and to restore Port Arthur to China in return for considerable concessions on the side of Vladivostok.

His plan was accepted, but "a lateral influence suddenly made itself felt, and the completely unexpected result was war." Large commercial interests were in fact involved in the forward policy, "the period of heavy capital expenditure was over, that of profits about to commence," and the power and intentions of Japan were ignored or misunderstood. Thus Russia entered upon the war unprepared in a military sense. To the guards and patrols of the Manchurian railway and the garrisons of Port Arthur and Vladivostok, 80,000 in all, Japan could, in consequence of her recruiting law of 1896, oppose a first-line army of about 270,000 trained men. Behind these, however, there were scarcely 200,000 trained men of the older classes, and at the other end of the long Trans-Siberian railway Russia had almost limitless resources.[2] The strategical problem for Japan was how to strike a blow sufficiently decisive to secure its object before the then insignificant forces of the East Siberian army were augmented to the point of being unassailable. It turned, therefore, principally upon the efficiency of the Trans-Siberian railway and in calculating this the Japanese made a serious underestimate. In consequence, far from applying the "universal service" principle to its full extent. they trained only one-fifth of the annual contingent of men found fit for service. The quality of the army, thus composed of picked men (a point which is often forgotten), approximated to that of a professional force; but this policy had the result that. since there was no adequate second-line army, parts of the first-line had to be reserved, instead of being employed at the front. And when for want of these active troops the first great victory proved indecisive, half-trained elements had to be sent to the front in considerable numbers—indeed, the ration strength of the army was actually trebled.

Objects of Japanese Attack.—The aim of the war, "limited" in so far that the Japanese never deluded themselves with dreams of attacking Russia at home, was to win such victories as would establish the integrity of Japan itself and place its hegemony in the far east beyond challenge. Now the integrity of Japan was worth little if the Russians could hope ultimately to invade it in superior force, and since Port Arthur was the station of the fleet that might convoy an invasion, as well as the symbol of the longed-for hegemony, the fortress was necessarily the army's first objective, a convincing Sedan was the next. For the navy, which had materially only a narrow margin of superiority over the Russian Pacific squadron, the object was to keep the two halves of that squadron at Port Arthur and Vladivostok respectively separate and to destroy them in detail. But in February weather these objects could not be pursued simultaneously. Prior to the breakup of the ice, the army could disembark only at Chemulpo, far from the objective, or at Dalny under the very eyes of its defenders. The army could therefore, for the moment, occupy only Korea and try to draw upon itself hostile forces that would otherwise be available to assist Port Arthur when the land attack opened. For the navy, instant action was imperative.

On Feb. 8, the main battle fleet, commanded by Vice-Adm. Heihachiro Togo, was on the way to Port Arthur. During the night his torpedo boats surprised the Russian squadron in the harbour and inflicted serious losses, and later in the day the battleships engaged the coast batteries. Repulsed in this attempt, the Japanese established a stringent blockade, which tried the endurance of the ships and the men to the utmost. From time to time the torpedo craft tried to run in past the batteries, attempts were made to block the harbour entrance by sinking vessels in the fairway and free and deadly use was made by both sides of submarine mines. Though not destroyed, the Port Arthur squadron was paralyzed by the instantaneous assertion of naval superiority.

Alexeiev and **Makárov.**—Adm. Evgeni Alexeiev, the tsar's viceroy in the far east and the evil genius of the war, was at Port Arthur and forbade the navy to take the risks of proceeding to sea.[3] For a time, when, in place of Admiral Starck (who was held responsible for the surprise of February), Adm. Stepan Makárov, an officer of European reputation, commanded the fleet, this lethargy was shaken off. The new commander took his ships to sea every day. But his energetic leadership was soon ended by a tragedy. A field of electromechanical mines was laid by the Japanese in the night of April 12–13, and on the following day the Japanese cruisers stood inshore to tempt the enemy on to the mine field. Makárov. however, crossed it without accident, and pursued the cruisers until Togo's battle fleet appeared, whereupon he went about and steamed for port. In doing so he recrossed the mine field, and this time the mines were effectual. The flagship "Petropavlovsk" was struck and went down with the admiral and 600 men, and another battleship was seriously injured. Then the advocates of passivity regained the upper hand and kept the squadron in the harbour, and henceforward for many months the Japanese navy lay unchallenged off Port Arthur, engaging in minor oper-

[1] Belated declarations of war appeared on Feb. 10.

[2] The total Russian army on a peace footing was almost 1,000,000 strong.

[3] A vivid picture of the state of affairs in the navy at this period is given in Semenov's Rasplata (Eng. trans.).

ations, covering the transport of troops to the mainland, and watching for the moment when the advance of the army should force the Russian fleet to come out. Meantime seven Japanese cruisers under Vice-Admiral Kamimura went in search of the Russian Vladivostok squadron; this, however, evaded them for some months, and inflicted some damage on the Japanese mercantile marine and transports.

Landing of Japanese 1st Army.—The Japanese had not waited to gain command of the sea before beginning the sea transport of that part of their troops allotted to Korea. The roads of that country were so poor that the landing had to be made not on the straits of Tsushima, but as far north as possible. Chemulpho, nearer by 50m. to Port Arthur than to Japan, was selected. On the first day of hostilities Rear-Admiral Uriu disembarked troops at Chemulpho under the eyes of the Russian cruiser "Variag," and next day he attacked and destroyed the "Variag" and some smaller war-vessels in the harbour, and the rest of the 1st Army (Gen. Kuroki) was gradually brought over during February and March in spite of an unbeaten and, under Makbrov's régime, an enterprising hostile navy. But owing to the thaw and the subsequent break-up of the miserable Korean roads, six weeks passed before the columns of the army (Guard, 2nd and 12th Divisions), strung out along the "Mandarin road" to a total depth of six days' march, closed upon the head at Wiju, the frontier town on the Yalu. Opposite to them they found a large Russian force of all arms.

The Russian commanders, at this stage at least, had not and could not have any definite objective. Both by sea and by land their policy was to mass their resources, repulsing meantime the attacks of the Japanese with as much damage to the enemy and as little to themselves as possible. Their strategy was to gain time without immobilizing themselves so far that the Japanese could impose a decisive action at the moment that suited them best. Both by sea and by land such strategy was an exceedingly difficult game to play. But afloat, had Makárov survived, it would have been played to the end, and Togo's fleet would have been steadily used up. One day, indeed (May 15), two of Japan's largest battleships, the "Hatsuse" and the "Yashima," came in contact with free mines and were sunk. One of them went to the bottom with 500 souls. But the admiral was not on board. The Russian sailors said, when Makárov's fate was made known, "It is not the loss of a battleship. The Japanese are welcome to two of them. It is *he.*" Not only the skill, but the force of character required for playing with fire was wanting to Makárov's successors.

Plans of **Kuropatkin.**—It was much the same on land. Kuropatkin, who had taken command of the army, saw from the first that he would have to gain three months, and disposed his forces as they came on the scene, unit by unit, in perfect accord with the necessities of the case. His expressed intention was to fight no battle until superiority in numbers was on his side. He could have gained his respite by concentrating at Harbin or even at Moukden or at Liao-Yang. But he had to reckon with the fleet[1] at Port Arthur. He knew that the defences of that place were defective, and that if the fleet were destroyed whilst that of Togo kept the sea there would be no Russian offensive. He therefore chose Liao-Yang as the point of concentration, and having thus to gain time by force instead of by distance he pushed out a strong covering detachment towards the Yalu. But little by little he succumbed to his *milieu,* the atmosphere of false confidence and passivity created around him by Alexeiev. After he had minutely arranged the eastern detachment in a series of rearguard positions, so that each fraction of it could contribute a little to the game of delaying the enemy before retiring on the positions next in rear, the commander of the detachment, Zasulich, told him that "it was not the custom of a knight of the Order of St. George to retreat," and Kuropatkin did not use hisauthority to recall the general, who, whether competent or not, obviously misunderstood his mission. Thus, whilst the detachment was still disposed as a series of rearguards, the foremost fractions of it stood to fight on the Yalu, against odds of four to one.

[1]Not, as is often assumed, the fortress **itself.**

Battle of the **Yalu.**—The Japanese 1st Army was carefully concealed about Wiju until it was ready to strike. Determined that in this first battle against a white nation they would show their mettle, the Japanese lavished both time and forethought on the minutest preparations. Forethought was still busy when, in accordance with instructions from Tokio, Kuroki on April 30 ordered the attack to begin at daybreak on May 1. For several miles above Antung the rivers Yalu and Aiho are parallel and connected by numerous channels. The majority of the islands thus formed were held and had been bridged by the Japanese. The points of passage were commanded by high ground a little farther up where the valleys definitely diverge, and beyond the flank of the ill-concealed positions of the defence. The first task of the right division (12th) was to cross the upper Yalu and seize this. To the Guard and 2nd Divisions was assigned the frontal attack on the Chiuliencheng position, where the Russians had about one-half of their forces under Maj.-Gen. Kashtalinski. On April 30, Inouye's 12th Division accomplished its task of clearing the high ground up to the Aiho. The Russians, though well aware that the force in their front was an army, neither retired nor concentrated. Zasulich's mediaeval generalship had been modified so far that he intended to retreat when he had taught the Japanese a lesson, and therefore Kuropatkin's original arrangements were not sensibly modified. So it came about that the combined attack of the 2nd and Guard Divisions against the front, and Inouye on the left flank and rear, found Kashtalinski without support. After a rather ineffective artillery bombardment the Japanese advanced in full force, without hesitation or finesse, and plunging into the river stormed forward under a heavy fire. A few moments afterwards Zasulich ordered the retreat. But the pressure was far too close now. Broken up by superior numbers the Russian line parted into groups, each of which, after resisting bravely for a time, was driven back. Then the frontal attack stopped and both divisions abandoned themselves to the intoxication of victory. Meanwhile, the right attack (12th Division) encountering no very serious resistance, crossed the Aiho and began to move on the left rear of the Russians. On the side of the defence, each colonel had been left to retire as best he could, and thus certain fractions of the retreating Russians encountered Inouye's advancing troops and were destroyed after a most gallant resistance. The rearguard itself, at Hamatan, was almost entirely sacrificed, owing to the wrong direction taken in retreating by its left flankguard. Fresh attempts were made by subordinates to form rearguards, but Zasulich made no stand even at Fêng-hwang-chêng, and the Japanese occupied that town unopposed on May 5. The Japanese losses were 1,100 out of over 40,000 present, the Russian (chiefly in the retreat) at least 2,500 out of some 7,000 engaged.

The Yalu, like Valmy, was a moment in the world's history. It mattered little that the Russians had escaped or that they had been in inferior numbers. The serious fact was that they had been beaten.

Distribution of Russian Forces.—The general distribution of the Russian forces was now as follows: The main army under Kuropatkin was forming, by successive brigades, in two groups—1st Siberian Corps (Stakelberg), Niu-chwang and Kaiping; 2nd Siberian Corps, Liao-Yang. Zasulich (3rd Corps and various other units) had still 21,000. In the Port Arthur "fortified rayon," under Lieut.-Gen. Stössel (4th Corps), were 27,000 men, and Gen. Linievich around Vladivostok had 23,000. These are, however, paper strengths only, and the actual number for duty cannot have been higher than 110,000 in all. The Trans-Siberian railway was the only line of communication with Europe and western Siberia, and its calculated output of men was 40,000 a month in the summer. In October 1904, therefore, supposing the Japanese to have used part of their forces against Port Arthur, and setting this off against the absence of Linievich and Stossel, Kuropatkin could expect to have a sufficient superiority in numbers to take the offensive. His policy was still, "No battle before we are in superior force."

Landing of Japanese 2nd Army.—For the moment it was equally Japan's interest to mark time in Manchuria. Still intent upon the Russian Port Arthur squadron, she had embarked her

2nd Army (Gen. Oku, 1st, 3rd, 4th and 5th Divisions) during April, and sent it to Chinampo whence, as soon as the ice melted and Kuroki's victory cleared the air, it sailed to the selected landing-place near Pitszewo. Here, under the protection of a continuous chain of war-vessels between the Elliot islands and the mainland, Oku began to disembark on May 5. But the difficulties of the coast were such that it took three weeks to disembark the whole and to extend across the peninsula to Port Adams. Oku then, leaving the 5th Division behind, moved down with the rest towards Kinchow, and after storming that place found himself face to face with a position of enormous strength, Nanshan hill, at the narrowest part of the peninsula, where part of a Russian division (3,000 only out of 12,000 were actually engaged) had fortified itself with extreme care. On May 26 took place the battle of Nanshan. The Japanese attack was convergent, but there was no room for envelopment; the Russian position moreover was "all-round" and presented no flanks, and except for the enfilade fire of the Japanese and Russian gunboats in the shallow bays on either side the battle was locally at every point a frontal attack and defence. The first rush of the assailants carried them up to the wire and other obstacles, but they were for many hours unable to advance a step farther. But the resolute Oku attacked time after time, and at last the 4th Division, on his right, assisted by its gunboats, forced its way into the Russian position. The Russians had just begun to retreat, in accordance with orders from higher authorities. But it was a second undeniable victory. It was, moreover, a preface to those furious assaults on Port Arthur which, because they were the expression of a need that every soldier felt, and not merely of a tactical method, transcend all cool-blooded criticism. The Japanese losses were 4,500 out of 30,000 engaged, or 15%, that of the Russians fully half of the 3,000 engaged. The victors captured many guns, but were too exhausted to pursue the Russians, whose retirement was not made in the best order.

The transports were now conveying the 6th and 11th Divisions to Pitszewo; these were to form the 3rd Army (Nogi) for operations against Port Arthur. Oku exchanged his 1st Division for the 6th. The 2nd Army then turned northward (3rd, 4th, 5th and 6th Divisions). The 10th Division, forming the nucleus of the 4th Army, had begun to land at Takusham on May 19. The 2nd and 4th Armies were the left wing of a widespread converging movement on Liao-Yang. Oku had the greatest distance to march, Kuroki the smallest. The latter therefore had to stand fast in the face of the Russian eastern detachment, which was three days' march at most from Fêng-hwang-chêng and could be supported in three more days by Kuropatkin's main body, whereas the pressure of Oku's advance would not begin to be felt by the Russian southern detachment until the twelfth day at earliest. It was necessary therefore for the first objective to make a slight concession to the second. Oku had to start at the earliest possible moment, even though operations against Port Arthur were thereby delayed for a week or two. In fact, Oku's march began on June 13, Kuroki's on June 24; the moves of the intermediate forces at various dates within this time.

Meanwhile Kuropatkin, assembling the main army week by week, was in a difficult position. His policy of gaining time had received a severe blow in the failure of his executive officer to realize it, and that officer, though his unpursued troops quickly regained their moral, had himself completely lost confidence. On the news of the battle (coupled with that of a fresh army appearing on the Korean coast)[1], Kuropatkin instantly sent off part of his embryo central mass to bar the mountain passes of Fenshuiling and Motienling against the imagined relentless pursuit of the victors, and prepared to shift his centre of concentration back to Moukden. The subsidiary protective forces on either flank of Zasulich had promptly abandoned their look-out positions and fallen back to join him. But the commander-in-chief, soon realizing that the Japanese were not pursuing, reasserted himself, sent the protective troops back to their posts, and cancelled all orders for the evacuation of Liao-Yang. From this time forward Kuropatkin allowed his subordinates little or no initiative. A few days later, Zasulich's persistent requests to be allowed to retreat and the still uncertain movements of the 2nd Army induced him once more to prepare a concentration on Moukden. But on May 6 he learned that the Japanese 1st Army had again halted at Fêng-hwang-chêng and that the 2nd Army was disembarking at Pitszewo, and he resumed (though less confidently) his original idea. The eastern protective detachment, now strengthened and placed under the orders of Count Keller, was disposed with a view to countering any advance on Liao-Yang from the east by a combination of manoeuvre and fighting.

[1]This was the 2nd Army, waiting in the port of Chinampo for the moment to sail for Pitszewo.

Alexeiev and Kuropatkin.—It was at this moment of doubt that Alexeiev, leaving Port Arthur just in time and profoundly impressed with the precarious state of affairs in the fleet and the fortress, gave the order, as commander-in-chief by land and sea, for an "active" policy (May 19). Kuropatkin, thus required to abandon his own plan, had only to choose between attacking the 1st Army and turning upon Oku. He did not yield at once; a second letter from the viceroy, the news of Nanshan, and above all a signed order from the tsar himself, "Inform General Kuropatkin that I impose upon him all the responsibility for the fate of Port Arthur," were needed to induce him to execute a scheme which in his heart he knew to be perilous. The path of duty for a general saddled with a plan which he disapproves is not easily discoverable. Napoleon in like case refused, at the risk of enforced resignation, and so did Moreau; the generality of lesser men have obeyed.

Stakelberg's 1st Siberian Corps was therefore reinforced towards the end of May up to a strength of above 35,000. But it remained a detachment only. The Liao-Yang central mass was still held in hand, for the landing of the 4th Army—really only a division at present—at Takushan and the wrong placing of another Japanese division supposed to be with Kuroki (really intended for Nogi) had aroused Kuropatkin's fears for the holding capacity of Keller's detachment. Moreover, disliking the whole enterprise, he was most unwilling to use up his army in it. The Russians, then, at the beginning of June, were divided into three groups, the southern, or offensive group (35,000), in the triangle Neuchwang-Haicheng-Kaiping; the eastern or defensive group (30,000), the main body of it guarding the passes right and left of the Wiju-Liao-Yang road, the left (Cossacks) in the roadless hills of the upper Aiho and Yalu valleys; the right (Mishchenko's Cossacks and infantry supports) guarding Fenshuiling pass and the road from Takushan; the reserve (42,000) with Kuropatkin at Liao-Yang; the "Ussuri Army" about Vladivostok; and Stössel's two divisions in the Kwantung peninsula.

On the other side the 1st Army was at Fêng-hwang-chêng with one brigade detached on the roads on either hand, the left being therefore in front of the Takushan division and facing the Fenshuiling. Oku's 2nd Army (four divisions or 60,000 combatants) was about Port Adams. This last was the objective of the attack of Stakelberg's 35,000. Kuropatkin's orders to his subordinate were a compromise between his own plan and Alexeiev's. Stakelberg was to crush by a rapid and energetic advance the covering forces of the enemy met with, and his object was "the capture of the Nanshan position and thereafter an advance on Port Arthur." Yet another object was given him, to "relieve the pressure on Port Arthur by drawing upon himself the bulk of the enemy's forces," and he was not to allow himself to be drawn into a decisive action against superior numbers. Lastly, on June 7, while Stakelberg was proceeding southward on his ill-defined errand, Kuropatkin, imposed upon by the advance of the Takushan column to Siu-yen, forbade him to concentrate to the front, only removing the veto when he learned that the 4th Army had halted and entrenched at Siu-yen.

Battle of Telissu.—On the 14th, all his arrangements for supply and transport being at last complete, Oku moved north. Although he was still short of part of the 6th Division, he was in superior force. He had, moreover, the perfectly definite purpose of fighting his way north, and at Telissu or Wafangkou on June 14, as he expected, he came upon Stakelberg's detachment in an entrenched position. On the 14th and 15th, attacking sharply on

the Russian front and lapping round both its flanks, Oku won an important and handsome victory, at a cost of 1,200 men out of 35,000 engaged, while the Russians, with a loss of at least 3,600 out of about 25,000 engaged, retired in disorder. Thus swiftly and disastrously ended the southern expedition. Meantime, except for the movement on Siu-yen already mentioned[1], and various reconnaissances in force by Keller's main body and by Rennenkampf's Cossacks farther inland, all was quiet along the Motienling front. Kuroki entrenched himself carefully about Fêng-hwang-chêng, intending, if attacked by the Russian main army, to defend to the last extremity the ground and the prestige gained on May 1.

From this point to the culmination of the advance at Liao-Yang, the situation of the Japanese closely resembles that of the Prussians in 1866. Haicheng represents Miinchengratz, Liao-Yang Gitschin, and the passes east of Liao-Yang Nachod and Trautenau. The concentration of the various Japanese armies on one battlefield was to be made, not along the circumference of the long arc they occupied, but towards the centre. Similarly, Kuropatkin was in the position of Benedek. He possessed the interior lines and the central reserve which enables interior lines to be utilized, and a stroke of good fortune prolonged the period in which he could command the situation, for on June 23 an unexpected sortie of the Russian Port Arthur squadron paralysed the Japanese land offensive. In the squadron were seen the battleships damaged in the February attacks, and the balance of force was now against Togo, who had lost the "Yashima" and the "Hatsuse." The squadron nevertheless, tamely returned to harbour, Togo resumed the blockade and Nogi began his advance from Nanshan, but the 2nd and 4th Armies came to a standstill at once (naval escort for their seaborne supplies being no longer available), and the 1st Army, whose turn to advance had just arrived, only pushed ahead a few miles to cover a larger supply area. On July 1 the Vladivostok squadron appeared in the Tsushima straits, and then vanished to an unknown destination, and whether this intensified the anxiety of the Japanese or not, it is the fact that the 2nd Army halted for 11 days at Kaiping, bringing the next on its right, 4th Army, to *a* standstill likewise. Its next advance brought it to the fortified position of Tashichiao, where Kuropatkin had, by drawing heavily upon his central reserve and even on the eastern detachment, massed about two army corps.

Tashichiao.—On the 24th Oku attacked, but the Russian general, Zarubayev, handled his troops very skilfully, and the Japanese were repulsed with a loss of 1,200 men. Zarubayev, who had used only about half his forces in the battle, nevertheless retired in the night, fearing to be cut off by a descent of the approaching 4th Army on Haicheng. and well content to have broken the spell of defeat. Oku renewed the attack next day, but found only a rearguard in front of him, and without following up the retiring Russians he again halted for six days before proceeding to Haicheng to effect a junction with the 4th Army (Nozu), which meantime had won a number of minor actions and forced the passage of the mountains at Fenshuiling South[2].

The 1st Army, after its long halt at Fêng-hwang-chêng, which was employed in minutely organizing the supply service—a task of exceptional difficulty in these roadless mountains—reopened the campaign on June 24, but only tentatively on account of the discouraging news from Port Arthur. A tremendous rainstorm imposed further delays, for the coolies and the native transport that had been laboriously collected scattered in all directions. The Motieniing pass, however, had been seized without difficulty,and Keller's power of counter-attack had been reduced to nothing by the dispatch of most of his forces to the concentration at Tashichiao. But Oku's 2nd Army was now at a standstill at Kaiping, and until he was further advanced the 1st Army could not press forward. The captured passe: were therefore fortified (as Fêng-hwang-chêng had been) for passive resistance. This, and the movements of the 4th Army, which had set its face towards Haicheng and no longer seemed to be part of a threat on Liao-Yang, led to the idea being entertained at Kuropatkin's headquarters that the centre of gravity was shifting to the south. To clear up the situation Keller's force was augmented and ordered to attack Kuroki. It was repulsed with a loss of nearly 1,000 men in the action at the Motienling (July 17), but it was at least ascertained that considerable forces were still on the Japanese right, and upon the arrival of a fresh army corps from Europe, Kuropatkin announced his intention of attacking Kuroki. And in effect he succeeded in concentrating the equivalent of an army corps, in addition to Keller's force, opposite to Kuroki's right. But having secured this advantage he stood still for five days, and Kuroki had ample time to make his arrangements. The Japanese general occupied some 20m. of front in two halves, separated by 6m. of impassable mountain, and knowing well the danger of a "cordon" defensive, he met the crisis in another and a bolder fashion. Calling in the brigade detached to the assistance of Nozu as well as all other available fractions of his scattered army, he himself attacked on July 31 all along the line. It was little more than an assertion of his will to conquer, but it was effectual. On his left wing the attacks of the Guard and 2nd Divisions (action of Yang-tzu-ling) on the Russian front and flank failed—the frontal attack because of the resolute defence, the flank attack from sheer fatigue of the troops. Count Keller was killed in the defence. Meantime on the Japanese right the 12th Division attacked the large bodies of troops that Kuropatkin had massed (Yu-shu-ling) equally in vain. But one marked success was achieved by the Japanese. The Russian 3jth and 36th Regiments (10th European Corps) were caught between two advancing columns, and, thanks to the initiative of one of the column leaders, Okasaki, destroyed. At night, discouraged on each wing by the fall of Count Keller and the fate of the 35th and 36th, the whole Russian force retired on Anping, with a loss of 2,400 to the Japanese 1,000 men.

Russian Retirement **on Liao-Yang.**—This was the only manifestation of the offensive spirit on Kuropatkin's part during the six months of marking time. It was for defence, sometimes partial and elastic, sometimes rigid and "at-all-costs," that he had made his dispositions throughout. His policy now was to retire on Liao-Yang as slowly as possible and to defend himself in a series of concentric prepared positions. In his orders for the battle around his stronghold there is no word of counter-attack, and his central mass, the special weapon of the commander-in-chief, he gave over to Bilderling and to Zarubayev to strengthen the defence in their respective sections or posted for theprotectionofhislineof retreat. Nevertheless he had every intention of delivering a heavy and decisive counterstroke when the right moment should come, and meantime his defensive tactics would certainly have full play on this prearranged battlefield with its elaborate redoubts, bomb-proofs and obstacles, and its garrison of a strength obviously equal (and in reality superior) to that of the assailants. The Japanese, too, had effected their object, and as they converged on their objective the inner flanks of the three armies had connected and the supreme commander Marshal Oyama had taken command of the whole. But instead of boldly pushing out the 1st Army to such a distance that it could manoeuvre, as Moltke did in 1866 and 1870, he attached it to the general line of battle. It was not in two or three powerful groups but in one long chain of seven deployed divisions that the advance was made.

Battle of **Liao-Yang.**—On Aug. 25 the 2nd and 4th Armies from Haicheng and the 1st Army from the Yin-tsu-ling and Yu-shu-ling began the last stage of their convergent advance. The Russian first position extended in a semicircle from Anshantien (on the Liao-Yang-Hai-cheng railway) into the hills at Anping, and thence to the Taitse river above Liao-Yang; both sides had mixed detachments farther out on the flanks. The first step in the Japanese plan was the advance of Kuroki's army to Anping. Throughout the 25th, night of the 25th-26th, and the 26th of August, Kuroki advanced, fighting heavily all along the line, until on the night of the 26th the defenders gave up the contested ground at Anping. Hitherto there had only been skirmishing on a

[1] The occupation of Siu-yen was chiefly the work of the brigade pushed out to his left by Kuroki. Only a portion of the 10th Division from Takushan helped to drive away Mishchenko's Cossacks.

[2] The 5th Division of the 2nd Army had been sent to join the 10th *as* the latter approached Hsimucheng. The Guard brigade of Kuroki's army which had served with Nozu in the advance had now returned to Fêng-hwang chêng.

large scale on the side of Hai-cheng. Kuropatkin having already drawn in his line of defence on the south side towards Liao-Yang, the 2nd and 4th Japanese Armies delivered what was practically a blow in the air. But on the 27th there was a marked change in the Japanese plan. The right of the 1st Army, when about to continue the advance west on Liao-Yang, was diverted northward by Oyama's orders and ordered to prepare to cross the Taitszeho. The retirement of the Russian southern force into its entrenchments emboldened the Japanese commander-in-chief to imitate Moltke's method to the full. On the 28th, however, the 1st Army made scarcely any progress. The right (12th) division reached the upper Taitszeho, but the divisions that were to come up on its left were held fast by their opponents. The 29th was an uneventful day, on which both sides prepared for the next phase.

The Russians' semicircle, now contracted, rested on the Taitszeho above and below the town, and their forces were massed most closely on either side of the "Mandarin" road that the 1st Army had followed. Opposite this portion of the line was the Guard and the 4th Army. Oku was astride the railway, Kuroki extending towards his proposed crossing-points just beyond Kuropatkin's extreme left (the latter was behind the river). On the 30th the attack was renewed. The Guard, the 4th Army and the 2nd Army were completely repulsed.

On the night of the 30th the first Japanese troops crossed the Taitszeho near Lien-Tao-Wun, and during the 31st three brigades were deployed north of Kwan-tun, facing west. The Russian left wing observed the movement all day, and within its limited local resources made dispositions to meet it. Kuropatkin's opportunity was now come The remainder of the Japanese and Division was following the 12th, leaving a nine-mile gap between Kuroki and Nozu, as well as the river It was not into this gap, but upon the isolated divisions of the 1st Army that the Russian general proposed to launch his counterstroke Reorganizing his southern defences on a shorter front, so as to regain possession of the reserves he had so liberally given away to his subordinates; he began to ccllect large bodies of troops opposite Kuroki, while Stakelberg and Zarubayev, before withdrawing silently into the lines or rather the fortress of Liao-Yang, again repulsed Oku's determined attacks on the south side. But it was not in confidence of victory that Kuropatkin began the execution of the new plan — rather as a desperate expedient to avoid being cut off by the 1st Army, whose strength he greatly overestimated

On the morning of Sept. 1—the anniversary of Sedan, as the Japanese officers told their men—Oyama, whose intentions the active Kuroki had somewhat outrun, delivered a last attack with the 2nd and 4th Armies and the Guard on the south front, in the hope of keeping the main body of the Russians occupied and so assisting Kuroki, but the assailants encountered no resistance, Zarubayev having already retired into the fortress. North of the Taitszeho the crisis was approaching. Kuroki's left, near the river, vigorously attacked a hill called Manjuyama which formed part of the line of defence of the 17th Corps from Europe. But the right of the 1st Army (12th Division) was threatened by the gathering storm of the counterstroke from the side of Yentai mines, and had it not been that the resolute Okasaki continued the attack on Manjuyama alone the Japanese offensive would have come to a standstill. Manjuyama, th'anks to the courage of the army commander and of a single brigadier, was at last carried after nightfall, and the dislodged Russians made two counter-attacks in the dark before they would acknowledge themselves beaten Next morning, when Kuroki (who had conceived the mistaken idea of a general retreat of the Russians on Mukden) was preparing to pursue, the storm broke. Kuropatkin had drawn together seven divisions on the left rear of the 17th Corps, the strength of the whole being about 90,000. On the extreme left was Orlov's brigade of all arms at Yentai mines, then came the 1st Siberian Corps (Stakelberg), the 10th Corps, and finally the 17th. But Orlov, perplexed by conflicting instructions and caught in an unfavourable situation by a brigade of the 12th Division which was executing the proposed "pursuit," gave way — part of his force in actual rout — and the cavalry that was with him was driven back by the Kobi (reserve army) brigade of the Guard. The fugitives of Orlov's command disordered the on-coming corps of Stakelberg, and the outer flank of the great counterstroke that was to have rolled up Kuroki's thin line came to an entire standstill. Meantime the 10th Corps furiously attacked Okasaki on the Manjuyama, and though its first assault drove in a portion of Okasaki's line, a second and a third, made in the night, failed to shake the constancy of the 15th Brigade Misunderstandings and movements at cross-purposes multiplied on the Russian side, and at midnight Kuropatkin at last obtained information of events on the side of Yentai mines. This was to the effect that Orlov was routed, Stakelberg's command much shaken, and at the same time Zarubayev in Liao-Yang, upon whom Oku and Nozu had pressed a last furious attack, reported that he had only a handful of troops still in reserve. Then Kuropatkin's resolution collapsed, although about three divisions were still intact, and he gave the order to retreat on Mukden

Russian Retreat on **Mukden.**—Thus the Japanese had won their great victory with inferior forces, thanks "in the first instance to the defeat of Gen. Orlov. But at least as large a share in the ruin of the Russian operations must be attributed to the steadfast gallantry of the 15th Brigade on Manjuyama." The losses of the Japanese totalled 23,000, those of the Russians 19,000. Coming, as it did, at a moment when the first attacks on Port Arthur had been repulsed with heavy losses, this successful climax of the four months' campaign more than restored the balance. But it was not the expected Sedan. Had the two divisions still kept in Japan been present Kuroki would have had the balance of force on his side, the Russian retreat would have been confused, if not actually a rout, and the war might have been ended on Japan's own terms As it was, Kuropatkin drew off the wbole of his forces in safety, sharply repulsing an attempt at pursuit made by part of the 12th Division on Sept 4. The railway still delivered 30,000 men a month at Mukden, and Japan had for a time outrun her resources At St. Petersburg the talk was not of peace but of victory, and after a period of reorganization the Russians advanced afresh to a new trial of strength. But the remainder of the Manchurian campaign proved little more than a series of violent and resultless encounters of huge armies — armies far larger than those which had fought out the real struggle for supremacy at Liao-Yang.

Naval Actions.—At this time the siege of Port Arthur had progressed only so far that the besiegers were able to realize the difficulties before them. Their exertions and sacrifices were not crowned with success until the year had run its full course, and meantime the repeated frustration of their hopes had a moral reaction on the main struggle in Manchuria, apart from keeping one of their armies away from the decisive theatre. At sea, however, the Japanese navy scored two important successes. After months of blockade and minor fighting, the Russian Port Arthur squadron had been brought to action on Aug 10. Admiral Vitheft, Makárov's successor, had put to sea shortly after the appearance of the 3rd Army on the land front of Port Arthur. The battle opened about noon, 20m south of the harbour; the forces engaged on each side varied somewhat, but Togo finally had a superiority. As the Russians became gradually weaker, the Japanese closed in to within 3m. range, and Prince Ukhtomsky (who succeeded to the command on Vitheft being killed) gave up the struggle at nightfall. The Russians scattered, some vessels heading southward, the majority with the admiral making for Port Arthur, whence they did not again emerge. All the rest were either forced into neutral ports (where they were interned) or destroyed, among the latter being the third-class cruiser "Novik," which had already earned a brilliant reputation for daring, and now steamed half round Japan before she was brought to action and run ashore. The victors blockaded Port Arthur, until near the close of the siege when, after going ashore and examining the remnant of the Russian fleet from 203-Metre hill, Togo concluded that it would be safe to return to Japan and give his ships a complete refit. Kamimura's squadrons, after various adventures, at last succeeded on Aug. 14 in engaging and defeating the Russian Vladivostok squadron (Admiral Jessen). Thus the Russian flag disappeared from the Pacific, and thenceforward only the Baltic

fleet could hope seriously to challenge the supremacy of the Japanese navy.

The remainder of the war on land, although it included two battles on a large scale and numerous minor operations, was principally a test of endurance. After Liao-Yang there were no widely extended operations, the area of conflict being confined to the plain of the coast side of the Hun-ho and the fringe of the mountains. Japan had partially accomplished her task, but had employed all her trained men in this partial accomplishment. It was questionable, even in Oct. 1904, whether she could endure the drain of men and money if it were prolonged much further. On the other hand, in Russia opposition to the war, which had never been popular, gradually became the central feature of a widespread movement against irresponsible government. Thus, while the armies in Manchuria faced one another with every appearance of confidence, behind them the situation was exceedingly grave for both parties. **A** state of equilibrium was established, only momentarily disturbed by Kuropatkin's offensive on the Sha-ho in October, and by the Sandepu incident in the winter, until at last Oyama fought a battle on a grand scale and won it. Even then, however, the results fell far short of anticipation, and the armies settled down into equilibrium again.

Battle of the **Sha-ho.**—After the battle of Liao-Yang Kuropatkin reverted for a moment to the plan of a concentration to the rear at Tieling. Politically, however, it was important to hold Mukden, the Manchurian capital, and as the Japanese, as on previous occasions, reorganized instead of pursuing, he decided to stand his ground, a resolution which had an excellent effect on his army. Moreover, growing in strength day by day, and aware that the Japanese had outrun their powers, he resolved, in spite of the despondency of many of his senior officers, to take the offensive. He disposed of about 200,000 men, the Japanese had about 170,000. The latter lay entrenched north of Liao-Yang, from a point gm. west of the railway, through Yentai station and Yentai mines, to the hills farther east. There had been a good deal of rain, and the ground was heavy. Kuropatkin's intention was to work round the Japanese right on the hills with his eastern wing (Stakelberg), to move his western wing (Bilderling) slowly southwards, entrenching each strip of ground gained, and finally with the centre—*i.e.,* Bilderling's left— and Stakelberg, to envelop and crush the 1st Army, which formed the Japanese right, keeping the 4th Army (Nozu) and the 2nd Army (Oku) fixed by means of Bilderling's main body. The manoeuvre began on Oct. 5, and by the evening of the 10th, after four days of advanced-guard fighting, Stakelberg was in his assigned position in the mountainous country, facing west towards Liao-Yang, with his left on the Taitszeho. The advance of Bilderling, however, necessarily methodical and slow in any case, had taken more time than was anticipated. Still, Bilderling crossed the Sha-ho and made some progress towards Yentai, and the demonstration was so far effectual that Kuroki's warnings were almost disregarded by the Japanese headquarters. The commander of the 1st Army, however, took his measures well, and Stakelberg found the greatest trouble in deploying his forces for action in this difficult country. Oyama became convinced of the truth on the 9th and 10th, and prepared a great counterattack. Kuroki, with only a portion of the 1st Army, was left to defend at least 15m. of front, and the entire 2nd and 4th Armies and the general reserves were to be thrown upon Bilderling. On the 11th the real battle opened. Kuroki displayed the greatest skill, but he was of course pressed back by the four-to-one superiority of the Russians. Still the result of Stakelberg's attack, for which he was unable to deploy his whole force, was disappointing, but the main Japanese attack on Bilderling was not much more satisfactory, for the Russians had entrenched every step of their previous advance and fought splendidly. The Russian commander-in-chief states in his work on the war that Bilderling became engaged *à fond* instead of gradually withdrawing as Kuropatkin intended, and at any rate it is unquestioned that in consequence of the serious position of affairs on the western wing, not only did Stakelberg use his reserves to support Bilderling, when the 12th Division of Kuroki's army was almost at its last gasp and must have yielded to fresh pressure, but Kuropatkin himself suspended the general offensive on Oct. 13. In the fighting of Oct. 13–16 the Russians gradually gave back as far as the line of Sha-ho, the Japanese following until the armies faced roughly north and south on parallel fronts. The fighting, irregular but severe, continued. Kuropatkin was so far averse to retreat that he ordered a new offensive, which had fair success on the 16th–17th. Kuropatkin wished to continue the offensive, but his corps commanders offered so much opposition to a further offensive that he at last gave up the idea. The positions of the rival armies from Oct. 18, the close of the battle of the Sha-ho, to Jan. 26, 1905, the opening of the battle of Sandepu (Heikoutai)—a period almost entirely devoid of incident—may be described by the old-fashioned term "winter quarters."

In Jan. 1905 the Russians, 300,000 strong, were now organized in three armies, commanded by Generals Linievich, Grippenberg and Kaulbars; the total strength of the Japanese 1st, 2nd and 4th Armies and reserve was estimated by the Russians at 220,000. Towards the end of January Kuropatkin took the offensive. He wished to inflict a severe blow before the enemy could be reinforced by the late besiegers of Port Arthur, and sent Grippenberg with seven divisions against Oku's two on the Japanese left. The battle of Sandepu (Heikoutai), fought in a terrible snowstorm on Jan. 26 and 27, 1905, came near to being a great Russian victory. But after two days' severe fighting, although Grippenberg had not been checked, Kuropatkin, in face of a counterattack by Oyama, decided to abandon the attempt.

Battle of **Mukden.**—Both sides stood fast in the old positions up to the verge of the last and greatest battle. Kuropatkin was reinforced, and appointed Kaulbars to succeed Grippenberg and Bilderling to the command of the 3rd Army vacated by Kaulbars. On the other hand, Nogi's 3rd Army, released by the fall of Port Arthur, was brought up on the Japanese left, and a new army under Kawamura (5th), formed of one of the Port Arthur and two reserve divisions, was working from the upper Yalu through the mountains towards the Russian left rear. The Russian line covering Mukden was 47m. long, the armies from right to left being 2nd (Kaulbars), 3rd (Bilderling) and 1st (Linievich); a general reserve was at Mukden. On the other side from left to right, on a line 40m. long, were Oku (2nd Army), Nozu (4th), Kuroki (1st) and Kawamura (5th), the general reserve in rear of the centre at Yentai and the 3rd Army in rear of Oku. Each side had about 310,000 men present. The entire front of both armies was heavily entrenched. The Russians had another offensive in contemplation when the Japanese forestalled them by advancing on Feb. 21. The 5th Army gradually drove in Kuropatkin's small detachments in the mountains, and came up in line with Kuroki, threatening to envelop the Russian left. The events on this side and misleading information induced Kuropatkin to pay particular attention to his left. The Japanese 1st and 5th Armies were now engaged (Feb. 25), and elsewhere all was quiet. But on the 27th the fighting spread to the centre, and Nogi (originally behind Oku) was on the march to envelop the Russian right. He was held under observation throughout by Russian cavalry, but it seems that little attention was paid to their reports by Kuropatkin, who was still occupied with Kuroki and Kawamura, and even denuded his right of its reserves to reinforce his left. With a battle-front exceeding two days' marches the wrong distribution of reserves by both sides was a grave misfortune. Kuropatkin was at last convinced, on Feb. 28, of the danger from the west, and did all in his power to form a solid line of defence on the west side of Mukden. Nogi's first attack (March 1–2) had not much success, and a heavy counterstroke was delivered on the 2nd. Fighting for localities and alterations in the interior distribution of the opposing forces occupied much time, and by the 3rd, though the battle had become severe, Kuropatkin had merely drawn in his right and right centre (now facing west and south-west respectively) a little nearer Mukden. His centre on the Sha-ho held firm, Kuroki and Kawamura made but slight progress against his left in the mountains. Nogi and Oyama were equally impressed with the strength of the new (west) Russian front, and, like Grant at Petersburg in 1864,

extended farther and farther to the outer flank, the Russians following suit. The Japanese marshal now sent up his army reserve, which had been kept far to the rear at Yentai, to help Nogi. It was not before the evening of March 6 that it came up with the 3rd Army and was placed in position opposite the centre of the Russian west front. On the rest of the line severe local fighting had continued, but the Russian positions were quite unshaken and Kuropatkin's reserves—which would have been invaluable in backing up the counter-attack of March 2—had belatedly returned to face Nogi. He had organized another counterstroke for the 6th, to be led by Kaulbars, but this collapsed unexpectedly after a brief but severe fight.

Russian Retreat on **Tieling.**—Kuropatkin now decided to draw in his centre and left towards Mukden. On the 7th, the various columns executed their movement to the Hun-ho with complete success, thanks to good staff work. The Japanese followed up only slowly. Nogi and Kaulbars stood fast, facing each other on the west front; after the arrival of the general reserve, Nogi was able to prolong his line to the north and eventually to bend it inwards towards the Russian line of retreat. On the 8th the fighting between Nogi and Kaulbars was very severe, and Kuropatkin now made up his mind to retreat towards Tieling. On the 9th, by Oyama's orders, Nogi extended northward instead of further swinging in south-eastward, Oku now occupied all the original line of the 3rd Army. Nozu alone was left on the south front, and Kuroki and Kawamura began to engage Linievich seriously. But Nogi had not yet reached the Mukden-Tieling railway when, on the night of the 9th, every preparation having been made, Kuropatkin's retreat began. On the 10th, covered by Kaulbars, who held off Nogi, and by strong rearguards at and east of Mukden, the movement continued, and though confusion was prevalent and the rearguards suffered very heavily, the Russians managed to draw off in safety to the northward. On the evening of the 10th, after all their long and hardly contested enveloping marches, Nogi's left and Kawamura's right met north of Mukden. The circle was complete, but there were no Russians in the centre, and a map of the positions of the Japanese on the evening of the 10th shows the 17 divisions thoroughly mixed up and pointing in every direction but that of the enemy. Thus the further pursuit of the Russians could be undertaken only after an interval of reorganization by the northernmost troops of the 5th and 3rd Armies. But the material loss inflicted on the Russians was far heavier than it had ever been before. It is generally estimated that the Russian losses were no less than 97,000, and the Japanese between 40,000 and 50,000. Japan had had to put forth her supreme effort for the battle, while of Russia's whole strength not one-tenth had been used. But Russia's strength in Europe, with but one line whereby it could be brought to bear in the Far East, was immaterial, and on the theatre of war a quarter of the Russian field forces had been killed, wounded or taken.

Rozhestvenski's Voyage.—It remains to narrate briefly the tragic career of the Russian Baltic fleet. Leaving Libau on Oct. 13–14, 1904, the fleet steamed down the North sea, expecting every night to be attacked by torpedo-boats. On the 21st, in their excitement, they opened fire on a fleet of British trawlers on the Dogger Bank (*q.v.*), and several fishermen were killed. This incident provoked the wildest indignation, and threatened for some days to bring Russia into conflict with England. A British fleet "shadowed" Rozhestvenski for some time, but eventually the Russians were allowed to proceed. On reaching Madagascar, Rozhestvenski heard of the fall of Port Arthur, and the question of returning to Russia arose. But a reinforcement under Rear-Admiral Nebogatov was despatched from the Baltic via Suez early in March 1905, and the armada proceeded by the Straits of Malacca, Nebogatov joining at Kamranh bay in Cochin China. The united fleet was formidable rather in number than in quality; the battleships were of very unequal value, and the faster vessels were tied to the movements of many "lame ducks." Rozhestvenski had, moreover, numerous store-ships, colliers, etc. Nevertheless, the Japanese viewed his approach with considerable anxiety, and braced themselves for a final struggle. Of the various courses open to him, Togo prudently chose that of awaiting Rozhestvenski in home waters. The Russians left Kamranh on May 14, and for a time disappeared into the Pacific. It was assumed that they were making for Vladivostok either via Tsushima strait or by the Pacific. Rozhestvenski chose the former course, and on May 27 the fleets met near Tsushima. By superior speed and handling the Japanese gained an increasing advantage, and by the following day the whole Russian fleet, with few exceptions, had been captured or sunk. (See TSUSHIMA for battle.)

The Peace **of Portsmouth.**—After the disasters of Mukden and Tsushima, and being threatened with internal disorder in European Russia, the tsar, early in June, accepted the mediation of the president of the United States, and *pourparlers* were set on foot. The war, meanwhile, drifted on through May, June and July. Linievich, who succeeded Kuropatkin shortly after the battle of Mukden, retired slowly northward, reorganizing his forces and receiving fresh reinforcements from Europe. A Japanese expedition occupied Sakhalin (July 8–30), and another, under General Hasegawa, advanced through Korea towards Vladivostok. But the fighting was desultory. The peace negotiations were opened at Portsmouth (N.H.), on Aug. 9, and by the end of the month the belligerents had agreed as to the main points at issue—that Russia should cede the half of Sakhalin, annexed in 1875, surrender her lease of the Kwantung peninsula and Port Arthur, evacuate Manchuria, and recognize Japan's sphere of influence in Korea. The treaty of peace was signed on Sept. 5, 1905.

BIBLIOGRAPHY.—Among the first-hand narratives the most important are: Ian Hamilton, *A Staff Officer's Scrap Book;* and the *British Officers' Reports,* War Office, 1908. Also *Reports of Military Observers,* General Staff U.S.A.; Major v. Tettau's 18 *Monate beim Heere Russlands;* von Schwarz, *Zekn Monate beim Heere Kuropatkins,* and Kuropatkin's own work (part of which has been translated into English). Of detailed military histories the principal are the semi-official series of narratives and monographs produced by the Austrian military journal "Streffleur" (*Einzelschriften über den russ.-japanischen Krieg*); the volumes of lectures delivered at the Russian staff college after the war, French translation (*Confe'rences sur la guerre russo-japonaise faites à l'Académie Nicolas*); British official *History of tke Russo-Japanese War;* German official *Russisch-japanischer Krieg* (Eng. trans. by K. von Donat); Loffler, *Der russisch-japanische Krieg* (Leipzig, 1907; French trans.); L. Gianni Trapani, *La Guerra russo-giapponese* (1908); *E.* Bujac, *La Guerre russo-japonaise* (1909). Of critical studies one of the most important is Culmann, *Étude sur les caractères généraux de la guerre en extrème-orient* (1909). One naval narrative of absorbing interest has appeared, Semenov's *Rasplata* (Eng. trans.).

RUSSO-POLISH CAMPAIGN. This campaign, of 1920, which resulted in the defeat and rout of the Soviet Army when it was within sight of the Polish capital, is full of dramatic incident. Organization of command, staff and administration was lacking on both sides, but above all it was the want of a proper system of supply which accounted for the sudden collapse of troops engaged in a victorious advance. The thinly populated territory lying between the Niemen in the north and the Dniester in the south was incapable of supporting large bodies of troops, and as both sides attempted to live on the country during their advances the failure of their operations followed quickly each success.

Cause **of** the **War.**—During the course of 1919 and early 1920, the Soviet Government had succeeded in clearing their territory of the White Russian armies under Kolchak, Denikin and Yudenich. They were thus at liberty to examine the situation on their frontiers. With such a mixture of races living side by side in the disputed regions no delimitation of frontier would have suited all parties, and in the absence of authority to enforce a decision, trouble quickly arose between the Soviet and the newly formed Polish State. Poland was determined to maintain her new liberty and had called up fresh levies to support the various legions which had been repatriated from the fronts upon which they had been fighting in the World War. The Soviet began to concentrate their troops towards the west. Inflammatory speeches in Moscow and a fierce propaganda amongst the Polish working people brought Polish public opinion to a fever heat. From seven divisions in January the Soviet had, by March, increased the number of their

troops facing the Poles to 20 divisions, with three cavalry divisions. Poland decided that she could not wait quietly for the inevitable Soviet attack by which she would certainly be destroyed, and that she must act at once.

Polish Offensive.— Strategically, the territory in dispute may be divided into two separate areas: White Russia in the north and Volhynia and Podolia in the south. The marshes of the Pripet divide one area from the other. Acting in collusion with Petlura, the Hetman of the Ukraine, who had promised to raise his country against the Soviet, the Poles advanced in April as far as Kiev. By the beginning of May the Polish-Soviet front ran from Dvinsk in the north along the course of the Dnieper to Kiev and thence to the Dniester near Kamenets. No sooner were the Poles established in Kiev than the Soviet northern army began to advance. The Poles were able to transfer troops from the south and counter-attacked the Soviet forces which had already penetrated as far west as Lida and Baranoicze. By the end of May the line held at the beginning of the month had been restored. Operations had been most ably carried out by the Polish minister of war, Gen. Sosnkowski, but there were indications that the Soviet were transferring more and more troops to the west and that a renewal of their attacks might be expected.

At the beginning of June, in the southern area there appeared a new Soviet cavalry leader, Budenny, who completely altered the situation. Budenny had been a non-commissioned officer in the old Russian Army and soon proved himself a man of action. Within a month he had driven back the Poles a distance of zoom. until their line in the south ran just east of Pinsk and Równe (Rovno) to the junction of the Dniester and Siret (Sereth).

Russian Success.—Fighting in the northern area continued intermittently during the month of June, preventing the Poles from transferring troops to the hard-pressed south. Despite the operations in the south it was clear that the main Soviet attack was coming in the north. On July 4 the blow fell. The whole Polish line gave way. Wilno (Vilna) and Minsk were lost in the first week. Grodno fell on July 20 and Bialystok on July 25. By the end of July the Soviet advance guards had reached the Bug. In 25 days the Poles had lost 300m. of territory. The main cause of the collapse was their failure to constitute reserves. In their desire to protect their new territory they had been led into a linear defence on a front of nearly 800m., where they were strong nowhere.

Disposition of Troops.— The Polish situation was now critical. With the help of the French military mission, under Gen. Weygand, a plan for a great counter-attack was evolved on Aug. 6. The situation of the opposing sides on that date was as follows:—

Soviet: (1) Northern group. Four armies—4th) 15th, 3rd and 16th, with a cavalry corps on the extreme north aiming to outflank the Polish left.

(2) Southern group. Two armies—12th and 14th with Budenny's cavalry, along a line from Kowel through Brody to Tarnupol. The men of the Soviet army were unfed and worn out with a month's marching.

Poles: (1) A Northern group formed of units which had been retreating for over a month, strengthened by reinforcements thrown in hastily as they came up. Much material had been lost and the men were tired and hungry, but the approach to the line of the Vistula was beginning to simplify the supply of food and munitions.

(2) Southern group. Three armies—6th, 3rd and 4th—facing the Soviet southern group. Here pressure from the enemy had been by no means so severe as in the north and many of the divisions still retained their original fighting value.

Polish Plan of Attack.— The Polish plan was to withdraw all but a minimum of force from the southern area and to attack the Soviet northern group with the greatest possible strength. The operation bears a close resemblance to Ludendorff's manoeuvre at Tannenberg. In many respects the situation was similar. The Russians were advancing in two main groups divided by the Pripet marshes instead of the Masurian lakes. Here the Soviet southern group was advancing slowly like Rennenkampf's army in 1914. The situation would become critical as soon as the two Soviet groups converged upon the Polish Army. No time was to be lost. Would the commander of the Soviet armies in the south allow himself to be deceived in the same manner as Rennenkampf?

On August 6 orders for the following fresh groupings were issued from Polish headquarters:—

(1) Three armies—2nd, ~ s and 5th—under Gen. Joseph Haller, were to withdraw slowly to the line of the Vistula from Dęblin to Modlin, with the 5th Army pushed well forward on the left to prevent any outflanking of the Polish left between Warsaw and the East Prussian frontier.

(2) Two armies, 3rd and 4th—were to concentrate behind the Wieprz between Chelm and Dęblin, ready to strike due north; the advance of these two armies to commence on Aug. 16.

(3) One army, 6th—would withdraw as necessity arose in the direction of Lemberg, tempting the Soviet southern group away from the critical point in the north.

By Aug. 12 all the armies, with the exception of the two on each flank, had reached their assigned positions without incident. In the south the 3rd had found the 12th Soviet army advancing and had been forced to throw out a detachment on its right flank to cover its concentration. It had been delayed in consequence. In the north, the 5th had been driven back by overwhelming strength and had been unable to prevent the enemy outflanking movement.

Enthusiasm in the Polish army had risen surprisingly in the days since the momentous decision to attack had been taken. The chief of the Polish State, Marshal Pilsudski, had himself taken command of the 3rd and 4th Armies. With the help of Weygand and his staff the service of supply had been restored. New bodies of reinforcements were moved forward from the depôts in Western Poland and the depleted units began to raise their heads again. National optimism returned. The enemy in the south made no determined move and appeared to have no inkling of what was afoot. Every hour that he delayed meant more chance of success for the Polish plan.

Polish **Advance.**—Gen. Sikorski's 5th Army in the north was the first to move. The Soviet movement round his left had assumed alarming proportions and had to be stopped. On Aug. 14 he pressed forward from his defensive position at Modlin and at once encountered the Soviet 15th Army advancing to the attack. Sikorski persisted in his attacks all through Aug. 15 and 16, his men fighting with determination. Not even the appearance of elements of the Soviet 4th Army in his left rear turned him from his purpose. Throwing out covering detachments to watch his rear, he attacked again on Aug. 17. His determination reaped its reward, for the enemy gave way in front of him, their retreat rapidly developing into a rout.

In the south Pilsudski's armies made good progress. The blow against the left of the Soviet 16th Army came as a complete surprise and they offered little resistance. During Aug. 16 and 17 the Poles covered over 50 miles. By Aug. 18 the 3rd Soviet Army, which lay between the 15th destroyed by Sikorski, and the 16th broken by Pilsudski, turned also in hopeless confusion.

On the extreme Soviet right their 4th Army, containing some of the picked Communist regiments, together with the cavalry corps, had reached the Vistula between Torun and Plock in their great turning movement when Sikorski suddenly advanced. Had they advanced resolutely even then, all might have been well, but they hesitated and were lost. Their half-hearted attacks against Sikorski's left had little effect. It was not till Aug. 20 that the order for a general retreat reached them. On Aug. 22, at Mlawa, and Aug. 23 at Chorzele they were successful in cutting themselves a passage, but on Aug. 24 at Kovno they ran up against Pilsudski's 4th Army blocking the way. Almost without making an effort to attack they passed ignominiously over the East Prussian border to internment.

The pace of the Polish pursuit was remarkable. From Aug. 16 to Aug. 25 the advanced units of the 2nd army had covered zoom. as the crow flies. The 4th Army averaged 25m. a day in their advance. The service of supply was left far behind. The troops existed as they could upon the exhausted country. Luckily

the Soviet resistance was so completely broken that there was no further fear of counter-attack and the Polish units had ample time in which to reorganize.

Conclusion.—The results of the battle of Warsaw, as it has been named, are only exceeded by those of Tannenberg. The Poles captured 70,000 prisoners, 200 guns and 1,000 machine-guns. From 50,000 to 100,000 Soviet troops passed over into East Prussia. The victory of the Poles was due to the adoption of a determined offensive based upon a sound plan. The raising of the ***morale*** of the beaten troops by the Polish authorities, roused to enthusiasm themselves by the inspiring presence of Gen. Weygand, is little short of miraculous. The crisis of the battle was undoubtedly Aug. 15–16, when Sikorski's 5th army cleared its front. If it was Pilsudski's force which completed the Soviet defeat, it was undoubtedly the magnificent fighting of Sikorski and his men which made victory possible.

RUSSO-TURKISH WARS. The Greek insurrection in 1824 gave England, France and Russia occasion to press demands upon Turkey, which the Porte refused to accede to, rejecting besides the London Protocol of July 1827. Hostilities broke out in Oct. 1827, when the allied fleet under Admiral Codrington defeated the Turkish flotilla off Navarino. This victory greatly facilitated the eventual Russian operations against Turkey as the Russian army supported and provisioned by her own fleet could march along the coast by the shortest road to Adrianople and thence towards the Turkish capital.

Towards the end of April 1828 the Russian army consisting of three army corps stood between the Pruth-Dniester 69,000 strong, war having been formally declared on April 28. Turkey, whose army was being reorganized at the time, decided to resist the enemy in the quadrilateral, Ruschuk, Silistria, Varna and Shumla, for which purpose she assembled about 80,000 men. One corps of the invading army invested Braila, which was captured on June 17; another Russian corps crossed at the mouth of the Danube on June 11, while a third drove back the garrisons of Ruschuk and Widdin into these fortresses from which they had emerged. The first two Russian corps now advanced on Shumen but finding the Turks to be stronger than they supposed, they fell back on Yenibazar. A Russian force was thrown forward towards Varna but only on the arrival of the Russian guard corps could the idea be entertained of investing it. The siege began on Sept. 10 and a month later Varna surrendered. The Russians owing to numerical weakness retired into winter quarters in Moldavia and Wallachia. leaving two corps in the vicinity of Varna, Pravodi and Bazardjik. The fortress of Silistria was still in Turkish hands and it now became on the resumption of hostilities the principal Russian objective. Sizopol at the entrance to the harbour of Burgas was captured providing the Russians with a base for their operations south of the Danube. Silistria being invested fell on June 29. Meanwhile Reschid Pasha advanced from Shumla against Pravodi hoping to recapture Varna but was beaten off. General Diebitch, who had replaced Wittgenstein as Russian commander-in-chief, defeated Reschid Pasha at Tcherkovna on June 11. Diebitch now decided to advance south of the Balkans. Reschid attempted to hinder his march but was vanquished at Sliven on Aug. 12. Adrianople was entered Aug. 20, but as Diebitch had only 15,000 men and pestilence was ravaging his ranks he deemed it wiser to conclude a treaty in September before Turkey became aware of the state of his army. Success crowned the Russian arms in Asia, Paskevitch gaining two important victories on June 1 and 2 at Erivan, his advance coming to a close by terms of the treaty arranged in Europe. A conference held in London proclaimed the independence of Greece, Russia receiving the islands at the mouth of the Danube, while Moldavia and Wallachia were to be no longer provinces of Turkey, but only under her protectorate.

The War of 1877–78.—The oppression of the Christian subjects of the Sultan had made hostilities in 1877 between Turkey and Russia inevitable. After the Crimean War Turkey promised to grant reforms, thereby bettering the treatment of the Christian population, but the following years brought no material change. In 1875 an insurrection broke out in Hercegovina and Montenegro, to be followed by Serbia openly taking up arms against Turkey. Russia, whose sympathies by reason of race and religion, were wholly on the side of the Slavs, could not remain a silent onlooker of the events in the Balkans. Russian volunteers flocked in great numbers to join the Serbians and General Chernyaeff was entrusted with their command. Disparity of numbers however, went against the Serbians, the Turks gaining several successes, which culminated in their victory at Djunis on Oct. 29, 1876. Alexander II. then stepped forward and insisted on hostilities ceasing, to which Turkey hurriedly assented. A conference now assembled at Constantinople, but after months of deliberation, it failed to come to an agreement, Turkey taking advantage of the divergent views of the Great Powers. She became as time progressed less willing to make concessions. To prepare for all eventualities and to bring greater weight to her influence at the conference Russia mobilized six army corps in Nov. They consisted of the VII., VIII., IX., X., XI. and XII., corps and were concentrated on the southern frontier, on the Rumanian borders. Mobilization arrangements were not worked effectively nor the deployment of the forces. It must be borne in mind that conscription had been only enforced in Jan. 1874 and there was consequently a lack of well trained officers and reserves. Another great obstacle that hindered Russia from dealing a quick blow at Turkey was the lack of a fleet in the Black sea, though this restriction was removed in 1871. Knowing the unprepared state of the forces several experts, among them General Todleben, the world famous defender of Sevastopol in the Crimean War (*q.v.*), were opposed to Russia undertaking an active campaign, but the Pan-Slav movement which was general in Russia, forced the Tsar to declare war April 24. Having underrated her foe Russia began hostilities with insufficient forces, sending 257,000 men into Rumania and 70,000 each to the Caucasus and to the Austrian frontier. The Grand Duke Nicholas, the Tsar's brother, was in command of the forces and orders were instantly given to cross the Rumanian frontier; this state having proclaimed her independence of Turkey afforded every facility to the Russians to move their army to the Danube. Early in June the Russian army was assembled around Bucharest; it consisted of the VIII., IX. and XII. corps, with detachments thrown forward to the Danube. The XI. corps was guarding the region from the river Argis to the river Yalomniza, further east towards the Pruth stood the XIV. corps while the XIII. was expected by the middle of June and the IV. a month later. The Russian army was armed indifferently and tactically was ill trained, which was due to the men being unused to handling their new weapons. The Russian forces in the middle of June which intended crossing the Danube numbered 257,000 men, but one must deduct those guarding the railway line through Rumania.

The Turks numbered 135,000 men north of the Balkans who were distributed in the following manner: 80,000 in the quadrilateral, 23,000 around Vidin, 10,000 in Nicopol, 8,000 in Dobrudja, 3,000 in Tirnovo, 4,000 in Sistovo, 2,000 at Lom Palanka and 5,000 at Rahoff. Forty thousand men were grouped around Adrianople and Constantinople and some 80,000 in Bosnia, Montenegro and Epirus. The Turks besides disposed of another 120,000 men in Asia Minor.

Political and military reasons forced Turkey to remain on the defensive while Russia was bent on the swiftest possible offensive—bordering on rashness. Rumania having allowed the Russians to traverse her territory greatly aided their initial concentration towards the Danube. She was even prepared in the middle of June to join the Russians against the Turks with her force of 32,000 infantry and 5,000 cavalry, but the Russians, feeling certain of an easy victory, declined her proffered help. Two months later they were only too glad to avail themselves of this assistance which would have been of inestimable value in their first operations south of the Danube. To cross this river was their primary object, but this was impeded by the Turkish flotilla which patrolled the Danube and prevented them bridging

it. The Russians by means of steam launches, batteries, mines and torpedoes drove the Turkish ironclads into Sulina harbour, one being destroyed, while the smaller vessels were obliged to seek refuge in Silistria and Ruschuk Mines were laid across the Danube, bridging now being made possible. Hearing of the hostile approach, Abdul Kerim, the Turkish leader, decided not to make a resolute defence against the enemy crossing the Danube, but to attack him, when advancing to besiege Ruschuk and Shumla. The distribution of the Turkish troops remained little changed by the middle of June; the detachments guarding the Danube were generally too weak to offer any serious resistance to the invader.

The Russians began crossing the river in boats at Zimniza early on June 23 and the following day the VIII. corps was across, standing on the southern bank of the Danube. The same day a bridge 1,300 yards long was begun to be constructed at Nicopol, which was ready by July 1, a second one being ready by Aug. 1. The other Russian corps, the XII. and XIII., commanded by the Tsarevitch, having crossed the Danube moved to the Lom and Yantra facing Ruschuk with the object of laying siege to it while the IX. corps made for Nicopol. Gourko's advance guard entered Tirnova July 7, the VIII corps following it five days later. The Grand Duke Nicholas wished to cross the Balkans with two corps while guarding his right flank with the IX. corps, and watching Ruschuk fortress with the XII. and XIII. corps, but Alexander II. would not sanction this, rightly considering this plan too risky. Gourko left Tirnova July 12 hearing the Shipka Pass was defended by only 3,000 men. He made for the Hainkioi Pass intending to turn the Shipka Pass (*q.v.*), while a Russian detachment attacked the Pass from the north. Gourko having been delayed 24 hours, was repulsed by the Turks when attacking the Pass; the same fate befell the Russians advancing north of Shipka. Nevertheless next day Gourko again pressed forward, when the Turks offered to negotiate terms of capitulation. While they were being drawn up the Turks evacuated all their positions and retreated to Philipopolis. Gourko's capture of Shipka gave the advantage to the Russians for a short time only, though he hastened to put it in a state of defence and it remained in their hands up to the end of the war. Alarmed by the incursion of the Russians, the Turks recalled Suleiman Pasha from Montenegro with his army 30,000 strong and having transported it by sea to the mouth of Maritza pushed it forward without delay on July 23 between Hermanli and Karabunar. After several engagements against greatly superior forces Gourko received orders Aug. 5 from the Headquarters to return north of the Balkans. The passes being deemed of great importance the Russians decided to defend them with the 9th Division, 4th Rifle Brigade and a Bulgarian contingent.

Meanwhile Nicopol fell July 17, the IX corps capturing 8,000 men and it now received orders to advance to Plevna. General Krudener, its commander, detached one division under Schilder-Schuldner, which without any preliminary reconnaissance attacked the Turks July 20, only to be thrown back with heavy losses by Osman Pasha's much superior force, which had marched from Vidin unperceived by the Russians. Though the Rumanians had warned them of the hostile approach no serious attention was given by the Russian military authorities, for which they had to pay dearly. But even now the Russians thought this to be a momentary check and gave orders to make a fresh effort to capture Plevna, for which purpose they detailed 40,000 men. Osman Pasha had meanwhile entrenched himself round Plevna and had occupied Lovcha on the 26th, thereby securing the direct road to Sofia. The second attempt to capture the town, July 31, failed as the first and the Russians at last began to realize that their forces were inadequate to vanquish the enemy. The Tsar, by an Imperial Ukaze called up the Guard and Grenadier Corps, 24th and 26th Infantry Divisions, also the and and 3rd Infantry Divisions with the 3rd Rifle Brigade which had already left Moscow for Bulgaria. Valuable assistance was also forthcoming from the Rumanian forces, which now joined the Russians. The Russian plan of campaign, which was faulty to a degree, now became absolutely impossible, there being no longer any question of moving south of the Balkans, whilst Osman from Plevna might threaten not only their right flank. but the bridges across the Danube. Every effort was to be made to vanquish the Turkish force defending Plevna, now greatly strengthened by field works.

At the end of July, Abdul Kerim, the Turkish commander-in-chief was superseded by Mohammed Ali, who decided to attack the Russian forces under the Tsarevitch (XI., XII. and XIII. corps) on the river Lom. Mohammed Ali had two army corps for his offensive, not to mention five divisions at Shumla and two at Ruschuk, but he carried out his movement with little skill, sending his left wing against the Russians standing on the Yantra, which brought about two engagements at Ayazla on Aug. 22 and 23. The Russians retreated slightly, and a week later the XIII. corps was attacked at Karahassankioi, but no serious result was gained by this move. On Sept. 5, another engagement occurred, but though the Russians retired across the Lom the Turks were unable to march further west. The intended plan to unite the forces of Mohammed Ali with those of Suleiman at Trnova failed, his advance producing no effect on the Russian forces assembled around Plevna, which were by that time considerably reinforced (two Russian and three Rumanian infantry divisions, together with a Russian rifle brigade). On the Rumanians joining the Russians, it was agreed that Prince Charles of Rumania should be in nominal command of the forces grouped around Plevna, which were now known as the Western army. But the authority vested in Prince Charles was small, as the Commander-in-Chief, the Grand Duke Nicholas, was living in the vicinity, not to mention the Tsar himself and General Milutin, the War Minister. By this time the Russians had mobilized a huge army.

Meantime Suleiman Pasha was ordered to join Osman, but he was instructed firstly to capture the Shipka Pass which he attempted to do Aug. 21. Severe fighting took place for several days, but Radetsky, being reinforced, maintained his position, beating off every hostile attack. Suleiman in five days having lost 10,000 men, a quarter of his effective strength, decided to fall back on Kazanlik, leaving detachments by the pass. Hearing that Suleiman had been forced to give up momentarily the attempt to capture the Shipka Pass, the Russians began to fear that he might endeavour, by using the Rosalita and Trojan Passes, not only to turn the Shipka Pass, but by moving via Lovcha to get into communication with Osman Pasha, who might at any moment make for Tirnova. For this purpose Prince Imeretinsky was ordered to drive a Turkish detachment from Lovcha, which he forced to retire into Plevna. Leaving a brigade to guard the town, Imeretinsky fell back on Bogot. The Allies now decided to assault Plevna again, for which purpose they assembled about 100,000 men. Three Rumanian divisions were to advance from Grivitza, four Russian from Radishevo, and a division, having a brigade in reserve under Skobeleff, facing the Green Hills. A long artillery preparation took place Sept. 7–11, but the allies failed to make any proper reconnaissance, for which they had to pay a severe penalty, thousands of lives being sacrificed in vain. They advanced on the 11th, but failed to break the Turkish circle of defence. The Rumanians captured a redoubt at Grivitza, but were held up at Radishevo; Skobeleff on his part established himself on the Green Hills, but was thrown back the next day by Osman Pasha, who used his reserves for the counter attack. A serious crisis now arose among the Allies and a council of war was held. Many of the members, including Milutin, the War minister, urged that the army should recross the Danube and renew the advance the following spring with increased forces. This opinion was over-ruled, the Tsar showing great determination, and it was decided to invest Plevna, entrusting all operations to General Todleben, the heroic defender of Sevastopol during the Crimean War. With his arrival, the Russians gained confidence and renewed energy, one and all feeling they were at last being led by a masterly head, that chaos was replaced by order. The Guard Corps, on arriving from Russia, was sent to cut the Turkish communications and the enemy was driven out of Gorni Dubniak and Telish by General Gourko, Plevna being thus cut off from the outer world In the middle of Nov. the Russians stood as follows: 12 divisions around Plevna, 6 on the Lom; 3 by the Shipka Pass;

23 on the Plevna-Orhanie road.

Suleiman, now commanding the main Turkish army, took the offensive, crossed the Lom and attacked the Russians at Mechka and Tristenik Nov. 19 and 26, but both times sustained a repulse. Vessil Pasha, who now in place of Suleiman stood facing the Shipka Pass, had been considerably weakened through sending reinforcements to aid Mohammed Ali near Sofia, and he could only muster 20,000 men. Meanwhile Gourko, hearing of Mohammed's preparations to relieve Plevna, urged that the Russians should advance boldly on Sofia, thereby depriving the enemy of the initiative. This plan being agreed to, Gourko, at the head of 30,000 men, drove the Turks out of Entropol, forcing Mohammed to retreat to Araba Konak Nov. 23. Gourko disposed of too small a force to be able to pursue the enemy, and so took up a position near Orhanie. Meantime in Plevna Osman's provisions were getting shorter every day, and ultimately he attempted a sortie, hoping to cut his way through Berkovitza to Sofia. After several hours severe fighting, however, Osman was convinced of the impossibility of breaking through, and surrendered with his whole army, about 40,000 men, on Dec. 10.

The Russians now decided to move on Sofia, cross the Balkans, relieve Shipka from the south and attack Vessil Pasha, the Tsarevitch with his 70,000 men being left to guard the communications. Gourko on Dec. 23 advanced with 5½ divisions against the Turks but on reaching Toshkesen he found that the Turks had already retreated. The Russians, after occupying Sofia, followed the enemy, who was making for Tatar Bazardjik. There Suleiman assumed command, having collected a force 50,000 strong, including reinforcements from Shumen. Radetsky began his attack on Jan. 5 at Shipka, being aided by two columns coming on his left and right; the western, Skobeleff with 17,000; the eastern, Prince Imeretinsky with 19,000 men. The Prince's advance was held up, while Skobeleff, delayed, came on the scene only the following day, when they together captured the Turkish entrenched camp two miles south of the Pass, forcing Vessil Pasha to capitulate with 36,000 men. Suleiman, on hearing of Vessil Pasha's surrender, made for Philipopolis, Gourko following in direct pursuit, while Radetsky cut off his retreat from Adrianople, entering the town with his advanced guard on Jan. 19. After several minor actions near the town Suleiman retreated to the south over the Rhodope Mountains direct to the coast reaching Enos on Jan. 28. His forces were then shipped to Constantinople. The Russians advanced rapidly towards the Turkish capital, reaching the Chataldja lines on Jan. 30. Next day an armistice was concluded, the terms being greatly modified at the Berlin conference which took place the following July, when Russia was deprived of many important concessions, which greatly irritated both the nation and the army. Bulgaria now became an independent principality, while Eastern Roumelia was to be under the protectorate of Turkey.

While these events were taking place in Europe military operations were simultaneously being carried on in the Caucasus. The Grand Duke Michael, the Tsar's brother, commanded the Russian forces which were 65,000 strong. The Turks numbered 70,000 men under Mukhtar Pasha. The same mistake was committed in the Caucasus as had been done in Europe — the Russian army finding itself too weak was obliged to await reinforcements, which arrived by the end of August when they began their advance. The first serious battle occurred on Oct. 13, at Aladja Dagh, when the Turks were defeated, a part of their forces hurriedly making for Kars, which was an important fortress, while the other portion fled to Erzerum. Kars was now invested. A month later on Nov. 18, the Russians stormed and captured it. This was a brilliant feat of arms, perhaps the finest Russian exploit throughout this war. Their communications now being assured, the Russians moved rapidly towards Erzeroum, but the severe winter weather and the strength of the fortifications prevented them capturing it as quickly as they had hoped. When the armistice was concluded Erzeroum was still holding out, but the Turks were now forced to evacuate it under the terms of the armistice. The Russo-Turkish War amply proved the truth of the military maxim that to wage war with insufficient forces is highly risky. The Russians were many times on the brink of disaster, which would most certainly have occurred had they been faced by abler Turkish leaders and more efficiently trained troops. (A. SMI.)

RUST, a term usually applied to the reddish deposit formed on iron and having the approximate chemical composition $2Fe_2O_3.3H_2O$. See also CORROSION AND OXIDATION OF METALS. For a description of plant rusts see FUNGI: *Basidiomycetes* (Club Fungi).

RUSTICATION, in architecture, a form of masonry in which the stones have their edges cut back to a careful plane surface but with the central portion of the stone face either left rough or projecting markedly. (See DRAFTED MASONRY.) Rusticated masonry is found in the platform of the tomb of Cyrus at Pasargadae in Persia (560 B.C.) and is common in certain types of Greek and Hellenistic work, such as retaining walls and the like. It was similarly used for terrace and retaining walls by the Romans, who also realized its decorative value and employed it not only for such utilitarian works as the Pont du Gard at Nimes, France, and the aqueduct at Segovia, Spain (c. 109), but also decoratively as in the Porta Maggiore at Rome (time of Claudius), where the rustication is very rough, and the walls of the temple of Augustus at Vienne, France (c. 41), in which the rustication is carefully finished, the faces of the stone cut to a plane and the edges very delicately sunk.

The early Renaissance architects developed this tradition still further and in the 15th-century palaces in Florence used it with magnificent effect. Thus in the Pitti palace by Brunelleschi (1458), the Riccardi by Michelozzo (1444–52) and the Strozzi by Benedetto da Maiano (1489) the carefully studied rustication forms the chief element in the design; and in the Rucellai, from designs by Alberti (1446–51), the wall surfaces between the pilasters are delicately rusticated. During the baroque period rustication assumed great importance in garden and villa design, and all sorts of fantastic surfaces were employed on the projecting portions of the stones, such as vermiculated work, in which the surface is covered with wavy and serpentine sinkages like worm-eaten wood or treated with vertical dripping forms like lime deposits from dripping water. Sometimes the stones had sides beveled and brought to a point or ridge in the centre.

The use of rustication was introduced into England by Inigo Jones, as in the gate of the Botanic gardens at Oxford (1632), and became a dominant feature in much English Renaissance work. In American colonial work this influence is seen in the occasional shaping of outside sheathing boards to imitate rusticated masonry, as in portions of the Morris-Jumel house in New York (1765). Quoins, or corner blocks, are, in many styles, rusticated, where the face of the wall is left smooth.

RUTABAGA (*Brassica napobrassica*), also known as the swede turnip, is a root crop grown in cool climates, in Canada, Great Britain and northern Europe, but little cultivated in the United States. See TURNIP.

RUTACEAE, a family of dicotyledonous plants, mostly shrubs and trees, comprising about 144 genera and 1,600 species, found in temperate and tropical regions, and especially abundant in Australia and south Africa. Ruta graveolens is rue (*q.v.*). Citrus includes the grapefruit, orange, lemon (*qq.v.*), etc. Chloroxylon *swietenia* is satinwood (*q.v.*); Ptelea trifoliata is shrubby trefoil or wafer ash; Zanthoxylum *americanum* is prickly ash (*q.v.*).

RUTBA WELLS, a post and watering place in the Syrian desert, in 33° N. and 40° E. The post, which is the headquarters of part of the desert police, is the most westerly occupied place in Iraq. Westward from this point, L. H. D. Buxton found considerable traces of Paleolithic remains in the desert.

See L. H. D. Buxton, ***Antiquaries* Journal** (1926).

RUTEBEUF or RUSTEBUEF (fl. 1245–1285), French *trouvère*, was born in the first half of the 13th century. His name is nowhere mentioned by his contemporaries. He frequently plays in his verse on the word Rutebeuf, which was probably a pseudonym. Some of his poems have autobiographical value. In Le *Mariage* de Rutebeuj he says that on Jan. 2, 1261, he married a woman old and ugly, with neither dowry nor amiability. In the

Complainte de Rutebeuf he details a series of misfortunes which have reduced him to abject destitution. In these circumstances he addresses himself to Alphonse, comte de Poitiers, brother of Louis IX, for relief. His distress could not be due to lack of patrons, for his metrical life of Saint Elizabeth of Hungary was written by request of Erard de Valéry, who wished to present it to Isabel, queen of Navarre; and he wrote elegies on the deaths of Anceau de l'Isle Adam, the third of the name, who died about 1251, Eude, comte de Nevers (d. 1267), Thibaut V of Navarre (d. 1270) and Alphonse, comte de Poitiers (d. 1271), which were probably paid for by the families of the personages celebrated. In the *Pauvreté de Rutebeuf* he addresses Louis IX himself.

The piece which is most obviously intended for popular recitation is the *Dit de l'Herberie*, a dramatic monologue in prose and verse supposed to be delivered by a quack doctor. Rutebeuf was also a master in the verse *conte*, and the five of his *fabliaux* that have come down to us are gay and amusing. The adventures of *Frère Denyse le cordelier*, and of *"la dame qui alla trois fois autour du moûtier,"* find a place in the *Cent Nouvelles nouvelles*.

Rutebeuf's serious work as a satirist probably dates from about 1260. His chief topics are the iniquities of the friars, and the defense of the secular clergy of the university of Paris against their encroachments; and he delivered a series of eloquent and insistent poems (1262, 1263, 1268, 1274) exhorting princes and people to take part in the crusades. He was a redoubtable champion of the university of Paris in its quarrel with the religious orders, and he boldly defended Guillaume de Saint-Amour when he was driven into exile. The libels, indecent songs and rhymes condemned by the pope to be burned together with the *Périls des derniers temps* attributed to Saint-Amour, were probably the work of Rutebeuf. The satire of *Renart le Bestourné*, which borrows from the Reynard cycle little but the names under which the characters are disguised, was directed, according to Paulin Paris, against Philip the Bold. To his later years belong his religious poems, and also the *Voie de Paradis*, the description of a dream, in the manner of the *Roman de la Rose*.

The best work of Rutebeuf is to be found in his satires and verse *contes*. A miracle play of his, *Le Miracle de Thkophile*, is one of the earliest dramatic pieces extant in French.

BIBLIOGRAPHY.—The *Oeuvres* of Rutebeuf were edited by Achille Jubinal in 1839 (new edition, 1874); a more critical edition is by Dr. Adolf Kressner (*Rustebuef's Gedichte;* Wolfenbuttel, 1885). *See* also the article by Paulin Paris in *Hist. litt. de la France* (1842), vol. xx, pp. 719–783, and *Rutebeuf* (1891), by *M.* Léon Clédat, in the *Grands Écrivains français* Series

RUTGERS UNIVERSITY, the state university of New Jersey, has its main campuses in New Brunswick, N.J., with major centres in Newark and Camden. It offers undergraduate and graduate instruction for both men and women.

The university dates from Nov. 10, 1766, when Queen's college was chartered as the eighth college in the American Colonies. It owed its founding largely to the zeal for religion and education of Dutch settlers of the reformed Protestant faith who saw the need of an institution of higher learning that might provide training for candidates for the ministry. The New Brunswick Theological seminary was affiliated with the college until 1856. Classes began in 1771 in New Brunswick, but during the American Revolution the small student body was forced to evacuate the city and meet elsewhere. In 1809 Queen's building, a splendid example of Georgian Colonial architecture designed by John McComb, was erected and for several decades housed all the college work. It became the main administration building of the university.

In 1825 the name of the institution was changed to Rutgers college in honour of Col. Henry Rutgers. a leading churchman and philanthropist of New York city. In 1864 the state legislature designated the newly organized Rutgers Scientific school to be "The State College for the Benefit of Agriculture and the Mechanic Arts," and in 1917 the land-grant units were declared to be the state university of New Jersey. Rutgers is the only land-grant college with a colonial charter. In 1880 the New Jersey Agricultural Experiment station was located at the college farm.

The New Jersey College for Women was created in 1918 by the trustees of Rutgers as an integral part of the university but with a separate campus in New Brunswick. The name "Rutgers University" was adopted in 1924, although the corporate title remained "The Trustees of Rutgers College in New Jersey." Divisions, with the dates of their founding or their association with the university, are: the college of arts and sciences (1766), the college of engineering (1864), the college of agriculture (1864), the school of education (1923), the university extension division (1925), the college of pharmacy (Newark, 1927), the graduate faculty (1932), University college (1934), the Newark Colleges of Arts and Sciences (Newark, 1946), the school of business administration (1946), the school of law (Newark and Camden, 1946, 1949), the institute of microbiology (1949), and the College of South Jersey (Camden, 1950).

Rutgers university was designated by legislation effective July 1, 1945, as the state university of New Jersey "to be utilized as an instrumentality of the State for providing public higher education" on a contractual basis, and the state board of education was given "visitorial general powers of supervision and control" over the university. Management of the institution was vested in a board of trustees of 58 members, 16 of whom would represent the state, seven the alumni and one the State Federation of Women's Clubs. Thirty-four "charter trustees" are elected for life terms by the board.

About 50 courses of study leading to the degrees of bachelor of arts, bachelor of letters, bachelor of science and bachelor of laws were established. Graduate instruction leading to the degrees of master of arts, master of science, master of laws, master of education, doctor of education and doctor of philosophy is also offered. There were more than 6,600 full-time students in the latter 1950s. (R. P. McC.)

RUTH, BABE (GEORGE HERMAN RUTH) (1895–1948), U.S. baseball player, the game's most popular figure and holder of the all-time home-run record of 60 in a 154-game season (1927), was born on Feb. 6, 1895, in Baltimore. Md., into a poverty-stricken environment. At age seven he nent to live at St. Mary's Industrial school in Baltimore, where he spent much of his boyhood and where he first became interested in athletics.

The "Sultan of Swat" hit a total of 714 home runs in 22 big league seasons. He finished with a lifetime batting average of .342, but of all his records he was proudest of having pitched $29\frac{2}{3}$ scoreless innings for the Boston Red Sox in the world series—against the Brooklyn Dodgers in 1916 and the Chicago Cubs in 1918. He was the best left-handed pitcher in the American league when he was moved to the outfield because of his slugging.

Ruth batted and threw left-handed. He stood 6 ft. 2 in. and weighed 21 j lb. He began his professional career at Baltimore in 1914 and was sold later that season to the Boston Red Sox for an estimated $2,900. In Jan. 1920 Ruth was sold to the New York Yankees for $125,000. During his major-league career Ruth broke more than 50 records. He led the American league in home runs for 12 years; he hit at least 50 home runs in four separate seasons and at least 40 in each of 11 seasons. He played in ten world series—three with the Red Sox and seven with the Yankees.

In 1922 he was suspended for 30 days for an unauthorized barnstorming tour. In 1925 he was fined $5,000 by Yankee manager Miller Huggins for "misconduct off the ball field." In 1930 and 1931 Ruth received a salary of $85,000 per season, then the all-time high. He played his last season (1935) with the Boston Braves, was released June 2, 1935, and concluded his baseball career as coach of the Brooklyn Dodgers in 1938 He was one of the first five players elected to Baseball's Hall of Fame at Cooperstown, N.Y., in 1936. Ruth died on Aug. 16, 1948, in New York city. In 1961 Roger Maris of the New York Yankees hit 61 home runs, a record for the 162-game baseball season, but because Maris hit only 59 in the first 154 games of the season Ruth's record stood. (J. D. McC.; X.)

RUTH, BOOK OF, in the Old Testament. The story of Ruth. the Moabitess, great-grandmother of David. is one of the Old Testament Hagiographa *(see* BIBLE: *Hagiographa*). On the other hand, it follows Judges in the Septuagint, the Vulgate and the English version. Although a *late* rearrangement might transfer Ruth from the Hagiographa, to the historical books

and place it between Judges and Samuel, no motive can be suggested for the opposite change, unless it had been placed in the last part of the Jewish canon after the second (with the historical books) had been definitely closed. Moreover, the book is untouched by the "prophetic" or "Deuteronomic" editing, which gave the "Former Prophets" (Joshua–Rings) their present shape after the fall of the kingdom of Judah. Nor has the narrative any affinity with the view that the history of Israel was a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God. Finally, had the book been known when Joshua–Kings was edited it could hardly have been excluded, since David's ancestry (iv, 17, 18–22) was of greater interest than Saul's (given in 1 Sam. ix, 1), whereas the old history names no ancestor of David beyond his father Jesse.

Date.—The book of Ruth deals with a distant past (Ruth i, 1), and delights in depicting details of antique life and obsolete usages (iv, 7). It views the stormy period before the kingship through the softening atmosphere of time, in contrast to the harsher colours of the old narratives of the book of Judges. It has been argued that, as the author seems to take no offence at the marriage of Israelites with Moabite women, he must have lived before the time of Ezra and Nehemiah (Ezra ix; Neh. xiii); but the same argument would prove that the book of Esther was written before Ezra. The very designation of a period of Hebrew history as "the days of the judges" is based on the exilic "Deuteronomic" parts of the book of Judges (ii, 16 sqq.), and although the language sometimes recalls the narratives in Samuel and Kings, it can be assumed, either that the book is the work of a late author acquainted with the earlier literature, or that an old narrative was rewritten. The fact that the language is in contrast to that of Chronicles, Ezra, Nehemiah, etc., has no force since writings evidently more or less contemporary did not necessarily share the same characteristics (observe, for example, the prose parts of Job).

Purpose.—Like the stories appended to Judges, the book of Ruth connects itself with Bethlehem, the birthplace of David. Some connection between Bethlehem and Moab has been found in 1 Chron. iv, 22 (where the Targum and rabbinical exegesis discover references to the story of Ruth), and is explicitly suggested by the isolated 1 Sam. xxii, 3 seq., which knows of some relationship between Moab and David. Next, the writer claims the sympathy of his readers for Ruth, upon whose Moabite origin he insists, and this is noteworthy in view of the aversion with which intermarriage was regarded at a certain period (Deut. xxiii, 3; Neh. xiii; Ezra ix *seq.*). The independent evidence for the present late form of the book has led many scholars to the conclusion that it was directed against the drastic steps associated with the reforms of Ezra and Nehemiah, which, as is known, were not everywhere acceptable. Thus, not only have we a beautiful portrait of a woman of Moabite origin, but she becomes the ancestress of David himself; and in the days of these measures the simple story would raise the question whether the exclusiveness of Judaism was being carried too far.

RUTHENIA (Ukr. CARPATHO-UKRAINE; Hung. RUTENFÖLD; Czech SUBCARPATHIAN RUTHENIA), a region lying southwest of the central Carpathian mountains; bounded W. by Slovakia, S.W. by Hungary. S. by Rumania and N.E. and N. by the western (formerly Polish) Ckraine. Much of the country is mountainous, deeply dissected by incised valleys which often open into broad, fertile basins in their upper courses. The southern edge of the highland is heavily forested with beech on its loner levels and conifers on the higher. But the plain, largely the drainage basin of the upper Tisza and its tributaries, is the important region. Sheltered from the cold winds of the north and northeast, it receives the full benefit of the moist southwesterly currents and the climate is ideal for cereal cultivation.

Before World War I Ruthenia had been a much neglected part of Upper Hungary. Agricultural methods were primitive and insufficient to assure an adequate standard of living to the population which in its large majority was Ruthenian. a Slavonic people closely related to the Ukrainians. Industrial activity was very small, illiteracy widespread. and the Ruthenian peasants without any initiative as a result of centuries of servitude.

The peace treaty of Trianon (June 4, 1920) brought the country under Czechoslovak administration. The Czechs founded a large number of schools with Ruthenian as the language of instruction, combatted illiteracy and the low state of public health and helped to modernize the economic life. The area of the province was 4,886 sq.mi.; the population in 1930 was 725,357, including 450,925 Ruthenians (62%), 115,805 Magyars (16%), 95,008 Jews, 34,511 Czechs and Slovaks and 13.804 Germans. With regard to religion 49.5% belonged to the Greek Catholic Church and 15.4% to the Greek Orthodox Church. Uzhgorod, the capital, had 32,250 inhabitants in 1941 and about 43,000 in 1956.

Following the Munich agreement of Sept. 29, 1938 (*i.e.,* the first partition of Czechoslovakia), the Prague government appointed on Oct. 9 an autonomous Ruthenian government headed by Father Augustin Voloshyn. By their Vienna award. on Nov. 2, 1938, Germany and Italy forced Ruthenia to cede to Hungary the southern districts including the capital city of Uzhgorod (Ungvar); 606 sq.mi. in all. Voloshyn moved the capital of the remaining part to Khust. On March 14, 1939, at the time of the second partition of Czechoslovakia. Voloshyn proclaimed the independence of his country. which was renamed Carpatho-Ukraine. Independence lasted one day before the Germans authorized occupation and annexation by Hungary.

When Czechoslovakia was restored in its pre-1938 frontiers after World War II, the Soviet government obtained from the Czechoslovak government the cession of Ruthenia. A formal treaty to this effect was signed in Moscow on June 29. 1945, Ruthenia becoming the Zakarpatskaya (Transcarpathian) *oblast* of the Ukrainian S S.R. On March 9, 1946. its Greek Catholic population was forced to abandon its faith and join the Greek Orthodox Church. The area of the Zakarpatskaya oblast is 4.916 sq.mi.; pop (1959) 920.173. Chief towns: Uzhgorod (cap), Mukachevo, Khust, Beregovo and Vinogradov (formerly Sevluysh).

Sre Michael Winch, Republic *for* a Day (London, 1939); Oscar Jaszi, "The Problem of Sub-Carpathian Ruthenia," in R. J. Kerner, ed, *Czechoslovakia;* Twenty Years of Independence (Berkeley, 1940; London, 1941). (H. Ko.; X.)

RUTHENIANS, a name also applied to those Ukrainians, or Little Russians. who were formerly Austrian subjects. The name is simply a Latinized form of "Russian," the terms "Red Russian," etc., being due to false derivations. When, honever the early Ruthene states lost their independence. the term "Russia" was monopolized by the Muscovite state which, anxious to deny to the Ruthenes a national individuality, gave them the name of "Little Russians." The Ruthenes themselves adopted the distinguishing title of "Ukrainians," *i.e.,* inhabitants of the Turko-Tatar frontier in S. Russia. The name Ruthene survived among the subjects of Poland and Lithuania, and later, Austria. The Ruthenians are thus neither more nor less than Ukrainians, and their linguistic and ethnographical features are described under that head. Yet they can be distinguished from the Ukrainians of Russia, both by their separate history (see POLAND, GALICIA) and bv their religion. After Galicia and Volhynia came under Polish and Lithuanian rule in the 14th century. their upper classes were soon assimilated into the conquering nations, whose language and Catholic faith they adopted. The peasants sank into a state of great degeneracy, which was largely due to the decadence of their own Orthodox priests; recognizing which, they themselves proposed union with Rome. This was proclaimed by the Pope and accepted by the Ruthenes at the Union of Brest-Litovsk, Oct. 6–10, 1596. Under this new "Uniate Church," the Ruthenes retained their Slavonic liturgy and most of the outward forms of the Greek Orthodox Church, while acknowledging the spiritual supremacy of the Pope. Although the two liturgies were nominally entitled to equal treatment in Poland, actually the Uniate was always treated as inferior, and its adherents sank into a lamentable state of ignorance and poverty, due partly to the ex-

actions of their feudal masters, partly to national oppression, partly to their portentous capacity for consuming fiery liquor, their habit of keeping the holidays of both Julian and Gregorian calendars (in 1860 16 districts in Galicia kept 160–200 days annually as holidays) and their superstitions (in 1807 a method of exorcising cattle plague was to place the carcasses of stricken animals in the wells, pastures and stables of uninfected districts).

On the partition of Poland, a number of Ruthenes passed back under Russian rule. Many of them were quickly reconverted to the Orthodox faith. and every effort was made to russify them. The Orthodox propaganda was extended to Galicia (see PAX-SLAVISM) but the results were more sensational than practical. The Russian government systematically discouraged Ruthenian nationalism until after the revolution of 1905, when some relaxation was made in the oppressive regulations. Similar efforts were made by the Poles of Galicia. and winked at by the Austrian government, but there something was done for the Ruthenes, A metropolitan bishopric was founded at Lemberg in 1806. and suffragates added at Przemysl and Stanislau. In 1877 a Ruthenian chair was established at Lemberg university, but Austria never granted a separate Ruthenian university, in spite of agitation.

After World War I the largest body of Ruthenes, those in east Galicia, claimed the right of self-determination, but their short-lived state was soon absorbed into Poland (see GALICIA). The Ruthenes in the northeast Carpathians were granted to Czechoslovakia, special guarantees being laid down for their national autonomy. They were formed into the province of Subcarpathian Russia (see CZECHOSLOVAKIA). The Ruthenes of Bessarabia and the Bukovina came under Rumanian rule (where the state religion was orthodox), with the protection of the Rumanian Minorities treaty.

The population of Transcarpathian oblast, formerly known as Ruthenia (*q.v.*) and bounded on northwest by Poland. west by Czechoslovakia, south by Rumania and southwest by Hungary, was (1956 est.) 929,000. The region, controlled briefly by Czechoslovakia during World War II, was ceded to the Soviet Union in Sept. 1945. It became an administrative unit of the Ukrainian Soviet Socialist Republic. See UKRAINE, POLAND, RUSSIA, etc.

See also the publications of the League for Ukrainian National Independence (1919–22). (C. A. M.)

RUTHENIUM is one of the platinum metals and resembles platinum in its silver-gray colour and lustre. It is found in small percentages in a number of platinum ores. It was identified as a chemical element in 1844 by Carl Claus, in Russia, and was the last of the platinum metals to be characterized. (See PLATINUM METALS.) The name was selected in honour of the district of Ruthenia by G. W. Osann in 1828, when he made a premature announcement of the discovery of the element in platinum ore from the Ural mountains. Although Osann's announcement was never confirmed, Claus retained the name.

Among the metals of the platinum group, only osmium is more infusible than ruthenium; the melting point of ruthenium is 2,450° C., and its boiling point. which can only be surmised, is estimated to be above 2,700° C. Because of the high melting point, ruthenium is not easily cast; its brittleness, even at a white heat. makes it very difficult to roll or draw into wires. Thus the industrial application of ruthenium is restricted to use as an alloy for platinum and other metals of the platinum group. It serves the same function as iridium for the hardening of platinum and, in conjunction with rhodium, is used to harden palladium. Ruthenium-hardened alloys of platinum and palladium have been found much superior to the pure metals in the manufacture of fine jewelry.

The chemical symbol of ruthenium is Ru, atomic number 44. atomic weight 101.1, specific gravity 12.38. Ruthenium is one of the group of more than 30 elements whose radioactive isotopes are formed when uranium and plutonium atoms disintegrate by the fission process. One of these ruthenium isotopes (Ru^{106}) emits beta rays with a half life of one year to yield a daughter, rhodium-106. Also radioactive, rhodium-106 emits high-energy beta rays and gamma rays with the half life of 30 seconds. This pair of isotopes contributes an important fraction of the residual radiation from uranium or plutonium fuels of fission-type atomic reactors which have "cooled" for a year following their use. The separation of ruthenium from the fissionable elements must be effected before these expensive fuels can be recovered and reprocessed to attain economically competitive atomic power. The chemical effects and hazards of intense radiation impose severe difficulties on the separation process. Similarities in the chemical behaviour of plutonium and ruthenium, in many cases,, make the separation even more difficult.

Ruthenium metal is not attacked by air in the cold. Heated in air or oxygen from about 700° to 1,200° C.. the powdered metal yields a dark blue dioxide, RuO_2, which decomposes at still higher temperatures. The element effectively resists attack by strong acids. even by aqua regia which readily dissolves platinum and gold. Ruthenium metal and the mineral alloys of ruthenium. osmium and iridium are most easily brought into soluble form by fusion with an alkaline oxidizing flux. Compounds, such as K_2RuO_4 (+6 state) and $KRuO_4$ (+7 state); are formed. When these compounds dissolve in aqueous systems, they usually decompose rapidly to lower oxidation states. Like all platinum elements, ruthenium can be readily reduced from its compounds to give free metal. Separation of ruthenium from other heavy metals is conveniently achieved by forming the tetraoxide. RuO_4, which is so volatile it readily distills from aqueous solutions. Osmium is the only other element which can form so high an oxidation state. However. OsO_4 is formed more readily and can be distilled from nitric acid alone. The formation of RuO_4 requires stronger oxidizing agents, such as bromate ion in acids or chlorine in alkaline solutions. RuO_4 is the only known compound of the element with the +8 oxidation state. It must be handled cautiously, for it is extremely poisonous, and above 100° C. it may decompose explosively. Although evidence for compounds of ruthenium in every oxidation state from 0 through +8 has been claimed, the +3, +4, +6 and +8 states are the most important.

The +3 and +4 oxidation states include numerous co-ordination complexes in which water or ammonia molecules. chloride ions or other groups are bonded covalently to a central ruthenium ion. Typically, six atoms bond to ruthenium. and the complexes are the inert type, in that groups are not replaced rapidly. Many of these co-ordination complexes possess striking colours. which facilitate chemical studies. The +3 or +4 oxidation states are readily interconvertible so that frequently in the past, errors have been made in the assignment of state to a particular compound'; *e.g.*, the compound which Claus originally thought was $K_2[RuCl_5]$, +3 state, proved to be $K_2[RuCl_5(OH)]$, +4 state. Exceptionally stable nitrosoruthenium compounds, containing NO groups bonded to the ruthenium ion, frequently form in the presence of nitric oxide. NO, or nitrate ion. Indeed, a salt which early workers believed mas $K_2[RuCl_6]$ was later shown to be $K_2[RuCl_5(NO)]$. More nitroso compounds are known for ruthenium than for any other element.

Solutions of ruthenium compounds with many reducing agents, such as zinc or hydrogen sulfide, give blue solutions containing the +2 state. A compound, $K_4[Ru(CN)_6]$, is an analogue of the familiar iron (II) compound. The carbonyl. $Ru(CO)_5$, represents the zero state. The only compound in the +5 state is the fluoride, RuF_5, prepared by the reaction between the elements.

(D. S. MN.)

RUTHERFORD, ERNEST RUTHERFORD, 1ST BARON. OF NELSOX AXD CAMBRIDGE (1871–1937), British physicist. winner of the Nobel prize in chemistry for 1908. whose researches in radiation and atomic structure were basic to the later 20th-century developments in nuclear physics. Born at Nelson, N.Z., on Aug. 30, 1871, he received his secondary training at Nelson college and, on graduation in 1889, gained a scholarship at the University of New Zealand, Wellington. By 1893 he had taken his M.A. degree with a double first in mathematics and physics.

In 189; Rutherford won an 1851 exhibition scholarship which took him to Cambridge university. At the Cavendish laboratory his ability was recognized at once by J. J. Thomson. His earliest research there was a detector for electromagnetic waves, its essential feature being a small magnetizing coil containing a tiny bundle of magnetized iron wire. Rutherford's second piece of

work, done jointly with Thomson, dealt with the temporary conduction in gases which results from ionization produced by X-rays.

In 1897 Rutherford worked with Thomson upon the mobility of ions and related topics, but especially upon the negative ions emitted when ultraviolet light falls upon a clean metal surface. The discovery of Becquerel rays and radium had aroused his curiosity as to just what kind of ions are emitted by radium. At this juncture Rutherford accepted a call to McGill university, Montreal, Que. On reaching the Macdonald laboratory there. in the autumn of 1898, he at once continued work begun at Cambridge on the radiation from radium, and reported in 1899 that it is quite complex, consisting first of all of easily absorbed rays—rays which are stopped by a few centimetres of air. These he called alpha rays. Besides these, he found uranium giving a far more penetrating radiation, able to pass through a sheet of aluminum several millimetres thick. These he named beta rays, and they proved to be high-speed electrons.

Rutherford's next work at Montreal was done jointly with R B. Owens. It was a study of thorium emanation, which led to the discovery of a new noble gas, an isotope of radon, later known as thoron. After Frederick Soddy came to McGill university in 1900, he and Rutherford created the modern theory of radioactivity, excellently set forth in Rutherford's *Radioactive Substances and Their Radzations.*

In 1907 Rutherford accepted an invitation to succeed Sir Arthur Schuster in the Langworthy professorship at Manchester university. It was about this time that he and J. T. Royds proved that alpha particles consist of helium atoms. The Nobel prize was presented to Rutherford on Dec. 11, 1908, two years before he began thinking about the scattering of alpha rays and the nature of a nucleus which could produce such scattering—his nuclear theory—the greatest of all his contributions to physics. In 1912 Niels Bohr came to work in the Manchester laboratory, and it was there that Bohr adapted the nuclear structure of Rutherford to the quantum theory of Max Planck and thus obtained an atomic structure which satisfied the experimental findings of J. R. Rydberg and other spectroscopists. About this time H. G. Moseley got in touch with Rutherford and worked with him during the year 1913. Moseley bombarded the atoms of various elements with cathode rays and proved that the inner structures of these atoms (with the positive charge on the Rutherford nucleus) respond in a group of lines which characterize the elements much as the natural numbers might do, so that each element can be assigned its atomic number. The importance of this discovery lies in the fact that the properties of an element are defined by its atomic number.

After World War I, in which he worked on methods of submarine detection, Rutherford succeeded, by the bombardment of nitrogen uith alpha particles, in transmuting the element nitrogen with an isotope of oxygen. *(See* NUCLEUS. *Description and History.)*

In 1919 Rutherford was invited to succeed J. J. Thomson in the Cavendish chair at Cambridge. Honours now came in rapid succession. Rutherford had been knighted in 1914. The Copley medal of the Royal society was bestowed on him in 1922; the presidency of the British Association for the Advancement of Science in 1923, to be followed, two years later, by the presidency of the Royal society. In 1925 he was appointed to the Order of Merit. In 1931 he was created 1st Baron Rutherford of Nelson. He died at Cambridge on Oct. 19. 1937.

Rutherford, together with J. Chadwick and C. Ellis, wrote *Radiations From Radioactive Substances* (1930), a book so thoroughly documented that it serves every need in the way of a chronological list of Rutherford's published papers.

See A. S. Eve, *Rutherjord* (1939). (H. Cw.; X)

RUTHERFORD, MARK, the pen name of William Hale White (1829–1913), English author, born at Bedford, Eng. His father, William White, a member of the nonconformist community of the Bunyan meeting. moved to London. where he was well known as a doorkeeper of the house of commons; he wrote sketches of parliamentary life for the *Illustrated Times*, papers afterward collected by his son as *The Inner Life of the House* of *Commons* (1897). The son was educated at Cheshunt and New College for the Congregational ministry, but the development of his views prevented his following that career, and he became a clerk in the admiralty.

He had already served an apprenticeship to journalism before he made his name as a novelist by the three books "edited by Reuben Shapcott," *The Autobiography oj Mark Rutherford* (1881), *Mark Rutherford's Delizerance* (1885), and *The Revolution in Tanner's Lane* (1887). Under his own name he translated Spinoza's *Ethics* (1883, new ed. 1894). Later books are *Miriam's Schoolzng, and other Papers* (1890), *Catherine Furze,* 2 vol. (1893), *Clara Hopgood* (1896), *Pages from a Journal, wzth other Papers* (1900), *John Bunyan* (1905), *More Pages from a Journal* (1910) and *Last Pages* (1915) which was edited by his wife Though for a long time little appreciated by the public, his novels—particularly the earlier ones—have a power and style which must always give his works a place of their own in the literary history of their time. He died at Groombridge, Sussex, on March 14, 1913.

See A. *E.* Taylor, "The Novels of Mark Rutherford" in *Essays and Studies* by members of the English association (1913–14).

RUTHERGLEN (locally pronounced *Rŭglen*), a royal and large burgh of Lanarkshire. Scot., 3 mi. S.E. of Glasgow, on the left bank of the Clyde. Pop. (1961) 25,067. Area 1.6 sq.mi. It is connected with the east of Glasgow by two bridges. The parish church stands near the spire of the ancient church where, according to tradition, the treaty was made in 1297 with Edward I, by which Sir John Menteith undertook to betray William Wallace to the English. Rutherglen was erected into a royal burgh by David I in 1126 and claims to he the oldest in Scotland. It then included a portion of Glasgow, but in 1226 the boundaries were rectified so as to exclude the city. and Rutherglen continued to resist incorporation with Glasgow. In early times it had a castle, which after the battle of Langside (1568) was burned by order of the regent Moray. In 1679 the Covenanters published their "Declaration and Testimony" at Rutherglen. The collieries in the area were worked out; the principal industries now include chemical works, paper mills. laundries and oatcake bakeries. and the making of' fireplaces, chairs and textiles, and light and structural engineering.

RUTHIN, a market town and municipal borough (1282) in the West Denbighshire parliamentary division of Denbighshire, Wales 5 mi. S.E. of Denbigh. Pop. (1961) 3.502. Area 3.1 sq mi. It stands on a hill above the Clwyd and is the administrative centre for Denbighshire. The castle, now a private nursing home, was founded in 1281. In 1646 it was demolished by order of parliament and rebuilt in 1826–52. St. Peter's church (1310) has a roof of black oak divided into about joo small panels; the incumbent is known as the warden. The old buildings of the grammar school. founded in 1574, are known as the Ellinor Roberts Memorial buildings. Nantclwyd house has been used as judges' lodgings from *c.* 1400. Ruthin has a mineral water industry.

RUTHVEN (riv'en), name of a noble Scottish family tracing descent from a certain Thor. who settled in Scotland during the reign of David I. In 1488 one of its members, Sir William Ruthven (d. 1528), was created a lord of parliament as Lord Ruthven. Patrick, 3rd Lord Ruthven (c. 1520–1566), played an important part in the political intrigues of the 16th century as a strong Protestant and a supporter of the lords of the congregation. He favoured the marriage of Mary with Darnley, and was the leader of the band which murdered Rizzio. This event was followed by his flight into England, where he died. Ruthven wrote for Queen Elizabeth a *Relation* of the murder, which is preserved in manuscripts in the British museum.

A descendant of the 1st Lord Ruthven in a collateral line, also named Patrick Ruthven (c. 1573–1651), distinguished himself in the service of Sweden, which he entered about 1606. After leaving the Swedish service he was employed by Charles I. in Scotland. He defended Edinburgh castle for the king in 1640, and when the Civil War broke out he joined Charles at Shrewsbury. He led the left wing at the battle of Edgehill, and after this engagement was appointed general-in-chief of the Royalist army. For his services he was created Lord Ruthven of Ettrick in 1639, earl of Forth in 1642 and earl of Brentford in 1644. The earl compelled Essex to surrender Lostwithiel, and was wounded at both battles of Newbury. In 1644 he was superseded in his com-

mand by Prince Rupert. After visiting Sweden on a mission for Charles II., Brentford died at Dundee on Feb. 2, 1651. He left no sons, and his titles became extinct.

Patrick, 3rd Lord Ruthven, was succeeded as 4th lord by his son William (c. 1541–1584), who like his father was prominent in the political intrigues of the period and was also concerned in the Rizzio murder. In 1582 he devised the plot to seize King James VI., known as the raid of Ruthven, and he was the last-known custodian of the famous silver casket containing the letters alleged to have been written by Mary, queen of Scots, to Bothwell. In 1581 he was created earl of Gowrie, but all his honours were forfeited when he was attainted and executed in May 1584. (See GOWRIE, 3RD EARL OF.)

In 1853 the barony descended to Mary Elizabeth Thornton (c. 1784–1864), the wife of Walter Hore (d. 1878). She and her husband took the name of Hore-Ruthven, borne by later barons.

See the Ruthven Correspondence, edited with introduction by the Rev. W. D. Macray (1868); J. H. Round, "The Barony of Ruthven of Freeland" in Joseph Foster's *Collectanea* Genealogica (1881–85); and Sir R. Douglas, The Peerage of Scotland (new ed. by Sir J. B. Paul).

RUTILE is the most abundant of the three native forms of titanium dioxide, the others being anatase and brookite (*q.v.*). Ordinary rutile is red or brown (hence the name from the Latin *rutilus*, "red").

