SALISBURY, JAMES EDWARD HUBERT GASCOYNE-CECIL, 4TH MARQUESS OF (1861–1947), British politician, eldest son of the 3rd marquis *(see* SALISBURY, ROBERT A. T. G.-C.), was educated at Eton and University college, Oxford. He entered parliament in 1885 and succeeded to the peerage in 1903. He served in the South African War, and on his return entered the ministry, joining the cabinet in 1903. In the crisis over the Parliament bill he threw in his lot with the "Die-hards." He did not join either coalition government during World War I, but was critical of both, taking an independent line. He gradually came to assume the informal leadership of the conservative opposition first in the house of lords, and afterward in the party generally. In a speech on Oct. 16, 1922, he categorically demanded the freedom of the party. Three days later the policy was accepted at the Carlton Club meeting. He was lord president in the council in Bonar Law's cabinet and in Stanley Baldwin's first cabinet. In Baldwin's second cabinet he was lord privy seal, and from Curzon's death in 1925 until 1929 was leader of the house of lords. He was created K.G. in 1917. He died on April 4, 1947.

SALISBURY, ROBERT ARTHUR TALBOT GASCOYNE-CECIL, 3RD MARQUIS OF (1830–1903), British statesman, second son of James, 2nd marquis, by his first wife, Frances Mary Gascoyne, was born at Hatfield on Feb. 3, 1830. Lord Robert Cecil, as he then was, was educated at Eton and Christ Church, Oxford. His health was delicate and after leaving Oxford, he spent nearly two years at sea on a voyage round the world, visiting Cape Colony, Australia, Tasmania and New Zealand. On his return home he stood for parliament and on Aug. 22, 1853, was returned unopposed as member for the borough of Stamford in Lincolnshire. In the same year he was elected to a fellowship of All Souls.

He married in July 1857, the eldest daughter of Sir Edward Hall Alderson, Baron of the Court of Exchequer, a man of notable parts who at Cambridge had earned the rare distinction of being both Senior Wrangler, Senior Classic and Smith's Prizeman. His daughter inherited his abilities but there was very little money, and to add to his income Lord Robert joined the staff of the *Saturday Review* which had been lately founded by his brother-in-law, Mr. Alexander Beresford-Hope, this being, so far as is known, his only contribution to pure journalism. Most of his writing was done for the *Quarterly Reziew,* whose articles were then exclusively anonymous. The literary quality and vigorous lucidity of his style secured him a welcome in its pages, and of the 24 numbers which appeared between the years 1860 and 1866 there were only three which did not contain an article from his pen. Six of these have since been republished in volume form — three of them biographical essays on Pitt and Castlereagh and three dealing with foreign questions. These were uncompromisingly denunciatory of Lord John Russell's policy and to the study required for an effective presentation of his case may probably be traced his first knowledge of and interest in foreign affairs.

In the House of Commons. — Speeches on the same subjects, and notably one or two in 1864 on the abandonment of Denmark at the time of Germany's annexation of Schleswig-Holstein, placed him for the first time by general consent in the front rank of parliamentary debaters. When Lord Russell's Government was defeated over Mr. Gladstone's Reform bill in 1866, it was a foregone conclusion that he should be among those invited to join Lord Derby's cabinet. His eldest brother had died in 1865 and it was as Lord Cranborne that, in July 1866, he took office as secretary of State for India.

He only held it for seven months. The story of that ministry is well known. In the summer of 1866 the Tory party, assisted by a secession of anti-democratic Liberals. defeated Mr. Gladstone's Reform bill as tending dangerously in the direction of household suffrage. In the summer of 1867 the same party passed a Reform bill which established household suffrage. Lord Cranborne, with two other members of the Cabinet, Lord Carnarvon and General Peel, resigned on Feb. 9, two days before the bill's introduction. The breach was embittered by the tactics which the two leaders employed towards their junior colleagues. They kept them in the dark till within a week or two of the bill's production; offered reassurance in the shape of counter-checks and limitations which were changed with every meeting of the cabinet — and were in fact all abandoned in the course of the bill's passage through parliament — and allowed 'them no opportunity for considered argument. Their belief that there had been a deliberate attempt to hustle them into a consent which it was known that they would not have given freely, estranged them personally from Disraeli for many years afterwards. When the parliamentary fight was over Lord Cranborne accepted the constitutional change as an accomplished fact which it behoved every good citizen to make the best of, and it was the offence against public morality of which he held his party and its leaders to have been guilty that became the theme of an article called "The Conservative Surrender" which appeared that October in the *Quarterly Review.* Its quality and its easily divined authorship procured it a sensational reception. Seven editions of the number which contained it had to be issued in order to meet the demand for it.

On April 12, 1868, his father died and his House of Commons career came to an end. During the six years which followed (1868–1874), Lord Salisbury joined actively from below the gangway in the warfare which his late colleagues waged against Mr. Gladstone's legislation. In 1870 he was chosen chancellor of Oxford university in succession to Lord Derby, — an indication of the reputation which his attitude in '67 had won for him among the more serious representatives of the party outside Parliament. It was a distinction which he always peculiarly prized. When, after the defeat of the Liberals in 1874, Disraeli undertook the formation of his second ministry, almost his first step was to invite the return of this alienated colleague. Under actual conditions there could be no risk of a repetition of his earlier experience, and after a few days of painful hesitation, he accepted. On Feb. 17 he resumed control of the Government of India where a disastrous famine claimed all his energies. By a curious chance a similar visitation had synchronised with his previous brief tenure of office and he had left behind him a high reputation for success in dealing with it.

The first two years of this ministry were uneventful — except in connection with an ecclesiastical measure — the Public Worship Act, introduced in 1874 by Archbishop Tait. Lord Salisbury and his chief took opposite sides upon it. and the momentary clashing of their swords in debate excited some quite unfounded anticipations of ministerial rupture. But in 1876 a crisis arose in the southeast of Europe, one of whose incidental results was to fix permanently Lord Salisbury's destiny in public life.

The Eastern Question. — Two or three of the European provinces of the Turkish Empire had revolted against its misgovernment; there had been a voluminous interchange of notes and protocols among the signatory Powers of the Treaty of Paris; the already autonomous principality of Serbia had taken up arms in support of its co-religionists, and finally the Russian tsar had mobilised his army and declared that, if the rest of Europe did not act, he would. A conference of the Great Powers had thereupon been called to meet at Constantinople in December, to draw up a scheme of reforms and, by securing the Porte's acceptance of it. avert the threatened war.

The repercussion of these events in England had been peculiarly characterized. The insurrection in Bulgaria had been suppressed by Turkish irregular troops with incidents of great savagery. Misled by the optimism of the British embassy at Constantinople, the prime minister — now become Lord Beaconsfield — had poured scorn upon the first newspaper reports of these outrages, and in the impassioned agitation which Gladstone initiated on the

subject throughout the country, the Tory Government became an object for almost equal denunciation with the Turkish sultan.. Salisbury resented the agitation, but was himself admittedly sympathetic with the cause of the insurgent Christians and had privately urged his colleagues to dissociate England once and for all from the incriminated cause of Turkish ineptitude. His views were known or divined and when Beaconsfield invited him to serve as plenipotentiary to the Constantinople Conference, the appointment helped to quiet the prevailing excitement and was received with general acclamation. At first all went smoothly at the Conference; there was no difficulty in obtaining unanimous agreement among the Christian Powers as to the reforms to be recommended. But there success stopped. The Turkish envoys rejected all proposals, and were deaf to every argument. Salisbury would have tried that of force, but his colleagues refused, and on Jan. 20, 1877, the conference broke up and Russia was left to carry out her originally proclaimed purpose.

She declared war on April 24. Throughout the remainder of that year counsels in the British cabinet were divided. The prime minister and Cairns advocated present intervention; Salisbury and Carnarvon opposed a resolute veto to any action which the Turks could construe into acquiescence in their defiance of Europe; and Derby, the foreign secretary, supported them with impartial loyalty. Agreement between the warring groups was obtained for a declaration of neutrality, balanced by a warning addressed to Russia that no attempt on Constantinople itself would be tolerated.

The change of issues foreshadowed in this document materialised in the new year and with it a change in cabinet grouping. The Turkish defence, at first resolute and successful, suddenly collapsed and when the Russian troops in rapid advance appeared upon the threshold of the forbidden city Lord Salisbury was foremost in urging that men-of-war should be sent up to the Bosphorus for its protection. On this decision being taken (Jan. 23), Derby and Carnarvon resigned, though the former was subsequently persuaded to withdraw his resignation.

An armistice was agreed upon and a treaty of peace, negotiated between the two belligerents, was signed at San Stefano on March 3. It provided for a huge Slav State under Russian protection stretching right across the Balkans and completely isolating Constantinople. Russia announced that at the approaching conference of the Signatory Powers required under treaty law to legalize the settlement she would admit discussion on those parts only of the new treaty which were "of European interest." The other Powers hesitated to enforce their rights but England declared that unless the treaty were submitted in its entirety she must decline to participate in the congress; Russia again refused, the summoning of the congress was indefinitely postponed, and when the British cabinet met on March 27 it was to face an imminent probability of war. They called out the Reserves and telegraphed orders for a contingent of Indian troops to be at once embarked for the Mediterranean. Lord Derby resigned the same evening and Lord Salisbury, who had taken a leading part in these decisions, was appointed foreign secretary the following day.

He signalized his accession to control by a despatch whose contents were telegraphed on April 1 to every capital and which became famous as the Salisbury Circular. Its object was to show that the Treaty of San Stefano, by reducing the Turkish Empire to vassalage, would constitute a greater menace to the interests of other Powers than would have arisen from its frank dismemberment in Russia's favour. It was by the treaty as a whole that this result would be achieved and it was as a whole therefore that it must be submitted to the judgment of Europe. This document, by the lucidity of its style and argument, the impression of resolution which it conveyed and the subtly indirect appeals which it contained to the interests or sentiments of the different neutral nations, effected an immediate revolution in the international position. Hesitation disappeared; the rest of Europe ranged itself on the side of the British contention and Russia could do no other than submit.

But danger was not over with the removal of obstacles to the meeting of the Powers. In present conditions a failure of agreement at the Congress itself must precipitate a general war and Salisbury refused to risk that possibility. He entered into private communication with Russia and satisfied himself that the provisions which either side regarded as vital were capable of adjustment. On May 31st a secret agreement was signed between him and the Russian ambassador binding both Powers not to push dispute on these provisions to the point of rupture at the Congress. Russia's price for this adjustment was her retention of her Asiatic conquests, and to counteract the effect of these Salisbury co-incidentally arranged a convention with Turkey. Under this, in consideration of her ceding Cyprus to England and entering into an engagement of administrative reform in Asia Minor, England guaranteed her Asiatic frontier against further aggression.

These preparations having been effected, the Congress, summoned by Prince Bismarck, met at Berlin on June 13. Lord Beaconsfield and Lord Salisbury attended it, and a month later a treaty was signed there by the seven great Powers. It secured all the objects for which England had contended, and when the two plenipotentiaries returned to London Beaconsfield was able to announce that they had brought back "Peace with Honour."

In Opposition.—At the generai election of 1880, the Conservative party was heavily defeated. Lord Beaconsfield died the following spring, and Lord Salisbury succeeded him as leader in the House of Lords, sharing with Sir Stafford Northcote in the leadership of the party as a whole. During this period of opposition and in the election campaign which closed it, he spoke continually on public platforms and developed gifts for attracting and holding mass meetings of working men which hitherto had had little opportunity for display.

In home affairs his attitude was distinguished alike from that of the Tory Democrats of that day and that of the more old-fashioned Toryism. He made no attempt, like the former, to clothe his views in radical or democratic phraseology, but on the other hand he was disdainful of privilege and frankly indifferent to tradition. That the confidence begotten of economic stability and respect for individual rights was of supreme importance to the class whose welfare depends on full and well-paid employment; that theorists and phrasemakers are the enemy, always and everywhere; above all, that unity and mutual trust are the indispensable foundation for all moral and all material welfare in a nation,—mere the recurrent texts from which he spoke. But he demurred to the title of Conservative: "There is much . . . which it is highly undesirable to conserve." He identified himself strongly with the movement for housing reform and in speaking to a bill promoted by a Royal Commission of which he had been a member, he shocked the rigid individualists of his own and the opposite party by his warm advocacy of State expenditure in dealing with the evils of overcrowding.

In 1884 Gladstone introduced a bill for enfranchising two million agricultural voters and divorced it from the large rearrangement of seats which such an unequally distributed addition to the electorate would require. Salisbury saw in this procedure an intention of manipulating the constituencies in a party sense and invited the House of Lords to compel an appeal to the country on the question by refusing to pass one bill without the other. They did so and a tempestuous campaign of protest against their action followed. It was responded to by a similar campaign in their favour, in which Salisbury took a prominent part. The recurrent climax of his speeches was a challenge to the Government to dissolve parliament and so obtain the verdict of the electors on the issue. Through the Queen's mediation the controversy was closed by Gladstone's giving the required guarantee of impartiality in the Redistribution bill by inviting Salisbury and Sir Stafford Northcote to assist in drawing it up.

On June 8, 1885, the Liberals, disorganized by Sudanese disaster, allowed their Government to be defeated on a Budget vote and Mr. Gladstone resigned. The passage of the Franchise Act had made a dissolution impossible until the new registers were completed in November, and there were patent reasons why Salisbury, whom the Queen summoned, should refuse to take office. It would lose for his party all the advantage of attack in the

approaching elections, and it would place on it the invidious responsibility of governing Ireland without the Crimes act, whose necessity it had urged and which was due to expire ihat summer. But the state of affairs abroad which the Queen revealed to him decided Salisbury upon acceptance. England was at that moment without friends or authority in Europe; perennial antagonists—Russia and Austria—France and Germany—had been negotiating reconciliation at her expense; if present conditions were suffered to continue it seemed to him that any catastrophe was possible. He kissed hands as prime minister and foreign secretary on June 24.

First Ministry.—His tenure of office this time was too short for the testing of any policy, but he achieved one sensational success. That September, the southern Bulgarians, who had been left under Turkish rule by the Treaty of Berlin, revolted and proclaimed union with their northern brethren. These and their Prince, Alexander of Battenberg, had in the intervening seven years quarrelled hopelessly with their Russian patron and Russia was now foremost in vindication of the treaty and insistence upon an immediate reversal of the achieved union. A conference of the Powers was called and the rest of the Continent rallied to the Russian demand. Salisbury alone refused. Now that the union had become an accomplished fact, he declared, the Bulgarians would never willingly surrender it and to force surrender, as the Imperial Governments proposed, by means of a Turkish military "execution," was unthinkable. For weeks he was argued with, pressed, objurgated for stultifying the united authority of Europe. He refused to give in and on Nov. 25 the conference broke up. Meanwhile Serbia, outraged at the accretion of territory illicitly secured by her neighbour, had invaded Bulgaria. Her unexpected and crushing defeat by Prince Alexander converted the great Powers to a depressed recognition of the facts upon which Salisbury had insisted. In December he was appealed to for help in discovering some face-saving compromise and the sultan was induced to come to a direct agreement with Prince Alexander, in which the union was recognized. The Treaty Powers had only to acquiesce, while the continental press turned round and congratulated the British minister upon the prescience and firmness which had saved Europe from a disastrous blunder.

Before this settlement was finally consummated Salisbury had left office. The general election in November had resulted in giving the Irish party the casting vote in the House of Commons. In December Gladstone had announced his adhesion to Home Rule and Salisbury's ministry was defeated on an amendment to the address on Jan. 26, 1886. Gladstone introduced his Home Rule bill which, with the assistance of 90 dissident Liberals, was rejected, on June 8. Parliament was dissolved; the Unionists gained a decisive victory though not one giving a majority to the Conservatives independently of their allies. On July 20, the Queen sent for Salisbury who, with her leave, pressed Hartington to take the premiership in his stead. But the Liberal-Unionist chief refused, promising independent support, and Lord Salisbury formed his second Government which remained in power for six years,—1886–92.

Government of 1886–92.—The worst difficulty which it had to encounter was at starting. Lord Randolph Churchill, who was the second man in the ministry and leader in the House of Commons, found himself unable to work with his colleagues, and resigned at the end of the year. The most popular platform speaker in the party, he was at that time without a rival on his own front bench, and the break up of the Government was anticipated. Salisbury again offered to widen its support by retiring in Hartington's favour, and Hartington again refused. But he advised his lieutenant, Goschen, to join the cabinet, which in the end suffered no permanent injury by Lord Randolph's defection. Salisbury, who at the outset had surrendered the foreign office to Lord Iddesleigh, now resumed its direction (Jan. 1887).

England was no longer in the position of dangerous isolation which she had occupied when he took office in 1885. The initiatory approaches which he had then made to the German chancellor had re-established friendly relations between them, and his successful obstinacy about Bulgaria had presented England to Europe as a power that had to be reckoned with. In '86, circumstances all combined to draw her towards the grouping of Central European Powers,—Germany, Austria and Italy as against the Russo-French combination. Russia had been alienated by her resistance to the coercion of Bulgaria, while across the Channel France's growing resentment at her continued presence in Egypt had operated in the same direction. But in 1887 there was an interval of hesitation. Salisbury was repelled by the German chancellor's methods. Throughout the preceding autumn and winter he had been ceaselessly resisting the chancellor's efforts to induce an Anglo-Russian war and so shift the Bulgarian quarrel from Austrian to English shoulders. The menacing pressure with which the chancellor visited any crossing of his wishes by a friendly Power had been a constant source of irritation. Salisbury's wish for a wider choice in friendships expressed itself that spring in a new departure in Egyptian policy. He offered to Turkey—as the suzerain power—an engagement to evacuate Egypt in three years if the conditions for her security permitted and with a right of re-entry reserved. After prolonged negotiation the sultan agreed to sign a convention to that effect (May 22, 1887). But France rejected the proffered compromise with indignation, and under threats of violence from her and Russia the sultan withdrew his consent, and refused ratification. The attempt, though it failed in its main object in a reconciliation with France, was not fruitless. It freed England from further solicitations and intrigues on the score of Egypt. She had made her offer and it had been rejected. Thenceforward, as Lord Salisbury soon made abundantly clear, she would consult only her own judgment as to the period of her occupation.

But France's inveteracy was decisive in determining England's continental friendships for the next ten years. Lord Salisbury declined to give them the character of alliances. In response to insistent requests from the Austrian and Italian Governments, backed by a private letter of strong appeal from the German chancellor (Nov. 22), he that autumn signed an engagement (the Tripartite Agreement, Dec. 10, 1887), to join with them in resisting any future coercion of Turkey on the part of Russia. The chancellor's letter hinted at a more general and binding adhesion to the Triple Alliance and it was followed by other suggestions to the same effect. These were ignored or evaded and more definite proposals met with more definite refusals. In the spring of 1887, Italy had asked for a defensive alliance specifically directed against France and in Jan. 1889 Germany invited a similar compact. Salisbury's answer on both occasions was that an undertaking to fight on an unarrived issue was contrary to the traditions of English policy and was impossible for a Constitutional Government.

To maintain this refusal of the only thing that constituted an alliance in Continental eyes without falling into the pit of national isolation was a difficult problem for diplomacy. Salisbury's large success in solving it during the period of his ministry was due in the main to his avoidance of exaggerated claims and his readiness not only to acquiesce in but actively to assist those of other countries wherever they were in any way admissible. Thus the detachment which must otherwise have become a source of jealousy and suspicion was, time and again, presented in a guise attractive to the needs of other nations. England never occupied a position of greater authority in Europe than during this time, and after Bismarck's retirement in 1890 Salisbury's became the dominating figure among European statesmen.

The white invasion of Africa which signalized that decade afforded opportunity for a marked display of his capacity for international co-operation. It was a movement unique in history for the rapidity, and, it may be added, the human benefit of its achievement. But behind the inrush of explorers, missionaries and traders of all nations, had now come their Governments, whose claims—undefined and illimitable—were, by the end of the eighties, advancing to inevitable conflict. England, whether by earlier occupation or the present activity of her adventurers, was a competitor in every region, north, south, east and west, and Lord Salisbury accepted the initiative to bring order out of chaos which was thus marked out for him. He engaged in negotiations, delimitations, arbitrations, and struck the best bargains he could

for his own clients compatible with an instructed sympathy with their rivals' requirements. With an eye for a future still eight years distant he averted encroachment upon the Nile valley up to the river's source, though no Englishman had as yet set foot south of Wady Halfa, and placated French enmity beforehand by a large complaisance in the west and north-west of the continent. He reasoned suavely with Italy's aspirations and sharply with Portugal's baseless obstruction to the northward advance of Cecil Rhodes' South Africans; and when England's and Germany's irreducible requirements proved incompatible, threw Heligoland into the scales in security of a peaceful settlement (June 1890). When he left office the main outlines of actual occupation and prospective "spheres of influence" had been drawn without the serious chilling of a single international relationship.

The elections of 1892 resulted in a victory for the Liberal party though with a small and unharmonious majority. Gladstone passed a bill for Home Rule and one for Welsh Disestablishment through the House of Commons in successive sessions, but the evident want, of enthusiasm in the country for either measure encouraged Salisbury, in accordance with the principle on which he acted in this connection, to invite their rejection by the House of Lords. The place of the Lords in the Constitution was to secure an appeal to the electorate but they could only wisely assert it against the House of Commons when there were sound reasons to believe that the electorate agreed with them. On this occasion his judgment proved amply justified. Parliament was dissolved in '95 and the verdict of the constituencies ratified the Lords' action by a substantial majority. Lord Salisbury again became prime minister and foreign secretary while the Liberal Unionist leaders established the fusion of the two sections of the party by joining his cabinet.

Third Ministry.—This was in many ways the least satisfactory of Lord Salisbury's four tenures of the foreign office. Since he was last in office the German emperor had quarrelled with England over Far East politics, and never afterwards paid more than lip service to the old friendship. The breach with France was not yet healed, and, though Lord Salisbury's personal authority remained and the influence of his initiative, England was isolated in European sympathy throughout this period. He found diplomacy once more absorbed in the Near East problem as the result of a peculiarly atrocious outbreak of Turkish cruelty and misgovernment in Armenia. After failing in a private proposal to Germany to join in some drastic enterprise—its details are not known—for the dismemberment or subjugation of Turkey, he appealed in 1896 to the Christian Powers as a whole to take combined action for enforcing reform on the Porte. They agreed and accepted his initiative. The "Concert of Europe" succeeded both in this matter and in a subsequent crisis in Crete, in averting the ever-present danger of a breach in the "armed truce" on the continent. But as regarded the lot of the unhappy Armenians it proved a sore disappointment to its author—Russia, who, in the strange whirligig of time, had become the champion of Turkish independences, vetoing, with German support, any form of coercion at Constantinople.

In the summer of 1895 a long-drawn-out frontier dispute between British Guiana and Venezuela achieved sudden importance through the action of the American Government which, with a view to hastening a conclusion, addressed a singularly discourteous despatch to that of England, claiming rights of dictation rather than intervention. Lord Salisbury, after some delay, replied with a reasoned demurrer to such a development of the Monroe doctrine. President Cleveland responded in a fierce speech, foreshadowing ultimatums, and was applauded by his public in a wild outbreak of anglo-phobic jingoism. Lord Salisbury declined the quarrel and some months later, when feelings had cooled, tacitly conceded America's claim to intervene and agreed to defer the whole question to neutral arbitration, whose verdict substantially conceded the British case. (Oct. 1899.)

In the winter of '97–98 a stir of anger was roused in England by Russia's illegal seizure from China of two ports—Port Arthur and Talienwan—which were supposed to secure domination over Pekin, and Lord Salisbury was much censured for passing the aggression by with no more than a diplomatic protest. Events elsewhere called urgently for complaisance. The culminating crisis of the long quarrel with France over Egypt was imminent and Lord Salisbury held that its peaceful issue would depend on her finding no militant encouragement from sympathetic outsiders when the moment came. Colonel Marchand had been for more than three years making his way through the forests of Central Africa with instructions to assert a French claim upon the upper waters of the Nile before England had established an effective occupation there. He succeeded in fact in arriving that July at Fashoda a few weeks before General Kitchener reached it., steaming hurriedly up the river from the battle of Omdurman. Rut the news of the planting of the French flag and that of its removal reached Paris concurrently and with it a telegram from Lord Salisbury announcing the British occupation of the post and warning the French Government and people in the clearest terms that no compromise on England's claim upon the Nile valley was possible. Popular passion, dangerously excited for a few days, was thus compelled in the first moment of its ebullition to face the gravity of the decision to be taken and in the end it suffered its Government, discouragingly advised thereto by its Russian ally, to follow counsels of peace. The episode thus safely passed through proved, in spite of the resentment which it aroused at the time, the close of the quarrel that had so long kept the two nations apart. The resentment was artificially prolonged by the general unpopularity in which England was submerged through the South African war the following year, but when in 1901 that had passed by, the way was left open for the automatic operation of the forces which three years later resulted in the Entente.

The successful conduct of this crisis was Lord Salisbury's last diplomatic achievement of any note. He surrendered the foreign office in Nov. 1900, and the prime ministership in July 1902—only deferring this final retirement to avoid the embarrassment of a change before peace had been concluded in South Africa. He died a year later on Aug. 22. 1903.

Science was his main interest outside his profession and he was also widely read in history and theology. He was a strong churchman and a devout Christian, his religious faith constituting. the fundamental inspiration of his life. (G. Ce.)

See *Speeches of the Marquis of Salisbury,* ed. *H.* W. Lucy, with short biography (188;) and Lord Salisbury's *Essays,* 2 vol. (1905); also F. S. Pulling, *Life and Speeches of the Marquis of Salisbury* (1885); S. H. Jeyes, *Life and Times* of *the Marquis of Salisbury,* 4 vol. (1895–96); G. G. Cecil, *Life of Robert, Marquis oj Salisbury* (1921).

SALISBURY, ROBERT CECIL, 1ST EARL OF SALISBURY (1563–1612), English secretary of state and lord high treasurer, was born on June 1, 1563, the only surviving son of Lord Burghley by his second wife, Mildred, daughter of Sir Anthony Cooke, tutor to Edward VI, and sister to Sir Francis Bacon's mother. (See BACON: FRANCIS.) Robert Cecil was educated at home, probably by his learned mother. and at St. John's college. Cambridge, for an unknown period around 1581. He was given his M.A. in 1605, although he had been lord steward of the university from 1591 and lord chancellor from 1600 until his death. He was admitted to Gray's Inn in 1580, but how long he studied law is not recorded. Probably to broaden his education he visited France in 1584, and accompanied Lord Derby to the Spanish Ketherlands in 1588. He was married on Aug. 31. 1589, to Elizabeth Brooke. daughter of Lord Cobham. After Sir Francis Walsingham's death in 1590, Cecil gradually took over the work of the secretaryship of state; although not formally appointed to that office until July j, 1596. He had been knighted and sworn of the privy council in 1591. He was elected to parliament for Westminster in 1584 and 1586, and for Hertfordshire in 1588, 1592, 1597 and 1601, and was the official exponent of government policy in the house of commons from 1593 until 1603. when he was created Baron Cecil of Essendine, and then in the upper house. Early in 1 j98 he headed a mission to Henry IV of France to try to prevent the inclusion of anything prejudicial to the English or Dutch in the treaty of Vervins between France and Spain. After his father's death in 1598 he became and remained the chief minister of the crown until his own death. His chief rival for the

favour of Elizabeth I was the earl of Essex. When in *1601* Essex was on trial for rebellion he alleged that Cecil had once said that only the Spanish infanta had any claim to succeed Elizabeth. Cecil's denial was supported by the witness Essex named. The incident had an important bearing upon his future because he could now disprove the false rumours which had reached James VI of Scotland that the secretary was hostile to his claims to the English throne. Cecil entered into a secret correspondence with the king and gave him the excellent advice not to plague Elizabeth formally to recognize him as her successor, but to be careful to cultivate her good will. As Cecil expected, James succeeded Elizabeth unopposed and retained her secretary of state as his chief minister.

Cecil was one of the chief examiners of the conspirators in the Gunpowder plot to blow up the two houses of parliament, but the suggestion that he fabricated it in order to enhance his position has been decisively refuted. He was a persecutor of those Catholics who upheld the papal claims'to depose heretical monarchs and release subjects from their allegiance. The test of loyalty for Catholics in the oath of *1606* was willingness or refusal to denounce those claims. His tract entitled *An Answere to Certain Scandalous Papers* (1606), denied that he intended to exterminate all English Catholics. A Calvinist in doctrine but not in church organization he felt that the "turbulent humours" of the Puritans necessitated their coercion. He was not, like his master. an enthusiastic advocate of the union of England and Scotland, but he supported the plantation of Ulster and accepted the barony of Clogher in Tyrone, Ireland, of *12,500* ac. He did not actively participate in the formation of the Virginia company.

In *1604* Cecil was created Viscount Cranborne and the next year earl of Salisbury. In *1608* he became lord treasurer, and found that the king was *£1,000,000* in debt. By new impositions on merchandise and other measures he reduced the debt to *£300,-*000 but could not balance expenditures and revenue. He failed, however, to persuade parliament to accept the Great Contract of *1610.* by which the revenue would have been increased by *£200.000* minus about *£100,000* received from various feudal dues which would be abandoned. He was equally unsuccessful in curbing James's extravagances. In foreign affairs he negotiated peace with Spain in *1604,* but sympathized with the Dutch in their war of independence. When the *12* years' truce was arranged in *1609,* England joined France in guaranteeing the Dutch against any infringement of it by Spain. He did not agree with the king's dreams of preventing wars by marriage alliances between the Catholic and Protestant powers. One of his last services was the betrothal of the Princess Elizabeth to Frederick of the Palatinate.

Salisbury died on May *24, 1612.* (G. Ds.)

SALISBURY, ROLLIN D. (1858–1922), U.S. geologist, was born at Spring Prairie, Wis., Aug. *17, 1858,* graduated from Beloit college in *1881,* and later spent a year in graduate study at the University of Heidelberg, Ger. He taught successively at Beloit college: at the University of Wisconsin and, from *1892,* at the new University of Chicago. From *1899* until his death Aug. 15, *1922,* he was dean of Chicago's Ogden graduate school of science. Salisbury's chief researches were in glacial geology. His early studies made famous the "driftless area" of the upper Mississippi valley. In *1895,* as a member of the Peary Relief expedition, he studied glaciers in Greenland. His most systematic field work was on the Pleistocene formations of New Jersey. In *1904–06* appeared the three volumes of *Geology,* written jointly with T. C. Chamberlin. (*R.* T. Cn.)

SALISBURY, THOMAS DE MONTACUTE, 4TH *EARL* OF (1388–1428), was son of John, the 3rd earl, who was executed in *1400* as a supporter of Richard II. Thomas was granted part of his father's estates and summoned to parliament in *1409,* though not fully restored until *1421.* He was present throughout the campaign of Agincourt in *1415,* and at the naval engagement before Harfleur in *1416* and in 1417–18. During the spring of *1419* he held an independent command, captured Fécamp, Honfleur and other towns, was appointed lieutenant general of Normandy and created earl of Perche. In *1420* he was in chief command in Maine and defeated Maréchal de Rieux near Le Mans. When Henry V went home *(1421)* Salisbury remained in France as the chief lieutenant of Thomas, duke of Clarence. The duke. through his own rashness, was defeated at Baugé on March *21. 1421.* Salisbury came up with the archers too late to retrieve the day, but recovered the bodies of the dead, and by a skillful retreat averted further disaster. He gathered a fresh force, and in June was able to report to the king "this part of your land stood in good plight never so well as now." *(Foedera,* x, *131.)* Salisbury's success in Maine marked him out as John of Bedford's chief lieutenant in the war after Henry's death. In *1423* he was appointed governor of Champagne, and by his dash and vigour secured one of the chief victories of the war at Crevant on July *30.* Subsequent operations completed the conquest of Champagne and left Salisbury free to join Bedford at Verneuil. There his "judgment and valour" won the day.

During the next three years Salisbury was employed on the Norman border and in Maine. After a year's visit to England he returned to the chief command in the field in July *1428.* Against the judgment of Bedford he determined to make Orleans his principal objective, and began the siege on Oct. *12.* While surveying the city from a window in Tourelles he was wounded by a cannon shot and died on Nov. *3, 1428.* Salisbury was the most skillful soldier on the English side after the death of Henry V.

(C. L. K.)

SALISBURY, WILLIAM LONGSWORD (or LONGESPÉE), 3RD *EARL OF* (d. 1226), was an illegitimate son of Henry II. who granted him the estates of Appleby, Lincolnshire *(1188).* In *1198* he received from Richard I the hand of Isabella or Ela (d. 1261), daughter and heiress of William, earl of Salisbury! and was granted this title with the lands of the earldom. He was received with favour by Ring John. who appointed him sheriff of Wiltshire in 1200, and subsequently gave him many important military and diplomatic posts, thus retaining his allegiance during the period of excommunication. In *1213* Salisbury was sent in command of a fleet to attack Philip of France. By his successful action at Damme, he foiled the projected invasion of England, but in the following year he was captured by the French and only exchanged after prolonged negotiations.

On his return to England he supported John in opposition to the baronial party, but feeling that the king's cause was hopeless, he surrendered to Louis on his arrival in England.

After the death of John! Salisbury deserted the French side in *1217,* supported Herbert de Burgh and the young king Henry III and was appointed sheriff of Lincoln. It is asserted by Matthew Parker that he took part in the siege of Damietta (1219), but the evidence in support of this is scanty. It is known, however, that he supported the excommunication of William of Aumble in *1221*; that he assisted in the war on the Welsh marches *(1224)*; and that in *1225* he accompanied the expedition to Gascony. On the return voyage he was wrecked on the isle of *RC;* the hardships which he suffered probably hastened his death, which occurred March 7, *1226,* at Salisbury.

SALISBURY, a city and municipal borough, the chief town of Wiltshire, Eng., *23* mi. W. of Winchester and *83* mi. W.S.W. of London by road. Pop. *(1961) 35,471*; area *4.4* sq.mi. The city lies in the valley at the junction of the Avon, Wylye, Nadder and Bourne. The cathedral stands out above the city, which is partly laid out in squares called the Chequers. To the north rises the bare upland of Salisbury plain. The neighbourhood of Salisbury was one of the most important areas in prehistoric England and was a meeting place of early cultures: *e.g.,* the Beaker peoples and the megalith builders; *6* mi. N. is Stonehenge (*q.v.*). The Salisbury: South Wilts and Blackmore museum in the city has exhibits of almost every age from the neighbourhood.

Old Sarum.—Most intimately associated with the origins of Salisbury is the great prehistoric fortress of Old Sarum, about 2 mi. N. of the centre of the city. The great mound has a fosse and earthwork; the summit is hollowed out like a crater and its rim surmounted by a rampart. The outer earthworks probably date from the Iron Age. It was an important site in Romano-British times and especially in the period immediately preceding the arrival of the Romans. It was known to the Romans as Sorviodunum. In 552 it was taken by Cenric, who named it Searobyrg, and it became the home of the kings of Wessex.

About 1075 Old Sarum became the seat of a bishopric, transferred there irom Sherborne. Osmund, the second bishop, compiled a missal which iorms the groundwork of the celebrated "Sarum Use." The "Sarum Breviary" was printed at Venice in 1483, and upon this, the prayer books of Edward VI were mainly based. Osmund also built a cathedral, in the form oi a plain cross (1078–92). The garrison and priests were perpetually feuding, and in 1217 the dean and chapter complained to Pope Honorius III, who granted a licence enabling the priests to move to the Avon valley. In 1220, under Bishop Richard Poore, work on the new cathedral was begun. With the building of New Sarum in the 13th century and the transference to it of the see, Old Sarum lapsed to the crown. By the end of the 15th century it was abandoned and in 1608 the town walls were demolished.

New Sarum.—The new city, New Sarum (New Saresbury, Salisbury), immediately began to spring up around the cathedral. A charter oi Henry III created it a free city in 1227. In 1611 the city obtained a charter under the title of "mayor and commonalty" of the city of New Sarum.

The Cathedral.— The cathedral church of St. Mary is a beautiiul example of Early English architecture, begun and completed! save its spire and a few details, within one briei period (1220–1265). It was consecrated in 1258. There is a tradition that Elias de Derham, canon of the cathedral (d. 1245), was the principal architect. The spire, the highest in England, measures 404 it. The building is 473 it. long (the nave being about 228 it. and the choir 220 it.). (For plan, see GOTHIC ARCHITECTURE.) The cathedral consists of a nave of ten bays, with aisles and a lofty north porch, main transepts with eastern aisles, choir with aisles, lesser transepts, and presbytery. The Lady chapel is the earliest part of the original building. The two upper stories of the tower and the spire above are early Decorated. The west front bears in its rich ornamentation signs of the transition to the Decorated style. The irequent use of Purbeck marble ior shafts contrasts with the delicate gray ireestone, the principal building material. An unhappy restoration (1782–91) destroyed many magnificent stained-glass windows which had escaped the Reformation, and also removed two Perpendicular chapels and the detached belfry which stood to the northn-est. The cloisters were built directly aiter its completion. The fine octagonal chapter house is of the time of Edward I with a series of contemporary sculptures. The library contains valuable manuscripts including a copy of *Magna Carta*. The diocese covers most of Dorset and Wiltshire, and a number oi parishes in Hampshire, Berkshire, Somerset and Devon.

The City.—There are three ancient parish churches: St. hlartin's, with square tower and spire, and possessing a Norman font and Early English portions in the choir; St. Thomas' (oi Canterbury), iounded in 1240 as a cathedral chapel, and rebuilt in the 15th century; and St. Edmund's, iounded as the collegiate church of secular canons in 1268, hut later rebuilt in the Perpendicular period. St. John's chapel, founded by Bishop Robert Bingham in the 13th century, is occupied by a dwelling house. There is a chapel attached to the St. Nicholas hospital. The poultry cross, or high cross, an open hexagon with six arches and a central pillar, was erected by Lord Montacute before 1335.

SALISBURY, the capital city of the Federation of Rhodesia and Nyasaland and of Southern Rhodesia. is situated in the north-eastern part of Southern Rhodesia: at an altitude of 4,865 ft. above sea level. The climate is'temperate, the average mean annual temperature being 65° F., and the average annual rainiall 31.92 in. Greater Salisbury comprises the city and numerous adjoining satellite towns. The population of Salisbury in 1956 was 225,750 (including 61.930 Europeans, 2,043 coloured, 1,777 Asians and an estimated 160,000 Africans).

Salisbury was iounded on Sept. 12, 1890, and named aiter the British prime minister, Lord Salisbury. Chartered in 1935, it is well laid out. with tree-lined avenues and, in the business and governmental centre, many multistoried buildings. Pearl .Assurance house and Robinson house, standing 205 it. and 163 ft. high respectively, are the tallest. The main streets run irom north to south and irom east to west. Notable buildings include the Anglican and Roman Catholic cathedrals, the Dutch Reiormed church, the Queen Victoria Memorial library and the town house. Adequate educational, medical, recreational and cultural facilities have been established. The Central African archives: the multiracial University of Rhodesia and Nyasaland, opened in 1957, and the National Art galleries are in the city. The Salisbury gardens and Cecil square are the chiei parks. Salisbury is on the main rail, road and air routes of Africa. The international airport is situated at Kentucky, close to the city. The city is the centre ior the agricultural industry of Southern Rhodesia, of which Virginia tobacco is the main crop. A gold-mining area also surrounds it. Secondary industries range irom clothing iactories to steel foundries. (F. J. LT.)

SALISBURY, a city of North Carolina, U.S., the seat of Rowan county, is located 120 mi. W.S.W. of Raleigh in the rolling countryside of the industrial piedmont section midway between Charlotte and Greensboro. The town's tree-lined streets dotted with ante-bellum homes are reminiscent of colonial times when Salisbury was one of the six largest boroughs in the colony. Settled by Scotch-Irish and Germans in the mid-18th century and named for Salisbury, Eng., it was laid out in 1753 as the county seat. It was incorporated in 1755, chartered in 1770 and has been city-manager governed since 1927.

Daniel Boone lived with his parents nearby from 1755 until 1767, and Andrew Jackson received his licence to practise law there in 1787 after studying for a year under Judge Spruce Macay. The British general Cornwallis pursued Gen. Nathanael Greene through Salisbury in Feb. 1781, just prior to the battle of Guilford Courthouse, and a small action occurred at Trading Ford 6 mi. E. During the American Civil War a large Confederate prison was established in an old cotton mill which housed, in the latter months of the war, 10,000 Federal prisoners of which about 6,000 died of starvation and disease. A national cemetery now marks the place where these unknown soldiers were buried in several long trenches.

Salisbury has been sustained historically by the textile industry and. during the first half of the 20th century, by major repair shops of the Southern Railway, since abandoned. There has been marked diversification in small industries, and remarkable growth of livestock, small grain farming, and dairying activity in the immediate area A 1.000-bed veterans hospital was completed there in 1953 Catawba college (1851) and Livingstone college (founded as Zion Wesley Institute in 1879) bulwark the town's cultural life. For comparative population figures see table in NORTH CAROLINA: *Population.* (JA. S. B.)

SALISH (FLATHEAD), a linguistic group of Indians, all speaking cognate dialects, in British Columbia and northwestern United States. The coast Salish had patrilineal clans practised potlatch festivals. accumulated wealth, held slaves and lived in plank houses like the other coastal tribes of the area. The arts and customs of the inland Salish were simpler. The principal groups or tribes are: (1) interior Salish. comprising the Shuswap. Lillooet. Thompson or Ntlakyapamuk, Okanagan in British Columbia, and the Flathead or Salish proper, Kalispel, Coeur d'Alêne, Spokane, Methow in the United States; (2) coast Salish, in order from north to south: Bellacoola of Dean's inlet. Comox, Cowichan of Vancouver Island. Nanaimo. Squawmish, Lummi, Snohomish, Snoqualmie (Seattle), Puyallup, Nisquallie, Conlitz, Skokomish, Songish. Clallam of Strait of Juan de Fuca. Quinault. Chehalis, and, south of Columbia river, Tillamook (called also Nehalim). In 1950 there were about 23,000 Salish. See also INDIANS, NORTHWEST COAST.

SALIVAN, a little-known South American Indian linguistic family, sometimes called Macuan and possibly related to Piaroan. The Salivan-speaking tribes lived along the Orinoco river in Venezuela. They had a hunting-fishing type of economy supplemented by the cultivation of root crops such as manioc. Like other tropical forest tribes, they were expert at extracting the poison from bitter manioc to make it edible. In the latter part of the 17th century they suffered from the depredations of the Carib Indians.

See also SOUTH AMERICA: *Ethnology: The* Tropicul Forest Tribes; SOUTH AMERICAN LANGUAGES.

SALIVARY GLANDS are certain glands, located in the mouth, that secrete saliva, a substance whose chief functions are to moisten and soften food and to keep the mouth moist. Saliva also contains a digestive enzyme and thus takes part in the chemical as well as the mechanical digestion of food. Numerous glands in the walls of the oral cavity pour their secretions into the mouth (*q.v.*); they are lodged in the submucosal tissue of the lips. cheeks, gums, tongue and palate. They are numerous in the lips. less so in the cheeks; the lingual glands are richly distributed at the base and lateral margin of the tongue and on the undersurface on each side of the frenulum. The glands of the roof of the mouth make up a large portion of the palatal mucosa and submucosa.

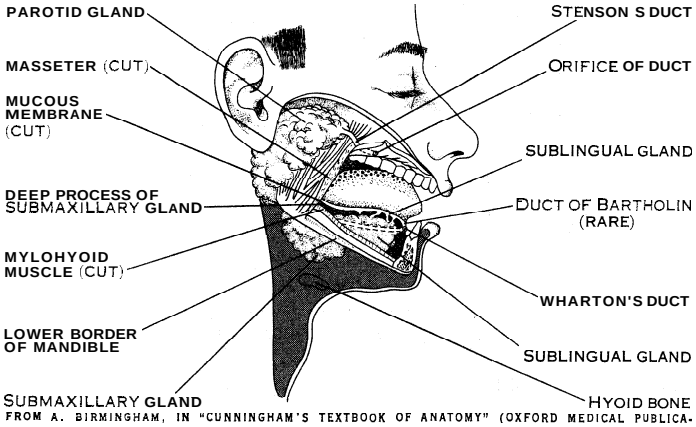
In addition to the above-described glands. which are intrinsic to the mouth cavity, there are three larger pairs: the salivary glands proper. They are the parotid, the submaxillary and the sublingual.

Anatomy.— Parotid.— Theparotid gland is the largest of the salivary glands and is situated between the ear and the ascending branch of the lower jaw. In cross section it is roughly triangular. The parotid is molded into the shape of a prism or wedge by the structures that bound the pit in nhich it is lodged. In front. the

gland embraces the ascending branch of the lower jaw; behind, it is delimited by the external opening of the ear, the styloid process of the temporal bone and the sternocleidomastoid muscle; on the deep (internal) aspect it approaches the wall of the pharynx; on the superficial (external) aspect it is covered by fascia prolonged upward from the platysma muscle of the neck. The gland is disposed in two partly overlapping leaves that are continuous behind at a so-called isthmus. The branches of the facial nerves course forward between these leaves, as do also branches of the external maxillary artery and tributaries of the external jugular vein. Accessory glandular masses are fairly common. They are likely to be situated above the parotid duct,-sometimes partly overlapping it. The parotid duct terminates in a minute orifice. opposite the second molar tooth of the upper jaw. The parotid duct (Stensen's duct) crosses the upper part of the masseter muscle and then pierces the buccinator muscle on its way to the mouth; it is about two inches long.

Submaxillary.—The submaxillary gland lies deep to the posterior half of the body of the lower jam; it is about the size of a walnut. The facial artery is embedded in the upper part of the gland. The submaxillary duct (Wharton's duct) runs forward to the sub. lingual papilla.

Sublingual.—The sublingual gland is placed farther forward



FROM A. BIRMINGHAM, IN "CUNNINGHAM'S TEXTBOOK OF ANATOMY" (OXFORD MEDICAL PUBLICATIONS)

THE SALIVARY GLANDS AND THEIR DUCTS. WITH THE GREATER PORTION OF THE BODY OF THE MANDIBLE REMOVED TO SHOW THE SUBLINGUAL AND THE DEEPER PARTS OF THE SUBMAXILLARY GLANDS

than the submaxillary; it is like an almond in shape though larger; its outer flattened surface rests against the lower jaw; its ducts are small and numerous.

Embryology.— Thesubmaxillary and sublingual salivary glands develop embryologically as solid outgrowths of the buccal epithelium that are canalized later, while the parotid appears first as a groove. The parotid is ectodermal in origin, all the others entodermal.

Diseases.—Among the diseases of the salivary glands is xerostomia. This rare condition, the result of arrested or diminished secretion of saliva (aptyalism), is of nervous origin. It probably is allied to the deficient secretion of saliva actuated by fear in ancient trials by ordeal. Dryness of the mouth in fever and in belladonna poisoning. though equally due to deficient secretion of saliva, is not included under the term.

Excessive salivation results from the action of certain poisons (*e.g.*, mercury, potassium iodide) and accompanies many diseased conditions of the mouth. In cancer of the tongue, floor of mouth, cheek or gingival border, salivation is one of the most distressing symptoms. Mercurial salivation disappeared largely after modern methods of treating syphilis were introduced, and at present is mainly the result of industrial conditions.

For the functions of saliva in digestion, see DIGESTION. See also ENZYMES; MOUTH.

See J. B. Erich, "Diseases of the Mouth, Salivary Glands and Pharynx," in R. L. Cecil and R. F. Loeb (eds.), Textbook *of* **Medicine,** 9th ed (1955). **(W. S. L.-B.; B. J. A.)**

SALIX, the genus name for the trees and shrubs comprising the willows and osiers (*qq.v.*).

SALK VACCINE: see INFANTILE PARALYSIS.

SALLÉ, MARIE (1707–1756), French dancer of extraordinary grace, elegance and dramatic power. was the first woman choreographer. She was also first to unify music. costumes and dance style with the theme of a ballet (Pygmalion, produced in London, 1734).

After childhood appearances in England, Sallé studied under Françoise Prévost, who sponsored her Paris opera debut in 1721. Never a virtuoso, Sallé was noted for her sensitive acting ability. As early as 1729, she had her partner discard the mask traditionally used by male dancers (and only formally abolished about 1770) to permit interplay of facial expression when they appeared together in the duet Les Caractbves de la Danse.

Sallé's greatest success was achieved in London, where she danced in Handel's operas and created, besides *Pygmalion,* the brilliant solo Les Cavactbves de *L'Amour* and a ballet. *Bacchus and Ariadne,* which revealed her power as a tragic actress.

Returning to Paris, she danced the rose in J. P. Rameau's Les *Indes* Galantes, and attained great distinction as Hébé in Castor et *Pollux.* In 1740 Sallé retired from the opera, but continued to appear at French court performances until 1752. She was painted by Nicolas Lancret.

See Émile Dacier, *Mlle. Sallé* (1909). (LN. ME.)

SALLUST (GAIUS SALLUSTIUS CRISPUS) (86–C. 34 B.C.), Roman historian and one of the great Roman literary stylists. He came of a plebeian family from the Sabine town of Amiternum. After a gay youth in Roman society he took up public life to obtain the quaestorship and enter the senate. His intellectual energy and personal ambition brought him into conflict with Pompey and the nobles. As tribune of the people (52) he was among those who bitterly attacked Cicero during the trial of the political agitator Milo. A freedman of Pompey, Lenaeus. satirized him for his criticism of the great man. It was doubtless for political reasons as well as on grounds of vice that in 50 he was removed from the senate. Caesar made him quaestor again in 49 so that he regained senatorial standing. In the Civil War he commanded a legion in 48. without distinction, and failed to control mutinous troops in Campania in 47, but as praetor in 46 he rendered Caesar valuable service in Africa and fought at Thapsus. For this he was renarded with the aroconsular governorship of Africa Nova. His administration of the province laid him under prosecution for extortion. Although he escaped conviction, he had become wealthy enough to build a magnificent mansion and gardens in Rome—the horti *Sallustiani*—and to retire from public life and devote himself to history.

The Cattltnae *Coniuratio* (or *Bellum* Catilinae), a study of Catiline's attempt at revolution (63). appeared in 44, and was followed by the *Bellum Iugurthinum,* which treated the war with Jugurtha in 111–106; both monographs survive complete. Then the *Historiae* in five books took up the events of 78–67, as a sequel to the work of L. Cornelius Sisenna; but only fragments (including speeches) remain. Sallust conceived the history of his age in terms of political degeneracy. which set in after the destruction of Carthage in 146. The war with Jugurtha. in his view, revealed the corruptness of the nobles, successfully challenged by popular leadership under Marius, despite his faults; Sulla intensified the troubles of the state, and after him both the nobles and Pompey proved unworthy to govern; the subsequent moral chaos threw up Catiline. His judgment involved an ideal of public morality, which declined through ambition, avarice and luxury, and this he expounds in his prefaces. Some critics have considered him a mere party propagandist who chose to arite about Catiline in order to create an opportunity to exonerate Caesar from charges of complicity in the plot and who chose his ground in the other works so as to attack the senatorial regime; but his real scope is wider. and he castigates not only the nobles but their rivals. His prefaces are not merely platitudinous; they provide the key to his selection of material. His conception, in fact, represents the political issue between the nobles, who regarded birth as the qualification for leadership, and the popular leaders, who—as Marius states in the *Jugurtha*—held that ability estab-

lished the right to rule. He applies this test of "Roman virtue" against the nobles, stressing it by his very praise of Cato, but equally against their unscrupulous rivals, apart from Q. Sertorius and Caesar. His analysis is too penetrating to be merely partisan —whatever secondary motives he had—but it is historically rigid. Rome was more unsettled before 146, less venal in 111, than he admits. His setting of Catiline's conspiracy may exaggerate its significance. just as it reduces the part of Cicero. His pattern of generalization led to chronological errors in detail.

As a stylist and in his generalizations about events Sallust shows the influence of Thucydides — with a Roman interest in typical personalities. What he grasps politically, he depicts dramatically, with an eye for a historical scene. In applying traditional standards he had recourse to the elder Cato. whose robust archaic style he consciously imitated. But he has a mordant, aggressive power of expression, which is his own. His style is an artificial creation —he took professional advice over it—and he fuses archaism with rhetoric, common speech with conventional vocabulary, under the pressure of a syntactical technique that used asymmetry and antithesis to point his distinctive anaiysis. The form of his language represents the character of his thought, as he conceived his theme. Occasional obscurity is the price for a powerful severity: his reward was to inspire Tacitus.

Doubtful Attributions. — Certain anonymous pieces in Sallust's historical style, which appear alongside his work in the manuscripts, have been dubiously attributed to him. An attack on Cicero (*Invectiva* in *Ciceronem*) in terms of the year 54 seems certainly spurious. Of two letters addressed to Caesar (*Epistulae ad Caesarem senem de re publica*) the first reflects conditions in 46. the second those in 49 (if not in 51 or 50). Both appear well-informed, but standard histories could have provided the material; and the second letter contains anachronisms that mark it as a later work. Stylistic comparisons may be deceptive. because Sallust was a likely object for imitation. In an age of literary conventions he would hardly have composed an "open letter" in his archaic historical style. In any event he had probably not evolved it before 45, and so even the first letter falls under suspicion.

SALMASIUS, CLAUDIUS, Latinized name of CLAUDE SAUMAISE (1588–1653), French classical scholar, born at Semuren-Xuxois in Burgundy on April 15, 1588. He was educated at Paris and Heidelberg, where he went over to Protestantism. In 1609 he brought out an edition of Florus. He then returned to Burgundy. In 1620 he published Casaubon's notes on the *Augustan History,* with copious additions of his own. In 1629 Salmasius produced his magnum opus as a critic, his commentary on Solinus' *Polyhistor,* or rather on Pliny, to whom Solinus is indebted for the most important part of his work. Salmasius learned Arabic to qualify himself for the botanical part of his task. In 1631 he went as professor to Leiden, where he composed for Frederick of Nassau his *De Re Militari Romanorum,* not published until 1657. He was persistently attacked by a clique led by Daniel Heinsius. His *De primatu Papae* (1645) excited a warm controversy in France.

In Nov. 1649 appeared his *Defensio regia pro Carolo I.* It is not known who influenced him to write it but Charles II defrayed the expense of printing and presented the author with £100. The first edition mas anonymous, but the author was universally known. This celebrated work, in modern times principally famous for the reply it provoked from Milton (1651). even in its own time added little to the reputation of the author. His reply to Milton, which he left unfinished at his death and which was published by his son in 1660, is insipid as well as abusive. Salmasius died on Sept. 3, 1653.

SALMERÓN, NICOLÁS (1838–1908). Spanish statesman, born at Alhama la Seca. Almeria. April 10. 1838. Professor of literature and philosophy at Madrid. he co-operated with Castelar on *La Democracia* and in 1865 was a member of the directing committee of the Republican party. Imprisoned as a suspect in 1867. he was elected to the *Cortes* in 1871 and on the resignation of Xmadeo (Feb. 11. 1873) was naturally marked out to be the leader of the party which sought to establish a republic in Spain. He succeeded Pi y Margall in the presidency of the republic on July 18. 1873, but resigned (Sept. 7), when he found that the generals insisted on executing rebels taken in arms. His successor, Castelar. was compelled to restore order by drastic means. Salmerón took part in the attack made on him in the *Cortes* on Jan. 3, 1874, and went into exile until recalled by Sagasta in 1881. In 1886 he was elected to the *Corfes* as Progressive deputy for Madrid He died at Pau. Sept. 21, 1908.

SALMON, THOMAS WILLIAM (1876–1927), U.S. physician and psychiatrist. was born in Lansingsburg. N.Y.. on Jan. 6, 1876. In 1899 he took his degree in medicine at the Albany Medical college and then entered private practice for a short time. Two years later he was appointed to the Willard (N.Y.) State hospital nhere he made one of the earliest studies of the role of human beings as disease carriers. In 1903 he was commissioned in the U.S. marine hospital service (now U S. public health service) and in 1905 undertook an assignment in conjunction with the immigration office' at Ellis Island. New York state authorities had become alarmed at the prevalence of foreign born among patients admitted to state hospitals. and under Salmon's direction, a psychiatric service mas incorporated into the regular medical department at Ellis Island. When the federal immigration lam was in process of revision, his aid was requested at congressional hearings, and much of his advice was incorporated into the new law. In 1915 Salmon became medical director of the newly formed National Committee for Mental Hygiene. in which capacity he gave practical guidance toward the extension of hygiene knowledge and the applications of psychiatry to public welfare. The second most outstanding achievement of his career was his role in establishing neuropsychiatric services for the armed forces during World War I. After the war, he provided plans for model hospitals to care for mentally disabled veterans. In 1921 he became professor of psychiatry at Columbia university, where he virtually established that field of study on an independent basis. He died on Aug, 13. 1927.

SALMON AND SALMONIDAE. The family Salmonidae, as understood in modern ichthyology, consists of three principal groups of fishes. which will be referred to here as the salmon. the trouts and the chars (*qq.v.*). Formerly the lake herrings or ciscoes and the whitefishes, also. were included. However, the last mentioned groups. having larger scales and a skull that differs in structure. now are generally assigned to a separate family called Coregonidae.

The Salmonidae have robust, somewhat-rounded, muscular bodies. The skeleton is bony. and the fins have soft rays only. The lower pair of fins, the ventrals. are attached to the abdomen, far behind the upper pair, the pectoral fins. A fleshy fin, without rays, is situated on the back behind the larger dorsal fin. and the caudal fin usually is more or less concave or forked. The entire body, exclusive of the head, is covered with small smooth-edged scales, of which more than a hundred are present along the middle of the side.

These fishes are more or less midway in zoological classification between the sharks with their primitive cartilaginous skeleton and the higher fishes such as the basses and cods with a complex tony frame. In colour the Salmonidae are greatly specialized, however. since many of them rival the most brilliant productions

of the tropical seas.

Nearly all the members of the family live in the northern part of the northern hemisphere and are largely restricted to coastwise waters, neighbouring islands and the inland waters of North America. Europe and Asia. Only a few have spread naturally beyond this range. as in the Atlas mountains of northern Africa. However, several species have been widely distributed and have become well established far beyond their natural range by the help of man.

Virtually all Salmonidae make some sort of migration to spawn. Those that live habitually in fresh water may ascend the stream they occupy only a short distance; inhabitants of lakes migrate somewhat farther as they ascend the streams; while those species that live chiefly in the sea make long migrations, to and in fresh-water rivers. some of which are exceedingly great as shown subsequently. Salmonidae are carnivorous, and normally feed on live bait. Fish, crustaceans and many insects are included in the diet.

The Salmon. — The name, salmon, when used herein as a group name is restricted to the several species of the Pacific belonging to the genus *Oncorhynchus.* This is done, notwithstanding that the name salmon was used for the anadromous species of the genus *Salmo* long before it came into use for the members of the genus *Oncorhynchus.* No other common English name is available for *Oncorhynchus,* whereas most of the species of the genus *Snlmo* have long been known as trout. Therefore, the common Atlantic salmon (*Salmo salar*), and its relatives, will be discussed in this article under the general group name) see *The Trouts* below.

The salmon, as defined in the preceding paragraph, differ externally from the trouts and chars in the size of the anal fin. In the salmon this fin is longer than it is high and has 13 or more developed rays. whereas in the trouts and chars it is higher than it is long and has fewer than 12 developed rays.

Five commercially important species of salmon of the genus *Oncorhynchus* occur on the Pacific coast of North America and northern Asia, with a few more. restricted to Japan and vicinity. These fishes are the source of the large annual pack of canned salmon shipped to virtually all parts of the world, and constituting a familiar article of diet to many millions of people. The catch for the United States and Canada totaled approximately 437,000,000 lb. in the mid-1950s. Of this amount the United States contributed about 324,000,000 lb. and Canada contributed about 113,000,000 lb. Alaska, the leading state in salmon catch contributed about 80% of the U.S. total.

The five important species of salmon are the Chinook or king salmon (*O. tschawytscha*), the largest, occasionally attaining a weight of 70 to 100 lb., though the average probably does not exceed 20 lb.; the chum or dog salmon (*O. keta*). generally weighing 7 to 10 Ib.; the silver salmon (*O. kisutch*) and the sockeye or blueblack (*O. nerka*), both weighing about 5 to 8 lb.; and the pink or humpback salmon (*O. gorbuscha*) averaging about 3 to 5 lb. in weight. The smallest of the five species exceeds every other species in the percentage of the total catch, and the largest supplied the least.

Even though the greater part of the catch of salmon came from Alaska, as has been the case for many years, the total catch has declined gradually but impressively over the years.

The salmon as well as some of the trouts, are anadromous. That is, they migrate from the sea to fresh-water streams to spawn. Some of the species ascend streams to their headwaters, whereas others spawn in the lower stretches of rivers. The king salmon goes to the headwaters. It has been found in the upper Yukon river, 3,000 mi. or so from the sea. The pink salmon, on the other hand, commonly spawns only a few miles above salt water.

The fish come in from the sea in fine condition. Upon entering fresh water they cease feeding. and sometimes they wear themselves out completely trying to reach proper places to deposit their eggs. They will ascend rapids and falls, often jumping vertically several times their onn length in passing difficult places. By the time they have spawned they often are terribly emaciated, and have broken and ragged fins However, whether worn out or still in fair condition the Pacific salmon die after spawning. It is not known nhether these fish have lived to spawn more than once.

When the fish reach the spawning ground — believed to be more or less the selfsame spot where these mature males and females themselves were hatched — the female with body, tail and fins prepares a trough-shaped depression in gravel or sand. The eggs are deposited in this "nest" and are fertilized at the same time by the male. Cpon completion of this process the female covers the eggs nith the excavated or other material, which is the final act in the life cycle. She, as well as the male. now appear to have lost interest in life. They drift downstream more or less nith the current, and as already indicated they soon die.

The relatively large eggs, one-fourth of an inch or more in diameter. may hatch in 60 days, though the incubation period may be prolonged several days by a drop in the temperature of a degree or two and shortened several days by a similar increase in temperature.

The newly hatched fish with their tremendously large yolk sac are quite helpless. They remain hidden among pebbles on the spawning ground until the yolk is absorbed. At that stage in life the young fish begin to swim about and to seek food. After remaining in fresh water from a few months to perhaps a year or more they descend the streams and enter salt uater. When once in salt water the fish grow rapidly.

Sometime between the ages of two to seven years the fish have matured. Sexual products have developed. and the urge to spawn causes them to re-enter the fresh-nater streams to fulfill their final mission in life. in the same vicinity uhere their ancestors completed their life cycle.

The **Trouts.**—The trouts (genus *Salmo*) are among the most difficult fishes to classify. Indeed, scarcely two ichthyologists agree as to the number of species that should be recognized. The reasons for the confusion are the irregularities in the anatomical structures. the great variation in colour and the confusing irregularities in habits. However, some generally accepted species exist, but a reasonable and logical interpretation of the group as a whole is missing.

The Atlantic salmon *(Salmo salar),* is one of the well-known and generally recognized species of the genus. It occurs on both sides of the North Atlantic and ranges well within the Arctic circle. In Europe it occurs as far south as the Bay of Biscay, and in North America to Cape Cod and formerly to the Hudson river. It has many near relatives that live habitually in fresh-water lakes and streams.

Salmo salar has been greatly reduced in abundance in some parts of its range. In New England it may be listed among the "vanishing animals." This depletion is in part the result of overfishing, but the construction of dams across rivers without providing "fish ladders," and the pollution of streams have constituted a far greater menace. Whether the streams formerly occupied can again be made suitable and the fish restored is an unsolved problem. Neither is it known whether the fish can be brought back in commercial numbers in those rivers that are still frequented to a limited extent.

The life history of *Salmo salar* is better known than that of any other species of the family, and therefore is described herein in some detail. In general. it is similar to that of the Pacific salmon. It also ascends rivers to spawn, but unlike the Pacific salmon it does not habitually die after spawning) but may live to spawn three or four times. The migration upstream starts in the autumn and occurs from October to February. *Salmo salar,* like the Pacific salmon, does not feed while in fresh water en route to its spawning ground. In the meantime the sexual products are developed at the expense of the other tissues. This causes the flesh. which was red and fat when the fish left the sea, to become pale and watery. In the breeding male the jaws become prolonged during migration; the lower one becomes curved upward. or even acquires a hook, and the teeth grow large. The silvery colour becomes replaced by a dull gray in the female, while the male acquires irregular dark and reddish spots on the body.

The eggs, as in the Pacific salmon, are deposited in shallow excavations made in sand or gravel by the female and covered by her after spawning is finished. The eggs are fully one-fourth of

an inch in diameter, and incubation extends over a period of about five months.

The newly hatched fish, about three-fourths of an inch long, is quite helpless at first and lies hidden among the pebbles until the big yolk sac it retains at hatching is absorbed. At this time the fish is an inch or more long and swims actively beginning its search for food. The little fish. known as à parr, soon becomes brilliant in colour, and has 10 or 11 dark crossbars, alternating with bright red spots.

The parr live in fresh water a variable length of time, according to the locality and factors not well understood. Most of the fish migrate to the sea principally in the spring and early summer, at the age of two years. when they have attained a length of about six inches. However, some linger in fresh water, especially in northern localities, three. four, five or even six years.

When the young fish approach tidewater they lose the bars and spots. and become silvery for their sojourn in the sea. These fish, known as smolts. stay in or near the mouths of rivers and in estuaries for some time: although by fall they have disappeared. Little is known of their movements during the first winter in the sea. It is certain, however. that they grow rapidly on the abundant diet in the ocean, for when they reappear on the coast the following spring they are 16 in. and more in length. and weigh 1½–7 lb. or, rarely. more. The fish, known as grilse, are distinguishable from older fish by the slenderer body. smaller head. more deeply forked caudal fin and by the more numerous spots on the body, which at this stage in life are bluish rather than black.

A few individuals, especially males. may spawn during the grilse stage, but the great majority remain in the sea. Many fish spawn after living in the ocean two years. while others do not make a return migration for three. four or even five years.

A tremendously large size for a trout is attained by the Atlantic salmon. An individual weighing 83 lb. has been reported from England. None even approaching such a weight has been found in America where a 50-lb. fish is a rarity. Large trout are not necessarily old, as they probably are fish that remained on rich feeding grounds in the sea without spawning. It is improbable that any Atlantic salmon lives more than eight or nine years. In general, the ones that begin spawning early in life and spawn every year do not grow large, whereas those that spawn for the first time late in life. and perhaps spawn only once. reach a large size.

Landlocked Salmon.—The Atlantic salmon has many near relatives that habitually live in fresh water; the nearest of all are the landlocked forms. The lake dwellers received this name from the belief long held that their ancestors. *Salmo salar,* in some way became shut off from the sea and were obliged to remain in fresh water. It seems more probable in the light of present knowledge that some young *Salmo salar* found certain lakes. which they reached while migrating toward the sea. a sufficiently agreeable substitute ior the ocean to remain there voluntarily and permanently. Thus, landlocked salmon seems to be a misnomer, and lake salmon has been suggested as a substitute.

Under the influence of the new environment in the lakes the progeny in the course of time diverged sufficiently from the parent stock. *Salmo salar,* to become recognized a.; distinct species. In fact, several species have been named. but in this case as in others general agreement as to their validity is lacking. Therefore, no attempt to list the species herein has been made.

Colonies of landlocked salmon exist in New England. eastern Canada and in Europe. While these fish spend most of their lives in lakes, they retain the migratory instinct of their ancestors and ascend rivers to spawn. In geuerai, landlocked salmon run smaller than the Atlantic salmon. though some weighing 20 lb. arid more have been reported. They are protected and reserved for sport, only, in the United States.

Sumerous other species of *Salmo* occur in the fresh waters of North America. and of Europe, and a few are found in the mountains of northern Africa. The fresh-water trouts are especially difficult to classify. Among ihem are the brown trout. *S. trutta,* and the Loch Eaven trout. *S. levensis,* of Europe. which have long been subjects of fish culture and have been widely distributed artificially.

In western North America there are numerous closely related species of *Salmo,* which J. O. Snyder regarded as belonging to two main groups which he called rainbon series and the cutthroat series. He has claimed that the steelhead trout, long held to be a distinct species somewhat intermediate of the rainbow and cutthroat trouts, is not entitled to specific rank because it is a sea migrant of a particular stream species. This is another illustration of the extreme difficulties met in classifying trouts. It is also an illustration of the diversity of habits, since some rainbow and cutthroat trouts retain the migratory instinct of distant ancestors and continue to migrate to the sea, whereas others remain in fresh water throughout life.

The rainbow and cutthroat trouts are extensively cultivated in America, where they also are protected and reserved for sport. There are many records of rainbow and cutthroat trouts weighing 20 lb. and more, but the average size is much smaller.

Chars.—Many species of char (genus *Salvelinus*) occur in Europe and the cold regions of the north the range extending far into the Arctic circle. Some of the species continue to live in salt water. like all the ancestors of the living species no doubt did However. others have become chiefly or nholly restricted to fresh nater. Certain species that live in fresh water in the southern part of their range throughout life will enter salt water if they inhabit streams adjacent to cold seas. *Salvelinus fontinalis,* known in the Cnited States as the eastern brook trout. for example, ranges southward into Georgia, but it enters the sea only from Cape Cod northward. Even there only a part of the population of any one river "run down" to the sea. The ones that enter salt water are called sea trout. These fish are not to be confused, however, with the sea trout of the southern shores of the C.S. which are not Salmonidae. but are members of the croaker family. Sciaenidae.

The chars, that is. the species of the genus *Salvelinus,* generally are distinguishable from the trouts of the genus *Salmo* by the smaller scales, which are so minute as to be hardly visible in some species, and usually they may also be distinguished by the colour, since the chars have reddish spots, whereas the trouts have dark ones. However, for certain identification it is necessary to examine the teeth on the roof of the mouth. In *Salvelinus* the teeth are present in a group on the anterior part of the vomer only. whereas in *Salmo* the teeth extend back on the vomer in a double zigzag series.

The chars generally are valued as food and game fishes. Thus, the eastern brook trout in America is extensively cultivated, and has been distributed by man far beyond its natural range. and is protected as a game fish. However, there is a disliked member: the Dolly Varden trout (*Salvelinus malma*), which occurs in the Pacific coast regions of North America. Kamchatka, U.S.S.R., and Japan. The Dolly Varden is highly predatory, destructive of salmon eggs and young salmon and is not regarded as a good game fish.

Chars generally do not run large in size, often attaining a length of only about 10–12 in.. though some individuals of those species that run down to the sea may attain a length of about 24 in.

The Great Lakes Trout (*Cristivomer namaycush*).—This fish, as its name indicates, lives in the Great Lakes of North America, and in other deep lakes northward and beyond to the Arctic circle. It does not belong to one of the major groups of Salmonidae named at the beginning of this article, though its relationship is with the trouts, genus *Salmo.* It is readily distinguished. however, as it lacks bright colours. and has pale yellow or grayish spots rather than dark ones. Further, its tail is more deeply forked. Although it does not belong to one of the major groups of Salmonidae, it is important enough to require at least brief mention. It is among the largest of the entire family. A maximum weight of roo lb. has been reported. Certainly a weight of 50 to 80 lb. is occasionally attained, though the average weight of the fish that reach the markets is less than ro lb. While the Great Lakes trout is chiefly a commercial fish, it is also a game fish of importance. The annual catch for the Great Lakes is around 2,400,000 lb. (S. F. Ha.; X.)

Hist. of New England.*

SALMONBERRY (*Rubus spectabilis*), a vigorous North American shrub of the raspberry genus, native from California to Alaska and eastward to Idaho, bearing rose-coloured flowers and large salmon-coloured edible berries.

The name is applied also to the thimbleberry (R. *parviflorus*), of similar range but extending farther eastward, with white flowers and red scarcely edible fruit.

SALMONEUS, in Greek mythology, son of Aeolus (king of Magnesia, in Thessaly,' looked upon as the mythic ancestor of the Aeolian race), grandson of Hellen and brother of Sisyphus. He removed to Elis, where he built the town of Salmone, and became ruler of the country. His subjects were ordered to worship him under the name of Zeus; he built a bridge of bronze, over which he drove at full speed in his chariot to imitate thunder, the effect being heightened by dried skins and cauldrons trailing behind; while torches were thrown into the air to represent lightning. At last Zeus smote him with his thunderbolt, and destroyed the town (Xpollodorus i. 89; Hyginus, Fabularum Liber, 60, 61; Strabo, viii, p. 356; Manilius, Asfronomica, 5, 91; Virgil, *Aeneid,* vi. 58j). This is a confused recollection of some old rite of weather magic.

At Crannon in Thessaly there was a bronze chariot, which in time of drought was shaken and prayers offered for rain (Antigonus of Carystus, Historiae mirabiles, 15).

Frazer, *Golden Bough, see* index s.v.; another interpretation in S. Reinach, *Cultes, Mythes et Religions,* II, 160.

SALOME, the name of one of the women present at the crucifixion of Jesus (Mark xv, 40) and at the sepulchre (xvi, 1). The name is derived from Heb. shalom, "peace." Comparison with Matt. xxvii, 56, suggests that she was the wife of Zebedee. The name was borne by some of the Herod family also, notably by the daughter of Herodias by her first husband, the disinherited Herod Philip.

She is probably the "damsel" (whose name is not given) mentioned in connection with the death of John the Baptist (Matt, xiv, 3–6; Mark vi, 17–22). She afterward married her uncle, Herod Philip the Tetrarch.

The reading in Mark vi, 22 adopted by Hort, however, assumes that the girl dancer was Herod Antipas' o n daughter, also called Herodias.

See Josephus, *Jewish Antiquities,* vol. xviii, 4; *Jewish War,* I, xxx, 7; Justin, *Dial.* 49; Schurer, *The Jewish People in the Time of Jesus Christ.*

SALOMON, ALICE (1872–1948), German social worker and founder of one of the earliest schools of social work, was born April 19. 1872, in Berlin. She was one of the first women granted a Ph.D. from the University of Berlin (1906), where her doctoral thesis concerned the inequality of pay between men and women doing equivalent work.

Convinced of the need for special training for social workers, in 1899 Miss Salomon organized regular training courses which soon evolved into the first German social work school, of which she was president until 1928 and which was named the Alice Salomon school in her honour in 1932. As president also of the federation of German schools of social work, her ideas and influence spread throughout that nation and to other countries. Miss Salomon was active in international feminist work and wrote on problems of public health and on the position of women and children in industry. In 1937, exiled from Nazi Germany, Miss Salomon went to the United States where she continued her work as a lecturer on social work administration. She died Aug. 30, 1948, in New York city. (M. C. E.)

SALOMON, HAYM (1740–1785), early American financier and patriot of Jewish-Portuguese origin, was born in Lissa, Pol. in 1740. He went to America following some revolutionary activities in defense of Polish liberty.

When he arrived in New York, he established himself as a commission merchant. and his personality and keen discernment soon made him a successful financier. During the American Revolutionary War, Salomon was with the patriotic party known as "Sons of Liberty." Within a short time he was made financial agent of the French government, for which services he accepted no commission. His ability and patriotic activities brought him to the attention of Robert Morris, who assigned him to the office of the superintendent of finance, where he handled all the bills of exchange.

Among his many other contributions to the colonies, Salomon subscribed heavily to government loans, endorsed notes, gave generously to soldiers and statesmen, and equipped several military units with his own money. He was made interpreter during the war, and was permitted to go into the British lines, but on two occasions was thrown into prison. He escaped, but suffered ill-health from exposure, which later led to his death.

While living in Philadelphia (1778–85), Salomon initiated a measure in behalf of Jewry in the state of Pennsylvania which later resulted in more liberal conditions of employment for them. At that time, persons seeking to qualify for civic employment in Pennsylvania were required to take an oath affirming their belief in the New as well as the Old Testaments. Salomon presented a petition to the Council of Censors on Dec. 23, 1783, in which he requested the removal of this condition, so that public service might not be closed to orthodox Jews. Later, the constitution of the state was so amended.

Salomon died in Philadelphia, Pa., on Jan. 6, 1785.

BIBLIOGRAPHY.—Patriotic Foundation of Chicago, *The Story of the George Washington-Robert Morris-Haym Salonzon Monument* (1942); Charles Edward Russell, *Haym Salomon and the Revolution* (1930); Howard Melvin Fast, *Haym Salomon, Son of Liberty* (1941).

SALON (-de-Provence), a town of southeastern France, in the department of Bouches-du-Rhône, 40 mi. N.N.W. of Marseilles by rail. Pop. (1954) 11,111. Salon is situated on the eastern border of the plain of Crau and on the irrigation canal of Craponne. The church of St. Laurent is 14th century, and the church of St. Michel (12th century) has a fine Romanesque portal. The central part of the town preserves a gateway of the 13th century and the remains of fortifications. There are remains of Roman walls near Salon, and in the *hôtel* de ville (17th century) there is a milestone of the 4th century.

SALONIKA or THESSALONIKE, as the name was officially fixed in Aug. 1937, the capital of Greek Macedonia, and one of the principal seaports of southeastern Europe. Pop. (1928, last census before World War II) 236,524, including some 50,000 Sephardic Jews. whose ancestors fled thither in the 16th century from Spain and Portugal: their language is a corrupt form of Spanish, called Ladino (*i.e.*, Latin). Pop. (1961) 377.026.

Salonika lies on the west side of the Chalcidic peninsula, at the head of the Gulf of Salonika (Simus *Thermaicus*), on a fine bay whose southern edge is formed by the Kalamara heights, while its northern and western side is the broad alluvial plain produced by the Vardar and Vistritza rivers.

Antiquities. — The Via Egnatia of the Romans (Grand Rue du Vardar) traverses the city from east to west, between the Vardar gate and the Kalamara gate. Excavations there have revealed the Hellenistic agora near the present prefecture. Two Roman triumphal arches used to span the Via Egnatia. The arch near the Vardar gate—a massive stone structure probably erected towards the end of the 1st century A.D., was destroyed in 1867 to furnish material for repairing the city walls; an imperfect inscription from it is preserved in the British museum. The other arch, assigned to the reign of Galerius (A.D. 305–311), is built of brick and partly faced with sculptured marble.

The ecclesiastical architecture of Salonika was once remarkable for its specimens of early Christian (Byzantine) origin and style, with well-preserved mural decorations. St. Sophia (Aya Sofia), formerly the cathedral, probably erected in the 6th century by Justinian's architect Anthemius, was converted into a mosque in 1589. The nave, forming a Greek cross, is surmounted by a

hemispherical dome covered with a rich mosaic representing the Ascension. St. Demetrius, which was probably older than the time of Justinian, consisted of a long nave and two side aisles, each terminating eastward in an atrium the full height of the nave, in a style not known to occur in any other church. This church was destroyed by the great fire of 1917. It is partly repaired but mainly ruinous. St. George's, conjecturally assigned to the reign of Constantine (d. 337), is circular in plan, measuring internally 80 ft. in diameter. The external wall is *18* ft. thick, and at the angles of an inscribed octagon are chapels formed in the thickness of the wall, and roofed with wagon-headed vaults visible on the exterior; the eastern chapel, however, is enlarged and developed into a bema and apse projecting beyond the circle, and the western and southern chapels constitute the two entrances of the building. The dome is covered throughout its entire surface of 800 sq. yd. with what is the largest work in ancient mosaic still extant, representing a series of fourteen saints standing in the act of adoration in front of temples and colonnades. The Eski Juma, or Old Mosque, is another interesting basilica, evidently later than Constantine, with side aisles and an apse without side chapels.

Salonika is the see of an Orthodox Greek archbishop. Each religious community has its own schools and places of worship, among the most important being the Jewish high-school, the Jesuit college, a high-school founded in *1860* and supported by the Jewish Mission of the Established Church of Scotland, a German school, dating from *1887*, and a college for boys and a secondary school for girls, both managed by the French *Mission Laïque* and subsidized after 1905 by the French government.

Railways, Harbour and Commerce.—Salonika is the principal Aegean seaport of the Balkan Peninsula, the centre of the import trade of all Macedonia, and the natural port of shipment for the products of an even larger area. It is the terminus of four railways. One line goes north to Nish in Serbia, where it meets the main line (Paris–Vienna–Constantinople) of the Oriental railways; another, after following the same route as far as Usküb in Macedonia, branches off to Mitrovitza in Albania. A third line extends westward from Salonika to Monastir. A fourth, the Constantinople junct+ railway to Constantinople, was partly dismantled and put out of use in *1921*, but re-organized later. It now runs via Séres and Kavalla and joins the main line at Kuleli Burgas.

The new harbour, which was opened to navigation in Dec. *1901*, allows the direct transhipment of all merchandise whatever may be the direction of the wind, which was previously apt to render shipping operations difficult. The harbour works consist of a breakwater 1,83*j* ft. long, with 28 ft. of water on its landward side for a width of 492 ft. Opposite the breakwater is a quay 1,47*j* ft. long, which was widened in 1903–07 to a breadth of 306 ft ; at each end of the quay a pier 656 ft. long projects into the sea. Between the extremities of these two piers and those of the breakwater are the two entrances to the harbour. Salonika exports grain, flour, bran, silk cocoons, chrome, manganese, iron, hides and skins, cattle and sheep, wool, eggs, opium, tobacco and fennel. Other industries are cotton-spinning, brewing, tanning, iron-founding, and the manufacture of bricks, tiles, soap, flour, ironmongery and ice. The spirit called mastic or raki is largely produced.

Province of Macedonia, of which Salonika is the capital, is rich in minerals, including chrome, manganese, zinc, antimony, iron, argentiferous lead, arsenic and lignite, but some of these are unworked. The chief agricultural products are grain, rice, beans, cotton, opium and poppy seed, sesame, fennel, red pepper; there is also some trade in timber, live stock, skins, furs, wool and silk cocoons. Apart from the industries carried on in the capital, there are manufactures of wine, liqueurs, sesame oil, cloth, macaroni and soap. The principal towns, Séres, Vodena and Kavalla, are described in separate articles; Tikvesh is the centre of an agricultural region, Karaferia a manufacturing town, and Drama one of the centres of tobacco cultivation. The total population of Macedonia is in the neighbourhood of 1,500,000. This total includes the large number of refugees who were settled here after *1922*. The Greeks form about 90% of the population; there are no Muslims except those of Albanian origin. Bulgarians number about 77,000, being about 5% of the total.

History — Thessalonica was built on the site of the older Greek city of Therma, so called in allusion to the hot-springs of the neighbourhood. It was founded in 315 B.C. by Cassander, who gave it the name of his wife, a sister of Alexander the Great. It was a military and commercial station on a main line of communication between Rome and the East, and had reached its zenith before the seat of empire was transferred to Constantinople. It became famous in connection with the early history of Christianity through the two epistles addressed by St. Paul to the community which he founded here; and in the later defence of the ancient civilization against the barbarian inroads it played a considerable part. In A.D. 390, 7,000 citizens who had been guilty of insurrection were massacred in the hippodrome by command of Theodosius. Constantine repaired the port, and probably enriched the town with some of its buildings. During the iconoclastic reigns of terror it stood on the defensive, and succeeded in saving the artistic treasures of its churches: in the 9th century Joseph, one of its bishops, died in chains for his defence of image-worship. In the 7th century the Macedonian Slavs strove, but failed, to capture the city. It was the attempt made to transfer the whole Bulgarian trade to Thessalonica that in the close of the 9th century caused the invasion of the empire by Simeon of Bulgaria. In 904 the Saracens from the Cyrenaica took the place by storm, and the inhabitants to the number of 22,000 were sold as slaves throughout the countries of the Mediterranean. In 1185 the Normans of Sicily took Thessalonica after a ten days' siege, and perpetrated endless barbarities, of which Eustathius, then bishop of the see, has left an account. In 1204 Baldwin, conqueror of Constantinople, conferred the kingdom of Thessalonica on Boniface, marquis of Montferrat; but in *1222* Theodore, despot of Epirus, one of the natural enemies of the new kingdom, took the city and had himself crowned there by the patriarch of Macedonian Bulgaria. On the death of Demetrius, who had been supported in his endeavour to recover his father's throne by Pope Honorius III., the empty title of king of Salonika was adopted by several claimants. In *1266* the house of Burgundy received a grant of the titular kingdom from Baldwin II when he was titular emperor, and it was sold by Eudes IV to Philip of Tarentum, titular emperor of Romania, in 1320. The Venetians to whom the city was transferred by one of the Palaeologi, were in power when Murad II appeared and on May 1st, 1430, in spite of the desperate resistance of the inhabitants, took the city, which had thrice previously been in the hands of the Turks. They cut to pieces the body of St. Demetrius, the patron saint of Salonika, who had been the Roman proconsul of Greece under Maximian and was martyred in A.D. *306*. In *1876* the French and German consuls at Salonika were murdered by the Turkish populace. On Sept. 4, 1890, more than 2,000 houses were destroyed by fire in the south-eastern quarters of the city. During the early years of the 20th century Salonika was the headquarters of the Committee of Union and Progress. the central organization of the Young Turkey Party, which carried out the constitutional revolution of 1908. Before this event the weakness of Turkey had encouraged the belief that Salonika would ultimately pass under the control of Austria-Hungary or one of the Balkan States, and this belief gave rise to many political intrigues which helped to delay the solution of the Macedonian Question.

When the first Balkan War broke out in *1912*, Salonika surrendered to the Greeks on the festival of its patron, St. Demetrios, Nov. 8, after 482 years of Turkish occupation. King George I. proceeded to what was now the second largest city of his kingdom, but was assassinated there on March *18*, 1913, by *a* Greek, named Schinasi.

The Treaty of London of May *30, 1913*, assigned Salonika *to* Greece, and the battle of Kilkis in the second Balkan War of that year prevented the Bulgarians from approaching it. Salonika was becoming more and more Hellenized when World War I brought it into prominence as the base of the Allied

operations in the Near East. (See SALONIKA CAMPAIGNS 1915–18.)

In 1916 a Venizelist revolution against King Constantine broke out there, and on Oct. 9 E. Venizelos arrived and formed a provisional government, which the Allies recognized, and to uhich Lord Granville was accredited as British representative. This government declared war on Nov. 23 against Bulgaria and Germany. On Aug. 18. 1917, a great fire destroyed a large part of the city, including the church of St. Demetrius. After the war an arrangement was made by which Yugoslavia should have a "Serbian Zone" in the harbour. After the proclamation of the Greek republic, Salonika often had a decisive voice in politics, and the large immigration of Greek refugees from Asia Minor further Hellenized the country round it. Salonika again figured prominently in World War II.

German forces driving southward from Bulgaria captured the city April 9, 1941, only three days after their initial assault on Greece. By so doing they cut off all Thrace from the rest of Greece and split Macedonia in two.

See General Sarrail, *Mon Commandement en Orient, 1916–18* (1920); P. Risal, La *Ville Convoitée, Salonique* (1914); *Greek Refugee Settlement* (League of Nations, Geneva, 1926).

SALONIKA CAMPAIGNS 1915–18. Gnder the heading SERBIAN CAMPAIGNS the collapse and subjugation of Serbia in 191 j is related in this work. The present article describes the campaigns in Salonika which formed the sequel to this Allied disaster.