Rutile, with the composition TiO_2, is a commercially important titanium mineral (See TITANIUM: Occurrence; Applications), although commercial TiO_2 is produced largely from ilmenite (*q.v.*), or titanic iron ore. Rutile has minor uses as a colouring agent in porcelain and glass, and in certain steels and copper alloys. Synthetic rutile, superior to natural crystals as a gem, is produced by the flame fusion (Verneuil) process. The boule as it comes from the furnace is black and is deficient in oxygen. Subsequent heating in an electric furnace in an atmosphere of oxygen produces a clear material. However, because of the high absorption of light in the violet end of the spectrum, the material has a yellow tinge. It has a very high index of refraction and high dispersion, hence shows "fire" and brilliance like the diamond, but is of inferior hardness. Synthetic gems can be produced in various colours by adding appropriate metal oxides to the original titanium dioxide. (See also GEM: Synthetic Gems.)

Like anatase, rutile crystallizes in the tetragonal system, but with different angles. It is isomorphous with cassiterite, SnO_2, the common ore of tin, which it resembles in crystal form, twinning, colour and streak, which is pale brown to yellow. The specific gravity is lower, being 4.2 in contrast to 7.0 for cassiterite. The hardness is 6 to 6.5. It is opaque. with a brilliant metallic to adamantine lustre. Some varieties contain significant amounts of iron, columbium or tantalum and are black, with a specific gravity as high as 5.5. Oriented microscopic crystals of rutile produce asterism in phlogopite, ruby and sapphire. The term sagenite is applied to needlelike crystals twinned to form reticulated, or netlike, skeletal plates. Rutilated quartz is rock crystal containing long delicate translucent needles of rutile. Venus's-hairstone (Pliny's *Veneris* crinis) refers to similar needles in smoky quartz.

Rutile is an accessory mineral in igneous rocks, but is more common in schists and gneisses. It is found in some pegmatites and in crystalline limestones. It occurs in apatite veins in Norway, where it is mined. Microscopic needles of rutile are of wide distribution in clays and shales and also in slates. It is common in detrital deposits, as in Florida sand deposits. Australia is the chief producing country. (L. S. RL.)

RUTILIUS CLAUDIUS NAMATIANUS, Roman poet, flourished at the beginning of the 5th century A.D. He was the author of a Latin poem, De Reditu Suo, in elegiac metre, describing a coast voyage from Rome to Gaul in A.D. 416. The literary excellence of the work, and the flashes of light which it throws across a momentous but dark epoch of history, combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about seven hundred lines.

The author is a native of S. Gaul (Toulouse or perhaps Poitiers), and belonged, like Sidonius, to one of the great governing families of the Gaulish provinces. His father was an imperial officialwith a distinguished career, and Rutilius himself was secretary of State and *praefectus* urbi. After reaching manhood, he passed through the tempestuous period between the death of Theodosius (395) and the fall of the usurper Attalus, which occurred near the date when his poem was written. Undoubtedly the sympathies of Rutilius were with those who during this period dissented from and, when they could, opposed the general tendencies of the imperial policy. We know from himself that he was the intimate of those who belonged to the circle of the great orator Symmachus — men who scouted Stilicho's compact with the Goths, and led the Roman senate to support the pretenders Eugenius and Attalus in the vain hope of reinstating the gods whom Julian had failed to save.

Perhaps the most interesting lines in the whole poem are those in which Rutilius assails the memory of "dire Stilicho," as he names him. Stilicho, "fearing to suffer all that had caused himself to be feared," planted the cruel Goths, his "skin-clad" minions in the very sanctuary of the empire. May Nero rest from all the torments of the damned, that they may seize on Stilicho; for Nero smote his own mother, but Stilicho the mother of the world!

We shall not err in supposing that we have here (what we find nowhere else) an authentic expression of the feeling entertained by a majority of the Roman senate concerning Stilicho. He had but imitated the policy of Theodosius with regard to the barbarians; but even that great emperor had met with passive opposition from the old Roman families. It is noteworthy that Rutilius speaks of the crime of Stilicho in terms far different from those used by Orosius and the historians of the lower empire. They believed that Stilicho was plotting to make his son emperor, and that he called in the Goths in order to climb higher. Rutilius holds that he used the barbarians merely to save himself from impending ruin. The Christian historians assert that Stilicho designed to restore paganism. To Rutilius he is the most uncompromising foe of paganism.

With regard to the form of the poem, Rutilius handles the elegiac couplet with great metrical purity and freedom, and betrays many signs of long study in the elegiac poetry of the Augustan era. The Latin is unusually clean for the times, and is generally fairly classical both in vocabulary and construction. The taste of Rutilius, too, is comparatively pure. It is common to call Claudian the last of the Roman poets. That title might fairly be claimed for Rutilius, unless it be reserved for Merobaudes. At any rate, in passing from Rutilius to Sidonius no reader can fail to feel that he has left the region of Latin poetry for the region of Latin verse.

BIBLIOGRAPHY.—All existing mss. of Rutilius are later than 1494, and are copies from a lost copy of an ancient ms. once at the monastery of Bobio, which disappeared about 1700. The editio *princeps* is that by J. B. Pius (Bologna, 1520), and the principal editions since have been those by Barth (1623), P. Burman (1731, in his edition of the minor Latin poets), Wernsdorf (1778, part of a similar collection), Zumpt (1840), and the critical edition by Lucian Muller (Teubner, Leipzig, 1870), and another by Vessereau (1904); also an annotated edition by Keene, with a translation by G. F. Savage-Armstrong (1906). Muller writes the poet's name as Claudius Rutilius Namatianus, instead of the usual Rutilius Clauaius Namatianus; but if the identification of the poet's father with the Claudius mentioned in the Theodosian Code (2, 4, 5) be correct, Muller is probably wrong. Rutilius receives more or less attention from all writers on the history or literature of the times, but a lucid chapter in Beugnot, *Histoire* de la destruction du Paganisme en Occident (1835), may be especially mentioned, and one in Pichon's Derniers *écrivains* profanes (1906). See also O. Schissel von Fleschenberg, Rutilius *Namatianus* (Vienna and Leipzig, 1920). (J. S. R.)

RUTLAND, EARLS AND DUKES OF. The 1st earl of Rutland was Edward Plantagenet (1373–1415), son of Edmund, duke of York, and grandson of King Edward III. In 1390 he was created earl of Rutland, but was to hold the title only during the lifetime of his father, on whose death in 1402 the earldom accordingly became extinct, the earl then becoming duke of York. The title earl of Rutland seems to have been assumed subsequently by different members of the house of York, though it does not appear that any of them had a legal right to it. One of these

was the 1st earl's nephew, Richard Plantagenet, duke of York, father of King Edward IV. Richard's daughter Anne married for her second husband Sir Thomas St. Leger, and their daughter Anne married George Manners, 12th Baron Ros, or Roos (d. 1513). Their son, Thomas Manners (d. 1543), was therefore great-grandson of Richard Plantagenet, who had styled himself earl of Rutland among other titles. In 1525 Thomas Manners was created earl of Rutland, and his descendants have held this title to the present day.

Thomas was a favourite of Henry VIII., who conferred on him many offices and extensive grants of land, including Belvoir Castle, in Leicestershire, which became henceforth the chief residence of his family. He was succeeded in the earldom by his son Henry (c. 1516–1563); and his second son, Sir John Manners, acquired Haddon Hall, Derbyshire, by his marriage with Dorothy, daughter of Sir George Vernon, called "the king of the Peak." Henry, the 2nd earl, was an admiral of the fleet in the reign of Queen Mary, and later enjoyed the favour of Queen Elizabeth.

John, 9th earl (1638–1711), a partisan of the Revolution of 1688, received the Princess Anne at Belvoir Castle on her flight from London; after the accession of Anne to the throne she created him marquess of Granby and duke of Rutland in 1703. The 1st duke was three times married; the divorce in 1670, while he was still known as Lord Ros, of his first wife, Anne, daughter of the marquess of Dorchester, was a very celebrated legal case, being the first instance of divorce *a vinculo* by act of parliament, a divorce *a mensa et* thoro having previously been granted by the ecclesiastical courts. His grandson John, the 3rd duke (1696–1779), was the father of John Manners, marquess of Granby (*q.v.*), a distinguished soldier, whose son Charles, 4th duke of Rutland (1754–1787), succeeded his grandfather. When marquess of Granby he represented Cambridge university in the House of Commons, and hotly opposed the policy that led to war with the American colonies. He helped to procure the entrance of the younger Pitt to the House of Commons, and remained through life Pitt's intimate friend. After succeeding to the dukedom in 1779, he sat in the cabinets of Shelburne and of Pitt, and became lord lieutenant of Ireland in 1784.

He was one of the earliest to advocate a legislative union between Ireland and Great Britain, which he recommended in a letter to Pitt in June 1784. The poet Crabbe was for some time private chaplain to the duke at Belvoir. His wife, Mary Isabella (1756–1831), "the beautiful duchess," whose portrait was four times painted by Sir Joshua Reynolds, was a daughter of the 4th duke of Beaufort. His eldest son, John Henry, 5th duke (1778–1857), was "the duke" in Disraeli's *Coningsby;* the latter's two sons, who succeeded in turn to the dukedom, the marquess of Granby and Lord John Manners, figuring in the same novel as "the marquis of Beaumanoir" and "Lord Henry Sidney" respectively. The 7th duke is noticed separately.

RUTLAND, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF (1818–1906), English statesman, was born at Belvoir Castle on Dec. 13, 1818, the younger son of the 5th duke of Rutland by Lady Elizabeth Howard, daughter of the 5th earl of Carlisle. Lord John Manners, as he then was, was educated at Eton and Trinity College, Cambridge. In 1841 he was returned for Newark in the Tory interest, along with W. E. Gladstone, and sat for that borough until 1847. Subsequently he sat for Colchester, 1850–57; for North Leicestershire, 1857–85; and for East Leicestershire from 1885 until in 1888 he took his seat in the House of Lords upon succeeding to the dukedom.

In 1841 Manners definitely associated himself with the "Young England" party, under the leadership of Disraeli. This party sought to extinguish the predominance of the middle-class *bourgeoisie*, and to re-create the political prestige of the aristocracy by resolutely proving its capacity to ameliorate the social, intellectual, and material condition of the peasantry and the labouring classes. Manners made an extensive tour of inspection in the industrial parts of N. England, in the course of which he and his friend Smythe expounded their views with a brilliancy which frequently extorted compliments from the leaders of the Manchester school. In 1843 he supported Lord Grey's motion for an inquiry into the condition of England, the serious disaffection of the working classes of the north being a subject to which he was constantly drawing the attention of parliament. Among other measures that he urged were the disestablishment of the Irish Church, the modification of the Mortmain Acts, and the resumption of regular diplomatic relations with the Vatican. In the same year he issued in pamphlet form a strong Plea for *National Holydays*. In 1844 Lord John vigorously supported the Ten-hours Bill, which, though strongly opposed by Bright, Cobden, and other members of the Manchester school, was passed in May 1847.

Manners figured as "Lord Henry Sidney" in Disraeli's *Coningsby*, and not a few of his ideas are represented as those of Egremont in Sybil and Waldershare in Endymion. But the disruption of the Young England party was already impending. Lord John's support to Peel's decision to increase the Maynooth grant in 1845 led to a difference with Disraeli. Divergences of opinion with regard to Newman's secession from the English Church produced further defections in the ranks, and the rupture was completed by Smythe acquiescing in Peel's conversion to Free Trade. Lord John produced another volume of verse, known as English Ballads, chiefly patriotic and historical, in 1850. During the three short administrations of Lord Derby (1851, 1858 and 1866) he sat in the cabinet as first commissioner of the office of works. On the return of the Conservatives to power in 1874 he became postmaster-general in Disraeli's administration, and was made G.C.B. on his retirement in 1880. He was again postmaster-general in Lord Salisbury's administration, 1885–86, and was head of the department when sixpenny telegrams were introduced. Finally, in the Conservative government of 1886–92 he was chancellor of the duchy of Lancaster. He had succeeded to the dukedom of Rutland in March 1888, upon the death of his elder brother. He died on Aug. 4, 1906 at Belvoir Castle.

RUTLAND, a midland county of England, bounded north and east by Lincolnshire, north and west by Leicestershire, and south-east by Northamptonshire. It is the smallest geographical county in England, having an area of 152 sq.mi. Rutland is a fertile county of rolling upland, rising to about 600 ft. on the Leicestershire border. On the western side the villages, built of local ironstone, are a golden colour. In the limestone areas, chiefly on the eastern side, gray stone walls and buildings are typical. The western portion is formed of the Jurassic beds, including Lias, inferior oolites and great oolites, which form the high ground. They dip gently to the east and are interrupted in places by faults, as in the Welland valley between Ketton and Duddington which is crossed by the Seaton viaduct ($\frac{3}{4}$-mi. long and 70-ft. high). The Lower Lias occupies but a small part in the extreme northwest. The Middle Lias includes ferruginous limestone (marlstone) yielding iron in workable quantities and forming the productive soil of the vale of Catmose. The Upper Lias forms the steep slopes below the oolitic scarps, and furnishes materials for bricks and tiles. Rutland's two chief rivers, the Gwash and the Chater, flow roughly parallel from west to east into the Welland, which forms the county's southern boundary.

History.— Ancient stone implements have been found in the Oakham district and along the Gwash river and small late Bronze Age hoards. At the time of the Roman invasion, this region was inhabited by a scanty population of the Coritani tribe. This is inferred by the absence of finds, although Ermine street passes through its eastern portion. Rutland was forested in pre-Norman days and only a few early settlements occurred, which were found on the belt of Northampton sands at its junction with the Lias clays, where dry sites could be found near springs, with pastures on the clay beds. These sites were occupied by a tribe of the Angli in the 6th and 7th centuries, and the whole region was absorbed subsequently in the kingdom of Mercia.

Although mentioned by name in the will of Edward the Confessor, who bequeathed it to his queen Edith for life with remainder to Westminster abbey, Rutland did not rank as a county at the time of the Domesday survey in which the term Rutland is applied only to that portion assessed under Nottinghamshire, while the southeast portion of the modern county is surveyed under Northamptonshire, where it appears as the wapentake of Wiceslea.

Rutland is first mentioned as a distinct county under the administration of a separate sheriff in the pipe roll of 1159, but as late as the 14th century it is designated "Rutland Soke," and the connection with Nottinghamshire. was maintained up to the reign of Henry III, when the sheriff of Nottingham mas by statute appointed also escheator in Rutland. Rutland was included in the diocese of Lincoln, and in 1291 it became a new rural deanery within the archdeaconry of Northampton; but on the elevation of Peterborough to an episcopal see by Henry VIII in 1541, the archdeaconry of Northampton with the deanery of Rutland was placed within the newly founded archdeaconry of Oakham.

The Norman Walkelin de Ferrers was connected with this county, and founded Oakham castle in the 12th century. One of the minor battles in the Wars of the Roses was fought (1470) north of Empingham on a site aftenvard known as hose coat field. Essendine was granted in 1545 to Richard Cecil of Burleigh, and the title of baron of Essenden bestowed on his grandson is retained by the earls of Salisbury. Burley-on-the-hill was the seat of George Villiers, duke of Buckingham, who there entertained James I. The present house was built by the earl of Winchelsea and Nottingham between.1694 and 1702 after the original had been burned down by the Parliament forces in 1645.

The county returned two members to parliament from 1295 until 1885, when the number was reduced to one. With part of the Kesteven division of Lincolnshire it forms the county constituency of Rutland and Stamford.

Agriculture and Trade.— Rutland has always been mainly an agricultural county. The Domesday survey mentions numerous mills in Rutland. and a fishery at Ayston rendered 325 eels. In the 14th century the county exported wool. Stilton cheese has long been made in Leyfield forest and the vale of Catmose, and limestone is quarried in many parts of the county. The development of the economic resources of Rutland was helped by the extension of the Melton Mowbray canal to Oakham, completed in 1803, now disused.

In the east and southeast districts of Rutland the soil is light and shallow, while in other districts it is a fertile loam, and in the vale of Catmose the soil is either clay or loam or a mixture of the two. The east part of the county is chiefly under tillage and the west in grass. The chief crops are barley. wheat. oats, turnips and other roots. Many sheep (Leicesters and Southdowns) and cattle (mainly Shorthorns) are reared. Large quantities of cheese are manufactured and sold as Stilton. Agriculture is practically the only industry of importance, hut there is some quarrying and bootmaking. The region producing iron is continued from Northampton into Rutland, and the working of the iron ore forms one of the industries of the county. The limestone quarries at Clipsham and Ketton have been worked since the 13th century. Clipsham stone has been used for many important buildings including cathedrals, Oxford colleges, and the house of commons after it was bombed in World War II; for the Cambridge colleges Ketton stone was largely used. Portland cement has been made at Ketton since 1928.

Population and Administration.— Thearea of the administrative county is 152 sq.mi., with a population (1951) of 20,537. The county contains five hundreds. Oakham (*q.v.*) is the county town and the only urban district., There are three rural districts: Ketton, Oakham and Uppingham (*q.v.*). The county is in the Midland circuit, and assizes are held at Oakham. It has one court of quarter sessions, and is not divided for petty sessional purposes.

BIBLIOGRAPHY.—James Wright, *History and Antiquities of the County of Rutland* (London, *1684)*; T. Blore, *History and Antiquities of the County of Rutland,* vol. i, pt. 2 (containing the East hundred and including the hundred of Casterton Parva; Stamford, 1811); C. G. Smith, *A Translation of that portion of Domesday Book which relates to Lincolnshire and Rutland* (London, 1870).

RUTLAND, a city of Vermont, U.S., is located 95 mi. N.E. of Albany, N.Y.; the seat of Rutland county. In 1759 the site was an outpost on Gen. Jeffrey Amherst's military road across Vermont, connecting forts on Lake Champlain with the Connecticut valley. Chartered in 1761 Rutland was settled by New England Yankees in 1770 and became one of the capitals of the republic of Vermont (see VERMONT: *History*).

After 1847 railroad construction and marble quarrying attracted many Irish, French Canadian and Italian settlers; around 1880 Rutland was Vermont's largest municipality. In 1886 three marble-producing areas (Proctor, Rutland Town and West Rutland) seceded; since then Rutland has been second in size to Burlington.

Rutland arrivals since 1900 include Scots, Swedes and Poles who found work in factories making scales, castings, dresses, gloves, plywood, machinery and airplane parts. Other economic opportunities came with Rutland's new highways, ski areas, golf courses, hospitals, hydroelectric plants and tourist accommodations; the city is also the business centre for west-central Vermont. Modern schools, public and parochial, are augmented by a public library. For comparative population figures see table in VERMONT: *Population.* (J. C. Hu.)

RUTLEDGE, JOHN (1739–1800), U.S. jurist and statesman: was born in Charleston, S.C. After studying law in England he returned to Charleston where he began to practise in 1761. He was a delegate to the Stamp Act congress in 1765 and to the Continental Congress in 1774–1777 and 1782–1783. He served as chairman of the committee which framed the state constitution of 1776 and as the first president or governor of South Carolina from 1776 to 1778 and again from 1779 to 1782. In 1787, having attained "distinguished rank among the American worthies," he was sent to the Constitutional Convention as one of South Carolina's representatives. There he championed the cause of slavery, urged the assumption of state debts by the national government and argued in favour of dividing society into classes as a basis for representation and requiring high property qualifications for office-holding. Having secured safeguards for slavery in the constitution, he took a strong nationalistic position, recommending as chairman of the committee of detail the granting to the national government of indefinite powers of legislation for the purpose, of promoting the general welfare. He was associate justice of the U.S. Supreme Court in 1789–1791, and chief justice of the supreme court of South Carolina in 1791–95. Nominated chief justice of the U.S. Supreme Court in 1795, he failed to win confirmation by the senate. He died in Charleston on July 18, 1800. (JN. C. M.)

His brother, EDWARD RUTLEDGE (1749–1800), a signatory of the Declaration of Independence, was born in Charleston on Nov. 23, 1749. He studied law in his brother's office, and in London in 1769–73, and practised in Charleston. He served in the Continental Congress in 1774–77, and was sent with John Adams and Benjamin Franklin to confer on terms of peace with Lord Howe on Staten Island in Sept. 1776. As captain of artillery and as lieutenant colonel he served against the British in South Carolina. He was a member of the State legislature from 1782 to 1798, and in 1791 drafted the act which abolished primogeniture in South Carolina. From 1798 until his death Jan. 23, 1800, he was governor of South Carolina.

RUTULI, a people of ancient Italy inhabiting Ardea and the district round it on the coast of Latium, at no very great distance from Aricia, and just west of the territory of the Volsci. They are ranked by the form of their name with the Siculi and Appuli (Apuli), probably also with the Itali, whose real Italic name would probably have been Vituli (see ITALY). This suggests that they belong to a fairly early stratum of the Indo-European population of Italy.

RUVO DI PUGLIA, a town and episcopal see of Bari, Puglia, Italy, 21 mi. W. of the city of Bari by tramway, 853 ft. above sea-level. Pop. (1951) 25,662. The cathedral, a splendid basilica with a very lofty nave and two aisles, has three apses, a square campanile and a rich façade with three portals. It belongs to the early 13th century. The interior has a fine triforium. Ruvo occupies the site of the ancient Rubi.

RUWENZORI, also known as Runsoro or Kokora, a mountain range of Central Africa, 65 mi. long and with a maximum breadth of 30 mi., trending a little east of north, lying just north of the equator between lakes Edward and Albert. The range falls steeply on the west to the central African rift-valley traversed by the Semliki, the western head-stream of the Nile, while on the east the fall is somewhat more gradual towards the western

Uganda uplands. The upper parts are separated by fairly low passes into six groups of snowy summits, lying a little west of the central line, rising in each case above 15,000 ft. and reaching, in the culminating point of the western group (Mount Stanley), 16,763 ft.

The origin of the range seems connected with that of the rift-valley on the west. Ruwenzori is a fault block of the Archaean floor of the continent, bounded east and west by lines of fracture, and having a general dip from west to east. A further upheaval produced an ellipsoidal anticline, causing the strata to dip outwards at a high angle. Traces of volcanic action are almost non-existent. Composed in its outer parts of Archaean gneisses and mica-schists offering no great resistance to denudation, in its centre the range consists of much more refractory rocks (amphibolites, diorites, diabases, etc.), to which fact, coupled with the existence of vertical fractures, the persistence and separation of the higher summits is probably due. The snow-clad area does not now extend more than ten miles in any direction; the snow-line is 13,450 ft. but there is evidence of a former extension to as low as 4,600 ft.

The upper region is almost entirely enveloped by day in thick cloud, which descends on the east to about 9,000 ft., and lower still on the west. As a result, the climate is excessively humid, the northern slopes having a rainfall of 200 inches a year giving extremely damp conditions on the mountain. The rivers are raging torrents and have cut deep valleys between the outer spurs. From the innermost recesses between Mounts Stanley, Speke and Baker, the main branches of the Mobuku descend to the east, while the four principal streams on the west unite to form the Butagu, the drainage on both sides ultimately finding its way to the Semliki, either directly or through lakes George and Edward.

The vegetation displays well-marked zones, varying with the altitude; but owing to the lower level to which the cloud descends on the west the limits of the several zones reach a lower level on the west than on the east. They have been defined as follows by Mr. R. B. Woosnam (1907), as follows, the figures in brackets being the upper limit on the east side:—grass (6,500 ft.), forest (8,500), bamboos (10,000), tree heaths (12,500) and lobelias and senecios (14,500), above which is the summit region of snow and bare rock. The boundaries between the zones merelv indicate the levels between which the respective forms are specially characteristic. The forest zone is the best marked, but on the west it merges in part with the low-lying forest of the Semliki valley. Mosses, hepaticae and lichens are prevalent in several of the zones, while bogs, vaccinium and other low-growing plants, are common above the forest zone. Helichrysums are abundant in the zone immediately below the snow. The larger mammals are found chiefly on the lower slopes, but bushbuck, pigs, leopards, monkeys, a hyrax and a serval cat occur at higher altitudes. The birds include kites, buzzards, ravens, sun-birds, touracos, a large swift, and various warblers and other small kinds. The upper limit of human settlement, with cultivation of colocasia and beans, has been placed at 6,700 ft.

In modern times the existence of a snowy range in this part of Africa was first made known by Sir Henry Stanley during the Emin Pasha relief expedition of 1887–89. Stanley named the main mass Ruwenzori, and outlying eastern peaks he called Mt. Gordon Bennett, Mt. Lawson, Mt. Edwin Arnold, etc.—the last named lying north-east of Lake George. Subsequently Stanley's own name was given to the chief summit. One of Stanley's officers, Lieut. Stairs, ascended the western slopes to over 10,000 ft. in 1889, and partial ascents were afterwards made by Dr. Stuhlmann, Mr. Scott-Elliot, Mr. J. E. S. Moore, Sir Harry Johnston, Mr. Douglas Freshfield, and others. Early in 1906 some of the secondary ridges above the snow-line were scaled by Messrs. Grauer, Tegart and Maddox, and by Dr. Wollaston and other members of the British Museum expedition, while later in the year the duke of Abruzzi led a well-equipped expedition to the upper parts of the range and ascended all the principal snow-clad peaks. The expedition produced for the first time a detailed map of the upper region, and threw much light on the geology and natural history of the range.

RUYSBROEK or **RUYSBROECK, JAN VAN** (1293–1381), Dutch mystic, was born at Ruysbroek, near Brussels, in 1293. In 1317 he was ordained priest and became vicar of St. Gudule, Brussels. When 60 years of age he withdrew with a few companions to the monastery of Groenendael, near Waterloo, giving himself to meditation and mystical writing, and to a full share of the practical tasks of the society. He was known as the "Ecstatic Teacher," and formed a link between the Friends of God and the Brothers of the Common Life, sects which helped to bring about the Reformation. Ruysbroek insisted that "the soul finds God in its own depths," and noted three stages of progress in what he called "the spiritual ladder" of Christian attainment: (1) the active life, (2) the inward life, (3) the contemplative life. He did not teach the fusion of the self in God, but held that at the summit of the ascent the soul still preserves its identity. His works, of which the most important were *De vera contemplatione* and *De septem gradibus amoris*, were published in 1848 at Hanover; also *Reflections from the Mirror of a Mystic* (1906) and *Die Zierde der geistlichen Hochzeit* (1901).

BIBLIOGRAPHY.—A new edition of his works, *Alle de werken van J. van Ruysbroec de Wonderbare, etc.*, was published at Bussum in 1912 *seq.* A translation of his works into French was begun by the Benedictines of St. Paul de Wisques in 1920 *seq.* The following single works have been translated: *The Book of the Twelve Béguines* (1913); *The Adornment of the Spiritual Marriage*, etc, trans. by C. A. Wynschenk, ed. with introd and notes by E. Underhill (1916). *See* also R. *M.* Jones, *Studies in Mystical Religion*, pp 308–14 (1909); M. RUYSDAEL (RUISDAEL, RUIJSDAEL), **SALOMON VAN** (c. 1602–1670), Dutch painter, best known for his landscapes, was born in Naarden. He originally had the name of De Gooyer, as did his brother Izack, the father of Jacob van Ruisdael (*q.v.*). Salomon entered the Haarlem Guild of St. Luke in 1628. His first dated pictures are from 1627. He spent his whole life in Haarlem, where he was head of the guild in 1648. He belonged to the Mennonites. He died as a well-to-do person in 1670.

Salomon's early works—winter scenes—continue the tradition of Esaias van de Velde, and his early landscapes are based on the colour scheme and composition of Pieter de Molyn. In the diagonal composition of the dunes and river scenes of the 1630s he is the equal of Jan van Goyen. The colours tend to a green. Around 1645 the composition becomes more powerful, with framing motifs of great trees on one side and a distant view on the other. The colours become warmer and more transparent. In later years the light effects are more outspoken, and the decorative elements become stronger. It is very probable that this change was partly caused by the influence of painters returning from Italy; *e.g.*, J. Both. In the 1660s a blue colour prevails, especially in the river scenes and broad river mouths, which the artist loved to paint. Another favourite subject was the village inn at the roadside with cattle and herdsmen.

Salomon van Ruysdael was a clever figure painter; all the small figures, which add much to the pleasant effects of his landscapes, are by his own hand. Unlike Jacob, he preferred to render actual scenery of Dutch towns, like Alkmaar, Arnhem, Dordrecht and Utrecht, but sometimes he combined motifs from different places in one picture. He also painted, especially in later years, large winter scenes, with skating on frozen rivers, of great decorative beauty.

See C. Hofstede de Groot, *Catalogue of Dutch Painters* (1912); W. Stechow, *Salomon van Ruysdael* (1938). (H. K. Gx)

RUYTER, MICHIEL ADRIAANSZOON DE (1607–1676), Dutch seaman reckoned as his country's greatest admiral, was born at Flushing on March 24, 1607. Going to sea as a boatswain's boy in 1618, he uorked his way up during the next 20 years to become an independent merchant captain. In 1641, he was appointed rear admiral of a fleet sent to assist Portugal against Spain and distinguished himself in a battle off Cape St. Vincent. He resumed his activities as a merchant captain in 1642, but on the outbreak of war with England in 1652 was persuaded to accept a command in the navy. Under Adm. M. H. Tromp, he showed outstanding skill in battles off Plymouth, in the Kentish Knock and off Dungeness (1652) and in the Three Days' battle in the Channel (1653). Appointed vice-admiral of Holland in the service of the Amsterdam admiralty board in Nov. 1653, he subsequently served against French privateers and Barbary pirates in the Mediterranean In 1659 he supported the Danes against the Swedes in the Baltic, but from 1661–64 he was again employed in the Mediterranean. In 1664–65, on secret orders from Holland, he took successful reprisals against the English on the Guinea coast where they had seized some Dutch trading settlements, but his campaign in the West Indies, where he went immediately afterward, was on the whole a failure. On his return to the Netherlands he became lieutenant admiral of Holland and collaborated closely with the grand pensionary. Johan de Witt, in strengthening the navy His greatest successes in the Second Anglo-Dutch War were the Four Days' battle (June 1666) and the raid on the Medway (June 1667), when he burned some of the finest English ships and carried off the flagship to Holland as a prize Perhaps his greatest services however, were in the Third Anglo-Dutch War. when his saving of the Dutch fleet in the battle of Solebay (Southwold bay) in 1672 and his victories over superior forces in the battles of Schooneveld and the Texel in 1673 prevented an Anglo-French invasion of Holland by sea. In 1675 and 1676 he was fighting against the French in the Mediterranean Wounded off Sicily on April 22, 1676, he died on April 29, at Syracuse.

RUZICKA, LEOPOLD (1887–), Yugoslav-Swiss chemist, who was awarded the Nobel prize for chemistry jointly with Adolf Butenandt in 1939 for his work on polymethylenes and higher terpenes, and established the isoprene rule of molecular structure. He was born on Sept. 13, 1887, at Vukovar, Yugos., and educated at the Technische Hochschule, Karlsruhe. He was elected to the chair of organic chemistry at the University of Utrecht in 1926 but returned to the Technische Hochschule and became professor of chemistry in 1929. His original work was in organic chemistry, especially in the composition of the essential oils and the higher terpenes. His investigation of civetone, which occurs in the perfume civet, showed the existence of a 17-membered ring of carbon atoms in its structure. Similar studies on ambergris showed that it was related to the substance that gives violets their perfume. Much of his success in these structural researches depended on his application of the hypothesis that the more complicated molecules were composed of aggregations of isoprene molecules or at least built out of them. This so-called isoprene rule enabled him to determine the constitution of vitamin A. Further work led to the first laboratory production of a sex hormone, namely androsterone, and at the same time to the determination of its constitution. (D. McK.)

RYAZAN, an *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., surrounded by those of Moscow, Ivanovo, Gorkiy, Prenza, Tambov and Tula, and not coinciding with the pre-1917 province of the same name. Area 15.328 sq.mi. Pop. (1959) 1,444.000; mainly Great Russians, with some Tatars, Poles and Jews in the towns. The province is drained by the Oka and its tributaries, the Pronya and Pra, and small lakes are numerous in the wide depression of the Oka. Forests cover about one-fifth of the area, conifers. especially pines, prevailing in the more forested north, and deciduous forest with birch, ash and oak appearing in scattered patches in the south. North of the Oka is gray forest soil of little value for agriculture, but south of that river the fertile black earth of the steppe begins. The climate is extreme, average February temperature 3.2° F., July 67° F., rainfall 16 to 18 in. per annum.

Industries. — The region is essentially agricultural, except for a coal mining belt extending along the railway west from Ryazhsk. Dairying is not much developed, as the land is not suitable for pasture, but grain growing gives a good guarantee for the peasant, and the villages are large, averaging 534 inhabitants. There are some collective agricultural artels The chief crops are rye (50%), oats (19%), millet (11.2%) and potatoes (10%). Buckwheat. grass, hemp and sunflower seed are sown. Orchard fruits, especially apples. and cucumbers. cabbages, onions and other vegetables are cultivated in the valley of the Oka. Sheep, working and milch cattle, horses, pigs and a few goats are bred.

Koustar (peasant) textile industries are widespread, as is the making of leather and felt footwear, and the district was once famous for its lacemaking and leather embroidery. The northern region has small industries of this type. including the making of wooden vessels, sledges and boats. the preparation of pitch and tar and basketwork from the reeds in the marshy northern areas, which occupy 6% of the region. The electric plant of Ryazan works on peat fuel from these bog areas and also on the local coal. Marshy areas near the Oka river have been successfully drained and are now pasture lands.

There is a comparatively good railway net, and 57% of the rivers are available for steam navigation: a good deal of transit trade goes on throughout the region.

RYAZAN, chief town of the above *oblast,* situated on the elevated right bank of the Trubezh. a mile above its confluence with the Oka in 54° 40' N., 39° 43' E. Pop. (1959) 213,000. A wide prairie dotted with large villages, the bottom of a former lake, spreads out from the base of the crag on which Ryazan stands. and actually has the aspect of an immense lake when it is inundated in the spring. The town manufactures agricultural machinery, boots, shoes and leather goods, and bricks, and has a distilling industry. It is an important trading centre, on a navigable river, with four railways radiating from it and a good main road linking it with Moscow. The Krestovozdvizhensk church contains tombs of the princes of the 15th and 16th centuries.

The capital of Ryazan principality was Ryazan—now Old Ryazan, a village close to Spask, also on the Oka. It is mentioned in annals as early as 1097 but continued to be the chief town of the principality only until the 14th century. In the 11th century one of the Kiev princes founded, on the banks of a small lake, a fort which received the name of Pereyaslav-Ryazanskiy. In 1294 (or in 1335) the bishop of Murom, compelled to leave his own town, settled in Pereyaslav-Ryazanskiy. The princes of Ryazan followed his example and by and by completely abandoned the old republican town of Ryazan. In 1300 a congress of Russian princes was held there, and in the following year the town was taken by the Moscow prince. It continued, however, to be the residence of the Ryazan princes until 1517.

RYBINSK, a town in Yaroslavl *oblast,* Russian Soviet Federated Socialist Republic, U.S.S.R., in 58° 3' N., 38° 47' E., on the navigable Volga. opposite the mouth of the Sheksna. which connects the Volga system with Lake Ladoga. Pop. (1959) 181,000. There goods are transshipped from the large Volga boats to the smaller ones of the Marii system linking with Leningrad. There are shipyards, wiredrawing mills, nail, metal and match factories, flour mills, leather works and a brewery.

2. A small settlement of Asiatic Russia on a left bank tributary of the Irtysh, in 56° 5′ N., 72° 30' E.

3. A small town of Asiatic Russia south of the trans-Siberian railway, lying between Krasnoyarsk and Kansk, in 55° 55' N., 94° 55' E.

RYDBERG, (ABRAHAM) VIKTOR (1828–1895), Swedish author, whose wide range of activities enabled him to exercise great influence on Swedish cultural life, was born at Jönkoping on Dec. 18, 1828. His mother died in a cholera epidemic, his father became a dipsomaniac, and he grew up among strangers,

with no home of his own. He matriculated at Lund but had to break off his studies for lack of money. In 1855 he found employment with the liberal newspaper *Goteborgs handelstidning,* in which *Den siste dtenaren,* the novel which made his name. appeared serially in 1859. Its description of the clash between paganism and Christianity in ancient Athens. showing a bias against clerical intolerance and orthodoxy, had a direct bearing on conditions in Sweden. He had previously published *Singoalla* (1857; revised 1865), a romantic lyrical tale of the middle ages in Sweden. His *Bibelns lära om Kristus* (1862), in which he maintained that, according to the Bible, Christ was not God, did much to further a liberal outlook in theology and the church.

In the 1870s Rydberg engaged in many new activities. He entered the *riksdag* for a short time. He advocated linguistic reform, being particularly anxious to reduce the number of words borrowed from the German. In 1874 he visited Rome and on his return wrote *Romerska dagar* (1877), in which his interest in classical antiquity finds its most mature expression. In 1876 he completed his translation of part i of Goethe's *Faust,* which had occupied him for many years. During these years also he revealed outstanding talent as a poet: his collection *Dikter* (1882) established him as the foremost lyrical poet since Esaias Tegnér and Erik Stagnelius. He gradually gained official recognition and was given an honorary doctorate by Uppsala university in 1877, elected to the Swedish Academy in 1878 and in 1884 called to the chair of cultural history at the Stockholm *högskola,* this professorship being subsequently changed to one in the theory and history of art. In the 1880s he was chiefly concerned with research into mythology, the results of which were published in the learned and imaginative *Undersökningar i germanisk mytologi,* 2 vol. (1886–89). In 1891 he published two late flowerings of his literary genius: *Vapensmeden,* a novel describing life at the time of the Reformation in Sweden, and a new collection of poems, one of which, "Den nya Grottesången," is a remarkable indictment of existing social conditions.

Rydberg was an idealist, faithful to the romantic tradition in poetry and thought but with a mind receptive to the ideas of a new age. He achieved an unequaled position of authority in Swedish culture. He died at Djursholm on Sept. 21, 1895.

His *Samlade Skrifter* were edited by K. Warburg, 14 vol. (1896–99).

BIBLIOGRAPHY.—K. Warburg, *Viktor Rydberg,* 2 vol. (1900; new abridged ed., 1913); V. Svanberg, *Rydbergs Singoalla* (1923), *Novantiken i Den siste atenaren* (1928); P. RYDE, a municipal borough and watering place in the Isle of Wight, Eng.. 4½ mi. S.W. of Portsmouth across the Solent. Pop. (1961) 19,796. Area 12.3 sq.mi. On rising ground on the northeast coast, overlooking Spithead, Ryde has woods reaching to the water's edge. and miles of golden sands. It is built on the site of a village called La Rye or La Riche, which mas destroyed by the French in the reign of Edward II. At the close of the 18th century it was a small fishing hamlet, but it rapidly grew as a watering place, and catering for tourists became its chief industry, with agriculture second in importance. The ancient Ryde carnival is held annually in September. The town was incorporated in 1868. Ryde is connected by boat with Portsmouth. The principal buildings are All Saints church, the market house and town hall. the Royal Victoria Yacht club, the pavilion, the Royal Isle of Wight infirmary and the Commodore theatre.

RYDER, ALBERT PINKHAM (1847–1917), U.S painter, noted for his lunar landscapes and allegorical scenes, was born at New Bedford, Mass.. March 19. 1847. About 1868 the family settled in New York city. where Ryder briefly studied painting. He first exhibited at the National Academy of Design in 1873, but most of his exhibited work was shown at the Society of American Artists, of which he was a founding member. In 1882 he traveled in Europe, but paintings in the art galleries interested him little. He was an imaginative, solitary painter; his lifework of about 150 pictures was produced slowly.

By 1900 his powers were impaired, and he injured some earlier paintings with misjudged reworkings; thus he unconsciously prepared the way for the many forged examples that appeared. After a critical illness, friends took him to their home in Elmhurst, Long Island. N.Y., where he died March 28, 1917. Major works include "Siegfried," "The Race Track" and "Toilers of the Sea." Extraordinary colourfulness triumphs over technical imperfections, and his themes range from an idyllic pastoralism through intensifying romanticism to an epic splendour. Many of Ryder's paintings have suffered rapid deterioration.

See Frederic Fairchild Sherman, *Albert Pinkham Ryder* (1920); *L.* Goodrich, *Albert Pinkham Ryder* (1947). (VL. B.; X.)

RYE, a municipal borough and market town in the Rye parliamentary division of East Sussex, Eng., 11 mi. N.E. from Hasting~by road. Pop. (1961) 4,429. Area 1.2 sq.mi. Rye is a picturesque market town, built up a hill by the Rother river, with cobbled streets and timber-framed and Georgian houses. Ypres tower (12th century), which stands on the cliff, was its only defense until Edward III walled the town, but Landgate (1329), one of the three original entrance gates, is all that remains of the 14th century fortifications. The Norman to Perpendicular church of St. Mary has a notable quarter-boy 16th-century clock, and in the churchyard is a Georgian reservoir. Other interesting buildings are the old grammar school (1636), the town hall (1742), the old hospital, the Mermaid inn (*c.* 1420) and the Flushing inn, which contains a mural dated 1547.

As part of the manor of Rameslie, Rye was granted by Edward the Confessor to the monks of Fécamp, by whom it was retained until resumed by Henry III in 1247. The town became a full member of the Cinque Ports *c.* 1350 when, with Winchelsea, the other ancient town, it was added to the confederation. It was then a flourishing port but declined in the late 14th century, partly recovered its prosperity with the decay of Winchelsea in the 1 jth and 16th centuries and then sank again when the sedimentation and consequent receding of the sea, which had been going on slowly since the 14th century, made the use of the harbour impracticable. By the mid-20th century the Rother's mouth was 2 mi. from the town. Rye was twice burned down by the French, in 1377 and 1448 The town was incorporated in 1289 and was granted a three days' fair. Twice-weekly markets had been held before 1405 when the Friday market was changed to Saturday. The market now serves a wide agricultural area. Industries include light engineering, dry cleaning and the tourist trade.

RYE. The cultivated types of rye, known botanically as *Secale cereale,* are grown extensively in Europe, Asia and North America for human and animal consumption. As the least important of the cereal crops, rye generally is grown for grain only where the environmental conditions are relatively unfavourable. Rye probably originated in southwestern Asia. like several other important genera. such as *Triticum* (wheat), *Avena* (oats) and *Hordeum* (barley).

The progenitor of *Secale cereale* is not known with certainty, but there is evidence to indicate that it came from *Secale ancestrale.* There are annual and perennial species that have a brittle rachis. Many varieties of weedy plants are closely related to the cultivated species. Early cultivation was likely in western Asia. followed by westward migration across the Balkan peninsula and over Europe (*see* AGRICULTURE).

No trace of cultivated rye has been found in early Egyptian monuments; likewise no reference to this crop is found in ancient a-ritings. However. the name occurs in northern European languages, suggesting early cultivation in this area.

Only one species of cultivated rye is recognized. *Secale cereale,* although several other species have been found growing wild. Rye has 14 somatic chromosomes, and there is no evidence of a polyploid series except for artificially produced tetraploids with 28 chromosomes. Most rye is grown as a fall-sown annual, though a little is spring sown with spring instead of winter varieties.

The greatest production of rye occurs in the temperate and cool regions of the world; it grows also where altitudes are high. It has the greatest winter hardiness of all small grains, and its culture

extends to the more northerly parts of North America and as far north as the Arctic circle of Europe and Asia. The type of soil has an important influence on geographic distribution. Rye is frequently gromn where other crops fail because of low fertility Most production is from the poorer soils of Europe and the U.S S R and the sandier and poorer soils of North America where it is too cool for winter wheat Soil requirements are modest—even more so than for oats. Rye will produce well on fertile soil, such as the chernozem (black earth) of eastern Europe, but this type of soil is reserved for growing other crops.

Cultivation and Uses.—Rye is gromn much the same as other cereal crops Usually it is planted nith a grain drill at a rate of five to six pecks per acre. depending upon the size of seed. It is not used generally as a companion crop in establishing forages as is common with wheat and oats. Usually it is rotated with other crops. taking the place of winter wheat. Where it is used for pasture, it serves largely as an emergency crop. Seedings are made in the fall, and the crop matures somewhat earlier than the other small grain crops such as wheat, oats and barley. Harvesting in the northern areas comes in late June and early July.

The principal uses of rye are as flour for bread. as feed for livestock and as a pasture plant. Of the cereals, only wheat and rye have the qualities necessary for making a loaf of bread from the flour. The rye flour, however, is very inferior to wheat for baking, lacking the elasticity so essential to a good loaf and being heavy and dark in colour. In Eurasia a loaf made from pure rye flour commonly is referred to as black bread because of its colour. Relatively little rye flour is used for breadmaking in the United States; when so used, it is commonly blended in varying proportions with wheat flour.

Livestock feed is one of the main uses of the rye crop For most classes of livestock it is usually fed in a mixture. It has less fats than has wheat, about the same protein content and compares favourably with wheat and corn for carbohydrates. Vitamin B_1 content is slightly lower than in barley and wheat and much lower than in oats. Rye is used also in the making of alcoholic beverages *(see* WHISKY).

Rye straw is fibrous and tough and used less for feed than for litter or bedding. It is used for mattresses and thatching in certain areas of the world, and in the manufacture of hats and paper.

Rye has considerable use for fall and spring cattle grazing. As a spring pasture it is available before permanent pastures have made sufficient growth for livestock use. The leaves are high in vitamin A content. In warmer areas the grain is used for fall grazing and cover cropping. It is also used as a green manure crop, being plowed under in the spring and followed by a crop of greater economic value.

Diseases.—Ergot is a disease condition that follows when the young kernel is penetrated by the fungus *Claviceps purpurea.* This results in purplish-black ergot bodies called sclerotia. They contain pharmaceutical compounds, such as ergosterol, ergotoxine, ergotamine, ergonovine, ergoclavine, etc.

Although other diseases, including snow mold. attack rye, most of them cause only minor yield reduction. There are several leaf and stem diseases, such as leaf and stem rust, stalk and head smut, scald and blotch, and some root rots. On the whole, if ergot is omitted. disease losses in rye are less than in other small grains.

Botanical Characteristics.— The spike of the rye plant resembles wheat in having alternately ranked spikelets attached to a zigzag axis or rachis, forming a fairly dense head or ear. Spikelets are composed of two thin, narrow, chaffy scales or glumes that subtend two or more florets, which, in turn, are enclosed by a lemma and palea. The lemmas taper into slender bristles or awns that are about two to four centimetres long. Each floret contains three stamens and a pistil, which, after pollination, develop into a one-seeded fruit that is partly exposed. The threshed seed or fruit is known as a caryopsis, a term applied generally to the fruits of cereal crops. Grain colour varies, but grayish-green and light brown predominate, while some are almost white. The thin shell or pericarp sometimes ruptures over the germ. Sterile florets occur to the extent of 25% to 30%, thereby reducing production. Cross-pollination occurs almost completely because the floaers are largely self-sterile. The first foliage leaf is reddish or purplish tinged. Other leaves are long, narrow and thin with a short ligule and a moderate-sized auricle at the juncture of the blade and sheath. The leaf sheaths have a bluish-green bloom. The height and number of the jointed stems or culms depend upon growth conditions.

Rye has the tallest and strongest straw of all of the small grain crops. The straw may attain a height of seven to eight feet on fertile soils but is usually five feet or less. Improved varieties generally have straw of a length more suitable for the use of harvesting equipment. There are numerous fibrous roots, and they penetrate more deeply than do those of other small grains.

Breeding and Hybridization.— Improvement of the rye plant by breeding is difficult because of the high degree of self-sterility. Most improvement has been accomplished by mass selection rather than by the pure line method of breeding. Varieties are genetically impure because of cross-pollination. Moderately self-fertile inbred lines can be perpetuated without difficulty. Hybrid vigour uith greater productivity than open-pollinated varieties results when selected inbred lines are properly mated. No method has been found to utilize this biologic principle commercially.

Since rye is thrifty and winter hardy it has been hybridized with wheat, resulting in winter-hardy selections with the appearance and quality of wheat. However, commercial production of varieties from wheat-rye hybrid origin is rather small. Hybrids with other genera have been made.

During the 1940s tetraploids (28 somatic chromosomes) in rye were produced by several scientists. One tetraploid called Tetra Petkus gained some prominence in the early 1950s; it is stiff strawed, leafy and late in maturity. Kernels are large, weighing $1\frac{1}{2}$ to 2 times as much as common rye. Tests indicate Tetra Petkus flour will bake satisfactorily. Reduced yield may result if the tetraploids are sown close to the common varieties, because cross-pollinated flowers do not produce seed.

In North America the following varieties of common rye are used commercially: Dakold, Emerald, Pierre, Imperial, Caribou, Rosen, Balbo and Abruzzi. The Balbo variety is especially valuable as a pasture crop. Tetra Petkus has proved excellent for pasture in some sections. Most of these varieties have come from stocks of European and Russian origin.

In other countries some important varieties are: Petkus, Kings II, Steel, Star, Ensi, Toivo, Borris Pearl and Vjatka.

Production and Trade.—The estimated world production of rye in the late 1950s was 1,430,000,000 bu. a year. Of this total, approximately 40% was produced in the U.S.S.R. The United States and Canada produced approximately 2.5% of the world total. The leading rye-producing countries in order of importance were the U.S.S.R.. western Germany, Argentina, Turkey, the United States, Spain, Hungary, France, the Netherlands, Austria and Denmark. The average acre yield in the United States is about 12 bu. The low yields are in part due to the practice of growing rye on poor soils unsuited to other crops. Yields in Europe are somewhat higher due to more intensive cultivation *(see* FOOD SUPPLY OF THE WORLD: *Cereals).* The leading rye-producing states in the U.S. are North Dakota, South Dakota, Nebraska, Minnesota and Wisconsin.

Trade in rye has been more limited than that in other grains. Seasonal production influences trade between countries. The U.S.S.R., Canada, Turkey and Argentina usually export rye, while Germany, Finland, Austria and Norway import much more than they export. The United States has been a large exporter but was importing modest quantities in the 1950s.

(H. L. Ss.; H. K. W.)

RYE GRASS, the common name given to species of the genus *Lolium,* comprising a few annual or perennial Eurasian grasses. Two species are of agricultural importance in the United States: English, or perennial rye grass (L. *perenne*) and Italian rye grass (*L. multiflorum*). Both are used to some extent for meadow, pasture and lawn, especially the latter, where a vigorous early growth is desired Another species (L. *temulentum*), commonly known as

darnel and occasionally found in waste places, is supposed to be the tares of the Bible. It is a weed possessing poisonous properties, probably oming to a fungus in the grains. (J. M. Bl.)

RYKOV, ALEKSEY IVANOVICH (1881–1938), Russian politician, was born at Saratov, on Feb. 13, 1881, the son of a peasant. At 18 he was a member of the Russian Social Democratic Workers' party (R.S.D.R.P.), visited Nicolai Lenin at Geneva in 1902, and returned to Russia as a revolutionary propagandist in various industrial districts. He was many times arrested and deported. but each time escaped. He attended the 3rd congress of the R.S.D.R.P. (London, 1905) and was elected a member of its central committee. He took part in the 1905 revolution and again was in London as a delegate to the 5th congress (1907). He lived for some time in Paris (1910–11), later returning to Russia. In 1913 he was exiled to Narym. western Siberia; in 1915 he escaped, was recaptured and sent back to Narym where he remained until the March 1917 revolution.

Rykov took an active part in the Nov. 1917 revolution and became people's commissar of the interior in the first Communist government headed by Lenin. In 1918 he became chairman of the Supreme Economic council, in 1923 was elected to the Politburo, and in Jan. 1924, after Lenin's death, was appointed chairman of the council of people's commissars. When Joseph Stalin started his fight against L. D. Trotsky, Rykov sided against the latter believing that by so doing he was working for peace, although he had no illusions about Stalin's thirst for dictatorial power. Later Rykov's influence waned and in 1930 he was succeeded by V. M. Molotov as chairman of the council of people's commissars. In 1931 Rykov became people's commissar for communications but on Sept. 29, 1936, was dismissed from this post and on March 17, 1937, expelled from the All-Union Communist party for his allegedly "treacherous anti-party activity." On March 13, 1938, with N. I. Bukharin, G. G. Yagoda and other "right-wing deviationists." he was sentenced to death and shot the next day.

See A. I. Rykov, *Statii i ryechi* (Articles and Speeches), 4 vol. (Moscow, 1926–28); A. Lomov, *A. I. Rykov* (Moscow, 1926).

RYLANDS, JOHN (1801–1888), English manufacturer and merchant, was born at St. Helens, Lancashire, on Feb. 7, 1801, and was educated at the grammar school in that town. In 1819 he, his elder brothers and his father, a manufacturer of cotton goods, founded the firm of Rylands and Sons, cotton goods and linen manufacturers, at Wigan. The business rapidly increased, dye-works and bleach-works were added, and the discovery of coal under some of the firm's property added materially to its wealth. In 1825 the partners became merchants as well as manufacturers, and subsequently acquired spinning mills at Bolton and elsewhere. In 1847, his father being dead and his brothers having retired, John Rylands assumed entire control of the business, which in 1873 was turned into a limited liability company. John Rylands was a benefactor to various charities, and was one of the original financiers of the Manchester Ship canal. He died at Stretford on Dec. 11, 1888. A permanent memorial, the John Rylands Library, was erected by his widow in Manchester in 1899.

RYMER, THOMAS (1641–1713), English historiographer royal, was the younger son of Ralph Rymer, lord of the manor of Brafferton in Yorkshire, executed for his share in the "Presbyterian rising" of 1663. Thomas was probably born at Yafforth Hall early in 1641, and was educated at a private school kept at Danby-Wiske by Thomas Smelt, a noted Royalist, and at Sidney Sussex college, Cambridge. He left the university without taking a degree. On May 2, 1666, he became a member of Gray's Inn, and was called to the bar on June 16, 1673. Rymer executed translations, wrote plays, prefaces and complimentary pieces. In 1692 Rymer became historiographer royal.

Within eight months of his official appointment Rymer was directed (Aug. 26, 1693) to carry out that great national undertaking with which his name will always be honourably connected, and of which there is reason to believe that Lords Somers and Halifax were the original promoters. The *Codex Juris Gentium Diplomaticus* (1693) of Leibniz was taken by the editor as the model of the *Foedera*. The plan was to publish all records of alliances and other transactions in which England was concerned with foreign powers from 1101 to the time of publication, limiting the collection to original documents in the royal archives and the great national libraries. Unfortunately, this was not uniformly carried out, and the work contains some extracts from printed chronicles. From 1694 Rymer corresponded with Leibniz, by whom he was greatly influenced with respect to the plan and formation of the *Foedera*. While collecting materials, Rymer unwisely engraved a spurious charter of King Malcolm, acknowledging that Scotland was held in homage from Edward the Confessor. When this came to be known the Scottish antiquaries were extremely indignant, and a controversy arose, the documents in which are now rare and valuable.

At last, on Nov. 20, 1704, was issued the first folio volume of the *Foedera, Conventiones, Litterae et cujuscumque generis Acta Publica inter reges Angliae et alios quosvis imperatores, reges, etc., ab* A.D. *1101 ad nostra usque tempora habita aut tractata*. The publication proceeded with rapidity, and 15 volumes were brought out in nine years. Rymer died after the appearance of the last volume, but he had prepared materials for carrying the work down to the end of the reign of James I. These were placed in the hands of Robert Sanderson, his assistant, who produced the remaining five volumes (1715–17 and 1726–35).

Rymer died at Arundel Street, Strand, on Dec. 14, 1713, and was buried in the church of St. Clement Danes. His will was dated July 10, 1713.

In 1810 the Record Commissioners authorized Dr. Adam Clarke to prepare a new and improved edition of the *Foedera*. Six parts, large folio, edited by Clarke, Caley and Holbrooke, were published between 1816 and 1830. Considerable additions were made, but the editing was performed in so unsatisfactory a manner that the publication was suspended in the middle of printing a seventh part. The latter portion, bringing the work down to 1383, was ultimately issued in 1869. A general introduction to the *Foedera* was issued by the Record Commission in 1817, 4to.

The best account of Rymer is to be found in the prefaces to Sir T. D. Hardy's *Syllabus* (1869–85, 3 vols. 8vo).

RYNCHOPIDAE: *see* SKIMMER.

RYOT or **RAYAT,** properly a subject, then a tenant of the soil (from the Arabic *ra'a,* "to pasture"). The word is used throughout India for the general body of cultivator.-; but it has a special meaning in different provinces. The *ryotwari* tenure is one of the two main revenue systems in India. Where the land revenue is imposed on an individual or community owning an estate, and occupying a position analogous to that of a landlord, the assessment is known as *zamindari;* and where the land revenue is imposed on individuals who are the actual occupants, the assessment is known as *ryotwari*.

RYSBRACK, JOHN MICHAEL (1694–1770), one of the principal sculptors and designers in England in the 18th century, was born at Antwerp in 1694 and studied there, probably in the workshop of Michael van de Voort. He was also influenced by the sculpture of F. Duquesnoy. He worked in Copenhagen, Paris and Rome and in 1720 established himself in London, where, except for another journey to France and Italy, he lived until his death on Jan. 8, 1770.

Rysbrack worked in a classical, sometimes eclectic manner, avoiding emphatic gestures, exaggerated asymmetry and extremes of illusionism. His work includes 16 monuments in Westminster abbey, the splendid equestrian statue of William III at Bristol, tombs in parish churches all over England and innumerable portrait busts. In some respects Rysbrack outshone L. F. Roubillac, his only rival for pre-eminence in England at that time. Pyramidal composition and judicious choice of material are characteristic features of Rysbrack's funeral sculpture.

See M. Batten, *Michael Rysbrack, Sculptor* (1954). **(J. A. Dr.)**

RYSWICK, TREATY OF, the treaty of peace which in 1697 ended the war which had begun in 1689 between France on the one side and the Empire, England, Spain and Holland on the other *(see* GRAND ALLIANCE, WAR OF THE). The treaty was signed by all the Powers concerned except the Empire on Sept. 20, 1697, a treaty being concluded between France and the Emperor on Oct. 30.

The basis of the peace was that all towns and districts seized

since the treaty of Nijmwegen in 1679 should be restored. Thus France surrendered Freiburg, Breisach and Philippsburg to Germany, although she kept Strasbourg. On the other hand, she regained Pondicherry and Nova Scotia, while Spain recovered Catalonia, and the barrier fortresses of Mons. Luxemburg and Courtrai. The duchy of Lorraine, which for many years had been in the possession of France, was restored to Leopold Joseph, a son of duke Charles V., and the Dutch were to be allowed to garrison some of the chief fortresses in the Netherlands, including Namur and Ypres. Louis undertook to recognize William as king of England, and promised to give no further assistance to James II.; he abandoned his interference in the electorate of Cologne and also the claim which he had put forward to some of the lands of the Rhenish palatinate.

RYŪKYŪ ARCHIPELAGO (called also LUCHU), a long chain of islands at one time forming Okinawa prefecture of Japan. stretching from a point 80 mi. S. of Kyushu to a point 73 mi. from the N.E. coast of Formosa, and lying between 24° and 30° N. and 123° and 130° E. Cartographers reckon the Luchu islands as 55, having a total coastline of 768 mi., an area of 848 sq.mi., and a population (1960) 881.967. They divide them into three main groups, of which the northern is called Oshima-shoto; the central, Okinawa-gunto; and the southern, Sakishima-retto. The terms *shoto, gunto* and retto signify "archipelago," "cluster of islands" and "string of islands" respectively. The last-named group is subdivided into Miyako-gunto and Yayeyama-gunto.

Almost at the extreme north of the chain are two islands with active volcanoes, Nakano-shima (3.386 ft.) and Suwanose-Jima (2.708 ft.), but the remaining members of the group give no volcanic indications, and the only other mountain of any size is Yuwan-dake (2,278 ft.) in Amami-Oshima. The capital is Naha in Okinawa, which possesses the principal harbour and has considerable trade. Shuri, on the same island, site of a picturesque castle, was the ancient capital.

Though so close to the tropics, the islands cannot be said to present tropical features: the bamboo is rare; there is no high grass or tangled undergrowth; open plains are numerous; the trees are not crowded together; lakes are wanting; the rivers are insignificant; and an unusual aspect is imparted to the scenery by numerous coral crags. The temperature in Naha ranges from a mean of 82° F. in July to 60" in January.

The fauna includes wild boars and deer, rats and bats. Excellent small ponies are kept, together with cattle, pigs and goats. The majority of the islands are infested with venomous snakes called *habu* (Trimeresurus), which attain a length of 6 to 7 ft. and a diameter of from $2\frac{1}{2}$ to 3 in. Their bite generally causes speedy death, and in the island of Amami-Oshima they claim many victims every year. The most important cultivated plant is the sugar-cane, which provides the principal staple of trade.

Luchu is noted for the production of particularly durable vermilion-coloured lacquer, which is much esteemed for table utensils in Japan. The islands also manufacture fabrics.

People.—Although the upper classes in Luchu and Japan closely resemble each other, there are palpable differences between the lower classes, the Luchuans being shorter and better proportioned than the Japanese; having higher foreheads, eyes not so deeply set, faces less flattened, arched and thick eyebrows, better noses, less marked cheek-bones and much greater hairiness. The last characteristic has been attributed to the presence of Ainu blood, and has suggested a theory that when the Japanese race entered south-western Japan from Korea, they drove the Ainu northwards and southwards, one portion of the latter finding their way to Luchu, the other to Yezo. Women of the upper class never appear in public in Luchu, and are not even alluded to in conversation, but women of the lower orders go about freely with uncovered faces. The Luchu costume resembles that of Japan. The chief staple of the people's diet is the sweet potato, and pork is the principal luxury. An ancient law, still in force, requires each family to keep four pigs. In times of scarcity a species of sago (obtained from the Cycas revoluta) is eaten.

History.—Tinsunshi, "Grandson of Heaven," is the mythical founder of the Luchu monarchy. Towards the close of the 12th century his descendants were driven from the throne, but the old national party soon found a victorious leader in Shunten, son of Tametomo, a member of the famous Minamoto family, who, having been expelled from Japan, had come to Luchu and married there. The introduction of the arts of reading and writing are assigned to Shunten's reign. Chinese invasions of Luchu may be traced back to A.D. 605, but they did not result in annexation; and it was in 1372 that China first obtained from the Luchuans recognition of supremacy. Luchuan relations with Japan had long been friendly, but at the end of the 16th century the king refused Japan assistance against Korea, and in 1609 the prince of Satsuma invaded the islands with 3,000 men, took the capital by storm, captured the king and carried him off to Kagoshima. A few years later he was restored to his throne on condition of acknowledging Japanese suzerainty and paying tribute. The Luchuans nevertheless continued to pay tribute to China also.

The Chinese government, however, though taking a benevolent interest in the welfare of the islanders, never attempted to bring them under military sway. The incongruity of this state of affairs did not force itself upon Japan's attention so long as her own empire was divided into a number of semi-independent principalities. But in 1879 the Japanese government, treating Luchu as an integral part of the mikado's dominions, dethroned its prince, pensioned him as the other feudal chiefs had been pensioned, and converted Luchu into a prefecture under the name of Okinawa. China remonstrating, a conference was held in Peking, when plenipotentiaries of the two empires signed an agreement to the effect that the archipelago should be divided equally between the claimants. The Chinese government, however, refused to ratify this compromise, and the Japanese continued their measures for the effective administration of all the islands. Ultimately (1895) Formosa also came into Japan's possession, and her title to the whole chain of islands ceased to be disputed.

RZESZOW, a town of Poland, in the wojewodzfwo (province) of Rzeszow, situated on the river Wislok, half-way between Lwow and Cracom. Pop. (1960) 62,000. It was founded by Casimir the Great and became the seat of a great family. taking their name from the town and dying out in 1583. The old church shows traces of the original structure built by King Casimir in the 14th century. Ordinarily it is a prosperous town in an agricultural and pastoral district. It was captured by Germany in Sept. 1939.

RZHEV (RZHOV), a town in the Kalinin *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., in 56° 20' N., 34° 19' E.. lying on both sides of the Volga river. there 350 ft. wide and navigable for steamers. It is a centre for four branch railway lines and a telegraph line, and has a radio station. Pop. (1956 est.) 42,200, mainly employed in sawmilling, leather work, oil pressing, silk spinning. distilling, brewing and the making of machinery. In the 12th century it was part of the principality of Smolensk, from 1225 a dependency of Novgorod. In the 15th century the parts of the town on the left and right banks were governed separately under independent princes.

S THIS letter corresponds to the Semitic W (sin "tooth"). The Greek treatment of the sibilants that occur in the Semitic alphabet is somewhat complicated. Semitic ǂ (*samech*) appears in Greek as Ξ (ksi) with the value in early times of *ss,* later and more generally of *x* or ks. The name *samech,* however, which through its Aramaean form became in Greek sigma, was applied to the letter ϟ which corresponded to Semitic W (sin) and stood for *s*. In certain Greek alphabets the letter was called by the name *san.* Semitic ssade appears in the early alphabets of Thera and Corinth in the form M representing s. These alphabets have no *sigma,* while those that have *sigma* do not have M .

Greek forms of the letter were Ϟ, Ɛ, Ϛ, ʃ, Ɛ. A rounded form appeared in the Chalcidian alphabet and from this it was taken into Latin. Etruscan had no rounded form, but it appears in Umbrian and Faliscan. In Latin cursive writing of the 6th century the form was ſ, and from this descended the Irish and Saxon forms ſ. The Carolingian form on the other hand nas extended above the line instead of belon, *e.g.,* ſ. In England in the 17th century the form was ſ and this is occasionally still seen in handwriting when followed by another s. The form ſs also occurs, the left-hand oblique stroke being really part of a ligature with a preceding letter. There was a Greek minuscule form ϲ or C of the 9th century AD., which may be the source both of the Cyrillic с and of the lunate *sigma* ϲ used in some fonts of Greek type at the present time. (See also ALPHABET.)

THE DEVELOPMENT OF THE LETTER 'S' FROM THE PHOENICIAN, THROUGH THE CLASSICAL. DOWN TO MODERN TIMES

The letter represents an unvoiced sibilant. This has become voiced in English when intervocalic (e g., *houses,* nose). In most other positions it remains unvoiced (e g., sing, save, stamp, speak, aspect). When doubled the letter represents the unvoiced sound in all positions (e.g., grasses, miss, assess). In vision and other words ending in sion the *s,* provided it is not doubled, has the voiced sound *ž,* and similarly in pleasure, leisure.

(B.F.C.A.; J. W. P.)

SAADIA BEN **JOSEPH** (SAID AL-FAYYUMI) (882–942) the greatest figure in the literary and political history of medieval Judaism, was born at Dilaz in the Faiyum, Egypt. Nothing certain is known of his father or of his early life. Saadia's literary work appears at a time when learning seemed to be dead in both east and west. Since the completion of the Talmud very little of any literary importance, except for a few midrashim, had been produced among the orthodox (rabbanite) Jews, although the Babylonian schools at Sura and Pumbeditha continued to enjoy a somewhat intermittent prosperity. On the other hand, learning was cultivated among the Karaites. In Saadia, however, the rabbanites found a powerful champion. Almost his first work was an attack on the teaching of 'Anan ben David (*q.v.*), the founder of Karaism (*q.v.*). This, like most of Saadia's polemical writings, is no longer extant, but something of its contents may be inferred from references in the author's other works and from the statements of his opponents. The controversy turned largely on the calendar, which of course involved the dates of festivals, and, since the rabbanite calendar had come down from ancient times, opened up the whole question of oral tradition and the authority of the Talmud. The conflict raged for many years, the chief representative of the other side being Solomon ben Yeruham, a virulent if not successful opponent. In 922 Ben Meir, a person of importance in Palestine. attempted to make alterations in the calendar, against the authority of the Babylonian schools. Saadia, who was then at Baghdad, warned him of his errors, refuted him in a work called "The Book of the Festivals," and finally procured his excommunication by David ben Zakkai, the exilarch or head of the Jewish community in Babylonia. The exilarch appointed Saadia as Gaon (q v.) of Sura, but within two years the exilarch, influenced by rival scholars, dismissed Saadia, uhile Saadia retorted by declaring the exilarch deposed (930). After three years of contention David ben Zakkai succeeded in sufficiently bribing the new and needy caliph, who definitely forbade Saadia to act as Gaon.

The next four years, spent in retirement at Baghdad. were devoted to literary labours. Eventually a reconciliation was effected nith David ben Zakkai, favoured probably by the new caliph Radi, and Saadia was reinstated as Gaon of Sura in 938.

Under his brief rule the school attained the highest reputation among the Jewish communities of east and west. His health was broken. however, and he died in 942.

Works.—Saadia's works were for the most part written in Arabic, the vernacular of the Jews in the east, so that after the breakup of the Babylonian schools in the middle of the 11th century they would be studied only in Spain, the new centre of Jewish learning, and in Egypt. After the expulsion of the Jens from Spain, Arabic practically ceased to be used by them for literary purposes, and in the rest of Europe (except perhaps in southern Italy) it was never understood. Even some Hebrew works, of great modern interest, must have been regarded at the time as of purely temporary value. The anti-Karaite works against 'Anan, Ibn Sakawaihi and Ben Zuta, the *Kitab at-tamyiz, Kitab al-Shara'i, Kitab al-'Ibbur* (calendar) and a book on anthropomorphisms, all in Arabic, are lost and only known from quotations. So also are the refutation of the skeptic Hivi of Balkh, and the *Sefer 'Ovayoth* (on prohibited marriage, against Karaites). Of the *Sefer ha-Mo'adim* and *Sefer ha-Galui* (against David ben Zakkai), both in Hebrew, some fragments have been recovered.

Closely allied to Saadia's polemical writings are his exegetical works. He translated most of the Bible into Arabic and commented on at least some of the books; the memorial edition of his complete works, edited by J. Derenbourg (1893), contains part of this work. The translation of the five Megilloth and of Daniel (with commentary), usually ascribed to Saadia, are not really by him, but a genuine translation of Daniel. with commentary, exists in manuscript. There is also ascribed to him a midrashic work on the Decalogue. These all, no doubt, exhibit the defects necessary to the time in which their author lived. But it must be remembered that Saadia was a pioneer. Hayyuj, the father of Hebrew grammar, was not yet born, nor had the scientific and comparative study of the language begun. In this respect Saadia contributed little to the subject. But both translations and commentaries are remarkable for their great learning, sound sense and an honest endeavour to arrive at the true meaning of the original. They were thus admirably suited for their purpose, which was, like the earlier Targums and the later work of Moses Mendelssohn (*q.v.*), to render the sacred text more intelligible to the faithful generally and to check the growth of error.

The grammatical work called *Agron,* a sort of dictionary, is lost, as are also the *Kutub al-Lughah* and perhaps other treatises on Hebrew grammar. The explanation of the 70 (really 90) *hapax legomena* in the Bible and a poem on the number of letters in the Bible are extant.

On Talmudic subjects again little is preserved beyond the *Kitab al-Mawarith* and a short treatise in Hebrew on the 13 *Middoth* or canons of exegesis of R. Ishmael and some *responsa* mostly in Hebrew. The translation of the Mishnah. the introduction to the Talmud and other works of the kind are known only by repute.

Of the *Siddur* or arrangement of the liturgy by Saadia, a large part exists in a single manuscript at Oxford, and several additional fragments were recovered from the Genizah (archive) of the old synagogue at Cairo. Numerous other liturgical poems, or parts of them, were obtained from the same source, and several were subsequently published in periodicals. His *Azharoth,* a poetical enumeration of the 613 precepts, in Hebrew, is included in the complete works.

Saadia's philosophical works are (1) a commentary on the *Sefer Yezira,* a mystical treatise ascribed to the patriarch Abraham. which, as the foundation of the cabala, had great influence on Jenish thought, and was the subject of numerous commentaries; (2) the *Kitab al-Amanat w'al-Z'tiqadat* ("Book of Beliefs and Convictions"), written in 933. Its system is based on reason in conjunction with revelation, the two being not opposed but rnutually complementary. It is thus concerned, as the title implies, with the rational foundation of the faith and deals with creation, the nature of God, revelation, free will, the soul. the future life and the doctrine of the Messiah. It shows a thorough knowledge of Aristotle, on whom much of the argument is based, and incidentally refutes the views of Christians, Moslems, Brahmans and skeptics such as Hivi. From its nature, however, the work, although of great interest and value, never had the same wider influence as that of Ibn Gabirol (*q.v.*). The Arabic text was published by S. Landauer (1880), the Hebrew version at Constantinople in 1562 and frequently thereafter. *See* also HEBREW LITERATURE; JEWISH PHILOSOPHY.

SAALE, a river of Germany, a tributary of the Elbe, 265 mi. long, rises between Bayreuth and Hof in the Fichtelgebirge. It joins the Elbe just above Barby. It is navigable from Naumburg, 120 mi., with the help of sluices, and is connected with the Elster near Leipzig by a canal. Its chief affluents are the Elster, Regnitz and Orla (right), and the Ilm. Unstrut, Salza, Wipper and Bode (left). Its upper course is rapid. It is sometimes called the Thuringian or Saxon Saale, to distinguish it from another Saale (86 mi. long), a right-bank tributary of the Main.

SAALFELD, a town in the district of Gera, Germany, in the former *Land* of Thuringia. situated on the left bank of the Saale, 24 mi. S. of Weimar and 77 mi. S.W. of Leipzig by rail. Pop. (1950) 27,673. Saalfeld grew up around the abbey founded in 1075 by Anno, archbishop of Cologne, and the palace built up by the emperor Frederick I. In 1389 it was purchased by the landgrave of Thuringia, and with this district it formed part of Saxony. In 1680 it became the capital of a separate duchy, but in 1699 it was united with Saxe-Coburg, passing to Saxe-Meiningen in 1826. One of the most ancient towns in Thuringia, Saalfeld is still partly surrounded by old walls and bastions and contains some interesting medieval buildings, among them a palace, built in 1679 on the site of the Benedictine abbey of St. Peter. which was destroyed during the Peasants' War; the Gothic church of St. John, dating from the beginning of the 13th century; the Gothic town hall, completed in 1537; the Kitzerstein, a palace standing on an eminence above the river, probably first erected by the German king Henry I, although the present building is not older than the 16th century; and the ruin of the Hoher Schwarm, called later the Sorbenburg, said to have been erected in the 7th century. Saalfeld has a number of prosperous industries, and there are ochre and iron mines in the neighbourhood.

SAAR (SAARLAND), an industrial and mining region on the Franco-German frontier, north of Lorraine, near the iron ore of Briey. Area 991 sq.mi.; pop. (1947 est.) 848,052; (1951) 955,413. Chief town, Saarbriicken, pop. (1939 est.) 135.080; (1951) 111.450. The basic industry is coal, good for industrial purposes and gas production and indifferent for coke.

History.—From 1381 to 1793 the city of Saarbrucken on the Saar river was ruled by the counts of Nassau-Saarbrucken, the territory around it, although inhabited by a German-speaking population, being latterly much influenced, and partially ruled, by France in the 150 years which followed the treaties of Westphalia (1648). After the defeat of Napoleon the Saar valley was included in the new Prussian province on the Rhine except for a small portion which was given to Bavaria. After World War I the Saar mines were ceded to the French state "as compensation for the damage to the north of France and as part payment toward the total reparation," and in Jan. 1920 the Saar was placed under a governing commission of the League of Nations for 15 years, at the end of which time a plebiscite was to be held enabling the inhabitants to choose between Germany, France or a continuation of the authority of the league.

The first president of the governing commission was a French chauvinist, Victor Rault. His attitude, and above all the French occupation of the Ruhr in 1923, aroused much anti-French feeling in the Saar, causing the first large-scale miners' strike there which lasted for 100 days. After this the Saar prospered under League of Nations rule, but when the full force of the Nazi propaganda machine was brought to bear upon the Saarlanders in 1933 it was easy enough to arouse anti-foreign feelings together with chau-

vinistic exaltation and personal fear. When it came to the plebiscite on Jan. 13, 1935, the attempts made by the league to ensure a free and secret vote failed to carry much conviction, and more than 90% of the votes went to Germany with 8.8% for the status quo and only 0.4% for France. The Saar territory was therefore handed over to Nazi Germany, which bought back the coal mines as the treaty of Versailles had stipulated.

In 1945 the Saar was occupied by the French. Two years later, having slightly extended its frontiers, the French military governor, Gilbert Grandval, arranged for the election of a representative assembly. The new Diet consisted mainly of representatives of the Christian People's party led by a Catholic, Johannes Hoffmann, who had opposed the Nazis in 1935, and of Social Democrats; it agreed to the political autonomy of the Saar within a diplomatic, tariff and financial union with France. By a Franco-Saar convention (1950), the Saar mines were leased to France for 50 years.

Hoffmann was elected prime minister of the autonomous Saar in 1947. He was attacked by German patriots as the tool of France, but his second success in the elections of Nov. 1952 showed that he was not unpopular. On this occasion his party alone, apart from his Socialist allies, polled 54.8% of the valid votes, while only 24.4% of the voters spoiled their papers to indicate their support of the suppressed pro-German parties. Indeed, because of its autonomy, the Saar recovered economically faster than the rest of Germany, and enjoyed more generous social services. It was only in 1954 that Hoffmann and autonomy lost ground, partly because of the failure of the European Deiense community project with which he linked his policy, and partly because West German prosperity by then magnetically attracted the sympathies of the Saarlanders.

In Oct. 1954 the French and German governments agreed to a statute for the Saar according to which French control should be replaced by that of Western European union; the Saarlanders were to give consent to this plan by referendum, the prohibited parties which favoured reunion with Germany being permitted three months before the vote. The referendum was fixed for Oct. 1955, and the pro-German parties therefore began their activities in July, and immediately announced that to reject the statute would be to vote for Germany. Their campaign, dominated by the lawyer, Heinrich Schneider, was passionate, and culminated in the casting of 67.7% of the votes against the statute. Hoffmann immediately resigned and the pro-German parties formed a government led by Hubert Ney. A new Diet was elected in Dec. 1955, leaving the party position unchanged with the Hoffmann party still holding 13 of the 40 seats. The French agreed in principle to the return of the Saar to Germany and negotiations began early in 1956. In June agreement was reached. The Saar became the tenth *Land* of the German Federal Republic on Jan. 1, 1957. France was allowed to continue to exploit the Warndt coal field on the Franco-Saar border and to canalize the Moselle between Coblenz and Thionville; concessions were made by France about the projected Alsace canal and the damming of the Rhine.

(E. WI.)

SAAR, a right-bank tributary of the Moselle river. It rises in the Donon, an eminence of the Vosges, and flows generally northward through the Saar coal field to its junction with the Moselle at Konz. The principal towns on the Saar are Saarguemines, Saarbrucken, Saarlouis and Saarburg. The river is navigable up to Saarguemines, a distance of 75 mi., where there is connection with the Rhine-Marne canal.

SAARBRÜCKEN, the capital of the *Land* Saarland, German Federal Republic, lies on both banks of the Saar river, 100 mi. S.W. of Frankfurt. Saarbriicken, which was formed in 1909 from the union of the former Saarbriicken with Malstatt-Burbach and St. Johann, is the centre of the Saar's industrial, commercial and cultural life. Pop. (1951) 111,450, (1956 est.) 122,600. It is finely situated among wooded hills and has been called the city of parks and baroque architecture. Among buildings of historic interest are the old town hall and the baroque Ludwigskirche (both of the 18th century) and the 13th-century Stiftskirche, a Gothic church in the St. Arnual district of the town. The 18th-century castle, formerly belonging to the princes of Nassau-Saarbriicken, stands on the site of the earlier royal castle of Sarabrucca; the castle church is of the 15th century. There is a university, an advanced college for electrical engineering and machine construction, and colleges for adult education, arts and crafts, music, local government and other specialized studies. The town is the seat of the Saar parliament and government and of the government's administrative offices. The district and higher courts meet there.

Situated in one of the world's great coal-mining regions, Saarbriicken is principally an industrial city. Its chief importance lies in its iron and steel industries, but manufactures, which are many and various, include optical instruments, lime and cement, soap, sugar and foodstuffs. There are breweries, potteries and printing works. The international Saar fair is held there annually.

Saarbriicken is a frontier town lying at the intersection point of Germany's chief arteries of road and rail communication with France, the Netherlands, Belgium, Luxembourg, Switzerland and Italy, as well as with the rest of Germany. There is an airport to the east of the city in the district of St. Arnual.

History.—The town's history has been traced back to Celtic times from the discoveries of coins, jewels and other artifacts. During the 1st and 3rd centuries there were Roman settlements where Saarbriicken now stands, but an entirely German settlement was later established by the Franks. The present town grew up around the royal castle of Sarabrucca, built by the Frankish kings and first mentioned in A.D. 999. Its early rulers were the bishops of Metz and the counts of Saarbriicken. The city received its charter in 1321. It belonged to the counts of Nassau-Saarbriicken from 1381 to 1793, when it was occupied by the French. In 1815 it passed to Prussia. Saarbriicken became the capital of the Saarland in 1919. As a vital centre of coal production, industry and communications, it was subjected to heavy bombing during World War II. By the late 1950s, however, extensive rebuilding had restored it to its former status.

(F.-J. J.)

SAAREMAA (formerly ÖSEL), an island of the Estonian S.S.R., U.S.S.R., lying in the Baltic sea across the mouth of the Gulf of Riga. Pop. 55,851. It has a length of 45 mi., and an area of 1,010 sq.mi. The chief town is Arensburg, on the south coast, noted for mud baths. In 1227 Ösel was conquered by the Knights of the Sword, and was governed by its own bishops until 1561 when it passed into the hands of the Danes. By them it was surrendered to the Swedes in 1645. Along with Livonia, it was united to Russia in 1721, passing to Estonia in 1918.

SAARLOUIS, a town in the Saar, German Federal Republic, on the left bank of the Saar river, 40 mi. S. of Trier. Pop. (1951) 31,102. Saarlouis was founded in 1681 by Louis XIV of France, and was fortified by Vauban in 1680–85. By the peace of Paris, in 1815, it was ceded to the Allies and by them was turned over to Prussia. There are coal mines in the vicinity, and the town has foundries and large manufactures. The city was named Saarlautern, 1936–45.

SAAVEDRA FAJARDO, DIEGO DE (1584–1648), Spanish diplomat and man of letters, showed himself master of an excellent prose style in his *Idea de un principe politico cristianc* (1640), of which there is an English translation by Astry (1700). His most interesting work is the *República literaria,* published in 1655 as the *Juicio de Artes y Sciencias* under the name of Claudio Antonio de Cabrera.

SAAVEDRA LAMAS, CARLOS (1878–1959), Argentine lawyer, professor, diplomat and Nobel peace prize winner, was born on Nov. 1, 1878, in Buenos Aires. He received the degree of doctor of law *summa cum laude* from the University of Buenos Aires (1903). He held numerous political posts, appointive and elective, in the municipal and national governments of Argentina, including those of minister of justice and public education (1915) and minister of foreign affairs (1932–38). He was Argentine delegate to conferences on world peace and international law, and became a member of several learned societies and academies the world over. For his untiring work for world peace he received the Nobel prize (1936) and numerous decorations and honours from Latin-American and European governments. He held various professorial chairs in the social sciences at the University of Buenos Aires and was rector of that university from 1941 to 1943. He wrote treatises on economics, education, and Argentine and international law. some of which have been translated into French and English. His most noteworthy work is *Por la Paz de las Américas*

(1937). He died in Buenos Aires on May 5, 1959. (C. S. SN.)

SABADELL, a town of northeastern Spain, in the province of Barcelona; on the Ripoll river and on the Barcelona-Zaragoza railway. Pop. (1950) $7,594. Cloth, linen, paper, flour and brandy are manufactured, and there are iron foundries and sawmills. About half the inhabitants are employed in the textile factories. Sabadell is said to be the Roman *Sebendunum,* but in Spanish annals it is not noticed until the 13th century.

SABAEANS. This name is used loosely for the ancient dwellers in southwest Arabia, in the parts now called Yemen, Hadhramaut and Asir. Strictly it belongs to one tribe and one state only. The chief source of information about these peoples is their inscriptions, found in their own land and elsewhere; other sources are the Greek geographers, Babylonian and Ethiopic inscriptions, the Bible and the record of Aelius Gallus' expedition.

History.— The land produced spices and incense and mas a stage on the trade road from India, the Malay archipelago and Africa. At an early date men from Arabia migrated to Abyssinia. The oldest state in Yemen of which anything is known was Ma'in or Ma'an, the Minaeans of the Greeks. Its chief towns, Karnawu, Kaminahu and Yathil (the modern Barakish), lay in the southern Jof, about 120 km. N.N.E. of Sanaa. Though the names of 20 kings are known, the history of Ma'in cannot be written. Relations with Hadramaut were friendly, indeed they "almost suggest a personal union," and there was a colony or outpost at Ma'in Musran (now El 'Ola) to guard the trade road to Egypt and Palestine. Later the state of Kataban began to encroach on Minaean territory, and after fighting with and becoming a vassal or ally of Saba, it joined with that state in destroying Ma'in about 700 B.C. Taking all things into account, the extent of the state, the number of kings, the highly developed script and language, the beginning of the Minaean kingdom cannot be put later than about 1500 B.C. The Sabaeans are mentioned in a Minaean inscription as nomads who raided the caravan road to El 'Ola. This suggests that they may have migrated south to Yemen and founded the kingdom of Saba which bears their name. Perhaps the queen of Sheba lived in the north of Arabia though she has been decorated with the wealth of the kingdom in Yemen. Marib, 100 km. east of Sanaa, was its capital. An inscription of Sargon (c. 715 B.C.) refers to It'i-amara the Sabaean, and one of Sennacherib (c. 685 B.C.) to Ka-ri-bi-lu, king of Saba'i. More than once the second successor of a Yt' 'Mr was a Krb'l. Most probably the pair referred to by the Assyrian kings was Yt' 'mr'Byn, who completed the Marib dam, so famous in Arab story, and defeated Ma'in, killing 45,000 of its inhabitants, and his grandson Krb'l Wtr, who finished the overthrow of Ma'in and pacified the country. Sennacherib speaks of receiving a present from Saba; even court flattery did not dare to call it tribute. About the same time Ausan, which had been a vassal of Kataban, was crushed along with its ally and neighbour Datinat.

Krb'l Wtr was one of the last of a line of rulers who bore the title Mkrb. It was used also by the earlier lords of Kataban. Not long after, the title of king was adopted by the ruler of Saba and used until 115 B.C. This period is marked by the rise of noble clans and ended with the incorporation of Kataban after war both civil and foreign. At home the Hamdan clan tried for the throne and Himyar appears for the first time among the external enemies with Gedarot which had taken the place of the older Ausan. This year 115 is the first of an era by which some of the later monuments are dated. Now began a serious attack on the trade supremacy of the Sabaeans. The Nabataeans fixed themselves across the trade road to Syria, and from Egypt as a base Rome tried to control the sea traffic, besides sending Gallus to attack by land. The royal title now became king of Saba and Du Raidan. About A.D. 300 Hadramaut was conquered and the style became king of Saba, Du Raidan, Hadramaut and Yamnat. This change coincided with a slackening of the Roman effort to control the eastern trade. In the middle of the century Abyssinia conquered the land, but by 375 there was a native king again. His immediate successor adopted the Jewish religion, a mark of an anti-Roman policy, and in 525 Du Nuwas, the last Jewish king, was killed and an Abyssinian governor ruled the land. The failure of the dam at Marib was at once an effect and a cause of the national decay. In 5i9 Persia conquered the country and in 628 the governor turned Moslem and submitted to the prophet. Kataban was ruled at first by Mkrb and then by kings who may have been foreigners. The capital Tmna lay about 110 km. S.E of Marib. The capital of Hadramaut was Sabwat, the Sabota of the ancients.

Government and Social Conditions.— The states were built up of tribes mostly held together by local ties, not by blood bonds. A tribe contained an aristocracy, tenant vassals, resident aliens and serfs. The name Kataban stood for the kingdom and for the tribes composing it; all were children of the god 'Amm. In Saba the tribe of that name stood apart from the others and held a commanding position in the kingdom. The common phrase is "Saba and the tribes." Saba alone is the child of 'Imkh. Later it was put on a level with the other tribes. and was merged in the militia. The king, tribal aristocrats and the temples were the great landholders. Under the form of government in Kataban (probably much the same in the other states) the king was helped and to some extent controlled by a council of elders, though general policy was decided by the assembly of the tribes. In this the serfs had. of course, no place. At a later time in Saba the government became feudal; no longer did the tribal assembly decide the allocation of the land, the king granted fiefs. The change may have been helped by the example of the temples, where the retainers had to obey the orders of the god whose land they tilled. The offices of Mkrb and king mere hereditary and the latter seems often to have associated his son with himself. The land paid three taxes which are never mentioned separately. The amount paid is not knonn but it was assessed while the crops mere standing. Taxes were paid to the temples also; the tithe is named. Public works were done by forced labour. No list of customs, duties or tolls has been found. In early times the title Kbr was given to the chief of a tribe or clan, the governor of a town or district, the chief of the king's serfs and the head of a college of officials; thus there were many offices with one name. Down to the latest times a Kbr was the eponym after whom the year was named. Kyl is first heard of as the name of a leading section of a tribe in the territory of the god Ta'lab Riyam. The ancestors of a petty king were also called Kyl. So it is probable that he was part of the tribal organization and took the place of the Kbr. The Kyn was an administrative officer to serve princes, temples or cities. One mas a priest. The name suggests that he was not a part of the tribal organization.

Trade and the Arts.— Monuments of the south Arabians have been found in Kuweit and Mesopotamia; a coffin of a dealer in spices nas found in Egypt and an altar with a bilingual dedication to Wadd in Delos. Spices and incense were the chief exports and re-exports. The road from Hadramaut ran through the capitals of the other three states, so it is not surprising that one tried to make itself supreme. The returning caravans certainly brought back female slaves for the temple service; women from Gaza and Yathrib (Medina) are mentioned. The production of incense was in the hands of the nobles, 3,000 families Pliny says, and was surrounded aith various tabus, besides a tithe paid to the temple at Sabwat. Great care was given to irrigation and the terracing of the hills into fields. The people were fine masons and stonecutters. The dam at Marib is now in much the same condition as when Hamdani (A.D. 848) saw it. The buildings were made of stone so carefully dressed that often the joints are scarcely visible; the stones are held together by leaden dowels and pillars are strengthened by mortise and tenon joints. Big buildings were often elaborately decorated and several forms of pillars and capitals were in use. The Arab tales of lofty houses with windows of translucent stone are not much exaggerated. The pointed arch was known. Many of the old cisterns are still in use. Many of the inscriptions are beautiful and testify to the skill of the stonecutters, nho were successful with the figures of animals and conventional foliage in low relief. Figures in the round were less good and in statues of men the body is usually a mere block while the face is nooden and expressionless and often out of proportion. Stone pots and jars for household use are simple but neat and well shaped. Most of the metalnork that survives is figures of animals and tablets with inscriptions. The figures are generally

crude. It is not certain that the jewelry, pottery and similar small articles really belong to the land and the period. The best things' suggest foreign influence or even origin. At first the coins followed Athenian models and the workmanship is very good in some. Later they degenerated until the owl looks like a jar with two round handles. Curiously, the standard is Babylonian. The latest coins are weak imitations of Koman coins.

Inscriptions and Language.— The inscriptions are all on stone or metal. Words are separated by a divider and the letters are never joined. In early times the characters were angular but later the corners were rounded and curves appear. The alphabet is connected with the Phoenician; some of the letters are exactly alike, some look as if they had been purposely altered by those who understood the art of carving in stone, and some not found in Phoenician are formed by differentiation from those that are. Short inscriptions have been found in Mesopotamia in nhich Sabaean letters are combined with others resembling the Phoenician and Greek forms. It is not certain nhether this is an early form of the alphabet or merely a freak. There are 29 letters. the 28 of Arabic and the second form of *s* which is found in Hebrew. The language is classified with Abyssinian as south Semitic and is split into several dialects which differ in grammatical forms and vocabulary. In Ma'in and Kataban *s* is used in the pronoun of the third person and in the causative form of the verb where Sabaean has *h*. Hadramaut has forms nhich are from a later period phonetically than the other dialects. The vowels are not indicated so the pronunciation of all words is a matter of guesswork. The writing is usually from right to left but some of the oldest inscriptions read alternately from right to left and from left to right. This is occasionally found in later ones but then for special reasons. Presumably there was a literature, but it has disappeared. Sabaean inscriptions have been found in Abyssinia and the Ethiopic alphabet is derived from the south Arabian. Inscriptions in various alphabets derived from the Sabaean are found in different parts of Arabia as far north as Damascus and testify to the widespread influence of the south Arabian kingdoms. Many of the south Arabian inscriptions are hard to interpret and the sense highly problematical.

Religion.— Over 100 gods and many temples are named but next to nothing is knonn about them. Certain deities are common to the nhole land. Sams, the sun, is feminine and perhaps all goddesses are forms of it. 'Attar, the star Venus, is masculine but corresponds philologically with the Babylonian Ishtar and the Canaanite Ashtoreth. The moon. Warah, Sahr or Sin, occurs occasionally and I1 or Ilan is the name of a god as well as a common noun. Each country had its own god; Ma'in had Wadd, Kataban had 'Amm, Saba had Ilmukah and the clan of Hamdan had Ta'lab Riyam. Perhaps these tribal gods are all forms of the moon. There are indications that the moon. sun and Venus formed a divine family. Others are Anbai, Du Samawi, the enigmatic Nakrah and Atirat (the Hebrew Ashera). Other divine names are clearly descriptive; Hawbas "the drier" is the moon according to Hamdani, Kahil "the old," Sa'd "luck" the giver of good fortune and Hukm "judgment" the judge. At times kings seem to have been worshiped (after death?). Springs and water courses were inhabited by spirits. The bull. the bull's horns and the crescent were symbols of the moon and a disk stood for both the sun and Venus. Often one cannot decide which of the two is meant. The people were the offspring and the king the first-born of the god, so the formula runs "god. king and people." There were no images of the gods. To obtain success in one's undertakings it was the custom to dedicate to the god a statue of oneself in stone, or figures of men or animals in gold (gilt?). Sacrifices and incense were offered to them. The names for altar and sacrifice are the common Semitic terms, and the altar of incense has among other names that of *miḳtār* as in Hebrew. A variety of spices (the wealth of the land) are named on these altars: as rand. ladanum. costus. tarum. frankincense and others not yet interpreted. Pilgrimages mere made at certain seasons and the pilgrim month was named Du Hijjatan or Du Mahajjat. There are many names for the months, some of which refer to agriculture. The name for priest is r-š-w (which may mean giver) and in the El 'Ola texts comes the word I-IT-': both masculine and feminine, which looks like Levite. In later times the name Rahman for God suggests Jewish influence. Christianity was introduced into south Arabia but it was not favoured because of its association with Abyssinia; the famous church in Sanaa mas looked on as a sign of foreign domination. The massacre of Christians in Nejran had poiitical causes as well as religious.

The ruins of the temple at Marib are an open space surrounded by an elliptical wall with the main door at one end of the shorter axis and a smaller at one end of the longer axis. Columns flanked the main door. Outside are several groups of pillars and a set of four may have held a canopy over a throne. The temple at Sirwah is an oblong building with two sets of pillars inside it. One set held up the roof of the sanctuary and the other surrounded a light well. Another at Yeha in Abyssinia is an oblong building with the door at one end. It seems to have been of three stories.

(A. S. T.)

SABANG, a port situated on the island of Pulu Weh, about 20 mi. N. of Kota Raja, the capital of Atjeh, in north Sumatra, Indonesia, 308 mi. from Penang (from which it lies due west), 608 mi. from Singapore and 1,100 mi. from Djakarta. Pop. about 9,000.

Sabang is the first port of call in the Malay archipelago for vessels proceeding from Europe eastward, being the westernmost point at the entrance to the Straits of Malacca. The harbour, built in 1887, principally as a coaling station, is sheltered from the heavy swell of the Indian ocean and strong winds by mountains and high stretches of coast line.

SABARKANTHA, a district of Bombay state, India, which includes some areas of the old Sabarkantha agency. Area of the district, 2,831 sq.mi.; pop. (1951), 684.017.

The SABARKANTHA AGENCY, a subagency of the Western India States agency?was set up in 1934 by the combination of the former Banas Kantha and Mahi Kantha agencies, with headquarters at Sadra. The agency comprised 46 petty states, 13 *talukas* and a number of other estates grouped into 9 thanas (police divisions); the agency occupied a large tract in northwestern Gujarat and five detached areas to the southeast. All the Sabarkantha states?etc., mere merged into Bombay in 1918.

SABATIEW, (LOUIS) AUGUSTE (1839–1901), French Protestant theologian, who applied to New Testament studies the methods of historical criticism and, particularly through his symbolic interpretation of Christian dogma. exerted influence on the Modernist movement (see MODERNISM). was born at Vallon (Ardèche), in the Cévennes, on Oct. 22, 1839. He was educated at the Protestant theological faculty of Montauban and the universities of Tiibingen and Heidelberg. After four years' work as a pastor he became professor of reformed dogmatics at Strasbourg (1867–73) and then (1877) at the newly established Protestant Theological faculty at Paris. He died April 12. 1901.

Among Sabatier's chief works were *The* Apostle *Paul* (1870; Eng. trans. 1891); *Outlines* of *a Philosophy* of *Religion* (1897; Eng. trans. 1897); and his posthumous *Religions* of *Authority and the Religion* of *the* Spirit (1903; Eng. trans. 1904).

See E. Ménégoz, "The Theology of Auguste Sabatier of Paris," *Expository Times, 15*:30–34 (1903–04).

SABATIER, PAUL (1858–1928), French historian who is chiefly remembered as a biographer of St. Francis of Assisi, was born at Saint-Ilichel-de-Chabrillanoux (Ardèche) on Aug. 3, 1858. A Calvinist from birth. he began his studies at the Protestant faculty of theology in Paris in 1880 and became pastor of St. Nicholas, Strasbourg. in 1885. He was expelled from Xlsace in 1889. because he refused to become a German subject, and although he was given a parish in the Cévennes, ill health forced him to retire and he devoted himself to historical research. He was professor of Protestant theology at Strasbourg from 1919 until his death there on March 4, 1928.

Sabatier's *Vie* de *St. François d'Assise* (1893; Eng. trans. 1894) enjoyed an immediate and spectacular success, running through more than 40 editions during its author's lifetime. The work, however, has many defects. not the least of which is Sabatier's disregard for the ideal of historical objectivity. He viewed St.

Francis as an earlier counterpart of the 19th-century Protestant liberal, whose obedience to the church was mere conformity and who u-as in reality the leader of the laity in the 12th century in rebellion against ecclesiastical authority.

SABATIER, PAUL (1854–1941), French organic chemist, shared the Nobel prize for chemistry in 1912 with Victor Grignard for researches in catalytic organic synthesis, and particularly for the discovery of the catalytic activity of finely divided nickel in hydrogenation-dehydrogenation reactions. Born at Carcassonne, Nov. 5, 1854. Sabatier studied at the École Normale Supérieure and under Marcellin P. E. Berthelot at the Collège de France, taking his doctor's degree in 1880. After a year at Bordeaux, he moved to the University of Toulouse in 1882, where he became professor (1884) and dean (1905).

Sabatier's discoveries formed the bases of the margarine, oil hydrogenation and synthetic methanol industries, as well as of numerous laboratory syntheses. He explored nearly the whole field of catalytic syntheses in organic chemistry, personally investigating several hundred hydrogenation and dehydrogenation reactions, showing that several other metals besides nickel possess catalytic activity, though in smaller degree. He also studied catalytic hydration and dehydration, examining carefully both the feasibility of specific reactions and the general activity of the various catalysts.

Sabatier's great discovery was made in 1897 when he and his pupil J. B. Senderens passed efhylene over hot nickel, in an effort to prepare a nickel compound of ethylene. They believed that since carbon monoxide, which has unsaturated valences, combines with nickel to form a carbonyl, then ethylene, too, which is also an unsaturated compound. might form an analogous compound with nickel. Actually, they obtained much carbon, indicating decomposition of the ethylene, and some ethane. Concluding that the ethane could have come only from undecomposed ethylene which had been reduced by hydrogen formed from the ethylene which had decomposed, they tried passing a mixture of hydrogen and ethylene over the nickel, and immediately obtained a smooth reduction.

Sabatier was invited to succeed Henri Moissan (*q.v.*) at the University of Paris, but he remained at the University of Toulouse until his retirement in 1930. He died Aug. 14, 1941.

See H. S. Taylor, *J. Amer. Chem. Soc.,* 66:1615 (1944); H. Vincent, *C. R. Acad. Clerm.-Ferrand,* 213:281 (1941). (P. O.)

SABAZIUS, a Phrygian or Thracian deity, frequently identified with Dionysus, sometimes (but less frequently) with Zeus. His worship was closely connected with that of Cybele and Attis and was chthonian and mystic in character. It reached Greece in the 5th century B.C. A few passages state that the Jews worshiped him (confusion with Heb. *sabaōth?*) see Val. Max. I, 3, 2. The true etymology of the name is unknown. Whether he was the same as Sozon, a marine deity of southern Asia Minor, is doubtful. His image and name are often found on "votive hands," a kind of talisman adorned with emblems, the nature of which is obscure. His ritual and mysteries (Sacra Svadia) gained a firm footing in Rome during the 2nd century A.D.

See Eisele in Roscher's *Lexikon, s.v.* (bibl.).

SABBATAI ZEBI (ZEVI or SEBI) (1626–1676), Jewish Cabalist and pseudo-Nessiah, was born in Smyrna (modern Izmir, Turk.) of Spanish descent. As a boy he was attracted by the mysticism of Isaac Luria (*q.v.*), which led him to adopt the ascetic life. He passed his days and nights in a condition of ecstasy, and attracted a steadily increasing number of followers. Sabbatai began to dream of the fulfillment of messianiac hopes, being supported in his vision by the outbreak of English millenarianism (see MILLENNIUM). Christian visionaries had fixed the year 1666 for the millennium, and since Sabbatai's father, Mordecai, was the Smyrna agent for an English firm, Sabbatai often heard of the expectations of the English Fifth Monarchy men (*q.v.*). In 1638 (the year the cabalists had calculated as the year of salvation), Sabbatai proclaimed himself Messiah. He left Smyrna in 1651 and went first to Salonika, an old cabalist centre, and then to Constantinople, where he encountered a man who pretended that he had been warned by a prophetic voice that Sabbatai was indeed the long-awaited redeemer. He journeyed to Palestine and then to Cairo, where he secured the support of Raphael Halebi, a philanthropist and treasurer of the Turkish governor. With a retinue of believers and considerable funds: Sabbatai returned in triumph to the Holy Land, transferring the centre of his growing movement to Jerusalem. Nathan of Gaza assumed the role of Elijah, the Messiah's forerunner, proclaimed the coming restoration of Israel and the salvation of the world through the bloodless victory of Sabbatai, "riding on a lion with a seven-headed dragon in his jaws." Again 1666 was given as the apocalyptic year.

Threatened with excommunication by the rabbis of Jerusalem, Sabbatai returned in the autumn of 1665 to Smyrna, where he was received with wild enthusiasm. From the Levant the Sabbatian movement spread to Venice, Amsterdam (hailed particularly by the numerous marranos who had fled there from Portugal), Hamburg, London and other centres of Europe and north Africa. Day by day Sabbatai was hailed by all the world as king of the Jews.

At the beginning of the fateful year 1666 he went (or was summoned) to Constantinople. He was placed under arrest, but the reports of miracles continued, and many of the Turks were inclined to become converts. Soon he was transferred to Abydos, where, in prison, he lived like a king, holding court and even receiving foreign delegates. In September Sabbatai was brought before the sultan, and he had not the courage to refuse to accept Islam. He became a Moslem and was appointed doorkeeper to the sultan. The messianic imposture thus ended in the apostacy of Sabbatai. He died in obscurity in Albania in 1676.

A sect of Moslem Sabbatians—the Donmeh of Salonika—survived him, and within the Jewish faith the controversy for and against his Messiahship continued up to the modern period, erupting into the Frankist movement in southern Poland and Czechoslovakia in the 18th century (see FRANK, JAKOB).

BIBLIOGRAPHY.—H. H. Graetz, *History of the Jews,* vol. v (1926). Israel Zangwill has a brilliant sketch of Sabbatai's career in his *Dreamers of the Ghetto* (1898). *See* also Gershon Scholem, *Major Trends in Jewish Mysticism* (1941); Josef Kastein, *The Messiah of Ismir, Sabbatai Zevi* (1931); *H.* C. Schnur, *Mystic Rebels* (1949); S. Schechter, *Studies in Judaism* (1958).

SABBATH, the seventh day of the week as a day of rest and sanctification according to the Jewish religion.

In the Pentateuch the institution of Sabbath is connected with various ideas. (1) It is associated with the doctrine of creation: the creation of the world was completed in six days; and God rested on the seventh day (Gen. ii, 1–2; Ex. xx, 11). (2) Sabbath has a social aspect: it is a day of rest for all men, servants and strangers (Ex. xx, 10; Deut. v, 12–15; Ex. xxiii, 12), and thus stands for the idea of equality of man. On that day there is neither master nor slave; in rest all men are alike. (3) Sabbath also is associated with the idea of holiness: "You shall be holy . . . and you shall keep my sabbaths" (Lev. xix, 1–3). (4) Sabbath is a covenant between God and Israel: "Wherefore the people of Israel shall keep the sabbath, observing the sabbath throughout their generations, as a perpetual covenant. It is a sign for ever between me and the people of Israel" (Ex. xxxi, 16–17). All these ideas must have arisen in different times; their historical sequence however, is difficult to establish.

Observances.—In the prophetic writings the people are continuously admonished to keep the Sabbath holy. Few commandments received the same emphasis. Deutero-Isaiah connects it with doing justice and righteousness: "Keep justice and do righteousness . . . Blessed is the man who does this . . . who keeps the sabbath, not profaning it, and keeps his hand from doing any evil" (Isaiah lvi, 1–2). The attainment of the highest blessings is made dependent on the keeping of the Sabbath (Isaiah lviii, 13–14). Jeremiah warns the people of the impending destruction of the Temple as a punishment for their desecration of the Sabbath: "But if you do not listen to me, to keep the sabbath day holy . . . then I will kindle a fire in its gates" (Jer. xvii. 27). Ezekiel singles out the sin of desecration of the Sabbath along with that of idolatry, as the only reasons for the wrath of God (Ex. xx, 13–24).

The strict observance of the laws of Sabbath since ancient times may be seen from the book of I Maccabees (ch. ii). When the

soldiers of Antiochus Epiphanes were arrayed against the Jews on the Sabbath, the Jews "answered them not, neither cast they a stone at them . . . And they rose up against them in battle on the Sabbath and they died, they and their wives and their children." Realizing that this policy could lead to the annihilation of the people, the Maccabees took counsel and decided, "Whosoever shall come against us to battle on the Sabbath day we shall fight against him and me shall in no wise all die." It was later established as a rule by the authorities that in war the laws of Sabbath are suspended (Bab. Talmud Sabbath 19*a*). The Essenes went to the extreme of not leaving their houses on that day (Josephus, Wars of the *Jews*), and the Jewish sect of Karaites followed this practice, assigning literal meaning to Ex. xvi, 29: "let no man go out of his place on the seventh day." Since the Sabbath begins Friday at sunset, they also insisted on remaining in darkness on Friday night, basing their action on their interpretation of Ex. xxxv, 3. On the other hand, rabbinic law ordained the kindling of lights before the beginning of Sabbath, and upon the lady of the house imposed the duty of inaugurating the Sabbath with a benediction on the kindling of lights.

In the Pentateuch there is no general definition of the kinds of work prohibited. There are, however, specific references to interdicted labours, such as plowing and harvesting (Ex. xxxiv, 21), the kindling of fire (Ex. xxxv, 3), gathering of wood (Num. xv, 32–36) and baking and cooking (Ex. xvi, 23). The types of work prohibited on Sabbath were established by the rabbinic authorities as consisting of 39 main categories of work and are enumerated in the Tractate Sabbath of the Talmud. The basis for the derivation of these prohibited categories was the consideration of the kinds of nork the Jews must have performed while in the wilderness in connection mith the building of the Tabernacle. From each of the main categories of mork cognate types were derived.

The positive duties of Sabbath observance are to wear one's best clothes, to rejoice (derived from Isaiah lviii, 13) and to eat at least three meals during the day. Before the evening meal a special blessing of sanctification, Kiddush, is read. An abbreviated Kiddush is recited before the meal following the morning service (see KIDDUSH AND HABDALAH). The service in the synagogue includes psalms extolling the majesty of God's work and of the Sabbath day. The entire Pentateuch is divided into sections (*Sidroth*), designed to be read on the 52 Sabbaths of the year. A prophetic selection (Haftarah; *q.v.*) is chanted after the reading of the Torah.

At the conclusion of the Sabbath a special blessing (Habdalah) is recited, emphasizing the idea of separation or distinction—separation between Sabbath and weekdays, between the holy and the profane, between light and darkness, etc. In the evening service at the end of the day a reference to the idea of separation is included in the prayer for wisdom and understanding. The concept of separation and discrimination is as indispensable to understanding as is the act of identification.

The precepts prohibiting all kinds of work on the Sabbath are suspended in case of danger to life. A very ancient rabbinic text reads: "It is written: 'You shall keep the Sabbath. because it is holy for you' (Ex. xxxi, 14), the Sabbath is given to you, you are not given to the Sabbath" (Yoma, 85*b*). The laws of Sabbath are thus not ends in themselves but are subordinated to a higher principle, the enhancement of human life. The statutes of the law were given that man might live by them (Lev. xviii, 5; Talmud Yoma 85*b*). The Sabbath laws are suspended even when the danger to health is doubtful. Where human life or health is jeopardized, "It is better to profane one Sabbath for the sake of making possible the observance of many Sabbaths" (ibid.). All affairs of business, even when they do not involve physical exertion, are prohibited on the Sabbath. But the law allows the exercise of offices of humanity, such as caring for the poor, and attending to communal matters, as well as the hiring of a teacher, even for the purpose of teaching one's child a trade (Talmud Sabbath 150*a*).

Some of the pagan Greek and Latin authors attacked the institution of Sabbath on the ground of its wastefulness; to be idle every seventh day is to lose a seventh part of one's life. Because of the Sabbath, the Roman emperors exempted Jews from military service. In modern times the austerity of the Sabbath laws has been criticized, but in fact, in the great age of faith, the Sabbath was pre-eminently a day of spiritual delight, not of either idleness or austerity. Complete abstention from the profane tasks of everyday life made possible the cultivation of intellectual and spiritual interests; worship in the synagogue, study of religious literature, and discourses on religious subjects occupied the better part of the day. It was a day of happiness and spiritual joy that guarded the Jew against the strains and stresses of a hostile world in the long history of his wanderings. "More than the Jew kept the Sabbath, the Sabbath kept the Jew." The close relationship between the observance of the Sabbath and the preservation of Israel was expressed in a poem by Abraham ibn Ezra (12th century): "I keep the Sabbath, God keeps me; it is a sign between Him and me."

Origin. — The question concerning the origin of the Sabbath and the part it played in the life of the Israelites before the Exile is still shrouded in mystery, despite the attempts that have been made to shed light upon it. Friedrich Delitzsch (Babel und *Bibel*) mas the first to propound the theory of the Babylonian origin of the Jewish Sabbath. From Babylonian sources it is known that certain days of the month, the 7th, 14th, 21st and 28th, were days in which the king might not perform certain acts, such as eating roast flesh, changing his dress, offering sacrifice, mounting his chariot or pronouncing judgment; neither might the *magus* prophesy, nor the physician minister to the sick. Thus Delitzsch found the original home of the biblical Sabbath in Babylonia. This theory remains unconvincing for the following reasons: The Babylonian days were "evil days," not propitious for certain actions. Furthermore, those actions were prohibited only to particular persons. such as the king, the *magus* and the physician. In addition to the days mentioned, the 19th day of the month also mas an "evil day," on which those actions were prohibited. Those days in the Babylonian calendar must have had their origin in some magical concept. This has nothing in common with the biblical Sabbath as a day of rest for all men, slave and stranger included—an institution that is bound up with the ethical and monotheistic concept of God as Creator. To be sure, the name Sabbath seems to have its origin in Babylonia. It may be a loan word from the Babylonian *Šappattu,* or Sabbattu, the 15th day of the month; it is, however, equally possible that both, *Šappattu* and Sabbath are derived from a common ground in a prehistoric Semitic tradition. In any case there is a long step from days of taboo to a day of spiritual delight.

There is no evidence of Sabbath observance in the patriarchal period. The reference in the historical and prophetic books of the Bible seem to indicate that a close connection existed betneen the Sabbath and the new-moon festival, and much has been made of the passages implying such a connection. When the Shunammite proposed to visit the prophet, her husband asks: "Why will you go to him today? It is neither new moon nor sabbath" (II Kings. iv, 23). Hosea warned the people in the name of the Lord: "And I will put an end to all her mirth, her feasts, her new moons, her sabbaths, and all her appointed feasts" (Hosea ii, 11). Amos denounced the dishonest traders who say: "When will the new moon be over, that we may sell grain? And the sabbath that we may offer wheat for sale?" (Amos viii, 5). In excoriating the offensive manner of the religious observances, Isaiah says: "Incense is an abomination to me. New moon and sabbath and the calling of assemblies" (Isaiah i, 13). New moon and Sabbath thus are commonly linked together. Hosea implies that Sabbath and new moon were days of festal joy, and from Amos it follows that on those days ordinary business activity was suspended. That carrying any burden on the Sabbath was not allowed can be seen from Jer. xvii, 21–27. That it was customary to visit the Temple on Sabbath days is clear from Isaiah lxvi. 23: "From new moon to new moon, and from sabbath to sabbath, all flesh shall come to worship before me." The linking together of Sabbath and the new moon led I. Meinhold to suggest that the Sabbath must have been originally the day of the full moon, since the counterpart of "new moon" is "full moon" and not the seventh

day of the week. It is further noted that among the Phoenicians the new moon and the full moon were the chief days of sacrifice.

Various theories have been suggested as to when the day of the full moon became the Sabbath. Meinhold attributes the change to Ezekiel. S. Mowinckel suggests a time shortly before the Exile. Max Weber rejects the exilic origin of the Sabbath, citing Neh. xiii, 15 as clear demonstration that those who remained in Palestine knew of the Sabbath as a weekly day. These theories, ho ever, are little more than stabs in the dark, since the transition from a moon-oriented day to the unvarying observance of a seventh day is left unexplained. The law of *Shmita* (*i.e.*, the sabbatical year) is associated with the Sabbath day. Both require cessation of work, the former prohibiting work in general on the seventh day and the latter forbidding agricultural labour in the seventh year. The law demanding the release of slaves in the seventh year (Ex. xxi, 2) again suggests the Sabbath as occurring on the seventh day. *(See* JUBILEE.)

Max Weber accepted the theory that the Sabbath is related to the Babylonian *Šappattu*, but only as a matter of common heritage and not as a borrowing from Babylonia. Weber argued on the basis of Neh. xiii, 15 that the seventh day was originally a day of rest and joy, on which the farmers came to the town markets to sell their produce and perhaps also to amuse themselves. He compared this day with the Roman *nundinae*, the first day of the eight-day week, which had the same social function in Roman life. Likewise, Eduard Meyer compared the Sabbath with the Roman *nundinae*, stressing the economic-social origin of the holiday. He repudiated the connection of the week-day Sabbath with the moon and considers its association with the Babylonian *Šappattu* improbable. He left the name Sabbath unexplained, however. The analogy of the Roman *nundinae* with the Sabbath, as it appears to Meyer and Weber from Nehemiah, is a sociological hypothesis, thus repudiating the speculations of an astrological origin of the Sabbath.

The nature of the Sabbath, however, can hardly be deduced from references to the practice of the people at a certain historical period. This practice was more likely a deviation from a previously existing law or tradition. In denouncing the people for their conduct on the Sabbath and characterizing it as a profanation. Nehemiah clearly implied the prior existence of a different tradition. "'What is this evil thing which you are doing. profaning the sabbath day? Did not your fathers act in this way, and did not our God bring all this evil on us and on this city? Yet you bring more wrath upon Israel by profaning the sabbath'" (Neh. xiii, 17–18). Not the practice of the people, but rather Nehemiah's reaction to their practice should serve as a basis for the understanding of the original nature of the Sabbath as a Jewish institution. Nehemiah is here not instituting something new but referring to a hallowed tradition concerning a day of rest. the profanation of which has in the past brought down upon Israel the wrath of God.

The various attempts to explain the origin of the Sabbath do not take into account the probability of a core of Mosaic or prophetic legislation with which the Sabbath law was closely connected. Admitting that biblical legislation in the form in which it came down to us is of a later date, its essential elements, such as the contents of the Decalogue, were known as a Mosaic tradition, as can be seen from the prophetic references to the "law of hloses." The laws relating to Sabbath as a rest day for all men, to the sabbatical year and to the release of slaves in the seventh year of servitude. imposing restrictions on ownership and on the power of the individual, were revolutionary and idealistic in character; apparently they were grounded in a concept of property and labour closely connected with the prophetic philosophy of God and man. Just as the prophetic concept of ethical monotheism was a new, indeed a unique idea, neither to be derived from, nor to be reduced to the various conceptions of God prevalent in the ancient world, so was the biblical institution of the Sabbath. The new concept of God transformed the sociological and astrological raw material into a new institution; with the result that the analogies to the Sabbath that can be found in the ancient world serve only to accentuate its uniqueness.

Modern Period. — Conservative and Reform Judaism have been confronted by the problem of Sabbath observance in the modern age. Conservative Judaism has not developed a unified point of view with regard to the laws of Sabbath observance. The traditionalists of that movement deny that there is any difference between conservative and orthodox Judaism as to observance of the law. The spokesmen of the liberal wing of the movement plead for certain changes, taking into consideration the conditions of modern life. such as allowing travel to the synagogue. Such modifications, however, have not received the unanimous approval of the official authoritative bodies.

The reform movement also has wrestled with the problem of preserving the Sabbath under modern conditions. It realizes the serious obstacles standing in the way of full observance of the Sabbath laws. The consensus, however, is that Sunday could never become the Jewish Sabbath. The institution of public services on Sunday aims merely at reaching those who are prevented from observing the Sabbath. The distinctive character of the Sabbath as a day of sanctification is necessarily bound up with the Sabbath as hallowed by tradition. A day of rest could be shifted to another day. But Sabbath is the symbol of the covenant of Israel with God and of creation; it is therefore indispensable for the Jew as a sign of his religion. If it is difficult to observe the day in accordance with traditional prescription, it is necessary to strive to observe it to the best of our ability. The humanitarian idea of the Sabbath has a universal message, which constitutes an essential element of the Jewish religion. Recognizing the distinctive and the positive idea of the day. Reform Judaism has striven to preserve it. Such an authoritative body as the Central Conference of American Rabbis recommended conscientious abstention from all those activities that would obscure the difference between Sabbath and the weekdays. By emphasizing in practice the line of cleavage between Sabbath and the weekdays, the idea of the Sabbath will be preserved and intensified. Reform Judaism instituted late Friday evening services and the reading of the Torah portion at that hour. This, of course, is in addition to the regular Sabbath morning Torah service. Reform liturgy provides also for a service in the home (Kiddush). These provisions aim at preserving the Sabbath in its essential elements.

Christianity. — The position Jesus took — that "the sabbath was made for man. not man for the sabbath" (Mark ii, 27) — was essentially in keeping with the rabbinic saying* cited above. It appears, however, that Jesus or his followers went far beyond the rabbis in the application of this. The early Christians taught that the principle of the love of God superseded the law of Moses. Jesus thus justified the conduct of the disciples in plucking ears of corn on the Sabbath, though this act violated the rule prohibiting harvesting. He himself. in healing the sick, broke the rule that one should not administer aid to a sick man when it involves a transgression of the precepts of Sabbath, except when life is threatened. For Jesus and for his followers, the love of God was a surer guide of conduct than mere obedience to the law of Moses.

The Jewish Christians of the early church continued to observe the Sabbath. According to Eusebius, the Ebionites kept both the Sabbath, as a memorial of the creation, and the Lord's day (Sunday), the weekly celebration of the Resurrection; and this was the general practice of the early Christians, as recommended by the Apostolic Constitutions *(see* CONSTITUTIONS, APOSTOLIC). The Eastern Church in recognizing the festive character of the Sabbath and prohibiting fasting on that day is in accordance with Jewish law. The spread of Christianity to the gentile world brought about a change in the Christian attitude. Paul began by insisting that the Jewish Sabbath was not binding on Christians. He ended by asserting that the principle of love was in contradiction of the law of Moses, and bitterly condemned the Christians who abided by the laws of Sabbath (Col. ii, 16 and Gal. iv, 9–11).

Chiefly because of the fact that the Resurrection took place on Sunday (*q.v.*), that day eventually replaced the Sabbath in Christian religion. A few post-Reformation bodies (as the Seventh-Day Adventists) observe the Sabbath rather than Sunday.

SABBATION or SAMBATYON, a river (1) natural and (2) supernatural. (1) The Targum pseudo-Jonathan to Exod. xxxiv., 10 states that the Ten Tribes were exiled beyond the Sambatyon: this is repeated in Gen. Rabba lxxiii.: Num. Rab. xvi. and Yalqūṭ Genesis 984. This is therefore a river in Media, identified by Ramban (Deut. xxxii., 26) with the Gozan (II Kings xvii., 6) and a natural stream. Fuenn (*Pirḥe Çafōn* ii., 133) identifies this with the Zab in Adiabene which Xenophon calls Sabatos and which became corrupted to Sabbation. This river must be sharply distinguished from that mentioned by Josephus (*War,* vii., v., 1) who makes Titus on his return from the destruction of Jerusalem pass, near Beirut, a river which, flowing only on one day in seven, is called after the Sabbath. It will be noted that this river is in Palestine, not in Media and that it is periodic.

(2) With Pliny (*Hist. Nat.* xxxi., 2) two supernatural elements enter the story. First the river rests one day in seven instead of flowing on that day and secondly that day is the Sabbath. A variant of the miracle occurs in Gen. Rabba xi. In the 9th century the mysterious Eldad the Danite carried the wonder still further. In his chronicle the river is waterless but full of sand and stones which roll with a great noise during the week-days but rest on the Sabbath. Th. Noeldeke (*Beiträge zur* Gesch. d. Alexanderromans, 48) traces the Sambatyon in the Alexander legend. The river of sand (*Wadi* ar-Raml) is mentioned by Kazwini (Cosmography ed. Wiistenfeld, ii., 17) and by Mas'udi. Benjamin of Tudela mentions the ten tribes and the Gozan river but he ascribes no miraculous properties to it, save that David Alroy crossed it on his mantle. In the 17th century the miracles hsve increased. Travellers from India relate that the sand or water is curative of leprosy. Menasseh ben Israel states that the sand, if kept in a bottle moves about during the week but rests on Sabbath. It has been suggested that the sand element in the story is to be explained by a confusion of a Hebrew name נהר חל (*Nehar Ḥōl*) which could mean either "weekday river" or "river of sand."

See Jew. *Enc. s.v.* and *A.* Neubauer, *Jew. Quart. Rev. I.,* "Where are the Ten Tribes?"

SABELLIC (from Latin *Sabellus,* "Samnite") has often been used of a minor group of the Italic dialects, namely the pre-Latin dialects of the Paeligni, Marrucini and Vestini (better called North Oscan), of the Volsci, and of the Marsi, Aequi, Sabini and other central Italian tribes (conveniently called Latinian); these dialects are all closely related to Oscan (*q.v.*). The same name, or sometimes Old Sabellic, is also used, but inaccurately, to describe two small but distinct groups of inscriptions from various sites near the east coast of central Italy: (1) from Novilara and Fano (near Pesaro); (2) from Belmonte Piceno, Cupra Marittima, Castignano, Bellante, Grecchio and Superequo. These may be better designated, by "East Italic."

The second group, not more recent in date than the 6th century B.C., are doubtless the oldest written documents known from Italian soil. The lines of writing run alternately left to right and right to left, the positions of the letters being both reversed and inverted in the lines written right to left. Their alphabet is clearly of the same Chalcid-Etruscan origin as that of all the other alphabets of ancient Italy (except the Greek and Phoenician), but shows some peculiarities which suggest direct Greek influence; the language, still untranslated, will probably prove to be an Indo-European (two I.-E. stems, *pater* "father," *mater* "mother" have been identified) and ancient Illyrian dialect (*meitime* is an Illyrian name). For it is known from the elder Pliny, from the Iguvine tables (*iapuzkum* "Iapydian," *i.e.,* "belonging to the Illyrian Iapydes"), and from archaeological evidence, that there were Illyrian settlers in or near that district, the ancient Picenum, where these inscriptions were discovered.

But the documents of the Novilara group are later in date, distinct in alphabet — this is perhaps of Etruscan origin, but shows certain resemblances both to the Umbrian and to the Oscan alphabets — and probably also in dialect. The suggestion that the dialect, however, is allied to Etruscan itself, is quite unsupported by the evidence; the decorative motifs, for example the spiral, which appear on all three of the inscriptions of this group, point rather to the opposite coast of the Adriatic, where similar motifs occur, especially round Nesazio, on contemporary monuments; and there is nothing in the word forms of these documents which may not be Indo-European, while the characteristic Etruscan Syncope and elision (at least in the writing) are entirely lacking.

SABELLIUS (*fl.* 230), early Christian presbyter and theologian, was of Libyan origin, and came from the Pentapolis to Rome early in the 3rd century. He became the leader of the strict Modalists (who regarded the Father and the Son as two aspects of the same subject) whom Calixtus had excommunicated along with their most zealous opponent Hippolytus. His party continued to subsist in Rome for a considerable time, and withstood Calixtus as an unscrupulous apostate. In the West, however, the influence of Sabellius seems never to have been important; in the East, on the other hand, after the middle of the 3rd century his doctrine found much acceptance, first in the Pentapolis and afterwards in other provinces. It was violently controverted by the bishops, notably by Dionysius of Alexandria, and the development in the East of the philosophical doctrine of the Trinity after Origen (from 260 to 320) was very powerfully influenced by the opposition to Sabellianism.

Sabellian Doctrine. — The Sabellian doctrine itself, however, during the decades above mentioned underwent many changes in the East and received a philosophical dress. In the 4th century this and the allied doctrine of Marcellus of Ancyra were frequently confounded, so that it is exceedingly difficult to arrive at a clear account of it in its genuine form. Sabellianism, in fact, became a collective name for all those Unitarian doctrines in which the divine nature of Christ was acknowledged: The teaching of Sabellius himself was very closely allied to the older Modalism ("Patripassianism") of Noetus and Praxeas, but was distinguished from it by its more careful theological elaboration and by the account it took of the Holy Spirit. His central proposition was to the effect that Father, Son and Holy Spirit are the same person, three names thus being attached to one and the same being. What weighed most with Sabellius was the monotheistic interest.

Sabelhus further maintained that God is not at one and the same time Father, Son and Spirit, but, on the contrary, has been active in three apparently consecutive manifestations or energies — first in the πρόσωπον of the Father as Creator and Lawgiver, then in the πρόσωπον of the Son as Redeemer, and lastly in the πρόσωπον of the Spirit as the Giver of Life. It is by this doctrine of the succession of the πρόσωπα that Sabellius is disiinguished from the older Modalists. In particular it is significant, in conjunction with the reference to the Holy Spirit, that Sabellius regards the Father also as merely a form of manifestation of the one God — in other words, has formally put Him in a position of complete equality with the other Persons. This view prepares the way for Augustine's doctrine of the Trinity. Sabellius himself appears to have made use of Stoical formulas (πλατύνεσθαι συστέλλεσθαι), but he chiefly relied upon Scripture, especially such passages as Deut. vi. 4; Exod. xx. 3; Isa. xliv. 6; John x. 38. Of his later history nothing is known; his followers died out in the course of the 4th century.

The sources of our knowledge of Sabellianism are Hippolytus (*Philos,* bk. ix.), Epiphanius (*Haer.* lxii.) and Dionys. Alex. (*Epp.*); also various passages in Athanasius and the other fathers of the 4th century. For modern discussions of the subject *see* Schleiermacher (*Theol. Ztschr.* 1822, Hft. 3); Lange (*Ztschr.* f. *hist. Theol.* 1832, ii. 2); Döllinger (*Hippolyt u. Kallist.* 1853); Zahn (*Marcell v. Ancyra,* 1867); R. L. Ottley, *The Doctrine of the Incarnation* (1896); various histories

of Dogma, and Harnack (*s.v.* "Monarchianismus," in Herzog-Hauck, Realencyk. fur prot. *Theol. und* Kirche, xiii. 303). (A. HA.)

ṢABIANS. The Ṣābians (*aṣ-Sābi'ūn*) who are first mentioned in the Koran (ii. 59, v. 73, xxii. 17) were a semi-Christian sect of Babylonia, the Elkesaites, closely resembling the Mandaeans or so-called "Christians of St. John the Baptist," but not identical with them. How Mohammed understood the term "Ṣābians" is uncertain, but he mentions them together with the Jews and Christians. The older Mohammedan theologians were agreed that they possessed a written revelation and were entitled accordingly to enjoy a toleration not granted to mere heathen. Curiously enough, the name "Ṣābian" was used by the Meccan idolaters to denote Mohammed himself and his Muslim converts, apparently on account of the frequent ceremonial ablutions which formed a striking feature of the new religion.

From these true Ṣābians the pseudo-Ṣābians of Ḥarrān (*Carrhae*) in Mesopotamia must be carefully distinguished. In A.D. 830 the Caliph Ma'mūn, while marching against the Byzantines, received a deputation of the inhabitants of Ḥarrān. Astonished by the sight of their long hair and extraordinary costume, he inquired what religion they professed, and getting no satisfactory answer threatened to exterminate them, unless by the time of his return from the war they should have embraced either Islam or one of the creeds tolerated in the Koran. Consequently, acting on the advice of a Mohammedan jurist, the Ḥarrānians declared themselves to be "Ṣābians," a name which shielded them from persecution in virtue of its Koranic authority and was so vague that it enabled them to maintain their ancient beliefs undisturbed. There is no doubt as to the general nature of the religious beliefs and practices which they sought to mask. Since the epoch of Alexander the Great Ḥarrān had been a famous centre of pagan and Hellenistic culture; its people were Syrian heathens, star-worshippers versed in astrology and magic. In their temples the planetary powers were propitiated by blood-offerings, and it is probable that human victims were occasionally sacrificed even as late as the 9th century of our era. The more enlightened Ḥarrānians, however, adopted a religious philosophy strongly tinged with Neoplatonic and Christian elements. They produced a brilliant succession of eminent scholars and scientists who transmitted to the Muslims the results of Babylonian civilization and Greek learning, and their influence at the court of Baghdad secured more or less toleration for Ṣābianism, although in the reign of Harūn al-Rashīd the Ḥarrānians had already found it necessary to establish a fund by means of which the conscientious scruples of Muslim officials might be overcome. Accounts of these false Ṣābians reached the West through Maimonides, and then through Arabic sources, long before it was understood that the name in this application was only a disguise.

See also "Nouveaux documents pour l'étude de la religion des Harraniens," by Dozy and De Goeje, in the *Actes* of the sixth Oriental congress, ii. 281 f. (1885); and Chwolsohn, *Sabier und der Sabismus* (1856).

SABICU WOOD is the produce of a large leguminous tree, *Lysiloma latisiliqua,* a native of Cuba, Haiti and the Bahamas. The wood has a rich mahogany colour; it is exceedingly heavy, hard and durable.

SABINE, SIR EDWARD (1788–1883), English astronomer and geodesist known for his work on terrestial magnetism, was born in Dublin, Ire. on Oct. 14, 1788. He served in the Royal Artillery and was appointed astronomer to the arctic expeditions of Sir John Ross (1818) and Sir William Parry (1819; *qq v.*) in search of the northwest passage. From 1821 to 1823 Sabine conducted pendulum experiments, to determine the figure of the earth, on the coasts of Africa, America and the arctic, publishing the results in 1825. These experiments he continued on the length of the seconds pendulum in London and Paris, the results appearing in 1828, in which year he was appointed one of the three scientific advisers to the admiralty. Most of his life was devoted to researches on terrestial magnetism, and he superintended the establishment of magnetic observatories on British territory throughout the world. The results appeared in Observations on Days of Unusual Magnetic Disturbance (1843). In 1852 he discovered a connection between the periodic variation of sun spots and magnetic disturbances on the earth. Sabine was president of the Royal society (1861–71) and was made a knight commander of the Order of the Bath (1869). He died at East Sheen, Surrey, on June 26, 1883.

SABINE RIVER in the southwestern United States, flows southeast and south for 380 mi. from Hunt county in eastern Texas to Sabine lake and on through Sabine pass into the Gulf of Mexico. The drainage basin of 10,400 sq.mi. lies entirely in Texas and in the Louisiana coastal plain. Discharge of the river varies from 372 to 61,200 cu.ft. per second. From southeast Panola county, Tex., to the gulf the Texas-Louisiana boundary follows the river, Sabine lake and Sabine pass. The Sabine has successively served as a boundary between France and Spain, Spain and the United States, Mexico and the United States and Texas and Louisiana; it has been in dispute many times.

The Sabine-Neches waterway, a portion of the Gulf Intracoastal waterway, provides 52 mi. of deep waterway through Sabine pass, along western Sabine lake and the lower Neches river to Beaumont, Tex., and 44 mi. of deep waterway to Orange, Tex. located 10 mi. N. of the Sabine river mouth. The Neches river, originating near Tyler, Tex., flows 280 mi. S.E. to Sabine lake. Commodities transported on the waterway are mostly crude petroleum and petroleum products. Navigation of the river above Orange, Tex., is not important. Port Arthur, Tex., is another important city on the Sabine-Neches waterway. (M. W. M.)

SABINI. This was an ancient tribe of Italy which was more closely in touch with the Romans from the earliest recorded period than any other Italic people. They dwelt in the mountainous country east of the Tiber, and north of the districts inhabited by the Latins and the Aequians in the heart of the Central Apennines. Their boundary, between the southern portion of the Umbrians on the north-west, and of the Picentines on the north-east, was probably not very closely determined. The traditions connect them closely with the beginning of Rome, and with a large number of its early institutions, such as the worship of Jupiter, Mars, and Quirinus, and the patrician form of marriage (*confarreatio*).

Of their language as distinct from that of the Latins no articulate memorial has survived, but we have a large number of single words attributed to them by Latin writers, among which such forms as (1) *fircus,* Lat. *hircus;* (2) *ausum,* Lat. aurum; (3) *novensiles,* Lat. *novensides* ("gods of the nine seats"); (4) the river name *Farfarus,* beside Pure Lat. *Fabaris* (Servius, ad *Aen.* vii. 715); and (5) the traditional name of the Sabine king, *Numa Pompilius* (contrasted with Lat. Quinctilius), indicate clearly certain peculiarities in Sabine phonology: namely, (1) the representation of the Indo-European palatal aspirate *gh* by f instead of Lat. *h;* (2) the retention of *s* between vowels; (3) the change of medial and initial d to l; (4) the retention of medial f which became in Latin *b* or *d;* and (5) the change of Ind.-Eur. *q* to *p*. The tradition (*e.g.,* Paul *ex Fest.* 327 M.) that the Sabines were the parent stock of the Samnites is directly confirmed by the name which the Samnites apparently used for themselves, which, with a Latinized ending, would be *Safini* (see SAMNITES and the other articles there cited, dealing with the minor Samnite tribes).

To determine the ethnological relation of these tribes, whom we may call "Safine," to the people of Rome on the one hand, and the earlier stratum or strata of population in Italy on the other, linguistic and archaeological material must be examined. Archaeological evidence connects the Sabines with the patricians of Rome, (see ROME, Ancient History). What language did the Sabines speak? Was it most nearly akin to Latin or to Oscan or again to Umbrian and Volscian? Festus, though he continually cites the Lingua Osca, never spoke of Lingua Sabina, but simply of Sabini, and the same is practically true of Varro, who never refers to the language of the Sabines as a living speech, though he does imply (v. 66 and 74) that the dialect used in the district differed somewhat from urban Latin. The speech therefore of the Sabines by Varro's time had become too Latinized to give us more than scanty indications of what it had once been. The language of the Samnites was that which is now known by the name of Oscan.

It appears that in, say, the 7th century, B.C., the Safines spoke a

language not differing in any important particulars from that of the Samnites, generally known as Oscan; and that when this warlike tribe combined with the people of the Latian plain to found or fortify or enlarge the city of Rome, and at the end of the 6th century to drive out from it the Etruscans, who had in that century become its masters, they imposed upon the new community many of their own usages, especially within the sphere of politics, but in the end adopted the language of Latium henceforth known as lingua Latina.

See R. S. Conway, *Italic Dialects* p. 351 (1897). For the history of the Sabine district *see* Mommsen, *C.I.L.* ix. p. 396; and Beloch, "Der italische Bund unter romischer Hegemonie" (1880) and "La Conquista Romana della regione Sabina," in the *Rivista di storia antica* ix. p. 269 (1905)

SABINIAN (d. 606), pope from 604 to 606, was of Tuscan origin. Little is known of his life and pontificate. Under Pope Gregory the Great he served in the important post of papal apocrisiary (legate) at Constantinople. As Gregory's successor, elected in 604, he seems to have been markedly more conservative than his predecessor. This, together with his cautious administration of the papal granaries during a winter famine, probably explains the later untrustworthy legend of his stinginess. which is moreover refuted by the praise of his generosity in his epitaph. It is uncertain modern conjecture that because of his unpopularity disorders threatened to erupt at his funeral in 606. (JN. SR.)

SABLE, the name of a small quadruped, closely akin to the martens, and known by the zoological name of Martes *zibellina*. It is a native of Siberia and famous for its fur. The name appears to be Slavonic in origin, whence it has been adapted into various languages. The Eng. and Med. Lat. sabellum are from the O.Fr. sable or saible (see MARTEN and FUR). "Sable" in English is a rhetorical or poetical synonym for "black." This comes from its usage in heraldry (first in French) for the colour equivalent to black.

SABLE ANTELOPE, a large and handsome South African antelope (*Hippotragus niger*), exhibiting the rare feature of blackness or dark colour in both sexes. The sable and the roan antelope (H. *equinus*) belong to a genus nearly related to the oryxes (*q.v.*), but distinguished by the stout, thickly ringed horns (present in both sexes) rising vertically from a ridge over the eyes at an obtuse angle to the plane of the lower part of the face, and then sweeping backward in a bold curve. The muzzle is hairy; there is no gland below the eye; the tail is long and tufted. Sable antelopes are among the handsomest of South African antelopes, and are endowed with great speed and staying power. They are commonly met with in herds including from 10 to 20 individuals. Forest-clad highlands are their favourite resorts. The roan antelope is a larger animal, with shorter horns, strawberry-roan in colour in both sexes. See also ANTELOPE.

SABLE ISLAND, an island of Nova Scotia, Canada, 110 mi. S.E. of Cape Canso. Composed of shifting sand, it is the exposed portion of a 50 mi. long, gently curved bar. The island itself is about 20 mi. long and 1 mi, wide, and the sand hills shaped by the wind rise to elevations up to 100 ft. It is reported to be moving slowly eastward, owing to the encroachment of the sea on the western end and the continual sand accumulation at the eastern end. The smooth coast line is without a harbour. Vegetation consists of grasses and other plants but no trees. It has long been known as "the graveyard of the Atlantic"; over 200 known wrecks have been catalogued. During the frequent fogs and storms this slender ribbon of land is virtually indistinguishable until close at hand. The danger of shipwreck has been minimized, however, by the Canadian government's maintenance of several lighthouses and lifesaving stations. (C. N. F.)

SABOTAGE, originally a designation of labour protest by impairing the profitable operation of the employer's business, had its inception in the French railway strike of 1910, which involved workers who cut wooden "shoes" (sabots) that held rails to sleepers. By legend, an aggrieved French worker clogged machinery with his wooden shoe. From 1912 to 1918 the American branch of the Industrial Workers of the World (I.W.W.) officially approved sabotage, described by Elizabeth Gurley Flynn, in her Sabotage (1915), as slowing up work, hence interfering with quantity of output, and also interfering with the quality of the product; sabotage, she said, "is simply another form of coercion."

The I.W.W.'s sanction of sabotage as a means of protest reflected the casual migratory worker's lack of reserve funds, the ease of replacing him, his generally footloose condition and his sometimes foreign birth, factors that made the use of formally organized strikes and conventional pressure bargaining relatively difficult. I.W.W. organizers cautioned against violent sabotage, and violence generally, even under provocative circumstances, and in 1918 the organization officially repudiated sabotage in any form because of wartime conditions. This did not forestall wartime and postwar legislation prohibiting advocacy as well as practice of sabotage. Membership in the I.W.W., or alleged membership, frequently was found sufficient cause for imprisonment. The peril to civil liberties of such procedure later came to be appreciated. World War II antisabotage legislation professedly aimed to punish action, not words. Some writers have applied the term to wasteful, restrictive and speculative business practices. At mid-20th century, "sabotage" came to be used interchangeably with "espionage," an ambiguity fraught with familiar dangers to civil liberties.

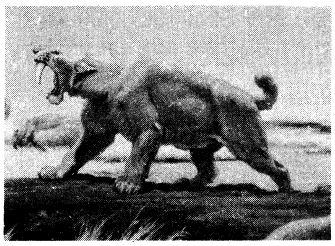
B.* Mathewson, *Restriction of Output Among Unorganized Workers* (1931); Thorstein Veblen, *The Engineers and the Price Systenz* (1921). (G. W. Z.)

SABRATHA, an ancient city of Africa Proconsularis (Tripolis), founded in the 7th–6th century B.C. by Tyrian settlers as a factory on the shore of a flat and inhospitable coast, mod. Sabratha Vulpia, 48 mi. W. of Tripoli by rail. Toward the end of the 2nd century A.D. its prosperity began to increase: Antoninus Pius built two temples; the tribunal before which Apuleius (*q.v.*) was tried met there; under Commodus the Sabratenses had a statio (or office) at Ostia (*q.v.*). Toward the end of the 4th century there occurred fiscal exactions, religious disputes and attempts at invasion by the tribes of the interior (the most destructive being that of the Austuriani in A.D. 363), after which, as inscriptions show, the buildings of Sabratha, and notably the baths, were rebuilt. The Vandals themselves, who only occupied Tripolitania in A.D. 455, were defeated by a native rebellion, and after the destruction of their power by the Byzantines the very natives who had invited the aid of the latter rose against them also. During the years of peace following 548 new fortifications were made. Justinian's death, in 565, brought a renewal of the native risings. The Arabs took Tripoli in 643, and Sabratha was surprised in the night and sacked. Excavations have revealed the east gate of the Roman walls, while Byzantine fortifications surround the western portion of the city, where are situated the forum, the *curia* or council hall, a temple of Jupiter (of whom a fine bust was found), and another temple (perhaps the Capitolium), both of the time of Antonius Pius, two Christian basilicas (one, erected by Justinian, with fine mosaics) and a baptistery. The theatre and the amphitheatre, fairly well preserved and recently carefully restored, lie farther away, near the quarries. The streets are wide and well laid, and the houses are numerous and closely built, without courtyards. There were no less than 12 fountains, supplied by an aqueduct. The Roman harbour was constructed by joining the rocks with masses of concrete, so as to form two moles with a narrow entrance between them; while along the shore were cisterns and storehouses.

SABRE FENCING: see FENCING.

SABRE-TOOTHED TIGER, an extinct subfamily, Machairodontinae, of the cat family, Felidae. The most characteristic feature, the basis of the name, is the pair of elongated, bladelike canine teeth in the upper jaw. The subfamily ranges in age from the Oligocene epcch, 30,000,000 to 35,000,000 years ago, to the Pleistocene, with final extinction not more than a few thousand years in the past. Well known as this subfamily is, there remain unresolved differences of opinion about its relationships to other felids and indeed differences as to the placement of some Oligocene and Miocene genera as sabretooths, false sabretooths (nimravines) or true cats (felines). In this article only the animals that can be placed nithout serious question among true sabre-toothed tigers (Machairodontinae) are considered.

The best-known genus of the subfamily is Snzilodon of the Pleistocene of North and South America. This was a large, massive, short-limbed carnivore with immense canine teeth. These



BY COURTESY OF CHICAGO NATURAL HISTORY MUSEUM, FROM A MURAL BY CPARLES R KNIGHT

RESTORATION DRAWING OF EXTINCT SABRE-TOOTHED TIGER

teeth appear to have been used for stabbing and slashing attacks upon the large, thick-skinned herbivores that formed the chief prey of the sabretooths. The skull was notably modified in adaptation to this type of feeding. The occipital region was high and the ventral mastoid processes long, in accommodation of strong neck muscles. The lower jaw was formed in such a way that it could be widely opened, thus freeing the dagger-like canines for action. Molar teeth were shearing blades, with no vestiges of grinding surfaces. Among living cats, only the lion approaches *Smilodon* in massiveness, and even the largest lions do not reach the proportions of the largest sabretooths.

The basic sabretooth characters were present, but less fully developed, in *Hoplophoneus,* a moderate sized Oligocene ancestor of *Smilodon.* Other early members of the family Felidae. such as *Dinictis* of the Oligocene, also had fairly well-developed sabre-like teeth but for the most part lacked the other specializations seen in the true sabretooths. Such forms have been variously classified as true cats or as false sabretooths.

Throughout the Miocene and Pliocene epochs of the Tertiary, machairodonts were present in North America and Europe, although, as for most carnivores, their remains are relatively rare. By Pliocene times they had spread to Asia and Africa, and in the Pleistocene were present in South America. The pattern of extinction of the sabre-toothed cats follows closely the pattern of extinction of the mastodons which appear to have been one of their principal sources of food. As these large, elephantlike animals become reduced and extinct in the late Pliocene of the old world, the sabre-toothed cats died out and are not found in the Pleistocene. In North and South America, where mastodons persisted through the Pleistocene. sabre-toothed tigers continued successfully to the end of that epoch. The best-known occurrence of *Smilodon* is in the tar pits of Rancho La Brea. in Los Angeles, Calif., where many individuals were trapped in the tar, apparently as they preyed upon large herbivores that also had become bogged. The tar deposits have preserved a wealth of bones virtually unaltered since the deaths of the animals. (E. C. O.)

SACAGAWEA or SACAJAWEA (1790?–1884?), the "Bird Woman," a Shoshone Indian girl who, in 1805–06, accompanied the Lewis and Clark expedition. She has been widely but erroneously credited with having guided the expedition across the Rocky and Cascade mountains to the Pacific coast. Actually her geographical knowledge and usefulness as a guide were limited to her native region of western Montana. Nevertheless, with her French-Sioux mate Toussaint Charbonneau, Sacagawea did accompany the expedition all the way from Fort Mandan, N.D., to the Pacific coast and back. First-hand accounts of the expedition, by Meriwether Lewis, William Clark, Patrick Gass and others, praise her courage, resourcefulness and good humour, while indicting that Charbonneau mistreated her and was not worthy of his hire.

Charbonneau was engaged as a guide in the autumn of 1804 and insisted upon bringing along Sacagawea, one of the two wives he had purchased from Indian slave traders. A son, Jean-Baptiste Charbonneau, was born to Sacagawea Feb. 11, 1805, at Fort Mandan, and the baby, too, made the entire journey. Toussaint Charbonneau was paid $500.33 for his services to the expedition, but Sacagawea received no remuneration. Their son was later taken to St. Louis, Mo., where Clark sponsored his education. The later history of the "Bird Woman" is obscure. An old Indian woman, who called herself Sacagawea and displayed a remarkably intimate and accurate knowledge of the Lewis and Clark expedition, died in Dakota territory in 1884.

See John Bakeless, *Lewis and Clark, Partners in Discovery* (1947); Charles Morrow Wilson, *Meriwether Lewis of Lewis and Clark* (1934).

SÁ-CARNEIRO, MÁRIO DE (1890–1916), Portuguese poet and novelist of the so-called "modernist" generation and one of the most original and complex figures in Portuguese literature in the first half of the 20th century was born in Lisbon on May 19, 1890. After leaving the secondary school there, he went to Paris where he studied for a year (1912–13) in the law faculty at the Sorbonne. Before leaving Lisbon he had made the acquaintance of Fernando Pessoa, the greatest literary figure of the generation, and maintained a regular correspondence with him while he was in France. Sá-Carneiro's first literary production was the play *Amizade* written in collaboration with a fellow-pupil while he was still at school. In 1912 he published *Princípio,* a collection of prose tales. His first poems were written in Paris in 1914 and were published in the same year under the title. *Dispersão.* In 1914 also he published the novel *A Confissão de Lúcio* and, back in Portugal, he launched the review *Orpheu* in 1915 in collaboration with Fernando Pessoa and other young men of the modernist group. The same year saw also the appearance of his collection of short stories, *Céu em Fogo.* Having returned to Paris, he suffered a moral and financial crisis, abandoned his studies, quarreled with his father and gave himself up to the life of a literary Bohemian. The crisis came to a head in 1916 when the poet, the victim of a sensibility which left him facing life disarmed—"without support" as he himself put it—committed suicide in the Hotel de Nice in Paris on April 26. Before his death he had sent his unpublished poems to Pessoa, and these appeared in 1937 under the title *Indicios de Oiro.* His *Poesias* were edited, with a preface, by J. Gaspar Simões in 1946.

See A. Casais Monteiro, "Mário de Sá-Carneiro," in *Considerações Pessoais* (1933); J. Gaspar Simões, *Historia da Poesia Portuguesa do Seculo xx* (1959). (J. G. Ss.)

SACATEPEQUEZ, a department in the highlands of central Guatemala, just west of Guatemala City. Area 179 sq.mi. Pop. (1950) 60,124. Its capital is Antigua, pop. (1950) 10,996, former capital of Guatemala. The department is a part of the chief coffee-producing area of the country. Other crops include maize, beans and hay. Much land is used for the grazing of beef cattle. The department is served by the Inter-American highway and by several all-weather feeder roads. Antigua was abandoned as the national capital because of frequent earthquakes. (P. E. J.)

SACCARDO, PIER ANDREA (1845–1920), Italian mycologist, is chiefly noted as author of the *Sylloge fungorum* (25 vol., 1882–1931), a compilation, in Latin, of nearly all species of fungi described through the year 1920. Born at Treviso on April 23, 1845, he was professor (1878–1915) and director of the botanical garden at the University of Padua. Many of the descriptions in *Sylloge fungorum,* especially of microscopic Ascomycetes and Fungi Imperfecti, are from Saccardo's own studies, but most are merely copied or translated. Saccardo's carpologic classification of species is a formal one, making much of colour, shape and septation of spores, and violates the rule that a genus should first be recognized and then defined; Saccardo decided in advance what characters should define a genus. Nevertheless, as a work bringing together descriptions of over 78,000 species of fungi, the *Sylloge* is invaluable to mycologists and pathologists. Saccardo died at Padua on Feb. 11, 1920.

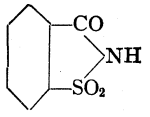
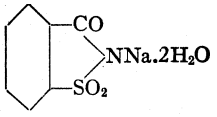
SACCHARIN is a name applied to several organic substances. The commonly known saccharin of commerce is derived from toluene. Commercial saccharin is marketed as insoluble saccharin, I—the imide of ortho-sulphobenzoic acid—and as soluble saccharin, II—the sodium salt of the former substance. Pharmaceutical manufacturers who compound saccharin for con-



I



II

sumer use commonly tablet saccharin into tiny pellets containing ¼, ½ or 1 gr. of pure saccharin. The pellets may contain the saccharin in the form of the soluble sodium salt or in the acid form combined with sodium bicarbonate which converts the acid to the sodium salt upon dissolving.

Commercial saccharin is a sweetening agent; it possesses no food value at all. The sweetening power of the commercial powder is estimated at 425 times the sweetening power of ordinary sugar; the commercial crystals, which contain some water of crystallization, are estimated to have a sweetening power 375 times that of sugar. A one-quarter grain pellet has roughly the same sweetening power as a level teaspoon of sugar. Saccharin is used all over the world as a sweetener. It cannot be considered as a substitute for sugar, since it offers no nourishment. However, saccharin is used as part of the diets of people who must avoid excessive sugar intake, such as diabetics. It is also used in the preparation of dietetic foods, dentifrices, mouthwashes and cosmetics, and for sweetening tobacco and medicinal preparations, particularly where the presence of sugar might lead to spoilage by fermentation or mold growth. Saccharin is not metabolized; it is excreted unchanged from the body in the urine.

Saccharin was discovered by Ira Remsen and C. Fahlberg in 1879 in the course of investigations at the Johns Hopkins university on the oxidation o-toluene-sulphonamide. Fahlberg noticed an unaccountable sweet taste to his food and found that this sweetness was present on his hands and arms, despite his having washed thoroughly after leaving the laboratory. Checking over his laboratory apparatus by taste tests, Fahlberg was led to the discovery of the source of this sweetness—saccharin.

Saccharin is made by treating toluene with chlorosulphonic acid. The reaction produces ortho- and para-toluene sulphonylchlorides. The two products are separated and the ortho-toluene sulphonylchloride is treated with ammonia to form the amide. The amide is then oxidized to saccharin.

SACCHETTI, FRANCO (c. 1330–1400), Italian poet and novelist whose work is typical of late 14th-century Florentine literature, was born in Ragusa of a noble Florentine family. Both as merchant and as *podesth* he traveled widely, thus acquiring an experience of life which compensated for his lack of a regular education. In his letters, in some of his verses and in the *Sposizioni di Vangeli* he expressed his political and moral views. Although poetry was not his main interest, some of his poems, written to be set to music, are among the best of 14th-century minor poetry. As a novelist he wrote 300 stories of which only 223 are known: they consist mainly of anecdotes and jokes derived from oral tradition and the author's direct observation of life. Their artistic value is to be found in the colourful and vivid description of people and places, and their best passages depict scenes from everyday life. Sacchetti does not convey the substance of human life, but only its external appearance.

BIBLIOGRAPHY.—The best modern editions of Sacchetti's works are *Il libro delle Rime* (1936) and *Battaglia, Lettere, Sposizioni* (1938), both ed. by A. Chiari; *Il Trecentonovelle,* ed. by V. Pernicone (1946). *See* also E. Li Gotti, F. *Sacchetti* (1940); L. Caretti, *Saggio sul Sacchetti* (1951). (G. A.)

SACCHI, ANDREA (1599–1661), Italian painter, was the chief representative of the classical current in Roman mid-17th-century painting (Nicolas Poussin, being a Frenchman. belonging in a sense apart) and as such he stood in opposition to the full baroque. He was born at Nettuno, 30 mi. S. of Rome, but trained under Francesco Albani at Bologna. After returning to Rome in 1621 he worked there till his death (June 21, 1661), except for short visits to north Italy after 1635 and to Paris in 1640.

His Bolognese training gave him an initial bias toward classicism and a taste for colour. But the direct influence of Raphael is already added to these qualities in the "Miracle of St. Gregory" of 1625–27 (chapter house, St. Peter's). This work brought Sacchi to the notice of the Sacchetti family, who employed him, with Pietro da Cortona, in the decoration of their villa at Castel Fusano in 1627–29. Both artists were next taken on by Antonio Cardinal Barberini to decorate the Barberini palace in Rome, and it was then that the classical and baroque currents became separated. Sacchi's ceiling fresco, "The Allegory of Divine Wisdom" (1629–33), is a grave, static work, markedly Raphaelesque in conception and containing relatively few figures, in contrast with Pietro da Cortona's full baroque "Triumph of Divine Providence" in an adjoining room. Sacchi's two altarpieces in Sta. Maria della Concezione, Rome (1631–38), are likewise distinguished by their classicism from the other pictures in the church.

His most important work after the "Divine Wisdom" is the series of eight canvases illustrating the life of St. John the Baptist in the cupola of S. Giovanni in Fonte, Rome (1639–45). He painted a few portraits but concentrated mainly on religious works. (M. W. L. K.)

SACCO-VANZETTI CASE, a murder trial in Massachusetts, extending over seven years, 1920–27, and resulting in the execution of the defendants, Nicola Sacco and Bartolomeo Vanzetti. The trial resulted from the murders in South Braintree, Mass., on April 15, 1920, of F. A. Parmenter, paymaster of a shoe factory, and Alessandro Berardelli, the guard accompanying him, in order to secure the payroll they were carrying. On May 5 Sacco and Vanzetti, two Italians who immigrated to the United. States in 1908, one a shoe worker and the other a fish pedlar, were arrested for the crime. On May 31, 1921, they were brought to trial before Judge Webster Thayer of the Massachusetts superior court, and on July 14, were both found guilty by verdict of the jury. Socialists and radicals protested the men's innocence. Many people felt that there was less than a fair trial and that the defendants were convicted for their radical, anarchist beliefs rather than the crime for which they were tried. All attempts for retrial on the ground of false identification failed. On Nov. 18, 1925, one Celestino Madeiros, then under a sentence for murder, confessed that he had participated in the crime with the Joe Morelli gang.

The state supreme court refused to upset the verdict since at that time the trial judge had the final power to reopen on the ground of additional evidence. The two men were sentenced to death on April 9, 1927.

A storm of protest arose with mass meetings throughout the world. Gov. A. T. Fuller appointed an independent investigatory committee of Pres. A. Lawrence Lowell of Harvard university, Pres. Samuel W. Stratton of the Massachusetts Institute of Technology and Robert Grant, a former judge. On Aug. 3, 1927, the governor refused to exercise his power of clemency; his advisory committee agreed with this stand. Demonstrations proceeded in many cities throughout the world and bombs were set off in New York and Philadelphia. The men, maintaining their innocence, were executed Aug. 23, 1927. Sacco-Vanzetti agitation continued and as late as April 1959, a legislative committee sat in Boston giving a full day for hearing on a proposal by Rep. Alexander J. Cella to the legislature to recommend to the present governor a retroactive pardon. The committee and the legislature declined to take such a step. Evidence was offered at the hearings, however, by correspondence and otherwise pointing to the guilt of Morelli and his gang. The entire record of the case has been preserved in printed form with a foreword written by a group of the leading attorneys of the nation.

Sacco and Vanzetti* (1958). (M. L. E.)

SACHEVERELL, HENRY (1674–1724), English ecclesiastic, was the son of Joshua Sacheverell, rector of St. Peter's, Marlborough. He was adopted by his godfather, Edward Hearst, and his wife; was sent to Magdalen college, Oxford, in 1689; was demy of his college from 1689 to 1701 and fellow from 1701 to 1713. Sacheverell took his B.A. in 1693, and became M.A. in 1695 and D.D. in 1708. His first preferment was the small vicarage of Cannock in Staffordshire; and in 1705 he was elected to the chaplaincy of St. Saviour's, Southwark. He had already shown himself a strong, indeed a violent, high churchman by his sermons and pamphlets. In 1709 he gained notoriety by his fa-

mous sermons attacking the Whig ministers on the charge of neglecting to watch over the interests of the church. These sermons were delivered, one in Derby on Aug. 15, the other in St. Paul's cathedral on Nov. 5; and both, in excessively violent language, especially aimed at the treasurer, the earl of Godolphin. They were immediately printed and made the preacher the idol of the Tory party.

The attention of the house of commons was drawn to the two sermons by John Dolben in Dec. 1709, and they were denounced as "malicious, scandalous and seditious libels." The ministry, then slowly but surely losing the support of the country, were divided as to the wisdom of impeaching Sacheverell. Sir John Somers was against it; but the earl of Sunderland and Godolphin urged the necessity of a prosecution, and gained the day. The trial lasted from Feb. 27 to March 23, 1710, and the verdict was that Sacheverell should be suspended for three years from preaching and that the two sermons should be burned at the Royal Exchange. The trial hastened the downfall of the ministry, Godolphin being dismissed in August and the other ministers in September. Immediately on the expiration of his sentence (April 13, 1713), Sacheverell was presented by the queen to the valuable rectory of St. Andrew's, Holborn, by the new Tory ministry. He died at the Grove, Highgate, on June 5, 1724. (*See* also ENGLISH HISTORY.)

SACHEVERELL, WILLIAM (1638–1691), English statesman, son of Henry Sacheverell, a country gentleman, entered parliament in 1670 for Derbyshire. He was an opponent of the court policy, especially of the secret treaty with France. In 1678 he was one of the most active investigators of the "Popish Plot," and one of the managers of the impeachment of the five Catholic peers. He also served as a manager in the impeachment of Danby. He made the first suggestion of the Exclusion Bill on Nov. 4, 1678, in a debate raised by Lord Russell with the object of removing the duke from the King's Council. He vigorously promoted the bill in the House of Commons and opposed granting supplies till it should pass.

At the general election following the death of Charles II. in 1685 Sacheverell lost his seat, but he was an active member of the convention parliament. He died on Oct. 9, 1691. In the judgment of Speaker Onslow, Sacheverell was the "ablest parliament man" of the reign of Charles II. He was one of the earliest of English parliamentary orators; his speeches greatly impressed his contemporaries, and in a later generation, as Macaulay observes, they were "a favourite theme of old men who lived to see the conflicts of Walpole and Pulteney."

SACHS, HANS (1494–1576), the most prolific German poet and dramatist in the 16th century, born in Nürnberg, Nov. 5, 1494, son of a tailor, was educated at the Latin school and apprenticed in 1509 to a shoemaker. Lienhard Nunnenbeck, a weaver, taught him the art of the Meistersinger (*q.v.*). As a journeyman (1511–16) he visited most of south and central Germany, making contact everywhere with Meistersinger guilds. In 1517 he became a master in the Nürnberg *Singschule* and in 1519, when he married, a master shoemaker. *Die Wittembergisch Nachtigall* (1523), a verse allegory supporting Luther, made him famous. Other Protestant writings followed, until in 1527 the Nürnberg council forbade further publications. Thereafter his life was devoted to his trade and especially his poetry. He died in Niirnberg, Jan. 19, 1576.

Besides 13 *Meisterlied* tunes and seven prose dialogues, Sachs wrote more than 6,000 poems, including some 200 dramas. His subject matter comes from the Bible, Greek, Latin and Italian literature (in translation), Germanic legend, courtly romances and collections of anecdotes, historical events and daily life. But everything is reduced to a common level of thought and language; his characters are essentially contemporary Niirnberg citizens. Subjects are used with little concern for their appropriateness to a particular genre; indeed Sachs's guiding principles are moral and didactic rather than aesthetic.

Sachs is regarded—especially since Wagner's Meistersinger *von Nürnberg*—as the greatest of the Meistersingers. His compositions (over 4,000 *Meisterlieder*) certainly contributed to Nürnberg's pre-eminence in Meistergesang; but his popularity rests on other foundations, for Meistergesang was not a popular art. Again, his tragedies and comedies, long-winded and formless, are simple stories in dialogue form, divided arbitrarily into acts in imitation of the humanists; they have only historical interest. His best and most popular works are his short, humorous narrative poems—Sankt Peter mit der Geiss (1555), Das *Kälberbrüten* (1557), *Der Müller mit* dem Studenten (1559)—and his *Fastnachtspiele,* some of which are still performed—*Der farend Schüler im Paradeis* (1550), Der bos Rauch (1557), Das *heiss Eisen* (1551) and *Der Rossdieb zu Fünsing* (1553). His work, though it has been overpraised, reflects a common sense, realistic attitude to life, a strong moral sense, a deep—but tolerant—attachment to Protestant Christianity, and a sometimes uproarious but always kindly humour.

SACHS, JULIUS VON (1832–1897), German botanist and outstanding plant physiologist, was born at Breslau (Wroclaw) on Oct. 2, 1832. On leaving school in 1851 he became assistant to the physiologist J. E. Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and established himself as *Privatdozent* (official but unpaid lecturer) for plant physiology in the University of Prague. In 1859 he was appointed physiological assistant to the Agricultural academy of Tharandt in Saxony, and in 1861 he went to the Agricultural academy at Poppelsdorf, near Bonn. He remained there until 1867, when he was nominated professor of botany in the University of Freiburg im Breisgau. In 1868 he accepted the chair of botany in the University of Würzburg, which he continued to occupy until his death on May 29, 1897.

Sachs was especially associated with the development of plant physiology which marked the latter half of the 19th century, though he contributed to every branch of botany. His earlier papers, in botanical journals and publications of learned societies, are of interest. Prominent among them is the series of "Keimungsgeschichten," which laid the foundation of knowledge of microchemical methods and the morphological and physiological details of germination. There is also his resuscitation of the method of water culture first used by J. Woodward in 1699, and its application to problems of nutrition; and, further, his discovery that the starch grains to be found in chloroplastids are the first visible product of their assimilatory activity. Sachs's later papers were published in the three volumes of the Arbeiten des *botanischen Instituts in Würzburg* (1871–88). Among these are his investigation of the periodicity of growth in length; his researches on heliotropism and geotropism, in which he introduced the "clinostat"; his work on the structure and arrangement of cells in growing points; the evidence upon which he based his imbibition theory of the transpiration current; and his studies of the assimilatory activity of the green leaf. Sachs was a great teacher, and botanists from all over the world worked in his laboratory. He had a great influence on British and American botany at the time when there was a swing over from purely systematic studies, an influence to which the English translations of his textbooks contributed.

Sachs's works are: Handbuch der *Experimentalphysiologie der Pflanzen* (1865; French ed., 1868); *Lehrbuch der Botanik* (1868; Eng. ed., 1875 and 1882), a comprehensive work, giving a summary of the botanical science of the period, including the results of original investigations; *Vorlesungen über Pflanzenphysiologie* (1882; 2nd ed., 1887; Eng. ed., 1887); Geschichte *der* Botanik (1875; Eng. ed., 1890).

See E. G. Pringsheim, *Julius* Sachs (1932).

SACHS, MICHAEL (1808–1864), German Rabbi, one of the first of Jewish graduates of the modern universities, was appointed Rabbi in Prague in 1836, and in Berlin in 1844. He took

the conservative side against the Reform agitation, and retired from the Rabbinate rather than acquiesce in the use of the organ in the synagogue. Sachs co-operated with Zunz in a new translation of the Bible. He is best remembered for his work on Hebrew poetry, *Religiose Poesie der Juden in Spanien* (1845).

SACKBUT, SHAKBUSSHE, SAGBUT, DRAW or DRAWING TRUMPET, the earliest form of slide trumpet, derived from the Roman buccina, which afterwards developed into the trombone. As soon as the effect of the slide in lengthening the main tube and therefore proportionally deepening the pitch of the instrument was understood, and its capabilities had been realized, the development of a family of powerful tenor and bass instruments followed as a matter of course. The transformation of the busine *(buccina)* into the sackbut involved two or three processes, the addition of the slide being accomplished in at least two stages, the extending portion of the tube being at first straight and later bent or folded to make the instrument less unwieldy. (*See* also TROMBONE; TRUMPET.)

SACKING AND SACK MANUFACTURE. Sacking is a heavy closely woven fabric, originally made of flax, but now almost exclusively made of jute or of hemp. The more expensive kinds, such as are used for coal sacks for government and other vessels, are made of hemp, but the jute fibre is extensively used for the same purpose, and almost entirely for coal sacks for local house supplies. The same type of fabric is used for wool sacks, cement bags. ore bags, pea sacks and for any heavy substance; it is also made up into a special form of bag for packing cops and rolls of jute and flax yarns for delivery from spinners to manufacturers. Proper sacking is essentially a twilled fabric, in which the number of warp threads per inch greatly exceeds the number per inch of weft.

Large quantities of cotton sacks are made for flour, sugar and similar produce; these sacks are usually plain cloth, some woven circular in the loom, otners made from the piece.

Large quantities of seamless bags or sacks for light substances are woven in the loom, but these are almost invariably made with what is termed the double plain weave; *i.e.,* the cloth, although circular except at the end, is perfectly plain on both sides, and similar in structure to, but wider than hose-pipe (*q.v.*). Circular bags have been made both with three-leaf and four-leaf twills, but it is found much more convenient and economical to make the cloth for these kinds, and in most cases, for all other types, in the piece, and then to make it up into sacks by one or other of the many types of sewing machines. The pieces are first cut up into definite lengths by special machinery, which may be perfectly automatic or semi-automatic — usually the latter, as many thicknesses may be cut at the same time, each of the exact length. The lengths of cloth are then separately doubled up, the sides sewn by special sewing machines.

For paper sacks *see* PAPER: *Manufacture.*

See T. Woodhouse, *The Finishing* of *Jute and Linen Fabrics (1928).*

SACKVILLE, GEORGE, 1ST VISCOUNT (1716–1785), generally remembered as Lord George Sackville or Lord George Germain, third son of Lionel Cranfield Sackville, 1st duke of Dorset, was born on Jan. 26, 1716. Educated at Westminster School and Trinity College, Dublin, he was gazetted captain in 1737, and saw active service in the German campaign. Wounded in the charge of Cumberland's infantry column at Fontenoy, he was taken to the tent of King Louis XV. to have his wound dressed, and was soon released. He received rapid military promotion, and was gazetted major-general in 1 75 j and lieutenant-general in 1757. Meanwhile he filled the offices of first secretary to his father, the lord-lieutenant of Ireland, and Irish secretary of war, and sat in each of the two Houses of Commons at Westminster and Dublin. In 1758, under the duke of Marlborough, he shared in the ineffective raid on Cancale Bay, and the troops, after a short sojourn in the Isle of Wight, were sent to join the allied army of Duke Ferdinand of Brunswick in Germany. Marlborough died shortly after they landed, and Sackville succeeded him as commander-in-chief of the British contingent. His haughty and domineering temper estranged him both from his second-in-command, Lord Granby, and the commander-in-chief, Prince Ferdinand. This culminated on the day of Minden (August 1, 1758). The British infantry, aided by some of the Hanoverians, had won a brilliant success, and every man in the army looked to the British cavalry to charge and to make it a decisive victory. But Sackville, in spite of repeated orders from Prince Ferdinand, sullenly refused to allow Granby's squadrons to advance. The crisis passed, and the victory remained an indecisive success. A court-martial in 1760 pronounced him guilty of disobedience, and adjudged him "unfit to serve his Majesty in any military capacity whatsoever." In 1763 his name was restored to the list of the Privy Council. In 1769 he allied himself with Lord North. To this period belong the famous Junius Letters, with the authorship of which Sackville was erroneously credited. In 1770, under the terms of a will, he assumed the name of Germain. In 1775, having meantime taken an active part in politics, he became secretary of state for the colonies in the North cabinet, and he was practically the director of the war for the suppression of the revolt in the American colonies. Germain and the North cabinet misunderstood the situation and there was constant friction with the generals and the army in the theatre of war. Nevertheless he received a peerage. He died at Stoneland Lodge (Buckhurst Park) Sussex, on Aug. 26, 1785.

SACKVILLE, THOMAS, 1ST EARL OF DORSET (d. 1608), English statesman and poet, son of Sir Richard Sackville, was born at Buckhurst, Sussex, between 1527 and 1536. He was called to the bar at the Inner Temple. He married Cecily, daughter of Sir John Baker of Sissinghurst, Kent. In 1558 he entered parliament as member for Westmorland, in 1559 he sat for East Grinstead, Sussex, and in 1563–67 for Aylesbury, Buckinghamshire.

During a visit to the continent in 1565 he was imprisoned at Rome for a rash declaration of Protestant opinions. The news of his father's death on April 21, 1566, recalled him to England. On his return he was knighted in the presence of Queen Elizabeth I, receiving at the same time the title of baron of Buckhurst.

He was sent on missions to France in 1568 and again in 1571, when he congratulated Charles IX on his marriage with Elizabeth of Austria. He also took part in the negotiations for the projected marriage of Elizabeth to the duke of Anjou. In 1571 he was created M.A. at Cambridge. In 1572 he was one of the peers who tried Thomas Howard, duke of Norfolk, and in 1586, after he had become a privy councillor, he was selected to convey the sentence of death to Mary queen of Scots.

He was sent in 1587 as ambassador to The Hague but failed to carry out his difficult mission to the queen's satisfaction and was recalled in disgrace. He was, however, liked and trusted by the Dutch and there was talk of sending him there again in 1589–90. This project fell through, but in 1598 he negotiated a new treaty with the states general.

He was elected chancellor of the University of Oxford in 1591, and in 1599 succeeded Lord Burghley as lord high treasurer. In 1601 as high steward he pronounced sentence on Essex. James I confirmed him in the office of lord treasurer. He was created earl of Dorset in 1604, and died suddenly at the council table on April 19, 1608.

Sackville's eldest son, Robert, the 2nd earl (1561–1609), was a member of parliament and a man of great learning. Two other sons were William (*c.* 1568–91), a soldier killed in the service of Henry IV of France, and Thomas (1571–1646), also a soldier.

Sackville is remembered, not only by his distinguished political career, but by his share in two works, each of which was, in its way, a new departure in English literature. To the second edition (1563) of William Baldwin's *Myrroure for Magistrates,* Sackville contributed the *Complaint* of Henry Stafford. duke of Buckingham, to which he prefixed an *Induction.* This induction was arbitrarily transposed (1610) to the beginning of the collection by a later editor, Richard Niccols, a proceeding which led to the attribution of the general design to Sackville. The originators were certainly Baldwin and his "printer" who designed the *Myrroure* as a continuation of John Lydgate's *Fall of Princes* in the form of laments of the ghosts of great men written by various hands. Fragments of the earliest edition entitled *A Memorial1 of such princes as . . . have been unfortunate . . .* are sometimes found bound up with Lydgate's book.

Sackville's *Induction* opens with a description of the oncoming of winter. The poet meets Sorrow, who offers to lead him to the infernal regions that he may see the sad estate of those ruined by their ambition, and thus learn the transient character of earthly joy. At the approaches of Hell he sees a group of terrible abstractions, Remorse of Conscience, Dread, Misery, Revenge, Care, etc., each vividly described. The last of these is War. on whose shield he sees depicted the great battles of antiquity. Finally, penetrating to the realm of Pluto, he is surrounded by the shades, of whom the duke of Buckingham is the first to advance, thus introducing the *Complaint.*

Sackville's models were Gavin Douglas and Virgil. The dignity and artistic quality of the narrative of the fall of Buckingham make the work one of the most important between the *Canterbury Tales* and the *Faerie Queene.*

Sackville has also the credit of being part author with Thomas Norton of the first legitimate tragedy in English. This was *Gorboduc* or *Ferrex and Porrex,* which was "furniture of part of the grand Christmasse in the Inner Temple" in 1560 and was later shown before the queen at Whitehall by "the Gentlemen of Thynner Temple" on Jan. 18, 1562 (*cf.* Sir E. *K.* Chambers, *The Elizabethan Stage,* iii, 457, Oxford, 1923).

The story is taken from book ii, chap. xvi, of Geoffrey of Monmouth's history. It was first printed (1565) in an unauthorized edition as *The Tragedie of Gorboduc* "where of three Actes were wrytten by Thomas Nortone, and the two laste by Thomas Sackuyle." Another, undated, edition, *The Tragidie of Ferrex and Porrex,* appeared about 1570–71. The tragedies of Seneca were now being translated, and the play is conceived on Senecan lines. The paucity of action is eked out by a dumb show to precede each act, and the place of the chorus is supplied by four "ancient and sage men of Britain." In the variety of incident, however, the authors departed from the classical model. The play is in blank verse, and is the first example of the application of Henry Howard, earl of Surrey's innovation to drama.

Jasper Heywood in the poetical address prefixed to his translation of Seneca's *Thyestes* alludes to "Sackvylde's Sonnets, sweetly sauste," but only one, prefixed to Sir T. Hoby's translation of Baldassare Castiglione's *Courtier,* survived. According to Archbishop George Abbot *(A Sermon preached at Westminster,* 1608), Queen Elizabeth I shared the general high opinion of Sackville's merits as a writer.

The best edition of *Mirror for Magistrates* is that of Lily B. Campbell, edited from original texts in the Huntington library (Cambridge, New York, 1938). *See* also her *Parts added to the Mirror for Magistrates* (Cambridge, New York, 1946); *Gorboduc* in *J. W.* Cunliffe (ed.), *Early English Classical Tragedies* (Oxford, 1912); *Cambridge History of English Literature,* iii; C. S. Lewis, *English Literature in the 16th Century Excluding Drama* (Oxford, 1954).

SACRAMENT, the title given by Christians to an external rite or ceremony regarded as the instrument, or at least a symbol, of the reception by those who participate in it of a spiritual benefit whereof Christ is the author. As the conception of a spiritual benefit received through participation in an external rite is by no means peculiar to Christianity, the expression is often applied also to rites in other religions more or less analogous to those designated sacraments by Christians, and sometimes to any instance of the use of material objects as instruments whereby spiritual benefits may be conveyed or appropriated, even although no religious doctrine or ritual be associated with such conveyance or appropriation.

The present article, however, will be mainly concerned with the Christian conception of a sacrament, and rather with the content and significance of that conception than with its history.

In the *Sentences* of Peter Lombard, bishop of Paris 1159–60, which served for centuries as the theological textbook of western Christendom, *sacramentum* in the most general use of the word is defined (5 *Sent.* dist. 1 B. following Augustine *Ep.* 138 § *8, signa quae, cum ad res divinas pertinent, sacramenta appellantur*) as *sacrae rei signum;* and, more precisely, as *invisibilis gratiae visibilis forma;* but in its strictest acceptation, wherein it is applicable only to certain Christian rites, as *quod ita signum est gratine Dei et invisibilis gratiae forma ut ipsius imaginem gerat et causa existat* — *an* outward and visible sign of an inward divine grace, which it both aptly represents (as immersion in baptismal water represents cleansing from sin, or eating and drinking eucharistic bread and wine the maintenance and strengthening of spiritual life) and also actually imparts to the recipient.

The word *sacramentum* is used in classical Latin literature of the pledge deposited in a temple by the parties to a lawsuit, and also of the soldier's oath of allegiance to his commander; and neither of the senses has been without influence on its employment by Christian theologians. But the far less restricted sense given to it by the Latin-speaking Fathers and their choice of it to render the Greek μυστήοιον point to its having had a more general signification, corresponding to its etymology, such as is suggested by St. Thomas Aquinas when he says that that may be called *sacramentum* whereby anything is made sacred (*sacratur)* as that whereby anything is adorned *(ornatur)* is called *ornamentum* (in 4 *Sent.* i. 1; *cf. Summ. Theol.* q.u. lx. art. 1: *Sacramentum dicitur a sacrando, sicut medicamentum a medicando*). Thus, behind the conception of a sacrament lies the notion, common to all peoples, of a "sacred" sphere or world, distinct from, but in close contact with, that of everyday life, so that particular persons, things, places and times can, by recognized methods of "consecration" or "desecration," be removed from one to the other.

The word μυστήριον, employed by the Greek-speaking Church, was associated with the same notion, being the regular designation of religious ceremonies of initiation. These ceremonies distinguished the initiated from those not counted worthy of such translation from the sphere of ordinary life to communion with denizens of a higher world, and suggested the *secrecy* with which "sacred" rites were invested, in order to secure their performance from the intrusion of profane or unconsecrated persons or things. In the New Testament μυστήριον is almost exclusively used of the divine secrets (*e.g.,* of God's purpose to include all nations in the covenant made by him at first with Israel alone) which are described as now at length divulged to the world by the preaching of Christ's apostles. It is not applied to the solemn rites of initiation and communion which were nevertheless already regarded as "means of grace," and came, with the spread of Christianity in the Graeco-Roman world, to be treated as corresponding in the new faith to the ceremonies there denoted by the name, in which Christians from Justin onwards, were accustomed to see a diabolical travesty of the Christian "sacraments." Nor for a long time was the word *sacramentum,* by which the earliest Latin translators of the Scriptures rendered μυστήριον limited to those outward "means of grace" to which it came eventually to be appropriated; and, even after it had been thus appropriated, it was only gradually that among a host of ceremonies and things used in ceremonies, all supposed to convey divine grace in some manner or degree, a certain number were definitely acknowledged as properly entitled to the name of sacraments.

THE SEVEN SACRAMENTS

Seven rites were recognized in the west, from Peter Lombard onwards, as sacraments in the strict sense: Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Orders and Marriage; the Councils of Trent and of the Vatican endorsed this list which has also been adopted by the orthodox Church of the east. The Churches of the Reformation, on the other hand, acknowledged only baptism and the eucharist, to which indeed a certain pre-eminence was universally allowed, as entitled to be called sacraments in the proper sense; mainly on the ground that these alone could be proved from Scripture to have been instituted by Christ himself as external ceremonies effecting, or at least attesting and sealing, the conveyance of an inward spiritual grace to worshippers qualified to receive it by faith in the promise expressly associated with its performance by its divine Founder. In demanding that a sacrament in the proper sense must be able to claim institution by Christ the Reformers did not differ from the Roman Church. But they refused to accept inferences from the words of Scripture, though supported by ecclesiastical tradition, as evidence of such institution equivalent to the direct

commands to be found for baptism in Matt. xxviii. and for the eucharist especially in 1 Cor. xi.

The Scriptural texts alleged to suggest a like institution for the other rites recognized by the Roman Church as sacraments seemed to them either to be inapplicable to them or else to make no such provision for a particular outward symbol of the promised grace as was necessary to constitute a "sacrament," while the traditional rendering of μυστήριον by *sacramenturn* in the application of the word to marriage in Eph. v. 32 could hardly be said to warrant the interpretation of the word there, as intended in a very specialized sense otherwise unknown to the New Testament. Where, however, there was, as with baptism and the eucharist, express scriptural authority for the institution by Christ of an outward and visible sign of an inward spiritual grace, of the bestowal whereof it was to be, to a believer in his promise, at least the assurance, if not the instrument, there the Protestant as well as the Catholic, recognized a genuine sacrament.

There was, however, an important point of difference between them, in respect of such ceremonies as they agreed in regarding as "sacraments." The former denied, and the latter affirmed that they confer grace *ex opere operato*. This phrase seems to have been originally intended to express the belief that sacraments do not depend for their efficacy on the moral character or even on the private beliefs of the individual minister; that where an otherwise qualified person, though wicked or unbelieving, yet intending "to do what the Church does," observes the appointed forms, the recipient need not be afraid that the promised grace is not received; the human minister being no more than an instrument in the hand of the true Giver, Christ Himself. This the Churches of the Reformation for the most part did not deny; the view of Wyclif that only one himself in a state of grace could administer a valid sacrament obtained little acceptance. But the Reformers objected to the phrase *ex opere operato*, which was solemnly reaffirmed against their objections by the Council of Trent. It seemed to them inconsistent with the supreme place assigned in their theology to faith as the sole means of justification. Catholics did not indeed deny that the absence of personal faith in a recipient in whom it could be present (as it could not be, for example, in infants brought to baptism) would present an impediment to this profiting by the grace offered in a sacrament, and on their side, Protestants, in allowing infant baptism, were constrained to admit that the requisite faith was not necessarily that of the individual recipient, but might be that of his parents or of the Church.

Nevertheless, the difference between Catholic and Protestant in that the one laid stress upon the necessity to salvation of sacraments where they could be had, and the other on the indispensableness of faith, which could justify without sacraments, while without it sacraments could not justify, profoundly affected their respective attitudes towards an institution which the Protestant as little intended to disparage as the Catholic. In respect of the eucharist, whereas Luther, Calvin, and the Reformers generally had hoped, by abolishing celebrations at which the priest alone communicated, to restore the primitive frequency of communions, the actual result of the changes introduced by them was to deprive that service in any form of the central place in the public worship of the Church which it had held from the very beginnings of Christianity. Catholics on the other hand were driven by the necessity of maintaining the efficacy of sacraments *ex opere operato* into placing and encouraging a reliance on sacraments which exposed them to the charge of allowing their religion to degenerate in practice into magic.

SYMBOLISM

It cannot be denied that the use of sacraments presents a certain resemblance to some kinds of magic. There is in both the employment of material objects and of bodily gestures in conjunction with a particular form of words to produce effects which, apart from such conjunction, they could not have accomplished, But sacraments resemble far more closely facts of human life which no one would think of describing as magical in any disparaging sense; such as the operation of words, spoken or written, in creating states of feeling, inspiring action, or revealing personality. Here the necessity of intelligent acceptance by those affected of the conventional meaning of the sounds or words employed, the limitation of the effect produced to a certain social context, and the quality (not merely physical, but intellectual or spiritual) of the result obtained distinguish verbal communication (though, as certainly not fully explicable on the principles recognized in the natural sciences, it may fairly be called *mysterious)* from what is usually meant by *magic*. And in these respects, sacraments must be classed with verbal communication. No Christian theologian would allow that these are effective altogether outside of the context of that agreement as to the meaning of the signs and formulas used which exists among Christians, or for the production of merely physical effects according to any law which, like those called "natural," operates irrespectively of the consciousness of tho'se in whose bodies they are produced.

Attempts to treat sacraments as thus effective for "magical" purposes have not been unknown; but they have always been denounced by ecclesiastical authority and regarded as wrong and profane. Without entering into details as to charges of the magical use of sacraments made by theological opponents against particular groups of Christians, it may be observed, in reference to one of special historical importance that, while it is quite arguable that to use the eucharist as a focus of adoring devotion apart from communion is an unwarrantable departure from its original intention, both parties to the controversy here indicated would agree in disapproving as illegitimate any use of it for purposes really other than that or those (whatever it or they may be) for the sake of which it was originally instituted.

Wherever sacraments are used at all (and few Christian denominations have, like the Society of Friends, abandoned the use even of the two which undoubtedly date back to New Testament times), although there may be no crude abuse of them for confessedly magical purposes, quite other than those which the Church holds them to be intended to secure, it is possible to assimilate them to magical performances, by losing sight of their function as vehicles for communicating to individuals a life essentially social and, like all social life, requiring a conventional or ceremonial mode of expression, and of the essentially ethical character of the life which they are thus designed to communicate. The use of material objects or of bodily gestures in the communication of spiritual grace is not alien to the religion of the New Testament, but it is never there taken out of the context of a moral and social life in the imparting and maintaining of which the whole purpose of such use of objects and gestures consists. It is in a firm grasp of the *social* character of sacraments and of the *moral* quality of the life which they are designed to serve as instruments in communicating that the true safeguard against the very real danger of a degeneration of sacramentalism into magic-mongering should be sought rather than in the elimination of sacramentalism from religion, with the whole history of which it is intimately bound up, and by which, as has been well said, "the higher gifts are made accessible to persons of all stages of culture."

"The principle that spiritual values and forces are mediated through material processes," the same writer observes, "runs through nature as a whole." The very production of a new personality is only possible through "a material process the most liable . . . to carnal misuse." "Truth, beauty, goodness . . . become effective only through material forms." There are "natural sacraments"—the kiss, the handshake, the flag—outside of religion. The admittedly important part which these and their like play in our common social life the sacraments play in religion; and in Christianity in particular, "we are bidden to act as sons of God and sharers in Christ, knowing by an outward sign that we are so. Our reliance is to be on the word and act of God, while the joy of responsive emotion comes and goes." (Gore, The Holy Spirit and the *Church,* p p 24, 146, 148.)

To the value of sacramentalism to human life Goethe (Wahrheit *u. Dichtung*, Th. ii., B. 7) and Comte, who devised an elaborate system of symbolic rites for his new Religion of Humanity, may be cited as witnesses. That in the early stages of civilization the

magical and the sacramental are not easily discriminated is no more than may be said of the magical and the religious in general, or indeed of the magical and the scientific. Primitive magic owes its disappearance at a higher level of culture to its confusion (arising at first from lack of experience, afterwards from the persistence of uncriticized tradition) of different kinds of causation; the supposition, for instance, that the utterance of a name may affect an animal, thing, or unconscious person as it may a person who hears himself called; or that the moral healing of a soul may be effected by external actions without a change in the direction of the will. We still know too little about the interaction of mind and body to despise our ancestors or undeveloped contemporaries for making mistakes in this department, which it has taken centuries of progress, religious and scientific, to render us inexcusable in making. But neither need these ancient errors, even though they may, here as elsewhere, have left traces of themselves, interesting to the archaeologist in conventions and customs which have survived the false beliefs in which they originated, be supposed to render trivial or illusory the higher activities and experiences in connection with which these traces are retained.

THE ARGUMENT OF CONTINUITY

But while we may speak of "natural sacraments" the word is strictly appropriate only where a distinction is drawn between the everyday world and a "sacred" world transcending this, although not necessarily separated from it in space or time. Where the use of the term is extended to the communication of spiritual illumination or power through material symbols apart from religion, we have to do either with a metaphor or, more usually, with a conviction that what is experienced in religion may be employed as a key to the true or ultimate nature of the world as a whole, including those features of it which are revealed to us in that part of our experience which is not in itself specifically religious. For Christians the "sacred" sphere is that which is directly related to Christ, and accordingly nothing can be properly called a "sacrament" which cannot claim authorization by Christ as a vehicle of Divine grace. While a statement in the Bible was taken as, by its presence there, guaranteed to be, when rightly understood, free from error, the undoubted occurrence in Scripture of direct statements that Christ instituted baptism and the eucharist was sufficient to establish their claim. Critical study of the Bible has here, however, altered the situation. Few scholars would now be prepared to regard Matt. xxviii. 19, and 1 Cor. xi. 23 sqq. as putting it beyond doubt that the historical Jesus actually prescribed the permanent observance of these rites by his followers. Thus the old question as to the number of sacraments cannot be argued on the old grounds, but rather on that of the continuity between any rite now in use and a rite observed in the primitive Christian community from which the New Testament proceeded; and of the degree in which that community regarded it as intimately bound up with that fellowship with the crucified and risen Saviour which this community existed to offer to all who would join themselves with it.

That baptism and the eucharist were regarded as very intimately bound up with it is certain. Converts were always initiated by a ceremonial washing in Christ's name; such a washing, symbolical of cleansing from sin, being (whether or no actually practised or enjoined by Jesus) familiar to Jews as used in the admission of proselytes and specially associated with Christ's own baptism by John the Baptist, whose mission Christians believed to have been preparatory to their Master's. From the first the followers of Jesus continued the custom, which had plainly been characteristic of his daily intercourse with his disciples, of the solemn blessing and breaking of bread at their social meals; a custom invested with specially solemn associations by the circumstances of His last supper whereat he was believed to have used words identifying the bread and cup shared among his companions with his own body and blood, which were so soon after to be broken and shed upon the cross.

The credentials of the other rites acknowledged by many Christians as sacraments were more doubtful. A laying on of hands symbolical of the gift of the Spirit seems usually from the beginning to have formed part of the initiatory rite, though sometimes detached from the baptism proper; but no tradition connected it with any injunction of Jesus; the gift imparted was associated in the New Testament with extraordinary manifestations not destined to be permanent; of the anointing which later became the chief feature of "confirmation" Scripture says nothing. Jesus had been wont to forgive sins, and sins were believed to be washed away in baptism; hut no ceremony or fixed formula is recorded to have been used by Jesus in this connection; only gradually was it realized that sin after baptism would be a normal feature of the Christian's life; nor can scriptural authority be claimed for the system of penitential discipline which was gradually developed in the Church. The unction of the sick mentioned in James was not, like the later rite which appealed to its precedent, intended to be "extreme"; its primary purpose was not the imparting of a spiritual gift, but bodily healing, which alone is mentioned as the object of unction in the only scriptural passage (Mark vi, 13) which appears to represent it as performed by Christ's direction. The setting apart of office-bearers in the Christian community by laying on of hands is certainly apostolical; but this symbolic mode of appointment is nowhere stated in Scripture to have been used or enjoined by Jesus himself. Lastly, the only claim of the immemorial and universal institution of marriage to be a "sacrament of the new law" appears, as said above, to be the incidental observation of St. Paul (doubtless suggested by the prophetic use of it as a symbol of the bond between Yahweh and Israel) that it is a "great mystery" or "sacrament" as representing the union of Christ with his Church. But though only certain rites may be reckoned as sacraments in a prerogative sense, the whole system through which individual members of a religious group are placed, through symbols, conventionally recognized therein as instruments of its communication, in contact with the spiritual life which gives unity to the group may be regarded as sacramental. In Christianity—and the associations of the word "sacrament" are Christian—this is the divine life historically manifested in the person and work of Jesus Christ and believed to be continued in the community which, as inspired by His Spirit, may be called His "mystical body." Here those rites, the continuous experience of grace received through which throughout the history of the community attest the unbroken presence therein of the same source of spiritual life are entitled to the name of sacraments. It is clear that only where there exists faith in the reality of this divine life and in the organic relation of the community thereto, can any significance or efficacy be attributed to these; but also that such faith can only be other than an illusion if this life and this relation are in fact real. (See also BAPTISM, EUCHARIST.)

(C. C. J. W.)

SACRAMENTALS, in the Roman Catholic Church, originally denoted the ceremonies, outside the essentials, used in the administration of the sacraments to elevate the mind to the contemplation of the divine mysteries; *e.g.*, genuflections during mass, the anointing of the priest's hands during ordination, the triple pouring at baptism. In a larger sense, they are all the other external signs employed by the church to obtain spiritual effects. These signs can be actions (exorcisms, making the sign of the cross, saying of grace at meals, blessings, etc.) or things (holy water, blessed candles, vestments, palms and ashes, crucifixes, rosaries, etc.).

The sacramentals are like sacraments in that they are sensible signs and symbols. They differ from the sacraments in that they do not give grace of themselves; rather, their special spiritual effects, e.g., an increase of charity, derive from the power of the church's prayer and are conditioned in the concrete by the dispositions of the user.

See J. Sullivan, *The Externals of the Catholic Church* (1959).

(E. J. A.)

SACRAMENTARIANS, the name given to those who during the Reformation controversies not only denied the Roman

Catholic doctrine of "transubstantiation," but also the Lutheran "consubstantiation." They admitted a spiritual presence of Christ which the devout soul can receive and enjoy, but denied any physical or corporeal presence. Finally accepting the Confession of Augsburg, they were merged in the general body of Lutherans; with the exception of the Swiss followers of Huldreich Zwingli, whose position was incorporated in the Helvetic Confession. It is a curious inversion of terms that in recent years has led to the name Sacramentarians being applied to those who hold a high or extreme view of the efficacy of the sacraments.

SACRAMENTO, the capital city of California, U.S., and seat of Sacramento county, is located about 75 mi. N.E. of San Fiancisco at the confluence of the American and Sacramento rivers, midway between the Sierra Nevada range and the Pacific ocean. Because of climatic factors favourable to growing camellias, the city became known as "the camellia capital."

History. — In Aug. 1839, John Augustus Sutter (*q.v*). a Mexican citizen. established a colony, known as New Helvetia, on the site of the future city. He had received a land grant of 11 square leagues (about 73 sq.mi.) from the Mexican governor Juan Alvarado and between 1839 and 1844, he used Indian labour to build an adobe fortress known as Fort Sutter. Situated as it was on the main line of travel, Fort Sutter soon became one of the greatest trading posts in California. Sutter extended unbounded hospitality to American immigrants between 1843 and 1848 James W Marshall, an employee of Sutter, was supervising the construction of a sawmill on the American river near Coloma. 35 mi. N.E. of the fort. when, on Jan 24, 1848. he found a gold nugget in the millrace. The discovery of gold on his land was, ironically the cause of Sutter's ruin. for his men deserted him. gold seekers pillaged his property and he died a poor man.

Sutter's son, who had been deeded the family property near the Embarcadero along the river, laid out a town there named after the Sacramento river. The federal census reported a population of 6.820 as early as 1850, the year that Sacramento was incorporated. Strategically located at the entrance to the gold areas, the city became a typical mining boom-town of about 10,000 within a few months.

When state government was established in 1849 Sacramento campaigned to be named the capital and offered $1,000.000 for the honour; in 1854 it was chosen the permanent seat of government. Three times between 1849 and 1853, and again in 1861, the city suffered from devastating floods, and in 1852 two-thirds of it was destroyed by fire.

Sacramento was a major depot on the overland mail routes between the Missouri frontier and the Pacific during the 1850s. When the pony express was established, the city became the western terminal As early as 1856 the Sacramento Valley railroad was completed to Folsom, 24 mi. N.E., and uas the first railway in the state to tap the freighting business between the gold camps by providing faster service than the freight wagons on the roads and trails. Theodore Dehone Judah, the chief engineer of the railroad. planned to extend the line across the Sierra Nevada. He found four merchants in Sacramento, Leland Stanford, Mark Hopkins, Charles Crocker and Collis P. Huntington, willing to help finance and promote his transcontinental project These men became the founders of the Republican party in California and thereby gained generous government support for their railroad that was constructed between 1863 and 1869. With the advent of rail transportation into the area, the future of Sacramento was assured.

Population. — The population of Sacramento city in 1960 was 191.667, an increase of 54.095 since the 1950 census representing a 39.3% growth. The standard metropolitan statistical area of Sacramento comprising Sacramento county had a population of 502.778 in 1960 and includes North Sacramento, Arden. Folsom, Natomas, Del Paso Heights, Town and Country area. Carmichael, Fair Oaks, North Highlands, Citrus Heights and Orangeville, all on the east side of the Sacramento river, with populations ranging from 5,000 to 45,000. The rapid growth of suburban communities in the Sacramento vicinity has caused the population growth of the county, 122.1% between 1950 and 1960, to exceed that of the state percentage-wise. (For comparative population figures see table in CALIFORNIA: *Population.)*

Administration. — Sacramento adopted a council-manager form of government in 1921. The nine members of the city council are elected for a two-year term. Sacramento county government is based upon a state charter providing for the election of five supervisors for four-year terms from defined geographic districts. A city-planning board was established in 1926 and zoning ordinances are in effect.

Transportation, Commerce and Industry. — Sacramento is on the main line of two transcontinental railroads and there is a connection with a third. Two major east-west transcontinental highways and the principal north-south Central valley route come together at Sacramento, making it a hub of highway transportation. Sacramento county has 14 airports: one is municipally controlled, one is administered by the county, two are United States air force installations and the remainder are privately owned. Barge service along the Sacramento river connects the city with the port of San Francisco and is used extensively in transporting agricultural and petroleum products.

Sacramento is the centre of an extensive wholesale and retail trade. Because of the surrounding region's high agricultural productivity. canning and food processing is the principal manufacturing activity with more than 100 plants. Associated with this agricultural processing are flour millers, bean and rice cleaners and polishers, olive-packing plants and one of the world's largest almond shelling plants. Among other large industrial establishments are manufacturers of jet-propellants, soaps and detergents. furniture, machine engine parts, boxes, brick and clay pipe and mining equipment. There are also large railroad shops and three military installations that maintain and repair aircraft. Natural gas fields in the vicinity and water power from the Sacramento river system provide the area with ample power facilities.

Education and Cultural Activities. — Public education is available from kindergarten through college. Sacramento City college was established in 1916. American River Junior college, opened in 1955, was relocated on a new campus in 1958. Sacramento State college (1947) emphasizes teacher education. The University of California, Davis, 15 mi. W. of Sacramento, offers advanced instruction in its colleges of agriculture, letters and science and school of veterinary medicine.

The state library there has an outstanding collection on the history of California, a fine law library and is an extensive depository of government documents. The E. B. Crocker Art gallery houses one of the largest and most valuable collections west of the Mississippi river. The municipal auditorium, completed in 1927, seats 5.000 and is a centre of cultural entertainment.

Parks and Recreation. — The state capitol, located in the heart of downtown Sacramento, is surrounded by a 40-ac. park, with numerous varieties of native American and foreign trees and shrubs, comprising one of the most diversified horticultural collections to be found within an area of similar size. The capitol, constructed 1869–74, is four stories high, surmounted by a large dome, and is Roman Corinthian in design. In 1951 a large annex, the east wing, was added to the building. One mile east of the capitol is old Fort Sutter, maintained by the state as a historic museum, surrounded by a public garden.

A vast network of waterways in the Sacramento area provide about 1,500 mi. of picturesque routes for boating enthusiasts. Folsom lake. 14 mi. long and covering 11,500 ac., provides for water skiing and other aquatic sports. (W. T. J.)

SACRAMENTO RIVER, the largest and most important stream in northern California, U.S., slightly less than 400 mi. long, but close to 600 if measured from the source of its longest tributary, the Pit, rises in the Klamath mountains near Mt. Shasta and empties into San Francisco bay. Flowing southward for most of its length, it turns westward just below the city of Sacramento, unites with the northward-flowing San Joaquin near Pittsburg and passes through Suisun and San Pablo bays and San Pablo strait into San Francisco bay. Its navigability varies with water level and dredging operations, with Red Bluff, about 250 mi. upstream, being accessible to small craft at high water. The Sacra-

mento and its tributaries, especially the American and Feather rivers, were the scene of the famous California Gold Rush of 1849. Together with the San Joaquin, the Sacramento forms the great Central valley of California, one of the richest agricultural areas in the world.

The Sacramento (northern) portion of the valley has only one third of the arable land but two thirds of the water resources (an average annual runoff of about 22,000,000 ac.-ft.). To control floods and shift surplus water to the more arid San Joaquin region, the Central Valley project was launched by the Federal Bureau of Reclamation in the 1930s. The project includes various dams, such as Shasta near Redding, one of the largest in the world. reservoirs, power plants and canals. (D. E. F.)

SACRED HEART. Devotion to the Sacred Heart of Jesus is a cult peculiar to the modern Roman Catholic Church. The principal object of this devotion is the Saviour Himself. Saint Marguerite Marie Alacoque (*q.v.*), assisted by her director, the Blessed Claude de la Colombière, S.J. (*q.v.*), spread the devotion This devotion was strongly opposed by the Jansenists, who claimed that the Heart of Christ was being adored as separate from the rest of His Being. Despite similar misunderstandings, the devotion has flourished strongly in the Catholic Church. The Jansenist synod of Pistoia, assembled by Scipio de Ricci, bishop of Pistoia (1780–91), which formulated this objection against the devotion, was condemned by Pope Pius VII in the Bull Auctorem *Fidei*, Aug. 28, 1794. In May 1805 De Ricci submitted to the papal condemnation of the synod. In 1856 Pius IX introduced the feast into the general calendar of the Roman Catholic Church, fixing the Friday after the Octave of Corpus Christi for its celebration, The beatification of Blessed M. M. Alacoque in 1864 gave a new impetus to the devotion.

SACRED HEART, BROTHERS OF THE (SOCIETAS FRATRUM SACRIS CORDIS; S.C.), a religious order founded in 1821 in Lyons, France, by André Coindre, a missionary priest, is primarily a teaching order, specializing in high school and elementary school education in both parochial and private schools. The Brothers arrived in the United States in 1847, from where they spread rapidly into Canada; there are seven Canadian provinces and three U.S. provinces. The Brothers are also a missionary society with missions all over the world. The motherhouse is in Rome. (A. Ro.)

SACRED HEART, MISSIONARIES OF THE (in full, SOCIETY OF THE MISSIONARIES OF THE SACRED HEART OF JESUS; SOCIETAS MISSIONARIORUM SACRATISSIMI CORDIS JESU; M.S.C.), is a Roman catholic congregation of men founded at Issoudun, France, Dec. 8, 1854, by Jules Chevalier, a secular priest, for restoring the faith in the rural sections of France. Pius IX directed the congregation to foreign-mission work.

The M.S.C. have provinces in Europe, the Americas (two in the U.S.) and Australia, and do foreign-mission work on all the continents and in the Pacific islands. The general motherhouse is in Rome. (L. F. P.)

SACRED HEART, PRIESTS OF THE (in full, CONGREGATION OF THE PRIESTS OF THE SACRED HEART OF JESUS; CONGREGATIO SACERDOTUM A SACRO CORDE JESU; S.C.J.), a congregation of priests and brothers founded in Saint-Quentin, France, in 1878, by Leo John Dehon.

Its aim is to spread the apostolate of the Sacred Heart and to undertake all forms of the priestly ministry: teaching, missions, retreats, home and foreign missions. The congregation has spread to five continents and to nine states in the U.S. Generalate headquarters are located in Rome. (J. T. O'C.)

SACRIFICE, the ritual destruction of an object, or, more commonly, the slaughter of a victim by effusion of blood, suffocation, fire or other means (from Lat. *sacrificium;* sacer, holy, and *facere,* to make). While the Hebrew for sacrifice, זֶבַח, makes the killing of the victim the central feature, the Latin word brings out sacralization (see TABU) as an essential element in many cases. The sacrifice of desacralization is also found; hence MM. Hubert and Mauss describe a sacrifice as "a religious act, which, by the consecration of a victim, modifies the moral state of the sacrificer or of certain material objects which he has in view"; *i.e.,* it either confers sanctity or removes it and its analogue, impurity. It is, in fact, "a procedure whereby communication is established between the sacred and profane spheres by a victim, that is to say by an object destroyed in the course of the ceremony."

Principles of Classification. — It is possible to classify sacrifices according to (1) the occasion of the rite, (2) the end to be achieved, (3) the material object to be effected or (4) the form of the rite. (1) The division into periodical and occasional is important in Hindu and other higher religions; the former class is obligatory, the latter facultative. In less developed creeds the difference tends to remain in the background; but where sacrifices are found, solemn annual rites, communal, purificatory or expiatory, are celebrated, and are obligatory. (2) The end to be achieved is sometimes sacralization, sometimes desacralization. In the former case the sacrificer is raised to a higher level; he enters into closer communion with the gods. In the latter either some material object, not necessarily animate, is deprived of a portion of its sanctity and made fit for human use, or the sacrificer himself loses a portion of his sanctity or impurity. In the sacrifice of sacralization the sanctity passes from the victim to the object; in that of desacralization, from the object to the victim. (3) Sacrifices may be classified into (a) subjective or personal, where the sacrificer himself gains or loses sanctity or impurity; (*b*) objective, where the current of mana (see TABU) is directed upon some other person or object, and only a secondary effect is produced on the sacrificer himself.

Ritual. — The necessary elements of a Hindu sacrifice are: (1) the *sacrificer,* who provides the victim, and is affected, directly or indirectly, by the sacrifice; he may or may not be identical with (2) the *officiant,* who performs the rite; we have further (3) the place, (4) the instruments of sacrifice and (5) the *victim;* where the sacrificer enjoys only the secondary results, the direct influence of the sacrifice is directed toward (6) the *object;* finally, we may distinguish (7) three *moments of the rite* —(*a*) the *entry,* (*b*) the *slaughter,* (*c*) the *exit.*

Sacralization and desacralization, sometimes performed by means of subsidiary sacrifices, were the essential elements of the preparation for sacrifice and the subsequent lustration. In developed forms, such as the offering of *soma,* they assumed a great importance; (1) the sacrificer had to pass from the world of man into a world of the gods; consequently he was separated from the common herd of mankind and purified; he underwent ceremonies emblematic of rebirth and was then subject to numberless taboos imposed for the purpose of maintaining his ceremonial purity. In like manner (2) the officiant prepared himself for his task; but in his case the natural sanctity of the priest relieved him of the necessity of undergoing all that the common man had to pass through; in fact, this was one of the causes which brought him into existence, the other being the need of a functionary familiar with the ritual, who would avoid disastrous errors of procedure, destructive of the efficacy of the sacrifice. (3) Where there was an appointed place of sacrifice there was no need of preparation of a place of sacrifice. (4) The necessary rites included (*a*) the establishment of the fires, friction being the only permitted method of kindling, (*b*) the tracing on the ground of the vedi, or magical circle, to destroy impurities, (*c*) the digging of the hole which constituted the real altar, (d) the preparation of the post which represented the sacrificer and to which the victim was tied, and other minor details. (5) The victim might be naturally sacred or might have to undergo sanctification. In the former case (a) individual animals might be distinguished by certain marks, or, (b) the whole species might be allied to the god. In the latter case the victim had to be with-

out blemish; (c) the age, colour or sex of the victim might differ according to the purpose of the sacrifice. It reached a degree of sanctity when only the priest might touch it. Finally, the priest made three turns round it with a lighted torch in his hand, which finally separated it from the world and fitted it for its high purpose. The sacrificer had to remain in contact with the victim, either personally, or, to avoid ritual perils, by the intermediary of the priest. After excuses made to the animal or to the species in general, the victim was placed in position, and silence observed by all who were present. The cord was drawn tight and the victim ceased to breathe; its spirit passed into the world of the gods. It remained to dispose of the corpse. After a rite intended to secure its perfect ceremonial purity, a part of the victim was removed, held over the fire and finally cast into it. The remainder, divided into portions, was cooked; a certain number of these portions fell to the sacrificer, after an invocation, which made them sacred by calling the deity to descend into the offering and thus sanctify the sacrificer. (6) Then followed the rites of desacralization. Finally the priest, the sacrificer, and his wife performed a lustration and the ceremonies were at an end.

With present knowledge the problem of the original form of sacrifice, if there be a single primary form, is insoluble. It is impossible to give a general survey of the purposes of sacrifice; they are too numerous, and it is rare to find any but mixed forms.

Cathartic Sacrifice.—In primitive cults the distinction between sacred and unclean is not well defined (see TABU); consequently we find two types of cathartic sacrifice—(i.) one to cleanse of impurity and make fit for common use, (ii.) the other to rid of sanctity and in like manner render suitable for human use or intercourse.

(i.) The best example of the first class is the, scapegoat, where a more concrete idea of expulsion of evil (see DEMON; EXORCISM) is present among primitive peoples, as, for example. the Australians.

(ii.) A5 an example of the second class may be taken the sacrifice of the bull to Rudra, which exemplifies the concentration of holiness in a single animal as representative of its species (see ANIMAL WORSHIP).

Communal Sacrifice.—The common meal is not a primitive rite of adoption. The custom of eating the body of the victim does not necessarily spring from any idea of communion with the god; it may also arise from a desire to incorporate the sanctity which has been imparted to it—an idea on a level with many other food customs. and based on the idea that eating anything causes its qualities to pass into the eater.

Where the victim is an animal specially associated with a god (the most conspicuous case is perhaps that of the corn spirit), it may be granted that the god is eaten; but precisely in these cases there is no custom of giving a portion of the victim to the god.

Deificatory Sacrifice.—The object of certain sacrifices is to provide a tutelary deity of a house, town or frontier. (a) In many countries, those who die a violent death are held to haunt the place where they met their fate; consequently, when a town is built living men are interred beneath the ramparts and the pillars of the gates. (b) In parts of North America the *nagual* or manitu animal, of which the Indian dreams during the initiation fast and which is to be his tutelary spirit, is killed with certain rites. (c) Human representatives of the corn or vegetation spirits are killed; in these, as in other cases of the sacrifice of the man-god, the killing of the old god is at the same time the making of a new god. (d) Suicide is treated as a means of raising a human being to the rank of a god. (e) Gods may be sacrificed (in theriomorphic form) to themselves as a means of renewing the life of the god. (f) The method of creating a fetish (see FETISHISM) on the Congo resembles deificatory sacrifice: but here there is no actual slaughter of a human being; magical means are alone relied upon.

Honorific Sacrifices.—Sacrifices tend to be interpreted as gifts to the god. Man seeks to influence his fellow men in various ways, and it is quite natural to find the same ideas in the sphere of religion. Food is often given to a god because he is believed to take pleasure in eating; the germ of this idea may have been to nourish the divine life. With the spiritualization of the god, comes a refinement of the tastes attributed to him, and the finer parts of the sacrifice, finally it may be only its savour, are alone regarded as acceptable offerings. Just as attendants are provided for the dead, so the god receives sacrifices intended to put slaves at his disposal. The gift theory of sacrifice is closely associated with that of the god as the ruler or king to whom man brings a tribute, just as he had to appear before his earthly king bearing gifts in his hands. The honorific sacrifice is essentially a propitiation but must be distinguished from the *piaculum* (see (below).

Mortuary Sacrifice.—Sacrifices, especially of human beings, are offered immediately after a death or at a longer interval. Their object may be (a) to provide a guide to the other world; (b) to provide the dead with servants or a retinue suitable to his rank; (*c*) to send messengers to keep the dead informed of the things of this world; (d) to strengthen the dead by the blood or life of a living being, in the same way that food is offered to them or blood rituals enjoined on mourners.

Piacular Sacrifice.—Whereas the god receives a gift in the honorific sacrifice, he demands a life in the piacular. The essential feature of the *piaculum* is that it is an expiation for wrong-doing, and the victim is often human.

Human Sacrifice.—If tradition is any guide, human sacrifice seems in many important areas to be of secondary character; in spite of the great development of the rite among the Aztecs, tradition says that it was unknown till 200 years before the conquest; in Polynesia human sacrifices seem to be comparatively modern; and in India they appear to have been rare among the Vedic peoples On the whole. human sacrifice is far commoner among the semi-civilized and barbarous races than in still lower stages of culture.

In Australia however, where sacrifice of the ordinary type is unknown. the ritual killing of a child is practised in connection with the initiation of a magician.

Among the forms of human sacrifice must be reckoned religious suicide. mainly found in India but riot unknown in Africa and other parts of the world.

Sacrifice in Greece and Rome.—Both on the mainland of Greece and in the Greek colonies human sacrifice was practised, usually as a means towards expulsion of evil. (See GREEK RELIGION)

At Rome the scapegoat did not suffer death; but in the Saturnalia a human victim seems to have been slain till the 4th century A.D. Many forms of animal sacrifice were found.

Sacrifice in Egypt.—Of Egyptian ritual little is known. (See EGYPT: *Ancient Religion.*)

Sacrifice in India.—Among human sacrifices may be mentioned the suttee, or custom of immolating a widow on the funeral pyre of the husband, and the Khond sat rifice of the Meriah, who was either purchased or the son of a victim father. Some days before the sacrifice, the victim, who was often kept in captivity for long periods, was devoted and his sanctity was increased; finally he was put to death by strangulation or pressure. The remains were dismembered and distributed among the fields, excepting the portion offered to the earth goddess, which was buried.

Sacrifice in Africa.—Especially in West Africa, many forms of sacrifice are found. Three main forms of human sacrifice existed: (1) the scapegoat; (2) the messenger: and (3) the expiation; but combinations were not infrequent. On the Congo, if a man committed a murder, the community voted whether he should die or be expelled; if the latter, a victim was killed, of which all partook; this is not a *piaculum* for re-establishment of the tribal bond, for the criminal is driven out of the community.

Sacrifice in America.—The Pawnees had an elaborate ritual, in which a human victim was sacrificed to the Morning Star; the blood of the victims was sprinkled on the fields, and the details of the rite are not unlike those of the Khond custom. The Iroquois sacrifice of the white dog bore in later times the character of a scapegoat festival. In Mexico human sacrifices were very

common, the number being estimated at 20,000 a year.

THE IDEA OF SACRIFICE IN THE CHRISTIAN CHURCH

There can be no doubt that the idea of sacrifice occupied an important place in early Christianity. It had been a fundamental element of both Jewish and Gentile religions, and Christianity tended rather to absorb and modify such elements than to abolish them. To a great extent the idea had been modified already. Among the Jews the preaching of the prophets had been a constant protest against the grosser forms of sacrifice, and there are indications that when Christianity arose bloody sacrifices were already beginning to fall into disuse; a saying which was attributed by the Ebionites to Christ repeats this protest in a strong form, "I have come to abolish the sacrifices; and if ye do not cease from sacrificing the wrath of God will not cease from you" (Epiph. xxx. 16). Among the Greeks the philosophers had come to use both argument and ridicule against the idea that the offering of material things could be needed by or acceptable to the Maker of them all. Among both Jews and Greeks the earlier forms of the idea had been rationalized into the belief that the most appropriate offering to God is that of a pure and penitent heart, and that the vocal expression of contrition in prayer or of gratitude in praise is also acceptable.

The best instances of these ideas in the Old Testament are in Psalms l. and li., and in Greek literature the striking words which Porphyry quotes from an earlier writer, "We ought, then, having been united and made like to God, to offer our own conduct as a holy sacrifice to Him, the same being also a hymn and our salvation in passionless excellence of soul" (Euseb. *Dem. Ev.*, 3). The ideas are also found both in the New Testament and in early Christian literature: "Let us offer up a sacrifice of praise to God continually, that is, the fruit of lips which make confession to His name" (Heb. xiii. 15); "That prayers and thanksgivings, made by worthy persons, are the only perfect and acceptable sacrifices I also admit" (Just. Mart. *Trypho*, c. 117); "We honour God in prayer, and offer this as the best and holiest sacrifice with righteousness to the righteous Word" (Clem. Alex. *Strom.*, vii. 6).

But among the Jews two other forms of the idea expressed themselves in usages which have been perpetuated in Christianity, and one of which has had a singular importance for the Christian world. The one form, which probably arose from the conception of Yahweh as in an especial sense the protector of the poor, was that gifts to God may properly be bestowed on the needy, and that consequently alms have the virtue of a sacrifice. Biblical instances of this idea are—"He who doeth alms is offering a sacrifice of praise" (Ecclus. xxxii. 2); "To do good and to communicate forget not, for with such sacrifices God is well pleased" (Heb, xiii. 16); so the offerings sent by the Philippians to Paul when a prisoner at Rome are "an odour of a sweet smell, a sacrifice acceptable, well pleasing to God" (Phil. iv. 18). The other form, which was probably a relic of the conception of Yahweh as the author of natural fertility, was that part of the fruits of the earth should be offered to God in acknowledgment of His bounty, and that what was so offered was especially blessed and brought a blessing upon both those who offered it and those who afterwards partook of it. The persistence of this form of the idea of sacrifice constitutes so marked a feature of the history of Christianity as to require a detailed account of it.

Meals as Thank-offerings.— In the first instance it is probable that among Christians, as among Jews, every meal, and especially every social meal, was regarded as being in some sense a thank-offering. Thanksgiving, blessing and offering were co-ordinate terms. Hence the Talmudic rule, "A man shall not taste anything before blessing it" (Tosephta Berachoth, *c.* 4), and hence St. Paul's words, "He that eateth, eateth unto the Lord, for he giveth God thanks" (Rom. xiv. 6; cf. 1 Tim. iv. 4). But the most important offering was the solemn oblation in the assembly on the Lord's day.

The points in relation to this offering which are clearly demonstrable from the Christian writers of the first two centuries, but which subsequent theories have tended to confuse, are these. (1) It was regarded as a true offering or sacrifice; for in the Teaching of the Twelve Apostles, in Justin Martyr and in Irenaeus it is designated by each of the terms which are used to designate sacrifices in the Old Testament. (2) It was primarily an offering of the fruits of the earth to the Creator; this is clear from both Justin Martyr and Irenaeus, the latter of whom not only explicitly states that such oblations are continued among Christians, but also meets the current objection to them by arguing that they are offered to God not as though He needed anything but to show the gratitude of the offerer (Iren. iv. 17, 18). (3) It was offered as a thanksgiving partly for creation and preservation and partly for redemption: the latter is the special purpose mentioned (*e.g.*) in the Teaching of *the* Twelve Apostles; the former is that upon which Irenaeus chiefly dwells; both are mentioned together in Justin Martyr (*Trypho*, c. 41). (4) Those who offered it were required to be not only baptized Christians but also "in love and charity one with another"; there is an indication of this latter requirement in the Sermon on the Mount (Matt. v. 23, 24, where the word translated "gift" is the usual lxx. word for a sacrificial offering, and is so used elsewhere in the same Gospel, viz. Matt. viii. 4, xxiii. 19), and still more explicitly in the *Teaching*, c. 14, "Let not any one who has a dispute with his fellow come together with you (*i.e.* on the Lord's day) until they have been reconciled, that your sacrifice be not defiled." This brotherly unity was symbolized by the kiss of peace. (5) It was offered in the assembly by the hands of the president; this is stated by Justin Martyr (*Apol.* i. 65, 67), and implied by Clement of Rome (*Ep.* i. 44, 4).

Sacred Meals.—Combined with this sacrifice of the fruits of the earth to the Creator in memory of creation and redemption, and probably always immediately following it, was the sacred meal at which part of the offerings was eaten. Such a sacred meal had always, or almost always, formed part of the rites of sacrifice. There was the idea that what had been solemnly offered to God was especially hallowed by Him, and that the partaking of it united the partakers in a special bond both to Him, and to one another. In the case of the bread and wine of the Christian sacrifice, it was believed that, after having been offered and blessed, they became to those who partook of them the body and blood of Christ. This "communion of the body and blood of Christ," which in early writings is clearly distinguished from the thank-offering which preceded it, and which furnished the materials for it, gradually came to supersede the thank-offering in importance, and to exercise a reflex influence upon it. In the time of Cyprian, though not before, we begin to find the idea that the body and blood of Christ were not merely partaken of by the worshippers but also offered in sacrifice, and that the Eucharist was not so much a thank-offering for creation and redemption as a repetition or a showing forth anew of the self-sacrifice of Christ.

This idea is repeated in Ambrose and Augustine, and has since been a dominant idea of both Eastern and Western Christendom. But, though dominant, it has not been universal, nor did it become dominant until several centuries after its first promulgation. The history of it has yet to be written. For, in spite of the important controversies to which it has given birth, no one has taken the pains to distinguish between (i.) the theories which have been from time to time put forth by eminent writers, and which, though they have in some cases ultimately won a general acceptance, have for a long period remained as merely individual opinions, and (ii.) the current beliefs of the great body of Christians which are expressed in recognized formularies. A catena of opinions may be produced in favour of almost any theory; but formularies express the collective or average belief of any given period, and changes in them are a sure indication that there has

been a general change in ideas.