I. OBJECTS OF THE EXPEDITION

Although undertaken for political objects—to bring relief to a hard-pressed ally and to check the influence of Germany in the Balkans—the Salonika campaigns were ultimately crowned by the first decisive military success of the World War. For on the Macedonian front the continent-wide trench barriers of the Central Powers were first breached beyond repair, and there too was knocked away the first national prop—Bulgaria—of the Germanic alliance. To disentangle cause from effect is difficult where moral, military and economic threads are so closely interwoven as in the years 1914–18, yet the fact at least stands out that the overthrow of Bulgaria began the series of national capitulations which ended with that of Germany on Nov. 11, 1918.

If Salonika was for several years an unproductive field of military effort, an infringement of the law of economy of force, which in some measure justified the German gibe that it was their largest concentration camp—"an enemy army, prisoner of itself"—the historian, when weighing his verdict, must throw the counterpoise of 1918 into the scales. And not this only, for it must be remembered that the Allied occupation of the Salonika front made possible the rebuilding of the Serbian army—from the ragged and disorganized survivors of the 1915 winter retreat throngh Albania to the well-equipped and irresistible force which broke through the Vardar front in Sept. 1918. On the credit side also must be set the fact that the Salonika expedition prevented the danger that Greece might become a submarine base for the Central Powers, one which would have lain in deadly proximity to the British artery of communication with the East via the Suez Canal. And again, that the Allied force contained the bulk of the Bulgarian army—although it is perhaps doubtful whether these would have placed their services at Germany's disposal for any front more remote from their homeland.

Although the Salonika expedition was the immediate outcome of the Serbian débâcle of Sept.–Oct. 1915, the idea had an earlier origin. For Salonika was not only the one feasible channel of Allied communication with and supply to Serbia, but that front offered a possible strategic flank for attack once the trench line on the western front had been welded into a seemingly impenetrable barrier. As far back as 1914, British and French naval missions, with guns, had been sent to support the Serbians, and they had also been supplied with munitions by the Salonika route. The question, too, had been mooted of a larger employment of military force in that theatre, but British commitments at Gallipoli led to this project being shelved—until the Bulgarian mobilization for war on the side of the Central Powers.

Throughout the summer of 1915 the two warring coalitions had been bidding for intervention on the part of the Bulgarians, and in this diplomatic bargaining the Entente suffered a moral and a material handicap—the first, their obvious failure at the Dardanelles; the second, Serbia's reluctance to concede any part of Bulgarian Macedonia, which she had seized as her share of the spoils of the second Balkan war of 1913. As this was the one prize on which the Bulgarians had set their heart, and as Austria had nothing to deter her from offering territory that belonged to her enemy—Serbia—the Entente offers failed to attract Bulgaria. Her intervention on the opposite side meant that free communication could be easily established between Germany and Turkey, and as a consequence that the Entente forces on the Gallipoli peninsula were imminently menaced.

II. THE RETREAT TO SALONIKA

Faced with this critical situation, the French and British Governments decided, albeit tardily, to succour Serbia with an expeditionary force.

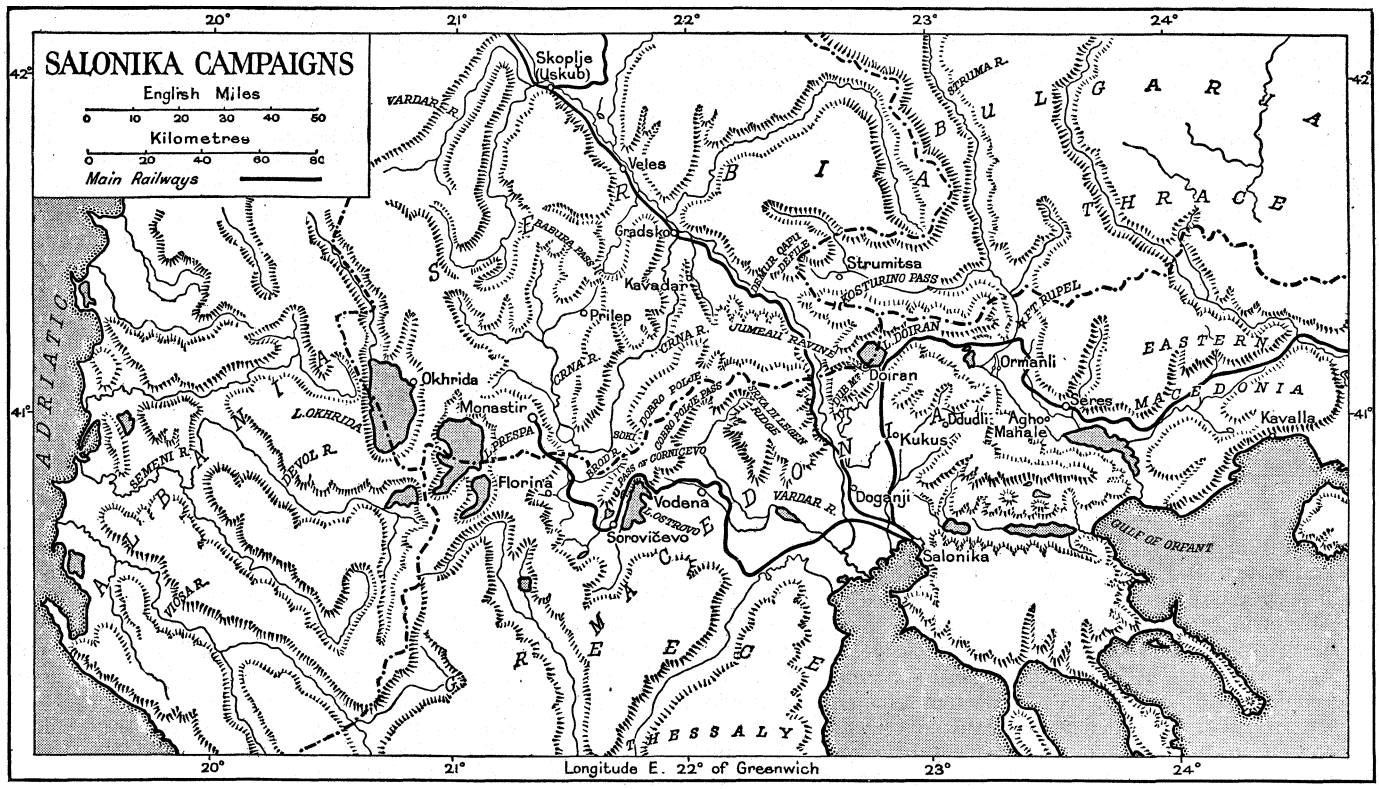
In this the French Government took the lead and nominated as commander Gen. Sarrail, the former chief of the III. Army in the Verdun sector. Sarrail's political activities had earned him the distrust of the military authorities; but the same factor, through his influence with the parties of the Left, made it difficult to ignore him completely. His removal by Joffre from the III. Army command placed the Government in a temporary dilemma, and they eagerly seized the opportunity of placating Sarrail and his political supporters by appointing him to a conveniently distant theatre of war.

While the constitution of Sarrail's force was still under discussion, the Bulgarian mobilization on Sept. 22 forced the hands of the Entente Governments. A hurried order was sent for the dispatch to Salonika of contingents from Gallipoli, preliminary to the arrival of reinforcements from France. Preceded by staff officers, the British 10th and French 156th Divs. began to disembark at Salonika on Oct. 5, and they were followed by the French 57th Division. On the same day, however, the Greek promise of aid to Serbia, made by M. Venizelos, was repudiated by King Constantine, and the Venizelist Government fell—to be replaced by that of M. Zaimis, which took neutrality as its keynote. This reacted at once not only on the Franco-British plan but on their operations. The Greek officials, civil and military, at Salonika did their best, or worst, to obstruct the disembarkation of the Allied contingents.

To increase the confusion, the intended concentration point was several times changed by successive orders from Paris until, on Sarrail's arrival on Oct. 12, he decided, in view of his slender resources and the doubtful attitude of the Greek army in his rear, to concentrate no further forward than the Demir Qapu (Demir Kapija) defile. The limited object was to protect the railway and to ease the pressure on the Serbian forces to the north by repelling a Bulgarian advance from Strumitsa (Strumica)—which would sever that line and so the Serbian line of retreat. Meanwhile, the British troops under Gen. Mahon began moving up to Doiran, in echelon behind the right of the French.

On Oct. 14 the vanguard of the French troops came into action at Strumitsa station (in Serbia), driving back a Bulgarian reconnaissance, and on Oct. 17, in response to Serbian urgings, a brigade was sent forward beyond the Demir Qapu defile as far as Krivolak. Reinforced by the arrival of the French 122nd Div. Sarrail began, on Nov. 3, an offensive northward to facilitate the Serbian retreat. But the seizure of the Babuna pass by the Bulgarians closed the channel of southward retreat for the main Serbian army, and finally shattered the hope that the Serbians might fall back on the relieving force, as was the advice of their allies.

Sarrail was thus faced with a difficult problem. On the one hand the gallant French efforts to break through toward the Babuna had failed and they were forced on the defensive, and, on the other, he received news of the Serbian decision to retreat westward through Albania toward the Adriatic. With his small force thus isolated he took the only possible decision—to fall



MAP SHOWING THE TERRAIN OF THE SALONIKA CAMPAIGNS IN 1915–1918. NATIONAL BOUNDARIES ARE INDICATED BY THE BROKEN LINE

back towards Salonika. This decision raised further problems. Were they to hold on there, or evacuate Greek soil altogether? With the disappearance of Serbia beneath the enemy flood, the Entente Powers could no longer claim that they were at Salonika merely to use a line of communication to which Serbia was by treaty entitled. The other justification, that they had come at the request of the Greek Government was now nullified by the downfall of Venizelos. Considerations of prestige and their desire to use Salonika as a base for diplomatic operations in the Balkans led the Entente Governments to remain, but without any clear policy as to the future.

Even with the decision to retreat taken, the Franco-British forces were not "out of the wood." The withdrawal had to be made down a single-track railway, through a country without roads—converted by the autumn rains into a swamp—and in face of a pursuing enemy. The retreat was made by echelons, in four stages, and only by a narrow margin did the French frustrate Bulgarian efforts to outflank and cut their retreat, first at the Demir Qapu defile, and again at Strumitsa station. The British, too, on the right were heavily attacked, and any weakening of their line at this critical juncture might have been fatal to the extrication of the Allied forces from the noose into which they had been pushed.

Fortunately, once the Greek frontier was regained the pursuit halted—mainly because the Germans were reluctant to undertake further commitments in the Balkans to the detriment of their strength in other theatres. Falkenhayn held that the Macedonian operations should be left to the Bulgarians, but this policy overlooked the fact that the Greeks. however friendly to the Germans, would have resented any invasion of their territory by the Bulgarians. Thus by Dec. 12 the retreating forces were safely out of reach of their pursuers, facing them across the frontier. After pausing for a few days on a line stretching roughly from Sorovičevo to Lake Doiran, the withdrawal was resumed, and by Dec. 18 the forces of Sarrail and Mahon were back in the vicinity of Salonika. Covering this base an entrenched line was constructed, on an 80m. arc stretching from the mouth of the Vardar through Doganji to the Gulf of Orfano, and occupied early in the new year.

Allied Reinforcements.—The delay in the expected enemy offensive enabled the Entente force to receive reinforcements, not only French and British but Serbian, for the remnant of their army, after resting and being re-equipped at Corfu, was brought round to Salonika. From April onwards the stream steadily swelled until by July their strength on the Salonika front reached a total of 152,000, divided into three armies of two divisions each. The French had four divisions. The British had been raised to five divisions (10th, 22nd, 26th, 27th, 28th), and later a sixth (60th), organized in two army corps; in May Lieut.-Gen. G. F. (later Sir George) Milne took over command as general officer commanding the British Salonika Force. The total allied force was thus a little over 300,000 men. Opposing it early in 1916 were the Bulgarian I. and II. Armies and the German XI. Army—a total of some 280,000 men—aligned on a front from Lake Okhrida on the west to the point where the Struma enters Bulgaria on the east. But from March onwards the drain on the German forces at Verdun led Falkenhayn to withdraw the German troops, all but one division; by 1918 the XI. Army, though German in name and in staff, contained only one complete German battalion.

On the Entente side the reaction of Verdun took the form of orders from Joffre to Sarrail to pin down the enemy on his front, in order if possible to prevent Falkenhayn drawing upon the forces there. Accordingly the French moved out west of the Vardar towards Vodena and the British advanced north to Rukus. This advance, although it lengthened the front to be defended and the lines of communication, was of essential value for the security of the Allied force, for the entrenched position at Salonika itself was dominated from the mountains east of the town, and might become untenable if these heights were occupied by the enemy. But in how small degree the Allied advance fixed the Germans can be gauged from the previous paragraph, and Sarrail, who had been placed under Joffre's supreme command in Dec., received instructions not only to operate with greatly increased vigor on the Salonika front but also to prepare and organize a definite offensive to be launched simultaneously with the anticipated entry of Rumania into the war.

Meantime the situation was complicated by a Greek incident; until 1918 politics were to play a larger part in the Salonika theatre than war. The neutral Greek forces, five corps, were

distributed throughout the region, in theory to guard the frontier; and such a situation, while Gilbertian in its absurdity to the distant observer, was a source of serious anxiety to the Franco-British forces on the spot. Feeling that they would be safer without such dubious protection, they brought diplomatic pressure to bear on the Greek Government for the withdrawal of the Greek forces from Macedonia and their demobilization. Reluctantly the Greeks complied, but while the Allies occupied certain of their forts the Bulgarians seized the opportunity to cross the frontier, and appeared before Fort Rupel, which commanded the Struma gate into the Macedonian plain. The Greek commander thereupon handed over the fort to them (May 26).

This unfriendly act bared the eastern flank of the Entente army, and gave the whole of Eastern Macedonia into the hands of the enemy. To meet the danger the British occupied the Struma line in force. Further, the Entente Governments instituted an economic blockade of the Greek coast, sent a brigade to Athens, and by the ultimatum of June 21 enforced the demobilization of the Greek army and the resignation of the Government. As it proved, however, the seizure of Rupel and Eastern Macedonia did not develop into a general offensive by the German-Bulgarian forces.

Handicaps of **the** Allies' Army.—While these external troubles with Greece beset the Entente Powers, they were far from the sum of the handicaps which hindered effective action by the Salonika force. The idea of an offensive was constantly discussed between the French and British Governments, as also between Joffre and Sarrail; but, apart from reluctance to provide adequate forces, it depended on too many contingencies, in particular the uncertain and often postponed intervention of Rumania. Furthermore the internal troubles of the Salonika force were notorious. Sarrail had the title of "Commander-in-chief of the Allied Armies in the Orient," and with him Cordonnier commanded the French forces; but his status was a nebulous one. Not only was the British commander to all intents independent, but also the Italian—a detachment arrived from Italy in Aug. 1916.

Apart from the defect that Sarrail's orders were issued from French headquarters without consultation with the other Allied Powers, Sarrail's own personality was not such as to weld this loose understanding into an effective co-operation. In a heterogeneous force, composed of French, British, Italians, Serbians and Russians, it was hardly a recommendation that the chief commander should be known not to have the confidence of his own supreme command, and that even the suspicion should exist that he was conducting operations with one eye on the political game at home. The British, by polite but firm insistence on their independence, maintained tranquil relations; wrangles and disputes between the other Allied commands were continual, and the majority were unfortunately attributable to the policy or tactlessness of Sarrail.

While the Allied leaders were debating ways and means, the opposing armies moved, on Aug. 17, to forestall and dislocate the Allied offensive, which they judged would synchronize with Rumania's intervention. The Bulgarians made their effort on the two wings. The eastern wing from Rupel drove back the French cavalry on the east of the Struma and pressed down towards its mouth. But they dissipated their force by detaching part to seize the coastal strip of Kavalla, and the stout resistance of the British prevented them forcing the river line. On the western wing the position was more critical, for the Bulgarian advance from the Monastir area drove the Serbs out of Florina and reached Lake Ostrovo before they were ultimately held.

III. THE FIRST AND SECOND ALLIED OFFENSIVES

These reverses caused a further change in Sarrail's plan for the Allied offensive; the forces east of the Vardar were merely to contain the enemy, while those west of the Vardar carried out the offensive. Thus to all intents it became no more than a counter-offensive to restore the impaired situation in this sector. To release additional French troops the British extended their line west from Doiran to the Vardar; Sarrail was thus enabled to form an offensive group (of 2½ French divisions, one Serbian division and a Russian brigade) under Cordonnier, in addition to the Serbian striking force of four divisions.

On Sept. 10 various British detachments crossed the river Struma in raids at six points in order to divert the enemy's attention, and on Sept. 11 the real attack developed west of the Vardar. The Serbs, skilled mountain fighters and inspired by the closeness of their native soil, made good progress, and on Sept. 14 gained the pass of Gorničevo, breaking through the hostile front. But the Cordonnier group was slower, partly because of transport difficulties and Cordonnier's own inclination for the secure methodical advances he had practised successively in France. As a result, however, the Bulgarians, broken by the Serbs at Gorničevo, were able to fall back across Cordonnier's front and re-establish their lines on the Brod. Sarrail, incensed, ordered fresh attacks by both groups, which were repulsed with heavy loss—as Cordonnier, protesting, had prophesied.

Between Sept. 30 and Oct. 8 the British XVI. Corps (Briggs) advanced its front to the line Agho Mahale-Ormanli, as a fixing move, coincidently with a fresh attack on the main front by the French and Serbs from Kaimakčalan westward. The pressure of the Serbs turned the Bulgar left and forced a further slight withdrawal, but a Franco-Russian attack on Oct. 6 failed. Cordonnier urged the idea of a wider turning manoeuvre, but Sarrail, in the mistaken belief that a Bulgarian collapse was imminent, ordered a fresh blow on Oct. 14. This was a costly failure and led to a violent scene between Sarrail and his subordinate. Cordonnier left for home a few days later. This internal friction caused a temporary breakdown of action, and the Serbs were left to fight unsupported, until Sarrail took the step of putting the whole attacking force under the Serbian Gen. Michich—a man of real military genius and with the knack of inspiring not only Serbian but other national forces.

Michich attacked in the Crna bend on Nov. 12 while, to aid this offensive, Milne's troops made local attacks and raids as a diversion on the Struma. Despite rain and snow the Serbs pressed on, turning successive positions, with the French, Russians and an Italian brigade on their left. Monastir was outflanked and on Nov. 19 was found evacuated—the first important Serbian town to be regained. For a moment there was a real opportunity of exploitation, as the Bulgarians were in full retreat towards Prilep; but the immediate attacking forces were tired and hungry, and Sarrail suspended the advance—to the annoyance of the Serbs, who, in default of receiving fresh reserves, tried to press on unsupported until exhaustion stopped them.

By this time the Rumanian collapse, under pressure of the convergent German and Bulgarian attacks, was clear, and on Dec. 11 Sarrail received instructions to consolidate a defensive line embracing as much of the regained territory as possible. This line stretched from Lake Prespa—just north of Monastir—north slopes of Kaimakčalan—to the Vardar, and thence by Doiran to the Struma and down to the sea. Its worst feature was that the commanding heights were held almost everywhere by the enemy. This front was to remain practically unchanged until Sept. 1918.

Reorganization.—Apart from the incident of a threatening Greek concentration in Thessaly—settled by a fresh ultimatum—the winter months of 1916–17 passed quickly, and the opportunity was taken to reorganize and regroup the forces. From the Gulf of Orfani to the Vardar the front was held solidly by the British, owing to Milne's insistence, but on the rest of the front Sarrail followed his usual plan of interspersing detachments of the various nationalities—presumably on the principle *"divide et impera."* Whatever its personal advantages it was hardly conducive to prompt and effective action. Reinforcements had now brought the French up to a strength of eight divisions, while there were six Serbian and 1½ Italian divisions—making with the British 21½ divisions, plus two Russian brigades. The total Allied strength was approximately 600,000, while the Greek National Defence, or Venizelist army, was in process of formation. This concentration afforded adequate reserves for a resolute offensive in the spring.

Confronting the Allies were still the nominal German XI.

Army, and Bulgarian I. and II. Armies, comprising the equivalent of one German and 13 Bulgarian divisions,[1] of which practically half faced the British. Apart from the II. Army, these forces were under a German Commander-in-chief, Gen. Von Scholtz. On their side no large move was considered, partly because the Bulgarians had already achieved their principal territorial aims, and merely desired to hold tight, while the Germans were satisfied with immobilizing so large an Allied force at no expenditure to themselves.

For the 1917 campaign Sarrail's scheme was for a preliminary flanking move on the extreme west, between Lakes Okhrida and Prespa, to shake the enemy's hold in the Monastir area; following this was to be the main fixing attack by the British on the Doiran front; then the French, Russians and Italians in the south-west of the Crna bend were to advance; and finally the Serbs were to strike the decisive blow to the west again.

The preliminary move began on March 12 and was soon suspended, achieving little apart from a creditable French local success on a spur west of Monastir. Then came the British turn —to attack the key position formed by the Dub and lesser ridges which commanded the passage between Lake Doiran and the Vardar. Milne had rejected an alternative proposal of Sarrail's that he should attack to gain Seres, which while attractive as a political advertisement had no military value, and being dominated by the hills behind would have been difficult to hold. After a two days' artillery preparation, in vile weather, the British infantry advanced to the assault, on a two-division front (22nd and 26th), at 9.45 P.M. on April 24, the late hour being to gain surprise and protection. On the left the enemy's first position was gained and held, but in the centre and right the difficulties of the Jumeaux ravine and the strength of the resistance foiled the attackers.

Worst of all, their sacrifice was in vain and their "fixing" rôle rendered abortive because the attack west of the Vardar was postponed by Sarrail, ostensibly for climatic reasons. Not until May g did the other attacks develop. Sarrail had rejected the Italian proposal for a flanking manoeuvre, in preference for a frontal blow, and this, made by the French and Italians, was a costly failure. The Serbian attack was even less effectual, in fact hardly developed, partly owing to internal political troubles then rife and partly to their want of confidence in the higher direction and in the genuineness of its intention to support their efforts. Once more the British, on the night of May 8, had deiivered a fixing attack, and once more their heavy sacrifice had been purposeless. The offensive was definitely closed down by Sarrail on May 24.

The Bulgarians, content with the prestige of this successful repulse, attempted no counter-stroke, and as the Allied forces were neither in the mood nor the condition for further efforts, the front relapsed into stagnation for the rest of the year. The only minor incidents were a successful local advance in Sept. by the French on the extreme left, west of Lake Okhrida, and Milne's withdrawal of his right from the marshy valley to the foot-hills west of the Struma, a precaution to lessen the danger of malaria and dysentery. The focus of interest again became political—common action was taken to settle the simmering menace and intrigues of Greece. In June, Allied troops invaded Thessaly, but the abdication of King Constantine was forced without fighting, and the Venizelist Government returned to power. The consequent reinforcement of the Allies by the Greek army came as a prospective counterpoise to the contemplated withdrawal of two British divisions in Sept. for the projected offensive in Palestine.

Sarrail Superseded.—At the end of 1917 the new Clemenceau ministry recalled Sarrail, in response to the renewed requests of the British and Italian Governments, which were supported by Foch. His successor was Gen. Guillaumat, who had distinguished himself as an army commander on the Verdun front. His first aim was to restore confidence and cohesion in the Allied forces at Salonika, while hastening the reorganization and training of the Greek army. His second, to think out and prepare the plan for a fresh offensive, adopting in its main outlines one which Gen. Michich had suggested in 1916. But to obtain the sanction of the Allied Governments was more difficult, obsessed as they were with the threatened German offensive in France, and in any case dubious of the effectiveness of any major operation in Macedonia. While biding his time, however, Guillaumat seized the opportunity to "blood" his new Greek troops in an ably planned coup de *main* against the Srka di Legen ridge. Supported by a powerful concentration of French artillery it was completely successful, and Guillaumat withdrew the attackers into reserve before any possible counterstroke might dilute the moral tonic. On the main front there were no other incidents of note between Jan. and Sept. 1918; but away on the Adriatic coast, in Albania, Ferrero's Italian XVI. Corps, aided by a French division, advanced in July from the Viosa to the line of the Semeni and Devol rivers; an Austrian counter-offensive late in Aug. regained most of the lost ground.

In July also, Gen. Guillaumat, his task of reorganization completed, was summoned back to France, to be entrusted with the defence of the capital in view of the critical situation caused by the German offensives. A man who put first not his own interests, nor even those of France, but his duty to the Allied forces as a whole, his military ability had won the respect, as his character had won .the esteem, of the multifarious contingents. He was succeeded by Gen. Franchet d'Esperey, who, if perhaps not possessing the exceptional tact and supra-national outlook of Guillaumat, was yet an able strategist, and well able to maintain allied co-operation. He adopted and put the finishing touches to Guillaumat's offensive plan, while the latter utilized his position at the centre of policy to gain sanction for its execution. Winning over M. Clemenceau, he then went to London and Rome on the same mission, and at last on Sept. 11 Franchet d'Esperey was authorized to attack—if there was still little confidence in its success.

IV. THE DEFEAT OF BULGARIA

The military situation on the eve of the offensive was numerically little changed. The Bulgarians had a ration strength of some 700,000 and a rifle strength of 200,000—divided into the same three armies. The Allies had a ration strength of about 574,000 and a rifle strength of 157,000, although against the inferiority of numbers they could put a slight preponderance in artillery and a heavy one in aircraft. But the real defect on the enemy's side was the first underlying war-weariness of the Bulgarians and their dissatisfaction with their German directors; and secondly the divided command by which the so-called German XI. Army and the Bulgarian I. Army—from Doiran westwards—were under Von Scholtz, while the Bulgarian II. Army and the coastal detachments were under the Bulgarian commander-in-chief, Gen. Gekoff.

For the new offensive Franchet d'Esperey's plan was first to strike a concentrated blow with a Franco-Serb group under Michich on a narrow front of seven miles along the Sokol-Dobro Polje range, aiming at a tactical break-through and a subsequent expansion of the breach to gain and clear the triangle formed by the Crna and the Vardar. This would menace the enemy's communications on both flanks, and the offensive would then be taken up in turn by the other forces along the front. The initial objectives were relatively modest, for the possibility of a strategic break-through, ending in the overthrow of the enemy armies, was no more than an idea in the commander's mind.

The immense difficulties of the terrain and the scantiness of reserves made even this limited aim far from certain of success. But Franchet d'Esperey's plan, made possible by the wholehearted co-operation of the other Allied commanders, was an admirable fulfilment of the principle of concentration. On the vital sector six Serbian and two French divisions with 600 guns—more than a third of the total artillery strength in Macedonia—were concentrated against one Bulgarian division, and to do this the other sectors were almost stripped of their artillery.

The offensive began on Sept. 1, as the British 27th Div. made

[1] A Bulgarian division had almost twice the infantry strength of a French or German division.

a feint attack in the Vardar valley to divert the enemy's attention, and on the night of Sept. 14 a heavy bombardment was begun on the real front of attack. Next morning at 5:30 A.M. the French divisions assaulted and after hard fighting gained the Dobro Polje ridge, the Sokol also falling by the evening — opening a path for the Serbian divisions of the I Army, hitherto in reserve, to be pushed through. At the same time the Serbian II Army advanced to the attack. By nightfall on Sept. 16 a penetration of 5 mi, had been made.

The Serbian troops now wonderfully inspired by success and the sight of their homeland swept forward with such *élan* that by the night of Sept. 17 they were 20 mi. forward, and the breach had been expanded to 25 mi. by Greek and French divisions on the flank. After the initial clash resistance was feeble, partly because the mountains hampered the lateral movement of reserves. By Sept. 19 the left wing of the attackers had reached across the Crna, while the right wing was rolling up the front eastward toward the Vardar, and between the two wings the Serbian cavalry had penetrated to Kavadarci in the apex of the Crna-Vardar triangle. Meanwhile on Sept. 18 Milne's troops attacked on the whole front from the Vardar to Lake Doiran in order to prevent the Bulgarians withdrawing troops to dam the breach west of the Vardar. Facing the British were the pick of the Bulgarian troops and also the strongest fortified positions, so that although they penetrated the enemy's lines along most of the front. it was little wonder that lack of reserves and artiliery compelled them to yield up the larger part'of their gains. But they had fulfilled their mission of pinning down the enemy including the reserves during these critical days, Sept. 18 and 19, and. by Sept. 21 the whole of the enemy's front west of the Vardar had collapsed under the convergent pressure of the exploiting Serbs and of the French on their flanks.

By the afternoon of the same day the collapse had extended to the Doiran-Vardar front, and the British aeroplanes spread considerable havoc among the troops of the Bulgarian VI Army falling back through the narrow Kosturino pass. Similarly, on the extreme west, facing Prilep, the Italians joined in the advance. From now on the advance became a strategic pursuit, now fast, now slow, in which successive rear-guard resistances of the enemy were outflanked. On Sept. 23 the Serbian spearhead reached Gradsko, and Veles three days later. Seizing their opportunity, a French cavalry brigade under Gen. Jouinot-Gambetta made a dash for Skoplje (Usküb), and seized this vital centre of communications, the key to the whole front, on Sept. 29. This definitely separated the XI Army from the remainder of the Bulgarian forces, forcing them on divergent lines of retreat. To the southeast the British had already invaded Bulgaria itself, taking Strumica on Sept. 26. That night a Bulgarian staff officer arrived at British headquarters to ask for an armistice, and three days later the Bulgarians capitulated, accepting the Allied terms unreservedly. The first national prop of the Central Alliance had fallen. While the reoccupation of Serbia proceeded rapidly, a mixed striking force was rapidly organized under Milne's command to advance through Thrace on Constantinople, and had pressed as far as the Maritsa, seizing the bridgeheads, when Turkey — its force in Syria already annihilated by Allenby — surrendered on Oct. 30. *(See* WORLD WAR *I: Bibliography.)*

SALSETTE (or SASHTI; *i.e.*, "sixty-six villages"). a large island north of Bombay city. Its area (246 sq.mi.) was distributed in April.1950 between Greater Bombay and Thana district (within which the whole island formerly lay). It is connected with Bombay Island and also with the mainland by bridge and causeway. In various parts of the island are ruins of Portuguese churches. convents and villas. and at Kanheri are 109 Buddhist cave shrines dating from the end of the 2nd century A.D. Salsette is crossed by the Central and Western railways, and the island is encircled by a motor road. The island was taken from the Portuguese by the Marathas in 1739 and from them by the British in 1774; it was formally annexed by the East India company in 1782. There is another Salsette in the Portuguese settlement of Goa.

SALSIFY or SALSAFY, *Tragopogon porrifolius*, sometimes called oyster plant or vegetable oyster: a hardy biennial with long, cylindrical, fleshy, esculent roots, which. when properly cooked, are extremely delicate and wholesome; it occurs in meadows and pastures in the Mediterranean region and in Britain is confined to the south of England, but is not native. The leaves are linear-lanceolate. The second season a handsome purplish flower is borne atop a stalk 2–4 ft. high; the mature seed head appears much like that of an enlarged dandelion. Salsify requires a free, rich. deep soil, which should be trenched in autumn, the manure used being placed at two spades' depth from the surface. The first crop should be sown in March and the main crop in April, in rows a foot from each other. the plants being afterward thinned to 8 in. apart. In November the whitish roots should be taken up and stored in sand for immediate use, others being secured in a similar way during intervals of mild weather. Salsify is widely naturalized as a wayside weed in the United States and Canada. In the United States. salsify is widely grown in home gardens but is of little importance as a market vegetable. It is sown about the average date of last frost in the spring. in rows about 1½ ft. apart and thinned to 3–4 in. apart. It requires the entire growing season to develop. Roots may be harvested and stored in a moist cellar or dug as needed through the winter. The roots are not damaged by freezing of the soil but must not be allowed to freeze after harvest. (V. R. B.)

SALSOMAGGIORE, a town of Emilia-Romagna, Italy, in the province of Parma, 6 mi. southwest of Fidentia by steam tramway. Pop. (1951) 8,476. It is a popular watering place. The water is strongly saline and is also used for inhalation. The wells are, some of them, over 2,000 ft. deep and yield illuminating gas and oil as well as water.

SALT, SIR TITUS, BART., 1869 (1803–1876), English manufacturer, was born on Sept. 20, 1803, at Morley, Yorkshire. His success in introducing the coarse Russian wool (*donskoi*) into English worsted manuiacture, due to special machinery of his own devising. gave his firm a great impetus. In 1836 he solved the difficulties of working alpaca (*q.v.*) wool, created an enormous industry in the production of the staple goods for which that name was retained and became one of the richest manufacturers in Bradford. In 1853 he opened, a few miles out of the city on the Aire, the extensive works and model manufacturing town of Saltaire. He died on Sept. 20, 1876.

SALT. In chemistry the term salt is applied generically to any compound formed by substituting the hydrogen of an acid by a metal or a group of elements acting as a metal. *(See* ACIDS AND BASES.) Common salt, or, simply. salt, is the name given to the varied natural and industrial forms of sodium chloride, NaCl.

Uses.—The best-known use of sodium chloride is as table salt. For this service, a fine-grained salt of high purity is used. To ensure that it will remain free-flowing when exposed to the atmosphere, small quantities of sodium carbonate or trisodium phosphate sufficient to combine with such hygroscopic impurities as calcium and magnesium chlorides are added. Usually potassium iodide is added in small quantity to overcome any possible iodine deficiency of the consumer. Common salt used for various manufacturing purposes may be coarser in grain than table salt. Salt is used universally as a condiment and preservative. It is employed in meat packing and fish curing, in the dairy and pickle industries, for salting cattle and curing hides and as a brine for refrigeration. It is indispensable to the manufacture of sodium carbonate (washing soda), sodium bicarbonate (baking soda). sodium hydroxide (caustic soda), hydrochloric acid. bleaching powder. chlorine and many other heavy and fine chemicals. The glass and soap industries are dependent upon it and it is used also in the glaze and enamel trades. As a flux, it enters into metallurgical processes and has been used in the manufacture of cement to aid in the recovery of potash as a by-product.

In the late 1950s the pattern of salt consumption in the U.S. was approximately as follows: chlorine, bleaches, etc. 36%; soda

ash 30%; other manufacturing uses 11%; food industries 5%; agricultural uses 5%; highway, railroads 6%; household use 3%; miscellaneous 4%. Total U.S. consumption was about 25,000,000 tons per year.

The production of salt is one of the world's most widely distributed mineral industries. Outputs of salt vary with the population and industrial activity of the country in question. Heavily populated countries like India and China require the major part of their production for food uses only; the Cnited States on the other hand requires several times as much salt for industrial purposes as is consumed in food. Many countries contribute to the total world production of salt. Within the last half of the 20th century some of the leading salt-producing countries were: the United States, United Kingdom, C.S.S.R., China, India. France, west Germany and Italy with a total annual production of about 50,000,000 tons.

Historical Background. — Salt must have been quite unattainable to primitive man in many parts of the world. Thus the Odyssey speaks of inlanders who did not know the sea and used no salt with their food. In some parts of America, and even of India (among the Todas), salt was first introduced by Europeans; and there are still parts of central Africa where its use is a luxury confined to the rich. Indeed, where men live mainly on milk and flesh, consuming the latter raw or roasted, so that its salts are not lost, it is not necessary to add sodium chloride, and thus it can be understood how the Numidian nomads in the time of Sallust and the Bedouins of Hadhramaut at the present day never eat salt with their food. On the other hand, a cereal or vegetable diet calls for a supplement of salt, and so does boiled meat.

The habitual use of salt is intimately connected with the advance from nomadic to agricultural life; *i.e.*, with precisely that step in civilization which had most influence on the cults of almost all ancient nations. The gods were worshiped as the givers of the kindly fruits of the earth, and, as all over the world "bread and salt" go together in common use and common phrase, salt was habitually associated with offerings, at least with all offerings which consisted in whole or in part of cereal elements. This practice was prevalent among the Greeks and Romans and among the Semitic peoples (Lev. ii, 13).

As covenants were ordinarily made over a sacrificial meal: in which salt was a necessary element. the expression "a covenant of salt" (Num. xviii, 19) is easily understood; it is probable, moreover. that the preservative qualities of salt made it a peculiarly fitting symbol of an enduring compact, and influenced the choice of this particular element of the covenant meal as that which sealed an obligation to fidelity. Hence the Greek phrase "Trespass not against the salt and the board," the Arab phrase "there is salt between us." the expression "to eat the salt of the palace" (Ezra iv, 14, Revised Version) and the modern Persian phrase *namak haram*, "untrue to salt" (*i.e.*, disloyal or ungratefulj and many others.

Salt and incense were economic and religious necessities of the ancient world and contribute greatly to knowledge of the ancient highways of commerce. Thus one of the oldest roads in Italy is the Via Lalaria, by which the produce of the salt pans of Ostia was carried into the Sabine country. Herodotus' account of the caravan route uniting the salt oases of the Libyan desert makes it plain that this was mainly a salt road, and to the present day the caravan trade of the Sahara is largely in salt. The salt of Palmyra was an important element in the vast trade between the Syrian ports and the Persian gulf (see PALMYRA), and long after the glory of the great merchant city was past "the salt of Tadmor" retained its reputation. In like manner the ancient trade between the Aegean and the coasts of southern Russia was largely dependent on the salt pans at the mouth of the Dnieper and on the salt fish brought from this district. The vast salt mines of northern India mere worked before the time of Alexander. The economic importance of salt is further indicated by the prevalence down to the present day of salt taxes or of government monopolies, In oriental systems of taxation high imposts on salt are seldom lacking and are often carried out oppressively with the result that the article is apt to reach the consumer in an impure state largely mixed with earth. "The salt which has Iost its savour" (Matt. v, 13) is simply the earthy residuum of such an impure salt after the sodium chloride has been washed out.

Cakes of salt have been used as money; *e.g.*, in Abyssinia and elsewhere in Africa, and in Tibet and adjoining parts. (See the testimony of Marco Polo and Sir Henry Yule's note on analogous customs down to our own time, in his translation of Polo ii, 48· et seq. The same work gives interesting details as to the importance of salt in the financial system of the Mongol emperors, ii, 200 et *seq.*)

In the Roman army an allowance of salt was made to officers and men, from which in imperial times this *salarium* was converted into an allowance of money for salt.

Salt in Sea **Water.**—Assuming that each gallon of sea water contains 0.2547 lb. of salt, and allowing an average density of 2.24 for rock salt, it has been computed that if dried up the entire ocean would yield no less than 4,500,000 cu.mi. of rock salt or about 14½ times the bulk of the entire continent of Europe above high-water mark.

Sea water contains on the average about 3.33% of solids, but the concentration of salts varies from about 2.9% in the polar seas to 3.55% and upward at the equator. Enclosed seas such as the Mediterranean and Red seas contain a higher proportion of salt than the open ocean at the same latitude. (See OCEAN AND OCEANOGRAPHY.) From C. R. Dittmar's analyses of sea water taken during the "Challenger" expedition (18; 2-76) the average composition of the solids in sea water may be considered to be: sodium chloride 2.60%, magnesium chloride 0.31%, magnesium sulfate 0.22%, calcium sulfate 0.12%, potassium chloride 0.07% and magnesium bromide 0.007%. The mixed salt obtained by evaporation of sea water has, however, the following composition irrespective of the source of the sea water: sodium chloride 77.82%, magnesium chloride 9.44%, magnesium sulfate 6.57%, calcium sulfate 3.44%, potassium chloride 2.11%, magnesium bromide 0.22% and some calcium carbonate.

Natural **Brines.**—Natural brines of commercial importance are found in Austria; France; Germany; Kharaghoda and Kuda, India; Michigan, New Tork state. Ohio; Pennsylvania, \Vest Virginia and the salt lakes of Utah in the United States; and in the Dead sea. In Great Britain there are salt brines in Cheshire, Worcestershire, Lancaster and Torkshire and in deep wells in Derbyshire, Staffordshire and Midlothian. Salt in brines is nearly always accompanied by chlorides and sulfates of potassium. calcium and magnesium; in many cases carbonates and the valuable element bromine are present.

The Dead sea. which covers an area of 394 sq.mi., contains approximately 11,600,000,000 tons of salt, and the river Jordan. which contains only 3; parts of salt per 100,000 of water, adds each year 850,000 tons of salt to this total. The composition of Dead sea water is given in Table I (although the salts exist as ions in solution and are so analyzed; it is customary to express the analvses in terms of compounds):

TABLE I.— Composition of Dead Sea Water

Item	Surface water	Deep water (250 ft.)
Specific gravity	1.1651	1.2356
Sodium chloride	6.11%	7.20%
Potassium chloride	0.85%	1.25%
Magnesium bromide	0.38%	0.61%
Magnesium chloride	9.46%	13.73%
Calcium chloride	2.63%	3.82%
Calcium sulfate	0.11%	0.05%
Total solids.	19.54%	26.66%

The concentration of salts in the Dead sea increases to a depth of about 250 ft., after which it remains practically constant. At this depth and below it is a concentrated solution, which, indeed, is supersaturated when pumped up. for a slight deposition of salt takes place owing to diminished pressure. Noteworthy features of Dead sea water are its relative freedom from sulfates and the high proportions of potassium and bromine. These facts, coupled with the circumstance that atmospheric conditions in Palestine are favourable to solar evaporation for about eight months of the year,

indicate that the production of salt, potassium and even bromine is feasible in the Dead sea area. the process as regards salt and potash being similar to that described below under *Manufacture*. The brines at Kharaghoda resemble sea water in the character of their dissolved salts, but are much more concentrated and in some cases practically saturated.

TABLE 11.—*Composition of Some Concentrated Natural Brines*

Item	Droitwich	Winsford	Syracuse, N.Y.	St. Charles, Mich.	Artern, Saxony	Friedrichshall, Württemberg
	%	%	%	%	%	%

Potassium chloride	..	..	..	..	0.12	..
Potassium sulfate	..	..	..	..	0.29	..
Magnesium bromide	..	..	..	0.26	..	..
Magnesium chloride	0.05	0.21	0.14	4.03	0.42	0.01
Calcium sulfate	0.37	0.45	0.50	0.20	0.40	0.44
Calcium chloride	..	..	0.19	0.77		..
Total solids	25.65	26.12	22.54	28.10	26.50	25.94

Table II gives the composition of some concentrated natural brines used for the production of salt in various countries.

Certain natural brines occurring in England and the United States are of interest. not only from the economic point of view, but also because they contain salts not usually found in brines, such as the chlorides of barium and strontium; when salt is produced from such brines special methods of manufacture are adopted.

In Great Britain these brines were found at great depth in boreholes in Derbyshire. Staffordshire and Midlothian during the search for petroleum wells. In the U.S. they occur in the Ohio valley district of West Virginia and in Ohio, at depths ranging from 1,100 ft. to 1,600 ft.

TABLE III.—*Natural Brines Containing Unusual Salts*

Item	Renishaw, Derbyshire	West Calder, Scotland	Pomeroy, Ohio	Malden, W. Virginia
Depth (feet)	3,198	3,910	..	..
Specific gravity	1.127	1.063	1.075	1.063
Sodium chloride	10.28%	6.26%	7.92%	6.01%
Potassium chloride	0.03%	0.04%	0.04%	0.06%
Magnesium bromide	0.11%	0.07%	..	..
Magnesium chloride	0.84%	0.55%	0.57%	0.50%
Calcium chloride	4.23%	1.34%	1.36%	1.49%
Strontium chloride	0.12%	0.16%	0.03%	0.02%
Barium chloride	0.14%	0.07%	0.04%	0.07%
Total solids	15.75%	8.49%	9.96%	8.15%

It has been suggested that those brines which are characterized by the absence of carbonates and sulfates have been produced by a natural process akin to the ion exchange (*q.v.*) process for softening water. (J. J. F.; A. G. F.; R. H. RN)

Rock Salt.—Rock salt is crystalline halite (sodium chloride) occurring in the form of rock masses and beds. It has a wide geographic distribution and occurs abundantly in rocks of all ages. Because of its great solubility in water it occurs under extremely thick cover in humid regions, but lies close to the surface in arid regions.

All important rock-salt deposits originated from the evaporation of sea water at some time during the geologic past. Some 77% of the mineral matter in normal sea water is sodium chloride. Upon evaporation of about nine-tenths of the volume of sea water, rock salt is precipitated. The precipitation of rock salt overlaps the precipitation of calcium sulfate (gypsum and anhydrite) on the one hand and potassium and magnesium salts on the other. Thus these compounds commonly occur uith rock salt. Deposits are found in beds from a few feet to many hundreds of feet thick. In age these beds are distributed through much of geologic time from the Cambrian through the Mesozoic.

Since it is necessary to evaporate a large quantity of sea water to deposit a small amount of salt, it is thought that many extremely thick rock-salt beds were deposited in partly enclosed arrns of the seas in which evaporation was greater than inflow of fresher water. The supply of aater was continually renewed by inflowing currents while a barrier on the sea floor at the entrance to the basin prevented the outflow of the concentrated saline water so that the salts were deposited in thick beds on the basin floor.

Such bedded salt deposits occur in the Lower Cambrian of the Punjab Salt range in Pakistan and in Iran, but are little exploited. The Silurian and Devonian rocks of the northeastern Cnited States and Ontario in Canada contain important rock-salt deposits which are extensively worked for industrial and domestic use. The Carboniferous of Nova Scotia contains extensive rock-salt deposits which are utilized in eastern Canada and northeastern United States. The Pennsylvanian (Carboniferous) of Colorado and Utah contains large amounts of rock salt.

The rocks of Permian age contain some of the largest rock-salt deposits in the world. The most important are the Zechstein deposits of Germany, long exploited not only for their common salt but for their potassium content. The salt deposits of the sub-Carpathian region extending from Poland through Hungary and Rumania may be of this age. In the Donetz basin and the Volga region of European U.S.S.R. are extremely important deposits of Permian rock salt. In the United States enormous thicknesses of rock salt underlie much of the Permian basin extending from Kansas to western Texas.

The Triassic of England contains important rock-salt deposits which have been worked for many years. In the Tyrol the Triassic strata also contain important salt deposits. In the province of Szechwan, China, rock salt occurs in beds of Triassic Age and has been exploited through salt wells for more than 2,000 years.

Another type of rock-salt deposit which is economically important is the salt dome. This deposit has been forced up by earth pressure from great depths in the form of plugs of roughly circular shape a few yards to a mile across. The domes appear to be a development of folding, in which the salt is forced up through other rocks, because of its great plasticity under high pressure, from depths as great as 20,000 ft. Such salt domes are abundant along the Gulf coast of southern United States and extend into the east Texas basin and northern Louisiana. Many domes occur at shallow depths and are extensively mined to supply the southern United States. Similar domes in the sub-Carpathian region of Europe have been worked since ancient times. The north German plain has many domes, extensively worked, which are thought to have originated below 6,000 feet. (See SALT DOME.)

Rock salt may be expioited by usual mining methods. Another method of exploitation is by drilling wells into the salt strata, pumping water down them to dissolve the salt and treating the returning brine in a manner similar to the treatment of natural brines. It is difficult to arrive at any estimate of the relative importance of rock-salt production as compared with production of other types of salt since most available statistics make no distinction between natural and artificial brines. The United States and Europe are leaders in exploitation of rock-salt deposits. However, South American countries are developing their deposits rapidly with Brazil the largest producer. (J. M. Hs.: R. H. RN.)

Manufacture.—At one time almost all of the salt used in commerce was produced from the evaporation of sea water. and sea salt still is a staple commodity in many maritime countries, especially where the climate is dry and the summer of long duration. Commercial salt is manufactured (1) from rock salt and (2) from sea water and other natural and artificial brines. Most of the artificial brines are obtained by pumping water into wells drilled into underground salt beds and pumping up the solution which results when this water dissolves salt from the deposit. In addition to the ordinary uses of crystalline salts, much is used directly in the form of brine in industrial countries.

Manufacture From Rock Salt.—The beds of rock salt are mined or quarried by the usual excavation methods, depending upon the depths and thicknesses of the deposits and upon local conditions. In some cases the mined rock salt is dissolved and salt manufactured by treatment of the brine as described below. This treatment affords opportunities for purification of the salt. Where the rock salt is of high degree of purity, as in the United States and in Galicia, the salt is ground, sieved and marketed with no further treatment. The mined salt in large lumps is first crushed. then

more finely ground and screened to separate the various size grades; the oversize material going back to the mill and the acceptable sizes being packed for market, usually by bagging. A disadvantage of such salt is the tendency to revert to hard masses in storage. In Germany rock salt is treated in similar fashion, except that the larger fragments of impurities such as anhydrite and gypsum are hand picked from the coarsely crushed rock salt. Less pure German rock salt is purified by fusion, either alone or with sodium carbonate and silica or with chalk and saltpetre (sodium nitrate). In some cases, the fused mass is "blown" with air to burn away carbonaceous material, leaving a clear melt which crystallizes on cooling. After separation from the slag by concussion, the salt is ground and sieved. Alternately, an impure salt is leached with a saturated solution of pure salt in dilute hydrochloric acid whereby impurities such as gypsum, magnesium salts and iron oxide are dissolved. The treated salt is filtered, washed with a saturated solution of pure salt, dried, ground and graded for market.

Manufacture From Sea Water and Brines.—When an aqueous solution of several salts is evaporated, the salts separate, each as it reaches its point of saturation in the solution. The solubilities of the salts in the complex solution will, in general, be similar to but not the same as the solubilities for the same salts in water. In the case of sea water and many brines the order of deposition is calcium carbonate, calcium sulfate, sodium chloride, magnesium sulfate, carnallite (potassium magnesium chloride) and magnesium chloride. These salts are not, however, deposited within sharply defined limits of concentration. As each salt reaches its own point of saturation it deposits along with all the other salts which have reached their own saturation points. Therefore each salt deposited is contaminated by some of the other salts and by the residual brine. Further, the relative solubilities are altered by temperature and hence in solar evaporation the difference in temperature between day and night and also the seasonal temperature changes affect the character of the salt deposited. The art of the saltmaker is to produce grades of salt suitable for the particular use to which it is to be put.

Salt is produced by solar evaporation from sea water in France, Portugal. Spain, Italy, India, the U.S.S.R. and the United States—in fact, in nearly all maritime countries. The processes generally adopted are similar in principle, although details of evaporating pans and of manufacturing plants vary with local conditions. A preliminary concentration is usually carried out by allowing the brine to flow through a series of channels to concentration ponds constructed of wood, puddled clay or concrete. The areas of the ponds vary from 280 sq. ft. to 50 ac. in different countries. The solution is concentrated first to a specific gravity of about 1.21. At this stage, suspended impurities (sand and clay) and the less soluble salts (calcium carbonate or chalk and calcium sulfate) are removed. The clear concentrated brine is then run successively into a series of crystallizing pans, usually three, where the salt is deposited. The total area of the crystallizing pans is approximately one-tenth of that of the evaporating pans. In the first crystallizing pan the brine is concentrated to a specific gravity of 1.25 and here the best grade of salt is produced. The specific gravity of the mother liquor increases slowly during crystallization of the salt because of the increasing concentration of the other salts. The mother liquor reaches a specific gravity of 1.26 in the second pan where a second grade of salt is obtained. In the third pan a specific gravity of 1.275 is obtained and here the lowest grade of salt is deposited. The final mother liquor, termed bitterns, is used in some countries (*e.g.,* France, India and the United States) for the manufacture of potash, bromine, Epsom salts (magnesium sulfate) and magnesium chloride.

The salt in each crystallizing pan is raked into rows and allowed to drain for several days, is then collected into heaps, drained again, lifted from the pans and finally dried. As a tax is levied on salt (by weight) in most European countries, it is obviously an advantage to trade in the dried material. The salt from the first pan is frequently used locally as table salt, that from the second pan may go into the chemical industry and that from the third pan is used for pickling fish, refrigeration and other purposes. Typical compositions of the salts thus produced are given in Table IV.

In Palestine, solar evaporation of the Dead sea water is aided by dye added to the water. The dye permits complete absorption

TABLE IV.—*Typical Compositions of* Salts from Evaporation Pans

Item	Grade I	Grade II	Grade III
	%	%	%
Sodium chloride	96.0	95.0	91.0

Water (moisture)	2.6	3.1	6.2
	100.0	100.0	100.0

of sunlight in thinner layers of water so that shallow ponds may be used and absorption of brine by the ground is reduced.

In England, Germany, most of the eastern part of the United States and other places where it is impractical to manufacture salt by means of solar heat, the brines are concentrated and evaporated by artificial heat. Formerly the brine was concentrated in open pans over fire. More recently steam-jacketed vessels were used, but now the largest part of the salt produced in the colder countries is manufactured in multiple-effect vacuum evaporators and an important quantity is made in open crystallizers or grainers which produce a type of crystal preferred for use in some of the food industries. The brine, natural or artificial, is first pumped into settling tanks, where calcium and magnesium compounds may be removed by chemical treatment, usually lime and sodium hydroxide are used. After settling and filtration, the brine is delivered to the grainer, which is a long open trough with steam coils. The brine is fed into the grainer at approximately the same rate as that at which evaporation is taking place and at a temperature only slightly below that of the brine in the grainer. The residue of brine or bitterns, may be removed daily or less often or may be withdrawn continuously. The evaporation occurs at the surface of the liquid and the crystals originate there. They remain at the surface, held up by the surface tension of the brine. The crystal grows at the top edges, becoming a small inverted hollow pyramid or hopper. Eventually the hopper sinks and ceases to grow. When the crystals are recovered the salt is largely in the form of flakes, whence the name "flake salt." When multiple-effect evaporators are used, the vacuum in each vessel is adjusted so that the vapour from the first vessel is sufficiently hot to boil the brine in the second; the vapour from the second supplying the heat to operate the third vessel or effect. The brine is usually sent through the stages or effects in succession, although in the case of salt manufacture, fresh brine may be fed to each stage if desired. In a triple-effect system, vacuums of 15 in., 25 in. and 27 in. of mercury have been found efficient. With open pans, one ton of coal will produce about two to two and one-half tons of salt whereas it will yield five to six tons of salt with an efficient triple-effect plant.

After crystallization, with either closed or open equipment, the brine is separated from the salt by draining or by centrifugal separation. The moist salt is then dried by a current of hot air, usually in rotary driers; however, a "fluid bed" type of drier may be used.

In the late 1950s, the proportions of salt produced in the United States by various processes were approximately: open-pan evaporation 2%, vacuum evaporation 10%, solar evaporation 5%, rock salt 20%, used in brine 59%.

Properties of Salt.—Pure sodium chloride may be made by passing dry hydrogen chloride gas into a saturated solution of the salt whereupon the purified salt is deposited as a colourless crystalline powder. It crystallizes in the cubic system, usually as cubes (see above under Rock Salt). The melting point is 800° C., which is a bright red heat. Vaporization begins near this temperature. It dissolves easily in cold water and a little more readily in hot water; 100 parts by weight of water dissolve 35.8 parts of salt at 20° C., 39.2 parts at 100° C. and 39.6 parts at 108.7° C., the boiling point of the saturated solution. If a saturated solution in water be cooled below 0° C. a crystalline hydrate, $NaCl.2H_2O$, separates. (See HYDRATE.)

Solution of salt in water is accompanied by reduction of tem-

perature: 36 parts of salt in dissolving in 100 parts of water at 12.6° C. will lower the temperature to 10.1° C. If the same proportion of salt and snow be intimately mixed the temperature falls to −21.3° C.

SALTA, a northwestern province of Argentina. An official decree of Sept. 23, 1943, awarded to Salta the departments of San Antonio de los Cobres and Pastos Grandes, both in the former territory of Los Andes. The province is bounded on the west by Chile. Area, after these boundary changes, 59.759 sq.mi.; pop. (1947) 290,826, (1960) 412,652. In terms of its present boundaries the western part of the province lies in the Andean highlands and is characterized by lofty chains of mountains (sierras) and high, intermont basins or salares.

The sandy and rock-strewn volcanic soils support a sparse cover of stunted plants and hard grasses. The climate is arid and cold, although extreme diurnal variations in temperature are quite common.

Streams are numerous but small, and nearly all drain into the salares, where their waters are rapidly evaporated. In the valleys of the central and eastern parts of the province the vegetation is exuberant, with thick forests of valuable woods. The eastern plain is well watered and hot, with precipitation and temperatures decreasing westward with increasing altitudes. The capital of the province is Salta (*q.v.*).

The chief rail communications of the province are provided by the Belgrano railway, with connections to all of the principal parts of Argentina and to Bolivia, and across the Andes to Antofagasta, Chile. The excellent natural forage in the province has long made livestock raising a lucrative enterprise. Since colonial times Salta has supplied the markets of northern Chile with cattle, formerly driven on the hoof across the Andes, and when prices are sufficiently high to offset transportation costs, the animals are in demand in the markets of the east coast. Sheep raising is also important.

Although a great variety of crops is planted, tobacco (considered the best in the country) and sugar cane lead in commercial importance. The province also produces appreciable quantities of timber and minerals, and ordinarily ranks third among the Argentine states in the production of petroleum. Other minerals include gold, silver, copper, marble and lead.

(R. W. RD.; X.)

SALTA, a city of Argentina and capital of a province of the same name. in the picturesque and historic valley of Lerma, 1,007 mi. by rail N.N.W. of Buenos Aires. Population (1960) 121,491. Salta was founded in 1582 (under the name of San Felipe de Lerma) by Hernando de Lerma, governor of Tucuman. In 1813, during the War of Independence, the Spanish forces under Gen. Pio Tristán, after suffering a decisive defeat at Salta, were obliged to capitulate to Gen. Manuel Belgrano. Salta, 3.895 ft. above sea level. is the centre of a rich mineral and timber region. Mean monthly temperatures range from 53° F. in June to 72° F. in January; average annual rainfall is 28 in., with a distinct dry season from May to October.

A colonial city that has preserved and perpetuated colonial architecture and traditions, Salta holds many attractions for tourists and offers exceptional hotel accommodations and travel facilities.

SALTASH, a municipal borough in the Bodmin parliamentary division of Cornwall, Eng., 4 mi. W.N.W. of Plymouth by road and ferry. Pop. (1961) 7,420. Area 8.3 sq.mi. It is on the wooded west shore of the Tamar estuary, on the opposite side of which lies Plymouth. Communications are maintained by two floating ferry bridges. At Saltash the Royal Albert bridge (1848–59), built by I. K. Brunel, carries the railway across the estuary. The church of St. Nicholas and St. Faith has an early Norman tower and that of St. Stephen retains its ornate Norman font. Saltash (Aysh, 1284; Saltesh, 1337), the oldest borough in Cornwall, belonged to the manor of Trematon, and at the Domesday survey was held by Reginald de Valletort. A charter was granted sometime at the end of the 12th century. Roger de Valletort gave the borough to the earl of Cornwall, and thenceforth the earls, and subsequently the dukes of Cornwall were lords of Saltash. The privilege of parliamentary representation was conferred by Edward VI.

In 1584 Elizabeth I granted the town a charter of incorporation which was superseded by another in 1683, and the modern charter was adopted in 1886. In 1832 Saltash was deprived of its two members of parliament. Saltash is in part a fishing town. One mi. S W. is Trematon castle, associated with the Black Prince.

SALTBUSH, the name given especially in Australia to plants of the genus *Atriplex* (family Chenopodiaceae). which inhabit arid saline soils, notably to A. halimoides and *A. nummularia*, which are cultivated for forage. *A.* semibaccata, also native to Australia, is grown as a forage plant in California, where it is known as Australian saltbush.

See GREASEWOOD.

SALT DOME. Geologic structures in which salt is a controlling factor may be steep folds in which salt flowage modifies the geologic deformation or structures in which the flow and uplift of the salt itself is the primary geologic movement. It is this latter type of geologic phenomenon which is commonly meant by salt dome. Such structures commonly are roughly circular in plan although some may be greatly elongated. Usually the vertical dimensions are of the same order or greater than the horizontal dimensions. A typical dome may consist of a more or less cylindrical vertical salt column about two miles across and with a vertical dimension of three to six miles. However, the size of individual domes in the same area may vary greatly.

Salt domes always occur in areas underlain by thick layers of salt which is primarily sodium chloride. Domes are not found in all areas of thick salt deposits but only where such deposits have been buried to great depth by subsequent deposition. It appears that a minimum overburden of the order of 10,000 ft. is required for salt domes to form and domes are known where the depth to the salt is estimated to be as great as 30,000 to 40,000 ft.

Origin and Mode of Formation.— There has been considerable controversy and speculation in geological literature on the mechanics of the formation of domes. European geologists. from studies of the German and Rumanian salt structures, recognized that the domes were formed from bedded salt which had flowed under pressure. In some areas the salt flowage resulted from recognized tectonic forces. In other cases, however, such as in the Gulf coast of the United States, there is no recognized tectonic pattern. The intrusive uplift of the domes now is generally attributed to buoyancy resulting from the fact that the density of the salt is less than that of the surrounding sedimentary rocks. The existence of a density difference is shown by the negative gravity anomalies of practically all of the simple, round intrusive salt domes of the Gulf coast and many other areas. as determined by geophysical prospecting (*q.v.*) methods

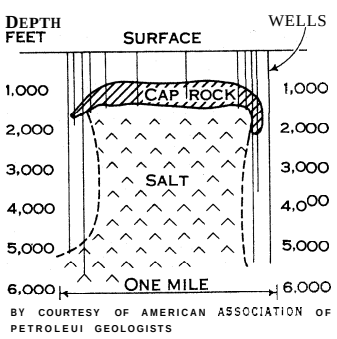

FIG 1.—CROSS SECTION OF A GULF COAST SALT DOME, ALLEN DOME, BRAZORIA COUNTY. TEX.

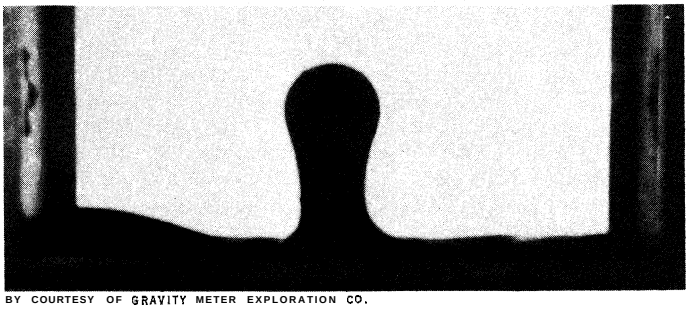
This theory. which appears to account for many of the major features of salt domes. may be likened to the flow of fluids. One can compare the layer of low density salt under heavier sediments with a low density fluid under a heavier one. and models based on this principle produce

forms which are rather strikingly similar to the forms which salt domes have in nature. Figure 1 shows a cross section of a salt dome and fig. 2 a fluid model consisting of a layer of asphalt with a density of 1.0 beneath heavy sirup with a density of 1.4. After the flow is localized by an initial disturbance. the asphalt rises up through the sirup because of its lower density and takes a form very similar to that which many of the Gulf coast domes are known to have from drilling and from analysis of geophysical surveys.



BY COURTESY OF GRAVITY METER EXPLORATION CO.

FIG. 2.— FLUID MODEL TO SIMULATE SALT DOME FORMATION. BLACK PART IS LOWER DENSITY ASPHALT FLOWING UPWARD IN HIGHER DENSITY SIRUP. ONE-FOURTH NATURAL SIZE

Moreover, the ratios between the mechanical properties of the model and those of its prototype in nature are such that the dimensional relations are approximately correct for dynamic similitude. Thus, it appears quite clear that a major factor in the uplift of intrusive salt domes is simple isostatic flowage of the salt because it is of lower density than the sediments.

Cap Rock.—Many of the salt domes, especially in the Gulf coast of the United States and in Germany, have a so-called cap rock. In the Gulf coast, this usually consists of an upper layer of limestone (calcium carbonate) and a lower layer of anhydrite (anhydrous calcium sulfate). In some shallow domes, the limestone may be missing and part or all of the anhydrite changed to gypsum. apparently by contact with surface waters. When present, the cap rock usually covers the top of the dome completely and may extend down the flanks forming a cap or thimble over the salt. It may vary in thickness from a few feet to over 1,000 ft.

The mechanism and chemistry of the formation of cap rock is not clearly understood. It has been suggested that the cap rock is a disk of overlying evaporite deposit which was punched out and pushed up by the intrusive salt, but this theory has been largely discarded

The more generally accepted theory is that the cap rock is formed from minerals originally disseminated through the salt which become concentrated as the salt is dissolved a ay by circulating waters near the surface.

Distribution **of** Domes.—The simple piercement salt domes resulting from isostatic flowage of salt are best known in the southeastern United States because of the intensive drilling around them on account of their economic importance. The Gulf coast belt of domes extends 50 to 100 mi. northward from the coast and reaches from the Mississippi river westward across Louisiana and Texas to midway between Houston and Corpus Christi. The same belt extends offshore for many miles, as shown by geophysical surveys and drilling in the waters of the continental shelf. There are now some 1 jo proven domes in this belt. **A** separate small group of five domes lies between Corpus Christi and Laredo, in southern Texas. The "interior" domes include about 20 in the Tyler basin of northeast Texas and about 70 in a belt extending southeastnard from Shreveport. La., across northern Louisiana and southern Mississippi to southwestern Alabama.

In addition to these domes proven by drilling into salt. there are a great many probable, and deeper domes indicated by geophysical work.

Outside of the southeastern states, the only salt structures known in North America are in the Paradox basin of western Colorado and eastern Utah. but these structures are long folds controlled by tectonic movement and not simple piercement domes. Salt occurrences. possibly in domes, are found in Nova Scotia.

Domes controlled primarily from flowage of salt. but in some cases with modification by tectonic forces, occur in northern Germany. Denmark. Poland. Rumania. northern Spain the Isthmus of Tehuantepec in Mexico, in small areas in Colombia, Peru, and Argentina. in southern Iran along the northeasterly shore of the Persian gulf and in the Persian gulf itself, in western U.S S.R. with the largest area being north of the Caspian sea, and on the west coast of French Equatorial Africa.

Economic Importance.— Salt domes are of great economic importance because of oil. sulfur. and the salt itself.

In areas where the salt domes have intruded or uplifted petroliferous-bearing sedimentary rocks, the deformation nhich localizes oil accumulation is commonly over or around a dome (see PETROLEUM).

A very large fraction of the oil production of the gulf coast of Texas and Louisiana is taken from salt dome structures Since the discovery of the first salt dome oil field in the gulf coast in 1901 some 350 proven or probable salt domes have been located (a large number by geophysical surveys) and many have oil fields over them or around their flanks.

The most productive salt dome area is the Texas-Louisiana coastal belt. where oil production averages about 300,000,000 barrels per year. Oil is also found in salt dome structures in Germany, Rumania. U.S.S.R. and in West Africa.

A relatively small number of the shallow domes with thick cap rock are very prolific sources of sulfur, which occurs in the porous limestone in the upper part of the cap rock. It is mined by the Frasch process in which the sulfur is melted by superheated water and pumped, by compressed air, as a liquid. Of the approximately 240 domes in Texas. Louisiana and Mississippi, approximately 60 are shallow and have thick cap rock but of these only about 18 all in the coastal belt. have sulfur in sufficient quantity and purity to be mined economically. Sulfur is also mined from a small number of domes in the Isthmus of Tehuantepec in Mexico. Salt dome sulfur production has averaged approximately 5,000,000 long tons per year.

In a small number of domes, the salt itself is mined, either by shafts into the dome and normal mining operations or by solution of the salt by circulating water. Production of salt is approximately 5,000,000 short tons per year.

SALTILLO, capital city of the Mexican state of Coahuila, is at the northern edge of the great central plateau of Mexico. Founded in 1586, Saltillo is chiefly significant as an active commercial and manufacturing centre and communications hub. It has an annual fair of importance and manufactures cotton and woollen fabrics, knitted goods and flour. Its blankets or serapes have for centuries been considered among Mexico's finest and many are collector's items. Coal seams near by are exploited on a small scale, though the chief reserves lie in the Sabinas basin. Pop. (1960) 95.066. (HD. C.)

SALT LAKE CITY, the capital of Utah, U.S., and seat of Salt Lake county. is the largest city between Denver and the Pacific coast. World capital of the Latter-day Saints (Mormons). it is also the seat of Roman Catholic and Episcopal dioceses and a regional metropolis influencing the economic. social. cultural, educational and political life of people in an area of about 185,000 sq.mi., embracing not only Utah but southern Idaho, eastern Nevada and southwestern Wyoming.

Salt Lake valley, in which the city is situated, is the southernmost of the numerous valleys which together compose the valley of the Great Salt Lake and is almost central in the longer chain of fertile irrigable valleys lying at the west base of the Wasatch mountains. Salt Lake City lies at an approximate elevation of 4.200 ft. under magnificent peaks that rise in places more than 7,000 ft. above the valley floor; its wide. generally rectangular, tree-lined streets are laid out on a series of terraces lifting gently east and north from the Jordan river. This river, which connects Utah lake with the Great Salt lake (*q.v.*), flows nearly north

through the valley, bordered on the west by poorly drained, alkaline and generally infertile plains. The principal incorporated area of Salt Lake City occupies the northern part of Salt Lake valley, east of the Jordan; in the central and southern reaches are various suburban communities. including South Salt Lake, Murray, Midvale, Sandy City and Draper.

On its founding, the centre of Salt Lake City was placed close under the northern benchlands, so the city developed asymmetrically to the east, south and southeast. Major expansion westward came only during and after World War II. That same period made the whole of Salt Lake valley a residential appendage of the city, as also Davis county to the north; this growth was directly related to the development of an adequate metropolitan water supply in the late 1930s and early 1940s. The metropolitan area of Salt Lake City reaches toward that of Ogden (*q.v.*), 35 mi. N., with which it has a twin-city relationship, but because of historical priority, general economic dominance and Salt Lake City's status as a federal and state government centre, the influence of the capital city is overriding.

History.— Salt Lake City (until 1868 Great Salt Lake City) was founded in 1847 as the central city of Mormon settlement in the west, and its history since has been inextricable from that of the church (see LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST OF) and of the state (see UTAH: History). A planned community from the outset, Salt Lake City was laid out by Brigham Young (*q.v.*) in accordance with a plat for the city of Zion drawn by Joseph Smith in 1833. Streets 8 rods wide were made to run with the cardinal directions and to cross at right angles, dividing the land into square blocks of 10 ac. each, originally divided into 1¼ ac. lots, with provision for public squares, of which one was set aside as the Temple block. Streets were numbered outward from the central Temple block, those on the south being named South Temple, 1st South, 2nd South, etc., those on the west, West Temple, 1st West, and so on. However, East Temple eventually was renamed Main street, and 1st East became State street. Later, as the city grew, "courts" and "places" were cut into many of the large central blocks, and new subdivisions were cut up into smaller areas, especially on the steep North Bench and south of 9th South street. The old rectangular street pattern continued dominant until World War II, and curving streets are found chiefly in modern subdivisions, west of the Jordan or high on the eastern benchlands.

Those who wintered in Salt Lake valley in 1847–48, numbering about 1,700, lived in a log and adobe fort centring upon the present Pioneer park. Permanent allocation of the land began when Young made his final return from the Missouri river in Sept. 1848, and most of the settlers began building on their lots the following spring. At that time the city was divided into 19 ecclesiastical wards of nine square blocks each, the bishop of each ward acting as magistrate.

Previously, reflecting the theocratic character of Mormon society, the city had been ruled by a high council, administering an ecclesiastical jurisdiction called a stake of Zion, coextensive with the city. It was the high council that enacted the first municipal ordinances, ratified in public meeting Jan. 1, 1848. Out of this original localized theocratic government evolved the broader State of Deseret, organized by the Mormons in 1849 to embrace a vast area between the Sierra Nevada and the Rocky mountains. By that time, the treaty of Guadalupe Hidalgo having been ratified, the site of Salt Lake City with the rest of Utah had passed from Mexican to U.S. sovereignty. The provisional State of Deseret was not recognized by congress, which instead created the Territory of Utah in Sept. 1850, but before its dissolution, the Deseret legislature in Jan. 1851, incorporated Great Salt Lake City. The city charter almost exactly duplicated that once granted the Mormon city of Nauvoo by the Illinois legislature, which made the city virtually an autonomous political unit, empowered to pass any law not in conflict with the state or federal constitutions and to maintain its own militia and city court. Until its repeal the Nauvoo charter was a storm centre of Illinois politics; in a different environment, the Salt Lake City charter occasioned no trouble.

Organized Mormon immigration, gathering the faithful initially from the midwest and later from the eastern states and Europe, quickly made Salt Lake City famous as "the New Jerusalem," "the City of the Saints." The unexpected discovery of gold in California in 1848 contributed greatly to its early growth, as a flood of gold seekers en route to California poured in upon the city in 1849, trading clothing, tools and manufactured goods for fresh livestock and crops. Overland emigration continued as a stimulus through the 1850s, not nithout friction between Mormon settlers and non-Mormon travelers. The city continued as a staging point for arriving Mormon converts, who were sent from Salt lake to open or strengthen new communities down the entire length of Utah. This planned system of colonization thus tended to drain off population that might otherwise have stimulated the early growth of the church headquarters city. but at the same time gave it deep roots in the entire mountain-desert west. Public works projects. instituted by the church in the early 1850s to furnish employment for the needy, contributed to the building up of the city, including a wall erected around the Temple block and a never-completed wall around the city itself, supposedly to protect it from the Indians but chiefly useful as an object-lesson to smaller and more exposed Mormon towns.

In 1858. during the so-called Utah war of 1857–58, when anti-Mormon agitation led to the federal government's declaring "a state of substantial rebellion" in Utah, Gen. Albert Sidney Johnston's army marched through the city en route to establish a military post, Camp Floyd. west of Utah lake. There followed a considerable influx of non-Mormons, giving Salt Lake City a rowdier character but also renewing economic vitality. These federal troops were withdrawn from Utah after the American Civil War broke out, but were replaced in 1862 by a regiment of California-Nevada volunteers commanded by Patrick Edward Connor, who established Camp (later Fort) Douglas on the benchland above the city, the better to keep the doubtfully regarded Mormons under military scrutiny. Prospecting by these soldiers soon opened up Utah's mining economy and gave non-Mormon merchants a better foothold in Salt Lake City, but their position continued precarious until the completion in 1869 of the Union Pacific railroad (which by-passed the city itself) put the mining industry on a sound basis.

The Mormon-built Utah Central railroad, completed Jan. 1, 1870, connected Salt Lake City with the Union Pacific at Ogden, and during the next decade other roads were built from Salt Lake City in all directions to now-booming mining regions. Violent political strife came for the first time with this new order of things, the non-Mormon Liberal party contending with the Mormon People's party for local supremacy, while the federal government intervened massively with legislation, ostensibly directed against the Mormon practice of polygamy but basically designed to force a separation of church and state. In 1690 the Mormon church surrendered on the polygamy issue, and though intermittent conflicts between Rformon and non-Mormon elements continued as late as 1905–07, when the American party captured the city government, the old social antagonisms gradually disappeared. Since World War I the history of the city has been primarily economic and cultural, as in the case of most other large U.S. cities.

Except between 1851 and 1856, when Fillmore was the legal capital, Salt Lake City since its founding has been capital of Utah in name as well as fact. The graceful capitol building at the head of State street overlooking the city was erected in 1912–15. Other familiar landmarks include Temple square, with the many-spired gray granite temple and the turtle-domed tabernacle; and on the adjacent block to the east, two of Brigham Young's residences, the Beehive house and the gabled Lion house. On what was once Emigration square the City and County building with its lofty sandstone clock tower was built in 1897. High office buildings and hotels along Main street were principally completed between 1909 and 1924. Along the East Bench sprawls the broad campus of the University of Utah, and above it old Ft. Douglas, established in 1862. Farther south, near the mouth of Emigration canyon, is a state park centred upon the This is the Place Monument, which commemorates the Mormon entrance into Utah in 1817.

Population.— By the 1960 census Salt Lake City's population

was 189.454. The population of the standard metropolitan statistical area (Salt Lake county) in 1960 was 383,035, an increase of 3.0% over 1950. The nonwhite percentage was less than 2% of the total population of the city and consisted principally of Japanese, Negroes, Chinese and Filipinos. Many of the early settlers in Salt Lake City came from Europe, particularly England and the Scandinavian countries, as the result of Mormon missionary work. After the Civil War the number of non-Mormons in the city steadily increased and by 1960 comprised an estimated 40% of the population.

Government.— Salt Lake City is governed by a mayor and board of five commissioners, elected in nonpartisan elections. Revenue comes mostly from taxation of real property but also from franchise and other taxes, from fees and licences, and from the municipally owned waterworks and airport.

Commerce, Industry and Transportation.— Principal industries include food processing, printing and publishing, oil refining, coking, copper refining, smelting of silver, lead and copper, manufacture of iron, steel and clay products and of radio equipment, electronics and textiles. The copper mines at Bingham and a Geneva steel plant in Utah valley have greatly contributed to the growth of metal fabricating industries since the early 1900s. The city serves a major wholesaling function in its region, aided by transportation facilities which include service by several railroads, highways and airlines. The city is the seat of a branch of the Federal Reserve Bank of San Francisco.

Education and Cultural Activities.— Public education is administered by a board made up of two members elected from each of the six municipal wards and by a superintendent appointed for a minimum term of two years. Institutions of higher learning in the city include the University of Utah (see UTAH: Education) and Westminster college (Presbyterian, established in 1875). Hospitals are operated by religious denominations and a fraternal organization as well as by Salt Lake county and the Veterans administration. The Utah Symphony orchestra, Salt Lake opera, Tabernacle choir and organ recitals and University of Utah music festival are among the best known of the state's musical activities. Art collections are displayed in the state capitol, the State Historical society mansion, the University museum and the Art Barn. Besides many specialized museums at the university and displays at the capitol, pioneer collections are shown in museums of the Mormon church at Temple square and the Daughters of Utah Pioneers, and in the Pioneer Village of the Sons of Utah Pioneers. Principal libraries are those at the university, Salt Lake City Free Public library, Utah State library, and Utah State Historical society, as well as the private Historian's Office of the Mormon church.

Parks and Recreation.— The 100-ac. landscaped Liberty park, once the Brigham Young farm, is the principal municipal park. Memory grove, below the capitol. is a war memorial. Other parks and playgrounds are scattered about the city, and some are maintained in nearby canyons, a contrast to beach resorts and a yacht. harbour on Great Salt lake, west of the city. Golf courses, a zoo, tennis courts and other recreational facilities are easily accessible. (D. L. M.)

SALTO, a rich department in northwest Uruguay. on the Uruguay river. Pop. (1954 est.) 123,003. Area 5,546 sq.mi. The rolling rocky soil is well suited for pasture and there are considerable numbers of both cattle and sheep on the ranches of Salto. Orange and tangerine production is also important; citrus groves stretch for about 20 mi. around the departmental capital, Salto (*q.v.*). The department's vineyards are considered the best in Uruguay. Salto also grows corn, cereals, sunflower seeds, flax, forage crops, tomatoes and strawberries. (M. I. V.)

SALTO, capital of the department of Salto in Uruguay, a river port on the Uruguay river, rivals Paysandú, farther south, for position as Uruguay's second city. Pop. (1954 est.) 44.900. North of Salto the Uruguay river is too shallow even for river boats so the port supplies northwest Uruguay and parts of the Brazilian state of Rio Grande do Sul. Salto has air and road connections with Montevideo and other points. Wine production and orange-drink bottling, both from locally grown fruits, are outstanding among Salto's industries. Pueblo Nuevo, a new suburb north of the city, has important shipyards. Salto probably was founded as a depot where hides could be assembled for shipment downriver, either in 1756 or 1817. (M. I. V.)

SALTPETRE: see NITRIC ACID AND NITRATES.

SALT RANGE, a hill system in the West Pakistan, deriving its name from its extensive deposits of rock salt. The range commences in Jhelum district, in the lofty hill of Chel (3,701 ft.), on the right bank of the Jhelum river, traverses Shahpur district, crosses the Indus in Mianwali district, thence a southern branch forms the boundary between Bannu and Dera Ismail Khan until it finally merges in the Waziristan system of mountains. The highest point (4,992 ft.) is at Sakesar resort.

SALTYKOV, MICHAEL EVGRAFOVICH (1826–1889), Russian satirist who wrote under the pseudonym of Nicolay Evgrafovich Stchedrin, was born in the province of Tula, Jan. 15 (27), 1826. In 1848 he published *Zaputennoye Dyelo* ("A Complicated Affair"), which led to his banishment to Vyatka, where he spent eight years as a minor government official. The clever picture of Russian provincial officials in his *Gubernskie* Otcherki ("Provincial Sketches") resulted from this experience. After an interval given to writing he was appointed deputy governor, first of Ryazan and then of Tver. On his return to St. Petersburg in 1864 he was appointed president of the local boards of taxation successively at Penza, Tula and Ryazan. In 1868 he finally left the civil service. His principal works are: Poshekhonskaya *Starina* ("The Old Times of Poshekhona"), *Istoria* odnavo Goroda ("The History of a Town"); a satirical history of Russia; Messieurs et *Mesdames* Pompadours; and Messieurs *Golovloff*. He died in St. Petersburg on April 30 (May 12), 1889.

SALUS, an ancient Roman goddess of safety and welfare, later identified with the Greek Hygieia (*q.v.*) who was exclusively a personification of health. Although essentially a deified abstraction, Salus was nevertheless worshiped quite early both at Rome and throughout Italy. Her temple on the Quirinal was dedicated in 302 B.C. and was the scene of an annual sacrifice on Aug. 5. Its walls were decorated with frescoes painted by C. Fabius, consul in 269 B.C. As a result he was called Pictor, "the Painter," a name which he handed down to his descendants—among them Fabius Pictor the annalist.

The *augurium* salutis, not involving a personification and possibly antedating the deification of Salus, was an annual performance; it was an inquiring to ascertain whether it was acceptable to the gods to hear prayers for the public salus. Since it had to be performed on a day of peace, the constant warfare of the late republic caused its interruption, but it was revived by Augustus. In the empire the goddess appears both as Salus publica and Salus Augusti.

In 180 B.C. on the occasion of a severe pestilence a *supplicatio* was held in honour of Apollo, Aesculapius (*qq.v.*) and Salus, revealing that the identification with Hygieia was made this early and Salus was regarded as a deity of public health. Indeed, on coins she appears regularly as Hygieia, with patera and sacred snake, although at times with ears of grain, symbolic of general prosperity.

BIBLIOGRAPHY.—G. Wissowa, Religion und *Kultus,* 2nd ed., pp. 131 ff., 306 ff. (1912); A. S. Pease on Cicero, De divinatione, I, 105 (1920); Platner-Ashby, Topographical Dictionary, *s.v.* (R. B. LD.)

SALUTATIONS (GREETINGS), the customary forms of kindly or respectful address, especially on meeting or parting or on occasions of ceremonious approach. Etymologically salutation (Lat. *salutatio,* "wishing health") refers only to words spoken.

Embraces.— Forms of salutation frequent in preliterate societies may persist almost unchanged in civilized custom. The habit of affectionate clasping or embracing is seen at the meetings of the Andaman islanders and Australian aborigines, or where the Fuegians in friendly salute hug "like the grip of a bear." This natural gesture appears in old Semitic and Aryan custom.

Rubbing Noses.—The salute by smelling or sniffing (often called by travelers "rubbing noses") belongs to Polynesians, Malays, Burmese and other Indochinese, Mongols, etc., extending thence eastward to the Eskimo and westward to Lapland.

Kissing.--The kiss, the salute by tasting, appears constantly

in Semitic and Aryan antiquity. Herodotus describes the Persians of his time as kissing one another—if equals on the mouth, if one was somewhat inferior on the cheek. In Greece. in the classic period. it became customary to kiss the hand, breast or knee of a superior. In Rome the kisses of inferiors became a burdensome civility. The early Christians made it the sign of fellowship: "greet all the brethren with an holy kiss." Of more ceremonial form is the kiss of peace given to the newly baptized and in the celebration of the Eucharist. which is retained by the Greek church. After a time, by ecclesiastical regulations, men were only allowed to kiss men. and women women, and eventually in the Roman Catholic Church the ceremonial kiss at the communion was only exchanged by the ministers, a relic or cross called an *osculatorium* or *pax* being carried to the people to be kissed. While the kiss has thus been adopted as a religious rite, its original social use has continued. Among men, however, it has become less effusive. Court ceremonial keeps up the kiss on the cheek between sovereigns and the kissing of the hand by subjects. When these osculations cease to be performed they are still talked to by way of politeness: Austrians say, *Küss d' Hand!* and Spaniards, *Beso* a *Vd. las manos!* ("I kiss your hand!") Strokings, pattings and other caresses have been turned to use as salutations.

Weeping.— Weeping for joy is sometimes affected as a salutation. Highly ceremonious meeping is performed by several primitive peoples when, meeting after absence, they renew the lamentations over friends who have died in the meantime. Among the Australian aborigines, the male nearest of kin presses his breast to the newcomer's, and the nearest female relative, with piteous lamentations, embraces his knees with one arm. while with the other she scratches her face till the blood drops. Obviously this is mourning. So, too, the New Zealand *tangi* is performed at the reception of a distinguished visitor, whether he has really dead friends to mourn or not. Weeping, as A. R. Brown has shown, is for the Andamanese a rite for the revival of sentiments that have lain dormant, the renewal of interrupted social relations and for the recognition of a change in personal relations.

Cowering.— Cowering or crouching is a natural gesture of fear or inability to resist. Its extreme form is lying prostrate, face to the ground. In barbaric society, as soon as distinctions are marked between master and slave. chief and commoner. these tokens of submission become salutations. The sculptures of Egypt and Assyria show the lowly prostrations of the ancient east, while in Dahomey or Thailand subjects crawl before the king. A later stage is to suggest, but not actually perform, the prostration, as the Arab bends his hand to the ground and puts it to his lips or forehead, or the Tongan would touch the sole of a chief's foot, thus symbolically placing himself under his feet.

Kneeling.— Kneeling prevails in the middle stages of culture. as in the ceremonial of China; Hebrew custom sets it rather apart as an act of homage to a deity; medieval Europe distinguished between kneeling in worship on both knees and on one knee only in homage.

Bowing.— Bowing, as a salute of reverence, appears in its extreme in oriental custom, as among the ancient Israelites: "bowed himself to the ground seven times." The Chinese according to the degree of respect implied bow kneeling or standing. The bowing salutation, varying in Europe from something less than the eastern salaam down to the slightest inclination of the head, is given mutually. Cncovering is a common mode of salutation. originally a sign of disarming or defenselessness or destitution in the presence of a superior. Taking off the hat by men has for ages been the accepted mode in the western world. Some eastern nations are apt to see disrespect in baring the head. hut insist on the feet being uncovered. Europeans have been called on to conform to custom by taking off their shoes to enter the royal presence. In Burma it is respectful to squat in the presence of a superior; elsewhere the inferior should stand.

Handshaking.— Grasping hands appears in antiquity as a legal act symbolic of the parties joining in compact. peace or friendship. In marriage, the hand grasp was part of the ancient Hindu ceremony, as was the *dextrarum iunctio* (joining of right hands) in Rome. which passed on into the Christian rite and became a mere salutation.