It is clear from the evidence of the early Western liturgies that, for at least six centuries, the primitive conception of the nature of the Christian sacrifice remained. There is a clear distinction between the sacrifice and. the communion which followed it, and that which is offered consists of the fruits of the earth and not of the body and blood of Christ. Other ideas no doubt attached themselves to the primitive conception, of which there is no certain evidence in primitive times, *e.g.* the idea of the propitiatory character of the offering, but these ideas rather confirm than disprove the persistence of those primitive conceptions themselves. All Eastern liturgies, in their present form, are of later date than the surviving fragments of the earlier Western liturgies, and cannot form the basis of so sure an induction; but they entirely confirm the conclusions to which the Western liturgies lead.

In the course of the 8th and 9th centuries, by the operation of causes which have not yet been fully investigated, the theory which is first found in Cyprian became the dominant belief of Western Christendom. The central point of the sacrificial idea was shifted from the offering of the fruits of the earth to the offering of the body and blood of Christ. The change is marked in the rituals by the duplication of the liturgical forms. The prayers of intercession and oblation, which in earlier times are found only in connection with the former offering, are repeated in the course of the same service in connection with the latter. The designations and epithets which are in earlier times applied to the fruits of the earth are applied to the body and blood. From that time until the Reformation the Christian sacrifice was all but universally regarded as the offering of the body and blood of Christ. The innumerable theories which were framed as to the precise nature of the offering and as to the precise change in the elements all implied that conception of it. It still remains as the accepted doctrine of the Church of Rome. For, although the council of Trent recognized fully the distinction which has been mentioned above between the Eucharist and the sacrifice of the mass, and treated of them in separate sessions (the former in Session xiii., the latter in Session xxii.), it continued the mediaeval theory of the nature of the latter.

The reaction against the mediaeval theory at the time of the Reformation took the form of a return to what had no doubt been an early belief,—the idea that the Christian sacrifice consists in the offering of a pure heart and of vocal thanksgiving. Luther at one period (in his treatise *De captivitate Babylonica*) maintained, though not on historical grounds, that the offering of the oblations of the people was the real origin of the conception of the sacrifice of the Mass; but he directed all the force of his vehement polemic against the idea that any other sacrifice could be efficacious besides the sacrifice of Christ. In the majority of Protestant communities the idea of a sacrifice has almost lapsed. That which among Catholics is most commonly regarded in its aspect as an offering and spoken of as the "mass" is usually regarded in its aspect as a participation in the symbols of Christ's death and spoken of as the "communion." But it may be inferred from the considerable progress of the Anglo-Catholic revival in most English-speaking countries that the idea of sacrifice has not yet ceased to be an important element in the general conception of religion.

Gaster, art. "Sacrifice, Jewish," *ibid.* p. 24; *G.* F. Moore, art. "Sacrifice" in the *Encyclopaedia Biblica; W. R.* Smith, *Religion of the Semites (1889;* reprint of 2nd ed., 1907); J. G. Frazer, *The Golden Bough*, pt. vi., "The Scapegoat," and *Folklore* in *the Old Testament.*

SACRILEGE, the violation or profanation of sacred things. The word comes from the Lat. *sacrilegiurn*, which originally meant merely the theft of sacred things, although already in Cicero's time it had grown to include in popular speech any insult or injury to them.

In primitive religions inclusive of almost every serious offence even in fields now regarded as merely social or political, its scope is gradually lessened to a single part of one section of ecclesiastical criminology, following inversely the development of the idea of holiness from the concrete to the abstract, from fetishism to mysticism. The primitive defence against sacrilege lay directly in the nature of sacred things, those that held a curse for any violation or profanation (*see* TABU). Early criminal law brought a measure of physical sanction into consideration. The Levitical code exacted of the offender reparation for the damage with the addition of one-fifth of the amount, and an expiatory sacrifice (Lev. v. 15, 16). The tragic story of the stoning of Achan, who stole some of the spoils of Jericho which Joshua had consecrated to the treasury of Yahweh, is one of the most graphic details of Old Testament history (cf. Joshua vii. 20–25).

No religion was more prodigal in rules to safeguard that which was holy or consecrated than the Jewish, especially in its temple laws; violation of them often led to mob violence as well as divine chastisement. The temple rules do not apply to synagogues, however, and unseemly conduct in them is liable only to civil action.

While the Roman cults were amply protected by tabus, there was no comprehensive term in Roman law for religious violations and profanations in general. *Sacrilegium* was narrowly construed as the theft of sacred things from a sacred place. According to Ulpian the punishment for *sacrilegium* varied according to the position and standing of the culprit and the circumstances under which the crime was committed. For the lower classes it was crucifixion, burning or the wild beasts. The latter penalty was also attached to theft of sacred things by night, but stealing by day from a temple objects of little value brought only sentence to the mines. People of higher rank were deported. During classical times the law kept to the narrow meaning of *sacrilegium*, but in popular usage it had grown to mean about the same as the English word. Traces of this usage are frequent in Augustan writers. The early church Fathers use the word most frequently in the restricted sense, although an effort has been made to read the wider meaning in Tertullian. But by the middle of the 4th century the narrower meaning had disappeared. In Ambrose, Augustine and Leo I., *sacrilegium* means sacrilege. The wider meaning had invaded the law as well. Mommsen was of the opinion that *sacrilegium* had no settled meaning in the laws of the 4th century. But it was rather that an enlarged application of the idea of sacredness made the crime of sacrilege in the sense of *violatio sacri* a more general one. This was partly due to the influence of Christianity, which sought to include as objects of sacrilege all forms of church property, rather than merely those things consecrated in pagan cults, partly to the efforts of the later emperors to surround themselves and everything emanating from them with highest sanctions. In the Theodosian Code the various crimes which are accounted sacrilege include—apostasy, heresy, schism, Judaism, paganism, attempts against the immunity of churches and clergy or privileges of church courts, the desecration of sacraments, etc., and even Sunday. Along with these crimes against religion went treason to the emperor, offences against the laws, especially counterfeiting, defraudation in taxes, seizure of confiscated property, evil conduct of imperial officers, etc. There is no formal definition of sacrilege in the code of Justinian but the conception remains as wide.

The penitentials (*q.v.*), or early collections of disciplinary canons, gave much attention to sacrilege. The Frankish synods emphasize the crime of seizing church property of every kind, including the vast estates so envied by the lay nobility. The worst sacrilege of all, defiling the Host, is mentioned frequently, and generally brought the death penalty accompanied by the cruellest and most ignominious tortures. The period of the Reformation naturally increased the commonness of the crime. Under the emperor Charles V. the penalty for stealing the Host was the stake; that for other crimes was graded accordingly. In France, in 1561, under Charles IX., it was forbidden under penalty of death to demolish crosses and images and to commit other acts of scandal and impious sedition. In the declaration of 1682, Louis XIV. decreed the same penalty for sacrilege joined to superstition and impiety, and in the somewhat belated religious persecution of the duke of Bourbon in 1724 those convicted of larceny in churches, together with their accomplices, were condemned, the men to the galleys for life or for a term of years, the

women to be branded with the letter V and imprisoned for life, or for a term. The trial of La Barre in 1766 at Abbevilie is the most famous sacrilege case in modem times. Convicted of wearing his hat while a religious procession was passing—as well as of blasphemy—he was accused as well of having mutilated a crucifix standing on the town bridge. Declared guilty, after torture, he was sentenced to have his tongue cut out, to be beheaded and the body to be burned, a sentence which was confirmed by the parlement of Paris and the bigoted king Louis XV. In the midst of the French Revolution respect for *civic* festivals was sternly enacted, but sacrilege was an almost daily matter of state policy. In 1825 the reactionary parlement once more brought back the middle ages, by decreeing the death penalty for public profanation, the execution to be preceded by the *amende honorable* before the church doors. "Theft sacrilege" was treated in a separate series of equally savage clauses. This ferocious legislation was expressly and summarily abrogated in 1830.

English Law.—In English law, sacrilege is the 'breaking into a place of worship and stealing therefrom. At common law benefit of clergy was denied to robbers of churches. A statute of 1553 made the breaking or defacing of an altar, crucifix or cross in any church, chapel or churchyard punishable with three months' imprisonment on conviction before two justices, the imprisonment to be continued unless the offender entered into surety for good behaviour at quarter sessions. The tendency of the later law has been to put the offence of sacrilege in the same position as if the offence had not been committed in a sacred building. Thus breaking into a place of worship at night, says Coke, is burglary, for the church is the mansion house of Almighty God. The Larceny Act of 1861 punishes the breaking into, or out of, a place of divine worship in the same way as burglary, and the theft of things sacred in the same way as larceny. Now by the Malicious Damage Act 1861 the unlawful and malicious destroying or damaging any picture, statue, monument or other memorial of the dead, painted glass or other monument or work of art, in any church, chapel, meeting-place or other place of divine worship, is a misdemeanour punishable by imprisonment.

SACY, ANTOINE ISAAC SILVESTRE DE, BARON (1758–1838), French scholar, the leading orientalist of his age, who specialized in Arabic and Islamic studies. His interest in these was aroused early by a monk in an abbey opposite his home in Paris, where he was born on Sept. 21, 1758. He learned, privately, Arabic, Hebrew, Persian and Turkish, and his studies ranged over oriental history, geography, religion and numismatics, as well as grammar and philology. In. 1781 he entered the civil service, but resigned in 1792. As a fervent Catholic and monarchist, he was out of sympathy with the revolutionary regime. Nevertheless. in 1795, despite his refusal to take a required oath against monarchism, he was given the chair of Arabic in the newly founded École des Langues Orientales Vivantes, and in 1806 was appointed professor of Persian in the Collège de France. In 1815, he became rector of the University of Paris. and from 1815 was active in the commission of public instruction. He was also official orientalist in the ministry of foreign affairs (1805–29), making Arabic translations of various state documents. He was made a baron by Napoleon in 1813, and created a peer of France in 1832.

Despite his distinction as an orientalist, he only once traveled outside France; and then no further than Genoa. He died in Paris, Feb. 21, 1838.

His skill as a teacher is attested by the long list of his pupils—especially French and German—who achieved fame. His works include editions of *Hariri* and *Kalila and Dimna,* and the incomplete *Expose' de la religion des Druzes,* 2 vol. (1838), the result of over 30 years' study. Of immense influence were his textbooks.

Sacy's *Grammaire arabe,* 2 vol. (1810) set a new standard for such works. and his *Chrestomathie arabe,* 3 vol. (1806) and *Anthologie grammaticale* (1829) were also important.

(J. A HD.)

SADDLE, a seat, usually of leather, fixed by girths to the back of a horse for riding; also a padded cushion for the back of a draft horse, fastened by girths and crupper; to it are attached the supports for the shafts, and rings for the reins. *(See* HARNESS AND SADDLERY.)

The word is also applied to many objects resembling a saddle in shape or function, such as a block to support a spar in a ship or in machinery to support a rod.

In architecture, a saddle is a piece of wood, metal, marble, etc., at the bottom of a door opening. The term is also applied to a saddle-shaped stone used as a coping.

Saddle bars are small, horizontal bars of iron or bronze running across a stained glass window; fastened to the stone or frame on each side. they brace the window structure, and form a rigid base to which the leading of the glass can be attached.

SADDLERY AND HARNESS: *see* HARNESS AND SADDLERY.

SADDUCEES, the name of a party in Judaism which was opposed to the Pharisees down to the destruction of Jerusalem in A.D. 70. 'The basic difference between the two parties lay in their respective attitudes toward the Torah, the Sadducees representing the extreme conservative view.

See JEWISH SECTS DURING THE SECOND COMMONWEALTH: *Pharisees* and *Sadducees*; JUDAISM.

SADE, DONATIEN ALPHONSE FRANÇOIS, COUNT (usually called the MARQUIS DE SADE) (1740–1814), French writer. was born in Paris on June 2, 1740. He entered the light horse at 14 and saw considerable military service before returning to Paris in 1766. There his vicious practices became notorious. and in 1772 he was condemned to death at Aix for an unnatural offense and for poisoning. He fled to Italy, but in 1777 he was arrested in Paris, taken to Aix for trial and there found guilty. In 1778 he escaped from prison, but was soon re-arrested and finally committed to the Bastille. There he began to write plays and obscene novels. In 1789 he was sent to the Charenton lunatic asylum, but was discharged in 1790, only to be recommitted as incurable in 1803. He died there on Dec. 2, 1814. Among his works, all of the type indicated. were *Justine* (1791). *Juliette* (1792). *Philosophie dans le boudoir* (1793) and *Les Crimes de l'amour* (1800). The word sadism is derived from his name.

See C. R. Dawes, *The Marquis de Sade: His Life and Works* (1927).

SADEDDIN, HOCA (1536–1599), Turkish historian. was the author of the renowned *Tac üt-tevarih* ("Crown of Histories"). The son of Hasan Can, court chamberlain to Selim I, he was tutor to Prince Murad. governor of Manisa, and followed him to Istanbul when he became sultan as Murad III. He was influential in the palace and later accompanied Murad's son, Sultan Mohammed III, on his campaign in Hungary, playing an important part in the victory at Erlau (1596) by the moral support he gave at a critical hour. He was made shaikh ul-Islam in 1598.

The *Tac üt-tevarih,* which covers the period from the origins of the Ottoman empire to the end of the reign of Selim I (1520), is based on earlier works. Its reputation can be attributed partly to its rhetorical and ornate style, popular in the 16th century, and to the fact that the author's family were influential in the palace for nearly a century. (F. I.)

SÁ DE MIRANDA, FRANCISCO DE (1481–1558), the first of the Portuguese Renaissance poets. was probably born on Aug. 28, 1481, the illegitimate son of a canon of Coimbra, Gonçalo Mendes de Sá. and Dona Inês de Melo. He was made legitimate in 1490. He studied at the university, which was then in Lisbon, and seems to have lived mainly in the capital until 1521, frequenting the royal court and taking part in the poetical improvisations there and, possibly, teaching at the university. The years from 1521 to 1526 he spent in Italy, visiting Milan, Venice, Florence, Rome, Naples and Sicily. He made the acquaintance of Giovanni Ruccellai, Lattanzio Tolomei and Jacopo Sannazaro; he met the illustrious Vittoria Colonna, a distant connection of his family, and in her house he probably talked with Cardinal Pietro Bembo and Ariosto, and perhaps met Machiavelli and Francesco Guicciardini. By the time he returned home in 1526 he had become familiar with Italian verse forms and metres: the sonnet and *canzone* of Petrarch, the tercet of Dante, the ottava

rima of Ariosto. the eclogue in the manner of Sannazaro, and Italian hendecasyllabic verse. He did not, however, abandon the short national metre, which he carried to perfection in his *Cartas* or epistles in verse.

His play *Os Estrangeiros,* written *c.* 1527, was the first Portuguese prose comedy in the classical manner, and he wrote another, *Os Vilhalpandos, c.* 1538 (published 1560). His *Cledpatra* (written *c.* 1550), of which only a dozen lines are extant, was probably the first Portuguese classical tragedy. About 1528 Sá de Miranda made his first attempt to introduce the new Renaissance forms of verse by writing in Spanish a *canzone* entitled *Fdbula do Mondego,* and this was followed a year or two later by the eclogue *Alexo.*

About 1530, in which year he married, he left Lisbon finally and settled on his country estate in the Minho. It is in this later period that he produced his best work: the eclogue *Basto,* the *Cartas* and the satires, in which he shows himself a stern critic of contemporary society. Some of the sonnets of this period are admirable, combining a grave tenderness of feeling and refinement of thought with simplicity of expression. He died on his estate at Tapada probably in May 1558.

Sa de Miranda was the leader of a revolution in Portuguese literature, and especially in poetry, which under his influence became higher in aim, purer in tone and broader in sympathy. As well as introducing the poetic and dramatic forms and spirit of the Renaissance into Portugal, he made an austere stand against the growing materialism of his time.

Poesias de F. de Sá de Miranda was edited, with life. notes and glossary. by C. Michaelis de Vasconcelos (1885); *Obras completas de F. de Sá de Miranda* was edited by M. Rodrigues Lapa, 2 vol. (1937).

SA'DI (MUSHARIFF-UD-DIN) (*c.* 1184–C.1291), Persian poet and prose writer. the author of two works, the *Bustan* ("Orchard") and *Gulistan* ("Rose Garden"), which came to be regarded as classics of Persian literature. He lost his father Muslih ud-din in early childhood; later he was sent to study in Baghdad at the renowned Nizamiya college where he acquired the traditional learning of Islam.

The unsettled conditions following the Mongol invasion of Persia, when, in the words of Sa'di, the world resembled "the curly hair of a Negro," led the poet to wander in many countries. He refers to his adventures in north Africa, central Asia and India; in Syria he was captured by the Franks and put to work in the trenches of the fortress of Tripoli. When he reappeared in his native Shiraz he was an elderly man. He dedicated the *Bustan* (1257) and the *Gulistan* (1258) to the local ruler (atabeg) Abu-Bakr ibn Sa'd. (His pen-name Sa'di was derived from the name Sa'd borne both by the father and the son of Abu-Bakr.) He seems to have spent the rest of his life in Shiraz. for his poems were dedicated to the later atabegs and governors, both heathen and Moslem, whom the Mongol *ilkhans,* established in Tabriz, sent to the province of Fars. References to contemporary events in Sa'di's works stop at about 1270.

That Sa'di produced his two greatest works so late in life and in such quick succession is not surprising. The material for them must have been collected and many of the poems written long before an opportunity for their publication occurred. The *Bustan* is entirely in verse (in the metre used in epic) and consists of stories aptly illustrating the standard virtues recommended to Moslems (justice, liberality, modesty. contentment), as well as of reflections on the behaviour of dervishes and their ecstatic practices.

The *Gulistan* is mainly in prose, and contains stories and personal recollections. The text is interspersed with a variety of charming little poems containing aphorisms, advice and humorous reflections. The morals preached in the *Gulistan* border on expediency; *e.g.,* a salutary lie is admitted to be preferable to a blunt truth. The fate of those who depend on the changeable moods of kings is contrasted with the freedom of the dervishes:

> I am neither riding a camel, nor carrying a load like a camel; I am neither a lord of subjects, nor the slave of a potentate; grief for what there is or distress for what there is not do not trouble me; I draw my breath freely and thus spend my life.

For western students the *Bustan* and *Gulistan* have a special attraction. but Sa'di is also remembered as a great poet, the author of a number of masterly general odes portraying human experience and also of particular odes (such as the lament on the destruction of the caliphate by the Mongols in 1258), which have a great appeal for Persian readers. A special section of his complete works is in Arabic, but Arabs find some of his methods of expression strange.

The peculiar blend of human kindness, resignation and humour displayed in Sa'di's works, together with a tendency to avoid the hard dilemma, make him, to many, the most typical and lovable writer in the world of Iranian culture.

BIBLIOGRAPHY.—Best editions of the *Bustan* and *Gulistan* are by M. A. Furughi (1938). The first competent trans. of the *Gulistan* was by *F.* Gladwin (1806, reprinted 1928), followed by that of E. B. Eastwick (1852, reprinted 1880); partial trans. are by Sir Edwin Arnold (1899), Sir R. Burton (1928) and A. J. Arberry (1945). A good French trans. of the *Bustan* is hy Barbier de Meynard (1880). Sir L. W. King trans. two series of the odes, the *Tayyibāt* (1919–21) and the *Badāyi'* (1925). A comprehensive bibliography is in H. Massé, *Biographie de Saadi* (1919). For a general appreciation *see* E. G. Browne, *A Literary History of Persia,* vol. ii (1928); A. J. Arberry, *Classical Persian Literature* (1958). Critical ed. of the *Gulistan* with Russian trans. by R. Aliyev (1960). (V. F. M.)

SADLER, MICHAEL THOMAS (1780–1835), English social reformer and politician, was born at Snelston. Derbyshire, on Jan. 3, 1780. While still young he became a Wesleyan Methodist, and his religion turned him into a philanthropist. In 1800 he became a businessman at Leeds, importing Irish linens, and soon he became a politician as well. He was Tory M P. for Newark, 1829 and 1830, and for Aldborough, 1831–32, but he failed to win the new Leeds seat in Dec. 1832, when he was opposed by T. B. (later Lord) Macaulay.

Macaulay had already criticized his *Law of Population* (1830), a massive anti-Malthusian treatise, and Sadler in turn was an outspoken critic of all forms of Whiggery. Along with Richard Oastler. Sadler became an advocate of factory reform. and of government intervention in the hours of child labour and factory conditions in general. As parliamentary representative of the newly founded short-time committees in the north of England, he introduced a factory reform bill in the house of commons in 1831 and subsequently acted as chairman of the select committee to which it was referred.

Sadler died in Belfast, July 29, 1835, after the parliamentary cause of factory reform passed into the hands of Lord Ashley. (4. BRI.)

SADLER (or SADLEIR), **SIR RALPH** (1507–1587), English statesman, was born at Hackney, Middlesex. in 1507. While a child he was placed in the family of Thomas Cromwell, afterward earl of Essex, whose secretary he eventually became. Sadler held many positions under Henry VIII, but he is best known for his employment under Elizabeth I in connection with the affair of Mary. Queen of Scots. Elizabeth sent him (1559) to Scotland, ostensibly to settle the border disputes, but in reality to secure a union with the Protestant party there, and he helped to arrange the treaty of Leith, July 6, 1560.

In 1568 Sadler was appointed chancellor of the duchy of Lancaster, and in the same year was one of the English commissioners employed in treating on the matters arising from the flight of the Queen of Scots. From this time he seems to have been continually engaged as a discreet and trusty servant in connection with Mary's captivity, and was frequently sent with messages to her. On Aug. 25, 1581, when, because of the imputations made by his countess. George 6th earl of Shrewsbury resigned his guardianship of the queen, Sadler succeeded him.

In September, Mary was removed from Sheffield to Wingfield and early in 1585 to Tutbury. In April, Sadler, after numerous petitions on his part, was permitted to resign his distasteful charge.

On March 30, 1587, Sadler died at Standon, and was buried there. His letters on Scottish affairs are interesting.

See *Letters and Negotiations of Sir Ralph Sadler* (1720); *The State Papers and Letters of Sir R. Sadler,* ed. *by* Arthur Clifford, 3 vol. (1809).

SADO, Japanese island of Niigata prefecture, 32 mi. W. of Niigata, the prefectural capital. Area 248 sq.mi., pop. (1955) 90,705. Sado, long known as an island of romance, is the home of *okesa* (folk-dancing songs, ballads). Camellia trees grow in abundance. The climate is mild all the year.

Sado was famous as a place of exile and among many statesmen and scholars banished two of the most exalted were the emperor Juntoku (1197–1242) and the Buddhist priest Nichiren (1222–1282). Sado is known for its gold and silver mines, continuously operated from 1601. Rice is the first product, followed by fishing. Tourism provides an important source of income. Ryōtsu, on the east shore! is the only city. It is the centre of the island's administration, and of its fishing industry. Serving as an outer port of Niigata, it is the principal port on the island. Aikawa is the largest town on the west coast. (R. B. H.)

SÁENZ, MANUELA (1797–1856), known throughout Latin America as "La Sáenz," mistress of the liberator Simón Bolivar, was born in Quito, Ecuador, on Dec. 27, 1797. At the time of her birth her mother was unwed, and the stain of illegitimacy left its mark. For years she shrouded her origins in mystery. In 1817 she married a British merchant. James Thorne, who took her to Lima, Peru; there Manuela first came into contact with the movement for independence which was then challenging Spanish rule throughout Latin America. On her return to Quito in 1822 she met Simón Bolivar, who had just completed the liberation of Ecuador. Manuela became the great passion of his life; she threw caution to the winds and united her life with his—and with the cause for which he was fighting.

The exigencies of war separated the couple for long periods, and there were occasions of neglect which Manuela bitterly resented. In return for her unflinching devotion she demanded an exclusiveness to which Bolivar was unaccustomed. When the war took Bolivar to Peru Manuela did not hesitate to follow him.

As she had shared the zenith of Bolivar's life, she also became engulfed in his decline. Her efforts to keep the Peruvians on his side were in vain. She was exiled from Lima and joined Bolivar in Bogotk, Colom., where on Sept. 25, 1828, she saved him from conspirators.

In the spring of 1830, when Bolivar resigned his office to go into exile. Manuela was left behind. His papers remained in her care and she refused to hand them over to his enemies. When she learned of his death (Dec. 17, 1830) she unsuccessfully attempted to take her own life.

In 1534, Manuela was exiled from Bogotá and went to the small Peruvian port of Paita, where she made a living as a vendor of sweets and tobacco. She died at Paita on Nov. 23, 1856.

SÁENZ PEÑA, ROQUE (1851–1914), Argentine president and diplomat. Although a wealthy leader of the landed aristocracy, he was responsible during his presidency for a broad suffrage law, which placed Argentina in the vanguard of Latin-American democracy.

Sáenz Peña was born in Buenos Aires on March 19, 1851, the descendant of a famous family. He was educated in Argentina, traveled in Europe and entered politics in the 1870s. when Argentina's population and economy were rapidly expanding. Among the many posts he held were those of minister of foreign affairs, delegate to the first International Conference of American States (Washington, D.C.. 1889–90) and ambassador to Spain and to Italy (1901–10). He was elected president in 1910 in a conservative-controlled election, but he had the vision to respond to the mounting demands of the popular majority, represented by Hipólito Irigoyen's Radical party, and forced a series of electoral reforms through the oligarchy-dominated congress. These laws, which have since borne his name and have been the basis of Argentine democracy, gave every Argentine male at the age of 18 the right to vote on a secret ballot.

Sáenz Peña died in office on Aug. 9, 1914, as Argentina was entering an era of change marked bv World War I and the election to the presidency in 1916 of his former opponent. Irigoyen. (T. F. McG.)

SAFARIK, PAVEL JOSEF (1795–1861), one of the leading figures of the Czech national revival and a pioneer of Slavonic philology and archaeology. Born at Kobeliarov, Slovakia, May 13, 1795, of a Protestant family, he studied at Jena and was director of the Serbian Orthodox grammar school at Novi Sad before settling in Prague in 1833. In 1841 he refused an invitation to occupy the chair of Slavonic philology at Berlin. preferring to remain as a private scholar in his own country. He died at Prague. June 26. 1861.

Erudition and scholarly integrity characterize a series of influential works on the history and languages of the Slavs: *Geschichte der slavischen Sprache und Literatur nach allen Mundarten* (1826); *Slovanské starožitnosti* (183;). better-known in the German translation *Slawische Altertümer* (1843); *Über den Ursprung und die Heimat des Glagolitismus* (1858); *Geschichte der südslawischen Literatur* (1864).

Although his work on the origins and migrations of the Slavs has been superseded. it was of great value in its time. His philological works can still be read with profit: in his belief in the priority of the Glagolitic alphabet over the Cyrillic he was far ahead of his time. (R. AY.)

SAFED KOH, in many respects the most remarkable range of mountains on the northwest frontier of West Pakistan. extending like a 14,000 ft. wall, straight and rigid, towering above all surrounding hills. It separates the Kabul basin from the Kurram and Afridi Tirah and thus forms a natural boundary between Afghanistan and Pakistan. The highest peak, Sikaram, is 15,600 ft. above sea level. Geographically the Safed Koh is not an isolated range, for there is no break in the continuity of water divide which connects it with the great Shandur offshoot of the Hindu Kush except the narrow trough of the Kabul river. which cuts a deep waterway across where it makes its way from Dakka into the Pesharvar plain. The northern spurs are extremely barren but the intervening valleys support agriculture and gardens abounding in mulberries, pomegranates, etc. The main range and the upper portions of the spurs are wooded with pine and deodar.

The same name is often used for the mountain range north of the Hari Rud river in its upper course.

SAFES, STRONG ROOMS AND VAULTS. Although boxes provided with locks or coffers must have followed closely on the development of locks (q *v.)* and been in use in ancient Egypt, no examples remain of earlier date than the middle ages. The earliest examples extant were constructed of hard uood banded with hammered iron, and subsequent development took place rather on artistic than on practical lines up to the time of the introduction of boxes entirely of iron On the continent of Europe the iron box was developed to a high standard of artistic beauty and craftsmanship, but with no real increase of security.

Milner's **Work.**—Up to the 17th century no attempt was made to make coffers fireproof. for though a patent for fireproofing was taken out in 1801 by Richard Scott, it does not appear to have been used In 1834, however, a patent was obtained by William Marr for the application of nonconducting linings, followed about four years later by a similar patent in the name of Charles Chubb. The foundation, however, of the modern safe industry was laid by Thomas Milner, originally a tinsmith of Sheffield, who after a few years' business in Manchester established, in 1830, works at Liverpool for the manufacture of tinplate and sheet iron boxes and who later made plate iron chests or coffers and, probably the earliest, safes about the year 1846.

Chatwood's Patent, 1860.—Concurrently with the increase of strength in safes and probably with the increased value of articles preserved in safes, the skill of the professional thief had also increased, and this went on for some years until the Cornhill burglary of 1865 called general attention to the question. In 1860

a patent was taken out by Samuel Chatwood for a safe constructed of an outer and inner body with the intervening space filled with ferromanganese or spiegeleisen in a molten state, the total thickness being 2 in.

To prevent safes from being opened by the drilling of one or two small holes in such positions as to destroy the security of the lock itself, advantage was taken of the improvements in the manufacture of high carbon steel and, even in the modern "fireproof" safe, a plate of steel which offers considerable resistance to drilling is placed between the outer doorplate and the lock. About 1888 the solid safe was introduced. In this the top, bottom and two sides of the safe, together with the flanges at the back only or at both back and front, are bent from a single steel plate.

The Modern Safe.—The requirements of a modern safe may be briefly summarized as follows:

For fire-resisting safes, the safe body must be constructed of steel plate of sufficient thickness to withstand the effect of a fall from an upper floor in the event of a fire and to resist the crushing effect of falling masonry, displaced girders, etc. The "proofing" of the safe must be of sufficient quantity, packed around the whole area of the body and door to preserve the heat resistance over a long period, otherwise when this reserve is exhausted the safe would become a slow oven and its contents charred and completely destroyed.

Safes which are intended to resist burglars, as well as fire, must be made with greater constructional strength successfully to resist brute force and destructive violence. In addition, they need to be formed from such a combination of metals and alloys as will withstand all forms of cutting and piercing tools and appliances, in addition to the oxyacetylene cutting blowpipe. The more successful of these alloys, although they can be heated by the gas flame to their melting point, cannot be cut, like steel, by the application of a stream of pure oxygen when their melting temperature has been reached.

It is essential that the walls and doors of such safes should be of considerable thickness, as mass is of great importance in providing resistance to the blowpipe method of attack. The doors of such safes must be closely and accurately fitted to the opening and secured in the closed position by a number of suitable moving bolts operated by an external handle. The actual shape of the bolts is not of vital importance provided they are of sufficient strength and rigidity to resist all forces that can be brought to bear against them in an effort to force the door away from the safe body. The majority of safe manufacturers use bolts formed from either round or flat section steel bars, but others are of special shape and design.

In the United States, fire-resisting safes usually are not made burglar proof, the highest standard of requirement being 20 minutes' protection against amateur attack through the door. Burglar-proof alloy steel chests are however frequently fitted into fire-resisting safes. Most important are the locks used to control its operation. To provide the maximum amount of security and lengthen the period of resistance that a safe will offer to forcible entry. more than one lock should be employed and the locks need to be made as large as possible to increase the amount of material which has to be removed to expose the lock. It is also advisable to provide the lock aith more than one moving bolt to engage with the bolting mechanism, as it is this moving lock bolt which prevents the bolt action being operated and the bolts retracted into the door.

When gunpowder was the only explosive available, it was possible to construct safe locks to resist its use, but with modern high-power explosives other methods must be employed. In good quality safes these take the form of independent bolting actions which are brought into active operation only by the actual force of an explosive, when used to destroy the working lock. The effect of such an explosion is to substitute the dogging action of the special device for that of the lock which it was sought to destroy.

Time locks with two, three or four chronometer movements are frequently employed to control the hours for opening safes and vault doors. These locks are fitted in addition to either the key or dial operated locks and are intended to prevent the door being opened at any other than the official times.

Strong Rooms and Vaults.—For the purpose of providing security for deeds, papers and books against the risk of fire, rooms are built either of brick or concrete, according to the conditions existing on the site and the amount to be expended on the construction, the thickness of the walls varying from 14 to 18 in. if built in brick, and from 8 to 14 in. in concrete. Bank vaults and strong rooms for the custody of securities, cash, etc., are mainly constructed of reinforced concrete or with a combination of brick and concrete, the thickness of the walls varying with their importance and the ground space available. Generally speaking, reinforced concrete walls can be built of less thickness than brickwork to provide equivalent security against penetration, but in all important vaults and strong rooms it is advisable to reinforce the walls, roof and floor with linings of steel and flame resisting alloy, forming a self-contained safe inside the concrete shell.

The most effective method of employing steel to reinforce the concrete construction is to use it in the form of plates attached to the inner face of the walls. The steel then prevents the breaking away of the inner face of the concrete in large sections into the strong room, whereas if the steel reinforcement is distributed throughout the concrete walling in the form of bars or mesh work, it can be quickly and easily cut through with the blowpipe.

In the design of strong rooms and vaults, the formation of the roof and floor is frequently of more importance than that of the walls. The latter are usually subject to inspection (unless the room is built against an exterior or party wall, which should be avoided if possible), whereas the floor is liable to attack by means of tunneling which can be carried out without any indication being given until the actual breaking through of the floor. The highest degree of security is obtained when the vault is built as an island with an inspection or patrol passage entirely surrounding it.

Electrical devices are frequently installed to give an alarm in the event of a burglariou: attempt upon strong rooms, either upon the main structure or the door. It is said that a burglar would require about six hours of uninterrupted effort with the oxyacetylene torch to penetrate a modern vault door 20 in. thick, containing a 12 in. plate of pure copper. The high resistance of copper to torch attack is explained by the fact that this metal is a rapid conductor of heat, in contrast with other metals of low heat conductivity heretofore used in vault construction. **A** torch capable of developing a heat between 5,000° F. and 6,000° F. will penetrate the first few inches of a copper plate in a comparatively short time. However, the flame loses its efficiency as the copper conducts the heat rapidly away before the entire body of the metal can be raised to a fusing point. The ductility of the metal makes it unsuited for successful attack with explosives.

SAFETY GLASS: see GLASS.

SAFETY LAMP. Toward the end of the 18th century coal mine explosions became increasingly common as the seams were dug to deeper levels where firedamp (methane gas) was more prevalent, and efforts were made to devise means of lighting which would be safe in the presence of the gas. The explosive nature of a cloud of fine coal dust was not then recognized, and explosions were attributed wholly to gas. The explosions usually originated at the flame of a tallow candle.

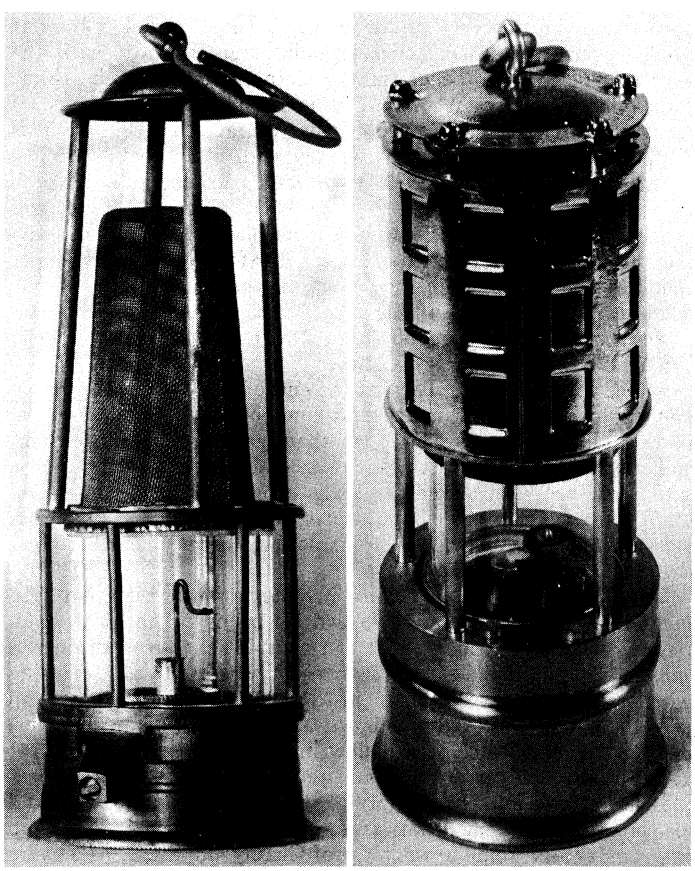
Davy Lamp.—W. Reid Clanny invented a form of lamp in 1813 in which the external air was blown by bellows through a small cistern of water and the products of combustion forced through a similar water seal. George Stephenson, who was experimenting with lamps for underground use in 1815, concluded that "if a lamp could be made to contain the burnt air above the flame, and permit the firedamp to come in below in small quantity to be burnt as it came in, the burnt air would prevent the passing of the explosion upwards and the velocity of the current from below would also prevent its passing downwards." Though neither type of lamp was satisfactory, some of the ideas of Clanny and Stephenson were incorporated in the Davy lamp as the latter was developed and improved. In Aug. 1815 the Sunderland Society of the Prevention of Accidents in Mines interested Sir Humphry Davy in the problem

of mine explosion, and by the end of that year the first Davy lamp was ready for testing.

Although many others worked along the same lines, his name is more generally known as the inventor of a relatively safe oil-burning lamp. He demonstrated the fact that a metal gauze having 28 openings to the linear inch would cool the products of combustion so that the heat of the flame would not ignite inflammable gas on the other side of the gauze. In order to avoid danger resulting from failure of a single gauze cylinder surrounding the flame, he found it necessary to use two concentric cylinders. one slightly smaller than the other. The lower edges fit snugly to the bowl containing the fuel; the upper ends of the cylinders were, of course, covered by disks of similar gauze. In the hands of a careful person, the Davy lamp could be used safely, but it could not be used in a strong air current because of the danger of passage of the flame through the gauze.

Eiectric Lamps. — Portable electric hand lamps and cap lamps were introduced in coal mines in the early 1900s, but their weight and cost retarded their widespread adoption until after World War I. By mid-20th century, however, portable electric cap lamps were used almost exclusively by miners in both coal and metal mines. The headpiece on the cap, attached by flexible rubber-insulated cable to the battery on the belt of the wearer, furnishes the miner with a powerful beam of light directed at the work in hand. Batteries use either an alkaline or acid solution and are recharged between working shifts to maintain almost constant illumination for eight hours or more. In the headpiece, there is a safety device that shuts off the electric current if the bulb or bulbs are broken. A single bulb may be fitted with two filaments. If one burns out, a switch may be turned to bring the other into use with no loss of time.

While the electric cap lamp gives excellent illumination, it is completely independent of the surrounding air. Therefore, it gives no warning of noxious gases or lack of oxygen. Consequently, a flame safety lamp must be kept burning within easy reach of the workers or frequent inspections must be made by an official, using a flame safety lamp or other form of detector. When the flame safety lamp is placed in an atmosphere containing firedamp the flame elongates, and if the gas is present in considerable quantity the lamp is filled with blue flame. For testing the presence of gas the flame of the lamp is lowered until the yellow part is at a minimum, when the gas will be discernible as a smal! blue cap to the flame. U.S. usage, based on federal and state laws, recommend that a minimum of two flame safety lamps in good operating condition be available at all mines for testing the presence of methane or oxygen deficiency. Specifications require that each lamp be equipped with double steel or brass gauzes constructed of wire between 29 and 27 American wire gauge (0.0113 to 0.014 in. in diameter), with mesh openings from 28 to 30 per lineal inch. There should be a shield or bonnet so constructed as to prevent injury to the gauzes and shield the gauzes from strong air currents. Lamp locks should be of the magnetic type and the relighting device simple and safe to use in the presence of flammable gas.



BY COURTESY OF BUREAU OF MINES, U.S DEPT. OF INTERIOR

FLAME SAFETY LAMPS

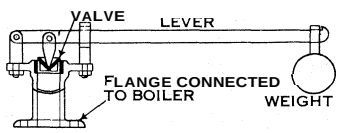
(Left) A Clanny lamp, 1815; (right) mid-20th-century lamp, used for gas detection only

The statutory regulations governing the manufacture and use of safety lamps vary slightly from country to country but are alike in substance. In addition to portable safety lamps, electric lighting from power mains may be allowed underground provided adequate safety features are incorporated in the design of the lighting fixtures, and care is exercised in the siting. Electropneumatic lamps are extensively used in European coal mines.

See also COAL AND COAL MINING: *Hazards of Mining and Measures of Safety.* (M. D. CR.)

SAFETY RAZOR: *see* RAZOR.

SAFETY VALVE is a valve which lifts at a predetermined pressure and "lets off steam," thus preventing the accumulation of a dangerous pressure in a steam boiler or hydraulic system. The resistance to pressure is provided by a weight or by springs, the use of the latter being obligatory if the boiler is not a stationary one. The lever valve *(see* diagram) is loaded with a weight at the end, to keep the valve shut. A casing with lock may be fitted over the device to prevent tampering by an unauthorized person. Many boilers carry two safety valves as a precaution, one being locked up. Marine boiler valves are of the direct spring-loaded type, the spring encircling the valve spindle. The pop valve blows off sharply with a pop, and is used for yacht and launch boilers. The valve closes again quickly when the pressure has been slightly reduced.



SCHEMATIC DIAGRAM OF SAFETY VALVE ON STEAM BOILER

SAFFARIDS, a Persian dynasty of the 9th century, founded about 866 by Yakub ibn Laith al-Saffar ("the coppersmith"), who gained the command of a body of local troops and took control of his native province of Seistan. He soon added Herat, Fars, Balkh and Tabaristan to his possessions, overthrew the Tahirid governors of Khurasan and, though still nominally dependent on the caliphs of Baghdad, established a dynasty in Seistan *(see* CALIPHATE: *The Abbasid Caliphs;* and PERSIA: *History).* In 900 Yakub's successor was defeated by the Samanids (*q.v.*), and few of the later Saffarids had any wide authority.

See T. Noldeke, Sketches from Eastern History, tr. by J. S. Black (1892).

SAF LOWER, the common name for *Carthamus tinctorius,* a flowering annual plant of the Compositae (*q.v.*) family, native to mountainous areas of southwest Asia and Ethiopia. It grows from one to three feet in height and is characterized by orange-red blossoms.

It was important at one time as a source of a red textile dye called carthamin ($C_{14}H_{16}O_7$), obtained from the dried flowers. Carthamin was replaced by synthetic aniline dyes, except in local areas of southwest Asia. Occasionally it has been an adulterant of saffron (*q.v.*). Safflower is grown now primarily for the oil obtained from the seed, the oil being used in paints and varnishes, and in salad and cooking oils.

Most of the production is in the Indian states of Bombay and Hyderabad. It has been introduced as an oil crop to the United

States, Australia, Israel, Turkey and Canada. It requires a growing season of 120 days or more and dry atmospheres after the appearance of the buds.

See P. F Knowles, "Safflower: Production, Processing and Utilization" in *Economic Botany,* vol. 9 (1955). (P. F. K.)

SAFFRON, a product manufactured from the dried stigmas and part of the style of the saffron crocus, a cultivated form of Crocus *sativus;* some of the wild forms are also employed. The purple flower, which blooms late in autumn, is very similar to that of the common spring crocus, and the stigmas, which protrude from the perianth, are of a characteristic orange-red colour; the fruit is rarely formed. The Egyptians, though acquainted with the bastard safflower (Carthamus *tinctorius*), often used to adulterate saffron, do not seem to have possessed the true saffron, but it is named in S. of Sol. iv, 14 among other sweet-smelling herbs. It is also mentioned by Homer and Hippocrates.

Saffron has long been cultivated in Iran and Kashmir, and is supposed to have been introduced into China by the Mongol invasion. It is mentioned in the Chinese materia medica (Pun tsaou, 1552–78). The chief seat of cultivation in early times, however, was in Cilicia. It was cultivated by the Arabs in Spain about 961, and is mentioned in an English leech-book of the 10th century, but seems to have disappeared from western Europe until reintroduced by the crusaders. According to Hakluyt, it was taken to England from Tripoli by a pilgrim, who hid a stolen corm in the hollow of his staff. It was especially cultivated near Histon in Cambridgeshire and in Essex at Saffron Walden (*q.v.*), its cultivators being called "crokers."

Saffron was used as an ingredient in many of the complicated medicines of early times; that it was much used in cookery is evidenced by many writers; the Chinese used to employ it largely, and the Iranians and Spaniards still mix it with their rice.

As a perfume saffron was strewn in Greek halls, courts and theatres, and in the Roman baths. The streets of Rome were sprinkled with saffron when Nero made his entry into the city. It was, however, mainly used as a dye. It was a royal colour in early Greek times, though afterward, perhaps from its abundant use in the baths and as a scented salve, it was especially appropriated by the hetaeriae.

Saffron is chiefly cultivated in Spain, France, Sicily, on the lower spurs of the Apennines and in Iran and Kashmir. It occurs in the form of cake saffron, which consists of the stigmas and part of the style which have been "sweated" and pressed together into a cake, and also as hay saffron, which consists of the dried stigmas alone.

SAFFRON WALDEN, a market town and municipal borough in the Saffron Walden parliamentary division of Essex, Eng., 27 mi. N.N.W. of Chelmsford by road. Pop. (1951) 6,828. Area 11.7 sq.mi. Of the old castle, dating probably from the 12th century. the keep and a few other portions still remain. Near it is a series of curious circular excavations in the chalk, called the Maze, of unknown date or purpose. The earthworks west and south of the town are of great extent; a large Saxon burial ground was there. The large church of St. Mary the Virgin contains the tomb of Lord Audley, chancellor to Henry VIII. The town has a museum with good archaeological and natural history collections. In the neighbourhood is the fine mansion of Audley End, built by Thomas, 1st earl of Suffolk, in 1603 on the ruins of the abbey, converted in 1190 from a Benedictine priory founded by Geoffrey de Mandeville in 1136.

The town corporation grew out of the Guild of the Holy Trinity. which was incorporated under Henry VIII, the lord of the town, in 1513. It was dissolved under Edward VI, and a charter was obtained appointing a treasurer and chamberlain and 24 assistants, uho, with the commonalty, formed the corporation. In 1694 William and Mary made Walden a free borough. The culture of saffron was the most characteristic industry at Walden from the reign of Edward III until its gradual extinction about 1768; market gardening is now the main industry.

SAFFRON WOOD or SAFFRONHOUT (Elaeodendron croceum), a South African tree belonging to the staff-tree family (Celastraceae) and yielding valuable timber. The genus *Elaeodendron* contains about 30 species, confined to the tropics and subtropics.

SAFI or ASFI, a seaport on the west coast of Morocco, in 32° 20′ N., 9° 12′ W., 106 mi. W.N.W. of Marrakesh. The old town, built on the rapid slope of a plateau toward the sea, is surrounded by crenellated ramparts dominated by an old Portuguese citadel, the Kechla. Safi is the chief town of the *contrôle* civil of Adba-Ahmar and the nearest port to Marrakesh. Trade reached 102,000,000 fr. in 1938 (imports 25,000,000, exports 77,000,000).

The population was (1936) 25,159, including 23,328 natives and 1,831 Europeans; (1944) 35,574, including 32,710 natives and 2,864 Europeans; (1952) 69,748.

In the early 1940s Safi became the second port of Morocco. The port was deepened, permitting eight ocean steamers to dock at one time. A rail line was built to the port from the Kowibgha phosphate deposits, which became the most important item of export.

The town was the site of one of the U.S. landings on Nov. 8, 1942, and for many months of the North African campaign was an important port for the landing of war supplies.

SAGA. The word saga is used in Icelandic for any kind of narrative. written or oral, whether anecdote, story or history. But in English. as in other languages in which it has been borrowed. this word has a narrower sense and is applied to biographies written in Iceland. or occasionally in Norway, during the middle ages. The sagas are thus a branch of literature distinct from annals and summaries of history, many of which were also written in Iceland during the 12th and 13th centuries. Several classes of sagas are distinguished.

Kings' sagas are the oldest class. The heroes described in them were rulers of Korway and of dependencies of Norway who lived between the 9th and 13th centuries. The oldest of the kings' sagas now known is the so-called First Saga of St. Olaf, which is a life of St. Olaf, king of Norway (d. 1030), and was written about 1180. It survives only in fragments, but these are sufficient to show its form and style. In form it closely resembled the popular lives of European saints, many of which had been translated into Icelandic in the 12th century. The style was halting and unpractised. The sources were, for the most part, oral. They consisted partly of popular tales about miracles worked through Olaf's agency and partly of verses composed in honour of Olaf during his lifetime and handed down orally. In these verses the battles and great achievements of Olaf were commemorated and they provided an outline of his career, giving the saga its chief value as history. This First Saga was used as a source, directly or indirectly, by authors who wrote later lives of Olaf. The most important of these later lives was written by Snorri Sturluson (1179–1241), who incorporated it in his *Heimskringla* (Orb of the World), which is a collection of biographies of rulers of Norway from the 9th century to the 12th.

Sagas of several other Norse rulers were written late in the 12th century and early in the 13th. They included sagas about Olaf Tryggvason (d. 1000), about Haakon the Good (d. *c.* 963), and about the earls of the Orkney Islands. The Morkinskinna (Rotten Skin) was written about 1220 and contains detailed sagas about kings who ruled Norway after the death of St. Olaf.

During the 13th and 14th centuries these early kings' sagas were often revised and combined with other works. The greatest of these compilations is the Book of Flatey, a magnificent manuscript written about 1390, which contains lives of the Korse kings combined with those of Icelandic heroes.

Icelanders' Sagas.—The terms "Icelanders' sagas" (Icelandic: fslendinga *sögur*) and "family sagas" are applied to biographies of heroes who are supposed to have lived in Iceland in the 10th and 11th centuries. Many of these heroes had visited the British Isles and lands as distant as Greece and Russia; some had emigrated to Greenland and others were said to have landed on Wineland the Good. as the Icelanders called the American continent.

The oldest of the Icelanders' sagas were written in the first years of the 13th century and were strongly influenced by the kings' sagas in structure, style and material. The sources were many

and varied, and included summaries of history and genealogies written in Iceland early in the 12th century, popular tales and poems preserved orally.

The value of Icelanders' sagas as history is difficult to assess. For a time they were accepted as trustworthy records, but it became widely agreed that they are, in the first place, works of art based upon historical and pseudohistorical sources. Such questions cannot, however, be discussed in general terms, for the aims and sources of the author of every saga must be considered separately.

Among the oldest of the Icelanders' sagas may be mentioned the *Fóstbrœðra* Saga (Saga of the Foster-brothers), a great part of which is placed in the wastes of Greenland. *Hallfreðar* Saga (Saga of Hallfred) is the tale of the favourite poet of King Olaf Tryggvason. The *Kormáks* Saga (Saga of Kormák) and the *Bjarnar* Saga *Hítdœlakappa* (Saga of Bjorn) are early love stories.

These early Icelanders' sagas are somewhat primitive, but the art of saga writing developed rapidly during the 13th century, reaching its zenith soon after the middle of that century. The most perfect saga of this class in structure is the *Laxdœla* Saga (Saga of the Men of Laxbrdal), a story in which women, love and romance play an unusually great part. The Gisla Saga (Saga of Gisli) belongs to the same period and is the story of an upright man, outlawed and unjustly persecuted, The Grettis Saga (Saga of Grettir the Strong), written rather later, is also an adventurous story of outlawry. Undoubtedly, the greatest of all sagas is the *Njáls* Saga (Saga of Burnt Njáll), written toward the end of the 13th century. There is no more moving tragedy in early Germanic literature and it is among the greatest prose narratives of the world.

Few of the Icelanders' sagas can be assigned to authors whose names are known. An exception is the *Egils* Saga (Saga of Egill), the story of the viking poet of the 10th century. It has lately been shown that this saga was probably written by Snorri Sturluson.

Bishops' Sagas.—At the beginning of the 13th century several sagas were written about bishops of the two Icelandic sees, Skálaholt and Hólar. These included sagas about Thorlbk (d. 1193) and Páll (d. 1211), bishops of Skálaholt, and about Jón, bishop of Hólar (d. 1121). Later bishops' sagas were those about Bishop Árni of Skblaholt (d. 1298) and Bishop Laurentius of Hólar (d. 1331).

Sagas of Later Times.—Numerous sagas were written about lay chieftains who lived in Iceland during the 12th and 13th centuries. Most of these were combined at the end of the 13th century in the *Sturlunga* Saga (Saga of the Sturlungar). The largest section of this compilation is the fslendinga Saga (Saga of the Icelanders), a history of the Icelanders beginning with the year 1183 and covering a great part of the 13th century. The author of the *Íslendinga* Saga was Sturla Thordarson (1214–84), nephew of Snorri Sturluson.

Heroic Sagas.—The term "Heroic sagas" (Icelandic: Fornaldar sogur) is applied to sagas about heroes of Scandinavia and continental Germania who lived before Iceland was peopled. The Ynglinga Saga (Saga of the Ynglingar) contains legends of the early kings of the Swedes and was written by Snorri Sturluson as an introduction to the Heimskringla. The *Skjöldunga* Saga (Saga of the Skjoldungar) was also written early in the 13th century and contained legendary tales about kings of the Danes.

Most sagas of this class date from the late 13th and 14th centuries. Their sources were often ancient heroic poems, such as those preserved in the Poetic Edda (see EDDA). One of the best known is the Volsunga Saga (Saga of the Volsungs), which contains a prose version of the legends of Sigurd and Brunhild. The *Hrólfs* Saga (Saga of Hrólf Kraka) is also based partly on heroic poetry, and contains interesting legends about the Danes. The *Heiðreks* Saga (Saga of Heiðrek) consists of numerous stories of devious origin, some of them about battles between Goths and Huns in the dark ages. Fantastic as they are. some of these heroic sagas preserve memories of historical events which would otherwise have been forgotten.

Romantic Sagas.—These are prose narratives based upon foreign romances. Many of them were written in Norway under the patronage of King Haakon Haakonarson (1217–63). They were later transcribed in Iceland and revised. They gained wide popularity and gave rise to original compositions in similar style. One of the best known, and perhaps the oldest, of the romantic sagas is the Tristrams Saga (Saga of Tristram), written in Norway in 1226, and based upon a French poem of the 12th century.

The *Karlamagnús* Saga (Saga of Charles the Great) contains prose versions of a number of French poems about Charles and his champions, including the Chanson de Roland (Song of Roland). Most of the romantic sagas are post-classical, dating from the 14th and later centuries.

(See ICELANDIC LITERATURE.)

SAGAING, a town, district and division of Burma, lying to the west of Mandalay on both sides of the Irrawaddy. The district has an area of 1.878 sq.mi.; pop. (1941) 387,270, showing an increase of 51,305 in the decade. The chief crops are sesame, millet, rice. peas, wheat and cotton. It lies in the heart of the dry belt, and the rainfall ranges from about 25 to 35 in. In the hot season the maximum shade temperature rises to a little more than 100° F. The lowest readings in the cold season average about 56° F.

Sagaing. the headquarters town, is opposite Ava, a few miles below Mandalay; pop. (1953) 15,439. It was formerly a capital of Burma. The Ava bridge (3.940 ft.), completed in 1934, with its western end at Sagaing, carries the Mandalay-Myitkyina railway and also road traffic. The steamers of the Irrawaddy Flotilla company call daily.

The Sagaing division (pop. [1956 est.] 2,210,983) includes the districts of Upper and Lower Chindwin, Shwebo, Sagaing, Katha, Bhamo, Myitkyina and Naga Hills.

SAGASTA, PRÁXEDES MATEO (1827–1903), Spanish statesman, born July 21, 1827, at Torrecilla de Cameros, in the province of Logroiio. From the first he displayed Liberal inclinations. He entered the Cortes in 1854 as a Progressist deputy for Zamora. Exiled after O'Donnell's coup *d'état* (1856), he returned to sit in the *cortes* 1859–63. Exiled again after conspiring with Prim and the Progressists against Isabella, he took part in the rising at Cadiz which culminated in the revolution of Sept. 1868, was minister several times under Serrano and then under King Amadeo, 1868–72. Sagasta headed the most conservative groups of the revolutionary politicians against Ruiz Zorrilla and against the federal republic in 1873; and in 1874 he vainly attempted to crush the Carlists and to check the Alphonsist military conspiracy that overthrew Serrano (Dec. 1874). After the restoration of the Bourbons, Sagasta was premier in 1885–90 and again in 1892–95.

His attempt to conciliate both the Cubans and the United States by a tardy offer of colonial home rule, the recall of Weyler, and other concessions, did not avert the disastrous war with the United States, and his party was defeated (March 1899). A trimmer par excellence, abler in opposition than in office, Sagasta returned with the Liberals to power in March 1901; in Dec. 1902 he was defeated on a vote of censure and resigned office, dying at Madrid on Jan. 15, 1903.

SAGE, RUSSELL (1816–1906), U.S. financier, was born Aug. 4, 1816, in Oneida county, N.Y. He began his career in the grocery business. In 1853 he purchased the Troy and Schenectady railroad from the city of Troy, N.Y., and sold it to the New York Central railroad. He participated in the development and reorganization of railroads in the northwest. Sage moved to New York city in 1863, becoming a dealer in "puts" and "calls" and the "call money" market. He worked with Jay Gould, manipulating the stock of the Union Pacific and other companies, and was Whig representative in congress (1853–57). Sage died July 22, 1906, leaving his estate to his wife, MARGARET OLIVIA SLOCUM SAGE (1828–1918). Mrs. Sage established the Russell Sage foundation in 1907. During her life she made public gifts of $40,000,000, and when she died Nov. 4, 1918, she left $36,000,000 to

be distributed to various public institutions. (J. R. LT.)

SAGE, the common name applied to plants of the genus *Salvia* of the mint family, especially to S. *officinalis,* the leaves of which are used for seasoning. See SALVIA.

SAGEBRUSH, the name given to various shrubby species of *Artemisia* native to plains and mountain slopes of western North America. The common sagebrush (*A.* tridentata) is a much-branched shrub, usually 3 ft. to 6 ft., but sometimes 12 ft. high, with silvery gray, bitter-aromatic foliage, the small, wedge-shaped leaves mostly with three teeth at the outer end. This shrub is very abundant on semiarid plains, mainly between 1,500 ft. and 6,000 ft. altitude, where it is often a conspicuous and characteristic feature of the vegetation. It occurs from Montana and western Nebraska to British Columbia and California.

SAGINAW, a city of Michigan, U.S., and seat of Saginaw county, is located 10 mi. S. of Bay City and 92 mi. N.W. of Detroit, on both banks of the Saginaw river 15 mi. from its entrance into Saginaw bay (Lake Huron). It is a centre of farming and manufacturing and a port of entry. Nearby communities include Chesaning, Carrollton and Frankenmuth.

Saginaw means "land of the Sauks" in the language of the Chippewa Indians who once dominated the valley after driving out the Sauks in the 16th century. A post was established in 1816 by the American Fur company and Fort Saginaw was constructed on the west bank of the river in 1822. Although the fort was abandoned the following year, a settlement known as Saginaw City grew up around the fur-trading post and received its charter in 1870. East Saginaw, established in 1849 and chartered 1859, joined with Saginaw City in 1889 to form Saginaw. In 1936 the city adopted a council-manager form of government.

Saginaw was a major lumbering centre from 1834 when a steam sawmill began operations until about 1890, by which time the pine forests were depleted. Salt deposits, coal and oil are productive mineral resources of the area and their development helped to offset the decline in lumber trade. Served by major railroads, highways and an airport. Saginaw became a wholesale and trading centre for northeastern Michigan. It manufactures automotive parts, particularly steering gears, malleable and gray iron, graphite, baking machinery, mobile homes, truck trailers and paper products. The county contains approximately 4,500 farms averaging 45 ac. in size and producing sugar beets, beans and wheat. One of the world's largest bean elevators is in Saginaw. Parks include the Ezra Rust and Hoyt parks and Ojibway Island. The Schuch hotel contains a museum of Indian artifacts.

Population of the city in 1960 was 98,265 and the Saginaw standard metropolitan statistical area comprising Saginaw county had a population of 190,752. For comparative population figures see table in MICHIGAN: Population. (MA. R.)

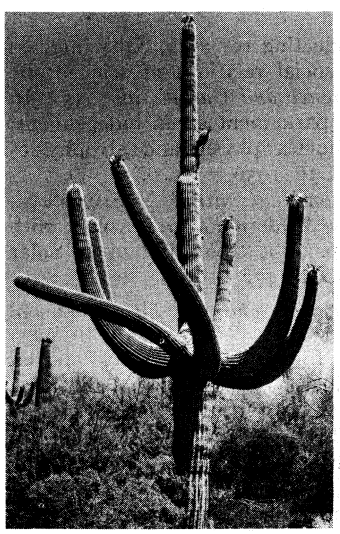
SAGITTARIUS (the "Archer"), in astronomy, a constellation and sign of the zodiac. In mythology, Sagittarius was pictured as a centaur preparing to shoot an arrow. The southernmost zodiacal constellation, it appears rather low in the south in the early evenings of the late summer for observers in middle northern latitudes. Six of its stars outline the inverted Milk Dipper, which has its handle thrust into the Milky Way, Near the western border of Sagittarius is the winter solstice, the southernmost point of the sun's apparent annual course around the heavens. Also in this region is the direction of the centre of our spiral galaxy, some 30,000 light-years distant from Earth. This area is accordingly one of exceptional complexity and interest as viewed with the naked eye and with the optical and radio telescope. The great star cloud in the central region of Sagittarius is one of the brightest features of the Milky Way. See CONSTELLATION.

(R. H. BR.)

SAGO, a food starch prepared from a deposit in the trunk of several palms, the principal source being the sago palms (*Metroxylon rumphii* and M. sagu), native to the Indonesian archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of 30 ft., with a thickset trunk. They attain maturity and produce an inflorescence (flower spike) at the age of 15 years, when the enarmous pith of the stem is gorged with starch. If the fruit is allowed to form and ripen, the whole of this starchy core material passes into the developing fruits, leaving the stem a mere hollow shell; and the tree after ripening its fruit dies. Accordingly the palms are cut down as soon as the inflorescence appears, the stems are divided into sections and split up and the starchy pith extracted and grated to a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, whence it is known according to size as pearl sago, bullet sago, etc.

A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting. Sago is also obtained from various other Indonesian palms such as the Gomuti palm (*Arenga pinnata*), the Kittul palm (Caryota urens), the cabbage palm (Corypha umbraculifera), besides *Corypha* utan, *Raphia flabelliformis* and Phoenix *pusilla,* also from *Mauritia flexuosa* and *Guilielma gasipaes,* two South American species. It is also obtained from the pith of species of Cycas.

SAGUARO (Cereus giganteus or *Carnegiea* gigantea), a remarkable tree cactus, rising to 50 ft. in height, called also giant cactus and monument cactus, native to arid districts in southern Arizona, southeastern California and Sonora, Mex. It has a stout, woody, vertically ribbed stem, one to two feet in diameter, sometimes rising unbranched, like a green, fluted column, whence the name monument cactus; more frequently it bears a few large. stout. widely diverging candelabralike branches, but occasionally it bears numerous branches which rise vertically from near the base like a group of organ pipes. Close to the top of the stem or branches it bears white flowers which are followed by crimson edible fruits. In Arizona, of which it is the floral emblem or state flower, a desert tract containing numerous fine living specimens of the tree was set apart and is now known as Saguaro National monument. See also CACTUS.



RUTHERFORD PLATT

SAGUARO (CEREUS GIGANTEUS)

SAGUENAY, a river of Quebec, Can., which drains the waters of Lake St. John into the St. Lawrence river about 120 mi. northeast of Quebec city. Flowing E.S.E., the Saguenay, in the first third of its 105-mi. length (475 mi. long from the head of the Peribonca river), descends about 300 ft. in a turbulent stream. Thereafter, the valley is virtually a fiord through which the river, without shoals (average depth, about 800 ft.) or obstructions, continues between precipitous cliffs which culminate in the majestic capes Trinity and Eternity, more than 1,600 ft. high. The upper river is an important source of hydro-electric power, used primarily for aluminum production at Arvida. The river is navigable from its mouth at Tadoussac, the oldest European trading post in Canada, to Chicoutimi, above which the rapids begin. Ha Ha bay. about 20 mi downstream from Chicoutimi is a fiordlike arm of the Saguenay into which the Ha Ha river and the Rivière Mars empty near Port Alfred at the head of the bay. (J. D. I.)

SAGUNTO, formerly Murviedro, a Spanish town 18 mi. N. of Valencia on the Valencia-Barcelona coast railway. Pop. (1950) 26.987 (mun.). The well-preserved Roman theatre looks across the Huerta de Valencia to the Mediterranean. Sagunto is the ancient Saguntum, an ancient Greek or Greek-Iberian town, founded by colonists from Zacynthus (whence its name). About the year 228 B.C. the Romans, disquieted by the enormous growth of Cartha-

ginian power in Spain, concluded an alliance with Saguntum and further required the Carthaginian general, Hasdrubal, not to pass the Ebro. These conditions were observed until 219 when Hannibal judged it safe to begin the war by attacking Saguntum. Confident in Roman protection, the town made a desperate resistance for eight months. at the end of which it was taken by storm. Rome complained to Carthage. requiring the surrender of Hannibal and the members of the council present with him; the council, though doubtful of the wisdom of Hannibal's action, naturally refused, and the second Punic War began. Saguntum never recovered its old importance, and in 138 B.C. was definitely eclipsed by the foundation of Valentia by D. Iunius Brutus, and its population by Lusitanian war-captives who were given the Latin franchise.

SAHA, MEGHNAD N. (1893–1956), Indian physicist noted for his development of the thermal ionization equation (which, in the perfected form due to E. A. Milne, has remained fundamental in all work on stellar atmospheres) and for his application of it to the interpretation of stellar spectra.

Born on Oct. 6, 1893. in Bengal, Saha received his first training in Calcutta, and carried out postgraduate work at Imperial college, London. After returning to India, lie became professor of physics at Allahabad (1923–38) and at Calcutta (1938–55). He was elected a fellow of the Royal society in 1927 and was president of the United Provinces Academy of Sciences and of other Indian scientific botiies. He was mainly instrumental in the foundation of the Calcutta Institute of Nuclear Physics, of which he became honorary director.

In his later years, while not neglecting research, Saha increasingly turned his attention to the social relations of science; he founded the outspoken journal Science *and* Culture in 1935. In 1951 he was elected to the Indian parliament as an independent. He continued publishing papers on nuclear physics and astrophysics until his death in New Delhi on Feb. 16, 1956.

Among his works are: *A Treatise on Heat,* with B. N. Srivastava, 3rd ed. (1950), and *A Treatise* on *Modern Physics,* vol. i, with N. K. Saha (1934). An important paper is "Ionization in the Solar Chromosphere," *Phil. Mag.,* vol. 40, p. 472 (1920).

See S. N. Sen (ed.), *Professor Meghnad Saha: His Life, Work and Philosophy* (1954). (B. E. J. P.)

SAHAPTIN, a large American Indian linguistic stock, spoken in what is now southeastern Washington, west central Idaho, part of eastern Oregon and north-central California. The four major divisions, all mutually unintelligible, were: northern Sahaptin, spoken by the Yakima, Klikitat, Kittitas, Wanapam, Tenino, Umatilla and Walula tribes; Nez Percé; Cayuse-Molala; and Klamath-Modoc. Cayuse-Molala was formerly called Waiilatpuan and considered a separate stock. Similarly. Klamath-Modoc was separated under the name Lutuamian. Further studies have shown these to be merely divergent branches of Sahaptin.

Earlier the spelling Shahaptian was sometimes used; also, the name occasionally was employed as a designation for the Nez Percé tribe.

See Melville Jacobs, "A Sketch of Northern Sahaptin Grammar" in *University of Washington Publications in Anthropology,* vol. 4, no. 2 (1931). (V. F. R.)

SAHARA, from the Arabic word *sahrá* (wilderness!. is the great desert of north Africa, the world's largest desert. It stretches right across Africa from the Atlantic coast through Egypt to the Red sea, beyond which the desert continues into Arabia and Iran. Around its edges there are transitional areas where rainfall is greater and true desert conditions gradually disappear. so that nowhere has it precise boundaries.

Its greatest west-east extension exceeds 3,000 mi.. and it is seldom less than 1.300 mi. wide. Its total area. perhaps 3,500,000 sq.mi., occupies between a quarter and a third of the African continent. Despite the physical unity of the whole area it includes numerous political divisions.

Geographical Divisions.—The Saharan plateau has an average elevation of 1,000 ft. and is not uniform in character. Across it runs a high central ridge of varying width, including the high mountains of Ahaggar anti Tibesti. Geographically five main subdivisions may be recognized, a central area, surrounded by northem, western, southern and eastern areas *(see* map).

The western or Atlantic Sahara is of monotonous relief, generally below 1,500 ft. and with large portions less than 600 ft. above sea level. The central Sahara extending from Mauritania eastward is made up of the Chech Erg, the great Tanezrouft, the Ahaggar massif (with its associated plateaus of Ahenet, Mouydir and the Tasili des Ajjer) and the Fezzan. The Ahaggar is formed of Archaean and Palaeozoic rocks and reaches 9,842 ft. in the peak of Tahat which is sometimes snow-capped. The northern Sahara consists of the Great Western Erg and the Great Eastern Erg, the oasis country of Touat and Gourara, and the Hammada el-Homra to the east. A depression along the south side of the Saharan Atlas is marked in the west by the Oued Draa and to the east by a line of chotts (salt lakes), of which the Chott Djerid, in southern Tunisia, is the largest. Near Biskra these chotts are lower than sea level, and the Gulf of Gabès (Qabes), an arm of the Mediterranean sea, represents a now submerged portion of the depression. The southern Sahara merges gradually on its southern sides into the semidesert areas of the interior of former French West Africa. It extends from the mountains of Mauritania through the Adrar des Iforas and the Air massif, to the massifs of Tibesti and Ennedi. The highest points in Tibesti. Emi Koussi and Mt. Tousside, an extinct volcano, reach 11,204 and 10,712 ft. respectively. The eastern Sahara extends from the Mediterranean coast to the latitude of Khartoum. In the west is the Libyan desert of uniform relief, with large parts in the north only 600 ft. above sea level; near the coast is the Jebel el Akhdar range, but otherwise this area consists of 500,000 sq.mi. of almost level dunes and sandy wastes. over which no routes pass except those going by way of the Kufra oases. In Egypt the desert is known as the Western desert. Between the Nile and the Red sea is the Arabian (or Eastern) desert in Egypt and the Nubian desert in the northeast of the Sudan.

Geology, Structure and **Physiographical** Evolution.—Though much work remains to be done, the main features of geology and structure are now fairly well understood. The oldest rocks, of Archaean and Pre-Cambrian Age, were folded and denuded to form the Saharan platform, upon which later deposits have been laid. There have been numerous dislocations, the more marked of which have been accompanied by volcanic activity; several of the highest peaks in the central Sahara are the remains of extinct volcanoes of Tertiary and Quaternary Age. Elsewhere vertical movements of the land have caused the renewal of erosion which has resulted in the cutting of deep valleys and gorges. such as those of the Tasili des Ajjer. During Cretaceous and later times much of the Sahara was submerged. and extensive areas are covered by sandstones, notably the Nubian sandstone of Cretaceous Age, and by limestones laid down in areas of the sea. There are also large basins now occupied by sediments of continental origin deposited by wind or in shallow fresh or saline waters. The horizontally bedded Cretaceous and other rocks form plains, plateaus and escarpments that are dissected by former river valleys and are in striking contrast to the volcanic topography of other areas. The Sahara as a whole is quite distinct from the Atlas mountains of French North Africa which belong, tectonically! to Europe.

The theory of a marine origin for the vast quantities of sand in the Sahara has been disproved, since the sand is of Quaternary, or, at the oldest, Pleistocene, Age and there is no evidence of any marine transgression since pre-Tertiary times. During the Quaternary Ice Age in Europe. the Sahara's climate must have been wetter, so that erosion took place as in other moist temperate or subtropical regions, and there was a proper system of rivers. The vegetation may have been grass with trees. With the retreat of the ice sheets from Europe, vegetation disappeared and arid conditions were established, so that the soil was dried out and became subject to large-scale wind erosion.

Three main types of surface and scenery are commonly recognized today—the erg, the reg and the hammada. The erg is the desert of shifting sand dunes, which lie in the bottom of the great basins where the ancient rivers piled up most alluvium; the Great Western and Eastern Ergs, between Béni-Abbès and Ghadames, are the most difficult of all Saharan areas and are the parts most carefully avoided by modern trans-Saharan routes. The Libyan

desert also constitutes an extensive area of unmitigated sandy waste. The reg desert consists of wind-scoured plains strewn with pebbles, boulders and gravels. The hammada are rocky plateaus with bare rock outcrops and are often cut by deeply eroded valleys and gorges; they are common around the Ahaggar and Tibesti and, at lower altitudes, in the western Sahara

Climate. — Climate is the fundamental basis for the definition of the Saharan region which consists of those areas with rainfall of less than 10 in a year in the northern districts (south of the Atlas mountains) and 1 j in. in the south (in about the latitude of Timbuktu and Agadès, where evaporation is much greater). The limits of the true desert, with perhaps less than five inches of rainfall a year, are rather narrower. The whole area is marked by a general lack of rainfall with great variations from year to year and a tendency for such rain as falls to come in sudden storms at very irregular intervals. Adrar has recorded 3 7 in in a few hours and Ain Sefra 3 in in two days El-Goléa had only one fall of rain in seven years and Tidikelt only one in ten years. The total rainfall recorded at In Salah in four years amounted to only 0.4 in. Absolute desert occurs in the extensive flat areas of the Tanezrouft or "land of thirst," to the west of the Ahaggar.

The Sahara is one of the hottest, if not the hottest, regions of the world, mean annual temperatures exceeding 80° F. over a high proportion of it and, in parts, 8j° F. June, July and August are especially hot months. Shade recordings of 136 4° F. have been reported from Azizia in Tripolitania, and the surface of the ground may sometimes exceed 170° F. There are, however. great differences between day and night temperatures, sometimes as much as 50°–60°, so that while the desert may be a furnace at midday, there is a rapid loss of heat from the ground after sunset, and the nights are usually cool and refreshing. The sky is generally cloudless, and the relative humidity very low, sometimes less than 10%. The most common winds are the northeast trades, though in the western Sahara winds often blow from the west.

In recent years meteorological stations have been established at various points on the edge of the Sahara and after 1932 regular observations were made at the Jules Carde observatory at Tamanrasset (Fort Laperrine) in the Ahaggar mountains, 4,429 ft above sea level. Figures for this station are given in the table to illustrate some climatic variations of the Sahara.

Vegetation. — Areas from which all plant life is absent form only a small part of the Sahara: the Tanezrouft, for example, and the Hammada of Tinghert, south of Ghadames. Sand deserts are not, however. the most barren parts of the Sahara, mobile dunes can carry little plant life, but the vegetation of the sandy stretches in the basins of the great rivers of Quaternary times can draw on some of the most copious underground water reserves.

Nevertheless plant life is usually poorly developed. It consists of two very distinct types: the permanent, such as betoum (Atlantic turpentine tree, *Pistacia* atlantica) and acacia trees, and thorny shrubs like tamarisks and jujubes; and the ephemeral — delicate herbs whose seeds germinate immediately after rain, grow rapidly, flower for a brief period, set fruits and seeds and then die. This ephemeral vegetation is widely known by the inhabitants of the desert as acheb.

The natural vegetation of the oases was probably the oleander with tamarisks. Among introduced plants the date palm is of outstanding importance. Its fruits provide food for local consumption and for trade, and the crushed seeds food for camels.

Fauna. — Domesticated animals have been introduced to all the oases, principally camels, sheep and goats, but the wild fauna of the desert is, like the vegetation, highly specialized Gazelles, desert antelopes and wild goats are common on the northern and southern edges of the desert; jackal, fox and badger also occur. Bustards are found on the south side of the Saharan Atlas; ostriches are much more scarce than formerly Horned vipers, scorpions and lizards are common, as are locusts, flies and ticks The Egyptian monitor (Varanus *niloticus*), looking like a small crocodile survives in certain areas such as in the tributaries of the Igharghar.

Peoples and Settlements. — Settlement was undoubtedly widespread when the desert area was wetter and better-covered with vegetation. There is evidence of Neolithic and Palaeolithic culture, and rock drawings have been found showing animals that no longer live in the Sahara. Within historic times it is suggested that there may have been drastic changes, because of the Roman military settlements established in places which are now desert or semidesert. But their decline may perhaps have been caused as much by the neglect of the water supply and irrigation systems as by climatic changes. In some cases colonies have been reestablished during the 20th century. especially by the French, on the sites of these abandoned settlements.

The first inhabitants were probably Negroes, who retreated in the face of the advancing Berbers with their swift-moving camels (*méharis*). After the death of Mohammed the Berbers were pushed back by the Arabs who also used camels and who made Islam a unifying element throughout the Sahara. Arabic became the chief language, though Berber pockets survived, chiefly in upland areas in the central Sahara. Slavery was introduced and remained a lucrative trade long into the 20th century. From the mixture of Negro, Berber and Arab there emerged the three great ethnic groups of today: the Tuareg, the Tibbu (Tebu) and the Moors (qq *v.*).

The Tuareg are camel nomads living in the central parts of the desert. There are several confederations; in the north the Ajjer, the Tasili and the Ahaggar and in the south the Iforas of the Adrar, the Ioulemedden of the middle Niger and the Kel Oui and Kel Gress of the Air They are known as the "people of the veil." because all male Tuareg wear a *litham,* or veil, which they lift only in order to eat. The society is matriarchal, and the women enjoy a degree of liberty unknown elsewhere among Moslem peoples.

The Tibbu of the eastern Sahara closely resemble the Tuareg but have mixed greatly with negroid peoples. They are light or dark bronze in colour and are probably of Hamitic stock. Their language closely resembles Kanuri, spoken in Kanem and in Bornu in northeastern Nigeria.

The Moors or *Beidan* (or whites, as compared with the black peoples of the Sudan) live in the western Sahara They are mostly nomads, a mixture of Berber and Arab, with the Berber element predominant. Unlike the Tuareg they have been completely Islamized and are a very cultured people.

Other smaller groups include the Chaanba, who are Arab-speaking nomads and the traditional enemies of the Tuareg. and the Mozabites, a group of heretical Moslems who settled in the Mzab, and whose commercial wisdom has given them an importance out of all proportion to their numbers. In the oases Negroes are still the most numerous. They are the descendants of the original inhabitants and of slaves introduced later. Three classes are recognized. the free men, the proprietors; the Haratin, the tradesmen; and the Negroes or slaves.

Of greater significance than differences of race or language is the distinction between nomadic and sedentary peoples. Pastoral nomads are most numerous on the edges of the desert and around the mountainous areas. The poorer the desert, the more scattered the population. Though the nomads depend most upon their camels, sheep and goats are more numerous, the range of grazing is determined by the availability of fodder and drink-

Seasonal Climatic Variations as Observed at Tamanrasset

PRINCIPAL GEOGRAPHICAL SUBDIVISIONS OF THE SAHARA

ing water. The Regibat of the Spanish Sahara will migrate 400 mi. to the Chech Erg in search of water for their camels. With the pacification of many areas, razzias or raids by nomads on oasis cultivators are less common than formerly.

The sedentary peoples account for about two-thirds of the total population of the desert. They live in the oases and cultivate with the aid of irrigation. Methods of irrigation include springs, wells, shadoofs, *foggaras* and artesian wells. The shadoof consists of a beam, pivoted between uprights, bearing a weight at one end and a bucket at the other. *Foggaras* are man-made subterranean channels, dug not quite horizontally to tap underground water ahich is led to the oasis by gravity and supplies a limited but regular amount; they are especially common in Touat and Gourara. Artesian wells are most used around Ouargla (Wargla) and in the Oued Rir, south of the Chott Melrir, uhere there are more than 1,000 wells supplying 69,000 gal. a minute and irrigating 1,750 000 palms. Unfortunately the withdrawal of these quantities of nater has caused a drop in the water table. but measures have now been taken to overcome this drawback. In all Saharan oases the date is the chief tree and the main source of food. In its shade are grown citrus fruits, figs, peaches, apricots, vegetables and cereals such as wheat, barley and millets.

Commerce and Communications. — Saharan commerce is of two types: the supplying of wheat, barley, wool and manufactured goods to the desert peoples in exchange for dates; and the long-established trans-Saharan trade, always the monopoly of the nomads. Salt and ivory were carried across the desert in very early times, and salt is still an important product. especially from Taoudéni and Bilma. In 1950 the Sahara produced more than 14,000 tons of salt, the equivalent of more than 100.000 camel loads which move in huge caravans on *azalaïs*, particularly on the salt route from Taoudéni to Timbuktu. Many other caravan routes remain important despite the introduction of new methods of communication. They include those from Tripoli to Ghat and to Murzuk, Bilma and Lake Chad; from Ouargla to In Salah, Tamanrasset, Zinder and northern Nigeria; from Colomb-Béchar to Tessalit and the upper Niger valley; and from southern Morocco through Atar to Nioro or Senegal. In the eastern Sahara the routes centre on the oases of Faya (Largeau) and Kufra and also link Egypt westward and southwestward with the desert. Camel traffic is important in the market centres such as Biskra, Ghardaïa and Agades on the desert edge.

Certain routes are commonly used by motor vehicles. Regular though infrequent buses use two roads—one crossing the Tanezrouft to Gao and Niamey in six days and the other passing through the Ahaggar to Agadès and Zinder. Railways reach to the edge of the Sahara from the north, west and south but do not penetrate far. There have been many proposals for a trans-Saharan railway. The most advanced, from Colomb-Béchar via the Tanezrouft to Gao on the Niger, has stopped 60 mi. south of Colomb-Béchar because of the high cost of construction and the economic uncertainty of the scheme. Numerous air routes between Europe and tropical and southern Airica cross the desert using airports on the fringes, as those at Tripoli and Kano.

Political Divisions. — Until 1961 most of the western and central areas of the Sahara were under French administration. Following the French occupation of Algiers in 1830 they advanced gradually southward. Control of the line of the northern Saharan oases was established when Laghouat and Ghardai'a, in the Mzab valley, were occupied in 1852 and Touggourt (Tuggart) and Ouargla in 1854. Dreams of a vast empire in the northern half of Africa were entertained, as the French also penetrated inland in west and equatorial Africa and established the protectorate of Tunisia in 1881. As early as 1879 plans for a trans-Saharan railway were being discussed, while official missions, notably that of Fernand Foureau and A. F. J. Lamy from 1898 to 1900, helped to establish French claims in the Sahara. These were iurther recoenized bv the Anglo-French agreements of 1890, 1898 and 1904, by which various boundaries were fixed and many of the existing political divisions established. The French portions oi the Sahara consisted, in 1961, of the Saharan *départements* of Oasis and Saoura (comprising the former southern territories of Algeria).

The Spanish Sahara, consisting of Rio de Oro and Sekia el Hamra, is on the Atlantic coast. In the eastern parts of the Sahara are Libya, the territory of which formed an Italian colony irom 1912 until World War II, after which it was placed partly under British and partly under French trusteeship until 1951, when it became an independent state—the United Kingdom of Libya—made up of the three provinces of Tripolitania, Cyrenaica and the Fezzan; the independent state of Egypt; and the Sudan, until 1954 the condominium of the Anglo-Egyptian Sudan.

Exploration. — The Egyptians penetrated the Libyan and Nubian deserts in places, and the Carthaginians and Phoenicians knew parts of the northern Sahara and Rio de Oro on the west coast. Roman Africa extended up the Nile to the Second Cataract (Wadi Halia), but the attempt to discover the sources of the Nile in A.D. 66 did not extend beyond the swamps of the Bahr el Jebel.

The Mohammedan conquest of North Airica largely eliminated European influence in the Sahara, although Jewish and Genoese merchants acquired considerable knowledge of the desert during mediaeval times.

The real opening up of the Sahara took place during the 19th century. In 1819 Joseph Ritchie and G. F. Lyon went from Tripoli to Murzuk and into the Fezzan. In 1822 D. Denham, H. Clapperton and W. Oudney crossed the desert irom Tripoli and were the first Europeans to see Lake Chad. Maj. A. Gordon Laing went from Tripoli to Timbuktu in 1825 but was murdered on his return journey. In 1827 and 1828 René Caillié, disguised as an Arab, travelled from Sierra Leone to Timhuktu, where he explored the middle Niger valley and then crossed the Sahara to Morocco.

The first scientific expedition was that of Heinrich Barth, who travelled extensively between Tripoli and Lake Chad from 1850 to 1855. G. Rohlfs explored parts of the western Sahara between 1862 and 1867 and later travelled from Tripoli to Siwa and Alexandria. In 1878 he attempted to reach Wadai but penetrated only as far as the Kufra oases. Henri Duveyrier explored the Ghat-Murzuk route between 1859 and 1861 and revealed many facts about the Tuareg

Several explorers were murdered, including Eugène Joubert and R. Dourneaux-Dupéré at Ghadames, on their way to Timhuktu from Algeria (1874); Erwin von Bary travelling from Tripoli to Timbuktu through Air (1877); and Col. Paul Flatters, who was killed by the Tuareg in 1881 while making a survey for a proposed French trans-Saharan railway. Timbuktu was reached from Morocco in 1881 by H. Oskar Lenz.

In the last decade of the 19th century, and following the Anglo-French agreement of 1890, the desert was conquered by the French, and since then many of its unknown regions have been explored. Especially important was the mission of F. Foureau and A. F. J. Lamy of 1898–1900, which crossed the desert from Biskra via Agadès and Zinder to Lake Chad, where contact was made with parties led by O. Meynier from the Niger and E. Gentil from the Congo. The military conquest followed in succeeding years. Gen. M. J. F. H. Laperrine was given command of the northern oases and concentrated on making the routes safe from Tuareg raids. He defeated the Ahaggar Tuarez at Tit in 1902 and secured their complete submission by 1905. He then turned his attention to the Tuareg of the Tasili des Ajjer, who were supported by the Senussi of Tripnlitania, who themselves were helped hv the Turks. He was succeeded bv another brilliant soldier, Captain Charlet, but was recalled in World War I to deal with numerous revolts, during which the monk C. E. de Foucauld, one of the Tuareg's

best friends. was murdered. Laperrine himself was killed during a flight to survey the possibilities of air services between North and West Africa. Comdr. Jean Tilho carried out military operations against the Senussi of Tibesti and explored Borku, Ennedi and Tibesti, returning in 1917 through Wadai and Darfur. Many French and other travellers and scientists have added greatly to the knowledge of the Sahara in the 20th century. These include E. Arnaud, M. Cortier, E. F. Gautier. R. Chudeau. W. J. Hardinp King, H. Vischer, A. M. Hassanein Bey, A. Buchanan and F. J. Rennell Rodd. By 1955 it was doubtful if any more discoveries of first magnitude would be made, though large areas remained unexplored.

SAHARANPUR, a city and district of India, in the Meerut division of Uttar Pradesh. The city, situated on a stream called the Damaula Nadi, is about 95 mi. north-northeast of Delhi. Pop. (1961) 185,019. It is an important railway junction. and there are railway workshops and a large woodcarving industry.

The DISTRICT OF SAHARANPCR has an area of 2.132 sq.mi. It forms the most northerly portion of the doab, or alluvial tableland, between the Ganges and Jumna rivers. The population in 1961 was 1.608.011: The district contains the towns of Roorkee and Hardwar (*qq.v.*).

SAHOS or SHOHOS, Africans of Hamitic stock living to the west of Massawa. Probably akin to the Gallas and Afars, they are mostly Mohammedans, a few being Christians.

SAICHŌ (767–822), eminent Japanese Buddhist monk who established the Tendai sect in Japan. He is also known as Dengyō Daishi, his posthumous name and title. His zeal for reform and the location of his monastery on Mt. Hiei (788) northeast of the new imperial capital Heian-kyō (Kyoto), established in 794, strengthened his affiliation with the court. Sent to China in 804, he returned the next year and introduced the highly eclectic Tendai (Chinese T·ien-t'ai) teachings. His co-operation with the court brought generous patronage and his monastery soon became the most powerful, a centre of Buddhist learning and discipline from which emerged most of the new sects during the next five centuries. He foreshadowed later Japanese Buddhist trends by his reverence for the native Shinto deities and emphasis on the patriotic mission of Buddhism to serve and protect the state. Although frequently engaged in polemics, his contribution was more significant as an effective leader and organizer than as a religious thinker. (D. H. SH.)

SAID HALIM, PRINCE (1863–1921), Turkish statesman, the son of Halim Pasha and the grandson of Mohammed Ali, the founder of the last Egyptian dynasty, was born in Cairo and was educated in Turkey, completing his studies in Geneva, Switz. Exiled because of his sympathy with the Young Turkish movement, he affiliated himself to the Committee of Union and Progress in Paris, Fr. After the revolution of July 1908 he returned to Constantinople and was nominated senator. At various times from 1908 to 1918 he was president of the council of state, minister for foreign affairs and general secretary to the Union and Progress party.

On June 17, 1913, he became grand vizier, in which capacity he endeavoured to settle the questions of Armenian reforms, Mosul oil and the participation of English, French and Russian capital in the Baghdad railway. He also endeavoured to establish close relations with Greece. Said Halim favoured a Turko-German alliance but sought to keep Turkey neutral in World War I. On its entry into the war he tendered his resignation, which was refused, and he remained in office until Feb. 1917. After the armistice of Mudros, Oct. 31, 1918. Said Halim was imprisoned by the British in Malta. Released in 1921, he was assassinated in Rome, Italy. on Dec. 6. 1921.

SAIGA (Saiga *tatarica*), a desert-dwelling antelope inhabiting the Khirghiz steppe. A century ago it extended as far west as Poland. During the later Tertiary period the saiga was widely distributed in Europe and Alaska.

SAIGON, the capital and river port of Vietnam, lies on the right bank of the Saigon river, which forms, with the Donnai river, a delta on the South China sea.

Relations with France began in the 18th century when French missionaries were sent to the town. In 1859 Saigon was captured by the French and in 1862 it came under French administration as part of the French colony of Cochin-China. On Jan. 1, 1932, Saigon and Cholon (*q.v.*) were merged for administrative purposes to form the prefecture of Saigon-Cholon, which, on Oct. 22, 1956, was re-titled the prefecture of Saigon. After the Indochinese war (1946–54), the city sheltered many refugees, particularly from the north. Saigon has been the capital of South Vietnam since July 20, 1954, following the convention of Geneva.

Under French administration. and especially during the 20th century, Saigon grew rapidly The population, which in 1907 was 228,471, was estimated at 498,100 by 1943 and 1,400,000 in 1960.

French influence is apparent in the spacious layout of the town, which looks more European than Asiatic. The boulevards are lined with magnificent trees whose branches. meeting overhead, form a leafy tunnel. There are many squares and public parks; the two most important parks are the Tao-Dan and the Thao-Cam Vien, which includes the botanical and zoological gardens. Saigon's three principal thoroughfares, Phan-thanh-Gian (formerly Général Lizé), Hong-thap-Tu (Chasseloup Laubat) and Tran-hung-Dao (Galliéni), link Saigon with Cholon, and at the same time give access to the provinces of the Donnai and Mekong river deltas.

Very little remains of the buildings which comprised the Vietnamese citadel before the arrival of the French. Among notable public buildings of the modern city are the Romanesque-style cathedral and the Vietnamese museum in the botanical gardens at the end of boulevard Thong Nhut (Norodom). The museum, which was opened in 1929 under the name of Musée Blanchard de la Brosse, owes its foundation to the Agricultural and Industrial committee (1865) which became the Society of Indochinese Studies in 1883. The geological and archaeological finds of this society were kept together and the museum houses two distinct collections, one of archaeological evidence of the Indian peoples (Khmer, Cham and Thai) and the other of the arts deriving from the Chinese civilization (Tibetan, Japanese and Funanese).

The first university buildings were erected after the end of the Indochinese War. There are faculties of letters, science, law and medicine. In addition there are advanced schools for teaching, arts and crafts, fine art and architecture.

Saigon uses its waterways for communications and trade and is connected by canals with the Mekong delta. Although about 75 mi. from the sea, Saigon is sheltered from the typhoons which regularly occur on the coast during the rainy seasons, and after Singapore is one of the chief commercial ports of the far east. Saigon is connected by the chief shipping lines with Marseilles, Kobé, Nouméa and with Atlantic ports via Manila, Hawaii and

Puerto Rico, etc. There is only one airport, at Tan-son-Nhut, 4½ mi. from the city. In addition to lines operating locally, there are services to Tokyo and to Paris. (N.-V.-P.)

SAIGŌ TAKAMORI *(1827–1877)*, Japanese rebel, a member of the warrior class and one of the best known of the leaders of the movement that overthrew the Tokugawa shogunate and restored power to the emperor, was born at Kagoshima in Kyushu on Dec. *7, 1827.*

On the Meiji restoration in *1868,* Saigō immediately assumed an important position in the new government. He left it in 1873, ostensibly over differences within the government on matters of foreign policy—though some historians regard his departure mainly as part of a factional struggle for power under the emperor—and retired to Kagoshima, where he founded a school and gathered around him a group of young men sympathetic to his personality and views on government.

In *1877* Saigō led an uprising, known as the Satsuma rebellion, intending to replace the existing incumbent government with one headed by himself. His forces were crushed and, rather than fall into enemy hands, he ordered one of his subordinates to put him to death with his sword, Sept. *14, 1877.*

Saigō became a national hero despite the rebellion, personifying to the Japanese the loyal subject who risks all to serve the emperor as he saw best.

SAIKAKU: *see* IHARA SAIKAKU.

SAILFISH, a large, powerful fish of the open seas, in which the bones of the upper jaw are consolidated and prolonged to form a rounded spear and the dorsal fin is greatly enlarged to form a saillike superstructure. Sailfishes (*Istiophorus* species), closely related to the marlins are classified with them in the family Istiophoridae. Like their relatives, sailfishes are strong and far-ranging snimmers, whose streamlined bodies cut the water at considerable speeds (perhaps *60* m.p.h. for short distances). The upper part of the torpedo-shaped body is a rich blue, the remainder a bright silver; the sides are often marked with vertical lines of lavender dots. The sail, deep purple at the base, blends into dark blue and is more or less spotted with dark dots. The fish folds the sail into a groove on the back when swimming rapidly and unfurls it nhen sunning itself, when breaking the surface or when fighting a sportsman's line. The spear is perhaps used to stun prey, such as mackerel, sierra, sauries and squid.

Sailfishes are widely distributed in the warm waters of all oceans and seasonally visit temperate regions as far south as the Cape of Good Hope and as far north as Massachusetts. There is much uncertainty regarding the number of species.

Two well-known species are the Atlantic sailfish (*Istiophorus albicans*), averaging less than *50* lb. in weight, and the Pacific form (**I.** *greyi*), averaging about *100* lb. Large specimens on record, caught with rod and reel, are an Atlantic sailfish *10* ft., *4* in. long and weighing *123* lb.; and a Pacific form *10* ft., 9 in. and *221* lb. Even though sailfishes are only fair quality as food, they are among the most highly prized of big game fish.

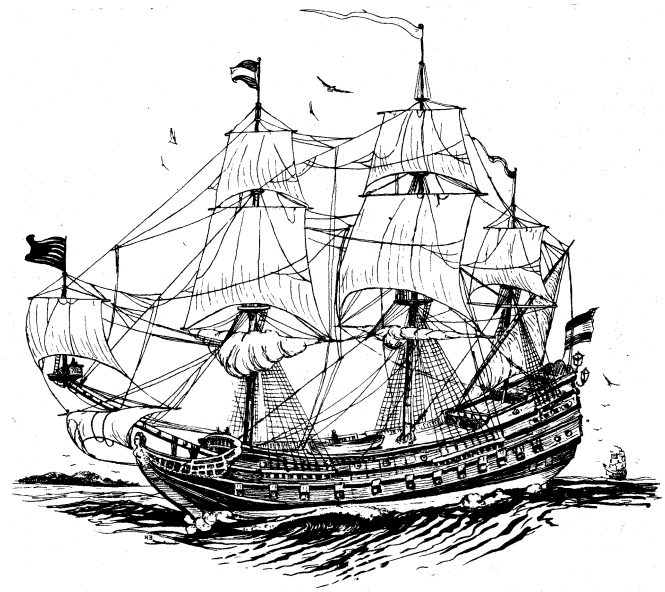
(L. A. WD.)

SAILING: *see* RIGGING; YACHTING; etc.

SAILS. The origin of sailcloth is obscure, although it can be assumed that primitive man first used the skins of animals as sails for his raft or canoe. The next probable step was to use woven mats of reeds stretched on poles. Sailcloth is mentioned by Homer in the *Odyssey,* in which he states that Calypso brought Odysseus "a web of cloth to make him sails."

Sailcloth was woven from flax fibre during the period when England, France and Spain were striving for supremacy. Fibre flax, grown chiefly in the U.S.S.R. and European countries, is still used for sails, although cotton has replaced it for better quality canvas. Cotton sails became popular in Europe after the U.S. racing yacht "America," using cotton sails, decisively defeated a fleet of British yachts in *1851.*

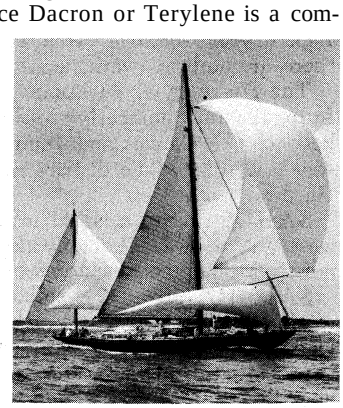
Cotton sailcloth has the advantage over flax in that it can be woven more closely, and therefore will not stretch out of shape as easily nor lose as much wind through the pores of the material.



17TH-CENTURY SHIP

Sails made of cotton, however, are very stiff, which makes them difficult to handle, and many a fingernail has been torn to the quick in furling cotton duck.

The chief modern users of quality sailcloth are yachtsmen. Less expensive grades of canvas are used in making awnings, covers, bags, tarpaulins, etc. Generally speaking, cotton supplanted not only flax but also hemp, ramie, jute and combinations of these materials as a fabric for quality sailcloth. Modern racing sails are made from Egyptian cotton, American cotton, Dacron (or Terylene, its British equivalent), nylon and Orlon, but the latter two synthetic fabrics were losing favour in the late 1950s since the stretch in nylon is hard to control and Orlon abrades and deteriorates comparatively rapidly. Egyptian cotton is superior to American cotton because the fibres are longer and stronger, and their greater degree of natural twist is conducive to producing a tightly woven fabric. It can be distinguished from American duck by its warm creamy colour. Since Dacron or Terylene is a comparatively new fabric, it had not been fully tested by the latter 1950s, but it is believed by many yachtsmen to be superior to any other fabric for sailcloth.



MORRIS ROSENFELD, N.Y.

YACHT "BOLERO"

Sail canvas formerly came in bolts of *90* yd. with a standard width of *22* in.; it was also available in widths of *14, 16,* 18, *20* and *24* in. It mas designated by weight from *00,* the heaviest, through 0 up to *12,* the lightest. On square-rigged vessels the courses and topsails were made of no. 0 and no. *1,* the topgallants of no. 3, the royals of no. *4* and the skysails of no. 5 *(see* RIGGING).

The modern standard width is 28½ in.. and other widths of *18,* 22, 36 and *40* in. are available. The latter two widths are termed spinnaker cloth. The U.S. designation is obtained from the weight of a piece of material *36* by 28½ in. In England this designation is obtained from the neight of a piece of material measuring *36* to *36* in. Thus if 1 sq.yd. neighs *12* oz. it is designated 12-oz. cloth.

Sailmaking.— The finest sails are still hand sewn, especially if the cloth weighs 13½ oz. or over. Machine sewing punches the needle through the material, which splits and weakens the yarns. The less expensive sails and sails for small craft, however, are machine sewn with a zigzag stitch.

The basic steps in manufacturing a sail may be outlined as follows: *(1)* The sailmaker studies the sail plan or measures the vessel's rig. (2) He calculates the stretch and the amount of draft,

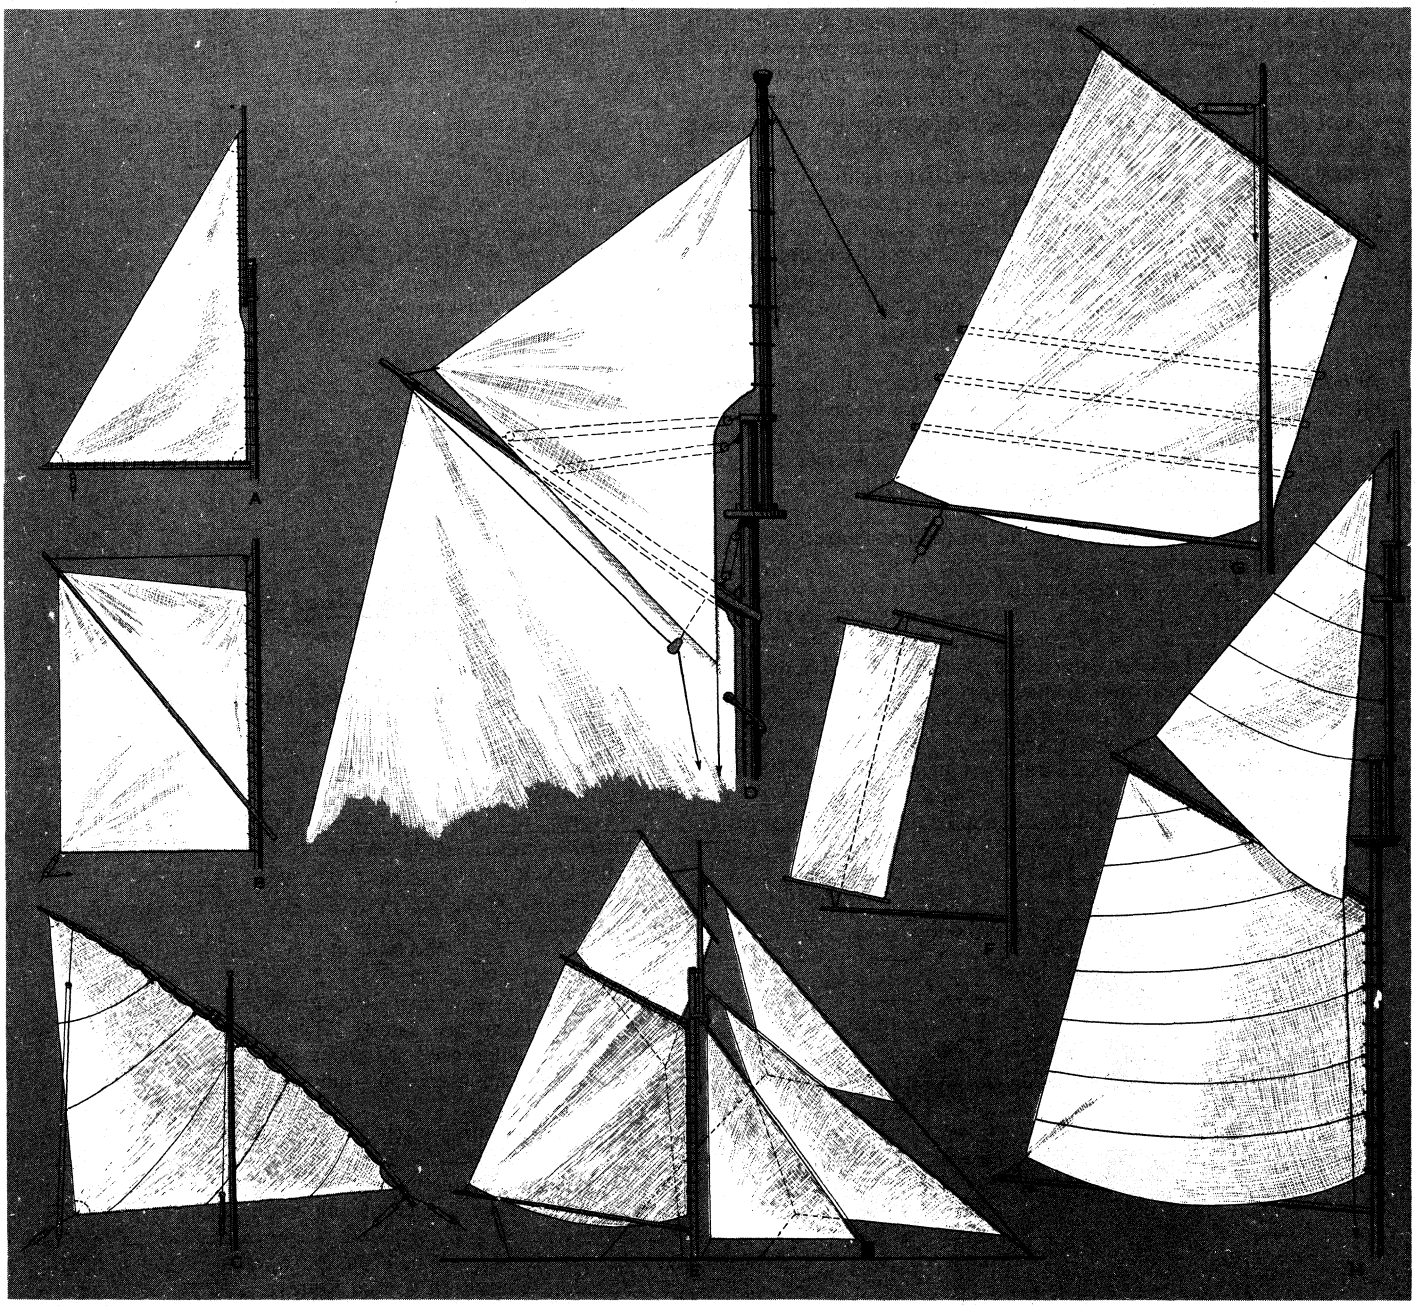


FIG. 1.— FORE-AND-AFT SAILS
(A) Sliding gunter; (B) spritsail; (C) lateen; (D) gaff topsail; (E) rig as used on cutter with mainsail, gaff topsail, staysail, jib and jib topsail; (F) ringtail; (G) balance lugsail; (H) spanker and jib-headed topsail

i.e., the curvature of the surface. (3) The actual plan of the sail is chalked out to full scale on the floor of the sail loft. (4) The cloths are laid down over this plan and their actual length and shape is marked on each individual cloth. (5) The cloths are numbered and then cut to the dimensions outlined by the markings. (6) Next the cloths are sewn together. If the sail is hand sewn, a flat stitch is used on a double flat seam in which the edge of one cloth overlaps the cloth next to it from $\frac{1}{2}$ to $1\frac{1}{2}$ in., depending on the material. A special sail twine is used as thread, and after the needle is threaded the twine is waxed so it will hold the right-hand twist then given to the twine. This twist helps the thread to mesh with the fabric. The sailmaker sews from right to left, using an inverted thimble held in a leather palm and a special three-sided sail needle. The cloths are prevented from slipping off the sailmaker's lap by a bench hook attached to the right side of his bench. The size of the sail needle depends on the weight of the material and the type of sewing. For the usual flat stitch. 10 to 12 stitches are taken within the distance corresponding to the length of the needle. (7) After all the cloths are sewn together, patches are attached to the corners and tabling (hems on the edges) is sewn on the luff (forward edge) and the foot—the places where the greatest strain develops. (8) The finishing touches are next applied. The luff rope is sewn inside the leading edge of the sail to prevent the sail from stretching out of shape. Strong ropes (boltropes) are sewn to the luff and foot, and various fittings, such as metal slides, grommets, reef points, cringles, etc., are attached to the sail.

Some Types of Sails.—The two major categories of sails are square sails and fore-and-aft sails. The first type is generally set in a position across the longitudinal axis of the ship; the second type of sails are set along this axis. Square sails drive the craft forward by the pressure of the wind on the afterside of the sail only; with fore-and-aft sails both sides may be used for forward propulsion. (See Figs. 1, 2 and 3.)

Sails are divided further into groups of primary and secondary sails. Primary sails are those that supply the chief propelling

force in ordinary weather; secondary sails are those that aid the primary sails either by helping to balance the ship or by providing additional driving power. There are six classes of primary sails: square sails, gaff sails, jib-headed sails (Bermuda or Marconi), spritsails. lugsails and lateen sails. Secondary sails are variations of these basic types.

Many sailing vessels also group their sails as follows: cruising sails for ordinary weather, summer sails for tropical weather, storm sails for extremely heavy weather and racing sails.

The name of a sail is frequently derived from the name of the piece of rigging on which it is set, or from its location mith reference to a near-by piece of gear. Thus the main topgallant sail hangs from the topgallant yard of the main mast (fig. 2), the jib topsail stands above the other jibs and so on.

Masts.—Many sails are named with reference to the nearest mast, therefore the names of the masts and their location are important. Siarting at the bow in a two-masted vessel the masts are termed the foremast and the mainmast; when the after mast is considerably smaller they are named the mainmast and the mizzenmast.

In all three-masted vessels the names of the masts are foremast, mainmast and mizzenmast.

Square-rigged vessels (those that have t o or more masts rigged with square sails) having four or five masts usually refer to the last mast as the spanker mast, unless it is considerably smaller than the others, when it is named the jigger mast. There is no fixed rule regarding the names of the masts of square-rigged vessels having five or more masts, though the terms foreward mainmast, after mainmast and middlemast are used. With sails fore-and-aft on vessels having four masts the mast names are: fore, main. mizzen, jigger and spanker.

One authority gives the following names for the masts of a six-masted, fore-and-aft vessel: fore, main: mizzen, jigger, spanker and pusher or driver. For the "Thomas W. Lawson"—the only seven-masted vessel ever built—the mast names are given as fore, main, mizzen, jigger, spanker, pusher and driver. Other authorities state that the seven masts were named for the days in the week. but that this method was later abandoned in favour of numbering from one to seven.