Words of Greeting.— As to words of salutation. even among primitive peoples certain ordinary phrases have passed into formal greetings. Many formulas express difference of rank and consequent respect. as where the Basuto salute their chiefs with *Tama sevata!* (*i.e.*, "Greeting. wild beast!"). Congo Negroes returning from a journey salute their wives with an affectionate *Okowe!* but they, meekly kneeling round him, may not repeat the word, but must say *Ka! kn!* Among civilized peoples salutations are apt to be expressions of peace and good will. There are numerous biblical examples; *e.g.*, "Peace be to you and peace he to your house" (I Sam. xxv, 6). Such formulas run on from age to age and may be traced on to the Moslem greeting *Salam 'alaikum!* ("The peace be on you"). to which the reply is *Wa-'alaikum as-salam!* ("And on you be the peace [of God]!"). This greeting is a password among fellow believers, for it may not be used by or to an infidel. The Babylonian form. "O king, live for ever!" (Dan. iii, 9), represents a series of phrases which continue still in the *Vivat rex!* ("Long live the king!"). The Greeks said, "Be joyful!" both at meeting and at parting. The Romans applied *Salve!* ("Be in health!",) especially at meeting, and *Vale!* ("Be well!") at parting. In the modern civilized world. everywhere, the old inquiry after health appears. the "How do you do?" becoming so formal as often to be said on hoth sides. without either waiting for an answer. Hardly less wide in range is the set of phrases "Good day!" "Good night!" etc.. varying according to the hour and translated into every European language. Among other European phrases. some correspond to the English "Welcome!" and "Farewell!" ("God be with you!") and French *Adieu!* ("To God!"). Such half meaningless forms of salutation serve the purpose of keeping up social relations. (E. B. T.: X.)

SALUTE, a friendly greeting or gesture of respect. Although the salute has existed in one form or another. both civilian and military. for many centuries. the modern connotation of the word is primarily military and naval. In this sense salutes are usually performed by prescribed movements of the hand. flag, rifle, sword or sabre, or by firing guns or playing music. Cheering and manning the yards of naval ships are forms of saluting that have become obsolete. It is not possible to determine the exact origin of the various forms of salute practised today, but they all have in common the symbolism of showing defenselessness or obeisance in the presence of a superior or friend. It is assumed that the hand salute, for example. originated in prehistoric times as a means of showing one's weapon hand raised and empty. Uncovering one's head—removing or simply tipping the hat—later became a universal form of salute or obeisance. During the age of chivalry an armoured knight removed his helmet or raised the visor to reveal his identity and also to indicate defenselessness in the presence of superiors or friends. Boning and kneeling had the same connotation.

When the wearing of uniforms became common in military forces around the mid-17th century. soldiers saluted, as did civilians of the period. by removing the hat. It was soon noted, however. that this practice soiled the hat and shortened its life. A regimental order of the Coldstream Guards in 1745 recorded: "The men ordered not to pull off their hats when they pass an officer. . . . but only to clap up their hands to their hats. and bow as they pass by." But this custom was not generally adopted hy other units until the advent of more cumbersome headgear such as the busby and bearskin made doffing the hat impracticable. At one time it was proper to salute with either the left or right hand, the rule being that one used the hand opposite the person being saluted.

Raising the right hand to the cap visor is now a universal military and naval salute. The junior initiates a hand salute when approaching or leaving a superior. when addressing or being addressed by a superior except when in ranks and on other prescribed occasions. The salute is a gesture of mutual recognition and respect among fighting men and the superior normally returns it or at least acknowledges it.

In the U.S. army. navy and, air force the hand salute is executed with the palm down. The British navy salutes the same way. but the British army and Royal Air Force salute with the palm turned forward. In several other European countries there are slightly different variations of the hand salute within the armed forces.

The rifle salute has various forms. When troops are in formation it consists of the movement in unison of "present arms." At this command. soldiers move their weapons to a vertical position with triggers forward. This ceremony has been traced to the restoration of Charles II in 1660. Monk's regiment (now the Coldstream Guards). wishing to come over to the king's service. was formed for his inspection in a field. On the king's approach they were given the command "Present your weapons for service under His Majesty." On this order each man held his musket or pike forward. With an eye for the dramatic. Charles prescribed that this ceremony he standardized for the entire army. When not in formation a soldier renders the rifle salute by touching his weapon in a variation of the normal hand salute.

The sword or sabre salute is executed by raising the hilt opposite the chin and then lowering the point of the weapon to one side. The first motion is believed to go hack to the crusaders' custom of kissing the cross (symbolized by the hilt) before battle; the second motion symbolizes lowering one's guard. Some old military prints show the sword salute being rendered with one hand and the hand salute with the other.

Gun or cannon salutes, now used to honour distinguished persons or to mark special occasions, originate from the practice of firing all guns of a battery, fort or ship as a token of disarming them, for early guns could not be speedily reloaded. Modern gun salutes are tired with blank cartridges or charges. The number of shots is prescribed by international custom and agreement, and is determined by the rank of the person being honoured. A 21-gun salute, for example, is fired for chiefs of state. heads of government. members of a reigning royal family and others of comparable rank; it is commonly referred to as a royal salute. Nineteen guns are fired for ambassadors, cabinet members. state governors (in the U.S.) and officers above the rank of admiral or general; salutes of 17. 15. 13, 11, 7 and 5 guns are fired for persons oi lesser ranks. In some cases it is prescribed that guns be fired on the person's departure as well as on arrival. The convention of firing an odd number of shots is believed to stem from an ancient naval superstition that an even number of shots is unlucky.

In the United States the national salute of 21 guns is fired on Feb. 22 (Washington's birthday) and May 30 (Memorial day): the salute to the union, fired July 4 (Independence day), is one gun for each state.

(For saluting the flag of the United States, *see* FLAG: *Flags of the United States.*)

Musical honours consist of a prescribed number of drum ruffles and bugle or trumpet flourishes followed by a march or by the national anthem of the person honoured. They are rendered in conjunction with gun salutes to an individual.

Saluting with the colours (flags carried by troops) consists of dipping them to the ground. Although it is a fundamental rule that the U.S. national flag is never dipped. an exception is made in the interest of international courtesy: U.S. vessels dip the national ensign in return for such a compliment from a passing ship of a country formally recognized by the U.S. In this case. dipping consists of lowering the flag a short distance and then running it back to the top of the mast. The U.S. navy dips the national ensign only in return for such a compliment. and answers dip for dip. The origin of the flag salute has been traced by some authorities to the naval custom of lowering sails as a token of respect.

SALUZZO, a city and episcopal see of Piemonte. It.. in the province of Cuneo. 12 mi. S. of Turin. Pop. (1951) 11.028. The old castle of the marquises of Saluzzo (1142–1548) now serves as a prison. Besides the Gothic cathedral (1480–1511). the churches of San Giovanni (formerly San Dornenico) and San Bernardo are noteworthy. Henry IV restored the marquisate to Charles Emmanuel I of Savoy at the peace of Lyons in 1601.

SALVADOR, EL, the smallest and most densely populated republic of Central America and probably the most intensively cultivated country in all of Latin America. Its capital city is San Salvador. The country is bounded on the north and east by Honduras, on the south by the Pacific ocean and on the west and northwest by Guatemala. It is the only republic of Central America that has no Atlantic seaboard. El Salvador is 140 mi. long from east to west and 60 mi. wide.

Physical Geography.—*Geology.*—The three principal physiographic-geologic features of El Salvador are: (1) mountain ranges in the north and south; (2) broad plateaulike areas between the mountain ranges cut by the upper Lempa and San Miguel rivers; and (3) the coastal and lower Lempa and San Miguel plains bordering the Pacific. The northern mountain range consists of lax-as. andesitic rocks and ashes of the Tertiary period, except for small areas of older Cretaceous sandstones, shales and conglomerates in the vest. Older rocks in the southern mountain range are covered deeply with Pliocene and Pleistocene eruptives — basaltic and andesitic lavas, pumice and ashes — forming over 20 volcanoes. These volcanoes are clustered in five groups that stretch across the country. The westernmost are Izalco (active since 1770. 6.181 ft.), San Marcelino, Santa Ana (highest mountain in the country. 7,818 ft.), Xaranjos, Aguila, San Juan de Dios, Apaneca, Tamajaso and Lagunita. Next in order come San Salvador (6.398 ft.) and Cojutepeque; San Vicente and Siguatepeque; Tecapa, Taburete, Buenapa, Usulutan, Chinameca and San Miguel (6,985 ft.); and. farthest east, Conchagua (4.101 ft.) and smaller ones nearby. Several of these volcanoes are still active. The coastal plain. 5 to 15 mi. wide, consists mostly of Pleistocene marine sediments and recent alluvium.

Relief *and Drainage.*—The northern and southern mountain ranges are high and rugged. Plateaulike areas between them. deeply carved by the upper Lempa and San Miguel rivers and tributaries, consist mostly of rolling to rough land between 700 and 3,500 ft. altitude. The Lempa river rises in Guatemala, crosses a corner of Honduras, cuts across the northern range. flows eastward for more than 80 mi. then south for 65 mi. across the southern range to the Pacific. The San Miguel system drains eastern El Salvador. The sloping coastal plain is mostly well drained by these two rivers and many other short ones.

Climate.—The temperature of various regions varies according to their altitude. The Pacific lowlands and low areas in the middle Lempa valley have mean monthly temperatures between 78° F. and 85° F. At San Salvador (2.156 ft.) the maximum monthly mean temperature is 95° F. in March and the lowest monthly mean is 58° F. in January. At 4,800 ft. mean monthly temperatures vary between 63° F. and 72° F. El Salvador has two seasons, the wet or summer season from Nov. to April and the dry or winter season from May to Nov. Annual precipitations on the Pacific lowlands averages about 68 in.; on the southern (volcanic) and northern mountain ranges between 2,000 and 3.500 ft. between 70 and 97 in.; higher mountains receive a little more. Annual precipitation in the deep valleys and plateaulike areas is between 45 and 60 in.

Vegetation.—The northern mountains have temperate grasslands and remnants of deciduous oak and pine forests. The southern volcanic mountains have temperate grasses, and below these are remnants of pine and deciduous broadleaf forests, including oak and many other species. Between these two mountain ranges the natural vegetation of the plateaulike areas and deep valleys, with 45 to 60 in. of rainfall annually concentrated during six rainy months, consists of small deciduous trees, or bushes, and of subtropical grasslands. On the Pacific plains and lower southern mountain slopes are savannas and deciduous broadleaf forests. Among the many species is balsam, the trunk of which yields excellent lumber and resin, the latter used in antiseptics and medicinal gums. In 1950, 46% of the land of El Salvador was in pastures (35% in natural pasturesj, 35% was cultivated and 14%

was in forest and woodland. There are many varieties of tropical fruit and many medicinal plants.

Animal Life.—The fauna of El Salvador is less rich and varied than that of other Central American countries because of the scanty rainfall and forest cover. However, it includes many species of land birds and water fowl, rodents, reptiles, insects (butterflies, beetles, bees, wasps, spiders, ants: flies and mosquitoes), and fresh-water and salt-water fish. Although many fish inhabit streams and lakes, most of the animal catch of nearly 750,000 lb. comes from offshore waters and coastal lagoons, and consists chiefly of mullets, grunts, snappers, jacks, groupers, sharks and anchovies.

Geographical Regions.—El Salvador may be divided into four major geographical regions: (1) northern mountains; (2) southern volcanic mountains; (3) between these two mountain ranges, the plateaus and deep valleys region; and (4) Pacific lowlands and coastal hills.

The northern mountains: comprising about 15% of El Salvador, are high and rugged. They have 6% of the national population, widely dispersed in many deep valleys; the region has no towns with more than 5,000 people. Although these mountain dwellers are engaged chiefly in subsistence farming and grazing, the region has several small coffee and lumbering districts, for the high rainy areas still have considerable stands of oak and pine forests.

As noted above, the southern volcanic mountains consist of about 20 steep cone-shaped volcanoes between 4,000 and 7,800 ft. and areas of gently sloping land between 1.000 and 4.000 ft. altitude. This region comprises 30% of El Salvador. It has 63% of the country's population. including most areas of dense rural settlement and all cities (except. two) with more than 10,000 people. Its soils, derived from lava and volcanic ashes, are the country's most productive. Its temperatures range from tropical to temperate. 'Three-fourths of its precipitation (between 70 in, and nearly 100 in.) falls during the period from May to Nov. This region produces 90% of El Salvador's coffee, tobacco and manufactured goods; two-thirds of its corn, beans, fruits, vegetables and sugar; and half the nation's cotton, rice and animal and forest products.

The region of plateaus and deep valleys comprises 45% of El Salvador's area and has 25% of its population. The people live in rural areas and in many towns of less than 10,000 population. Lying between 700 and 3.500 ft. altitude. its temperatu.es are tropical to subtropical. With only 45 to 60 in. of precipitation during the rainy months from May to November, it is the driest region of El Salvador. Its soils, derived largely from old volcanic materials, are generally shallow and stony. The region has much more pasture land than cropland. It is significant in supplying animal products, corn, beans, vegetabies, henequen and simple manufactures.

The Pacific lowlands and coastal hills comprise 10% of El Salvador's area and have 6% of its population. This region is hot all year around and rainy for six months. It has much more land in either pasture or forest than in crops. It is significant in the production of beef, forest products, cotton, sesame, rice, sugar, corn and fish. (C. F. J.)

The People.—Over four-fifths of the people of El Salvador are of mixed Spanish-Indian descent (mestizo). The remainder are pure Indians. whites and a few Negroes. When the Spaniards arrived the land was inhabited mainly by the Pipil Indians, whose civilization resembled that of the Aztecs in Mexico. The majority of the tribes were farmers; the others were potters, carpenters, masons, weavers, etc. The Indians were great builders, left numerous ruins and had advanced to the stage oi developing hieroglyphic writing. Of the several large towns which they established, two which have continued to remain in existence are the present cities of Sonsonate and Ahuachapán.

Few Spanish settlers arrived to colonize the erea but intermarriage of these few Spaniards and the Pipil Indians resulted in a racially homogeneous people. Only a few pure Indians remain today, notably the Izalco Indians, and the Panchos from the village of Panchimalco near the capital. Their bright costumes and traditional ceremonies lend much colour to the land. The language of El Salvador is Spanish, although a few of the Indians still speak their native tongue. The majority of the people are of Roman Catholic faith.

The Salvadoreans show a well-developed interest in art. They are also sports loving and have been hosts to numerous national and international sports events Many festivals are held throughout the country, such as the day of *El* Salvador *del Mundo* ("the Saviour of the World"), held from July 24 to Aug 6, and the Día del Indio ("Day of the Indian") held on Dec. 12.

(P. H. AR.)

History.—El Salvador was in early times the home of Indian groups nho were advanced in civilization but whose identities are unknown The Pipil most significant of the three groups nho inhabited the land in the 15th century, had their capital at Cuscatlán, a name still sometimes used as that of the country. The first Europeans to enter El Salvador were Spaniards commanded by Pedro de Alvarado (*q.v*), who came from Guatemala in 1524. Though Cuscatlán mas briefly occupied at that time, and nearby San Salvador founded in 1525, it was not until 1527 that the Pipil were subdued by Alvarado's lieutenants. San Salvador was a part of the province of Guatemala, as was San Miguel, founded east of the Lempa river in 1530 to discourage the territorial ambitions of Pedrarias Dávila in Nicaragua. The port of Acajutla was used by Alvarado in preparations for his illegal expedition to Ecuador in 1534. Western El Salvador became valuable to the Spaniards economically nhen Acajutla after a few decades became the funnel through which passed a lively export trade in cacao. Nearby Sonsonate was founded in 1552 to handle this trade.

Sonsonate and San Salvador developed as separate provinces, ruled by *alcaldes mayores*, each subject to the jurisdiction of the Spanish *Audiencia* de Guatemala. Sonsonate was the smaller of the two but remained the wealthier for about a century until the cacao trade declined under competition from Ecuador. San Salvador gren more slonly, nith dependence upon stock raising, general agriculture and the manufacture oi indigo, but eventually became more important The city of San Miguel was included in its territory. The Spanish town of San Vicente, founded in 1635 to remove Spaniards, Negroes and persons of mixed blood from nearby Indian viilages, was also included in El Salvador as was Cihuatehuacán (Santa Ana), an Indian centre which grew second in size to the city of San Salvador but went unrecognized as a Spanish town until 1812. The province of San Salvador was raised in 1786 to the rank of an intendancy, along with León (Nicaragua), Comayagua (Honduras), and Ciudad Real (Chiapns, Mexico), each continuing to be subordinate to the government in Guatemala. Both Sonsonate and San Salvador had by this time a large mestizo population, with some mixture of Negro blood as well Most of the important "Indian" villages, including Ahuachapán, Chalchuapa, Zacatecoluca, Cojutepeque, Suchitoto, and Usulután, were becoming progressively non-Indian in their customs.

Independence Movement.—In the rapid evolution of Central American affairs from 1811 to 1840, San Salvador played a most active role. The first Central American defiance of Spain occurred there in Nov. 1811, inspired by the deeds of Miguel Hidalgo y Costilla (*q.v.*) in Mexico, and led by another priest, José Matías Delgado (who aspired to become San Salvador's first bishop) and his nephew, Manuel José Arce. Both this attempt and another in 1814 failed. When the government in Guatemala declared independence from Spain, Sept. 15, 1821, subject to the approval of a Central American congress, the authorities in San Salvador went one step further (Sept. 22) and declared absolute independence. Battles were fought in 1822 and 1823 to resist annexation to the Mexican empire. Arce even traveled to Washington, D.C., to eek the protection of the United States. Sonsonate was annexed by force in 1823, but Delgado and Arce now played prominent roles in the provisional government of the United Provinces of Central America (1823–1825), and Arce mas chosen first president of the federation (1825–1829). Although San Salvador, now a state in the union: tried unsuccessfully to secede in 1832 and 1533, the federal ccpital was transferred there in 1834. The union ended in 1839; Francisco Morazan, its second and last

president, was forced to leave San Salvador in 1840.

The republic of El Salvador ("The Saviour") was first so named on Jan. 30, 1841, but only provisionally so until 1856. It now ran through 45 years of checkered history, in which Conservatives (heirs of the opposition to Francisco Morazán) battled with Liberals (the Morazán party, generally the more interested in a renewal of the Central American union) for control of the country. Both groups found support from and lent assistance to similar parties in the neighbouring states. In the midst of the turmoil, El Salvador organized its first university and was finally established as a bishopric. Agitation quieted somewhat during the longer administrations of Francisco Dueñas (1863–1871), who was backed by Conservative elements in Guatemala, and Rafael Zaldivar (1876–1885), a protégé of Dueiias who nevertheless maintained friendly relations for some time with Liberal administrations in all the bordering republics. Coffee, introduced as a crop in 1840, was exported in sizable quantities by the 1870s. Zaldivar successfully opposed the move of Pres. Justo Rufino Barrios of Guatemala to reunify Central America by force (1885), but was himself pushed out of office soon after Barrios was killed in battle.

Coffee became all-important to the country's economy in the period from 1885 to 1931, while international conflicts became less frequent and the presidential succession more regular. Violence upset only one of the eight four-year terms which followed each other starting in 1899. Relative absence from turmoil did not bring democracy. Each president's successor was a friend or close relative and all power remained in the hands of the wealthy. But the coffee plantations flourished; companies from Britain and the United States built a national network of railroads; the port of La Unión was developed; the population more than doubled (passing the million mark); and El Salvador enjoyed some of the blessings of peace.

Military Dictatorships.—A step toward democracy in 1931 led to a military dictatorship instead. Pio Romero Bosque, president from 1927 to 1931, decided not to control the election of his successor. When no candidate won a majority of the popular vote, Arturo Araujo was chosen by congress, but he was overthrown by force before the year was out. Gen. Maximiliano Hernandez Martinez then came to power but was not recognized by the other Central American states or by the United States because he had been involved in the coup *d'état*. Hernández Martinez retained power only by a ruthless policy which involved mass executions.

Hernandez Martinez maintained his authoritarian rule from 1931 to 1944. Re-elected to the position in 1935, he was chosen to continue in 1939 by an assembly which he had picked to write a new constitution. Recognition of his government by neighbouring republics came in 1934. Energetic measures of the early years of this regime included the establishment of a new coinage system, the organization of a national bank, the pushing of the Inter-American highway across the country, and the extension of state control over the coffee industry. Hernbndez Martinez gained international attention by early recognition of the Japanese puppet regime in Manchukuo (1934) and of the regime of Francisco Franco in Spain (1936). He was generally accounted to have warm relations with Nazi Germany and Fascist Italy, and German business interests had considerableholdings in El Salvador in the late 1930s. Nevertheless, El Salvador after Pearl Harbor quickly joined the side of the United States against the Axis, and Hernandez Martinez received the same material benefits from co-operation with Washington through the war as did his isthmian neighbours.

Post-World War *II* Era.—The end of the Hernández Martinez regime was not the end of government by military officers. Hernandéz Martinez' resignation came after a fierce revolt (which brought bombings and fire to the capital) and a general strike, prompted by a decision of the assembly to extend his term five more years. Gen. Andrés Menéndez, vice-president, held office from May to Oct. 1944, when a new coup brought in Col. Osmin Aguirre y Salinas. Salvador Castaneda Castro, who took office March 1, 1945, after elections, lasted until Dec. 14, 1948, when a military junta took control. Maj. Oscar Osorio, important in this junta, was the popular choice in new elections of March 1950. His political group, the new Partido Revolucionario de Unificación Democrática (P.R.U.D.), came to dominate the political life of the country.

Osorio remained in the presidential chair for a full six-year term, starting Sept. 14, 1950. Material progress during this period was considerable. To coffee exports, which continued as valuable to the country as ever, were added significant sales of cotton. The new emphasis on growing cotton even caused temporary problems due to shortages of corn and beans. Low standards of living continued to prevail for the masses of underpaid workers, but various measures, including government construction of low-cost homes, held some hope for their future. Of particular importance were the hydroelectric power project on the Lempa river, the asphalting of the Inter-American highway nearly from border to border, the development of a new east-west highway closer to the Pacific, the construction of a few industrial plants and plans for modern port facilities at Acajutla.

When a new beginning was made in the 1950s on the project of Central American union, El Salvador qualified as a ready participant. The Charter of San Salvador, written in the city Oct. 8–14, 1951, and ratified by the five Central American governments, provided for meetings at regular intervals of the chief officials of the republics, with the purpose of constituting an economic and cultural unity on the isthmus which might eventually express itself through a political federation. After further delay caused by renewed isthmian dissension, a meeting of the foreign ministers held in Antigua, Guatemala (Aug. 1955) chose José Guillermo Trabanino of El Salvador as first secretary general of the Organización de Estados Centroamericanos (O.D.E.C.A.). Serving in this capacity from Oct. 14 of the same year, Trabanino was able to conciliate ruffled feelings between the nations on more than one occasion, even when his own country was involved.

The candidate of P.R.U.D. for the presidential election in March 1956, was Lieut. Col. José Maria Lemus. Other parties withdrew from the race shortly before the balloting, and Lemus was inaugurated Sept. 14. In his first years, Lemus continued the policies of his predecessor as to public works and undertook a variety of measures to buoy sagging price levels for coffee. A controversy with Nicaragua in Jan. 1957, concerning El Salvador's lack of apprehension of persons allegedly involved in the murder of Pres. Anastasio Somoza, was quieted through the efforts of Trabanino. A treaty with Guatemala in April of the same year dealing with the use of the waters of international Lake Guija for mutual hydroelectric developments indicated a hoped-for new era in Central American relations.

New unrest broke out in El Salvador in 1960. A six-man junta led by Col. César Yánez Urias ousted President Lemus on Oct. 26. The junta promised a democratic regime. Political parties rapidly organized in preparation for elections. However, another coup (Jan. 25, 1961) brought into power a new five-man junta of distinctly rightist orientation. Elections were still envisaged, but with restricted participation. (F. D. P.)

Population.—El Salvador had a population of 1,855,917 in 1950 and an estimated 2,475,665 in 1958, with an area of 8,260

Population and Area of El Salvador by Department

Departments	Area (sq.mi.)	Population*	Capital	Population*
Ahuachapán	472	124,399	Ahuachapán	12,629

*1958 estimate. †Land area only. Total area is 8,260 sq.mi.
‡Total includes 4,153 registered migrants not distributed by departments.

sq.mi. there were 299.7 inhabitants per square mile. Three-fourths of the people are concentrated in the area around the department of San Salvador, which has a population density four times the national average. The least heavily populated department is Chalatenango in northern El Salvador, with 170.3 inhabitants per square mile in 1958.

Administration and Social Conditions. — The constitution adopted in 1950 provides for a representative form of government with three branches — legislative, executive and judicial. All Salvadoreans, male and female, who have attained the age of 18 are permitted to vote. Executive power is exercised by the president, his cabinet ministers and undersecretaries of state. The president is elected by direct, popular vote for a term of six years anu is ineligible to succeed himself. Legislative power is vested in a unicameral national legislative assembly (*asamblea nacional legislativa*), which meets in regular session on the first of June and the first of December of each year. The number of deputies is determined by apportionment. They are elected by popular vote for two-yzar terms, with no bar to re-election. The judicial branch is composed of a supreme court of justice, whose members are selected by the national assembly, and of other tribunals as established by statute. The supreme court consists of nine magistrates, one of whom serves as president.

The territory of El Salvador is divided into fourteen departments (see Populatiort, above.). Each department has a governor and a substitute governor, appointed by the executive power. For purposes of local government the departments are divided into municipalities, which are governed by popularly elected municipal councils (*consejos* municipales), consisting oi a mayor (alcalde), a syndic (*síndico*), and two or more aldermen (*regidores*), the number of whom are in proportion to the population. Independent in their local functions, the municipalities are limited to economic and administrative activities.

With the exception of Costa Rica, El Salvador has the highest per capita income in Central America. Its per capita income is estimated to he increasing at a rate of about 2% or 3% each year. This income is not evenly distributed, but the government has taken active steps to insure a more equitable distribution by emphasizing workers' education, sponsoring projects in literacy and training workers for union activity and community life. Union orgarization was given government support in 1950 and soon over half a hundred unions were in existence. In 1950 the Urban Housing and Rural Colonization institutes were created to help overcome the lack of low-cost housing and to insure adequate housing iacilities ior future population increases. The Social Security institute was inaugurated in 1949 as an autonomous organization to provide health, accident, unemployment, old age and life insurance. Its benefits are financed by contributions from workers, employers and the government.

All public and private institutions of learning are under the jurisdiction of the ministry of culture. The school system is composed of preschool, primary, secondary and university categories. Primary education is free and compulsory but the illiteracy rate is high. The National University of El Salvador has schools of law and social sciences, medicine, engineering, chemistry and pharmacy, architecture, dentistry, economics and humanities. The Institute of Fine Arts fosters the talents of novelists, poets and essayists. The Institute has a literary department, a department of plastic arts and music, and a department of theatre and dancing. There is also a National Agricultural institute and the:: are schools of public administration, social service, and nursing and various other vocational schools.

Military service ior at least one year is compulsory for all Salvadorean males from 18 to 30 years oi age. The strength of the army is fixed annually by the national assembly; in no case not less than 3,000 men.

Economy. — The foundation of El Salvador's economy in modern times has continued to be agriculture. Coffee accounts for about 85% of the country's total foreign exchange resources derived from exports making the country vulnerable to world price changes. During the second quarter oi the 20th century, however, the government took steps to stimulate diversification of the economy with the result that there was a steadily increasing investment in industry and other fields. The inauguration of the "5 de Noviembre" hydroelectric plant on the Lempa river in 1954 gnve a great deal oi impetus to the industrial expansion program by providing much needed electric power.

Cotton ranks next to coffee in El Salvador's agricultural production. Then come sesame and balsam, a healing drug produced only in El Salvador. Corn, sorghum, beans and rice are grown for domestic consumption. As the wooded area oi the country is small, there is little forestry. Mining activities are limited and the production of gold and silver declined during the 1950s. The fishing industry, or the other hand was greatly expanded during the 1950s. Of the country's local industries, textiles were the most important; by 1960 El Salvador had the largest number of cotton mills in Central America. Other industries includrd the processing of foods and beverages, and the production of cement, bricks, simple chemicals (soap, candles, matches and iertilizers), leather, cigarettes, footwear, hats and cardboard. There were also woodworking shops, printing establishments and machinery and metal-repair shops.

The value of exports from El Salvador increased from $25,000,000 in 1946 to $138,000,000 in 1957. Of this amount coffee accounted for 79% and cotton 11%. The value of imports during 1957 amounted to $115,000,000, chiefly manufactured products, foodstuffs and raw materials from the United States, Germany and Japan.

The monetary unit of El Salvador is the colón, which is divided into 100 centavos. The colon has been stabilized in world market quotations at 2½ to the U.S. dollar. Central banking functions are performed by the Central Reserve Bank of El Salvador, created in 1934.

El Salvador's transportation facilities are well developed. There are two foreign-owned railroad companies (one U.S. and one British), operating 383 mi. of public service lines. A highway network stems irom the Inter-American highway, which crosses the country from border to border and is completely paved. The total highway mileage in El Salvador in 1960 was 5,561, of which 610 mi. were paved.

SALVADOR, known as SÃO SALVADOR and BAHIA, the oldest city and first capital of Brazil. now the major port and capital of the state of Bahia. Pop. (1950) 589,422. Salvador is located at the southern tip of a picturesque and bluff-formed peninsula that separates All Saints bay (Bahia de Todos os Santos), a deep natural harbour 28 mi. wide and 22 mi. long, from the Atlantic. The mean temperature is 78° F. and the annual rainfall is 52 in. The terrain on which the city is built is sharply broken by a series of short, narrow valleys and steep hills that range in elevation from slightly above sea level to about 250 ft. Residences and public buildings for the most part are situated on the slopes (*ladeiras*) and ridges. The valleys and other open places in the city are characterized by lush, tropical vegetation.

A distinctive feature of Salvador is its division into two separate sections, the lower city *(cidade baixa)* and the upper city *(cidade altaj.* The port. commercial district and adjoining residential zones are located at the foot of a cliff on a low shelf of land facing west onto the bay only a few feet above the water level. The principal shopping districts, state and municipal government offices and the leading residential areas are on the upper level. This section extends northward for several miles and eastward to the Atlantic shore. The two sections of the city are connected by a few graded, winding roads, a funicular railway and several elzvators. Of these, the Lacerda elevator, the outstanding landmark of Salvador, is the chief link joining the separate streetcar systems that operate on the upper and lower levels of the city.

Salvador was a major centre of the African slave trade in the colonial period and still has one of the largest concentrations of Negro and mulatto population in Brazil. These two racial groups, which constitute the great bulk of the inhabitants of the city, have contributed many of the folkways, costumes and distinctive foods for which Salvador is noted. After 1940 the city experienced continuous and rapid population growth, increasing at the rate of about 40% per decade. During this growth the racial composition of the population remained fairly constant.

Significant economic expansion accompanied the population growth. It was reflected in extensive public works and private construction — notably in the form of new residential suburbs in the upper city and improvements in port facilities and the erection of numerous modern office buildings in the lower city. The port of Salvador is one of the finest and more important of Brazil. It is protected by two long breakwaters and is dredged to permit ocean-going vessels to tie up at the docks. There are many large warehouses, and mechanical energy has largely replaced physical labour in handling cargo. Imports consist chiefly of manufactured goods, while exports include cacao, tobacco, sugar, hides, castor beans, diamonds, hardwoods and petroleum from the nearby Candeias oil field. The number of industrial plants in Salvador rose at a slow and steady rate during the middle part of the 20th century. Food and tobacco processing, textile manufacturing,

metallurgy. wood- and leatherworking and shipbuilding and repair are the chief industries. The Brazilian government. maintains a naval base and dockyard in the port area. Abundant electric power is available from the Paulo Xfonso hydroelectric project on the São Francisco river 250 mi. N. of the city.

In the second part of the 20th century Salvador was becoming a fairly important tourist attraction. It is served by domestic and foreign steamship lines and by domestic airlines. There are regular rail and bus connections with central and southern Brazil. Salvador is famed throughout Brazil for the number and beauty of its baroque colonial churches, the most striking of which is the church of the convent of the Third Order of St. Francis. Among other leading attractions of Salvador are examples of colonial lay architecture. the Barra lighthouse at the Atlantic tip of the peninsula and the numerous 17th-century fortresses which dot the bay shore and harbour. The city's educational facilitiei include a university with schools of medicine, law and engineering; normal. commercial and trade schools; and schools of fine arts and arts and crafts.

Salvador was founded in 1549 by Tomé de Sousa, first governor general of Brazil, as capital of the Portuguese colony. It was named, and is still known officially as, São Salvador da Bahia de Todos os Santos. As the seat of the colonial government and entrepôt of the thriving sugar trade that developed in the Recôncavo area along the shores of All Saints bay. Salvador soon became a tempting prize for pirates and enemies of Portugal. Chief of these were the Dutch, who attempted to wrest northeastern Brazil from Portuguese control between 1624 and 1654. Salvador was captured by Dutch forces in 1624 but was retaken the following year. It remained under the control of Portugal until 1823. when the last Portuguese troops were expelled in the war for Brazilian independence. With the transfer of the capital to Rio de Janeiro in 1763, Salvador lost political pre-eminence in Brazil and entered a long period of economic decline from nhich it did not emerge until after 1900 (R E. P.)

SALVAGE, a term used in maritime law to designate either the act of rescuing life or property from peril on nater or the reward to which the rescuers, known as salvors, are entitled. In common English usage the term is used generally to describe rescue operations of various sorts (in commercial and banking circles, for example, the refloating of a corporation that has run on financial reefs is often referred to as a salvage operation) but it has no legal significance outside the field of maritime law. The present article is devoted exclusively to the legal aspects; for salvage engineering see SALVAGE, MARINE.

Rescue Efforts and the Law. — In Anglo-American law (apart from the law of the sea) there is, as laymen and beginning law students are usually shocked to discover, neither a duty to go to the aid of another person when he or his property is in peril nor a right to a reward if aid is furnished and life or property preserved. If a man happens to see someone drowning or if. walking past a house he observes that it is on fire. he may in either case enjoy the spectacle with a clear legal conscience. If, on the other hand, he thrusts himself forward and rescues someone from drowning or a house from destruction by fire he has no right, enforceable in a court. to compensation for services or even to reimbursement for injuries he may have suffered or for damage to his own property in saving others' In the eyes of the common lan the volunteer rescuer is an officious intermeddler.

In maritime law a quite different set of rules developed. At sea there is both a duty to gibe aid and assistance and where property is saved a right to a reward, which is not looktd on merely as a compensation for services rendered but is. it has often been said. to be generously computed in order to furnish an inducement to mariners and shipowners to risk their lives and property. The generosity with which salvage awards are computed may also serve. as one judge has realistically reminded us, "to withdraw from the salvors as far as possible every motive to depredate upon the property of the unfortunate owner" (Clifford, J. in *The Clara* and *The Clarita,* 90 U.S. [23 Wall.] 1, 17 [1874]).

The salvage rules are a branch of property law rather than of moral law; this proposition may be illustrated by the fact that under general maritime law salvors of life at sea hsd no right to a reward. Life salvage was formally recognized in the Salvage convention of 1912, which was adopted by the principal maritime countries of the world. The U.S. version of the life salvage provision is that: "Salvors of human life, who have taken part in the services rendered on the occasion of the accident giving rise to salvage, are entitled to a fair share of the remuneration awarded to the salvors of the vessel, her cargo and accessories.!! It will be noted that this provision does not purport to reward "pure" life salvage. If only life is saved, the situation remains as it was before the convention. If both life and property are saved on the same "occasion," the life salvors get a "fair share" of the award to the property salvors and there is nothing in the quoted language to suggest that the total amount of the award is to be increased over what it would have been if only property had been saved. Neither does it appear that one whose life is saved in such a combined operation himself becomes liable to the salvors for any fraction of the award, which continues to be assessed exclusively against the property. As will be seen. the courts in computing salvage awards have traditionally, and without regard to the life salvage provision of the Salvage convention! taken into account the moral aspects of the salvors' behaviour. Daring rescues of survivors inure to the benefit of good salvors when the award is computed and the greedy salvors who let the survivors drown while they save the property find themselves appropriately punished. The only situation in which the Salvage convention appears to justify an award that would not otherwise be made is one in which. following the same accident. two sets of salvors appear and, acting independently of each other, one set saves only life and the other set saves only property. There have been a few such cases (*e.g., The Shreveport,* 42 F. 2d 524 [E.D S C. 1930]) and the judges have taken the life salvage provision to mean that a portion, typically a small portion, of the

award made for saving the property should be taken from the property salvors and given to the life salvors.

Salvage Defined.—The classical statement of the components of an act of salvage is: the rescue of maritime property (a ship or her cargo) on navigable waters within the jurisdiction of the admiralty from a peril which, except for the salvor's assistance, would have led to the loss or destruction of the property. Except for salvage performed under contract, a salvor must act voluntarily without being under any legal duty to do so, apart from the general duty, which has been reinforced by statute, to give assistance to those in peril at sea or to stand by after a collision. Since the salvage award is computed on the value of the property saved, it is evident that only successful salvage attempts will be rewarded. An abandoned ship or derelict is fair game for anyone who comes across it, but, so long as the owner or his agent remains on the ship, unwanted offers of salvage may be refused. It was not merely romantic heroism that in Dec. 1951 prompted Capt. H. K. Carlsen to remain aboard the "Flying Enterprise" until the contract salvors arrived but a commendable desire to protect his owners from a judicially computed salvage award.

There appears to be a fairly widespread belief, which might be described as folk lam, that a salvor becomes the owner of the property that he rescues, at least if the property had been abandoned by the owner or was derelict. There is no foundation for this belief. The owner may always reclaim his property from the salvor on paying salvage money. The salvor has a maritime lien on the salved property and the salvage lien outranks all other maritime liens except the lien for seamen's wages. As lienor, the salvor need not return the property to the owner until his claim is satisfied and may file a libel in *rem* against the property, in which case the admiralty court will take possession of the property unless the owner posts a bond to secure its release. An owner may elect not to reclaim his property but to abandon it; if he does so, he cannot be made liable for a salvage award. The only basis for the popular belief about the salvage of derelict property is that awards for salvage of such property may run somewhat higher than for other property, but the reason for the additional award is that salvage under such circumstances. will usually be a more dangerous operation for the salvors than when the ship in peril is still manned by her own crew.

Any act that in fact contributes to the preservation of property in peril may rank as a salvage service. At the bottom of the scale is the situation in which one ship merely tows another into port, without danger, difficulty or delay. The owner of the towed ship, now safe in port, will naturally take the position that the towage was convenient but not necessary, that his ship could have made port under her own power, and will offer to pay for the service at the customary towage rates. The owner (and crew) of the towing ship will claim salvage on the ground that, except for the assistance rendered, the other ship would have been unable to make port and might well have come ultimately into peril even though no immediate disaster threatened. If the court finds that the danger was real, it will decree salvage and make an award that will be substantially in excess of the towage rates. Typical acts of salvage include releasing ships that have run aground or on reefs, raising sunken ships (or their cargo), putting out fires and so on. In centuries more colourful than the 20th, one of the most liberally rewarded acts of salvage was the recapture of a ship taken by pirates or taken as prize in time of war; following the Russian Revolution of 1917 an English court had occasion to make such an award to an impromptu crew of Allied soldiers who sailed a ship out of Murmansk harbour under gunfire after collapse of the Allied intervention (The Lomonosoff [1921] P. 97). The salvage act need not be some kind of physical assistance directly rendered to the ships in peril. Standing by ready to give aid if necessary, summoning assistance that is given by others and even giving information as to the channel to follow in dangerous waters have all been regarded as salvage acts.

Objects of Salvage.—It is often said that the only objects of salvage are a ship, her accessories and her cargo, and that the rescue of other types of property, looked on as nonmaritime, from peril at sea will go unrewarded. The U.S. author G. H. Robinson has suggested, in a hypothetical example, that there would, under this theory, be no right to salvage for raising a freight car that had fallen into the sea from a railroad trestle. The strict "maritime property" theory is principally based on two 19th-century cases, one English, one U.S. In Cope v. Valette Dry-Dock Co. (119 U.S. 625 [1887]) the U.S. supreme court decided that no salvage could be claimed with respect to a dry dock that, having been moored in a fixed position for 20 years, had broken loose from its moorings. A few years later the house of lords came to the same conclusion in The Gas-Float *Whitton* No. 2 ([1895] P. 301) with respect to a navigation beacon. There seems to have been neither much reason nor much authority behind these decisions of the two highest courts. A leading U.S. admiralty judge of the period had commented, in awarding salvage on rafts of timber found floating in Boston harbour, that it would be no defense to a salvage claim "that the goods had been washed out to sea from the shore by a gale or a flood, or had been dropped from a balloon" (Lowell. J. in 50,000 Feet of Timber, 9 Fed. Cas. 47 [D. Mass. 18711). In the 20th century the invention of the airplane raised in a novel context the problem of whether "nonmaritime property" found in peril at sea is a proper object of salvage. After some initial hesitation while the courts wrestled with the distinguished authorities, the answer has been given, in England by statute and in the United States by the course of judicial decision, that salvage can be claimed for aircraft rescue on navigable waters. Recent U.S. cases in particular have shown a tendency to award salvage with respect to any kind of property found afloat—even money recovered from a dead body in New York harbour (Broere v. $2,133, 72 F. Supp. 115 [E.D N.Y. 19471). Since the supreme court has not reversed itself and since the house of lords is said not to be able to reverse itself. the Cope case and The Gas-Float *Whitton* are still technically good law but, it may be, only as to dry docks and navigation beacons, respectively.

Legal **Duty** as a **Bar** to Claims.—The requirement that a salvor act as a volunteer and the rule that a legal duty to give aid defeats his salvage claim has analogies in other areas of law. It is. for example, a principle of the law of contracts that doing or promising to do something which the promisor already has a legal duty to do is not sufficient consideration to make a return promise enforceable. Thus a law officer who is under a duty to arrest criminals cannot claim rewards offered for their apprehension, at least if he makes the arrest in the course of performing his regular duties. In a commercial context the pre-existing legal duty rule has led courts to conclude that a creditor who has given his debtor a full release upon a part payment of a liquidated debt can. despite the release, sue to collect the balance of the debt. In making the part payment the debtor was merely performing his existing duty so that the creditor's promise to forgive the balance nas not binding. The rule that salvage services must be voluntarily performed is not a peculiarity of maritime law but an integral part of our general legal theory of obligations.

There are several classes of salvage claimants against whom the legal duty rule is regularly employed to defeat the claim. One class consists of public officials and employees; municipal firemen and licensed pilots may be taken as examples. The rule is also applied to salvage claims by the crew of the salved ship. Since the crew is under a duty to save the ship at all costs, no feats of heroism, however extraordinary, will be rewarded as salvage. When the ship was recaptured from pirates or enemies, the traditional rules did allow for a liberal award to the crew; the modern formulation of the piracy cases is that salvage can be claimed by crew members who voluntarily return to the ship after the master has abandoned it. The rule against crew salvage has been, somewhat illogically, extended to passengers, although extraordinary contributions by passengers have occasionally been rewarded. A somewhat different application of the legal duty rule appears in the cases where a tug claims salvage against a vessel she is towing under contract. Under the contract of towage the tug is said to be under a duty to come to the tow's assistance and the salvage claim is denied. In most of the cases mentioned, with the possible exception of that of the crew when the master has not

abandoned ship. the legal duty rule appears not to be an absolute bar. Rescue efforts that are above and beyond the call of duty may be rewarded as salvage.

In 19th-century salvage law the legal duty rule seems to have led to the odd conclusion that there could be no salvage claims when both the salving and the salved ship were held in common ownership. Obviously the owner of the two ships had no interest in claiming salvage from himself; the effect of the rule was to deny salvage to the crew of the salving ship, presumably on the ground that the crew was under a duty to preserve the onner's property. The Salvage convention of 1912 provided that common ownership of salving and salved vessels should not affect salvage claims and in the United States a statute was passed to implement the rule of the convention. In England the house of lords seems to have rejected the 19th-century doctrine in *The Kafiristan* ([1937] *P.* 63).

There appears to be no reason why a government cannot claim salvage for rescue operations performed by its naval or merchant fleets. A U.S. judge commented: "While I can see that a sovereign would and perhaps should consider it beneath his dignity to ask for compensation for saving property at sea, I can imagine no legal reason to prevent him from doing so" *(The Impoco,* 287 Fed. 400 [S.D.N.Y. 19221). In several cases decided during and after World War II both the British and the United Statei governments made salvage claims, sometimes apparently for the benefit of the government, sometimes for the benefit of the crew of the salving ship. Naval personnel would presumably be unable to bring forward such a claim without governmental sponsorship, but the crews of government-owned merchant ships have been allowed to claim salvage as freely as the crews of privately owned ships.

Computation of Awards.— The judicial computation of salvage awards is far from being an exact science. A classical statement of a method of computing awards was formulated by Justice Nathan Clifford in *The Blackwall* (77 U.S. [10 Wall.] 1 [1869]) in the following often quoted language:

> Courts of admiralty usually consider the following circumstances as the main ingredients in determining the amount of the award to he decreed for a salvage service:
> (1) The labor expended by the salvors in rendering the salvage service.
> (2) The promptitude, skill and energy displayed in rendering the service and saving the property.
> (3) The value of the property employed by the salvors in rendering the service, and the danger to which such property was exposed.
> (4) The risk incurred by the salvors in securing the property from the impending peril.
> (5) The value of the property saved.
> (6) The degree of danger from which the property was rescued.

It was noted earlier that salvage is a doctrine of property lam and not of morals. but it is clear from Justice Clifford's list that the moral element intrudes to the extent of making it impossible for anyone successfully to contest the trial judge's computation. Since he is entitled to take into account such imponderables as "skill." "risk " "energy" and "danger," and to increase or decrease his award accordingly it will be impossible to say that any award he may choose to make is "wrong." Consequently each salvage case is a law unto itself and precedents are valueless except to indicate in a general way the maximum and minimum amounts which judges have, at various periods, in fact awarded.

The converse of the rule that good behaviour—extraordinary skill. daring, heroism or ingenuity—increases the award is that bad behaviour—negligence or incompetence or vandalism or theft—decreases the award or, in extrenie cases, forfeits it entirely. It is a natural and obvious stratagem for owners to put forward such allegations, and a reading of the defense testimony in a random sample of salvage cases will leave the impression that the typical salvor is a blackhearted villain lineally descended from Captain Ridd. The admiralty courts. which sit nithout juries, are inclined to treat such testimony with deserved skepticism. Self-serving allegations of negligence or worse brought by owners against salvors will therefore be disregarded unless the proof is compelling Doctrinally, however, the salvor may forieit his award, in whole or in part, for bad behaviour and is also liable to the owner for any unnecessary damage that an incompetently performed salvage service may have caused to the property.

An extension of the fault principle is that a ship that has been solely or jointly at fault in a collision cannot claim salvage for services thereafter rendered to the other ship. This point is confidently stated in the leading British treatise on salvage as well as by most U.S. commentators. There are in fact almost no cases except a few of relatively ancient vintage. It is also customarily stated, with one dissent in a 20th-century U.S. treatise, that the fault of a ship is, in this context, "imputed" to its crew, so that even the personally innocent crew members would be barred from salvage claims for post-collision services.

The key item in a salvage award is the valuation of the property saved. (It is also customary, as the quotation from *The Blackwall* indicates. to value the salvor's property in order to determine how much he had put at risk. The valuation of the salvor's property appears to have no direct relationship to the amount of the award and is typically undertaken in a lighthearted fashion. There is disagreement between British and U.S. commentators on whether cargo carried in the salving ship may be added to the value of the ship and her freight to increase the total value of the property at risk and thus, hopefully, the amount of the award.) The importance of the valuation of the salved property is that the award will be in all cases calculated as a fraction of that value. In any case of salvage that involves a large ship, this phase of the proceedings will typically be protracted, bitter and hard fought.

In arriving at the valuation the items taken into account are the value of the ship: the value of the cargo and the amount of freight that would, except for the salvage, have been lost. In valuing the ship, the customary method is to take its sound value before the salvage less the cost of repairs for damage suffered in the peril from which the ship was rescued. The owner is not, of course. entitled to deduct from sound value the cost of repairs that would put his ship in a better state than it was in before the accident or the cost of repairs not directly occasioned by the accident. The value of cargo will customarily be determined by the price for which it can be sold in the port where it is unloaded.

Another element not mentioned by Justice Clifford in *The Blackwall* that is taken into account is expenses incurred (and, less frequently, profits lost) by the salvor in the course of or as a result of a salvage service. Since the value of the salved property in any event ultimately determines the amount of the anard, the salvor does not necessarily recover all that he may have lost; if he has spent, or lost, $1,000 in saving property worth $100, the loss is for his account and not for that of the onner. Items of reimbursement for expenses or for lost profits are often stated separately from the general award for the salvage. It is unclear whether such items represent an addition to the award that the judge would othernise have made or whether all that is involved is a method of allocation. Since the expenses are incurred or the profits lost by the onner of the salving ship, such items are entirely for the onner's account and are not shared by him with the crew.

The amount of salvage awards, expressed in percentages of the value of the salved property, seems to have steadily decreased since the middle of the 19th century. This trend is obviously related to the tremendous increase in ship values that took place when steam replaced sail and. that continues with 20th-century giant liners and supertankers, to say nothing of atomic-powered ships. It was once said that the general rule was a "moiety"—half the value—of the salved property: awards on that basis for the salvage of a multimillion-dollar ship would result in fortunes for the lucky salvors and. needless to say. such awards are not made. Where great values are involved, the largest 20th-century awards do not exceed 20% of the value of the salved property and such awards have been made only for exceptionally difficult, and dangerous salvage. An example is *The Esso Greensboro* (122 F. Supp. 133 [S.D. Tex. 1954]) where the value of the salved ship was stipulated to be $1,000.000 and awards of over $200,000 were made to the officers and crew of the salving ship, whose onner made no claim for his own account. The salvors of the "Greens-

boro" came across her in mid ocean, burning and derelict; they boarded the burning hulk. searched for survivors, put out the fires. made necessary repairs and towed her to port, the whole affair taking eight days. At the other end of the scale, where the salvage barely rises above the level of simple towage, a customary award is double the usual towage rates.

Distribution of Awards.—A salvage award is divided between the officers and crew of a salving ship and her owner. It is said that owners who had not personally participated in a salvage operation were at one time not allowed to share in the an-ard, on the ground that the only purpose of the salvage rules n-as to encourage individual heroism ior to remove the temptation toward theft). Awards to absentee owners appear in U.S. cases as early as the end of the 18th century. In the course of the 19th century awards to owners. as owners and not as participants. came to be regularly made. The usual explanation for this development is the continuing increase in ship values, which meant that increasingly valuable property was being put at risk when used (typically in emergency situations. without the owner's prior consent) in dangerous salvage attempts. It is also true that the increased values were insured against an ever-wider range of risks, Thus the risk for which the owner is said to be compensated by being given a share of the salvage award is to a degree illusory, although it cannot, on the other hand. be gainsaid that a ship in being is, in most situations; *more* useful than a claim on an insurance policy. Whatever the reasons may be, the owner's share of the award has tended to increase. Early 19th-century cases seem to have allocated a quarter or a third of the award to the owner. Recent U.S. cases reveal that two-thirds of the award is customary and the leading British authority suggests that three-fourths of the award should go to the owner. When the salving ship is operated under charter, a term in the charter party will usually provide for a division of salvage money between owner and charterer. In the absence of such a provision salvage is for the owner's account except in the case of a so-called demise or bare-boat charter (one under which the charterer is responsible for manning. supplying and navigating the ship).

Among the officers and crew, basic awards are made according to rank or monthly pay. without regard to individual participation in the salvage work. Additional awards are often inade to individuals whose participation contributed to the success of the venture or who in situations of danger displayed unusual bravery. The officers' and crew's right to salvage cannot he defeated by agreement between the owners of the salving ship and the salved property or by arbitration proceedings to which they have not consented.

Cargo that may be carried on the salving ship is said not to have a right to share in the award. At first glance. it would appear that the absentee cargo interest has as much right to a share as the absentee shipowner, since the cargo is quite as likely as the ship to be damaged in the course of the salvage. Furthermore, under most biils of lading and charter parties. it will be provided that the ship is not liable to cargo for damage suffered in an attempt to save life or property at sea (although cargo, of course. carries its own insurance against such risks). There appear to be almost no modern cases in which cargo owners have demanded a share of the salvage award. As always in the law, the absence of litigation may he taken to mean either that the point is not settled at all (despite the statements in the books) or that it is settled beyond doubt.

Payment of Awards.— The owners of the salved property are liable to the salvors for the award in the ratio that the value of their properly (*i.e.*, such of it as is saved, valued in its condition after the salvage) bears to the aggregate value of all property saved. The usual contributing values are cargo. the ship and pending freight. For example, if the salved ship, including freight, is worth $1,000,000 and the salved cargo is also worth $1.000.000, being owned in equal shares by ten people, then the shipowner is liable for 50% of the award and each of the ten cargo owners for 5%. Since the salvors have a maritime lien against the salved property, they can proceed directly against the property by proceedings *in rem* or (unless the owner abandons his property) they can hold the owners liable in personam. It has been said by a distinguished judge that any person "who has a direct pecuniary interest" in the salved property may be held liable for salvage (Augustus Hand. J. in *The* G.L. *40*, 66 F. 2d 764 [2d Cir. 1933]). If that statement is true. it would seem that such persons as insurers, mortgagees or buyers of salved property might be held liable to salvors. There are. however, almost no cases in which salvors have attempted to proceed against such more or less remote interests and it may be doubted whether the attempt. if made, would be successful.

It is customary for the owner of a salved ship to pay the salvors in full and then to seek reimbursement from the owners of other salved property for the shares of the award for which they are liable. The shipowner has a lien against cargo for salvage money paid out on cargo's behalf and may refuse to deliver the cargo until his lien is satisfied. In any situation where large values are involved, the liability of ship and cargo for salvage will be worked out in a general average settlement. (*See* AVERAGE.)

Contract Salvage.— Much salvage work is also carried out under contract by professional salvors. In cases where the circumstances permit the bringing in of contract salvors, the owners will doubtless pay less for the work than under a judicially determined award to volunteers. The amount of compensation to which a contract salvor is entitled is of course determined by the terms of his contract and not by the rules that have been set out in this article. It is customary for professional salvors to operate under a so-called "no cure-no pay" arrangement; that is, they get nothing unless the salvage is, at least to some degree. successful. Conceivably this unusual arrangement may reflect one of the basic principles in the law of volunteer salvage. which is that there can be no award unless property is actually saved. A salvage contract under which a salvor would be paid for his labours, whether or not they were successful. would of course be quite as valid as the "no cure-no pay" contract..

BIBLIOGRAPHY.—The leading treatise is Sir W. R. Kennedy, **Civil** *Salvage*, 4th ed. *by* K. C. McGuffie (1958). This British test is usually considered authoritative by U.S. as well as by British courts. *See* also M. J. Norris, *The Law* of *Salvage* (1959); G. H. Robinson, *Handbook of Admiralty Law in the United States*, ch. 15 (1939); Grant Gilmore and C. L. Black, *The Law of Admiralty*, ch. *8* (1957). (G. GI.)

SALVAGE, MARINE, consists of the operations required to refloat a ship or other vessel that has sunk or run aground. There are many kinds of salvage operations, varying from those of utmost simplicity to those involving complicated technical studies and procedures which require special equipment, machinery and tools.

Ordinary Grounding.— The most common salvage problem is ordinary grounding in which all or part of the grounded ship is above water. It can be simple, difficult or impossible. It is a simple problem if the ship or vessel has run only slightly aground on a mudbank or sand bar. It is a difficult problem if grounding occurs on a rock-bound seacoast where wind and tide cause a pounding action which may spring plates or seams. thus opening the ship's interior to serious flooding from the sea. It is often impossible if the grounded vessel is "high and dry." having been lightly loaded when pushed up on the shore by heavy seas at high tide.

The first step in salvaging a ship that has run aground is to obtain the use of tugs. These powerful little vessels may be able to ton- the grounded ship hack into deep water. Another step is to place the ship's regular anchors, or special salvage anchors known as beach gear, in deep water so that the endangered vessel can hold to them and thus prevent heavy seas from forcing it farther up on the shore. A third method is to keep a strain on a towline while awaiting high tide in the hope that the grounded vessel will come afloat and can be towed away. This simple remedy of "tug and tide" is frequently successful. but when a vessel is hard aground it is usually not possible to move her by the few tons of pull exerted by a towline.

If the tug-and-tide method fails. the next step is usually to lighten ship. This consists of the removal of weight from the vessel to the extent computed to be necessary. The quickest and easiest items to remove are liquids such as water and oil that can

be pumped overboard. If further lightening is required, the cargo may be removed along with, in extreme cases, boats, booms, furniture and anything else that is portable. These items may be transferred to barges alongside by the ship's onn cargo-handling equipment or by onshore or floating equipment Such removal of neight, however, should never be begun until the ship is sufficiently secured to prevent her, in her lightened condition, from being pushed farther ashore by storm and tide. This is a rule that is often violated with the result that the ship suffers greater damage or may be lost completely.

If the ship has remained generally watertight, the steps outlined above should prove successful. If, however. the vessel has been opened to the sea it is necessary to make temporary repairs of the fractured plates or to isolate the compartments into which sea nater is flowing. If the ship is high and dry at low tide the diagnosis and treatment of ailing parts are easy. Temporary repairs. both inside and outside, are made as necessary. For submerged areas, trained divers may estimate damage, do underwater cutting and welding of steel and fit and secure steel or wooden patches. The securing of these patches is usually quite simple because water pressure tends to hold them in place and make them reasonably watertight. At times wooden patches are of the caisson (*q.v.*) type and are attached to the ship's hull by oakum packing or underwater concrete.

Water is removed from flooded spaces by the use of suction pumps or "push" pumps placed on the deck of the stricken vessel. The suction type of pump is not the best for a large ship because the maximum height to which water can be lifted under perfect operating conditions is only about 30 ft. The push-type pump is not so limited (see PUMP; VACUUM). One push type is the submerged electric pump: another is the deep-well type which has a centrifugal pump at the bottom of a steel pipe and is driven by a steel shaft rotated by an electric motor or gas engine. When enough pumps are operating, the water can be removed from the ship faster than it runs in; and, as the inflow is gradually lessened by repair work, the ship eventually comes afloat.

The use of compressed air to empty a vessel of water is a method which has proven very effective but requires that the structure to be emptied of water be made capable of withstanding the necessary air pressure. To lower the level of water in a compartment submerged 10 ft.. for example, would require a pressure of about 5 lb. per square inch (p.s.i.); for 30 ft., it would require about 15 p.s.i., which may cause bursting unless the structure is strengthened. The air compressors required are usually on the salvage tug or the ship's deck or on barges alongside, and are operated by electricity or gas.

With ail of the above operations completed a ship may come afloat at high tide. If it does not float, more of the same efforts may do the trick. If the ship is aground on a sloping shore a few additional steps are called for. When a ship is hard aground, or high and dry, it is customary to do something about removing some of the rocks and rough bottom to facilitate sliding the vessel toward deep water. This cutting of a channel is normally done by dredge or, at low tide, by bulldozer.

As noted above, beach gear is often employed to provide means for a strong and steady pull toward deep water. This gear consists of a number of heavy anchors strategically laid out toward deep water, to which chains or wire rope are attached. By using winches on the deck of the ship and tackle with high mechanical advantage, a tremendous pull can be exerted. Then, as the tide comes in, the bow or stern or both are skewed back and forth to break the suction between the ship and the ground and to start the ship moving. If calculations are correct. or the tide is especially favourable, the ship will come afloat.

Sunken and Submerged Ships.—As a result of collisions, explosions or other maritime disasters, vessels are sometimes sunk in deep water. Whether such vessels are salvable depends on the current, sea conditions, depth of water, equipment available, estimated cost and other considerations. Small vessels are salvable in depths up to about 300 ft., but salvage of large vessels in such deep water is rarely practicable. The lift required to bring a sunken vessel to the surface is furnished by such devices as compressed air, floating cranes or pontoons. Trained divers (see DIVING APPARATUS) must do the underwater work on a sunken ship. This may consist of connecting air lines to the ship's fittings, securing lifting chains or wire rope hawsers and girdling the sunken vessel's hull with lifting hawsers. Examples of such salvage are some of the vessels raised to clear the Suez canal in 193'7 and raising of sunken submarines from time to time. The amount of lift that can be applied by pumping compressed air into a ship or by lifting hawsers limits the size of the vessel that can be salvaged by these methods.

For salvaging larger ships, lift pontoons are attached directly to the hull or to cables that girdle the hull. The pontoons are large steel cylinders. usually sheathed with wood, and are equipped with heavy shackles and air connections. Usually they are filled with water, sunk and secured alongside the submerged ship. When their water is expelled by compressed air they become buoyant and exert lift. In raising sunken submarines pontoons are arranged in pairs connected by hawsers under the hull. Four or five pairs are usually employed to provide a combined lift of about 700 or 800 tons. A simpler type of pontoon, one not designed for use of compressed air, can be used on the surface where the rise and fall of tide is great enough to permit the wreck to be gradually moved to shallower water during succeeding high tides.

Capsized Ships.—Ordinarily, a ship lying on its side on the bottom must first be brought to an upright position. This is done by pumping air into selected compartments. Another method is to fasten pontoons to the ship. or to wire rope or chain hawsers which pass under the ship, and to exert lift on such hawsers by floating cranes. derricks or winches and tackle on the beach or pier. Raising the giant liner "Normandie," which caught fire and capsized alongside a pier in New York city in 1941, was a good example of this type of operation.

The decision as to which operations apply to a specific salvage problem depends upon study, calculations and experience. The old practice of "cut and try" is usually the rule. Ingenuity is indispensable on a complicated job. Oftentimes it is advisable to concentrate effort toward raising one end of a sunken vessel and then to proceed progressively. This is often requisite when equipment and facilities are limited.

Salvage companies and navies have in readiness well-equipped salvage tugs with crews trained to perform many operations without procuring much of the special equipment referred to above. They also have naval architects who can determine whether a ship will be stable after it is refloated. (H. N. W.)

SALVARSAN or "606." the trade name of arsphenamine, the dihydrochloride of dioxydiaminoarsenobenzene, a remedy for syphilis introduced by Paul Ehrlich in 1910. It is a yellow powder that was prepared for injection into a vein by a rather complicated process. Later, Ehrlich introduced a modification, "914" or neosalvarsan, that was much easier to use, and preparations of this type became those most commonly employed until the advent of Mapharsen and the antibiotics. A moderate dose of an arsenobenzene preparation usually caused the infecting organisms to disappear from the secretions of open sores within a day, and a rapid amelioration of symptoms followed, but it was necessary to treat for one and one-half to two years or more and to use in addition either the older remedy, mercury, or the newer one, bismuth.

The arsenobenzene preparations were not tolerated equally well by all patients. In a minute percentage of cases they could cause death by damaging the small vessels of the brain or the kidneys. Other toxic effects were jaundice and an inflammation of the skin (either of which might be fatal), and a variety of minor troubles. Serious effects from arsenobenzene injections were. however, far too rare to counteract their very great advantages. One of the most important of these was the rapidity with which patients were rendered noninfectious.

Salvarsan was the first successful drug developed out of Ehrlich's concept of chemotherapy, the cure of an infectious disease by the administration of a chemical agent that would kill the invading parasite without injuring the host. The use of quinine as an antimalarial represents an earlier application of chemotherapy, and sulfonamide and antibiotic therapy represent later develop-

ments embodying the same basic concept. See also EHRLICH, PAUL: VENEREAL DISEASES. (V. E.)

SALVATION ARMY, a religious philanthropic organization founded by William Booth (see BOOTH [family]), who in 1865 began to hold meetings for preaching in the streets in London and in tents. music halls, theatres and elsewhere. In 1878 the mission, which had spread beyond London, was reorganized on a quasi-military basis, and the title of the Salvation Army was definitely adopted in June of that year. with William Booth as "general" of the whole body., The spiritual operations of the army rapidly expanded. in spite of much disorderly opposition in some places.

In doctrine. the army is in harmony with the main principles of the evangelical bodies.

Its preaching is practical and direct., affirming the reality of sin and redemption. and the supreme duty of self-sacrifice for the sake of the salvation of others.

Organization. — The army was organized under the general for the time being, who issued all orders and regulations. Large powers devolved upon other officers. such as the chief of the staff, the foreign secretary and the chancellor. who directed affairs from the international headquarters in London. The system of government was autocratic. "unquestioning obedience" being required throughout all ranks. The army was divided. usually in harmony with national boundaries. into territories. each under a territorial commander. with headquarters in the capital of the country. The territories mere generally divided into divisions. which included a number of corps. each supporting its own captain and lieutenant. The soldiers or members were dran-n from all classes of the community. The property of the army in the United Kingdom was held by the general for the time being, for the benefit of the army exclusively. he being constituted the sole trustee of the property, in the disposal of which and in the appointment of his successor he was placed under the government of a deed poll. executed by Booth while the body was still known as the Christian Mission and enrolled in the court of chancery in Aug. 1878. In other countries various modifications were necessary. but the general's ultimate control was practically assured.

The announcement of the founder's death was accompanied by the intimation that his eldest son, William Bramwell Booth, formerly his chief of staff. had become the new general. Under the deed poll of 1878, each general appointed his successor under seal, but the name of the person so chosen was not divulged until the proper time. At an international staff council in 1904 a supplementary deed poll was adopted. the principal object of which was to set up machinery for removing from the position any general who proved to be unworthy of confidence and also for the selection of a general by a high council of the army called into being for this purpose, in the event of the position becoming vacant through failure to appoint or other cause. In Jan. 1929 the high council voted to remove General Booth on the ground of incapacity. but Booth carried the issue to the courts. The court decided that the removal was illegal because no hearing had been given the general or his representatives before the vote was taken. On Feb. 13 after such a hearing a second vote had the same result as the first: and the council proceeded to elect Edward J. Higgins, formerly chief of staff, as the new general. Booth intended to continue the fight; but he died in June. In Sept. 1934 Comdr. Evangeline Booth. the founder's daughter: and leader of the army in the U.S., was elected to succeed General Higgins, and assumed command in November.

Extension. — In many quarters it was feared that after the withdrawal of the forceful and picturesque personality who had dominated Salvation Army affairs for a generation. and had raised up a world-wide following from what was originally a despised and derided local effort in the slums of London. the army would decline. World Wars I and II also were a menace to all international organizations. These fears. however. proved to be groundless. The number of adherents steadily increased, and the "field" occupied grew greatly in extent.

New organizations were called into existence, especially, for influencing and instructing the young of both sexes. Careful provision was made to ensure a constant replenishment of officers by means of colleges for the training of cadets. Each year young men and women are trained for army work, to which they have to devote the whole of their time. Congresses on national and international lines are held frequently for the instruction and encouragement of officers; and constantly increasing use is made of the printing press.

Social Work. — The social work. which received its first great impetus in 1890 with the publication of *In Dnrkesf England and the Way Out,* by William Booth, became not only more extensive but more varied in character. This work from the first was regarded by the army leaders as an organized warfare against social evils in order to clear the way for evangelization.

It was realized that the physical and environmental condition of many of the people. especially in great cities. made it extremely difficult for them to apprehend the spiritual message which the army had to deliver. Therefore various social activities arose, diverse in character but all actuated by the same purpose, from the provision of free breakfasts and night shelters to the settlement of people in overseas dominions. This last was a department of work characterized by careful selection of the emigrants, and was coupled, particularly in the case of the young. with training beforehand and effective provision for future care. while work was assured upon arrival. The efforts of the army in getting men to work on the land. both in England and overseas, called forth many commendations from statesmen and others.

Rescue work among women was one of the earliest social tasks to which the army set its hand. In this work Florence Booth, wife of Gen. Bramwell Booth. was the responsible leader from its inception until 1912. Maternity work was carried out by the army's ministering women. and for this in 1918 the army received a grant from the British government — the first state subsidy made to the army in the country of its origin. In other lands also social work proceeded. adapted to the different national conditions and needs. and often commended and assisted by the governments concerned. This was true also of eastern lands; thus. settlements for criminals were established in India, and leper colonies in the Dutch Indies.

Spiritual Character of the Work. — The army maintained its original character as a body of spiritual witness and aggressive evangelism. In theory and creed it is at one in almost every respect with orthodox evangelical belief. but its methods — its realistic presentation of religion, and its use of various constraining means to bring people to salvation — distinguish it from other religious bodies. It continues to lay the greatest emphasis upon the need for conversion, preceded by penitence; and followed by growth in holiness. The people gathered into its ranks are cared for by its officers and trained in a real separation from the world and devotion to Christ. They are set to work immediately with a definite objective, their zeal is employed in the winning of others, and public testimony is required from them. however unlearned or backward in religious experience they may be.

A large place in the army's endeavours is given to music. In every country the band — usually a brass band — is a feature of army work. The strains of such a band. reaching farther than the human voice, draw numbers within earshot of the army's message who would otherwise not be attracted. The army also made use of improvisations of various kinds. not only because in this way public attention is more likely to be caught, but because these methods prevent the officers from falling into the conventional and the ordinary.

The army exacts a high standard of behaviour from its adherents. In the series of *Orders and Regulations* for officers and for the rank and file. definite guidance is given even in the smaller matters of everyday conduct. Officers accept a relative poverty, being content to receive sufficient for their simple needs. There are contributory funds from which they receive allowances on retirement. and from which provision is made for widows and orphans. Marriages are solemnized "under the flag." and children of members are dedicated to become soldiers or officers in the "war." Officers wear a regulation uniform, which it is not permissible for the individual to vary. The uniform is regarded as a means of confessing to the world the fact of separation and consecration, as

opening the way to many opportunities of usefulness which would not otherwise appear, and as making possible instant recognition and fellowship among Salvationists themselves. One of the great principles of the army. firmly adhered to, is that women have absolute parity of privilege. position and dignity.

Salvation Army funds are raised from the voluntary offerings of the corps. from open-air and other collections, from the profits on publications and general trading, and from friends interested in evangelical and charitable work. The financial statements of the various funds are annually published, certified by public accountants.

Reports and statistics of the spiritual and social operations of the army are given in the annual *Salvation Army Year Book* and in the *War Cry* and other publications issued at headquarters (Queen Victoria street, London, E. C. 4).

George Lyndon Carpenter was elected general in 1939, Albert Orsborn succeeded him in 1946 and in 1954 he retired and Wilfred Kitching became the seventh general.

The army had corps and outposts in 85 countries and territories throughout the world in 1954. Its 17,002 corps included 26.775 commissioned officers,, 104,778 local officers (laymen) and thousands of soldiers and adherents.

THE UNITED STATES

The Salvation Army began its operations officially in March 1880 in the United States, the first country to which evangelists were sent from England. A family of converts had gone to Philadelphia in 1879 and started evangelical services. At their request Gen. William Booth sent Commissioner George Scott Railton and seven women assistants as pioneer officers. The original staff soon found it impossible to cope with the success attending their efforts, and more help was sent from England. The U.S., however, soon began to produce its own officers, a development which grew through the years until by the 1950s four training colleges were devoted exclusively to maintaining the requisite supply of officers. These send out annually into the field young men and women as officer reinforcements, in addition to providing help for the missionary countries of the world.

After having served in England and as national leader in Canada. Evangeline Booth. daughter of the founder. William Booth, became national commander for the U.S. in 1904. For 30 years she continued to direct Salvation Army work. much progress being made in the extension of welfare services. During World War I specialized services organized for the nation at war endeared the organization to the U.S. public, and Evangeline Booth was awarded the distinguished service medal.

Commander Booth was succeeded by Commissioner E. J. Parker when she was elected general in 1934 and became international leader of the organization. Commissioner Donald McMillan became national commander in 1953.

Again in World War II the services of the Salvation Army, which became a participant in the United Service organizations (U.S.O.). were helpful in maintaining morale among the fighting forces, and during the Korean war this service was continued.

Activities of the Salvation Army in the U.S. include sheltering, evangelistic meetings, rehabilitation centres, care for the unmarried mother and her child, children's homes, clinics, family welfare, aid to prisoners and their families, free employment bureaus, search for missing relatives, camps and summer outings for women and children, and social and religious instruction.

In 1952 the army held 91.854 meetings on street corners in the U.S. In its social service program 35,992 patients were treated in 8 clinics and dispensaries; 1,349 missing persons were located; 34 maternity homes and hospitals for unwed mothers cared for 9.384 women and children: and 16.874 mothers and children were sent to summer camps. A total of 108 men's social service centres provided shelter and work for 32,610 men.

In the field of prison work, 8.449 prisoners were assisted on discharge and given employment in 1952; 1,988 prisoners were paroled in care of the Salvation Army.

During 1953 emergency service was rendered by the Salvation Army in connection with the tornadoes at Waco (Tex.), Flint (Mich.), and Worcester (Mass.), and in other areas where emergencies of disastrous proportion took place. (Do. McM.)

SALVEMINI, GAETANO (1873–), Italian historian, was born in Molfetta in Sept. 1873. In 1902 he became professor of mediaeval and modern history at Messina university. He then went to Pisa university and in 1917 was appointed to the chair of history at Florence university. Historical works by Salvemini included *Magnati e popolani nel commune di Firenze dal 1280 al 1295* (1899), *La Rivoluzione francese 1789–92* (1906), *Mazzini* (1905) and *L'Italia e gl'Imperi Centrali dal 1871 al 1915*. He edited the Liberal newspaper *L'Unità* (1911–21).

Before World War I he vigorously criticized the Socialists for halfhearted social work and attacked Giovanni Giolitti's electoral methods. During the war he was a leading advocate of Italian. diplomatic moderation. He was a member of the Italian parliament, 1919–21.

After the fascists captured power, however, his political activity was made impossible, and, being suspect, he was in constant personal danger. In June 1925 he was arrested in Rome and taken to Florence, where he was charged on the hearsay evidence of a printer with complicity in the production of an antifascist newspaper, *Non-Mollare*. His case was postponed till July 1925, when he was provisionally released. In Oct. 1925 he left the country, going to London and later to the United States. In 1940 he became a naturalized citizen of the U.S. He was appointed in 1934 Lauro de Bosis lecturer in history of Italian civilization at Harvard university, Cambridge, Mass., a post he held until he became professor emeritus in 1948.

His later works included *The Fascist Dictatorship in Italy* (1927), *What To Do With Italy* (1943), *Historian and Scientist* (1939) and *Prelude to World War Two* (1949).

SALVI, NICCOLÒ (NICOLA) (1697–1751), Italian sculptor, whose masterpiece is the Trevi fountain in Rome, was born in 1697 at Rome. He began in the studio of the painter Niccolò Ricciolini and subsequently studied architecture under Antonio Canevari. In 1732 he competed unsuccessfully for the facade of S. Giovanni in Laterano, Rome, but in the same year his project for the Trevi fountain was chosen in preference to those of a great number of competitors. Most of his energy was absorbed by the work; he was responsible not only for the over-all design but also for the details of the decoration and the program of the statuary. After Salvi's death Giuseppe Pannini finished the fountain in 1762, somewhat altering the original scheme. The idea of combining palace front and fountain was derived from a project by Pietro de Cortona, but the grand pageantry of the central triumphal arch with its mythological and allegorical figures. of the natural rock formations and of the gushing water was Salvi's. This queen of fountains is the swan song of the Roman baroque era. Salvi also executed minor works in churches and has the doubtful merit (with Luigi Vanvitelli) of having enlarged G. L. Bernini's Palazzo Odescalchi. He died in 1; 51. (RF. W.)

SALVIA, a large genus belonging to the family Labiatae (*q.v.*), containing about 550 species in the temperate and warmer regions of both hemispheres. The name is derived from the Latin *salvo*, from the healing properties of the garden sage. *S. officinalis*, which has been known for at least three centuries and which has been cultivated in kitchen gardens for the grayish-green wrinkled

leaves that are commonly used in flavouring meats.

S. verbenaca is found in Great Britain in dry pastures and waste places, as is also *S. pratensis.*

Many native species of *Salvia* occur in western North America, especially in California. where 15 species are found. Among these are S. *carduacea* (thistle sage), cultivated for its thistlelike, white woolly foliage and blue flowers; *S. columbariae* and related, mostly Mexican. species are the source of chia.

Some Californian sages are important bee plants, among them the black sage *(S. mellifera)* and the bigflower sage (S. *grandiflora).*

Some of the salvias are among the most showy of soft-wooded plants, the blossoms being of a bright glowing scarlet. A useful species is *S. splendens,* a Brazilian shrub; commonly called scarlet sage. Treated as a tender annual, it is one of the most popular bedding plants in American gardens. There are other very ornamental species of easy growth, increased by cuttings in spring, and succeeding well in ordinary rich loamy soil.

SALVIAN OF MARSEILLES (*c.* 400–c. 490), church writer, was born probably in Trier or Cologne. He certainly was educated at ,Trier, studying among other things law, though he probably never was a lawyer. He married Palladia, a convert from paganism, and they had one daughter. By 435, with the consent of his wife, he retired to the new monastery of Lérins. He mas ordained priest. probably at Lérins, and moved to Marseilles. where he was a writer and preacher. He lived to an old age, dying in Marseilles toward the end of the 5th century. Two of his works are noteworthy: the four books *ad Ecclesiam* and the eight books *de gubernatione Dei.* The first. written under the name of Timotheus, is a plea for Christian socialism. against the evils of widespread poverty and iniquitous distribution of wealth. The second work is of greater importance because it describes the collapse of western Rome through the eye of a witness. The thesis is that the downfall of Rome was caused not by God's indifference to Roman fate but by the general viciousness of the Catholic Romans who were morally inferior to the German barbarians. Important as the book is to the historian. it must be used cautiously because the indignant Salvian is anxious to draw as black a picture of 5th-century Rome as is possible.

Salvian's works are reprinted in J. P. Migne, *Patrologia Latina,* vol. liii. Other editions are those of F. Pauly. *Salviani presbytcri massiliensis opera quae supersunt,* in *Corpus Scriptorum Ecclesiasticorum Latinorum,* vol. viii (1883), and C. Halm, *Salviani presbyteri massiliensis opera quae supersunt,* in *Monumenta Germaniae Historica* (1877). English translations are found in J. F. O'Sullivan, *The Writings of Salvian, tlze Presbyter in The Fathers of the Church* (1947); E. M. Sanford, *On tlze Government of God* (1930).

See S. Dill, *Roman Society in tlze Last Century of the Western Empire (1933).* (G. WL.)

SALVINI, TOMMASO (1829–1915), Italian tragic actor, renon-ned especially for his Othello, was born at Milan on Jan. 1, 1829. to a family of actors. He made his debut as Pasquino in Carlo Goldoni's *Le Donne curiose* (1812) and won his title as tragic actor in Vittorio Xlfieri's *Oreste* (Teatro Valle, Rome, 1847) with Adelaide Ristori. Nine years later he played Othello at Vicenza. He visited America five times between 1873 and 1889 and made his debut in Othello at the Academy of Music in Brooklyn; N.Y. (Sept. 16, 1873); where in 1886 he was billed to play Othello to the Iago of Edwin Booth and the Ghost to Booth's Hamlet. Corrado in Paolo Giacometti's *Morte civile* was one of his most accepted roles. Other title roles were in Giovanni Battista Niccolini's *L'Edipo* a *Colono,* Alfieri's *Saul,* Giacometti's *Sofocle,* and *Macbeth, Lear* and *Coriolanus,* along with Egisto in Alfieri's *Merope* and Paolo in Silvio Pellico's *Francesca da Rimini.* He retired in 1890 and wrote his memoirs *Ricordi, aneddoti e impressioni* (1895). He appeared in Rome in 1902 for Ristori's 80th birthday. Salvini died in Firenze. Dec. 31, 1915.

BIBLIOGRAPHY.—G. C. D. Odell, *Annals of the New York Stage* (1926), articles in *Illustrated London News* and *The Athenaeum,* also *Leaves from the Autobiography of Tommaso Salvini* (1893); Giulio Piccini, *Vita aneddotica di Tommaso Salvini (1908); Notes et souvenirs sur T. Salvini (1878).* (JN. H. M.)

SALVINIA, a small genus of fern allies belonging to the Salviniaceae family of the class Filicinae, or true ferns, and consisting of small floating aquatic plants that are widely distributed in tropical regions. One species (S. *rotundifolia),* of a total of about ten species, is commonly grown in aquariums and has escaped to ponds and marshes in parts of southern United States.

(J. M. BL.)

SALWEEN, a river of Tibet, China (Yunnan) and Burma, having a total length of 1,750 mi. This river, called Nam Kong by the Shans, Thanlwin by the Burmese, Lu Kiang, Nu Kiang or Lu Tzu Kiang by the Chinese, is the longest river in Burma and one of the wildest and most picturesque streams in the world. It rises in Tibet south of the Kuen-lun, and is thus a much longer river than the Irrawaddy. From the time it leaves Tibet it has a very narrow basin, and for long stretches has no other affluents than the mountain torrents from the hills, which rise from 3,000 to 5,000 or 6,000 ft. above the level of the river bed. In the dry season the banks are alternate stretches of blinding white, fine sand, and a chaos of huge boulders, masses and slabs of rock, with here and there, usually where a tributary enters. long stretches of shingle. In the rains all these disappear, and the water laps against forest trees and the abrupt slope of the hills. The average difference between high and low water level of the Salween throughout the Shan state is between 50 and 60 ft., and in some places it is as much as 90.

There are many rapids, caused by reefs of rock running across the bed, or by a sudden fall of from one to several feet, which produce very rough water below the swift glide; but the most dangerous places for navigation are where a point juts out into the stream, and the current, thrown back, causes a violent double backwater. Nevertheless. long stretches of the river, extending to scores of miles, are habitually navigated by native boats. The current is extremely variable, from ½ m.p.h. to ten knots. Launches ply regularly from Moulmein to the mouth of the Yunzalin, in lower Burma. The worst part of the whole Salween, so far as is known, is the gorge between the mouth of the Yunzalin and Kyaulthnyat. It is quite certain that steam launches could ply over very long sections of the river above that, perhaps as far as the Kaw ferry, or even the Kunlong ferry. In Burma however, there are very few settlements on the river itself, and frequently the ferry villages are built 1.000 ft. above the river.

The Chinese believe the Salween valley to be deadly to all strangers, but it is in Chinese territory — particularly in the Lu Kiang, or Möng Hko state — that there is the largest population on the river until Lower Burma is reached. A description of the Salween resolves itself into a list of the ferries at which it can be crossed, for no one marches up the river. The river is bridged by the Chinese on the main route from Tēng Yüeh (Momien) and Bhamo to Tali-fu. Native boats can ply from Kyodan S., and light draught steamers ascend as far as Shwegūn, 63 mi. from Moulmein.

The Salween enters the sea in the Gulf of Martaban by two mouths, one to the north and one to the south of Bilugyun island. The southern mouth is the more important, and is the one by which ocean-going craft approach the port of Moulmein. The Salween is a formidable natural obstacle. It seems probable, however, that long stretches of it can be opened to trade. It is certainly no less navigable than the Middle Mekong or the Yangtsze-kiang above I-chang.

SALYES (SALLYES, SALYI, SALLUVII), a people occupying the plain south of the Druentia (Durance) between the Rhone and the Alps. According to Strabo (iv, p. 203) the older Greeks called them Ligyes. and their territory *Ligustikē.* In 154 B.C. the inhabitants of Massalia, who had been connected with the Romans by ties of friendship since the second Punic war, appealed for aid against the Oxybii and Decietes (or Deciates). These people, called by Livy (*Epit.* 47) "transalpine Ligurians," were perhaps two smaller tribes included under the general name of Salyes. They were defeated by Quintus Opimius. In 125–124 B.C. hostilities broke out between the Romans and the Salyes from the same cause.

Gaius Sextius Calvinus (123–122 B.C.), subdued the Salyes, de-

stroyed their chief town, and founded near its ruins the colony of Aquae Sextiae (Aix). Part of their territory was handed over to Massaliots. From this time the Salyes practically disappear from history.

SALZA, HERMANN VON *(c.* 1170–1239), master of the Teutonic order and councilor of the emperor Frederick II, entered the Teutonic order in early life, became very intimate with Frederick II, took part in the expedition to Damietta in *1221,* and accompanied the emperor on the crusade of *1228.* About *1210* he was appointed master of the Teutonic order and in *1226* received the province of Kulm from Conrad I, duke of Masovia, in return for help against the Prussians. In *1230* the conquest of Prussia was begun by the order, although not under his immediate leadership. In *1225* he reconciled Valdemar II, king of Denmark, with Henry I, count of Schwerin, and thus won again the land on the right bank of the Elbe for the empire and the recognition of imperial superiority over Denmark. Trusted by Pope Gregory IX and the emperor alike, he brought about the treaty of San Germano between them in *1230,* was the only witness when they met in conference at Anagni in the same year and it was he who, in *1235,* induced Frederick's son Henry to submit to his father. He died on March *19, 1239,* at Barletta in Apulia, and was buried there in the chapel of his order.

See A. Koch, *Hermann von Salza, Meister des deutschen Ordens* (1885).

SALZBURG, a Bundesland of Austria (area 2,762 sq.mi.), includes from south to north parts of the following lithological belts of the Alps: the crystalline, the slate and schist, the limestone High Alps and the flysch zones. The first named extends from the glacier-capped Hohe Tauern and southern slopes of the Niedere Tauern to the line of the Pinzgau eastward to the Mandling pass. This is a region much dissected by tributaries of the Salzach and characterized by forestry and pastoral pursuits. The most important valley is that of the Gastein leading to a col between the Hohe and Niedere Tauern ranges and followed by a railway to Carinthia. North of this belt is a wedge-shaped mass of slates and schist, with softer outlines and lower forested heights, which is in turn replaced by the lake-strewn plateau of Dachstein limestone, split into several detached blocks; *e.g.,* the eastern end of the Kitzbühl Alps, the Salzburg Alps (Birnhorn *8,642* ft.), the Reiteralpe and the glacier-capped Schonfeldspitze mass *(8.320* ft.). Part of the Dachstein group also belongs to Salzburg. Drainage is effected mainly by the Salzach which in its upper course follows a west-east marshy valley (Pinzgau) along the foot of the Hohe Tauern, at the junction of crystallines and slates, to Schwarzach St. Veit, where it takes a transverse course through a wider and more fertile valley (Ponzgau), breaking through a narrow pass between the Hagengebirge and the Tennegebirge and reaching the foreland at Salzburg; the upper waters of the Enns and blur take the drainage of the eastern half of the Niedere Tauern. Salzburg is noted for its numerous beautiful lakes and the many magnificent falls on its rivers, *e.g.,* the four Krimml falls, together 1,247 ft. high, the most important falls in the eastern Alps.