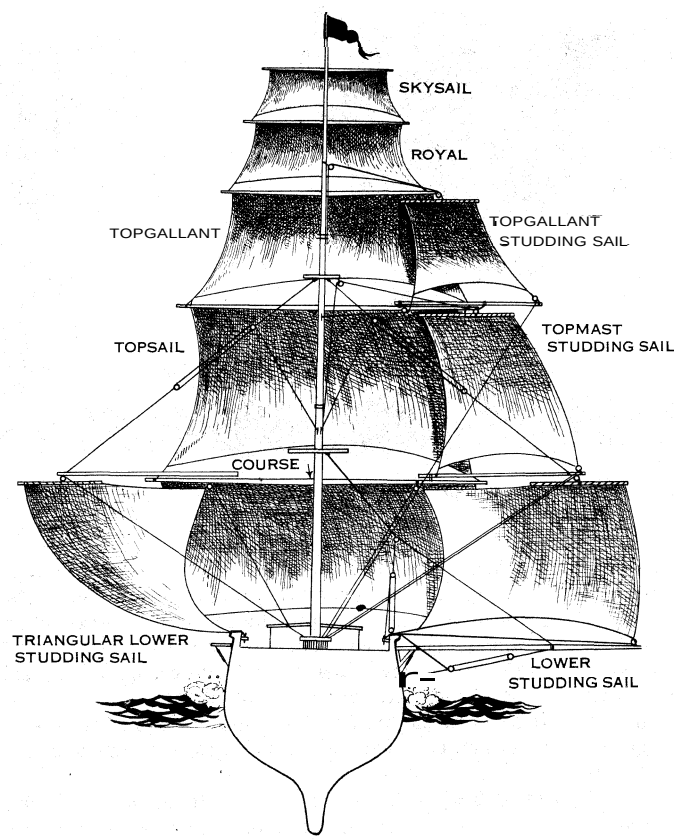

FIG. 2.— SQUARESAILS
Studding sails are shown with their rigging, seen astern

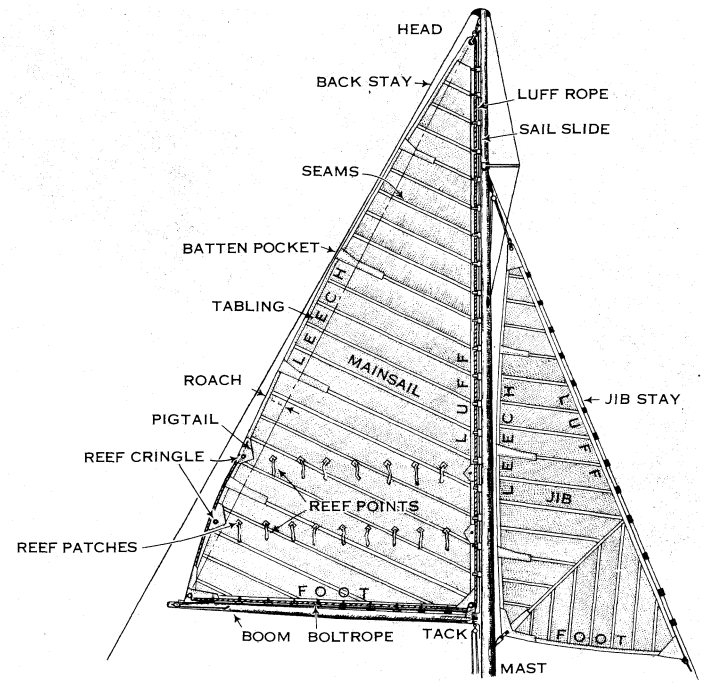

FIG. 3.— PARTSOF MAINSAIL AND WORKING JIB

The names and locations of the working sails of a full-rigged ship are illustrated in the article on RIGGING.

SAINFOIN (*Onobrychis viciaefolia)* is a low-growing perennial plant of the pea family (Leguminosae), mith a woody rootstock. whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic.

The flowers are borne in close pyramidal or cylindrical clusters on the end of long stalks. Each flower is about half an inch in length with lanceolate calyx teeth shorter than the corolla, which is pink, with darker stripes of the same colour. The pods or legumes are flattened, wrinkled, somewhat sickle shaped and crested, and contain a single olive-brown seed. It is sparingly naturalized in the eastern Cnited States.

In Great Britain the plant is a native of the calcareous districts of the southern counties. It is native through central Europe and Siberia.

SAINT, a term applied in the Old Testament to any Israelite as one of the chosen people of God. In the New Testament it was used of any member of the Christian churches; for example, St. Paul addresses his letter to the Philippians "To all the saints in Christ Jesus who are at Philippi." It was not until about the 6th century that the word became a title of honour specially given to the dead whose cult was publicly celebrated in the churches: and it is in this sense that the term is understood in this article.

The cult of the saints in the public worship of the Christian church began with the primitive church practice of paying honour to those who willingly endured death at the hands of persecutors rather than deny the Christian faith; *i.e.,* martyrs. The title of martyr at first was bestowed generally on those who distinguished themselves as witnesses for Christ, then the term mas given to those who suffered for Christ, and, in the latter half of the 3rd century, it was restricted to those witnesses who endured death in loyalty to Christ. (*See* MARTYRS. EARLY CHRISTIAN.)

After that of St. Stephen. the earliest and most complete ex-

tant account of a martyrdom is the *Martyrium Polycarpi,* the Smyrna congregation's account of the martyrdom of St. Polycarp (d. *c.* 155). important because it contains the first-known reference to an annual festival of a martyr. In the letter it is stated that a martyr's passion and death are considered as analogous to the passion and death of Christ.

Veneration of martyrs took place first at the place of their torments and burial; from thence it often spread to other localities, and even became world-wide as the church grew. The power of deciding true martyrdom and of granting consequent permission to worship in any particular case belonged originally to the bishop of the area where the martyr gave witness to Christ. The bishop made an investigation of a reported martyrdom, inquiring into the motive of death; and after concluding that the person had died a true martyr for the faith, the bishop permitted his cult and sent the name of the person with an account of the martyrdom to other churches, in order that, with approval of the respective bishops, the worship of the martyr might be carried on in those churches also.

This geographical restriction of cult is evident from exploration of ancient Christian cemeteries in which are found paintings only of martyrs who suffered in the region near the cemetery. At the same time, the practice of notifying other churches explains the rapid and almost universal veneration of certain martyrs, for example St. Lawrence (d. 258) or St. Cyprian of Carthage (d. 258).

At the centre of veneration of the martyrs was the eucharist, celebrated in an atmosphere of triumph. Often it took place over the tomb of the martyr. Hence, there arose the practice of constructing altars like graves and of providing them with relics. The first churches were dedicated to the martyrs. The word *martyrium,* designating first a church built over the grave of a martyr, later was used for churches in general, even for those churches not dedicated to martyr saints. Even today the relics of the saints that are sealed into every altar stone or antimension (in the Eastern Church, a silk or linen cloth used as a portable altar or as covering for the true altar) must include relics of at least one martyr. The martyr's body was guarded with great care in the beginning, but translation of the remains and severing of the body for relics later came into practice as Greek innovations.

Taking the name of a martyr, as an act of reverence, was another custom that arose and soon became established. St. Dionysius of Alexander (d. 265) relates, for example, that two favourite names in his time were Peter and Paul.

Veneration paid to the martyrs was not given to others—not even to the Blessed Virgin Mary—until later. Thus, veneration of the confessor saints, as they are called *(see* CONFESSOR), is not so ancient as cult of the martyrs. The term confessor was given originally to those who confessed Christ when questioned in the presence of enemies of the faith, thus exposing themselves to danger and suffering, but did not endure martyrdom. After the early Christian period the word took on another meaning, being applied to anyone who had led a life of heroic virtue and had died a holy death in peace. This is the meaning of confessor as understood here; and, according to common opinion, confessors so understood first received public ecclesiastical honour some time in the 4th century. In the east, for example, Hilarius and Ephraem, and in the west St. Martin of Tours and St. Hilary of Poitiers, were venerated in the 4th century. The first persons to be considered confessors were the ascetics, perhaps due to the fact that they were seen to resemble the martyrs by their acts of self-denial and their lives of heroic virtue.

Worship of confessor saints grew and expanded according to time and place. Nevertheless, cult of neither martyr saints nor confessor saints was ever lawful unless carried on with ecclesiastical permission, despite the fact that in both cases it was dependent primarily on the consciousness of the faithful as a whole.

Roman Catholic Church.—Throughout the 1st millennium of the Christian era bishops on their own authority could allow public veneration of martyrs or confessors for determined localities. (In certain areas, however, it was a prerogative of the primates and patriarchs.) This was carried on even beyond the 12th century, as is evidenced by the fact that in 1215 Peter of Trevi was canonized by the bishop of Anagni. According to the present discipline in the Roman Catholic Church, however, canonization is beyond the power of a bishop, and it is a procedure distinct from that of beatification, a stage prior to canonization. Canonization, as taught today, is a solemn declaration by the pope that a person has attained the beatific vision and that veneration of the person as a saint is imposed on the entire church. In this judgment, according to the common doctrine, the Roman pontiff is infallible.

Beatification—the declaration that a person is blessed—on the other hand, is not an infallible judgment, and it grants only restricted authorization to venerate. Beatification, thus, implies a permission, while canonization connotes a precept that is universal. The medieval centuries had no such distinct procedures. The titles *beatus* and *sanctus,* technically different in meaning and application in the Roman Catholic Church today, were used with no distinction in the middle ages.

The history of the development of law concerning canonization and beatification, and the procedures laid down in the Code of Canon Law, are described in the article CANONIZATION.

Dogmatically the veneration of saints in the Roman Catholic Church can be understood only in the light of the dogma of the unique mediatorship of Jesus Christ (I Tim. ii, 5). Jesus Christ alone, according to Roman Catholic teaching, redeemed men by His death on the cross. Furthermore, no divine gift can come to man except through man's Redeemer. Hence, all the prayers of those on earth and of the saints in heaven are efficacious only through Christ.

The saints, who are specially pleasing to God, join their prayers to the prayers of those who invoke them, and their aid to men is through the merits of Christ, man's Redeemer and one Mediator. The Council of Trent states it thus:

> The saints, reigning together with Christ, pray to God for men. It is a good and useful thing to invoke the saints humbly and to have recourse to their prayers and to their efficacious help to obtain favors from God through His Son Jesus Christ, Our Lord, who alone is our Redeemer and Savior.

Intercession of the saints was unanimously taught by the early Fathers. For example, St. Cyril of Jerusalem, in his *Catecheses,* says:

> We then commemorate those who have fallen asleep before us, patriarchs, prophets, Apostles, and martyrs, in order that God, by their prayers and intercessions, may receive our petitions.

St. Jerome, in his work against Vigilantius, writes:

> If apostles and martyrs, while still in the flesh and still needing to care for themselves, can pray for others, how much more will they pray for others after they have won their crowns, their victories, their triumphs.

And against the Manichaean Faustus, St. Augustine of Hippo states:

> Faustus blames us for honoring the memory of the martyrs, as if this were idolatry. The accusation is not worthy of a reply. Christians celebrate the memory of the martyrs with religious ceremony in order to arouse emulation and in order that they may be associated with their merits and helped by their prayers.

From the second Council of Nicaea (787) came the theological terms *dulia* and *latria* to indicate a distinction between the worship paid the saints and that paid to God. The two terms correspond, more or less, with the English words veneration and adoration. *Latria* is the worship reserved to God alone and *dulia* is worship given to the saints.

Another term, *hyperdulia,* was composed in the middle ages as a technical theological word to designate the special worship paid to the Blessed Virgin Mary because of her special gifts and holiness bestowed on her by God.

Closely connected with veneration of the saints in the Roman Catholic Church is the cult that is paid to the relics and images of saints, a worship that is referred to the holy person whom the image represents or to whom the relic belonged by contact. St. Thomas Aquinas, in the *Summa Theologica,* states briefly the principle underlying this veneration of relics and images:

> It is manifest that we should show honor to the saints of God as being members of Christ, the children and friends of God and our

intercessors. Wherefore in memory of them we ought to honor every relic of theirs in a fitting manner: principally their bodies which were temples and organs of the Holy Ghost dwelling and operating in them, and as destined to be likened to the body of Christ by the glory of the Resurrection. Hence God himself fittingly honors such relics by working miracles at their presence.

Orthodox Eastern Church. — Veneration of the saints is also a practice in the Orthodox Eastern Church, the liturgy of which takes account of the feasts of the saints throughout the year and establishes the manner of celebrating the feasts. Moreover, the Orthodox venerate images of the saints, called icons, and they show reverence to the relics of saints; the latter are placed in the antimension, as in the Roman Catholic Church they are placed in the altar stone.

The teaching of the Eastern Church concerning the state of those who have passed out of this world is different from that of the Roman Catholic Church. Though the Orthodox pray for their dead and offer prayers to the saints, the church teaches that all the dead are asleep, awaiting the coming of the Day of Judgment, when the good will receive their reward of heaven and the wicked will be judged deserving of hell. The saints too appear to be in this middle state, although they are invoked. In fact, prayers to the'saints play as large a part in Orthodox as in Roman Catholic devotions, and stories of miraculous apparitions of the Blessed Virgin Mary and of the saints are equally numerous.

The process of canonization in the Orthodox Eastern Church is less juridical than that in the Roman Catholic Church *(see* CANONIZATION).

The Menaion, a liturgical work of 12 volumes (one for each month) contains the proper of the immovable feasts of Christ and the saints, corresponding to the *Proprium Sanctorum* of the Roman Catholic breviary *(see* BREVIARY). For each day, it includes a *synaxarion,* a short narrative of the life of a saint or exposition of a feast, taken from the menology (a liturgical book containing the lives of the saints, arranged by months) and read after the sixth ode of the canon for the day.

The Eastern Church also celebrates the Feast of All Saints, on the Sunday after Pentecost. In the churches representations of the saints are found on the iconostasis (the screen separating the sanctuary from the nave); in private homes icons are used.

The saint that occupies the first place of honour among the Orthodox, after the Blessed Virgin, is St. John the Baptist, venerated as the precursor of Our Lord. Greatly beloved, and particularly so in the Russian Church, is St. Nicholas, the saint who helps those in need. The protector of trade, virginity and the family is St. Paraskeva. Among the modern saints is the Russian St. Serafim Sarovskij (canonized in 1903), who is held in special honour.

Anglican Communion. — Teaching in regard to worship and invocation of saints is one of the distinguishing differences between the Roman Catholic Church and the churches of the Reformation. According to Protestant doctrine, worship of the saints tends to detract from the position of Christ himself. Though the churches of the Reformation do not teach the nonexistence of saints, they maintain that to pray to the saints and to ask their intercession is to contradict the commands of our Lord when he taught us how to pray directly to the Father. The saints should be considered ideal examples of the faith, but men ought not to invoke their intercession by name.

The Anglican Church, like other churches of the Reformation, rejects doctrinally the worship and invocation of the saints. Its teaching and faith are contained in the Thirty-Nine Articles drawn up under Queen Elizabeth I in 1562 and amplified by the Book of Common Prayer. Article xxii states:

> The Romish doctrine concerning purgatory, pardons, worshipping and adoration, as well of images as of relics, and also invocation of saints, is a fond thing, vainly invented, and grounded upon no warranty of Scripture, but rather repugnant to the Word of God.

Nevertheless, Anglican doctrine allows the *veneration* of the saints provided veneration does not become worship or invocation. On the one hand, there is no solid reason for stating that the departed saints cannot hear our prayers, if no solid reason for stating that they can: hence a private practice of addressing them cannot be condemned. It cannot be known whether or not they know individual men on earth, for there is no revelation or other knowledge on this matter. Thus, honour can be given to the saints. and Anglicans pray that they may "follow the blessed saints in all virtuous and godly living."

Under the influence of the Oxford movement, veneration of saints was revived in the Church of England. Nor are the Thirty-Nine Articles considered representative of the ritual and doctrinal position of the Protestant Episcopal Church in America, despite the fact that they are included in the American Book of Common Prayer.

In the Episcopal Church some teach that the saints do intercede for men; moreover, the saints bear witness to man's efforts to serve God on earth, and they aid men by their prayers.

Patron Saints. — During the middle ages the practice arose of bestowing on a saint honour for possessing definite attributes and then of considering the saint as an intercessor with special power regarding particular human needs. Thus, the saints became. in time, special patrons even of countries, cities and vocational groups. This practice of patron saints has continued up to the present day.

A group of 14 saints, the auxiliary saints or holy helpers, are venerated for the efficacy of their prayers on behalf of human necessities. They are: St. George (April 23); St. Blaise (Feb. 3); St. Erasmus (June 2); St. Pantaleon (July 27); St. Vitus (June 15); St. Christopher (July 25); St. Denis (Oct. 9); St. Cyriacus (Aug. 8); St. Acacius (May 8); St. Eustace (Sept. 20); St. Giles (Sept. 1); St. Margaret (July 20); St. Barbara (Dec. 4); and St. Catherine of Alexandria (Nov. 25).

In addition to the auxiliary saints, there are many others who are invoked for special needs, among them St. Peregrinus Laziosi (May 1), cancer patients; St. Dympna (May 15), the mentally ill; St. Anne (July 26), women in labour; St. Ottilia (Dec. 13), the blind; St. Roch (Aug. 16), invalids.

Patron saints exist also for various occupations: St. George (April 23), farmers; St. Florian (May 4), firemen; St. Andrew (Nov. 30), fishermen; St. Apollonia (Feb. 9), dentists; St. Ferdinand III (May 30), engineers; St. Francis de Sales (Jan. 29), journalists; St. Thomas More (July 9), lawyers; St. Albert (Nov. 15), scientists; St. Barbara (Dec. 4), miners; St. Luke (Oct. 18), physicians; St. Michael (Sept. 29), policemen; St. John Baptist de la Salle (May 15), teachers.

Most nations also have one or more patron saints, examples being: the Immaculate Conception (Dec. 8), United States; St. George (April 23), England; St. Boniface (June 5), Germany; St. James (July 25), Chile; Our Lady of Lujan (May 3), Argentina; St. Patrick (March 17), Ireland; St. Francis of Assisi (Oct. 4), Italy; St. Joseph (March 19), Canada; St. Lawrence (Aug. 10), Ceylon; Our Lady of Guadalupe (Dec. 12), Mexico.

The literature dealing with the lives and legends of the saints is discussed in the article HAGIOLOGY. The great collection known as the *Acta Sanctorum* is dealt with in BOLLANDISTS.

ST. ALBANS, CHARLES BEAUCLERK, 1ST DUKE OF, created 1684 (1670–1726), a natural son of Charles II by Nell Gwynne was born in London on May 8, 1670. Charles was made Baron Hedington and earl of Burford in Dec. 1676. He took service with the emperor Leopold I, being present at the siege of Belgrade in 1688. After the battle of Landen in 1693, William III made him captain of the gentlemen pensioners, and four

years later gentleman of the bedchamber. His Whig sentiments prevented his advancement under Anne, but he was restored to favour at the accession of George I. He died at Bath on May 10. 1726.

Charles' wife Diana, daughter and heiress of Aubrey de Vere, last earl of Oxford, was a well-known beauty, who became lady of the bedchamber to Caroline, princess of Wales, and survived until Jan. 15, 1742.

ST. ALBANS, HENRY JERMYN, EARL OF **(c.** 1604–1684), son of Sir Thomas Jermyn of Rushbroke, Suffolk, was vice chamberlain and then master of the horse to Queen Henrietta Maria. He accompanied Henrietta Maria in 1644 to France, where he continued to act as her secretary. In the same year he was made governor of Jersey, and conceived the idea of ceding the Channel Islands to France as the price of French aid to Charles against the parliament. When Charles. II. went to Breda, Jermyn remained in Paris with Henrietta Maria, who persuaded her son to create him earl of St. Albans in 1660. Gossip even asserted a secret marriage between the queen and Jermyn. At the Restoration St. Albans received various appointments, and he contributed to the close secret understanding between Charles II. and Louis XIV., taking part in the preliminaries of the Treaty of Dover in 1669. In 1664 he obtained a grant of land in London near St. James's Palace, where Jermyn street preserves the memory of his name, and where he built the St. Albans' market on a site afterwards cleared for the construction of Regent street and Waterloo place. The earl, who was a friend and patron of Abraham Cowley, died in January 1684.

ST. ALBANS, a cathedral city, market town and municipal borough in the St. Albans parliamentary division of Hertfordshire, Eng.. 19 mi. N.N.W. of Marble arch. London. by road. centred on the junction of Watling street with the road from London via Barnet to the midlands. Pop. (1951) 44.098. Area 8.0 sq.mi. The diocese of St. Xlbans covers Hertfordshire and Bedfordshire.

The city is named after the first English martyr, St. Xlban, and the Abbey church (cathedral) stands on the hill which is the traditional site of the martyrdom, *c.* A.D. 303. The present church, built after the Conquest by Paul de Caen (1077) of Roman bricks from the ruins of nearby Verulamium (*q.v.*), succeeded the Saxon church of the monastery founded by Otia of Mercia, about 793, on the site of a still earlier church. The most famous Saxon abbot was Ulsinus who, in 948, founded three churches. St. Stephen's, St. Michael's and St. Peter's. planned and laid out the town, and founded the market which is still held. The school (not a monastic school) was already flourishing by 1100, and an early headmaster was Alexander Neckam (*q.v.*), foster brother of Richard I. Nicholas Breakspear, afterward Pope Adrian IV, was the son of an abbey tenant. The church was reconsecrated in 1116. Of this church, the tower, the transepts and the east end of the nave remain. The west front and part of the nave were pulled down for rebuilding by John de Cella (1195–1214), but his money was exhausted and the work was completed by his successor, William de Trumpington, in Early English style. During the second half of the 13th century, the Lady chapel and the sanctuary were built, but in 1323, five Norman pillars on the south side of the nave, the roof of the south aisle and part of the cloisters collapsed. This part of the abbey was repaired in Decorated style. The high altar screen was completed in 1484 by William Wallingford, though it was probably commenced by John Wheathampstead or Bostock, friend of Humphrey, duke of Gloucester, who is buried in the abbey. After the Dissolution, the school was housed in the Lady chapel. and remained there until a jail was built in St. Albans. and the prisoners transferred from the Great gateway, which had been used as the town jail. The school took over this building in 1871 and it still remains part of the premises. By the 19th century, the abbey was in urgent need of restoration, and this was carried out, first by Sir George Gilbert Scott, and then a more extensive reconstruction was financed by Lord Grimthorpe. His alterations have been much criticized, but they made the structure safe. The extreme length of the abbey is 550 ft., while the nave, 292 ft., is the longest Gothic nave in Christendom.

The abbey played a large part in English history. As their power greu, the abbots obtained the right to destroy the Saxon royal borough of Kingsbury. on a neighbouring hilltop, and it finally disappeared in the reign of Stephen. The constant visits of kings and nobles, English and foreign, led to the development of a famous school of history, in charge, first, of Roger of Wendover, and later, of Matthew Paris. In 1213, the first draft of Magna Carta was read to an assembly of clergy and nobles in the abbey by Archbishop Stephen Langton. Later the town was occupied by troops of the dauphin. After the battle of Poitiers, the captured King John of France was held in the abbey as a prisoner until his ransom was paid. In the time of the Peasants' revolt, 1381, the Great gate of the monastery was stormed by the townsfolk. and Abbot Thomas de la Mare was forced to grant a charter, which was later revoked when the revolt collapsed. John Ball, the famous preacher, was executed at St Albans. The clock tower, a town belfry almost unique in England, was built between 1402 and 1411, but the bell is older.

During the Wars of the Roses, two battles were fought at St. Albans. In 1455, the Lancastrians were defeated by the earl of Warwick. the duke of Somerset was killed and Henry VI captured. In 1461, Queen Margaret defeated Warwick, set Henry free and allowed her soldiers to sack the town.

Like other abbeys, St. Albans declined in wealth and importance during the late 15th and early 16th centuries. Cardinal Thomas Wolsey was for a time abbot but never visited the abbey. It was dissolved in 1539 and St. Albans became a borough, its first charter being dated 1553. The Gorhambury lands of the abbey came eventually into the possession of Sir Nicholas Bacon, lord keeper to Elizabeth I, who visited him there several times. His son, Sir Francis Bacon, Baron Verulam, is commemorated by a statue in St Michael's church, which is within the site of Verulam and contains much ancient work. During the Civil War, the town was the headquarters of the army of the earl of Essex.

Sarah Jennings, later duchess of Marlborough, was baptized in the abbey and spent many years, both as a girl and with her husband, John Churchill, at her family home in St. Albans, founding some still existing almshouses. In the 18th century the town became notorious for bribery and corruption at parliamentary elections, and in 1852 the separate borough representation was abolished. The diocese was formed in 1877 and St. Albans became a cathedral city.

Many old buildings are to be seen in the streets, though many others have been pulled down or altered in the 20th century. The most important industry is printing. One of the earliest printing presses was set up in the town by the "Scolemaster Printer," and operated from about 1479 to 1486. One of his books, *The* Book of *St. Albans,* contains the first example of colour printing in England. Other local trades are horticulture (seeds and orchids), musical instruments, clothing, electrical apparatus, chronometer making and a large variety of other light industries.

ST. ALDWYN, MICHAEL EDWARD HICKS BEACH, 1st Earl (1837–1916), English statesman, who served twice as chancellor of the exchequer. The son of Sir Michael Hicks Beach, 8th bart., whom he succeeded in 1854, he was born in London on Oct. 23, 1837, and was educated at Eton and Christ Church, Oxford.

St. Aldwyn entered parliament as Conservative M.P. for East Gloucestershire in 1864, and was made chief secretary for Ireland in 1874 and a member of the cabinet in 1877. From 1878 to 1880 he was colonial secretary. In 1885 he was elected for West Bristol, and became chancellor of the exchequer and leader of the house of commons. After W. E. Gladstone's brief Home Rule ministry in 1886 he entered Lord Salisbury's next cabinet as Irish secretary, making way for Lord Randolph Churchill as leader of the

house and chancellor of the exchequer; but bad eyesight compelled him to resign in 1887 and meanwhile George Goschen replaced Lord Randolph as chancellor of the exchequer. From 1888 to 1892 Hicks Beach returned to active work as president of the board of trade, and in 1895 he again became chancellor of the exchequer. In 1899 he lowered the fixed charge for the national debt from £25,000,000 to £23,000,000—a reduction imperatively required, apart from other reasons. by the difficulties found in redeeming consols at their then inflated price. When compelled to find means for financing the war in South Africa, he insisted on combining the raising of loans with the imposition of fresh taxation; and besides raising the income tax each year, up to *1s. 3d.* in 1902, he introduced taxes on sugar and exported coal (1901), and in 1902 proposed the reimposition of the registration duty on corn and flour which had been abolished in 1869 by Robert Lowe. On Lord Salisbury's retirement in 1902 Hicks Beach also left the government. He accepted the chairmanship of the Royal Commission on Ritualistic Practices in the Church, and he did valuable work as an arbitrator. A firm advocate of free trade, he did much by his campaign against Joseph Chamberlain's protectionist program to prevent A. J. Balfour from committing his party to protection.

He was raised to the peerage as Viscount St. Aldwyn in 1906 and mas created an earl in 1911. He died in London on April 30, 1916.

SAINT-AMANT, MARC ANTOINE DE GERARD, SIEUR DE (1594–1661), French poet, was born near Rouen in the year 1594, the son of a merchant. He obtained a patent of nobility, and attached himself to different great noblemen—the duc de Retz and the comte d'Harcourt among others. He saw military service and sojourned at different times in Italy. in England —a sojourn which provoked from him a violent poetical attack on the country, *Albion* (1643)—in Poland, where he held a court appointment for two years, and elsewhere. Saint-Amant's later years were spent in France; and he died at Paris on Dec. 29, 1661. Saint-Amant has left a not inconsiderable body of poetry. His *Albion* and Rome ridicule set the fashion of the burlesque poem, a form in which he was excelled by his follower Paul Scarron.

In his later years he devoted himself to serious subjects and produced an epic. *Moïse sauvé* (1653). His best work consists of Bacchanalian songs. his *Débauche* being one of the most remarkable convivial poems of its kind.

The standard edition is that in the *Bibliothèque Elzévirienne,* by M. C. L. Livet, 2 vol. (1855).

ST. ANDREWS, a city, royal burgh, university town and seaport of Fifeshire. Scot. Pop. (1951) 9.457. It is on a bay of the North sea, 13 mi. S.E. of Dundee by road and ferry. It occupies a plateau of sandstone rock about 50 ft. high, breaking off on the north in precipitous cliffs. The Eden enters St. Andrews bay northwest of the golf links, which rank among the finest in the world.

St. Andrews originated in a Celtic ecclesiastical settlement that may have been first formed by St. Kenneth in the 6th century. In the 8th century a new church was built by Angus MacFergus, king of the Picts, and dedicated to St. Andrew, who was adopted as the patron saint of the Pictish and thereafter of the Scottish nation. Relics of the saint were brought there and acquired such celebrity that the place. first called Mucross ("the headland of the wild boar") and then Kilrymont ("the cell of the king's mount"), came to be known as St. Andrews. About 908 the bishop of the Scots transferred his seat there from Dunkeld. In the early 12th century the bishopric of St. Andrews was regarded as the most important in the kingdom and was in due course raised to the dignity of an archbishopric in 1472 when its holder was recognized as primate of Scotland.

The mediaeval cathedral and priory of St. Andrews began with a foundation of Augustinian canons established between 1127 and 1144 by Bishop Robert in association with the so-called church of St. Regulus that still survives. In 1160 a larger cathedral and priory church was begun by Bishop Arnold and eventually consecrated in 1318. Built partly in the Norman arid partly in the early Gothic style it was considerably the largest church in Scotland with an internal length of 3j7 it. The cathedral and priory were enclosed by an elaborate precinct wall. In addition to the Augustinian~St. Andrews in the middle ages contained communities of Dominicans (c. 127j) and Observantine Franciscans (c. 1450). The bishops and archbishops resided in a formidable castle founded on a rocky headland to the northwest of the cathedral in about 1200 by Bishop Roger. An organized municipality or burgh was founded by Bishop Robert about 1140.

St. Andrews was granted most of the privileges of a royal burgh by King Malcolm IV about 1160 and grew into one of the largest towns in mediaeval Scotland. The parish church of the Holy Trinity was rebuilt to a commensurate scale on a central site in 1410 by Bishop Wardlaw.

As the ecclesiastical capital of the country. St. Andrews was the centre of many of the most critical episodes in the Scottish Reformation. After the triumph of the Reformers in 1j60 the cathedral and priory were abandoned and fell into ruins but the town remained a place of considerable importance until the close of the 17th century. In the 18th century it underwent a serious decline from which it was rescued mainly through the activity of Sir Hugh Lyon Playfair, provost from 1840 to 1861. Already well-known as a golfing centre, especially since the foundation of the Royal and Ancient club in 1754, St. Andrews acquired the favourable reputation as a holiday resort which it still retains. During the 20th century it consolidated its position as an educational centre and as the commercial and administrative focus of the adjoining region of Fife. St. Andrews is the seat of a presbytery of the Church of Scotland and gives its name to a bishopric of the Scottish Episcopal church (but combined with Dunkeld and Dunblane and with its seat at Perth) and to an archbishopric of the Roman Catholic church (but combined with Edinburgh and with its seat in the latter city).

Of the buildings of the mediaeval city comparatively little remains. The cathedral largely vanished apart from the east and west gables and part of the south wall, but the priory precinct wall was preserved throughout practically its entire length. Also to be seen are the north transept (1525) of the Dominican church and a great part of the castle. Holy Trinity church, after undergoing considerable alteration in 1799, was well restored in 1907–09 and is one of the most impressive churches in Scotland. The town is notable for its wide and handsome streets and retains many interesting domestic buildings of the 16th and 17th centuries and the fine gateway of the West Port (1589).

The university of St. Andrews. the oldest in Scotland. owed its origin to a society of scholars formed in 1410. A charter of incorporation was issued in 1412 by Bishop Henry Wardlaw and in 1413 the full privileges of a university were conferred by the antipope Benedict XIII. The first buildings consisted of a "College and Chapel of St. John" appropriated to the use of the university in 1419 and in 1430 associated with a "Pedagogy" on an adjacent site. In 1450 St. Salvator's college was founded and richly endowed by Bishop Kennedy. In 1512 St. Leonard's college was estahlished and between 1537 and 1554 the early Pedagogy was erected into St. Mary's college. Following the Reformation, in 1579, St. Mary's college was assigned to the study of theology and in 1747 the other two colleges were combined as the United College of St. Salvator and St. Leonard. University college, Dundee, founded in 1881, was in 1897 affiliated to the University of St. Andrews and in 1954 (following the act of 1953) joined with the University Advanced Medical school (1898) and Dental school (1914) as a constituent college of the university entitled Queen's college.

In 1892 women were admitted to all courses of instruction in the university.

The buildings of the university include the splendid tower and church of St. Salvator's college. the church of St. Leonard's college, and the courtyard of St. Mary's college, all of which date from the middle ages. The University library, which was refounded by King James VI in 1612, is partly housed in the original building. within which the Scottish parliament met in 164j. The library contains over 400.000 printed books. some of great rarity, and important collections of manuscripts. The university expanded greatly during the 20th century and by the latter 1950s included some 2,000 students. of whom approximately 1.200 pur-

sued their studies in St. Andrews itself and the remainder in Dundee.

SAINT ARNAUD, JACQUES LEROY DE (1801–1854), marshal of France, was born at Paris on Aug. 20, 1801. He entered the army in 1817, retired from the service in 1827 and re-entered it at 30 as a sublieutenant. He took part in the suppression of the Vendée *kmeute,* and was for a time on General (Marshal) Bugeaud's staff. But his debts and the scandals of his private life compelled him to go to Algeria as a captain in the foreign legion.

In 1848 he was placed at the head of a brigade during the revolution in Paris. On his return to Africa, it is said because Louis Napoleon considered him suitable to be the military head of a coup d'état, an expedition was made into Little Kabylia, in which St. Arnaud provided his superiors with the pretext for bringing him home as a general of division (July 1851). He succeeded Marshal Magnan as minister of war and superintended the military operations of the coup d'ktat of Dec. 2, 1851, which placed Napoleon III on the throne. A year later he was made marshal of France and a senator, remaining at the head of the war office till 1854, when he set out to command the French in the Crimea, his British colleague being Lord Raglan.

Saint Arnaud died on board ship on Sept. 29, 1854, shortly after commanding at the battle of the Alma. His body was conveyed to France and buried in the Invalides.

See ***Lettres du Maréchal de Saint Arnaud*** (1855; 2nd ed. with memoir by Sainte-Beuve, 1858).

ST. ASAPH, a cathedral village-city of Flintshire, north Wales, on the Chester-Holyhead trunk road, and 15 mi. W. of Flint by road. Pop. (1951) 9,860. Its Welsh name, Llanelwy, is derived from the Elwy, between which river and the Clwyd it stands. Asaph, to whom the cathedral (the smallest in Great Britain, excluding converted parish churches) is dedicated, was bishop there in the 6th century. The small, irregularly built town also has a parish church, remains of a Perpendicular chapel near Ffynnon Fair (St. Mary's Well) and almshouses founded in 1678 by Bishop Isaac Barrow. The hill on which St. Asaph stands is Bryn Paulin, with early associations. The early cathedral, of wood, was burned by the English in 1247 and 1282, and that built by Bishop Anian in the 13th century (Decorated) was mostly destroyed during the raids of Owen Glendower (*c.* 1402). Bishop Richard Redman's building (c. 1480) was completed by the erection of the choir about 1770. Further restoration took place in the 19th century. The church is plain, cruciform, chiefly Decorated but partly Early English, with a square tower; it has a library of nearly 2,000 volumes, some of which are rare and which include the Welsh translation of the Bible by Bishop William Morgan, who is buried in the cathedral. In 1920 the bishop of St. Asaph was enthroned in his cathedral as the first archbishop of the disestablished Church in Wales.

SAINT AUGUSTINE, a city of Florida. U.S., the oldest city in the U.S., and the seat of St. Johns county, is in the northeastern part of the state 75 mi. S. of the Georgia border, on the Intracoastal waterway. It is connected with Anastasia Island on the Atlantic ocean by the Bridge of Lions across Matanzas river and is served by the Florida East Coast railway, which also has its headquarters and shops there.

In 1564 France established Fort Caroline near the mouth of the St. Johns river. A year later, in order to defend and maintain Spanish sovereignty over Florida, Adm. Pedro Menéndez de Avilés destroyed the French colony and founded St. Augustine. Throughout the following 256 years it was the northernmost outpost of the Spanish colonial empire except for 20 years, 1763–83, when Florida belonged to England.

Since 1821 it has been a part of the United States. A plaza, narrow streets, stucco houses, balconies, patios and gates from the wall that once protected the town are evidences of its heritage. A symbol of Spanish power is the grim and massive Castillo de San Marcos, a rectangular bastioned fortress with walls 30 ft. high and from 9 to 12 ft. thick, surrounded by a moat 40 ft. wide.

St. Augustine was plundered by Sir Francis Drake and besieged by James Oglethorpe; it became a refuge for Loyalists during the American Revolution and during the Indian wars provided a prison for captured Seminoles, including Osceola. The Federals occupied it the last three years of the American Civil War.

In the 1880s Henry M. Flagler, an oil magnate, became interested in developing the east coast of Florida as a resort area. Among the notable structures he erected in St. Augustine were the luxury hotel Ponce de Leon, and the Memorial Presbyterian church. Both were designed by the architects John M. Carrère and Thomas Hastings.

St. Augustine is the site of a Roman Catholic cathedral and of the oldest Episcopal church in the state. The city has had a council-manager form of government in effect since 1915. There are numerous shrines and museums. The economy is based on tourism, commercial fishing and some industry.

For comparative population figures *see* table in FLORIDA: Population. (A. J. H.)

ST. AUSTELL, a market town and urban district in the Truro parliamentary division of Cornwall, Eng., 11½ mi. S.S.W. of Bodmin by road. Pop. (1951) 23,655. Area 28.7 sq.mi. To the north, the high ground on which St. Austell stands culminates in Hensbarrow Downs (1,034 ft.). The town is the centre of the china clay (kaolin) district, and many people are employed in the industry, exports being made to the Potteries and Lancashire and abroad; huge white spoil heaps abound.

Nearby is Menacuddle well, a good example of an Early English baptistery. The harbours of Mevagissey, Par and Charlestown are in the district.

ST. BARTHOLOMEW (ST. BARTHELEMY), French West Indian island, 17" 55' N. and 63° 60' W., about 130 mi. N.W. of Guadeloupe, of which it is a dependency. The horns of an irregular crescent enclose the bay of St. Jean, pointing north; the surface culminates in a central limestone hill 1,003 ft. high. It is 10 sq.mi. in area, and timberless. Gustavia, on the southwest coast has a small but safe harbour. Lorient is the only other town. The inhabitants, mainly of French and Negro descent, are English-speaking, and numbered 2,079 in 1954.

St. Bartholomew was occupied by France in 1648 and ceded to Sweden in 1784. In 1877 it was again acquired by France at the cost of £11,000.

ST. BARTHOLOMEW, MASSACRE OF. This was the name given to the massacre of the Huguenots, which began in Paris on St. Bartholomew's Day, Aug. 24, 1572. The initiative for the crime rests with Catherine de' Medici. Disquieted by the growing influence of Admiral Coligny, who against her wishes was endeavouring to draw Charles IX into a war with Spain, she resolved to have him assassinated. The attempt failed, however, and Catherine then determined to massacre all the Huguenot leaders.

After holding a council with the Catholic leaders, including the Duke of Anjou, Henry of Guise, the Marshal de Tavannes, the Duke of Nevers, and René de Birague, the keeper of the seals, she persuaded the king that the massacre was a measure of public safety, and on the evening of Aug. 23 succeeded in wringing authorization from him.

The massacre began early on Sunday morning, and continued in Paris till Sept. 17. Once let loose, it was impossible to restrain the populace. From Paris the massacre spread to the provinces till Oct. 3. The Duc de Longueville in Picardy, Chabot-Charny (son of Admiral Chabot) at Dijon, the Comte de Matignon (1525–97) in Normandy and other provincial governors refused to authorize the massacres. François Hotman estimates the number killed in the whole of France at 50,000. Catherine de' Medici received the congratulations of all the Catholic powers, and Pope Gregory XIII commanded bonfires to be lighted and a medal to be struck.

See H. Mariéjol, "La Réforme et la Ligue" (1904), in vol. vi of the ***Histoire de France,*** by ***E.*** Lavisse, which contains a complete bibliography of the subject.

ST. BENOÎT-SUR-LOIRE, a village of France, in the *département* of Loiret, on the Loire, 22 mi. E.S.E. of Orléans. Pop. (1954) 509.

St. Benoît has a huge basilica, only survival of a 7th-century

monastery to nhich the relics of St. Benedict were brought from Monte Cassino In the crypt is a modern shrine containing the remains of St Renedict which attract many pilgrims The establishment was important during the middle ages, partly because of its school.

In 1562 it was pillaged by the Protestants and. though the buildings were restored by Richelieu. the abbey declined. The basilica (1025–1218) has a narthex of two stories and two sets of transepts surmounted by a square central toner.

SAINT BERNARD PASS, actually two passes across the main chain of the Alps, both traversed by motor roads. The Great St. Bernard (8.100 ft.) leads (53 mi.) from Martigny (anc. *Octodurus*) in the Rhone valley (Switzerland) to Aosta (anc. Augusta Praetoria) in Italy. It was knonn in Roman times. The hospice on the pass was founded (or refounded) by St. Bernard of Menthon (d. *c.* 1081), and since the 12th or early 13th century has been in charge of a community of Austin canons, the mother house being at Martigny. In former days the servants of the canons, and the famous dogs, saved many lives, especially of Italian workmen. In May 1800, Napoleon led his army over the pass, which was then traversed by a bridle road only. The Little St. Bernard (7 178 ft.) also nas known in Roman times, and the hospice refounded by St. Bernard, though later it was in charge of the military and religious order of SS. Maurice and Lazarus. The pass leads (39 mi.) from Bourg St. Maurice in the Isère valley (Savoie) to Aosta.

There is no certain mention of the road over the pass of the Great St. Bernard (*Alpis Poenina,* Poeninus *Mons*) before 57 B.C. nhen Julius Caesar sent Servius Galba over it. Even in Strabo's time it was impassable for wheeled traffic. Augusta Praetoria originally had but two gates, one opening toward the Little St. Bernard (*Alpis* Graia), the other toward Eporedia (Ivrea), but none toward the Alpis Poenina. The military arrangement of the German provinces rendered the construction of the road necessary, and it is mentioned as existing in AD. 69. Remains of it cut in the rock, about 12½ ft. in nidth, still exist near the lake at the top of the pass. On the plain at the top of the pass is the temple of Jupiter Poeninus (Penninus).

The Little St. Bernard was known to the Romans as Alpis Graia. It derived its name from the legend that Hercules, returning from Spain with the oxen of Geryon, crossed the Alps by this route, though the legend rather suits the route through the Maritime Alps. According to some modern scholars, Hannibal passed this way over the Alps (see HANNIBAL). In any case it was the principal pass over the Alps into Gallia Comata until the pass of the Alpis Cottia (Mont Genèvre) was opened by Pompeius in 75 B.C., and became the principal route, though the road was only completed under Augustus by Cottius in 3 B C.

SAINT BONIFACE, a city in Manitoba, Can., situated at the confluence of the Seine and Red rivers opposite Winnipeg, and part of the Winnipeg metropolitan area. Pop. (1961) 37.600.

The city was founded in 1818 by the missionaries Provencher and Dumoulin upon the site of an earlier, unsuccessful settlement by Swiss mercenaries, who gave the place its present name in honour of the patron saint of Germany.

As a Catholic religious centre it attracted French-speaking colonists from the east as well as local métis (Indian mixed bloods). It was incorporated as a town in 1883 and as a city in 1908. Railways and roads converged there to bridge the Red river for Winnipeg, creating conditions favourable to industrial development. There are meat-packing plants, flour mills, paint and soap works and oil refineries. Large numbers of livestock move daily into its famous stockyards.

St. Boniface is the centre of French-Canadian culture in the west; it has a French-language radio station and a French-language college affiliatedwith the University of Manitoba. Principal among its buildings are the Roman Catholic basilica and large hospitals overlooking the Red river. The basilica is the oldest church in western Canada. Besides the French-speaking community. there are large British. Ukrainian. German and Polish groups. The city suffered severely from a disastrous flood in 1950. (W. H. PR.)

SAINT BRIEUC, a town of western France, capital of the *département* of Côtes-du-Nord, 63 mi. N.W. of Rennes by the railway to Brest. Pop. (1954) 32,965. St. Brieuc is named after the missionary St. Briocus, who came from Wales in the 5th century. and whose tomb afterward attracted crowds of pilgrims. The place was defended in 1375 by Olivier de Clisson against the duke of Brittany, and later attacked by the same Clisson in 1394, the cathedral suffering greatly in both sieges.

In 1592 the town was pillaged by the Spaniards, in 1601 ravaged by the plague and in 1628 surrounded by walls of which no traces remain. Between 1602 and 1768 the states of Brittany several times met at St. Brieuc. It stands 290 ft. above the sea. about 2 mi, from the English channel and less than 1 mi. from the right bank of the Gouet, at the mouth of which is its seaport, Le Légué. St. Brieuc is the seat of a bishopric in the province of Rennes, and has a 13th-century cathedral, partially rebuilt in the 18th. and afterward restored.

SAINT CATHARINES, county seat of Lincoln county, Ontario, Can., on the old Welland canal 2 mi. south of Lake Ontario. The first settlement was about 1790 and by 1797 part of the present site was known as Shipman's Corner. St. Catharines became a town in 1845 and a city in 1876. Known as the garden city, St. Catharines adjoins the towns of Thorold and Merritton in a continuously built-up area extending along the old canal where it climbs the Niagara escarpment. In the late 19th century St. Catharines was famed for its mineral springs but in modern times it is a manufacturing centre and the warehousing and distribution centre for the Niagara fruit belt in which it is located. Its larger industries produce automobile parts, heavy electrical apparatus, structural engineering goods and service, light and heavy hardware and hosiery.

Pop 11961) 84.472. (G. FN.)

SAINT CHARLES, a suburb of St. Louis, Mo. See SAINT LOUIS (No.).

SAINT CLAIR, LAKE, is an expansive shallow basin in the St Clair–Detroit river waterway which connects Lakes Huron and Erie and forms the boundary between the state of Michigan and the province of Ontario. The nearly circular lake is 26 mi. long, north to south, and 24 mi. wide, and has a surface area of 490 sq.mi. The area of its drainage basin, exclusive of lake surface (and exclusive of the upper Great Lakes) is 7.430 sq.mi. The principal irregularity of the shoreline is the large delta of the St. Clair river, with seven channels. The lake has low and marshy shores and a gently sloping bottom with a maximum natural depth of about 21 ft. Ship channel improvements provide a minimum depth of 25 ft. across the lake from the mouth of the St. Clair river south channel to the head of the Detroit river. The mean surface altitude of the lake is 575 ft.—6 ft. below the level of Lake Huron and 2½ ft. above that of Lake Erie. As in the connecting rivers, the monthly mean level of water surface has fluctuated through a range of about 3 ft. during the navigation seasons.

There are no port cities of importance on Lake St. Clair, but Detroit, Mich., and Windsor, Ont., have dock facilities on the Detroit river a few miles downstream from the lake.

For a discussion of the regional relationships of Lake St. Clair see GREAT LAKES, THE. See also SAINT CLAIR RIVER.

(J. L. HH.)

SAINT CLAIR RIVER, the outlet for Lake Huron, which in turn receives the waters from lakes Superior and Michigan, forms part of the boundary between the state of Michigan, U.S., and the province of Ontario, Can. Flowing in a southerly direction into Lake St. Clair with a fall of about 5.8 ft. in 40 mi., the river discharges through seven mouths, the one known as the south channel being used for deep-draft vessels, while several of the other channels are used for small craft. The south channel was improved by the dredging of separate channels to provide a minimum depth of 25 ft. for St. Lawrence seaway traffic. The river has a velocity near its upper end of more than 5 m.p.h. through the rapids section, and a velocity of about 2 m.p.h. through the channels entering Lake St. Clair.

The river level fluctuates nith the levels of the lakes above and

below. From the year 1910 on, the difference between the highest and lowest monthly mean levels during the navigation season (generally from March to Dec.) has been about 4 ft.

Near the head of the river are the cities of Port Huron, Mich., and Sarnia, Ont., both of which handle some water-borne commerce but the great bulk of the traffic moves through the river without intermediate stop. This traffic is composed principally of iron ore, grain and limestone down bound and coal up bound.

There are several small towns and industrial plants along the shores of the river. For a discussion of the regional relationships of the St. Clair river see GREAT LAKES, THE. See also SAINT CLAIR, LAKE. (J. L. HH.)

SAINT CLAIR SHORES, a city of Michigan, U.S., in Macomb county, 10 mi. N.E. of Detroit is located on the western shore of Lake St. Clair. It is about 7½ mi. long and 1½ mi. wide, with a total area of 10½ sq.mi. First settled in the 18th century by the French, who laid out farms along the Detroit river and Lake St. Clair, it remained a farming area until after 1920. By mid-20th century it had developed as a suburban residential community. Its excellent boat harbours support its claim as the boating capital of Michigan. Many of its subdivisions along the lake provide canals from the lake terminating in boat-wells at the rear of residences.

Private beaches for residents are also available. It was first incorporated as a village in 1925, as a city in 1950 and adopted a council-manager form of government in 1951. The population rapidly increased from 10,405 in 1940 to 76,657 in 1960. (P. P. M.)

SAINT CLOUD, a town of northern France, in the *départe*ment of Seine-et-Oise, on the left bank of the Seine, 2 mi. W. of the fortifications of Paris. Pop. (1954) 20,407. The town is named after Clodoald or Cloud, grandson of Clovis. He had granted the domain to the bishops of Paris, who possessed it as a fief till the 18th century. At St. Cloud Henry III and the king of Navarre (Henry IV) established their camp during the league for the siege of Paris and there the former was assassinated. The castle was acquired in 1658 by the duke of Orleans, who built the palace which perished in 1870. It was at St. Cloud that Bonaparte executed the coup d'état of the 18th Brumaire (1799), and there he celebrated his marriage with Marie Louise. In 1815 it was the scene of the signing of the capitulation of Paris. Seized by the Prussians at the beginning of the investment of Paris in 1870, St. Cloud was sacked during the siege. St. Cloud, built on a hill slope overlooking the river, the Bois de Boulogne and Paris, is a favourite resort.

SAINT CLOUD, a city and seat of Stearns county in the central part of Minnesota, U.S., is located at the junction of the Mississippi and Sauk rivers, 65 mi. N.W. of Minneapolis. The fertile surrounding country produces dairy products and grain in particular. Extensive ledges of high quality granite have given St. Cloud the nickname of the "granite city," and its chief industries are granite quarrying and granite products. It also has smaller printing and metal industries and extensive railroad shops are maintained there.

St. Cloud is the seat of the second largest Minnesota state college (established 1869), and of the state reformatory (1887), a U.S. veterans hospital (with 350 ac. of ground), a Roman Catholic cathedral and several schools and charitable institutions under religious auspices. Nearby are located two Roman Catholic colleges—St. John's university (1857) at Collegeville, for men; and the College of St. Benedict (1913) at St. Joseph, for women. The population is predominantly of German descent, and Roman Catholicism is the main religion of the community.

St. Cloud was settled in 1851, platted in 1854, by John L. Wilson of Maine and named for the French city, incorporated as a village in 1868, and chartered as a city in 1889. Since 1912 it has had a commission form of government. Before the coming of the railroad it was the terminus of the Hudson's Bay company for unloading furs brought down from the Red River valley in wooden oxcarts. During the Sioux uprising of 1862 in the Minnesota river valley, the men of St. Cloud hastily erected fortifications, and the settlement served as a refuge for thousands of homesteaders who fled from the Sioux attack.

For comparative population figures see table in MINNESOTA: Population. (R. W. F.)

SAINT CROIX (SANTA CRUZ), the largest (80 sq.mi.) of the Virgin Islands (*q.v.*), purchased by the United States from Denmark in 1917. The island was discovered Nov. 14, 1493, by Columbus who called it Santa Cruz, a name still sometimes used. After the fierce aboriginal Carib Indians were exterminated, it was occupied and partly settled in turn by small numbers of Spanish, Dutch, English and French. It was held by the Knights of Malta (1651–65). The island was virtually deserted (1695–1733) when the Danish West India and Guinea company purchased it. By 1742 there were 1,900 slaves.

Denmark acquired the island in 1754 and, after an insurrection of the slaves, emancipated them in 1848. About 90% of the 14,935 inhabitants (1960) are of Negro and Negro-white descent. The literacy rate is high.

The island is served by a network of asphalt roads. There is air service to all parts of the Caribbean from the Alexander Hamilton airport. Frederiksted is a west coast port and Christiansted, the chief town (sometimes called Bassin), is located on the northeast coast. Hills rise abruptly from the northern shore (highest point Mt. Eagle 1,165 ft.) and give way to fertile rolling lands, lagoons and beaches to the south. The climate is healthful with a mean annual temperature of 74° F. and an average rainfall of 45.7 in.

The tourist trade, rum, sugar cane and cattle raising constitute the island's basic economy. Despite appropriations by the United States, housing, potable water, sewage, road construction and maintenance and a higher standard of living remain continuing problems. After the fall of Batista in Cuba, Jan. 1, 1959, and the subsequent unrest under Castro the number of tourists increased. (R. W. LN.)

SAINT CROIX RIVER, 129 mi. long, forms the international boundary between Maine in the U.S. and New Brunswick in Canada. It arises as the outlet of the Chiputneticook lakes, which are also the boundary, and discharges into Passamaquoddy bay. From the mouth upstream for approximately 10 mi. it is a tidal estuary, navigable to Calais, Me., where power dams block the channel.

SAINT CROIX RIVER of Wisconsin flows 164 mi. southwestward across the state emptying into the Mississippi at Prescott, Wis., about 20 mi. south of St. Paul. For 130 mi. upstream from its mouth it forms the boundary between Wisconsin and Minnesota. (C. M. DA.)

SAINT CYR-L'ÉCOLE, a town of France in the *départe*ment of Seine-et-Oise, 3 mi. W. of Versailles at the end of the old park of Louis XIV. Pop. (1954) 6,570.

Its importance is due to the famous military school (*école spéciale* militaire) in which officers for the cavalry and infantry were trained. Established in 1808 in a convent where Racine's Esther and *Athalie* were first acted, the military school was destroyed during World War II.

SAINT DAVID'S (Tyddewi), cathedral village of Pembrokeshire, Wales, situated near the sea, southeast of St. David's head, the most westerly promontory of south Wales. Pop. (1951) 1,505. St. David's is 16 mi. N.W. of Haverfordwest and 16 mi. S.W. of Fishguard by road. The little town, locally known as "the city," stands in a lofty position near the cathedral close, and consists of four streets focusing on the square, called Cross square, the ancient market place still possessing its market cross (restored 1873). The origin of the fine cathedral and its village "city" in an area so remote under modern conditions is of special interest. Northwestern Pembrokeshire, like most western promontories of Britain, France and Spain, is remarkably rich in old stone monuments (menhirs, dolmens and stone circles), a fact pointing in all probability to its being on the coastwise and transpeninsular route frequented by prehistoric traders from the Mediterranean to Ireland. (*See* PEMBROKESHIRE.) The little boats of old were driven hither and thither at the mercy of wind and tide, and so the coast in these parts became dotted with alternate landing places, *e.g.,* Porth y Rhaw, St. Non's Bay, Porth Clais, Porth Stinian,

Whitesand Bay, which seem to have made the neighbourhood important in pre-Christian times, as one may judge from folk tradition, monuments on the headland, etc.

The pre-Christian tradition was continued by the Celtic saints moving between Ireland and Wales. In early mediaeval days the same route grew important, as pilgrims moved to and from the shrine of St. Iago de Compostella in northwestern Spain. (See Hartwell Jones, "Celtic Britain and the Pilgrim Movement," Y Cymmrodor, 1912.) The little landing places on the shore had Christian chapels, where prayers were possibly said for safe voyages. The most important ruins at present are those of St. Justinian and St. Non. At a focal point behind a group of these small ports, in the quiet sheltered, well-watered valley of the Alun, the fine cathedral (from Norman times with the double dedication to St. David and St. Andrew) was built, and on the high plateau around, as if sheltering it still further, the "village-city" grew. Throughout the middle ages the cathedral was the centre of pilgrimage and the mediaeval roads (often marked by sacred wells) may be traced across Pembrokeshire focusing on St. David's. Two pilgrimages to St. David's were popularly thought to equal one to Rome, and three pilgrimages to St. David's one to Jerusalem. The early holders of the see ventured, while the central government was weak, to exercise metropolitan rights over much of south Wales, but the increasing power of the Norman penetration reached St. David's, and Anselm's forcible appointment of Bernard—a Norman monk—to be bishop in 1115 made St. David's a suffragan see of Canterbury. A conciliatory step, it would appear, was the canonization of David about 1120. Gerald de Barri (Giraldus Cambrensis) strove vainly to regain the ancient power of St. David's from 1199–1203.

The Cathedral. — The cathedral church is partly built of a beautiful purple-hued sandstone, quarried locally. Its central tower, rebuilt after the original had fallen in 1220, was restored by Sir George Gilbert Scott who also designed the west front and did an extensive restoration of the cathedral. The earliest and main portion of the existing fabric, the fourth on the site, was erected under Bishop Peter de Leia (1176–98) in the transitional Norman-English style. Bishop David Martin (1296–1328) built the Lady chapel; Bishop Henry de Gower (1328–47) made many additions in the Decorated style, including the stone rood screen and southern porch; and Bishop Edward Vaughan (1509–22) roofed over the space between the choir and Lady chapel now known as the Trinity chapel. The cathedral suffered severely during the changes brought about by the Reformation and at the hands of Bishop William Barlow (1536–48) and again during the civil wars of the 17th century. Subsequent restorations took place. The interior of the nave, separated by six wide bays from the aisles, is imposing with its triforium and clerestory. It has an elaborate roof of Irish oak, the gift of Treasurer Owen Pole (c. 1500). The nave is divided from the choir by Bishop Gower's fine stone screen. while the choir contains the richly carved stalls erected by Bishop Tully (1460–81), the episcopal throne and an oaken screen separating choir and presbytery. Bishop Vaughan's chapel contains fine Tudor fan-vaulting, and the Lady chapel decorated sedilia.

To the north of the cathedral is the ruined shell of the beautiful chapel, with an adjoining tower, that formed part of the college of St. Mary, founded by John of Gaunt and Bishop Adam Houghton in 1377. On the west bank of the Alun stand the ruins of the episcopal palace erected by Bishop Gower (c. 1342). The palace was built for residential purposes rather than for defense and occupies three sides of a quadrangle 120 ft. square, and, though roofless and deserted for nearly three centuries, retains most of its principal features. The great hall possesses a traceried wheel window, the chief portal is still imposing, and the chapel retains its curious bell turret, while the peculiar but graceful arcaded parapet of the roof extends intact throughout the whole length of the building. Partially dismantled by Bishop Barlow (c. 1540), the palace was occasionally occupied by succeeding bishops prior to the civil wars. The close contains the deanery and other residences of the cathedral clergy, mostly on the sites of ancient buildings. It was formerly surrounded by a wall, traces of which survive; there were four gateways but the Tower gate alone remains.

ST. DENIS, RUTH (RUTH DENNIS) (1877–), whose active dance career spanned half a century, was one of the most important pioneers of 20th-century American dance. Her personal influence was enormous, and through the pupils she shared with her husband, Ted Shawn (*q.v.*), it extended into almost every phase of the dance art in the United States.

Born in Newark, N.J., Ruth St. Denis was a comparatively successful vaudeville and musical-comedy dancer and also an actress before she became a serious dance artist and innovator. A cigarette poster accidentally seen in 1904, while she was touring in David Belasco's production of Du Barry, turned her attention to Egypt and the orient. Careful study of Hindu philosophy and art led to the production of her ballet, Radha, in 1906. Its success brought her a triumphant three-year tour of Europe.

Returning to the United States, she produced *Egypta* and a Japanese dance drama, *O-Mika*. In 1914 she met and married the young dancer Ted Shawn, who shared her serious, idealistic approach to the dance. Together they founded the Denishawn school. which fostered many figures of later importance in modern American dance.

The Denishawn company toured widely in the United States, and visited the orient in 1925–26. Never divorced, she and her husband separated in 1931. After brief semiretirement, she soon resumed performing her famous solos. Deeply concerned with the spiritual aspects of her art, Ruth St. Denis devoted herself intensively to the furtherance of dance in religion.

See her autobiography, ***Unfinished Life*** (1939); Walter Terry, "Ruth St. Denis," ch. 6 in ***The Dance in*** *America* (1956). (LN. ME.)

ST. DENIS, a suburb 5½ mi. N. of Notre Dame de Paris, capital of an arrondissement in the *département* of Seine. Pop. (1954) 79,611. St. Denis, an important junction on the northern railway, stands in a plain on the right bank of the Seine, which is there joined by the canal of St. Denis. It has numerous metallurgical works where railway material, naval engines and the like are constructed, distilleries of spirits, glassworks, potteries and manufactories of drugs, chemical products, oils, nickel plate and pianos. The name and fame of the town are derived from the abbey founded by Dagobert I on the spot where St. Denis, the apostle of Paris. was interred.

St. Denis, the ancient Catalliacum, was a town of no pretensions till the foundation of its abbey, which became one of the most powerful in France. The rebuilding of the church, begun in the 12th century by Suger, was completed in the 13th century. Among the many domains of the abbey was the French Vexin. It uas held during the later middle ages by the French kings and vassals of the abbey, and to this fact is due their adoption of the oriflamme or red banner of St. Denis as the royal standard. Louis XIV reduced the abbey to the rank of a priory and at the Revolution it was suppressed. the tombs being violated and the church sacked (1793). Louis XVIII caused all the articles belonging to St. Denis to be brought back to their original site, and added numerous other monuments from the suppressed abbeys, but it was not until after 1848 that, under the direction of Viollet-le-Duc, the basilica recovered its original appearance. St. Denis, which was the key of Paris on the north, was more than once pillaged in the Hundred Years' War, suffering especially in 1358 and 1406. A sanguinary battle, in which the Catholic leader Constable Anne de Montmorency found victory and death, was fought between Huguenots and Catholics in the neighbourhood on Nov. 10, 1567.

The church exhibits the transition from the Romanesque to the Gothic style. The west front was built between 1137 and 1140. The right-hand tower is almost pure Romanesque; that on the left was Gothic, but its spire was struck by lightning in 1837. The porch formed by the first three bays contains some remains of the basilica of Pepin the Short and Charlemagne, by whom the church was rebuilt. The nave proper (235 ft. long and 57 wide) has seven bays, and dates, as well as most of the choir and transepts, from the reign of St. Louis. The secondary apse (rond-point) and its semicircular chapels (consecrated in 1144) are considered as the first perfected attempt at Gothic. The transepts have fine facades, the north of the 12th, the south

of the 13th century, each with two unfinished towers; if the plan had been fully carried out there would have been six towers beside a central spire in lead. Tho church contains a series of tombs of the kings and princes of the royal houses of France. The most remarkable are those of Louis XII and Anne of Brittany, executed from 1516 to 1532; of Henry II and Catherine de Médicis, a masterpiece by Germain Pilon (1564–83); of Louis of Orléans and Valentine of Milan, from the old church of the Celestines at Paris (1502–15); of Francis I and Claude of France, one of the most splendid tombs of the Renaissance, executed under the direction of Philibert Delorme (1550–60); and that of Dagobert, which, though considerably dilapidated, ranks as one of the most curious of medieval (13th-century) works of art. In the apse some stained glass of the time of Suger remains.

The crypt dates partly from the 10th or 11th century. In the centre is the vault where the coffin of the king used to lie until, to make room for that of his successor, it was removed to its final resting place. It is at present occupied by the coffin of Louis XVIII, the last sovereign whose body was borne to St. Denis. Besides fine statues, the crypt contains the Bourbon vault, in which among other coffins are deposited the remains of Louis XVI and Marie Antoinette.

See F. de Guilhermy, *Monographie de l'église royale de St. Denis* (1848).

SAINTE ANNE DE BEAUPRÉ, a village of Montmorency county, Quebec, Can., is about 20 mi. N.E. of Quebec city at the junction of the Ste. Anne and St. Lawrence rivers. Laid out along the St. Lawrence, the village is located on a narrow agricultural plain with hills in the background. Pop. (1956) 1,865. The shrine of Ste. Anne de Beaupré is a notable Roman Catholic place of pilgrimage where numerous miraculous cures have been recorded. Settled about 1650, the first chapel was built in 1658, according to tradition, by French sailors who, having been shipwrecked in the St. Lawrence, promised, if saved, to build a small chapel where they would reach land.

The first reported miracle, the curing of a local resident's rheumatism, occurred that same year. The Huron Indians, in 1670, were the first pilgrims to visit the chapel. In the 20th century the shrine was visited by pilgrims from all over Canada and the United States. The basilica of Ste. Anne de Beaupré, of 12th century Roman gothic style, is 373' ft. long, 200 ft. wide and 100 ft. high. It has five naves, 10 small chapels and can accommodate approximately 9,000 worshipers. Begun in 1923, it had not been finished by the 1960s.

Sainte Anne de Beaupré is the headquarters of the French Canadian Rédemptorists and the seat of their college. An attraction of the village is a huge cyclorama depicting the day of the Crucifixion. (P. CA.)

SAINTE-BEUVE, CHARLES AUGUSTIN (1804–1869), French critic, was born at Boulogne-sur-Mer on Dec. 23, 1804. He was a posthumous child. His father, a native of Picardy, and controller of town-dues at Boulogne, was a man of literary tastes; his mother was half English, her father, a mariner of Boulogne, having married an Englishwoman. Charles Augustin was sent to a boarding school in Paris to attend the classes of the Collbge Charlemagne, and then of the Collège Bourbon. He then studied medicine, but after four years abandoned it to join the staff of the new Liberal newspaper, *The Globe*, in which he published the excellent articles on the French poetry of the 16th century afterwards separately published as *Tableau historique et critique de la poésie française au XVIe sikcle* (2nd ed., 1842). In 1829 he made his first venture as a poet with the *Vie, poésies, et pensées de Joseph Delorme.* His own name did not appear; but Joseph Delorme, that "Werther in the shape of Jacobin and medical student,?' as Guizot called him, was the Sainte-Beuve of those days himself. In 1830 came his second volume of poems, the *Consolations.* But the critic in him grew to prevail more and more and pushed out the poet. Sainte-Beuve was at this time a devoted Catholic and a little later for a very short period a disciple of Lamennais. But he gradually separated from his Catholic friends, and at the same time a coldness grew up between him and Victor Hugo, whose warm friendship he had won by an early article on *Odes et Ballades.* He became the lover of Madame Hugo, and a definite separation between the former friends ensued in 1834. In 1831 the *Revue des deux mondes* was founded, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Volupté* in 1834, his third and last volume of poetry, the *Pensées d'août,* in 1837. He had long meditated work on Port-Royal, which took shape in a series of lectures delivered at Lausanne in 1838. The book occupied him at intervals until 1848—Port *Royal* (5 vols. 1840–48; 5th ed., 1888–91).

In 1840 Victor Cousin, then minister of public instruction, appointed him one of the keepers of the Mazarin library, an appointment which gave him rooms at the library, and a competence, and leisure for study. With a Greek teacher, M. Pantasides, he read and re-read the Greek poets. Articles on Homer, Theocritus, Apollonius of Rhodes, and Meleager in the *Revue des deux mondes* were fruits of his new Greek studies. Eut in general his subjects were taken from the great literature of his own country. Seven volumes of *Portraits,* contributed to the *Revue de Paris* and the *Revue des deux mondes,* exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value. In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo.

In March 1848 was published an account of secret-service money distributed in the late reign, and Sainte-Beuve was put down as having received the sum of one hundred francs. The sum appears to have been in reality paid for alterations to a smoky chimney in the library, but Sainte-Beuve was annoyed at the imputation and resigned his chair. He lectured for a time at Liége, but returned to Paris within a year. Dr. Véron, the editor of the *Constitutionnel,* proposed to him that he should supply that newspaper with a literary article for every Monday; and thus the famous *Causeries du lundi* were started. Sainte-Beuve now lived in the small house in the Rue Montparnasse (No. 11), which he occupied for the remainder of his life, and where in 1850 his mother, from whom he seems to have inherited his good sense, tact and finesse, died at the age of eighty-six. For three years he continued writing every Monday for the *Constitutionnel;* then he passed, with a similar engagement, to the *Moniteur.* In 1857 his Monday articles began to be published in volumes, and by 1862 formed a collection in 15 volumes; they afterwards were resumed under the title of *Nouveaux lundis,* which now make a collection of 13 volumes more.

In 1854 he was nominated to the chair of Latin poetry at the college of France. He was rudely interrupted by the students, and resigned; he was then appointed lecturer on French literature at the École Normale Supérieure Here he lectured for four years During this period his contributions to the *Moniteur* were intermittent. He now returned to a regular Monday article for the *Constitutionnel.*

The Empire was tardy in acknowledging his merits, and it was not until 1865 that he received the senatorship with its income sufficient to make him independent, and his health was failing him. He could seldom attend the meetings of the senate; the part he took there, however, on two famous occasions--when the nomination of Ernest Renan to the college of France came under discussion in 1867, and the law on the press in the year following—offended the majority in that conservative assembly and delighted those who "belonged," to use his own phrase, "to the diocese of free thought." He gave further pleasure in this diocese by leaving the *Moniteur* at the beginning of 1869, and contributing to a Liberal journal, the *Temps.* This defection finally alienated him from the Bonapartists, and lost him the friendship of the Princess Mathilde His literary activity suffered little abatement, but pain made him at last unable to sit to write; he could only stand or lie. He died in his house in the Rue Montparnasse on Oct. 13, 1869.

The root of Sainte-Beuve's criticism is his single-hearted devotion to truth. What he called "fictions" in literature, in politics, in religion, were not allowed to influence him. Some one had talked on his being tenacious of a certain set of literary opinions. "I hold very little," he answers, "to literary opinions; literary

opinions occupy very little place in my life and in my thoughts. What does occupy me seriously is life itself and the object of it." "I am accustomed incessantly to call my judgments in question anew. and to re-cast my opinions the moment I suspect them to be without validity." "What I have wished" (in *Port-Royalj* "is to say not a word more than I thought, to stop even a little short of what I believed in certain cases. in order that my words might acquire more weight as historical testimony." To all exaggeration and untruth, from whatever side it proceeded. he had an antipathy. "I turn my back upon the Michelets and Quinets, but I cannot hold out my hand to the Veuillots."

But Sainte-Beuve could not have been the great critic he was had he not had, at the service of this his love of truth and measure. the conscientious industry of a Benedictine. "I never have a holiday. On Monday towards noon I lift up my head, and breathe for about an hour; after that the wicket shuts again and I am in my prison cell for seven days." The *Causeries* were at this price. They came once a week. and to write one of them as he wrote it was indeed a week's work.

To mental independence. industry, measure and lucidity, his criticism adds the merit of happy temper and disposition. Sainte-Beuve has more, as a critic. than the external politeness which once at any rate distinguished his countrymen: he has a personal charm of manner due to a sweet and humane temper. He complained of *un peu de dureté,* "a certain dose of hardness." in the new generation of writers. The personality of an author had a peculiar importance for him; the poetical side of his subjects, however latent it might be, always attracted him and he always sought to extricate it. This was because he had the instincts of the true poetic nature. As a guide to bring us to a knowledge of the great personalities in French literature he is unrivalled.

SAINTE-CLAIRE DEVILLE, HENRI ÉTIENNE (1818–1881), French chemist whose most important work was in inorganic and thermal chemistry, was born on March 11. 1818, on the island of St. Thomas: West Indies, where his father was French consul.

In 1844 having graduated as doctor of medicine and doctor of science, he was appointed to organize the new faculty of science at Besançon, where he acted as dean and professor of chemistry from 1845 to 1851. He succeeded A. J. Balard at the École Normale, Paris, in 1851, and in 1853 became professor at the Sorbonne in place of J. B. A. Dumas (*q.v.*). He died at Boulogne-sur-Seine on July 1, 1881.

He began his experimental work in 1841 with investigations of oil of turpentine and tolu balsam, in the course of which he discovered toluene (*q.v.*). In 1849 he discovered nitrogen pentoxide, the first of the so-called anhydrides of the monobasic acids to be isolated. In 18j5 he devised a method by which aluminum (*q.v.*) could be prepared on a large scale by the aid of sodium, the manufacture of which he also developed. His best-known contribution to chemistry is his work on the phenomena of reversible reactions (*see* REACTION KINETICS).

ST. ELMO'S FIRE, the glow accompanying the brushlike discharges of atmospheric electricity which usually appears as a tip of light on the extremities of pointed objects such as church towers or the masts of ships during stormy weather. It is commonly accompanied by a crackling or fizzing noise.

St. Elmo's fire, or corona discharge. is commonly observed on the periphery of propellers. along the wing tips, windshield and nose of aircraft flying in dry snow. ice crystals, or in the vicinity of thunderstorms. The discharge may be sufficiently strong to cause a noisy disturbance in the radio, called static. which may obliterate all other signals. The corona discharge from an aircraft may initiate a lightning discharge which. striking the airplane: may cause small structural damage. impair the radio or temporarily blind the pilot. Various flight procedures, in addition to mechanical and electrical devices designed to reduce the charge accumulation, are utilized as safeguards in preventing or minimizing discharges.

The name St. Elmo is an Italian corruption. through *Sant' Ermo,* of St. Erasmus. the patron saint of Mediterranean sailors, who regard St. Elmo's fire as the visible sign of his guardianship. (E. J. MR.)

STE.-MARIE-AUX-MINES or MARKIRCH. a town of France in the *département* of Haut-Rhin intersected by the Lièpvrette, an affluent of the Rhine. Pop. (1954) 6.451. The once productive silver: copper and lead mines of the neighbourhood were worked from the 9th till the 19th century. The main industries of the place are weaving and dyeing. The river was at one time the boundary between the German and French languages; the German-speaking inhabitants on the right bank were Protestants and subject to the counts of Rappoltstein, while the French inhabitants were Roman Catholics and under the rule of the dukes of Lorraine.

ST. EMILION, a town of southwestern France, in the *département* of Gironde, 2½ mi. from the right bank of the Dordogne and 27 mi. E.N.E. of Bordeaux by rail. Pop. (1954) 845. The town derived its name from a hermit who lived there in the 7th and 8th centuries. The town has remains of ramparts of the 12th and 13th centuries. The parish, once collegiate church, dates from the 12th and 13th centuries. A Gothic cloister adjoins the church. A belfry (12th. 13th and 15th centuries) commanding the town is built on the terrace, beneath which are hollowed in the rock the oratory and hermitage of St. Emilion. and adjoining them a large ancient monolithic church. Remains of a monastery oi the Cordeliers (1jth and 17th centuries) and of a building (13th century) known as the Palais Cardinal, are also to be seen. St. Emilion is celebrated for its wines.

SAINTE-PALAYE, JEAN BAPTISTE LA CURNE (or LACURNE) DE (1697–1781), French scholar. was born at Auxerre on June 6, 1697. His father, Edme, had been gentleman of the bedchamber to the duke of Orleans, brother of Louis XIV, a position which descended to his son. In 1724 he had been elected an associate of the Académie des Inscriptions et Belles-Lettres, and from this time he devoted himself exclusively to the work of this society. He began a series of studies on the chroniclers of the middle ages for the *Historiens des Gaules et de la France* (edited by Dom Bouquet): Raoul Glaber, Helgaud, the *Gesta* of Louis VII, the chronicle of Morigny, Rigord and his continuator, William le Breton, the monk of St. Denis, Jean de Venette, Froissart and the Jouvencel. His *Glossaire de la langue française* was ready in 1756, but remained in manuscript for more than a century. He died on March 1, 1781.

See the biography of La Curne, with a list of his published works and those in manuscript, at the beginning of the tenth and last volume of the *Dictionnaire historique de l'ancien langage françois, ou glossaire de la langue frangoise depuis son origine jusqu'au siècle de Louis XIV,* published by Louis Favre (1875–82).

SAINTES, a town of western France, capital of an *arrondissement* in the *département* of Charente-Maritime, 47 mi. S.E. of La Rochelle by the railway from Nantes to Bordeaux. Pop. (1954) 21,1j4. Saintes (*Mediolanum* or *Mediolanium*), the capital of the Santones, was a flourishing town before Caesar's conquest of Gaul; in the middle ages it was capital of the Saintonge. Christianity was introduced by St. Eutropius, its first bishop, in the middle of the 3rd century. Charlemagne rebuilt its cathedral. The Normans burned the town in 845 and 854. Richard Coeur de Lion was besieged and captured there by his father Henry II. In 1242 St. Louis defeated the English there, but the town was not permanently recovered from the English until the reign of Charles V. It has Roman remains, of which the best preserved is the arch of Germanicus, dating from the reign of Tiberius. This formerly stood on a Roman bridge destroyed in 1843. when it was removed and reconstructed on the right bank of the river. Ruins of baths and of an amphitheatre are also to be seen. The large amphitheatre dates probably from the close of the 1st or beginning of the 2nd century and was capable of holding 20,000 spectators. Saintes was a bishop's see till 1790; the cathedral of St. Peter, built in the early 12th century, was rebuilt in the 15th

century and again after it had been almost destroyed by the Huguenots in 1568. It has a 15th century tower. The church of St. Eutropius (6th century, rebuilt in the 11th having had its nave destroyed in the Wars of Religion) stands above a large, well-lighted crypt adorned with richly sculptured capitals and containing the tomb of St. Eutropius (4th or 5th century). The fine stone spire dates from the 15th century. Notre-Dame (11th and 12th centuries) has a noble clock tower and is now desecrated. The old *hôtel* de *ville* (16th and 18th centuries) contains a library. Small vessels ascend the river as far as Saintes, which carries on trade in grain, brandy and wine, has iron foundries and railway works and manufactures earthenware and tiles.

ST. ÉTIENNE, an industrial town of east-central France, capital of the department of Loire, 310 mi. S.S.E. of Paris and 36 mi S.S.W. of Lyons by rail. Pop. (1946) 177,966. At the close of the 12th century St. Btienne was a parish of the Pays de Gier belonging to the abbey of Valbenoite. By the middle of the 14th century the coal trade was developing, and in the early 15th century Charles VII allowed the town to build fortifications. The manufacture of firearms for the state was begun at St. Btienne under Francis I and was put under the surveillance of state inspectors early in the 18th century. The manufacture grew rapidly. The first railways opened in France were the line between St. Btienne and Andrézieux on the Loire in 1828 and that between St. Btienne and Lyons in 1831. In 1856 St. Btienne became the administrative centre of the department.

St. Btienne stands on the Furens, which flows through'it from southeast to northwest, partly underground, and is important for the silk manufacture. The town is the seat of a prefect, of tribunals of first instance and of commerce, of a chamber of commerce and of a board of trade-arbitrators and has schools of mining, chemistry and dyeing, etc.

The town owes its importance chiefly to the coal basin which extends between Firminy and Rive-de Gier over an area 20 mi. long by 5 mi. wide and is second only to those of Nord and Pas-de-Calais in France. The mineral is of two kinds—smelting coal, said to be the best in France, and gas coal. There are manufactures of ribbons, trimmings and other goods made from silk and mixtures of cotton and silk. This industry dates from the early 17th century and is carried on chiefly in small factories (electricity supplying the motive power). The attendant industry of dyeing is carried on on a large scale. The manufacture of steel and iron and of heavy iron goods such as armour-plating is important. Firearms are manufactured at the national factory under the direction of artillery officers. Private firms make both military rifles and sporting-guns, revolvers, etc. Other industries are the manufacture of elastic fabrics, glass, cartridges, liqueurs, hemp cables, etc. Weaving machinery, cycles, automobiles and agricultural implements are also made.

ST. EUSTATIUS and **SABA,** two Netherlands West Indian islands located respectively 9 mi. and 16 mi. N.W. of St. Kitts. Politically, they are part of the colony of Curacao (*q.v.*). St. Eustatius (area: 7 sq.mi.; pop. 1950, 955) is composed of volcanic hills and intervening valleys. There is an open roadstead off Oranjestad on the west. Saba (5 sq.mi.; pop. 1950, 1,110) is a volcanic cone rising 2,851 ft. from the sea. Its town, Bottom, can be approached from the shore 800 ft. below only by steps in solid rock known as "the Ladder." Some of the best boats in the Caribbean are built there; the wood is imported and the vessels, when completed, are lowered over the face of the cliffs. Many men from both islands are employed as seamen on ships elsewhere, so that women predominate by 50% in Saba and more than 20% in St. Eustatius. Remittances home are an important factor in the islands' economy. (L. W. BE.)

SAINT-EVREMOND, CHARLES DE MARGUETEL DE SAINT-DENIS, SEIGNEUR DE (1610--1703), was born'at Saint-Denis-le-Guast, near Coutances, on April 1, 1610. Hz served through a great part of the Thirty Years' War, distinguishing himself at the siege of Landrecies (1637), when he was made captain. During his campaigns he studied the works of Montaigne and the Spanish and Italian languages. In 1639 he met Gassendi in Paris, and became one of his disciples. He was present at Rocroy, at Nordlingen and at Lerida. For a time he was personally attached to Condé, but offended him by a satirical remark and was deprived of his command in the prince's guards in 1648.

During the Fronde, Saint-Bvremond was a steady royalist. The duke of Candale (of whom he has left a very severe portrait) gave him a command in Guienne, and Saint-Bvremond, who had reached the grade of *maréchal* de camp, is said to have saved 50,000 livres in less than three years. He was one of the numerous victims involved in the fall of Fouquet. His letter to Marshal Créqui on the peace of the Pyrenees, which is said to have been discovered by Colbert's agents at the seizure of Fouquet's papers, seems a very inadequate cause for his disgrace. Saint-Évremond fled to Holland and to England, where he was kindly received by Charles II and was pensioned. After James II's flight to France Saint-Évremond was invited to return, but he declined. Hortense Mancini, the most attractive of Mazarin's attractive group of nieces, came to England in 1670, and set up a salon for love-making, gambling and witty conversation, and here Saint-Évremond was for many years at home. He died on Sept. 29, 1703, and was buried in Westminster abbey.

Saint-Bvremond empowered Des Maizeaux to publish his works after his death, and they were published in London (2 vols., 1705), and often reprinted. His masterpiece in irony is the so-called Conversation du *maréchal d'Hocquincourt* avec le *père Canaye* (the latter a Jesuit and Saint-Evremond's master at school).

His ***Oeuvres mêlées,*** edited from the MSS. by Silvestre and Des Maizeaux, were printed by Jacob Tonson (London, 1705, 2 vols.; 2nd ed., 3 vols., 1709), with a notice by Des Maizeaux. His correspondence with Ninon de Lenclos, whose fast friend he was, was published in 1752; *La Comédie* des *académistes,* written in 1643, was printed in 1650. Modern editions of his works are by Hippeau (Paris, 1852), C. Giraud (Paris, 1865), and a selection (1881) with a notice by M. de Lescure.

ST. GALL, a canton in northeast Switzerland, bordered by the principality of Liechtenstein and by Vorarlberg (Austria). It entirely surrounds the canton of Appenzell, which formerly belonged to the abbots of St. Gall. Five other cantons lie along its north, west and south borders.

Its area is 777.2 sq.mi., of which about 88% are reckoned "productive," forests covering about 165 sq.mi. and vineyards only about 1 sq.mi. The altitude above sea level varies from 1,309 ft. (the Lake of Constance) to 10,667 ft. (the Ringelspitz) in the extreme south. There are nearly 3 sq.mi. of glaciers but slightly over one-quarter of the unproductive area consists of lakes, including portions of the Lake of Constance, of the Wallensee, and of the Lake of Ziirich, together with several small lakes wholly within its limits. The canton is mountainous in the south near its borders with the Grisons and Glarus, but towards Thurgau the surface is characterized by hummocky hill country. Considerable low-lying alluvial plains occur along the courses of the Linth and Rhine, particularly in those sections of the rivers which form, in part, its frontiers on the east and southwest. Within the canton, the most important streams are the upper River Thur and the lower and middle portions of its principal tributary, the Sitter. It has ports on the Lake of Constance (Rorschach) and of Zurich (Rapperswil), while Weesen is the chief town on the Wallensee. Probably the most fashionable watering place is Ragatz, receiving the hot mineral waters (95° F.) of Pfafers by means of a 3 mi. conduit. The main railway lines from Zurich past Sargans for Coire, and from Sargans past Rorschach for Constance skirt its borders, while the capital is on the direct railway line from Ziirich past Wil to Rorschach, and communicates by rail with Appenzell and with towns in the Toggenburg (*q.v.*). In 1930 the population of the canton was 286.362 of whom 279,230 were German-speaking, 4,989 Italian-speaking and 993 French-speaking, while there were 170,445 Catholics, 114,545 Protestants and 704 Jews; in 1950 the population was 309,106. The capital of the canton is St. Gall, population (1950) 68,011; the other most populous places (1950 census) are Rorschach (pop. 11,325), Altstatten (pop. 8,603), Gossau (pop. 8,316) and Wattwil (6,336). In the southern and more Alpine portion of the canton the inhabitants mainly follow pas-

toral pursuits, while in the central and northern regions agriculture is frequently combined with manufactures.

The canton is one of the most industrial in Switzerland. Cotton spinning is widely spread, though the characteristic industry is the manufacture of muslin, embroidery and lace, chiefly at the capital and at Altstatten; the value of the embroidery and lace exported from the canton, though fluctuating, normally amounts to about one-seventh of the total export trade of Switzerland. Ores of iron and of manganese are raised in the Gonzen mine near Sargans. The canton is divided into 14 administrative districts, which comprise 91 communes.

The existing constitution dates from 1890. The legislature (Grossrat) of 174 deputies is elected on the principle of proportional representation. Each commune of 1,500 Swiss inhabitants or less has a right to one member, and as many more as the divisor 1,500 justifies. Members hold office for three years. The seven members of the executive (Regierungsrat) also hold office for three years and are elected by the combined communes. The two members of the federal *Ständerat* are named by the legislature, while the 13 members of the federal Nationalrat have, since 1911, been elected by a scheme of proportional representation, using the popular vote. The right of "facultative referendum" and of "initiative" as to legislative projects has, since 1875 and 1890 respectively, belonged to any 4,000 electors, but in case of "initiative" in constitutional matters (1861) 10,000 must sign the demand. The canton of St. Gall, a great part of which formerly belonged to the abbots of St. Gall, is one of the later political units, having been formed in 1803, from numerous districts, some of which, *e.g.*, Gaster, Uznach and Gams, had been controlled by the adjacent and older cantons since the 11th century.

ST. GALLEN (Fr. **ST. GALE**), capital of the Swiss canton of that name, is situated in the upland valley of the Steinach, 2,195 ft. above sea-level. Its population is almost all German-speaking, while the Protestants and Catholics each comprise about half the population, with a small number of Jews. In 1920 the population was 70,437; in 1930 63,947, and in 1941 62,360, a decrease due partly to World Wars I and II.

St. Gallen owes its origin to St. Gall, an Irish hermit, who in 614, built his cell in the forest which then covered the site, and lived there till his death in 640. About the middle of the 8th century the collection of hermits' dwellings was transformed into a regularly organized Benedictine monastery. For the next three centuries this was one of the chief seats of learning and education in Europe. About 954 the monastery and its buildings were surrounded by walls as a protection against the Saracens, and this was the origin of the town.

In 1311 St. Gallen became a free imperial city, and about 1353 the gilds, headed by that of the cloth-weavers, obtained the control of the civic government, while in 1415 it bought its liberty from the German king Sigismund. This growing independence did not please the abbots, who had been made princes of the Empire in 1204, and there followed a long struggle between them and their rebellious subjects of St. Gallen and Appenzell. In 1411 the Appenzellers became "allies" of the Swiss confederation, as did the town of St. Gallen a few months later, this connection becoming an "everlasting" alliance in 1454, while in 1457 the town was finally freed from the abbot. After further conflicts, the abbot in 1490 concluded an alliance with the Swiss which reduced his position almost to that of a "subject district." The townsmen adopted the Reformation in 1524, and this new cause of difference further envenomed their relations with the abbots. Both abbot and town were admitted regularly to the Swiss diet, but neither succeeded in its attempts to be received a full member of the Confederation. In 1798 and finally in 1805 the abbey was secularized, while out of part of its dominions and those of the town the canton Santis (now St. Gall) was formed, with St. Gallen as capital.

St. Gallen is by rail 9 m. S.W. of Rorschach, its port on the lake of Constance, and 53 m. E. of Zurich. The older or central portion of the town retains the air of a small rural capital, but the newer quarters present the aspect of a modern commercial centre. Its chief building is the abbey church of the celebrated old monastery (dating in its present form from 1756–1765). It has been a cathedral church (Catholic) since 1846. The famous library is housed in the former palace of the abbot, and is one of the most renowned in Europe by reason of its rich treasures of early mss. and printed books. Other portions of the monastic buildings are used as the offices of the cantonal authorities, and contain the extensive archives both of this monastery and of that of Pfafers.

See *Dict.* geogr. de *la Suisse,* vol. iv. (1906).

SAINT-GAUDENS, AUGUSTUS (1848–1907), American sculptor, was born in Dublin, Ireland, on March 1, 1848, the son of a French father, a shoemaker by trade, and an Irish mother, and was taken to America in infancy. He was apprenticed to a cameo-cutter, studying in the schools of Cooper Union (1861) and the National Academy of Design, New York (1865–1866). His earliest work in sculpture, made upon the eve of his departure, in 1868, for Paris, was a bronze bust of his father, Bernard P. E. Saint-Gaudens. After some delay he was admitted as a pupil of Jouffroy in l'École des Beaux-Arts, and two years later, with his fellow-student Mercié, he went to Italy, where he remained three years. While in Rome he executed his statues "Hiawatha" and "Silence." Returning in 1873 to New York he made, the following year, an admirable bust of the statesman, William M. Evarts, and was commissioned by John La Farge to execute a relief of adoring angels for St. Thomas' Episcopal Church, New York, a work which immediately won the esteem of his brother artists. The church was destroyed by fire a few years later. His statue of Admiral Farragut, Madison Square, New York, was ordered in 1876, exhibited at the Paris salon of 1880 and unveiled in 1881. It was received with enthusiasm and from its first appearance Saint-Gaudens was recognized as a new leader in his art. To this period also belong the "Randall" of the "Sailors' Snug Harbour," Staten Island, and the beautiful caryatides for the Vanderbilt fireplace, preserved in the Metropolitan Museum.

At all times throughout his life the sculptor found diversion from more serious tasks in modelling portraits of friends in low relief. Among these we may note the medallions and placques of Bastien-Lepage and Dr. Henry Shiff (1880); Homer Saint-Gaudens and the children of Prescott Hall Butler (1881); Mrs. Stanford White (1884); Robert Louis Stevenson (1887); William M. Chase and the children of Jacob H. Schiff (1888); Kenyon Cox (1889), etc. Yet another form of sculpture was developed in his high-reliefs of Dr. Henry Bellows (1885) and Dr. McCosh (1889); and the lovely "Amor Caritas," which, with variations, long occupied his mind. His noble statue of Lincoln was unveiled in 1887 in Lincoln park, Chicago, and was at once accepted as the country's ideal. In Springfield, Mass., his unique "Deacon Chapin," known as "The Puritan," appeared also in 1887. The Adams memorial (1891) in Rock Creek cemetery, Washington, D.C., is considered by many to be Saint-Gaudens' greatest work; indeed not a few rate it as America's highest artistic achievement. The mysterious draped figure with shadowed face is often called "Grief," but the sculptor had no such intention; "Peace" or "Nirvana" better convey the meaning. The Garfield memorial in Fairmount park, Philadelphia, was completed in 1895. The Shaw memorial in Boston, a monument to Robert G. Shaw, colonel of a negro regiment in the Civil War, was begun in 1884 and occupied the master intermittently for more than 12 years, being dedicated in 1897. It is a large relief in bronze, measuring some 15 by 11 ft., and containing many marching soldiers, led by their young officer on horseback. The year 1897 saw likewise the completion of the "Logan" on a fiery steed, in Grant park, Chicago.

Another famous equestrian statue is the "General Sherman" which was begun in 1892 and dedicated in 1903. Standing at the entrance of Central park at 59th Street and Fifth Avenue, New York, this golden group of the mounted commander led by a beautiful winged "Victory" is one of the most impressive of the city's monuments. The "Sherman" was shown with other works of Saint-Gaudens at the Paris Exposition of 1900, receiving there the highest honours. The sculptor was made an officer of the Legion of Honour and corresponding member of the Institute of

France. A bronze copy of his "Amor Caritas" was purchased by the French Government. Other important works are the Peter Cooper memorial, New York; the "Parnell," in Dublin; the Phillips Brooks monument in Boston and a fine seated figure of Lincoln, recently erected on Chicago's lake front. Saint-Gaudens died at Cornish, N.H., on Aug. 3, 1907. He is rightly regarded as America's greatest sculptor and his work continues to exert a powerful and beneficent influence in the United States. In 1877 he married Augusta F. Homer and left a son, Homer Saint-Gaudens, now director of fine arts of the Carnegie Institute, Pittsburgh, Pa. His brother Louis (1854–1913) also a sculptor, assisted Augustus Saint-Gaudens in some of his creations.

Lewis Hind, *Augustus Saint-Gaudens* (1908); Homer Saint-Gaudens, *The Reminiscences of Augustus Saint-Gaudem* (1913). (L. T.)

ST. GAUDENS, a town of France, capital of an arrondissement in the department of Haute-Garonne, 1 m. from the river Garonne, 57 mi. S.S.W. of Touiouse on the railway to Tarbes. Pop. (1936) 4,684. St. Gaudens derives its name from a martyr of the 5th century. at whose tomb a college of canons was established. It was important as a capital of the Nébouzan. as the residence of the bishops of Comminges and for its cloth industry. The church, once collegiate, dates chiefly from the 11th and 12th centuries, but the main entrance is flamboyant Gothic.

SAINT-GERMAIN, COMTE DE (c. 1710–*c.* 1780) called *der Wundermann, a* celebrated adventurer. Of his parentage and place of birth nothing is definitely known; the common version is that he was a Portuguese Jew. He knew nearly all the European languages, and spoke German, English, Italian, French (with a Piedmontese accent), Portuguese and Spanish. Grimm affirms him to have been the man of the best parts he had ever known. He was a musical composer and a capable violinist. His knowledge of history was comprehensive, and his accomplishments as a chemist, on which be based his reputation, were in many ways real and considerable. He pretended to have a secret for removing flaws from diamonds, and to be able to transmute metals. The most remarkable of his professed discoveries was of a liquid which could prolong life, and by which he asserted he had himself lived 2,000 years.

Saint-Germain is mentioned in a letter of Horace Walpole's as being in London about 1743, and as being arrested as a Jacobite spy and released. Walpole says: "He is called an Italian, a Spaniard, a Pole; a somebody that married a great fortune in Mexico and ran away with her jewels to Constantinople; a priest, a fiddler, a vast nobleman." At the French court, where he appeared about 1748, he exercised for a time extraordinary influence and was employed on secret missions by Louis XV.; but, having interfered in the dispute between Austria and France, he was compelled in June 1760, on account of the hostility of the duke of Choiseul, to remove to England. He appears to have resided in London for one or two years, but was at St. Petersburg in 1762, and is asserted to have played an important part in connexion with the conspiracy against the emperor Peter III. in July of that year, a plot which placed Catherine II. on the Russian throne. He then went to Germany, where, according to the *Mémoires authentiques* of Cagliostro, he was the founder of freemasonry, and initiated Cagliostro into that rite. He was again in Paris from 1770 to 1774, and after frequenting several of the German courts he took up his residence in Schleswig-Holstein, where he and the Landgrave Charles of Hesse pursued together the study of the "secret" sciences. He died at Schleswig in or about 1780–1785, although he is said to have been seen in Paris in 1789.

Andrew Lang in his *Historical Mysteries* (1904) discusses the career of Saint-Germain, and cites the various authorities for it. Saint-Germain figures prominently in the correspondence of Grimm and of Voltaire. *See* also Oettinger, *Graf Saint-German* (1846); F. Bülau, *Geheime Geschichten und räthselhafte Menschen,* Band i. (1850–60); Lascelles Wraxall, *Remarkable Adventures* (1863); and U. Birch in the *Nineteenth Century* (January 1908).

SAINT-GERMAIN, CLAUDE LOUIS, COMTE DE (1707–1778), French general, was born on April 15, 1707, at the Chbteau of Vertamboz. He entered the army, but left France, apparently on account of a duel, and fought in the armies of the elector palatine and the elector of Bavaria. Then, after a brief service under Frederick the Great of Prussia, he joined Marshal Saxe in the Netherlands, and was created a field-marshal of the French army. On the outbreak of the Seven Years' War (1756) he was appointed lieutenant-general, but he fell a victim to court intrigues and professional jealousy. He resigned his commission in 1760 and accepted an appointment as field-marshal from Frederick V. of Denmark, being charged in 1762 with the reorganization of the Danish army. On the death of Frederick in 1766 he returned to France. bought a small estate in Alsace near Lauterbach, and devoted his time to religion and farming. In October 1775 he was appointed minister of war by Louis XVI., but his efforts to effect economies and to introduce Prussian discipline in the French army brought on such opposition that he resigned in September 1777. He died in his apartment at the arsenal on Jan. 15, 1778.

ST. GERMAIN, TREATY OF (*see* also VERSAILLES, TRIANON, and NEUILLY, TREATIES OF). Austria and Hungary had up to 1918 formed a diplomatic unit, but in Oct. 1918 they were virtually two separate states. The Armistice of Nov. 4 still recognized Austria-Hungary as a diplomatic unit, but Austria was proclaimed a Republic Nov. 12, as was Hungary Nov. 16. The Armistice concluded by the Powers direct with Hungary (Nov. 13) recognized that Power's *de facto* independence of Austria.

All the Powers, except the United States, early asserted that the "Fourteen Points," etc., did not apply to the settlements with Austria and Hungary. In Jan. 1919 it was known that even Wilson favoured including in Italy part of the Slovene population of Istria and Carniola, and would make Italy further concessions. On April 14 he agreed to grant Italy the Tirol south of the Brenner Pass, with about 250,000 Germans, as well as the Trentino, as already agreed by France and Great Britain. It was known also that the Czechoslovak State would include over 3,000,000 Germans. Austria was to be reduced to some two-thirds of her German-speaking territories. In mid-April the French Prime Minister Clemenceau obtained from the Allies the further important decision to prohibit union between Austria and Germany without the unanimous consent of the Council of the League. This was embodied in the draft treaty with Germany of May 6, and formed article 80 of the Treaty of Versailles of June 28, appearing as article 88 of the Treaty of St. Germain, and article 72 of the Treaty of Neuilly.

On May 2 the Austrian delegation was invited to Paris. On June 2 they were presented with a very imperfect draft treaty, followed by a more detailed one on July 20. Austria made great protests, turning mainly on two points. She asserted the applicability of the "Fourteen Points" to her case, and her right therefore to retain all her German subjects. President Wilson alone was willing to extend the application of the "Fourteen Points" to Austria; the treaty assigned 3,500,000 Germans to Czechoslovakia, about 250,000 to Italy. The other main point of dispute was how far Austria must accept the responsibilities of old Austria-Hungary. The Allies finally decided that the Austrian Republic was not a new State but an old one lopped off certain outlying provinces and endowed with a new government. The Allies recognized this government *de facto* by accepting their credentials on May 22 and *de jure* on Sept. 10, by signing the treaty with them at St. Germain-en-Laye. It came into force On July 16 1920.

Part I. The Covenant, and Part XIII. Labour, are as in the Treaty of Versailles.

Part II. of the Austrian Treaty details the borders of the new Austrian State.

Part III. Political Clauses for Europe.—This deals with technical details such as the financial obligations of the former Austrian empire affecting Italy, Yugoslavia, Czechoslovakia and Rumania. Articles 49–50 arranged for a plebiscite in two areas of the Klagenfurt basin. This plebiscite, taken in 1920, went in Austria's favour. West Hungary, with about 333,000

souls, was transferred from Hungary to Austria but ultimately, in 1921, without its chief town (see BURGENLAND). Further clauses in Part III dealt with the protection of racial and religious minorities. Article No. 88 prohibits Austria from alienating her independence (*i.e.*, joining Germany) otherwise than with the consent of the Council of the League of Nations.

Part IV. Austrian Interests Outside Europe.—As in the Treaty of Versailles this part provides for a total renunciation of state properties immovable and movable outside Europe, and also of treaties, capitulations, concessions, etc., in the following countries: Morocco, Egypt, Siam and China.

Part V. Military, Naval and Air Clauses followed the general lines of the similar clauses in the Treaty of Versailles but showed somewhat more consideration to Austria. A long-service voluntary force not exceeding 30,000 was allowed. The manufacture of arms, etc., was confined to a single factory (article 132). The naval clauses were very drastic; the whole Austro-Hungarian navy was broken up or distributed among the Allies, Austria only retaining four patrol boats on her inland waters. The air clauses were as in the German treaty.

Part VI. Prisoners of War and Graves, *Part XI.* Aerial Navigation, were as in the German Treaty, with a few very small alterations.

Part VII. Penalties provided for the trial before Allied military tribunals of Austrian offenders against the laws and customs of war. This provision was not executed.

Part VIII. Reparations; *Part IX.* Financial Clauses; *Part X.* Economic Clauses.—By article 177 Austria accepted responsibility for herself and her Allies for causing loss and damage to the Allied (Entente) governments by the war. The rest of the "Reparation Chapter" followed the corresponding section in the German treaty. No lump sum was fixed, but discretion mas, in effect, given to the Reparation commission to fix it. Austria handed over her whole commercial fleet and much livestock to the Allies. Czechoslovakia, Yugoslavia, Poland and Rumania had, however, to contribute to expenses incurred by the Allies in liberating their territory from Austria. The financial clauses involved many complex questions as to the allocation of pre-war debt and the distribution of war debts. All these provisions were somewhat relaxed by the Supreme council on March 17, 1921, and the process was completed by Austria placing her finances under control of the league in Sept. 1922 (see AUSTRIA).

Part XII. Ports, waterways and railways, merely stressed some points in the corresponding section of the German treaty.

See *Treaty Series*, No. II (Cmd. 400 of 1919); also H. W. V. Temperley (ed.), *A History of the Peace Conference of Paris;* vol. iv. and v. (Institute of International Affairs, London, 1921).

ST. GERMAIN-EN-LAYE, a town of northern France, in the department of Seine-et-Oise, 13 mi. W.N.W. of Paris by rail. Pop. (1946) 22,013. Built on a hill on the left bank of the Seine and on the edge of a forest 10,000 to 11,000 ac. in extent, St. Germain has a bracing climate, which makes it a summer residence for Parisians. A monastery in honour of St. Germain, bishop of Paris, was built in the forest of Laye by King Robert. Louis VI built a castle close by. Burned by the English, rebuilt by Louis IX, and again by Charles V, this castle was completed by Francis I. A new castle was begun by Henry II and completed by Henry IV; it was subsequently demolished, except the so-called Henry IV pavilion. The old castle has been restored. James II of England died at St. Germain.

ST. GERMANS, a village in the Bodmin parliamentary division of Cornwall, Eng., on the St. Germans or Lynher creek. 22 mi. E.S.E. of Bodmin by road. Pop. (1951) 2,084. It is an agricultural district with market gardens and quarries and is also a holiday centre. St. Germanus, bishop of Auxerre in France, founded a monastery there in the 5th century and before 931 it was the seat of the Cornish bishopric founded by Athelstan. The see was transferred to Creditou in *c.* 1043 and to Exeter *c.* 1050. In the 12th century a priory of Augustinian canons was established at St. Germans, and the present church of St. Germanus, consecrated in 1261. was built. Mostly the original Norman, it has Early English, Perpendicular and Decorated additions and the east window is by E. Burne Jones. After the suppression of the monasteries the crown retained the borough until 1610. Elizabeth I created it a parliamentary borough and from 1563 until 1832 it returned two members. In the villages of the district, Callington was granted a market in 1267 and the pannier market still exists; Cotehele house, above the Tamar near Calstock, is a beautiful Tudor house (1485–1539) formerly the seat of the Edgcumbe family and given to the National trust in 1947; St. Germans has a row of six gabled almshouses, probably 17th-century work.

ST. GILLES, a town of southern France, in the department of Gard, on the canal from the Rhone to Cette, 12½ mi. S.S.E. of Nîmes by road. Pop. (1946) 4,473. In the middle ages St. Gilles, the ancient *Vallis Flaviana,* was the seat of an abbey founded in the 7th century by St. Aegidius (St. Gilles). It acquired wealth and power under the counts of Toulouse, who added to their title that of counts of St. Gilles. The church was founded 1116. The lower part of the Romanesque front (12th century) has three bays decorated with columns and bas-reliefs. There is a 12th century crypt. St. Gilles was the seat of the first grand priory of the Knights Hospitallers in Europe (12th century) and was their place of embarkation for the east. In 1226 the countship of St. Gilles was united to the crown. In 1562 the Protestants ravaged the abbey, which they occupied till 1622, and in 1774 it was suppressed. The town has an important trade in wines.

ST. GOTTHARD PASS, an important motor and railway route from northern Europe to Italy. It takes its name from St. Gotthard, bishop of Hildesheim (d. 1038), but does not seem to be mentioned before the early 13th century perhaps because the access to it lies through two very narrow Alpine valleys much exposed to avalanches. The hospice on the summit is first mentioned in 1331, and from 1683 onward was in charge of two Capuchin friars. But in 1775 the buildings near it were damaged by an avalanche, while in 1799–1800 everything was destroyed by the French soldiery. Rebuilt in 1834, the hospice was burnt in March 1905. The mule path (dating from about 1293) across the pass served for many centuries. The carriage road was only constructed between 1820 and 1830. Beneath the pass is the St. Gotthard tunnel (pierced in 1872–1880, 9¼ mi. in length, and attaining a height of 3,786 ft.), through which runs the railway (opened in 1882) from Lucerne to Milan (175½ mi.). The railay runs first along the northern and eastern shores of Lake Lucerne, from Lucerne to Flüelen (32¼ mi.), and then up the Reuss valley past Altdorf and Wassen, near which is the first of the famous spiral tunnels, to Goschenen (56 mi. from Lucerne). Here the line enters the tunnel and gains, at Airolo, the valley of

A SECTION OF THE ST. GOTTHARD PASS IN THE FREMOLA VALLEY

the Ticino or the Val Leventina, which it descends, through several spiral tunnels, till at Biasca (38 mi. from Goschenen) it reaches more level ground. Thence it runs past Bellinzona to Lugano (304 mi from Biasca) and reaches Italian territory at Chiasso, 35 mi. from Milan. The railway is now the property of the Swiss Government.

ST. HELENA, an island and British colony in the South Atlantic, 15° 55′ 26″ S., 5° 42′ 30″ W. (Ladder Hill observatory). Area 47.3 sq.mi., extreme length, southwest to northeast, 10½ mi., extreme breadth 6½ mi. The island is wholly of volcanic origin,

the activity being long extinct, while subaerial denudation has greatly modified it and marine erosion has formed perpendicular cliffs 450 to 2.000 ft. high on the east, north and west sides. Its principal feature, a semicircular ridge of mountains, with the culminating summit of Diana's peak (2,704 ft.), is the northern rim of a great crater; the southern rim having been breached hypothetically forms the centre of the ring. From the crater wall outward water-cut gorges stretch in all directions, widening as they approach the sea into valleys, some of which are 1,000 ft. deep. These valleys contain small streams. Springs of pure water are abundant. Along the enclosing hillsides caves have been formed by the washing out of the softer rocks. The lavas are basalts, andesites, trachytes and phonolites; there is much volcanic ash, tuff, scoriae, etc., and conspicuous features are formed by rocks, representing a late period of activity. Such features are Ass's Ears, Lot and Lot's Wife and the Chimney. There are several subsidiary craters. The only practicable landing place is on the leeward side at St. James's bay. From the head of the bay a narrow valley extends for 1½ mi. The greatest extent of level ground is in the northeast of the island, where are the Deadwood and Longwood plains, more than 1,700 ft. above the sea.

Although the island is within the tropics, its climate is healthful and temperate. This is due to the southeast tradewind and to the effect of the cold waters of the South Atlantic current. The temperature varies on the sea level from 68° to 90° F. in summer and 57° to 84° in winter. The higher regions are about 10° cooler. The rainfall varies considerably.

Flora and Fauna. — St. Helena has three vegetation zones: (1) the coast zone. extending inland for 1 mi. to 1½ mi., now "dry, barren, soilless. lichen-coated, and rocky," with little save prickly pears, wire grass and *Mesembryanthemum;* (2) the middle zone (400–1,800 ft.). extending about ¾ mi. inland, with shallower valleys and grassier slopes—the English broom and gorse. brambles, willows. poplars and Scotch pines being the prevailing forms; and (3) the central zone, about 3 mi. long and 2 mi. wide, the home. for the most part. of the indigenous vegetation. Many of the endemic species have become extinct. but by 1955 some of the rarer ones were protected. The indigenous vegetation shows affinities with that of Africa, and its exotic appearance gives the island almost the aspect of a botanic garden; for example, the oak, thoroughly naturalized. grows next to the bamboo and banana. Common trees include the endemic cabbage tree (Senecio), the cedar and the eucalyptus. The New Zealand flax (Phormium) was introduced from that country with great commercial success, and encouragement has been given by the government to the cultivation of lily bulbs (Lilium *longiflorum*).

Besides domestic animals the only land mammals are rabbits, rats and mice, the rats being especially abundant. The only endemic land bird is a small plover called the wirebird, Charadrius sanctae-helenae. Introduced birds now common on the island include the avadavat, Java sparrow, cardinal, ground dove, partridge (the Indian *chukar*), ring-necked pheasant and guinea fowl. Among sea birds are the sooty tern, white-winged tern and noddy. There are no freshwater fish but of 65 species of seafish caught 17 are peculiar to St. Helena; economically the more important kinds are gurnard, eel, cod, mackerel, tunny, bullseye, cavalley, flounder, hogfish, mullet and skulpin.

History. — The island was discovered on May 21, 1502, by the Portuguese João de Nova Castella, on his voyage home from India, and by him named St. Helena. The Portuguese found it uninhabited. imported livestock, fruit trees and vegetables, built a chapel and one or two houses and left their sick there to be taken home, if recovered, by the next ship, but they formed no permanent settlement. Its first known permanent resident was Fernando Lopez, a Portuguese in India, who had turned traitor, and had been mutilated by order of Alphonso d'Albuquerque. He preferred being marooned to returning to Portugal in his maimed condition, and was landed at St. Helena in 1513, with three or four Fegro slaves. By royal command he visited Portugal some time later. but returned to St. Helena. where he died in 1546. In 1584 two Japanese ambassadors to Rome landed at the island. The first Englishman known to have visited it was Thomas Cavendish, who touched there in June 1588 during his voyage around the world. Another English seaman. Captain Kendall, visited St. Helena in 1591, and in 1593 Sir James Lancaster stopped at the island on his way home from the east. In 1603 the same commander again visited St. Helena on his return from the first voyage equipped by the East India company. The Portuguese had by this time given up calling at the island, which appears to have been occupied by the Dutch about 1645. The Dutch occupation was temporary and ceased in 1651, the year before they founded Cape Town. The (British) East India company appropriated the island immediately after the departure of the Dutch, and in 1659 they dispatched a small force of troops and others under John Dutton to form a settlement. The company was confirmed in possession by a clause in their charter of 1661. The fort built by the company was named after the duke of York (James II).

On New Year's day, 1673, the Dutch succeeded in capturing St. Helena. but they were ejected the following May 5 by Sir Richard Munden. By a new charter granted in Dec. 1673 the East India company were declared "the true and absolute lords and proprietors of the island." Thereafter St. Helena was in the undisturbed possession of Great Britain, though in 1706 two ships anchored off Jamestown were carried off by the French. In 1673 the inhabitants had numbered about 1,000, of whom nearly half were Negro slaves. In 1810 the company began to bring in Chinese from their factory at Canton. During the company's rule the island prospered; homeward-bound vessels, numbering hundreds in a year, anchored in the roadstead and stayed for considerable periods refitting and revictualling. Large sums of money were thus expended in the island, where wealthy merchants and officials had their residence. The plantations were worked by slaves, who were subjected to very barbarous laws until 1792, when a new code of regulations ensured their humane treatment and prohibited the importation of any new slaves. Later it was enacted that all children of slaves born on or after Christmas day 1818 should be free, and between 1826 and 1836 all slaves were set at liberty.

Among the governors appointed by the company to rule at St. Helena was one of the Huguenot refugees, Capt. Stephen Poirier (1697–1707), who attempted unsuccessfully to introduce the cultivation of the vine. A later governor (1741–42) was Robert Jenkins (*q.v.*) of "Jenkins' ear" fame. William Dampier visited the island in. 1691 and 1701; Halley's mount commemorates the visit paid by the astronomer Edmund Halley in 1676–78.

In 1815 the British government selected St. Helena as the place of detention of Napoleon Bonaparte. He was brought to the island in October of that year and lodged at Longwood, where he died in May 1821. During this period the island was strongly garrisoned by regular troops, and the governor, Sir Hudson Lowe, was nominated by the crown. After Napoleon's death the East India company resumed full control of St. Helena until April 22, 1834, on which date it was, in virtue of an act passed in 1833, vested in the crown. As a port of call the island continued to enjoy a fair measure of prosperity until about 1870.

Afterward the great decrease in the number of vessels visiting Jamestown deprived the islanders of their principal means of subsistence. When steamers began to be substituted for sailing vessels and when the Suez canal uas opened (1869) fewer ships passed the island and fewer still found it necessary to call. The withdrawal in 1906 of the small garrison, hitherto maintained by the imperial government, was another cause of depression, but during World War I the island was again garrisoned. During the South African War (1899–1902) some thousands of prisoners were detained at St. Helena, which has also served as the place of exile of several Zulu chiefs, an ex-sultan of Zanzibar and others. In 1922 Ascension Island (*q.v.*), up to that time under the care of the British admiralty, was made a dependency of St. Helena. Similarly, Tristan da Cunha (*q.v.*) and the associated islands of Nightingale, Inaccessible and Gough, became dependencies of St. Helena in 1938. The island was of strategic importance in the naval operations of World War II.

Population. — When discovered the island was uninhabited. The majority of the population are of mixed European (British, Dutch, Portuguese), East Indian and African descent. The origi-

nal European settlement was made by John Dutton with a few soldiers and followers sent in 1659 by the (British) East India company to annex the island. Subsequently more soldiers and settlers were sent from England, and their numbers were augmented by members of the crews of ships returning to Europe from the east. From 1840 onward for a considerable period there was an influx of freed slaves of West African origin. The estimated population of the colony proper in 1953 was 4,895, of whom about one-third live at Jamestown, the port and capital. Longwood, where Napoleon died in 1821, is $3\frac{1}{2}$ mi. E. of Jamestown. Most of the population is Anglican in religion. St. Helena is the seat of an Anglican bishopric (within the province of South Africa) established in 1859. Ascension and Tristan da Cunha are in the diocese.

Education is compulsory and is provided free for all children between the ages of j and 1 j years. There were 11 primary schools and 1 secondary school in 1953, and the total number of pupils was 1,223.

Letters patent of 1939 provide for an executive council consisting of the government secretary and the colonial treasurer ex *officio* and such other nominated members as may be approved; and for an advisory council consisting of six persons not holding any office under the crown, two nominees of the friendly societies and one representing the phormium flax industry. The governor makes ordinances, as there is no legislative council, but power is reserved to the sovereign in council to legislate by order. The governor also acts as chief justice.

Economy.— Less than a third of the area of the island is suitable for farming. The principal crops are phormium flax and potatoes. Cattle and sheep are raised—but there is no outside market—and lace making is carried on. Local trade received a severe blow when, with completion of the Suez canal, ships en route from Europe to the orient ceased to call at the island. The principal exports are phormium fibre, tow rope and twine, and small quantities of wool and lily bulbs are sold. St. Helena's ten-year development program (revised 1951) was financed entirely from an allocation of £200,000 under the Colonial Development and Welfare act of 1945. The only banking institution is the government savings bank. Bank of England notes and the coinage of the United Kingdom are legal tender, but South African currency also circulates and is acceptable. The colony's revenue in 1952 was $127,536 and the expenditure £142,022. There is an insular mail steamship service to England and to South Africa, and direct cable communication with Cape Town and Porthcurno, Eng. (for London).

ST. HELENS, a municipal, county and parliamentary borough, Lancashire, England, 12 mi. E.N.E. by road of Liverpool. Pop. (1951) 110,260. Area 12.4 sq.mi. The town's modern development began with the opening of coal mines in the 17th century and was furthered when glass works were started in 1773. It is one of the world's biggest glass-making centres, employing nearly 20,000 workers in the 1950s. The industry is based on field sand found in southwest Lancashire. Other important manufactures include patent medicines, iron and brass foundries, pottery and textiles. There is a trading estate at Parr. St. Mary's church (rebuilt after a fire in 1916) occupies the site of "Sainct Elyn's Chapell" after which the town is named. The Gamble institute houses a technical school and a public library. The town was incorpordted in 1868; became a parliamentary borough in 1885 (returning one member) and a county borough in 1888.

ST. HELIER, capital of Jersey, Channel Islands. About 1150 an abbey was built on an islet in St. Aubin's bay and dedicated to St. Helier, a legendary hermit said to have been martyred on a neighbouring rock. The monks acquired land on the main island opposite and opened a market, around which shops and taverns sprang up. When the court began to meet there on market days, further houses were built. What had been a tiny fishing hamlet became a town, but quite a small one. In 1685 it had only 210 houses.

Its more rapid growth began in the 18th century with the building of the harbour, followed by an inrush of French aristocrats fleeing from the Revolution. Then in modem times came a great invasion of Englishmen fleeing from income tax. It became a busy commercial centre, which by 1951 had 25,360 residents.

In the Royal square, the former market place, where in 1781 the battle of Jersey was fought and the last French invasion defeated, stand the Town church (mainly 14th and 15th century), the Royal court (built 1865), the public library (1886) and the States' chamber (1887), while Fort Regent (1815) frowns down from the hill above. On another hill Victoria college (1852), a public school with 330 boys, commemorates a visit of Queen Victoria.

The abbey fell into ruins after the Reformation and was replaced in Elizabeth's reign by Elizabeth castle. Its first governor was Sir Walter Raleigh. There Charles II took refuge twice during the civil wars. (See also CHANNEL ISLANDS and JERSEY.)

(G. R. B.)

BIBLIOGRAPHY.—G. R. Balleine, *The Bailiwick of Jersey* (London, 1951); E. T. Nicolle, *The Town of St. Helier* (Jersey, 1931); N. V. L. Rybot, *The Islet of St. Helier and Elizabeth Castle* (Jersey, 1951).

ST. HUBERT, a small town of Belgium in the province of Luxembourg and in the heart of the Ardennes. Pop. (1939) 3,02 j. Its abbey church contains the shrine of St. Hubert, and has an annual pilgrimage. According to tradition the church and a monastery attached to it were founded in the 7th century by Plectrude, wife of Pippin of Herstal. The second church was built in the 12th century, but burned in the 16th century. The present building has been restored in modern times and presents no special feature. The spot where St. Hubert is supposed to have met the stag with the crucifix between its antlers is about 5 mi. from the town. St. Hubert is the patron saint of huntsmen.

ST. HYACINTHE, a city and port of entry of Quebec, Canada, and capital of St. Hyacinthe county, 50 mi. E.N.E. of Montreal, on the Yamaska river and on the Canadian National railway. Pop. (1951) 20,236. It is the seat of a Roman Catholic bishop and contains a classical college, a technical school, a dairy school, two monasteries and several other educational and charitable institutions. Manufactures include organs, leather. shoes, silks, furniture, woollens and mill machinery. The city is a distributing centre for the surrounding district.

ST. IMIER, a town in the west of the canton of Berne, Switz., on the railway from Biel to La-Chaux-de-Fonds. It lies at the foot of Mont Soleil (4,240 ft.), which is ascended by a funicular railway. It is the centre of the watchmaking industry, a health resort, and a place for winter sports. The inhabitants, (1950) 5,972, are French-speaking and generally Protestant.

SAINTINE, JOSEPH XAVIER (1798–186j), French novelist and dramatist, whose real surname was BONIFACE, was born in Paris on July 10, 1798. In 1823 he produced a volume of poetry in the manner of the Romanticists, entitled *Poèmes,* odes, *et épîtres.* In 1836 appeared *Picciola,* the story of the comte de Charney, a political prisoner in Piedmont, whose reason was saved by his cult of a tiny flower growing between the paving stones of his prison yard. This story is a masterpiece of the sentimental kind and has been translated into many European languages. Saintine also wrote a great number of plays.

Saintine died on Jan. 21, 186 j.

ST. IVES, a municipal borough and fishing port in the St. Ives parliamentary division of Cornwall, Eng., 20 mi. N.E. of Land's End and 8 mi. N. by E. of Penzance by road. Pop. (1951) 9,051. Area 6.7 sq.mi. It lies on the north coast, its little harbour sheltered from the Atlantic by The Island, a strip of land running out to a granite knoll. The picturesque old town, with its winding streets and colour-washed stone cottages housing fishermen and artists, with their boats, clusters along this strip and round the harbour; the ground rises steeply behind, and to the southeast a modern residential quarter extends around the sandy bay for about $2\frac{1}{2}$ mi. to Carbis Bay. Fishing and tin-mining were important until the late 19th century when pilchards ceased to visit the waters and many miners emigrated. The beautiful sandy beaches and

the mild climate inspired the inhabitants to make St. Ives a holiday centre, and this trade has superseded the others.

The name St. Ives commemorates St. Eia, a 5th-century woman missionary who, according to tradition, floated over from Ireland on a leaf (coracle) and was later martyred. The present church of St. Ia is of the 15th century with a noble tower. Perkin Warbeck was proclaimed King Richard IV when he anchored in St. Ives bay in 1497. In 1639 a charter of incorporation was granted with provision for four fairs annually, tao weekly markets and a grammar school, but as the town declared for parliament in the Civil War its charter was withdrawn by Charles II. The present charter was granted in 1690. The guildhall was completed in 1940.

ST. IVES, a market town and municipal borough in Huntingdonshire, England, mainly on the left bank of the Ouse, 6 mi. E. of Huntingdon. Pop. (1961) 4,076. Area 3.3 sq.mi. The river is crossed by a 15th-century bridge with a chapel over the centre pier that was restored in 1689. The church of All Saints is Perpendicular, with earlier portions and a rebuilt spire. Oliver Croinwell lived in Old Slepe hall (demolished 1848) for five years, and his statue stands in the market place, the centre of the town. St Ives was noted for its eight-day fair beginning on Monday in Easter week. granted to the abbot of Ramsey by Henry I. In the reign of Henry III merchants from Flanders came to the fair, uhich had become so important that the king granted it to be continued beyond the eight days if the abbot agreed to pay a fee of £50 yearly for the extra days. The fair, with a market on Monday granted to the abbot in 1286. survives and was purchased by the town in 1874, the year of incorporation, from the duke of Manchester. The markets, extremely important to St. Ives as an agricultural centre. were substantially altered to give greater facilities for auction sales The Norris library and museum. opened in 1933, is mainly devoted to books and collections relating to the county.

SAINT JEAN (ST. JOHNS), the county seat of St. Jean county, Que.. Can.. 20 mi. S.E. of Montreal and on the west bank of the Richelieu river. Pop. (1961) 26,988, of which over 88% was French-speaking. Fort St John was established on the site in 1748. Later the city uas important as a trading centre on the canal system which connected Sorel. on the St Lawrence below Montreal, to Lake Champlain and thence to the Hudson river in New York state, and as the terminus of the first railway in Canada from Montreal. Its excellent location in respect to rail, road and canal routes. markets and available labour force, helped to maintain it as an important commercial and industrial centre Manufacturing is important, the principal products being sewing machines, ribbons, wooden articles, bricks, textiles and metallurgical products. (W. F. Ss)

ST. JEAN-DE-LUZ, a coast town of southwestern France, in the *département* of Basses-Pyrénées, at the mouth of the Nivelle, 14 mi. S.W. of Bayonne on a branch of the Southern railway. Pop (1954) 8,476. From the 14th to the 17th century St. Jean-de-Luz enjoyed a prosperity due to its mariners and fishermen. Its vessels were the first to set out for Newfoundland in 1520 In 1558. the Spaniards attacked and burned the town In 1627, houever. it was able to equip 80 vessels, which succeeded in saving the island of RC from the duke of Buckingham In 1660 the treaty of the Pyrénées was signed at St. Jean-de-Luz. At that time the population numbered 15,000. The cession of Newfoundland to England in 1713, the loss of Canada, and the silting-up of the harbour contributed to the decline of the town's maritime trade. St. Jean-de-Luz is situated in the Basque country on the bay of St. Jean-de-Luz, the entrance to which is protected by breakuaters and moles. It has a 13th-century church, the chief features of uhich are the galleries in the nave, which, by the Basque custom, are reserved for men.

ST. JOHN, OLIVER (c. 1598–1673), English statesman and judge, was the son of Oliver St. John of Cayshoe, Bedfordshire, and great-grandson of the first Lord St. John of Bletso. He was educated at Queens' college. Cambridge, and was called to the bar in 1626. He got into trouble with the court over a seditious publication and became closely associated with the future parliamentary leaders. He was employed as a lawyer by the earl of Bedford and was a member of the Providence Island company with the earl of Warwick, Lord Saye and John Pym. In 1637, as counsel for John Hampden, he made a notable speech defending Hampden's refusal to pay ship money. In 1638 he married, as his second wife. Elizabeth Cromwell, a cousin of Oliver Cromwell, to whom his first wife also had been distantly related. The marriage led to an intimate friendship with Cromwell. St. John was member for Totnes in both the short and the long parliament, uhere he acted in close alliance with Bedford, Hampden and Pym and led the attack on ship money (*q.v.*). In 1641. with a view of securing his support, the king appointed St. John solicitor general. Nonetheless he took an active part in promoting the impeachment and attainder of the earl of Strafford and in preparing other bills brought forward by the popular party in the commons.

During the civil war St. John gradually became a recognized leader of the Independents and in the quarrel betueen the parliament and the army in 1647 he sided with the latter. Throughout he enjoyed Cromwell's confidence.

In 1648 St. John was appointed chief justice of the common pleas. He refused to act as one of the commissioners for the trial of Charles I. In 1651 he went to The Hague on an unsuccessful mission to negotiate a union between England and the Netherlands. In the same year he was sent with other commissioners to settle the government of Scotland and to prepare the way for its union with England Otherwise, during the Commonaealth and Protectorite he largely confined himself to his judicial duties, having no great sympathy for the new order. After the Restoration he published an account of his past conduct (*The Case of Oliver St* John, 1660), which saved him from any more severe vengeance than exclusion from public office. He retired to his house in Northamptonshire till 1662, when he went to live abroad. He died on Dec. 31, 1673.

SAINT JOHN, the capital of St. John county and the largest city in New Brunswick. Can. Pop. (1961) city, 55.153; metropolitan area, 95,563.

Situated on a rocky peninsula at the mouth of the St. John river, the city has enjoyed importance as a port and as the gateway to the vast timber resources of the St. John river valley. The sheltered harbour has a depth of 32 ft. at low tide and 58 to 60 ft. at high tide, and is ice-free throughout the year. The river enters the harbour through a narrow rock gorge. making a 17-ft. descent to the ocean at low tide. At slack tide ships may pass through the gorge. With the rising tide ocean waters force themselves upstream, giving rise to the phenomena called the "reversing falls." (See also FUNDY, BAY OF.)

The site was visited in 1604 by Sieur de Monts and Champlain, but it was not until 1635 that Charles de la Tour established a trading post called Fort St. Jean, a fortification which was subsequently renamed, abandoned and rebuilt several times. In 1713 Acadia was ceded to England and in 1758 Col Robert Monckton refortified the site, calling it Fort Frederick. In 1783 a large body of United Empire Loyalists landed at Saint John, establishing Parr Tonn on the peninsula and Carleton across the harbour. By royal charter in 1785 the two areas became the city of Saint John the oldest incorporated city in present-day Canada.

Under protective British tariffs the city flourished during the early and middle 1800s. Wooden shipbuilding was a major industry and the lumber and fish trades boomed. Railway connections nith Moncton were completed in 1860, and in 1890 with Montreal via the Canadian Pacific railnay's "short line" through the state of Maine. The city's growth was checked by the disastrous fire in 1877 and by the decline of the lumber trade and wooden ships in the late 1800s.

The city is an important distributing centre and a major Canadian winter port A pulp and paper plant, oil and sugar refineries. a large brush factory. a large dry dock and a variety of light manufacturing industries are located in the area. The municipal airport gives connections with Halifax and hlontreal, and there is regular boat service across the Bay of Fundy to Digby, Nova Scotia. (C. W. Rn.)

SAINT JOHN ISLAND, the smallest (20 sq.mi j of the Virgin Islands (*q.v.*) purchased by the United States from Denmark in 1917. It was discovered by Columbus. Nov. 17, 1493. The fierce aboriginal Carib Indians were exterminated. but th

island was not settled until 1717 by planters from Saint Thomas Island (*q.v.*), 4 mi. E. In 1733 the population consisted of 208 whites and 1,087 slaves. The latter launched a formidable insurrection on Nov. 13, 1733 that was not crushed until July 1734. Denmark emancipated the slaves in 1848. The predominantly Negro population (1960, 923) is concentrated in the two settlements: Cruz bay and Coral bay (the best harbour refuge in the West Indies) at the western and southeastern ends of the island respectively.

Some cattle are raised and bay leaves (for bay rum) gathered from the forest around Bordeaux mountain (1.277 ft.).

The Caneel Bay Tourist development and the preservation of a large part of this mountainous island by the United States national park service serve to attract an increasing number of tourists.

(R. W. LN.)

ST. JOHN OF JERUSALEM, KNIGHTS OF THE ORDER OF THE HOSPITAL OF, known also later as the KNIGHTS OF RHODES and the SOVEREIGN ORDER OF THE KNIGHTS OF MALTA. The history of this order divides itself naturally into four periods: (1) from its foundation in Jerusalem during the first crusade to its expulsion from the Holy Land after the fall of the Latin kingdom in 1291; (2) from 1309–1310, when the order was established in Rhodes, to its expulsion from the island in 1522; (3) from 1529 to 1798, during which its headquarters mere in Malta; and (4) its modern development, as reconstituted after its virtual destruction in 1798.

Early **Development.**—Ever since Jerusalem became a centre of Christian pilgrimage. a hospital or hospice for pilgrims had existed there; and early in the 11th century one of these was restored, served by Benedictines and later dedicated to St. John the Baptist. When, in 1099, the crusaders surrounded the Holy City, the head of this hospital was a certain Gerard who is said to have assisted them during the siege. After the capture of the city he used his popularity to enlarge and reconstitute the hospital and adopted for his order the Augustinian rule. Donations and privileges were thereafter showered upon the new establishment in both Syria and Europe. In 1113 Pope Paschal II took the order and its possessions under his immediate protection (bull of Feb. 1 j to Gerard). his act being confirmed in 1119 by Calixtus II and subsequently by other popes. Gerard was indeed, as Pope Paschal called him. the institutor of the order, if not its founder. It retained, however, during his lifetime its purely eleemosynary character. The armed defense of pilgrims may have been part of its functions, but its organization as an aggressive military force was the work of Raymond du Puy who succeeded as grand master on the death of Gerard (Sept. 3, 1120). The statesmanlike qualities of Raymond rendered his long mastership epoch-making for the order; and from 1137, when the knights accepted custody of the newly fortified castle of Bait Jibrin, they took a regular part in the wars of the Cross. During the second crusade Raymond was present at the council of the leaders held at Acre in 1148, which resulted in the ill-fated expedition against Damascus. The failure at Damascus was repaired five years later by the capture of Ascalon (Aug. 1153), in which the grand master and his knights had a conspicuous share.

Meanwhile. in addition to its ever-growing wealth, the order had received from successive popes privileges which rendered it, like the companion order of the Temple, increasingly independent of and obnoxious to the secular clergy. During the 30 years of Raymond's rule the hospital, which Gerard had instituted to meet a local need. had become universal, and establishments were formed east and west. After Oct. 1158, when his presence is attested at Verona, this master builder of the order disappears from history; he died some time between this date and 1160 when the name of another grand master. Gilbert d'Assailly, appears.

Organization of the Order.—The rule of the hospital, as formulated by Raymond du Puy, was based upon that of the Augustinian canons (*q.v.*). Its further developments, of which only the salient characteristics can be mentioned here. were closely analogous to those of the Templars (*q.v.*), whose statutes regulating the life of the brethren. the terms of admission to the order. the maintenance of discipline and the scale of punishments, culminating in expulsion are, *mutatis mutandis,* closely paralleled by those of the Hospitallers.

Within the order were the three classes of knights, chaplains and serving brothers. The dominant class was that of the knights, in whose hands lay all power within the order. At its head was the master who held office for life. His powers were limited only by the statutes and customs and by the chapter general which, however. mas only an occasional body summoned by himself. He was assisted in the exercise of his authority by the great officers of the order—prior, preceptor, marshal, hospitaller. drapier and treasurer—to whom were added. shortly after 1300, the turcopolier and admiral. The unit of provincial administration was the priory (England constituted one. while in Italy there were seven), and within each of these there mere a number of commanderies (there were 36 in England at the end of the middle ages). As the order increased in size, the brethren came to be grouped in nations or tongues, and in the 14th century the division of the order into its seven tongues (Provence, Auvergne, France. Italy, Spain. England, Germany) was a recognized feature of its constitution. One of the great officers was placed at the head of each tongue; priories and commanderies were reserved for the brethren of the tongue concerned. and disputes were settled within the assembly of the tongue. From the later middle ages the Hospitallers were rather a federation of national societies than a united cosmopolitan order.

In two important respects the knights of St. John differed from the Templars. The latter were a purely military organization; the Hospitallers, on the other hand. were at the outset preponderatingly a nursing brotherhood. and though this character was subordinated during their later period of military importance. it never disappeared. It continued to be a rule of the order that in its establishments it was for the sick to give orders. for the brethren to obey. The chapters were largely occupied with the building. furnishing and improvement of hospitals, to which were attached learned physicians and surgeons who had the privilege of eating with the knights. The revenues of particular properties were charged with providing luxuries (*e.g.*, white bread) for the patients, and the various provinces of the order with the duty of forwarding blankets, clothes, wine and food for their use. The Hospitallers. moreover, encouraged the affiliation of women to their order. which the monastic and purely military rule of the Templars sternly forbade.

The Knights in Syria.—As the wealth and military resources of the orders grew, so did their influence in the affairs of the Latin states. The military feudal class among the Syrian Franks had never been sufficiently numerous to ensure effective settlement, and it was continuously impoverished by a variety of causes. As a result the orders acquired castles which lay magnates could no longer afford to maintain. and with the buildings the knights secured the appurtenances—lands and rights over tenants. The Hospitallers acquired Bait Jihrin in 1137, Krak (Crac) des Chevaliers and an extensive border area to the north and east in 1142, Arca and Jebel Xkkar in 11 jo. Chastel Ruge in 1177 and Margat, which later became the headquarters of the order, in 1186. To this extent the military orders were replacing the feudal aristocracy as landlords. It was a change in the balance of power which weakened the monarchy of Jerusalem, for the orders were not bound to the king by the same ties of allegiance as were the feudatories.

The role which the orders were enabled to play in the affairs of the kingdom was reflected in events. The Templars refused to take part in invasions of Egypt led by King Amalric I. but the Hospitallers encouraged the project, supplied the king with an important contingent of his army and bargained with him for the price of that support almost as an independent power. In the problems of regency and succession which followed the death of Amalric in 1174, the masters of the military orders emerged as figures of the first importance, and when Baldwin V died in 1185 all the castles of the kingdom were given into their custody.

These problems weakened the kingdom at a time when Saladin's power was advancing and prepared the way for the disasters of 1187: the annihilation of the Christian army at Hattin and the loss of Jerusalem (see CRUSADES). The Hospitallers played a full

part in the vain military effort to avert these defeats. After Hattin, Saladin spared the lives of nearly all his prisoners except the Templars and Hospitallers whom he massacred in cold blood. This uncharacteristic act is a measure of the respect in which the knights were held by the Moslems. The Hospitallers were again prominent in the ensuing third crusade and especially distinguished themselves in King Richard of England's victory at Arsuf (1191). During the following decade there was a steady development of the property and privileges of the order.

During the 13th century the Latin states in Syria were less securely established than they had been during the 12th century: the settlement grew progressively weaker until, with the loss of Acre in 1291, it was finally extinguished. The authority of the monarchy was compromised by the succession of women and by the civil war provoked by the conduct of the emperor Frederick II in Syria and Cyprus, and was never subsequently resurrected. The way was left clear for certain groups, such as Baronial families, Italian merchant communities and the military orders, to follow their particular interests unchecked by higher authority.

In this way the Hospitallers played a part in weakening Latin Syria. They were engaged in frequent disputes with diocesans and with the Templars. From 1199, in opposition to the Templars, they supported an Armenian claimant to the principality of Antioch and were not reconciled to its prince Bohemund IV until 1231. They held aloof from the efforts of Frederick II to recover Jerusalem. In 1240–41 they and the Templars gave differing advice to the crusaders Thibaut IV of Champagne and Richard of Cornwall in their efforts to negotiate a truce with the Moslems. The two orders again took different sides in the war between the Venetians and Genoese which devastated Acre between 1256 and 1258. In 1236 it had come to the attention of Pope Gregory IX that, in pursuance of their own private quarrels, the knights were contemplating alliance with the sect of the Assassins, and he sternly rebuked them both on this account and because of their backsliding from the ideals of their order *(see* his letters translated in E. J. King's *The Knights Hospitallers in the Holy Land,* pp. 234–236).

It must be emphasized that in these respects the knights were no worse than their contemporaries in Syria and that there is another side to the picture. The order was to the fore in all the major attacks made on the Moslems during the 13th century. It played a distinguished part in the invasions of Egypt by the forces of the fifth crusade in 1218–21 and by those of St. Louis in 1249–50. It joined the expeditions led by Andrew II of Hungary (1217) and by Thibaut of Champagne (1239). It maintained the great strongholds of Krak and Margat, which up to their loss (1271 and 1285 respectively) continued to serve as bulwarks against Moslem attack and as bases from which Christian raids were organized. The order accepted the custody of the exposed city of Ascalon in 1243 and that of the fortified monastery on Mount Thabor in 1257. At all times it spared neither men nor resources to hold the Moslems at bay.

In the years 1258–60 there were signs of the military orders composing their differences, but it was already too late. In 1260 Bibars, the Mameluke sultan of Egypt, was already free from the Tatar threat, and in 126j he began the series of conquests which culminated in the fall of Acre in 1291 and in the expulsion of the Franks from Syria. The headquarters of the order were moved to Cyprus. Under a great, master Guillaume de Villaret, the order was drastically reformed by a series of statutes between 1301 and 1304. In 1309 a new chapter in its history began when the knights conquered Rhodes from the Byzantines: the order was to rule that island as a sovereign power for more than two centuries.

The Knights in **Rhodes.**—The character and aims of the order were profoundly affected by their newly acquired sovereignty. The Hospitallers ruled an island too narrow to monopolize their energies but occupying a position of vast commercial and strategic importance. Close to the Anatolian mainland, commanding the outlet of the archipelago and lying in the direct trade route between Europe and the east, Rhodes had become the chief distributing point in the lively commerce which. in spite of papal objections, Christian traders maintained with the Moslem states; the Hospitallers were thus divided between their duty as sovereign, which was to watch over the interests of their subjects, and their duty as Christian warriors. which was to combat the infidel. In view of the fact that the crusading spirit was everywhere declining. it is not surprising that their policy was henceforth directed less by religious than by political and commercial considerations. Not that they altogether neglected their duty as protectors of the Cross: they became a naval power and maintained a fleet of galleys until the loss of Malta; their consuls in Egypt and Jerusalem watched over the interests of pilgrims; their hospitals were still maintained for the service of the sick and the destitute. But, side by side with this, secularization proceeded apace; even toward the infidel the attitude of the knights was necessarily influenced by the fact that their supplies of provisions were mainly drawn from the Moslem mainland. By the 15th century their crusading spirit had grown so weak that they even attempted to negotiate a commercial treaty with the Ottoman sultan; the project broke down on the refusal of the knights to accept the sultan's suzerainty.

Throughout its occupation of Rhodes. the hospital was always ready to give all possible support to any major attack on the Moslems. In 1344 its galleys took part in the conquest of Smyrna, a town which the knights continued to hold until 1402. They contributed to the force that Peter I of Cyprus led to the temporary capture of Alexandria in 1365. A contingent was at the disaster of Nicopolis in 1396. They showed courage and great military skill in defending Rhodes. In 1440 and 1444 they repelled attacks launched from Egypt. In 1480 the garrison, commanded by the grand master Pierre d'Aubusson, held at bay an Ottoman fleet and army. A still greater attack was mounted in 1522 by Suleiman the Magnificent. Reinforcements failed, the Christian powers sent no assistance. and the knights capitulated! withdrawing with all the honours of war to Crete.

Their occupation of Rhodes had postponed for about two centuries the appearance of the Ottomans as a first-rate naval power in the Mediterranean, a debt which Europe never sufficiently acknowledged. When the emperor Charles V received news of the final siege he exclaimed: "Kothing in the world has been so well lost as Rhodes!" He would give no help in the plans for its recovery. but instead he gave to the hospital the Island of Malta and the fortress of Tripoli.

The Knights in Malta.—The settlement of the Hospitallers in Malta was contemporaneous with the Reformation, which profoundly affected the order. In England the refusal of the grand prior and knights to acknowledge the royal supremacy led to the confiscation of their estates by Henry VIII, and though not formally suppressed, the English organization practically ceased to exist. The knights of Malta, as they came to be known. nonetheless continued their vigorous warfare. In 1550 they defeated the redoubtable corsair Dragut, but in 1551 their position in Tripoli, always precarious, became untenable and they capitulated to the Turks and concentrated their forces in Malta. On May 18. 1j65, the Ottoman fleet appeared off the island and one of the most famous sieges in history began. It was ultimately raised in September on the appearance of a large relieving force dispatched by the Spanish viceroy of Sicily, after 25,000 of the enemy had fallen. The memory of the grand master Jean Parisot de la Vallette, the hero of the siege, who died in 1j68, is preserved in the city of Valletta which was built on the site of the struggle.

In 1571 the knights shared in the victory of Lepanto. This crowning success, however. was followed during the 17th century by a long period of depression due to internal dissensions and culminating during the Thirty Years' War! the position of the order being seriously affected by the terms of the peace of Westphalia (1648). The character of the order at this date became more exclusively aristocratic, and its wealth, partly acquired by commerce and partly derived from the contributions of the commanderies scattered throughout Europe, was enormous. The wonderful fortifications. planned by French architects and improved by every grand master in turn, the magnificent churches, chapels, *auberges* and the great library founded in 1650 were the outward and visible signs of the growth of a corresponding luxury in the private life of the order. Nevertheless, under Ramon Perellos

(1697–1720) and Antonio Manoel de Vilhena (1722–36), the knights restored their prestige in the Mediterranean by victories over the Turks. In 1741 Emmanuele Pinto, a man of strong character, became grand master. He expelled the Jesuits, resisted papal encroachments on his authority and, refusing to summon the general chapter, ruled as a despot. Emanuel, prince de Rohan (d. 1797), who was elected grand master in succession to Francisco Jimenes de Texada in 1775, made serious efforts to revive the old spirit of the order. The last great expedition of the Maltese galleys was worthy of its noblest traditions: they were sent to carry supplies for the sufferers from the great earthquake that destroyed Messina in 1783. They had long ceased to be effective fighting ships and survived mainly as gorgeous state barges in which the knights sailed on ceremonial pleasure trips.

The French Revolution was fatal to the order. Rohan made no secret of his sympathy with the losing cause in France, and Malta became a refuge-place for the *émigrés*. In 1792 the vast possessions of the order in France were confiscated; six years later the Directory resolved on the forcible seizure of Malta itself. When Napoleon occupied the island on his way to Egypt in 1798 the grand master Ferdinand von Hompesch organized no resistance, and the knights' long rule of the island came to an end. With this the history of the order of St John practically ends

The Order in Modern Times.—After their expulsion from Malta, the knights ceased to be a territorial power and lost their *raison d'être* as a military order. After 1814 Malta was retained by the British, and subsequent French expansion into North Africa extinguished the Barbary corsairs. But the order continued to exist, although much reduced in size, and to fulfil the original purpose of its founder. Since its first beginnings it had never ceased to serve the poor and sick, and from the early 19th century the order, in all its forms has continued to discharge this Christian work in accordance with its own splendid tradition.

After establishing itself temporarily, first at Catania and then at Ferrara, the order moved to Rome in 1834, where its headquarters remained. The pope, as first superior of the order. appointed a grand master in 1801, but between 1805 and 1879 appointed only lieutenant masters. But the renown gained by the order in the relief of suffering was such that in 1879 the pope re-established the mastership. The third of the restored line. Prince Ludovico Chigi della Rovere Albani, died in 1951. The order, organized into the Italian and German tongues, still retained certain diplomatic privileges and at mid-20th century had accredited representatives with five governments, including that of Spain.

In addition, there remained two orders of St. John of Jerusalem of Protestant origin. During the Reformation in Germany the master and knights of Brandenburg adopted the new religion. They remained divided from the main order, but joined with it again in 1763. This bailinick of Brandenburg was suppressed in 1810, but it was restored by the king of Prussia 43 years later. It was not recognized by the order in Rome. but continued as an independent Protestant body. It supports a number of hospitals in Germany and in many respects provided a model for the second Protestant order. that in England.

The grand priory of England, like other religious orders in that country. came to an end as a result of the religious settlement of Henry VIII and Elizabeth I. The grand masters in Malta continued to appoint titular grand priors of England, but the order had neither roots nor property there Its restoration in the 19th century was due to the initiative taken by the French knights, whose organization was temporarily revived between 1814 and 1848. The Greek War of Independence raised hopes that the order might regain Rhodes; English support was needed and as a means to this end the French worked for the revival of the English priory, so that in 1831 Sir Robert Peat became prior of the Venerable Tongue of England. The English knights hoped to become a Protestant branch of the main order, but the lieutenant masters in Rome ruled that Protestants could not he admitted. and in 1858 the English knights proclaimed themselves an independent order. By its constitution of 1871 (which subsequently was little amended) it became the Order of St. John of Jerusalem in England under the headship of its own prior. Between 1861 and 1888 that office was held by William Drogo Montagu, seventh duke of Manchester, and during that period the philanthropic work of the order assumed the modern forms: the life saving medal was instituted in 1874; the ophthalmic hospital was founded in Jerusalem in 1882; and the St. John's Ambulance brigade followed in 1888, growing from an association which the order had founded ten years earlier. Also in 1874, the order acquired the site and remains of the priory at Clerkenwell which had been the headquarters of the Hospitallers in England from the 1140s until 1559. It became an imperial order, incorporated by royal charter as the Order of the Hospital of St. John of Jerusalem in the British realm. The reigning monarch is its sovereign head, and it has subordinate commanderies in certain of the dominions. From 1888 the prince of Wales (after 1901 King Edward VII) was its grand prior, until in 1910 that office was assumed by Arthur duke of Connaught. The British order added to its lustre by outstanding work in the medical field in World Wars I and II.

ST. JOHN RIVER, the largest river in New Brunsmick, Can., discovered by De Monts and Champlain in 1604, and named after St. John the Baptist. It is 418 mi. long and drains a basin of 21,600 sq.mi., of which 14.000 are in the provinces of New Brunswick and Quebec, and the remainder in the state of Maine. The river rises in northwestern Maine and flows northeasterly to the New Brunswick border from whence it gradually turns southeastward and for 80 mi. forms the international boundary. Just above Grand Falls the river enters Canada and flows through New Brunswick into the Bay of Fundy at Saint John. The lower 81 mi. are tidal and navigable for large steamers as far as Fredericton. Hydroelectric power development totaled 213,000 hp. in 1556 (170.000 hp. at Grand Falls and Beechwood on the St. John; the remainder on its tributaries, the Tobique, Aroostook and Madawaska rivers). (C. W. RD.)

ST. JOHN'S, the provincial capital of Newfoundland. Can., lies on the east coast of the island and is the most easterly city of the North American continent. The city's population in 1961 was 55,153 and that of the metropolitan area was 95,563. The people of St. John's are almost entirely of Irish and English origin. Nearly half are adherents of the Roman Catholic Church and the remainder belong to several Protestant churches, chiefly the Anglican and the United Church of Canada.

The city stands on the steep, western slope of its excellent landlocked harbour which opens suddenly in the lofty coast. The entrance, known as The Narrows, guarded by Signal hill (500 ft.) and South Side hills (620 ft.), is about 1,400 ft. wide, narrowing to 600 ft. between Pancake and Chain rocks.

At an early date the harbour of St. John's was recognized as one of the most outstanding in this part of North America and was used as a haven for fishing vessels. The earliest allusion to the name St. John's was in a letter written in 1527 by an English ship captain who mentioned that he had stopped at the harbour called "St. John's" (from St. John the Baptist) and found Norman, Breton and Portuguese ships anchored there. In early years settlement was discouraged by the English government in order to protect the fishery for the exploitation of the home fishermen (see NEWFOUNDLAND: *History*) and permanent settlement was not established until the beginning of the 17th century. In spite of this delay, St. John's is one of the oldest cities in North America. During its history frequent conflagrations swept through the town, destroying extensive areas.

St. John's occupies a most important position in the economic and cultural life of the province. Within the economic structure of Newfoundland the city is outstanding in retail and wholesale trade and is important also in service trade and performs a promi-

nent role in transportation. Its substantial and varied commodity exchanges in the shipping trade are especially noteworthy. It is the major terminal point for rail, highway and air transportation systems. (C. N. F.)

ST.-JOHN'S-WORT, any low, shrubby plant of the genus *Hypericum* of the St.-John's-Wort family (Hypericaceae), having usually yellow flowers, and opposite, often stalkless leaves that are dotted with transparent glands. Of over 300 species, widely distributed in temperate and tropical regions, more than 40 are found in the United States, chiefly in the eastern part. Among them are some cultivated for their showy flowers: *H. frondosum (aureum),* H. *densiflorum* and H. *prolificum,* all from the eastern and southeastern states.

Over 50 species, mostly of Eurasian origin, are cultivated in British gardens. especially H. *perforatum* and the tutsan (H. *androsaemum*), both once widely used in medicine. Aaron's-beard, the rose of Sharon (H. *calycinum*) from the Mediterranean region, is naturalized in Great Britain and has evergreen leaves and very showy yellow flowers. Mostly perennials, all are easily grown from seed in any ordinary garden soil, preferably in a shady situation; in the U.S. many species are hardy north to New York and New England. (N. TR.)

SAINT JOSEPH, a city of southwestern Michigan, U.S., and seat of Berrien county, is situated on Lake Michigan at the mouth of the St. Joseph river about 60 mi. across the lake northeast of Chicago. In the 1670s Father Jacques Marquette and René Robert Cavelier Sieur de La Salle visited the region, and, thereafter the river's mouth became the site of a French military and trading post because of its strategic location. In the early 19th century the soil and climatic conditions of the area attracted settlers from New England and New York who early turned to fruit and grape cultivation. St. Joseph was incorporated as a village in 1834; its eastern portion gained incorporation as Benton Harbor (*q.v.*) in 1869; and in 1891 both communities received separate city charters. The two cities, connected by a wide thoroughfare and a ship canal, are integrated economically and culturally and are virtually a unit. In the mid-19th century St. Joseph's importance as a port city was curtailed by expanding midwestern railroad facilities. From that time it has continued to serve as a regional marketing centre for fruit growers, a resort with beaches and mineral springs and an industrial centre specializing in canning and in manufacturing automotive parts, castings and rubber goods. For comparative population figures see table in MICHIGAN: *Population.* (E. O. *E.*)

SAINT JOSEPH, a city of northwestern Missouri, U.S., on the east bank of the Missouri river, 55 mi. N.W. of Kansas City; the seat of Buchanan county. Rich in historical tradition, St. Joseph is known as the city "where Southern hospitality meets Western democracy." A post was established there in 1826 by Joseph Robidoux, a French-Canadian trapper from St. Louis. The site was regarded as a sacred area by local Indians, who called the river "road to paradise" and the high bluffs above "Blacksnake hills." In 1836, by the Platte Purchase. the Sac. Fox and Iowa tribes surrendered their lands and six counties were added to northwestern Missouri; subsequently there was an influx of white settlers. Robidoux laid out the town in 1843 and named it after his patron saint; it was made the county seat in 1846 and was chartered as a city in 1851. With the coming of the railroad era, complementing the already thriving steamboat traffic, St. Joseph appeared destined to become the metropolis of the trans-Mississippi West. In 1859 the Hannibal-St. Joseph, a land-grant railroad, was completed and in April 1860, it delivered the first mail pouch to the rider who launched the brief but spectacular history of the Pony Express (*q.v.*).

St. Joseph boomed as a major outfitting centre for emigrants headed for the gold fields of California and other points on the Pacific coast. Before and during the American Civil War the frontier town was on the fringe of the bloody guerrilla warfare in Kansas and Missouri and was visited by such border outlaws as W. C. Quantrill and Jesse James, who was killed in his home there in 1882. Between 1860 and 1900 St. Joseph enjoyed its greatest period of expansion but mas eclipsed by Omaha, Neb., and Kansas City when trans-continental railroads passed it by. In the mid-20th century the city again grew fairly rapidly, partly by annexation (for comparative population figures see table in MISSOURI: *Population).* The population of the city in 1960 was 79,673 and of the standard metropolitan statistical area (Buchanan county) 90,581. Corn, tobacco, blue grass, small grains. livestock and fruit are produced and marketed there. Major industries include meat packing, milling, cereal and dairy products, clothing, foundry, machine-shop and electrical products and wholesale distribution. The state hospital for the mentally ill is in St. Joseph. (Jo. L. H.)

SAINT JOSEPH RIVER, the name of two rivers in the United States, both of which rise in south-central Michigan. The larger of the two flows generally westward for 210 mi. to empty into Lake Michigan at a point between Benton Harbor and St. Joseph, Mich. Midway in its course it swings southward into northern Indiana past the cities of Elkhart and South Bend. At Elkhart the average flow is 3,350 cu.ft. per second. The maximum rate of flow, an average of 9,380 cu.ft. per second, comes in February; the minimum flow, 620 cu.ft. per second, in September. The St. Joseph has been dammed at Union City, Mich., for water-power development. The river is also an important source of urban and industrial water supply.

The other St. Joseph river flows southward over 100 mi. through Michigan, Ohio and Indiana to join the St. Mary's river. The two form the Maumee river at Fort Wayne, Ind.; the Maumee in turn flows northeastward to empty into Lake Erie. Except for Fort Wayne, there are no large cities in the St. Joseph basin. (R. R. D.)

SAINT-JOSSE-TEN-NOODE (Flemish SINT-JOOST-TEN-NODE), a northeastern commune of Brussels (*q.v.*), Belg. Pop. (1955) 25,310. In the mid-19th century it changed from a rural area to a residential and cominercial suburb of Brussels. The Botanical gardens date from 1826 and the Charlier museum was a patrician residence, bequeathed with its contents to the commune. The dukes of Burgundy had a castle there and royal processions entered the capital through the village. Charles Rogier (*q.v.*) lived there for 50 years and Charles de Bériot from 1841–68. It is a centre of the Belgian film industry. (*Y*.E. D. J.)

SAINT-JUST, ANTOINE LOUIS LÉON DE RICHEBOURG DE (1767–1794), French revolutionary leader, was born at Decize in the Nivernais on Aug. 25, 1767. At the outbreak of the Revolution he was elected an officer in the National Guard of the Aisne. He assumed a stoical demeanour united to a tyrannical policy. He entered into correspondence with Robespierre, who, flattered by his worship, admitted him to his friendship. Thus supported, Saint-Just became deputy to the National Convention, where he made his first speech on the condemnation of Louis XVI — gloomy, fanatical, remorseless in tone — on Nov. 13, 1792. In the convention, in the Jacobin club, and among the populace he was dubbed the "St. John of the Messiah of the People."

In the name of the Committee of Public Safety he drew up reports to the convention upon the absorbing themes of the overthrow of the party of the Gironde (report of July 8, 1793), of the Hébertists, and finally, of that denunciation of Danton which consigned him and his followers to the guillotine. Camille Desmoulins said of Saint-Just — the youth with the beautiful countenance and the long fair locks — "He carries his head like a Holy Sacrament." "And I," savagely replied Saint-Just, "will make him carry his like a Saint Denis." The threat was not vain: Desmoulins accompanied Danton to the scaffold.

Saint-Just proposed that the National Convention should, through its committees, direct all military movements and all branches of the government (report of Oct. 10, 1793). This was agreed to, and Saint-Just was despatched to Strasbourg to superintend the military operations. It was suspected that the enemy without was being aided by treason within. Saint-Just "organized the Terror," and soon the heads of all suspects sent to Paris were falling under the guillotine. But there were no executions at Strasbourg, and Saint-Just repressed the excesses of J. G. Schneider, who, acting as public prosecutor to the revolu-

tionary tribunal of the Lower Rhine, had ruthlessly applied the Terror in Alsace. Schneider was sent to Paris and guillotined. The conspiracy was defeated, the frontier was delivered and Germany invaded. On his return Saint-Just was made president of the convention. Later, with the army of the north, he placed before the generals the diletnma of victory over the enemies of France or trial by the dreaded Revolutionary tribunal; and before the eyes of the army he organized a force charged with the slaughter of those who should seek refuge by flight. He succeeded again, and Belgium was gained for France (May, 1794).

Meanwhile affairs in Paris looked gloomier than ever, and Robespierre recalled Saint-Just to the capital. Saint-Just proposed a dictatorship. At the famous sitting of the 9th Thermidor, he presented as the report of the committees of General Security and Public Safety a document expressing his own views, a sight of which had been refused to the other members of committee the previous evening. Then the storm broke. He was interrupted, and the sitting ended with an order for Robespierre's arrest! which entailed that of Saint-Just. On the following day, July 28, 1794, 22 men, nearly all young, were guillotined. Saint-Just maintained his proud self-possession to the last.

Fleury, *Études révolutionnaires* (2 vol., 1851), with which *cf.* articles by Sainte-Beuve *(Causeries du lundi,* vol. v), Cuvillier-Fleury *(Portraits politiques* et *révolutionnaires)*; E. Hamel, *Histoire de Saint-Just* (1859), which brought a fine to the publishers for outrage on public decency; F. A. Aulard, *Les Orateurs de la Législative et de la Convention* (2nd ed., 1905); M. Leneru, *Saint-Just* (1922). Thr *Oeuvres complètes de Saint-Just* were edited with notes by C. Vellay (1908).

ST. KILDA (Gaelic *Hirta,* "the western land"), the largest of a small group of seven islets of gabbro and similar rocks in the Outer Hebrides. Inverness-shire. Scot. It is in the civil parish of Harris and lies 40 mi. W. of North Uist. It measures 3 mi. from east to west and 2 mi. from north to south. Except at the landing place on the southeast, the cliffs rise sheer out of deep water, and on the northeastern side the highest eminence, Conagher, forms a precipice 1,397 ft. high. The 36 inhabitants, an industrious Gaelic-speaking community, were in 1930 evacuated at their own request and were settled mainly in Morvern, County Argyll. The island was practically cut off from the world for eight months of the year and is now seldom visited. It was in the possession of the Macleods for hundreds of years, except for the period 1779–1871, and now belongs to the marquess of Bute. On St. Kilda is the largest gannetry in the world, and puffins, fulmars and other sea birds breed. There are also a subspecies of starling and of wren and two species of mice. The Soay sheep were probably introduced by the Vikings.

ST. KITTS or ST. CHRISTOPHER, an island, forming, with Nevis and Anguilla, one of the colonies in Leeward Islands of the West Indies. It is a long oval with a narrow neck of land projecting from the southeastern end: total length 23 mi., area 68 sq.mi. Mountains traverse the central part from northwest to southeast, the highest being Mount Misery (3,792 ft.). The island is well watered, fertile and healthy, and its climate is cool and dry (temperature between 78° and 85° F.: average annual rainfall 38 in.). The rim of land formed by the skirts of the mountains, and the valley of Basseterre are cultivable. The higher slopes of the hills afford pasturage; the summits are crowned with dense woods. Sugar is the chief product and export, followed by sea-island cotton. Primary education is free and compulsory. In 1950 there were 17 government and 2 subsidized private primary schools and three government-aided secondary schools. Basseterre (pop. [1960] 15,742), on the southwest coast, is the island's port as well as capital of the presidency. St. Kitts was discovered in 1493 by Columbus but was not occupieci until 1623, when Thomas Warner made the first English settlement in the West Indies there. It was seized by the French three times between 1666 and 1782 and held for short periods, but remained British from 1783.

The island had a population of 38,291 in 1960, mostly Negro. (L. . BE.)

ST. LAURENT, LOUIS STEPHEN (1882–). Canadian statesman, was born on Feb. 1, 1882, at Compton, Que. He studied at St. Charles college, Shzrbrooke, and at Laval university, Quebec, Que. He was called to the bar at Quebec in 1905 and became one of Canada's leading lawyers, serving two terms as president of the Canadian Bar association. On Dec. 10, 1941, he entered federal politics as minister of justice, succeeding Ernest Lapointe, leading representative of French-speaking Canadians in the Mackenzie King administration.

In the face of widespread opposition in French-speaking Canada, St. Laurent defended the government's limited use of military conscription in 1914. By his forthright attitude, he maintained Quebec's place in the wartime government and thereby avoided a serious split within the Canadian population. In the election of June 1945, his position was overwhelmingly endorsed by the electorate of his province. He took a leading part at the San Francisco conference (1945) that created the Cnited Nations, and in 1946 became Canada's secretary of state for external affairs.

Despite a personal preference to return to his law practice, St. Laurent was persuaded to accept the leadership of the Liberal party in Aug. 1948, and succeeded Mackenzie King as prime minister on Nov. 15, 1948. He was one of the main architects of the North Atlantic Treaty organization (*q.v.*). His government gave instant and substantial military support to the United Nations intervention in Korea in 1950. The St. Laurent government declined to support the British and French intervention at Suez in 1956, but took a leading part in establishing the United Nations emergency force to restore peace and order there. A firm believer in the British Commonwealth of Nations, St. Laurent's influence contributed greatly to keeping India and Pakistan within that voluntary association of free nations. His bold initiative removed the obstacles to the joint construction of the St. Lawrence seaway (*q.v.*) by Canada and the United States.

By the union of Newfoundland with Canada, the St. Laurent government completed the grand design of the fathers of confederation. His government was responsible for giving final jurisdiction to the supreme court of Canada, thereby ending appeals to the judicial committee of the United Kingdom privy council. He strengthened the unity and fostered the development of the Canadian nation by instituting measures for the equalization of provincial revenues, enlarged social security: grants to universities and the establishment of the Canada council for the promotion of arts and letters.

After winning overwhelming victories in the 1919 and 1953 elections, the St. Laurent government was defeated by a narrow majority on June 10, 1957. He served as leader of the opposition until a national Liberal convention chose Lester B. Pearson to succeed him as Liberal leader in Jan. 1958. He then retired from public life and resumed his law practice in the city of Quebec. (D. C. T.)

SAINT LAURENT, a suburban city of Quebec, Can., on the northwest side of Montreal island; part of the Montreal metropolitan area. Industries include the manufacture of aircraft, railway cars, foundry products, chemicals and textiles. Pop. (1961) 49,805. Founded in 1845 on the site of a mission which dated back to 1720, the village of St. Laurent became a town in 1893 and was incorporated as a city in 1955. In 1952, in an exchange with Montreal, St. Laurent ceded part of its eastern section to the larger city.

In 1954, after residential developments had nearly filled the available land, St. Laurent city annexed St. Laurent parish, thus quadrupling its area. (M. C. BA.)

SAINT LAWRENCE RIVER, the greatest North American river draining to the Atlantic coast. At its head is the Great Lakes basin which has a land and water area of about 291,900 sq.mi. and discharges into the St. Lawrence an average yearly volume of 235,000 cu.ft. per second. The tremendous storage capacity of the Great Lakes stabilizes the supply of water contributed to the river to an unusual extent; the maximum and minimum mean monthly outflow of the lakes since 1860 has ranged from 315,000 cu.ft. per second (May 1870) down to 154,000 cu.ft. per second (Feb. 1936). This maximum-minimum ratio of about 2 to 1 makes the St. Lawrence one of the world's most dependable rivers.

While the St. Lawrence drainage area extends as far as the headwaters of the St. Louis river. a stream which flows into Lake Superior at its western extremity (Duluth. Minn.), the St Lawrence river has its head at the eastern end of Lake Ontario. The river thus becomes the connecting link betneen the Great Lakes basin and the Atlantic ocean. It has, however, a number of major rivers which are direct tributaries—the Ottawa, St. Maurice, Saguenay and Richelieu (draining Lake Champlain). The drainage area in Canada, excluding the Great Lakes section. is estimated by official sources as 198,000 sq.mi.

In determining the length of the St. Lawrence river the figure arrived at depends upon the locality taken as the mouth. On many official maps and the U.S. navy's *Sailing Directions for the Gulf and River St. Lawrence* it is extended as far seaward as the eastern part of the Gaspé peninsula. where the west end of Anticosti Island serves as the transition point between the river and gulf of St. Lawrence. From northern to southern shore is about 70 mi., and the distance to Lake Ontario at Kingston, Ont., is 72j statute miles. A more restrictive definition, one which is preferred in geographical terms places the mouth between Pointe des Monts and Cap-Chat on the northern and southern shores, respectively. This locality is about 595 mi. downstream from Lake Ontario. There the river is 25 mi. wide; seaward from this point the width increases rapidly as the left shore turns abruptly northward.

The St. Lawrence was discovered in 1535 when Jacques Cartier, a French explorer, entered what is now known as the Gulf of St. Lawrence via the Strait of Belle Isle. On Aug. 10. feast day of St. Lawrence (a Christian martyr who died Aug. 10. 258) Cartier discovered a bay on the mainland north of Anticosti Island. which he named for the saint. Noting the current in the strait which now bears his name, Cartier continued westward up the river until he reached the present site of Montreal. He referred to the river as the River of Canada but through usage it gradually became the St. Lawrence. No settlement was established along the river until 1599 when Pierre Chauvin settled Tadoussac at the mouth of the Saguenay. In 1608 Samuel de Champlain laid the foundation for Quebec, the first permanent settlement.

The St. Lawrence is one of the principal routes through the highlands of eastern North America and its course is the focal centre of one of Canada's most important economic and culture areas—the St. Lawrence lowlands. This area lies between the Laurentian upland or Canadian shield to the north and Appalachian highlands and Adirondack mountains on the south. It extends from Quebec city westward to the vicinity of the Thousand Islands near the head of the river. These islands mark the zone where the Pre-Cambrian rocks of the Canadian shield extend south of the St. Lawrence and form the Xdirondacks in New York state. About midway on the long axis of the lowland is Montreal; here the width of the lowland is about 70 mi. The area is underlain by sedimentary rocks—limestone, shale and sandstone—in contrast to the older, harder rocks of the adjacent highlands. Following the retreat of the continental ice sheet of the Pleistocene period, the sea invaded the lowland and formed the Champlain sea. Marine sediments deposited during this period of inundation produced deep, fertile soils over the lower levels of the lowland. The soil materials in the higher sections are of glacial origin including fluvioglacial outwash.

For purposes of analysis the St. Lawrence and its borderlands divide conveniently into three segments: the upper river (above Montreal), the middle river (Montreal to Quebec), and the lower river (the estuary).

The Upper River.—This section extends 182 mi. from Kingston, at the outlet of Lake Ontario. to Montreal. Que. From its head to a point where it crosses the 45° parallel N.. a distance of 114 mi., the St. Lawrence forms the boundary between the United States and Canada (New York state and the province of Ontario). The remainder of its course to the sea lies wholly in Canada. A former system of 14-ft. navigation canals and the present 27-ft. seaway, constructed to avoid the series of rapids in the river, are located entirely within this upper segment of the St. Lawrence. At Lake Ontario the surface elevation of the river is about 245 ft. above sea level and at Montreal it is about 20 ft. The international power dam and two control dams constructed in connection with the seaway development have eliminated some of the upper rapids. including the well-known Long Sault rapids, and in their place is a broad, man-made water body of about 100 sq.mi. named Lake St. Lawrence. In the construction of this lake about 38,000 ac. of land were inundated. and it was necessary to relocate several river-front communities. Flooding of the area began on July 1, 1958, and the new level was achieved within several days.

Downstream from Lake St. Lawrence and above Montreal the river broadens in two areas to form Lake St. Francis. about 28 mi. long, and Lake St. Louis, about 15 mi. long. To utilize the hydroelectric power potential resulting from a difference of about 82 ft. in the water level of these two lakes: a power canal 15 mi. long was completed in 1932. It later became part of the St. Lawrence seaway (*q.v.*).

At the head of Lake St. Louis is the confluence of the Ottawa river, a stream which served as an outlet to the sea for the postglacial upper Great Lakes before rise of land to the north diverted their discharge to Lake Erie and to the present upper course of the St. Lawrence. Part of the Ottawa's flow discharges into the St. Lawrence below Montreal and thus creates an island on which the city of Montreal is located.

The Middle River.--Montreal developed at the head of navigation on the St. Lawrence—the point where further progress upstream was blocked by the Lachine rapids. Completion of the St. Lawrence canals in the 1800s and the seaway in 1959 permitted small and medium-sized ocean vessels to continue past Montreal but the port remains the terminal point for the larger merchant ships of the world. A ship channel 35 ft. in depth extends from Jlontreal to a point 40 mi. below Quebec city. Of the 200 mi. of the middle river, about 113 mi. is dredged canal. Montreal is one of the great seaports of the world and is accessible for ocean vessels for an average of $7\frac{1}{2}$ months of the year.

From Montreal to Quebec, a distance of 160 mi., the St. Lawrence has a low gradient and a mean width of more than a mile. In the harbour of Montreal the elevation is 20 ft.; about midway to Quebec, at Three Rivers, mean sea level is reached. Three Rivers hence becomes the upstream limit of tidal conditions. About 45 mi. do nstream from Montreal is the port of Sorel, at the mouth of the Richelieu river and at the head of Lake St. Peter. The Richelieu-Lake Champlain route provides a shallow-draft waterway which connects with the Hudson river. In the large impounded section of the St. Lawrence called Lake St. Peter the river widens to more than 8 mi. but has a natural depth of only about 11.ft. At the head of the lake, near Sorel, is a delta with many islands formed from river deposits.

Three Rivers (Trois-Rivieres), about 77 mi. above Quebec. is at the mouth of the St. Maurice river. This river valley is Canada's leading pulp and paper-producing region, and Three Rivers is the capital of this industry. In the 1950s this ocean port handled more traffic than Quebec. Below Three Rivers the St. Lawrence follows an irregular course and narrows to less than three-quarters of a mile at Quebec bridge, about 7 mi. upstream from the city, and between Quebec and Levis. Because of the narrowness of the river. the ebb current has a velocity up to j.8 knots and the flood current 4.7 knotsw

The Lower River.—At the head of the estuary section of the St. Lawrence stands the city of Quebec. In the language of the Algonkin Indians its name means "where the river narrows." Once the capital of Canada, the city is now the capital of the largest province. The city is divided into an Upper Town and Lower Town by steep cliffs, and commanding a site 340 ft. high is the famous old fortress named the Citadel.

Tidal action is increased in the long funnel-shaped estuary, with the result that spring tides in Quebec harbour rise from 16 ft. to 19 ft. and neap tides about 13 ft. The regular navigation season is about eight months. from April 15 to December 15, although there is some all-winter navigation east from Quebec city along the north shore of the St. Lawrence. The length of the estuary to Pointe des Monts is 253 statute mi.; to Anticosti Island is an additional 130 mi. St. Paul Island in Cabot strait is 620 statute

(538 nautical) mi. from Quebec.

Below Quebec the St. Lawrence has a littoral lowland which is more extensive on the south shore, with a resulting greater population and agricultural development than on the narrow, discontinuous lowland on the opposite shore. The Island of Orleans, near the head of the estuary, narrows the river into two channels, the main one lying to the south of the island. Waters of the St. Lawrence are considered fresh to the lower end of this island. At Father point, near Rimouski on the south shore and about 180 mi. below Quebec. is the pilotage station for the St. Lawrence river. Pilotage is optional but payment of the fee is compulsory.

At a number of points below Quebec there is ferry service across the river from spring to fall. In the estuary ice conditions vary greatly from sector to sector. the most difficult being from Île aux Coudres to Quebec (j5 mi.).

Along the north shore of the lower estuary, the towns of Baie Comeau and Seven Islands (Sept-Îles) are the principal centres. Paper and aluminum are produced at the Baie Comeau, and Seven Islands is the terminus of the 360-mi. railroad extending to the rich Labrador-Quebec iron-ore deposits.

The fisheries of the St. Lawrence are of relatively minor importance compared with those of the Maritime provinces and Newfoundland. Nevertheless, the river and estuary remain well known for several salt-water species which frequent these waters at certain periods of the year. Sea sturgeon abound in the estuary; there is intensive commercial fishing from the Island of Orleans to Rivière du Loup. Atlantic salmon spawn in the many tributaries of the St. Lawrence seaward of Île aux Coudres. The American eel (Anguilla rostrata) is among the most important species caught in the fresh or brackish waters of the river. The mature fish are caught in the fall as they begin their journey to the Sargasso sea to spawn. Other prominent species in the lower river and estuary are catfish, cod, herring and smelt.

The St. Lawrence has two major hydroelectric power developments in its upper course. The Beauharnois dam in the late 1950s had an installed capacity of 1,400,000 h.p. The international power dam, constructed jointly by the state of New York and province of Ontario concurrently with the seaway development, has an installed capacity of 2,200,000 h.p.

SAINT LAWRENCE SEAWAY, a major improvement of the St. Lawrence waterway which made a highly important interior section of North America accessible for the first time to deep draft, ocean-going vessels, and also permitted the large Great Lakes freighters to extend their range of operations to the ports on the lower St. Lawrence. The waterway was completed for the opening of the navigation season on the St. Lawrence river and Great Lakes in April 1959 and was formally dedicated June 26, 1959.

The project which brought about this development was a joint undertaking of the governments of the United States and Canada to provide 27-ft. navigation channels between Montreal and Lake Erie. A related United States project, scheduled for completion in 1964, provided for widening and deepening the connecting channels of the Great Lakes (the Detroit, St. Clair and St. Mary's rivers) to make them commensurate in depth with those of the seaway.

Strictly speaking, the seaway is the St. Lawrence river portion of the waterway, but the Welland ship canal was officially incorporated into the project through legislation, and improvements were made in it as a part of the total seaway undertaking. However, the broader concept of the '(seaway," and one which is in general usage, includes the entire system of lakes, locks, canals and rivers which have converted over 6,600 mi. of mainland Great Lakes shore line of the United States and Canada into another seacoast.

History of Navigation on the St. Lawrence. Since 1535, when the explorer Jacques Cartier was turned back from his quest for the Northwest passage by the Lachine rapids of the St. Lawrence, men have made plans and built works to provide a through waterway from the Atlantic to the "inland seas."

Segments of the pre-seaway canal system were begun in the early 1700s. After union of the provinces of Upper and Lower Canada in 1841, work was undertaken to deepen all of the canals along the St. Lawrence route to 9 ft. and the project was completed in 1848. Following the Acts of Confederation in 1867 the Canadian government decided upon a program for'the improvement of the canal system to a depth of 14 ft., with locks to be 270 ft. by 45 ft. The enlargement and deepening was carried out in stages, and the canal system was opened for traffic in 1901 although some work was not completed until 1913. Improvement of the Welland canal, a 27-mi. waterway built to overcome the 326-ft. difference in the levels of Lakes Erie and Ontario, was carried out concurrently with work on the St. Lawrence canals and a 14-ft. channel was completed in 1887. The Welland ship canal, completed in 1932, was built with a controlling depth of 25 ft.; it included eight locks which had dimensions equal to those built as a part of the seaway project.

The 14-ft. St. Lawrence canals system as it existed for over a half century prior to the seaway was entirely a Canadian facility. To overcome the obstacles to navigation in the 112-mi. section of the river between Montreal and the head of the Galop rapids, a series of six canals was built along the north shore to bypass eight rapids. The canal segments totaled 47 mi. in length, and 21 locks accounted for a total lift of 209 ft. of the 225-ft. difference in river levels between Montreal and Lake Ontario. The maximum lift of any single lock was 23.5 ft. Lock dimensions varied slightly, the smallest, and hence the controlling lock for ship dimensions, being 43 ft. 8 in. wide and 270 ft. long, with a depth over the lock sills restricting the draft to 14 ft. The maximum over-all length for a vessel using this lock was 259 ft. The maximum cargo which could be carried through this canal system was about 1,600 tons for ocean vessels and about 2,800 tons for "canallers," a vessel especially designed for transporting bulk cargo through the canals. Ocean vessels could load down to their ocean draft of about 20 or 21 ft. upon reaching Montreal, since the St. Lawrence ship channel, with a depth of 35 ft., extended up the river to this port.

International negotiations toward establishing a deep waterway from the sea to the Great Lakes date back at least to 1905 when an International Waterways commission was created. After lack of U.S. congressional approval prevented international agreements in 1932 and again in 1941, the governments of Canada and the province of Ontario began to plan for a joint seaway and power project. In 1951 the (Canadian) St. Lawrence Seaway authority was established. Negotiations followed which resulted in agreement for the joint development of power in the International rapids section by Ontario and New York state power agencies. Legal obstacles followed but in June 1954 the U.S. supreme court upheld the action of the Federal Power commission in granting a license to the New York State Power authority.

Meanwhile, bills were introduced in 1953 in congress to provide for United States participation in construction of the seaway. Enactment of the Wiley-Dondero bill in May 1954 created the St. Lawrence Seaway Development corporation to construct part of the seaway in United States territory and authorized the agency to issue revenue bonds up to $105,000,000 to finance its activities. In 1957 the amount was increased to $140,000,000. The two public power entities began their joint project in Aug. 1954, and soon thereafter the work of the two seaway authorities was started. The total cost for construction of the bipurpose undertaking, which was over $1,000,000,000, marks it as the greatest peacetime task that two nations have ever jointly attempted.

The Present Seaway.— The seaway project in the St. Lawrence river consisted of constructing seven locks, dredging long sections of channel, constructing protective dikes, digging canals and raising and building bridges. The related power project required construction of a power dam and two control dams and the relocation of several towns, railroads and highways as a result of

flooding areas bordering part of the river course.

Limitations on the maximum size of ships operating through the seaway are imposed by channel depth, lock dimensions and overhead clearances. The 27-ft. depth restricts vessel drafts to 25 ft. for minimum safe clearance. All locks are 800 ft. long and 80 ft. wide and have a 30-ft. depth over the sills. Because of these dimensions normal traffic is limited to ships not more than 715 ft. in length with a beam no longer than 72 ft. However, ships having a length up to 730 ft. and a beam up to 75 ft. can be accommodated. Minimum clearance for fixed bridges is 120 ft. above water level. The seaway dimensions permit ocean-going vessels with cargo capacities up to 8,000 or 9,000 tons to enter the Great Lakes and allow the transit of bulk-cargo "lakers" with capacities of up to about 25,000 tons.

The seaway route from Montreal to the head of Lake St. Francis is a-holly in Canada; and all works were carried out by the Canadian seaway agency. A canal about 16 mi. long leads from Montreal harbour to Lake St. Louis, and two locks—St. Lambert and Côte Ste. Catherine—overcome a drop of about 45 ft. in water levels between these two areas. At the head of Lake St. Louis the seaway bypasses the Beauharnois power dam to enter a 16-mi. power canal. Two locks—the Upper and Lower Beauharnois—each have a lift of approximately 41 ft. The power canal, which extends to Lake St. Francis, was completed in 1932 with a navigable depth of 27 ft. in anticipation of the seaway.

The international boundary extends along the St. Lawrence river from the head of Lake St. Francis to Lake Ontario. At the lower end of this section, the seaway route is constructed through United States territory in order to bypass the power dam, a structure divided evenly by the international boundary. The United States navigation works consist of the 10-mi. Wiley-Dondero ship channel and two locks—Bertrand H. Snell (lower, 45-ft. lift) and Dwight D. Eisenhower (upper, 42-ft. lift). These facilities were opened July 4, 1958. The upper end of the ship channel terminates in Lake St. Lawrence. This head pond was created by flooding about 38,000 ac. of land above the power dam.

The major structure in the $600,000,000 power project is a dam with 32 generators (16 belonging to each power entity), which have a total capacity of 1,880,000 kw. (2,200,000 h.p.). The half owned by the Hydro-Electric Power Commission of Ontario is named the Robert H. Saunders—St. Lawrence generating station, and the portion constructed by the Power Authority of the State of New York is called the Robert Moses power dam. In addition to the power structure. it was necessary to build tuo control dams—Long Sault and Iroquois—to maintain the level of the head pond at an operating level of about 242 ft. above sea level. This provides a drop of nearly 90 ft. to the level below the dam.

At the head of Lake St. Lawrence, about 25 mi. above the pouer dam, are the Iroquois dam and the Iroquois canal and lock. The latter is the fifth Canadian lock on the St. Lawrence and has a lift of 2 to 6 ft. to the level of the Thousand Islands section of the river. It was the first seaway lock opened to commercial traffic. having been placed in service in May 1958. Iroquois dam controls and regulates the outflow from Lake Ontario. The International Joint commission has agreed on maintaining this lake at an elevation of 244 to 248 ft.

From the Iroquois facilities to Lake Ontario. about 77 mi., is the Thousand Islands section of the seaway. The improvements required were channel enlargement and lowering of scattered rock shoals. Both the power and seaway entities participated in this work.

The Welland ship canal entrance on Lake Ontario is 157 mi. W. of the head of the St. Lawrence river. Deepening of the canal channel to 27 ft. mas carried out by the Canadian seaway agency. The eight locks—three are double for upbound and down-bound traffic—required no alteration to serve deep-draft vessels.

Tolls for use of the seaway are used to liquidate the cost of the project within a so-year period as required by legislation. The toll rates established were based on an estimated total cost of $471,000,000 (U.S., $131,000,000; Canada, $340,000,000) at the time the project was completed. The composite toll system is based partly on the gross registered tonnage of the ship and partly on the actual cargo tonnage. The division of the toll revenues for transit between Montreal and Lake Ontario is 71% to Canada and 29% to United States. All tolls derived from transit of the Welland ship canal accrue to Canada. Pleasure craft and passenger vessels also are assessed for transit of any segment.

The seaway's primary economic benefit is to the shipping industry; upon its completion the size of general-cargo and bulk-cargo vessels which could utilize the St. Lawrence river route was

increased greatly. From some Great Lakes ports the all-water route to western European ports is shorter than the transatlantic routes from the U.S. east coast, and all lake ports are hundreds of miles nearer Europe than are the ports of the Gulf Coast. In the late **1950s** the Great Lakes-overseas commerce was overshadowed by bulk cargo between the Great Lakes and lower St. Lawrence ports. Leading commodities in this traffic are down-bound grains and upbound iron ore. Ice conditions limit the navigation season on the seaway to about **230** to **240** days, from mid-April to early December.

ST. LEGER, SIR ANTHONY (c. 1496–1559), lord deputy of Ireland, eldest son of Ralph St. Leger, a gentleman of Kent, was educated in Europe and at Cambridge. He quickly gained the favour of Henry VIII, and was appointed in 1537 president of a commission for inquiring into the condition of Ireland. In 1540 he was appointed lord deputy of Ireland. His first task was to repress disorder, and he at once proceeded with severity against the Kavanaghs, permitting them, however, to retain their lands, on their accepting feudal tenure on the English model. By a similar policy he exacted obedience from the O'Mores, the O'Tooles and the O'Conors in Leix and Offaly; and having conciliated the O'Briens in the west and the earl of Desmond in the south, the lord deputy carried an act in the Irish parliament in Dublin conferring the title of king of Ireland on Henry VIII and his heirs. Conn O'Neill, who in the north had remained sullenly hostile, was brought to submission by vigorous measures. For the most part, however, St. Leger's policy was one of moderation and conciliation — rather more so, indeed, than Henry VIII approved. St. Leger's personal influence was proved by an outbreak of disturbance when he visited England in **1544,** and the prompt restoration of order on his return some months later. St. Leger retained his office under Edward VI, and again effectually quelled attempts at rebellion by the O'Conors and O'Byrnes. From **1548** to 1550 he was in England. He was recalled from Ireland in 1551. Under Mary he was again lord deputy from 1553 to 1556, when he was recalled on a charge of falsifying accounts.

St. Leger died (March **16,** 1559) before the investigation was completed.

His great-grandson, SIR WILLIAM ST. LEGER, took part in "the flight of the earls" (*see* O'NEILL) in 1607, and spent several years abroad. Having received a pardon from James I and large grants of land in Ireland, he was appointed president of Munster by Charles I in **1627.** He supported Strafford, actively assisting in raising and drilling the Irish levies destined for the royalist service. In the Great Rebellion of **1641** he executed martial law in his province with great severity, hanging many rebels, often without much proof of guilt. He died at Cork on July 2, **1642.**

A biography of Sir Anthony St. Leger will be found in *Athenae Cantabrigienses*, by C. H. Cooper and T. Cooper (1858); *see* also *Calendar of State Papers relating to Ireland, Hen. VIII–Eliz.; Calendar of Letters and Papers of the Reign of Henry VIII; Calendar of State Papers (Domestic Series), Edward VI–James I; Calendar of Carew MSS.;* J. O'Donovan's edition of *Annals of Ireland by the Four Masters* (7 vol., 1851); Richard Bagwell, *Ireland under the Tudors* (3 vol., 1885–90); J. A. Froude, *History of England* (12 vol., 1856–70). For Sir William St. Leger, see *Strafford's Letters and Despatches* (2 vol., 1739); Thomas Carte, *History of the Life of James, Duke of Ormonde* (6 vol., 1851); *History of the Irish Confederation and the War in Ireland*, ed. by Sir J. T. Gilbert (1882–91).

ST. LEONARDS, EDWARD BURTENSHAW SUGDEN, 1ST BARON (1781–1875), lord chancellor of Great Britain, was born on Feb. 12, 1781, the son of a hairdresser of Duke street, Westminster. After practising for some years as a conveyancer, he was called to the bar by Lincoln's Inn in **1807,** having already published his well-known *Practical Treatise of the Law of Vendors and Purchasers of Ertates* (14th ed., **1862).** His parliamentary career was notable for his opposition to the Reform bill of **1832.** He was appointed solicitor general in **1829,** and was lord chancellor of Ireland in **1835** and again from **1841** to **1846.** Under Lord Derby's first administration in **1852** he became lord chancellor as Lord St. Leonards. He devoted himself with energy and vigour to the reform of the law; in **1855** he was offered the great seal again, but had to refuse. He was learned and lucid, though inclined to be waspish and overbearing. He died at Thames Ditton on Jan. 20, **1875.** He was the author of various important legal publications, many of which passed through several editions.

See J. B. Atlay, *Lives of the Victorian Chancellors*, vol. ii (1906); E. Manson, *The Builders of Our Law, etc.*, 2nd ed. (1904).

ST. **LÔ,** a town of northwestern France, capital of the *département* of Manche, 47½ mi. W. by S. of Caen by rail. Pop. (1954) 11,287. St. LB, called *Briovera* in the Gallo-Roman period, owes its present name to St. Lô (Laudus), bishop of Coutances (d. **568).** In the middle ages St. Lô became an important fortress and a centre for the weaving industry. In 1574 the town, which had embraced Calvinism, was stormed by the Catholics and many of its inhabitants massacred. In 1800 it was made capital of its department in place of Coutances.

In the *hôtel de ville* is the "Torigni marble," the pedestal of an ancient statue, with inscriptions relating chiefly to the annual assemblies of Gallic deputies held at Lyons under the Romans.

SAINT LOUIS, the chief city of Missouri, U.S., 200 years old in **1964,** is a mid-continental focal point of transport and manufacture. The incorporated area extends almost **20** mi. on the west bank of the Mississippi river, within 3½ mi. of the mouth of the Missouri river on the north. By the census bureau definition, St. Louis is the central city of a standard metropolitan statistical area of **3,191** sq.mi., comprising, in addition to the city itself, the separately established St. Louis county, with **98** incorporated communities, and St. Charles and Jefferson counties in Missouri as well as Madison and St. Clair counties in Illinois. Among the separately incorporated Missouri municipalities in the metropolitan area are Clayton, Kirkwood, Maplewood, St. Charles, University City and Webster Groves. For further information on these, and on Illinois cities in the metropolitan area, see *Government*, below.

Migration from the inner city is reflected in the population of the city of St. Louis, which declined from **856,796** in **1950** (when it was eighth in population among C.S. cities) to **750,026** in **1960,** a loss of 12.5%, ranking it tenth. At the same time the metropolitan area nas making considerable gains, its **1960** population of **2,060,103** representing a **19.8%** increase over the **1950** population of **1,719,288.** *See* also *Population Characteristics*, below.

History. — *French* Period. — The original site of St Louis was a shelf of river front under a bluff, bordered by a wide prairie to which the community later spread. The location was chosen by Pierre Laclède Liguest, junior partner in a fur-trading company, organized in New Orleans, which had obtained the exclusive right to trade with the Missouri river Indians and with those west of the Mississippi above the Missouri. The monopoly was granted by the French director-general of Louisiana, who had not yet been informed that the territory had been ceded to Spain in **1762;** it was withdrawn by the Spanish government in **1765** but by that time Laclede was already well established and he and his successors long remained important in the fur trade. The site for the community was well chosen for trade: downstream over **1,000** mi. was New Orleans, La., already a thriving commercial centre and a major fur market; the Great Lakes, Detroit, Mich., and Montreal, Que., were accessible by the Illinois river, entered **38** mi. upstream; the Ohio, joining the Mississippi **180** mi. to the south, was to become important later as a route for settlers from the east.

The village was named by Laclède for Louis IX, the crusader king of France. Clearing of the site began Feb. **15, 1764,** under the direction of Auguste Chouteau, destined to become a leading citizen, though then only in his 14th year. Settlers in addition to the original party began arriving almost immediately; the treaty of **1763,** ending the French and Indian War, had given Great Britain all the territory east of the Mississippi and many of the

French residents of Cahokia and other Illinois villages began to cross the river to the new outpost rather than live under British rule. On the invitation of Laclbde, Capt. Louis St. Ange de Bellerive, the French-Canadian commandant of the surrendered Fort de Chartres, brought over his garrison of 20 men and assumed administrative duties that Spain did not take over until 1770, when the first Spanish lieutenant governor of Upper Louisiana arrived.

Spanish Period.—The change in administrations did not significantly alter the course of the city's history or make any particular impress upon its culture, which remained predominantly French until large numbers of Americans arrived in the 19th century. Laclbde died in 1778 and most of his functions fell upon Auguste Chouteau and his younger brother, Pierre Chouteau. The fur trade was a profitable business, with furs, acquired in exchange for supplies and showy articles of trifling value, bringing as much as 500% profit overseas. Spain's sympathy with the American Revolution drew an attack on St. Louis in 1780 by a Sioux war party under British auspices. This was driven off by a garrison of 29 Spanish soldiers and 281 residents, though not before the death of 15 whites and 7 slaves, mainly in outlying areas. Except for such isolated incidents the community had a peaceful life; close and generally friendly relations were maintained with the Indians, and visiting chiefs often pitched their teepees in the gardens of their business hosts. In 1788 the Mississippi was cleared of pirates. The increased trade made St. Louis the centre of wealth and culture in the upper valley, in spite of its isolation; although by 1800 its population was still somewhat less than 1,000, some of its homes had good libraries and furniture, glass and china brought from France.

American Period.—Under the Louisiana Purchase (*q.v.*), St. Louis passed from France to the U.S. (the territory having previously been retroceded to France in 1800). On March 10, 1804, Capt. Amos Stoddard of the U.S. army officially took possession of Upper Louisiana for the U.S. In 1804 congress created the district of Louisiana, with St. Louis as district headquarters; in 1805 the territory of Louisiana was created, with St. Louis again the seat of government; and in 1812 the territory of Missouri was created, with St. Louis still the territorial capital. It was incorporated as a town in 1809. Population growth was slow: by 1815 it probably did not exceed 2,609, and in 1821, when Missouri was admitted to the union, there were 621 buildings and a population of 5,600. In 1822 St. Louis was incorporated as a city by the state legislature. As a result of urban-rural friction St. Louis ceased to be the capital upon the coming of statehood.

After the Louisiana Purchase, St. Louis became the crossroad of westward expansion of the U.S. and was also the starting point for exploring parties, one of the best known being that of Meriwether Lewis and William Clark in 1804–06. Jefferson Barracks on the Mississippi became an important military post; among the officers stationed there were U. S. Grant, Robert E. Lee and Jefferson Davis. Early in the 19th century fur trading, which had been carried on mostly by individual traders, began to be done by companies. In 1809 the Missouri Fur company was organized by William Clark, Manuel Lisa, Pierre and Auguste Chouteau, Sylvestre Labadie and others, and a branch of John Jacob Astor's American Fur company was established in the city in 1822.

In the War of 1812 the settlement raised 500 mounted rangers to patrol a cordon of 22 stations or family blockhouses along a 75-mi. line from Fort Bellefontaine to Kaskaskia, thus confining Indian forays to petty pilfering and raids on isolated homesteads. In the Mexican war of 1846 young St. Louisans volunteered enthusiastically, interest being heightened by a well-developed trade in mules and silver with the southwest. Cholera struck the city in 1832 and a recurrence in 1849 cost more than 4,000 lives. Fire spreading from burning steamboats made 1849 a year of disaster along the water front as well, hundreds of buildings being destroyed; this area, however, was rebuilt more substantially, with wider and better streets. In spite of these reverses, the census of 1850 showed a population of 77,860.

The American Civil War and Afterward.—In a border state where slavery was legalized, St. Louis was bitterly divided throughout the Civil War and was kept under martial law, Although early settlers had come mainly from Virginia, the Carolinas, Tennessee and Kentucky, they were followed by New Englanders and other northeners who, with the vigorous support of German-born residents, swung the balance to the Union side. A state-wide delegate convention held in St. Louis early in 1861 voted against secession and called for peaceful adjustment, impossible after the firing on Fort Sumter. Gov. Claiborne F. Jackson, having rejected President Lincoln's call for troops from Missouri, set up Camp Jackson in the neighbourhood of Olive and Grand avenues and assembled 800 militiamen. Meantime, discovery of Confederate arms shipments labeled "ale" and "marble" raised fear of an attack on the large Federal arsenal. Suspecting disaffection among regular army officers, Capt. Nathaniel Lyon supplemented a small Federal force by home guards made up largely of German voters who had been organized in political marching clubs during Lincoln's presidential campaign. Camp Jackson surrendered without bloodshed until pistol shots from a crowd of spectators drew fire from the raw recruits, leaving about 15 dead, including some of the captive militiamen, and 5 more mortally injured. Sympathy was further alienated from the Gnion cause the following day, May 11, when more newly enlisted "Wide Awakes." excited by a pistol shot killing one of their marchers, wheeled and fired down a city street, killing four of their own number and two civilians. Only the return of Gen. W. S. Harney, who marched four regiments of regulars into the heart of the city, restored order and stemmed a rush to leave the community.

War orders for clothing and supplies gave impetus to the city's commercial growth, already accelerated by the building of railroads in the 1850s. An earlier stimulus to the economy had been steamboat traffic, beginning in 1817 and declining by 1870. The city also developed as an outfitting point for trade with the southwest and the 1849 California gold rush. In the ten years up to 1870 population almost doubled, reaching 310,864. Eads bridge across the Mississippi, completed in 1874, gave access to the city for trains from Cincinnati; previously passengers from the east had been ferried.

A world's fair, the Louisiana Purchase exposition, was held in St. Louis in 1904. The city grew steadily in the late 19th and early 20th centuries, with both commerce and industry becoming increasingly important. World Wars I and II stimulated industrial development of the area. Other modern developments are discussed in Government, below.

Historic Sites.—A permanent Jefferson National Expansion memorial, administered by the national park service since 1935, was begun with the clearing of derelict buildings from 40 blocks along the river front. It includes a design by Eero Saarinen for a 500-ft, stainless-steel arch on the old levee, symbolizing the gateway to the west. The oldest of the three remaining landmarks is the Old Rock house, built on the water front in 1818 for Manuel Lisa's fur trade. Another, the Old Cathedral of St. Louis of France, dates from 1831–34. The national park service rehabilitated the Old Courthouse, which was begun in 1839, and installed a historical museum which includes dioramas of early events. The 198-ft. dome above a 60-ft. rotunda bears frescoes by Carl Wimar, an early day artist. The courtroom where the Dred Scott case was heard occupies one wing.

Population Characteristics.—From the beginning St. Louis has been a cosmopolitan community, indicating the varieties of its heritages by wildly acclaiming the marquis de La Fayette on his visit in 1825, welcoming the Hungarian patriot Lajos Kossuth in 1852, and firing a 100-gun salute on the 100th anniversary of the birth of the German poet Schiller in 1859. The earliest settlers were French Creoles from New Orleans, French Canadians and a handful of Spaniards; after 1804 Americans began settling in the area and soon outnumbered the French. In the 19th century Germans became most numerous among the foreign born, their influx starting in the 1830s in response to glowing reports sent home by Gottfried Duden, a pioneering Prussian. Most numerous after the Germans were the Irish, and after them the British. In the population shift in the middle years of the 20th century a part of the outward movement from the city was compensated for by an influx from rural areas, including a large number of Negroes from the

south. The nonwhite proportion of the population increased from 13.4% in 1940 to an estimated 25% in 1960.

Government. — By a charter of 1876, the city of St. Louis was established as a unit completely independent of the county and free from control of the state legislature except for general laws A new charter in 1914, while retaining this feature, introduced several changes: the number of elective offices was reduced, the appointive powers of the mayor mere increased, the city council was made a unicameral body, the budget system was introduced, the right to municipal ownership of utilities was granted and provisions were made for the use of the initiative, referendum and recall

City boundaries as established in 1876 (and subsequently unchanged) prevented city services from following families moving out to less expensive or more satisfactory housing in suburban surroundings. The rapid, and largely planless, spread of the metropolitan area in the 20th century deprived the city of needed tax income; well-to-do and middle-class out-migrants were usually replaced by in-migrants of lesser means, who came largely from rural areas nhere farm mechanization had reduced the demand for labour. At the same time problems of traffic, parking and transportation were multiplied by persons driving to work in the central city. The complexity of local governmentis indicated by the fact that in 1960 there were 200 municipalities in the standard metropolitan area, and St. Louis county alone had 28 school districts.

A privately financed metropolitan survey in 1958 recommended a functional but not political consolidation of city and county for joint handling of such common services as traffic and health. Three high-speed trafficways from beyond the city limits nere built to bring more traffic into the downtown business district, suffering from the competition of one-stop shopping centres and places, of amusement in outlying areas. New residential apartments for middle-income families were made possible in the vicinity of the business centre by urban renewal and slum clearance projects. Smoke elimination through regulation of the use of highly volatile coal was carried out successfully in the 1940s by an engineer, Raymond R. Tucker, subsequently elected mayor.

A housing rehabilitation program was allotted $4,000,000 from a $110,639,000 bond issue voted in 1955 for public improvements. Included was $10,000,000 for slum clearance. Neighbourhood pilot projects demonstrated that it cost less to rehabilitate some blighted areas than to clear slums and rebuild. In other areas public housing replaced substandard dwellings with apartments for Ion-income families. These buildings are in many instances 8 to 11 stories high and in one 28-block section doubled the density of population, nith consequent traffic, school and other complications. A small public-housing program was undertaken in St. Louis county.

Though the suburbs are not without their fringe of shacks, in the main the old amenities have persisted. University City, the largest residential suburb in the county, borders on St. Louis and shares many of its problems. It was incorporated in 1906 and adopted a council-manager plan of government in 1947. Other nearby communities having a city manager are Webster Groves, Clayton, Berkeley. Olivette and Ferguson. Kirkwood dates from 1853, when 40 families moved there to take advantage of newly opened railroad service. Other county communities include Florissant, Jennings, Richmond Heights, Maplewood and Overland.

The municipality of St. Charles, across the Missouri river, dates from Spanish days, about 1679. It has a considerable industry. In Jefferson county are the twin towns of Festus and Crystal City. (For comparative population figures for the city of St. Louis and these suburbs see table in MISSOURI: Population.)

Illinois communities in this metropolitan complex had an early advantage in heavy industry because of high railroad rates for freight crossing the river; however. many of their residents now commute to daily employment in the central city. The largest of the Illinois suburbs is East St. Louis; ranking next is its neighbour, Granite City; followed by Belleville, Alton (*qq.v.*), Woodriver and Edwardsville. (For comparative population figures for these municipalities see table in ILLINOIS : Population.)

The Economy. — Industry in the St. Louis area profits from adequate supplies of labour, raw materials and water, plus transportation service by many trunk-line railroads and several major highways, airlines and river-barge companies. Natural gas for industry is supplemented by coal from nearby Illinois fields. Almost three-fourths of all possible manufacturing categories are represented and no one industrial group employs more than 6% of the total factory force. Leading industries, ranked by value added by manufacture, are motor vehicles and equipment. beer and other beverages, petroleum refining, electrical industrial apparatus, meat products. organic chemicals, drugs and medicines, iron and steel foundries, paints and allied products, miscellaneous foods, structural and ornamental fabricated metalwork, service and household machines, bakery products, soap and related items and women's outerwear.

Education and Cultural Activities. — Two urban universities and numerous colleges, seminaries and trade schools dram thousands of students to the St. Louis area. St. Louis university, a Roman Catholic co-educational university founded in 1818, includes among others, schools of law, medicine and dentistry. It has branches at Florissant, Mo., St. Mary's, Kan., and East St. Louis. The Pius XII library, built to preserve microfilms of Vatican library treasures, is on the St. Louis campus. Washington university, chartered in 1853, was founded by Rev. William Greenleaf Eliot, grandfather of the poet T. S. Eliot. Its adult-education division, University college, enrolls more than half of the total student body and also operates a civic education centre. This pioneer venture in problems of urban living relies heavily on television programs directed toward small informal discussion groups, known as viewing posts. The centre also conducts civic leadership seminars and consultation services for community organizations. The two universities and the city school system share in an educational television station, KETC.

Other institutions of higher learning in the metropolitan area include, in Missouri, Fontbonne, a Roman Catholic college for women, chartered in 1917; Harris Teachers college, a municipally controlled co-educational institution established in 1857; and Maryville College of the Sacred Heart, a Roman Catholic women's college established in 1827, all in St. Louis; Lindenwood, a Presbyterian women's college established in 1827, in St. Charles; and Webster, a Roman Catholic college founded in 1915, in Webster Groves. The Illinois section of the metropolitan area includes Southern Illinois university branches at East St. Louis and Alton, with their headquarters at Edwardsville; the Principia college at Elsah, a private college founded in 1898, with enrollment limited to sons and daughters of Christian Scientists; and Monticello, at Alton, a private junior college for women, founded in 1835.

The St. Louis public-school system was integrated racially in 1955, without difficulty. The first public high school west of the Mississippi was established in St. Louis in 1856, followed in 1873 by the nation's first public kindergarten, installed by Susan Blow. William T. Harris (*q.v.*), then superintendent, introduced a phonetic system for reading and added natural sciences to the curriculum. He also founded and edited the *Journal* of *Speculative* Philosophy (1867–93), the first periodical of the sort in English.

Works of early artists such as George C. Bingham, Chester Harding and Carl Wimar, together with a large collection of historical writings, are part of the privately endowed Mercantile library (1846). The public library, with many neighbourhood branches, dates from 1865; the Symphony orchestra from 1881; the Academy of Science from 1856. The Missouri Botanical garden (1858), the gift of Henry Shaw, an early merchant, includes the headquarters of the National Council of State Garden Clubs. Relics of the past include the birthplace of Eugene Field (*q.v.*); the Campbell house (1851), an ante-bellum mansion open to the public, with a display of Victorian furnishings and clothing; and the log cabin in which U. S. Grant lived as a farmer for five years. A famous example of the original skyscraper architecture is the Wainwright building (1891), designed by Louis Sullivan.

In the latter part of the 20th century the city had two large daily newspapers, the Post-Dispatch and the Globe *Democrat*, many local and neighbourhood journals, several television stations and a number of radio stations.

Parks and Recreation. — Of the city's recreational areas,

PUBLIC BUILDINGS OF ST. LOUIS

1. Civil Courts building. Plaza Commission, architects
2. Federal building (U.S. court and customs house). Mauran, Russell. Crowell, and Mullgardt, architects
3. Federal Reserve Bank building. Mauran, Russell, Crowell, and Mullgardt, architects
4. Municipal auditorium, facing the Memorial plaza. The building has an opera house with a seating capacity of 3,500 persons and an arena seating 12,500 persons. The Plaza Commission, consisting of members of seven firms of architects, designed the building

Forest park is the largest, with 1,380 ac. At one entrance is the Jefferson memorial, housing the Missouri Historical society: one wing is filled with the collected souvenirs of Charles A. Lindbergh's flight across the Atlantic in 1927. On a hill is the City Art museum, its main building designed by Cass Gilbert for the world's fair, which was held at this location. The park contains the St. Louis Municipal Opera theatre (1919), which is an outdoor theatre seating 12,000 persons. There are also a zoo, golf courses and other athletic facilities, including boating and a large ice-skating and roller rink used the year round, and the Jewel Box with flower displays. The county contains a Museum of Transport and maintains the Jefferson Barracks Historical Site park. Alton Lake, on the Mississippi river, provides harbours for small pleasure craft. Cahokia Mounds, a 144-ac. park between East St. Louis and Collinsville, preserves a number of examples of the work of a prehistoric race of Mound Builders. The city is the home of the Cardinal baseball team and many athletic and other events are staged in Kiel auditorium, part of the civic centre. On the adjoining Aloe Memorial plaza, facing Union station, is the Carl Milles fountain "The Meeting of the Rivers." An annual event since 1878 is the Veiled Prophet parade and ball.

SAINT LOUIS, a city and iormer capital of the Republic of Senegal, was the first capital (1895–1902) of French West Africa. a considerable regional market, and the onetime French West African port for overseas and Senegal river trade.

Located at the point nhere the Senegal reaches a dune-covered sand bar. behind which it flows 12 mi. before entering the sea, it is near the climatic division between Sahara and Sudan. Its original site. and later commercial core and locale of the Senegalese government is a bar-shaped island 1¼ mi long. This is connected by tno short bridges, and by a bridge 2,132 ft. long, with a suburb at the mainland terminal of the railroad to Dakar (*q.v.*), 168 mi. south. In 1958 Dakar replaced Saint Louis (the temporary capital) as the seat of government of the Republic of Senegal.

Pop. (1958) 37.104 (commune).

Vessels draning up to 10 ft. can cross the bar and navigate the river during the rains (July–September inclusive), but water traffic has been suppianted by rails. Founded in 1659 by Dieppe merchants, Saint Louis is the oldest colonial establishment in Africa belonging to France. After 1854 it became the base of military expeditions leading to the formation of French West Africa. Made one of the two original communes in Senegal in 1872, its citizens may vote for a representative in the French chamber of deputies.

Institutions include a secondary school on the model of a French *lycée,* a school for sons of Moslem chiefs (specializing in administration, lam and accounting), and a hospital.

See R. Rousseau, "Le site et les origines de Saint-Louis," *La Géographie 44* (1925). (D. WH.; X.)

SAINT LOUIS PARK, a city of Hennepin county, Minn., U.S., on the southwestern edge of Minneapolis (*q.v.*) and a part of the Minneapolis-St. Paul metropolitan area. After World War II it experienced great population growth, as did other cities around Minneapolis.

The first settlers in St. Louis Park were William Laycock and his wife, who built a log cabin on their claim in 1854. Sometime before 1886. the first depot was built by the Minneapolis and St. Louis railway. The village, first called Elmwood, was renamed after that railroad.

Farming was the main industry in the early days but gradually disappeared with the advent of suburban growth. Plans for the development of the city as a manufacturing suburb began as early as 1886. The panic of 1893 bankrupted several flourishing factories. Then new industries moved in and between 1900 and 1913 another cycle of decline and boom was experienced.

From 1914 to 1920 industry was on a reduced scale with the exception of important dairying and truck farming. Chief industries in the second half of the 20th century were metal and wood products.

St. Louis Park was incorporated in 1886 and its residents adopted a home rule charter in 1954; a council-manager form of government went into effect in 1955. For comparative population figures see table in MINNESOTA: Population. (R. W. F.)

ST. LUCIA, the largest of the Windward Islands. in the West Indies, in 13° 54′ N. and 60° 59′ W., 24 mi. S. of Martinique and 21 mi. N.E. of St. Vincent. Area 238 sq.mi., length 27 mi., maximum breadth 14 mi.; circumference 150 mi. It is considered one of the loveliest of the West Indian islands. It is a mass of mountains, rising steeply from the water, their summits bathed in perpetual mist. The highest of these is Mt. Gimie (3,117 ft.), but the Pitons (2.619 ft. and 2.461 ft.) are the chief natural feature—two immense pyramids of rock rising abruptly from the sea with their slopes, inclined at a 60° angle, clothed on three sides with dense verdure. Near Petit Piton is Soufrière, a low-lying volcanic crater. The boiling sulphur springs which give Soufrière its name are at Ventine, 2½ mi. S.E. of the town of Soufrière. Rainfall averages 91 in. a year, the temperature averages 80° F.

History.—St. Lucia was discovered by Columbus in 1502 and named after the saint on whose day it was sighted. The Dutch are said to have built a fort there. but the first attempt to settle was made by Englishmen in 1605. Carib resistance compelled its abandonment. From this time until the island became definitely a British possession in 1814 it was the scene of fiercely recurring struggles between England and France; and 13 British regiments gained the right to inscribe the name St. Lucia on their colours. In the first half of the 17th century it was included in royal grants made by the kings of England and France; but English settlers were long deterred by the unlucky reputation which St. Lucia gained after a second disastrous attempt at colonization in 1638, frustrated by sickness and native hostility. The French were more successful, sending settlers from Martinique in 1650, by nhom a treaty was made with the Caribs ten years later. England defeated the French shortly afternard, and regained the island, but it was restored by the peace of Breda in 1667.

Another British settlement under a grant of 1722 was frustrated by France. In 1748 the two nations agreed to regard St. Lucia as neutral. In 1762 it was captured by Rodney and Monckton, only to be given up once more by the treaty of Paris. In 1778 it again surrendered to the British, who used its harbours as a naval base; and it was from Gros Islet bay that Rodney sailed before his famous victory over de Grasse in April 1782. Between 1782 and 1803 the possession of St. Lucia passed six times between England and France. England having to suppress a vigorous revolutionist part, aided by insurgent slaves, before gaining possession in 1803. confirmed by a final cession in 1814. From this time the island was administered as a crown colony—under Barbados from 1838 to 1885.

Representative government was obtained by the constitution of 1924 which introduced an elective element into the legislative council, and the constitution of 1936 provided for an unofficial majority in the council.

French influence on the development of St. Lucia has been very great, and is illustrated by the preponderance of the Roman Catholic Church and the survival of a French patois. In the years folloning 1763 French planters came from St. Vincent and Grenada and formed cotton and sugar plantations. In 1772 the population was said to number 15,000, mostly slaves. In 1834, when the slaves were emancipated there were in St. Lucia more than 13.000 Negro slaves, 2.600 free Negroes and 2,300 whites. Prosperity was greatly retarded by the frequent wars. by epidemics of cholera and smallpox and by the decline of the sugar-cane industry. Improvement came nith the increase of banana and cocoa cultivation, and resuscitation of sugar-cane cultivation.

The excellent landlocked harbour of Castries, one of the best in the West Indies, gives St. Lucia great strategic importance.

In 1940, as part of its "destroyer-bases" agreement with Great Britain, the United States acquired on 99-yr. lease a naval and air base on Gros Islet bay, 4 mi. from Castries: along with other facilities. These were all relinquished by 1949, but the United States retained the right to re-establish them in the event of war or grave emergency.

Population and Economic Conditions. — The population of St. Lucia was 86.108 in 1960. Castries (pop. [1957 est.] 25,000), the capital, on the N.W. coast. was almost completely destroyed by fire in June 1948, but rebuilding on a carefully planned basis began shortly thereafter. The bulk of the inhabitants of the island are Negroes and mulattoes; the rest are whites or of East Indian extraction. A French patois is generally spoken by most, gradually being supplanted by English. The government subsidizes primary education through grants-in-aid to the island's denominational primary schools (principally Roman Catholic) and two secondary schools.

Government is under an appointed administrator (subordinate to the governor of the Windward Isiands, of which colony St. Lucia forms part). The legislative council is partly appointed, partly elected.

The colony's essentially agricultural economy is dominated by sugar raising. In 1950 St. Lucia produced 10.441 tons of sugar. Although much of the land is held in large estates. there were more than 4.000 individual proprietors in 1949. Fishing is carried on extensively for the local market and provided full-time employment for 1.; 50 persons in 1949 In addition to sugar and sugar products. copra and coconuts, cacao, bananas and lime products are exported to non-West Indian areas. There is also a flourishing charcoal trade with Barbados. In 1950 exports totalled £309,071 in value; imports, principally flour, rice and other foodstuffs and a wide variety of manufactured goods. were valued at £1,093,372.

External communication is by steamer service which is irregular but fairly frequent, and by air. St. Lucia enjoys better air service than any other of the West Indian islands except Jamaica and Trinidad.

ST. MALO, a seaport of western France. capital of an *arrondissement* in the *département* of Ille-et-Vilaine, 51 mi. N.N.W. of Rennes by rail. Pop. (1954) 13,515.

In the 6th century the island on which St. Malo stands was the retreat of Xbbot Aaron, n-ho gave asylum in his monastery to Malo (Maclovius or Malovius), a Cambrian priest, who afterwards became bishop of Aleth (now St. Servan); the see was transferred to St. Malo only in the 12th century. In the 17th century the maritime power of St. Malo attained some importance. In Nov. 1693 and July 1695 the English vainly bombarded it. The St. Malo shipowners financed the Rio de Janeiro expedition of Duguay-Trouin in 1711 and also lent the king large sums for carrying on the war of the Spanish Succession. In June 1758 the English inflicted great loss on the royal shipping in the harbour of St. Servan, but another expedition in the following September received a complete check. In 1778 and during the wars of the Empire the St. Malo privateers resumed their activity. In 1789 St. Servan was separated from St. Malo, and in 1801 St. Malo lost its bishopric.

St. Malo is situated on the English channel on the right bank of the estuary of the Rance at its mouth. It is a garrison town surrounded by ramparts which include portions dating from the 14th, 15th and 16th centuries but as a whole were rebuilt at the end of the 17th century and restored in the 19th century. The most important of the gates are those of St. Vincent and the Grande Porte, defended by two massive 15th-century towers. The granite island on which St. Malo stands communicates with the mainland on the northeast by a causeway known as the "Sillon" (furrow), commanded by the old 14th and 1jth century castle: flanked with four towers, one of which, the great keep, is an older and loftier structure. In the sea round about lie other granite rocks, which have been turned to account in the defenses of the coast. The rocks and beach are continually changing their appearance, owing to the violence of the tides; spring tides sometimes rise 50 ft. above low-water level, and the sea sometimes washes over the ramparts. The harbour of St. Malo lies south of the town in the creek separating it from the neighbouring town of St. Servan., Including the contiguous and connected basins belonging to St. Servan, it comprises an outer basin, a tidal harbour, two wet-docks and an inner reservoir, affording a total length of quayage of over 2 mi. The wet-docks have a minimum depth of 13 to 1j ft. on sill, but the tidal harbour is dry at low water. The great bulk of trade is with England, the exports comprising large quantities of fruit, dairy produce, early potatoes and other vegetables and slate. The principal imports consist of coal and timber. The Southern railway maintains a regular service of steamers between Southampton and St. Malo. The port carries on shipbuilding and equips a fleet for the Newfoundland cod-fisheries. The industries also include iron- and copper-founding and the manufacture of portable forges and other iron goods and rope. The town is the seat of a sub-prefect and has a tribunal of commerce.

St. Malo is largely frequented for sea-bathing, but not so much as Dinard, on the opposite side of the Rance. The town presents a tortuous maze of narrow streets and small squares lined with high and sometimes quaint buildings. Above all rises the stone spire (1859) of the cathedral, a building begun in the 12th century but added to and rebuilt at several subsequent periods.

SAINT-MARTIN, LOUIS CLAUDE DE (1743–1803), French illuminist who signed his works "LE PHILOSOPHE INCONNU," was born at Amboise on Jan. 18, 1743. He studied law and practised for six months at Tours, but joined the army in 1765. Stationed at Bordeaux. he came under the influence of the Jewish visionary. Martinez Pasqualis. Saint-Martin left the army in 1771 and began to propagate mysticism, first in Paris under Martinez Pasqualis and later in Lyons. where he was active in masonic lodges. His first book, *Des Erreurs et de la vérité* (1775), in which Gnostic theories were used to refute Condillac's materialism, won him the favour of certain literary groups among the nobility. On his return to France in 1788 after visiting England and Italy he settled in Strasbourg, where he met Charlotte dé Boecklin and Rudolphe Salzmann. These two introduced him to the writings of Jakob Boehme. under whose influence he gradually broke loose from that of Martinez Pasqualis. In 1794 he was exiled from Paris and retired to Amboise.

During the French Revolution he was arrested as an aristocrat and was about to appear before the revolutionary tribunal when the overthrow of Robespierre in July 1794 freed him. Two years later he published his *Considérations sur la révolution française*, in which he proposed theocracy as the ideal form of society. Later he came under the influence of Swedenborg. Saint-Martin died at Aunay, near Paris, on Oct. 13, 1803.

His works include *L'Homme de désir* (1790); *Le Nouvel Homme* (1792); *Éclair sur l'association humaine* (1797); *Le Crocodile* (1798), an allegorical poem; *De l'Esprit des choses* (1800); and *Le Ministère de l'homme-esprit* (1802; Eng, trans., *The Ministry of Man and Spirit,* 1864). Other treatises appeared in his *Oeuvres posthumes* (1807).

See A. E. Waite, *The Life of Louis Claude de Saint-Martin* (1901); *R.* Amadou, *Louis Claude de Saint-Martin et le Martinisme* (1946).

SAINT MARYLEBONE, a metropolitan (1899) and parliamentary borough of London, is bounded north by Hampstead, east by St. Pancras, south by Westminster at Oxford street and west by Paddington at Edgware road. Pop. (1961) 68.834. Area 2.3 sq.mi. The boundary corresponds to the Domesday manors of Tyburn and Lilleston (whence Lisson grove). The name derives from the proximity of the old village to the river Tyburn, St. Mary-at-the-bourn. London began to engulf it in the early 18th century, when the Harley-Portland estate, followed by the Portman estate, were laid out in well-planned streets and squares. By 1800 the northern limit of building was the New (Marylebone) road, made in 1756. The present St. Marylebone parish church at York gate was built during 1813–17. The crown estate, Marylebone park. became Regent's park. 1812–30, the brilliant concept of John Nash, who also cut Regent street, with All Souls' church as its apex, to im-

prove access to the park. He incorporated nith it Portland place, built 50 years earlier by the Adam brothers. nhich he completed with the sweep of Park crescent. St. John's Wood, mainly the Eyre estate, was developed during 1830–50 as London's first garden suburb. Oxford street is one of the great shopping centres and behind it are the dependent wholesale fashion and textile trades. In and around Harley and Wimpole streets is the medicai precinct of London. The borough has several hospitals, including the Middlesex (1755). It houses Bedford college, the Wallace collection in Hertford house, the Courtauld institute and the Zoological gardens. Modern developments have brought in administrative headquarters for the British Broadcasting corporation (BBC), British railways, and many great commercial firms. The Tonn hall (1914. 1939) is in Marylebone road. Mme Tussaud's waxworks exhibition (*see* TUSSAUD, MARIE) and the London planetarium adjoin Baker street station. The collection of Sherlockiana, including a reconstruction of the Baker street sitting room, is in the "Sherlock Holmes" inn. Westminster. Lord's cricket ground, in St. John's Wood. is the home of the MCC (Marylebone Cricket club) and of the Middlesex County club. Despite the loss of Queen's hall in 1941. St. Marylebone still retains its musical importance with the Royal Academy of Music, Trinity College of Music and Wigmore hall. (S. J RU.)