The enclosed basins of the higher mountain districts experience very hard winters and settlement in them is thin and confined to the sunny slopes and alluvial fans. About 16% of the total area is unproductive and of the remainder about 11% is given over to crops and 10% to meadows. Forestry and pastoral activities. aided by a wealth of alpine pasture (30% of the area) are most important. Mineral resources include: salt at Hallein, copper near Bischofshofen, iron ore at Werfen, marble (Adnet) and small quantities of gold, silver and arsenic. The absence of coal is compensated by the rich stores of water from which electrical power is developed at Lend Gastein, Barenwerk, etc., yet industry is only moderately progressive.

Catering for visitors to the spas, scenic resorts and centres' for winter sports is the most remunerative industry. Apart from Salzburg (*q.v.*), the capital, the population, which was *327.232* in *1951* and 351,970 in *1961* was largely rurally distributed, mainly along the valleys and chief lines of traffic. Many of the people are of German stock and they are mainly Roman Catholic in religion. The province *(Reichsgau)* was seized by Germany in March *1938* and held until *1945.*

BIBLIOGRAPHY.—F. Martin, *Kunstgeschichte von Salzburg* (1924); *E.* Spengler, *Geologischer Fuhrer durch die Salzburger Alpen und das Salzkammergut* (1924); *E.* Kriechbaum, *Salzburg und das Oberdonauland* (1938).

SALZBURG, the capital of the Bundesland of Salzburg, Austria, lies on both banks of the Salzach where this river leaves its narrow valley through the limestone Alps and enters the alpine foreland.

The situation is important economically and strategically, for there several types of physical region, with differing agricultural possibilities, meet and the Orient route from Germany through Munich joins the Orient route from France through Switzerland and branches along the Salzach valley and through the Hohe Tauern to Carinthia and Italy. The site has been occupied since pre-Roman time, the original settlement being replaced by a Roman trading town (*Juvavum*) which was sacked by the barbarians (477). The modern city grew up around the monastery and bishopric founded there about *700* by St. Rupert of Worms, who preached Christianity in the district at the invitation of its ruler Duke Theodo of Bavaria, and its history from that time is closely bound up with that of the see. The present name, due to the local abundance of salt, appears first in *816* by which time it had been raised to an archbishopric. Its archbishops gained in temporal power and dignity and were made imperial princes by Rudolf of Habsburg in *1278.*

Relations between the ecclesiastical rulers on the one hand and the nobles and people on the other were always difficult, *e.g.,* during the Peasants' War of 1525–26, quelled with the aid of the Swabian league. and contributing to a reaction against the church when Salzburg became a stronghold of resistance to the Reformation. Persecution was rife and Protestant citizens were driven from the town. Nevertheless, the movement grew and in 1731–*32,* aided by the intervention of Frederick William I of Prussia, *30,000* people sold their possessions and left the see, *6.000* of them leaving the capital. By the peace of Lunéville *(1802)* the see was secularized and given to the archduke of Austria. Follo ing the peace of Pressburg *(1805)* it fell to Austria but four years later passed to Bavaria, returning to Austria in *1816* with the exception of a small portion on the left bank of the Salzach. In *1849* it became a crownland, several of its districts being transferred to Tirol. and remained so until *1918,* when it became part of the Austrian republic. With the rest of Austria it was annexed to Germany by Hitler from March *1938* to *1945.*

Its ecclesiastical buildings include *8* convents and *25* churches, the majority interesting from their antiquity, architecture or associations. Of these, the 17th century cathedral. one of the largest and most perfect specimens of the Renaissance style in the Germanic countries, is on the model of St. Peter's at Rome. Though situated in the old town it is bounded on three sides by open squares, which permit its beauties to be appreciated. Other buildings of note are the old and new residences of the archbishops. the latter occupied by government offices. the present palace, the 15th century town hall and the Mozart house and museum. The only relic of the university *(1623–1810)* is a theological seminary. By the suppression of its university Salzburg has been prevented from making that contribution to Austrian culture that its importance as an administrative and spiritual centre leads one to expect.

Salzburg has had a heavy seasonal tourist traffic. favoured by a healthy climate. delightful scenic surroundings and excellent music.

Its manufactures include brewing, bookbinding, musical instruments and marble wares and light iron goods.

Pop. *(1961)* of the *Bundesland* of Salzburg was *351,970,* and of the town, *109.724.*

SALZGITTER, a town in the Land of Lower Saxony. Germany. on the Mittelland canal and the Hildesheini-Borssum railway, 12 mi. S.W. of Brunswick. Pop. (1959 est.) *106.761.* It was formerly a small town, known chiefly for its salt baths; however, after *1937* it was enlarged into a model housing settlement as the residence for workers in the newly created Hermann Goring Coal and Iron works factories nearby. Coal and coke for

smelting ore was brought cheaply and easily from the Ruhr by the Mittelland canal. opened in 1937.

SALZKAMMERGUT is a mountainous district of Austria forming the drainage area of the Traun and its tributaries above Gmunden. Originally its name (literally "salt-exchequer property") and its economic importance were derived from the valuable salt deposits. worked from prehistoric times at Hallstatt and Aussee, but although these are still valuable the region is rapidly developidg as a health and tourist resort. Belonging to the eastern Alps it contains the Dachstein group (Dachstein. 9.826 ft.) with the most easterly glaciers of the Alps, the Totes Gebirge (Grosser Priel. 8,277 ft.), the Hollengebirge (Hollenkogel, 6,109 ft.), the Ischler and Sensen groups. Among its lakes are Traun. Hallstatt. St. Wolfgang and Attersee, largest in Austria (18 sq.mi., 1.532 ft. above sea level, 560 ft. deep), each over-shadowed by forested heights. The district embraced parts of the Austrian provinces of Styria, Salzburg and Upper Austria, and the occupations of its population, apart from those suggested above, are cattle rearing. forestry and the development of electricity. The towns are small, along the valleys and lake shores. Among them Gmunden (*q.v.*) is the chief, while Hallstatt is famous for its museum of local finds illustrative of the cultural period to which it gave its name. Germany annexed the district in 1938.

SAMAIN, ALBERT VICTOR (1858–1900), French poet. was born at Lille on April 4, 1858. He was educated at the lycée of that town, and on leaving it entered a bank as a clerk. He enjoyed no literary associations, and his talent developed slowly in solitude. About 1884 Samain went to Paris, having obtained a clerkship in the Prefecture de la Seine, which he held for most of his life. His earliest volume of poems, *Au Jardin de l'infante,* led to the sudden recognition of his talent, and to applause from critics of widely different schools. In 1897 this book was reprinted in a more popular form! with the addition of a section entitled *L'Urne penchée.* Samain's second volume, *Aux flancs* du vase, appeared in 1898. His health began to fail and he withdrew to the country, where he died, in the neighbourhood of the village of Magny-les-Hameaux, on Aug. 18, 1900. A third volume of his poems, *Le* Chariot *d'or,* appeared after his death. with a lyrical drama, *Polyphème* (1901), which was produced at the Théâtre de l'Oeuvre in 1904. Samain's natural life was patiently spent in squalid conditions; he escaped from them into an imaginative world of the most exquisite refinement.

Gosse, French *Profiles* (1905); *F.* Gohin, *L'Oeuvre poétique d'Albert Samain, 1858–1900* (1919); G. Bonneau, *A. Samain, poète Symboliste* (1925).

SAMANÁ, a province in northeastern Dominican Republic. Area 848 sq.mi., pop. (1950) 83.263. It occupies the mountainous (to 1,673 ft.) Samaná peninsula. the delta region of the Yuna river and a large part of the northeastern coastal plain. It is a rich coconut region. a leading rice producer from reclaimed marshlands and a significant producer of cacao. corn and tropical hardwood. The province was created in 1908 from El Seibo province. The capital. Santa Bárbara de Samaná (1950 pop. 2,480), was founded in 1756 by Spaniards from the Canary Islands, and in 1825 there was a notable influx of Negro immigrants from the U.S. Sánchez is a railroad terminus and port.

SAMANÁ BAY, which is bounded on the north by the Samaná peninsula is approximately 40 mi. long and 15 mi. wide. with deep water and well-protected anchorages. and is one of the finest natural harbours in the West Indies. Apart from its importance as a fishing and tourist site. it is used relatively little for commerce. However the bay's location. on the Mona passage between the Atlantic and the Caribbean, makes it potentially important strategically, and several times in the 19th century the United States or other powers showed an interest in acquiring it. Two treaties. one leasing the bay to the United States and the other providing for the annexation of the Dominican Republic were signed in 1869. but both agreements were defeated by opposition in the U.S. senate when it was learned that U.S. speculators were promoting the annexation in the hope of profiting by concessions in the Samaná region. (D. G. Mo.; D. R. D.)

SAMANA RANGE, mountain ridge in the Kohat district of the North-West Frontier Province of Pakistan, commanding the south boundary of Tirah. The ridge lies between the Khanki valley on the north and the Miranzai valley on the south, and extends for some 30 mi. W. from Hangu to the Samana Suk. It is some 6,000 to 7,000 ft. high. Beyond the Samana Suk lies the pass, known as the Chagru Kotal, across which the Tirah Expedition marched in 1897. On the opposite hill on the other side of this road is the famous position of Dargai (see TIRAH: Campaign). After the Miranzai Expedition of 1891 this range was occupied by British troops and eleven posts were established along its crest, the two chief posts being Fort Lockhart and Fort Gulistan. In 1897 all the forts on the Samana were attacked by the Orakzais, and this and the Afridi attack on the Khyber pass were the two chief causes of the Tirah Expedition. When Lord Curzon reorganized the frontier in 1900, British garrisons were withdrawn from most of the Samana forts, which were later held by a corps of tribal police 450 strong, called the Samana Rifles.

SAMANIDS, the first great native dynasty which arose in Persia after the Arab conquest. In the 8th century Saman, a Persian noble of Balkh, who was a close friend of the Arab governor of Khurasan, Asad ibn 'Abdullah, was converted from Zoroastrianism to Islam. His son Asad, named after Asad ibn 'Abdullah, had four sons who rendered distinguished service to the caliph al-Ma'mun. In return they all received provinces: Nuh obtained Samarkand; Ahmad, Ferghana; Yahya, Shash; and Ilyas, Herat. In 875 Ahmad's son Nasr was recognized by the caliph al-Mu'tamid as governor of Transoxiana. He was succeeded in 892 by his brother Isma'il, who overthrew the Saffarids (*q.v.*) in Khurasan and the Zaidites of Tabaristan and thus, though remaining nominally a provincial governor under the caliph of Baghdad, established an almost independent rule over Transoxiana and eastern Persia, with Bukhara as his capital.

The descendants and successors of Isma'il, almost all renowned for the impulse that they gave both to the patriotic feelings and the national poetry of modern Persia (see PERSIAN LITERATGRE), were Ahmad ibn Isma'il (907–914); Nasr II, ibn Ahmad, the patron and friend of the great poet Rudagi (914–943); Nuh I, ibn Nasr (943–954); 'Abd ul-Malik I, ibn Nuh (954–961); Mansur I, ibn Nuh, whose vizier Bal'ami translated Tabari's universal history into Persian (961–976); Nuh II, ibn Mansur, whose court poet Dakiki began the Shahnama (976–997); Mansur II, ibn Nuh (997–999); and 'Abd ul-Malik II, ibn Nuh (999). Under their government, which was organized on a loosely centralized feudal system, the provinces of Transoxiana and Khurasan attained a high degree of prosperity. The expansion of their industry and commerce is attested by the use of Samanid silver dirhems as currency all over the north of Asia, and they have been found in great numbers in Pomerania, Sweden and Norway, brought by Russian traders. The later interruption of the northern trade routes was a factor in weakening the dynasty; and it succumbed eventually to the internal feuds and rivalries of the nobles and to the pressure of the rising Turkish powers in central Asia and Afghanistan.

Under Mansur I a Turkish slave, Alptagin, formerly commander of 'Abd ul-Malik's guard at Bukhara, had to flee for refuge to the mountainous regions of Ghazni, nhere he established a semi-independent rule. to which, after his death in 977, his son-in-law Sabuktagin, likewise a former Turkish slave, succeeded. Nuh II, in order to retain at least a nominal sway over those Afghan territories confirmed him in his position and invested Sabuktagin's son Mahmud with the governorship of Khurasan, in reward for the help they had given him in his struggles with a confederation of disaffected nobles under the leadership of Fa'ik. During this conflict, the greater part of Transoxiana was occupied by the Turkish Kara-khanids, whose chief. Boghra Khan, occupied Bukhara for a short time in 992. Sabuktagin died in the same year as Nuh II (99;) : and Mahmud (see MAHMUD OF GHAZNI), confronted with an internal contest against his own brother Isma'il, had to withdraw for a short time from Khurasan. This interval sufficed for Fa'ik. supported by a Kara-khanid force under the Ilek khan Nasr I. to concentrate poner in his onn hands and

to involve Mansur II in a conflict with Mahmud. After the deposition of Mansur, who was suspected of intending to come to an agreement with Mahmud, the latter took possession of Khurasan. A few months later, the Ilek khan Nasr marched on Bukhara and carried 'Abd ul-Malik and his relatives into captivity. The last prince of the Samanid house, Muntasir, a bold warrior and a poet of no mean talent. carried on guerrilla warfare for some years against both Mahmud and the Kara-khanids, till he was assassinated in 1005.

See CALIPHATE and PERSIA: *History*.

See W. Barthold. *Turkestan Down to the Mongol Invasion* (1928); S. Lane-Poole, *Muhammadan Dynasties* (1894).

SAMAR, an island in the east central part of the Philippine archipelago, which with several dozen surrounding islets constitutes a province. Area 5,050 sq.mi.; pop. (1959 est.) 927,630. Samar is the third largest island in the Philippines (after Luzon and Mindanao). It lacks the high mountains which characterize many of the islands in the group but is exceedingly hilly. with extensive level land found only in the coastal areas. The highest point is Mt. Capotoan (2,789 ft.). in the north central section. Annual rainfall varies from 100 to 170 in. and is evenly distributed throughout the year except on the east coast where there is a marked winter maximum. Samar receives considerable wind and flood damage from frequent typhoons.

Rice is the main food crop followed by root crops such as sweet potatoes and cassava. Coconuts and bananas are raised for cash along the coastal lowlands. Iron ore in small quantities is mined in the southeastern part of the island and is shipped from the port of General MacArthur. There are deposits of coal and phosphate rock near the west coast.

The provincial capital and important trading town is Catbalogan, pop. (1959 est.) 32.839. on the west coast; Calbayog. a chartered city. is also a trading centre located on the northwest coast.

(R. E. HE.)

SAMARA (now KUIBYSHEV), an *oblast* of the Russian Soviet Federated Socialist Republic. U.S.S.R.. lying east of the Volga. except for the territory enclosed in the great Volga loop, and south of the Tatar Autonomous Soviet Socialist Republic. Its southern boundary lies between the Great Irgiz and the railway from Saratov to Uralsk. and runs parallel to the latter to the boundary of the Kazakh S.S.R.. on the Obschiy Syrt plateau. Chkalov *oblast* and the Bashkir A.S.S.R. lie to the east.

South of the Volga loop (Samarskaya Luka) is a low flat steppe recently emerged from the post-Pliocene Aral-Caspian basin; from the Samara to the Sok are Permian formations. The region is a transition area between the black earth and salt steppe soils. The most fertile black earth, humus content of 18%, lies northeast of the region in the lyesso-steppe area—*i.e.,* steppe with patches of forest, mainly oak. Between the Samara and the Moksha, except for a patch north and south along the eastern part of the latter the black earth is of poorer humus content, of a sandy type, and patches of salted soil appear. especially near the Volga. South of the Great Irgiz the soil is salt steppe. and there are salt marshes. South of the Samara there is no forest, but the land in the loop and north of it is forested, and there is a patch of forest on the north bank, west of Buzuluk.

The region is undergoing a process of rapid desiccation. It has an arid climate, the rainfall varying from 8 to 16 in. per annum, mostly falling in spring and summer in heavy showers, so that the runoff is excessive and only the surface becomes saturated. The prevailing winds are from the northeast, dry and strong. and blowing with great violence in winter, so that snow does not lie and the ground is exposed to the severe winter frost. The average July temperature at Kuibyshev is 70.4° F. and January 9.3° F. An added disadvantage is the liability to years of excessive drought such as 1911 and 1921. Winter lasts for five months and rain falls on an average of 95 days per annum, 34 of which are in June–August. Thunderstorms are frequent in June and July and, if accompanied by dry hail, may ruin the crops.

Diminution in the spring rainfall causes the disastrous famines to which the region is subject. Of the inhabitants, 90% are occupied in agriculture, depending on the crops for sustenance and for purchase of necessities. Bad harvests, therefore, such as those of 1911 and 1921, bring disaster. In 1921 great numbers died of starvation and starvation diseases and others fled from the region, many to perish on the road. Bands of starving children, whose parents had succumbed first in their efforts to feed the children, penetrated even as far as the Caucasus. Livestock diminished, and when the weakened survivors of the terrible period faced the next year there was a shortage of everything, from seeds and instruments to working cattle.

The area subsequently revived to an extraordinary degree, an evidence of the fertility of its famous black soil. Attention had been concentrated on the drought problem and the need for more intensive agriculture in Samara as early as 1864, and some efforts were made to improve the type of cultivation. Further evidence of the crisis of extensive agriculture in the region is the great variation in the harvest. In 1911 there was not enough to satisfy local needs, in 1913 a surplus of 110,000,000 poods (3,972,430,000 lb.). Six experimental stations were established to study local problems, Resenchuk, Buguruslan, Alekseyev, Bugulma, Buzuluk, and one connected with the Kuibyshev agricultural school at Kinel. In 1927 collective farming became the foundation of agricultural policy. Mechanized agriculture achieved considerable success in its struggle with drought.

The main lines along which attempts are being made to improve agriculture and lessen the chances of famine in the district are the increasing practice of irrigation; a wider range of variety in crops, and especially the sowing of grasses and lucerne, in which respect Kuibyshev stands first in the regions of the famine area; the preservation of what forest is left, and the planting of more trees, in view of their protective value in a windswept region, and their influence on moisture conditions in the soil; the greater extension of stock raising, in view of the increasing importance of meat, dairy products, fats and wool for the growing industrial regions. Though many experiments have been made, no kind of winter corn able to withstand the severe conditions has yet been discovered, but more drought resisting varieties of hard wheat, which commands a better market than soft wheat, have been introduced.

About 90% of Kuibyshev region is favourable for vegetation, and of this about two-thirds is ploughed land, about one-tenth is forest and scrub, and the rest is pasture, meadowland or garden. In the stock-raising areas, cattle, sheep and pigs are at pre-1914 level, but horses are still much below that level. Cattle plague often devastates the herds. A few dairy artels have been established. Bee-keeping and poultry raising are subsidiary occupations. The manufactures in the region are entirely dependent on local products and include flour milling, distilling, starch manufacture, tobacco making, confectionery, woollen goods, leather and matches. Most of them are of the small scale, peasant type. Two sugar factories were working before 1914, and there is one factory producing agricultural machinery.

The population (1959) was 2,257,000 of which 1,391,000 was urban. The population consists mainly of Great Russians, with Mordvas, Chuvashes, Tatars and Bashkirs. The ethnographic variety is great, and the colonies of Poles, Mennonites from Danzig, and Circassians settled there in 1847–59 by the government added to it. Difficulties of overcoming illiteracy under these conditions are great. Area of the region is 20,772 sq.mi. The Volga is the great artery of commerce, but its tributaries are shallow and not suitable for navigation, with the exception of the Great Irgiz up to Kushum. Kuibyshev is linked by rail with Moscow on the west. and with Ufa and Chkalov on the east, while a branch line reaches the Sok river. Roads are poor. there are few bridges, and transport difficulties hamper development.

The chief towns are Kuibyshev (*see* SAMARA), Pugachevsk, Buzuluk and Buguruslan.

See P. A. Preobrazhenskiy *The Restoration of Agriculture in the Famine Area of Russia* (1922, in English); *Colonisation of the Samara Region* (1923, in Russian); M. M. Dubenskiy, *The Central Volga Region* (1927, in Russian).

SAMARA (now KUIBYSHEV), a town of the Russian S.F.S.R. in the Kuibyshev *oblast,* 53" 11' N., 50° 9' E., on the left

bank of the Volga loop, at the junction of the Samara river. Pop. (1959) 806,000. It is a fine river port, and acts as an entrepôt for goods brought by rail and transhipped, or vice versa. Its industries include the making of machinery, distilling, brewing, matchmaking, sawmilling, leatherwork and flour milling. There are municipal electricity, water and canal and tram services. Near the town is a *kumiss* or fermented mare's milk sanatorium. Samara was built in 1586 to secure communication between the recently conquered principalities of Kazan and Astrakhan. Later discontent among the serfs led to a rising in the district in 1774 and the town was the centre for its leader, Pugachev. In 1670 it had been captured by the rebel Stenka Razin. Its importance as a trading centre dates from the end of the 18th century, when colonization spread eastward. In 1918 the Russian state gold treasure was transferred from Kazan to Samara, under the charge of employees of the tsarist government, but when the military situation became critical it was removed under an escort of Czech soldiers.

SAMARIA, ancient city of Palestine in the tribe of Ephraim, 6 mi. N. of Shechem (Nablus). The site, an isolated hill in the centre of Palestine, is one of great natural strength. Sebastiyeh, a village of 600 inhabitants, occupies part of the area of the royal city; its houses are mostly built with ancient materials.

History.—Omri, king of Israel, bought the hill from its owner, Shemer, for two talents of silver, and erected a city which he made his capital (I Kings xvi, 24). The evidence of the excavations establishes that the site was unoccupied prior to the time of Omri (10th century B.C.). Ahab occupied the city, built a temple and remodelled Omri's palace, which was further extended later and probably by Jeroboam II. Ben-hadad II of Syria in the days of Elijah and Elisha, after having been repulsed from its walls (I Kings xx, 34) returned to besiege it and bring it to dire straits through famine (II Kings vi, vii). Shalmaneser IV laid siege to it for three years (724–22 B.C.), but died during its progress. The operation was completed by Sargon. who deported its inhabitants and substituted for them a new body of settlers from Cutha, according to Jewish tradition, the ancestors of the Samaritans. Alexander the Great conquered it in 331 B.C., as did also later Ptolemy Lagos and Antiochus Poliorcetes. It offered a lively resistance to the fanatical John Hyrcanus. Pompey rebuilt it, and Gabinius restored it. Herod the Great was its chief benefactor. A temple, hippodrome and colonnaded streets were among his endowments; their remains still arrest attention. He made it his capital and it took the name Sebaste (commemorating Augustus). The rise of Nablus (Neapolis), restored by Vespasian, involved the gradual decay of Sebaste. The crusaders built a church on the hill and established a bishopric. The church, like so many others. was later converted into a mosque. Here were shown the tombs of Elisha, Obadiah and John the Baptist.

Archaeology.—From 1908 to 1910 excavations, under the auspices of Harvard university were carried out on the site, the results of which were published in 1924. The oldest edifice found on the hill was the palace of Omri, added to and enlarged by Ahab and Jeroboam II. An interesting discovery was that of a number of Hebrew texts traced in ink on tiles in Hebrew writing of a beautiful type belonging to the 9th century B.C. The foundations of a forum, senate house, palace, city gate flanked by two round towers, etc., have been laid bare. The low ground to the northeast was the site of the stadium.

See G. A. Reisner, C. S. Fisher, D. G. Lyon, Harvard Excavations *at Samaria (1908–10)* (1924); R. Dussaud, "Samarie au temps d'Achab," Syria 6, 314 et seq. (1925). (E. Ro.)

SAMARITANS, the name given to a peculiar religious community formerly widespread throughout Samaria in Palestine and now represented by a few families at Nablus, near the site of the ancient Shechem. They claim to be descendants of the ten tribes, denying that the latter were ever deported en masse to Assyria, as related in the Old Testament (II Kings xvii, 2.3). Their religion, they assert, represents the true, unalloyed teaching of Moses, since they accept the Pentateuch alone as holy scripture. This they transmit in an archaic script resembling ancient Phoenician characters and in a text which differs slightly (sometimes only through dogmatic manipulation) from that of the Jews. They identify the "chosen place" of God not, as do the Jews, with Zion, but with Mt. Gerizim, overlooking Shechem. In their version of Deuteronomy xxvii, 4, the altar of God is enjoined to be erected on that mountain, not on Mt. Ebal, as in the Jewish recension, and a similar injunction is appended to the Ten Commandments, after Exodus xx, 17, and Deuteronomy v, 21. The temple at Jerusalem and the earlier shrine at Shiloh are regarded as apostatic.

The origin of the sect is obscure because the native and the Jewish accounts (in Josephus, Jewish *Antiquities,* xi, 7, 2; c. 8) are alike tendentious, the former deliberately apologetic and the latter deliberately defamatory. Most probably, the inhabitants of Samaria first organized themselves as a schismatic community when the Jews, regarding them as mongrel stock, refused their aid in the building of the Second Temple (Ezra iv, 1–3). The schism seems to have crystallized, however, only about 200 years later, when a rival temple was established, about 332 B.C., on Mt. Gerizim.

In spite of the differences which separated the two communities, their external histories at first ran parallel. Samaritans as well as Jews were deported to Egypt by Ptolemy Lagos, the two parties subsequently continuing their rivalry in Alexandria; while under Antiochus IV Epiphanes they too were compelled to devote their sanctuary to the worship of a heathen god (II Maccabees v, 23; vi, 2). Open hostility would appear to have developed especially when the Hasmonaean state of the Jews embarked upon a policy of expansion. and this reached its climax with the destruction of the Samaritan temple by John Hyrcanus I in 129 B.C. Thereupon the Samaritans found themselves caught between the Jews on the one hand and the Romans on the other. When the Jews were subjugated in 63, Samaria was liberated from Jewish domination and entered briefly upon a new lease of life. The capital city was restored by the Roman governor Gabinius and enjoyed the special favour of Herod, who there celebrated his marriage with Mariamne. On the other hand, the Samaritans supported the Jews in an uprising against Vespasian and paid dearly in a retributive massacre, and like the Jews they were grievously oppressed by Hadrian, who burned their traditional writings. They seem also to have shared in the Jewish dispersion, for in later times we hear of Samaritans and their synagogues in Egypt, in Rome and in other parts of the empire. During the 4th century, however, they enjoyed a brief renascence on their native soil under the leadership of a certain Baba Rabba, who built many synagogues (some of them excavated in the second quarter of the 20th century) in the villages around Shechem. Eventually, hostility to the Christians brought about their final eclipse. In 529 a rigorous edict against them was promulgated by Justinian, and although he subsequently softened its terms, renewed hostility on their part resulted, in 572, in a definitive withdrawal of all their rights and privileges by Justin II.

Under Arab and, later, under Turkish rule, the history of the Samaritans is generally one of constant oppression and subjection, relieved only by occasional bright intervals. Although they are mentioned in later times by such Arab writers as Masudi (943) and Sharastani (d. 1153), by Jewish travellers such as Benjamin of Tudela (1163) and Obadiah Bertinoro (1488 in Egypt), by Jehan de Mandeville (1322), William of Baldensel (1336) and others, little was known of them in Europe until Joseph Scaliger opened communications with them in 1583. In consequence of the interest thus aroused, the traveller Pietro della Valle visited them in 1616 and obtained from them a copy of their Pentateuch, of their ancient Aramaic translation (Targum) of it and of various other writings. At that time they had already quit their colony in Damascus and were beginning also to abandon their other settlements and to concentrate themselves in Nablus. By mid-20th century they lived mainly in a special quarter of that city, about 190 in number, though a few families had migrated to Tel Xviv and Jaffa. Their economic and cultural level is extremely low, and their principal problem is how to perpetuate themselves without infringing the forbidden degrees of marriage.

Religion.—Briefly summarized, the creed of the Samaritans is as follows: (1) God is one, incorporeal and without associate; (2) Moses is the only prophet, a preordained creature sui generis, the vessel of the divine "light" and "image" and the intercessor for man on the final Day of Judgment; (3) the Law of Moses, coeval with the world, is the only divine revelation and is immutable; (4) Mt. Gerizim is the chosen place of Cod, the only centre of worship and the "navel of the earth"; (5) there will be a Day of Requital and Reward, when the dead will emerge from their graves, the righteous to enter paradise, the guilty to roast in eternal fire. The Samaritans divide their history into a period of Divine Pleasure (Rahuta), when their temple was standing, and one of Divine Displeasure (*Fanuta*), which has continued ever since it was destroyed. Eventually, 6,000 years after creation, a Restorer (Taheb) will arise to ameliorate their fortunes. He will live 110 years.

In religious practice, the Samaritans observe only those laws and institutions that are prescribed in the Pentateuch. They interpret them, however, in a manner divergent from normative Jewish tradition, often agreeing with the Sadducees against the Pharisees and with sectarian Jewish usages later revived by the Qaraites. Passover, for example, begins on the 14th day of that lunar month the beginning of which falls in April (*Abib; cf.* Deuteronomy xvi, 1); Pentecost falls always on a Sunday, since the law (Leviticus xxiii, 15) which dates it seven weeks "from the morrow of the sabbath" is taken to refer to the sabbath in the paschal week. They do not wear prayer shawls or phylacteries, interpreting the laws of Numbers xv, 37–41, and Deuteronomy vi, 8,

symbolically. The law of levirate marriage (Deuteronomy xxv, 5) is taken to enjoin the marriage oi a widow to any near kinsman of her deceased husband, not specifically to his blood brother. The paschal sacrifice is still offered on Mt. Gerizim, and pilgrimages are made thither on each of the seasonal festivals.

The religious direction of the community is vested in a high priest. Formerly he traced his ancestry to Aaron, but in 1623 the Aaronid line died out, and ever since he has been known as the "priest levite," claiming descent from Aaron's uncle Uzziel (Exodus vi, 18).

In Jewish tradition, the Samaritans are styled Cuthaeans, the implication being that they are not genuine Israelites but simply descendants of the ioreign colonists irom Cutha allegedly imported into Samaria by the Assyrian conqueror when the kingdom of Israel fell in 722 B.C. (II Kings xvii, 24). Various restrictions are imposed on intercourse with them, and intermarriage is forbidden.

Language and Literature.— The Samaritan language is a dialect of Western Aramaic. After the Moslem conquest in 632, however, it was superseded by Arabic ior all but liturgical purposes.

During the Hellenistic period, the Samaritans appear to have composed several works, including a translation of their Pentateuch in Greek, but all of these perished except for a few iragments. Of extant writings there is none which can be dated before the 4th century A.D. The Targum or Samaritan-Aramaic version of the Pentateuch was most probably redacted about that time, though it was clearly based on a much older tradition and must have undergone various recensions. It bears a strange similarity in many points to the contemporary Jewish Targum of Onkelos. To the same period belong the liturgical compositions of Amram Darah and Marqah, as well as the latter's midrashic commentary (called "The Book of Wonders") on parts of the Pentateuch, all in Aramaic. The last named is especially valuable not only from the linguistic viewpoint but also because it exemplifies a tradition of exegesis divergent from that of the Jews and because it anticipates several concepts and even idioms found later in the Koran. With the possible exception of one or two hymns there is nothing further until the 11th century, when there appears an Arabic version of the Pentateuch probably composed by Abul-hasan oi Tyre and later revised by Abu Said and Abul-barakat. Oi the same date (1053) is an anonymous commentary on Genesis, interesting because it quotes from books of the Bible other than the Pentateuch and from the Mishnah. Other mediaeval writings oi note are: (1) the *Kafi*, or "Ritual Compendium," by Joseph ben Solomon oi Askar, a village near Shechem (1042); (2) the *Masa'il al-Khilaf*, a disquisition on differences between the Samaritans and the Jews, by Munajja ben Sadaqah (*c.* 1150): and (3) the Tabakh, or "Potpourri," a collection of ritualistic and doctrinal discussions by Abul-hasan of Tyre. All these works are in Arabic. To the same period probably belongs also an Aramaic book of biblical legends known as "The Stories (*Asatir*) of Moses," though this would appear to draw upon far older sources. Of Samaritan chronicles, mention may be made especially of the *Taulida*, commenced in 1149 by Eleazar ben Amram and continued in 1334 by Jacob ben Ishmael in Damascus, as well as oi the so-called Samaritan Book of Joshua, a record of events irom the death of Moses until the 4th century A.D. This work appears to have been compiled irom traditional material at some time in the 13th century. An Arabic chronicle by Abul-fath, written in Egypt in 1355, has also survived. There are also several minor theological treatises and a more ambitious work entitled "Way of the Heart" (Sirr all-Qalb) by Abraham Qabazi of Damascus (1532), as well as a poetic book of praises in honour of Moses (*Molad Mosheh*) by Qabazi's pupil Ismail ar-Rumaihi (1537). In the 19th century, translations of these works were made from Arabic into Samaritan by the priests Pinehas ben Isaac and Jacob ben Aaron. and such activity was continued later by Abisha ben Pinehas and Ab Hasda (Abul-hasan) ben Jacob.

The principal collections oi Samaritan manuscripts are in the British Museum and the Vatican library. Most of the literature remains unedited and unrranslated.

BIBLIOGRAPHY.—James A. Montgomery, The *Samaritans* (Philadelphia, 1907); Moses Gaster. *The Samaritans* (London, 1925) and The *Asatir of Moses* (London, 1927). The Pentateuch was edited with critical apparatus by August von Gall (Giessen, 1914–18). A convenient edition of the Targum is that by Adolf Brüll (Frankfurt, 1874–75). For the liturgy, *see* A. Cowley, *The Samaritan Liturgy* (Oxford. 1909). The best grammar of the Samaritan language is that of J. H. Petermann in the "Porta Linguarum Orientalium Series" (Karlsruhe and Leipzig, 1873). (T. H. G.)

SAMARIUM (symbol Sm, atomic number 62. atomic weight 150.43) is a metallic element belonging to the rare-earth group. The element, as well as the mineral samarskite. is named after the Russian engineer Col. M. Samarski. It has seven natural. stable isotopes: Sm^{144} (3.16%); Sm^{147} (15.07%); Sm^{148} (11.27%); Sm^{149} (13.84%); Sm^{150} (7.47%); Sm^{152} (26.63%): and Sm^{154} (22.53%). One of these, Sm^{147}. is a naturally occurring radioactive isotope: it has a half life of 1.4×10^{11} years and is an a-particle emitter. The element was discovered in 1879 by L. de Boisbaudran and was obtained in the form of very pure compounds by E. Demarcay about 1901. Samarium occurs in many minerals such as monazite, gadolinite, samarskite, etc.; it is also found among the fission products of uranium, thorium and plutonium.

Formerly it was usually separated from other members of the rare-earth group by the fractional crystallization of the double magnesium nitrate from 50% nitric acid: many other procedures were also used nhich involved long-continued fractionations. Since 1945, rapid separation has been achieved on adsorption columns. Bands of adsorbed rare earths containing samarium are eluted down an ion-exchange column with a buffered solution of citric acid or ethylenediamine tetra-acetic acid. Very pure samarium can be obtained by this means. The common oxide (Sm_2O_3) has a pale yellow colour and is rapidly soluble in most acids, giving topaz-yellow salts such as samarium sulphate ($Sm_2[SO_4]_3.8H_2O$). The salts are paramagnetic. The metal is a silver colour and oxidizes slowly in air. It melts around 1,052° C. and has a density of 7.54 g. per cubic centimetre. The crystal structure of samarium is rhombohedral. with $a = 8.996$ Å (Å $= 10^{-10}$ m.), $\alpha = 23° 13'$, $Z = 3$. The metal has been prepared by electrolysis of the fused halides and by thermal reduction with some alkaline-earth metals. It is several hundred times as volatile at a given temperature as lanthanum, and the metal can be prepared readily by mixing lanthanum metal with samarium oxide and distilling the samarium metal away in a high vacuum at around 1,400° C.

A divalent oxide (SmO) and a divalent series of compounds exist. Most of these divalent compounds are soluble in water but rapidly bring about its decomposition. It has been found desirable to take advantage of the divalent state in rapidly separating samarium from the other rare earths. J. K. Marsh (1942) found that sodium amalgams will reduce samarium salts. The samarium is subsequently extracted from the amalgam in a fairly pure state by the use of acids. although special procedures have to be followed in order to separate the samarium from europium and ytterbium. which are also reduced. While it readily forms an amalgam with mercury. it is extremely difficult to separate the pure samarium metal from the mercury. The trivalent solutions give a characteristic absorption spectrum and the element has a characteristic spark spectrum. It has found rather limited use in the ceramic industry and as a catalyst for certain organic reactions. One of its isotopes has a high capture cross section for neutrons. Therefore, samarium acts as a powerful poison to some nuclear chain reactions. (See RARE EARTHS.) (F. H. SF.)

SAMARKAND, a city of Asiatic U.S.S.R.. in 39° 39' N.. 66° 56' E., situated in the Uzbek S.S.R. Pop. (1939) 134.346. The city is the ancient Maracanda, the capital of Sogdiana, then the residence of the Moslem Samanid dynasty, and subsequently the capital of the Mongol prince Timur. It was captured by the Russians under General Kaufmann, after a fierce struggle. in 1868 and for a time declined. In 1900 its population was 58,194, but after the foundation of the Uzbek republic in 1924, with Samarkand as its administrative centre. the town grew rapidly; an electric power station was constructed, and there are leather factories, cotton cleaning mills, flour mills. distilleries and pencil and brick factories. It is linked by rail with Chkalov and with the Caspian, and these lines are joined up via Seinipalatinsk with the trans-Siberian line.

Samarkand is situated at a height of 2.358 ft. in the fertile loess valley of the Zaraf-shan. at the point where the river issues from the western spurs of the Tien-shan, on a high plain, with the snow-clad Hissar range rising to the south, from which bracing winds blow and make the city more healthful than others in central Asia. Within a journey of a couple of days lie the glacier snouts of the Archa-Maidan, "Place of Junipers."

The Russian part of the town has wide streets lined with poplar, acacia, willow and elm trees, but the Moslem part is an intricate labyrinth of narrow, winding streets. Gardening. the making of pottery and metal goods. and trade in cotton. silk. wheat. rice, horses, asses, fruit and cutlery are among the occupations of the people. The native city. with its maze of yellow houses nestling among the trees, and from which rises the turquoise cupola of the Bibi-Khanum (a college erected in 1388 by a Chinese wife of Timur), centres on the Rigistan, a square around which are three

madrasahs (Moslem colleges), Ulug-beg, Shir-dar and Tilla-kari, of great architectural symmetry and beauty, decorated with enamelled tiles of various colours. Outside the walls of Samarkand are the Hazret Shah-Zindeh, the summer palace of Timur, on a terrace reached by 40 marble steps, and the grave of Shah-Zindeh (Kasim ibn Abbas), a companion of Timur. The latter was a famous shrine in the 14th century (Ibn Batuta's Travels, iii, 52). The Gur Amir, the tomb of Timur, a dome-crowned chapel, has suffered much from time and earthquakes; on its interior walls are turquoise arabesques and inscriptions in gold.

Maracanda was destroyed by Alexander the Great in 329 B.C. and was the scene of the murder of Cleitus. Ruins of its buildings, among which are plain and enamelled tiles and Graeco-Bactrian coins, lie outside Samarkand and are now called Aphrosiab. The city reappears as Samarkand at the time of the Arab conquest, when it was finally reduced by Kotaiba ibn Muslim in A.D. 711–712. Under the Samanids it became a brilliant seat of Arabic civilization and is reported to have been defended by 110,000 men when besieged by Jenghiz Khan in 1221, by whom it was destroyed and pillaged. When Timur (Tamerlane) made it his residence in 1369, its inhabitants numbered 150,000. The magnificent buildings of Timur's successors, which still remain, testify to its former wealth, but by the beginning of the 18th century it was almost uninhabited. It fell under Chinese dominion and subsequently under that of the amir of Bukhara, and finally under that of Russia.

SAMAWA, a town on the Euphrates in 31° N., 45° E., at the junction of the Hindieh and Hilla branches of the Euphrates. The town is on the Baghdad-Basra railway and there is a good clear stretch of river as far as Nasiriyeh 71 m. down stream (up stream the river is practically impassable). It is also situated on the caravan routes to Hilla, Nejef and Basra, in a fertile area and is a centre of trade in local agricultural products, including vegetables, rice and wheat and barley. Like most of the Euphrates towns it is a market for such imported goods as sugar, indigo and coffee and also Manchester goods. A good deal of wool is raised locally and woollen carpets are manufactured in the town. Pop. (1947) 15,292.

SAMBALPUR, a municipal town and district in Orissa state. India. The town is on the left bank of the Mahanadi river, and the terminus of a branch of the Eastern railway. Pop. (1951) 23,523. It contains a ruined fort with old temples. and is the site of the Gangadhar Meher college, affiliated to Utkal university.

SAMBALPUR DISTRICT has an area of 6,767 sq.mi. and a population (1951) of 1,301,804. The Mahanadi, which is the only important river. divides it into unequal parts. The greater portion is an undulating plain. with ranges of rugged hills. the largest of which is the Bara Pahar. covering an area of 300 sq.mi., and attaining at Debrigarh a height of 2,267 ft. The Mahanadi affords means of water communication for 90 mi., its principal tributaries in Sambalpur are the Ib, Kelo and Jhira. To the west of the Mahanadi the district is under close cultivation; to the east the country is broken by hills and a considerable area is under forest. Gold dust and diamonds have been found near Hirakud. at the junction of the Ib and Mahanadi. At Hirakud in the late 1950s a dam was being completed across the Mahanadi for irrigation, flood control and power production.

Sambalpur lapsed to the British in 1849. On the outbreak of the Mutiny in 1857 a general rising took place, and it was not until 1864 that tranquillity was restored.

SAMBOURNE, EDWARD LINLEY (1844–1910), English draughtsman, illustrator and designer, was born in London, on Jan. 4, 1844. He was educated at the City of London school, and aiso received a few months' education at the South Kensington school of art. After a six years' "gentleman apprenticeship" with John Penn and Son, marine engineers, Greenwich, his humorous and fanciful sketches made surreptitiously in the drawing-office of that firm were shown to Mark Lemon, editor of Punch, and at once secured him an invitation to draw for that journal. In April 1867 appeared his-first sketch, "Pros and Cons," and from that time his work was regularly seen, with rare exceptions, in the weekly pages of ***Punch.*** In 1871 he was called to the Punch "table." He drew his first political cartoon, properly so-called, in 1884, and ten years later began regularly to design the weekly second cartoon, following Sir John Tenniel as chief cartoonist in 1901. He died on Aug. 3, 1910.

See M. H. Spielmann, The History of Punch (1895).

SAMBUCA, SAMBUTE, SAMBIUT, SAMBUE, SAMBUQUE, an ancient stringed instrument of Asiatic origin generally supposed to be a small triangular harp of shrill tone (Arist. Quint. Meib. ii. p. 101). But there is no certainty on the point and the most widely different characters have been ascribed to the instrument from time to time in the older records. Thus it has been described as a kind of tambourine, as a sort of flute, as a cithara, as another form of the sackbut, and so on.

SAMLAND, a peninsula of Germany, in the province of East Prussia, on the Baltic. It separates the Frisches Haff on the west from the Kurisches Haff on the north-east, and is bounded on the south by the river Pregel and on the east by the Deime. Its shape is oblong; it is 43 m. long, and 18 broad, and has an area of goo sq.m. The surface is mostly flat, but on the west sand-hills rise to a height of 300 ft. The chief product is amber. The former episcopal see of Samland was founded by Pope Innocent IV. in 1249 and subordinated to the archbishop of Riga. Bishop Georg von Polentz embraced the Reformation in 1523, and in 1525 the district was incorporated with the duchy of Prussia.

SAMNAN: see SEMNAN.

SAMNITES, the name given by the Romans to the warlike tribes inhabiting the mountainous centre of the southern half of Italy. The word *Samnites* was not the name, so far as we know, used by the Samnites themselves, which would seem rather to have been (the Oscan form of) the word which in Latin appears as *Sabini* (*see* below). The ending of *Samnites* seems to be connected with the name by which they were known to the Greeks of the Campanian coast. Both from tradition and from surviving inscriptions (*see* OSCAN and R. S. Conway, Italic Dialects, pp. 169–206) it is clear that they spoke Oscan; and tradition records that the Samnites were an offshoot of the Sabines (see *e.g.,* Festus, p. 326 Miiller). On two inscriptions, of which one is unfortunately incomplete, and the other is the legend on a coin of the Social War, we have the form *Safinim,* which would be in Latin *Sabinium,* and is best regarded as the nominative or accusative singular, neuter or masculine, agreeing with some substantive understood, such as *nummum* (*see* Conway, ibid., pp. 188, 216).

The abundance of the group names ending in the suffix *-no-* in all the Samnite districts classes them unmistakably with the great Safine stock (see SABINI). The Samnites are intimately related to the patrician class at Rome (see ROME: Ancient History).

The longest and most important monument of the Oscan language, as it was spoken by the Samnites (in, probably, the 3rd century B.C.) is the small bronze tablet, engraved on both sides, known as the *Tabula Agnonensis,* found in 1848 at the modern village Agnone, not very far from the site of Bovianum, which was the centre of the northern group of Samnites called *Pentri.* This inscription, now preserved in the British Museum, is carefully engraved in full Oscan alphabet.

The text and commentary will be found in Conway, *op. cit.,* p. 191: it contains a list of deities to whom statues were erected in the precinct sacred to Ceres, or some allied divinity, and on the back a list of deities to whom altars were erected.

See R. S. Conway, *Dialectorum Italicarum exempla selecta,* and C. D. Buck, Oscan and Umbrian Grammar.

SAMO, a tall, robust-looking people inhabiting the borders of Upper Volta and the French Sudan. They speak a language, still little known, apparently related to Sia, and live in independent villages, distributed in quarters consisting of flat-roofed houses of mud. Marriage is restricted within the village but must be outside the extended family group. In the case of a divorce the children remain with the father The family property passes to the brother of the deceased, and personal goods, or individual property, is inherited by the eldest son The Samo are skilled cultivators, and raise cattle. They are animists and perform seasonal sacrifices and worship sacred animals protecting the

villages. The dead are exposed and then buried in special places set apart for (1) old men, (2) young men, (3) old women and (4) young women.

See Tauxier, Le *Noir* du Yatenga (1917).

SAMOA. The Samoan group of islands extends from 13° 26' to 14° 22' S. lat. and from 168° 10' to 172° 48' W. long., and is about 1,600 mi. E. of New Zealand, 2,700 mi. E. of Australia and 2,200 mi. S. of the Hawaiian Islands. The archipelago is divided administratively into two parts: the six islands east of 171° W. long. constitute American Samoa, a dependency of the U.S., and the nine islands west of the 171° meridian constitute Western Samoa, a UN trust territory administered by New Zealand. American Samoa consists of the inhabited islands of Tutuila, Tau. Olosega, Ofu and Aunuu and the uninhabited coral atoll Rose Island. Swains Island, 210 mi. N.W. of Tutuila and considered to be outside the Samoan archipelago, was made a part of American Samoa in 1925. Western Samoa consists of the inhabited islands of Upolu, Savaii, Manono and Apolima and the uninhabited islands of Fanuatapu, Namua, Nuutele, Naulua and Nuusafee.

The total area of American Samoa is 76 sq.mi. Tutuila, the largest island of American Samoa, has an area of about 52 sq.mi. and is about 18 mi. long and about 3 mi. across in the widest part.

Western Samoa has a total land area of 1,133 sq.mi. Savaii, the largest island, has an area of 703 sq.mi. and is 60 mi. long. Upolu has an area of 430 sq.mi. and is 58 mi. long. The other seven islands of Western Samoa are quite small.

All the Samoan islands, except Nuusafee, are rocky and of volcanic origin. Upolu, Savaii and Tutuila have high inland ridges rising to peaks of 6,095 ft. in Savaii, 3,608 ft. in Upolu and 2,141 ft. in Tutuila. These islands have little level land except along the coast and in the case of Tutuila there is a broad fertile plain in the southwestern part of the island. The soil is alluvial and quite fertile in the valleys. Because of the heavy rainfall, the soil on hillsides is thin and there is no subsoil.

The climate of the islands is tropical but equable for a good portion of the year. From May to November strong southeast winds blow and the islands have experienced many severe hurricanes. June and July are the coolest and most pleasant months. The average temperature is 79.3° F. with a mean range from 73.8° to 84.7". Rainfall is generally heavy; the central ridges receive over 200 in. annually.

History. — The archipelago was probably discovered by Jacob Roggeveen, a Dutchman, in 1722. The islands were subsequently visited by Louis de Bougainville in 1768, the comte de la Pérouse in 1787, Edwards in 1791 and Otto von Kotzebue in 1824. The first missionaries to go to Samoa were two members of the London Missionary society who established a mission in 1830. Charles Wilkes, a U.S. explorer, surveyed the islands in 1839. Great Britain, the U.S. and Germany appointed representatives on the islands in 1847, 1853 and 1861, respectively.

In Jan. 1878 the U.S. signed a treaty with the then independent Samoan kingdom which gave the U.S. the right to establish a coaling station in the harbour of Pago Pago, best in the archipelago. A trading agreement was also concluded. Germany and Great Britain received similar privileges the following year, but the interests of the three countries were often in conflict. A conference of the three powers, held in Berlin in 1889, concluded a general act providing for the neutrality of the islands and establishing in effect a tripartite protectorate over the islands.

This arrangement did not operate so successfully as planned, and on Dec. 2, 1899, a convention was signed by Great Britain. Germany and the U.S. by which the paramount interests of the United States in those Samoan islands east of 171° W. long. were recognized and Germany's interests in the other Samoan islands were similarly recognized. Great Britain withdrew from Samoa altogether in consideration of rights in Tonga and the Solomon Islands. The high chiefs of the islands of Tutuila and Aunuu ceded those islands to the U.S. on April 17, 1900, and the chiefs of Tau, Olosega and Ofu Islands ceded their islands to the U.S. on July 16, 1904. The U.S. congress accepted the islands under a joint resolution approved Feb. 20, 1929.

Germany controlled Western Samoa until World War I. New Zealand troops occupied the islands on Aug. 30, 1914, and the League of Nations granted New Zealand a mandate over them in 1920. Western Samoa was made a trust territory by the United Nations with New Zealand as the administering authority on Jan. 25, 1947.

Population. — The population of American Samoa totalled 20,040 in 1960 with about four-fifths of the population on the main island of Tutuila. The population of Western Samoa was 97,327 in 1956, with about three-fourths on Upolu. The Samoans are Polynesian and closely akin to the people of Hawaii and the Maoris of New Zealand.

The Samoan language is believed to be the oldest form of Polynesian speech in existence. It is closely related to the Maori, Tahitian, Hawaiian and Tongan languages.

Despite the increasing contacts with the western world, Samoan culture is still the dominant influence in the lives of the people. The basic unit of Samoan society is the *aiga,* an extended family system headed by the *matni.* Kinship ties are important in Samoan social and economic life and all who are related by birth or adoption are recognized as belonging to one *aiga.*

Samoa differs from most large Polynesian communities in its system of chieftanships. The basis of this system is an intricate hierarchy of graded titles. Essentially, those titles are of two kinds—ali'i and tulafale. The former may be called titular chiefs and the latter orator chiefs. All chiefs are referred to by the generic title *matai.* Succession to a title is elective within a family and while heredity is a contributory qualification, general ability, popularity and the capacity to make a good speech are governing qualifications.

Most of the population have become converts to Christianity. In Western Samoa, one-half of the population is affiliated with the London Missionary society. Other major religious affiliations in Samoa are Roman Catholic. Methodist, Mormon and Seventh-Day Adventist.

Government. — American *Samoa.*—American Samoa is an unorganized U.S. possession with a governor appointed by the president of the United States. The islands were under the jurisdiction of the navy department between 1900 and July 1, 1951, when administration was transferred to the department of the interior.

American Samoa is divided into 14 counties grouped into three administrative districts; the counties and districts correspond to the old Samoan political units. Each district has a governor who is appointed by the governor of American Samoa from the ranks of county chiefs. In each village of the district a chief is appointed by the district governor.

The legislature, as established in 1948 and reorganized effective Nov. 21, 1952, was made bicameral and given only advisory powers. The upper house, or senate, was allotted 15 members, 5 being selected in accordance with Samoan tradition from each of the three districts. It was provided that election of the 18 members of the lower house, or house of representatives, be by direct popular secret vote. In addition, a 12-member council of paramount chiefs, of the highest-ranking chiefs in American Samoa, was established to advise the governor on matters pertaining to Samoan ceremony and custom.

The judiciary consists of a high court presided over by a chief justice and two to four associate judges, and five district courts, each of which has one judge. The seat of the government is at Pago Pago on Tutuila.

Western Samoa.—An act of the parliament of New Zealand, effective March 10, 1948, reorganized the government of Western Samoa. The administration is headed by a high commissioner (formerly the administrator) appointed by the governor general of New Zealand. He governs with the aid of the council of state, which consists of Samoan leaders. The high commissioner consults the council of state on all proposals for legislation and on matters affecting Samoan customs and welfare. An executive council was created in 1952 to advise the high commissioner in forming and implementing policy measures.

The legislative assembly (formerly the legislative council) was created, presided over by the high commissioner or his nominee. The assembly consists of the Samoan members of the council of state, 12 additional Samoans who are nominated by a native fono, or assembly, no more than 5 elected Europeans and no more than 6 official members, of whom 3 are nominated by the governor general of New Zealand and 3 by the high commissioner. The legislative powers of the assembly are wide, with certain notable exceptions such as laws relating to defense questions and foreign affairs. Village and local affairs are controlled by native village officials nominated by the villagers. The seat of government is at Apia on Upolu.

Education. — Education in American Samoa was made compulsory for all children from 7 to 15 years of age, inclusive. It was estimated in 1954 that 99% of all persons ten years of age or older were literate. In that year about 7,000 children were enrolled in 61 public and 6 missionary schools with a total of 213 teachers; about 80% of the enrolment was in public schools.

Education in Western Samoa is dependent to a great extent on the

activities of various missions. Education was not compulsory in the mid-1950s and there was no age limit on attendance. In 1951, 14% of those ten years of age or older were illiterate. In 1953 there were 132 primary schools with 571 teachers and 20,607 pupils, 4 secondary schools with 173 students, 8 technical schools with 469 students and 1 normal school with 189 students.

Economy.—The natural resources of Samoa are of little economic consequence. There are no minerals and no timber of sufficient quantity to warrant industrial development for export. A cannery was established at Pago Pago in 1953 to process and export tuna caught by Japanese fishing vessels under contract. The main products of American Samoa are copra and native handicraft consisting principally of mats and rugs woven from local grasses. Western Samoa's main products are copra, cocoa beans, desiccated coconut and bananas.

Agriculture is the basis of the Samoan economy. Crops cultivated are corn, beans, peas, watermelons, cucumbers, squash. eggplant, tomatoes, lettuce, radishes, sweet potatoes, breadfruit, papayas, bananas, taro and pineapple. There are also some cattle and in American Samoa a small dairy industry.

Imports by American Samoa in the fiscal year ending June 30, 1954, were valued at $992,543. The United States was the major source, followed by Australia and New Zealand. Export's totalled $546,238, of which about two-thirds was copra and one-fifth canned tuna. Western Samoa's imports in 1955 totalled £1,894,542. New Zealand was the major source, followed by the United Kingdom and Australia. Exports totalled £2,511,899, of which 46% was copra (17,178 long tons) and 35% cacao (3,118 tons). The United Kingdom was the principal customer, followed by New Zealand and the United States. (*See* also PACIFIC ISLANDS.)

(S. NR.; J. W. MW.)

SÁMOS, an island in the Aegean sea, separated from the mainland of Turkey by a strait of only about a mile in width; about 27 mi. in length, by 14 in greatest breadth; occupied by mountains, of which the highest, Mt. Kerkis, near its western end, is 4,710 ft. high. This range continues from Mt. Mycale on the mainland. Samos was annexed to Greece in 1912. The capital is at Vathy, in a deep bay on the north coast, a quite modern town, well paved and connected by carriage roads with villages round both sides of the bay, and with Tigani on the south coast, the site of the ancient city. A third port, Carlovasi, farther west on the northern coast, serves a separate lowland district. The island is remarkably fertile, and a great portion of it is covered with vineyards. Oil, raisins, silk, cotton and tobacco are also grown, and barges and sailing vessels are built at Tigani, almost wholly from native timber. Cigarette making employs many women and girls, the tobacco coming chiefly from Thrace. The population in 1951 was 47,865. The predominant religion is the Orthodox Greek; the metropolitan district is Samos and Icaria.

History.—At the time of the great migrations, in the 11th century B.C., Samos received an Ionian population mainly from Epidaurus in Argolis. By the 7th century B.C. it had become one of the leading commercial centres of Greece through its position near the Maeander and Caÿster trade-routes from inner Asia Minor. The Samians also traded with the Black sea and with Egypt, and claimed to be the first Greeks to reach the Straits of Gibraltar. Their commerce brought them into close relations with Cyrene, Corinth and Chalcis, but made them bitter rivals of their neighbour, Miletus. The feud involved both cities in the Levantine war (7th century B.C.) when Corinth built triremes for the Samians. The result favoured Miletus, but in the 6th century the insular position of Samos preserved it from mainland aggressions to which Miletus was exposed. About 535 B.C., when its oligarchy was overturned by the tyrant Polycrates (*q.v.*), Samos reached the height of its prosperity. Its navy "ruled the waves" from its new deep-sea harbour, and blockaded the mainland subjects of Persia; the tunnelled aqueduct (still open) secured copious water, and the great Temple of Hera was built. Polycrates first intrigued, and then quarrelled, with the Persian governor of Lydia, and after his death by treachery, Darius conquered Samos and partly depopulated it. It had regained much when, in 499, it joined the general revolt of the Ionians against Persia; but owing to jealousy of Miletus, part of its contingent, at the decisive battle of Lade (4943, deserted. In 479, however, following Xerxes' defeats in Greece, Samos betrayed the Persian fleet to the Greeks at Mycale. In the Delian League the Samians held special privilege and remained loyal to Athens until 440, when a dispute with Miletus, which the Athenians had decided against them, provoked them to secede. With a fleet of 60 ships they held their own for some time against a large Athenian fleet led by Pericles himself, but after a siege, capitulated and were degraded to a tributary rank. Towards the end of the Peloponnesian war, when Miletus became a Spartan naval base, Samos appears as one of the most loyal dependencies of Athens; and a temporary home of the Athenian democracy during the revolution of the Four Hundred at Athens (411 B.C.), and in the last stage of the war, it was rewarded with the Athenian franchise. This friendly attitude towards Athens was accompanied by the establishment of democracy. After the downfall of Athens, Samos was besieged by Lysander and again placed under an oligarchy. In 394, when the Spartan navy withdrew, the island declared its independence and re-established a democracy, but by the Peace of Antalcidas (387) it fell under Persian dominion. Recovered by the Athenians in 366, after a siege, it received a body of military settlers. After 322, when Athens was again deprived of Samos, its fate is obscure. For some time (about 275–270 B.C.) it served as a base for the Egyptian fleet, at other periods it recognized the overlordship of Syria; in 189 B.C. it was transferred by the Romans to the kings of Pergamum. Enrolled from 133 in the Roman province of Asia, it revolted to Aristonicus (132) and Mithridates (88), and forfeited its autonomy, but recovered it between the reigns of Augustus and Vespasian, and remained prosperous. Under Byzantine rule Samos became the head of the Aegean *theme* (military district). After the 13th century it passed through much the same changes as Chios (*q.v.*), and became the property of the Genoese firm of Giustiniani (1346–1566). At the Turkish conquest it was severely depopulated, and provided with new settlers, partly Albanians.

During the Greek War of Independence Samos bore a conspicuous part, and it was in the strait between the island and Mt. Mycale that Canaris blew up a Turkish frigate, in the presence of the army assembled for invasion. The enterprise was abandoned and Samos held its own to the end of the war. On the conclusion of peace the island was, indeed, again handed over to the Turks, but since 1835 held an exceptionally advantageous position, being in fact self-governed, though tributary to the Turkish empire, and ruled by a Greek governor nominated by the Porte, who had the title of "Prince of Samos," and was supported and controlled by a Greek council and assembly. The prosperity of the island bore witness to the wisdom of this arrangement, but did not prevent annexation to Greece when the political situation allowed it.

The ancient capital was on the south coast, at the modern Tigani, directly opposite to the promontory of Mycale. A natural cove, dominated by a low hill, has been converted' by ancient and modern breakwaters into a safe port for small vessels. Behind the modern town rises a steep enclosing ridge, Astypalaea, crowned by Polycrates' wall, and perforated by his aqueduct. From this city a road led about 4m. W. to the Temple of Hera, whose site, close to the shore, is still marked by a single column, which has given to the neighbouring headland the name of Capo Colonna. Though so little remains standing, German excavators have revealed its massive foundations.

The modern capital of the island was, until recently, at Khora, about zm. from the sea and from Tigani, but in the 19th century the capital was transferred to Vathy, on the north coast.

Samos was the birthplace of Pythagoras (*q.v.*), the philosopher, whose name and figure are found on coins of the city in imperial times. It also produced a school of sculptors beginning with Rhoecus and Theodorus, who are said to have invented the art of casting statues in bronze. Rhoecus was also the architect of

the Temple of Hera. Another famous Samian sculptor was Pythagoras, who migrated to Rhegium. The vases of Samos are among the most characteristic Ionian pottery in the 6th century.

SAMOSATA (SUMEISAT, modern SAMSAT), a city on the right bank of the upper Euphrates in Malatya, Turkey. Pop. (1955) 851. Samosata is an important crossing place of the river close to the point where it enters the plain. It forms one of the series of border forts (Edessa (*q.v.*) was the most important), which had a stormy history in relation to the frontier defense of Upper Mesopotamia. It had an additional importance as forming a point at which the 'crossing of the river could be made. Although it is uncertain whether it was ever on the Persian royal road, there was a bridge at this point in Strabo's time! when the city is described as being strongly fortified and the centre of a small but very fertile district.

The fortunes of Samosata followed those of the great empires at whose boundaries it stood. It appears originally to have been a Hittite city and was incorporated in the Assyrian empire in 708 B.C. Later it passed into the hands of the successors of Alexander and became the capital of Commagene. In A.D. 72 it became a Roman province; later it passed through a series of changes, losing its status as the capital city of a district under Constantine. and in the 10th century became temporarily an administrative military district of the Byzantine empire. It is said in the 13th century to have been an Armenian settlement, but in modern times is mainly occupied by Kurds.

SAMOTHRACE (mod. Gr. SAMOTHRAKI, Turk. SEMADREK), an island in the north of the Aegean sea belonging to Greece, nearly opposite the mouth of the Hebrus (Maritza) north of Imbros and northeast of Lemnos. It has a population (1951) of 4,258, nearly all Greek. Though of small extent it is, next to Mount Athos, the most conspicuous natural feature in this part of the Aegean (5,240 ft.). In *Iliad* xiii, 12, the poet represents Poseidon using its summit to survey the plain of Troy. This mountainous character and the absence of harbours precluded political importance. It permitted the survival of the archaic worship of the Cabeiri (*q.v.*) which Herodotus (ii. 51) and others attributed to "Pelasgian" aborigines. Probably on account of its sacred character the island always enjoyed autonomy, even in the time of Pliny. The "Victory of Samothrace." set up by Demetrius Poliorcetes *c.* 305 B.C., was discovered in the island in 1863. and is now in the Louvre. The ancient city was situated at Palaeopoli below the modern village on the north side of the island close to the sea; it has considerable remains of ancient walls, in Cyclopean style, of the sanctuary of the Cabeiri and of other edifices of Ptolemaic and later date.

SAMOYED, a division of the Uralic linguistic stock found in the northern U.S.S.R. and comprising two language groups, Northern and Southern Samoyedic. The former includes the Yurak or Nenets (16.000 in 1926), reindeer pastoralists, sea-mammal hunters and fishermen occupying tundras from Kanin peninsula on the White sea 900 mi. eastward to the Yenisei river in Siberia as well as the forested basin of the Pur; the Tenets (800 in 1926). sedentary fishermen on the lower Yenisei; and the Tavgi or Nganasany (800 in 1926), wild-reindeer hunters of the Taimyr peninsula in the far north. In the 20th century the Sel'kup alone represent Southern Samoyedic. They include fishermen and trappers of the Taz river basin (1.500 in 1947); fishermen, cattle and horse breeders and trappers on the Tym and Ket (southeast branches of the Ob or Obi river), who numbered 4,500 in 1947, with 2,000 of them speaking only Russian. In the Sayan ranges. the Samoyedic dialects (Kamasin, Karagas, Mator or Koybal and Taigi) have been totally replaced by the Turkic languages and Russian.

Early in the Christian era, proto-Samoyedic peoples lived in southwest Siberia, probably occupying the Ob–Irtysh (Irtish) basin. They traded with archaic Turkic folk, borrowing from them terms for horses, sable and ermine, bells and money; early contacts with Kettic peoples are also evident. Proto-Samoyedic culture included reindeer domestication (with castration); the casting of bronze and forging of iron; tailored arctic clothing (parka is an indirect Samoyedic loan to English); the conical tent and the cache raised off the ground; and, in religion, shamans, enchantment by singing accompanied by a drum, wooden idols and the idea of luck. Furthermore, the archaeology of early Samoyedic sites (and, in part, Sel'kup ethnology) reveal villages with semisubterranean houses fortified by earthen walls and moats; subsistence from domesticated horses, cattle and sheep as well as fishing and hunting; pit-and-comb marked pottery; birchbark manufactures; bone as well as metal tools and weapons; helmets and armour; cemeteries and votive hoards, with cast images of men. beasts and fantastic creatures, with imported wares and money.

Ostyak pressures from the west, beginning about 700 A.D., displaced the Samoyeds. The Mator were identified east of the Irtysh river in the 10th century; other Samoyeds reached north Russia before 1100 AD. Cultural change accompanied migration. Pottery disappeared. In the Tundra, the Samoyeds adopted arctic aboriginal elements, such as sea-mammal hunting, reindeer hunting with decoys and enclosures, and sacrificial mounds of reindeer antlers. They transmitted reindeer domestication and many religious beliefs to the Ostyaks. the Zyryanians and the Yukaghir; they had less influence on the Lapps.

Despite variant subsistence patterns, recent Samoyedic cultures have retained similar forms of social organization and religion. All have patrilineal, named clans owning definite territories, with sanctuaries, cemeteries and exclusive economic rights. Marriage is strictly exogamic (outside the clan) and residence is usually patrilocal; widows normally marry a younger clansman of the deceased. Older sons receive allotments, leaving to form new lineages; the youngest inherits the residual. Shamans are clan officials, curing. divining luck and ill-doing (see SHAMANISM). The cosmogony includes a high god; a universe tree upholding seven heavens; an underworld; sun, moon, forest. water and ancestral spirits. Shamanistic magic "flights." animal sacrifices and dedications and the "feeding" of household idols are prominent rituals.

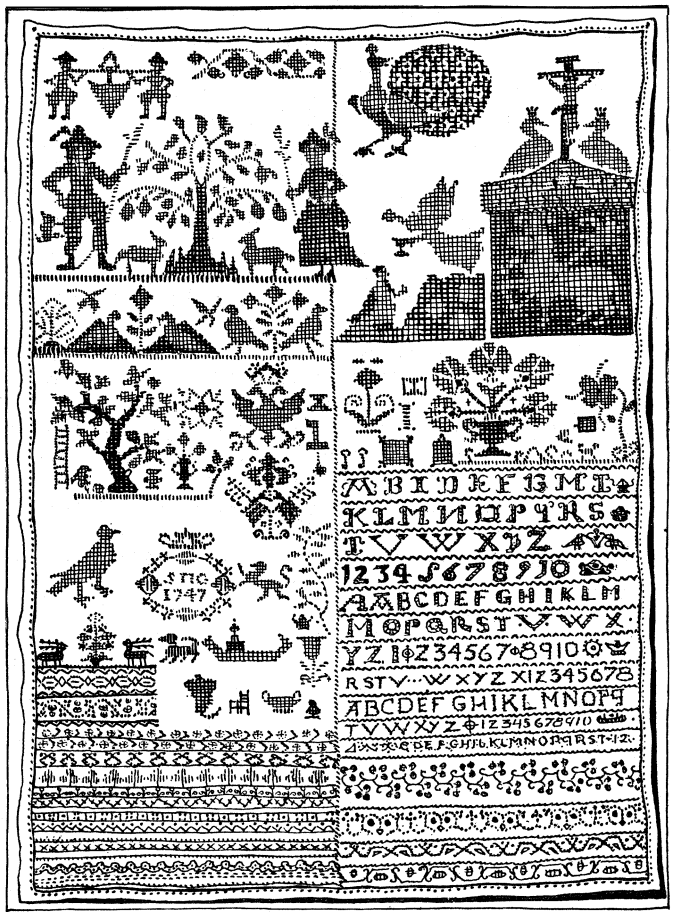
SAMPAN: see BOAT.

SAMPLER, a model or pattern to be copied, particularly a small rectangular piece of embroidery worked on canvas or other material as a pattern or example of a beginner's skill in needlework, as a means of teaching the stitches. Down to comparatively recent times every little girl worked her "sampler," and examples of 17th century work are still found and have become the object of the collector's search. See ill. on p. 924. They usually contained the alphabet, the worker's name, the date and Bible texts, verses, mottoes, the whole surrounded with some conventional design. The earliest sampler in existence is dated 1643 and is in the Victoria and Albert museum, South Kensington.

See M. B. Huish, *Samplers and Tapestry Entbroideries* (1900).

SAMPSON, WILLIAM THOMAS (1840–1902), U.S. naval commander, was born at Palmyra, N.Y., on Feb. 9, 1840. and graduated at the head of his class from the U.S. Naval academy, Annapolis, Md., in 1861. In that year he was promoted to master, and in the following year was made lieutenant. He mas executive officer in the "Patapsco" when she mas blown up in Charleston harbour in Jan. 1865. He served on distant stations and (1868–71 and 1876–78) at the Naval academy, and became lieutenant commander in 1866 and commander in 1874. He mas a member of the International Prime Meridian and Time conference in 1884, and of the board of fortifications in 1885–86; was superintendent of the Naval academy from 1886 to 1890; and was promoted to captain and served as delegate at the International Maritime conference at Washington in 1889. He was chief of the Bureau of Ordnance in 1893–97. About 95% of the guns employed in the Spanish-American War were made under his superintendence. His influence was felt decisively in the distribution of guns and armour, and in the training of the personnel of the navy. He



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART
A SAMPLER OF 1747, FROM THE FISHBACK COLLECTION

superintended the gunnery training and prepared a new drill book for the fleet. In Feb. 1898 Sampson, then a captain, was president of the board of inquiry as to the cause of destruction of the "Maine" At the outbreak of the war nith Spain he was placed in charge of the North Atlantic squadron, and conducted the blockade of Cuba. When it was known that Admiral Cervera, with a Spanish fleet. had left the Cape Verde Islands. Sampson withdrew a force from the blockade to cruise in the A7indnard passage, and made an attack upon the forts at San Juan, Puerto Rico After his return to the coast of Cuba he conducted the blockade of Santiago, and the ships under his command destroyed the Spanish vessels when they issued from the harbour of Santiago and attempted to escape. (See SPANISH-AMERICAN WAR OF 1898.) Sampson himself was not actually present at the battle, having started for Siboney just before it began in order to confer with General Shafter, commanding the land forces. He reached the scene of battle as the last Spanish vessel surrendered, and the engagement was fought in accordance with his instructions. He was promoted to commodore in 1898, to rear admiral on March 3, 1899, and was made commandant of the. Boston (Charlestomn) navy yard in October of the same year. He died in Washington, D.C., on May 6, 1902.

BIBLIOGRAPHY.—W. A. M. Goode, *With Sampson Through the War* (1899); A. T. Mahan, "Sampson's Naval Career," *McClure's Magazine*, vol. xix (1902); James Parker, *Rear Admirals Schley, Sampson and Cervera* (1910).

SAMSON, whose deeds are recorded in Judges xiv.–xvi., was a hero of early Hebrew folk-tales. He belonged to the tribe of Dan, and was renowned for his exploits against the Philistines. The narratives are marked by a grim and boisterous humour, and are so little concerned with religion that they may almost be called pagan. But, though they contribute little towards the understanding of Hebrew religion, they add much to our knowledge of early customs, and throw light on Philistine civilization. Their account of the relationships between Hebrews and Philistines, too, is of some historical worth. (*See* PHILISTINES.)

It has often been noted that there are points of resemblance between the story of Samson and the myths of Gilgamesh, Melkart, and Hercules; but, while the kinship must be admitted, Samson is much more human than his counterparts in pagan myth and legend, and is probably to be regarded as a historical person. The story contains many features drawn from solar mythology. The name Samson is a derivative, of uncertain meaning, from the Hebrew word Sun—shemesh. It is noteworthy that a shrine of the Sun, Beth-Shemesh, stood in the neighbourhood of Samson's home. Long hair, in which according to the story lay the secret of his strength, is a familiar feature of solar heroes, as a symbol of the sun's rays. His exploit with the gates of Gaza may be connected with the myth which represents the sun as passing through a double-gated door on the eastern horizon. It has, indeed, been argued that the entire Samson story is a solar myth; but it is apparently much more highly probable that in this case the story of a popular hero has been expanded and decorated by mythological motifs.

Why does a story so lacking in religious interest appear in the book, and why is an almost pagan character like Samson reckoned among the saviours of Israel, when the story itself does not record any deliverance of the people from Philistine oppression? There is some evidence that the story was not included in an earlier form of Judges, and that a later editor was constrained by its popularity to insert it. The account of Samson's birth—suspiciously reminiscent of an incident in the history of Gideon—and dedication as a Nazirite, Judges xiii., is an editorial attempt to fit for more respectable company the boisterous, sensual Samson of the folk-tales, who wears his Nazirite costume with some obvious difficulty, and is moved far more by his own erratic impulses than by the spirit of Yahweh. S. A. Cook, comparing Judges xiii. with vi. 11–24, suggests that Samson may have been regarded as the founder of a local Manahathite cult.

See Burney, *Judges*, pp. 335–408, A. S. Palmer, *The Samson-Saga, and its place in comparative Religion;* S. A. Cook, *Journ.* of *Theol. Stud.* 1927, pp. 372 *sqq.* (W. L. W.)

SAMSUN (anc. AMISUS), the chief town of Samsun vilayet in Turkey, on the south coast of the Black sea between the deltas of the Kizil and Yeshil Irmaks. Pop. (1955) 62,618. Its district is one of the principal sources of Turkish tobacco. Samsun exports cereals. tobacco and wool. Amisus, which stood on a promontory about 1½ mi. N.W. of Samsun, was, next to Sinope, the most flourishing of the Greek settlements on the Euxine and under the kings of Pontus it was a rich trading town. By the 1st century A.D. it had displaced Sinope as the north port of the great trade route from central Asia.

SAMUEL, the most outstanding character in Israel's history betneen Moses and David, is represented in I Samuel in every role of leadership open to a man of his day—seer. Nazirite, priest, judge and military leader. The traditions concerning him have been much edited and embellished with legend, so that it is not easy to form a clear historical picture of him. One episode must be dismissed as fabrication: the story of his miraculous and conclusive defeat of the Philistines (vii) is contradicted by the subsequent military exploits of Saul and David and is best ascribed to a late editor who wished to belittle the achievement of Saul. The story of Samuel's childhood (i–iii) contains elements of folklore, but there is no reason to doubt that he grew up as a Nazirite associated with the priesthood at Shiloh, or that he had prophetic clairvoyance. As a Nazirite, dedicated to the defense of the religion of Yahweh against syncretism with the fertility cults of the Canaanite Baals, he had some affinity with the prophetic guilds of wandering ecstatics who made their first appearance at this time; but his visions, in his role of seer, owed nothing to their collective and contagious ecstasy, so that he resembled more closely the great prophets of later times than those who bore the name of prophet in his own day. As priest his chief function was the giving of authoritative decisions from God, including perhaps the dispensation of justice; and here too his gifts as seer differentiated him from ordinary priests who derived their decisions from the sacred lot (xiv, 36–42; xxiii, 6–12; xxx, 7–8).

Samuel's greatest claim to fame was the establishment of monarchy in Israel. The biblical account of this is a conflation of two apparently irreconcilable sources. According to the earlier one (ix; x, 1–16; xi, 1–11, 15), written probably in the reign of Solomon', Samuel, prompted by God, took the initiative in anointing Saul as king, to give unity to the divided tribes of Israel and to lead them to freedom from Philistine domination. According to the later source (viii; x, 17–24), written when the monarchy had fallen into disrepute, Samuel, already the theocratic ruler of a united Israel, resisted the popular demand for a king. because it involved a repudiation of the sovereignty of Yahweh. The early source is the more trustworthy, and it is possible to regard the later one as evidence only for the antimonarchical feeling of the prophetic school that produced it. On the other hand, it is unlikely that these prophetic writers would have depicted Samuel as the critic of monarchy if he had in fact been its wholehearted advocate.

It may be, then, that the two sources preserve the two sides of an early and long-continued debate, and that Samuel the kingmaker was a big enough man to see both the advantages and the dangers of his innovation. See also SAMUEL, BOOKS OF.

(G. B. CA.)

SAMUEL OF NEHARDEA. usually called MAR SAMUEL or YARHIÑAI (*c.* 165–*c.* 257), Babylonian rabbi. was born and died in Nehardea in Babylonia. He is associated with the fame of his great contemporary 'Abba 'Arika. Besides his mastery in the traditional law. Samuel was famed for his scientific attainments. He was one of the first to compile a calendar of the Jewish year, thus preparing the way for the fixation of the festivals by means of scientific calculations. But Samuel's fame rests on the service he rendered in adapting the life of the Jews of the diaspora to the law of the land: "The law of the state is binding law" was the principle he enunciated. When the king of Persia, Shapur, captured Caesarea Mazaca, the Cappadocian capital (modern Kayseri, Turk.), Samuel refused to mourn for the 12,000 Jews who lost their lives in its defense.

See H. Graetz, History of the *Jews*, vol. ii. ch. xix (1893). (I. A.)

SAMUEL, HERBERT LOUIS SAMUEL, 1ST VISCOUNT (1870–). British statesman. owed his position as leader of the Liberal party in the house of commons (1931–35) and in the house of lords (1944–55) to his combination of loyalty to principle and ability to persuade others to compromise. Born in, Liverpool on Nov. 6. 1370. he was educated at Balliol college, Oxford, and entered parliament in 1902, inspired toward politics and Liberalism by seeing slum conditions in Whitechapel. As parliamentary undersecretary to the home office, 1905–09, he established the probation and juvenile court systems. He joined the cabinet as chancellor of the duchy of Lancaster in 1909 and became postmaster general in 1910 and home secretary in 1916, but resigned when David Lloyd George took office. His flair for mediation was given full scope in his guidance of Palestine as its first high commissioner. 1920–25; in his conduct or' the negotiations which ended the general strike (1926); and in his ability as the Liberal party chairman. 1927–29, to hold a balance between H. H. Asquith and Lloyd George. He was home secretary in Ramsay MacDonald's national government, 1931–32, but resigned on the signing of the Ottawa trade agreements (*see* LIBERAL PARTY). He was raised to the peerage in 1937.

Empiricism. Lord Samuel's great gift as a politician, also marks his work as a philosopher. His best-known books are Belief and *Action* (1937); *The Tree of Good and Evil* (1933); and *Practical* Ethics (1935). He published his *Memoirs* in 1945.

SAMUEL, BOOKS OF, two books of the Old Testament, which in the Jewish canon are ranked among the Former Prophets (Joshua–Kings) in contrast to the Latter Prophets (Isaiah–Malachi).

Contents. — The books of Judges, Samuel and Kings are made up of a series of extracts from various sources, and freely handled by copyists down to a late date, as is shown by the numerous and often important variations between the Hebrew text and the Greek version (Septuagint). The main redaction of Judges and Kings was made under the influence of the ideas which characterize Deuteronomy, that is, after the reforms ascribed to Josiah (2 Kings, xxiii); but in Samuel the "Deuteronomic" hand is much less prominent and the chronological system which runs through Judges and Kings occurs only occasionally.

The book of Samuel completes the history of the "Judges" of Israel (11th century B.C.), and begins by relating the events which led to the institution of the monarchy under Saul, the part played by Samuel being especially prominent (1 Sam. i–xiv). The interest is then transferred to David, the founder of the Judaean dynasty, and his early life is narrated with great wealth of detail. As Saul loses the divine favour, David's position advances, until, after the death of Saul and the overthrow of Israel, he gains the allegiance of a disorganized people (1 Sam. xv–2 Sam. iv), and Jerusalem becomes the centre of his empire (v–viii)—*c.* 1000 B.C. A more connected narrative is now given of the history of David (ix–xx), which is separated from the account of his death and Solomon's accession (1 Ki. i., ii.) by an appendix of miscellaneous contents (xxi.–xxiv.).

Samuel and Saul. — The introductory account (i.–iv. 1*a*) of the birth, dedication and calling of the young prophet Samuel is a valuable picture of religious life at the sanctuary at Shiloh. It is connected by the prophecy of the punishment of the house of Eli (iii. 11 *sqq.*) with the defeat of the Israelites by the Philistines at Ebenezer near Aphek, the loss of the ark (iv. 1*b*–22), and its subsequent fortunes (v.–vii. 1). A Philistine oppression of 20 years ends when Samuel, here the recognized "judge" of Israel, gains a great victory at Ebenezer near Mizpah (vii.). But the deliverance of Israel from the Philistines is also ascribed to Saul (xiv.); there is no room for both in the history of the prophet (*see* vii. 14), and it is now generally recognized that two conflicting representations have been combined: (*a*) vii., viii., x. 17–24, xii., (*b*) ix. 1–x. 16, xiii., xiv. (*See* further SAMUEL, SAUL.) The account of Eli, Shiloh and the ark (i.–iii.) is a natural prelude to iv.–vii., where, however, we lose sight of Samuel and the prophecy. The punishment of Eli and his sons (iv.) becomes a passing interest. The sequel of the defeat in iv. is not stated, although other allusions to the fall of Shiloh (Jer. vii. 12–15, xxvi. 6, 9, Ps. lxxviii. 60 sqq.), and the subsequent reappearance of the priestly family at Nob (xxi. *seq.*) suggest that a fuller account of the events must have been extant. A narrative of Eli and the priesthood of Shiloh has probably been used to form an introduction to Samuel's victory (vii.), and it has been supplemented partly by the account of the early life of the future prophet and judge (note the present abrupt introduction of Eli in i. 3) and partly by narratives of the history of the ark (v. *seq.*). The section was handled at a relatively late period. This is clear from the presence of the Deuteronomic prophecy in ii. 27–36, which hints at the rise of the Zadokite priests of Jerusalem. Also, Hannah's psalm (ii. 1–10)—the prototype of the "Magnificat"—is a post-exilic passage, "probably composed in celebration of some national success" (Driver); its present suitability rests upon the interpretation of verse 5.

Saul.—Saul's reign is introduced in xiii. 1, where a blank has been left for his age at accession (some mss. insert "30"); the duration of his reign is also textually uncertain. The formula is parallel to that in 2 Sam. ii. 10 *seq.*, v. 4 seq., and frequently in the Book of Kings, with the additional feature that the age at accession, there usually confined to the Judaean kings, is here given for the Israelite Saul and his son Ishbosheth (*i.e.*, Ishbaal). The summary in xiv. 47 *sqq.* is immediately followed by a reference to the continuous Philistine warfare (*v.* 52, contrast vii. 13) which forms an introduction to the life of David. But the summary gives a picture of Saul's ability and position which differs so markedly from the subsequent more extensive narratives of David's history that its genuineness has sometimes been questioned; nevertheless, it is substantiated by the old poem quoted from the Book of Jashar in 2 Sam. i. 17–27, and a fundamental divergence in the traditions may be assumed. Similarly in 2 Sam. ii. 8–IOU,the length of Ishbaal's reign conflicts with the history of David (ii. 11 and iv. 1–v. 3), and the reorganization of (north) Israel with the aid of Abner does not accord with other traditions: which represent David as the deliverer of (all?) Israel

from the Philistine yoke (iii. 18, xix. 9). But ii. 8–IOU,in common with 1 Sam. xiii. 1, xiv. 47–51 (*cf.,* also the introduction in 1 Sam. vii 2 and the conclusion vii 15–17), are of a literary character different from the detailed narratives; the redactional or annalistic style is noticeable, and they contain features characteristic of the annals which form the framework of Kings. In Kings the Israelite and Judaean records are kept carefully separate and the independent standpoint of each is at once obvious. Here, however, much complication arises from the combination of traditions of distinct origin, independent records of Saul having been revised or supplemented by writers whose interest lay in David.

David.—The stories of the relations between the founders of the respective monarchies of Israel and of Judah reflect the popular interest in DAVID (*q.v.*). Apart from the more detailed and continuous history, there are miscellaneous passages in 2 Sam. v.–viii., with an introduction (v. 1–3), and a concluding chapter rounding off David's reign (viii.). A similar collection in xxi.–xxiv. severs the closely-knit sequence of narratives in ix.–xx. (the "Court history of David") from David's death in 1 Ki. i.–ii. Their contents range over all periods, from the Amalekite war (viii. 12, *cf.* 1 Sam. xxx) to David's "last words" (xxiii. 1; but see 1 Kings i. 1 and ii. 1). In particular they narrate the capture of Jerusalem from the Jebusites (v. 6–10) and other fights in that district as far as Gezer (vv. 17–2j), the purchase of land from a Jebusite for the erection of an altar (xxiv.; *see* 1 Chron. xxi.–xxii. 1, 2 Chron. iii. 1), and the pacification of the Gibeonites (xxi. 1–14). The last two inter-related narratives are severed by the no lees inter-related material in xxi. 1j sqq., xxiii. 8 *sq.* (connected with the conflicts in ch. v); and these in turn are now separated by the psalm in xxii. (Ps. xviii) and by David's "last words." The repetition of the list of officials in viii. 15–18 and xx. 23–26 is attributed by several authorities (after Budde) to the later insertion of ix.–xx. 22. On this view, the two groups v.–viii, xxi–xxiv. were once contiguous—though not necessarily in their *present* form or order.