SAINT MARYS, a city of western Auglaize county, O., U.S., on the eastern shore of Grand lake (Lake Saint Marys), 95 mi. N. of Cincinnati. On an important portage between rivers connecting the Great Lakes and the Ohio river. it was the site of Girty's Town, the trading post of an American renegade named James Girty, in the 1780s; Ft. Saint Marys. supply post in the Indian wars of the 1790s; Ft. Barbee in the War of 1812; and the negotiation of an important Indian treaty in 1818. Platted in 1823, it became a city in 1903. German and Irish ancestry predominate in the population. Industrial output includes blankets, rubber products, heavy machinery and processed foodstuffs. Grand lake. one of the world's largest artificial bodies of water, constructed (1837–1845) as a reservoir to feed the Miami and Erie canal. is now used for recreation and contains a large warm water fish hatchery. For comparative population figures *see* table in OHIO: *Population.* (D. L. S.)

SAINT MARYS RIVER, a stream, about 63 mi. long, connecting Lake Superior with Lake Huron and forming part of the international boundary between northeastern Michigan, U.S., and Canada. The upper third of the river is at the Lake Superior level, but at Sault Ste. Marie (*q.v.*) it drops about 20 ft. in a distance of about one mile through the Sault Ste. Marie rapids to the level of Lake Huron. The rapids, impassable for navigation, are bypassed by the American and Canadian ship canals which contain a total of five locks and form the world's busiest waterway. The lower river is divided into a series of lakes and channels by large islands. The river is the narrowest part of the Great Lakes system and a natural crossing site which was used by the Indians and visited by early French explorers. (C. M. DA.)

ST. MICHAEL'S MOUNT, a lofty pyramidal island of granite, rising about 400 yd. from the shore of Mount's bay, and included in the West Penwith rural district of Cornwall, Eng. Pop. (1951) 52. It is united with Marazion by a natural causeway passable only at low tide. The Mount, topped by a very ancient building. can be seen from any part of the coast between Mousehole and Cudden point. It was given by Robert, count of Mortain, to Mount St. Michael in Normandy, of which abbey it continued to be a priory until the dissolution of the alien houses by Henry V, when it was given to the abbess and convent of Syon in Middlesex. It came into the possession of the crown after the Reformation and governors were appointed by the monarch.

It was a resort of pilgrims, encouraged by Pope Gregory. in the 11th century and in the 12th century the monastery was rebuilt by Bernard, the abbot of Mount St. Michael. The Mount was captured by Henry Pomeroy in the reign of Richard I. and John de Vere. earl of Oxford, seized it and held it against the king's troops in 1473. Perkin Warbeck occupied it in 1497. Humphry Arundell, governor of St. Michael's Mount, led the rebellion of 1549. During the reign of Elizabeth I it was given to Robert. earl of Salisbury, by whose son it was sold to Sir Francis Basset, whose brother. Sir Arthur Basset, held it against the parliament until July 1646. It was sold in 1659 to Col. John St. Aubyn, and his descendant, Lord St. Levan. has a residence in the castle. In 1955 an arrangement was made between the St. Aubyn family and the National Trust, whereby the latter have taken over the Mount, subject to certain rights in favour of the present Lord St. Levan and his heirs. Of the original monastic buildings. the refectory (Chevy Chase room) is the chief survival. The chapel of St. Michael, which is extra-diocesan, is a beautiful 1 jth-century building with an embattled tower.

The harbour. widened in 1823–24 to allow vessels of 500 tons to enter, has a pier dating from the 15th century.

ST. MIHIEL, a town of northeastern France, in the *département* of Meuse, on the right bank of the Meuse and the Canal de l'Est. 23 mi. S. by E. of Verdun by rail. Pop. (1954) 4,933. St. Mihiel is famous for its Benedictine abbey of St. Michael, founded in 709. The abbey buildings (occupied by the municipal offices) date from the end of the 17th century and the beginning of the 18th century, and the church from the 17th century. The church of St. Étienne, chiefly in the flamboyant Gothic style, contains a magnificent Holy Sepulchre by Ligier Richier. St. Mihiel formerly possessed fortifications and two castles, destroyed in 1635.

Battle of St. Mihiel, 1918.—In his first conference with the commander-in-chief of the French armies, Gen. Pershing visualized the reduction of the St. Mihiel salient as the first U.S. operation in World War I. In accordance with studies made at his headquarters in Sept. 1917, he planned that the decisive U S. effort would be against the German railroad system north and east of the Meuse river and the ore deposits in the vicinity of Metz and Longwy, with the elimination of the St. Mihiel salient as a necessary preliminary. Though early American control of the Woevre sector was agreed (May 19, 1918) the demands for American troops to assist the Allies in meeting the Germans elsewhere limited further steps along these lines to the creation of supply installations. At Bombon, on July 24, the commanders-in-chief, having determined to maintain the offensive, accepted Gen. Pershing's proposal that his army should undertake to reduce the St. Mihiel salient before the autumn rains began about the middle of September. This operation harmonized with the Château Thierry offensive and the British and French attacks against the Amiens and Ypres-Lys salients, made in order to free strategic railroads, preparatory to more extended operations. The counter-offensives against the Marne and Amiens salients in July and Aug. had gained such advantages that it was apparent the emergency which justified the dispersion of American divisions had passed. On Aug. 9, final decision was given for the immediate assembly of the American army for an attack against the St. Mihiel salient.

The American troops in France—at this time over 1,200,000—were sufficient for the offensive, but they were dispersed along the front from Switzerland to the Channel. While the I Army Headquarters, two corps and corps troops and seven divisions were operating in the Marne offensive, other American divisions were holding sectors in the Vosges and Lorraine and several were training as reserves behind the British front. To assemble these combat and service troops into an army and undertake a major operation within the short period available and with the staffs so recently organized was an extremely difficult task. Deficiencies in artillery, aviation and special troops, caused by shipment of an undue proportion of infantry andmachine guns to assist the Allies, were largely met by the French. While the I American army was given a distinct and independent mission, Gen. Pershing suggested, as expedient, that it should function under the nominal direction of Gen. Pétain, the French commander-in-chief, in order to assure co-ordination on the part of the French armies adjacent to the I army and to provide French units needed at the outset for supply services. To all intents and purposes the I army was entirely independent of French command, as all plans were prepared and all movements and operations ordered by the commander of the I army. The initial battle plan approved by Marshal Foch by Aug. 17, contemplated as an ultimate objective the general line:

Marieulles (east of the Moselle), the heights south of Gorzé, Mars la Tour, Etain and the employment of 25 divisions under Gen. Pershing's personal direction. In furtherance of this plan, the scattered divisions, corps and service troops were first gathered in areas about Chaumont and Neufchâteau and then, beginning Aug. 28, the army advanced to its battle position.

The I American army took command of the front from Port-Sur-Seille (east of the Moselle) to Watronville (north of Les Eparges) from the II and VIII French Armies on Aug. 30. On this day, at I American Army headquarters (Ligny-en-Barrois), Marshal Foch discussed with Gen. Pershing a general plan for future operations and proposed employing American divisions under French command in the Champagne and Meuse-Argonne regions with a material reduction of the St. Mihiel forces in order to make available American troops for these new operations. Gen. Pershing could not accept such plans as they would require the immediate separation of the recently formed I American army into several groups delaying further the formation of a distinct American army. Moreover, an enormous amount of preparations had already been made in supplies arid munitions and in construction of roads, railroads, regulating stations and other installations for the supply of the army on a particular front. While willing to accept the employment of the American army as a unit where desired, Gen. Pershing would not entertain proposals for its disruption. At a later conference on Sept. 2, the employment of the American army as a unit was conceded and a decision reached to the effect that after reducing the St. Mihiel salient, the I American army would attack by Sept. 2 j between the Meuse river and Argonne forest. As a result of the decisions, the depth of the St. Mihiel operation was limited to the line Vigneulles, Thiaucourt, Regnieville The number of divisions to be used was reduced and the time shortened. There were 15 American divisions (each equal in size to 2 French divisions) and 4 French divisions available, 6 of which would be in reserve. Furthermore, 2 army corps headquarters and corps troops. practically all army artillery and aviation and the Ist, 2nd and 4th divisions, the first 2 destined for a leading part in the St. Mihiel attack, were all due to be withdrawn and started for the Meuse-Argonne by the fourth day of the battle.

The salient had been held by the Germans since Sept. 1914. It covered the most sensitive section of the enemy's position on the western front; *i.e.,* the Mézières-Sedan-Metz railroad and the Briey Iron Basin; it threatened the entire region between Verdun and Nancy and interrupted the main railroad line from Paris to the east. Its primary strength lay in the natural defensive features of the terrain itself. The western face of the salient extended along the rugged, heavily-wooded eastern heights of the Meuse; the southern face followed the heights of the Meuse for 5 mi. to the east and then crossed the plain of the Woevre, including within the German lines the detached heights of Louvemont and Mont Sec, which dominated the plain and afforded the enemy unusual facilities for observation. The enemy had reinforced the positions by every artificial means during a period of four years. Having concentrated by night movements over 600,000 men on the battlefield, the troops of the I army were deployed in attack positions on the night of Sept. 11. On the south face of the salient was the I corps (4 divisions in line) extending from the Moselle westward. On its left was the IV corps (3 divisions in line) with left facing Mont Sec. These 2 corps were to deliver the main attack, the advance pivoting on the centre of the I corps. The left of the IV corps was to advance toward the heart of the salient where contact would be made with the V corps from the west. On the western face of the salient lay the V corps (3 divisions in line) extended from Mouilly via Les Eparges to Watronville. While the centre division made a deep advance to gain contact with the IV corps on the south, the rest of the corps was to limit its advance while covering the flanks of the centre division. Between the IV and V corps around the apex of the salient, the II French corps (3 divisions in line) covering 24 mi., had the mission of attacking to hold the enemy in the salient. American artillery and aviation were greatly augmented by French artillery and aviation and assisted indirectly by the British independent air force located south of Nancy. The heavy artillery could reach the railroads entering Metz.

Gen. Foch's Army Detachment C held the salient on Sept. 12 with 8 divisions in line and 3 divisions in immediate reserve. While the Germans had an inkling of a possible American attack as early as Sept. 1, the magnitude and imminence were not suspected. An American ruse at Belfort, which comprised extensive preparation for an attack in that region, proved misleading to the enemy. A decision having been made to withdraw in face of a serious attack at St. Mihiel, preparations for a deliberate and methodical withdrawal were under way, some dismounted batteries having been displaced, when the Americans launched their attack at dawn on Sept. 12. After four hours' violent artillery preparation, accompanied by small tanks, the I and IV corps advanced. The infantry of the V corps attacked at 8 A.M. The operation was carried out with precision. Just after daylight of the 13th, elements of the IV and V corps joined at Vigneulles, 11 mi. N.E. of St. Mihiel. The enemy was overwhelmed, and all objectives were reached on the afternoon of Sept. 13. During the 14th and 1 jth, while the two German counterattacks were repulsed by the I corps, the Americans advanced along the Moselle to the line Jaulny-Pagny-sur-Moselle. On Sept. 14–16, local operations continued, American patrols advancing to Dampvitoux. eastern edge of Etang de Lachaussee, Jonville and Fresnes-en-Woevre. The swiftness with which the operation was carried out enabled the Americans to smother the opposition to such an extent that they suffered less than 7,500 casualties during the actual period of the advance. During the battle the Germans engaged four new divisions and drew into local reserve several other divisions.

The Americans captured nearly 16,000 prisoners (over 4,000 in the salient proper), 443 guns and large stores of material and supplies. The moral result of the victory was striking. An American army had suddenly appeared and crushed the enemy in one of his strongest positions. No form of propaganda could overcome the depressing effecton the enemy of this demonstration of ability to organize a large American force in so short a time and drive it successfully through its defenses. The strength of the I American army in the battle totalled over 500.000 Americans and 100,000 French, approximately 2,900 cannons, 400 tanks and 1,000 aeroplanes. (H. A. DR.; J. J. P.)

ST. MORITZ, loftiest (6,037 ft.) and most populous village of the Upper Engadine in the Swiss canton of the Graubunden Pop. (1950) 2.558; about half were German-speaking, the rest chiefly Romansch and Italian About half mere Protestant and half Roman Catholic. It is built above the north shore of the lake of the same name. and is 56 mi. from Coire by the Albula railway. The village is about 1 mi. north of the baths, an electric tramway connecting the two. Both are ordinarily frequented by foreign visitors. The baths (chalybeate, sparkling with free carbonic acid) were already well-known in the 16th century.

ST. NAZAIRE, a town of France, capital of an *arrondissement* in the *département* of Loire-Inférieure, 40 mi. W.N.W. of Nantes by rail and 29 mi. by river. Pop. (1954) 33,513. According to remains discovered, St. Nazaire seems to occupy the site of the ancient *Corbilo,* placed by Strabo among the more important maritime towns of Gaul. At the close of the 4th century the site of Corbilo was occupied by Saxons, and, their conversion to Christianity being effected one or two hundred years later by St. Felix of Nantes, the place took the name of St. Nazaire. Under the Second Empire it was chosen as the site of the new harbour for Nantes, because the ascent of the Loire was becoming difficult. St. Nazaire, on the Loire at its mouth, is a modern town. It possesses a granite dolmen 10 ft. by 5 ft. resting horizontally on two other stones. The harbour, accessible to largest ships, is separated from the estuary by a narrow strip of land and comprises an outer harbour and entrance, two floating docks. three graving docks and the extensive shipbuilding yards of the Loire Co. and of the General Transatlantic Co. whose steamers connect St. Nazaire with Mexico, the Antilles and the Isthmus of Panama. Ships for the navy and the mercantile marine are built, and there are important steelworks, blast furnaces, forges and steam sawmills.

The town is the seat of a sub-prefect and has a board of trade-arbitrators. a chamber of commerce and a tribunal of commerce.

ST. NICOLAS, town. province of East Flanders. Belgium, 12 mi. S.W. of Antwerp, a railway junction on the Antwerp-Ghent line. with linen manufactories of its own, and the central market of Waes; formerly barren and bleak downs, it is now highly productive. Pop. (1955 est) 46.099.

ST. OMER, a town and fortress of northern France. capital of an arrondissement in the *département* of Pas-de-Calais. 42 mi. W.N.W. of Lille on the railway to Calais. Pop. (1954) 17,444.

Omer, bishop of Thérouanne, in the 7th century established the monastery of St. Bertin, from which that of Notre-Dame was an offshoot. In the 9th century the village which grew up round the monasteries nas named St. Omer. In 1559 St. Omer became a bishopric and Notre-Dame was raised to the rank of cathedral. The town and monastery were surrounded by walls by 980. Situated on the borders of frequently disputed territories, St. Omer long continued subject to siege and military disaster.. In 1071 Philip I and Count Arnulf III of Flanders were defeated at St. Omer by Robert the Frisian. In 1127 the town received a communal charter from William Clito, count of Flanders. In 1493 it came to the Low Countries as part of the Spanish dominion. In 1677, after 17 days' siege, Louis XIV forced the town to capitulate; and the peace of Nijmwegen permanently confirmed the conquest. In 1711 St. Omer, on the verge of surrendering to Prince Eugene and the duke of Marlborough owing to famine, was saved by the daring of Jacqueline Robin, who brought provisions into the place. St. Omer ceased to be a bishopric in 1801.

At St. Omer begins the canalized portion of the Aa, which reaches the sea at Gravelines, and under its walls connects with the Neuffossé canal, which ends at the Lys. There are two harbours outside and one within the city. The old cathedral belongs almost entirely to the 13th, 14th and 15th centuries. A heavy square tower finished in 1499 surmounts the west portal. The church contains interesting paintings, a colossal statue of Christ seated between the Virgin and St. John (13th century, originally belonging to the cathedral of Thérouanne) and the cenotaph of St. Omer (13th century). The richly decorated chapel in the transept contains a wooden figure of the Virgin (12th century), the object of pilgrimages. Some arches and a lofty tower are all that remain of the abbey church of St. Bertin. St. Sepulchre (14th century) has a beautiful stone spire and stained-glass windows. There is a fine collection of records in the town hall, which was built of the materials of the abbey of St. Bertin. There are several houses of the 16th and 17th centuries; of the latter the finest is the Hôtel Colbert, once the royal lodging. St. Omer is the seat of a sub-prefect, of a court of assizes, of a tribunal of commerce, of a chamber of commerce, and of a board of trade arbitrators. It was the British headquarters during part of World War I. The industries include the manufacture of linen goods, sugar, soap, tobacco pipes and mustard, the distilling of oil and liqueurs, dyeing, salt-refining, malting and brewing.

The suburb of Haut Pont to the north of St. Omer is inhabited by a special stock, which has remained faithful to the Flemish tongue, its original costume and its peculiar customs, and is distinguished by honesty and industry. The ground which these people cultivate has been reclaimed from the marsh, and the *lègres* (*i.e.,* the square blocks of land) communicate with each other only by boats floated on the ditches and canals that divide them. At the end of the marsh, on the borders of the forest of Clairmarais, are the ruins of the abbey founded in 1140 by Thierry d'Alsace. to which Thomas Becket betook himself in 1165.

SAINTONGE, one of the old provinces of France, of which Saintes (*q.v.*) was the capital, was bounded on the north-west by Aunis, on the north-east by Poitou, on the east by Angoumois, on the south by Guyenne, and on the west by Guyenne and the Atlantic. It now forms a small portion of the *département* of Charente and the greater part of that of Charente Inférieure. Originally occupied by the Gaulish Santones, whose name it preserves, the district subsequently formed part of Aquitania Secunda. It formed the bishopric of Saintes and was divided into two *pagi: Santonicus* (whence Saintonge) and Alienensis (Aunis). Divided between the kings of England and France in 1259 it was wholly ceded to the king of England in 1360, but reconquered by Du Guesclin in 1371. Up to 1789 it was in the same gouvernement with Angoumois, but for judicial purposes Saintonge was under the parlement of Bordeaux and Angoumois under that of Paris.

See D. Massiou, *Histoire* politique, civile et *religieuse* de *la* Saintonge *et* de *l'Aunis,* 6 vol. (1836–39; 2nd ed., 1846); P. D. Rainguet, Biographie saintongeaise (1852). *See* also the publications of the *Société* des archives *hist.* de la Saintonge et de *l'Aunis* (1874 seq.).

ST. PANCRAS, a metropolitan borough of London. England, bounded east by Islington. southeast by Finsbury, south by Holborn and west by St. Marylebone and Hampstead, and extending north to the boundary of the county of London. Pop. (1951) 138.377. Area 4.2 sq.mi. In the centre of the borough are Camden Town and Kentish Town and the three great railway termini of Euston. St. Pancras and King's Cross, with their extensive goods depots and adjacent hotels. To the south of this lies the residential district of Bloomsbury (part of which is in Holborn), one mainly of university buildings and private hotels, and with several fine squares. North of the railway stations are residential districts near Hampstead heath and Regent's park, including Gospel Oak and part of Highgate.

There are considerable open spaces, the largest of which are Waterlow park, parts of Regent's park and of Primrose hill. Parliament Mill fields (bought for the public in 1886) and Kenwood (purchased in 1919). The last contains Kenwood house, bequeathed to the public by Lord Iveagh (d. 1927) together with its noted collection of pictures.

A thoroughfare, called successively Tottenham Court road, Hampstead road, Camden High street, Kentish Town road, and Highgate road, runs from south to north; Euston road crosses it in the south, and Camden road and Chalk Farm road branch from it at Camden Town. The old parish church of St. Pancras in the Fields, near Pancras road. has lost its ancient character as a result of reconstruction. though it retains several early monuments. The new parish church of St. Pancras is in Woburn place. University college (a part of London university). Gower street. was founded in 1826 and provides education in all branches common to universities excepting theology. With the department of medicine is connected the University College hospital (1833) opposite the college. There are several other hospitals: among them the Royal Free hospital (Gray's Inn road), the London Skin hospital (Fitzroy square) and the Elizabeth Garrett Anderson Hospital for Women (Euston road). The site of the Foundling hospital (*q.v.*), in the old Lamb's Conduit fields, has been transformed into a permanent open-air study and play centre for children through a fund initiated for the purpose by Lord Rothermere. Other institutions are the British Medical association in Tavistock square (1925), the Royal Veterinary college and the North Western polytechnic (1929). The Mary Ward (formerly Passmore Edwards) settlement, first named for its principal benefactor, was founded largely through the instrumentality of Mrs. Humphry Ward. In Euston road are the British headquarters of the Society of Friends. the nen buildings of which were completed in 1926. Park Village East and Park Village West, at the north end of Albany street and separated by the canal, mere built by John Nash.

St. Pancras with Holborn returns two members to parliament, for St. Pancras North, and Holborn and St. Pancras South. Many of the inhabitants are employed in work connected with the railways. There are also cigarette, furniture and piano-making industries.

St. Pancras is mentioned in Domesday as belonging to the chapter of St. Paul's cathedral. in which body the lordship of the manors of Cantelows (Kentish Town) and Totenhall (Tottenham Court) was invested. Camden Town takes its name from Baron Camden (d. 1794), lord chancellor under George III. King's Cross was so called from a statue of George IV. erected in 1830 and greatly ridiculed and removed in 1845. but an earlier name, Battle Bridge. is traditionally derived from the stand of Queen Boadicea against the Romans, or from one of Alfred's contests with the Danes.

SAINT PAUL, capital city of Minnesota, U.S., seat of Ram-

sey county and a port of entry, is located 2 mi. below the head of navigation on the Mississippi river and adjacent to Minneapolis; it is about 350 mi. N.W. of Chicago. It has 16 mi. of river frontage along a deep S-shaped bend of the Mississippi which flows south to its confluence with the wider Minnesota river, northeast past the business district, and then sharply south again in its broadening valley. The heart of the city, built upon a series of terraces which rise from the river (altitude, 703 ft.) to the surrounding glacial plains (altitude, 900 ft.), presents a striking sky line from the southern and eastern approaches, and various points along the heights within the city afford sweeping views across the river valley. The downtown area, surrounded by hills, grew up with an irregular street pattern which is reminiscent of older eastern cities. St. Paul and Minneapolis (*q.v.*), to the west and north, are contiguous and, though very different in character and development, are often called the Twin cities.

History. — In 1680, Father Louis Hennepin (*q.v.*) passed the site of St. Paul, and in 1766 Jonathan Carver (*q.v.*), searching for the northwest passage, explored a cave near the city. In 1805, Lieut. Zebulon Montgomery Pike (*q.v.*), leader of a U.S. expedition, camped beneath the bluffs of the Minnesota and Mississippi rivers on what is known as Pike Island where he made an unofficial treaty with the Sioux for possession of the region, including the commanding site above him on which Fort Snelling was later built. The first claim in what is now St. Paul was made in 1838 by Pierre "Pig's Eye" Parrant. The landing was known as Pig's Eye until 1841 when Father Lucian Galtier built a log chapel dedicated to St. Paul. In 1849 St. Paul became the capital of the newly formed Minnesota territory. Settlers, mainly from the eastern states, poured into the river town which was incorporated in 1854, its population by 1860 exceeding 10,000.

Industrial and *Commercial* Growth. — St. Paul's historic importance in the development of the upper midwest was as a commercial centre located near the head of navigation on the Mississippi river. Furs were its first products for the outside market, with groceries and dry goods assuming early importance. The first private bank in the territory was established in St. Paul in 1852 and the First National Bank of St. Paul nas organized in 1863. In 1862 the first train left the city on the 10-mi. track of the St. Paul and Pacific railroad. In 1883 a great celebration marked the completion of the Northern Pacific railroad to the west coast. and 11 years later the Great Northern railroad, under the leadership of James J. Hill (*q.v.*), was completed. Banking in St. Paul has continued its close affiliation with the railroads whose development gave it the name, "gateway to the great northwest."

St. Paul's manufacturing developed slowly in a diversified pattern based upon the resources and needs of the surrounding country. Boots and shoes ranked first among the industries in the 1870s. In 1882 the Union Stock Yards company was established by the railroads. By mid-20th century the livestock market, now in suburban South St. Paul was one of the world's largest public livestock markets in salable receipts. There are numerous printing and publishing houses including an important law publishing firm. Among the largest employers are manufacturers of automobiles, electronic communications equipment, abrasives and magnetic tape, refrigerators, construction equipment, advertising specialties and beer. Tno large oil refineries and three chemical plants were brought to the St. Paul area by the development of industrial sites along the river to the south of the city.

Population and Administration. — St. Paul is in the Minneapolis-St. Paul standard statistical metropolitan area comprising the counties of Anoka, Dakota, Hennepin. Ramsey and Washington, which according to the federal census of 1960 had a population of 1,482,030. The population of St. Paul proper was 311,349 in 1950 and 313,411 in 1960. Its period of greatest growth mas between 1880 and 1895 when the population increased from approximately 40,000 to 140,000. During this period also the proportion of foreign born reached its peak, with Germans and Irish leading in numbers. This phase of immigration underlies the character of the modern city, though by 1930 when the population was 271,606 the foreign born included a high percentage of Scandinavians and also east Europeans, Italians and Mexicans. St. Paul is the seat of a Roman Catholic archdiocese which was built up by Archbishop John Ireland (*q.v.*) who greatly influenced the development of the city. Roman Catholics in the early 1960s numbered about two-fifths of the population, though Protestant, Jewish and Orthodox faiths were well represented.

Under the commission plan of government, adopted by the voters in 1912, city officials are elected for two-year terms. The legislative council consists of the mayor and six commissioners who serve as administrators of the various city departments. Judges of the municipal court are also elected officials as are the seven members of the board of education who serve without pay.

Transportation. — St. Paul is served by nine first-class railroads which own and operate a terminal switching line in the city. By mid-20th century it had become one of the largest trucking centres in the nation. The rafting industry, carrying logs and lumber down the river, was important to St. Paul until about 1900. The last raft left in 1914, but river traffic attained a new significance in the late 1950s with 25 barge lines carrying about 2,000,000 tons of bulk commodities such as coal, grain, oil and fertilizers between the Port of St. Paul and Mississippi river markets and Gulf ports. St. Paul and Minneapolis are jointly served by the Wold-Chamberlain International airport.

Education, Culture and Recreation. — St. Paul has five liberal arts colleges, all with active building programs and growing enrollments: the College of St. Thomas, for men (Roman Catholic, 1885); Macalester college (Presbyterian, 1885); Concordia junior college (Lutheran, 1905); Hamline university (Methodist, 1854); and Bethel College and Seminary (originally established in 1871 as Scandinavian Department of Baptist Union Theological Seminary of The University of Chicago) since 1947, a four-year college. The University of Minnesota Institute of Agriculture has a large campus in the northeast corner of the city. Luther Theological seminary and St. Paul seminary (Roman Catholic) are in St. Paul, and the William Mitchell College of Law gives a full degree through evening courses. Parochial and private schools are well represented, and a recognized program for pupils of all levels of ability was instituted in the city's public schools.

An Italian Renaissance building, built in 1916, houses both the public library and the James Jerome Hill reference library, a private corporation with especially extensive collections in economics, science and technology. The Minnesota Historical society, founded in 1849, has an outstanding collection of manuscripts and printed materials and also a museum relating to the region. The science museum of the St. Paul institute, founded in 1906, supported 50% by public funds, houses exhibits of anthropology, geology and related sciences. The St. Paul Gallery and School of Art, supported 13% by public funds, has, since 1926, encouraged crafts and local arts. St. Paul has long been known as a musical city. The Schubert club, founded in 1882, provides a distinguished concert series and sponsors a scholarship program, and the St. Paul Civic Opera association has, since 1934, encouraged local talent through its productions. More than 1,000,000 people attend the annual state fair, held in the grounds near the Institute of Agriculture. and since 1886, when the first ice palace was built, the St. Paul Winter carnival has been a colourful annual event. Perhaps the most distinctive of the city's entertainment events is the biennial Festival of Nations first sponsored in 1932 by the International institute and featuring dances, handicrafts and foods of many nations. A distinctive social service in the city is the Wilder Charities, established in 1910 under a trust fund by Amherst H. Wilder "for the benefit of the poor of the city." The Municipal auditorium, built in 1907, and enlarged in 1932, seats 15,000 and the Municipal stadium, built in 1954, holds 10,000.

Buildings and Parks. — A city of quiet, tree-shaded streets and middle-class homes, St. Paul is crowned by Summit avenue which, progressing westward from the bluffs overlooking the business district, reveals along its 49-mi. length the changing styles of residential and church architecture, beginning with the impressively located baroque Cathedral of St. Paul which overlooks the city and the mansion of James J. Hill, built in 1887, passing the bold and symbolic structure of Mount Zion temple, completed in 1954, and ending with the homes of the mid-20th century. Among

the landmarks is the home of Gov. Alexander Ramsey, a fine example of the dignified domestic architecture of the 1880s. The Federal Courts building (1900) is a delightfully bizarre example of French Renaissance architecture. In the concourse of the 19-story functional City hall and Ramsey County courthouse, erected in 1931, stands the huge rotating onyx figure of the Indian God of Peace by the Swedish sculptor, Carl Milles. The Woman's City club overlooks the river. The First National bank has, since 1931, with the Cathedral of St. Paul and the capitol building (designed by Cass Gilbert and inspired by Italian High Renaissance) both on the bluffs behind it, dominated the sky line. Extensive clearing, begun in 1956, has beautified the capitol approach which gives, from its height, a spectacular vista of the city and the valley beyond.

St. Paul has 11 major parks, the most interesting of which are Como park, begun in 1872, with its lake, greenhouse and zoo, and Indian Mounds park, where Indian burial mounds dot the margin of the bluff which gives a sweeping view across the southward course of the river and of the city to the east. (MA. C. B.)

SAINTPAULIA: *see* AFRICAN VIOLET.

SAINT PAUL ROCKS, also known as Rochedos São Paulo and as St. Peter and St. Paul, a number of islets in the Atlantic, nearly 1° N. of the equator and 540 mi. from South America, in 29° 15′ W. The whole space occupied does not exceed 1,400 ft. in length by about half as much in breadth. Besides seafowl the only land creatures are insects and spiders. Fish are abundant, seven species being collected by the "Challenger" expedition (*q.v.*). Darwin considered the rocks not of volcanic origin but later investigators maintain that they probably are eruptive.

(J. L. TR.)

ST. PETER PORT, the chief town of Guernsey, one of the Channel Islands. Pop. (1951) 16,799. It lies on a steep slope above its harbour, on the east coast of the island. The harbour is enclosed by breakwaters, the southernmost of which connects with the shore and continues beyond an islet on which stands Castle Cornet (12th century). A sea wall extends more than a mile toward the port of St. Sampson. To the south of the town is Fort George. The old boundaries of the town are marked by five stones. St. Peter's, the town church, standing low by the side of the quay, dates from various periods, with possible remnants of Norman walls, and has fine details of the 14th and 15th centuries. The Elizabeth college for boys was founded by Queen Elizabeth I. Hauteville house, the residence of Victor Hugo from 1856 to 1870, is preserved as he left it, and the authorities of the city of Paris are now its trustees. Among other works which he produced in this island fastness was *Les Travailleurs de la Mer* (1863), unsurpassed even among the works of its author for splendour of imagination and for pathos.

The original harbour was built under King Edward I, if not earlier; it was added to under Queen Elizabeth I and outside this harbour lay a roadstead, landward of the islet of Castle Cornet. Most of this roadstead was enclosed by breakwaters in the mid-19th century, and the large harbour thus formed has had its quayage increased by the completion in 1930 of a jetty projecting out into the pool. A large export trade in fruit, vegetables and flowers is carried on, and it is a popular port for visiting yachts from England and continental Europe. (B. C. DE G.)

ST. PETERSBURG: *see* LENINGRAD.

SAINT PETERSBURG, a resort city, is located on the west coast of Florida, U.S., in Pinellas county. Occupying the tip of Pinellas peninsula in Tampa bay, it is connected by the 7-mi. Gandy bridge with the mainland toward Tampa, 20 mi. N.E., and by the 15-mi. Sunshine skyway, consisting of five bridges and six causeways, with the mainland south-southwest toward Bradenton and Sarasota. Bridges and causeways to the west provide access across Boca Ciega bay to island beaches along the Gulf of Mexico. The population in 1960 was 181,298 (for comparative population figures *see* table in FLORIDA: *Population*). St. Petersburg is designated by the census bureau as a central city of the Tampa-St. Petersburg standard metropolitan statistical area (*see* TAMPA).

Known as the "Sunshine city," St. Petersburg was named for the birthplace in Russia of Peter A. Demens who with John C. Williams of Detroit founded the Florida city. In 1888 Demens completed a railway connecting it with the St. Johns river, then the main artery of traffic to interior Florida. Settlers and tourists were attracted by development projects of the Hamilton Disston corporations which owned much of the surrounding area. The city was incorporated in 1892 and adopted a council-manager form of government in 1931. There are several hundred small, diversified industries and branch shops and plants of national corporations. A large number of retired persons live in the city.

A one-half mile municipal pier has fishing balconies, a museum, a solarium and pools. Bays, harbours and marinas about the city accommodate a large fleet of pleasure craft which frequently participate in races and regattas. Other recreational and entertainment attractions are band concerts, major-league baseball teams in spring training, fishing, golf and other out-of-door sports.

The public-school system is headed by the St. Petersburg junior college, founded in 1927. Among other educational institutions are the Admiral Farragut Naval academy (preparatory), the Law College of Stetson university, and the Florida Presbyterian college, established in 1959 and opened in 1960. (A. J. H.)

SAINT-PIERRE, CHARLES IRÉNÉE CASTEL, ABBÉ DE (1658–1743), French writer, was born at the Château de Saint-Pierre l'Église near Cherbourg on Feb. 18, 1658. His father was *bailli* of the Cotentin, and Saint-Pierre was educated by the Jesuits. In Paris he frequented the salons of Madame de la Fayette and of the marquise de Lambert. He was presented to the abbacy of Tiron, and was elected to the Academy in 1695. In the same year he gained a footing at court as almoner to Madame. But in 1718, in consequence of the political offence given by his *Discours sur la polysynodie,* he was expelled from the Academy. He died in Paris on April 29, 1743.

Saint-Pierre's works are almost entirely occupied with an acute criticism of politics, law and social institutions. They had a great influence on Rousseau, who left elaborate examinations of some of them, and reproduced not a few of their ideas in his own work. His *Projet de paix perpétuelle,* which was destined to exercise considerable influence on the development of the various schemes for securing universal peace which culminated in the Holy alliance, was published in 1713 at Utrecht, where he was acting as secretary to the French plenipotentiary, the Abbé de Polignac. His works were published at Amsterdam in 1738–40 and his *Annales politiques* in London in 1757. A discussion of his principles, with a view to securing a just estimation of the high value of his political and economic ideas, is given by S. Siégler Pascal in *Un Contemporain égaré au XVIII^e siècle. Les Projets de l'abbé de Saint-Pierre, 1658–1743* (1900).

ST. PIERRE and **MIQUELON,** the largest islands of two small groups 10 mi. off the south coast of Newfoundland; united area about 93 sq.mi. Both islands are rugged masses of granite, with a few small streams and lakes, a thin covering of soil and scanty vegetation. Area of St. Pierre group, 10 sq.mi.; Miquelon group, 83 sq.mi. The population of the two islands in 1957 was 4,827, the capital city of St. Pierre having 4,222 people.

The islands were occupied by the French in 1604 and fortified in 1696. In 1702 they were captured by the British and held until 1763, when they were given back to France as a fishing station. They are thus the sole remnant of the French colonies in North America. Taken by the Ehglish in 1778, restored to France in 1783, again captured and depopulated by the English in 1793, recovered by France in 1802 and lost in 1803, the islands have remained in undisputed French possession since 1814 (treaty of Paris). Their importance is due to their proximity to the Grand Banks. Primary education is free, with two schools for boys and three for girls, besides private schools.

Fishing activities of the archipelago have been limited to coastal fishing in dories. Salted and dried cod is exported to the Antilles, but production is not sufficient for the economy of the islands. As a result of a subsidy from France, however, a company was formed in 1951 to produce frozen fish fillets and by-products of fish. St. Pierre also has a fur industry (fox and mink). The pelts, shipped to the markets of the world, are of good quality.

Communication between St. Pierre and Canada is maintained by

a French vessel, property of the government. This boat transports passengers. mail and freight on the St. Pierre-Halifax line during the winter and on the St. Pierre-Sydney line during the summer. Nonscheduled air transport is furnished by a Canadian company, Maritime Central Airways. A small steamer with accommodation for passengers and freight provides transportation between the islands of St. Pierre and Miquelon. Administration of the islands and public services is carried out by a governor, assisted by a private council. In 1946 a general council, composed of 14 members elected by universal franchise, assumed a large part in the administration of this territory. It acquired power particularly over the local budget and the fixing of customs, tariffs and all other taxes. The territory of St. Pierre and Miquelon is represented in the French parliament by a member in the national assembly and by a senator in the council of the republic. It elects, as well, a representative to *l'assemblée de l'union française.*

ST. QUENTIN, a manufacturing town of northern France, capital of an *arrondissement* in the *département* of Aisne, 32 mi. N.N.W. of Laon by rail. Pop. (1954) 52,148. St. Quentin (anc. *Augusta Veromanduorum)* stood at the meeting-place of five military roads. In the 3rd century it was the scene of the martyrdom of Gaius Quintinus. The date of the foundation of the bishopric is uncertain, but about 532 it was transferred to Noyon. Towards the middle of the 7th century St. Eloi (Eligius), bishop of Noyon, established a collegiate chapter at St. Quentin's tomb, which became a famous place of pilgrimage. The importance of the town was increased during the middle ages by the rise of its cloth manufacture. The town was surrounded by walls in 883. It became under Pippin, grandson of Charlemagne, one of the principal domains of the counts of Vermandois, and in 1080 received from Count Herbert IV a charter which was extended in 1103. From 1420 to 1471 St. Quentin mas occupied by the Burgundians. In 1557 it was taken by the Spaniards *(see* below). Two years later the town was restored to the French, and in 1560 it was assigned as the dowry of Mary Stuart. During the Franco-Prussian War St. Quentin repulsed the German attacks of Oct. 8, 1870; and in January 1871 it was the centre of the great battle fought by General Faidherbe. In World War I St. Quentin was held by the Germans from the end of Aug. 1914 to Oct. 1, 1918.

The town stands on the right bank of the Somme, at its junction with the St. Quentin canal (which unites the Somme with the Scheldt) and the Crozat canal (which unites it with the Oise). The collegiate church of St. Quentin, a fine Gothic building of the 12th, 13th, 14th and 15th centuries, damaged during World War I, was reopened in 1920. It has no west façade but terminates at that end in a tower and portal of Romanesque architecture; it has double transepts. The choir (13th century) has remains of a choir screen of the 14th century. Under the choir is a crypt of the 11th century, containing the tombs of St. Quentin (Quintin) and his fellow-martyrs Victoricus and Gentianus. The hôtel-de-ville of St. Quentin (only slightly damaged) is a Gothic building of the 14th, 15th and 16th centuries, with a flamboyant façade, adorned with curious sculptures. St. Quentin is the seat of a subprefect, of a tribunal of commerce, of a board of trade-arbitrators, and a chamber of commerce. The town has recovered its industrial activity and is the centre of a district which manufactures cotton and woollen fabrics. St. Quentin produces chiefly window-curtains and carries on the spinning and preliminary processes and the bleaching and finishing. Other industries are the making of embroideries by machinery and by hand, and the manufacture of iron goods, machinery and chemical products. Trade is in grain, flax, cotton and wool.

1. **Battle of** 1557.—An army of Spaniards under Emmanuel Philibert of Savoy, invading France from the Meuse, joined an allied contingent of English troops under the walls of St. Quentin, which was then closely besieged. Admiral Coligny threw himself into the town, and the old Constable Montmorency prepared to relieve it. On St. Lawrence's Day, Aug. 10, the relieving column reached the town without difficulty, but time was wasted in drawing off the garrison, for the pontoons intended to bridge the canal had marched at the tail of the column, and when brought up mere mismanaged. The besiegers, recovering from their surprise, formed the plan of cutting off the retreat of the relieving army. Montmorency had thrown out the necessary protective posts, but at the point which the besiegers chose for their passage the post was composed of poor troops, who fled at the first shot. Thus, while the constable was busy with his boats, the Spanish army filed across the Bridge of Rouvroy, some distance above the town, with impunity, and Montmorency, in the hope of executing his mission without fighting, refused to allow the cavalry under the duc de Nevers to charge them, and miscalculated his time of freedom. The Spaniards, enormously superior in force, cut off and destroyed the French gendarmerie who formed the vanguard of the column, and then headed off the slow-moving infantry south of Essigny-le-Grand. Around the 10,000 French gathered some 40,000 assailants with forty-two guns. The cannon thinned their ranks, and at last the cavalry broke in and slaughtered them. Yet Coligny gallantly held St. Quentin for seventeen days longer, Nevers rallied the remnant of the army and, garrisoning Péronne, Ham and other strong places, entrenched himself in front of Compiègne, and the allies, disheartened by a war of sieges and skirmishes, came to a standstill. Soon afteruards Philip, jealous of the renown of his generals and unwilling to waste his highly trained soldados in ineffective fighting, ordered the army to retreat (Oct. 17), disbanded the temporary regiments and dispersed the permanent corps in winter quarters.

2. **The Battle of** 1871.—This was fought between the German I. Army under General von Goeben and the French commanded by General Faidherbe. The latter concentrated about St. Quentin on Jan. 18, and took up a defensive position on both sides of the Somme Canal. The Germans, though inferior in numbers, were greatly superior in discipline and training, and Goeben boldly decided to attack both wings of the French together on the 19th. The attack took the customary enveloping form. After several hours' fighting it was brought to a standstill, but Goeben, using his reserves in masterly fashion, drove a wedge into the centre of the French line between the canal and the railway, and followed this up with another blow on the other bank of the canal, along the Ham road. This was the signal for a decisive attack by the whole of the left wing of the Germans, but the French offered strenuous resistance, and it was not until four o'clock that Faidherbe made up his mind to retreat. By skilful dispositions and orderly movement most of his infantry and all but six of his guns were brought off safely, but a portion of the army was cut off by the victorious left wing of the Germans, and the defeat, the last act in a long-drawn-out struggle, was sufficiently decisive to deny to the defenders any hope of taking the field again without an interval of rest and reorganization. Ten days later the general armistice was signed. *(See* further FRANCO-GERMAN WAR.)

ST. QUENTIN, BATTLE OF (sometimes called "Cambrai-St. Quentin"), the attack by British troops against the German Hindenburg position in World War I (Sept.–Oct. 1918).

The first in the series of Allied advances to the Hindenburg position (sometimes known as the battle of Amiens) began in Aug 1918. At 4:20 A.M. on Aug. 8, the Canadian corps (right) and Australian corps (left), supported by 435 British tanks, began to advance in the area east of Amiens and south of the Somme. Rapid progress was made. Later in the day troops of the French IX and XXXI corps on the right and the British III corps on the left (north of the Somme) also attacked but met stubborn opposition. During this first day the Germans lost about 28.000 men, 400 guns and nearly 100 aircraft, against less than 10,000 Allied casualties.

On Aug. 9 the British III corps made substantial gains north of the Somme and captured 2.960 prisoners but in general little further progress was made, and the day was characterized by small isolated actions rather than a co-ordinated advance. Operations on Aug. 10 were equally disappointing. On Aug. 11 slight progress was made. but in the afternoon, because of the exhaustion of the troops and the stubborn resistance of the Germans, the advance was halted until the heavy artillery had been moved forward. The total German casualties between Aug. 6 and 12 were esti-

mated at 75.000; those of the Allies were 24.232.

The offensive was continued on Aug. 20. There followed the battles of Albert, Bapaume. Second Arras. Scarpe and the U.S. action of the Saint-Mihiel salient. By the last week in Sept. 1918 the stage was set for the Allied assault on the Hindenburg position and the final advance to victory.

The attack was made on the front of the 3rd (Gen. Sir J. Byng), 1st (Gen. Sir H. Horne) and 4th (Gen. Sir H. Rawlinson) armies, in all 41 divisions supported by 1,500 heavy guns. 1.100 aircraft and 14 battalions of tanks. Opposed to these were 27 German divisions in front line and 14 in reserve. The attack began on Sept. 27 and, by the evening of Sept. 28, British and Canadian troops of the 3rd and 1st armies had advanced 6 mi. Early on Sept. 29 troops of the 4th army joined in the attack and the 3rd and 1st armies advanced a further *2* mi. By Oct. 8 the Germans were in full retreat on a wide front, morale began to crack and the British took many prisoners.

On Sept. 28 Ludendorff had reported to Hindenburg that the situation was irretrievable; on the following day Hindenburg told a council of war that an armistice was essential. On Oct. 4 German and Austrian notes were sent to President Wilson of the U.S. proposing an armistice.

See Sir James E Edmonds and R. Maxwell Hyslop (compilers), the official British *History of the Great War—France and Belgium 1918,* vol. iv and v (1947). (C. N. B.)

SAINT-RÉAL, CÉSAR VICHARD, ABBÉ DE (d. 1692), French man of letters whose lively writings did much to bring about a new view of history and entitle him to be regarded as a forerunner of Montesquieu and of Voltaire. Born in Savoy (after 1638; perhaps in 1643 or 1644), the son of a magistrate, he went to Paris about 1663. Gabriel Guéret. in 1669, could describe him as the constant counselor of Racine and Boileau and as being regarded in their circle as an authority on literary taste. In 1674, however. he returned to Savoy and attached himself to the errant duchess Mazarin (Hortense Mancini), whom in 1676 he followed to England and whose reconciliation with the court he tried to negotiate on his return to France. He died in Chambéry in Sept. 1692.

Saint-Réal is said to have been a man of original views, great powers of persuasion and doubtful morals. His views on the real motives of human activity resemble La Rochefoucauld's, and his treatise *De l'usage de l'histoire* (1671) suggests that he had absorbed a reverence for Machiavelli from Italian historiographers, His most popular work was *La Conjuration des Espagnols contre la république de Venise* (1674), which inspired Thomas Otway's *Venice Preserved.* His other works include *Dom Carlos* (1672; one of the sources of Schiller's *Don Carlos*); a remarkable *Vie de Jésus-Christ* (1678); a translation of the first two books of Cicero's letters to Atticus (1691); and numerous further essays on historical subjects. Several collections of his works appeared in the 18th century, the last of them in eight volumes (1757).

SAINTS, BATTLE OF THE. This battle was fought between the fleets of England and France in the channel between the islands of Dominica and Guadeloupe on April 12, 1782. It takes its name from the Saints Islands in the channel. The French had 35 battleships under the Comte de Grasse based on Martinique, and their object was to give the British fleet the slip and capture Jamaica. The British fleet of 36 ships was based on St. Lucia and was under Adm. George Rodney. On April 8 the signal came that the French were out. At dawn on April 9 the British van under Viscount Hood was close to De Grasse. who ordered his store ships to Guadeloupe with two escorting battleships. Hood was soon in action with the French rear, and his position was awkward in that he only, of the English, had made the Saints passage, the centre and rear being becalmed under the lee of Dominica. De Grasse was thus in a position to attack him with all his force, but he merely cannonaded his enemy from a distance. The British van suffered enough to make it necessary subsequently for it to change places with the rear, under Drake, but the arrival of Rodney caused De Grasse to withdraw and the French battleship "Cato" was put out of action. During the ensuing night and day the French gained somewhat and seemed likely to get clear away, but on the night of the 10th two battleships collided. One was abandoned and, on the 11th, the other fell far behind and De Grasse turned to help her. Thus a general action was joined on April 12. the French by then having only 30 effective ships. The two fleets approached one another on opposite courses with the French being nearer the wind. The fight began early and about 10 o'clock the wind shifted and gaps appeared in the French line. Rodney grasped the possibilities of the situation, and decided to risk it. There were no signals for the movement so, relying on the force of example, Rodney took his flagship, the "Formidable," stationed in the centre, through a gap in the rear of the French centre. He was followed by the five ships immediately astern. all raking the French as they passed. A similar movement took place in the rear. Captain Affleck, in the "Bedford," passing through the head of the same French squadron, was followed by Hood with the entire British rear.

The French were thus broken into three bodies, De Grasse, in the "Ville de Paris," with other ships of the centre being isolated and captured. (G.A.R.C.; J.G.B.)

SAINT-SAENS, CHARLES CAMILLE (1835–1921), French composer. pianist and organist known for his symphonic poems and his opera, *Samson et Dalila.* Born on Oct. 9, 1835, in Paris, he studied the piano with C. M. Stamaty and gave his first recital as a child prodigy in 1846. At the Paris conservatoire he studied the organ under F. Benoist and composition under J. F. Halévy. His first symphony was performed in 1853. He was appointed organist at the church of Saint-Merry in Paris, in the same year, and at the Madeleine in 1857. About this time he met Liszt who described him as "the finest organist in the world." From 1861 to 1865 he was professor of piano at the École Niedermeyer where his pupils were Gabriel Fauré and André Messager. In 1865 he played his first piano concerto at Leipzig, and in 1871, after the Franco-German War, he founded, with the singer, Romain Bussine, the Société Nationale de Musique, with the motto, *Ars Gallica,* which promoted performances of the main French orchestral works of the following generation. In the same year he produced his first symphonic poem, *Le Rouet d'Omphale;* other later symphonic poems were *Phaëton, Danse Macabre* and *La Jeunesse d'Hercule.* Following the production of his first operas, *La Princesse jaune* (1872) and *Le Timbre d'argent* (1877), his biblical opera, *Samson et Dalila,* rejected in Paris on account of its subject, was given in German at Weimar on Dec. 2, 1877, on the recommendation of Liszt. Despite its success, the prejudice in France and elsewhere against the portrayal of biblical characters on the stage persisted, and early performances in London, New York and Brussels had to be given in concert form. It was first given in Paris on the stage on Oct. 31, 1890, at the Théâtre Eden, and subsequently became Saint-Saëns' most popular dramatic work.

In 1878 Saint-Saens lost his elder son, who fell to his death from a window, and six weeks later his younger son died in infancy. It is possible that he imputed these tragedies to his wife's negligence: certainly he separated from her three years later, and undertook over the following years extensive tours throughout Europe, the United States, South America, the near east and the far east. On these tours he played the piano in the performances of his five concertos and other works and conducted his symphonic works. As a pianist he mas admired by Wagner for his brilliant technique and was the subject of a study by Marcel Proust. From about 1880 until the end of his life his large number of works covered all fields of dramatic and instrumental music. Between 1879 and 1911 he wrote ten operas, including *Henry VIII, Les Barbares* and *Déjanire,* and between 1915 and 1921 a series of works for wind instruments and piano. His third symphony (1886), dedicated to the memory of Liszt, shows a romantic tendency. The *Carnaval des Animaux* for small orchestra, written in 1886 but not publicly performed in his lifetime, is a humorous work with realistic effects, conceived as "a zoological fantasy." *Africa,* for piano and orchestra (1891), and the *Caprice Arabe* for two pianos (1894) show an oriental in-

fluence. Among the best of his later works are the fifth piano concerto (1896) and the second cello concerto (1902). He gave his last concert in Dieppe in 1921, and died in the same year at Algiers. on Dec. 16.

Under the influence of Liszt, Saint-Saens developed the symphonic poem and wrote for the piano in an elegant. virtuoso style. The clarity of his orchestration long remained a model. Though he lived through the period of the Wagnerian influence he remained unaffected bv it, adhered to the classical models and upheld a conservative iheai in French music, admired for its polished craftsmanship and sense of form. In his essays and memoirs he described the contemporary musical scene in a shrewd and often an ironic manner.

SAINTSBURY, GEORGE EDWARD BATEMAN (1845–1933), English man of letters, was born at Southampton on Oct. 23, 1845. He was educated at King's college school, London, and at Merton college, Oxford (B.A. 1868), and spent six years in Guernsey as senior classical master of Elizabeth college (1868–74). From 1874 to 1876 he was headmaster of the Elgin educational institute. He began his literary career in 1875 as a critic for the *Academy,* and for ten years was actively engaged in journalism, becoming an important member of the staff of the *Saturday Review.* Some of the critical essays contributed to the literary journals were afterward collected in his *Essays in English Literature, 1780–1860* (2 vol., 1890–1895), *Essays on French Novelists* (1891), *Miscellaneous Essays* (1892) and *Corrected Impressions* (1895). His first book, *A Primer of French Literature* (1880), and his *Short History of French Literature* (1882; 6th ed., 1901) were followed by a series of editions of French classics and books and articles on the history of French literature, which made him the most prominent English authority of his day on the subject. His studies in English literature were no less comprehensive and included: the valuable revision of Sir Walter Scott's edition of Dryden's *Works* (18 vol., 1882-1893); *Dryden* (1881) in the "English Men of Letters" series; *History of Elizabethan Literature* (1887); *History of Nineteenth Century Literature* (1896); *A Short History of English Literature* (1898; 3rd ed., 1903); an edition of the *Minor Poets of the Caroline Period* (3 vol., 1905-1921); a collection of rare poems of great value; and editions of English classics. He edited the series of "Periods of European Literature," contributing the volumes on *Tile Flourishing of Romance and the Rise of Allegory* (1897) and *The Earlier Renaissance* (1901). From 1895 to 1915 he was professor of rhetoric and English literature at Edinburgh university. During this period he produced two of his most important works, *A History of English Prosody From the 12th Century to the Present Day* (i, 1906; ii, 1908; iii, 1910) and *The Later Nineteenth Century* (1900). Saintsbury also wrote *A History of Criticism* (3 vol., 1906–1921), *The History of English Criticism* (1911) and *A History of the French Novel* (1917-1919).

Saintsbury died on Jan. 28, 1933.

SAINT SERVAN, a town of western France, in the *département* of Ille-et-Vilaine. on the right bank of the Rance, south of Saint-Malo. Pop. (1951) 12,077. Southwest of the town is the tower of Solidor. This stronghold, erected toward the close of the 14th century by John IV, duke of Brittany, for the purpose of contesting the claims to the temporal sovereignty of the town of Josselin de Rohan, bishop of Saint-Malo, consists of three distinct towers formed into a triangle by loopholed and machicolated curtains. To the west St. Servan terminates in a peninsula on which stands the "Cité." Nearby is a modern chapel which replaced the cathedral of St. Peter of Aleth, the seat of a bishopric from the 6th to the 12th century. The Cité occupies the site of the city of Aleth, which at the close of the Roman empire supplanted Corseul as the capital of the Curiosolites. Aleth was a bulwark of Druidism in those regions and was not Christianized until the 6th century when St. Malo became its first bishop. On the removal of the bishopric to Saint-Malo. Aleth declined and nas almost destroyed by Louis IX in 1235. The houses that remained standing became the nucleus of the new community of St. Servan. It nas not until the French Revolution. however, that St. Servan became a separate commune from Saint-Malo. North of the town is a net dock, forming part of the harbour of Saint-Malo. The dock is used chiefly by coasting and fishing vessels, a fleet starting annually for the Newfoundland codfisheries.

SAINT-SIMON, CLAUDE HENRI DE ROUVROY, COMTE DE (1760–1825), French socialist, was born in Paris on Oct. 17, 1760. He fought in the War of American Independence, was imprisoned in the Luxembourg during the Terror, and, on his release, amassed a small fortune by land speculation. He was also the originator of schemes to unite the Atlantic and Pacific by a canal, and to construct a waterway from Madrid to the sea. He continued his experiments throughout his life with the result that he was completely impoverished, and for some years before his death he was obliged to work nine hours a day to earn £40 a year. In 1823 he attempted suicide. He died two years later, on May 19, at Paris. Although a prolific writer his work attracted little attention while he lived and it was only after his death that his influence became considerable.

As a thinker Saint-Simon was deficient in system, clearness and consecutive strength; but his influence on modern thought is undeniable. both as the historic founder of French socialism and as suggesting much of what was afterwards elaborated into Comtism. Apart from the details of his socialistic teaching, his main ideas are simple, and are at once a reaction against the French Revolution and the militarism of Napoleon. So far was he from advocating fresh social revolt that he appealed to Louis XVIII to inaugurate the new order of things. In opposition, however, to the feudal and military system, he advocated an arrangement by which the industrial chiefs should control society. In place of the mediaeval church the spiritual direction of society should fall to the men of science. What Saint-Simon desired, therefore, was an industrialist state directed by modern science in which universal association should suppress war, and society should be organized for productive labour by the most capable men. The social aim is to produce things useful to life.

Although the contrast between labour and capital is not emphasised by Saint-Simon, the cause of the poor is discussed, and in his greatest work, *The New Christianity,* it takes the form of a religion. It was this development of his teaching that occasioned hia final quarrel with Comte Previous to the publication of the *Nouveau Christianisme,* Saint-Simon had not concerned himself with theology; but here. beginning with a belief in God he endeavours to resolve Christianity into its essential elements and finally propounds this precept—"The whole of society ought to strive towards the amelioration of the moral and physical existence of the poorest class; society ought to organize itself in the may best adapted for attaining this end" This principle became the watchword of the entire school of Saint-Simon.

Of the disciples uho propagated his doctrines the most important were Olinde Rodrigues, and Barthélemy Prosper Enfantin (q *v*), who together had received Saint-Simon's last instructions. Their first step was to establish a journal, *Le Producteur,* but it was discontinued in 1826. The sect, however, had begun to grow, and before the end of 1828, had meetings not only in Paris but in many provincial towns An important departure was made in 1828 by Amand Bazard, who gave a "complete exposition of the Saint-Simonian faith" in a long course of lectures at Paris, which were well attended. His *Exposition* de *la doctrine de St. Simon* (2 vols., 1828–1830), which is by far the best account of it, won more adherents. The second volume was chiefly by Enfantin, who along with Bazard stood at the head of the society, but who was superior in metaphysical power, and was prone to push his deductions to extremities. The revolution of July (1830) brought a new freedom to the socialist reformers. A proclamation was issued demanding the community of goods, the abolition of the right of inheritance, and the enfranchisement of women. Early next year the school obtained possession of the *Globe* through

Pierre Leroux (*q.v.*), who had joined the school, which now numbered some of the ablest and most promising young men of France.

The members formed themselves into an association arranged in three grades, and constituting a society or family, which lived out of a common purse in the Rue Monsigny. Before long, however, the sect was split by dissensions between Bazard, a man of logical and solid temperament, and Enfantin, who desired to establish a fantastic sacerdotalism with lax notions as to the relation of the sexes. After a time Bazard seceded, together with many of the strongest supporters of the school. A series of extravagant entertainments given by the society during the winter of **1832** reduced its financial resources and discredited it in character. They finally removed to Ménilmontant, to a property of Enfantin, where they lived in a communistic society, distinguished by a peculiar dress Shortly after the chiefs were tried and condemned for proceedings prejudicial to the social order; and the sect was broken up **(1832)**.

Saint-Simonism.—In the doctrine of the followers of Saint-Simon we find a great advance on the confused views of the master. In the philosophy of history they recognize epochs of two kinds, the critical or negative and the organic or constructive. The former, in which philosophy is the dominating force, is characterized by war, egotism and anarchy; the latter, which is controlled by religion, is marked by the spirit of obedience, devotion and association. The two spirits of antagonism and association are the social principles whose prevalence determines the character of an epoch. The spirit of association, which tends more and more to prevail over its opponent, is to be the keynote of the social development of the future. Under the present system the industrial chief exploits the proletariat, the members of which, though nominally free, must accept his terms under pain of starvation The only remedy for this is the abolition of the law of inheritance, and the union of all the instruments of labour in a social fund, which shall be exploited by association. Society thus becomes sole proprietor, intrusting to social groups and social functionaries the management of the various properties. The right of succession is transferred from the family to the state.

The school of Saint-Simon insists strongly on the claims of merit; they advocate a social hierarchy in which each man shall be placed according to his capacity and rewarded according to his works. This is, indeed, a most special and pronounced feature of the Saint-Simon socialism, whose theory of government is a kind of spiritual or scientific autocracy, degenerating into the fantastic sacerdotalism of Enfantin. With regard to the family and the relation of the sexes the school of Saint-Simon advocated the complete emancipation of woman and her entire equality with man. The "social individual" is man and woman, who are associated in the exercise of the triple function of religion, the state and the family. In its official declarations the school maintained the sanctity of the Christian law of marriage. Connected with these doctrines was their famous theory of the "rehabilitation of the flesh," deduced from the philosophic theory of the school, which was a species of Pantheism, though they repudiated the name. On this theory they rejected the dualism so much emphasized by Catholic Christianity in its penances and mortifications, and held that the body should be restored to its due place of honour.

An excellent edition of the works of Saint-Simon and Enfantin was published by the survivors of the sect (47 vols., Paris. 1865–78). Of his other works the most important are, *Lettres d'un habitant de Genève* (1802); *Du Système Industriel* (1821): *Catéchisme des Industriels* (1823–24); *Nouveau Christianisme* (1825). *See* also Georges Weill, *Un Précurseur du socialisme, Saint-Simon et son oeuvre* (Paris, 1894), and a history of the *École Saint-Simonienne*, by the same author (1896); G. Dumas, *Psychologie de deux messies positivistes St. Simon et Comte* (1905), G. Brunet, *Mysticisme social de Saint-Simon* (1925); E. N. Butler, *The St-Simonian Religion in Germany* (1926); and M. Leroy, *Vie véritable de Saint-Simon* (1925).

SAINT-SIMON, LOUIS DE ROUVROY, DUC DE **(1675–1755)**, French soldier, diplomatist and writer of memoirs, was born at Versailles on Jan. 16, 1675. The peerage granted to his father, Claude de St. Simon, is the central fact in his history. The boy had for godfather and godmother Louis XIV. and the queen. After some tuition by the Jesuits (especially by Sanadon, the editor of Horace), he joined the *mousquetaires gris* in 1692. He was present at the siege of Namur, and the battle of Neerwinden. At this time he chose to begin the crusade of his life by instigating, if not bringing, an action on the part of the peers of France against Luxembourg, his victorious general, on a point of precedence. He fought, however, another campaign or two (not under Luxembourg), and in 1695 married Gabrielle de Durfort, daughter of the maréchal de Lorges, under whom he latterly served. He seems to have regarded her with respect and affection; and she sometimes succeeded in modifying his aristocratic ideas. But as he did not receive the promotion he desired he flung up his commission in 1702. Louis took a dislike to him, and it was with difficulty that he was able to keep a footing at court. He was, however, intensely interested in all the transactions of Versailles, and by dint of a most heterogeneous collection of instruments. ranging from dukes to servants, he managed to obtain the extraordinary secret information which he has handed down.

His own part appears to have been entirely subordinate. He was appointed ambassador to Rome in 1705, but the appointment was cancelled before he started At last he attached himself to the duke of Orleans and, though this was hardly likely to conciliate Louis's goodwill to him, it gave him at least the status of belonging to a definite party, and it eventually placed him in the position of tried friend to the acting chief of the state. He was able, moreover, to combine attachment to the duke of Burgundy with that to the duke of Orleans. Both attachments were no doubt all the more sincere because of his undying hatred to "the bastards," that is to say, the illegitimate sons of Louis XIV. It does not appear that this hatred was founded on moral reasons or on any real fear that these bastards would be intruded into the succession. The true cause of his wrath was that they had precedence of the peers.

The death of Louis seemed to give Saint-Simon a chance of realizing his hopes. The duke of Orleans was at once acknowledged regent, and Saint-Simon was of the council of regency. But he had little real influence with the regent. In 1721 he was appointed ambassador to Spain to arrange for the marriage (not destined to take place) of Louis XV. and the infanta. His own account of the cessation of his intimacy with Orleans and Dubois, the latter of whom had never been his friend, is, like his own account of some other events of his life, obscure. But there can be little doubt that he was practically ousted by the favourite. He survived for more than thirty years; but little is known of his life. His wife died in 1743, his eldest son a little later; he had other family troubles, and he was loaded with debt. When he died. at Paris on March **2, 175j,** he had almost entirely outlived his own generation, and the prosperity of his house.

Saint-Simon was an indefatigable writer, and he began very early to set down in black and white all the gossip he collected, all his interminable legal disputes of precedence, and a vast mass of unclassified and almost unclassifiable matter. Most of his manuscripts came into the possession of the government, and it was long before their contents were published in anything like fulness. Saint-Simon, though careless and sometimes even ungrammatical, ranks among the most striking memoir-writers of France, the country richest in memoirs of any in the world. He has been compared to Tacitus, and for once the comparison is just. In the midst of his enormous mass of writing, phrases scarcely inferior to the Roman's occur frequently, and here and there are passages of sustained description equal, for intense concentration of light and life, to those of Tacitus or of any other historian. As may be expected from the vast extent of his work, it is in the highest degree unequal. But he is at the same time not a writer who can be "sampled" easily, inasmuch as his most characteristic phrases sometimes occur in the midst of long stretches of quite uninteresting matter. The interest of the *Memoirs*, independent of the large addition of positive knowledge which they make, is one of constant surprise at the novel and adroit use of word and phrase. Some of Macaulay's most brilliant

portraits and sketches of incident are adapted and sometimes almost literally translated from Saint-Simon.

The first edition of Saint-Simon (some scattered pieces may have been printed before) appeared in 1788. It was a mere selection in three volumes and was much cut down before it was allowed to appear. Next year four more volumes made their appearance, and in 1791 a new edition, still further increased. The whole, or rather not the whole, was printed in 1829–1830 and reprinted some ten years later. The real creator of Saint-Simon, as far as a full and exact text is concerned, was M. Chéruel, whose edition in 20 volumes dates from 1856, and was reissued again revised in 1872. The standard edition is that edited by A. de Boislisle for the *Grands Ecrivains de la France* Series. For criticism on Saint-Simon there is nothing better than Sainte-Beuve's two sketches in the 3rd and 15th volumes of the *Causeries du lundi.* The latter was written to accompany M. Chéruel's first edition. In English by far the most accurate treatment is in a Lothian prize essay by E. Cannan (Oxford and London, 1885).

SAINT THOMAS, a city and port of entry of Ontario, Can., capital of Elgin county, on Kettle creek, 18 mi. S. of London and 8 mi. N. of Lake Erie. Pop. (1961) 22.469. It is an important station on the Canadian National, New York Central, London & Port Stanley, Chesapeake and Ohio, Wabash, and Canadian Pacific railways. A collegiate institute and Alma Ladies' college are located there. The New York Central railway shops and car-wheel foundry, flour, flax and planing mills, shoe and knitted-goods factories are among the chief industries.

SAINT THOMAS (Portuguese SÃO TOMÉ), an island off the west coast of Africa in that part of the Gulf of Guinea called the Bight of Biafra, lies 137 mi. W.N.W. of Cape López. The southern tip of the island just clears the equator. Its area is 854 sq.km. (330 sq.mi.).

Together with the smaller island of Principe (*q.v.*) 93 mi. N.N.E., and the 11-ac. enclave surrounding the old fortress of São João Baptista at Ouidah in Dahomey republic, St. Thomas forms the Portuguese overseas province of São Tomé e Principe.

Physical Characteristics. — St. Thomas, which is about 20 mi. broad and about 30 mi. from northeast to southwest, is volcanic and has many craters and old lava flows. It rises centrally to 6,640 ft. (Pico de Tomé) and in the west-centre has ten peaks of over 3.500 ft. Some culminate in phonolites resembling upward-pointing fingers, where the softer volcanic rocks have been eroded to expose harder rock which formed the cone of the volcano. From these peaks there are sharp descents to the often sheer west coast, but there are a number of bays on the northeast, east and south coasts. The lowlands in the south have much volcanic ash and cinder and the off-lying Rôlas islet (which is crossed by the equator) is of basalt and has two craters.

Although the climate is tropical and humid, equatorial conditions are modified by the cold Benguela current: by coastal breezes and by altitude. Climatically the island belongs to the southern hemisphere, since its drier season (the *gravana*) is from June to September. Four regions can be distinguished: (1) the hot and humid northeast lowland with about 40 in. annual rainfall; (2) above about 1,300 ft. where temperatures are lower, though variable, and rainfall heavier; (3) above 2,000 ft. where temperatures are yet lower, the nights cold and mist frequent; (4) the southeast lowland where there is no drier season. The lowlands have the reputation of being malarial.

The volcanic soil of St. Thomas is extremely fertile. Rain forest is densely developed above about 3,250 ft. but below that height the land has in most places been cleared for cultivation.

Population and **Administration.**—With many rugged areas unsuitable for habitation, the island has developed clusters of population in the more level and fertile northeast around the provincial capital São Tomé (pop. 7.813). In the west there are fewer people. Of the total population of 55,827 (1950), about 1,100 are Europeans and about 4,300 of mixed ancestry. Among the Negroes, men outnumber women by roughly two to one because of the presence of about 28,000 immigrant plantation labourers who were brought in on long and severe contract terms, largely from Mozambique. In the 1950s efforts were made to encourage fixed labour by making land grants on new roads south of São Tome and by improved education and housing.

With other Portuguese colonies, São Tomé e Principe was in 1951 given the status of an overseas province. The governor resides at São Tomé, which is also the residence of the *curador* who is the legal guardian of the *serviçaes* (labourers). The province has more than 20 elementary schools, a secondary school and a technical school.

Economy. — The earliest crop on St. Thomas was sugar, but this was ruined by Brazilian competition in the late 16th century. The island then served as a food-supply base for ships and as a slave depot. Agriculture revived with the introduction of coffee in 1800 and of cocoa in 1822. Most agriculture is on plantations, one estate alone occupying one-tenth of the island. Coconuts and oil palms are grown in the coastal belt, and their products represent respectively about 10% and 15% of the exports by value. Between about 650–1,300 ft. elevation, especially in the northeast, cocoa is dominant, and until about 1905 St. Thomas was the leading world producer. Production has since declined for many reasons, but cocoa still makes up about two-thirds of the exports by value. Other exports are coffee, grown on higher ground up to about 4.300 ft., and cinchona. Subsistence crops include yams. Fishing, especially for sharks, has some importance.

Communications. — A 12-mi. state-owned railway connects São Tomé with Vila da Trindade in the interior and with several plantations. There are more than 170 mi. of roads. São Tomé has a sheltered harbour on Ana de Chaves bay and clears about 1,400 vessels with a net tonnage of 600,000 annually. Several shipping lines call regularly. The island has two airfields and is linked with Principe and with Luanda, Angola, by daily air services.

History.——St, Thomas was uninhabited when discovered on Dec. 21 (St. Thomas' day), 1470, by the Portuguese navigators João de Santarém and Pedro de Escobar. Attempts at colonization mere made in 1485, but there was no permanent settlement until a number of criminals and young Jews were settled on the island in 1493. The capital was founded a few years later by Álvaro de Caminha. By mid-16th century there were more than 80 sugar mills and 50,000 settlers, but in 1567 the island was attacked by the French, and in 1574 the Angolares began raids which ended only with their subjugation in 1693. In 1595 there was a slave revolt, and in 1641–44 the Dutch, who had plundered the capital in 1600, held the island. The French made another damaging raid in 1709, and, with the loss of the sugar trade to Brazil and internal anarchy, St. Thomas was reduced to a deplorable state.

Revival came with the greatly increased demand for cocoa in the 1890s, when many new plantations were established. As the islanders would not work on them, indentured labourers were brought from the mainland, chiefly from Angola. St. Thomas obtained notoriety when in 1908–09 British observers denounced the treatment of these labourers as indistinguishable from slavery. In consequence, large cocoa and chocolate firms in Europe and the Cnited States refused to import cocoa from St. Thomas or Principe unless recruitment for the plantations was made voluntary. Recruitment was resumed in 1910 under new regulations. To overcome the difficulties of obtaining workers from Angola, recruitment was also begun in Mozambique.

See W. A. Cadbury, *Labour in Portuguese West Africa,* 2nd ed. (1910); H. Galvao and C. Selvagem, *Império Ultramarino Português,* vol. ii (1951); R. J H. Church, *West Africa* (1957).

SAINT THOMAS ISLAND, the most important, commercially, of the Virgin Islands purchased by the United States from Denmark in 1917. Pop. (1960) 16,201.

Saint Thomas lies 40 mi. east of Puerto Rico, 1,442 mi. S.E. of New York city and 1.020 mi. from the Panama canal. It is 12 mi. long, varies in width from 1 mi. to 3 mi. and has an area of 32 sq.mi. It is of volcanic origin. The main ridge, peaks of a submerged range, extends east and west the length of the island. Its hills are steep and rocky and sparsely covered with vegetation, the original timber having been cut away for lumber and charcoal. Two summits, Crown mountain and Signal hill, rise above 1,500 ft. Many of the spurs of the ridge slope down to the shore and form protected bays where the buccaneers of the 17th and 18th centuries found refuge.

The climate of the island is salubrious, particulariy during the first quarter of the year when the trade winds blow. The mean temperature is 78° F., the thermometer rarely falling below 64°

and rarely rising above 91°. The average rainfall is 38.23 in.; the driest weather is in March and the rainy season in October and November. Drinking water is stored in cisterns because of the dearth of wells.

After the abolition of slavery in 1848, agriculture became decadent. Destruction of the once profitable rum export trade as a result of prohibition of liquor in the United States contributed heavily to economic decline. From 1926 to 1933 the annual federal government contribution to the municipal treasury of the U.S. Virgin Islands averaged around $100.000; however, gradual improvement was made after 1931. By the late 1950s federal contributions to grant-in-aid programs had increased to more than $650.000.

Improved hotels and a stimulation of the tourist trade, along with governmental encouragement of small landholdings. were important among the economic developments. There is an agricultural experimental station at Estate Dorothea. Most of the island's agricultural and dairy produce is for local consumption and ship supplies. Native handicraft work and rum distilleries provide the chief direct exports.

St. Thomas Island was discovered and named by Christopher Columbus on his second voyage in 1493. The first colony mas planted in 1657 by the Dutch who soon after abandoned it and migrated to New Amsterdam (New York). The Danes arrived and took formal possession in 1666, but their first colony also failed. The Danish West India company dispatched an expedition under Gov. Jorgen Iversen which landed in St. Thomas harbour on May 25. 1672, and effected a permanent settlement. Later Huguenot refugees from St. Kitts were granted asylum.

In 1755 the king of Denmark acquired the company's rights and made the harbour a free port. The island was temporarily seized by England in 1801–02. and again held in 1807–15. but was restored to and held by Denmark until 1917, when it was sold to the United States.

The chief value of the island is the harbour of Charlotte Amalie, one of the best in the Antilles, important as a United States naval base. It is perfectly landlocked. with a bottlenecked entrance, and has a deserved reputation for refuge. It commands the gateway to the Caribbean through the Virgin passage and is a port of call for passenger steamers from New Tork and European ports bound for the Panama canal and Central America via the Lesser Antilles. There are ample coaling facilities, oil reservoirs, shipyards and machine shops, floating docks and wharves with electric cranes.

Charlotte Amalie. pop. (1960) 12.880 (known as St. Thomas city from 1917 to 1932). the seat of government of the Virgin Islands. lies on three low spurs of the island ridge; the spurs are dubbed Foretop. Maintop and Mizzentop. A single level street parallel to the water front forms a common base for three cone-shaped clusters of nhite dnellings on the green background of the ridges. Government hill is one of the attractive residential sections, the location affording constant enjoyment of the breezes and panorama. The population is predominantly Negro, but there is a considerable minority group of French-Iiorman origin nho have lived there for many generations. English is the prevailing language, but Danish, Dutch, French and Spanish are also common. Air services connect with all parts of the Caribbean.

For general government, see VIRGIN ISLANDS. (M F. DE C.)

SAINT TROND, town, province of Limburg. Belg , 18 mi. northwest of Liège in an important strategic position near the frontier.

Pop (1955 est.) 19,969.

ST. VINCENT, JOHN JERVIS, EARL OF (1735–1823), British admiral who won fame as a commander at the battle of St. Vincent (1797) (*q.v.*), was born at hleaford, Staffordshire, on Jan. 9, 1735. He entered the navy on Jan 4, 1749 and became lieutenant on Feb. 19. 1755; he served in that rank till 1759, taking part in the conquest of Quebec. He was made commander of the "Scorpion" sloop in 1759, and post captain in 1760. During the peace he commanded the "Alarm" (32 guns) in the Mediterranean, and when he was put on half pay he traveled in Europe, taking professional notes everywhere. While the American Revolutionary War lasted, he commanded the "Fourroyant" (80) in the English channel, taking part in the battle of Ushant (1778) and in the various reliefs of Gibraltar. His most signal service was the' capture (April 19, 1782) of the French "Pégase" (74) after a long chase.

In 1783 he entered parliament as member for Launceston, and in the general election of 1784 as member for Yarmouth. In politics he was a strong Whig. On Sept. 24, 1787, he attained flag rank. and was promoted vice-admiral in 1793. From 1793 to 1795 he was in the West Indies co-operating with the army in the conquest of the French islands. On his return he was promoted admiral. In Nov. 179j he took command in the Mediterranean, where he maintained the blockade of Toulon, and aided the allies of Great Britain in Italy.

But in 1796 the occupation of Italy by the French armies closed all the ports to his ships, and Malta was not yet in the possession of Great Britain. Then the addition of the Spanish fleet to the French altered the balance of strength in the Mediterranean. The Spaniards were very inefficient, and Jervis would have held his ground, if one of his subordinates had not taken the extraordinary course of returning to England, because he thought that the dangerous state of the country required that all its forces should be concentrated at home. He was therefore obliged to act on the instructions sent to him and to retire to the Atlantic, withdrawing the garrisons from Corsica and other places. His headquarters were now on the coast of Portugal, and his chief duty was to watch the Spanish fleet at Cadiz. On Feb. 14, 1797, he gained a complete victory against heavy odds. (See ST. VINCENT, BATTLE OF.) For this victory, which came at a critical time, he was made an earl and was granted a pension of £3,000.

St. Vincent's qualities as a disciplinarian were soon to be put to a severe test. In 1797 the grievances of the sailors. which were of old standing, and had led to many mutinies of single ships, came to a head in the great general mutinies at Spithead and the Nore. Similar movements took place on the coast of Ireland and at the Cape of Good Hope. The spirit spread to the fleet under St. Vincent, and there was a danger that some outbreak would take place in his command. The peril was averted, however. He had always taken great care of the health of his men, and was as strict with the officers as with sailors. He carried his strictness with his officers to an extent which aroused the actual hatred of many among them, and exasperated Sir John Orde (1751–1824) into challenging him to fight a duel. Yet he has been credited with having raised the discipline of the navy to a high level. His health broke down and in June 1799 he resigned his command.

When St. Vincent's health was restored in the following year he took the command of the channel fleet, into which he introduced his own rigid system of discipline to the bitter anger of the captains. But he was able to maintain the blockade of Brest for 121 days with his fleet. In 1801 he became first lord and held the office till William Pitt returned to power in 1803. His administration is famous in the history of the navy, for he now applied himself to the task of reforming the corruptions of the dockyards. He was fiercely attacked in and out of parliament, and he gave an opening to his critics by devoting himself so wholly to the reform of the dockyards that he neglected the preparation of the fleet for war. He would not recognize the possibility that the peace of Amiens would not last. Pitt made himself the mouthpiece of St. Vincent's enemies, mainly because he considered him as a dangerous member of the party which was weakening the position of England in the face of Napoleon. When Pitt's second ministry was formed in 1803, St. Vincent refused to take the command of the channel fleet at his request. After Pitt's death he resumed the duty with the temporary rank of admiral of the fleet in 1806, but held it only until the following year. After 1810 he retired to his house at Rochetts in Essex.

The rank of admiral of the fleet was conferred on him in 1821 on the coronation of George IV, and he died on March 14, 1823.

(D. H.; X.j

The *Life* by J. S. Tucker (2 vol.), whose father had been the admiral's secretary (marred by excessive eulogy). *See* W. N. Anson, *Life of John Jervis, Admiral Lord St. Vincent* (1913); also W. L. Clowes, The *Royal Navy* . . . vol. iv. The life by Captain Brenton

is rather inaccurate. The *Naval Career of Admiral John Markham* contains an account of the reforms in the navy. His administrations produced a swarm of pamphlets. Many mentions of him will be found in the correspondence of Nelson.

ST. VINCENT, a British island in the Windward group of the West Indies, lying about 13° 9 N., 61° 14' W., south of St. Lucia and west of Barbados. The island is about 18 mi. long, with a maximum width of 11 mi., and has an area of 133 sq.mi. Beautiful, thickly wooded volcanic hills form its backbone, with picturesque valleys intermingled. The highest summit is the volcano Soufrikre ((4.018ft.) in the north. Two eruptions of Soufrikre, in 1821 and in 1902, were especially disastrous, the latter devastating some of the most fertile parts of the island. The climate is fairly healthful and in winter very pleasant, but hurricanes are not infrequent. Two (in 1780 and 1898) were especially destructive of both life and property. Rainfall averages 101.32 in. annually; the normal temperature range is from 66° to 88° F.

The colony of St. Vincent includes most of the Grenadines (*q.v.*) (area: 17 sq.mi.; 1960 pop. 5,068) and was part of the loosely federated Windward Islands colony until it became a member of The West Indies federation. It had a common governor and shared some judicial institutions with the other Windward colonies. but had its own separate partly-appointed, partly-elected legislative body. Kingstown (1960 pop. 4,296), on the southwestern coast, is the capital as well as the chief port. The colony's population ([1960 census] 79,948j is nearly 75% of Negro descent. Only 2½% is white; the remainder of mixed or East Indian blood. A very few are of almost pure Carib stock. Primary education. free but not compulsory, is provided by 16 government and 22 government-subsidized schools (1949). There are two government secondary schools.

St. Vincent is predominantly agricultural and has a virtual monopoly of the world market for arrowroot, its principal crop. Sugar was formerly the colony's economic backbone but, in contrast with most of the other West Indian islands, became relatively unimportant, with an annual output of 2,000 to 2,500 tons. A distinctive and fancy quality molasses is produced. Sea Island cotton and peanuts and some coconuts, sweet potatoes and cassava are grown. The principal trade is with the United Kingdom, Canada. and the United States.

St. Vincent was discovered by Christopher Columbus on Jan. 22 (St. Vincent's day) 1498. Its Carib inhabitants, however, were left almost undisturbed for more than a century. In 1627 Charles I of England granted the island to the earl of Carlisle, but no effective occupation was made. In 1672 it was regranted to Lord Willoughby. Meanwhile, French and Dutch as well as English settlements were attempted, with the French dominant until the Seven Years' War, when Gen. Robert Monckton occupied it (1762). The treaty of Paris confirmed British possession, and settlement proceeded despite Carib refusal to accept British sovereignty. After some fighting in 1773, a treaty was concluded with the Caribs, who were granted lands in the north as a reserve. In 1779 the island was seized by the French, but was restored to Britain in 1783. In 1795 the Caribs rose, assisted by French from Martinique, and were finally subdued the following year. Most of them were then deported to the Bay Islands (off Honduras). Emancipation of Negro slaves in 1834 was disastrous for the island's economy. In 1848 Portuguese labourers were introduced, followed by East Indians in 1861.

See Colonial Office, *Colonial Annual Reports.* (L. W. BE.)

ST. VINCENT, BATTLE OF, fought on the 14th of February 1797, between the British and Spanish fleets, the most famous and important of many encounters which have taken place at the same spot. The battle first revealed the full capacity of Nelson, which was well known in the navy, to all his countrymen. In 1796 the Spanish government had made the disastrous alliance with the French republic, which reduced its country to the level of a pawn in the game against England. The Spanish fleet, which was in a complete state of neglect, was forced to sea. It consisted of 27 sail of the line under the command of Don Jose de Córdoba—fine ships, but manned in haste by drafts of soldiers, and of landsmen forced on board by the press. Even the flagships had only about eighty sailors each in their crews. Cordoba was drifting about with his unmanageable ships in two confused divisions separated from one another, in light winds from the west and west-south-west, at a distance of from 25 to 30 m. S.W. of the Cape. While in this position he was sighted by Sir John Jervis, of whose nearness to himself he was ignorant, and who had sailed from Lisbon to attack him with only 15 sail of the line. Jervis did not hesitate to give battle. Six Spanish ships were to the south of him, separated by a long interval from the others which were to the south-west. The British squadron was formed into a single line ahead, and was steered to pass between the two divisions of the Spaniards. The six vessels were thus cut off. A feeble attempt was made by them to molest the British, but being now to leeward as Jervis passed to the west of them, and being unable to face the rapid and well directed fire to which they were exposed, they sheered off. One only ran down the British line, and passing to the stern of the last ship succeeded in joining the bulk of her fleet to windward. As the British line passed through the gap between the Spanish divisions ships were tacked in succession to meet the windward portion of the enemy. If this movement had been carried out fully, all the British ships would have gone through the gap and the Spaniards to windward would have been able to steer unimpeded to the north, and perhaps to avoid being brought to a close general action. Their chance of escape was baffled by the independence and promptitude of Nelson. His ship. 'the "Captain" (74), was the third from the end of the British line. Without waiting for orders he made a sweep to the west and threw himself across the bows of the Spaniards His movement was seen and approved by Jervis, who then ordered the other ships in his rear to follow Nelson's example. The British force was thrown bodily on the enemy. As the Spanish crews were too utterly unpractised to handle their ships, and could not carry out the orders of their officers which they did not understand, their ships were soon driven into a herd, and fell on board of one another. Their incompetence as gunners enabled the "Captain" to assail their flagship, the huge "Santissima Trinidad" (130), with comparative impunity. The "San Josef" (112), and the "San Nicolas" (80), which fell aboard of one another, were both carried by boarding by the "Captain." Four Spanish ships, the "Salvador del Mundo" and "San Josef" (112), the "San Nicolas" (80), and the "San Isidro" (74), were taken. The "Santissima Trinidad" is said to have struck, but she was not taken possession of. By about half-past three the Spaniards were fairly beaten. More prizes might have been taken, but Sir John Jervis put a stop to the action to secure the four which had surrendered. The Spaniards were allowed to retreat to Cadiz. Sir John Jervis was made Earl St. Vincent (*q.v.*) for his victory. The battle, which revealed the worthlessness of the Spanish navy, relieved the British government from a load of anxiety, and may be said to have marked the complete predominance of its fleet on the sea. (D. H.)

AUTHORITIES.—A very interesting account of the battle of Cape St. Vincent, *A Narrative* of *the Proceedings of the British Fleet, etc.* (London, 1797), illustrated by plans, was published immediately afterwards by Colonel Drinkwater Bethune, author of the History *of the Siege of Gibraltar,* who was an eyewitness from the "Lively" frigate. *See* also James's *Naval History* (London, 1837); Captain Mahan, *The Influence of Sea Power on the French Revolution and Empire* (London, *1892*); Professor Goeffrey Callender, *The Naval Side of British History* (1924).

ST. VITUS' DANCE (CHOREA MINOR; SYDENHAM'S CHOREA) is a name commonly applied to the neurological manifestations of rheumatic infection. The disease is characterized by irregular, involuntary and purposeless movements of muscle groups. These movements are most obvious in the extremities and face, but are present in the trunk and may involve muscles of phonation and swallowing. While the names are derived from descriptive terms applied to epidemics of dancing mania in the 14th, 15th and 16th centuries, common usage of the term chorea condones its rerention.

The name of St. Vitus' dance originated in the fact that sufferers from the mania were wont to resort to the chapels of St. Vitus (more than one in Swabia, Ger.), the saint being believed to possess the power of cure.

Chorea is chiefly a disease of childhood. occurring most frequently between the ages of 5 and 15 years and much more frequently in females. It may occur in young adults and is an infrequent complication of pregnancy. when it is especially severe. Chorea has a close association with rheumatic fever and may be considered a peculiar manifestation of this disease Episodes of choiea commonly occur in children who have had rheumatic fever. Patients with chorea who have evidence of systemic infection as indicated by fever, increase of white blood cells or of the sedimentation rate of red blood cells, have rheumatic heart disease as frequently as do those who have rheumatic fever. However, if these indications of systemic infection are absent, heart disease is uncommon, and if it does occur it is especially apt to be gradual stenosis of the mitral valve. Some effort has been made to separate rheumatic chorea from chorea of psychogenic origin on the basis of laboratory findings, but this differentiation is difficult to substantiate.

While emotional crises and anxiety may appear to be intimately related to the onset of chorea they are a manifestation of the disease and do not precipitate it. Facial grimaces tics and habit spasms are frequently confused with chorea, but these repetitive movements are quite different from the inco-ordinated Purposeless movements of the disease. These movements, which are typical and recognizable, are usually preceded by or appear with, evidence of irritability and emotional instability, chiefly episodes of crying initiated by trivial incidents.

The symptoms vary in severity. They may be mild or completely incapacitating. They are often first considered as awkwardness. Inability to hold objects or to write properly and difficulty in walking are frequent. Vague identification of deterioration in ability to perform customary tasks is soon replaced by recognition of gross twitching of muscle groups, most easily observed in the extremities. The movements are more marked on one side but are present on both.

While there is debate concerning the pathological changes in the central nervous system, there is considerable evidence that both the emotional manifestations and the typical movements are related to changes in the cerebral cortex.

Attacks of chorea tend to be self-limited although the duration is several weeks. Recurrence is frequent. Recovery is hastened by rest in bed in a pleasant sympathetic environment, and patients improve quickly in hospitals or convalescent sanitaria. Sedation with phenobarbitol is especially helpful, and administration of salicylates is often advisable. (D. E. C.)

SAINT-WANDRILLE, a village of northwestern France, in the *département* of Seine-Inférieure, 28 mi. west-northwest of Rouen by rail. Pop. (1954) 230.

Saint-Wandrille is celebrated for the ruins of its Benedictine abbey. The abbey was founded in the 7th century by St. Wandrille. In the 13th century it was burned down, and the rebuilding was not completed until the 16th century. Later it was practically destroyed by the Huguenots and was again restored. The demolition of the church was begun at the time of the Revolution. The abbey church belongs to the 13th and 14th centuries; portions of the nave walls supported by flying buttresses are standing, and the windows and vaulting of the side aisles are in fair preservation. There is a cloister, from which a Renaissance door opens into the refectory, containing a richly ornamented *lavabo*. The refectory has graceful windows.

SAIONJI, KIMMOCHI, PRINCE (1849–1940), Japanese statesman, was born in Oct. 1849, at Kyoto. When less than 20 years of age, he took part in the councils which led to the Restoration, and at 19 was commander in chief of an imperial army. In 1881 he commenced his official career, and in the following year accompanied Hirobumi Ito to Europe and the United States to investigate the parliamentary system. In 1885 Saionji was appointed minister to Austria; three years later he became vice-president of the house of peers and was raised to the privy council in 1894. In the same year he received the portfolio of education in the second Ito cabinet.

In July 1903 Saionji became the leader of the Seiyu-Kai and in 1906 prime minister; he was again premier from 1911 to 1912. In 1919 he represented Japan as chief envoy at the peace conference and in 1920 he was made prince. He was famous as Emperor Hirohito's chief adviser and as the last of Emperor Meiji's Genro (elder statesmen).

Saionji died Nov. 24, 1940.

SAIS (Egyptian *Sai*), an ancient city of the Egyptian Delta, lying westward of the Thermuthiac or Sebennytic branch of the Nile It was the capital of the 5th nome of Lower Egypt and must have been important from remote times. In the 8th century B.C. Sais held the hegemony of the Western Delta, while Bubastite families ruled in the east and the kings of Ethiopia in Upper Egypt At the time when invasions by the Assyrians drove out the Ethiopian Taracus again and again, the chief of the 20 princes to whom Esarhaddon and Assur-bani-pal successively entrusted the government was Niku, king of Sais and Memphis. His son Psarnmetichus (*q.v.*) was the founder of the 26th dynasty. Although the main seat of government was at Memphis, Sais remained the royal residence throughout this flourishing dynasty.

Neit, the goddess of Sais, was identified with Athena, and Osiris was worshipped there in a great festival.

The brick enclosure wall of the temple is still plainly visible near the little village of Sa-el-hagar (Sa of stone) on the east bank of the Rosetta branch; otherwise only crude brick ruins and rubbish heaps remain on the site, but a few relics conveyed to Alexandria and Europe in the Roman age have come down to our day, notably the inscribed statue of a priest of Neit who was high in favour with Psammetichus III, Cambyses and Darius. Bronze figures of deities are now the most interesting objects to be found at Sa-el-hagar.

SAISSET, BERNARD (d, *c.* 1314), French bishop, was abbot of Saint Antonin de Pamiers in 1268. Boniface VIII, detaching the city of Pamiers from the diocese of Toulouse in 1295, made it the seat of a new bishopric and appointed Saisset to the see. Of a headstrong temperament, Saisset as abbot brought to an end (1297) the struggle with the counts of Foix, begun two centuries before, for the lordship of the city of Pamiers, which had been shared between the counts and abbots by the feudal contract of *pariage*. As an ardent Languedocian he hated the French and opposed Philip IV. But when he tried to organize a general rising of the south, he was denounced to the king, perhaps by his old enemies the count of Foix and the bishop of Toulouse. Philip IV charged Richard Leneveu, archdeacon of Auge in the diocese of Lisieux, and Jean de Picquigni, vidame of Amiens, to make an investigation, which lasted several months

Saisset was on the point of escaping to Rome when the vidame of Amiens surprised him by night in his episcopal palace He was brought to Senlis and on Oct. 24, 1301 appeared before Philip and his court. He was charged with high treason. and Philip tried to obtain from the pope the canonical degradation of Saisset. Boniface VIII, who had supported Saisset against the count of Foix (when Saisset was a legate), ordered the king in Dec. 1301 to free the bishop in order that he might go to Rome to justify himself. At the same time disagreement between Boniface and Philip became more acute, and in the process Saisset was forgotten. He had been turned over in Feb. 1302 into the keeping of Jacques des Normands, the papal legate, and was ordered to leave the kingdom at once.

Saisset lived at Rome until after the incident at Anagni. In 1308 the king pardoned him and restored him to his see, He died, still bishop of Pamiers. about 1314.

SAISSET, ÉMILE EDMOND (1814–1863), French philosopher, born at Montpellier, Fr.. on Sept. 16, 1814, studied philosophy in the school of Victor Cousin and carried on his eclectic tradition.

He was professor of philosophy at Caen, at the École Normale in Paris and later at the Sorbonne.

His works include *Discours de la philosophie de Leibnitz*

(1857); *Précurseurs* et disciples de Descartes (1862); and Critique *et histoire* de la *philosophie* (1865).

Saisset died in Paris on Dec. 17, 1863.

SAITAMA, a Japanese prefecture (Ken) north of Tokyo, with an area of 1,468 sq.mi. and a population (1960) of 2,430,871. Its level land areas are extensive and the ratio of cultivated area (38%) is the highest among the prefectures. Horticultural produce for consumption in Tokyo is the characteristic feature of agriculture. The Sayama area produces a choice green tea. The western section is devoted to sericulture. The chief products of manufacturing are textile goods and machinery. Cities in the south, including Urawa (*q.v.*), the prefectural capital, have become suburban residential centres for Tokyo commuters.

(R. B. H.)

SAIT FAIK ABASNANIK (1907–1954), Turkish author, who introduced a new form of short-story writing into Turkish literature. Born at Adapazari and educated in Istanbul and Bursa. he spent four years in France (1931–35), mainly in Grenoble. and on his return began to publish his short stories in *Varlik*, the leading avant-garde periodical. These were in a style new to Turkish literature: shapeless, without definite plot, but gripping, and conveying in a single episode a wide range of human experience.

In 1936 he published his first volume of short stories, *Semaver*. A dozen others followed, including *Lüzumsuz Adam* (1948), *Kumpanya* (1951), *Havuzbashi* (1952) and *Alem* Daginda aar *bir* Yilan (1953). He also experimented with a novel, ***Bir*** *Takim Insanlar* (1952), and published a volume of, verse. The subjects of his powerful sketches and stories are taken from the life of simple people in humble occupations;' his style, though realistic, has an element of poetry. He died in Istanbul. May 11. 1954. (F. I.)

SAITO, MAKOTO, VISCOUNT (1858–1936), Japanese naval officer and statesman. was born in Iwate prefecture, Dec. 2. 1858. Graduating from naval school in 1877, he rose to the rank of admiral in 1912. Being an unusually able administrator. he was appointed minister of the navy in 1906, a position which he held until 1914 in five successive cabinets. After the Korean uprising against Japanese rule in 1919, he was appointed governor-general of the colony, where he became noted for his liberal education policies. In 1927 he headed his country's delegation to the Geneva disarmament conference and from 1932 to 1934 served as the premier of Japan. As a moderate conservative he was strongly opposed by extremists in the government and army. In the military uprising of Feb. 1936. when Saito was serving as lord keeper of the privy seal and as imperial adviser, his political beliefs and influence led to his assassination (Feb. 26) by army fanatics. (HN. KN.)

SAKA (SHAKA), the name of various tribes which invaded India from central Asia. More accurately, it denotes the tribe which invaded India 140–130 B.C. They are the Sacae of classical authors and the Se of the Chinese, representing an original Sek or Sok. The Chinese state that they were a pastoral people in the neighbourhood of the modern Kashgar.

About 160 B.C. the Saka were driven southward by the advance of the Yue-Chi (*q.v.*) from the east. One portion appears to have settled in western Afghanistan, hence called Sakasthana, in modern Persian Seistan. The other section occupied the Punjab and possessed themselves of Sind, Gujarat and Malwa. The rulers of these provinces bore the title of satrap (*kshatrapa* or *chhatrapa*) and were apparently subordinate to a king who ruled over the valley of Kabul and the Punjab. In 57 B.C. the Sakas were attacked simultaneously by Parthians from the west and by the Malava clans from the east and their power was destroyed.

SAKAI, a city in Osaka urban prefecture, Japan. Pop. (1960) 339,863. Many large earthen tomb mounds around the city attest its antiquity; Emperor Nintoku's tomb (1,574 ft. long, 105 ft. high) is the largest in Japan. Sakai was celebrated in the 16th century as the leading eastern inland sea port and was noted for its rich merchants. A shift in the course of the Yamato river silted its harbour, and the city sank in obscurity with the rise of neighbourlng Osaka to commercial and industrial greatness. Sakai has revived as an Osaka industrial satellite since the opening of rail service between the two cities. Machinery, bicycle and automotive parts, fertilizer, tabi (cotton socks). dyestuffs and chemicals are among its chief products. The main industrial belt is located along the coast on reclaimed land. while residential areas spread inland on elevated sites. The port handles an active traffic in small native craft. (J. D. EE.)

SAKE, the national beverage of Japan, is a rice beer, often mistakenly called a wine because of its high alcoholic content, usually 17% to 18%. Brewing of sake dates back many centuries.

Production of sake begins with steamed rice or koji, which is mixed with *Aspergillus oryzae,* a specially cultured mold that converts the rice starch into fermentable sugars. Preparation of the koji takes place in warm, draft-free cellars. The next step is the mixing together of 36 litres of koji, 90 l. of fresh steamed rice and 108 l. of water. The, resulting mass is worked and kneaded by hand for two hours until a smooth, lump-free paste of even consistency is obtained. It is allowed to rest for 24 hours, after which it is put into a large vat containing more steamed rice and water. A wooden or enameled iron bucket 18 in. deep. with a diameter of 12 in. at the top and 8 in. at the bottom, filled with boiling water. is suspended and immersed in the mash, being moved about periodically to heat the mash evenly. A slow, free fermentation occurs over a period of four weeks. the result of which is *moto,* with an alcoholic content of 10½% to 11%. Additional quantities of koji, steamed rice and water are added to the *moto* in the fermenting vat and a new fermentation takes place. lasting seven days. In order to facilitate fermentation a culture of the yeast *Saccharomyces* sake is sometimes added to the fermentation mixture. Lactic acid also may be added, to prevent bacterial contamination. The fresh sake is rested for another week, after which it is filtered and bottled.

The drinking of sake is a delicate, even poetic ceremony. It is always served warm, in tiny porcelain bowls that hold little more than an ounce. It is sipped.

Though each drink of sake is small. consumption in Japan is an important economic factor. The average annual consumption of alcoholic beverages in Japan after World War II was about 350,000,000 U.S. gal., of which sake represented 40%.

(H. J. GN.)

SAKHALIN, an elongated, mountainous island, 29.344 sq.mi. in area. located off the Pacific coast of the C.S.S.R. Irregularly shaped. Sakhalin varies in width from 4 to 99 mi. (between 141° 49′ E. and 144" 45' E.) and extends over 589 mi. from Cape Yelizaveta in the south (45° 54' N.) to Cape Kril'on (Crillon) in the north (54° 25' N.). Between the island and the Asian mainland is the Tatar strait, an arm of the Sea of Japan. which in its narrowest section, called Nevelskogo strait (about 5 mi. wide), freezes in winter. The north and east coasts are washed by the cold waters of the Sea of Okhotsk. La Pérouse strait separates Sakhalin from Japanese Hokkaido, 25 mi. to the south.

Physical Features.— Mountains parallel much of the east and west coasts. The rugged, western Kamyshevy range, though rising scarcely above 4,000 ft., is the longest and most formidable of the island's ranges. In its southern extension. south of the 49th parallel, the range actually forms the spine of the island. Along the east coast! the mountains are more rounded and less extensive, terminating on the south in the Terpeniya peninsula; yet they contain the highest peaks on the island (Lopatina, 5,279 ft., and Nevelskogo, 4,587 ft.).

North of 51° N., the elevation of the island becomes lower and the uplands yield to unattractive lowlands. Enclosed by the coastal ranges is a central valley, from 3 to 19 mi. wide, drained northeastward to Okhotsk sea by the Tym river and southward to the Gulf of Terpeniya by the Poronai river. A narrow watershed separates the headwaters of the rivers, while sand bars and lagoons clutter the estuaries. Rapids impede the upper course of the Tym. but the Poronai, in which salmon and other fish abound, is navigable for small craft for about 30 mi. There are other shorter rivers on the island, including the Susunai in the extreme south, and numerous lakes.

Climate.—Sakhalin has a severe climate. Winter temperatures. lower than might be suggested by latitude (*i.e.,* from Odessa to Tula), result from the cold winds which sweep in from the

north over Okhotsk sea. The January mean ranges from 17° F. in the south to −10° F. in the north. The summers are cool, but thermally less varied than are the winters. Mean July temperatures of 60° F.–64° F. prevail throughout the Tym-Poronai valley. The relative warmth of the Kuro Shiwo current ameliorates the climate of the west coast, while the Okhotsk current chills the east. Dampness and fog are characteristic of the coasts. Off the north coast drift ice may appear as late as July The vegetation period varies from 97 days in the north to 167 in the extreme south. Much of the 20 in. (and more) annual precipitation occurs in summer and autumn, occasionally resulting in destructive floods. Snow falls from October to May, persisting on the mountain slopes until August.

Soils and Vegetation.—Basically, the soils of the island consist of infertile podsols, with barren tundra common throughout the northern lowland and on the higher uplands However, the alluvial soils of the valleys are fertile, support luxurious meadows and, in the southern half of the island where a more favourable climate prevails, permit the growing of foodstuffs. Taiga (coniferous) forest covers most of Sakhalin, with spruce and fir dominant. In the protected valleys may be found Manchurian deciduous species, while bamboo grows along the west coast. Fur-bearing animals are abundant in the forest and there are a great variety of birds.

History. — Although the island was first visited by Japanese, Russian and Dutch navigators (1630–49), it remained for the Japanese in 1805–08 to prove that Sakhalin was not a projection of the mainland but an island. Japanese fishing stations appeared along the southwest coast. but little settlement occurred. However, a growing interest in the island on the part of both the Japanese and Russian governments led, in 1855, to the establishment of a joint condominium. Twenty years of competition resulted in the treaty of St. Petersburg, 1875, in which Japan relinquished its claims to Sakhalin in exchange for the Kurile Islands to the east. Under complete Russian sovereignty, Sakhalin served for many years as a penal colony.

The treaty of Portsmouth, 1905, which ended the Russo-Japanese War. divided the island at the 50th parallel, establishing Japanese dominion over the southern half, called Karafuto. The Russian inhabitants withdrew northward, and their numbers declined from 40,000 to about 6,000 by World War I. As a result of rapid Japanese immigration, the population of Karafuto grew to more than 68,000 by 1917. Between 1920 and 1924, Japan occupied the Russian half of the island, but with the establishment of Soviet power in the far east it was forced to withdraw, retaining important mining concessions in the north.

Upon the collapse of Japan at the end of World War II, Soviet troops entered Karafuto and most of the 400,000 Japanese inhabitants were subsequently evacuated to Japan proper. In Jan. 1947, Sakhalin, together with the Kurile Islands, became a separate *oblast* of the U.S.S.R., with Yuzhno-Sakhalinsk (Toyohara) in the Susunai valley as the capital.

Population.—From a pre-World War II population of 120,000, the Russian population was estimated to have more than doubled by the mid-1950s. A small group of native peoples, numbering several thousand, still inhabited the island, divided primarily into two main ethnic groups: the Tungus-Manchurian, including the Tungus proper and the Goldi (Nanais) in the interior; and the Palaeo-Asiatics, including the Ainus in the south and the Gilyaks (Nivkhis) near the coasts.

Resources and Industry.—The wealth of the island lies in its minerals, fisheries and lumber and paper products. Petroleum, the existence of which was first officially reported in 1894, is the most important resource. Okha and Ekhabi, near the northeast coast, are the main fields. Contributing about 3% to the total Soviet oil production, they are the major source of supply for the entire Soviet far east. Refineries are located at Okha, as well as at Port Moskal'vo, a deep-water port on the Gulf of Sakhalin. A pipeline links the refineries to Nikolayevsk on the mainland near the mouth of the Amur river. Sakhalin's coal deposits, the reserves of which are reputed to be about 4,500,000,000 tons, are mainly lignite. Principal mining centres are located along the west coast near Aleksandrovsk and Uglegorsk.

The commercial fisheries are well-developed as the result of Japanese enterprise prior to World War II. Fishing, both maritime and inland, is a common occupation of the inhabitants, with fish a major item of diet. Small fishing villages, many of which possess canneries and other facilities for handling the catch. dot the south and west coasts. The lumber and paper industries are also concentrated in the south, primarily at Tomari, Kholmsk and Nevel'sk.

Agriculture, confined to the southern half of the island, is relatively unimportant. With a cultivated area of about 75,000 ac., the main crops are grains, vegetables, potatoes and sugar beets, etc. Livestock raising and dairying, based on the lush natural meadows in the valleys. have considerable potential.

Transportation.—Roads are virtually nonexistent and, save for a short line between Okha and Port Moskal'vo, the railroads are all in the southern half of the island, of prewar Japanese construction. Regular steamer connection exists between Aleksandrovsk and Nikolayevsk in the navigation season, from mid-May to Nov. 1.

See L. S. Berg, *Geographical Zones of the Soviet Union,* vol. ii, pp. 465–474 (1952); *Geographical Atlas for Teachers of Middle School,* pp. 134, 150 (1954). (D. JN.)

SAKI, the name of a group of tropical American monkeys. The sakis form the genus Pithecia, closely related to the uakaris (*q.v.*). They are characterized by their long, bushy and nonprehensile tails, distinct whiskers and beard and the elongated hair on the crown of the head, which may either radiate from a point in the centre or be divided by a median parting. They are very delicate animals and normally silent.

See PRIMATES.

SAKJEGÖZÜ, a village in a piedmont valley of the Anti-Taurus near Zincirli Hüyük in the Gaziantep vilayet of southern Turkey Sakjegözü first attracted the attention of archaeologists as the source of a Late Hittite slab relief depicting a royal lion hunt. which had been taken from the walls of the village chief's house and placed in the Berlin museum. There it was noticed by the British archaeologist, J. Garstang, who traced its original source to a small mound called Jobba Hüyük, adjacent to the village Excavations undertaken on this mound between 1907 and 1911 revealed a Late Hittite palace of moderate dimensions at its summit, fortified with a practically rectangular enclosure measuring 400 × 300 ft. The gateway of the enclosure was on the lower side of the mound, while the palace occupied the opposite higher section of the walled precinct. The walls, which were nearly 12 ft. thick and rested on massive foundations, were strengthened by projecting external buttresses and, at the corners, by turrets.

The palace itself was approached through a portico containing an outstanding series of sculptures. Notable among these are the two life-size gate lions flanking the entrance to the palace and forming its cornerstones. The representations comprise sphinxes and other fabulous creatures in the Assyrian manner; likenesses of human beings, and symbolic scenes, such as the "fertilizing of the sacred tree," reflect equally thoroughgoing Assyrian influence

Since no inscriptional material was found at Sakjegözü, neither the ancient name nor the precise date of the palace settlement could be determined. To provide a stratigraphic substitute for more immediate chronological evidence, a deep sounding mas made underneath the palace foundations down to virgin soil. The whole mound was found to be made up of the stratified debris of successive habitation layers, reaching back to Neolithic times; *i.e*, the 5th and early 4th millennia B.C. Flint and obsidian implements and burnished monochrome pottery (mostly rather simple black, grey or brown bowls) characterize the early Neolithic phase. During the latter half of the period a new style of pottery using coloured paint makes its appearance.

See J. Garstang, *The Hittite Empire,* pp. 262–278 (1929); S. Lloyd, *Early Anatolia* (1956). (J. PL.)

SAKONNAKHON is a province (changwat) in northeastern Thailand. Area 3,683 sq.mi., pop. (1960) 414,832. It

is comparatively level in the northeast and covered with sandy loams. Sandstone hills cover the southwestern part. The area is chiefly forest and grazing land. Cultivated land, settlements and population are concentrated in the few large valleys. Glutinous rice and livestock are the chief products. Sakonnakhon (pop. [1960] 16,457), the provincial capital, 85 mi. E. of Udon (Udon Thani), is on an all-weather highway net connecting the main towns of northeast Thailand. (T. F. B.)

SAKTISM. The worship of Sakti or female energy, is believed to be derived from lower cults prevalent in northeast Bengal and Assam. The principal Sakti shrine is situated at Kamakshya (? the fulfillment of lust) on the summit of a hill two miles west of Gauhati. In Indian speculation the male principle is often regarded as quiescent, while the female principle is active and creative, a view which it may be noted is found in the physiological ideas of the Ba Ila, who hold that the male element is an inert creature but upon the female depend all the generative functions (Ila-speaking Peoples, 1920, vol. i, p. 227). A close connection exists with Tantrism. the ritual for which includes the *pancamakara,* the five elements (wine, meat, fish, parched grain, copulation). Apart from this, caste restrictions are minimized, girl widows may remarry, women are honoured.

SAL (Shorea robusta), a valuable timber tree the wood of which resembles teak. Large forests of sal occur in India, where the tree is widely planted and officially protected. The genus Shorea (family Dipterocarpaceae) contains about 90 species found in India, Ceylon and thence eastward to the Philippines.

SALAD, a preparation of fresh or cooked vegetables or other ingredients, eaten cold, and served with a dressing of which oil, vinegar and salt are essential ingredients. The word comes from Med. Lat. *salata,* salted, pickled, salare, to sprinkle with salt.

Salads are prepared from raw green leaves and stems such as lettuces, watercress and endive, but many varieties are also made from fresh fruits and cold cooked vegetables. Cold fish, poultry, game, meat and eggs, may likewise be included.

SALADIN (Arab. *Salah ud-Din,* "Honour of the Faith") (1138–1193), first Ayyubite sultan of Egypt. was born at Tekrit in 1138. The brilliance of his career was made possible only by the condition of the east in the 12th century. Such authority as remained to the orthodox caliph of Baghdad (see CALIPHATE) or to the heretical Fatimites (*q.v.*) of Cairo was exercised by their viziers. The Seljuk empire had, after 1104, been divided and subdivided among Turkish atabegs. The Latin kingdom of Jerusalem had existed since 1098 only because it was a united force in the midst of disintegration. Gradually. however, Christian enthusiasm had aroused a counter enthusiasm among the Moslems. Zengi, atabeg of Mosul, had inaugurated the sacred war by his campaigns in Syria (1135–46). Nureddin, his son, had continued his work by further conquests in Syria and Damascus. by the organization of his conquered lands and by "publishing everywhere the Holy War."

The opportunity of Saladin lay therefore in the fact that his lifetime covers the period when there was a conscious demand for political union in the defense of the Mohammedan faith. By race Saladin was a Kurd of Armenia. His father, Ayyub (Job), and his uncle Shirguh, sons of a certain Shadhy of Ajdanakan near Dawin, were both generals in Zengi's army. In 1139 Ayyub received Baalbek from Zengi. in 1146 he moved, on Zengi's death, to the court of Damascus. In 1154 his influence secured Damascus to Xureddin and he was made governor. Saladin mas therefore educated in the most famous centre of Moslem learning, and represented the best traditions of bloslem culture.

His career falls into three parts: the conquest of Egypt, 1164–74, the annexation of Syria and Mesopotamia, 1174–86; and lastly the destruction of the Latin kingdom and subsequent campaigns against the Christians. 1187–92. The conquest of Egypt was essential to Nureddin. It was a menace to his empire on the south, the occasional ally of the Franks and the home of the unorthodox caliphs. His pretext was the plea of an exiled vizier, and Shirguh was ordered to Egypt in 1164, taking Saladin as his lieutenant. The Christians under King Amalric I of Jerusalem immediately intervened; and the four expeditions which ensued in 1164, 1167, 1168 and 1169 mere duels between Christians and Saracens. They resulted in heavy Christian losses. the death of Shirguh and the appointment of Saladin as vizier with the title of al-Malik al-Nasir. His relations toward the Fatimite caliph were marked by extraordinary tact, and on his death in 1171 Saladin was powerful enough to substitute the name of the orthodox caliph in all Egyptian mosques. The Mohammedan religion was thus united against Christianity. To Nureddin he was invariably submissive, but from the vigour nhich he employed in adding to the fortifications of Cairo and the haste with nhich he retreated from an attack on Montréal (1171) and Krak (Kerak, 1173) it is clear that he feared his lord's jealousy.

In 1174 Nureddin died, and the period of Saladin's conquests in Syria began. Nureddin's vassals rebelled against his youthful heir, as-Salih, and Saladin came north, nominally to his assistance. In 1174 he entered Damascus, Emesa and Hamah; in 1175 Baalbek and the towns round Aleppo.

The next step was political independence. Me suppressed the name of as-Salih in prayers and on the coinage and was formally recognized by the caliph in 1175. In 1176 he defeated an invasion by Saif ud-Din of Mosul and reached an agreement with as-Salih and also with the Assassins In 1177 he returned by Damascus to Cairo, which he enriched with colleges, a citadel and an aqueduct. From 1177 to 1180 he made war on the Christians from Egypt, and in 1180 he imposed terms of peace on the sultan of Konia. From 1181 to 1183 he was chiefly occupied in Syria. In 1183 he induced the atabeg Imad ud-Din to exchange Aleppo for the insignificant Sinjar and in 1186 he received the homage of the atabeg of Mosul. The last independent vassal was thus subdued and the Latin kingdom enclosed on every side by a hostile empire.

In 1187 a four years' truce was broken by the brilliant brigand Raynald of Chbtillon, and thus began Saladin's third period of conquest. In May a small body of Templars and Hospitallers was cut to pieces at Tiberias. and on July 4 Saladin inflicted a crushing defeat upon the united Christian army at Hittin. He then overran Palestine on Sept. 20 besieged Jerusalem and on Oct. 2. after chivalrous clemency to the Christian inhabitants. crowned his victories by entering and purifying the Holy City. In the kingdom only Tyre was left to the Christians. Probably Saladin made his worst strategical error in neglecting to conquer it before winter. The Christians had thus a stronghold whence their remnant marched to attack Acre in June 1189. Saladin immediately surrounded the Christian army and began the famous siege.

Saladin's lack of a fleet enabled the Christians to receive reinforcements and thus to recover from defeat by land. On June 8. 1191, Richard of England arrived, and on July 12 Acre capitulated without Saladin's permission. Richard followed up his victory by an admirably ordered march down the coast to Jaffa and a great victory at Arsuf (*q.v.*).

During 1191 and 1192 there were four small campaigns in southern Palestine when Richard circled round Beitnuba and Ascalon with Jerusalem as objective. In Jan. 1192 he acknowledged his impotence by renouncing Jerusalem to fortify Ascalon. Negotiations for peace accompanied these demonstrations, which showed that Saladin was master of the situation. Though in July Richard secured two brilliant victories at Jaffa, the treaty made on Sept. 2 was a triumph for Saladin. Only the coast line was left to the Latin kingdom, with a free passage to Jerusalem; and Ascalon was demolished The union of the Mohammedan east had beyond question dealt the death blow to the Latin kingdom. Richard returned to Europe, and Saladin returned to Damascus, where on March 4, 1193, after a few days' illness, he died. He was buried in Damascus and mourned by the whole east. (See CRUSADES)

The character of Saladin and of his work is singularly vivid. In many ways he was a typical Mohammedan, fiercely hostile toward the unbelievers who had occupied Syria, though tolerant to his own Christian subjects. intensely devout and regular in prayers and fasting. He shoued the pride of race in the declaration that "God reserved this triumph for the Ayyubites before all others." His generosity and hospitality were proved in his gifts to Richard and his treatment of captives. He had the oriental's power of endurance, alternating with violent and emotional courage. Other vir-

tues were all his own, his extreme gentleness, his love for children, his flawless honesty, his invariable kindliness. his chivalry to women and the weak. Above all he typifies the hlohammedan's utter self-surrender to a sacred cause. His achievements were the inevitable expression of his character. He was not a statesman, for he left no constitution or code to the east; his empire was divided among his relatives on his death. As a strategist, though of great ability, he cannot be compared to Richard. As a general, he never organized an army. "My troops will do nothing." he confessed, "save when I ride at their head and review them." He is famous in eastern history as the conqueror who stemmed the tide of western conquest on the east and turned it definitely from east to west, as the hero who momentarily united the unruly east and as the saint who realized in his personality the highest virtues and ideals of Mohammedanism.

BIBLIOGRAPHY.—The contemporary Arabian authorities are Saladin's secretary Imad ud-Din and his army judge Beha ud-Din. The latter is translated in J. F. Michaud's *Recueil des historirns des Croisades* (1876), together with the general history of Ibn Athir (1160–1233), the eulogist of the atabegs of Mosul but the unwilling admirer of Saladin, and parts of the general history of Abulfeda. The autobiography of the poet Usama ibn Munkidh (1095–1188), edited by **H.** Derenbourg (1886), gives an invaluable picture of eastern life. Later Arabian authorities are Ibn Khallikan (1211–82) and Abu Shama (born **1267**). Of Christian authorities the following are important: the history of William of Tyre (1137–85); the *Itinerarium peregrinorum,* probably the Latin version of the *Carmen Ambrosii* (ed. by *W.* Stubbs, in the "Rolls Series," **1864**); and the *Chronique d'outremer,* or the French translation of William of Tyre's history and its continuation by Ernoul. the squire of Balian, seigneur of Ibelin (1228). The best modern authority is Stanley Lane-Poole's *Saladin* ("Heroes of the Nations Series," London, 1903). *See* also the bibliography to CRUSADES.

(W. F. K.; X.)

SALAMAN, REDCLIFFE NATHAN (1874–1955), English botanist, noted for his work on potatoes, was born in London on Sept. 12. 1874. He was educated at St. Paul's school and Trinity hall, Cambridge, took a medical degree and became director of the Pathological institute. London hospital. In 1904 he developed tuberculosis and in 1906 left London for Barley, near Royston, Hertfordshire. where he made a beautiful country home. There he became interested in William Bateson's genetic investigations, and in his garden he studied the potato intensively, particularly its resistance to blight. Later he studied its virus diseases with such success that a special research institute was set up at Cambridge to extend the work and he was appointed head. He initiated the building up of virus-free stocks of seed potatoes now carried on by the National Institute of Agricultural Botany at Cambridge.

Salaman was a man of wide culture and extensive interests and an active governor of the Hebrew university, Jerusalem. He died on June 12. 1955, at Royston.

His books include: *Potato Varieties* (1926) and *The History* and *Social Influence of the Potato* (1949). (E. J. R.)

SALAMANCA, a frontier province of western Spain, formed in 1833 out of the southern part of the ancient kingdom of León, and bounded north by Zamora and Valladolid, east by Ávila. south by Cáceres and west by Portugal. Pop. (1960 est.) 443,476; area, 3,763 sq.mi. Salamanca belongs almost entirely to the basin of the Duero (Portuguese *Douro, q.v.*), its principal rivers being the Tormes, which after a course of 135 mi. flows into the Duero; the Yeltes and the Agueda, also tributaries of the Duero: and the Alagon, an affluent of the Tagus. The southern border is partly defined along the crests of the Gredos and Gata ranges, but the highest point is La Alberca (5,653 ft.) in the Sierra de Peña de Francia, a little farther north. Forests of oak, pine, beech and chestnut cover a wide area in the south and southwest. Of the 50 Spanish provinces only Badajoz, Cáceres and Teruel have a larger number of livestock. Gold is found in the streams, and iron, lead, copper. zinc, coal and rock crystal in the hills, but the mines are only partially developed. The capital, Salamanca (*q.v.*), Ciudad Rodrigo (*q.v.*) and Béjar (15,511 [pop. 1950]) are the chief towns.

The railways from Zamora. Medina, Plasencia and Peñaranda converge upon the capital, whence two lines go westward into Portugal—one via Barca d'Alva to Oporto, the other via Villar Formoso to Guarda. The province was occupied by nationalist troops shortly after the outbreak of the civil war of 1936–39.

SALAMANCA (anc. SALMANTICA or ELMANTICA), the capital of the Spanish province of Salamanca on the right bank of the river Tormes, 2,648 ft. above sea level and 172 mi. by rail N.W. of Madrid. Pop. '(1960 est.) 89,085 (mun.).

The town was of importance as early as 222 B.C.. when it was captured by Hannibal from the Vettones; and it afterward became under the Romans the ninth station on the Via Lata from Merida to Saragossa. It passed successively under the rule of the Goths and the Moors. till the latter were finally driven out about 10jj. About 1100 many foreign settlers were induced by Alphonso VI to establish themselves in the district, and the city was enlarged by Count Raymond of Burgundy. The Fuero de Salamanca, a celebrated code of civil law, probably dates from about 1200. Thenceforward. until the second half of the 16th century. the prosperity of the university rendered the city one of the most important in Spain.

Salamanca is the centre of a network of railways which radiate north to Zamora. northeast to Medina. east to Pefiaranda, south to Plasencia. west-southwest to Guarda in Portugal and west to Oporto in Portugal. The river is here crossed by a bridge 500 ft. long built on 26 arches, 15 of which are of Roman origin, while the remainder date from the 16th century. The city is still much the same in outward appearance as when its tortuous streets were thronged with students. The university was naturally the chief source of wealth to the town, the population of which in the 16th century numbered 50,000, nearly 8 000 of whom were students. Its decay of course reacted on the townsfolk, but it fortunately also arrested the process of modernization. The ravages of war alone have wrought serious damage, for the French in their defensive operations in 1811–12 almost destroyed the western quarter. Salamanca was again the scene of bitter fighting between nationalist and loyalist troops during the civil war of 1936–39.

The magnificent Plaza Mayor, built by Andres Garcia de Quiñones at the beginning of the 18th century. and capable of holding 20,000 people to witness a bullfight, is one of the finest squares in Europe. It is surrounded by an arcade of 90 arches on Corinthian columns, one side of the square being occupied by the municipal buildings.

The University.—Salamanca is still rich in educational establishments. It still keeps up its university. with the separate faculties of letters, philosophy, sciences, law and medicine; its university and provincial public library, with many thousand volumes and manuscripts; its Irish college, provincial institute. superior normal school. ecclesiastical seminary (founded in 1778), economic and other learned societies. and very many charitable foundations. The city still has its 25 parishes, 25 colleges. and as many more or less ruined convents, and 10 yet flourishing religious houses.

The university, the oldest in the peninsula. was founded about 1230 by Alphonso IX of Leon, and refounded in 1242 by St. Ferdinand of Castile. Under the patronage of the learned Alphonso X its wealth and reputation greatly increased (1252–82), and its schools of canon law and civil law attracted students even from Paris and Bologna. In the 15th and 16th centuries it was renowned throughout Europe. Here Christopher Columbus lectured on his discoveries, and here the Copernican system was taught long before it had won general acceptance. But soon after 1550 a period of decline set in.

Principal Buildings. — The old cathedral is a cruciform building of the 12th century, begun by Bishop Jeronimo, the confessor of the Cid (*q.v.*). Its style of architecture is that late Romanesque which prevailed in the south of France, but the builder showed much originality in the construction of the dome, which covers the crossing of the nave and transepts. The inner dome is made to spring, not from immediately above the arches, but from a higher stage of a double arcade pierced with windows. The thrust of the vaulting is borne by four massive pinnacles, and over the inner dome is an outer pointed one covered with tiles.

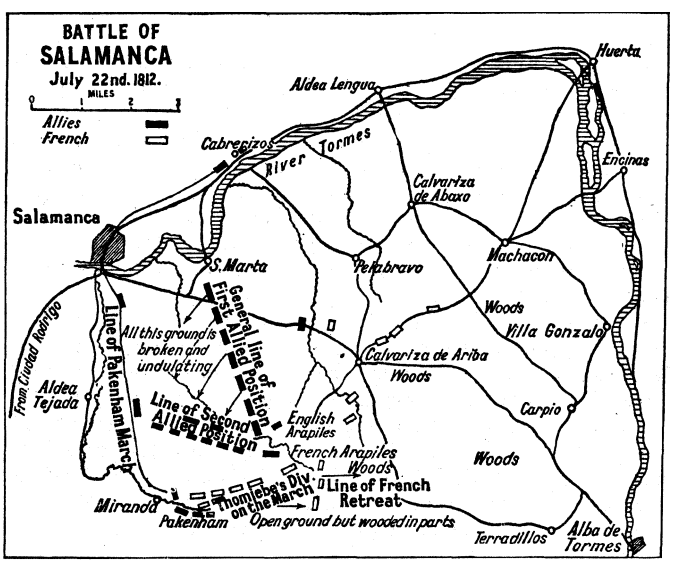
The Capilla de Talavera is used as a chapel for service according to the Mozarabic rite. which is celebrated there six times a year. On the north of and adjoining the old church stands the new cathedral, built from designs by Juan Gil de Ontaiion. Though begun in 1509 the work of construction made little progress until 1513. when it was entrusted to Ontaiion under Bishop Francisco de Bobadilla; though not finished till 1734, it is a notable example of the late Gothic and Plateresque styles. Its length is 340 ft. and its breadth 160 ft. The treasury is very rich, and among other articles possesses a custodia which is a masterpiece of goldsmith's work, and a bronze crucifix of undoubted authenticity, which was borne before the Cid in battle.

Of the university buildings the façade of the library is a peculiarly rich example of late 15th-century Gothic. The cloisters are light and elegant; the grand staircase ascending from them has a fine balustrade of foilage and figures. The Colegio de Nobles Irlandeses was built in 1521 from designs by Pedro de Ibarra. The double arcaded cloister is a fine piece of work of the best period of the Renaissance. The Jesuit college is an immense and ugly Renaissance building begun in 1614 by Juan Gomez de Mora. The Colegio Viejo, also called San Bartolome, was rebuilt in the 18th century, and serves as the governor's palace. The Dominican convent of San Esteban shows a mixture of styles from the 13th century onward. The church is Gothic with a Plateresque façade of great lightness and delicacy. The convent of the Augustinas Recoletas. begun by G. Fontana in 1616, is in better taste than any other Renaissance building in the city. The church is rich in marble fittings and contains several fine pictures of the Neapolitan school. especially the Conception by J. Ribera (1588–1656) over the altar. The convent of the Espiritu Santo has a good door by A. Berruguete (*c.* 1480–1561).

Many of the private houses are untouched examples of the domestic architecture of the times in which they were built.

Rashdall, *Universities of Europe in the Middle Ages,* vol. ii, pt. 1 (1895); E. Esperabé, *Historia pragmática e interna de la Universidad de Salamanca,* 2 vols. (1914–17). (X.)

Battle of Salamanca, 1812. (For the operations which preceded this battle *see* PENINSULAR WAR.)—On July 22, 1812, the



allied army under Wellington (about 46,000 with 60 guns) was drawn up south of Salamanca, the left resting on the river Tormes, with a division under Pakenham on the north bank of Cabrerizos. Wellington's object was to cover Salamanca and guard his communications through Ciudad Rodrigo with Portugal.

The French under Marshal Marmont (about 42.000 with 70 guns) were collecting toward Wellington's right, stretching southward from Calvariza de Ariba. The country generally is undulating.

Until the morning of the battle it had been uncertain whether Marmont wished to reach Salamanca by the right or left bank of the Tormes, or to gain the Ciudad Rodrigo road, but Wellington now felt that the latter was his real objective. At daylight there was a rush by both armies for the two commanding hills of the Arapiles; the allies gained the northern (since termed the "English"). and the French the southern (since termed the "French") Arapiles. While Marmont was closing up his forces, a complete change of position was carried out by Wellington. Pakenham was directed to march through Salamanca, crossing the Tormes, and move under cover to a wood near Aldea Tejada. while Wellington took up a line under cover of a ridge between Arapiles and Aldea Tejada. By noon his old right had become his left, and he was nearer to the Ciudad Rodrigo road, flanking Marmont should he move toward it.

It was not Wellington's wish (*Despatches,* July 21, 1812) to fight a battle "unless under very advantageous circumstances." He knew that large reinforcements were nearing the French, and, having determined to fall back toward Portugal, he began to pass his baggage along the Ciudad Rodrigo road. Marmont, about 2 P.M. seeing the dust of his baggage column, ignorant of his true position, and anxious to intercept his retreat. ordered two divisions under Maucune to push westward, while he himself attacked Arapiles. Maucune moved off, flanked by some cavalry and 50 guns, leaving a gap between him and the rest of the French. Wellington instantly took advantage of this. Directing Pakenham to attack the head of the leading French division, and a Portuguese brigade (Pack) to occupy the enemy by assaulting the south (or French) Arapiles, he prepared to bear down in strength upon Maucune's right flank. The French attack upon Arapiles was after hard fighting repulsed; and, at about 5 P.M., Maucune's force, when in confusion from the fierce attack of Pakenham and Wellington in front and flank and suffering severely. was suddenly trampled down "with a terrible clamour and disturbance" (Napier) by an irresistible charge of cavalry under Sir Stapleton Cotton. This counterstroke decided the battle, Marmont's left wing was being completely broken. The French made a gallant but fruitless effort to retrieve the day, and repulsed Pack's attack upon the French Arapiles; but, as the light waned, Clausel. Marmont being wounded, drew off the French army toward Alba de Tormes and retired to Valladolid. Both armies lost heavily, the allies about 6,000, the French some 15,000 men, 12 guns, 2 eagles and several standards.

The rout would have been even more thorough had not the castle and ford at Alba de Tormes been evacuated by its Spanish garrison without Wellington's knowledge.

Salamanca was a brilliant victory, and followed by the capture of Madrid, it severely shook the French domination in Spain.

(C. W. Ro.)

SALAMANCA, a city of Cattaraugus county, in southwestern New York, U.S., about 55 mi. S.E. of Buffalo, is located on the Allegheny river.

Salamanca is on both sides of the river at an altitude of 1,390 ft., with wooded hills on the horizon. It lies in the Xllegany Indian reservation, and all land is held under a 99-year lease, authorized by congress in 1892. It is the northern gateway to Xllegany State park of 65,000 ac., which lies immediately south of the city.

Industries consist of railroad shops and terminals, furniture factories, tannery, plastic molding, worsted yarns, print rolls, last blocks and milk processing plants. Salamanca was first settled in 1855 and called Hemlock. It was later named after a Spanish banker who was a large stockholder in the first railroad built in the county in 1862.

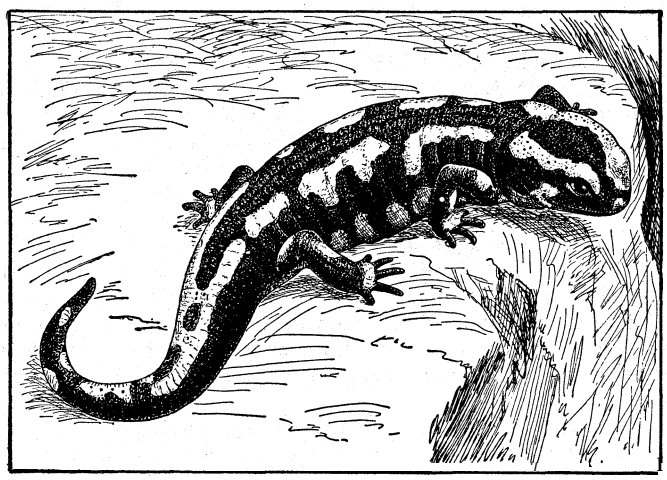
For comparative population figures *see* table in NEW YORK: *Population.*

SALAMANDER, properly the term for the tailed amphibians constituting the order Caudata. The group includes eight families of very diverse form, the majority of which are exclusively North American.

See AMPHIBIA.

In Europe the term may refer principally to the genus *Salamandra,* which is restricted to the western parts of the Palaearctic region. The fire salamander, *S. salamandra,* is the well-known

black and yellow creature inhabiting central Europe and northwest Africa, and southwest Asia; the black salamander, S. *atva,* is restricted to the Alps. These salamanders, far from being able to withstand the action of fire, as was believed by the ancients, are found only in damp places. They often emerge in great numbers in misty weather or after thunderstorms. Although harmless to man, the large glands on their smooth, shiny bodies secrete a milky poison, which protects them from many enemies. The bright coloration of S. *salanzandra* may therefore have a warning function.



THE EUROPEAN FIRE SALAMANDER, AFTER BREHM

The two well-known European species pair on land, the male clasping the female at the arms, and the impregnation is internal. Long after pairing the female gives birth to living young. *S. salamandra,* which lives at low altitudes (up to 3.000 ft), deposits her young, 10 to 50 in number, in the water, in springs or cool rivulets. These young at birth are similar to small newt larvae, and provided with external gills. *S. atra,* on the other hand, inhabits more hilly regions, up to 9,000 ft. Such altitudes not being, as a rule, suitable for larval life in the water, the young are retained in the uterus until after metamorphosis. Only two young, rarely three or four, are born, and may measure as much as 50 mm. at birth, the mother measuring only 120. The fertilized eggs are large and numerous, as in S. *salamandra,* but only one develops in each uterus, the embryo being nourished on the other eggs, the embryos of which break down into a soupy "vitelline mass." The embryo passes through three stages—(I) still enclosed within the egg membrane and living on its own yolk; (2) free, within the vitelline mass, which is swallowed by the mouth; (3) there is no more vitelline mass, but the embryo develops long external gills, which serve for a nutritive exchange through the maternal uterus, these gills functioning in the same way as the chorionic villi of the mammalian embryo's placenta. Embryos, in the second stage, if artificially released from the uterus, are able to live in water, but the uterine gills soon wither and are shed and are replaced by other gills similar to those in the larva of S. *salamandra.* In S. *salanzandra* without access to water, the development of the embryos becomes closely similar to that of *S. atra.*

SALAMIS, an island of Greece in the Saronic Gulf of the Aegean Sea, extending along the coasts of Attica and Megaris, and enclosing the Bay of Eleusis between two narrow straits on the W. and S. Its area is 36 sq.mi., its greatest length in any direction 10 mi.; its extremely irregular shape gives rise to the modern popular name Κουλλοῦρι, *i.e.,* baker's crescent. In Homer Salamis was the home of the Aeginetan prince Telamon and his sons Ajax and Teucer, and this tradition is confirmed by the position of the ancient capital of the island opposite Aegina. It subsequently passed into the hands of the Megarians, but was wrested from them about 600 B.C. by the Athenians under Solon (*q.v.*) and definitely awarded to Athens by Sparta's arbitration. Though Attic tradition claimed Salamis as an ancient possession the island was not strictly Athenian territory; a 6th-century inscription shows that it was treated either as a cleruchy or as **a** privileged foreign dependency. The town of Salamis was removed to an inlet of the east coast opposite Attica. In 480 Salamis became the base of the allied Greek fleet after the retreat from Artemisium, while the Persians took their station along the Attic coast off Phalerum. Through the stratagem of the Athenian Themistocles the Greeks were enclosed in the straits by the enemy, who had wheeled by night across the entrance of the east channel and detached a squadron to block the west outlet. The Greeks had thus no resource but to fight, while the Persians could not utilize their superior numbers, and as they advanced into the narrow neck of the east strait were thrown into confusion. The allies, among whom the Athenians and Aeginetans were conspicuous, seized this opportunity to make a vigorous attack which probably broke the enemy's line. After waging a losing fight for several hours the Persians retreated with a loss of zoo sail and of an entire corps landed on the islet of Psyttaleia in the channel; the Greeks lost only 40 ships out of more than 300. During the Peloponnesian War Salamis served as **a** repository for the country stock of Attica. About 350 Salamis obtained the right of issuing copper coins. In 318 Cassander placed in it a Macedonian garrison which was finally withdrawn through the advocacy of the Achaean statesman Aratus (232). The Athenians thereupon supplanted the inhabitants by a cleruchy of their own citizens. By the end century A.D. the settlement had fallen into decay. In modern times Salamis, which is chiefly peopled by Albanians, has regained importance through the transference of the naval arsenal to Ambelaki near the site of the ancient capital. Excavations in this region have revealed large numbers of late Mycenaean tombs.

C.)

SALAMIS, the principal city of ancient Cyprus, situated on the east coast north of the river Pedias (Pediaeus). It had a good harbour, well situated for commerce with Phoenicia, Egypt and Cilicia, which was replaced in mediaeval times by Famagusta (*q.v.*), and is wholly silted now. Its trade was mainly in corn, wine and oil from the midland plain, and in salt from the neighbouring lagoons. Traditionally, Salamis was founded after the Trojan War (c. 1180 B.C.) by Teucer from the island Salamis, **off** Attica, but there was a Mycenaean colony somewhat earlier.

A king Kisu of Silna (Salamis) is mentioned in a list of tributaries of Assur-banî-pal of Assyria in 668 B.C., and Assyrian influence is seen in terra-cotta figures from a shrine excavated in 1890–1891. Salamis seems to have been the principal Hellenic power in the island. The revolts against Persia in 500 B.C., 386–380 B.C. and 352 B.C. were led respectively by its kings Onesilas, Evagoras (*q.v.*) and Pnytagoras. In 306 B.C. Demetrius Poliorcetes won a great naval victory here over Ptolemy I. of Egypt. Under Egyptian and Roman administration Salamis flourished greatly, though the seat of government was at New Paphos (see PAPHOS). But it was greatly damaged in the Jewish revolt of A.D. 116–117; suffered repeatedly from earthquakes, and was wholly rebuilt by Constantius II. (A.D. 337–361) under the name Constantia. There was a large Jewish colony, and a Christian community was founded by Paul and Bamabas in A.D. 45–46. Barnabas was himself a Cypriote, and his reputed tomb, discovered in A.D. 477, is still shown near the monastery of Ail Barnába. St. Epiphanius was archbishop A.D. 367–402. The Greek city was destroyed by the Arabs under the Caliph Moawiya in 647; Christian survivors migrated to the neighbouring Ammochostos (see

FAMAGUSTA).

SAL AMMONIAC (AMMONIUM CHLORIDE): *see* AMMONIA.

SALANDRA, ANTONIO (1853–1931). Italian statesman, was born of a wealthy family at Troia, Puglia, on Aug. 13. 1853. He was a barrister who also taught public administration in Rome university. Politically he was a conservative. An undersecretary in 1891, he became minister of agriculture in 1899 and then finance minister in 1906 and in 1909–10. When, in March 1914, Giolitti resigned. Salandra was called upon to form the new cabinet.

Salandra was premier on the outbreak of World War I, and it was his cabinet that took the momentous decision of proclaiming Italy's neutrality, in spite of the existence of the triple alliance, because Austria-Hungary had declared war on Serbia without a previous agreement with Italy.

After bargaining with both sides, in May 191 j Salandra assumed the still greater responsibility of bringing Italy into the war on the side of the Allies. This highhanded decision was taken during a parliamentary recess. Subsequently he had to resign office in June 1916, in consequence of the Austrian offensive in the Trentino. During the disturbed period from 1919 to 1922 Salandra upheld the principles of authoritarian conservatism. He succeeded T. Tittoni as Italian delegate on the League of Nations council and in its assembly, and represented the Italian thesis in the Italo-Greek conflict of Aug.–Sept. 1923 *(see* CORFU).

The Fascist movement was supported from the first by Salandra, but he did not join the Fascist party; and when he felt that Fascism was incompatible with the old Liberal tradition. especially after Mussolini's speech of Jan. 3, 1925, he modified his support. In 1928 on the proposal of Mussolini he was created a senator. He died on Dec. 9, 1931.

Salandra's war policy is covered in his two books *La Neutralità italiana, 1914: ricordi e pensieri,* published in 1928, and *L'Intervento, 1915* (1930). (D. M. SH.)

SALARIA, VIA, an ancient highroad of Italy which ran from Rome by Reate and Asculum to Castrum Truentinum (Porto d'Ascoli) on the Adriatic coast, a distance of 151 mi. Its first portion was the route by which the Sabines came to fetch salt from the marshes at the mouth of the Tiber. Considerable remains of its course through the Apennines survive.

SALAR JUNG, SIR (1829–1883), Indian statesman of Hyderabad. born in 1829, descendant of a family of officials under the Xdil Shahi kings of Bijapur, then under the Delhi emperors and lastly under the nizams. Sir Salar Jung's personal name was Mir Turab Ali. He succeeded his uncle Suraju 'l-Mulk as prime minister of Hyderabad in 1853. Salar Jung disciplined Arab mercenaries, the more valuable part of the nizam's army, and employed them against the rapacious nobles and bands of robbers who had annihilated the trade of the country. He then constituted courts of justice at Hyderabad, organized the police force, constructed and repaired irrigation works and established schools. On the outbreak of the mutiny he supported the British. and although unable to hinder an attack on the residency, he warned the British minister that it was in contemplation. The attack was repulsed; the Hyderabad contingent remained loyal and their loyalty served to ensure the tranquillity of the Deccan. Salar Jung took advantage of the preoccupation of the British government with the mutiny to push his reforms more boldly. and when the Calcutta authorities were again at liberty to consider the condition of affairs his work had been carried far toward completion. During the lifetime of the nizam Afzulu'd-dowla, Salar Jung was considerably hampered by his master's jealous supervision. When Mir hlahbub Ali. however, succeeded .his father in 1869. Salar Jung. at the instance of the British government, was associated in the regency with the principal noble of the state, the Shamsu 'l-Umara or Amir Kabir, and enjoyed an increased authority. In 1876 he visited England. unsuccessfully attempting to obtain the restoration of Berar.

Salar Jung died at Hyderabad on Feb. 8, 1883.

SALAYAR (Dutch SALAJAR), a group of islands between 5° 36′ and 7° 25′ S. and 119° 50′ and 121° 30′ E., Celebes, Indon., including Tambalongang. Pulasi and Bahuluwang. The main island, Salayar, is more than 50 mi. long and 8 mi. at its widest point; area, 248 sq.mi. The strata of the island are sedimentary rocks; except in the north and northwest it is covered by fertile soil. Pop, about 80.000, mainly a mixture of Macassars, Buginese and natives of Luvu and Buton, Salayar being one of the most thickly populated parts of the division of Celebes. Trepang, tortoise shell, copra, coconqt oil and salt are exported.

SALAZAR, ANTONIO DE OLIVEIRA (1889–), Portuguese statesman, was born on April 28. 1889, at Vimieiro, near Santa Comba Dão, province of Beira Alta, Port., the son of António de Oliveira and Maria do Resgate Salazar, modest small holders. From village school he passed in 1900 to the seminary at Viseu; after eight years he decided he had no vocation for the priesthood. He entered Coimbra university in 1910, took an economics degree in 1914 and joined the teaching staff. In 1918 he was appointed professor of economic sciences. Devoutly Catholic and much influenced by the papal encyclical *Rerum Novarum,* he became widely known for his writings and speeches on political economy. In Jan. 1921 he was one of three Catholic deputies elected to parliament. He appeared only once in the chamber.

When in May 1926 the parliamentary system was replaced by a dictatorship. Salazar was offered the portfolio of finance, which he accepted, only to resign five days later. However, on April 27, 1928, he left Coimbra to become finance minister under Gen. António Oscar de Fragoso Carmona on terms that gave him virtual control of the machinery of government. On July j. 1932, he became president of the council of ministers (prime minister).

The new constitution of 1933, which combined principles of an authoritarian state with *Rerum Novarum* ideas of social justice, was a distillation of theories and doctrines consistently expounded by Salazar from his earliest student days.

Salazar's first and most enduring impact on government was through budgetary reforms and controls, but he was, in fact, the all-pervading (though rarely seen) genius of Portugal's *Estndo Novo.* (F. *B.* H.)

SALCEDO, a province in northern Dominican Republic, is the smallest province in area (191 sq.mi.) and has the greatest density of population (1960 average. 359.5 per sq.mi.). Its many small farms produce a great quantity of cacao, coffee, corn and some tobacco. The province is crossed by the eastern section of the low Cordillera Septentrional. which divides the drainage northward to the Atlantic from the streams that flow southward to the fertile Vega Real.

Salcedo was created in 1952 from Espaillat province. The population of Salcedo province was 57,813 in 1950 and 68.656 in 1960.

The capital is Salcedo (pop. [1960] 6,175). (D. R. D.)

SALDANHA BAY, an inlet on the southwestern coast of South Africa, 63 mi. by sea north by west of Cape Town, forming a landlocked harbour. The northern part of the inlet is known as Hoetjes bay. From Kalabas Kraal on the Cape Town-Clanwilliam railway, a narrow gauge line was built via Hopefield to Hoetjes bay—126 mi. from Cape Town. It was used as a naval base during World War II. Saldanha bay was named after Antonio de Saldanha, captain in Albuquerque's fleet which visited south Africa in 1503.

SALDERN, FRIEDRICH CHRISTOPH VON (1719–1785), Prussian soldier and military writer, entered the army in 1735, and was transferred to the guards in 1739. As one of Frederick's aides-de-camp he was the first to discover the approach of Neipperg's Austrians at Mollwitz. He commanded a guard battalion at Leuthen, again distinguished himself at Hochkirch and was promoted major general. In 1760 at Liegnitz Frederick gave him four hours in which to collect, arrange and despatch the spoils of the battle. 6,000 prisoners, 100 wagons. 82 ,guns and 5,000 muskets. His complete success made him a marked man even in

Frederick's army. At Torgau, Saldern and Mollendorf with their brigades converted a lost battle into a great victory by their desperate assault on the Siptitz heights. In the following winter, however, being ordered by Frederick to sack Hubertusburg, Saldern refused on the ground of conscience. Nothing was left for him but to retire, but after the peace the general was at once made inspector of the troops at Magdeburg.

SALE, SIR ROBERT HENRY (1782–1845), British soldier, entered the 36th Foot in 1795, and went to India in 1798. He served in the operations against Tippoo Sahib, against the raja of Travancore (1808–09) and in the expedition to Mauritius (1810). In the Burmese War he rose to command a brigade. In 1838, on the outbreak of the Afghan War, Sale was assigned to the command of the 1st Bengal brigade.

Sale's column arrived at Kandahar in April 1839, and in May it occupied the Herat plain The Kandahar force next set out on its march to Kabul, and a month later Ghazni was stormed, Sale in person leading the storming column and distinguishing himself in single combat. The place was well provisioned, and on its supplies the army finished its march to Kabul easily. He was left. as second-in-command, with the army of occupation, and in the interval between the two wars conducted several small campaigns ending with the action of Parwan which led directly to the surrender of Dost Mohammed.

By this time the army had settled down to the quiet life of cantonments. and Lady Sale and her daughter came to Kabul. But the policy of the Indian government in stopping the subsidy to the frontier tribes roused them into hostility, and Sale's brigade received orders to clear the line of communication to Peshawar. After severe fighting Sale entered Jalalabad on Nov. 12. 1841. Ten days previously he had received news of the murder of Sir Alexander Burnes, along with orders to return with all speed to Kabul.

These orders Sale. for various reasons, decided to ignore; suppressing his personal desire to return to protect his wife and family, he gave orders to push on. and on occupying Jalalabad at once set about making the old and half-ruined fortress fit to stand a siege. There followed a close and severe investment. At last Pollock and the relieving army appeared, only to find that the garrison had on April 7, 1842, relieved itself by a brilliant and completely successful attack on Akbar's lines. Pollock and Sale after a time took the offensive, and after the victory of Haft Kotal, Sale's division encamped at Kabul again.

At the end of the war Sale received the thanks of parliament. In 1845, as quartermaster-general to Sir H. Gough's army, Sale again took the field. At Moodkee (Mudki) he was wounded and he died on Dec. 21. 1845.

SALE, a municipal borough in the Altrincham and Sale parliamentary division, Cheshire. Eng., 5 mi. S.W. of Manchester. Pop. (1961) 51.317. Area 5.7 sq.mi. In 1930 the urban districts of Sale and Ashton-upon-Mersey were amalgamated. The borough, created in 1935, is mainly residential but market gardening to supply Manchester is extensive. The Mersey river separates Sale from Manchester. Salford and Stretford. The Bridgewater canal passes through the town.

SALÉ (SLÄ), a seaport on the Atlantic coast of Morocco, on the north side of the Bu Ragreg, opposite Rabat (*q.v.*). Salé, inhabited by a native bourgeoisie, has many Moslem sanctuaries, mosques. *zaouïas, medersas* and tombs of saints. In the middle ages, it mas the most important merchant port and entrepôt of the west coast.

In the 17th century it became an independent republic, a great centre of corsairs. Various French and English expeditions tried. without much success, to put an end to it. Pop. (1960) 75,799.

SALE CITY, the first city to be proclaimed in Gippsland province in the county of Tanjil. Victoria, Austr.. on the Thomson river, 127½ mi. by rail E.S.E. of Melbourne. Pop. (1954) 6.537. It is an important administrative and educational centre situated in a rich agricultural (dairying and mixed farming) irrigation district. Sale City is the seat of the Anglican bishop of Gippsland and also of the Roman Catholic bishop of Sale. The climate is temperate; the average annual rainfall is 24 in.

SALEM, a city and district of Madras state, republic of India. The city is on both banks of the Tirumanimuttar river, 3 mi. from a station on the Southern railway, 206 mi. S.W. of Madras city. Pop. (1961) 249,084. There is a considerable weaving industry. Its situation in a green valley between the Shevaroy and Jarugumalai hills is picturesque.

The DISTRICT OF SALEM has an area of 7,063 sq.mi. Except toward the south it is hilly, with extensive plains lying between the several ranges. It consists of three distinct tracts, formerly known as the Talaghat, the Baramahal and the Balaghat. The Talaghat is situated below the Eastern Ghats on the level of the Carnatic generally; the Baramahal includes the whole face of the Ghats and a wide area of country at their base; and the Balaghat is situated above the Ghats on the tableland of Mysore.

The western part of the district is mountainous. Among the chief ranges are the Shevaroys, the Kalrayans, the Melagiris, the Kollimalais, the Pachamalais and the Yelagiris. The population in 1961 was 3.826.349. The principal crops are millets, rice, pulses, mangoes and oilseeds. Coffee is grown on the Shevaroy hills. The chief irrigation work is the Barur tapk system. The Southern railway runs through the district, with two narrow-gauge branches. The chief industry is cotton weaving, and magnesite and steatite are worked, and there are iron and steel works.

The district was acquired partly by the treaty of peace with Tippoo Sultan in 1792 and partly by the partition treaty of Mysore in 1799.

SALEM, one of New England's most historic cities, is an old seaport in Essex county, Mass.. U.S.. about 15 mi. N.E. of Boston. Its diversified industry includes a large parlor-game plant; electronic devices and leather goods are also important products. Its principal modern interest, however, is linked with its distinguished past. particularly its remarkable early maritime achievements, its witchcraft trials and executions, and its associations with Nathaniel Hawthorne (*q.v.*).

Salem was founded in 1626 by Roger Conant, six years after the settlement of the "Old Colony" at Plymouth. In 1628 Gov.

ROBERT FINKELSTEIN

JOHN TURNER HOUSE

Built in 1668 in Salem and made famous by Nathaniel Hawthorne in "The House of the Seven Gables"

John Endecott brought a band of settlers there as an advance guard of the Massachusetts Bay colony, which was established in force at Boston in 1630. In 1629 the first Congregational church in America was organized at Salem by Rev. Francis Higginson; Roger Williams was one of its early pastors. Several 17th-century homes are still standing, including the Pickering house (1660); the John Turner house (1668), immortalized by Hawthorne as "the house of the seven gables"; and the John Ward house (1684), preserved with 17th-century furnishings by the Essex institute. There is

also the "witch house," where Judge Jonathan Curtin held some of the preliminary examinations during the witchcraft hysteria of 1692, in which 19 persons, chiefly women, were condemned and executed for supposedly practising the occult arts.

Salem's chief distinction to historical fame comes from its achievements at sea during the 50 years following the outbreak of the American Revolution. It had a very mediocre harbour and a meagre hinterland but during the "golden age" of the American merchant marine its ships and mariners voyaged with great success to distant seas, particularly beyond the Cape of Good Hope. The boom came from privateering during the American Revolution, when Salem vessels made about 445 captures. With trade routes open in 1783 after British colonial regulations were removed, some of the larger Salem privateers, especially those of Elias Haskett Derby, opened up new contacts with the Baltic, the Mediterranean. India and what Samuel E. Morison in his *Maritime History of Massachusetts* has called the Salem East Indies, with pepper from Sumatra as a specialty. Particularly high profits were made by the Derbys, the Crowninshields and others by neutral traffic during the Anglo-French wars from 1793 until the end of 1807, when the Embargo act ended virtually all commerce with foreign nations. Salem still contains much atmosphere from the heyday of that trade, particularly in the high, square brick houses, with beautiful carved woodwork, designed by Samuel McIntire (*q.v.*). Of these, the Pingree house (1804), beautifully furnished, is opened to the public by the adjacent Essex institute. The atmosphere of the great age of Salem shipping has been ably preserved by the national park service's 9-ac. Salem Maritime National historic site, established in 1938. It includes the great Derby wharf, commenced around 1760, and the adjacent, shorter Central wharf; the Derby house (1762); the McIntire-designed Hawes house (1801); and the Salem Custom house (1819), nhere Hawthorne, as surveyor of the port from 1846 to 1849, wrote part of *The Scarlet Letter*. Salem's commerce never regained its former volume, although after the embargo was lifted there developed a lively trade with Zanzibar and a factory was started to produce cloth for that market. Eventually, as ships became larger, the harbour could not accommodate them and controlled and manned vessels operated out of Boston or New York.

Important custodians of the Salem tradition are the Essex institute, with its rich library and its quarterly *Historical Collections*, and the Peabody museum, housed in the old granite building of the East India Marine society and possessing maritime and ethnographic collections. In addition to Hawthorne, other distinguished Salem natives were Nathaniel Bowditch, pioneer in navigation; Timothy Pickering, early postmaster general and secretary of state; and William Hickling Prescott, the historian. Alexander Graham Bell did much of his significant telephone research while a resident of Salem.

SALEM, a city of New Jersey, U.S., 38 mi. S.W. of Philadelphia, Pa.. is the oldest permanent English settlement in the Delaware valley and many of its houses, as well as its Quaker meeting house, have been preserved from colonial times. It was established in 1675 on Salem creek, 2 mi. from the Delaware, by John Fenwick, an English Quaker. Fenwick took the name Salem, meaning "land of peace," from the Old Testament. In 1682 Salem received royal permission to become a port of entry. In the decade before the American Revolution, however, the collector of customs reported that smuggling, especially of rum, sugar and molasses, was prevalent. During the American Revolution, the British occupied Salem in 1778, following Anthony Wayne's foraging expedition into the area for supplies for Washington's army at Valley Forge. It was during these years that the massacre of American militia at the William Hancock house, 4 mi. from Salem, occurred. The house is now a state museum.

The railroad reached the edge of Salem in 1863 but did not come into the town itself until 1882, when a bridge was built over Salem creek. The decade of the 1860s also witnessed the establishment of a glass works and an "oil cloth" factory to make floor coverings. By mid-20th century these two industries, along with canned foods, were the major sources of employment. Many inhabitants, however, commuted to work in nearby industries.

A point of historical interest is the Alexander Grant house (1721), home of the county historical society museum. The ancient oak tree under which Fenwick bartered with the Indians continues to attract visitors.

For comparative population figures *see* table in NEW JERSEY: *Population,* (H. F. *Wt.)*

SALEM, the capital of Oregon, U.S., and the seat of Marion county, is situated in the centre of the rich Willamette valley, equidistant from beach and mountain playgrounds, 50 mi. S. of Portland. The government buildings, built along an open mall and dominated by a modern neoclassical capitol completed in 1939, are in the heart of the city. Volcanic peaks of the Cascade mountains can be seen to the east and the forested Coast range to the west.

In 1834 a group of Methodist missionaries came to Oregon under the leadership of Jason Lee! a native of the Canadian border, of New England parentage and education. The first site chosen for the mission, 10 mi. N. of the present city of Salem, proved unhealthful, and in 1840 the mission was moved to a site known as Chemeketa, an Indian name, which meant "place of peace." This they translated to the biblical name of Salem and there erected a grist and sawmill and an Indian school.

In 1842 the missionaries decided to found a second school, for white children, called the Oregon institute, which they hoped would become a university; the first instruction was given in 1844. To provide funds for the institute, the missionaries decided in 1846 to lay out a town and sell lots. The Willamette valley was the focal point of the first migrations over the Oregon trail and as the population grew the mission townsite prospered. By a charter granted in 1853 the Oregon institute became Willamette university, the oldest institution of higher learning in the western United States. It is still related to the Methodist Church and offers liberal arts training and graduate work in law, music and education.

Salem became territorial capital of Oregon in 1851 and state capital in 1859, after having been chartered as a city in 1853. As the state grew, city and government grew, the city spreading from the flood plain by the river to surrounding hills. (For comparative population figures *see* table in OREGON: *Population.)* The city has had a council-manager form of government since 1947.

An eight-months growing season, an annual rainfall of 40 in. and a variety of soils produces a diversity of more than 100 crops in the area and Salem's canneries and frozen-food plants make it an important processing centre. Strawberries, beans, blackberries, sweet corn, onions! cherries and broccoli had the largest pack in 1960. As highways widen the market area, the city has become a major retail centre. Wood, paper products and metal fabrications are long standing and growing industries. The community used the Willamette river for transportation until 1933. It is served by north-south rail lines, an interstate highway and airlines.

The Salem Art museum in the Asahel Bush house (1878) is a city cultural centre. In the city or nearby are state schools for the blind and deaf, state hospitals, Fairview home for the mentally retarded and penal institutions.

(U. C. D.)

SALE OF GOODS. The law of sale is usually treated as a branch of the law of contract, because sale is effected by contract. Thus Pothier entitles his classical treatise on the subject, *Traité* du *contrat de vente.* But a completed contract of sale is something more. It is a contract plus a transfer of property. By an agreement to sell a *ius in personam* is created; by a sale of *ius in rem* is transferred. The essence of sale is the transfer of property for a price. If there be no agreement for a price, express or implied, the transaction is of the nature of a gift. So, too, if commodity be exchanged for commodity, the transaction is called barter and not sale, and the rules relating to sales do not apply in their entirety. Again, a contract of sale must

contemplate an absolute transfer of the property in the thing sold or agreed to be sold. A mortgage may be in the form of a conditional sale, but English law regards the substance and not the form of the transaction. If in substance the object of the transaction is to secure the repayment of a debt, and not to transfer the absolute property in the thing sold, the law at once annexes to the transaction the complex consequences which attach to a mortgage. So, too, it is not always easy to distinguish a contract for the sale of an article from a contract for the supply of work and materials. If a man orders a set of false teeth from a dentist the contract is one of sale, but if he employs a dentist to stop one of his teeth with gold the contract is for the supply of work and materials. The distinction is of practical importance, because very different rules of law apply to the two classes of contract. The property which may be the subject of sale may be either movable or immovable, tangible or intangible. The present article relates only to the sale of goods—that is to say, tangible movable property.

The Code of 1893.—In 1847, when Justice Story wrote his work on the sale of personal property, the law of sale was still in process of development. Many rules were still unsettled, especially the rules relating to implied conditions and warranties. But for several years the main principles have been well settled. In 1891 the subject seemed ripe for codification, and Lord Herschell introduced a codifying bill which two years later passed into law as the Sale of Goods Act, 1893.

Sale is a consensual contract. The parties to the contract may supplement it with any stipulations or conditions they may see fit to agree to. The code in no wise seeks to fetter this discretion. It lays down a few positive rules—such, for instance, as that which reproduces the 17th section of the Statute of Frauds. But the main object of the act is to provide clear rules for those cases where the parties have either formed no intention or have failed to express it. When parties enter into a contract they contemplate its smooth performance, and they seldom provide for contingencies which may interrupt that performance—such as the insolvency of the buyer or the destruction of the thing sold before it is delivered. It is the province of the code to provide for these contingencies, leaving the parties free to modify by express stipulation the provisions imparted by law. When the code was in contemplation the case of Scotland gave rise to difficulty. Scottish law varies widely from English. To speak broadly, the Scottish law of sale differs from the English by adhering to the rules of Roman law, while the English common law has worked out rules of its own. The Codifying bill of 1891 applied only to England, but on the advice of Lord Watson it was extended to Scotland. As the English and Irish laws of sale were the same, the case of Ireland gave rise to no difficulty, and the act now applies to the whole of Great Britain. As regards England and Ireland, very little change in the law has been effected. As regards Scotland, the process of assimilation has been carried further, but this has not been completed. In a few cases the Scottish rule has been saved or re-enacted, in a few other cases it has been modified, while on other points, where the laws were dissimilar, the English rules have been adopted.

The act is divided into six parts, the first dealing with the formation of the contract. The 1st section, which may be regarded as the keystone of the act, is in the following terms: "A contract of sale of goods is a contract whereby the seller transfers or agrees to transfer the property in goods to the buyer for a money consideration called the price. A contract of sale may be absolute or conditional. When under a contract of sale the property in the goods is transferred from the seller to the buyer the contract is called a 'sale,' but when the transfer of the property in the goods is to take place at a future time or subject to some condition thereafter to be fulfilled the contract is called an 'agreement to sell.' An agreement to sell becomes a sale when the time elapses or the conditions are fulfilled subject to which the property in the goods is to be transferred." This section clearly enunciates the consensual nature of the contract, and this is confirmed by sec. 55, which provides that "where any right, duty or liability would arise under a contract of sale by implication of law," it may be negatived or varied by express agreement, or by the course of dealing between the parties, or by usage, if the usage be such as to bind both parties to the contract. The next question is who can sell and buy. The act is framed on the plan that if the law of contract were codified, this act would form a chapter in the code. The question of capacity is therefore referred to the general law, but a special provision is inserted (sec. 2) relating to the supply of necessaries to infants and other persons who are incompetent to contract. Though an infant cannot contract he must live, and he can only get goods by paying for them. The law, therefore, provides that he is liable to pay a reasonable price for necessaries supplied to him, and it defines necessaries as "goods suitable to the condition in life of such minor or other person, and to his actual requirements at the time of the sale and delivery."

The 4th section of the act reproduces the famous 17th section of the Statute of Frauds, which was an act "for the prevention of frauds and perjuries." The object of that statute was to prevent people from setting up bogus contracts of sale by requiring material evidence of the contract. The section provides that "a contract for the sale of any goods of the value of £10 or upwards shall not be enforceable by action unless the buyer shall accept part of the goods so sold, and actually receive the same, or give something in earnest to bind the contract, or in part payment, or unless some note or memorandum in writing of the contract be made and signed by the party to be charged, or his agent in that behalf." It is a much-disputed question whether this enactment has brought about good or harm. It has defeated many an honest claim, though it may have prevented many a dishonest one from being put forward. When judges and juries have been satisfied of the bona *fides* of a contract which does not appear to satisfy the statute, they have done their best to get round it. Every expression in the section has been the subject of numerous judicial decisions, which run into almost impossible refinements, and illustrate the maxim that hard cases make bad law. It is to be noted that Scotland is excluded from the operation of sec. 4. The Statute of Frauds has never been applied to Scotland, and Scotsmen appear never to have felt the want of it.

As regards the subject-matter of the contract, the act provides that it may consist either of existing goods or "future goods"—that is to say, goods to be manufactured or acquired by the seller after the making of the contract (sec. 5). Suppose that a man goes into a gunsmith's shop and says, "This gun suits me, and if you will make or get me another like it I will buy the pair." This is a good contract, and no question as to its validity would be likely to occur to the lay mind. But lawyers have seriously raised the question, Whether there could be a valid contract of sale when the subject-matter of the contract was not in existence at the time when the contract was made. The price is an essential element in a contract of sale. It may be either fixed by the contract itself, or left to be determined in some manner thereby agreed upon, *e.g.*, by the award of a third party. But there are many cases in which the parties intend to effect a sale, and yet say nothing about the price. Suppose that a man goes into an hotel and orders dinner without asking the price. How is it to be fixed? The law steps in and says that, in the absence of any agreement, a reasonable price must be paid (sec. 8). This prevents extortion on the part of the seller, and unreasonableness or fraud on the part of the buyer.

Warranty.—The next question dealt with is the difficult one of conditions and warranties (secs. 10 and 11). The parties may insert what stipulations they like in a contract of sale, but the law has to interpret them. The term "warranty" has a peculiar and technical meaning in the law of sale. It denotes a stipulation which the law regards as collateral to the main purpose of the contract. A breach, therefore, does not entitle the buyer to reject the goods, but only to claim damages. Suppose that a man buys a particular horse, which is warranted quiet to ride and drive. If the horse turns out to be vicious, the buyer's only remedy is to claim damages, unless he has expressly reserved a right to return it. But if, instead of buying a particular horse, a

man applies to a dealer to supply him with a quiet horse, and the dealer supplies him with a vicious one, the stipulation is a condition. The buyer can either return the horse, or keep it and claim damages. Of course the right of rejection must be exercised within a reasonable time. In Scotland no distinction has been drawn between conditions and warranties, and the act preserves the Scottish rule by providing that, in Scotland, "failure by the seller to perform any material part of a contract of sale" entitles the buyer either to reject the goods within a reasonable time after delivery, or to retain them and claim compensation (sec. 11 [2]). In England it is a very common trick for the buyer to keep the goods, and then set up in reduction of the price that they are of inferior quality to what was ordered. To discourage this practice in Scotland the act provides that, in that country, the court may require the buyer who alleges a breach of contract to bring the agreed price into court pending a decision of the case (sec. 59). It seems a pity that this sensible rule was not extended to England.

In early English law *caveat emptor* was the general rule, and it was one well suited to primitive times. Men either bought their goods in the open market-place, or from their neighbours, and buyer and seller contracted on a footing of equality. Now the complexity of modern commerce, the division of labour and the increase of technical skill, have altogether altered the state of affairs. The buyer is more and more driven to rely on the honesty, skill and judgment of the seller or manufacturer. Modern law has recognized this, and protects the buyer by implying various conditions and warranties in contracts of sale, which may be summarized as follows: First, there is an implied undertaking on the part of the seller that he has a right to sell the goods (sec. 12). Secondly, if goods be ordered by description, they must correspond with that description (sec. 13). Thirdly, there is the case of manufacturers or sellers who deal in particular classes of goods. They naturally have better means of judging of their merchandise than the outside public, and the buyer is entitled within limits to rely on their skill or judgment. A tea, merchant or grocer knows more about tea than his customers can, and so does a gunsmith about guns. In such cases, if the buyer makes known to the seller the particular purpose for which the goods are required, there is an implied condition that the goods are reasonably fit for it, and if no particular purpose be indicated there is an implied condition that the goods supplied are of merchantable quality (sec. 14). Fourthly, in the case of a sale by sample, there is "an implied condition that the bulk shall correspond with the sample in quality," and that the buyer shall have a reasonable opportunity of comparing the bulk with the sample (sec. 15).

Effects of Contract. — The main object of sale is the transfer of ownership from seller to buyer, and it is often both a difficult and an important matter to determine the precise moment at which the change of ownership is effected. According to Roman law, which is still the foundation of most European systems, the property in a thing sold did not pass until delivery to the buyer. English law has adopted the principle that the property passes at such time as the parties-intend it to pass. Express stipulations as to the time when the property is to pass are very rare. The intention of the parties has to be gathered from their conduct. A long train of judicial decisions has worked out a series of rules for determining the presumed intention of the parties, and these rules are embodied in secs. 16 to 20 of the act. The first rule is a negative one. In the case of unascertained goods, *i.e.,* goods defined by description only, and not specifically identified, "no property in the goods is transferred to the buyer unless and until the goods are ascertained." If a man orders ten tons of scrap iron from a dealer, it is obvious that the dealer can fulfil his contract by delivering any ten tons of scrap that he may select, and that until the ten tons have been set apart, no question of change of ownership can arise. But when a specific article is bought, or when goods ordered by description are appropriated to the contract, the passing of the property is a question of intention. Delivery to the buyer is strong evidence of intention to change the ownership, but it is not conclusive. Goods may be delivered to the buyer on approval, or for sale or return. Delivery to a carrier for the buyer operates in the main as a delivery to the buyer, but the seller may deliver to the carrier, and yet reserve to himself a right of disposal. On the other hand, when there is a sale of a specific article, which is in a fit state for delivery, the property in the article *prima facie* passes at once, even though delivery be delayed. When the contract is for the sale of unascertained goods, which are ordered by description, the property in the goods passes to the buyer, when, with the express or implied consent of the parties, goods of the required description are "unconditionally appropriated to the contract." It is perhaps to be regretted that the codifying act did not adopt the test of delivery, but it was thought better to adhere to the familiar phraseology of the cases. Section 20 deals with the transfer of risk from seller to buyer, and lays down the *prima facie* rule that "the goods remain at the seller's risk until the property therein is transferred to the buyer, but when the property therein is transferred to 'the buyer, the goods are at the buyer's risk whether delivery has been made or not." *Res perit domino* is therefore the maxim of English, as well as of Roman law.

Title. — In the vast majority of cases people only sell what they have a right to sell, but the law has to make provision for cases where a man sells goods which he is not entitled to sell. An agent may misconceive or exceed his authority. Stolen goods may be passed from buyer to buyer. Then comes the question, Which of two innocent parties is to suffer? Is the original owner to be permanently deprived of his property, or is the loss to fall on the innocent purchaser? Roman law threw the loss on the buyer, *Nemo plus iuris in alium transferre potest quam ipse habet.* French law, in deference to modern commerce, protects the innocent purchaser and throws the loss on the original owner. "En fait de meubles, possession vaut titre" *(Code civil,* art. 1,599). English law is a compromise between these opposing theories. It adopts the Roman rule as its guiding principle, but qualifies it with certain exceptions, which cover perhaps the majority of the actual cases which occur (secs. 21 to 26). In the first place, the provisions of the Factors Act, 1889 (extended to Scotland by 53 and 54 Vict. c. 40), are preserved. That act validates sales and other dispositions of goods by mercantile agents acting within the apparent scope of their authority, and also protects innocent purchasers who obtain goods from sellers left in possession, or from intending buyers who have got possession of the goods while negotiations are pending. In most cases a contract induced by fraud is voidable only, and not void, and the act provides, accordingly, that a voidable contract of sale shall not be voided to the prejudice of an innocent purchaser. The ancient privilege of market overt (*i.e.,* "open market") is preserved intact (sec. 22). The section does not apply to Scotland, nor to the law relating to the sale of horses which is contained in two old statutes, 2 and 3 Phil. and Mar. c. 7, and 31 Eliz. c. 12. The minute regulations of those statutes are never complied with, so their practical effect is to take horses out of the category of things which can be sold in market overt. The privilege of market overt applies only to markets by prescription, and does not attach to newly-created markets. The operation of the custom is therefore fitful and capricious. For example, every shop in the City of London is within the custom, but the custom does not extend to the greater London outside. If then a man buys a stolen watch in Fleet street, he may get a good title to it, but he cannot do so if he buys it a few doors off in the Strand. There is, however, a qualification of the rights acquired by purchase even in market overt. When goods-have been stolen and the thief is prosecuted to conviction, the property in the goods thereupon revests in the original owner, and he is entitled to get them back either by a summary order of the convicting court or by action. This rule dates back to the statute 21 Hen. VIII. c. 11. It was probably intended rather to encourage prosecutions in the interests of public justice than to protect people whose goods were stolen.

Having dealt with the effects of sale, first, as between seller and buyer, and, secondly, as between the buyer and third parties,

the act proceeds to determine what, in the absence of convention, are the reciprocal rights and duties of the parties in the performance of their contract (secs. 27 to 37). "It is the duty of the seller to deliver the goods and of the buyer to accept and pay for them in accordance with the terms of the contract of sale" (sec. 27). In ordinary cases the seller's duty to deliver the goods is satisfied if he puts them at the disposal of the buyer at the place of sale. The normal contract of sale is represented by a cash sale in a shop. The buyer pays the price and takes away the goods "Unless otherwise agreed, delivery of the goods and payment of the price are concurrent conditions" (sec. 27). But agreement, express or implied, may create infinite variations on the normal contract. It is to be noted that when goods are sent to the buyer which he is entitled to reject, and does reject, he is not bound to send them back to the seller. It is sufficientif he intimate to the seller his refusal to accept them (sec. 36).

Remedies of Buyer and Seller.—The ultimate sanction of a contract is the legal remedy for its breach. Seller and buyer have each their appropriate remedies. If the property in the goods has passed to the buyer, or if, under the contract, "the price is payable on a day certain irrespective of delivery," the seller's remedy for breach of the contract is an action for the price (sec. 49). In other cases his remedy is an action for damages for non-acceptance. In the case of ordinary goods of commerce the measure of damages is the difference between the contract price and the market or current price at the time when the goods ought to have been accepted. The convenient market-price rule is subordinate to the general principle that "the measure of damages is the estimated loss directly and naturally resulting in the ordinary course of events from the buyer's breach of contract" (sec. 56). Similar considerations apply to the buyer's right of action for non-delivery of the goods (sec. 51). In exceptional circumstances the remedy of specific performance is available to the buyer (sec. 52). Thus the court might order the specific delivery of an autograph letter of an otherwise unrecorded signatory of the Declaration of Independence. The seller's rights are further protected by the rules as to lien and stoppage in *transitu* (secs. 38 to 48).

The sixth and last part of the act is supplemental, and is mainly concerned with drafting explanations, but sec. 58 contains some rules for regulating sales by auction. The practice known as a "knock-out" has since been struck at by the Auctions (Bidding Agreements) Act, 1927, by which it is declared illegal and punishable.

The act of 1893 has been adopted in substance by very many of the colonial possessions, and has been followed in the main by the American Sales Act (U S.A.). (M. D. C.)

C.I.F. Contracts.— These are in a class by themselves. The law governing them is mostly of recent growth and, nearly all of it, case law. They are contracts for the sale of sea-borne goods where the price quoted covers cost, insurance and freight. Hence the name. But the distinguishing characteristic of these sales is this: Performance is effected by tender of the documents in place of the delivery of the actual goods. Indeed, in the business world they are often referred to as sales of documents. By their means the goods are often sold many times over while still afloat; even though the ship be sunk or the goods perish no loss need fall upon the buyer, because he is protected under the policy of insurance effected on the goods or the bill of lading under which they are carried.

The documents are naturally the focus of attention. The seller must tender to the buyer the invoice, the bill of lading and the policy of insurance. On this point the requirements of the English courts are strict. By bill of lading is meant a bill or document attesting that the goods have been loaded on board, not that a shipping company is under contract to carry the goods on a named or subsequent ship. In the United States the practice may be different and the courts there may recognize "received for shipment" bills of lading and similar documents which circulate freely enough in the commercial world. Similarly with the policy of insurance. English law requires the tender of a policy. In the United States certificates of insurance and even more informal records of the contract of insurance are in recognized use. In this respect perhaps English law lags a little behind commercial practice, for certainly these certificates are a great convenience and by special agreement can be regularly employed. But in criticizing the law as it stands it must not be forgotten that other interests besides those of buyer and seller are affected; the banker and underwriter have to be taken into account. The banker for his part has up till now resolutely set his face against the so-called "bill of lading" which gives no certain information as to the whereabouts of the goods.

When the documents are tendered the buyer must be ready and willing to pay the price. He is not entitled to withhold payment until he has had an opportunity of examining the goods. The term "net cash" in a c.i.f. contract means cash against documents. The property passes, if any one general rule can be laid down on the subject, when the documents are tendered. But on this as on other aspects of the sale there is a growing body of law to which it is very difficult to do justice in a general statement. Some of the topics are not altogether free from difficulty. Moreover, though it is a form of contract in use the world over, the law governing it is by no means as uniform as could be wished. Accordingly it has been suggested, though the suggestion has a greater measure of support on the Continent where it originated than in either England or the United States, that attempts should be made to secure uniformity along the lines of the York-Antwerp rules. More doubtless will be heard of the proposal as time goes on. (H. GOT.)

UNITED STATES

The English law, as stated above, gives even in its details a picture of the American law. There is, to be sure, no market overt in the United States; and the American Factors' Acts are not only less broad in scope than the English, but, even with their narrower scope, are found only in a handful of States. Their policy should be compared with that of the statutes requiring filing or recording of chattel mortgages (*see* BILL OF SALE) and of conditional sales (*see* INSTALLMENT CREDIT). Where found, they commonly permit a consignee of goods, whose business also includes selling on his own account, to make an effective pledge of his principal's goods to secure his own debt; but the American law extends such powers to the "intending purchaser" who has secured possession only in a few specific cases, such as (in many States) instalment purchase. It should also be noted that the rule that risk follows title has an exception where title is withheld—as in the instalment purchase—only for securing payment of the price.

The chief divergence of American sales law from that described above has to do with warranties; *i.e.*, the nature of the seller's obligation with reference to the kind and quality of goods sold. The facts which will place some obligation on the seller with reference to quality are substantially the same in both countries. But in the United States, if the seller has undertaken any obligation in this respect, the buyer will, in the majority of States, be entitled not only to damages (the English "warranty") but also (at his election) to return the goods and recover the price (the English "condition"). This rule as indicated, is not universal. The American common law was in some conflict and confusion on the point, and the Uniform Sales Act, incorporating the view just stated, has not been adopted as yet (1928) in 20 of the States.

The long controversy over the buyer's power to return defective goods indicates the extent to which the law of warranty has been a creature of mercantile law, designated to settle disputes about goods between merchants. Of recent years, however, the law of warranty has been put to another striking social use: that of allocating the risks incident, in a highly industrialized society, to the unavoidable use of goods manufactured by persons with whom the user has no direct contact, who may be a "corporation" located in a distant place, Whose methods the user has neither skill nor opportunity to know—but whose efficiency he is forced by the nature of the market to rely upon. Injury in those cases results from a tack or a piece of glass concealed in cake or a can of beans, from the explosion of an automatic water-heater, or from the breaking of an automobile wheel. In such cases return of the goods is not in

question, but only the allocation of the damage suffered. The device of an action for negligence has recently been extended for this purpose; but it seems to be limited to personal injury, as opposed to property damage; and it is obviously ineffective in the many States in which the burden rests on the injured plaintiff of proving the manufacturer negligent in regard to the particular defective article. There is some tendency to shift the burden to the manufacturer where the article is one, which, if negligently made, would be dangerous; *i.e.,* to make an injury due to defect raise a presumption of negligence in manufacture Under this rule the remedy "for negligence" is effective—so effective indeed, as apparently to have given rise to a considerable volume of fraudulent claims. The remedy in negligence, too, may well be extended to any injured purchaser.

But the remedy for the same injury by way of the law of warranty seems in almost all States to be limited to the specific purchaser against his specific seller; it has been held to extend neither to his wife, his child, his employee nor his guest. Nor, under most decisions, will it run against the manufacturer if the plaintiff bought the article not directly from him, but from an intervening dealer. On the other hand, wherever remedy, in warranty is available, it requires no proof of negligence at all: the seller is held to guarantee against dangerous defects in the article. It is clear the situation is one in which the courts are groping toward satisfying a definite social need, and yet one in which the traditional legal devices are only with delay and distortion capable of being made to fill the need.

Documents of Title.--One feature of American law in which wide changes have been worked in recent years requires mention. The old rule that no man might convey goods which he did not own imposes on buyers either a noticeable risk (of having any goods which have been improperly sold to them recovered by their true owners) or a degree of investigation incompatible with rapid turnover. Especially dangerous and impracticable is this in the case of bankers advancing money on the security of goods in warehouse or in transit; a banker's margin of profit is too low to make losses readily compensable, and enquiry into title is in general outside his competence. A practice therefore grew up, in the case of goods in warehouse, of accepting the warehouseman's receipt for the goods, if fair on its face, as full evidence of title to the goods, and of dealing with the receipt as with the goods themselves. The same practice has developed, even earlier, with reference to bills of lading, *i.e.,* carriers' receipts for goods entrusted to their care.

This mercantile custom has now received full warrant at law, in America, in all 28 States which have adopted the Uniform Sales Act (beginning in 1906); also, as to warehouse receipts, in the 48 States which have enacted the Cniform Warehouse Receipts Act (beginning in 1906); in more than half the States, as to bills of lading, and in all bills of lading arising out of interstate shipments, by the adoption of the Uniform Bills of Lading Act by Congress and many State legislatures (beginning in 1909). Sharp distinction is taken under these acts between straight or *non-negotiable* documents, which do not contain a promise to deliver to the *order* of named person, and which can transfer only such rights as the transferor possesses; and on the other hand, *order* or negotiable documents, which do carry a promise to deliver to the order of a named person, and which in general carry to a *bona fide* purchaser (or pledgee) for value all the rights apparent on their face, even though the transferor may have lacked such rights. The English law is to the same effect, and even expressly extends the same rules to policies of marine insurance drawn in proper form All the American uniform acts named above are the work of Prof. Samuel Williston, whose credit in this connection is as great as that of Chalmers in England, and whose text on sales (see *The Law of Sales,* 2nd ed , 1924) promises to remain for a generation the authoritative work on the subject.

SALEP, a drug extensively used in oriental countries as a nervine restorative and fattener, and also much prescribed in paralytic affections. It is not used in European medicine. It consists of the tuberous roots of various species of *Orchis* and *Eulophia,* which are decorticated, washed, heated until horny in appearance, and then dried. Its most important constituent is a mucilaginous substance which it yields with cold water to the extent of 48%

SALERNO (known in Roman and mediaeval times as Salernum), a small seaport, archiepiscopal see and capital of a province of the same name, about 30 mi. S.E. of Naples, Italy. finely situated at the foot of an amphitheatre of hills. Pop. (1957 est.) 102.614 (commune). The modern town is of little commercial importance, but during World War II it was the landing site for the invasion of Italy by Allied forces on Sept. 9, 1943.

The site was of some strategic significance under the Roman Republic and Empire, but the town was of only secondary importance until mediaeval times. It was dismantled by Charlemagne in the 9th century. Later it became the fortified capital of an independent principality and the rival of Benevento. During the 9th and 10th centuries it was frequently attacked by the Saracens. It was taken in 1076 by the Normans under Robert Guiscard. In 1194 it was sacked by Henry VI., and its develnpment ceased. Salerno revived somewhat in the early 13th century, under Frederick II. (1194–1250), but soon fell into decay. The historic interest of Salerno centres round its medical school, the foundation of which is ascribed to the legendary "four masters"—a Latin, a Greek, a Jew and a Saracen. The legend represents the syncretic cultural influences under which the school arose. In the 10th and 11th centuries the place was a health resort. Under Norman rule the medical element became organized and was profoundly influenced by the work of Constantine the African (d. 1087, *q.v.*), secretary to Robert Guiscard who translated medical works from Arabic into Latin. A contemporary who translated medical works from Greek was Alfanus, archbishop of Salerno. A Jewish element was early in evidence. Under Frederick II. lectures in Hebrew were given at Naples, and one of the most important Latin translators from the Arabic; the Jew, Faraj ben Salim (d. c. 1290), worked at Salerno. The decline of the school dates from 1224, when Frederick II. instituted a university at Naples. The very well known doggerel Latin verses on the preservation of health, known as the *Regimen Sanitatis Salerni,* have been translated into almost every European language. They are addressed to an apocryphal "King of England," usually supposed to be Robert of Normandy, but there is no doubt that the verses are mostly of the 14th century. They are probably, in the main, the work of Arnald of Villanova (1235–1313).

The school is regarded as the earliest university in Europe. It became, in the later middle ages, a place of bogus degrees but survived till 1811, when it was closed by Napoleon.

BIBLIOGRAPHY.—F. Hartmann, *Die Literatur von Früh- und Hochsalrrno* (Leipzig, 1919), and C. Singer, *Essays on the History of Medicine, presented to K. Sudhoff* (Oxford, 1924), contain bibliographies. The legends of Salerno are disposed of by C. Singer in *From Magic to Science* (1928), and the Arabic and Hebrew Salernitan relationships are discussed by him in *The Legacy of Israel* (Oxford, 1927). *The* work of Alphanus is printed by C. Burkhard, *Nemesii Episcopi Premnon Physcon . . . Alfano Salerni in Latinum translatum* (Leipzig, 1917). The records of the University of Salerno are collected by H. Rashdall, *The Universities of the Middle Ages,* 3 vols. (Oxford, 1895). An important document, recording the physicians at Salerno, is C. A. Garufi, *Necrologio del Liber Confratum di S. Matteo di Salerno* (1922), discussed by P. Capparoni, *Magistri Salernitani noudum cogniti* (London, 1921). The last edition of the *Scola Salernitana* is by F. R. Packard and F. H. Garrison, *The School of*

Salernum Regimen Sanitatis Salernitanum (1920). (C. SI.; X.)

SALESBURY or **SALISBURY, WILLIAM** (c. 1520–*c.* 1584), Welsh scholar, was a native of Denbighshire, being the son of Foulke Salesbury, who belonged to a family said to be descended from a certain Adam of Salzburg, a member of the ducal house of Bavaria. who came to England in the 12th century. Salesbury was educated at Oxford, where he accepted the Protestant faith, bat he passed most of his life at Llanrwst, working at his literary undertakings. The greatest Welsh scholar of his time, Salesbury was acquainted with nine languages, including Latin, Greek and Hebrew, and was learned in philology and botany. He died about 1584. About 1546 he edited a collection of Welsh proverbs (*Oll synwyr pen kembero)*, probably the first book printed in Welsh, and in 1547 his *Dictionary in Englyshe and Welshe* was published (facsimile edition, 1877). In 1563 the English parliament ordered the Welsh bishops to arrange for the translation of the Scriptures and the Book of Common Prayer into Welsh. The New Testament was assigned to Salesbury, who had previously translated parts of it. He received assistance from Richard Davies, bishop of St. Davids, and also from Thomas Huet, or Hewett (d. 1591), but he himself did the greater part of the work. The translation was made from the Greek, but Latin versions were consulted, and in Oct. 1567 the New Testament was published in Welsh for the first time. This translation never became very popular, but it served as the basis for the new one made by Bishop William Morgan (*c.* 1547–1604).

Salesbury and Davies continued to work together, translating various writings into Welsh, until about 1576 when the literary partnership was broken. After this event, Salesbury, although continuing his studies, produced nothing of importance.

SALESMANSHIP. Like other skills, salesmanship is based on a body of kno ledge that approaches a science; but a mere knowledge of the principles involved is not sufficient to make a person a good salesman. He must be able to apply these principles with an efficiency gained only by practice. Certain native abilities are helpful, but most of the needed skills can be acquired by any normal person willing to study and practise diligently.

The salesman is a concomitant of the industrial era wherein most goods are manufactured for exchange rather than for use by the maker. The maker himself employs salesmen to sell his product to the middleman, the middleman uses salesmen to sell to other middlemen or to consumers, while some manufacturers sell directly to the final buyers. The production of goods on a large scale usually involves the problem of finding buyers for those goods, because it is cheaper for the salesman to contact several buyers than for each of those buyers to contact several manufacturers. Thus the salesman performs an economic function, imparting to the product time utility, place utility or possession utility. The buyer is willing to pay for these utilities for the same reason that he pays for the form utility imparted by the manufacturers.

In addition the salesman often brings to his customer a fund of helpful suggestions relating to the use of his product or its resale at a profit, thereby still further meriting the payment he receives for his work. With this recognition of the importance of the salesman's work came a marked improvement in his economic and social status.

There are many types of selling and just as many types of salesmen, each of which should be fitted by endowment and training for his particular task. This need for varied abilities makes it possible for nearly anyone to find some sort of congenial sales work. At one extreme is the sales engineer who requires considerable academic training before he receives his specialized education from the company whose product and services he sells. This man must be intelligent and possess a better-than-average personality. At the other extreme may be classed the clerk in a chain store whose duties embrace little more than making change and wrapping parcels. Little education or product knowledge is demanded, and personality traits are not of so great importance.

Between these extremes are found salesmen and saleswomen whose jobs vary widely as to type of employer (manufacturer, wholesaler, retailer), type of product sold (tangible or intangible, specialty or staple), complexity (some jobs are simple while others involve the performance of many functions), personality preferred (some selling demands aggressiveness while other sales jobs are best handled by persons of the type termed by psychologists as "submissive"), repetitive or pioneering (some salesmen call on the same customers at frequent intervals while others are always calling on new prospective buyers), seeking out customers (retail store salesmen wait for customers to walk in while insurance salesmen must seek out their customers), physical vigour required (some selling work is light and easy while other jobs demand great strength and stamina), general difficulty (the greater the difficulties to be surmounted, the higher the rewards to the salesman who can surmount them).

Most salesmen work as part of an organization, not as individual entrepreneurs. This is true whether they work for a manufacturer, wholesaler, retailer or as a door-to-door salesman. An organization implies management of the individuals in that organization, and the head of the sales organization or department is usually called the sales manager.

In a large manufacturing establishment this department may embrace hundreds or even thousands of individuals, and it is divided and subdivided by geographical divisions, by products sold, by type of prospects called on, or by the functions performed by the salesmen. Over each division of the organization is placed a minor sales manager responsible for sales in his jurisdiction and responsible to the man immediately above him in the chain of command.

The management of a sales organization is subject to the same principles that govern management anywhere. Management is management, but the methods used by the sales manager will vary with the manager himself and with the type of salesmen under him. Here are the same extremes as those seen in the political world—the extreme of dictatorship on the one hand and, on the other, a considerable degree of democracy marked by a two-way flow of ideas between the sales manager and salesmen and by a large amount of self-management exercised by the salesmen. The higher the type of salesman involved, the greater the degree of self-government granted him; the lower type of salesman requires more detailed supervision.

The sales manager gives careful attention to such problems as analysis of the market, estimating potential sales, fixing quotas for each territory and salesman, analysis of the product sold, determination of marketing policies, selection of salesmen, their training, assignment to proper duties, their supervision in the field, analysis of their jobs, methods of compensation, stimulation to optimum effort, adequate reports from salesmen, conferences with individual salesmen or with groups varying in size up to a general convention, pensions and retirement programs, and dealings with unions in which his salesmen may hold membership.

In selecting new salesmen the sales manager employs personal interviews, credentials and references, and various psychological tests to determine aptitudes, attitudes and pertinent personality traits. Such tests may forecast with accuracy the testee's probable success, but they have not supplanted the judgment of the manager, based on personal appraisal of the applicant.

After the new salesman is hired, he is usually put through a course of training that may vary from a few days to a couple of years in length, depending on the complexity of the product or service to be sold and on the difficulties in selling it. This training may be accomplished through classroom instruction; trips through or actual work in the factory; accompanying experienced salesmen and watching them operate; coaching in the field by persons trained for such work; or correspondence courses in which the young salesman must study printed lessons and pass examinations on them. Careful training greatly increases the productiveness of salesmen.

Assignment of salesmen to various duties is based on an analysis of the jobs to determine precisely each salesman's duties. A proper job analysis enables the sales manager to choose for each job a man who, as nearly as possible, will fit that job. The result is happier, more efficient salesmen, and a lower rate of turnover

in the sales force.

Most salesmen, like other workers, require some supervision. This may be done in large organizations by men whose status is similar to that of factory foremen, each of whom supervises the work of a group of salesmen. In retail stores the department head or proprietor does this.

Salesmen are paid in a wide variety of ways ranging from a straight time wage or salary to a straight commission on volume of sales. In choosing or devising a method of compensation the sales manager seeks one that will accomplish these objectives: attract the type of salesman he wants, keep him working happily, pay him for doing what the sales manager wants him to do, offer him an incentive to put forth his best efforts, and not be too complicated to understand or too costly to operate. The time wage gives the sales manager the greatest degree of control; the commission offers the strongest selling incentive to the salesman. A combination is often worked out to afford the salesman some feeling of security based on a fixed salary or drawing account on which he can depend even when his sales fall below normal. To this may be added payments or bonuses based on volume of sales, number of new customers, collections made by salesmen, opening of new accounts, etc. Some companies have tried profit-sharing plans for paying their salesmen. but these are hard to compute and the salesman is likely to feel that profits depend too much on others' efforts. Above all, any system of compensation must appeal to the salesman as being equitable.

To stimulate salesmen to greater effort, resort may be had to contests, with attractive prizes for the winning salesmen. Bulletins and house organs are also used to develop and maintain enthusiasm. Salesmen are usually expected to make daily reports on their activities, these reports being used by the sales manager as a basis for determining policies and helping the salesmen who need help.

Unions among salesmen are relatively rare in the United States,. although in some fields the movement had made progress by mid-20th century. Pensions likewise gained in popularity, although many salesmen feel quite competent to make their own provisions against old age.

In learning to be a salesman, a person must master three areas of knowledge. He must learn all he can about the product or service he is to sell; he must study himself and strive to develop a good selling personality; and he must study prospective buyers or prospects so that he may learn what objectives each is seeking and what desires each is trying to satisfy. Only when he has learned this can the salesman intelligently and helpfully demonstrate how his proposition will meet those needs.

The salesman thus becomes a practical psychologist, specializing in motivation. He learns to recognize such buying motives as greed, the urge to feel important, love of family, physical comfort or pleasure, knowledge, imitation, romance, health, caution, love of beauty, and the desire for security. He adapts his presentation to the individual prospect, making it appeal to whichever buying motives dominate that prospect at that time.

To make a sale, the salesman must carry the prospect through five mental stages, viz., attention to the salesman and his proposition, interest in that proposition, desire to possess it, confidence that it will be as represented by the salesman, and finally, action or the decision to buy.

To accomplish this, the salesman himself must often take certain definite steps. The first may be to locate his prospect, a task of vital importance to many specialty salesmen, although one seldom performed by the store salesman. To discover logical prospects the salesman functions as a detective, utilizing many sources of information.

His next step is termed the preapproach or the gathering of information about the prospect — information pertinent to his task. This will include, among other items, the question of which buying motives are most likely to appeal to the prospect; but it embraces also such matters as ability to buy, actual need for the proposition, hobbies, preferences and prejudices in many lines. The preapproach continues even after the salesman and prospect face each other.

Perhaps the next step is the winning of the interview or a chance to tell his story — sometimes a challenging sales project in itself.

Then comes the actual demonstration of his proposition, which is a dual task — to awaken in the prospect's mind a feeling of need and to show how the salesman's proposition meets that need. He utilizes logical reasoning and emotional appeals, usually relying more heavily on the latter; he listens attentively at proper times and displays tact in other ways; he avoids argument; he speaks the prospect's language; he dramatizes his points; he follows a more or less standardized sales talk to insure its completeness and effectiveness; he treats competition firmly but fairly; he meets a variety of objections and questions raised by the prospect, being careful to give them due weight and to avoid becoming involved in a debate; he takes the prospect through the successive mental stages of buying, making certain that he has taken each step before urging him to take the next one.

Finally, the salesman attempts to gain the buying decision or to close the sale. If he is a skilled salesman he has injected into his canvass a number of intimations that the prospect has decided to buy, such suggestions being known as "trial closes." The prospect's reaction informs the salesman as to whether he can safely proceed with the real closing effort. Also, he watches the prospect closely to detect signs of rising interest.

In closing, most salesmen use such proved techniques as obtaining a series of affirmative replies to various questions that lead or add up to the final decision; getting a decision on a minor point as size of order, date of delivery, terms, or colour desired; summarizing the talking points previousiy made; simply asking for the order. He strives to avoid creating an atmosphere of tension. Rather, he seeks to convey the impression that consummating a sale is nothing out of the ordinary for either buyer or salesman. He makes the final decision seem like merely one more in a series of decisions.

After he obtains the order, the salesman strives to take his departure with dignity and poise, leaving the door open for future sales. And finally, he will follow through on the sale to assure himself that the buyer is thoroughly pleased with his purchase. The truly professional salesman always remembers that his ultimate success depends upon the service he renders the buyer.

SALES TAXES. Sales, excise and commodity taxes refer to taxes levied upon sellers of designated goods and services. When the classes of commodities are defined in tax legislation by broad classes and the tax base is the money value of the things sold, the tax is called a sales tax.

Usually sales taxes are levied upon manufacturers, wholesalers or retailers. When sales taxes are levied upon the services sold by workers, they are very close to income taxes restricted to wages and salaries.

Commodity taxes in one form or another are found in every country, and their use dates back to antiquity. Many small countries employ import duties in place of internal sales taxes because of the administrative convenience of the concentration of goods at ports-of-entry. These duties play much the same role as do internal sales taxes in larger countries. Manufacture sales taxes are limited to countries with important fabricating industries. Canada first imposed such a tax in 1920 and continued it with many modifications.

The federal government of the United States has never levied a tax officially described as a sales tax, but it has levied an assortment of commodity taxes both at the manufacture and the retail levels. Retail sales taxes. widely used by American states, were introduced during the 1930s under the pressure of dwindling revenues from other sources, and they became a main revenue source

for many states. This type of taxation spread to local governments also. In California, all major cities and many minor ones have retail sales taxes.

Great Britain introduced the misnamed "purchase tax" in 1940 as a war measure with differential and high rates, exceeding 100% in some instances. The purpose was to curtail the production of luxury items, permitting an increase in the output of utility items. This wholesale sales tax was continued into the postwar era with a downward modification of rates.

Sales taxes are commonly believed to fall upon consumers by raising the prices paid for taxed items. Sellers who are legally responsible for the tax are, according to this view. simply collectors of the tax from consumers. It is this belief that provides the basis for the claim that sales taxes are regressive, when the burden of the tax is compared with income size. Other explanations have been suggested.

According to some authorities, sales taxes are only partly shifted to buyers; a portion of the taxes rests upon sellers by reducing their money incomes. The degree of shifting to buyers depends upon the character of the market. whether competitive or monopolistic, the nature of the demand for each commodity, and the cost conditions surrounding its production.

Some experts regard sales taxes as falling upon sellers and their suppliers by reducing their money incomes. Such taxes are looked upon as similar to nonsystematic income taxes without exemptions. Buyers pay higher prices for taxed items but pay less for other commodities. suggesting that as a group they do not bear sales or coinmodity taxes. The legislative assumption that consumers pay such taxes in their entirety receives only modest support among economists.

SALFORD, a city and a municipal, county and parliamentary borough. Lancashire, Eng.. 2 mi. W. of Manchester. Pop. (1961) 154.963. Area 8.1 sq.mi. The parliamentary borough returns two members, for Salford East and Salford West. Salford is a quarter sessions borough.

The borough, composed of three townships identical with the ancient manors of Salford, Pendleton and Broughton, is for the most part separated from Rlanchester by the river Irwell. The main railway station is Exchange station which is connected with Victoria station. Manchester, by one of the longest railway platforms in the world. Salford town hall was built in 1825 and Pendleton town hall in 1866. St. John's Roman Catholic cathedral was opened in 1848. Peel park. formerly Lark hill but renamed after Sir Robert Peel, contains the art gallery and museum and the Royal Technical college (1896). In Ruile Hill park is the natural history 'museum.

The only old building remaining in Salford is Ordsall hall, the ancient seat of the Radcliffe family, which dates from 1350. Kersall cell, the site of a 12th-century Cluniac monastery, was the birthplace of John Byrom (1692–1763). James Joule, the physicist, (1818–89) was born in Salford.

The Flemish weavers settled first in Salford in about 1360, and from that date it has been one of the foremost cotton towns. To the opening of the Manchester ship canal (*q.v.*) in 1894 is due its great commercial importance, for it contains the largest docks on this canal. Ram cotton is imported and among many exports are manufactured cotton and woollen goods. machinery and locomotives. Salford is an important centre for importing timber and also a great distributing centre. It has more than 1,000 factories which include cotton spinning, bleaching and dyeing, brewing, the making of rubber goods and waterproofed fabrics, paper mills and engineering.

Neolithic implements. British urns and Roman coins have been found within the borough. Domesday Book mentions the Great Hundred of Salford (of which Manchester formed a part) as held by Edward the Confessor and covering some 400 sq.mi. At the Conquest it was part of the domain granted to Roger le Poitevin. In 1228 Henry III granted the town an annual fair and market and a weekly market; in 1825 George IV granted two annual fairs and a weekly market. When the corporation bought the market rights they built a new market, on the site of the old cattle market, which was opened in 1939.

In 1230 Ranulf de Blundeville, earl of Chester, granted a charter constituting Salford a free borough and it was administered according to this charter until 1791. In 1267 Salford was granted by Henry III. with all the crown demesne, to his son Emund, earl of Lancaster.

When the house of Lancaster succeeded to the throne their Lancashire possessions were kept separate and Salford remained part of the duchy of Lancaster thereafter. The borough was incorporated as a municipal borough in 1844; Broughton and Pendleton were amalgamated with it in 1853; in 1888 it became a county borough. It was raised to the status of a city in 1926.

SALICACEAE, a family of dioecious trees or shrubs consisting of two genera, the flowers borne in characteristic catkins. The family is essentially characteristic of the north temperate zone of both hemispheres, but *Salix* also extends into the arctic and tropical regions.

Populus, known as poplar (*q.v.*), conservatively estimated to have about 18 species in 1900, had more than 100 additional species proposed in the succeeding half century. *Salix,* known as willow (*q.v.*), has in excess of 1,000 described species, but many of these are probably only forms or varieties and others are hybrids. (*See* also OSIER.) (E. D. ML.)

SALICETI, ANTOINE CHRISTOPHE (1757–1809), French revolutionary, was born at Saliceto, Corsica, on Aug. 26, 1757.

After studying law in Tuscany. he became an *avocat* at the upper council of Bastia and was elected deputy of the third estate to the French states-general in 1789. Later he was elected as deputy to the Convention and voted for the death of Louis XVI. He was sent to Corsica on a mission to oppose counterrevolutionary intrigues. but the success of his adversaries compelled him to withdraw to Provence, where he took part in repressing revolts at Marseilles and Toulon. On that mission he met and helped his compatriot Napoleon Bonaparte.

His friendship with Robespierre led to his denunciation on 9 Thermidor year II, but he was saved by the amnesty of Brumaire year IV.

Saliceti subsequently organized the army of Italy and the two departments into which Corsica had been divided, was deputy to the Council of the Five Hundred and accepted various offices under the consulate and the empire, being minister of police and of war at Naples under Joseph Bonaparte (1806–09).

He died at Naples on Dec. 23, 1809.

SALICIN (SALICINUM), the bitter principle of willow bark, $C_{13}H_{18}O_7$, found in most species of *Salix* and *Populus.*

Salicin is prepared from a decoction of the bark by first precipitating the tannin by milk of lime, then evaporating the filtrate to a soft extract and dissolving out the salicin by alcohol. As met with in commerce it is usually in the form of glossy white scales or needles.

Salicin is neutral, bitter, odourless, unaltered by exposure to the air, soluble in about 30 parts of water and So parts of alcohol at the ordinary temperature, and in 0.7 of boiling water or in 2 parts of boiling alcohol, and more freely in alkaline liquids. It is also soluble in acetic acid without alteration, but is insoluble in chloroform and benzol.

Salicin is used in medicine for the same purposes as salicylic acid (*q.v.*), but is much less effective.

SALIC LAW and other Frankish laws. The Salic law is one of those early mediaeval Frankish laws which, with other early Germanic laws, are known collectively as *leges germanorum.* It originated with the Salian Franks. The Salic law has come down in numerous manuscripts. The most ancient form, represented by Latin manuscript no. 4404 in the Bibliothèque Nationale, consists of 6j chapters. The second form has the same 65 chapters, but contains interpolated provisions. The third text consists of 99 chapters. The fourth version, as amended by Charlemagne, consists of 70 chapters with the Latinity corrected

and without the glosses. The last version, published by B. J. Herold at Easel in 1557 is founded on the second recension.

The law is a compilation, the various chapters were composed at different periods, and we do not possess the original form of the compilation. Even the most ancient text, that in 65 chapters, contains passages which a comparison with the later texts shows to be interpolations. The scale of judicial fines is given in the *denarius* ("which makes so many *solidi"),* and it is known that the monetary system of the *solidus* did not appear until the Merovingian period. Even in its earliest form the law contains no trace of paganism—a significant fact when we consider how closely law and religion are related in their origins. The Romans are clearly indicated in the law as subjects, but as not yet forming part of the army, which consists solely of the *antrustions, i.e.,* Frankish warriors of the king's bodyguard. As yet the law is not impregnated with the Christian spirit; this absence of both Christian and Pagan elements is due to the fact that many of the Franks were still heathens, although their king had bee6 converted to Christianity. (For contrary opinion *see* Franz Beyerle in the *Zeitschrift der Savigny-Stiftung,* xliv, 216 *seq.)* Christian enactments were introduced gradually into the later versions. Finally, we find capitularies of the kings immediately following Clovis being gradually incorporated in the text of the law—*e.g.,* the *Pactum pro tenore pacis* of Childebert *I* and Clotaire I (511–558), and the *Edictum Chilperici* (561–584), chapter iii of which cites and emends the Salic law.

The law as originally compiled underwent modifications of varying importance before it took the form known to us in Latin ms. No. 4404, to which the edict of Childebert I and Clotaire I is already appended. Finally, Charlemagne, who took a keen interest in the ancient documents, had the law emended, the operation consisting in eliminating the Malberg glosses, which were no longer intelligible, correcting the Latinity of the ancient text, omitting a certain number of interpolated chapters, and adding others which had obtained general sanction.

The Salic law is not a political law; it is in no way concerned with the succession to the throne of France, and it is absolutely false to suppose that it was the Salic law that was invoked in 1316 and 1322 to exclude the daughters of Louis X and Philip V from the succession to the throne. The Salic law is pre-eminently a penal code, which shows the amount of fines for various offenses and crimes, and contains, besides, some civil law enactments, such as the famous chapter on succession to private property (de alode), which declares that daughters cannot inherit land.

Of the numerous editions of the Salic law only the principal ones can he mentioned: J. M. Pardessus, *Loi salique* (Paris, 1843), 8 texts; *A.* Holder, *Lex Salica* (1879 *seq.),* reproductions of all the mss. with all the abbreviations; H. Geffcken, *Lex Salica* (Leipzig, 1898), the text in 65 chapters, with commentary paragraph by paragraph, and appendix of *additamenta:* and the edition undertaken by Bruno Krusch for the *Mon. Germ. hist.* For further information *see* E. Mayer-Homberg, *Die fränkischen Volksrechte und das Reichsrecht* (1912); Cl. v. Schwerin, in the *Neues Archiv,* xl, 581 *seq.;* Bruno Krusch, in the *Neues Archiv,* xl, 497 *seq.,* and in the *Nachrichten der Gesellschaft der Wissenschaften zu Gottingen* (1916), 683 *seq.;* E. Heymann and others, in the *Neues Archiv,* xli, 375 *seq.,* 419 *seq.;* Franz Beyerle, in the *Zeitschrift der Savigny-Stiftung,* xliv, 216 *seq.*

The *Lex Ripuaria* was the law of the Ripuarian Franks, whose centre was Cologne. We have no ancient mss. of the law of the Ripuarians; the 35 mss. we possess, as well as those now lost which served as the basis of the old editions, do not go back beyond the time of Charlemagne.

On analysis, the law of the Ripuarians, which contains 89 chapters, falls into three heterogeneous divisions. Chapters i–xxviii consist of a scale of compositions; but, although the fines are calculated, not on the unit of 15 *solidi,* as in the Salic law, but on that of 18 *solidi,* it is clear that this part is already influenced by the Salic law. Chapters xxix–lxiv are taken directly from the Salic law; the provisions follow the same arrangement; the unit of the compositions is 15 *solidi:* but capitularies are interpolated relating to the affranchisement and sale of immovable property. Chapters lxv–lxxxix consist of provisions of various kinds, some taken irom lost capitularies and from the Salic law, and others of unknown origin.

There is an edition of the text of the Ripuarian law in *Mon. Ger. hist. Leges* (1883), v. 185 *seq.* by R. Sohm, who also brought out a separate edition in 1885 for the use of schools. For further information *see* the preiaces to Sohm's editions; H. Brunner, *Deutsche Rechtsgeschichte* (2nd ed., Leipzig, 1906), I, 442; Bruno Krusch, *Die Lex Bajuvariorum, mit zwei Anhängen: Lex Alamannorum und Lex Ribuaria* (1924) 333 *seq.* and *Neue Forschungen über die drei oberdeutschen Leges: Bajuvariorum, Alamannorum, Ribuariorum* (1927) 142 *seq.;* Franz Beyerle, in the *Zeitschrift der Savigny-Stiftung,* xlviii, 264 *seq.*

Lastly, we possess a judicial text in 48 paragraphs, which bears the title of *Notitia vel commemoratio de illa ema (law), quae se ad Amorem habet.* This was in use in the district along the Yssel formerly called Hamalant. The name Hamalant is unquestionably derived from the Frankish tribe of the Chamavi, and the document is often called *Lex Francorum Chamavorum.*

There is an edition of this text by R. Sohm in *Mon. Germ. hist. Leges,* v. 269, and another appended to the same writer's school edition of the *Les Ribuaria. See* also Fustel de Coulanges, *Nouvelles Recherclzes sur quelques problèmes d'histoire* (1891).

(C. PF.; K. A. ECK.)

SALICYLIC ACID, a white, crystalline solid, is used, with its derivatives, in medicines and flavouring agents and in the manufacture of dyes. The largest single use is in the preparation of aspirin (*q.v.*).

Salicylic acid occurs naturally in small amounts in the roots, leaves, blossoms and fruits of many plants. particularly in the oils from various species of *Spiraea.* The methyl ester is widely distributed in nature in the roots, bark and leaves of plants and is the principal constituent of oil of wintergreen from the wintergreen shrub, *Gaultheria procumbens.*

Chemically, salicylic acid is orthohydroxybenzoic acid, HO.C_6H_4.COOH. It crystallizes from hot water in the form of white needles which melt at 159° C., and sublimes without decomposition at temperatures up to 155° C. It is very soluble in alcohol and ether, but soluble in water to the extent of only 1.8 g. per litre at 20° C. and 20.5 g. per litre at 80° C.

Preparation. — Salicylic acid was first prepared by R. Piria in 1838 by treating salicylaldehyde with potassium hydroxide. Until 1874 the only commercial source was the hydrolysis of the methyl salicylate obtained from the bark of sweet birch (*Betula lenta*) or the leaves of the wintergreen shrub.

The general method of large-scale manufacture in the late 1950s was based on the celebrated synthesis discovered in 1859 by H. Kolbe in which phenol (*q.v.*) was treated with carbon dioxide in the presence of metallic sodium. In 1874 the method was modified to the treatment of dry sodium phenate with carbon dioxide at elevated temperature and pressure.

Commercial Preparation.—Phenol and a hot concentrated solution of sodium hydroxide in water are mixed in an autoclave and the solution heated to about 130° C. The resulting sodium phenate is dried by heating and stirring in the autoclave, initially at atmospheric pressure and then under reduced pressure. The dry pulverized sodium phenate is cooled to about 100° C., and continuously stirred while carbon dioxide is admitted to the autoclave under a pressure of approximately 100 lbs. per square inch. After the desired amount of carbon dioxide has been absorbed. the autoclave is heated at about 150° C. for several hours and then cooled. The resulting sodium salicylate is dissolved in water and the solution acidified with mineral acid to precipitate crude salicylic acid, which is recovered by centrifuging and drying.

The crude acid thus obtained is purified by recrystallization and sublimation.

Salicylic acid decomposes at about 200° C. into phenol and carbon dioxide. It develops a violet colour in aqueous solution with ferric chloride.

In its chemical behaviour it undergoes the typical reactions of an aromatic carboxylic acid as well as a phenol. Salts, esters, ethers and acyl derivatives are readily prepared.

Uses of Salicylic **Acid** and Derivatives. — Salicylic acid finds some use as a preservative in nonfood products, but its use in food is objectionable and is unlawful in many countries. Lotions, ointments and powders containing from 2% to 10% of the acid are used in the treatment of skin diseases.

Salicylic acid applied to unbroken skin causes a softening of the horny layer of the epidermis and hence is used as a wart, corn and callus remover.

Large quantities of crude salicylic acid are used in the manufacture of dyes such as monoazo mordant dyes, direct diazo and triazo dyes and mordant-type dyes of the triphenylmethane series.

The sodium salt of salicylic acid, sodium salicylate, is used medicinally as an antipyretic (an agent that relieves fever) and as an analgesic (an agent that alleviates pain), particularly in the treatment of rheumatic fever.

The largest use of salicylic acid is in the preparation of its acetyl derivative, aspirin. which is made by treating the acid with acetic anhydride. Aspirin is widely used both as an analgesic in the treatment of headache, neuralgia. etc., and as an antipyretic in the treatment of colds, flu, etc. The annual world-wide production of acetylsalicylic acid is in the many millions of pounds.

The second largest use of salicylic acid is in the preparation of its methyl ester (synthetic oil of wintergreen). It is made by esterifying the acid with methyl alcohol, sulfuric acid being used as a catalyst. Methyl salicylate is widely used as a flavouring agent in confectionery, beverages, dentifrices, etc. Medicinally it is used externally as a counterirritant in ointments and lotions

Phenyl salicylate. since it absorbs ultraviolet light, has been used in antisunburn creams. It is also used for enteric-coated (protected from absorption until reaching the intestine) pills. Salicylanilide is a fungicide and finds use as a mildewproofing agent for cotton articles.

SALIENTIA, the scientific term for the amphibian superorder that includes living frogs and toads (order Anura) and ancestral types (order Proanura). Some zoologists relegate Salientia to the rank of order, placing all forms in this group. In such a scheme Salientia becomes practically synonymous with Anura. *See* AMPHIBIA.

SALIERI, ANTONIO (1750–1825), Italian composer, was born at Legnano on Aug. 19, 1750. In 1766 he was taken to Vienna, Aus.. by F. L. Gassmann, who introduced him to the emperor Joseph, His first opera. *Le Donne letterate,* was produced at the Burg-Theater in 1770. Others followed in rapid succession, and his *Armida* (1771) was a triumphant success. On Gassmann's death in 1774. he became *Kapellmeister* and, on the death of Bonno in 1788. *Hofkapellmeister.* He held his offices for 50 years, though he made frequent visits to Italy and Paris, and composed music for many European theatres. His chef-d'oeuvre was *Tarare,* later called *Axur, re d'Ormus* (1787), a work which was preferred by the Viennese public to Wolfgang Mozart's *Don Giovanni.* His last opera was *Die Neger,* produced in 1804. After this he devoted himself to the composition of church music, for which he had a very decided talent. Salieri lived on friendly terms with F. J. Haydn, but was a bitter enemy to Mozart, though the wild suggestion that he actually poisoned him (albeit made the basis of Nicolas Rimsky-Korsakov's *Mozart and Salieri)* has long been scouted.

Salieri retired from office on his full salary in 1824, and died at Vienna on May 7, 1825.

Salieri gave lessons in composition to M. Cherubini and to Ludwig van Beethoven, who dedicated to him his three sonatas for pianoforte and violin, op. 12.

SALII ("dancers"). An ancient priesthood at Rome, consisting of two colleges, each of 12 members! the Salii Palatini and the Salii Collini or Agonenses, connected respectively with the worship of Mars on the Palatine and the Quirinus on the *collis Quirinalis.* They wore armour of an ancient pattern, probably the old war dress of the Italians, and in particular, carried shields called *ancilia,* shaped somewhat like the figure 8. These they carried in procession on certain days of the year, in March (Mars's month) and October (end of the campaigning season under early conditions), singing a very ancient hymn or hymns *(axanzenta,* in honour of all the gods, and separate hymns to single deities, called by their names). They were assisted by women similarly dressed and called *saliae virgines;* these were hired for the occasion in historical times. The whole performance was accompanied with dancing.

All this suggests a war dance, and can easily be paralleled from the customs of uncivilized peoples. But the matter is complicated by a statement of Johannes Lydus, a late and untrustworthy author, that on March 15 a man clad in goatskins and called Mamurius was driven out with rods. This person Lydus identifies with Mamurius Veturius. said to have been the smith who made the *ancilia* after a pattern fallen from heaven. *(See* Joannes Lydus, *De Mensibus,* p. 105. 19 Wünsch.) But the name may mean "old Mars," hence it has been plausibly conjectured that the ritual is at least in part connected with vegetation. the "old Mars" or worn-out spirit of fertility being yearly driven away. As, however; we have no proof that the Salii were connected with this ceremony, it is open to us to suppose, with Georg Wissowa, that it is a mere coincidence of date, and that the name of the skin-clad figure was a popular one only, made up from the unintelligible words *mamuri veturi* in the Saliar hymn.

The balance of evidence certainly is in favour of supposing the ritual of the Salii to have been purely war magic, in its origin at least.

There were also Salii at Tibur, of whom nothing is known (Servius on *Aen,* viii. 285).

SALINA, a city of central Kansas; U.S., 75 mi. N.W. of Wichita is located on the Smoky Hill river near its confluence with the Saline; the seat of Saline county. Salina is a distribution and trade centre for the great central Kansas wheat-growing area; grain milling is the chief industry and there are extensive facilities for the storage and processing of wheat. The city was founded in 1858 by Col. William A. Phillips; much of its early trade was with Indians and settlers and with soldiers from nearby Ft. Riley. By 1862, however: only about 12 families lived there; the first real growth of the community came with the arrival of the Kansas Pacific (part of the Union Pacific) railway in 1867. The city was chartered in 1870. If has a council-manager form of government, in effect since 1921. Kansas Wesleyan university (Methodist, established 1885), Marymount college (Roman Catholic. founded 1922) and St. John's Military school (Episcopal. established 1887) are among the educational institutions in Salina. Schilling air force base (formerly Smoky Hill air base) is near the city. For comparative population figures *see* table in KANSAS: *Population.* (D. P. G.)

SALINA CRUZ, southernmost port of Mexico on the Pacific coast in the state of Oaxaca at the southern terminus of the transisthmian railway across Tehuantepec. The population in 1950 was 8.243. In the northwestern part of the bay. Salina Cruz lies at the mouth of the Tehuantepec river, and is divided into a free port and a fiscal port. Lying in a hot, semiarid area. Salina Cruz is chiefly a transshipment point for petroleum products from Minatitlan on the north to supply the western parts of Mexico. It also exports coffee. (HD. C.)

SALINAS, a city in western California, U.S., the seat of Monterey county, is situated near the Pacific ocean, about 10 mi. from Monterey bay and less than 100 mi. S. of San Francisco. The city lies on a broad plain which is just above sea level and which extends southward for 50 mi. along the Salinas river, so named because of the salt pools along its lower course. This area is protected by the Coast range and the Gabilans on the east and the Santa Lucias on the west. The original site of Salinas and its growth were determined by the route of the Southern Pacific railroad. Settlement on El Camino Real, now a U.S. highway, began in the 1850s and the town was incorporated in 1874. It adopted the city-manager form of government in 1936. The economy is mostly agricultural, the valley being under irrigation except for the foothills which are used for grazing and dry-land farming. Salinas is the shipping centre for vegetables, including beets, lettuce, celery, broccoli, cauliflower, spinach, artichokes, peas and onions. Some fruits are grown, especially strawberries. The production of sugar beets, once the primary crop, centres around the

largest sugar beet factory in the United States. Many beets are still grown in the valley and tons are also shipped in from adjacent and remote valleys, thereby keeping the factory at high-level production for several months each year. Salinas is the centre of a bulb and seed industry, with experimentation and production possible all year because of the excellent climate and fertility of the soil. It is the home of Hartnell college (1920), a state-supported institution. Salinas is widely known as the home of the annual California rodeo. For comparative population figures *see* table in CALIFORNIA: *Population.* (B. L. B.)