The compiler of 2 Sam. v.–viii. has placed affer the capture of Jerusalem (v. 6 sqq.) the conflict with the Philistines (v. 17 sqq), where the "hold" is not Zion but some place of retreat, perhaps Adullam (cf. xxiii. 14). Similarly, the conflicts in xxi. 1j sqq., xxiii. 8 sqq., which are located around Gath, Lehi (so read xxiii. 11), Pas-dammim (so v. 9; see 1 Chron. xi. 13), Bethlehem, and the valley of Rephaim, should also precede the occupation of Jerusalem and the subsequent partition of territory among David's sons and others (*e.g.*, xiii. 23, near Bethel). These passages combine to furnish a representation of the events leading to the capture of the capital which is distinct from and now superseded by the detailed narratives in ii. 12–iv. Here, Ishbaal is east of the Jordan, David's men are engaged in fighting Benjamin and Israel—even at Gibeon (about 6 m. N.W. of Jerusalem), the interest of the history is in David's former relations with Israel at Saul's court, and he is regarded as the future deliverer of the oppressed people. The fragments preserved in 2 Sam. v.–viii., xxi.–xxiv. throw another light upon David's relations to Saul's family (xxi. 1–14, contrast ix.); and the stories of heroic conflicts with giant-like figures of Gath, etc. (xxiii. g seq., 18, *cf.* 1 Chron. xi. 11, 20) find no place by the side of the more detailed records of his sojourn under the protection of a king of Gath, one of a confederation of Philistine cities (1 Sam. xxvii., xxix). It is possible that popular stories cf the conquest of the earlier inhabitants have been applied to the PHILISTINES (*q.v.*); their general character associates them with the legends of the "sons of Anak," who enter into Judaean (perhaps originally Calebite) tradition elsewhere (Num. xiii. 22, 28), and who according to one group of traditions occupied all the hill-country from Hebron northwards (Josh. xi. 21 sqq, xv 14)

Saul and David.—The accounts of David's conflicts with giant heroes and of the conquest of Jerusalem and its district belong to Judaean traditions which have been almost superseded by other traditions of the rise of the Hebrew monarchy and by popular narratives of early relations between the Judaean David and the (north) Israelite king and people. The emphasis (in 1 Sam.) upon the rejection of Saul, his enmity towards David, the latter's chivalry, and his friendship for Jonathan, partly account for the present literary intricacies. On quite general grounds, divine traditions of distinct origin (Calebite or Jerahmeelite; indigenous Judaean; North Israelite or Benjamite) are to be expected in a work now in post-exilic form. Moreover, the late genealogy of Saul in 1 Chron. viii. 29 sqq., ix. 35 sqq., is evidence of a keen interest in the Saulidae in post-exilic times. David's history is handled independently of Saul in 1 Sam. xxv.; and the narrative, now editorially connected with the context (v. 1, see xxviii. 3; and v. 44, see 2 Sam. iii. 1j), gives a valuable picture of his life in the south of Palestine, with which we may compare his relations with south Judaean cities in xxx. 26–31. (The chapter with the prophecy of Abigail may be of Calebite origin.) His flight northwards to the Philistine king of Gath (xxvii.) is hardly connected with the preceding situations in xxiv. 17–22, xxv., or xxvi. 21–25, or with his previous slaughter of Philistines at Keilah (xxiii. 1–15). His earlier successes over them are ignored in xxix. 5, although the couplet there quoted now finds its only explanation in xviii. 7 after the death of Goliath and the defeat of the Philistines. These traditions of the relations between Judah and the Philistines (cf. xxvii. 5 seq.) are distinct from the popular stories of giants of Gath, and now form part of the joint history of David and Saul.

The independent narrative of Saul's fate represents one of the disastrous attacks which recur in earlier and later history of the north (xxviii.–4, xxix.). The geographical data are confused by the stories of David (see 1 Sam. xxviii. 4, xxix. 1), and while the "Philistines" march north to Jezreel to deliver their attack, David's presence is not discovered until Aphek is reached (xxix.). His journey is the opportunity for an Amalekite raid (xxx. cf. xxvii. 8 seq.), and a defeat of Amalek by David proves more successful than that which led to Saul's rejection (*xv. 20 seq.* 26–28). Similarly, Saul's disaster leaves Israel again in the hands of the "Philistines" (xxxi. 7, cf. xiii. 6 seq.), and it is for David to save the people of Israel out of their hands (2 Sam. iii. 18, cf. 1 Sam. ix. 16); so, also, David's wars (2 Sam. viii.) bear a certain resemblance to those of Saul (1 Sam. xiv. 47). The sequel to the joint history has another version of Saul's death (2 Sam. i. 6–10, 13–16), and an Amalekite is the offender; contrast his death in i. 15 seq. with iv. 10 seq. The chapter explains the transference of the royal insignia from Israel to Judah. Here is quoted (from the "Book of Jashar") the old poetical lament over the death of the valiant friends Saul and Jonathan, describing their successful warlike career, the wealth they brought the people, and the vivid sense of national misfortune (i. 19–27). It is utilized for the history of David, to whom it is attributed.

In general, it appears that those narratives wherein the histories of Saul and David are combined—very much in favour of the latter—were originally distinct from those where (a) Saul's figure is more in accord with the old poem from the Book of Jashar, and (b) where David's victories over prehistoric giants and his warlike movements to Jerusalem pave the way for the foundation—from a particular Judaean standpoint—of his remarkably long dynasty, for the literary problem of 1 and 2 Samuel is that of the writing of the history of the early monarchy and how it came to be formed.

SAMURAI, the Japanese warrior caste. In Japan in the 11th century, the power of the imperial government to maintain order in the provinces waned. It was then that the samurai emerged as a distinct social group. Held together by personal loyalty to powerful chiefs, warrior groups brought ever more territory under their control. fighting wars for local and. eventually. national supremacy. From the end of the 11th century until 1868, government was exclusively in the hands of the samurai class. In the

early years of almost continual warfare. when manpower was short and physical courage and prowess were at a premium, entry into the group was relatively open. But after 1600, when, under the strict rule of the Tokugawa shogun. the country was at peace for 250 years. warriors became a closed caste.

The establishment of warrior dominance at the end of the 12th century marked a break with the classical culture of the court. New forms of literature, religion and drama emerged. forms congenial to the samurai. nhich helped mold samurai taste. But samurai political dominance lasted longer than samurai cultural dominance. which was surpassed around 1700 by the lusty plebeian culture of Japan's growing cities.

The samurai virtues of pride and loyalty are illustrated in the story of the Forty-Seven Ronin (*q.v.*). See also JAPAN: History: *Minamoto Yoritomo.* (T. C. SH.)

SANA (Arabic SAN'A'), a town of Yemen, southwestern Arabia, situated in a broad depression, running locally nearly north and south, on the lofty uptilted western edge of the great Arabian land block.

The population in 1953 was estimated at 50,000.

Early traditions of ancient Sana connect it with the old kingdom of Himyar. Its early name was Azal, possibly associated with Uzal of Gen. x, 27. A Syriac writer of the 6th century mentions a Himyarite nation of Auzalites. Its later name. signifying "fortified," is associated with the Abyssinian conquerors of Yemen. Sana was the capital of the Abyssinian, Abraha (A.D. 525). who built there the famous church (*al-qalis*) which was destroyed two centuries later by order of the caliph Mansur. Its later history has been a record of desert raids interspersed with periods of prosperity. After the withdrawal of the Turks (1918), Sana became the capital of the imam of Yemen proper.

The town consists of three parts: (1) The Medina, the old city and Arab quarter, on the east, containing the principal mosques. There also, at its southeast corner, is the citadel al-Qasr. On the crest of Jabal Nukum (2,000 ft. above the valley) are the ruins of the old fort of al-Birash and the Mutawakkil, formerly containing the palace of the imams. covering its western face. (2) The Bir 'Azab, west of the city, the residential area; and (3), on the extreme west. the Qa' al-Yahud or Jewish quarter. The city, with the Qasr and Mutawakkil, is surrounded by a lofty and thick wall. The Bir 'Azab and Qa' al-Yahud are enclosed in a similar mall. but of more recent construction. The Jami' Masjid or principal mosque, with a model of the Ka'ba at Mecca in the centre, stands on the site of the Christian church built by Abraha.

The neighbourhood of Sana suffers from a lack of water, but in places where this is brought from the hill streams on the west fields of barley and alfalfa (lucerne) and market gardens are seen, particularly at Raudha, a suburb 6 mi. N. of the town, and in the deep gorges of the Wadi Dhahr and Wadi Hadda, the terraced orchards of which are celebrated for their fine fruit trees.

SANA'I (ABU'L-MAJD MAJDUD) (c. 1070–c. 1140), Persian poet and mystic, author of the first great mystical epic in Persian. He was born in Ghazni, where as a young man he served as a panegyrist at the court of the Ghaznavid sultans. He later traveled to Balkh and other cities of Khorasan, and as a result of his association with mystics and philosophers abandoned the life of the court. and devoted himself to the pursuit of the mystical life. Late in life he returned to Ghazni. where he lived in retirement, resisting the blandishments of the Ghaznavid ruler Bahramshah, and completed the composition of his most important work, the philosophical poem Hadiqat al-Haqiqa ("Garden of Truth"; Eng. trans. of book i by J. Stephenson, 1911).

Sana'i's poetical writings show clearly the spiritual change that divided his life; his early court panegyrics, though skillful, lack originality, whereas his mystical and philosophical poetry is full of deep feeling and sensibility. Sana'i wrote five or six other *mathnavi* (rhymed couplet) poems in addition to the Hadiqa, and also a considerable number of fine *ghazals* (lyrics). He was the first major Persian poet to use verse for the expression of the mystical, philosophical and ethical ideas of Sufiism (*q.v.*) and so influenced the whole trend of Persian poetry. In particular he paved the way for both Farid-ud-din 'Attar and Jalal-ud-din Rumi (*qq.v.*).

For discussions of Sana'i's life and work *see* E. G. Browne, *A Literary History of Persia,* vol. ii (1928); T. W. Haig in *Encyclopaedia of Islam,* vol. iv (1934). (L. P. E.-S.)

SAN ANDRÉS Y PROVIDENCIA, an intendancy of Colombia, consisting of St. Andrew's Island. Old Providence Island and three small keys in the Caribbean sea, 250 mi. S.W. of Jamaica and 100 mi. E. of Nicaragua. Pop. (1951) 5,675 (3,705 are on San Andrés); area 21 sq.mi. The islands were settled in 1629 by English Puritans and later by planters, woodcutters and Negro slaves from Jamaica. They were awarded to Spain in 1786 and became part of Colombia in 1821. The population remains English-speaking and Protestant but decreased after 1938 by emigration. San Andrés produces coconuts, copra and oranges; Providencia relies on subsistence agriculture. (G. J. B.)

SAN ANGELO, a city of southwestern Texas, U.S., is located 90 mi. S.W. of Abilene; the seat of Tom Green county. It was founded in 1867 near Ft. Concho at the confluence of the Concho rivers; the fort, abandoned as an army installation in 1889, is now a public museum. The mild climate (mean temperature 65° F.) and diversified recreational facilities attract tourists and sportsmen. San Angelo is also the educational, cultural, medical and trade centre for an area larger than New England; its public-school system includes a municipal junior college. The region produces oil, gas, sheep, wool, a major portion of the nation's Angora goats and mohair, and diversified farm crops; San Angelo is a major wool market. Oil and Goodfellow air force base, converted in 1958 from flight to security-service training, have been important in the growth of the city. Manufactures include boots, saddles, western-style jewelry, meat and dairy products, shoes and moccasins, cottonseed products. tile, trailers, printing and binding and metal products. The multipurpose Twin Buttes dam, completed in 1961, provides the municipal water supply. The city has a large coliseum in which a ram show, fat-stock show and rodeo are presented annually. San Angelo has a council-manager form of government, in effect since 1916. The population of the city in 1960 was 58,815, an increase of 11.4% from 1950; that of the standard metropolitan statistical area (Tom Green county) was 64,630, an increase of 8.8%. For comparative population figures see table in TEXAS: Population. (J. S. SP.)

SAN ANTONIO, a city of Texas, U.S., is located 80 mi. S.S.W. of Austin on the headwaters of the San Antonio river; the seat of Bexar county. San Antonio is exceptional among the larger cities of the U.S. in that its modern American character is blended with a considerable amount of foreign influence. This effect is due less to the fact that it was for 118 years a Spanish-Mexican outpost than to the close cultural ties which the city now has with Mexico. Situated on the plains of south-central Texas (see LLANO ESTACADO) at the foot of the Edwards plateau to the northwest, San Antonio is only 150 mi. from the Mexican border at Laredo and is on the most traveled route between the U.S. and Mexico by air, rail or highway. Spanish is spoken in most downtown retail establishments. The Latin section of the city, south and west of the business district,,resembles an indigenous Mexican city, with its own shops, theatres, cafés, clubs, a weekly newspaper (La *Prensa*) and a Spanish-language television station. The population of the city in 1960 was 587,718, an increase of 43.9% over 1950; that part of the population which is of Spanish-Indian origin (estimated at 40%) has increased by a steady flow of immigration as well as by birth. The population of the standard metropolitan statistical area (Bexar county) was 687,151 in 1960, an increase of 37.3% during the decade. (For comparative population figures see table in TEXAS: Population.)

History.—San Antonio was founded on May 1, 1718, by a Spanish military expedition from Monclova, then capital of Coahuila, in northern Mexico, on the trail through the Texas wilderness to the recently opened trading posts of the French in Louisiana. The site was chosen for the springs welling up within what is now the city to form the San Antonio river, which flows southeastward into the Gulf of Mexico. Before the Spaniards came the site had been occupied by a Coahuiltecan Indian village, Yanaguana.

On the west side of the river the soldiers built a small fort which they called the presidio of Béjar; on the other side arose a Franciscan mission, San Antonio de Valero. In 1731 a party of 55 indigent settlers arrived, after an arduous journey from the Canary Islands (a Spanish possession), to colonize the lonely frontier post. Given land. they laid out a town near the fort and named it San Fernando. In time the three settlements grew together into a pueblo which was called San Antonio de Béjar. Eventually the presidio gave its name to Bexar county, of which modern San Antonio is the major part. For reasons which are no obscure. Mission San Antonio de Valero came to be known as the Alamo. from the Spanish word for "cottonwood tree."

Between 1720 and 1731 four more Franciscan missions were established at intervals for a distance of eight miles down the San Antonio river. When the missions were secularized in 1794 their cultivated lands were distributed among the Indians under their tutelage and the buildings were abandoned. The Alamo was then used as a garrison by the soldiers defending San Antonio, replacing the old presidio.

With the Mexican revolution of 1821 San Antonio passed out of the hands of Spain and became a part of Mexico. It was still one of only three established communities in Texas, the others being Goliad, on the San Antonio river toward the Gulf, and Nacogdoches, near the Louisiana border. In August of that year. however, Stephen F. Austin arrived in San Antonio. where he arranged with the Mexican government to admit 300 families into Texas from the U S. By 1836, when Texas in turn declared its independence, the Anglo-American settlers around the Gulf coast had grown to at least 35.000.

The high moment in San Antonio's history was the battle of the Alamo during the war between Texas and Mexico (see TEXAS: *Revolution* and Republic). At that time San Antonio had 2.500 inhabitants and was still the foremost city of Texas. Within 14 years, while it continued to grow, it had lost first place to Galveston, the Gulf port through which immigrants were pouring into Texas, and nas being challenged by the new city of Houston.

During the last decades of the 19th century San Antonio was a major cattle centre, where herds were assembled for the long drives overland to the railroads in Kansas The famous Chisholm trail, uith its various offshoots, began in San Antonio; and it was usually to this city that cattlemen and cowhands repaired for relaxation after the drives. They brought a resurgence of prosperity to San Antonio. From 1900. when a hurricane virtually destroyed Galveston, until 1930. when both Houston and Dallas overtook San Antonio, it was again the first city of Texas.

The Economy.—Lacking the oil and chemical deposits around Houston and the rich trade area around Dallas, San Antonio after World War I gradually fell behind as a business and industrial capital. On the other hand. it acquired a new distinction as the home of what is probably the largest military establishment in the U.S Ft. Sam Houston, on a tract of 3,365 ac. inside the present city. is the headquarters of the 4th U.S army. an administrative district covering the five states of Texas, Louisiana. Arkansas. Oklahoma and New Mexico. Also at Ft. Sam Houston is Brooke army medical centre. which includes a large hospital, research laboratories and the army's basic school for medical officers, nurses and technicians.

Surrounding the city are four important U.S. air force bases. Kelly, the oldest, was established in 1917. Until 1943 it was the advanced flight training centre of the air force. Then it was converted into an aircraft maintenance and supply base. By the end of World War II Kelly had grown into a vast industrial complex, with 24,000 civilian employees, acres of shops and warehouses, 8 mi. of concrete runways and 28 mi. of railway spurs and sidings.

An offshoot of Kelly, and adjacent to it. is Lackland air force base, the principal air force training school for recruits and officer candidates. Randolph air force base, 17 mi N.E. of the city, is the headquarters of the Air Training command.

Brooks air force base, near Kelly and Lackland, is the site of the new Aerospace medical centre occupied in 1959 by the former school of aviation medicine. There the air force gives postgraduate training to flight surgeons and conducts advanced research on problems of atmospheric and space flight. The model air force hospital at Lackland is a unit of the centre.

These military operations largely account for the phenomenal growth of San Antonio after 1940, the city being without private industry of any great significance. They also explain its attraction for retired members of the armed forces, who permeate its social, business and professional life.

Education and Cultural **Activities.**—Among the many educational institutions in San Antonio are St. Mary's university (Roman Catholic; established 1852) and Trinity university (Presbyterian; established 1869); two Roman Catholic colleges for women, Incarnate Word (chartered 1881) and Our Lady of the Lake (founded 1896); and two private schools administered by the Protestant Episcopal Church, St. Mary's hall for girls and Texas Military institute for boys. The Protestant Episcopal bishop of west Texas has his diocesan centre in San Antonio. Cultural exhibits are found in the Witte Memorial museum and in the Marion Koogler McNay Art institute, which contains a notable collection of modern French paintings.

Historic Sites.—Among places of interest to visitors in San Antonio, the most notable is the Alamo (*q.v.*). A small section of the Spanish colonial town near the Alamo has been restored with later additions; it is known as La Villita and is used as a civic centre. San Fernando cathedral. built by the Canary Islanders, is the seat of a Roman Catholic archbishop. For a discussion of the missions and the governor's palace, all of great architectural and historic interest) see TEXAS: State *and National* Parks. San Antonio river: formally channeled and landscaped, winds unobtrusively below the level of the downtown streets.

SANATRUCES (*Sinatruces,* Pers. *Sanatruk*), Parthian king. In the troublous times after the death of Mithradates II (c. 88 B.C.) he mas made king by the Sacaraucae, a Mongolian tribe which had invaded Iran in 76 B.C. He was 80 years old and reigned 7 years: his successor was his son Phraates III. (Lucian, *Macrob.* 15; Phlegon, fr. 12 *ap.* Phot. cod. 97; Appian, *Mithr.* 104: Dio Cass. xxxvi, 45.)

SAN BERNARDINO, central city of the San Bernardino-Riverside-Ontario standard metropolitan area in southern California, is the seat of San Bernardino county (area 20,160 sq.mi., comprising 12% of the area of California). The city lies 60 mi. E. of Los Angeles at an elevation of 1,054 ft. at the southern base of the San Bernardino mountains (maximum altitude 11,502 ft.). Pop. (1960) of city 91,922; of standard metropolitan statistical area comprising San Bernardino and Riverside counties 809.782.

Spanish military commandant Pedro Fages first explored the area in 1772. On May 20, 1810, Franciscan Father Francisco Dumetz from the San Gabriel mission named the valley for St. Bernardino of Siena. About 1820 a *mayordomo* mas sent out by the mission fathers and an irrigation ditch and *asistencia* ("chapel") were started. In 1842 the valley was granted to the Lugo brothers and Diego Sepulveda, who had established a great cattle ranch there in 1839. The Rancho San Bernardino was sold to Mormon immigrants who came by wagon train from Salt Lake City in 1851. In that year the leaders of this group, Charles C. Rich and Amasa Lyman, founded the city of San Bernardino. The county was created in 1853. The city was incorporated in 1854, and its present charter dates from 1904.

San Bernardino city, surrounded by orange groves and vineyards, is the centre of a rich, irrigated agricultural region. Adjoining is Norton air force base, headquarters of the San Bernardino air materiél area. Numerous other large military installations are located in the vicinity. Seven miles west of the city is the largest integrated steel operation in the western U.S. The Santa Fe railroad maintains extensive shops; other important industries are foundries, aircraft and rocket factories, plumbing material, cement, and colour printing plants. San Bernardino is the centre of a large trade area with numerous wholesale distributors.

The city has fine churches and schools and is the site of San Bernardino Valley college (1926). In the metropolitan area are

the University of Redlands (1907), the University of California at Riverside (1905) with its Citrus Experiment station, the Loma Linda university (1905), Chaffey college (established in 1883 as Chaffey College of Agriculture) and Riverside City college (1916). The state. county and municipal buildings are grouped in a civic centre. The National Orange show, held annually since 1915, has permanent exposition buildings.

Immediately to the north of the city the San Bernardino mountains and national forest provide a resort area with fishing, boating and swimming in summer and facilities for skiing in winter. Beyond the mountains, on the way to Las Vegas and Palm Springs, are the numerous playgrounds of the Mojave desert (*q.v.*).

SAN BLAS: see CUNA.

SAN BRUNO, a city of California, U.S., in San Mateo county, is located 14 mi. S. of San Francisco near the west shore of San Francisco bay. Tanforan race track, established in 1899, attracted early settlements, and the town was incorporated in 1914. Favoured by a cool, sunny climate and easy access to the metropolis, the city grew slowly as a commuter's suburb until the 1940s. Sharing in the bay area's rapid population growth, its size tripled between 1940 and 1960. Many of its residents work in San Francisco but a number are employed locally in printing, aircraft operation and maintenance (San Francisco International airport) and electronics. A U.S. naval personnel depot and the U.S. marine corps reserve 7th infantry battalion were stationed in San Bruno after World War II. For comparative population figures see table in CALIFORNIA: *Population.* (J. H. ST.)

SAN BUENAVENTURA: see VENTURA.

SAN CARLOS, a city in California, U.S., in San Mateo county on the San Francisco peninsula, is located 26 mi. S.E. of San Francisco on historic El Camino Real, now a federal highway. Local tradition seems to have suggested the city's name, for it is believed that it was on the feast day (Nov. 4) of St. Carlo Borromeo, in 1769, that the expedition of Gaspar de Portolá first sighted San Francisco bay from the nearby hills. The original townsite was plotted in 1888 for the Southern Pacific railway on sections of an old Spanish land grant, but the city was not incorporated until 1925. The city-manager form of government was adopted in 1949. San Carlos shared in California's spectacular growth after World War II; its population increased about 80% from 1940 to 1960. Although predominantly a suburban residential community, it includes within its limits some light industry. mainly electronics. For comparative population figures see table in CALIFORNIA: Population. (S. B. KN.)

SANCHEZ COELLO, ALONSO (1515–1590), Spanish painter, according to some authorities a native of Portugal, was born, according to others, at Benifacio, near the city of Valencia. He studied many years in Italy and, returning to Spain in 1541 he settled at Madrid, and worked on religious themes for most of the palaces and larger churches. He was a follower of Titian, and, like him, excelled in portraits and single figures, elaborating the textures of his armours, draperies and such accessories in a manner so masterly as strongly to influence Velázquez in his treatment of like objects. Many of Sanchez' pictures were destroyed in the fires that consumed the Madrid and Prado palaces, but many good examples are yet extant, among which may be noted the portraits of the infantes Carlos and Isabella and the St. Sebastian painted in the church of San Gerónimo in Madrid.

SANCHI, a village in Madhya Pradesh state, India, the site of probably the oldest surviving buildings in the Indian subcontinent, apart from the Indus valley remains of the Harappan civilization (see INDIA: History) which belong to an earlier and different archaeological period. Pop. (1950) 448. The main structures of interest are the Buddhist stupas (religious buildings) on Sanchi hill, a sandstone feature, some 300-ft. high on the left bank of the Betwa river. Although the remains include an Asokan pillar, a fact which points to its importance in the early growth of the Buddhist religion and community, it has not proved possible to identify Sanchi in the textual geography of early Buddhism. The evolved style at Sanchi seems to form part of an artistic sequence from the Bhaja cave. near Poona, through the material from Bharhut and Gaya, to the great stupa which is Sanchi's chief glory. The conclusions to be drawn from art historical studies suggest that the railings and gateways from Bharhut, Gaya and the great stupa can be assigned to the period about 150–50 B.C. in that sequence. Stupa II, which was found to contain the relics of two of the Buddha's disciples, may, in fact, be older than Bharhut, to judge from the archaic nature of its carvings. but the great stupa in its final form is undoubtedly the work of developed schools of craftsmen who fully mastered the technique of work in stone in an idiom which, although it may owe some of its motifs to the west, is wholly Indian in feeling and treatment. Though the railings and gateways preserve details of constructional techniques appropriate to wood, the technique of the sculpture is unmistakably that of workers in stone, showing a marked technical progression from the north and south gateways, where the treatment is essentially that of the bas-relief, to the "free-swinging" bracket figures of the east and the west. The stupa consists of a base bearing a hemispherical dome (*anda*) representing the dome of heaven enclosing the earth, which is surmounted by a square railed unit (*harmika*), the world mountain, from which rises a mast (*yasti*) to symbolize the cosmic axis. The mast bears umbrellas (*chatra*) which represent. by their tiered arrangement, the various heavens of the gods (*devaloka*). Provision is made for a railed circumambulatory (*pradaksinapatha*) about 16-ft. above the base of the dome. and the whole is surrounded by a flagged path with an enclosing railing and ceremonial gateways (*torana*) at the cardinal points, the actual entrance being slightly offset,apparently to avoid direct, undeviating access to the enclosure. The whole edifice is at once a funerary monument and a microcosm. The great stupa in its present form—the basal diameter of the dome is about 11j ft. rising to a height of about 50 ft. at the *harmika* platform of which the diameter is some 40 ft.—is the result of additions to an original. probably Asokan foundation of much less imposing proportions and ornamentation. The dome is covered with well-laid masonry, while the railings of *harmika, pradaksinapatha,* and of the outer ring are splendidly masoned and well-proportioned, though, in contrast to those from Bharhut, Gaya and even from stupa II, they are left uncarved. But this is more than compensated by the magnificent gateways, probably to be dated in the order south. north, east, west. These portray upon their square uprights, their triple architraves and their brackets, scenes from the life of the Buddha, of his previous existences (jutukas), and a mass of space-filling motifs and figures: mythical animals, floral designs, the representations of spirits and godlings. The gates are topped with religious emblems. The carvings are not arranged in accordance with any master plan, but were commissioned by individuals and guilds as offerings of piety.

Despite this lack of planned arrangement, the effect is that of a coherent, if exuberant. whole. The Buddha figure does not appear, his presence being indicated by symbols, the Wheel, the Stupa, Footprints and the like.

Other features of interest include a caitya or assembly hall, apparently forming part of a complex, Asokan pillar-stupa-caityu, monastic buildings, perhaps to be assigned to the Sthaviravadin sect, and a small early Gupta temple (No. 17; early 5th century A.D.). This is a beautiful example of the flat-roofed type with a small *cella* and pillared verandah of which the architrave is carried around the building as a string course.

SAN CRISTÓBAL, name, from 1962, of former Dominican Republic province, of Trujillo: see TRUJILLO.

SAN CRISTOBAL (formerly called SAN CRISTÓBAL DE LOS LLANOS. CICDAD DE LAS CASAS and CIUDAD REAL), a town of Mexico, in the State of Chiapas, on a level tableland about 6,700 ft. above sea level and 48 mi. E.N.E. of Tuxtla Gutiérrez. Pop. (1950) 17,448. The surrounding country is fertile and healthful and is populated chiefly with Indians. San Cristóbal was founded

in 1528 on the site of an Indian village, and afterwards was famous as the residence of Las Casas, bishop of Chiapas. It was the capital of Chiapas until near the end of the 19th century.

SANCROFT, WILLIAM (1616–1693), archbishop of Canterbury, was born at Fressingfield, Suffolk, on Jan. 30, 1616, and entered Emmanuel college, Cambridge, in July 1634. He became fellow in 1642, but was ejected in 1649 for refusing to accept the "Engagement." He remained abroad till the Restoration, after which he was chosen one of the university preachers, and in 1663 was nominated to the deanery of York. In 1664 he was installed dean of St. Paul's, to the rebuilding of which, after the fire of 1666, he gave £1,400. He also rebuilt the deanery, and improved its revenue. In 1668 he was admitted archdeacon of Canterbury upon the king's presentation, but he resigned the post in 1670. In 1677, being now prolocutor of the Convocation, he was unexpectedly advanced to the archbishopric of Canterbury (1678). He attended Charles II upon his deathbed. He wrote with his own hand the petition presented in 1687 against the reading of the Declaration of Indulgence. which was signed by himself and six of his suffragans. For this they were all committed to the Tower, but were acquitted. Upon the withdrawal of James II he concurred with the lords in a declaration to the prince of Orange for a free parliament. and due indulgence to the Protestant dissenters. But, when that prince and his consort were declared king and queen, he refused to take the oath to them. and was accordingly suspended and deprived. From Aug. 5, 1691, till his death on Nov. 24, 1693. he retired to his native place.

He published *Fur praedestinatus* (1651), *Modern Politics* (1652), and *Three Sermons* (1694). *Nineteen Familiar Letters to Mr. North* (afterwards Sir Henry North) appeared in 1757. *See* G. O'Oyly, *Life of Sancroft* (a vols., 1821); A. Strickland, *Lives of the Seven Bishops* (1866).

SANCTIONS AND GUARANTEES in international law correspond to the means adopted in national law to enforce legal decisions. During the years which followed the World War it became increasingly apparent that the most important and the most enduring of European political problems was that known as the problem of "security" (*q.v.*).

As a deduction from the new conception of security the word "sanctions" began to replace in the language of diplomacy the word "alliance." Security was now to be sought not in limited agreements between small groups of states to fight together whenever any of them should, for whatever cause, be involved in international conflict, but in common agreements among a greater or smaller number of states to act together when—and only when—the established rights of one of them had been violated by force. Security, therefore, must be found in "sanctions" against the wrongdoer. For some time indeed, the word "guarantees" was used instead of, or on an equal footing with, the word "sanctions," but gradually the use of the word "guarantee" disappeared and the word "sanctions" took its place.

The discussions which occurred after the war soon showed that there were two ways by which Governments believed the result in view could be achieved; first, by creating a general system embracing all the States throughout the world; and second, by creating limited arrangements applying to a certain number of States situated in geographical proximity to each other and bound together by common bonds of material interest.

Article 16 of the Covenant.— It was by the general method that the first step was made towards the organization of a true system of international sanctions. This first step consisted in the adoption of the Covenant of the League of Nations, Article 16 of which imposes obligations upon every member of the League to adopt common coercive measures, including especially a financial and economic boycott, against states which, in violation of the undertakings of the Covenant, resort to war. But unfortunately Article 16 contained ambiguities which seriously diminished the confidence of Governments in its efficiency. It was not, therefore, generally regarded as by itself creating a sufficiently sound system of sanctions to solve the problem of security. For that reason the Temporary Mixed Commission set up by the Council of the League of Nations prepared in 1923 the draft treaty of mutual guarantee (or assistance), on the basis of which was prepared the Geneva Protocol of 1924. Both instruments were founded on the clear acceptance by all signatory states of obligations to co-operate by military or other necessary means against an aggressor.

Regional Guarantees.— The second method received its first application in the Anglo-American-French guarantee treaties drawn up in 1919 at Paris. These treaties failed to secure ratification, and were replaced by the Franco-Belgian, Franco-Polish and other similar treaties of alliance. The Little Entente was another example of the same method. But it was recognized even by the authors of these treaties that although they were subject to the Covenant of the League they were, nevertheless, liable to degenerate into alliances of the old sort, and that therefore they would be dangerous unless they were effectively controlled by the League. The Temporary Mixed Commission above mentioned in its draft treaty of mutual assistance for the first time combined the two methods into one coherent system. The Protocol similarly recognized the utility of special treaties in support of general sanctions, but on condition that such special treaties could only be applied *after* it had been recognized by some impartial arbitrator that aggression had taken place. After the failure of the combination method of the Geneva Protocol, a return was made in the Locarno Agreements to the method of partial treaties. These agreements, however, in no way resembled an old-time alliance; the concern of their authors was plainly to create one more stable element in a new system of general international sanctions against aggression. *(See* LEAGUE OF NATIONS and bibliography thereto and INTERNATIONAL LAW, PUBLIC.) (P. J. N.-B.)

On Oct. 9, 1935, the League Assembly, with Austria and Hungary dissenting, declared that Italy had resorted to war contrary to Article XII of the Covenant. Fifty member states pledged to apply collective sanctions against Italy and, in due course, these countries adopted an arms embargo. A financial embargo was added by 48 states, a boycott of imports from Italy by 47 states, a ban on certain exports to Italy by 47 states, and a pact of mutual support by 34 states. The U.S., acting independently, applied an embargo to both belligerents. League sanctions did not include oil and, as limited, they failed to arrest Italy's invasion of Ethiopia. In June 1936, sanctions were abandoned and an endeavour by France to apply sanctions to Germany when it marched troops into the Rhineland did not materialize.

SANCTI SPÍRITUS, an old Cuban city in Las Villas Province, is on a sandy plain in an angle of the Yayabo river, which winds through the city. Pop. (1953) 58,160. It is connected by railway with Zaza del Medio, on the main railway line of the island, and with its port, Tunas de Zaza, 30 mi. (by rail) to the south. Sancti Spíritus was one of the seven cities founded by Diego Velásquez. Its settlement was ordered in 1514 and accomplished in 1516. The present city is about two miles from the original site (Pueblo Viejo). In 1518, as a result of the war of the Comunidades of Castille, a mimic war broke out in Sancti Spíritus among its two score villagers. The place was sacked by French and English corsairs in 1719. Sancti Spíritus grew rapidly in the second quarter of the 20th century in consequence of the expansion of the hide and dairy industries. (C. E. Mc.)

SANCTORIUS (the Latin form of SANTORIO SANTORIO) (1561–1636), professor at Padua and colleague of Galileo, owes his medical fame to his demonstration that loss by "insensible perspiration" exceeds all other bodily excretions combined. Being inspired by the devices of Galileo, he invented a thermometer and an apparatus for measuring the pulse, and also a trocar and a cannula. His chief works are the *De Medicina Statica* (1614) and a commentary on the *Canon* of Avicenna.

SANCTUARY, a sacred or consecrated place, particularly one affording refuge, protection or right of asylum. The word is also applied to the privilege itself, the right of safe refuge, and even to places of refuge for animals, such as a "bird sanctuary." In Egyptian, Greek or Roman temples it was applied to the *cella* in which stood the statue of the god, and the Latin word for

altar, *ara,* was used for protection as well. In Roman Catholic usage sanctuary is sometimes applied to the whole church, as a consecrated building, but is generally limited to the choir. The idea that such places afforded refuge to criminals or refugees is founded upon the primitive and universal belief in the contagion of holiness. Hence it was sacrilege to remove the man who had gained the holy precincts; he was henceforth invested with a part of the sacredness of the place, and was inviolable so long as he remained there. The story of the death of Demosthenes (*q.v.*) is a famous instance. Not all Greek and Roman temples, however, had the right of sanctuary. But where it existed, the action of the Roman civil law was suspended, and in imperial times the statues and pictures of the emperors were a protection against pursuit. Roman law did not recognize the use of Christian sanctuaries until toward the end of the 4th century, but the growing recognition of the office of bishop as intercessor helped much to develop it. In 399 the right of Christian sanctuary was finally and definitely recognized, and in 419 the privilege was extended in the western empire to 50 paces from the church door. In 431, by an edict of Theodosius and Valentinian it was extended to include the church court-yard and whatever stood therein, in order to provide some other place than the church for the fugitives to eat and sleep. Justinian in a Novel of the year 535 limited the privilege to those not guilty of the grosser crimes. In the new Germanic kingdoms, while violent molestation of the right of sanctuary was forbidden, the fugitive was given up after an oath had been taken not to put him to death. This legislation was copied by the Church at the council of Orleans in 511; the penalty of penance was added, and the whole decree backed by the threat of excommunication. Thus it passed into Gratian's Decretum, but historians like Gregory of Tours have many tales to tell showing how frequently it was violated.

The earliest extant mention of the right of sanctuary in England is contained in the code of laws issued by the Anglo-Saxon king Aethelberht in A.D. 600. By these he who infringed the church's privilege was to pay twice the fine attaching to an ordinary breach of the peace. Crosses inscribed with the word "Sanctuarium," were common on the highways, serving probably as sign-posts to guide fugitives to neighbouring sanctuaries. The canon law allowed the protection of sanctuary to those guilty of crimes of violence for a limited time only, in order that some compensation (*wergild*) should be made, or to check blood-vengeance. The procedure, upon seeking sanctuary, was regulated in the minutest detail. The fugitive had to make confession of his crime to one of the clergy, to surrender his arms, swear to observe the rules and regulations of the religious houses, pay an admission fee, give, under oath, fullest details of his crime (the instrument use , the name of the victim, etc.), and at Durham he had to toll a special bell as a formal signal that he prayed sanctuary, and put on a gown of black cloth on the left shoulder of which was embroidered a St. Cuthbert's cross. The protection afforded by a sanctuary at common law was this: a person accused of felony might fly for safeguard of his life to sanctuary, and there, within 40 days, go, clothed in sack-cloth, before the coroner, confess the felony and take an oath of *abjuration of the realm,* whereby he undertook to quit the kingdom, and not return without the king's leave. Upon confession he was, *ipso facto,* convicted of the felony, suffered attainder of blood and forfeited all his goods, but had time allowed him to fulfil his oath. The abjurer started forth on his journey, armed only with a wooden cross, bareheaded and clothed in a long white robe, which made him consoicuous among mediaeval wayfarers. He had to keep to the king's highway, was not allowed to remain more than two nights in any one place, and must make his way to the coast quickly. The time allowed for his journey was not long. In Edward III.'s reign only nine days were given an abjurer to walk from Yorkshire to Dover.

Under the Norman kings there appear to have been two kinds of sanctuary; one *general,* which belonged to every church, and another *peculiar,* which had its force in a grant by charter from the king. This latter type could not be claimed by prescription, and had to be supported by usage within legal memory. General sanctuaries protected only those guilty of felonies, while those by special grant gave immunity even to those accused of high or petty treason, not for a time only but apparently for life. Of chartered sanctuaries there were at least 22: Abingdon, Armathwaite, Beaulieu, Battle Abbey, Beverley, Colchester, Derby, Durham, Dover, Hexham, Lancaster, St. Mary le Bow (London), St. Martin's le Grand (London), Merton Priory, Northampton, Norwich, Ripon, Ramsey, Wells, Westminster, Winchester, York. At the Reformation general and peculiar sanctuaries both suffered drastic curtailment of their privileges, but the great chartered ones suffered most. By the reforming act of 1540 Henry VIII. established seven cities as peculiar sanctuaries. These were Wells, Westminster, Northampton, Manchester (afterwards transferred to Chester), York, Derby and Launceston. By an act of James I. (1623), sanctuary, as far as crime was concerned, was abolished throughout the kingdom. The privilege lingered on for civil processes in certain districts which had been the site of former sanctuaries and which became the haunts of criminals who there resisted arrest—a notable example being that known as Whitefriars between Fleet Street and the Thames, east of the Temple. This locality was nicknamed Alsatia (the name first occurs in Shadwell's plays in Charles II.'s reign), and there criminals were able to a large extent to defy the law, arrests only being possible under writs of the lord chief justice. So flagrant became the abuses that in 1697 the "Escape from Prison Act," finally abolished all such alleged privileges. A further amending act of 1723 completed the work of destruction.' The privileged places named in the two acts were the Minories, Salisbury Court, Whiteiriars, Fulwood's Rents, Mitre Court, Baldwin's Gardens, The Savoy, The Clink, Deadman's Place, Montague Close, The Mint and Stepney.

In Scotland the most famous sanctuaries were those attaching to the Church of Wedale, now Stow, near Galashiels, and that of Lesmahagow, Lanark. All religious sanctuaries were abolished in the northern kingdom at the Reformation. But the debtor found sanctuary from "diligence" in Holyrood House and its precincts until late in the 17th century. This sanctuary did not protect criminals, or even all debtors, *e.g.,* not crown debtors or fraudulent bankrupts; and it was possible to execute a *meditatio fugae* warrant within the sanctuary. The abolition of imprisonment for debt in 1881 practically abolished this privilege of sanctuary.

A presumptive right of sanctuary attached to the royal palaces, and arrests could not be made there. In Anglo-Saxon times the king's peace extended to the palace and 3,000 paces around it: it extended to the king himself beyond the precincts. At the present day members of parliament cannot be served with writs or arrested within the precincts of the houses of parliament, which extend to the railings of Palace yard. During the Irish agitation of the 'eighties Parnell and others of the Irish members avoided arrest for some little while by living in the house and never passing outside the gates of the yard. The houses of ambassadors were in the past quasi-sanctuaries. This was a natural corollary of their diplomatic immunities *(see* DIPLOMACY).

In Europe, generally, the right of sanctuary survived under restrictions down to the end of the 18th century. In Germany the more serious crimes of violence were always excepted. Highwaymen, robbers, traitors and habitual criminals could not claim church protection. In 1418 sanctuary was further regulated by a bull of Martin V. and in 1504 by another of Julius II. In a modified form the German *Asylrecht* lasted to modern times, not being finally abolished till about 1780. In France *le droit d'asile* existed throughout the middle ages, but was much limited by an edict of Francis I. in 1539. It was entirely abolished at the Revolution.

SAND, GEORGE (1804–1876), the pseudonym of Madame Amandine Lucile Aurore Dudevant, *née* Dupin.

George Sand was the daughter of Maurice Dupin, a retired lieutenant, and of Sophie Delaborde, the daughter of a Paris bird-fancier. Their ill-assorted marriage took place only a month

before the birth of the child (July 1, 1804; at Paris). Her paternal grandfather was M. Dupin de Francueil, a farmer-general of the revenue, who married the widow of Count Horn, a natural son of Louis XV., she in her turn being the natural daughter of Maurice de Saxe, the most famous of the many illegitimate children of Augustus the Strong, by Marie Rinteau ("Mlle. de Verrières"). George Sand, who was a firm believer in the doctrine of heredity, devotes a whole volume of her autobiography (*Histoire de ma vie*, 1857 *seq.*) to the elaboration of this strange pedigree. She boasts of the royal blood which ran through her veins, but she is no less frank in declaring that she is *vilaine et très vilaine*, a daughter of the people who shares by birth their instincts and sympathies. Her birth itself was romantic. Her father died when she was a small child, and her mother, after a struggle, abandoned Aurore to the care of her grandmother, Madame Dupin de Francueil, who was a survival of the ancien régime.

Her childhood was spent at Nohant, near La Châtre in Berry, Madame Dupin's country house. Here she imbibed the passionate love of country scenes and country life which neither absence, politics nor dissipation could uproot; here she learnt to understand the ways and thoughts of the peasants, and laid up that rich store of scenes and characters which a marvellously retentive memory enabled her to draw upon at will. Next to the grandmother, the most important person in the household at Nohant was Deschatres. He was an ex-abbé who had shown his devotion to his mistress when her life was threatened during the Revolution, and henceforward was installed at Nohant as factotum. He was maire of the village, tutor to Aurore's half-brother, and undertook the education of the girl. At odd hours of lessons she picked up a smattering of Latin, music and natural science, but most days were holidays and spent in country rambles and games with village children.

From the free out-door life at Nohant she passed at thirteen to the convent of the English Augustinians at Paris, where for the first two years she never went outside the walls. Nothing better shows the plasticity of her character than the ease with which she adapted herself to this sudden change. One day in the convent chapel she underwent conversion in the mystical sense. There is no doubt of the sincerity of her narrative, or even the permanence of her religious feelings under all her many phases of faith and aberrations of conduct.

Again in 1820 Aurore exchanged the restraint of a convent for freedom, being recalled to Nohant by Mme. de Francueil, who had no intention of letting her granddaughter grow up a *dkvote*. She rode across country with hey brother, she went out shooting with Deschatres, she sat by the cottage doors on the long summer evenings and heard the flax-dressers tell their tales of witches and warlocks. She was a considerable linguist and knew English, Italian and some Latin, though she never tackled Greek. She read widely though unsystematically, studying philosophy in Aristotle, Leibnitz, Locke and Condillac, and feeding her imagination with *Rend* and *Childe Harold*. Her confessor lent her the *Génie du Christianisme*, and to this book she ascribes the first change in her religious views.

On her grandmother's death she married on Dec. 11, 1822, Casimir Dudevant, natural son of Baron Dudevant. He seems then to have been neither better nor worse than the Berrichon squires around him, and the first years of her married life, during which her son Maurice and her daughter Solange were born, except for lovers' quarrels, were passed in peace and quietness, though signs were not wanting of the coming storm. Among these must be mentioned her friendship with Aurélien de Sèze, advocate-general at Bourdeau, which her husband resented. So long as the conventions were preserved she endured her life, but when her husband took to drinking and made love to the maids under her eyes she resolved to break a yoke that had grown intolerable. She then discovered a paper docketed "Not to be opened till after my death," which was nothing but a railing accusation against herself. She at once quitted Nohant, taking with her Solange, and in 1831 an amicable separation was agreed upon, by which her whole estate was surrendered to the husband with the stipulation that she should receive, in return for this relinquishment on her part, an allowance of £120 *a* year.

Aurore Dudevant had regained her liberty, and made no secret of her intention to use it to the full. She endeavoured unsuccessfully to eke out her irregularly paid allowance by various expedients, and lived in a garret. She found a friend in Delatouche, the editor of *Figaro*. He was a native of Berry, like herself, a stern but kindly taskmaster who taught her the trade of journalism. On the staff of *Figaro* was another compatriot, Jules Sandeau, a clever and attractive young lawyer. Articles written in common soon led to a complete literary partnership, and in 1831 there appeared in the *Revue de Paris* a joint novel entitled *Prima Donna* and signed Jules Sand. Shortly after this was published in book form with the same signature a second novel, *Rose et Blanche*. The sequel to this literary alliance is best recounted in George Sand's own words: "I resisted him for three months but then yielded; I lived in my own apartment in an unconventional style." Her first independent novel, *Indiana* (1832), was written at the instigation of Delatouche, and the world-famous pseudonym George (originally Georges) Sand was adopted as a compromise between herself and her partner. The one wished to throw *Indiana* into the common stock, the other refused to lend his name, or even part of his name, to a work in which he had had no share. The novel was received with instant acclamation. *Indiana* is a direct transcript of the author's personal experiences (the disagreeable husband is M. Dudevant to the life), and an exposition of her theory of sexual relations which is founded thereon. To many critics it seemed that she had said her whole say and that nothing but replicas could follow. *Valentine*, which was published in the same year, indicated that it was but the first chapter in a life of endless adventures, and that the imagination which turned the crude facts into poetry, and the fancy which played about them like a rainbow, were inexhaustible.

Her liaison with Jules Sandeau, which lasted more than *a* year, was abruptly terminated by the discovery in their apartment on an unexpected return from Nohant of *une blanchisseuse quelconque*. For a short while she was broken hearted:—"My heart is a cemetery!" she wrote to Sainte-Beuve. "A necropolis," was the comment of her discarded lover when years later the remark was repeated to him.

Her third novel, *Lélia* (1833), is in the same vein, a stronger and more outspoken diatribe against society and the marriage law. Lélia is a female Manfred, and Dumas had some reason to complain that George Sand was giving them "du lord Byron au kilo." But a new chapter in her life was now to open. In her despair she turned for comfort and counsel to Sainte-Beuve, now constituted her regular father confessor. He recommended new friendships, but she found Dumas "trop commis-voyageur," Jouffroy too serenely virtuous and Musset "trop dandy." Mérimée was tried for a week, but the cool cynic and the perfervid apostle of women's rights proved mutually repulsive. Alfred de Musset was introduced, and the two natures leapt together.

The Musset Episode.—Towards the end of 1833 George Sand, after winning the reluctant consent of Musset's mother, set out in the poet's company for Italy, and in January 1834 the pair reached Venice, staying first at the Hôtel Danieli and then in lodgings. At first it was a veritable honeyrnoon; conversation never flagged and either found in the other his soul's complement. But there is a limit to love-making, and George Sand, always practical, set to work to provide the means of living. Musset, though he depended on her exertions, was first bored and then irritated at the sight of this *terrible vache à écrire*, whose pen was going for eight hours a day, and sought diversion in the cafés and other less reputable resorts of pleasure. The consequence was a nervous illness, through which George Sand nursed him with tenderness and care. But she made love at the same time to a young Venetian doctor whom she had called in, by name Pagello. The two found their way eventually to Paris, leaving Musset in Italy, deeply wounded in his affections, but, to do him justice, taking all the blame for the rupture on himself. George Sand soon tired of her new love, and even before she had given him his congé was dying to be on again with the old. She cut off her hair and sent it to Musset as a token of penitence, but Musset, though he still

flirted with her, never quite forgave her infidelity and refused to admit her to his deathbed. Among the mass of *romans à clef* and pamphlets which the adventure produced, two only have any literary importance, Musset's *Confessions d'un enfant du siècle* and George Sand's *Elle et lui.* In the former woman appears as the serpent whose trail is over all; in the latter, written twenty-five years after the event, she is the guardian angel abused and maltreated by men. *Lui et elle,* the rejoinder of the poet's brother Paul de Musset, was even more a travesty of the facts with no redeeming graces of style.

It remains to trace the influence, direct or indirect, of the poet on the novelist. *Jacques* was the first outcome of the journey to Italy, and in precision and splendour of style it marks a distinct progress. In *Les Lettres d'un voyageur,* which ran in the *Revue des deux mondes* between 1834 and 1836, we have not only impressions of travel. but the direct impressions of men and things not distorted by the exigencies of a novel. The Everard of the *Lettres* introduces us to a new and for the time a dominant influence on the life and writings. Michel de Bourges was the counsel whose eloquent pleadings brought the suit for a judicial separation to a successful issue in 1836. Unlike her former lovers, he was a man of masterful will, a philosopher who carried her intellect by storm before he laid siege to her heart. He preached republicanism to her by the hour, and even locked her up in her bedroom to reflect on his sermons. She was but half converted, and fled before long from a republic in which art and poetry had no place. Other celebrities who figure in the *Lettres* under a transparent disguise are Liszt and Mme. d'Agoult (known to literature as Daniel Stern), whom she met in Switzerland and entertained for some months at Nohant. Liszt, in after years when they had drifted apart. wrote of her: "George Sand catches her butterfly and tames it in her rage by feeding it on flowers and nectar — this is the love period. Then she sticks her pin into it when it struggles — that is the congé and it always comes from her. Afterwards she vivisects it. stuffs it, and adds it to her collection of heroes for novels." There is some truth in the satire, but it wholly misrepresents her rupture with Chopin.

Liaison with Chopin. — It was doubtless a revulsion of feeling against the doctrinaires, especially the strong influence of Lamennais and P. Leroux, and in particular against the puritanic reign of Michel that made her turn to Chopin. She found the *maestro* towards the end of 1837 dispirited by a temporary eclipse of popularity and in the first stage of his fatal malady, and carried him off to winter with her in the south. How she roughed it on an island unknown to tourists is told in *Un hiver à Majorque* (1842), *a* book of travel that may take rank with Heine's *Reisebilder.* In nearly all George Sand's loves there was a strong strain of motherly feeling. Chopin was first petted by her like a spoilt darling and then nursed for years like a sick child. In the end Chopin remonstrated with her for refusing to receive her ne'er do well son-in-law, Clésinger, at Nohant, and when she resented his interference, he left her in anger.

Meanwhile, during this, her second period, George Sand allowed herself to be the mouthpiece of others—"un écho qui embellissait la voix," as Delatouche expressed it. *Spiridion* (1838) and *Les Sept cordes de la lyre* (1840) are mystic echoes of Lamennais. *Le Compagnon du tour de France* (1841), *Les Maîtres mosaïstes* and *Le Meunier d'Angibault* (1845), *Le Péché de M. Antoine* (1847) are all socialistic novels. George Sand had adopted her socialism from Pierre Leroux, and many works of this period are inspired by his humanitarianism. *Consuelo* (1842–1844) and its seque! *La Comtesse de Rudolstadt* (1843–1845) are *fantaisies à la Chopin,* though the stage on which they are played is the Venice of Musset. Chopin is the Prince Karol of *Lucrezia Floriani* (1847), a self-portraiture unabashed as the *Tagebuch diner Verlorenen* and innocent as *Paul et Virginie.*

George Sand wrote with the rapidity of Walter Scott and the regularity of Anthony Trollope. For years her custom was to retire to her desk at 10 P.M. and not to rise from it till 5 A.M. She wrcte *à la diable,* starting with some central thesis to set forth or some problem to investigate, but with no predetermined plot or plan of action. Round this nucleus her characters (too often mere puppets) grouped themselves, and the story gradually crystallized. This unmethodical method produces in her longer and more ambitious novels, in *Consuelo* for instance and its continuation, a tangled wilderness, the clue to which is lost or forgotten; but in her novelettes, when there is no change of scenery and the characters are few and simple, it results in the perfection of artistic writing, "an art that nature makes."

The Pastoral Novels. — From novels of revolt and tendency novels George Sand turned at last to simple stories of rustic life, the genuine pastoral. It is here that she shows her true originality and by these she will chiefly live. George Sand by her birth and bringing-up was half a peasant herself, in M. Faguet's phrase, "un paysan qui savait parler." She had got to know the heart of the peasant — his superstitions, his suspiciousness and low cunning, no less than his shrewdness, his sturdy independence and his strong domestic attachments. *Jeanne* (1844) begins the series which has been happily called the Bucolics of France. To paint a Joan of Arc who lives and dies inglorious is the theme she sets herself, and through most of the novel it is perfectly executed. The last chapters when Jeanne appears as the Velida of, Mont Barbot and the Grande Pastoure are a falling off and a survival of the romanticism of her second manner. *La Mare au diable* (1846) is a clear-cut gem, perfect as a work of Greek art. *François le champi* and *La Petite Fadette* are of no less exquisite workmanship. Les *Maîtres sonneurs* (1853) brings the series of village novels to a close, but as closely akin to them must be mentioned the *Contes d'une grande-mère,* delightful fairy tales of the Talking Oak, Wings of Courage and Queen Coax, told to her grandchildren in the last years of her life.

The revolution of 1848 arrested for a while her novelistic activities. She composed manifestos for her friends, addressed letters to the people, and even started a newspaper. But her political ardour was short-lived; she cared little about forms of government, and, when the days of June dashed to the ground her hopes of social regeneration, she returned to her quiet country ways and her true vocation as an interpreter of nature, a spiritualizer ot the commonest sights of earth and the homeliest household affections. In 1849 she writes from Berry to a political friend: "You thought that I was drinking blood from the skulls of aristocrats. No, I am studying Virgil and learning Latin!" In her latest works she went back to her earlier themes of romantic and unchartered love, but the scene is shifted from Berry, which she felt she had exhausted, to other provinces of France, and instead of passionate manifestos we have a gallery of *genre* pictures treated in the spirit of *François le champi.* "Vous faites," she said to her friend Honoré de Balzac, "la comédie humaine; et moi, c'est l'églogue humaine que j'ai voulu faire."

George Sand was as fond of acting as Goethe, and like him began with a puppet stage, succeeded by amateur theatricals, the chief entertainment provided for her guests at Nohant. Undaunted by many failures, she dramatized several of her novels with moderate success—*François le champi,* played at the Odéon in 1849, and *Les Beaux Messieurs de Bois-Doré* (1862) were the best; *Claudie,* produced in 1851, is a charming pastoral play, and *Le Marquis de Villemer* (1864) (in which she was helped by Dumas fils) was a genuine triumph. Her statue by Clésinger was placed in the foyer of the Théâtre Français in 1877.

George Sand died at Nohant on the 8th of June 1876. To a youth and womanhood of storm and stress had succeeded an old age of serene activity and then of calm decay. Hrr nights were spent in writing, which seemed in her case a relaxation from the real business of the day. playing with her grandchildren, gardening, conversing with her visitors — it might be Balzac or Dumas, or Octave Feuillet or Matthew Arnold — or writing long letters to Sainte-Beuve and Flaubert. "Calme, toujours plus de calme," was her last prayer, and her dying words, "Ne détruisez pas la verdure."

BIBLIOGRAPHY.—The collected edition of George Sand's works was published in Paris (1862–83) in 96 volumes, with supplement 109 volumes; the *Histoire* de *ma vie* appeared in 20 volumes in 1854–55. The *Étude bibliographique sur les œuvres de George Sand by* the vicomte de Spoelberch de Lovenjoul (Brussels. 1868) gives the most complete bibliography. Of Vladimir Karenin's (pseudonym of

Mme. Komarova) *George Sand,* the most complete life, the first two volumes (1899–1901) carry the life down to 1839. There is much new material in *George Sand et sa fille,* by S. Rocheblave (1905), *Correspondance de G. Sand et d'Alfred de Musset* (Brussels, 1904), *Correspondance entre George Sand et Gustave Flaubert* (1904), and *Lettres à Alfred de Musset et à Sainte-Beuve* (1897). E. M. Caro's *George Sand* (1887) is rather a critique than a life. *See* studies by Sainte-Beuve in the *Causeries du lundi* and in *Portraits contemporains;* Jules Lemaitre in *Les Contemporains,* vol. iv.; E. Faguet, *XIX^e Siècle;* F. W. H. Myers, *Essays Ancient and Modern* (1883); Henry James in *North American Review* (April 1902); Matthew Arnold, *Mixed Essays* (1879). *See* also René Doumic's *George Sand* (1909), which has been translated into English by Alys Hallard as *George Sand: Some Aspects of her Life and Writings* (1910); C. Maurras, *Les Amants de Venise; George Sand et Musset* (1916); L. Vincent, *George Sand et le Berry* (2 vols. 1919); E. A. L. Seillière, *George Sand* (1920); E. W. Schermerhorn, *The Seven Strings of the Lyre. The Life of George Sand (1804–76)* (1928); and Eng. trans., by M. J. Howe, of her *Journal Intime* as *The Intimate Journal of George Sand* (1929).

SAND. The products of rocks and minerals broken down by natural or artificial agencies are gravels, sands. silts and clays. In the U.S. the term sand is applied to particles $\frac{1}{16}$ to 2 mm. diameter. and in Europe to those from .02 to 2 mm. diameter. Although most of the rock-making minerals occurring on the earth's crust are found in sands, only a limited number are met with at all frequently.

For several reasons quartz is by far the commonest; it is abundant in rocks, is comparatively hard and has practically no cleavage so that it is not readily worn down to a fine state. Moreover it is nearly insoluble in water and does not decompose. In certain localities feldspar, calcareous material, iron ores and volcanic glass, among other substances, have been found to be dominant constituents of sand. Most quartzose sands contain a small quantity of feldspar. Small plates of white mica. which, though soft and very fissile, decompose slowly, are often present. In addition, all sands contain small quantities of "heavy" rock-forming minerals among which may be garnet, tourmaline, zircon, rutile. topaz, pyroxenes, amphiboles, iron ores, etc.

In certain shore and river sands these heavier constituents become concentrated as a result of current action and the removal of the lighter constituents. Economically valuable deposits may then be yielded. Such are the sands worked for diamonds and other gem stones, gold, platinum, tin, monazite and other ores. The greensands. widely distributed over the floor of the ocean and found in ancient strata on the continents, owe their colour to the presence of glauconite, a potash-bearing mineral. These sands are used for nater softening and for land dressing, and attempts have been made to extract potash from them.

In the pottery, glassmaking and silicate (water glass) industries very pure quartzose sands are used in large quantities as a source of silica. Similar sands are required for lining the hearths of acid-steel furnaces. Molding sands, that is, the sands utilized in foundries for making the molds in nhich metal is cast, usually have a clayey bond uniting the grains of quartz Because of the hardness and poor cleavage of quartz, sands are used extensively as abrasives. Garnet sands. although of more restricted occurrence, are similarly used. Ordinary sands find a multitude of other uses. among which may be mentioned the preparation of mortar, cement and concrete. In underground formations, sand strata are frequently sources of water supply. (P. G. H. B.; X.)

SANDALWOOD, a fragrant wood obtained from various trees of the natural order Santalaceae, and principally from *Santalum album,* a native of India. The use of sandalwood dates at least as far back as the 5th century B.C. It is still extensively used in India and China, wherever Buddhism prevails, being employed in funeral rites and religious ceremonies. In India it is used in the manufacture of boxes, fans and other ornamenfal articles of inlaid work.

The oil, obtained by distilling the wood in chips, is used as a perfume. few native Indian attars or essential oils being free from admixture with it. As a ponder or paste the wood is employed in the pigments used by the Brahmans for their distinguishing caste marks.

Red sandalwood is the product of a small leguminous tree, *Pterocarpus santalinus,* native to southern India, Ceylon and the Philippine Islands. A fresh surface of the wood has a rich deep red colour, which on exposure, however, assumes a dark brownish tint; its principal application is in wool dyeing. Several other species of *Pterocarpus,* notably P. *indicus,* contain the same dyeing principle and can be used as substitutes for red sandalwood. The barwood and camwood of the Guinea coast of Africa. from *Baphia nitida* or an allied species, called *santal rouge d'Afrique* by the French, are also closely allied to the red sandalwood of oriental countries.

As a substitute for copaiba (*q.v.*), which is used as a diuretic and stimulant, sandalwood oil. distilled from the wood of *Santalum album,* is pleasanter to take, but it is less efficient and more expensive.

SANDARAC, in mineralogy realgar or native arsenic disulfide, but generally a resinous exudation obtained from the small coniferous tree *Tetraclinis articulata,* native to the northwest regions of Africa, and especially the Atlas mountains. The resin, a natural exudation on the stems, comes into commerce as small round balls or elongated tears, transparent, and having a delicate yellow tinge. It is used as a varnish and as incense. and by the Arabs medicinally as a remedy for diarrhea. An analogous resin is procured in China from *Callitris sinensis,* and in southern Australia, under the name of pine gum, from various species of *Callitris.* (F. L. A.)

SANDAWE, the name of a tribe of about 20,000 persons living near Kilimatinde. Tanganyika. between the Bubu and Mponde rivers. The Sandawe have been known to anthropological and linguistic science since 1891.

Many aspects of their culture show the influence of their Bantu neighbours. Their isolated wooden houses with roofs of clay are built in the lee of the wind. The staple food is millet, supplemented with fat, milk and butter. meat being rarely eaten: culinary utensils are largely wooden. Their traditional clothes were of *hika*-grass, feathers and hides. and the dominant cosmetic practices include shaving of the hair, ear lobe piercing and face tattooing. Circumcision, general for both sexes, seems a recently acquired practice. Their weapons are bows and iron-tipped arrows; they also trap animals but regard hunting with a net as an occupation of the poor. Their hunting weapons. as well as the conservative beehive huts which are occasionally seen. resemble those of the Hadzapi.

The Sandane cultivate the soil with a mattock. fertilize with manure and keep cattle, sheep and goats. The men clear the land. tend the animals and hunt. while the women do the cultivation and food gathering. They drink beer and mead. but the term for the latter is borroned from Bantu.

Their legal practices. which have an indigenous terminology. relate to such subjects as inheritance and indemnity for adultery; the latter is not as serious a transgression as it is among the Bantu.

Households, each comprising a nuclear family, are organized into patrilineal exogamous clans which form the basis for autonomous local communities. Marriage, which is monogamous (as with the nearby Mbugwe) with a bride-price, is forbidden with parallel cousins and preferred with the maternal uncle's daughter. Residence is patrilocal, often after an initial period near the wife's parents.

The kinship terminology is classificatory: the paternal uncle is called a "father." as with most Bantu and contrary to Bushman-Hottentot. Paternal cousins are called by sibling terms. while maternal cousins are distinguished. The same term is used reciprocally for maternal uncle and a man's sister's child. while the children of one's sibling of one's own sex are termed the same as one's own children.

Language.— Sandawe shares certain syntactic features with Bushman-Hottentot: inflection is accomplished by suffixes, and not by prefixes as in Bantu languages; the modifying noun precedes the modified ("cow's head"; not "head of-cow" as in Bantu); and the basic sentence order is subject — object — verb.

Pronominal reference is expressed either by independent words or by suffixes to verbs and nouns; it distinguishes subject function from other relationships, including possession. Pronouns and

many nouns distinguish two grammatical genders. feminine and "indifferent." and indifferent forms also show plural (feminine rarely so). Nouns are inflected in a limited way for case, such as instrumental and locative. Suffixes serve, too. to mark commands and interrogations. Certain of the most common verbs are anomalous in having totally unrelated shapes in the singular and plural.

The most striking feature is the presence, in addition to a rich set of about 26 conventional consonants. of three types of clicks (*q.v.*): alveolar, lateral and palatal. In acoustic effect, these match the corresponding clicks of Hottentot and Hadzapi (which each have a fourth type) and of Bushman (Southern Bushman has five varieties). Like Bushman-Hottentot, Sandawe has tones, but no accurate description of them has been made.

Sandawe. Bushman-Hottentot and Hadzapi are genetically related not only by lexical agreements but also by specific suffixal correspondences: noun plural *-ko* = Hottentot masculine plural *-ku;* feminine singular *-su* = Hottentot *-s,* Naron Bushman and Hadzapi *-sa;* feminine plural *-tsi, -si* = Hottentot and Hadzapi *-ti,* Naron *-si;* predicative indifferent *-we* = Hottentot masculine singular *-p,* Naron *-ba,* Hadzapi *-wa.* Among pronominal correspondences there are first singular *ts-, s-* = Hottentot first singular prefix *ti-* and Hottentot and Southern Bushman first exclusive *si-,* respectively; first singular subject form *tsa* = Hadzapi and Hottentot first singular *-ta.* The vocalism of Bushman *ha* "that" and *he* "this" exactly matches that of Sandawe *ha* "that." *he* "this," and *na* "there." *ne* "here." Thus in perfect accord are Sandawe *ha-we,* Hadzapi *ha-.;'a,* Naron *xa-ba* "he."

Despite their geographic proximity, the relationship of Sandawe seems no closer to Hadzapi than to Bushman-Hottentot.

SANDAY, WILLIAM (1843–1920). English New Testament scholar, one of the pioneers in introducing to English students the mass of work done by continental scholars in biblical criticism, was born at Holme Pierrepont, Notts., Aug. 1, 1843. Educated at Repton and Balliol college, Oxford, he became a scholar of Corpus Christi in 1863. He was a fellow and lecturer at Trinity in 1866, and was ordained in 1867. In 1876 after holding various college livings. he was appointed principal of Hatfield hall, Durham. ,In 1882 he was appointed Ireland professor of exegesis at Oxford, and in 1895 Lady Margaret professor of divinity and canon of Christ Church. positions he held until 1919. He died at Oxford on Sept. 16, 1920.

Sanday's chief works are *The Authorship and Historical Character of the Fourth Gospel* (1872); *The Gospels in the Second Century* (1876); *Inspiration* (Bampton lectures) (1893); *Commentary on the Epistle to the Romans,* with A. C. Headlam (1895); *Clzristologies, Ancient and Modern* (1910).

See obituary by W. Lock in *Journal of Theological Studies,* 22:97–104, also pp. 193–205 of the same issue list a bibliography of his published works by A. Souter.

SANDBLASTING: *see* BLAST CLEASISG AND SHOT PEENING.

SANDBURG, CARL (1878–), U.S. poet, historian, novelist and folklorist. one of the group of writers responsible for the pre-World War I "Chicago Renaissance" in letters. was born Jan. 6, 1878, at Galesburg, Ill. The son of a Swedish immigrant. he began earning his keep at the age of 11. He worked in a barbershop. drove a milk wagon and turned hobo for a time in the Kansas wheat fields. When the Spanish-American War broke out, he enlisted in the 6th Illinois infantry. These early years Sandburg later described in his autobiography *Always the Young Strangers* (1953).

After attending Lombard college in Galesburg. he acted as an organizer for the Social Democratic party and secretary to the mayor of Milwaukee (1910–12). Moving to Chicago in 1913, he was an editor of *System* and then joined the staff of the *Daily News.*

In 1914 he made his appearance in Harriet Monroe's *Poetry* magazine with a group of his *Chicago Poems,* which were issued in book form in 1916. Sandburg's poetry made an instant and favourable impression. In this and succeeding volumes—*Cornhuskers* (1918), *Smoke and Steel* (1920) and *Slabs of the Sunburnt West* (1922)—he was recognized as a genuine poet of the people. In *Good Morning, America* (1928) Sandburg seemed to have lost some of his faith in democracy, but from the depths of the depression he wrote a poetic testament, unique in form, to the power of the people to go forward, *The People, Yes* (1936).

Few Americans have known the lore of their country as has Sandburg. Some of its folk say is in *The People, Yes.* The folk songs that he sang before delighted audiences were issued in two collections, *The American Songbag* (1927) and *Carl Sandburg's New American Songbag* (1950). In 1923 his publishers suggested that he write a life of Lincoln for young people. The project grew into one of the most deservedly popular of biographies. *Abraham Lincoln: the Prairie Yeavs* (2 vol., 1926) and *Abraham Lincoln: the War Years* (4 vol., 1939; Pulitzer prize, history, 1940). In 1948 Sandburg published a long novel, *Remembrance Rock,* which recapitulates the American experience from Plymouth rock to World War I. *Complete Poems* (1950) won the Pulitzer prize for poetry in 1951.

The Sandburg Range (1957) contains selections from the entire gamut of his work. It is abundantly illustrated with photographs taken at various stages in his career.

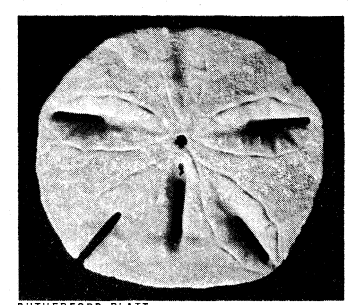
(W. T.)

SAND DOLLAR, a common name for small. disk-shaped marine animals, the most specialized members of the Clypeastroidea. a group of sea urchins (*q.v.*). Throughout the temperate and tropical zones. they live molelike in sand at moderate depths. The sand dollar has a flattened body. from less than $\frac{1}{2}$ in. to about 4 in. in diameter. with the plates of the test (or shell) firmly united and rather thick; the inside of the test is reinforced by pillars. The spines on the upper side are short and crowded. forming a dense fur which holds the sand out, while those on the underside are longer and assist in pushing the animal through the sand. The colour varies but is usually a dark shade—olive. purplish. brown or black.



RUTHERFORD PLATT

TEST (SHELL) OF KEYHOLE SAND DOLLAR

Showing underside with mouth opening in the centre

A bilateral symmetry is superimposed upon the original five-rayed symmetry. and these forms can only move forward, not in all directions as can the ordinary five-rayed sea urchins. When it meets an obstacle, the sand dollar stops and. nith the aid of ventral spines. pivots around the axis which runs vertical through the mouth. and then continues in the new direction. The anus lies on the underside. In these forms the tube feet spread out from the radial canals over large parts of the underside. whereas those on the central part of the upper side are modified for respiration and form flattened leaves. On the dead tests, after the spines have dropped off. the characteristic star-shaped pattern of the gill pores is revealed. The centrally placed mouth has five ciliated grooves radiating out from it, along which food particles are carried in. sifted and subdivided by the teeth.

Sand dollars live more or less concealed in the sand. at a depth of a few icet—sometimes placed at a sharp angle with the anterior edge downward. They have been extremely successful in utilizing a niche in nature which few other forms have invaded, and they occur usually in very large numbers, as evidenced by the thousands of shells washed up after a heavy storm.

SANDEAU, LÉONARD SYLVAIN JULIEN (JULES) (1811–1883), French novelist, was born at Aubusson, Fr., on Feb. 19, 1811. Sent to Paris to study law, he spent much of his time with unruly students. In 1831 he and Amandine Lucile Aurore Dudevant (George Sand) were living in Paris. The intimacy did not last long, but it produced Rose et Blanche (1831), a novel written in common under the name Jules Sand, from which George Sand took the idea of her famous pseudonym.

Sandeau continued for nearly 50 years to produce novels and to collaborate in plays. His works include Marianna (1839), in which he drew a portrait of George Sand; Le Docteur *Herbeau* (1841); Catherine (1845); and Mademoiselle de *la Seiglière* (1848), a picture of society under Louis Philippe, dramatized in 1851. Le Gendre de M. Poirier (1854) was one of several plays he wrote with Émile Augier.

Sandeau was made conservateur of the Mazarin library in 1853, elected to the French academy in 1858 and the next year appointed librarian of St. Cloud.

He died in Paris on April 24. 1883.

SAND-EEL, or SAND-LANCE. The fishes known under these names form a small family (Ammodytidae). Their body is of an elongate-cylindrical shape. with the head terminating in a long conical snout, the projecting lower jaw forming the pointed end. A low dorsal fin occupies nearly the whole length of the back. and a long anal fin commences immediately behind the vent, which is placed about midway between the head and caudal fin. The tail is forked and the pectorals are short. The absence of ventral fins indicates the burrowing habits of these fishes. In the Japanese Bleekeria small jugular ventral fins are present. The scales, when present, are small, but generally the development of scales has only proceeded to the formation of oblique folds of the integument. The dentition is quite rudimentary.

Sand-eels are small littoral marine fishes, only one species attaining a length of 18 in. (*Ammodytes* lunceolatus). They live in shoals at various depths on a sandy bottom and bury themselves in the sand on the slightest alarm. Sand-eels destroy a great quantity of fry and other small creatures, such as the lancelet (Amphioxus), which lives in similar localities. They are excellent eating and are much sought after for bait. The eggs of sand-eels are small, heavier than sea water and slightly adhesive; they are scattered among the grains of sand in which the fishes live.

Sand-eels are common in the north Atlantic; a species scarcely distinct from the European common sand-lance occurs on the Pacific side of North America, another on the east coast of South Africa. On the British coast three species are found.

SANDERS (SANDER), **NICHOLAS** (c. 1530–1581), English Roman Catholic scholar. controversialist and historian of the English reformation. was born in Surrey about 1530 and educated at Winchester and New college, Oxford, at which university he became a lecturer in canon law. He left England shortly after the accession of Elizabeth I in order to be free to practise Roman Catholicism, and by 1561 had been ordained priest at Rome. Stanislaus Cardinal Hosius, prince-bishop of Ermeland, having been appointed one of the five papal legates at the renewed sessions of the council of Trent, took Sanders with him as one of his theologians. Sanders' immense reputation among the English Catholic exiles in the Low Countries, however, caused the cardinal to allow him to go to Louvain, where Sanders became professor of theology and was soon busy controverting the claims of Episcopalian divines, especially Bishop John Jewel.

Of Sanders' many books the best known was a history of the English Reformation written in Latin, left unfinished at his death, and published with additions by a fellow exile. Father Edward Rishton, at Cologne in 1585. Many editions and translations followed rapidly; eventually it was put into English by David Lewis, entitled The Rise and Growth of the Anglican Schism (1877). Bitterly attacked at first by English Protestant writers as malicious and erroneous, it has come more and more to be appreciated as an outstanding piece of historical writing for its time.

The later part of Sanders' life was occupied in promoting a military invasion of England for the restoration of Catholicism. Lengthy and unsatisfactory negotiations for this purpose in both Rome and Madrid culminated in his landing in Ireland in 1579 as a papal agent to promote rebellion and his failure and death there in 1581.

Wainewright (ed), "Some Letters and Papers of Nicolas Sander, 1562–1580," *Publications of the Catholic Record Society,* vol. xiii (1926). (E McD.)

SANDERSON, FREDERICK WILLIAM (1857–1922), distinguished English schoolmaster whose practical outlook, exemplified during his headmastership of Oundle school. near Peterborough. Northamptonshire, from 1892 until his death, has had considerable influence on the curriculum and methods of secondary education, was born at Brancepeth, county Durham, on May 13. 1857. He nas educated at the local school. at Durham university and at Christ's college, Cambridge. In 1889 he became senior physics master at Dulwich college. where he formed a successful "engineering side." His appointment as headmaster of Oundle in 1892 came at a critical period in the fortunes of the school. In spite of initial opposition he transformed the school and completed an ambitious building program which included laboratories, workshops, a foundry, an observatory, an experimental farm and a spacious library.

A scientist and a practical teacher who understood boys and their interests, Sanderson's maxim was "Education must be fitted to the boy. not the boy to education." During his headship Oundle developed from a school of less than 100 pupils to one which accommodated five times that number. Though not mentioning him by name, the Hadow report on the Education of the Adolescent (1926) was strongly influenced by his ideas.

Sanderson died in London on June 15, 1922.

See *Sanderson of Oundle* (1923), an account of his work compiled by his colleagues; H. G. Wells, *The Story of a Great Schoolmaster* (1924). (S. J. C.)

SAND FLY, any of the bloodsucking biting midges belonging to the family Ceratopogonidae of the order Diptera (*q.v.*). They belong to the genera Culicoides, *Lasiohelia* and Leptoconops and attack man and warm-blooded animals most viciously. All are small, under 3 mm., and generally grayish or brownish in colour, but a few are yellow; the wings are covered with tiny hairs forming a weak pattern; the strong veins are in front, the other veins weak. Because of their minute: size and difficulty of seeing them when they bite they are called "no-see-ums" in parts of North America; also "punkies." The larvae are aquatic, live in the tide zone of sandy beaches, in decaying vegetation, tree holes and mud. The adults are crepuscular and nocturnal but bite viciously on dark days; they are so fragile that they remain in hiding with even a moderate breeze, but may form large swarms in the lee of buildings and enter houses through mosquito screens. Many seashore areas are made extremely uncomfortable by them. Species of Culicoides are vectors in Africa and tropical America of the filarial worms, Acanthocheilonoma perstans and Mansonella ozzardi, but these are nonpathogenic in man. There are 33 species of Culicoides in the British Isles. The name sand fly is also applied to species of *Simulium* in some parts of the world. (C. H. CN.)

SAND-FLY FEVER (FLEBOTOMUS FEVER, PAPPATACI FEVER) is an acute, infectious, febrile disease caused by a specific filterable virus and producing temporary incapacitation. It is transmitted by the female sand fly, Flebotomus *papatasii,* and is prevalent in the moist subtropical countries of the eastern hemisphere lying between latitude 20° and 45° N., particularly around the Mediterranean sea, in the middle east and parts of India. It breaks out in epidemic form during the summer season following the breeding of this species of fly, but between epidemics the reservoir is unknown and there is no conclusive evidence that the virus is congenitally transmitted in the insect host. The sand fly becomes infected from biting infected persons when the virus is circulating in the patient's blood, not more than 48 hours before the clinical onset and no more than the first 24 hours thereafter. The virus then requires seven to ten days incubation, after which the sand fly remains infected for life.

Pathogenesis and **Symptomatology.**—Man becomes infected from the bites of infected sand flies. Using human adults of both sexes and different racial groups as volunteers, A. B. Sabin, C. B. Philip and J. R. Paul (1944) obtained 95% infection following skin exposure to infected *Flebotomus papatasii.* The virus multiplies and becomes widely disseminated throughout the body, and within two and one-half to five days after exposure there is suddenly a feeling of lassitude, abdominal distress and dizziness, followed within one day by a chilly sensation and a rapid rise in temperature during the next 24 to 48 hours to 102°–104.5° F. (38.8°–40.3° C.). As in dengue (*q.v.*) there are typically severe frontal headache and postorbital pain, intense muscular and joint pains, likewise a flushed appearance of the face, but no true rash or subsequent desquamation. During the first day of fever there is an accelerated pulse. Usually after two days the temperature slowly returns to normal; only rarely is there a second episode of fever. Following the febrile period there is great fatigue and weakness, accompanied by slow pulse and frequently subnormal blood pressure. Convalescence may require only a few days or several weeks.

Prognosis is always favourable in sand-fly fever. The average case is considerably less severe than in dengue. Diagnosis is based on the clinical manifestations, the geographical area in which the disease occurs, the prevalence of *Flebotomus papatasii* and the epidemic development of the disease. More specifically, although there is no change in the total number of white blood corpuscles, there is an increase in the proportion of immature neutrophilic forms (*e.g.*, a marked shift to the left in the Schilling count). Treatment is entirely symptomatic.

Prevention.— Sand flies breed in vegetation within a few hundred feet of human habitations. These breeding places are difficult to discover, hence larvicidal control is impractical. The bloodsucking females feed only from sunset to sunrise and only at ground level, so that sleeping quarters above the ground floor provide moderately good protection. Ordinary mosquito netting and screening are useless, since the unfed female flies can pass through 18-mesh squares. Insect repellents such as dimethyl phthalate, dibutyl phthalate and benzyl benzoate, when applied to exposed skin, will keep sand flies away for a few hours, but the use of DDT-pyrethrum sprays on verandas, on screens, around doors and windows and within habitations will readily kill all adult sand flies which alight on the sprayed surfaces. With this procedure an epidemic can be rapidly terminated.

Rook, "Observations on the Life History and Bionomics of *Phlebotomus papatasii,*" *Brit. M.J.,* part 2, p. 1144 (1923). (E. C. F.)

SAND GROUSE, the name applied to birds resembling grouse (*q.v.*) in certain features but more closely related to the pigeons. They inhabit desert regions. They comprise the family Pteroclidae. A common form is Pallas's sand grouse *(Syrrhaptes paradoxus*), of central Asia which occasionally invades Europe in large flocks. The nest is on the ground and contains four inconspicuous eggs. The wings are long. The birds' plumage is adapted to the colour of the desert. Sand grouse supply their young with water by soaking the breast feathers in water, which the little birds drink *(see* P. A. Buxton, *Animal Life in Deserts,* New York, 1923). Fossil species occur in the Miocene formation. (K. P. S.)

SANDHURST, a large village in the Wokingham parliamentary division of Berkshire, Eng., 9 mi. N. of Aldershot. Pop. (1951) 5,244. Between the village and the town of Camberley, in wooded grounds with a lake and playing fields, lies the Royal Military academy, Sandhurst, where most of the potential regular officers for the British army undergo a course of general and military education as officer cadets. The present R M.A. is heir to the functions performed up to 1939 by both the Royal Military academy at Woolwich and the Royal Military college at Sandhurst. The R.M.C. was established by royal warrant in 1802 at Great Marlow, largely as a result of the efforts of Col. J. G. Le Marchant and Gen. Francis Jarry, an exiled French officer, who had organized a training school for officers at High Wycombe three years earlier. The move to Sandhurst took place in 1812 when the "Old Building" there was completed. The college at first included a senior department for the training of staff officers, but in 1858 this was made entirely separate and in 1862 was transferred to the present staff college building in the same grounds. In 1911 a new building was added to accommodate the increasing numbers of cadets. After World War I, during which it was for a time reduced to four months, the length of the course was fixed at 18 months and officers were trained for commissions in all branches of the British and Indian armies except the artillery, engineers and signals which were separately provided for at Woolwich. In order to educate and train all regular army officers on a common basis it was planned to amalgamate the R.M.A. and the R.M.C. at Sandhurst in 1940. World War II intervened and Sandhurst became temporarily the location of an O.C.T.U. (Officer Cadet Training unit), but in Jan. 1947 the present academy came into being.

Most cadets enter the academy at 18½–19½ years after passing the competitive army entrance examination and doing a short period of army training as other ranks. Others are selected while doing national service and. if not up to the educational standard required, go to a special company attached to Sandhurst for a preliminary course. Another source of cadets is the college established by the war office at Welbeck abbey in 1953 for boys of about 16½ who intend to obtain commissions in technical arms. In the early 1960s about one-tenth of the cadets were from commonwealth overseas territories.

The academy has a major general as commandant and is organized into three colleges, each of four companies. with training and administrative staff. There are also more than 70 civilian lecturers in the four departments of mathematics, science; modern subjects and languages, headed by a director of studies responsible to the commandant. Some cadets are prepared with a view to taking the mechanical sciences tripos at Cambridge university or the degree course at the military college of science, others for the army interpretership examination. Atomic physics and the problems of government. especially within the Commonwealth. are studied The military courses include history, organization and administration, military law. tactics, drill, signals and weapon training. In addition to the usual games and societies, mountaineering, exploration and ocean sailing are officially sponsored.

At the end of the course commissions are allotted in the arms of the service according to existing vacancies First choice of regiment is usually given to those high up in the order of merit, which is determined by a formula which combines educational achievement with an assessment of personal qualities. Each term the Queen's medal is awarded to the first cadet in this order and the Sword of Honour to the cadet considered by the commandant to be the best of the term.

Cadets at Sandhurst receive the pay of their rank during their previous service in the army. The course in military subjects is common to candidates for commissions in all arms. appropriate specialist training is provided for each officer immediately after commissioning.

See also MILITARY, NAVAL AND AIR ACADEMIES. (W. F. G.)

SAN DIEGO, a Pacific coast city of California. U S , an important naval base and seat of San Diego county, is situated 16 mi N. of the Mexican border and about 110 mi S.S E of Los Angeles Between 1950 and 1960. the population. stimulated by industrial gron th. naval and military activities. and a mild climate. increased from 334,387 to 573,223. one of the highest percentage increases for any major U.S. city. The population of the San Diego standard metropolitan statistical area, comprising San Diego county. was 556,808 in 1950 and 1.003.011 in 1960. (For comparative population figures *see* table in CALIFORNIA: *Population.*)

History.— Juan Rodriguez Cabrillo, a Portuguese explorer in the service of Spain, discovered the bay on Sept 23, 1542, and named it San Miguel. The next visitor was Sebastián Vizcaíno,

who was sent in 1602 to reconnoitre California preparatory to the establishment of a Spanish colony. He renamed the bay for San Diego de Alcalb de Henares, a Spanish monk whose name Vizcaíno's flagship bore.

In 1769 the harbour was chosen as the base for the exploration and settlement of California because of its excellence and its relative proximity to Mexico. The sacred expedition of that year, led by the first governor, Gaspar de Portolb, founded the San Diego presidio as the initial settlement in the new colony. On the same day, July 16, 1769. Father Junipero Serra dedicated San Diego mission, the first of the California missions. The settlement was slow to spread beyond the presidio walls because of the menace of Indian and foreign attack. In 1774 the missionaries removed to the site of an Indian village, but the new mission buildings were soon destroyed by Indians and a brief return to the protection of the ramparts was necessary. Not until 50 years had passed did the town itself expand outside the presidio. which was strategically located on a hill. Then, with the overthrow of Spanish control by Mexico. and the pacification of savage tribes, it became possible for inhabitants to go below the walls onto flat lands to build what has become known as Old Town, which was organized a pueblo in 1834.

American conquest in 1846 brought few immediate changes. The Old Town was incorporated in 1850 but did not grow and lost its charter two years later. San Diego then remained a Mexican adobe village until Alonzo E Horton arrived in 1867 with the intention of founding a nen town. He purchased a tract by the bay, 3 mi. S. of Old Town, for 26 cents an acre. In a few years his promotion became the largest California community south of Los Angeles, and has remained so ever since. The new city was incorporated in 1872. In 1931 the council-manager form of government was adopted.

Favourable year-round climate proved the great attraction to early settlement. Rainfall averages only 10 in. a year, which comes mostly in the mild winters. Growth tended to be extremely influenced by California land booms. The Santa Fe railway arrived in 1884, at the time of a general boom. and population and real estate values multiplied. Most of the towns in San Diego county were founded at that time. Except for the hard times that followed and lasted through the early 1890s, the city's growth thereafter was rapid.

Commerce and **Industry.**—San Diego is the headquarters of the 11th naval district and the extensive development of installations including army, marine and coast guard establishments added a great government payroll to the income of the area. The pleasant living conditions attract retired persons, especially naval personnel.

Equable climate and recreational facilities have encouraged a considerable tourist trade. Before World War II, climatic factors attracted San Diego's principal industry. aircraft construction, and later stimulated an increase of management personnel and the establishment of important new industries, such as electronics and rocketry.

San Diego is one of the leading agricultural counties in the United States in the value of production. Citrus, avocado, truck garden crops and livestock are the major products.

The roomy (22 sq.mi.), landlocked bay, one of the great natural harbours of the world, is a first port of call for coastwise and foreign shipping, operating through the Panama canal. As an outlet for growing amounts of Imperial valley cotton, its export tonnage is increasing yearly. Shipbuilding developed as an industry in the mid-1950s. San Diego was once the country's leading tuna-packing area; a post-World War II decline was blamed on Japanese competition.

Recreation and Culture.—Deep-sea fishing is a popular recreation. Opportunities for other aquatic sports, swimming, motorboat racing, water skiing and sailing, were expanded by the development of Mission bay, a shallow harbour just north of San Diego bay, as a large aquatic park area. There are many well-situated golf courses about the metropolitan area.

Cultural establishments are centred in Balboa park. An annual Shakespeare festival, which offers scholarships to promising actors, is centred around a replica of London's Old Globe theatre. The art gallery, the Museum of Man, the Natural History museum, an open-air amphitheatre and one of the world's largest outdoor organs are all set amid the park's landscaped area. Light opera productions are given outdoors in summer. Also in Balboa park is the San Diego zoo, housing one of the largest collections of animals in the world.

The southern city limit is also the Mexican border. The international gate is the busiest crossing on the southern frontier of the United States. Principal attractions in Mexico are bullfights, horse and dog racing, jai alai and Mexican and foreign merchandise.

Educational facilities include San Diego State college (1897), San Diego College for Women (Roman Catholic; 1949), University of San Diego College for Men (Roman Catholic; 1949), California Western university (Methodist; chartered in 1924 as Balboa university and rechartered in 1952) and a rapidly developing branch of the University of California at La Jolla which is also the site of the Scripps Institution of Oceanography. (A. P. N.)

SAND LILY (*Leucocrinum* montanum), a North American plant of the lily family (Liliaceae), native to plains and mountain valleys from South Dakota and Nebraska west to the Pacific coast. It is a small stemless perennial with long. narrow, grasslike leaves tufted on a short rootstock from which rise also the nearly stalkless, pure white, fragrant, slender-tubed, lilylike flowers, about two inches long and half an inch across. The sand lily, often called star lily, is a conspicuous early spring flower in many parts of its range. See SOAP PLANTS.

SANDOMIERZ, a town of Poland in the province of Kielce, 140 mi. S.S E. of Warsaw on the left bank of the Vistula. It is mentioned as early as 1079; from 1139 to 1332 it was the chief town of the principality of the same name. In 1240 and in 1259 it was burned by the Mongols. In 1429 it was the seat of a congress for the establishment of peace with Lithuania, and in 1570 the "Consensus Sandomiriensis" was held there for uniting the Lutherans. Calvinists and Moravian Brethren. Subsequent wars ruined the town. There in 1702 the Polish supporters of Augustus of Saxony banded together against Charles XII of Sweden. The cathedral was built between 1120 and 1191; rebuilt in stone in 1360. Pop. (1957 est.) 10,600.

SANDOWAY, a town and district in the Arakan division of Burma. The town (pop. [1953] 5,172) is said to have once been the capital of Arakan. The district has an area of 4.157 sq.mi.; pop. about 140.000. The country is mountainous. The hills are clad with evergreen forest or useless bamboo brake on their lower slopes; by evergreen oak forests on the higher parts. Except for a few acres of tobacco nearly all the cultivation is rice. Sandoway was ceded to the British, with the rest of Arakan (*q.v*) by the treaty of Yandabo in 1826. It became part of the independent Union of Burma on Jan. 4, 1948.

SANDOWN-SHANKLIN, a holiday resort and urban district in the Isle of Wight, Hampshire, Eng. Sandown is 6 mi. and Shanklin 8 mi. S. of Ryde by road. Pop. (1961) 14,257. Area 5.5 sqmi. Sandown rises from the wide sandy shore of Sandown bay, on the southeast of the island, and is bordered to the north by the white Culver cliff. Shanklin stands on the cliffs at the southerly end of the bay, with the esplanade below, and the winding chasm of Shanklin chine lies to the south of the town. The district is noted for its floral beauty and long hours of sunshine.

SANDPAPER, an abrasive material prepared by coating heavy paper with glue and sifting fine sand over its surface before the glue sets. It is used for smoothing the surface of wood, for rubbing down paint and similar purposes. See ABRASIVE.

SANDPIPER, the name given to all the smaller limicoline birds which are not plovers (*q.v.*), snipe (*q.v.*) or phalaropes (*q.v.*). The greenshank (*q.v.*) and the redshank (*q.v.*) are also related to the common sandpiper or summer snipe (Tringa *hypoleucus*). This little bird is a summer visitor to northern Europe and Asia. In the British Isles it arrives in May. It frequents clear streams, beside which it nests on the ground. There are four eggs, protectively coloured, as is also the case with the young. It winters in India, Australia and the Cape. In America it is replaced by *Actitis* macularia, the peetweet or spotted sandpiper, having similar

habits. The green sandpiper (*T. ochropus*) is unique among the group, except for the North American solitary sandpiper (*Calidris solitarius*), in using the old nests of other birds wherein to lay eggs. Another European species is the wood sandpiper (T. *glareola*), like the last very dark in colour.

Other forms include the knot (*q.v.*), the dunlin (*q.v.*), the sanderling (*Calidris arenaria*), which lacks the hind toe, the purple sandpiper (C. *striata*) and the little, Temminck's and American stints (*T. minuta*, *T. temmincki* and *Pisobia minutilla*). The American stint, often called the least sandpiper, is darker and ranges from the arctic to Brazil. Ronaparte's sandpiper (P. *fuscicollis*), distinguished by its white tail coverts, is a common American form. It is called the white-rumped sandpiper. The semipalmated sandpiper (*Ereunetes pusillus*) has partially webbed feet; it is a small form, breeding in arctic America. The buff-breasted sandpiper (*Tryngites subruficollis*) is common in the Mississippi valley in autumn and breeds in Alaska and Keewatin, wintering in Argentina and Uruguay.

SANDRINGHAM, a civil parish in the Freebridge Lynn rural district of Norfolk, Eng., 9 mi. S.N E. of King's Lynn by road. Pop. (1951) 608. Sandringham house, a country seat of the sovereign, was acquired by Edward VII in 1563. The estate, of 19.500 ac., includes a park of 200 ac. The church of St. Mary Magdalene contains memorials of the royal family. George VI died at Sandringham on Feb. 6. 1952.

SANDSTONE is a consolidated rock built up dominantly of grains of sand (*q.v.*) held together by a cementing substance. Sandstones are composed mainly of quartz, but may vary in composition in the same manner as sands. By increase in the size of their constituents they pass into conglomerates (*q.v.*) and by decrease into arenaceous shales and clay rocks. When the grains of sand are angular, the rock is termed a grit.

The minerals of sandstones are the same as those of sands. Quartz is the commonest; with it often occurs a certain amount of feldspar (as in the rock arkose) and frequently white mica. The flakes of mica may often be seen lying on the bedding planes and may give the sandstone a cleavable character (*e.g.*, paving stone) of much value in quarrying. The cementing material is often fine chalcedonic silica, or it may be secondary quartz, producing a quartzitelike rock. Calcareous material (calcite), glauconite, iron oxides, carbonaceous matter and other substances also act as cements and give the sandstones characteristic colours. Glauconitic sandstones are greenish, ferruginous sandstones, red, brown and yellow or gray. When the cementing substance is clay, the rock is often of white or gray colour and firmly compacted.

Pure sandstones may contain as much as 99% of silica. If relatively soft they are crushed to sand for commercial purposes. If firmly cemented they are utilized. on account of the resistance of silica to heat, for the manufacture of silica bricks. furnace linings, hearths, etc. Of this character is the well-known rock "ganister" worked in the districts of Sheffield. South Wales. etc. Less pure, but firmly-cemented siliceous sandstones are used for the making of grindstones and millstones. Similar rocks, as well as calcareous, dolomitic (see DOLOMITE) and ferruginous sandstones are extensively worked as building stones, mostly by quarries but sometimes by mines. As sandstones are always porous, they do not take a good polish. and are not used as ornamental stones. but this property makes the sandstone formations valuable storage basins and sources of water. (P. G. H. B.)

SANDUSKY, a city of northern Ohio, U.S., a port of entry and the seat of Erie county, is situated on Sandusky bay off Lake Erie, 56 mi. S.W. of Cleveland. It was platted in 1818 and incorporated in 1824; the name is Indian. referring to "clear water." Both French and British traders established posts in the area and the English fort built in 1761 was burned during Pontiac's conspiracy in 1763. During the War of 1812 Sandusky was a supply depot; Perry's naval victory of Sept. 10, 1813, occurred about 25 mi. N.W., near Put-in-Bay. (See WAR OF 1812.)

This terminated Indian and British aggressions in the area and it was then settled by Connecticut residents; the townsite was in that portion of the Connecticut Western Reserve set aside for persons who had suffered losses from British raids in Connecticut during the American Revolution. A large number of Germans came in 1840–60. Bypassed as a terminus of a lake to Ohio river canal, Sandusky obtained the first Ohio railroad charter and service began in 1838. Johnson's Island in Sandusky bay was a prison for Confederate officers from 1862 to 1865. Sandusky's early trade was in lumber, fish, and wood and agricultural products. Principal trade items in modern times include crayons, school paints. ball bearings, automotive and small steel castings, corrugated paper products, pleasure boats, rubber toys, radios, paper and textile machine rolls. quarry products and lake shipment of coal. The city is located in boating, fishing and sand beach vacationing area and has many municipal parks. Sandusky has a commission-manager form of government. in effect since 1916. For comparative population figures see table in OHIO: *Population.* (C. E. F.)

SAND VERBENA (*Abronia*), a large genus of plants of the four-o'clock family (Nyctaginaceae), allied to the *Mirabilis* of the gardens, comprising about 50 species, native chiefly to dry sandy soils in western North America. They are low, often prostrate annuals or biennials, with opposite, entire, thick, sometimes viscid leaves; showy, red, yellow or white, usually fragrant flowers, clustered in stalked heads encircled at the base by bracts, and a broadly winged fruiting achene enclosing a single shining seed. The white sand verbena (*A. fragrans*), with very numerous fragrant flowers, occurs from Iowa to Idaho and south to Texas and Mexico. The yellow sand verbena (*A.* latifolia) and the pink sand verbena (*A. umbellata*), found along the seashore from southern California to British Columbia, are grown as ornamentals in borders and rockeries. Various species bloom in immense profusion in deserts during the short rainy season.

SANDWICH, EDWARD MONTAGU or MOUNTAGU, 1ST EARL OF (1625–1672), English admiral, was born on July 27, 1625, son of Sir Sidney Montagu (d. 1644) of Hinchinbrooke, who was a brother of Sir Henry Montagu, 1st earl of Manchester, and of Edward Montagu, 1st Lord Montagu of Boughton. He joined the parliamentary party at the outbreak of the Civil War. In 1643 he raised a regiment. and he fought at Marston Moor. Naseby and at the siege of Bristol. Though one of Oliver Cromwell's intimate friends and M.P. for Huntingdonshire, 1645–48, he took little part in public affairs until 1653, when he was appointed a member of the council of state. In 1656 he was made a general at sea, his colleague being Robert Blake. He took part in the covering operations against Dunkirk in 1657 and was chosen a member of Cromwell's house of lords in the same year. In 1659 he was sent by Richard Cromwell with a fleet to arrange a peace between Sweden and Denmark. After the fall of Richard he resigned his command and assisted in the restoration of Charles II. Again general at sea early in 1660. Montagu carried the fleet over to the side of the exiled king, and was entrusted with the duty of fetching Charles from the Netherlands. He mas then made a knight of the Garter, and in July 1660 was created earl of Sandwich.

During the war with the Dutch in 1664–65 Lord Sandwich commanded a squadron under the duke of York and distinguished himself in the battle off Lowestoft on June 3, 1665. When the duke retired later in the same year he became commander in chief. Trouble arose over certain valuable Dutch prizes which he had taken, and Lord Sandwich was dismissed from his command, but as a solatium was sent to Madrid as ambassador extraordinary. He arranged a treaty with Spain and mediated a treaty between Spain and Portugal (Feb. 1668). In 1670 he was appointed president of the council of trade and plantations. When the third Dutch war broke out in 1672 Lord Sandwich again commanded a squadron under the duke of York and during the fight in Solebay (Southwold bay) on May 28, 1672, his ship, the "Royal James," after having taken a conspicuous part in the action, caught on fire and was blown up. The earl's body was found some days later and was buried in Westminster Abbey.

Lord Sandwich claimed to have a certain knowledge of science, and his translation of a Spanish work on the *Art of Metals* appeared in *1674.* He is mentioned frequently in the *Diary* of his kinsman, Samuel Pepys. *See* also F. R. Harris, *Life of Edward Montague,* 2 vol. (London, 1912).

SANDWICH, JOHN MONTAGU, 4TH EARL OF (1718–1792), was born on Nov. 3, 1718, and succeeded his grandfather, Edward, the 3rd earl, in the earldom in 1729. Educated at Eton and at Trinity college, Cambridge, he spent some time in travelling, and on his return to England in 1739 he took his seat in the house of lords as a follower of the duke of Bedford. He was a

commissioner of the admiralty, plenipotentiary to the congress at Breda (1746), first lord of the admiralty (1748), and in 1753 a principal secretary of state. He took a leading part in the prosecution of John Wilkes. He had been associated with Wilkes in the notorious fraternity of Medmenham, and his attitude now in turning against the former companion of his pleasures made him very unpopular, and, from a line in the *Beggar's Opera,* he was known henceforward as "Jemmy Twitcher." He was postmaster general in 1768, secretary of state in 1770, and again first lord of the admiralty from 1771 to 1782. For corruption and incapacity Sandwich's administration is unique in the history of the British navy. He died on April 30, 1792.

The Sandwich Islands *(see* HAWAII) were named after him by Captain Cook. His *Voyage round the Mediterranean in the Years 1738 and 1739* was published posthumously in 1799, with a flattering memoir by J. Cooke; the *Life, Adventures, Intrigues and Amours of the celebrated Jemmy Twitcher* (1770), which is extremely rare, tells a very different tale. *See* also the various collections of letters, memoirs and papers of the time, including Horace Walpole's *Letters* and *Memoirs* and the *Bedford Correspondence.*

SANDWICH, a market town and municipal borough in the Dover parliamentary division of Kent, Eng., 12 mi. E. of Canterbury on the Stour river. Pop. (1951) 4,140. Area 3.3 sq.mi. One of the original Cinque Ports, and second in precedence to Hastings, it is now 2 mi, from the sea. In the line of the old defensive ramparts, now marked by a public walk, the Fisher gate (dating from 1384, restored 1954) is the only gateway remaining. the other three —Newgate, Sandown and Canterbury gates—having been pulled down in the 18th century; the Barbican was built in 1539 as one of a chain of blockhouses along the coast. In the twisting streets of Sandwich are timber-framed houses, and others built by the Flemings; *e.g.,* White Friars on the site of a 13th-century Carmelite priory; three ancient hospitals—St. Bartholomew's (probably founded 1217), just outside the town, with a fine Early English chapel, St. Thomas' dating from 1392 and rebuilt in 1864, and St. John's; three old churches—St. Clement's (the parish church since 1948) which dates from the 12th century and has a beautiful Norman tower, St. Mary the Virgin which stands on the site of a 7th-century monastery, but is not now in regular use, and St. Peter's. of various dates from the 12th century, where the curfew is still rung at 8 p.m. on the tenor bell and which is now the chapel of Sir Roger Manwood's grammar school (1563). The school's present buildings were put up in 1895 and the old house, Manwood court (1564), is now a private house. The guildhall, a 16th-century building, is still in use.

Rutupiae (Richborough, *q.v.*), 1¼ mi. *N.* of Sandwich, was established as a Roman town in A.D. 43 and was the centre of administration and one of the main entries from the continent. Sandwich was called Lundenvic by the Saxons and later became Sandwic; it was a borough by prescription before 1226, when the record of mayors begins. The governing charter until 1835 was that granted by Charles II in 1684. For many centuries the naval headquarters, the port for the wool trade and chief port of embarkation for the European continent, Sandwich lost its importance in the 16th century when the harbour became silted up. The town flourished again when the Flemish refugees were given permission by Elizabeth I to live there; during the Napoleonic Wars; during World War I; and in World War II when it was extensively used for the construction of Mulberry harbour. The chief industries are agriculture, and the manufacture of antibiotics, rubber products, shuttlecocks, textiles and welding equipment. It is also a holiday town with fine golf links and sands at Sandwich bay.

SANDYS (Sändz), **SIR EDWIN** (1561–1629), British statesman and a founder of the colony of Virginia, was the second son of Edwin Sandys, archbishop of York, and his wife Cecily Wilford. He was born in Worcestershire on Dec. 9, 1561. He was educated at Merchant Taylors' school and at Corpus Christi college, Oxford, and, though he never took orders, became a prebendary of York. He retained his prebend until 1599. He was entered in the Middle Temple in 1589. From the year 1593 till 1599 he travelled abroad. When in Venice he became closely connected with Fra Paolo Sarpi, who helped him in the composition of the treatise on the religious state of Europe, known as the *Europae speculum.* In 1605 this treatise was printed from a stolen copy under the title, *A Relation of the State of Religion in Europe.* Sandys procured the suppression of this edition, but the book was reprinted at the Hague in 1629. He was member for Andover in 1586 and for Plympton in 1589. On James I's accession Sandys was knighted. He sat in the king's first parliament as member for Stockbridge. He assailed the great monopolies, and he endeavoured to secure to all prisoners the right of employing counsel. He had been connected with the East India company before 1614. and took an active part in its affairs till 1629 His most memorable services were, however, rendered to the (London) Virginia company, to which he became treasurer in 1619. He sat in later parliaments as member for Sandwich in 1621, for Kent in 1624, and for Penrhyn in 1625. He died in Oct. 1629.

See Alex. Brown's *Genesis of the United States* (London, 1890).

SANDYS, GEORGE (1578–1644), English traveller, colonist and poet, the seventh and youngest son of Edwin Sandys, archbishop of York, was born on March 2, 1578. He studied at St. Mary hall. Oxford, but took no degree. In 1610 he set out on a journey which he described in *A Relation of a Journey begun An. Dom. 1610, in Four Books* (published in 1615 and dedicated, like all Sandys' works, to Charles I). He visited Italy, Constantinople, Egypt. Palestine and Cyprus and his observations on geography and ethnology made his work a valuable source book to Sir Francis Bacon. John Milton and Sir Thomas Browne. He took a great interest in the early colonization of America and in 1621 became colonial treasurer of the Virginia company and sailed for Virginia with Sir Francis Wyat, the new governor. who had married his niece. In 1624. when Virginia became a crown colony, he was created a member of the council He returned to England about 1631.

He had published a translation of part of Ovid's *Metamorphoses* in 1621; he completed this in 1626, and later added to it a translation of book I of the *Aenezd* (1632). On this rests his claim to be considered, by John Dryden, as "the best versifier of the former age." As a translator, he aimed at the closest possible rendering of the Latin text, and this led him to perform a remarkable feat of compression—his translation of the *Metamorphoses* occupies exactly the same number of lines as the original. His greatest importance was in the development of the closed, antithetically balanced couplet, which was later brought to perfection by Dryden and Alexander Pope, both of whom read Sandys' translation of Ovid in boyhood Also interesting was his use of a compressed, Latinate poetic diction; he was one of the first, and certainly the most influential, of the poets who adopted Latin syntax, chose Latin verbs rather than compound English ones, and, above all, used English words in their original Latin sense for the sake of brevity and wit. Many of the words of this type associated traditionally with Milton's style are borrowed from Sandys. The *Metamorphoses* is also of interest as the chief source of John Keats' knowledge of classical fable.

His other works include *A Paraphrase upon the Psalmes of David, etc.* (1636); *A Paraphrase upon the Divine Poems* (1638); and a translation of *Christ's Passion* from the Latin of Hugo Grotius (1640). His *Poetical Works* were edited in two volumes, with a memoir, by Richard Hooper (London, 1872).

See B. Penrose, *Urbane Travellers, 1591–1635* (Philadelphia, 1942); and, for an account of his influence on poetic diction, G. Tillotson, *On the Poetry of Pope,* 2nd ed (London, 1951).

SAN FERNANDO, a seaport of southern Spain. in the province of Cadiz, on the Isla de León, a rocky island among the salt marshes which line the southern shore of Cadiz bay. Pop. (1950) 38,174 (mun.). San Fernando was probably a Carthaginian settlement. On a hill to the south stood a temple dedicated to the Tyrian Hercules; to the east is a Roman bridge, rebuilt in the 15th century after partial demolition by the Moors. The arsenal was founded in 1790. During the Peninsular War the cortes met at San Fernando (1810), but the present name of the town dates only from 1813; it was previously known as Isla de León. In the neighbourhood salt is produced and stone is quarried. Manufactures include foundry products, spirits, beer, leather, esparto fabrics, soap, hats, sails and ropes.

SAN FRANCISCO, a city and port of California, U.S., co-

extensive with San Francisco county, is centrally located on the California coast about 350 mi. N.W. of Los Angeles at latitude 37° 47' N. and longitude 122" 26' W. It is the cultural, maritime, financial and trading centre of a densely populated metropolitan area.

PHYSICAL CHARACTERISTICS

Covering the tip of the southernmost of two peninsulas which guard the Golden Gate (*q.v.*) between the Pacific ocean and San Francisco bay, the city commands one of the world's finest land-locked harbours. Around the bay is a band of contiguous metropolitan subcentres. Inland lie the rich valleys and metropolitan zones which are linked geographically and economically to the bay area. Heavily traveled sea and air lanes make San Francisco the major U.S. Pacific coast port and the gateway to the orient.

From the ocean to the mid-line of the bay. the city controls 93 1 sq.mi., 44 6 on land. It is hilly with Telegraph. Nob, Russian and other hills rising almost from the water's edge; Twin Peaks. Mt Davidson and Mt. Sutro stand more than 900 ft. high. San Bruno mountain (1,315 ft) is just south of the city line. Encircling the bay, ridges of the Coast range rise from about 1,200 ft. to such peaks as Mt. Tamalpias (2,604 ft.), on the northern Marin peninsula; Mt. Diablo (3,849 ft.), east; and Mt. Hamilton (4,029 ft.), well south. The foothill vegetation varies from rich groves of redwood (Sequoia *sempervirens*) to oak, chaparral and grass. In some places, large stands of eucalyptus were planted in modern times. Green in winter and spring, golden brown in summer and autumn, marked irregularly by the deep blue of the trees, the hills are a dramatic amphitheatre for the bay.

San Francisco Bay.—Geologically, the bay is a drowned valley which drains the great central basin of California. The Golden Gate, the outlet carved by an ancient river before the valley was inundated, is 1 mi. to 1.7 mi. wide and about 3 mi long. The bay varies from 5 to 13 mi. in nidth and stretches its two arms northeast about 42 mi. through San Pablo bay. the Carquinez strait, and Suisun bay; and south about 35 mi. The total surface area is approximately 400 sq mi. Although the bay is 357 ft. deep in the Golden Gate channel, and from 100 to 140 ft. deep in the centre, about 70% of it is no more than 18 ft. in depth. At its northeastern extremity, the confluence of the Sacramento and the San Joaquin rivers passes through Carquinez strait, and numerous small streams descend from the surrounding hills.

Six highway and tno railroad bridges span the bay. Across the southern arm, a railroad bridge and two highway bridges were built in 1927 and 1929. The double-tiered bridge with tao main spans of 2.310 ft. each across the central bay betneen San Francisco and Oakland, and the spectacular suspension bridge with a span of 4.200 ft. across the Golden Gate were completed in 1936 and 1937, at costs of more than $77,000,000 and $35,000 000, respectively. A bridge across San Pablo bay was built in 1956, and a matching span to an older bridge at Carquinez strait mas completed in 1958. Suisun bay is crossed by a railroad bridge. With the completion of the newest of these spans, ferry service on the bay ended after a century of operation.

Several islands are within the bay. On Alcatraz, 12 ac. of rock just inside the Golden Gate, are a federal prison (1934) and a 214-ft. lighthouse. Farther inside the Gate, Angel Island, the largest in the bay. rises 771 ft. above sea level; on it is old Ft. McDowell. Yerba Buena (formerly Goat Island) and adjacent Treasure Island (built by fill for the 1939 Golden Gate International exposition) are approximately in the bay's centre. The first anchors the San Francisco-Oakland bridge midway in its course; the second is the site of a naval training centre.

Extending to the bay are two main valleys, the Santa Clara from the south and the Sonoma from the north. East of the ridges, more extensive valley systems open upon the delta and sedimentary lands of the central valley of California.

Climate.—San Francisco's climate is mild. cool and even. The annual mean temperature is 56.5° F., with an annual mean minimum of 50.4° F. and an annual mean maximum of 62.6° F. The average daily temperature range is but 12.2" F. The ocean's proximity produces not only equable temperatures but bracing breezes and a cooling fog. The annual mean wind velocity is only 9.1 m.p.h., and the city enjoys sun during 66% of the possible sunlight hours. Precipitation consists entirely of rain, the mean annual fall being 20.51 in.. most of which comes from November through March. The relative humidity is 73%, ranging monthly from 69% (Nov.) to 80% (Aug.). Greater climatic variation occurs in the surrounding metropolitan region. Some valley points are notably warmer and-dryer, while on the leeward slopes of the ridges greater precipitation and wider temperature ranges are encountered. Variability in rainfall characterizes the entire area, changes as high as 100% from year to year being not infrequent.

HISTORY

Inhabited by the Penutian linguistic family of Indians, the San Francisco area was unknown to Europeans until the late 18th century. From the 16th century onward the Spanish, who claimed California, had sailed along the coast without discovering the bay's entrance. although they had charted the Farallon Islands offshore. Sir Francis Drake. in 1579, had also sailed past the Golden Gate, anchoring briefly in a cove (Drake's bay) a few miles north. Rumours of Russian overseas expansion, however, stirred the Spanish into an effort to establish permanent control over Upper California. To that end Gaspar de Portolá (*q.v.*) led a party northward from San Diego during the summer of 1769. The expedition passed Monterey bay, its intended destination, without recognizing it, and continued northward until a scouting party under José Francisco de Ortega sighted San Francisco bay from the hills of the southern peninsula. Three years later, another party explored the region more thoroughly, and in 1775 the vessel "San Carlos," piloted by Juan Manuel de Ayala, sailed into the bay.

Early the following year, Capt. Juan Bautista de Anza selected a site for a permanent colony on the bay. Lieut. José Joaquin Moraga and Father Francisco Palóu, leading a band of settlers and soldiers from Monterey. then established a presidio (Sept. 17. 1776) and the Mission San Francisco de Asís (Oct. 9. 1776). The mission was soon more familiarly called for the stream near which it was situated, Mission Dolores Beside a shallow cove inside the Golden Gate, the colonists settled in the pueblo of Yerba Buena (named for the "good herb," an aromatic vine growing on the sand dunes). In 1777 Father Junipero Serra (*q.v.*), founder of the Upper California missions, visited the new colony. Within a few years a group of six missions was located in the region which, 150 years later, comprised the modern metropolitan area.

For a half-century, the small outpost led an isolated existence. Beginning in 1806, ho'wever. Russia spread its fur-trading activities into the area, unsuccessfully at San Francisco and nith moderate success after 1812 at Fort Ross, about 75 mi N. The Russian venture. which ended in 1841. was the forerunner of increasingly frequent visits from traders in hides and tallow. whalers and. by 1840. explorers, fur hunters and merchants. Meanwhile, Upper California became a province of Mexico (1825) and San Francisco bay was made a Mexican port of entry (1835). In the same year, the United States attempted to buy the bay from Mexico, after traders and whalers had reported the commercial possibilities of the area.

With the outbreak of war between Mexico and the United States on May 13, 1846, a new era began. North of the bay at Sonoma, the insurgents of Capt. John Charles Frémont (q *v.*) raised the "Bear Flag" of an independent California, and on July 9, 1846, Capt John B. Montgomery in the sloop of war "Portsmouth" entered the bay, hoisted the Stars and Stripes in the plaza, now known as Portsmouth plaza, and claimed the territory for the United States. On Jan. 30, 1847, the pueblo was renamed San Francisco. It was incorporated in 1850. Even without the political stir which this turn of history produced, the moment was propitious for change. By the mid-1840s, immigrant parties were struggling across the Rockies, bound for Oregon and California. However. the discovery of gold on the American river at Coloma in Jan. 1848 produced social and economic results overnight which no mere shift of political fortune could have produced in decades.

Within three months, San Francisco was almost deserted, its residents off to the mother lode country. Then, in Feb. 1849, fortune hunters from all over the world crowded into the town. Deserted ships choked the bay. Shacks and tents, mire and dust, fantastic prices and a spate of gambling, drinking and vice appeared ashore. While gold fever was acute, many people in the city were transients. An increasing number, however, stayed to provide equipment, supplies and capital to the Argonauts (prospectors). Maritime enterprises, of course, flourished from the start. Merchants extended wharves out toward deep water. More improvements followed the transfer of harbour management from the city to a state board of harbour commissioners in 1863. Between 1877 and 1914, a great stone wall was built well outside the early water front; the bay was filled in behind it; and out from it finger piers were projected. Sardine fishing began in the 1850s, followed soon by shrimp fishing and, on the Sacramento river, salmon fishing. Whalers based their operations at San Francisco more and more, and the bay was one of the world's most important whaling bases between 1885–1905. Oyster beds were planted in the bay after 1870.

Inland shippers busily covered the bay and built up river ports at Sacramento and Stockton. Shipbuilding and repair works rose at numerous points. The first dry dock was built in 1851; the Union Iron works launched the first steel ship built on the Pacific coast in 1885. Overseas trade thrived. Exports of $8,500,000 in 1860 had increased sixfold by 1890, a period which saw the fast grain clippers give may to the more prosaic freighter fleets plying with monthly regularity to the orient (after 1867), Hawaii (after 1878), Australia (after 1885), and Europe (after 1899).

As a trading centre, the city increased its range significantly after the first transcontinental railroad was completed in 1869. By then, its commerce and local industries were firmly founded upon the rich resources of central and northern California. Food processing, meat packing, flour milling, lumber milling, woolen textile, tanning, iron foundries and implement manufacturing establishments appeared in the 1850s. Sugar refining, smelting and refining of minerals, and a wide variety of fabricating industries developed in the 1860s. By 1870, the value of manufactured goods exceeded $22,000,000 and 20 years later manufacturing products had multiplied in value to $120,000,000.

In contrast to this steady development, the city's financial growth was spectacularly unstable. Connected to the risks of gold mining in the 1850s, the heavily capitalized silver mining of the 1860s. and the vast railroad construction projects, and to speculative land development, San Francisco capital not only sustained long-term growth in the entire west, but provided some of the most acute fluctuations in banking and stock exchange in U.S. history. Periodic panics wiped out fortunes; new waves of optimism and economic gro th built them up again repeatedly. The city remained the centre of regional finance, however, and, with the more stable fiscal practices enjoined by national and state legislation in the 20th century, it increased its pre-eminence and security in this economic domain.

Political and social turbulence matched economic growth. Vicious gangs nearly overwhelmed the early city until they were forcibly suppressed by citizen vigilance committees on two occasions in the 1850s (see VIGILANCE COMMITTEE). Demagoguery often swept the city in the 1860s and 1870s, sometimes mixed with demands on behalf of the working class or based on hostility toward Chinese labourers who, having been brought to work on the railroads, drifted into San Francisco. Reform programs in government intermittently succeeded careless or corrupt administration. A notable outburst of public indignation early in the 20th century gave rise to a series of trials of public officials and ushered in the more businesslike governments of the modern period.

Swept repeatedly by fire in the early days. the more substantially built city of the later 19th century spread back from the water front onto the hills. A few early architectural landmarks survived into the 20th century, including a sober Greek Revival mint and a dignified block of offices. The Victorian fantasies and eclecticism of mansions on Nob hill and hotels and offices in the commercial centre reflected the opulence and confidence of the period. Rapid introduction of technological improvements testified to the open physical structure of the ambitious city. Steam and horse-drawn street railroads appeared in the 1860s; these were replaced on the hills by cable-drawn cars (introduced by Andrew S. Hallidie in 1873), and by electric trams (1900), both of which continued in use in the 20th century. After the turn of the century, rail transportation to outlying districts and nearby villages provided means for daily commuting. The telegraph was introduced in 1853, the telephone in 1877, gas lighting in 1854 and electric lighting and power after 1876.

Cultural growth accompanied the improvement of economic and physical resources. Numerous educational institutions arose in the latter half of the 19th century. The city had welcomed the theatre and opera as early as 1849 and enthusiastically supported them thereafter. Symphony performances became annual occurrences after 1874, receiving public funds in 1911. In the sciences and arts, appropriate associations appeared in 1853 and 1871, respectively. In journalism, the Alta California (est. 1849) outlived many fugitive papers until its own demise in 1891, while the 20th-century San Francisco Examiner, Chronicle and *Call-Bulletin* (merged with the News in Nov. 1959 to become the *San* Francisco News-Call Bulletin) dated from the mid-1860s.

Earthquake and Reconstruction.— If the results of a city's early growth are measured not only by absolute achievement but by recuperative vitality, San Francisco met and passed the most severe of tests in 1906. The city had experienced earthquake disturbances in 1864, 1898 and 1900, but on April 18, a violent earthquake, folloned by fire, demolished most of the city's central business and residential districts. (See EARTHQUAKES: Great *Earthquakes:* California [1906].) Hundreds were killed or injured. Homeless residents camped in thousands on the dunes west of the city, while others fled to outlying towns (incidentally giving impetus for 20th-century suburban growth). The loss in buildings was estimated to be more than $100,000,000, while the total property loss was believed to be well over three times as much. Within a short time, relief shipments of food and clothing reached the city, and some $10,000,000 in financial aid came from Europe and America. Although insurance payments in the neighbourhood of $300,000,000 were forthcoming, the long task of reconstruction was sustained by local courage and persistence. Much of the city was rebuilt to be earthquake and fire resistant, and new plans for civic development made headway as the debris of the old city vanished. In 1915 San Francisco invited the world, with pardonable pride, to see the results of its efforts at the Panama-Pacific International exposition.

The opening of the Panama canal, celebrated by the aforementioned exposition; westward expansion of American population: and the continual agricultural and industrial gains in California all stimulated steady metropolitan centralization in the 20th century. War industry in the second decade, and general, diversified growth in the third brought the city's population to more than 500,000. Static during the world-wide depression of the 1930s, San Francisco thereafter entered a new period of metropolitan history—the development of a regional metropolitan complex of which the city was the heart, not the whole; and the explosion of the city not so much by internal growth as by the rapid rise of contiguous, peninsular or trans-bay urban communities.

Change at Mid-20th **Century.**—San Francisco was the scene of the historic conference, April–June 1945, at which the charter of the United Nations was promulgated. The peace treaty with Japan was signed there in 1951.

Kineteenth-century San Francisco had been the unrivaled urban centre of an agricultural region. During the 20th century it became a city of international rank, and the principal, but not dominant, star in a metropolitan galaxy. It retained leadership in many social, economic and cultural activities. But the remarkable growth of population, economic institutions and cultural centres elsewhere in the bay metropolitan area was the most prominent change of the era. The quality of leadership, rather than the quantity of activity and resources, became the basis on which San Francisco retained its traditional role of pace setter and lodestone of the west.

POPULATION

Rich agricultural valley regions support the concentrated urban life of the bay area and give rise to notable inland metropolises: those of San Jose, 45 mi. S.; Sacramento, 80 mi. N. on the Sacramento river; Stockton, 50 mi. E. on the San Joaquin river; and Fresno, 50 mi S W. Though self-sustaining, these are integrally related to the San Francisco-Oakland standard metropolitan statistical area of 3,314 sq mi , with a population of 2,783 359 in 1960, and which comprises Alameda. Contra Costa, Marin, San Francisco, San Mateo and Solano counties.

San Francisco has more than a quarter of the population (742,855 in 1960) of the metropolitan area which includes Oakland, Berkeley, Alameda across the bay to the east; Richmond, Vallejo, Benicia. Martinez and Pittsburg to the northeast; San Rafael. Mill Valley and Sausalito to the north; and a string of suburbs extending down the peninsula to the south — South San Francisco, Pacific& San Bruno, Burlingame, San Mateo, Redwood City. Menlo Park and Palo Alto. (For comparative population figures see table in CALIFORNIA: *Population.*) With its historical priority, and its advantageous westerly site on the bay, the ,city is the heart of the entire complex of urban and regional development of the central Pacific coast. Through finance, commerce and shipping its influence is extended still farther.

Social Characteristics. — After a century typified by population gains of more than 20% per decade, San Francisco by 1960 appeared to be approaching its maximum size, while the remaining cities and counties of the metropolitan area were experiencing remarkable growth. Oakland. half as large as San Francisco, was the next largest city of the bay area. The population of San Francisco. like that of the area, was predominantly white in 1960. Foreign-born and oriental peoples were relatively more numerous in San Francisco, honever. Added to the indigenous inhabitants of foreign extraction, they gave the city a pronounced cosmopolitan atmosphere; citizens of Italian and Chinese descent mere numerous. In total, but not among native-born white and Negro residents, slightly more men than women lived in the city; in the area, the same relationship prevailed except among Negroes, where it was reversed. The city population was much more dense and more mobile, somewhat older and more heavily weighted in upper income brackets than that of the area. However, the higher proportion of home owners in the metropolitan area was notable; ribbons of new houses encircled the hills and frantic programs of school construction had been undertaken in the suburbs, whereas the city was especially involved in projects to construct automobile freeways, parking centres and downtown office and public buildings. Reflecting this difference of emphasis was the heavy daily volume of traffic, especially automobiles, carrying commuters to and from San Francisco.

GOVERNMENT

San Francisco's five charters were granted respectively in 1850, 1856, 1861. 1898 and 1932. Initiative and referendum clauses were first included in the 1898 charter. Under its 1932 charter, San Francisco has a consolidated city and county government in which the mayor, certain executives, the judiciary and the 11-member board of supervisors are elected. The mayor appoints the city's chief administrative officer and a variety of administrative boards, including police, utilities, civil service and planning. Water supply, based on the Hetch-Hetchy system of dams and reservoirs, and a surface public transportation system are municipally owned; gas and electricity are supplied through private enterprise.

Peculiar to the mid-20th century were complex intergovernmental relationships involving the city with many overlapping county and community agencies, as well as with state and national institutions. Quasi-political boards with metropolitan area scope were developed to co-ordinate local attacks on regional problems, such as transportation, air pollution, waste disposal and economic resource development, but active authority remained divided. Although San Francisco exercises leadership in a number of such enterprises. it no longer has independent control over many problems of vital concern to it.

Foreign consulates and branches of national and state political agencies are located in the city. Both the navy and the army maintain important headquarters, the latter occupying the 1.500 ac. Presidio grounds.

Finance. — As the financial and insurance centre of the west, San Francisco's position grew far more rapidly than its population in the middle decades of the 20th century. In the Federal Reserve system (12th district headquarters), the city's banks ranked high in the nation in volume of transactions, debits and clearings, There are 15 banks (several with branches), including the headquarters of one of the world's largest. and 13 savings and loan associations. In the late 1950s deposits. resources and clearings attained figures above $13,000,000,000, $15,000,000,000 and $33,-000,000,000, respectively, having increased by about 300% after World War 1 More than half the insurance companies authorized to transact business in California have their headquarters in San Francisco. The nearly 700 carriers and 20 insurance associations received a total of more than $2,000,000,000 in premiums and paid about $900,000,000 for losses annually. The San Francisco Stock exchange, which became part of the Pacific Coast exchange in 1957, listed in the late 1950s transactions averaging $400,000,000. The San Francisco Mining exchange trades in millions of shares annually.

ECONOMY

The economic prosperity of San Francisco was founded on its maritime trade and its proximity to diversified resources It is a great cosmopolitan seaport, the commercial and distributing centre for inland California and the financial hub of the west.

Commerce. — In the early 1960s, San Francisco bay was sixth in importance as a U.S. port, and twice as active as any other on the Pacific coast. The water front (the Embarcadero) is state-owned and operated and has 1.912 ac. of harbour facilities, but port developments at Oakland, Richmond and Mare Island reduced its earlier relative eminence in the bay. However. by the late 1950s, its U.S. customs receipts had approached $1,000,000,000 annually and accounted for more than 30% of Pacific coast export and import tariffs. A World Trade centre was opened in 1956. Coastal and other domestic traffic accounted for about two-thirds of the port activity. In foreign trade, commerce nith Asia and the Pacific area took the lead; second. in imports, was trade with eastern South America (especially Brazil), and, in exports, Europe. Total value of customs exports in the late 1950s was about $500,000,000 annually; of imports. above $400,000.000. The totals of both had increased by more than 50% since 1950. Vegetable food products, machines, textiles and vehicles were the chief export items; foodstuffs (especially coffee and sugar) and petroleum were the major import items.

As a wholesale centre, San Francisco's activity comprised over half of that in the bay area, with annual sales about $5,000,000,000. The principal items handled were machinery and equipment, foodstuffs, apparel and electrical products For the metropolitan area, petroleum products distributed from the east bay refineries were far more important than for San Francisco, as were automotive products and construction materials. In the late 1950s San Francisco's retail establishments sold approximately $2,000,-000.000 of goods annually. Food. general merchandise. apparel and automobiles led in both San Francisco and the area, the former's share and growth in the trade approximating its share and growth in the population.

Industry and Labour. — By the 1960s, although San Francisco's historical lead in industry remained dominant in comparison to any other bay city, its industrial and labour strength had declined relatively from one-half to one-third that of the whole metropolitan area. The latter's economy was given tremendous impetus by World War II. Some evidence existed that declines of the late 1940s and early 1950s in the number of San Francisco industrial establishments and employees were accompanied by higher productivity and value added by manufacturing; reductions of about 20% in the former were balanced against increases of about the same amount in the latter. In both. however. the area as a whole recorded gains of from 30% to 50%. Leading products

included foods and beverages, apparel (for San Francisco, principally), furniture and fixtures, chemicals, petroleum, and fabricated and primary metals (for the area), machinery and equipment.

San Francisco's labour force in the 1960s nas equal to about half its population. It was highly organized and relatively heavily weighted with technically trained, skilled and semiskilled workers It comprised about 35% of the metropolitan area force. Women workers were relatively less numerous in the area than in San Francisco, finding employment in clerical, service, domestic and professional categories especially.

Transportation and Communication.— Serving the bay area and terminating in San Francisco are: 4 class 1 railroads connecting to 7 transcontinental routes; more than 100 truck lines; 2 transcontinental bus lines; and, at the International airport (opened 1954) south of the city, overseas and domestic airlines, as well as local and air freight lines. About 250 air and marine shippers have San Francisco offices. The great bridge system and the automobile freeways built in the 1940s and 1950s—and still expanding—nere key forces in both the growth and the internal shifts in activity within the metropolitan area. Vast increases in automobile and truck movements precipitated serious problems of city parking and traffic flow. as well as safety and air pollution. In air and maritime traffic, city and area growth was reflected by gains of more than 100% betneen 1950 and 1960. The fact that rail freight movements in and out of the city remained about level in the same period reflected changes in the economic relation of San Francisco to the rest of the metropolitan area, as well as technological changes in transportation.

As a communications centre. San Francisco is the trans-Pacific headquarters of five radio systems and western headquarters for all telephone and telegraph networks. Military. naval and aeronautical headquarters and communications grids are located in the city. There are nine standard and five frequency modulation radio stations, and four television stations, leading the area in these media of communications and entertainment.

EDUCATION AND CULTURAL ACTIVITIES

From its early days, San Francisco's concern with education was vigorous and area wide. It passed its first public school law in 1851. A century later there were 120,000 students enrolled in the public schools of the city. An additional 30,000 pupils were in Catholic and Protestant schools. About 40,000 more were students in the colleges and universities in or near San Francisco. Nearly 40.000 men and women were participants in various forms of adult education.

In higher education, St. Ignatius' college (Roman Catholic) was chartered in 1855 and rechartered in 1930 as the University of San Francisco, St, Mary's college (Roman Catholic, later moved to Oakland and, finally, to Moraga Valley) in 1863. Mills college (founded 1852) for women moved from Benicia to Oakland in 1871. The site of the University of California, a land-grant institution, was selected in Berkeley in 1857; and in 1855, at Palo Alto, Leland Stanford, California's Civil War governor and one of the "Big Four" in railroad development, began building the university he named as a memorial to his deceased son, Leland Stanford, Jr. Within the city, in addition to the University of San Francisco, are San Francisco State college (1899), San Francisco College for Women (Roman Catholic, 1930, formerly college of the Sacred Heart at Menlo Park, 1898), City College (1935, a two-year public junior college) and the California School of Fine Arts (established as School of Design, 1874). Important branches of the University of California are also located in the city. Extension programs of the colleges and universities, and public adult education programs engaged an increasingly large number of residents.

The city's 19th-century cultural history was distinguished in literature. Among its writers in the 1860s and 1870s were Samuel L. Clemens (Mark Twain), Bret Harte, Joaquin (Cincinnatus Heine) Miller and Henry George; followed by George Sterling. Gelett Burgess, Ambrose G. Bierce, Edwin Markham, Hubert H. Bancroft, the historian, and the turn-of-the-century naturalistic novelists Jack London and Frank Norris.

Early San Francisco theatres and concert halls were important centres of western American culture. They continued to flourish in the 20th century. Though dependent upon New York for its road shows. San Francisco's numerous professional and amateur little theatres are distinguished and lively. Annual opera and symphony seasons of first quality; continuous art exhibits at public and private galleries; touring concert artists and ensembles—as well as motion pictures and television—maintain a constant and varied cultural program unequaled elsewhere in the metropolitan area.

In the mid-20th century, San Francisco and its neighbouring cultural centres continued to foster the creative arts. Novelists such as Walter Clark. Wallace Stegner. George Stewart, Mark Harris and Arthur Foff; poets such as Yvor Winters, Josephine Miles. Kenneth Patchen and Kenneth Rexroth; and critics such as Mark Shorer were active. Many were on the faculties of bay area colleges and universities. From jazz to serious composition (*e.g.*, Darius Milhaud on the Mills college faculty) in music. in sculpture (Beniamino Bufano) and in painting and design. San Francisco's artists earned recognition for experiment, sharing attention with artists in such other centres as Sausalito on the Marin peninsula.

BUILDINGS, STRQETS AND PARKS

In its public and domestic buildings, San Francisco reflects all the prominent architectural styles of the later 19th century and modern periods. 4 distinguished group of 20th-century Renaissance classic buildings in the civic centre includes the city hall, public library, auditorium and state building. Elsewhere, a notable example of the mid-19th-century Greek Revival is found in the building formerly housing the U.S. branch mint. The California Palace of the Legion of Honour, overlooking the Golden Gate, is a replica of the Palace of the Legion of Honour in Paris. Reflecting Victorian and early 20th-century eclecticism are numerous homes originally designed for wealthy 19th-century business and financial leaders: the Palace of Fine Arts near the Presidio (a U.S. military reservation of 1,512 ac.. which includes Ft. Winfield Scott and Letterman General hospital); the post office: the Hall of Justice; the Ferry building built by the state in 1896, 659 ft. long and 156 ft. wide; and the outstanding churches of the city. Notable examples of contemporary design include the V. C. Morris store (Frank Lloyd Wright); the Maimonides Health centre (Eric Mendelsohn); and the Crown Zellerbach office building.

San Francisco churches include the historic Mission Dolores. Grace cathedral (Episcopalian), an unfinished gray stone building of modified Gothic design, and St. Patrick's church! an example of early Gothic architecture which was rebuilt in 1906 after Old St. Patrick's (1854) was destroyed by fire. St. hlary's Cathedral of the Assumption (seat of the Roman Catholic diocese) is a large red brick German Gothic structure completed in 1894, while Old St. Mary's church (Paulist fathers) in Chinatown dates from 1853. The SS. Peter and Paul church (1924) serving the Italian community is of Romanesque design. Temples Emanu-el and Sherith Israel are the San Francisco centres of Reform Judaism; the unique Kong Chow and Tin How temples are monuments to the pioneer Chinese.

Recreational facilities are provided by 54 parks and numerous recreational units. The municipal parks and the several government reservations account for an aggregate of about one-ninth of the city's area. All of San Francisco's parks are man made. The Golden Gate park, in the midst of residential districts, comprises 1,017 ac. and is about 3 mi. long and ½ mi. wide, extending from Stanyan street on the east to the Pacific ocean on the west. In the park are the De Young Memorial museum, Academy of Sciences, Steinhart aquarium, the Museum of Anthropology, an aviary, music temple, stadium, tennis courts, baseball and football grounds, bridle paths, an athletic field and running track, paddocks and children's playgrounds. Improved driveways in the park exceed 25 mi. in length. At the western end of the park is to be seen the sloop "Gjoa," the first vessel to navigate the northwest passage; it was given to San Francisco by its owner, Capt. Roald Amundsen. The Fleishhacker Playfield and Zoological gardens are

set in a landscaped area of a small valley. The city is the home of the national professional football team. the San Francisco Forty-niners, and, since 1958, of the National league baseball team, the San Francisco Giants.

San Francisco's street system was begun in 1835 when Calle de la Fundación, or Foundation street, was laid out. The first survey, made in 1839, covered what is now the financial and retail sections of the city. Other streets and avenues were gradually added until 1845 when Jasper O'Farrell made a second survey. This system applied the "checkerboard layout," with Market street the main artery and division point.

The streets north of Market run north and south and east and west; the streets south run parallel and at right angles to Market street. The Market street slant is about southwest and northeast Among the scenic boulevards are those in the Marina, Twin Peaks and the Market street extension districts, including the Lincoln, Embarcadero and Great Highway paralleling the ocean.

San Francisco's Chinatown, the largest Chinese settlement outside the orient, comprises an area paralleling Grant Ave. between Bush St and Columbus Ave. The "town" is hedged in by the financial, hotel and apartment house districts and a part of North Beach, where once the riotous "Barbary Coast" gave both colour and notoriety to the city The Latin Quarter, where many artists and colonies of Italians, French, Spanish and Portuguese reside, centres on Telegraph and Russian hills. Fisherman's wharf is the picturesque home of the fishing fleet and is renowned for its sea-food restaurants. Beaches, peninsular camping and picnic grounds. and other recreational facilities are within easy motoring distance.

SAN FRANCISCO CONFERENCE (1945). The United Nations Conference on International Organization (UNCIO) met in San Francisco, Calif., on April 25, 1945 It was attended by representatives of the 46 states that had signed the Declaration of the United Nations, Jan. 1, 1942. Four other states (Ukraine. Belorussia, Argentina and Denmark) were admitted during the conference. The conference ended with signature of the charter on June 26. 1945. Poland, though not represented at the conference. was permitted to become an original member of the United Nations, which thus began with 51 members.

Pres. Franklin D. Roosevelt having died shortly before the conference began, Pres Harry S. Truman formally opened the sessions with a radio message. All of the great powers and many other states were represented by their foreign ministers, some of whom left after the surrender by Germany on May 7. Six international organizations aere represented (the League of Nations. the International Labour organization, the Permanent Court of International Justice, the CN Relief and Rehabilitation administration, the Interim Commission on Food and Agriculture and the Pan American Union). Nearly 10.000 people participated officially or unofficially as members or advisers of delegations. officials or employees of the international secretariat, or as representatives of the press, radio or nensreels.

The San Francisco conference was the first major international conference for two millenniums not dominated by Europe Not only was it remote from Europe geographically, but only nine continental European states west of Russia were represented The 21 American republics, 7 near eastern states, 6 commonwealth nations. 3 Soviet republics, 2 far eastern and 2 African states represented all parts of the world. Nine enemy states (Germany, Italy, Japan, Hungary, Austria, Rumania, Bulgaria. Finland and Thailand), eight neutral states (Switzerland, Spain, Portugal, Sweden, Ireland, Afghanistan, Iceland and Yemen) and Poland, which was unable to organize a government until the conference was over, were not represented.

The Dumbarton Oaks proposals, certain Chinese proposals later adapted by the "big four" (U.S.. U.K.. U.S.S.R. and China) and the Yalta (*q.v.*) agreement on voting procedure provided the agenda of the conference. These documents together with 24 amendments proposed by the "sponsoring powers" (Dumbarton Oaks) and 72 submitted by 40 other nations were classified in a book of over 400 pages for the benefit of the delegates.

The international secretariat provided interpreters, translators and stenographers and distributed documents and speeches every day in the five official languages (English, French, Spanish, Russian and Chinese). The chairmanship of the plenary sessions rotated among the big four. The private consultations of the big four. to which France was later added, in the penthouse apartment of U.S. Secretary of State Edward R. Stettinius, Jr., exerted great influence. The rule of unanimity, usual in political conferences, was abandoned. Measures could be carried in committees, commissions and plenary sessions by a two-thirds vote.

No political conference ever worked so much under the public eye. Plenary sessions and commission meetings were open to the press and the public, thus relegating confidential discussions to the big four consultations and the committees, but even these discussions soon reached the public. Many private organizations were represented by "consultants" who exerted an important influence on certain questions such as human rights and nonself-governing territories.

The charter which emerged from the conference followed the general lines of the Dumbarton Oaks proposals, but gave greater weight to the general assembly. "Justice" was insisted on as well as peace in the settlement of disputes, and the provisions concerning human rights, social and economic progress, nonself-governing territories and trusteeships were greatly elaborated.

Political issues arose, especially between the western powers and Russia, over the admission of the Ukraine, Belorussia and Argentina, the recognition of a government of Poland and the extension of the great-power veto in the Security council to discussion as well as recommendations and decisions. These controversies were settled by compromises. The issues concerning domestic jurisdiction v. international competence, the status of colonial areas, regional and defense arrangements and great power dominance *v.* the equality of states involved other groupings. In these matters the small states, the oriental states and the Latin-American states succeeded in obtaining modifications of the Dumbarton Oaks proposals.

The conference was successful in launching the United Nations with general concurrence, but the release of atomic energy a month after the conference was over, the rising tensions between communism and free democracy and the emergence of many new states in Asia and Africa developed conditions that had not been foreseen and required much adjustment in the actual functioning of the United Nations (*q.v.*).

SAN GABRIEL, a city of California, U.S., 9 mi. E. of Los Angeles and a part of the Los Angeles standard metropolitan statistical area, is famous as the site of the fourth Franciscan mission in the settlement of the region. Founded in 1771, the well-preserved mission (dating from 1775) owes its massive style of architecture to Father Antonio Gruzado, who modeled the church after a fortress of his native Andalusia.

The first settlement was composed of Indians and their mission guardians who engaged in agriculture until 1834 when the Mexican government took over the lands. After years of confusion, during which California became part of the United States. the mission lands passed almost completely into private ownership. This second community was made up of wheat farms, cattle ranches, vineyards and citrus groves. Modern San Gabriel, incorporated in 1913, is a residential town whose inhabitants work mostly in neighbouring Alhambra and Los Angeles.

It has a council-manager form of government, in effect since 1943. For comparative population figures *see* table in CALIFORNIA: *Population.* (J. A. Sz.)

SANGALLO, the name of a family of Italian Renaissance architects and military engineers active in Florence and Rome.

GIULIANO DA SANGALLO (1445?–1516), who worked. for the Medici in Florence and built their villa at Poggio a Caiano in 1485. His masterpiece is a church of Greek cross plan, the Madonna delle

Carceri in Prato (1485–91). Strongly influenced by Filippo Brunelleschi, it is the purest, most classic expression of that style of 15th-century architecture. In Rome Giuliano was overshadowed by Bramante. He designed influential facade projects for S. Lorenzo. Florence, in 1515–16.

ANTONIO DA SANGALLO, THE ELDER (1455?–1534), who often worked with his brother Giuliano but, under the influence of Bramante, became a more powerful designer. In S. Biagio, Montepulciano (1518–29), he created an ideal central church of the High Renaissance.

ANTONIO PICCONI DA SANGALLO, THE YOUNGER (1483–1546), nephew of the two preceding, was trained in Rome under Bramante and became the most influential architect of his time. In 1520 he succeeded Raphael as architect of St Peter's and held the position until the end of his life. His design, an elaboration of Bramante's, survives in a wooden model. He designed buildings for the Farnese family, including a palace-fortress at Caprarola; his most important work is the Farnese palace in Rome, beguh in 1541. Antonio the younger was an important military engineer and city planner as well as a keen student of ancient architectural remains.

See G. Clausse, *Les San Gallo* (1900–02); G. Giovannoni, *Antonio da Sangallo il giovane* (1959) (B H H.)

SANGER, FREDERICK (1918–), British biochemist awarded the Nobel prize for chemistry in 1958 in recognition of his outstanding achievement in determining the structure of the insulin molecule, was born on Aug. 13, 1918. Educated at Bryanston school and at St. John's college, Cambridge, he worked continuously from 1939 on biochemical research at Cambridge. He was a Beit memorial fellow from 1944 to 1951, and thereafter worked under the auspices of the Medical Research council. In 1951 he was awarded the Corday-Morgan medal and prize of the Chemical society, and in 1954 was elected a fellow of the Royal society and a fellow of King's college, Cambridge. At the time of the completion in 1955 of Sanger's ten years' research on the insulin molecule, this was the largest protein molecule to have its chemical structure elucidated. Sanger's discovery opened the road to the determination of protein structure in general. and it was an essential preliminary to any chemical synthesis of insulin and of related substances which might enable diabetes to be treated more conveniently. (W. J. BP.)

SANGER, JOHN (1816–1889), English circus proprietor, was born at Chew Magna, Somerset, in 1816, the son of a former sailor who had turned showman. In 1845 he started with his brother George a conjuring exhibition at Birmingham. The venture was successful, and the brothers, who had been interested spectators of the equestrian performances at Astley's amphitheatre, London, then started touring the country with a circus entertainment consisting of a horse and pony and three or four human performers. Eventually John and George Sanger became lessees of the Agricultural hall, London, and there produced a large number of elaborate spectacles. In 1871 the Sangers leased Astley's, where they gave an equestrian pantomime every winter, touring in the summer with a large circus Subsequently the partnership was dissolved, each brother producing his own show. John Sanger died while touring, at Ipswich on Aug. 22, 1889, the business being continued by his son.

SAN GERMÁN, a town in the southwestern part of Puerto Rico, is one of the two original settlements established by the Spaniards on the island. Pop. (1960), town 7,779, municipal district 27,658. Founded in 1508 by order of Diego Colón, a son of Columbus, San Germbn was repeatedly destroyed by attacks of Indians and French pirates and was moved inland from the exposed seacoast in 1573. The modern town was the seat of government for the western district during several centuries. Along one of the town's plazas stands the Porta Coeli convent, more than 400 years old and one of the oldest buildings in the West Indies. It is now a museum. San Germbn is the home of Inter-American university, a private and fully accredited institution whose campus is built on a series of hills near the town.

Modern highways connect San Germbn with Ponce on the south coast and Mayagüez on the west coast. The rural area surrounding San German produces sugar and coffee. To the south on the Caribbean coast near the fishing village of La Parguera is a famous phosphorescent bay where the college of agriculture and mechanical arts of the University of Puerto Rico maintains an institute of marine biology and a zoological park. (T. G. Ms.)

SANGIHE (SANGIR) AND TALAUT (TALAUD) ISLANDS, two groups of islands off the northeast coast of Celebes, Indonesia. Area of the Sangihe Islands 217 sq.mi.; of Talaut Islands 495 sq.mi. Pop. (1956 est.) of Sangihe Islands 86,232; of Talaut Islands 30.632.

The Sangihe Islands continue the northeastern extension of Celebes toward Mindanao, in the Philippines, and are set upon a long, narrow ridge, along a volcanic band, with very deep water on either side.

Although fringed with recent coral formation, they are distinctly volcanic, with active volcanoes, Mount Awu, on Sangihe Island, having experienced recent severe eruptions, while earthquakes also have occurred. Sangihe, Siau and Tagulanda are the chief islands, and Talisse and Banka (Banka lies off the east coast of Sumatra) are between Tagulanda and the mainland of Celebes.

Banka gives its name to Banka passage, the channel by which entry is obtained from Celebes sea to the Molucca passage. Sangihe is 28 mi. long, and from 4 to 13 mi. in width, is mountainous in the north, elevation decreasing considerably in the south, and has a coast which is generally steep. There is extensive cultivation of nutmegs, coconuts and Manila hemp. Taruna. on the west coast, and Peta, on the east coast, are regular ports of call; also Hulu, the capital and port of Siau, and Tagulandang, and Talisse. on the islands of that name. Ruang, a small island west of Tagulandang, has an active volcano.

The people of Sangihe and Siau are closely related to the people of Minahasa and of portions of the Philippine Islands. The Talaut. or Talaud. Islands consist of a group lying northeast of Sangihe, the chief of which is Karakelang. The coast is steep. except on the south shore. which is fringed by a wide reef. Some tiny islands known as the Nanusa Islands lie northeast of Karakelang. (E. E. L.; X.)

SAN GIMIGNANO, a town of Toscana, Italy, in the province of Siena, 24 mi N W. of Siena. Pop. (1951) 3.616. It is a medieval town in appearance. In the Palazzo Comunale (1288–1323) is a fresco by Lippo Memmi of the Madonna enthroned (1317). The Collegiata of the 12th century was enlarged after 1466 by Giuliano da Maiano. whose brother Benedetto carved the altar and ciborium in the chapel of S. Fina. The beautiful frescoes are the earliest work of Domenico Ghirlandajo (1475). The cathedral also contains New Testament scenes by Barna da Siena (1380) and some fine choir stalls. S. Agostino (1280–1298) contains frescoes by Benozzo Gozzoli, with scenes irom the liie of St. Augustine (1463–1467). The town was independent in the 13th century, but in 1353, because of the dissensions of the Salvucci (Ghibellines) and Ardinghelli (Guelphs), it fell into the hands of Florence.

SAN GIULIANO, ANTONINO PATERNO-CASTELLI, MARQUIS DI (1852–1914), Italian statesman, was born at Catania on Dec. 10, 1852. After graduating in law at the University of Catania he became, in 1879, mayor of his native city, and in 1882 was elected to parliament. When in 1892 G. Giolitti became premier. San Giuliano was selected as undersecretary for agriculture, while in the second Pelloux ministry (1899–1900) he held the portfolio of posts and telegraphs. Having been defeated at the election of 1904, he was nominated senator. In Dec. 1905 A. Fortis appointed him minister for foreign affairs, and in 1906 he was appointed ambassador in London. Transferred to Paris, he returned to the Consulta in 1910 as foreign minister. San Giuliano believed in the Triple Alliance but he carried out the policy of neutrality adopted by Italy on the outbreak of World War I. San Giuliano died in Rome on Oct. 16, 1914.

SANGLI, formerly a princely state composed of scattered territories (total area 1,146 sq.mi.; pop., 1941, 293,381) in the Deccan Kolhapur agency; merged into Bombay state on March 8. 1948. Sangli town (pop., 1951, 50.287) is the headquarters of Satara South district, Bombay state, India. It is known for the manufacture of brass and copper vessels and has a textile mill.

Willingdon college and the New Engineering college are institutions of Poona university.

SANGRE DE CRISTO, a range of the Rocky mountains, consists of a narrow, elongated, steep anticlinal uplift extending for about 220 mi. from Salida, Colo., southward to Santa Fe, N.M., U.S. The range was supposedly named by the Spanish explorer Antonio Valverde y Cosio in 1719 while breaking camp in the Purgatoire valley in Colorado. He was so impressed by the red-tinted. snowy peaks at sunrise that he uttered a fervent "Sangre de Cristo" ("blood of Christ"). These colourfully named mountains have many spectacularly glaciated peaks including the highest elevation, Blanca peak, 14,317 ft. Two outstanding land forms, Great Sand Dunes National monument and the volcanic Spanish peaks (13,623 ft.), are located near the western and eastern foothills. (A. W. SM.)

SANHEDRIN (sometimes incorrectly written SYNEDRIUM or SANHEDRIM), the supreme rabbinic court in Jerusalem during the Second Commonwealth era. The term is a hebraization of the Greek *synedrion,* meaning "assembly"; the term also is used for the Areopagus in Athens.

Rabbinic sources speak of a Great Sanhedrin of 71 members and of smaller Sanhedrins, trial courts of 23. judging criminal cases or violations of Jewish law. The Great Sanhedrin as a permanent institution is to be distinguished from the temporary Great Assembly of that era. Meetings of the Great Sanhedrin were held on the Temple Mount in Lishkat Hagazit (Chamber of Hewn Stone [or Decision]). Talmudic tradition pictures the Great Sanhedrin as the highest legislative and judicial court of Halakah (rabbinic law), headed by a duumvirate known as nasi (head) and ab bet din (father of the court), whereas nonrabbinic sources describe the institution as a political-executive and judicial body headed by the high priest. Though some scholars have sought to regard the rabbinic picture as an academic reconstruction, descriptive of the patriarchal court of the 2nd century C.E., the discrepancy of sources is easily explained in recognizing the existence of two contemporary bodies, one strictly religious, the other wholly secular or the civil authority.

The Mishnaic Sanhedrin consisted of scribes (soferim) who interpreted the Halakah, whereas the Synedrion, described in Josephus and the Gospels, was composed of the aristocracy of the state. including Pharisees and Sadducees. and served only as the secular state council of the high priest. The trials of Jesus and the Apostles as portrayed in the New Testament were before the priestly state Synedrion, sanctioned by Pontius Pilate. Jesus was crucified by the Romans and not by the Great Sanhedrin as "king of the Jews." Though the Jews were allowed to administer capital punishment, this right was restricted to religious lam.

In biblical days justice was administered by the kings (such as David or Solomon) or by the chieftains (*shofetim*). In early postexilic days (4th and 3rd centuries B.C.E.) the priests with their *gerousia* (council of elders) served as the judges. However, in 141 B.C.E., with the Hasmonaean victory over the Syrian Greeks, a new commonwealth mas established. The Great Sanhedrin was then instituted as a specialized body of Halakah to interpret Jewish law. Ritual matters of the Temple were left to the council of priests, and the government administration belonged to the monarchs and city officials in their executive boule (council).

Among the functions of the Great Sanhedrin were the enactment of decrees for religious observances, judging violations thereof, serving as the court of higher appeal, supervising smaller courts and controlling the priestly ceremonials in the Temple. Particularly did the body uphold the sanctity of the traditional lam and its oral interpretations as based upon the written law of the Torah. The functions and procedure of the Great Sanhedrin are discussed in the talmudic tractate Sanhedrin.

The first heads of the Sanhedrin were known as *zugot* (pairs). They were not merely president and vice-president of the body, but majority and minority leaders, representing the conflicting opinions current in the institution. The Sanhedrin was dissolved in 66 C.E., four years before the destruction of Jerusalem by the Romans in 70 C.E.

Among the leaders of the Great Sanhedrin were such men as Simon ben Shetah, who enacted laws for universal education, for rights of women and for the administration of trial courts and acceptance of testimony; he was a contemporary of Alexander Jannaeus (*c.* 100 B.C.E.). Another head nas Hillel (*q.v.*), whose dictum, "That which is hateful to you, do not do unto your neighbour." is considered as the basis for the similar maxim found in the Sermon on the Mount. Hillel's leniency in halakic interpretation illustrates the mode of Jewish harmonization of law and life. His descendants established the patriarchate in Palestine.

In the course of Jewish history many rabbinic institutions sought to exercise the power of this traditional Sanhedrin. Such were the patriarchate in Palestine (100–415 C E.) and the gaonate (see GAON) of Babylonia (660–1040 C.E.). where various academies of learning thrived. A bold attempt to reinstitute the body was made by Rabbi Jacob Birab and Rabbi Joseph Qaro in the early 16th century, after the expulsion of the Jews from Spain. with the direct purpose of receiving the marranos back to Judaism. Napoleon Bonaparte also. in 1806, sought to organize a Sanhedrin to decide the conduct of laws for the French Jews. The Paris Sanhedrin met in Feb. 1807 and agreed that the principles of a liberal, secular state were compatible with the laws of the Jewish religion. With the establishment of the state of Israel in 1948, hopes rose among some Orthodox Jews for the revival of the Great Sanhedrin. Many groups within Orthodoxy and outside its ranks oppose any such effort.

SANITATION: see HYGIENE; PREVENTIVE MEDICINE; PUBLIC HEALTH; and such specific related articles as PLUMBING; SEWAGE DISPOSAL; etc.

SANITATION, MILITARY. Simply stated, military sanitation is the practical application of the laws and principles of sanitary science within a military framework. Its scope and underlying principles are basically the same as sanitation and hygiene elsewhere.

Sanitation is the effective use of measures that will create and maintain healthful environmental conditions. Traditional among these are treatment of water, safeguarding of food and control of disease-bearing insects and rodents. More recently, measures directed against air pollution, noise, radiation and chemical hazards have been included.

Hygiene is the employment by the individual of practices that a-ill keep him healthy. These include proper nourishment, personal cleanliness and the avoidance of known sources of disease.

Military sanitation includes the practice of both environmental sanitation and personal hygiene, within the situations and experiences associated with military life. Thus it is a special application of general sanitation; the nature of the population toward which it is directed and the environment within which it must be applied are sufficiently distinct to warrant its consideration as a distinct specialty of the art.

The predominant characteristic of military populations that affects military sanitation is their lack of permanence. They are constituted by bringing together large numbers of individuals of many different backgrounds, generally in an environment that is comparatively primitive. Even after formation into military units they do not become static. Training requirements, changing political forces and constant turnover of personnel keep individuals and units ever moving. In peacetime these forces may be less intense and a degree of stability may be achieved. Gnder such circumstances sanitary problems lose their peculiar military character and sanitary practices more nearly resemble those of fixed civilian communities.

Another special characteristic that affects the nature of military sanitation is the composition of the population. Military forces are made up predominantly of young adult males in good physical condition. Although the armed forces are often responsible for civilian employees and for the families of both military and civilian personnel. this responsibility does not usually require significant deviations from customary civilian practice. In striking contrast, however, are the problems attendant upon the care of large num-

bers of refugees, displaced persons and other civilian populations which may come under military control, especially during wartime. Planning of military sanitary programs must include provision for these groups.

Military activities are generally group activities that continue for protracted periods of time. Therefore there is great opportunity for multiple and extended contact, a factor which fosters outbreaks of disease. Though basically healthy, military personnel are subjected to a great deal of mixing with other individuals of markedly different disease experience. This loss of protection afforded by the group immunity of the civilian groups from which they come leaves them potentially more susceptible to epidemic disease until their own group immunity is developed either artificially by immunization or naturally by infection.

Historical Background. — Whenever large groups of people have gathered in temporary locations, some efforts at sanitation have undoubtedly been made. Classically quoted is the Mosaic dictum (Deut. xxiii, 12–13), "You shall have a place outside the camp and you shall go out to it; and you shall have a stick with your weapons; and when you sit down outside, you shall dig a hole with it, and turn back and cover up your excrement." Although sanitary benefit undoubtedly derived from the law, an examination of the next verse makes it clear that its basis was aesthetic. "Because the Lord pour God walks in the midst of your camp, . . . therefore your camp must be holy. that he may not see anything indecent among you. . . ." This confusion of the sanitary and the aesthetic has plagued practitioners of the sanitary art ever since. Cleanliness rather than disease prevention has often erroneously been considered the goal of sanitation.

Herodotus described what is probably the earliest known instance of treating water for human consumption in a military organization. He wrote that, when going to war, Cyrus the Great, king of Persia (6th century B.C.), transported boiled water in silver flagons loaded on four-wheeled cars drawn by mules. It is likely that this was an effort to convert fresh water into a more stable product through killing of algae, etc., rather than a true sanitary measure.

More likely to have been a military application of a sanitary practice was the order issued by Timur (Tamerlane) that his troops were to drink only water that had been previously boiled. It is believed that this practice, rigidly enforced, may be credited with having protected his army from the decimating epidemics of enteric infection so common in armies. Whether this order stemmed from superstition, magic or pragmatic observation is not recorded.

In spite of these efforts, military history is replete with examples of the devastating effect of epidemic diseases upon military operations. It has been said that soldiers rarely win wars; they more often mop up after a barrage of epidemics. Until the 20th century, epidemics of dysentery, typhoid fever, malaria, typhus fever, yellow fever, etc., decided the course of military campaigns more often than did the force of arms.

As late as World War I disease significantly affected the course of military operations. The Austrian attack and the Serbian counterattack in the fall and winter of 1914 left northern Serbia a shambles. Villages were in ruins and the civilian population had fled to the south. Typhus appeared in the Serbian army in Nov. 1914; in February and March of 1915 the epidemic exploded violently, reaching a case fatality rate of 70%. In less than six months. 150,000 people had died of typhus. During this period a military stalemate existed in the Balkans; Serbia was helpless, yet Austria dared not attack because of fear of the disease. Typhus fever held the battlefield. It is not unlikely that this delay of six months in the Austrian attack may have tipped the balance of victory. A quick drive to Salonika, neutralization of Turkey, Bulgaria and Greece and the development of a southern front against Russia might have led to an early capitulation to the Central Powers. Typhus may not have won the war for the Allies, but it probably helped avert defeat.

In contrast was the experience less than 30 years later of the U.S. army when it met typhus in Naples during its drive northward through Italy. There, because of DDT and an effective sanitary organization to use it, for the first time in history an epidemic of typhus fever was brought to a standstill in midwinter. Because of effective environmental sanitation, armies need no longer fear their traditional scourge.

Scope of Military Sanitation. — The primary function of military sanitation is that of all military health programs — conservation of fighting strength. Effective manpower is a nation's most valuable military asset; its protection is an essential military mission. Even though in recent wars more deaths have resulted from enemy action than from disease, disease still causes the greatest loss of military manpower through disability and time lost from duty. Success in battle — the ultimate objective of any military force — demands that personnel be maintained in a constant state of combat readiness. Military sanitation contributes to this effort by employing measures to protect and improve the health of personnel.

Because there is little in the environment and in personal action that does not ultimately affect health, the scope of military sanitation is broad. Problems generated by the creation of a temporary community must be solved. These include the disposal of excreta, sewage and community waste in a safe and economical manner. Attention must be paid to the logistic problems of the supply and handling of water, milk and other foods to ensure that these items do not become health hazards. Definition of the potential or actual role of insects and rodents in the transmission of human disease and the implementation of effective measures for their control loom large in military sanitation programs. The safety, industrial and radiation hazards of the environment are of ever-increasing importance in the domain of the sanitary engineer. Associated with all of these may be the problems inherent in arctic, desert and jungle operations.

In general, the measures employed in combating these problems, as well as others in the field of environmental hygiene, are carried out for the individual, often without his knowledge. Their effectiveness does not necessarily depend upon his co-operation. In contrast are the measures employed in personal hygiene. These must be carried out by the individual. They include personal cleanliness, care of the feet and skin (particularly in tropical and arctic areas), rest and recreation, protection against the elements, protection against insects and personal protective action to avoid potential sources of disease such as those of malaria, enteric disease and the venereal diseases. In such a broad field, the military sanitarian must select his targets so that his efforts will not become merely diffuse and ineffective. He must continually evaluate the situation to determine which health hazards are of real military significance. Maximum results from the effort expended may then be expected.

Contributions of Military Sanitation. — Though military sanitation is but a segment of the field of sanitation as a whole, it has made many significant contributions to the general body of knowledge and guided the way to many practical advances. Military forces are commonly thrust into foreign areas where health hazards are little understood. Such conditions provide both the opportunity and the necessity for the development of simple, effective techniques for the control of environmental hazards.

Sometimes the problem requires research to determine the cause of disease. The linking of Aedes *aegypti* to yellow fever by Maj. Walter Reed (*q.v.*) and Lieut. Bailey K. Ashford's demonstration that malignant Puerto Rican anemia was caused by massive hookworm infection are examples. Sometimes the contribution has taken the form of the practical application of knowledge. Such was the work of Maj. William Crawford Gorgas (*q.v.*) in Havana and Panama in mosquito control and Maj. Frederick F. Russell's inoculation of the U.S. army against typhoid fever.

One of the most significant contributions of military sanitation, and probably the one most nidely adopted in civilian practice, relates to the chlorination of water to make it potable. In 1910 Maj. Carl R. Darnall, who had previously developed a widely used mechanical filter for water treatment, first used chlorine gas supplied from steel cylinders of liquid chlorine to sterilize drinking water. Chlorination of public water supplies is now practised throughout the world. In addition, Maj. William J. L.

Lyster's (1913) method of treatment of small water supplies with calcium hypochlorite or a similar chemical is still commonly used.

Program Planning. — Of all the many principles that military sanitation has in common with civilian practice, at least two are worthy of special mention. Not that they are any more applicable in military practice, but here the cost of failure to observe them is measured in human life. not in dollars.

Environmental sanitation deals with health problems whose importance and nature demand long-range planning and the use of special skills for their solution. In order that personnel and facilities may be available at the proper place when needed to meet such problems as water treatment and distribution, sewerage and sewage treatment. refuse collection and disposal and insect and rodent control. the skills of sanitary engineers should be utilized early in the planning stages of military operations. These experts should be consulted in selection of campsites. approval of designs, planning of landing operations and movement of large bodies of troops. Prior planning here may not only preclude poor performance, but may sometimes avert disaster.

Because sanitary engineers. in common with others possessing special technical skills. are always in short supply during periods of emergency. they should be utilized only in work that requires this specialized knowledge and experience for its performance. For example, such knowledge is needed in selecting designs for water-treatment and sewage-treatment plants to ensure efficient operation. It is needed in many phases of insect and rodent control, such as area survey and determination of how engineering can best contribute to the over-all program. Although the purpose of environmental-control measures is medical. the method by which they are accomplished is engineering. The skill and knowledge of the highly trained engineer should be brought to bear where they may do the most good. His talents must not be dissipated in the routine day-to-day sanitary housekeeping at military camps, for the handling of which nonprofessional technical skills are normally sufficient. *See* also MEDICAL SERVICES. MILITARY. (H. E. GR.)

SANJŌ SANETOMI (1837–1891), was one of the court noble statesmen in the Japanese imperial government established in 1868. Sanjō's service in high office helped emphasize the importance of the throne and the imperial court. whose power the feudal lords had usurped for so long. He held the post of first minister of the council of state during most of the period from 1871 to 1885. His most important function mas to serve as spokesman for the bureaucracy which ruled in the name of the emperor Meiji. For example, it was Sanjō who promulgated the imperial rescript of Oct. 12, 1881, promising a parliament and constitution. The most important and dramatic moment in his career occurred in 1873, when the faction which advocated war with Korea pressed him to secure imperial approval. Unable to bear the pressure of decision, he turned his post over to his colleague, Iwakura Tomomi, who was able to defeat the plans of the war party. Finally. in 1885, when the modern cabinet system was instituted in preparation for constitutional government, Sanjō was elevated to the post of lord keeper of the privy seal. (GE. M. B.)

SAN JOSE, a department in southern Uruguay. Pop. (1954 est.) 106.789. Area 1.912 sq.mi. A major steel railroad bridge permits easy communication with Montēvideo. about 60 mi. away. There are also road, sea and air routes to the national capital. As elsewhere in southern Uruguay. closeness to Montevideo's markets encourages dairying and agriculture. Poultry and swine are increasingly important. San José is a ranching region and its breeding establishments service a wide area; both cattle and sheep are raised. The departmental capital is San José (pop., [1954 est.] 13,500). (M. I. V.)

SAN JOSE (Sax JOSÉ DE COSTA RICA), the capital of the republic of Costa Rica, is located on the Jleseta Central, 3.880 ft. above sea level. It is an important point on the Inter-American highway and the junction of the Northern railway from Limón and the Pacific railway from Puntarenas. Pop. (1950) 86,909. The year-round climate is moderate, divided into a wet and a dry season. San José developed very slowly in the Spanish colonial era; it was called Villa Nueva when it was founded in 1736. Its early source of wealth was the tobacco trade. Following independence in 1821, San José citizens briefly fought those of Cartago and in 1823 the capital of the republic of Costa Rica was moved from Cartago to San José.

In the 1840s San José emerged as the centre of coffee production. chief source of Costa Rican wealth throughout the 19th century. The political, social and economic centre of Costa Rica and an episcopal see. San José grew very rapidly in the 20th century, especially in its suburbs. The number of industrial establishments doubled between 1952 and 1956. Commerce is carried on mainly by a large number of small operations. Costa Rica's substantial import trade is centred in San José.

The city has paved. electrically lighted streets, a large central market and excellent hospitals. schools and parks. The University of Costa Rica is in San José as are the 18th-century cathedral and the imposing national theatre. The city is the capital of San José province (1.892 sq.mi.), a fertile coffee- and livestock-raising area. The population of the province increased 84% between 1927 and 1950. Serving the province is the international airport. El Coco, about 12 mi. from San José. Just outside the city is the beautiful plain known as La Sabana, lined with lovely homes. The National stadium occupies one section of the Sabana. The city is increasingly popular with foreign tourists.

(T. L. K.)

SAN JOSE, known as the "Garden city," in west central California, U.S., is the principal city and county seat of Santa Clara county. Located on the level floor of the Santa Clara valley between the Diablo range and the Santa Cruz mountains. it is 50 mi. S. of San Francisco and 30 mi. N.E. of Monterey bay. Pop. (1960) city 204,196; standard metropolitan statistical area (Santa Clara county) 642,315. Included within the metropolitan area are the cities of Palo Alto, Santa Clara and Sunnyvale (*qq.v.*). For comparative population figures see the table in CALIFORNIA: *Population.*

Founded on Nov. 29. 1777, as El Pueblo de San José de Guadalupe by José Joaquin hloraga under orders from Felipe de Neve, Spanish governor of Alta California, and named for St. Joseph, California's patron saint. it was California's first civil community. During the Spanish and Mexican periods it supplied wheat, vegetables and cattle to the garrisons of the presidios in Monterey and San Francisco. Located 3 mi. from Mission Santa Clara (founded 1777) and 16 mi. from Mission San José (founded 1797). San Jose also became the centre for ecclesiastical activities in the area. Some of this rich heritage is retained in the colourful Spanish place names for streets and districts.

The U.S. flag was raised above San Jose during the Mexican War on July 14. 1846, and it remained a U.S. city. It became California's first state capital. and the first state legislature ("the legislature of 1,000 drinks") convened there on Dec. 15. 1849. It was also the home of Peter H. Burnett, the state's first elected governor. However, San Jose was not destined to be the seat of government for long; in Jan. 1852 the capital was removed to Vallejo. One of California's first cities. San Jose was incorporated in March 1850. and by this date had changed from a drowsy little Spanish pueblo to a bustling trading centre and quicksilver denot for the gold fields. Most of California's auicksilver. used in the amalgamation process of extracting gold from ores, came from New Almaden, 13 mi. S.

In 1864 the coming of the railroad from San Francisco gave San Jose improved trade connections and new industries began to vie nith the agriculture of the valley. The area soon developed into a fruit-producing region nith French prunes (introduced by Louis Pellier, 1856) and apricots predominating. San Jose was long the centre of the world's dried-fruit and canning industry and until 1940 most of its industry was concerned with food processing or preserving and with manufacturing orchard supplies and food machinery. After World War II, honever, there was a meteoric rise in the manufacture of durable goods such as electrical machinery. ordnance, aircraft parts and automobiles. During this period the population of San Jose doubled and thousands of new single-story, single-family homes began to replace the orchards and farms Displaying the better features of suburbia and without the worst features of a metropolis, San Jose's newer districts contain dis-

persed shopping facilities in several subcentres like Willow Glen, Valley Fair and East San Jose, each a complete community for family living within the confines of the city. With a moderate climate and only one hour's drive from San Francisco, San Jose also became an attractive suburban settlement for many workers in the bay area.

The council-manager type of government came into effect in 1916. The city's public-school system includes a large modern junior college, established in 1921. San Jose State college (founded 1857) is the oldest and the largest California state college. Two universities, Santa Clara (Roman Catholic) and Stanford (private), are nearby. The civic auditorium, city symphony. Alum Rock park, the municipal rose garden, the Egyptian museum and numerous parks and playgrounds are other noteworthy community assets of San Jose. (D. T. M.)

SAN JUAN, an Andean province of Argentina, bounded north and east by La Rioja, south by San Luis and hfendoza and west by Chile, from which it is separated by the Andean cordilleras. Area 33,257 sq.mi. Pop. (1960) 352,461. It is roughly mountainous. and belongs to the closed drainage basin of western Argentina, centring in the province of hfendoza. It is traversed by several rivers, fed by the melting snows of the Andes and discharging into the swamps and lagoons in the southeastern part of the province, the largest of which is Huanacache. The largest of these rivers are the Bermejo, Jachal or Zonion and San Juan, all used for irrigation. The climate is extremely hot and dry in summer, but the winter temperature is mild and pleasant. Agriculture is the principal occupation of the inhabitants, though the soil is generally sterile and the rainfall uncertain and very light. Cereals are grown in some localities. and fruits and wine grapes of excellent quality are cultivated under irrigation on a large scale.

The province contains gold, silver, copper. iron, lead, coal and salt. Pastoral interests are largely in feeding cattle for the Chilean markets, for which large areas of alfalfa are grown in the irrigated valleys of the Andes. Rail communication is provided by the Belgrano and the San Martin railways.

The capital of the province is San Juan (pop. [1960] 106,776), in a great bend of the San Juan river, 97 mi. N. of Mendoza and about 750 mi. from Buenos Aires by rail. The city was founded in 1562 by Juan Jufré, a companion of Pedro del Castillo, the founder of Mendoza, and was the capital of the province after 1820. The original settlement, named San Juan de la Frontera and now referred to as Pueblo Viejo, 4 mi. N., was abandoned in 1593 because of frequent inundations. The present town is about 2,163' ft. above sea level and is defended from inundations by an embankment called the Murallón. The city has suffered severely from political disorders. In 1894 and 1944 it was nearly destroyed by earthquake. With the possible exception of the earthquake of March 20, 1861, which completely destroyed the city of Mendoza, Argentina never suffered a greater disaster than the earthquake that occurred in San Juan province on Jan. 15, 1944. Whatever the intensity of the shock may have been elsewhere in the province, the worst damage and greatest loss of lives were sustained by the city of San Juan. More than 90% of the buildings, including the cathedral, the government house, municipal building, churches, schools, hospitals, railway station and historical monuments, were either destroyed or damaged beyond repair, and the toll of lives was numbered in the thousands.

(R. W. Rd.; X.)

SAN JUAN, the capital of the island of Puerto Rico, is the oldest city under the U.S. flag. Pop. (1960) 432,377. In 1508 Ponce de Leon founded the original settlement, called Villa de Caparra. near the shore of a perfectly protected harbour opposite the present site of San Juan. The unhealthful conditions forced the Spaniards to move in 1521 to the present location on a very small island protecting the entrance to the harbour (see PUERTO RICO: History). Since the city was subject to frequent foreign attacks, the Spanish constructed several large fortifications and a massive wall, two parts of which still stand. with moats, gates and bridges. On a high bluff guarding the entrance to the harbour is the formidable Morro castle; and to the east overlooking the Atlantic is the great fortress of San Cristóbal.

Other buildings of historical interest include La Fortaleza, the home and office of the governors, the construction of which was started in 1533; the Casa Blanca, built for the descendants of Ponce de León (1523); the cathedral, originally constructed in 1512 but rebuilt in 1549; and the city hall. built on the principal plaza in 1602. The government of Puerto Rico, through the Institute of Puerto Rican Culture, has undertaken in every way possible the restoration of the historical aspect of old San Juan, with its narrow cobblestone streets, overhanging balconies, cool porticoes and 19th-century lights.

In the 20th century the city expanded rapidly beyond its walled confines, incorporating such suburban areas as Miramar, Santurce and El Condado along the coast and Rio Piedras and Hato Rey inland. In 1960 the standard metropolitan area of San Juan, with a population of 588,805, included the urban areas of Bayamón, Cataño, Guaynabo and San Juan. In these newer areas are found beautiful modern buildings, such as the Lawyers' Association building in Santurce, the Roman Catholic church of Cataño and in Rio Piedras the library of the University of Puerto Rico with its famous mural by the Mexican painter Rufino Tamayo.

Politically, culturally, socially and commercially the metropolitan area is the centre of Puerto Rico. The governor's home and office are still in the Fortaleza in old San Juan. A marble capitol of the classic type houses the bicameral legislature and nearby, in the same area of Puerto de Tierra, is the modern building of the supreme court of the island. In an effort to decentralize the metropolitan area many government offices and agencies have been moved back across the bay to a location not too distant from the original site of Caparra.

The Institute of Puerto Rican Culture, Carnegie library, the Atheneum and the School of Tropical Medicine are centrally located near old San Juan. In addition to the University of Puerto Rico an excellent bicultural education is offered by such schools as the College of the Sacred Heart and Robinson school. The Casa de España, the Puerto Rico casino, the Yacht club and a number of private country clubs offer social activity for their members. Entertainment facilities include horse racing at a large modern hippodrome between Río Piedras and Carolina and night baseball during the winter season with big league players.

San Juan has one of the largest and best protected harbours in the West Indies. Fully equipped with modern docking facilities and a dry-dock service, the harbour receives freight and passengers from the Atlantic! Gulf and Pacific ports of the U.S., from South and Central America, the countries of Europe and the other West Indian islands. hfost of the people coming to the island arrive by air at the San Juan International airport. The airlines of three continents and the West Indies make San Juan a regular stop. Most of those arriving for the first time, whether by plane or boat. are tourists staying for short periods at the ultramodern tourist hotels located for the most part along the Atlantic coast between old San Juan and the airport to the east. In the commercial centres of San Juan, Santurce and the other suburban areas many U.S. chain stores, banks and important corporations have local offices and distributing centres. (T. G. hls.)

SAN JUAN DE LA MAGUANA: see BENEFACTOR.

SAN JUAN (HARO) ISLANDS, an archipelago of 172 habitable islands and several hundred tide-mashed rocks in upper Puget sound south of Georgia strait and east of the Strait of Juan de Fuca; politically it is a part of the state of Washington. The islands are geologically part of a submerged mountain chain whose summits appear in the ocean-filled trough where British Columbia and Washington meet. They were first explored and named during the expedition of Francisco Eliza in 1790–92. They were also visited by Capt. George Vancouver in 1792 and Charles Wilkes of the U.S. navy in 1831. They were occupied for a time by the Hudson's Bay company, then subjected to a dispute between Great Britain and the United States over their ownership. In 183'9 troops of both nations landed on San Juan Island. For a few weeks there was imminent danger of war but trouble was averted when both nations agreed to arbitration. In 1872 the emperor of Germany assigned them to the United States. The population is almost exclusively Caucasian and the permanent population is sta-

ble. Between 1940 and 1950 the number of permanent residents increased only 3% while the population of the rest of the state increased 37%. The islands are used extensively for summer homes and camps. The highest point in the group is Mt. Constitution on Orcas Island. at 2,408 ft. The rainfall of the islands is light, averaging less than 30 in. a year. Of the total area of the islands (265 sq.mi.), 79% is in the three largest islands of San Juan. Orcas and Lopez.

See David Lavender, Land of **Giants** (1958) ; Dorothy O. Johansen and Charles M. Gates, *Empire of the Columbia (1957).* (K. A. M.)

SAN JUAN RIVER, low-gradient. easterly flowing Central American stream through which Lake Nicaragua discharges to the Caribbean sea. For much of its 120-mi. course the right bank marks a segment of the Nicaragua-Costa Rica frontier. Anglo-American rivalry for this potential transisthmian water route was adjusted by the Clayton-Bulwer (1850) and Hay-Pauncefote (1901) treaties. In the Bryan-Chamorro treaty (signed 1914; ratified 1916) Nicaragua granted the United States rights to construct a canal. (J. T.)

SAN JUAN RIVER, in the southwestern United States. the second most important tributary of the Colorado river system, rises in the San Juan mountains of southwestern Colorado on the west side of the continental divide in Mineral county. The river flows west and is 360 mi. long; it empties into the Colorado 80 mi. upstream from Lee Ferry, Ariz. Important tributaries of the San Juan in northwestern New Mexico are the Animas, Los Pinos, Piedra. La Plata and Mancos rivers. In this area the river valley widens and some irrigation agriculture is practised. At "Four Corners," where the boundaries of New Mexico, Utah, Arizona and Colorado meet, the San Juan enters the Colorado plateau into which it has carved numerous S-shaped canyons over 1,000 ft. deep. This section of the river is known as the Goosenecks. From the Goosenecks the San Juan flows through wild. rugged, desert country in a relatively straight, deep canyon to the Colorado. The San Juan is one of the important rivers in the multiple-purpose development of the upper Colorado river. discharging almost 2,000,000 ac.ft. of water annually into the Colorado. The Navajo dam is an irrigation and flood-control project on the San Juan in northnest New Mexico. (M. J. L.)

SANKA, a pariah group in Japan, one of a series of so-called tribes or ethnic enclaves against whom the Japanese developed a marked sense of prejudice and discrimination. These groups. commonly designated as the *senmin,* a term referring to their low social status. became in effect outcastes: living at the very bottom of the rigidly structured social system of feudal Japan. The Sanka are sometimes called the Japanese gypsies, being a wandering people traditionally limited to the mountainous regions of Honshu. Their descendants are generally located in the mountains behind Niigata and in the area of Mt. Chausu. Although such people are mentioned in Japanese chronicles from the 11th century A.D., much of the information about them is vague, being dependent in some measure on Japanese folklore. There seems no reason to equate the Sanka with the aboriginal Japanese Ainu; indeed, they are not distinguishable in either physical type or language from the Japanese proper. In general. the Sanka may be appraised along with such other outcaste elements in Japan as the Hinin and Eta. The fact that they were landless people, living isolated lives, may have served to establish their unfortunate reputation.

When it is remembered that traditional Japanese society viewed the nonagriculturalist with contempt. the position of the Sanka may become clearer. Little is known of Sanka organization. Like other depressed castes in Japan, they had chiefs through whom they dealt with feudal authority and who were responsible for the conduct of the group. Socially they were forced into endogamy. There is no evidence to support the common Japanese claim that the Sanka were a wild people who lacked houses and lived in caves. In their mountain habitat they seem to have been wood gatherers and charcoal burners as well as hunters. Although the Japanese-in 1869 legislated against social discrimination, the feelings of contempt still apply to the descendants of the Sanka as they do to the Eta. (R. F. Sr.)

SANKARAN NAIR, SIR CHETTUR (1857–1934), Indian jurist, rose to high positions in the government rarely open to Indians of his time and was noted for his robust independence and frank expression of views. Born in Malabar on July 11, 1857, he was educated at the Madras presidency college. A member of the Madras legislature and a prominent delegate to the Indian National Congress for a number of years, he was a keen social reformer; he presided at the Amraoti session of the Congress (1897) and at the Indian Social Reform conference, Madras. He became advocate general of Madras in 1907 and judge of the Madras high court in 1908. As a judge he expressed himself fearlessly even against the government, and in a famous judgment upheld conversion to Hinduism and decided that such converts were not outcastes. In 1915 he became a member of the viceroy's council. and as such had many conferences with the secretary of state for India in connection with constitutional reforms. Holding that martial law was continued too long in the Punjab, he resigned; however, for his sympathies with the Montague-Chelmsford reforms he was appointed in 1920 to the council of the secretary of state for India in London. He resigned in 1921 to take office in Indore. In his book *Gandhi and Anarchy* (1922) he attacked both the nonco-operation movement and the government actions under martial law; a costly libel action brought by Sir Michael O'Dwyer, then governor of the Punjab, followed. In 1925 he was elected to the council of state, and in 1928 was appointed chairman of the All-India committee to sit with the Simon commission to report on constitutional progress. He was founder and editor of the *Madras Review* and the *Madras Law Journal.* He was knighted in 1912. He died at Madras on April 24. 1934. (L. R. S.)

SANKEY, JOHN SANKEY, 1st Viscount (1866–1948), British lord chancellor, was born at Moreton, Gloucestershire, on Oct. 26, 1866. Educated at Lancing college and at Jesus college, Oxford. he was called to the bar at the Middle Temple in 1892. He took silk in 1909 and from that time advanced rapidly in his profession. He became a judge in the king's bench division in 1914 and a lord justice of appeal in 1928. He was chairman of the royal commission on the coal industry in 1919. In 1929 he was raised to the peerage and appointed lord chancellor in the second Labour government, retaining the appointment in the national government formed in 1931. He was created a viscount in 1932 and retired in 1935. He died in London on Feb. 6, 1948.

SANKHYA (Samkhya), the oldest system of Indian philosophy. its founder. Rapila, having been born probably a century before Buddha's birth. *See* Indian Philosophy: *The Samkhya;* Sanskrit Language and Literature: *Philosophical Systems.*

SAN LEANDRO, a city of Alameda county, Calif., U.S., bordered by Oakland on the north and Hayward on the south, a part of the San Francisco-Oakland standard metropolitan statistical area. The city lies on a coastal plain 47 ft. above sea level, adjacent to San Francisco bay. It forms part of the East bay metropolitan strip characterized by suburban developments, commercial trading centres and water-front industries. Manufacturing includes tractors, calculating machines. electrical appliances, paper products, hosiery and processed foods. The area also has a large cut-flower business.

José Joaquin Estudillo established the first residence in 1837 and named the site after St. Leander, a former bishop and patron saint of Seville, Spain. From 1855 to 1871 the town was the county seat of Alameda county. It was incorporated in 1872. It has a council-manager form of government, in effect from 1928. Pop. (1960) 65.962. (R. M. W.)

SAN LÚCAR (Sanlúcar de Barrameda), a fortified seaport of southern Spain, in the province of Cádiz; 27 mi. by sea from Cádiz, on the left bank of the Guadalquivir estuary. Pop. (1950) mun. 35.517. Inscriptions and ruins prove that San Lúcar and Bonanza were Roman settlements, though the original names are unknown. San Lúcar was captured from the Moors in 1264, after an occupation lasting more than five and a half centuries. After 1492 it became an important centre of trade with America. From this port Columbus sailed across the Atlantic in 1498, and Magellan started in 1519 to circumnavigate the world. The 14th-century church and the palace of the dukes of Medina Sidonia contain many valuable pictures. The hospital of St. George was

established by Henry VIII of England. The Guadalquivir estuary is deep and sheltered. Bonanza, 2 mi. by rail up the river, and on the same bank, is the headquarters of the shipping and fishing trades. It is named after a chapel dedicated there by the South American Company of Seville to the Virgin of Fair Weather (*Virgen* de la Bonanza). The fisheries and agricultural trade of San Lucar are considerable; there are flour mills in the town.

SAN LUIS, one of the three Argentine provinces forming the region of Cuyo, an Araucanian word meaning "land of sand." Area 29.632 sq.mi. Pop. (1960) 174.251. Although the province is in the Andean plain. much of its surface is broken by chains of mountains, the largest of which is the Sierra de San Luis. Forests are extensive and provide an important source of wealth, as do also the mineral resources (copper, iron, wolfram, gold, silver; mica and lead). There are relatively few rivers, the principal ones being the Desaguadero. Quinto. Conlara and San Luis. The economy is based chiefly on mining, lumbering, agriculture and stock raising, the emphasis with respect to the latter two categories being placed on cattle, sheep, cereals and fruits. The capital is San Luis (pop. [1956 est.] 28,024), founded in 1596 by Martin de Loyola, governor of the captaincy general of Chile. Mercedes, the largest city in the province, has a population of 28.879 (1956 est.). (R. W. Rd.; X.)

SAN LUIS POTOSÍ, a central state of Mexico, bounded north by Coahuila, east by Nuevo Leon, Tamaulipas and Veracruz, south by Hidalgo. Querétaro and Guanajuato and west by Zacatecas. Area 24,417 sq.mi. Pop. (1560) 1,054,206. The state comprises the high plateau region with the exception of a small area in the southeast angle, where the tableland breaks down into the tropical valley of the Pánuco. The surface is comparatively level, with some low mountainous wooded ridges. The mean elevation is about 6,000 ft.. ensuring a temperate climate. The rainfall is light and uncertain and the state is poorly provided with rivers. The soil is fertile and in favourable seasons large crops of wheat, maize. beans and cotton are grown on the uplands. In the low tropical valleys, sugar, coffee, tobacco, peppers and fruit are staple products. Stock raising is an important industry and hides, tallow and wool are exported. Fine cabinet and construction woods are also exported to a limited extent.

San Luis Potosi ranks among the leading mining states of Mexico. The Catorce district, which includes Matehuala and the once-important mining station of Real de Catorce, has some of the richest silver mines in the country. Other well-known silver-mining districts are Peñón Blanco, Ramos and Guadalcázar. The development of Guadalcázar dates from 1620 and its ores yield gold, copper, zinc and bismuth as well as silver. In the Ramos district, Cocinera lode is said to have had a total yield of more than $60.000.000. The state has good air. rail and highaay connections. Rio Verde, an agricultural centre with a national agricultural experiment station in its vicinity. is 65 mi. E.S E. of the state capital, San Luis Potosí. (J. A. Cw.)

SAN LUIS POTOSÍ, a city of Mexico and capital of the state of the same name, 215 air miles (327 mi. via rail; 409 mi. via paved highway) N.W. of Mexico City. Pop. (1560) 173,886. Its altitude, 6,168 ft. above sea level, ensures a temperate climate.

San Luis Potosi is the hub of a rich silver-mining and agricultural region and a leading manufacturing centre. The city produces a variety of products including rope, brushes, shoes. cotton and woolen textiles and clothing. There are several large plants for the smelting and refining of various ores and crude metals brought from adjacent states. It has a large arsenic plant. The state-supported Instituto Cientifico offers courses in law, medicine and science. Notable buildings include the cathedral, conspicuous for its typical Churrigueresque style; the state capitol, noted for its façade of rose-coloured stone; the churches of Nuestra Señora del Carmen, San Francisco and Guadalupe; and the mint.

The city dates from the founding of the Franciscan mission of San Luis Rey by Diego de la Magdalena in 1583, and takes its name from the Cerro de Potosi, a nearby hill of silver, said to resemble the famous Potosi mines of upper Peru (Bolivia). It was the centre of the region's colonial administration and played an important part in the political disorders following Mexican independence. For a brief time in 1863 it was the seat of the government of Benito Juárez. Imprisoned there by Porfirio Diaz in June 1910, Francisco I. Madero drew up his famous "Plan of San Luis Potosi" (Oct. 7) which contained the political and social goals for the Mexican revolution launched Nov. 20, 1910. (R. B. McCk.)

SAN MARCOS, the department in western Guatemala that borders Mexico. Area 1.464 sq.mi. Pop. (1957 est.) 282,951. Its capital is San Marcos (pop. [1960 est.] 5.058). In the highlands the Maya Indian farmers raise maize. beans and wheat. On the south-facing slopes there are plantations of coffee. On the coastal lowland there are bananas, sugar cane and rice. A branch of the Inter-American highway passes through San Marcos to the Mexican border. Ayutla is the railroad terminus opposite the end of the Mexican railroad. Ocos is the port. (P. E. J.)

SAN MARINO, a republic in northern Italy, 14 mi. S.W. of Rimini by road. It is the smallest republic in the world (24 sq.mi. in area) and is entirely surrounded by the region of Emilia-Romagna. It is situated mostly on the slopes of Monte Titano, in the northern Apennines, the three peaks of which, each surmounted by a tower, are pictured on the arms of the republic. The estimated population in 1957 was 14,421. The capital is San Marino. Most of the republic falls within the diocese of Montefeltro, a small portion within that of Rimini.

According to tradition, the republic was founded by Marinus, a native of Arbe, probably after the middle of the 4th century. The Castellum Sancti Marini is mentioned in 755; the oldest document in the republican archives mentions the abbot of San Marino in 885. The republic, as a rule, avoided the factional fights of the middle ages but joined the Ghibellines and was interdicted by the pope in 1247–49. After this it was protected by the Montefeltro family (later dukes of Urbino) and the papacy and successfully resisted the attempts of Sigismondo Malatesta against its liberty. It fell into the hands of Cesare Borgia in 1503 but soon regained its freedom. Other attacks failed, but civil discords increased. Its independence was recognized in 1631 by the papacy. In 1739 Cardinal Alberoni attempted to deprive it of its independence, but this was restored in 1740 and was respected by Napoleon. It put itself under the protection of the kingdom of Italy in 1862. In World War II San Marino remained neutral, but suffered a severe bombing raid and other infringements of its neutrality. The fascist regime was overthrown in 1943.

The general council consists of 60 members and is elected by proportional representation from single-party lists. Its functions are deliberative and legislative, while a grand council of 12 exercises the executive functions of government. The councils are elected every four years. The peaceful revolution of March 25, 1506, restored the original system of election to the council (which had become a close corporation, renewed by co-option) by the Arengo, or assembly of heads of families, one-third of the council being henceforth renewable every three years. In 1909 the household suffrage was replaced by universal male suffrage, but women were not given the vote until 1958. Residence in the republic is not necessary for voting. The election of the two *capitani* reggenti ("captains regent") takes place every six months. They enter into office on April 1 and Oct. 1 with much traditional pomp and preside over the two councils; but the real governmental power is in the hands of two secretaries of state.

The available armed forces of the republic include about 1,200 men, all citizens able to bear arms being technically obliged to do so from 16 to 60 years. The language spoken is Italian and the inhabitants are Roman Catholics. Italian money is current. A considerable part of the revenue is drawn from the Italian government in exchange for an acknowledgment of the Italian state monopolies in tobacco. playing cards, etc. Only in 1922 did San Marino introduce an income tax. A fruitful source of revenue is found in the frequent change of postage stamps (first issued in 1877); other chief exports are stone from Monte Titano — the legendary founder of San Marino was a Dalmatian stonecutter— and the strong wine made from the grapes which flourish on the

THE TOWN OF SAN MARINO, CAPITAL OF THE REPUBLIC

San Marino, founded probably in the 4th century, is situated on the slopes of the mountain whose steep sides and crags constitute in great part the territory of the Republic. It has three citadels, all overlookina Rimini (Italy) and the Adriatic. The turreted building on the left is the Parliament house

country's volcanic soil. The main occupation is agriculture.

There are traces of three different circles of walls surrounding the three peaks of Monte Titano and dating from the 14th. 15th and 16th centuries. The town of San Marino is on the most northerly peak. on top of which stands a castle. The old church, first mentioned in 951. was rebuilt as a Franciscan church in the 14th century. The principal church (Pieve), in classical style, dates from 1826–38 and contains the body of St. Marinus. The museum contains among other curiosities the banner of Garibaldi's "Italic legion" which sought refuge at San Marino in 1849. The archives were rearranged and described by C Malagola. On the southern side of the town is a new suburb and to the northeast is Borgo Maggiore, the main suburb. Serravalle is the only other town in the republic.

SAN MARTIN, JOSÉ DE (1778–1850), South American soldier and statesman, whose heroic efforts together with those of Simón Bolivar (q *v.*) helped to make South American independence a reality. was born on Feb. 25, 1778, in Yapeyú, a Jesuit village at the northern frontier of Argentina. He was the son of an aristocratic Spanish family which. when he was seven. returned to Spain. His upbringing therefore was European. His biographer, Ricardo Rojas, divides San Martin's life into three periods: 1778–1817, the years of initiation; 1817–22, the years of achievement; 1822–50, the years of renunciation.

San Martin served 22 years in the Spanish army. attaining the rank of lieutenant colonel. When in 1812 he learned that a movement for the independence of his native Argentina had flared up in Buenos Aires, he offered his services to the revolutionary government. On his return to Argentina he found his homeland in chaos. No stable government had emerged, nor had the ties with Spain been severed by a formal declaration of independence. San Martín did not aspire to political power. He was a soldier first and foremost, though he expressed a preference for constitutional monarchy. His primary purpose was to defeat the Spanish forces and establish the independence of the Americas. He was convinced that the Spanish hold on America would not be broken until Peru should be liberated: "The war," he said. "will not end until me are in Lima." His plan therefore was to train a small, disciplined army in western Argentina, then go to Chile and clear out the Spaniards, establish a friendly and stable government there and finally lead his army across the sea to Peru.

Argentina proclaimed its independence in 1816, while San Martín patiently bided his time. For three years he organized and drilled his army and then. at the beginning of 1817, crossed the .Andes at two points. Los Patos and Uspallata, catching the Spanish off guard. He defeated them at Chacabuco and entered Santiago de Chile on Feb. 15, 1817. Naming his friend and collaborator Bernardo O'Higgins as political director of Chile, he braced himself for the next step. A second victory over the Spaniards at Maipú sealed the independence of Chile.

The conquest of Peru, however. was another matter. San Martin spent nearly two years in assembling a fleet for the transportation of his army. At last. in Aug. 1820, he set sail for Lima. and entering the city on July 9. 1821. he proclaimed the independence of Peru. But the Spanish forces retreated into the Peruvian highlands. and San Martin was unable to cope with them. It was natural that his mind should turn toward Bolivar, who was then moving southward in his campaign to liberate Ecuador. The two men met in Guayaquil in July 1822. The content of their conversation is one of the most debated issues in Hispano-American history. One thing is certain: no agreement was reached on a plan to liberate Peru or to design a political future for Latin America that would be pleasing to both. Disappointed. San Martín left Gunyaquil. confessing that Bolivar was "not the man we imagined him to be." In Sept. 1822 he presented his resignation to the Peruvian congress. Whether he took this action to give Bolívar a free field or because of his own blighted hopes will never be completely clear. His farewell to America was a silent one. He wrote to O'Higgins: "I am tired of being called a tyrant . . . of having the people say that I want to be king, emperor, or even the devil." His life in exile was spent first in Belgium, later in Paris and finally in Boulogne-sur-Mer. He died at Boulogne on Aug. 17, 1850.

San Martin's influence on the South American independence movement is not so great as Bolivar's. nor have his political ideas found acceptance. He favoured a centralized constitutional monarchy. which most Latin-American nations believed unsatisfactory. As soldier and human being, he reaches a place among South America's great men. For San Martin one precept was essential: "Be what you must be or you will be nothing." By this principle he lived, in action as well as in exile, tactiturn, proud, stoic. selfless. The victories of Chacabuco and Maipú are landmarks in the independence of Argentina, Chile and Peru, but even so, the final triumph over the Spanish forces was obtained only after San Martin had retired from the struggle.

(1890; Eng. trans., *The Emancipation of South America,* 1893); J. de San Martin, *Correspondencia* (1925); R. Rojas, *San Martín, Knight of the Andes* (1945); J. C. Metford, *San Martín, the Liberator* (1950). (G. S. M.)

SAN MARTÍN, a department in northeastern Peru, bounded on the north by Amazonas and Loreto, on the east by Loreto, on the south by Huánuco and on the west by La Libertad and Amazonas. Area 20.488 sq.mi. Pop. (1958 est.) 165,924. The department was created from a part of Loreto in 1906. The chief centre of settlement is around the capital. Moyobamba (pop. [1958 est.] 11.340). Most of the inhabitants are farmers. whose products include sugar cane. cacao, coca, rice, maize, coffee, tobacco. cassava and fruit. San Martin is known to contain mineral resources such as gold: salt, gypsum, lignite. lime and petroleum, but these resources are little developed. The warm: rainy climate supports dense forests in which there are sources of rubber, balata, vanilla and cabinet woods. At Moyobamba straw hats are woven and *aguardiente* or sugar brandy is distilled. (P. E. J.)

SAN MATEO, in San Mateo county, a city on the shore of San Francisco bay. 18 mi. S. of San Francisco, Calif., U.S., and a part of the San Francisco-Oakland standard metropolitan statistical area; it is served by the San Francisco International airport. Sheltered by hills from ocean wind and fog, San Mateo enjoys a mild marine climate.

A Spanish exploring party (1776) named the creek at this place after St. Matthew. Later a mission outpost was established there, and in the 1850s an American village appeared. surrounded by farms. After a railroad was built (1863). men with gold-rush fortunes bought up farms to establish their country "estates." surrounding the village and preventing its expansion but supplying much of its economic sustenance.

The village was incorporated in 1894 and by 1900 had a population of 1,832. Some estates were then being subdivided and the number of "commuters" to San Francisco was growing, a trend that continued until about 1950. Thereafter the proportion of commuters in the city's population declined because of employment opportunities presented by the increasing number of administrative offices, mercantile businesses and light industries in San Mateo.

Cultural and recreational facilities include a public library with neighbourhood branches. a two-year public junior college, two museums. a little theatre, a city park system, a county-owned beach and yacht harbour and a municipal golf course. The city has a council-manager form of government, in effect from 1923.

Pop. (1960) 69,870. (F. M. ST.)

SANMICHELI, MICHELE (1484–1559), architect of the Italian Renaissance, noted for his original treatment of military fortifications. was born in San Michele near Verona. He was a pupil of his father, Giovanni, and his uncle Bartolommeo, both architects at Verona. and went at an early age to Rome to study classical sculpture and architecture. Among his first works are the *duomo* of Montefiascone, the church of S. Domenico at Orvieto. several palaces and a fine tomb in S. Domenico. He was also employed by the *signoria* of Venice as a military architect and designed elaborate fortresses for Venice: Cyprus and Crete. One of his most graceful designs is the Cappella Pellegrini in the church of S. Bernardino at Verona. He built a number of fine palaces at Verona, including those of Canossa, Bevilacqua and Pompei, as well as the graceful Ponte Nuovo. In 1527 Sanmicheli began to

transform the fortifications of Verona according to the newer system of corner bastions which he did much to advance. His last work (1559) uas the round church of the Madonna di Campagna, 1½ mi. from Verona. He also urote a work on classical architecture. I *cinque ordini dell' architettura,* printed in 1735.

SAN MIGUEL, a department in east central El Salvador and its capital city. Pop. of department (1958) 224,888. Extending from the Pacific ocean to the Honduran border, the department has some large lowlands along the Rio Grande de San Miguel. the second river in the country, and also some of the country's highest mountains, including San Miguel volcano. 6.957 ft. Important agriculturally, the department produces significant quantities of sesame, cattle, poultry, cheese, corn, tobacco, cotton and swine.

SAN MIGUEL city (pop. [1958] 72,956) was founded in 1530 by Spanish settlers near the right bank of the Rio Grande. Near it are the ruins of an ancient Indian town. It is 80 mi. S E. of San Salvador (*q.v.*) on the Inter-American highway and the International Railways of Central America, and 29 mi. by road from La Unión (*q.v*), its port. Because of these transportation facilities it is an important commercial centre for eastern El Salvador. It possesses handsome municipal buildings, several churches. law courts, well-equipped hospitals and schools. It has cotton-textile, vegetable-oil, meat-processing, grain-milling, clothing, clay-product, leather, cordage and tobacco factories. (C. F. J)

SANNAZZARO, JACOPO (1456–1530), Italian poet whose *Arcadia* was, until the rise of the romantic movement, one of the most influential and popular aorks of Italian literature, was born at Naples on July 28, 1456 He spent his early years in San Giovanni Picentino. Returning to Naples at the age of 20, he became court poet of the kings of the house of Aragon, whom he served devotedly In 1501 when Frederic. last king of the dynasty, lost his throne, Sannazzaro accompanied him into exile in France. During this period he brought to light several lost Latin works. including Ovid's *Halieutica* and h'emesianus' *Cynegetica.* After Frederic's death in 1504 Sannazzaro returned to Naples, where he spent the rest of his life and died on April 24. 1530

Sannazzaro wrote both in Italian and in Latin. His Italian uorks include a *canzoniere* in Petrarchan style, but he is remembered chiefly for *Arcadia* (1504; critical edition. 1926), a pastoral romance, partly autobiographical, partly allegorical, consisting of eclogues linked by prose narrative. Its hero, Sincero, wishing to forget his unrequited love, decides to leave Naples and retire into Arcadia. There he shares the simple life of the shepherds, joining in their poetical contests and pagan festivals To this central part of the work. written betneen 1480 and 1485, was subsequently added a second part. more erudite and elaborate, describing how Sincero, unable to find in Arcadia the peace he desires. returns through underground caves, guided by a nymph, to Naples. The success of *Arcadia* is due not so much to Sannazzaro's use of many formal artifices as to his delicate and introspective analyses of the impulses of the human mind and to his fanciful creation of a dream world which introduced a new type of poetic sensibility. Less important were his works in Latin, including the *Eclogae piscatoriae* (1526; Eng trans., 1726; critical edition, 1914) in which he revived the classical bucolics, substituting the world of fishermen for that of shepherds, and the *De partu virginis* (1526; critical edition, 1948). a poem in hexameters in which Sannazzaro, a sincere Christian. celebrates in a classical and sometimes pagan form the birth of the Redeemer. His best achievement in Latin was, however. the *Elegiae* and *Epigrammata,* in which he expressed his upright and tender personality.

See F. Torraca, "Jacopo Sannazzaro" in *Scritti critici* (1907); *E.* Percopo, "Vita di Jacopo Sannazzaro," in *Archivio Storico per le Provincie Napoletane,* vol. 56 (1931) ; E. Carrara, in *La poesia pastorale* (1908) ; *A.* Momigliano, in *Studi* di *poesia* (1938). (G. P. G.)

SAN NICOLÁS, a town and river port of Argentina, in the province of Buenos Aires, on the west bank of the Paraná, 150 mi. N.W. of the city of Buenos Aires by rail. Pop. (1956 est.) 30,179. It is a flourishing commercial town and a port of call for both river and ocean-going steamers of medium tonnage. It is a rail station on the main line from Buenos Aires to Rosario and the north, and also the terminus of a branch line running from Pergamino. It exports uheat. flour, wool and meat. During the Perón régime San Nicolás was chosen as the site for a large thermoelectric station (which now provides electric power to Buenos Aires and the province of Santa Fe) and for the construction of a completely integrated steel plant. These have greatly increased the town's importance. It was founded in 1748 as San Nicolas de Bari y de los Arroyos. (GE. P.)

SANOCRYSIN. A proprietary gold preparation (gold and sodium thiosulfate) which is of proved value in the treatment of certain skin diseases and of doubtful value in rheumatoid arthritis and tuberculosis. Incautious use may lead to widespread toxic manifestations including skin rashes, gastrointestinal upsets and blood changes.

SAN PABLO, CITY OF, a chartered city in Laguna province. Phil., 45 mi. S.S.E. of Manila. The city was created May 7, 1940. Its 52 6 sq.mi. constitute a single municipality divided into 43 barrios (villages) and a *poblacidn* (administrative centre). Pop. (1960) 70,772, about 45% of which was in the *poblacidn.* The main line of the Manila railroad traverses the city, while four important highways radiate from the *poblacidn.* The city lies in a fertile pocket of volcanic soil and is almost surrounded by quiescent cones. Within the city are seven small crater lakes. The *poblacidn* is an important copra-processing and shipping centre as well as the trading centre for a well-populated hinterland. (R. E. HE.)

SAN PEDRO, a department of central Paraguay, drains toward the Paraguay river which forms its 100-mi.-long western boundary. Area 7,723 sq.mi. **A** well-watered lowland of savanna and forest, it is one of the principal maté (Paraguayan tea)-producing areas. Lumbering, cattle raising and a little agriculture (oranges and petitgrain) provide for the department's 80,125 population (1960). There are several small river ports and centres processing the region's products; San Pedro is the largest town and the departmental capital. There are no railways or all-weather roads.

Limestone is quarried for cement in the south and there are also iron-ore deposits. (G. J. B.)

SAN PEDRO DE MACORÍS, a province and its capital city in southeastern Dominican Republic. Area 450 sq.mi. The province occupies a wide strip of the southern coastal plain and a part of the rolling interior (to 950 ft. elevation) that slopes gently southward from the centre of the country. It is a region given over chiefly to sugar-cane cultivation. The province is the nation's leading sugar producer, accounting for one-fourth of the national output. Cattle raising is important in the drier parts. Lumbering of tropical hardwoods is also significant. The province was established in 1908. Pop. (1960) 68,953.

The capital city is situated at the mouth of the wide estuary of the Higuamo river, 38 mi. E. of Ciudad Trujillo. As the chief city of the southeastern region of the sugar industry, the most vital economic activity in the country, it serves actively as a commercial and industrial centre. The port has been developed along modern lines and handles about one-fifth of the nation's exports, including sugar, molasses, cattle and timber. Its industries include corn milling, manufacture of clothing and soap and alcohol distilling. Its international airport signifies its importance as a transport centre. Pop. (1960) 22,935. (D. R. D.)

SAN PEDRO SULA, capital of the department of Cortés Honduras. Pop. (1961) 58,126. San Pedro Sula, the second city of Honduras. is the centre of an important agricultural area, producing bananas for export, and sugar, rice, plantains, bananas, corn, sweet potatoes, yuca, cattle, swine and poultry for domestic consumption.

Located 48 mi. by railway from Puerto Cortés (the leading port of the country). 182 mi. by the Inter-Ocean highway from Tegucigalpa and with other railway and road connections, San Pedro Sula is a financial and distributing point for northern and western Honduras. It manufactures foodstuffs, clothing, hats, beer, soap, candles, cigarettes, shoes, brick and other clay products and furniture, and it has fine public buildings and some beautiful private residences. (C. F. J.)

SANQUHAR, a royal and 'small burgh of Dumfriesshire, Scot.. situated on the Nith, 58 mi. S.W. of Edinburgh by road. Pop. (1961) 2,182. Area .5 sq.mi. Sanquhar castle. on a hill overlooking the Nith, is now in ruins. It was re-erected a burgh of barony in 1484 and was created a royal burgh by James VI in 1598. The first "declaration of Sanquhar" was affixed to the market cross in 1680 by the covenanter Richard Cameron, the second in 1685 by James Renwick (*qq.v.*). The town is a summer resort and the principal coal mart in the county. Industries include coal mining (considerably developed after World War 11), iron and brick works. The Riding of the Marches (the confirmation of the town boundaries) is celebrated each year in August.

SAN RAFAEL: *see* ELÍAS PIÑA.

SAN RAFAEL, a city of California. U.S., about 15 mi. N. of San Francisco on San Pablo straits at the foot of Mt. Tamalpais; the seat of Marin county. A Franciscan mission (iater destroyed) was established there in 1817 and the town grew up around it. A replica of the original mission has been built on the site. The city was incorporated in 1874. Manufactures include oil burners, bricks, aluminum products and footwear. Dominican College of San Rafael (Roman Catholic, founded in 1850 at Monterey) for women is located there. For comparative population figures *see* table in CALIFORNIA: *Population.*

SAN REMO, a seaport of Liguria, Italy, in the province of Imperia, on the Riviera di Ponente, $9\frac{3}{4}$ mi. E. of Ventimiglia by rail, and 84 mi. S.W. of Genoa. Pop. (1957 est.) 47,609 (commune). Climbing the slope of a steep hill it looks south over a small bay, and, protected towards the north by hills rising gradually from 500 to 8,000 ft., it is in climate one of the most favoured places on the whole coast, which accounts for its reputation as a winter resort. The older town, with its narrow steep streets and lofty sombre houses protected against earthquakes by arches connecting them, contrasts with the new visitors' town, containing all the public buildings, which has grown up at the foot of the hill. The small harbour is sheltered by its sickle-shaped mole, 1,300 ft. long. Besides the Romanesque cathedral of San Siro, the white-domed church of the Madonna della Costa, at the top of the old town, may be mentioned. The emperor Frederick's residence at San Remo in 1887–88 greatly increased its repute as a winter resort. Flowers, especially roses and carnations, are extensively grown for export, and olives, lemons and palms are also cultivated.

SAN REMO, CONFERENCE OF (April 19–26, 1920). This conference was preceded by a meeting of the Supreme Allied council from Feb. 12 to 23 in London, where the main lines of the future treaty of Sèvres (*see* SÈVRES, TREATY OF) with Turkey were laid down, and the draft treaty with Hungary and the Fiume question were discussed. At San Remo itself, where Great Britain, France and Italy mere joined by those from Greece, Belgium and Japan, the Turkish treaty was the first and principal business dealt with, and the framework of the Sèvres treaty was there constructed. The mandates for Syria. Palestine and Iraq were assigned to France and Great Britain, respectively. and an Anglo-French oil agreement was negotiated which covered Rumania and the French and British nonself-governing colonies as well as the middle east. The most controversial question dealt with. as between the Allies, was that of the maximum strength of the German army—both its total and the number of troops allowed in the neutral zone skirting the area under Allied occupation. On account of the Kapp *Putsch* and other internal disorders the German government asked the conference to permit the increase of the German army to twice the strength allowed by the Versailles treaty. This request was refused and Germany charged with default in respect both of reparations and disarmament.

SAN SALVADOR, a department near the centre of El Salvador; extending from near the Pacific ocean on the south to the deep Lempa valley on the north. Pop. (1958 est.) 395,284, of which about 75% was urban. Population is concentrated in the highland portion of the department, the southern lowlands and the slopes to the Lempa valley having few people. In the western part of the department rises the massive volcano San Salvador, 6,398 ft. high. The department produces tobacco, sugar, fruits and cotton and also has considerable manufacturing. (C. F. J.)

SAN SALVADOR, the capital of the republic of El Salvador, is situated in Las Hamacas valley, a tributary of the Rio Acelhaute, at an altitude of 2,115 ft. Pop. (1958 est.) 232,659, about one-fourth of the urban population of the country. It is connected by modern highways with all principal cities of the country and with the ports of La Libertad (24 mi.), Acajutla (53 mi.) and La Unión (116 mi.), and is served by International Railways of Central America, which connect it with Guatemala and La Union, and by the older El Salvador railway to Acajutla.

San Salvador was founded in 1524 at a spot near the present site, to which it was transferred in 1528. It served as capital of the colonial province of Cuscatlán and of San Salvador province of the United Provinces of Central America, and except for the period 1854–59 it has been capital of El Salvador since 1841. It was temporarily ruined by earthquakes in 1854 and 1873.

San Salvador has sturdy government buildings, a modest cathedral, a handsome national university, an academy of science and literature. several theatres, a national astronomical observatory, a national library, several modern hospitals and charitable institutions, a country club, excellent botanical gardens, several beautiful parks and plazas and a modern water system. Among its several rapidly growing residential suburbs are Mejicanos and Villa Delgado in the hills to the northeast and Soyapango to the east. Six miles to the east is beautiful Lake Ilopango, the largest lake in country. in an ancient volcanic crater. With shores dotted with private homes, resort hotels and older fishing villages, the lake is San Salvador's playground.

San Salvador is the leading financial, commercial and industrial centre of the country. It manufactures cotton and silk textiles, clothing, hosiery, hats, foodstuffs, leather goods, wood products, liquors, clay products, cement, soap, matches, cordage, cigarettes and cigars. (C. F. J.)

SANS-CULOTTES, the term originally given during the early years of the French Revolution to the ill-clad and ill-equipped volunteers of the Revoluntionary army, and later applied generally to the ultrademocrats of the Revolution. They were for the most part men of the poorer classes. or leaders of the populace. but during the Terror public functionaries and persons of good education styled themselves *citoyens sans-culottes* ("citizens without knee-breeches"). The distinctive costume of the typical sans-culotte was the *pantnlon* (long trousers)—in place of the *culottes* worn by the upper classes—the *carmagnole* (short-skirted coat), the red cap of liberty and *sabots* (wooden shoes). The influence of the sans-culottes ceased with the reaction that followed the fall of Robespierre (July 1794), and the name itself was proscribed. In the Republican calendar the complementary days at the end of the year were at first called *Sans-culottides;* this name was, however, suppressed by the Convention when the constitution of the year III (1795) was adopted, that of *jours complémentaires* being substituted.

SAN SEBASTIAN (Basque IRUCHULO; officially GUIPÚZCOA), a seaport and capital of the Spanish province of Guipúzcoa, on the Bay of Biscay. Pop. (1960 est. mun.) 123,935. The city became the summer residence of the court in 1886. It occupies a narrow sandy peninsula. which terminates on the northern or seaward side in a lofty mass of sandstone. Monte Urgull. The old town, rebuilt after the fire of 1813, lies partly at the foot of Monte Urgull. partly on its lower slopes. Until 1863 it was enclosed by walls and a strong fort, the Castillo de la Mola, still. crowns the heights of Urgull. There are saw and flour mills, and manufactures of preserves, soap, candles. glass and paper, especially in the suburb on the right bank of the Urumea. The fisheries are important.

SAN SEVERINO (anc. SEPTEMPEDA), a town and episcopal see of Marche, Italy, in the province of Macerata. Pop. (1957 est.) 15.358 (commune). The lower town contains the new cathedral of S. Agostina, with a fine altarpiece by Pinturicchio (1489). S. Lorenzo in Doliolo and S. Domenico are both Romanesque churches. The Palazzo Coinunale has pictures by artists of the Marches. The old cathedral of S. Severino is in the upper town.

The ancient Septempeda lay 1 mi. below the modern town, on

the branch road which ran from Nuceria Camellaria, on the Via Flaminia.

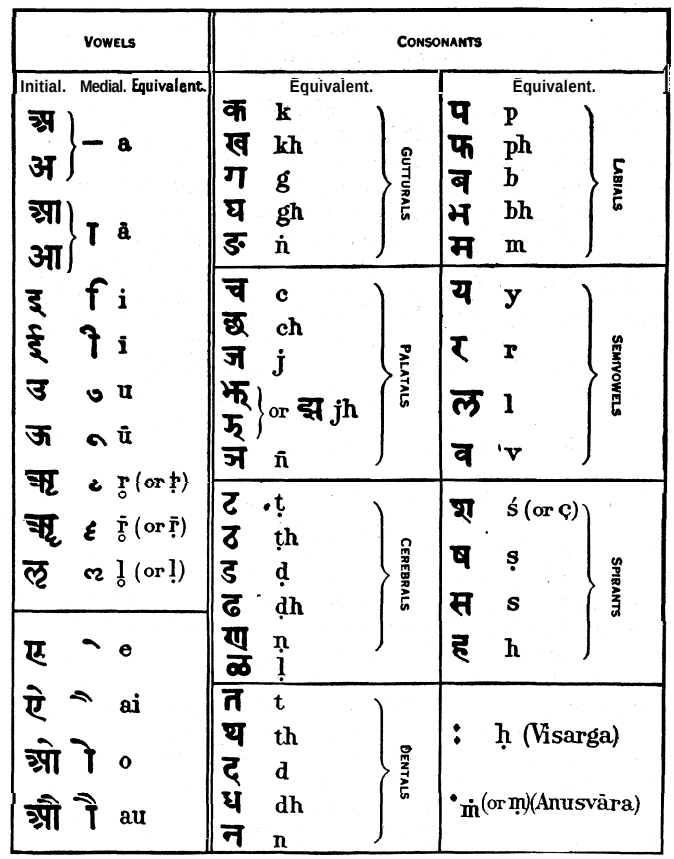
SAN SEVERO, a city in Apulia, It., in the province of Foggia, from which it is 17 mi. N.N.W. by rail. Pop. (1951) 47,875. It lies at the foot of the spurs of Monte Gargano, 292 ft. above sea level. It is the see of a bishop (since 1580), and has some remains of its old fortifications. San Severo dates from the middle ages. It was laid in ruins by Frederick II. In 1799 the town was almost entirely destroyed by the French. In 1627, 1828 and 1851 the town suffered from earthquakes. It is surrounded by fertile vineyards and oliveyards.

SANSEVIERIA, a genus of herbaceous perennials of the lily family, commonly known as bowstring-hemp or snake-plant. The genus is important in the production of a strong fibre. Sansevierias are commonly grown as porch and house plants in the north and out-of-doors in the south, requiring little direct sun and doing best in a rather heavy soil. Propagation is by division or by leaf cuttings about 3 in. long set in sand. The plant is frequently called old-woman's tongue or mother-in-law's tongue.

(J. M. BL.)

SANSKRIT LANGUAGE AND LITERATURE. The most important branch of the Indo-European family of languages in Asia is Aryan or Indo-Iranian, with two main divisions: Iranian and Indo-Aryan. Languages belonging to the latter are spoken to-day by 250 million people in India, where they are the dominant languages except in the south, in Ceylon and the Maldive Islands, and throughout western Asia and Europe by colonies of Gypsies (see ROMANY LANGUAGE). As languages of administration they spread at one time far into central Asia, where now is Chinese Turkestan; and as vehicles of Buddhism they have influenced through translation the whole of central and eastern Asia; Hindu civilization carried their vocabulary into the East Indies and the Malay peninsula. The oldest documents of Indo-Aryan are composed in Sanskrit. These are the Vedic texts. Their exact date is unknown, but it is probable that the oldest of them belong to the latter half of the second millennium B.C. They were probably composed before the Aryans had learned the use of writing; but being religious texts uhich it was essential to preserve unchanged they were handed down by an oral tradition which by various controls was made exceedingly exact. Even at the time of entry into India there must have been some dialectical differences in the language as spoken by the various invading tribes; with their further extension into India itself these differences became accentuated. The language of the Vedic texts shows a certain mixture, but is in the main founded upon the dialect of the north-west of India. With the advance of Aryan culture into the Punjab and the Gangetic plain the eastern dialects gained in importance; and this eastern influence, discernible in the earliest texts, constantly gains ground.

The most archaic of these texts is the Rig-veda, a collection of liturgical hymns; this is followed by the Atharva-veda, consisting chiefly of magical formulas, of prayers, curses and incantations. Considerably later come the first compositions in prose, commentaries on the Veda and philosophical treatises termed Brāhmaṇas and Upanishads. Although originally preserved as a religious language, Sanskrit was finally used for secular purposes. The earliest inscription in Sanskrit dates from 150 A.D., but it became the regular language of official inscriptions only in the 4th century A.D. But long before that the grammarians (of whom the most celebrated was Pāṇini in the 4th century B.C.) had fixed it as a learned language to which alone a strict interpretation confines the name Sanskrit, "the perfected." but which may conveniently be termed Classical Sanskrit as opposed to the Vedic or older form. As a literary language it is still cultivated; and a vast literature—philosophical, narrative, lyrical, dramatic, technical—has been written in it. Standing, in form at least, between the later Vedic and the Classical, but more nearly approaching the latter, is the language of the two great epics, the Mahābhārata and the Rāmāyaṇa, in which the influence of the spoken language can clearly be seen. For in the meantime the spoken dialects continued to develop. Some of these, such as Pali and the Prakrits (*qq.v.*), were in turn crystallized and used as religious languages by new sects as well as for secular purposes before Sanskrit was so employed. From these vernaculars are eventually derived the modern Indo-Aryan languages (*q.v.*). Sanskrit, the literary language, although preserving the sound-system of Vedic practically unchanged, did not escape the influence of its descendants. The grammar was considerably changed, chiefly in a simplifying and normalizing direction; meanings of words were altered and developed, and vast quantities of new words were gradually absorbed after being given a Sanskrit form. On the other hand



FROM MACDONELL, "SANSKRIT GRAMMAR FOR STUDENTS" (CLARENDON PRESS)

Sanskrit has continued to influence the spoken languages.

Sounds.—The sound-system of Sanskrit consisted of: (a) Fourteen vowels, viz.: Twelve simple vowels: a, *ā,* i, i, *u, ū, r̥, r̥̄, l̥,* (*l̥̄*), *ē, ō.* Two diphthongs: ai, au.

(b) Thirty-six consonants, viz.: Five series of stops and nasals: guttural: k, kh, g, gh, *ṅ;* palatal: c, ch, *j,* jh, *ñ;* cerebral: *ṭ,* th, d, dh, *ṇ;* dental: t, th, d, dh, *n;* labial: *p,* ph, b, bh, m. Four semi-vowels: y, r, l, v. Three sibilants: palatal *ś,* cerebral *ṣ,* dental s. Two aspirates: voiced h, unvoiced h (visarga). A nasal with loose closure of the lips *ṁ* (*anusvāra*), and another nasal *m̃* (*anunāsika*) which probably was a simple nasalization of the vowel rather than a consonant proper.

Vowels.—The vowel-system was inherited practically unchanged from the common Indo-Iranian period, the only specific Sanskrit development being the change of the Indo-Iranian short diphthongs **ai, *au* (=Avestic *aē,* ao) to *ē,* 6 (still classed as diphthongs by Indian grammarians) and of the long diphthongs **āi, *āu* to ai, au. Thus to Avestic dudvo haomo *uxδāiš gāuš* Sanskrit corresponds with *dēvāḥ sōmāḥ ukthāiḥ gáuḥ.* The comparative simplicity of the vowel-system and the great predominance of the vowels a and *ā* were due to the fact that in the Indo-Iranian period four distinct Indo-European sounds—e, o, a, *r̥* (*ṅ, ṇ, m*)—had coalesced in the one sound a (similarly *ē, ō, ā* had all become *ā*). The only trace left of the earlier differentiation was the fact that an original guttural before *ā* representing older *ē* had became a palatal: thus we have sdcatd, "follows," from **sekʷetai* (Greek *hépetai,* Latin sequitur), but *sákṣat,* "he shall follow" beside Gk. *hépsetai.* Similarly the 12 I.E. diphthongs—ei, oi, *ai,* eu,

ou, au, *ēi, ōi, āi, ēu, ōu, āu*—were merged in four Skt. sounds 6, *ō, ai*, au. In this way the vowel alternation (especially between e and o), a characteristic feature of Indo-European, was largely lost. Nevertheless, where the word contained a sonant the alternation, although diminished in scope, was still discernible: *e.g.*, I.E. ei: oi: *i* became Skt. 6: *i* (*e.g.*, Gk. leipei: *loipós: élipe* = Skt. *rēcati: rēkaḥ:* aricat), I.E. e, *o:* 6, *ō* became Skt. a: 6. The correspondences thus resulting—a: 6; *i: ē:* ai; u: 6: au; *ṛ:* ar: *ār*—being associated with particular grammatical formations were still further developed in Sanskrit into a system, which, early recognized by the Indian grammarians, was used by them in their description of the formation of the language.

Consonants.—The consonant-system has remained much truer to the original Indo-European. It is characterized by the rarity of spirants and by the opposition of unaspirated and aspirated stops (both surd and voiced) in each series. In preserving the voiced aspirate stops unchanged, Sanskrit and its descendants (for most of the modern Indo-Aryan languages still possess these sounds) are unique among the Indo-European languages, in which these sounds either became surd aspirates and later spirants (as in Greek and Latin) or lost their aspiration (as in Iranian, Balto-Slavonic, Armenian, Albanian, Germanic, Celtic). Thus to Greek *phérō*, Latin fero, Eng. bear, Sanskrit corresponds with *bhárāmi*, to Gk. *éthēke*, Lat. *fēcit*, Eng. deed with *ádhāt*.

Some consonants were restricted in their use: *ñ* appeared only before or after palatals, *ṁ* only finally or before gutturals (and where a guttural had subsequently disappeared), *ṇ* only between vowels and semivowels or before cerebral stops, h only finally or before sibilants and surd gutturals or labials, *ṁ* only finally or before consonants. Neither aspirate nor h nor *ś* ended a word. At the end of a sentence only the following consonants were used: *k, ṭ, t, p, ṅ, n, m, ḥ*.

Of the palatals *ch* appears as a single consonant only initially: elsewhere it is always doubled unless preceded by another consonant, for it corresponds to the Indo-European group sk_1: *e.g.*, chindinti "they cut" = Latin *scindunt*, *gácchāmi* "I go" = Greek *báskō*, *vāñchā* "wish" = Germ. *Wunsch*. *j* represents two I.E. sounds (1) palatal g_1 (= Gk. g, Avestic *z*): *jánaḥ* "birth" = Av, *zanō*, Gk. *génos*, Lat. genus; (2) velar g^w before an original *ĕ* or *ĭ* (= Av. j): *jīváḥ* "alive" = Av. *jīvō*, Lat. *vīvos*, cf. Gk. *bíos*, Eng. quick, jh does not belong to the Indo-European part of the vocabulary, but appears only in onomatopoeic and borrowed words, or in words taken from the vernacular in which the frequent Sanskrit groups dhy and hy became *(j)jh*.

Of the sibilants *ś* corresponds to I.E. palatal k_1: in this Sanskrit agrees with the other eastern I.E. languages (Balto-Slavonic, Albanian, Armenian, Iranian) which have an *s* or sh sound as opposed to the k (h in Germanic) of the western languages: *e.g.*, *śatám* "100" = Av. *satem*, Lithuanian *šimtas*, but Gk. *he-katón*, Lat. centum, Eng. hundred. Before the surd dentals this *ś* became *s: viśáti* "enters," *viṣṭáḥ* "entered." But *ṣ* also corresponds to I.E. *s* when preceded by *i, u, r* or k, agreeing in this with Iranian and partly with Armenian and Balto-Slavonic. The chief innovation in the consonant-system is the introduction of the third series, the cerebrals or linguals (better termed retroflex). The dentals were formed by the tip of the tongue striking the roots of the teeth, the cerebrals by the tip of the tongue, bent backwards, striking further back on the palate. In the oldest Sanskrit they are derived from the dentals when immediately preceded by *ṣ* or **ẓ* (which subsequently disappeared): thus **diśtas* (= Lat. dictus) became **diṣtas* and then *diṣṭáḥ; *miẓdham* (= Gk. *misthds*) became **miẓḍham* and then *mīḍhám*. Later also under the influence of a preceding *r* or *ṛ* dentals became cerebrals: such words are loans from the popular dialect, but they begin to appear in the literary language even as early as the Rigveda: thus *víkaṭaḥ* "monstrous" is derived from *víkṛtaḥ* "strange." Some words, however, contain cerebrals which cannot be explained as derived from dentals in either of these ways. It is probable that these sounds were characteristic of both the families of languages, Muṇḍā and Dravidian, which the Aryan speakers of Sanskrit found in possession of India; and the appearance of them in Sanskrit and its descendants (and in a few of the adjoining Iranian languages such as Baluchi and Pashto) can scarcely be unconnected with this fact.

The Indian grammarians emphasized the difference in the pronunciation of consonants according as they came at the beginning, in the middle or at the end of a word or before other consonants. These differences, though slight, have ended in transforming the whole Sanskrit consonant-system in its descendants, the modern Indo-Aryan languages. Final consonants were pronounced without being fully exploded: in the spoken languages these final consonants had disappeared before the middle of the 3rd century B.C. A similar pronunciation is assigned to consonants before stops: in the spoken languages these were early assimilated (*e.g.*, *suptáḥ* became *suttō*). y and v were pronounced more strongly initially than intervocalically: in the modern languages initial y– has remained or become j, but intervocalic *–y–* has been lost. [This contrast is observable even in the dialect of the Rigveda. For in the phonetically weak position of the termination and in certain accessory words intervocalic *–dh–* has lost its occlusion and become *–h–: ihí* "go" = Greek *íthi*, *śēmahē* "we lie" = Gk. keimetha. Further in all words intervocalic *–d–* has become *–ḷ–*, although other more easterly dialects still preserve it (through whose influence it was afterwards re-established in Classical Sanskrit): thus Classical nidah "nest" (from **niẓda-*) is *nīḷáḥ* in Vedic.]

Accent.—Our knowledge of the accent of Sanskrit words is derived from its marking in the more important Vedic texts and from the statements of grammarians. It was predominantly a musical or tonic, not a stress, accent. Three different types are generally distinguished, the udatta '(raised," *anudātta* "unraised" and *svarita* the rising-falling accent following the udatta. Generally the position of the *udātta* agrees, as far as can be ascertained by comparison, with that of the chief word accent of Indo-European. The rhythm of Sanskrit was purely quantitative; in verse metre depended only on the number and the length of the syllables composing a line, and was entirely independent of accent. In this respect, the Yashts of Avestan literature are similar.

GRAMMAR

Nouns.—Sanskrit makes a perfect distinction between nouns (including adjectives, pronouns and indeclinables) and verbs. The declension of nouns comprises three numbers—singular, dual and plural; and eight cases, viz., nominative, accusative, instrumental, dative, ablative, genitive, locative, vocative. In the majority of declensions ablative and genitive are not distinguished in the singular, nor dative and ablative in the plural, while the dual universally has only three separate forms,—(1) nom.–acc.–voc., (2) inst.–dat.–abl., (3) gen.–loc. These confusions were inherited from Indo-European, but the tendency to confuse still further the forms and functions of the cases continued within Sanskrit itself, the genitive especially enlarging its sphere at the expense of other cases. This process, continued in the spoken languages down to the present day, has resulted in a noun declension, which for the most part consists of two cases only—(I) a direct case founded on the Sanskrit nominative and accusative; (2) an oblique case founded on the Sanskrit genitive or, perhaps, in some forms, the dative. Among the numbers the dual by itself was reserved to express natural pairs (such as *akṣī* "the eyes," *karṇáu* "the ears"), or any two objects or persons already referred to or present in the mind of the speaker or hearer; otherwise the use of the word for "two" itself was required.

Although the idea of case was in the main expressed by the termination (as, *e.g.*, the nominative by *–s* in *dēvás* = Latin deus, the accusative by *–m* in *dēvám* = deum), it was sometimes accompanied by change in the pre-terminational element, and was connected with a shift of accent:

	Skt.	Greek	Skt.	Greek	Skt.	Greek

voc.			*dyàuḥ*	*Zeũ*	*pítar*	*páter*

There was, however, one important class of stems, namely masc.

and neut. in –a and fem. in –*ā* (corresponding to the –*o* and –*ā* stems of Greek and Latin), in which the accent was fixed either on the stem or on the termination throughout the paradigm without any change in the form of the stem, of the type *áśvaḥ* = Gk. hippos, Lat. equos. There had, moreover, been a tendency in the pre-Sanskrit period to fix the form even of the variable stems, especially those consisting only of a root: thus the long vowel was generalized in *vāc–* "voice" (nom. vdk):

	Skt.	Latin	Avestic	Greek
acc.	*vå̊cam*	*vōcem*	*vācim*	
gen.	*vācáḥ*	*vōcis*	vacd	*opós*

But in the process of normalization the vowel declension (and especially with the stems in –a –*ā*) was predominant, and even in Sanskrit itself there was a considerable transference of consonant-stems and root-stems to this declension: *e.g.*, *pā̊da-* "foot," *dvā̊ra–* "door," ddnta– "tooth" replaced *pād–* pad–, *dant–* dat–, *dvār–* dur–. This proceeded apace in the spoken tongue, for the declension of the modern languages rests exclusively on vowel-stems and of these chiefly on the –a –*ā* stems.

As in Indo-European, the pronominal declension differed from the nominal, that of the personal pronouns radically, that of the demonstratives and others to a varying degree. In the personal pronoun each number had a different root (*t[u]vám* "thou," *yūyám* "you"), while that of the first person had different roots also for the nominative and the oblique cases (*ahám* "I," *mám* "me," vaydm "we," *asmān* "us"). The tendency of the two declensions, the nominal and the pronominal, to influence each other is observable: *e.g.*, the nominal ending of the neuter sing. nom. and acc. –*m* as in kim "what?" (=Lat. *quid*) replaced the –*d* or –*t* still found in other pronouns (tdt "that" = Lat. is-tud). In the spoken language this mutual influence continued to react until practically all distinction between the two types of declension was lost. Perhaps the most satisfactory explanation of the various elements that stand between Indo-European demonstrative pronouns and their case endings is to be found in Hittite where the original pronominal stems were appended to the sentence connective (Skt. "tasmin" = Hit. "ta [sentence connective] + smi [pronoun]"; Sk. "tas" = Hit. "ta + as"), etc.

Numerals. — The numeral-system, built upon a decimal basis, is that of Indo-European. There are separate names for the numbers up to 10; from 11 to 19 compounds of the units with the word for 10 partly correspond with those of Greek and Latin: *e.g.*, *d*(u)*vádaśa* "12" = Gk. *dṑdeka*, Lat. *duōdecim*. Above that the tens (20, 30, etc.) were in origin probably compounds expressing a number of tens, and the intermediate numbers were formed by compounds of the units nith these: *e.g.*, *páñca* "5" (Gk. *pénte*, Lat. *quīnque*), *pañcāśát* "50" (cf. Gk. pentdkonta, Lat. quinquiiginta), *páñcapañcāśat* "55." There are separate words for 100 and 1000. The special word for 100.000 (*lakṣaḥ*, whence modern *lākh*) is post-vedic. The numerals from 1 to 19 are adjectives; the rest are substantives.

Gender. — Traces of the distinction of gender between animate (=masculine and feminine) and inanimate (=neuter) are seen in the use of the neut. *udakám* "water as a medium of floating, etc.," and the fem. *å̊paḥ* "water as personified as sentient beings." But for the most part in Sanskrit gender is grammatical and largely independent of nature, except that male and female living beings are usually (though not always) respectively masculine or feminine. There were three genders — masculine, feminine and neuter. The neuter was distinguished by its termination (or lack of termination) in the nominative and accusative, and by the fact that the form of the accusative was the same as that of the nominative. But the masculine and feminine substantives were primarily distinguished only by the form of an adjective, if there were one, in agreement with them (as often, *e.g.*, in French or German). But there was a tendency to reserve certain types of stem for one or other gender. Thus the –a stems in Sanskrit are reserved only for masculine and neuter nouns (although in Greek they may still be feminine, *e.g.*, *hē hippos* "the mare"); and the –6 stems are mostly feminine. In the older language the –*i* stems might be masculine or feminine; in the later language they are almost all feminine. Similarly even in Classical Sanskrit –*i* stems are either masculine or feminine; but in the spoken language there was a growing tendency to confine them to feminine: thus words of this declension which are masculine in Sanskrit become feminines in the modern languages: agnih m. "fire" (=Lat. *ignis*) becomes Hindi *āg* f.

Verbs.—In the Vedic language the verbal system is of considerable complexity. A verb might have various stems, viz. present (sometimes more than one), aorist (three in number, root, *e.g.*, *ásthām* = Gk. *éstēn*, strong, *e.g.*, *aricam* = Gk. *élipon*, sigmatic, *e.g.*, *araikṣam* = Gk. *éleipsa*); perfect (characterized by reduplication and peculiar terminations); future (rare in the old language). The significance of the stems lay in the mode of action they expressed. Very generally speaking, the present indicated continuous action, the aorist momentary action, the perfect a state resulting from past action. The various present stems indicated various types of present-stem action, such as intensive, repetitive, inchoative, causative, desiderative, etc. Each of the first three stems had five moods — indicative expressing fact, injunctive and subjunctive expressing will and futurity, optative expressing wish, imperative expressing command. In the indicative of the present, perfect and future stems there were two tenses, present and past; the aorist stem was in the indicative confined to the past tense. Each tense had three persons and three numbers — singular, dual and plural. Finally each tense could be conjugated in tno voices with different terminations — active and middle. Among the parts of the infinite verb there was connected with each stem a participle which could be either active or middle, present, past, or perfect, and independent of tense stems a past participle, one or more infinitives (for the most part case-forms of verbal nouns), a gerundive (=future passive participle) and an indeclinable participle or gerund. The total number of possible forms belonging to any one verb is thus very great.

The idea of time was expressed in the indicative primarily by the termination: the primary endings expressing present and future time, the secondary endings past (and also, to some extent, future) time. Past time was usually still further defined by the prefixing of a particle, a or *ā*, before the verb (corresponding to the Greek and Armenian augment), *e.g.*, *dádhāmi* "I place," *ádadhām* "I placed" = Gk. *títhēmi*, *étithēn*. The active voice indicated that the action performed had reference to some person or thing other than the doer, the middle that the action had reference to the doer in some way or other: *e.g.*, active *taṇḍulā̊n nēnēkti* "he mashes the rice" (French *il* lave), middle *pā̊ṇī nēniktē* "he washes his hands" (it se lave les mains). As in Greek, the middle could also be used to express passive sense, but this use was later confined to the perfect and especially the aorist stems, while a special present stem (characterized by the suffix –*yá–* with middle terminations) was used for the present passive: *e.g.*, *labhatē* "he takes," *labhyatē* "is taken." The expression of person was inherent in the verbal form, and pronouns nere used only when emphasis was desired. As with the nouns, there were two types of stems — the athematic with variable accent and variable stem form to which the terminations were directly attached (type *ás-ti* "he is" = Gk. estz, Lat. est), the thematic with invariable accent and stem betueen nhich and the termination the vowel a was inserted (type *váh-a-ti* = Lat. veh-i-t). There was a growing tendency for verbs to be brought into this class from the other, since its conjugation was the more normal; thus yundk-ti (3rd plur. *yuñj-ánti*) "joins," contrasted with the already thematic Lat. *jung-i-t*, became later *yuñj-a-ti* (3rd plur. *yuñj-a-nti*). This type almost alone survives in the modern languages.

This verbal system was greatly simplified in Classical Sanskrit. The injunctive mood almost, and the subjunctive entirely. disappeared or were incorporated in the imperative. The aorist and perfect stems remained only in the indicative, and the aorist participle disappeared. The infinitive uas reduced to one form only (the accusative of a noun in –*tu–*, corresponding in form to the Latin supine, *e.g.*, *jñātum* "to know" = [*g*]*nōtum*), and the absolutive to two, one for simple, one for compound verbs. This left the present stem predominant; and though the aorist and the perfect survived in the indicative, their meaning was scarcely,

if at all, to be distinguished from that of the past tense of the present stem (*i.e.,* the imperfrct). Finally even in Sanskrit itself the imperfect tended to be replaced by the past participle used as a finite verb. Among the spoken languages in some areas the aorist seems to have been developed further as a past tense, but as a whole the verb of the modern languages possesses a present system based on the Sanskrit present stem and a past system based on the Sanskrit past participle.

Syntax. — In its main lines the syntax of Sanskrit is Indo-European, and the primary uses of its cases, moods and tenses can be paralleled from other Indo-European languages. Its most peculiar development was in the region of composition. Compounds, usually of not more than two members, are common in the Vedic texts. Even in the Epic their extension is considerable, and compounds consisting of three or four separate members are not rare. In the later, more artificial, language compounds may be met with nhich extend over a page or more.

Vocabulary. — Sanskrit shows a constant change and development of vocabulary. Part of this is in the natural evolution of already existing material. The main constituent of the vocabulary of Vedic Sanskrit is Indo-European, but even here there are some words which are not Indo-European. One source of such words is undoubtedly the languages which the Aryans found in India; and recently J. Przyluski has demonstrated that some (such as *bānáh* "arrow," *mayūraḥ* "peacock," *karpāsam* "cotton") were received from *Muṇḍā* or Austro-Asiatic languages. Another source for nea words was found in the spoken Aryan languages: words taken from these were given a Sanskrit form. In this way even original Sanskrit nords returned under a new form: we have already seen how zikrita–, having in the spoken language become *vikaṭa–*, was readopted in that form in the literary tongue, and retained side by side uith *vikrita–*.

LITERATURE

The history of Sanskrit literature like the political history of ancient India suffers from the total nant of anything like a fixed chronology. In its vast range there is scarcely a work of importance the date of which can be fixed with absolute certainty. The original composition of most Sanskrit uorks can indeed be confidently assigned to certain general periods but as to many of them, there is reason to doubt whether they have come down to us in their original shape.

The history of Sanskrit literature readily divides itself into two main periods — the Vedic and the classiczl. These periods partly overlap, and some of the later Vedic norks are included in that period on account of their subject matter, and archaic style, rather than for any claim to a higher antiquity than some of the oldest works of classical Sanskrit. The first period may be put at 1500–200 B.C. and the second 500 B.C.–A.D. 1000.

THE VEDIC PERIOD

Samhitâs.—The term veda, *i.e.* (sacred) "knowledge," "lore"—embraces a body of writings the origin of which is ascribed to divine revelation (*śruti,* literally '(hearing"), and which forms the foundation of the Brāhmanical system of religious belief. This sacred canon is divided into three or (according to a later scheme) four co-ordinate collections, likewise called Veda: (1) the *Rig-veda,* or lore oi praise (or hymns); (2) the *Sāma-veda,* or lore of tunes (or-chants); (3) the *Yajur-veda,* or lore of prayer (or sacrificial formulas); and (4) the *Atharva-veda,* or lore of the Atharvans. Each of these four Vedas is a collection (*saṃhitā*) of sacred, mostly poetical, texts of a devotional nature, called *mantra.* This entire body of texts (and particularly the first three collections) is also known as the tvayi *vidyā,* or threefold wisdom, of hymn (*rich*), tune or chant (*sāman*), and prayer (*yajus*)—the fourth Veda, when included, being classed together with the Rik.

Classes **of** Priests. — The Brahmanical religion finds its practical expression chiefly in sacrificial performances: The Vedic sacrifice requires for its proper performance the attendance of four officiating priests, each of whom is assisted by one or more (usually three) subordinate priests, viz.: (1) the Hotar (or *hotri,* i e , either "sacrificer," or "invoker"), whose chief business is to invoke the gods, in prayers or hymns; (2) the Udgdtar (udgātri), or chorister, who has to perform chants (stotra) in connection with the hotar's invocations; (3) the Adhvaryu, or offeringpriest par excellence, who performs all the material duties of the sacrifice, such as the kindling of the fires; (4) the Brahman, or chief "priest," uho superintends the performance and rectifies any mistakes that may be committed. The Sāmaveda and Yajurveda form special song and prayer books, arranged for the practical use of the udgātar and adhvaryu respectively; the Rik-saṃhitā, though not arranged for any such practical purpose. contains the entire body of sacred lyrics whence the hotar draws the material for his recitations. The brahman had no special textbook, but was expected to be familiar with all the Saṃhitās as well as with the practical details of the sacrificial performance. (*See* BRAHMA AYD BRAHMAN.)

Brāhmaṇas.—The several Saṃhitās have attached to them certain theological prose works, called *Brāhmaṇa,* which also form part of the canon. Their object is to explain the relationship of the Vedic texts to the now very elaborate sacrificial ceremonial and to explain their mystic import. (See BRAHMANAS.)

Āraṇyakas and Upanishads. — Closely connected with the Brāhmaṇas are two classes of treatises called Aranyaka and *Upanishad.* The Aranyakas, *i.e.,* works "relating to the forest," intended to be read or expounded by anchorites in the quiet of the forest, resemble the Brāhmaṇas, which they supplement by dealing with special points of ritual. The Upanishads are of a more mystical nature, and form the first attempts at a systematic treatment of metaphysical questions. From their pantheistic views later developed the Vedānta philosophy. The Upanishads have to be assigned to verv different periods of Sanskrit literature. The oldest treatises of this kind are doubtless those which form part of the Saṃhitās, Brāhmaṇas and Āraṇyakas of the three older Vedas.

Different Recensions. — As the sacred texts were not committed to writing till a much later period, but were handed down orally in the Brāhmaṇical schools, it was inevitable that local differences of reading should spring up, which in course of time gave rise to a number of independent versions. Such different text-recensions, called *śākhā* (*i.e.,* branch), were at one time very numerous, but only a limited number have survived. As regards the Samhitas, the poetical form of the hymns, as well as the concise style of the sacrificial formulas, rendered these texts less liable to change.

Vedāṅgas.—Besides the purely ceremonial matter, the Brāhmaṇas also contained a considerable amount of matter bearing on the correct interpretation of the Vedic texts; and, indeed, the sacred obligation incumbent on the Brāhmans of handing down correctly the letter and sense of those texts necessarily involved a good deal of serious grammatical and etymological study in the Brāhmaṇical schools. These literary pursuits resulted in the accumulation of much learned material, which it became desirable to throw into a systematic form. These practical requirements were met by a class of treatises, grouped under six different heads or subjects, called *Vedāṅgas, i.e.,* members, or limbs, of the (body of the) Veda. In their present form these works represent a rather advanced stage of scientific development. Though a few of them are composed in metrical form — the majority belong to a class of writings called *sūtra, i.e.,* "string," consisting of strings of rules in the shape of tersely expressed aphorisms, intended to be committed to memory.

Sūtras.—The Siitras form a connecting link between the Vedic and the classical periods of literature. These treatises are included among the Vedic writings, and in point of language may be considered as the latest products of the Vedic age, but they are no longer *śruti* or revelation. They are of human, not of divine, origin. The Siitras are regarded nevertheless as works of great authority, second only to that of the revealed Scriptures;

in contrast to the latter they are called smriti, or tradition.

The six branches of Vedic science, included under the term Vediinga, are as follows:—

1. *Śikshā,* or Phonetics.—In addition to a small treatise ascribed to the great grammarian Pāṇini, the *Pāṇinīyā śikshā,* there are usually included under this head certain works, called *Prātiśākhya, i.e.,* "belonging to a certain *śākhā* or recension," which deal minutely with the phonetic peculiarities of the several Samhitiis, and are of great importance for Vedic textual criticism.

2. Chhandas, or Metre.—Tradition makes the *Chhandaḥ-sūtra* of Piṅgala the starting-point of prosody. The Vedic metres, however, occupy but a small part of this treatise; they are particularly dealt with in the Nidāna-sūtra of the Siimaveda, and in a chapter of the Rik-prātiśakhya. For later profane prosody, on the other hand, Pingala's treatise is valuable.

3. *Vyākaraṇa,* or Grammar.—Pāṇini's famous grammar is said to be the Vedāṅga; but it marks the culminating point of grammatical research rather than the beginning, and treats chiefly of the post-Vedic language.

4. Nirukta, or Etymology.—Yāska's Nirukta deals entirely with Vedic etymology and exegesis. It consists, in the first place, of strings of words in three chapters: (1) synonymous words; (2) such as are purely or chiefly Vedic; and (3) names of deities. These lists are followed by Yāska's commentary, interspersed with numerous illustrations. Yāska quotes the works of several predecessors but his is by several centuries the oldest surviving work of its kind. The above four studies deal with the correct understanding of texts, the next two with rites and their proper seasons.

5. Jyotisha, or Astronomy.—The metrical treatise which has come down to us in two different recensions under the title of Jyotisha, ascribed to one Lagadha, or Lagata, seems to be the oldest existing systematic treatise on astronomical subjects.

6. *Kalpa,* or Ceremonial.—Sacrificial practice gave rise to a large number of systematic sfitra-manuals for the several classes of priests. The most important of these works have come down to us, and they occupy by far the most prominent place among the literary productions of the sfitra-period. The Kalpa-sfitras, or rules of ceremonial, are of two kinds: (1) the *Śrauta-sūtras,* which are based on the Sruti, and teach the performance of the great sacrifices, requiring three sacrificial fires; and (2) the *Smārta-sūtras,* or rules based on the smṛiti or tradition. The latter class again includes two kinds of treatises: (1) the *Grihya-sūtras,* or domestic rules, treating of ordinary family rites, such as marriage, birth, name-giving, etc., connected with simple offerings in the domestic fire; and (2) the *Sāmayāchārika-* (or *Dharma-*) *sūtras,* which treat of customs and temporal duties, and are supposed to have formed the chief sources of the later law-books.

THE FOUR VEDAS

After this brief characterization of the various branches of Vedic literature, we proceed to take a rapid survey of the several Vedic collections.

Rigveda.—The *Rigveda-saṃhitā* has come down to us in the recension of the Śākala school, which shows that it consists of 1,028 hymns, including eleven so-called *Vālakhilyas,* probably of later date. The hymns are composed in a great variety of metres, and consist, on an average, of rather more than 10 verses each, or about 10,600 verses altogether. This body of sacred lyrics has been subdivided by ancient authorities in a twofold way, viz. either from a purely artificial point of view, into eight *ashṭakas* of about equal length, or, on a more natural principle, based on the origin of the hymns, and invariably adopted by European scholars, into ten books, or mandalas, of unequal length. Tradition has handed down the names of the reputed authors, or rather inspired "seers" (*rishi*), of most hymns. These indications have enabled scholars to form some idea as to the probable way in which the Rik-samhitii originated, though much still remains to be cleared up by future research.

Mandalas ii.–vii. are evidently arranged on a uniform plan. Each of them is ascribed to a different family of rishis, whence they are usually called the six "family-books": ii., the Gritsamadas; iii., the Viśvāmitras or Kuśikas; iv., the Vāmadevyas; v., the Atris; vi., the Bharadviijas; and vii., the Vasishfhas. Further, each of these books begins with the hymns addressed to Agni, the god of fire, which are followed by those to Indra, whereupon follow those addressed to minor deities—the Viśve Devāh ("all-gods"), the Maruts (storm-gods), etc. Again, the hymns addressed to each deity are arranged in a descending order, according to the number of verses of which they consist.

Mandala i., the longest in the whole Saṃhitā, contains 191 hymns, ascribed, with the exception of a few isolated ones, to sixteen poets of different families, and consisting of one larger (50 hymns) and nine shorter collections. Here again the hymns of each author are arranged on precisely the same principle as the "family-books." Maṇḍalas viii. and ix., on the other hand, have a special character of their own. To the Siimaveda, these two mandalas have contributed a much larger proportion of verses than any of the others. The hymns of the eighth book are ascribed to a number of difierent ṛishis, mostly belonging to the Kāṇva family. The chief peculiarity of this mandala, however, consists in the strophic character of its composition and the numerous repetitions throughout it. It is closely connected with the first half of the first mandala and they were evidently added as beginning and end to the collected ii.–vii. The ninth mandala consists entirely of hymns (114) addressed to Soma, the deified juice of the so-called "moon-plant" (*Sarcostemma viminale,* or *Asclepias acida*), and ascribed to poets of different families. They are called *pavamānī,* "purificational," because they were to be recited by the hotar while the juice expressed from the soma plants was clarifying. The hymns are by poets of the same families as ii.–vii. and it is evident that when these hymns were collected the soma hymns mere taken out and put into a single collection. There are also a few soma hymns in the later books (i., viii., x.).

Maṇḍala x. contains the same number of hymns (191) as the first, which it nearly equals in actual length. In the latter half of the book the hymns are clearly arranged according to the number of verses, in decreasing order—occasional exceptions to this rule being easily adjusted by the removal of a few apparently added verses. This mandala came into existence after the other nine were in their present form, a fact of which there is abundant evidence. It shows considerable uniformity and is all older than the latest insertions in other books of the former collectors.

It is usual to call the Rik-samhitii (as well as the Atharvan) an historical collection, as compared with the two Samhitiis put together for purely ritualistic purposes. And indeed, although the Rigveda itself, in its oldest form, may have been intended as a common prayer-book, for the whole of the Briihmanical community, it is certain that in the stage in which it has been finally handed down it includes a certain portion of hymn material (and even some secular poetry) which could never have been used for purposes of religious service. It may, therefore, be assumed that the Rik-samhitii contains all of the nature of popular lyrics that was accessible to the collectors, or seemed to them worthy of being preserved. The question as to the exact period when the hymns were collected cannot be answered with any approach to accuracy. For many reasons, however, which cannot be detailed here, scholars have come to fix on the year 1000 B.C. as an approximate date for the collection of the Vedic hymns. From that time every means that human ingenuity could suggest was adopted to secure the sacred texts against the risks connected with oral transmission. But, as there is abundant evidence to show that even then not only had the text of the hymns suffered corruption, but their language had become antiquated to a considerable extent, and was only partly understood, the period during which the great mass of the hymns were actually composed must have lain considerably farther back, and may very likely have extended over the earlier half of the second millenary, or from about 2000 to 1500 B.C.

As regards the people which raised for itself this imposing monument, the hymns exhibit it as settled in the regions watered by the mighty Sindhu (Indus), with its eastern and western tributaries, the land of the five rivers (Panj-āb) thus forming the central home of the Vedic people. But, while its advanced guard

has already debouched upon the plains of the upper Gaṅgā and Yamuni, those who bring up the rear are still found loitering far behind in the narrow glens of the Kubhā (Cabul) and Gomatī (Gomal). Scattered over this tract of land, in hamlets and villages, the Vedic Xryas are leading chiefly the life of herdsmen and husbandmen. The numerous clans and tribes, ruled over by chiefs and kings, have still constantly to vindicate their right to the land but lately wrung from an inferior race of darker hue. Not infrequently, too, the light-coloured Aryas wage internecine war with one another—as when the Bharatas, with allied tribes of the Panjāb, goaded on by the royal sage Viśvāmitra, invade the country of the Tṛitsu king Sudās, to be defeated in the "ten kings' battle," through the inspired power of the priestly singer Vasishṭha. The priestly office has already become one of high social importance by the side of the political rulers, and to a large extent an hereditary profession; though it does not yet present the baneful features of an exclusive caste.

The religious belief of the people consists in a system of natural symbolism, a worship of the elementary forces of nature, regarded as beings endowed with reason and power superior to those of man. In giving utterance to this simple belief, the priestly spokesman has, however, frequently worked into it his own speculative and mystic notions. Indra, the stout-hearted ruler of the cloud-region, receives by far the largest share of the devout attentions of the Vedic singer. His ever-renewed battle with the malicious demons of darkness and drought, for the recovery of the heavenly light and the rain-spending cows of the sky, forms an inexhaustible theme of spirited song. Next to him, in the affections of the people, stands Agni (*ignis*), the god of fire, invoked as the genial inmate of the Aryan household, and as the bearer of oblations, and mediator between gods and men. Indra and Agni are thus, as it were, the divine representatives of the king (or chief) and the priest of the Aryan community; and if, in the arrangement of the Saṃhitā, the Brāhmanical collectors gave precedence to Agni, it was but one of many avowals of their own hierarchical pretensions. Hence also the hymns to Indra are mostly followed, in the family collections, by those addressed to the Viśve Devah (the "all-gods") or to the Maruts, the warlike storm-gods and faithful companions of Indra, as the divine impersonations of the Aryan freemen, the *viś* or clan. But, while Indra and Agni are undoubtedly the favourite figures of the Vedic pantheon, there is reason to believe that these gods had but lately supplanted another group of deities who play a less prominent part in the hymns, viz., Father Heaven (Dyaus Pitar, Ζεὺς πατήρ, Jupiter); Varuna (probably οὐρανός), the all-embracing (esp. nocturnal) heavens; Mitra (Zend. Mithra), the genial light of day; and Savitar, the quickener, and Sūrya (ἥλιος), the vivifying sun.

Brāhmaṇas of *Rigveda.*—Of the Brāhmaṇas that were handed down in the schools of the *Bahvṛichas* (*i.e.*, "possessed of many verses"), as the followers of the Rigveda are called, two have come down to us, viz. those of the Aitareyins and the Kaushītakins. The *Aitareya-brāhmaṇa* and the *Kaushītaki-* (or Sinkhdyana-) *brāhmaṇa* evidently have for their groundwork the same stock of traditional exegetic matter. They differ, however, considerably in their arrangement of this matter. There is also a certain amount of material peculiar to each of them. The Kaushitaka is, upon the whole, far more concise in its style and more systematic in its arrangement—features which would lead one to infer that it is probably the more modern work of the two. While the Aitareya deals almost exclusively with the Soma sacrifice, the Kaushitaka first treats of the several kinds of *haviryajña*, or offerings of rice, milk and ghee, and then of the Soma sacrifice. Sāyaṇa, in the introduction to his commentary on the work, ascribes the Aitareya to the sage Mahidāsa Aitareya (*i.e.*, son of Itarā), also mentioned elsewhere as a philosopher; and it seems likely enough that this person arranged the Brāhmaṇa and founded the school of the Aitareyins. Regarding the authorship of the sister work we have no definite statement. Probably it is what one of the manuscripts calls it—the Brāhmaṇa of Śānkhāyana (composed) in accordance with the views of Kaushītaki.

Each of these two Brāhmaṇas is supplemented by a "forest-book," or Aranyaka. The *Aitareyāraṇyaka* is not a uniform production. It consists of five books (*āraṇyaka*), three of which, the first and the last two, are of a liturgical nature, treating of the ceremony called *mahāvrata*, or great vow. The last of these books, composed in sūtra form, is, however, doubtless of later origin. The second and third books are purely speculative, and are also styled the *Bahvricha-brāhmaṇa-upanishad.* Again, the last four chapters of the second book are usually singled out as the *Aitareya-upanishad,* ascribed, like its Brāhmaṇa (and the first book), to Mahidāsa Aitareya; and the third book is also referred to as the *Saṃhitā-upanishad.* As regards the *Kaushītaki-āraṇyaka,* this work consists of fifteen adhyiyas, the first two (treating of the mahāvrata ceremony) and the seventh and eighth of which correspond to the first, fifth, and third books of the Aitareyāraṇyaka respectively, whilst the four adhyāyas usually inserted between them constitute the highly interesting *Kaushītaki-* (*brāhmaṇa-*) upanishad, of which we possess two different recensions. The remaining portions (9–15) of the Aranyaka treat of the vital airs, the internal Agnihotra, ending with the vaṃśa, or succession of teachers. Of *Kalpa-sūtras,* or manuals of sacrificial ceremonial, composed for the use of the hotar priest, two different sets are in existence, the *Āśvalāyana-* and the *Śānkhāyana-sūtra.* Each of these works follows one of the two Brāhmaṇas of the Rik as its chief authority: the Aitareya and Kaushitaka respectively. Both consist of a *Śrauta-* and a *Grihya-sūtra.* Āśvalāyana seems to have lived about the same time as Pāṇini (? c. 400 B.C.)—his own teacher, Saunaka, who completed the Ṛik-prātiśākhya, being probably intermediate between the great grammarian and Yāska, the author of the Nirukta. Saunaka himself is said to have been the author of a *Śrauta-sūtra* (which was, however, more of the nature of a Brāhmaṇa) and to have destroyed it on seeing his pupil's work. A *Grihya-sūtra* is still quoted under his name by later writers. The *Āśvalāyana Śrauta-sūtra* consists of twelve, the Grihya of four, adhyāyas.

Regarding Śānkhāyana still less is known; but he, too, was doubtless a comparatively modern writer, who, like Āśvalāyana, founded a new school of ritualists. Hence the Kaushītaki-brāhmana, adopted (and perhaps improved) by him, also goes under his name, just as the Aitareya is sometimes called Āśvalāyana-Brāhmaṇa. The Śānkhāyana Śrauta-sūtra consists of eighteen adhyāyas. The last two chapters of the work are, however, a later addition, while the two preceding chapters, on the contrary, present a comparatively archaic, brāhmaṇa-like appearance. The Grihya-sūtra consists of six chapters, the last two of which are likewise later appendages. The Sdmbavya *Grihya-sūtra,* of which a single ms. is at present known, seems to be closely connected with the preceding work. Professor Bühler also refers to the Rigveda the *Vāsishṭha-dharmaśāstra,* composed of mixed sūtras and couplets.

A few works remain to be noticed, bearing chiefly on the textual form and traditionary records of the Rik-saṃhitā. The Prātiśākhyas have already been referred to as the chief repositories of śikshā or Vedic phonetics. Among these works the *Rik-prātiśākhya* occupies the first place. The original composition of this important work is ascribed to the same Sakalya from whom the vulgate recension of the (Śākala) Saṃhitā takes its name. He is also said to be the author of the existing *Pada-pāṭha* (*i.e.*, the text-form in which each word is given unconnected with those that precede and follow it).

Sāmaveda.—The term *sāman,* of uncertain derivation, denotes a solemn tune or melody to be sung or chanted to a rich or verse. The set chants (stotra) of the Soma sacrifice are as a rule performed in triplets, either actually consisting of three different verses, or of two verses which, by the repetition of certain parts, are made, as it were, to form three. The three verses are usually chanted to the same tune; but in certain cases two verses sung to the same tune had a different *sāman* enclosed between them. One and the same *sāman* or tune may thus be sung to many different verses; but, as in teaching and practising the tunes the same verse was invariably used for a certain tune, the term *sāman,* as well as the special technical names of *sāmans, are*

not infrequently applied to the verses themselves with which they were ordinarily connected.

In accordance with the distinction between rich or text and *sāman* or tune, the siiman-hymnal consists of two parts: the *Sāma-veda-saṃhitā,* or collection of texts (*rich*) used for making up siiman-hymns, and the *Gāna,* or tune-books, song-books. The textual matter of the Samhitii consists of somewhat under 1600 different verses, selected from the Rik-samhitii, with the exception of some seventy-five verses, some of which have been taken from Khila hymns, whilst others which also occur in the Atharvan or Yajurveda, as well as such not otherwise found, may perhaps have formed part of some other recension of the Rik. The *Sāmaveda-saṃhitā* is divided into two chief parts, the *pūrva-* (first) and the uttara- (second) *ārchika.* The second part contains the texts of the siiman-hymns, arranged in the order in which they are actually required for the stotras or chants of the various Soma sacrifices. The first part, on the other hand, contains the body of tune-verses, or verses used for practising the several *sāmans* or tunes upon—the tunes themselves being given in the *Grāma-geya-gāna* (*i.e.,* songs to be sung in the village), the tune-book specially belonging to the Pūrvārchika.

Sāmaveda-brāhmaṇas.—The title of *Brāhmaṇa* is bestowed by the Chhandogas, or followers of the Siimaveda, on a considerable number of treatises. The majority of the Sāmaveda-brāhmaṇas present, however, none of the characteristic features of other works of that class; but they are rather of the nature of sūtras and kindred treatises, with which they probably belong to the same period of literature. Moreover, the contents of these works—as might indeed be expected from the nature of the duties of the priests for whom they were intended—are of an extremely arid and technical character, though they all are doubtless of some importance, either for the textual criticism of the Samhitii or on account of the legendary and other information they supply.

If the Siimaveda has thus its ample share of Brāhmaṇa-literature, though in part of a somewhat questionable character, it is not less richly supplied with siitra-treatises, or works on exegesis, some of which probably belong to the oldest works of that class.

Yajurveda.—This, the sacrificial Veda of the Adhvaryu priests, divides itself into an older and a younger branch, or, as they are usually called. the Black (*krishna*) and the White (*śukla*) Yajurveda. Tradition ascribes the foundation of the Yajurveda to the sage Vaiśampāyana. Of his disciples three are specially named, viz.: Katha, Kaliipin and Yāska Paingi, the last of whom again is stated to have communicated the sacrificial science to Tittiri. We have three old collections of Yajus-texts, viz. the *Kāthaka,* the *Kālāpaka* or *Maitrāyani Samhitā,* and the *Taittiriya-samhitd.* The *Kāthaka* and *Kālāpaka* are frequently mentioned together; and the author of the "great commentary" on Pāṇini once remarks that these works were taught in every village. From the *Kaṭhas* and *Kālāpas* proper schools seem early to have branched off, each with their own recensions of the text. As regards the Taittiriya-samhitii, that collection, too, in course of time gave rise to a number of different schools, the text handed down being that of the Xpastambas.

The four collections of old Yajus texts, so far known to us, while differing more or less considerably in arrangement and verbal points, have the main mass of their textual matter in common. This common matter consists of both sacrificial prayers (*yajus*) in verse and prose, and exegetic or illustrative prose portions (*brāhmaṇa*). A prominent feature of the old Yajus texts, as compared with the other Vedas, is the constant intermixture of textual and exegetic portions. The Charakas and Taittiriyas thus do not recognize the distinction between Saṃhitā and Briihmana in the sense of two separate collections of texts, but they have only a Saṃhitā, or collection, which includes likewise the exegetic or Briihmana portions. The Taittiriyas seem at last to have been impressed with their want of a separate Brāhmaṇa and to have set about supplying the deficiency in rather an awkward fashion: instead of separating from each other the textual and exegetic portions of their Samhitii, they merely added to the latter a supplement (in three books), which shows the same mixed condition, and applied to it the title of *Taittirīya-brāhmaṇa.*

The *Maitrāyaṇī Saṃhitā,* the identity of which with the original Kālāpaka has been proved pretty conclusively by Dr. L. v. Schroder, who attributes the change of name of the Kālāpa-Maitriiyaniyas to Buddhist influences, consists of four books, attached to which is the *Maitri-* (or *Maitrāyaṇī*) *upanishad.* The *Kāṭhaka,* on the other hand, consists of five parts, the last two of which, however, are perhaps later additions, containing merely the prayers of the hotar priest, and those used at the horse-sacrifice. There is, moreover, the beautiful *Kaṭha-* or *Kāṭhaka-upanishad,* which is also, and more usually, ascribed to the Atharvaveda, and from which Siinkhya-Yoga ideas may have developed.

Saṃhitā of the White **Yajurveda.**—The defective arrangement of the Yajus texts was at last remedied by a different school of Adhvaryus, the Vājasaneyins. The reputed originator of this school and its text-recension is Yājñavalkya Vājasaneya (son of Vājasani). The result of the rearrangement of the texts was a collection of sacrificial mantras, the *Vājasaneyi-saṃhitā,* and a Briihmana, the *Śatapatha.* On account of the greater lucidity of this arrangement, the Viijasaneyins called their texts the White (or clear) Yajurveda—the name of Black (or obscure) Yajus being for opposite reasons applied to the Charaka texts. Both the Samhitii and Brāhmaṇa of the Vājasaneyins have come down to us in two different recensions, viz., those of the *Mādhyandina* and *Kāṇva* schools. In several points of difference the Kāṇva recension agrees with the practice of the Rik-saṃhitā, and there probably was some connection between the Yajus school of Kāṇvas and the famous family of ṛishis of that name to which the eighth mandala of the Rik is attributed.

The *Vājasaneyi-saṃhitā* consists of forty adhyiiyas, the first eighteen of which contain the formulas of the ordinary sacrifices. The last fifteen (or even twenty-two) adhyiiyas are doubtless a later addition. The last adhyiiya is commonly known under the title of *Vājasaneyi-saṃhitā* (or *Iśāvāsya-*) *upanishad.* Its object seems to be to point out the fruitlessness of mere works, and to insist on the necessity of man's acquiring a knowledge of the supreme spirit.

The last book is of the Upanishad order, and bears the special title of *Brihad-* (great) *āraṇyaka;* its last six chapters are the *Brihadāraṇyaka-upanishad,* the most important of all Upanishads. As regards the age of the Śatapatha, the probability is that the main body of the work is considerably older than the time of Pāṇini, but that some of its latter parts were considered by Pāṇini's critic Kātyāyana to be of about the same age as, or not much older than, Pāṇini.

The consolidation of the Briihmanical hierarchy and the institution of a common system of ritual worship, which called forth the liturgical Vedic collections, were doubtless consummated in the so-called Madhya-deśa, or "midland," lying between the Sarasvati and the confluence of the Yamunii and Gangii; and more especially in its western part, the Kuru–kshetra, or land of the Kurus, with the adjoining territory of the Pañchālas, between the Yamunā and Gangii. From thence the original schools of Vaidik ritualism gradually extended their sphere over the adjacent parts. The Charakas seem for a long time to have held sway in the western and north-western regions; while the Taittiriyas in course of time spread over the whole of the peninsula south of the Narmadā (Nerbudda), where their ritual has remained pre-eminently the object of study till comparatively recent times. The Viijasaneyins, on the other hand, having first gained a footing in the lands on the lower Ganges, chiefly, it would seem, through the patronage of King Janaka of Videha, thence gradually worked their way westwards, and eventually succeeded in superseding the older schools north of the Vindhya.

Atharvaveda.—The Artharvan was the latest of Vedic collections to be recognized as part of the sacred canon. That it is also the youngest Veda is proved by its language, which in vocabulary and grammar marks an intermediate stage between the main body of the Rik and the Brāhmaṇa period. In regard also to the nature of its contents, and the spirit which pervades them, this Vedic collection occupies a position apart from the others. Whilst the older Vedas seem clearly to reflect the recognized religious

notions and practices of the upper classes of the Aryan tribes, as jealously watched over by a priesthood deeply interested in the undiminished maintenance of the traditional observances, the fourth Veda, on the other hand, deals mainly with all manner of superstitious practices such as have at all times found a fertile soil in the lower strata of primitive and less advanced peoples, and are even apt, below the surface, to maintain their tenacious hold on the popular mind in comparatively civilized communities. Although the constant intermingling with the aboriginal tribes may well be believed to have exercised a deteriorating influence on the Vedic people in this respect, it can scarcely be doubted that superstitious practices of the kind revealed by the Atharvan and the tenth book of the Rik must at all times have been present among the Aryan people, and that they only came to the surface when they received the stamp of recognized forms of popular belief by the admission of these collections of spells and incantations into the sacred canon. If in this phase of superstitious belief the old gods still find a place, their character has visibly changed so as to be more in accordance with those mystic rites and magic performances and the part they are called upon to play in them, as the promoters of the votary's cabalistic practices and the averters of the malicious designs of mortal enemies and the demoniac influences to which he would ascribe his fears and failures as well as his bodily ailments. The fourth Veda may thus be said to supplement in a remarkable manner the picture of the domestic life of the Vedic Aryan as presented in the Grihya-sūtras or house-rules; for while these deal only with the orderly aspects of the daily duties and periodic observances in the life of the respectable householder, the Atharvaveda allows us a deep insight into "the obscurer relations and emotions of human life"; and, it may with truth be said that "the literary diligence of the Hindus has in this instance preserved a document of priceless value for the institutional history of early India as well as for the ethnological history of the human race" (M. Bloomfield). It is worthy of note that the Atharvaveda is practically unknown in the south of India.

This body of spells and hymns is traditionally associated with two old mythic priestly families, the Atharvans and Angiras, their names, in the plural, serving either singly or combined (Atharvāṅgirasas) as the oldest appellation of the collection. The two families or classes of priests are by tradition connected with the service of the sacred fire; but whilst the Atharvans seem to have devoted themselves to the auspicious aspects of the fire-cult and the performance of propitiatory rites, the Angiras, on the other hand, are represented as having been mainly engaged in the uncanny practices of sorcery and exorcism. The current text of the *Atharva-saṃhitā*—apparently the recension of the Saunaka school—consists of some 750 different pieces, about five-sixths of which is in various metres, the remaining portion being in prose. The whole mass is divided into twenty books. The principle of distribution is for the most part a merely formal one, in books i.-xiii. pieces of the same or about the same number of verses being placed together in the same book. The next five books, xiv.-xviii., have each its own special subject: xiv. treats of marriage and sexual union; xv., in prose, of the Vrātya, or religious vagrant; xvi. consists chiefly of prose formulas of conjuration; xvii. of a lengthy mystic hymn; and xviii. contains all that relates to death and funeral rites. Of the last two books no account is taken in the Atharva-prātiśākhya, and they indeed stand clearly in the relation of supplements to the original collection. The nineteenth book evidently was the result of a subsequent gleaning of pieces similar to those of the earlier books, which had probably escaped the collectors' attention; while the last book, consisting almost entirely of hymns to Indra taken from the Rik-saṃhitā, is nothing more than a liturgical manual of recitations and chants required at the Soma sacrifice; its only original portion being the ten so-called *kuntāpa* hymns (127–136), consisting partly of laudatory recitals of generous patrons of sacrificial priests and partly of riddles and didactic subjects.

The Atharvan has come down to us in a much less satisfactory state of preservation than any of the other Saṃhitās. The discovery in Kashmir of a second recension of the Atharva-saṃhitā, contained in a single birch-bark ms., written in the Śāradā character, has provided further material for its study. This new recension, ascribed to the Paippalāda school, consists likewise of twenty books (*kāṇḍa*), but in textual matter and arrangement it differs very much from the current text While lacking much of the latter the new version offers a good deal of fresh matter, amounting to about one-sixth of the whole. From the Mahābhashya and other works quoting as the beginning of the Atharva-saṃhitā a verse that coincides with the first verse of the sixth hymn of the current text, it has long been known that at least one other recension must have existed; but the first leaf of the Kashmir ms. having been lost, it cannot be determined whether the new recension (as seems all but certain) corresponds to the one referred to in those works.

Atharvaveda-brāhmaṇa.—The only Brāhmaṇa of the Atharvan, the *Gopatha-brāhmaṇa,* is one of the most modern and least important works of its class. It consists of two parts, the first of which contains cosmogonic speculations, interspersed with legends, mostly adapted from other Brāhmaṇas, and general instructions on religious duties and observances; while the second part treats, in a very desultory manner, of various points of the sacrificial ceremonial.

Atharvaveda-sutras.—The Kalpa-siitras belonging to this Veda comprise both a manual of Srautarites, the *Vaitāna-sūtra,* and a manual of domestic rites, the *Kauśika-sūtra.* The teacher Kauśika is repeatedly referred to in the work on points of ceremonial doctrine. The last sūtra-work to be noticed in connection with this Veda is the *Śaunakīyā Chaturādhyāyikā,* being a Prātiśākhya of the Atharva-saṃhitā, so called from its consisting of four lectures (adhyāya). Although Saunaka can hardly be credited with being the actual author of the work, considering that his opinion is rejected in the only rule where his name appears, there is no reason to doubt that it chiefly embodies the phonetic theories of that teacher, which were afterwards perfected by members of his school. Whether this Saunaka is identical with the writer of that name to whom the final redaction of the Sākalaprātiśakhya of the Rik is ascribed is not known.

Upanishads. — Another class of writings traditionally connected with the Atharvaveda are the numerous *Upanishads* which do not specially attach themselves to one or other of the Saṃhitās or Brāhmaṇas of the other Vedas. The Ātharvaṇa-upanishads, mostly composed in ślokas, may be roughly divided into two classes: those of a purely speculative or general pantheistic character, treating chiefly of the nature of the supreme spirit, and the means of attaining to union therewith, and those of a sectarian tendency. Of the former category, a limited number—such as the Praśna, Muṇḍaka and Māṇḍūkya-upanishads—have probably to be assigned to the later period of Vedic literature; whilst the others presuppose more or less distinctly the existence of some fully developed system of philosophy, especially the Vedanta or the Yoga. The sectarian Upanishads, on the other hand—identifying the supreme spirit either with one of the forms of Vishnu (such as the Nārāyaṇa, Nṛisiṃha-tāpanīya, Rāma-tāpaniya, Gopāla-tāpanīya Upanishads), or with Śiva (*e.g.,* the Rudra-upanishad), or with some other deity—belong to post-Vedic times.

THE CLASSICAL PERIOD

The Classical Literature of India is almost entirely a product of artificial growth, in the sense that its vehicle was not the language of the general body of the people, but of a small and educated class. It would scarcely be possible. even approximately, to fix the time when the literary idiom ceased to be understood by the common people. We only know that in the 3rd century B.C. there existed several dialects in different parts of northern India which differed considerably from the Sanskrit; and Buddhist tradition states that Gautama Śākyamuni himself, in the 6th century B.C., used the local dialect of Magadha (Behar) in preaching his new doctrine. Not unlikely, indeed, popular dialects, differing perhaps but slightly from one another, may have existed as early as the time of the Vedic hymns, when the Indo-Aryans, divided into clans and tribes, occupied the Land of the Seven Rivers; but such dialects must have sprung up

after the extension of the Aryan sway and language over the whole breadth of northern India. But there is no reason why, even with the existence of local dialects, the literary language should not have kept in touch with the people in India, as elsewhere, save for the fact that from a certain time that language remained altogether stationary, allowing the vernacular dialects more and more to diverge from it. Although linguistic research had been successfully carried on in India for centuries, the actual grammatical fixation of Sanskrit seems to have taken place about contemporaneously with the first spread of Buddhism; and indeed that popular religious movement undoubtedly exercised a powerful influence on the linguistic development of India.

Epic Poems.—The Hindus, like the Greeks, possess two great national epics, the *Mahābhārata* and the *Rāmāyaṇa.* The *Mahābhirata, i.e.,* "the great (poem or tale) of the Bhiiratas," is not so much a uniform epic poem as a great collection of poetry, consisting of a mass of legendary and didactic matter, worked into and round a central heroic narrative. The authorship of this work is aptly attributed to Vyāsa, "the arranger," the personification of Indian recension. Only the bare outline of the leading story can here be given.

At Hastināpura (sixty miles from the modern Delhi) in the Bharata country Dhritarāshṭra, the elder of the princes, being blind, was passed over for his brother Pāṇḍu on the death of their father. On the death of Pāṇḍu, however, Dhritarāshṭra assumed the government, assisted by his uncle Bhishma, the Nestor of the poem. Pāṇḍu had five sons, Yudhishfhira, Bhīma and Arjuna, by his chief wife Kiinti. and the twins Nakula and Sahadeva by his wife Mādrī. From their great-grandfather Kuru both families are called *Kauravas;* but for distinction that name is more usually applied to the sons of Dhritarāshṭra, while their cousins, as the younger line, are named, after their father, *Pāṇḍavas.* The Pāṇḍavas were brought up at their uncle's court like his own sons. The rivalry and varying fortunes of these two houses form the main plot of the great epic. The Pāṇḍu princes soon proved themselves greatly superior to their cousins; and Yudhishṭhira, the eldest of them all, was to be appointed heir-apparent. But they had to leave the country to escape the plots of their jealous cousins. In their exile Draupadi, daughter of King Drupada of Panchāla, won by Arjuna in open contest, became the wife of the five brothers. At the contest they met their cousin, nephew of their mother Kunti, the famous Yādava prince Krishna of Dvārakā, who ever afterwards remained their faithful friend and confidential adviser. Dhritarāshṭra now divided the kingdom between the two houses; whereupon the Pāṇḍavas built for themselves the city of Indraprastha (on the site of the modern Delhi). After a time of great prosperity, Yudhishfhira, in a game of dice, lost everything to Duryodhana, when it was settled that the Pāṇḍavas should retire to the forest for twelve years, but should afterwards be restored to their kingdom if they succeeded in passing an additional year in disguise. During their forest-life they met with many adventures, among which may be mentioned their encounter with King Jayadratha of Chedi, who had carried off Draupadi from their hermitage. After the twelfth year has expired they leave the forest, and, assuming various disguises, take service at the court of King Virāṭa of Matsya. Here all goes well for a time till the queen's brother Kichaka, a great warrior and commander of the royal forces, falls in love with Draupadi, and is slain by Bhima. The Kauravas, profiting by Kichaka's death, now invade the Matsyan kingdom, when the Pāṇḍavas side with King Virāṭa, and there ensues, on the field of Kurukshetra, during eighteen days, a series of fierce battles, ending in the annihilation of the Kauravas; only the Pāṇḍavas, Arjuna and his charioteer Krishna survived on the victorious side. Yudhishfhira now at last becomes yuva-rāja, and eventually king—Dhritariishfra having resigned and retired with his wife and Kunti to the forest, where they soon after perish in a conflagration. Learning also of the death of Krishna, Yudhishṭhira himself at last becomes tired of life and resigns his crown; and the five princes, with their faithful wife, and a dog that joins them, set out for Mount Meru, to seek admission to Indra's heaven. On the way one by one drops off, till Yudhishfhira alone, with the dog, reaches the gate of heaven; but, the dog being refused admittance, the king declines entering without it, when the dog turns out to be no other than the god of Justice himself, having assumed that form to test Yudhishṭhira's constancy. But, finding neither his wife nor his brothers in heaven, and being told that they are in the nether world to expiate their sins; the king insists on sharing their fate, when this, too, proves a trial, and they are all reunited to enjoy perpetual bliss.

The complete work consists of upwards of 100,000 couplets—its contents thus being nearly eight times the bulk of the Iliad and *Odyssey* combined. **It** is divided into eighteen books, with a supplement, entitled Harivaṃśa, or genealogy of the god Hari (Krishna-Vishnu). The portion relating to the feud of the rival houses constitutes somewhere between a fourth and a fifth of the work; and it is by no means improbable that this portion once formed a separate poem, called the *Bhirata.* While some of the episodes are so loosely connected with the story as to be readily severed from it, others are so closely interwoven with it that their removal would seriously injure the very texture of the work. This, however, only shows that the original poem must have undergone some kind of revision, or perhaps repeated revisions. That such has indeed taken place, at the hand of Brāhmans, for sectarian and caste purposes, cannot be doubted. According to Lassen's opinion, which has been very generally accepted by scholars, the main story of the poem would be based on historical events: on a destructive war waged between the two neighbouring peoples of the Kurus and Panchiilas, who occupied the western and eastern parts of the Madhyadeśa (or "middle land" between the Ganges and Jumna) respectively, and ending in the overthrow of the Kuru dynasty. On the original accounts of these events—perhaps handed down in the form of lays or sagas—the Pāṇḍava element would subsequently have been grafted as calculated to promote the class interests of the Brāhmanical revisers.

Date of **the** Epic.—The earliest direct information regarding the existence of epic poetry in India is in a passage of Dion Chrysostom (c. A.D. 80)—"even among the Indians, they say, Homer's poetry is sung, having been translated by them into their own dialect and tongue." It is generally agreed that this does not imply an Indian translation of Homer but means that the Indians had similar works. Whence Dion derived his information is not known; but as many leading names of the Mahābhārata and even the name of the poem itself are mentioned In Pāṇini's grammatical rules, not only must the Bhārata legend have been current in his time (*?c.* 400 B.C.), but most probably it was at the time of Patañjali, the author of the "great commentary" on Pāṇini (c. 150 B.C.). It cannot, however, be doubted that long before that time heroic song had been diligently cultivated in India at the courts of princes and among Kshatriyas, the knightly order, generally. In the *Mahābhārata* itself the transmission of epic legend is in some way connected with the Siitas, a social class which, in the caste-system, is defined as resulting from the union of Kshatriya men with Brāhmaṇa women, and which supplied the office of charioteers and heralds, as well as (along with the Miigadhas) that of professional minstrels. Be this as it may, there is reason to believe that, as Hellas had her *ἀοιδοί* who sang the *κλέα ἀνδρῶν,* and Iceland her skalds who recited favourite sagas, so India had from olden times her professional bards, who delighted to sing the praises of kings and inspire the knights with warlike feelings. If in this way a stock of heroic poetry had gradually accumulated which reflected an earlier state of society and manners, we can well understand why, after the Briihmanical order of things had been definitely established, the priests should have deemed it desirable to subject these traditional memorials of Kshatriya chivalry and prestige to their own censorship, and adapt them to their own canons of religious and civil law. Such a revision would doubtless require considerable skill and tact; and if in the present version of the work much remains that seems contrary to the Brāhmanical code and pretensions—*e.g.,* the polyandric union of Draupadi and the Pāṇḍu princes—the reason probably is that such features were too firmly rooted in the popular tradition to be readily eliminated; and **all** the revisers could do was to explain them away as best

they could. Thus Draupadi's abnormal position is actually accounted for in five different ways, one of these representing it as an act of duty and filial obedience on the part of Arjuna who, on bringing home his fair prize and announcing it to his mother, is told by her, before seeing what it is, to share it with his brothers. The epic in time became a great treatise on duty (*dharma*) inculcating the divine origin of Brahman institutions, the caste system and the superiority of the priestly caste not only over the people but over kings. From inscriptions we know that by the end of the 5th century A.D. the Mahābhārata was appealed to as an authority on matters of law. and that its extent was practically uhat it now is, including its supplement, the Harivaṃśa. Indeed, everything seems to point to the probability of the work having been complete by about A.D. 200. But, whilst Bhārata and Kuru heroic lays may, and probably do, go back to a much earlier age, it seems hardly possible to assume that the Pāṇḍava epic in its present form can have been composed before the Greek invasion of India, or about 300 B.C. Moreover, it is by no means impossible that the epic narrative was originally composed—as some other portions of the works are—in prose, either continuous or mixed with snatches of verse. The leading position occupied in the existing epic by Krishṇa (whence it is actually called *kārshṇa-veda,* or the veda of Krishna), and the Vaishnava spirit pervading it, make it very probable that it assumed its final form under the influence of the Bhāgavata sect with whom Vāsudeva (Krishna), originally apparently a venerated local hero, came to be regarded as a veritable god, and incarnation of Vishnu. Its culminating point this sectarian feature attains in the *Bhagavat-gītā* (*i.e.,* the upanishad), "sung by the holy one[x]—the famous theosophic episode. in which Krishna, in lofty and highly poetic language, expounds the doctrine of faith (*bhakti*) and cleims adoration as the incarnation of the supreme spirit. Of the purely legendary matter incorporated with the leading story of the poem, not a little, doubtless, is at least as old as the latter itself. Some of these episodes—especially the well-known story of Nala and Damayanti, and the touching legend of Sāvitrī—themselves form epic gems of high poetic value.

The **Rāmāyaṇa,** *i.e.,* poem "relating to Riima," is ascribed to the poet Viilmiki; and, allowance being made for some later additions, the poem indeed presents the appearance of being the work of an individual genius. In its present form it consists of some 24,000 ślokas, or 48,000 lines of sixteen syllables, divided into seven books.

(I.) King Daśaratha of Kośala, reigning at Ayodhyii (Oudh), has four sons borne him by three wives, viz., Rāma, Bharata and the twins Lakshmana and Śatrughna. Rāma wins for a wife Sītā, daughter of Janaka, king of Videha. (II.) On his return to Ayodhyii he is to be appointed heir-apparent; but Bharata's mother persuades the king now to grant her a long promised boon and insists on his banishing his eldest son for fourteen years, and appointing her son instead. Separation from his favourite son soon breaks the king's heart, whereupon the ministers call on Bharata to assume the reins of government. He refuses, however, and, betaking himself to Riima's retreat on the Chitrakūta mountain (in Bundelkhund), implores him to return; but, unable to shake Rāma's resolve to complete his term of exile, he consents to take charge of the kingdom in the meantime. (III.) After a ten years' happy residence in the forest. Rāvaṇa, the demon-king of Ceylon, carries off Sītā to his capital Laṅkā while her two protectors are away in pursuit of a golden deer sent to mislead them. While she resolutely rejects the Rākshasa's addresses, Riima sets out with his brother to her rescue. (IV.) After numerous adventures they enter into an alliance with Sugriva, king of the monkeys; and, with the assistance of the monkey-general Hanumān, and Rāvaṇa's own brother Vibhīshaṇa, they prepare to assault Lankii. (V.) The monkeys, tearing up rocks and trees, construct a passage across the straits—the so-called Adam's Bridge, still designated Riima's Bridge in India. (VI.) Riima crosses with his allies, slays the demon and captures the stronghold; Sītā successfully undergoes an ordeal by fire to clear herself of the suspicion of infidelity; they return to Ayodhyii, where, after a triumphal entry, Riima is installed. (VII.) Rāma, however, seeing that the people are not yet satisfied of Sītā's purity, resolves to put her away; whereupon, in the forest, she falls in with Vālmīki himself, and at his hermitage gives birth to two sons. While growing up there, they are taught by the sage the use of the bow, as well as the Vedas, and the Rāmāyaṇa as far as the capture of Laṅkā and the royal entry into Ayodhyii. Ultimately Rāma discovers and recognizes them by their wonderful deeds and their likeness to himself, and takes his wife and sons back with him.

The first and last books are later additions by which the poem has been turned to the glory of Vishnu. In these two books Rāma has become deified and identified with the god Vishnu, whilst in the body of the poem his character is simply that of a perfect man and model hero. The background of the epic is a purely mythological one—Rāma representing the god Indra, and Sitii—in accordance with the meaning of the name—the personified "Furrow," as which she is already invoked in the *Rigveda,* and hence is a tutelary spirit of the tilled earth, wedded to Indra, the Jupiter Pluvius. Rāvana would correspond to the demon Vritra of the Rigzeda.

One version of the same story, with, however. many important variations of details, forms an episode of the *Mahābhārata,* the *Rāmopākhyāna,* the relation of which to Vālmīki's work is still a matter of uncertainty. In respect of both versification and diction the Rāmāyaṇa is of a distinctly more refined character than the larger poem; and, indeed, Vālmīki is seen already to cultivate some of that artistic style of poetry which was carried to excess in the later artificial poems (Kāvyas), whence the title of *ādi*-kazi, or first poet, is commonly applied to him. The *Rāmāyaṇa* itself contains a prophecy like that of Horace's to the effect that it will always live on the lips of men, and it has been more than fulfilled. No story in India has attained such popularity. It has been translated into many vernaculars and through the version of Tulsi Das has exerted a tremendous influence on the spiritual life of India. To characterize the Indian epics in a single word: though often disfigured by fancies and exaggerations, they are yet noble works, abounding in passages of remarkable descriptive power, intense pathos, and high poetic grace and beauty; and while, as works of art, they are far inferior to the Greek epics, in some respects they appeal far more strongly to the romantic mind of Europe, namely, by their loving appreciation of natural beauty, their exquisite delineation of womanly love and devotion, and their tender sentiment of mercy and forgiveness.

Purāṇas and **Tantras.**—The *Purāṇas* are partly legendary, partly speculative histories of the universe, compiled for the purpose of promoting some special, locally prevalent form of Brāhmanical belief. They deal with cosmogony, stories of gods, sages and heroes, Vishnu's avatars, the solar and lunar lines of kings and other pseudo-historical matter. They are sometimes styled a fifth Veda, and may indeed in a certain sense be looked upon as the scriptures of Brkhmanical India. The term *purāṇa,* signifying "old." applied originally to prehistoric, especially cosmogonic legends, and then to collections of ancient traditions generally They are popular encyclopaedias of useful knowledge mostly with a Vaishnava tendency. They are connected in subject matter with the *Mahābhārata* and have some relationship to the law books and go back to a common source.

They are almost entirely composed in the epic couplet, and indeed in much the same easy flowing style as the epic poems, to which they are, however, as a rule greatly inferior in poetic value.

According to the traditional classification of these works, there are said to be eighteen (*Mahā-,* or great) *Purāṇas,* and as many *Upa-purāṇas,* or subordinate Puriinas. The former are by some authorities divided into three groups of six, according as one or other of the three primary qualities of external existence—goodness, darkness (ignorance), and passion—is supposed to prevail in them, viz. the *Vishṇu, Nāradiya, Bhāgavata, Garuḍa, Padma, Varāha—Matsya, Kūrma, Liṅga, Śiva,* Skanda, *Agni—Brahmāṇḍa, Brahmavaivarta, Mārkaṇḍeya, Bhavishya, Vāmana* and *Brahma-Purāṇas.* The eighteen principal Puriinas are said to consist of together 400,000 couplets. In northern India the Vaishnava Purāṇas, especially the *Bhāgavata* and *Vishṇu,* are by far the

most popular. The former is held in the highest estimation, and, especially through the vernacular versions of its tenth book, treating of the story of Kṛishṇa, has powerfully influenced the religious belief of India.

From the little we know regarding the Upa-purāṇas, their character does not seem to differ very much from that of the principal sectarian Purāṇas. Besides these two classes of works there is a large number of so-called *Sthala-purāṇas,* or chronicles recounting the history and merits of some holy "place" or shrine, where their recitation usually forms an important part of the daily service.

The *Tantras* have to be considered as partly a collateral and partly a later development of the sectarian Purāṇas; though, unlike these, they can hardly lay claim to any intrinsic poetic value. These works are looked upon as their sacred writings by the numerous *Śāktas,* or worshippers of the female energy (Sakti) of some god, especially the wife of Siva, in one of her many forms (Pārvatī, Devi, Kālī, Bhavānī, Durga). This worship of a female representation of the divine power appears already in some of the Purāṇas; but in the Tantras it assumes quite a peculiar character, being largely intermixed with magic performances and mystic rites, partly, indeed, of a grossly immoral nature. (See HINDUISM.) See the series of Tantric works edited by A. Avalon.

Artificial Epics and Romances. — About the beginning of the Christian era a new class of epic poems begins to make its appearance, differing widely in character from those that had preceded it. These later productions are of a decidedly artificial character, and must necessarily have been beyond the reach of any but the highly cultivated. They are, on the whole, singularly deficient in incident and invention, their subject matter being almost entirely derived from the old epics. Nevertheless, these works are by no means devoid of merit and interest; and a number of them display considerable descriptive power and a wealth of genuine poetic sentiment. The simple heroic couplet has been largely discarded for various more or less elaborate metres; and in accordance with this change of form the diction becomes gradually more complicated.

The generic appellation of such works is *kāvya,* which, meaning "poem." or the work of an individual poet (kavi), is, as we have seen, already applied to the *Rāmāyaṇa.* Six poems of this kind are singled out by native rhetoricians as standard works, under the title of *Mahākāvya,* or great poems. Two of these are ascribed to the famous dramatist Kalidasa, the most prominent figure of this period of Indian literature and truly a master of the poetic art. In a comparatively modern couplet he is represented as having been one of nine literary "gems" at the court of a king Vikramāditya. Whether this name refers to Chandragupta II. Vikramāditya or not, Kālidāsa must have flourished about this time, c. A.D. 400. Of the principal poets of this class, whose works have come down to us, he appears to be one of the earliest; but there can be little doubt that he was preceded in this as in other departments of poetic composition by many lesser lights, eclipsed by the sun of his fame, and forgotten. Thus the Buddhacharita, a Sanskrit poem on the life of the reformer, which was translated into Chinese about A.D. 420, and the author of which, Aivaghosha, is placed by Buddhist tradition as early as the time of Kanishka (who began to reign in A.D. 78), calls itself, not without reason, a "mahākāvya"; and the panegyrics contained in some of the inscriptions of the 4th century likewise display, both in verse and ornate prose, many of the characteristic features of the kāvya style of composition.

Of the six universally recognized "great poems" here enumerated, the first two, and doubtless the two finest, are those attributed to Kalidasa. (1) The *Raghuvaṃśa,* or "race of Raghu," celebrates the ancestry and deeds of Rāma. The work, consisting of nineteen cantos, is manifestly incomplete; but hitherto no copy has been discovered of the six additional cantos which are supposed to have completed it. (2) The *Kumāra-sambhava,* or "the birth of (the war-god) Kumāra" (or Skanda), the son of Siva and Pārvatī, consists of seventeen cantos, the last ten of which are looked upon as spurious by some scholars, mainly on account of their erotic character, not a strong argument. There is no reason to doubt that the eighth canto is by Kālidāsa but he cannot have written much of the other nine. (3) The *Kirātārjunīya,* or combat between the Pāṇdava prince Arjuna and the god Siva, in the guise of a Kirāta or wild mountaineer, is a poem in eighteen cantos, by Bhāravi, who is mentioned together with Kālidāsa in an inscription dated A.D. 634. (4) The *Śiśupāla-badha,* or slaying of Śiśupāla, who, being a prince of Chedi, reviled Kṛishṇa, who had carried off his intended wife, and was killed by him at the inauguration sacrifice of Yudhishthira, is a poem consisting of twenty cantos, attributed to Māgha (ninth cent.), whence it is also called *Māghakāvya.* (5) The *Rāvaṇabadha,* or "slaying of Rāvaṇa," more commonly called *Bhaṭṭikāvya,* was composed for the practical purpose of illustrating the less common grammatical forms and the figures of rhetoric and poetry. Bhaṭṭi, apparently the author's name, is usually identified with the well-known grammarian Bhartṛihari, whose death Professor M. Müller, from a Chinese statement, fixes at A.D. 650, while others make him Bhartṛihari's son. (6) The Naishadhiya, or *Naishadha-charita,* the life of Nala, king of Nishadha, is ascribed to Śrī-Harsha (son of Hira), who is supposed to have lived in the latter part of the 12th century. The Nalodaya deals with the same subject but the author's main object is to show his skill in tricks of style and metre. The long lost and recently discovered *Janakī-harana* of *Kumāradāsa* (eighth cent.) takes its subject (the rape of Sītā) from the *Rāmāyaṇa* strongly imitative of Kālidāsa; it is, however, the work of a poet of no mean ability. The stanzas of the *Rāghavapāṇḍavīya* are so ambiguously worded that the poem may be interpreted as relating to the leading story of either the *Rāmāyaṇa* or the *Mahābhārata.* Less ambitious in composition, though styling itself a mahākāvya, is the *Vikramāṅka-devacharita,* a panegyric written about A.D. 1085 by the Kashmir poet Bilhana, in honour of his patron the Chālukya king Vikramāditya of Kalyāṇa, regarding the history of whose dynasty it supplies some valuable information.

In this place may also be mentioned, as composed in accordance with the Hindu poetic canon, Kalhana's *Rājatarangiṇī* (c. A.D. 1150) or "river of kings," being a chronicle of the kings of Kashmir, and the only important historical work in the Sanskrit language, although even here considerable allowance has to be made for poetic licence and fancy.

Under the general term "kāvya" Indian critics include, however, not only compositions in verse, but also certain kinds of prose works composed in choice diction richly embellished with flowers of rhetoric. The feature generally regarded by writers on poetics as the chief mark of excellence in this ornate prose style is the frequency and length of its compounds; whilst for metrical compositions the use of long compounds is expressly discouraged by some schools of rhetoric.

The Drama. — The Hindus ascribe the origin of dramatic representation to the sage Bharata (the word in Sanskrit means also "actor"). We know that treatises on the dramatic art existed at the time of Pāṇini, as he mentions two authors of *Naṭa-sūtras,* or "rules for actors," Śilālin and Kriśāśva. Now the words *naṭa* and *nāṭya*—as well as *nāṭaka,* the common term for "drama" — being derived (like the modern vernacular "Nautch" = *nritya*) from the root *naṭ* (nrit) "to dance," seem to point to a pantomimic or choral origin of the dramatic art. Fortunately, however, Patañjali, in his "great commentary," speaks of the actor as singing, and of people going "to hear the actor." Nay, he even mentions two subjects, taken from the cycle of Vishnu legends: the slaying of Kamsa (by Krishna) and the binding of Bali (by Vishṇu)—which were represented on the stage both by mimic action and declamation. Judging from these allusions, theatrical entertainments in those days seem to have been very much on a level with the old religious spectacles or mysteries of Europe. It is not, however, till some centuries later that we meet with the first real dramas, which mark at the same time the very culminating point of Indian dramatic composition. Although we know the names of at least five predecessors of Kālidāsa, nothing but a few quotations from them have been preserved.

The long disputed possibility of Greek influence on the Sanskrit drama is not now maintained. although there are some superficial points of resemblance. The Hindu dramatist has little regard for

the "unities" of the classical stage, though he is hardly ever guilty of extravagance in his disregard of them. Unlike the Greek dramatic theory, it is an invariable rule of Indian dramaturgy, that every play, however much of the tragic element it may contain, must have a happy ending. A death never takes place on the stage, nor is anything indecorous allowed. The dialogue is invariably carried on in prose plentifully interspersed with those neatly turned lyrical stanzas in which the Indian poet delights to depict some aspect of nature, or some temporary physical or mental condition. The outstanding feature of the Hindu play, however, is the mixed nature of its language. While the hero and leading male characters speak Sanskrit, women and inferior male characters use various Prākrit dialects. As regards these dialectic varieties, it can hardly be doubted that at the time when they were first employed in this way they were local vernacular dialects; but in the course of the development of the scenic art they became permanently fixed for special dramatic purposes, just as the Sanskrit had, long before that time, become fixed for general literary purposes. Thus it would happen that these Prākrit dialects, having once become stationary, were soon left behind by the spoken vernaculars, until the difference between them was as great as between the Sanskrit and the Prākrits.

The *Mrichchhakatikā,* or "little clay cart," has been considered earliest of the existing dramas because of a certain clumsiness of construction, but probably does not antedate the sixth century. According to several stanzas in the prologue, the play was composed by a king Śūdraka, but it is probably the work of a poet patronized by him. Chārudatta, a Brāhman merchant, reduced to poverty, and Vasantasenā, an accomplished courtezan, meet and fall in love with each other. This forms the main plot, which is interwoven with a political underplot, resulting in a change of dynasty. The connection between the two plots is effected by means of the king's rascally brother-in-law, who pursues Vasantasenā with his addresses, as well as by the part of the rebel cowherd Aryaka, who, having escaped from prison, finds shelter in the hero's house. The wicked prince, on being rejected, strangles Vasantasenā, and accuses Chārudatta of having murdered her; but, just as the latter is about to be executed, his lady love appears again on the scene. Meanwhile Aryaka has succeeded in deposing the king, and, having himself mounted the throne of Ujjain, he raises Vasantasenā to the position of an honest woman, to enable her to become the wife of Chiirudatta. The play is one of the longest, consisting of not less than ten acts, some of which, however, are very short. The interest of the action is, on the whole, well sustained; and, altogether, the piece presents a vivid picture of the social manners of the time, whilst the author shows himself imbued with a keen sense of humour, and a master in the delineation of character.

Kālidāsa.—In Kālidāsa the dramatic art attained its highest point of perfection. From this accomplished poet we have three well-constructed plays, abounding in stanzas of exquisite tenderness and fine descriptive passages: the two well-known mythopastoral dramas, *Śakuntalā* in seven and *Vikramorvaśī* in five acts, and a piece of court intrigue, distinctly inferior to the other two, entitled *Mālavikāgnimitra* in five acts. The plot of the last named is as follows: King Agnimitra, who has two wives, falls in love with Mālavikā, maid to the first queen. His wives endeavour to frustrate their affection for each other, but in the end Mālavikā turns out to be a princess by birth, and is accepted by the queens as their sister.

Śrī Harshadeva.—Srī-Harshadeva—identical with the king (Śīlāditya) Harshavardhana of Kānyakubja (Kanauj) mentioned above, who ruled in the first half of the 7th century—has three plays attributed to him; they are probably only dedicated to him by poets patronized by him. This at least commentators state to have been the case as regards the *Ratnāvalī,* the authorship of which they assign to Bāṇa. Indeed, had they been the king's own productions, one might have expected the Chinese pilgrims (especially I-tsing, who saw one of the plays performed) to mention the fact. The *Ratnāvalī,* "the pearl necklace," is a graceful comedy of domestic manners, with well-drawn characters. Ratnāvalī, a Ceylon princess, is sent by her father to the court of King Udayana of Vatsa to become his second wife. She suffers shipwreck, but is rescued and received into Udayana's palace under the name of Sāgarikā, as one of Queen Vāsavadattā's attendants. The king falls in love with her, and the queen tries to keep them apart, but, on learning the maiden's origin, she becomes reconciled, and recognizes her as a "sister." Very similar in construction, but inferior, is the *Priyadarśikā,* in four acts, having for its plot another amour of the same king. The scene of the third play, the *Nāgānanda,* or "joy of the serpents" (in five acts), on the other hand, is laid in semi-divine regions. In spite of its shortcomings of construction the *Nāgānanda* is a play of considerable merit, the characters being drawn with a sure hand, and the humour is by no means despicable.

Bhavabhūti, a Brahman of Vidarbha, passed his literary life chiefly at the court of Yaśovarman of Kanauj (c. A.D. 700). Bhavabhiiti was the author of three plays, two of which, the *Mahāviracharita* ("life of the great hero") and the *Uttararāmacharita* with very little action ("later life of Rāma"), in seven acts each, form together a dramatized version of the story of the *Rāmāyaṇa.* The third, the *Mālatīmādhava,* is a domestic drama in ten acts, representing the fortunes of Mādhava and Mālatī, the son and daughter of two ministers of neighbouring kings, who from childhood have been destined for each other, but, by the resolution of the maiden's royal master to marry her to an old and ugly favourite of his, are for a while threatened with permanent separation. The action of the play is full of life, and abounds in stirring, though sometimes improbable, incidents. The poet is considered by native critics to be not only not inferior to Kālidāsa, but even to have surpassed him in his *Uttararāmacharita.*

Minor **Dramatists.**—Bhaṭṭa Nārāyaṇa, the author of the *Veṇīsaṃhāra* ("the binding up of the braid of hair," based on an incident in the Mahābhārata), is known to have been alive in A.D. 840. The piece is composed in a style similar to that of Bhavabhūti's plays, but is inferior to them in dramatic construction and poetic merit, though valued by critics for its strict adherence to the rules of the dramatic theory, and popular in India, owing to its partiality for the cult of Krishna. The *Hanuman-nitaka* is a dramatized version of the story of Rāma, interspersed with numerous purely descriptive poetic passages. Contrary to the general practice, Sanskrit alone is employed in it. The play is attributed to Dāmodara Miśra (11th cent.), but gives the impression of being the production of different hands. Bhāsa is traditionally one of the great dramatists of India, a predecessor of Kālidāsa, but nothing of his has survived.

The *Mudrārākshasa,* or "Rākshasa (the minister) with the signet," is unique in being a drama of political intrigue, partly based on historical events, the plot turning on the reconciliation of Rakshasa, the minister of the murdered king Nanda. with the hostile party, consisting of Prince Chandragupta (the Greek Sandrocottus, 315–291 B.C.), who succeeded Nanda, and his minister Chāṇakya. The plot is developed with considerable dramatic skill, in vigorous, if not particularly elegant, language. The play was composed by Viśākhadatta, not much later than A.D. 860.

The *Prabodha-chandrodaya,* or "the moon-rise of intelligence," composed by Krishṇamiśra about the 12th century, is an allegorical play, in six acts, the *dramatis personae* of which consist entirely of abstract ideas and symbolical figures divided into two conflicting hosts; it is full of vigour, however. It depicts the struggle between the wicked king Error and the good king Reason.

Lyrical, Descriptive and Didactic Poetry.—Allusion has already been made to the marked predilection of the mediaeval Indian poet for depicting in a single stanza some peculiar physical or mental situation. The profane lyrical poetry consists chiefly of such little poetic pictures, which form a prominent feature of dramatic compositions. Numerous poets and poetesses are only known to us through such detached stanzas, preserved in native anthologies or manuals of rhetoric, and enshrining a vast amount of descriptive and contemplative poetry. An excellent specimen of a longer poem, of a partly descriptive, partly erotic character, is Kālidāsa's *Meghadūta,* or "cloud messenger," in which a

banished yaksha (demi-god) sends a love-message across India to his wife in the Himālaya, and describes, in verse-pictures of the stately mandākrāntā metre the various places over which the messenger, a cloud, will have to sail in his airy voyage. Another much-admired descriptive poem by Kālidāsa is the *Ritu-saṃhāra,* or "collection of the seasons," in which the attractive features of the six seasons are successively set forth.

As regards religious lyrics, the fruit of sectarian fervour, a large collection of hymns and detached stanzas, extolling some special deity, might be made from Puriinas and other works. Of independent productions of this kind only a few of the more important can be mentioned here. Sankara Āchārya, the great Vedāntist, who seems to have flourished about A.D. 800, is credited with several devotional poems, especially the *Ānanda-laharī,* or "wave of joy," a hymn of 103 stanzas, in praise of the goddess Pārvatī. The *Sūrya-śataka,* or century of stanzas in praise of Siirya, the sun, is ascribed to Mayūra, the contemporary (and, according to a tradition, the father-in-law) of Bāṇa (in the early part of the 7th century). The latter poet himself composed the *Chaṇḍikāstotra,* a hymn of 102 stanzas, extolling Śiva's consort. The *Khaṇḍapraśasti,* a poem celebrating the ten avatāras of Vishṇu, is ascribed to no other than Hanumān, the monkey general, himself. Jayadeva's beautiful poem Gitagovinda, which, like most productions concerning Kṛishṇa, is of a very sensuous character, is a religious drama.

Didactic Poetry.— The particular branch of didactic poetry in which India is especially rich is that of moral maxims, expressed in single stanzas or couplets, and forming the chief vehicle of the *Nīti-śāstra* or ethic science. Excellent collections of such aphorisms have been published—in Sanskrit and German by Bohtlingk, and in English by John Muir. Probably the oldest original collection of this kind is that ascribed to Chāṇakya, but really much later.

Fables and Narratives.— For purposes of popular instruction stanzas of an ethical import were early worked up with existing prose fables and popular stories. A collection of this kind, a mirror for princes, was translated into Pahlavi in the reign of the Persian king Khusru Anushirvan, A.D. 531–579; but neither this translation nor the original is any longer extant. A Syriac translation, however, made from the Pahlavi in the same century, under the title of "Qualilag and Dimnag"—from the Sanskrit "Karataka and Damanaka," two jackals who play an important part as the lion's counsellors—has been discovered and published. The Sanskrit original, which probably consisted of fourteen chapters, was afterwards recast—the result being the Panchatantra, or "five books" (or headings), of which several recensions exist. A popular but late summary of this work, in four books, the *Hitopadeśa,* or "Salutary Counsel," has been shown by Peterson to have been composed by one Nārāyaṇa. Other highly popular collections of stories and fairy tales, interspersed with sententious verses, are: the *Vetālapanchaviṃśati,* or "twenty-five (stories) of the Vetāla" (the original of the Baitāl Pachisi), older than the 11th century, since both Kshemendra and Somadeva have used it; and the *Śuka-saptati,* or "seventy (stories related) by the parrot," the author and age of which are unknown.

SCIENTIFIC AND TECHNICAL LITERATURE

Law (*Dharma*).—Among the technical treatises of the later Vedic period, certain portions of the Kalpa-siitras, or manuals of ceremonial, peculiar to particular schools, are the earliest attempts at a systematic treatment of law subjects. These are the *Dharma-sūtras,* or "rules of (religious) law." The Dharmasfitras consist chiefly of strings of terse rules, containing the essentials of the science, and intended to be committed to memory, and to be expounded orally by the teacher—thus forming, as it were, epitomes of class lectures. These rules are interspersed with stanzas or "gāthās," in various metres, either composed by the author himself or quoted from elsewhere, which generally give the substance of the preceding rules. One can well understand why such couplets should gradually have become more popular, and should ultimately have led to the appearance of works entirely composed in verse. Such metrical law-books did spring up in large numbers, not all at once, but over a long period of time. These works are the metrical *Dharma-śāstras,* or, as they are usually called, the *Smriti,* "recollection, tradition,"—a term which, as we have seen, belonged to the whole body of Siitras (as opposed to the *Śruti,* or revelation), but which has become the almost exclusive title of the versified institutes of law (and the few Dharmasiitras still extant). Of metrical Smritis about forty are known to exist, but their total number probably amounted to at least double that figure.

Manu.—With the exception of a few of these works—such as the Agni-, Yama- and *Vishṇu-Smritis*—which are ascribed to the respective gods, the authorship of the Smritis is attributed to old rishis, such as Atri, Kāṇva, Vyāsa, Śāṇdilya, Bharadvāja. It is, however, extremely doubtful whether, as a rule, there really existed a traditional connection between these works and their alleged authors or schools named after them. The idea, which early suggested itself to Sanskrit scholars, that Smritis which passed by the names of old Vedic teachers and their schools might simply be metrical recasts of the Dharma- (or Grihya-) siitras of these schools, was a very natural one, and, indeed, is still a very probable one, though the loss of the original Siitras makes it difficult to prove. One could, however, scarcely account for the disappearance of the Dharmasiitras of some of the most important schools except on the ground that they were given up in favour of other works; and it is not very likely that this should have been done, unless there was some guarantee that the new works, upon the whole, embodied the doctrines of the old authorities of the respective schools. Thus, as regards the most important of the Smritis, the *Mānava-Dharmaśāstra,* there exist both a Śrauta- and a Grihya-siitra of the Miinava school of the Black Yajus, but no such Dharmasfitra has hitherto been discovered, although the former existence of such a work has been made all but certain by Professor Buhler's discovery of quotations from a *Mānavam,* consisting partly of prose rules, and partly of couplets, some of which occur literally in the Manusmriti, whilst others have been slightly altered there to suit later doctrines, or have been changed from the original trishtubh into the epic metre. The idea of an old lawgiver Manu Svāyambhuva—"sprung from the self-existent (svayam-bhii)" god Brahman (m.)—reaches far back into Vedic antiquity: he is mentioned as such in early texts; and in Yāska's *Nirukta* a śloka occurs, giving his opinion on a point of inheritance. But whether or not the Mānava-Dharmasūtra embodied what were supposed to be the authoritative precepts of this sage on questions of sacred law we do not know; nor can it as yet be shown that the Manusmriti, which seems itself to have undergone considerable modifications, is the lineal descendant of that Dharmasfitra.

The Mānava Dharmaśāstra consists of twelve books, the first and last of which, treating of creation, transmigration and final beatitude, are, however, generally regarded as later additions. In them the legendary sage Bhrigu. here called a Miinava, is introduced as Manu's disciple, through whom the great teacher has his work promulgated. Except in these two books the work shows no special relation to Manu, for, though he is occasionally referred to in it, the same is done in other Smritis. The oldest existing commentary on the *Mānava-Dharmaśāstra* is by Medhātithi, who is usually supposed to have lived in the 10th century. The most esteemed of the commentaries is that of Kulliika Bhaṭṭa, composed at Benares in the 15th century.

Yājñavalkya.—Next in importance among Smritis ranks the *Yājñavalkya Dharmaśāstra.* Based on the Manusmriti, it represents a more advanced stage of legal theory and definition than that work. Yājñavalkya, as we have seen, is looked upon as the founder of the Vājasaneyins or White Yajus, and the author of the Śatapatha-brāhmaṇa. The work bears some [illegible] to the *Pāraskara-grihyasūtra* of the *white Yajur Veda* but a [illegible] nection between it and the *Mānava-grihyasūtra* seems, however, likewise evident. As in the case of Manu, Slokas are quoted in various works from a *Brihat-* and a *Vriddha- Yājñavalkya.* The Yājñavalkya-smriti consists of three books, corresponding to the three great divisions of the Indian theory of law: *āchāra,* rule of conduct (social and caste duties); *vyavahāra,* civil and criminal law; and *prāyaśchitta,* penance or expiation.

Nāradasmriti.—The *Nāradīya-Dharmaśāstra,* or *Nāradasmriti,* is a more practical work; indeed, it is probably the most systematic and businesslike of all the Smritis. It does not concern itself with religious and moral precepts, but is strictly confined to law.

Whether any of the Dharmaśāstras were ever used in India as actual "codes of law" for the practical administration of justice is doubtful. No doubt these works were held to be of the highest authority as laying down the principles of religious and civil duty; but it was not so much any single text as the whole body of the Smriti that was looked upon as the embodiment of the divine law. Hence. the moment the actual work of codification begins in the 11th century. we find the junsts engaged in practically showing how the Smritis confirm and supplement each other, and in reconciling seeming contradictions between them. This new phase of Indian jurisprudence begins with Vijñāneśvara's *Mitāksharā,* which, although primarily a commentary on Yājñavalkya, is so rich in original matter and illustrations from other Smritis that it is far more adapted to serve as a code of law than the work it professes to explain. This treatise is held in high esteem all over India, with the exception of the Bengal or Gauriya school of law, mhich recognizes as its chief authority the digest of its founder, Jīmūtavāhana, especially the chapter on succession, entitled *Dāyabhāga.* Based on the Mitāksharā are the *Smritichandrikā,* a work of great common sense, written by Devāṇḍa Bhaṭṭa, in the 13th century, and highly esteemed in Southern India; and the *Viramitrodaya,* a compilation consisting of two chapters, on āchāra and vyavahāra, made in the first half of the 17th century by Mitramiśra, for Raja Virasimha, or Birsinh Deo of Orchhā, who inurdered Abul Fazl, the minister of the emperor Akbar, and author of the *Āīn-i* Akbari. There is no need here to enumerate any more of the vast number of treatises on special points of law. the more important of which will be found mentioned in English digests of Hindu law.

Philosophy.—The contemplative Indian mind shows at all times a strong disposition for metaphysical speculation. In the old religious lyrics this may be detected from the very first. Not to speak of the abstract nature of some even of the oldest Vedic deities, this propensity betrays itself in a certain mystic symbolism, tending to refine and spiritualize the original purely physical character and activity of some of the more prominent gods, and to impart a deep and subtle import to the rites of the sacrifice. The primitive worship of more or less isolated elemental forces and phenomena had evidently ceased to satisfy the religious wants of the more thoughtful minds. Various syncretist tendencies show the drift of religious thought towards some kind of unity and of the divine powers, be it in the direction of the pantheistic idea, or in that of an organized polytheism, or even towards monotheism. In the latter age of the hymns the pantheistic idea is rapidly gaining ground, and finds vent in various cosmogonic speculations; and in the Brāhmaṇa period we see it fully developed. The fundamental conception of this doctrine finds its expression in the two synonymous terms *brāhman* (neutr.), probably originally "mystic effusion, devotional utterance," then "holy impulse," and *ātman* (masc.), "breath, self, soul."

The recognition of the essential sameness of the individual souls, emanating all alike (whether really or imaginarily) from the ultimate spiritual essence (*parama-brahman*) "as sparks issue from the fire," and destined to return thither, involved some importanc problems. Considering the infinite diversity of individual souls of the animal and vegetable world, exhibiting various degrees of pcrfcction, is it conceivable that each of them is the immediate efflux of the Supreme Being, the All-perfect, and that each, from the lowest to the highest, could re-unite therewith directly at the close of its mundane existence? The difficulty implied in the latter question was at first met by the assumption of an intermediate state of expiation and purification, a kind of purgatory; but the whole problem found at last a more comprehensive solution in the doctrine of transmigration (*saṃsāra*). This doctrine not found in the *Rigveda* was probably aboriginal and adopted by the Aryan invaders. The notion of *saṃsāra* has become an axiom, a universally conceded principle of Indian philosophy. Thus the latter has never quite risen to the heights of pure thought; its object is indeed *jijñāsā,* the search for saving knowledge; but it is an inquiry (*mīmāṃsā*) into the nature of things undertaken not solely for the attainment of the truth, but with a view to a specific object—the discontinuance of *saṃsāra,* the cessation of mundane existence after the present life. The task of the philosopher is to discover the means of attaining moksha, "release" from the bondage of material existence, and union with the Supreme Self—in fact, salvation. Desire is due to ignorance or wrong knowledge of the true nature of things and is the cause of transmigration. The purpose of each philosophical school is to attain true and saving knowledge. Intense self-contemplation being the only way of attaining the all-important knowledge, this doctrine left little or no room for those mediatorial offices of the priest, so indispensable in ceremonial worship; and indeed we actually read of Brahman sages resorting to Kshatriya princes (in the Upanishads) to hear them expound the true doctrine of salvation. But, in spite of their anti-hierarchical tendency, these speculations continued to gain ground; and in the end the body of treatises propounding the pantheistic doctrine, the Upanishads, nere admitted into the sacred canon, as appendages to the ceremonial writings, the Brāhmaṇas. The Upanishads thus form literally "the end of the Veda," the Vedanta; but their adherents claim this title for their doctrines in a metaphorical rather than in a material sense, as "the ultimate aim and consummation of the Veda."

In later times the radical distinction between these speculative appendages and the bulk of the Vedic writings was strongly accentuated in a new classification of the sacred scriptures. According to this scheme they were supposed to consist of two great divisions—the *Karma-kāṇḍa,* "the work-section," or practical ceremonial (exoteric) part, consisting of the Saṃhitās and Brāhmaṇas (including the ritual portions of the Wranyakas), and the *Jñānakāṇḍa,* "the knowledge-section," or speculative (esoteric) part. These two divisions are also called respectively the *Pūrva-* ("former") and *Uttara-* ("latter," or higher) *kāṇḍa*; and when the speculative tenets of the Upanishads came to be formulated into a regular system it was deemed desirable that there should also be a special system corresponding to the older and larger portion of the Vedic writings. Thus arose the two systems—the *Pūrva-* (or Karma-) *mīmāṃsā,* or "prior (practical) speculation," and the *Uttara-* (or *Brāhma-*) *mīmāṃsā,* or higher inquiry (into the nature of the godhead), usually called the Vedanta philosophy.

Philosophical Systems.—It is not yet possible to determine, even approximately, the time when the so-called *Darśanas* (literally "demonstrations"), or systems of philosophy which subsequently arose, were first formulated. And, though they have certainly developed from the tenets enunciated in the Upanishads, there is some doubt as to the exact order in which these systems succeeded each other. Of all the systems the Vedanta has indeed remained most closely in touch with the speculations of the Upanishads, which it has further developed and systematized. The authoritative expositions of the systems have, however, apparently passed through several redactions; and, in their present form, these sūtra-works evidently belong to a comparatively recent period, none of them being probably older than the early centuries of our era. By far the ablest general review of the philosophical systems (except the Vedanta) produced by a native scholar is the *Sarva-darśana-saṅgraha* ("summary of all the Darśanas"), composed in the 14th century, from a Vedāntist point of view, by the great exegete Mādhava Āchārya.

Among the different systems, six are generally recognized as orthodox, as being (either wholly or for the most part) consistent with the Vedic religion—two and two of which are again more closely related to each other than to the rest, viz.:

(1) *Pūrva-mīmāṃsā* (*Mīmāṃsā*), and (2) *Uttara-mīmāṃsā* (Vedanta);
(3) *Sānkhya,* and (4) Yoga;
(5) *Nyāya,* and (6) *Vaiśeshika.*

Mīmāṃsā.—1. The (*Pūrva-*) *Mīmāṃsā* (First Inquiry) is not a system of philosophy in the proper sense of the word, but rather a system of dogmatic criticism and scriptural interpretation. It maintains the eternal existence of the Veda, the different parts **of**

which are minutely classified. Its principal object, however, is to ascertain the religious (chiefly ceremonial) duties enjoined in the Veda, and to show how these duties must be performed, and what are the special merits and rewards attaching to them. Hence arises the necessity of determining the principles for rightly interpreting the Vedic texts, as also of what forms its only claim to being classed among speculative systems, namely, a philosophical examination of the means of, and the proper method for, arriving at accurate knowledge. The foundation of this school, as well as the composition of the Sūtras or aphorisms, the *Mīmāṃsā-darśana*, which constitute its chief doctrinal authority, is ascribed to Jaimini. The Sūtras were commented on by Śabara Svāmin in his *Bhāshya*; and further annotations (*Tantra-vārttika* and *Śloka-vārttika*) thereon were supplied by the great theologian Kumārila Bhaṭṭa (about A.D. 700). The most approved general introduction to the study of the Mīmāṃsā is the metrical *Jaiminīya-Nyāya mālāvistara*, with a prose commentary, both by Mādhava Āchārya.

Vedānta.—2. The Vedanta philosophy or *Uttara-mīmāṃsā* (Second Inquiry) in the comparatively primitive form in which it presents itself in most of the older Upanishads, constitutes the earliest phase of sustained metaphysical speculation. In its essential features it remains to this day the prevalent belief of Indian thinkers, and enters largely into the religious life and convictions of the people. It is an idealistic monism, which derives the universe from an ultimate conscious spiritual principle, the one and only existent from eternity—the *Ātman*, the Self, or the Purusha, the Person, the Brahman. It is this primordial essence or Self that pervades all things. and gives life and light to them, "without being sullied by the visible outward impurities or the miseries of the world, being itself apart"—and into which all things will, through knowledge, ultimately resolve themselves. "The wise who perceive him as being within their own Self, to them belongs eternal peace, not to others." But, while the commentators never hesitate to interpret the Upanishads as being in perfect agreement with the Vedāntic system, as elaborated in later times, there is often considerable difficulty in accepting their explanations. In these treatises only the leading features of the pantheistic theory find utterance, generally in vague and mystic, though often in singularly powerful and poetical language, from which it is not always possible to extract the author's real idea on fundamental points, such as the relation between the Supreme Spirit and the phenomenal world—whether the latter was actually evolved from the former by a power inherent in him, or whether the process is altogether a fiction, an illusion of the individual self.

The foundation of the Vedanta system, as "the completion of the Veda," is naturally ascribed to Vyāsa, the mythic arranger of the Vedas, who is said to be identical with Bādarāyaṇa the reputed author of the Brahmd- (or *Śārīraka-*) *sūtra*, the authoritative, though highly obscure, summary of the system. The most distinguished interpreter of these aphorisms is the famous Malabar theologian Sankara Āchārya, who also commented on the principal Upanishads and the Bhagavadgītā, and is said to have spent the greater part of his life in wandering all over India, as far as Kashmir, and engaging in disputations with teachers—whether of the Saiva, or Vaishnava, or less orthodox persuasions—with the view of rooting out heresy and re-establishing the doctrine of the Upanishads. In Sankara's philosophy the theory that the material world has no real existence, but is a mere illusion of the individual soul wrapt in ignorance,—that, therefore, it has only a practical or conventional (*vyāvahārika*) but not a transcendental or true (*pāramārthika*) reality,—is strictly enforced. In accordance with this distinction, a higher (pard) and a lower (*aparā*) form of knowledge is recognized; the former being concerned with the Brahman (*n.*), whilst the latter deals with the personal Brahmā, the Īśvara, or lord and creator, who, however, is a mere illusory form of the divine spirit, resulting from ignorance of the human soul. To the question why the Supreme Self (or rather his fictitious development, the Highest Lord) should have sent forth this phantasmagory this great thinker (with the author of the Sūtras) can return no better answer than that it must have been done for sport (*līlā*), without any special motive—since to ascribe such a motive to the Supreme Lord would be limiting his self-sufficiency—and that the process of creation has been going on from all eternity. Sankara's *Śārīraka-mīmāṃsā-bhāshya* has given rise to a large number of exegetic treatises, of which Vāchaspati-miśra's exposition, entitled *Bhāmatī*, is the most esteemed. Of numerous other commentaries on the Brahma-sūtras, the *Śrī-bhāshya*, by Rāmānuja, the founder of the Sri-Vaishnava sect, is the most noteworthy. This religious teacher, who flourished in the first half of the 12th century, caused a schism in the Vedanta school. Instead of adhering to Sankara's orthodox advaita, or non-duality, doctrine, he interpreted the obscure Sūtras in accordance with his theory of *viśishṭādvaita*, *i.e.*, non-duality of the (two) distinct (principles), or, as it is more commonly explained, non-duality of that which is qualified (by attributes). According to this theory the Brahman is neither devoid of form and quality, nor is it all things; but it is endowed with all good qualities, and matter is distinct from it; whilst bodies consist of souls (*chit*) and matter (*achit*); and God is the soul. On the religious side, Rāmānuja adopts the tenets of the ancient Vishnuite Pāñcharātra sect, and, identifying the Brahman with Vishṇu, combines with his theory the ordinary Vaishnava doctrine of periodical descents (*avatāra*) of the deity, in various forms, for the benefit of creatures; and allowing considerable play to the doctrine that faith (*bhakti*), not knowledge (*vidyd*), is the means of final emancipation. This phase of Indian religious belief, which has attached itself to the Vedanta theory more closely than to any other, makes its appearance very prominently in the Bhagavadgitd, the episode of the *Mahābhārata*, already referred to—where, however, it attaches itself to Sānkhya-yoga rather than to Vedānta tenets—and is even more fully developed in some of the Purāṇas, especially the Bhāgavata. Its highest phase of development this doctrine probably reached in the Vaishnava sect founded, towards the end of the 15th century, by Chaitanya, whose followers subsequently grafted the Vedanta speculations on his doctrine. In opposition both to Sankara's theory of absolute unity, and to Rāmānuja's doctrine of qualified unity—though leaning more towards the latter—Mādhva Āchārya, or Pūrṇa-prajña (A.D. 1197–1276), started his dvaita, or duality doctrine, according to which there is a difference between God and the human soul (*jiva*), as well as between God and nature; whilst the individual souls, which are innumerable, eternal, and indestructible, are likewise different from one another; but, though distinct, are yet united with God, like tree and sap, in an indissoluble union. This doctrine also identifies the Brahman with Vishnu, by the side of whom, likewise infinite, is the goddess Lakshmi, as Prakṛiti (nature), from whom inert matter (jada) derives its energy. Here also bhakti, devotion to God, is the saving element. A popular summary of the Vedanta doctrine is the *Vedānta-sāra* by Sadānanda, which has been frequently printed and translated.

Sānkhya.—The *Sānkhya* system seems to derive its name from its systematic enumeration (sankhyd) of the twenty-five principles (tattva) it recognizes—consisting of twenty-four material and an independent immaterial principle. In opposition to the Vedanta school, which maintains the eternal coexistence of a spiritual principle of reality and an unspiritual principle of unreality, the Sānkhya assumes the eternal coexistence of a material first cause, which it calls either *mūla-Prakṛiti* (fem.), "prime Originant" (matter), or *Pradhāna*, "the principal" cause, and a plurality of individual souls, Purusha, which continually interact on one another. The system recognizes no intelligent creator (such as the *Īśvara*, or demiurgus, of the Vedānta)—whence it is called *nirīśvara*, godless; but it conceives the Material First Cause, itself unintelligent, to have become developed, by a gradual process of evolution, into all the actual forms of the phenomenal universe, excepting the souls. Its first emanation is *buddhi*, intelligence; whence springs *ahaṃkāra*, consciousness; thence the subtle elements of material forms, namely, five elementary particles (*tanmātra*) and eleven organs of sense; and finally, from the elementary particles, five elements. The souls have from all eternity been connected with matter,—having in the first place become invested with a subtle frame (*liriga-*, or

sūkshma-, śarīra), consisting of seventeen principles, namely, intelligence, consciousness, elementary particles, and organs of sense and action, including mind. To account for the spontaneous development of matter, the system assumes the latter to consist of three constituents (*guṇa*) which are possessed of different qualities, viz. sattva, of pleasing qualities, such as "goodness," lightness, luminosity; rajas, of pain-giving qualities, such as "force," passion, activity; and tams, of deadening qualities, such as "darkness," rigidity, dullness, and which, if not in a state of equipoise, cause unrest and development. Through all this course of development, the soul itself remains perfectly detached, its sole properties being those of purity and intelligence, and the functions usually regarded as "psychic" being due to the mechanical processes of the internal organs themselves evolved out of inanimate matter. Invested with its subtle frame, which accompanies it through the cycle of transmigration, the soul, for the sake of fruition, connects itself ever anew with matter, thus, as it were, creating for itself ever new forms of material existence; and it is only on attaining perfect knowledge, which reveals the absolute distinction between soul and matter, that the Purusha is liberated from the miseries of Saṃsāra, and continues to exist in a state of absolute consciousness and detachment from matter. The existence of God, on the other hand, is denied by this theory, or rather considered as incapable of proof; the existence of evil and misery, for one thing, being thought incompatible with the notion of a divine creator and ruler of the world.

The reputed originator of this school is the sage Kapila, to whom tradition ascribes the composition of the fundamental text-book, the *Sānkhya-sūtra,* or *Sānkhya-pravachana,* as well as the *Tattva-samāsa,* a mere catalogue of the principles but these are comparatively modem. Probably the oldest existing work is Īśvarakrishṇa's excellent *Sānkhya-kārikā,* which gives, in the narrow compass of sixty-nine ślokas, a lucid and complete sketch of the system.

Yoga.—The Yoga system is a branch of the preceding school, holding the same opinions on most points treated in common in their Sūtras, with the exception of one important point, the existence of God. To the twenty-five principles (tattva) of the Niriivara Sānkhya, the last of which was the *Purusha,* the Yoga adds, as the twenty-sixth, the *Nirguṇa Purusha,* or Self devoid of qualities, the Supreme God of the system. Hence the Yoga is called the *Seśvara* (theistical) *Sānkhya.* But over and above the purely speculative part of its doctrine, which it has adopted from the sister school, the theistic Sānkhya has developed a complete system of mortification of the senses—by means of prolonged apathy and abstraction, protracted rigidity of posture, and similar practices—many of which are already alluded to in the Upanishads—with the view of attaining complete concentration (yoga) on, and an ecstatic vision of, the Deity, and the acquisition of miraculous powers. It is from this portion of the system that the school derives the name by which it is more generally known.

Nyāya and *Vaiśeshika.*—The *Nyāya* and *Vaiśeshika* (the latter the older) are separate branches of one and the same school, which supplement each other and the doctrines of which have virtually become amalgamated into a single system of philosophy. The term Nyāya (*ni-āya,* "in-going," entering), though properly meaning "analytical investigation," as applied to philosophical inquiry generally, has come to be taken more commonly in the narrower sense of "logic," because this school has entered more thoroughly than any other into the laws and processes of thought, and has worked out a formal system of reasoning which forms the Hindu standard of logic.

The followers of these schools generally recognize six categories (*padārtha*): substance (dravya), quality (*guṇa*), action (karma), generality (*sāmānya*), particularity (*viśesha*), intimate relation (*samavāya*) to which was added a seventh, non-existence (*abhāva*). Substances forming the substrata of qualities and actions are of two kinds: eternal (without a cause), namely, space, time. ether, soul and the atoms of mind, earth, water, fire and air; and non-eternal, comprising all compounds, or the things we perceive, and which must have a cause of their existence. Causality is of three kinds: that of intimate relation (material cause); that of non-intimate relation (between parts of a compound); and instrumental causality (effecting the union of component parts). Material things are thus composed of atoms (*aṇu*), *i.e.*, ultimate simple substances, or units of space, eternal, unchangeable and without dimension, characterized only by "particularity (*viśesha*)." It is from this predication of ultimate "particulars" that the Vaiieshikas, the originators of the atom istic doctrine, derive their name The Nyāya draws a clear line between matter and spirit, and has worked out a careful and ingenious system of psychology. It distinguishes between individual or living souls (*jīvātman*), which are numerous, infinite and eternal, and the Supreme Soul (Paramitman), which is one only, the seat of eternal knowledge, and the maker and ruler (*Īśvara*) of all things. It is by his will and agency that the unconscious living souls (soul-atoms, in fact) enter into union with the (material) atoms of mind, etc., and thus partake of the pleasures and sufferings of mundane existence.

The original collection of *Nyāya-sūtras* is ascribed to Gautama, and that of the *Vaiśeshika-sūtras* to Kaṇāda. The etymological meaning of the latter name seems to be "atom eater," whence in works of hostile critics the synonymous terms *Kaṇa-bhuj* or Kana-bhaksha are sometimes derisively applied to him, doubtless in allusion to his theory of atoms.

Heretical Systems.—As regards the different heretical systems of Hindu philosophy, there is no occasion, in a sketch of Sanskrit literature, to enter into the tenets of the two great anti-Brāhmanical sects, the Jainas and Buddhists. Among the minor systems may be mentioned the following:

The *Chārvākas* are an ancient sect of undisguised materialists, who deny the existence of the soul, and consider the human person (*purusha*) to be an organic body endowed with sensibility and with thought, resulting from a modification of the component material elements, but their authoritative text-book, the *Bārhaspatya-sūtra,* is only known so far from a few quotations in polemics against the school. The sect was anti-Brahmanical and such moral teaching as it taught was pure hedonism.

The *Pāñcharātras,* or *Bhāgavatas,* are an early Vaishnava sect, in which the doctrine of faith, already alluded to, is strongly developed. Hence their tenets are defended by Rāmānuja, though they are partly condemned as heretical in the Brahma-sūtras.

The *Pāśupatas,* one of several *Śaiva* (Māheśvara) sects, hold the Supreme Being (*Īśvara*), whom they identify with Siva (as *paśu-pati,* or "lord of beasts"), to be the creator and ruler of the world, but not its material cause. With the Sānkhyas they admit the notion of a plastic material cause, the *Pradhāna;* while they follow Patañjali in maintaining the existence of a Supreme God.

Grammar (Vyākaraṇa).—*Pāṇini.* Linguistic inquiry, phonetic as well as grammatical, was early resorted to both for the purpose of elucidating the meaning of the Veda and with the view of settling its textual form. The particular work which came ultimately to be looked upon as the "vedāṅga" representative of grammatical science, and has ever since remained the standard authority on Sanskrit grammar in India, is Pāṇini's *Ashṭādhyāyī,* so called from its "consisting of eight lectures (*adhyāya*)," of four *pādas* each. For a comprehensive grasp of linguistic facts, and a penetrating insight into the structure of the vernacular language, this work stands probably unrivalled in the literature of any nation—though few other languages, it is true, afford such facilities as the Sanskrit for a scientific analysis. Pāṇini's system of arrangement differs entirely from that usually adopted in our grammars, namely, according to the parts of speech. As the work is composed in aphorisms intended to be learnt by heart, economy of memory-matter was the author's paramount consideration. His object was chiefly attained by the grouping together of all cases exhibiting the same phonetic or formative feature. no matter whether or not they belonged to the same part of speech. For this purpose he also makes use of a highly artificial and ingenious system of algebraic symbols, consisting of technical letters (*anubandha*), used chiefly with suffixesand indicative of the changes which the roots or stems have to undergo in word-formation. The date of

Pāṇini has been the subject of much discussion but may be safely put at about 400 B.C.

Pāṇini mentions some sixty-four predecessors which shows that this study had undergone a long process of development. Perhaps the most important of his predecessors was Sākaṭāyana, also mentioned by Yāska—the author of the Nirukta, who is likewise supposed to have preceded Piinini—as the only grammarian (*vaiyākaraṇa*) who held with the etymologists (*nairukta*) that all nouns are derived from verbal roots.

Pāṇini's Sūtras continued for ages after to form the centre of grammatical activity. But, as his own work had superseded those of his predecessors, so many of the scholars who devoted themselves to the task of perfecting his system have sunk into oblivion.

Kātyāyana.—The earliest of his successors whose work has come down to us (though perhaps not in a separate form) is Kātyāyana, the author of a large collection of concise critical notes, called *Vārttika,* intended to supplement and correct the Siitras, or give them greater precision.

Patañjali.—Kātyāyana was followed by Patafijali, the author of the (*Vyākaraṇa-*) *Mahā-bhāshya,* or Great Commentary, who flourished about 150 B.C. For the great variety of information it incidentally supplies regarding the literature and manners of the period, this is, from an historical and antiquarian point of view, one of the most important works of the classical Sanskrit literature. The Mahābhāshya is not a continuous commentary on Pāṇini's grammar, but a collection of the critical comments or *kārikās* on 1,713 of the 4,000 rules of Pāṇini. Patafijali is also called Gonardiya perhaps meaning "a native of Gonarda," a place, probably identical with Goṇḍa, a town some 20 m. northwest of Oudh—and Goṇikāputra, or son of Goṇikā.

Lexicography.—Sanskrit dictionaries (*kośa*), invariably composed in verse, are either homonymous or synonymous, or partly the one and partly the other. There are occasional attempts at alphabetical order in the former but not in the latter. There are many intended for the use of poets and are collections of rare words and synonyms, rather than lexicons of the language. The great dictionary is the famous *Amara-kośa* ("immortal treasury") by Amarasimha, who probably lived early in the 6th century. This dictionary consists of a synonymous and a short homonymous part; whilst in the former the words are distributed in sections according to subjects, such as heaven and the gods, time and seasons, etc.; in the latter they are arranged according to their final letter, without regard to the number of syllables.

Prosody (**Chhandas**).—The oldest treatises on prosody have already been referred to in the account of the technical branches of the later Vedic literature. Among more modem treatises the most important is the *Mrita-sanjīvanī,* a commentary on Pingala's Sūtra, by Halāyudha (perhaps identical with the author of the glossary above referred to). Sanskrit prosody, which is probably not surpassed by any other either in variety of metre or in harmoniousness of rhythm, recognizes two classes of metres, namely, such as consist of a certain number of syllables of fixed quantity, and such as are regulated by groups of breves or metrical instants, this latter class being again of two kinds, according as it is or is not bound by a fixed order of feet.

Music (**Saṅgīta**).—The musical art has been practised in India from early times. The theoretic treatises on profane music now extant are, however, quite modern productions. The two most highly esteemed works are the *Saṅgīta-ratnākara* ("jewel-mine of music"), by *Śārngadeva,* and the *Saṅgīta-darpaṇa* ("mirror of music"), by Dāmodara. Each of these works consists of seven chapters, treating respectively of—(I) sound and musical notes (svara); (2) melodies (*rāga*); (3) music in connection with the human voice (*prakīrṇaka*); (4) musical compositions (prabandha); (5) time and measure (*tāla*); (6) musical instruments and instrumental music (*vādya*); (7) dancing and acting (nyitta or *nritya*).

Rhetoric (**Alaṅkāra-śāstra**).—Treatises on the theory of literary composition are very numerous. Indeed, a subject of this description—involving such nice distinctions as regards the various kinds of poetic composition, the particular subjects and characters adapted for them, and the different sentiments or mental conditions capable of being both depicted and called forth by them—could not but be congenial to the Indian mind. The *Nātya Śāstra* of Bharata is possibly as early as the sixth century. Not much later is the *Kāvyādarśa,* or "mirror of poetry," by Dandin, the author of the novel *Daśakumāracharita.* The work consists of three chapters, treating—(I) of two different local styles (riti) of poetry, the Gaudi or eastern and the Vaidarbhi or southern (to which later critics add four others, the Pāñchālī, Māgadhī, Lāṭī, and Āvantikā); (2) of the graces and ornaments of style, as tropes, figures, similes; (3) of alliteration, literary puzzles and twelve kinds of faults to be avoided in composing poems. Other important works are the *Kāvyālaṅkāra,* by the Kashmirian Rudraṭa (9th century), the *Daśarūpa,* or "ten kinds of drama," by Dhanaṃjaya (10th century), the Sarasvati-*kaṇṭhābharaṇa,* "the neck-ornament of Sarasvati (the goddess of eloquence)," a treatise, in five chapters, on poetics generally (11th century), the *Kāvya-prakāśa,* "the lustre of poetry," (12th century) by Mammaṭa, a Kashmirian, and the late but important *Sāhitya-darpaṇa* (*c.* A.D. 1450).

Medicine (**Āyur-veda, Vaidya-śāstra**).—Though the early cultivation of the healing art is amply attested by frequent allusions in the Vedic writings, it was doubtless not till a much later period that the medical practice advanced beyond a certain degree of empirical skill and pharmaceutic routine. From the simultaneous mention of the three humours (wind, bile, phlegm) in a *vārttika* to Pāṇini (v. 1, 38), some kind of humoral pathology would, however, seem to have been prevalent among Indian physicians several centuries before our era. The oldest existing work is supposed to be the *Charaka-saṃhitā,* a bulky cyclopaedia in Slokas, mixed with prose sections, which consists of eight chapters, and was probably composed for the most part in the early centuries of our era. Whether the Chinese tradition which makes Charaka the court physician of King Kanishka (c. A.D. 100) rests on fact is uncertain. Of equal authority, but doubtless somewhat more modern, is the *Suśruta* (*-saṃhitā*), which Suśruta is'said to have received from Dhanvantari, the Indian Aesculapius, whose name, however, appears also atnong the "nine gems." It consists of six chapters, and is likewise composed in mixed verse and prose—the greater simplicity of arrangement, as well as some slight attention paid in it to surgery, betokening an advance upon Charaka. Both works are, however, characterized by great prolixity, and contain much matter which has little connection with medicine.

Astronomy and Mathematics.—Early Indian astronomical knowledge is summed up in the *Jyotisha Vedānga* (ed. Weber, 1862). A more scientific era is marked by the appearance of the five original Siddhāntas (partly extant in revised redactions and in quotations), the very names of two of which suggest Western influence, namely, the *Paitāmaha-, Sūrya-,* Vasishtka-, Romaka- (*i.e.,* Roman) and *Pauliśa-siddhāntas.* Based on these are the works of the most distinguished Indian astronomers, namely, Aryabhata, probably born in 476; Varāha-mihira, probably 505–587; Brahmagupta, who completed his *Brahma-sphuta-siddhānta* in 628; Bhatfa Utpala (10th century), distinguished especially as commentator of Varāha-mihira; and Bhāscara Āchārya, who, born in 1114, finished his great course of astronomy, the *Siddhānta-śiromani,* in 11 jo.

In the works of several of these writers, from Aryabhata onwards, special attention is paid to mathematical (especially arithmetical and algebraic) computations. The question whether Aryabhata was acquainted with the researches of the Greek algebraist Diophantus (c. A.D. 360) remains still unsettled, hut, even if this was the case, algebraic science seems to have been carried by him beyond the point attained by the Greeks,

(H. J. E.; J. AL.)

SANSON, CHARLES HENRI (b. 1739), public executioner of Paris from 1788 to 1795, was great-grandson of Charles Sanson, who had received in 1688 the office of *exécuteur des hautes oeuvres de Paris,* which became hereditary in his family. Sanson's brothers exercised the same trade in other towns. In the last days of 1789 Gorsas in the *Courrier de Paris* accused Sanson of harbouring a Royalist press in his house. Sanson was brought to trial, but acquitted, and Gorsas withdrew the accusation. After the execution of Louis XVI., a statement by Sanson was inserted in the *Thermomètre politique* (13th February 1793) in contradiction of the false statements made in respect of the king's behaviour when confronted with death. He surrendered his office in 1795 to his son Henri, who had been his deputy for some time, and held his father's office till his death in 1840. There is no record of the elder Sanson's death. Henri's son Clément Henri was the last of the family to hold the office.

The romantic tales told of C. H. Sanson have their origin in the apocryphal *Mémoires pour servir à l'histoire de la Révolution Française par Sanson* (2 vols. 1829). Other *Mémoires of Sanson,* edited by A. Grégoire (ps. for V. Lombard) in 1830, and by M. d'Olbreuze (6 vols., 1862–63) are equally fictitious. The few facts definitely ascertainable are collected by G. Lenôtre in *La Guillotine pendant la Révolution* (1893).

SANSOVINO, ANDREA CONTUCCI DEL MONTE (1460–1529), Florentine sculptor and architect, was the son of a shepherd, Niccolo di Domenico Contucci, and was born at Monte Sansovino near Arezzo, whence he took his name. He was a pupil of Antonio Pollaiuolo, and at first worked in the style of 15th-century Florence. Early works are: the terra-cotta altarpiece in Santa Chiara at Monte Sansovino, and the marble reliefs of the "Annunciation," the "Coronation of the Virgin," a "Pietà," the "Last Supper," and various statuettes in the Corbinelli chapel of S. Spirito at Florence. In 1490 he was invited to Portugal by King John II. and some pieces of sculpture by him still exist in the monastic church of Coimbra. These early reliefs show strongly the influence of Donatello. The beginning of a more pagan style is shown in the statues of "St. John baptizing Christ" over the east door of the Florentine baptistery. This group was, however, finished by the weaker hand of Vincenzo Danti. In 1502 he executed the marble font at Volterra, with good reliefs of the "Four Virtues" and the "Baptism of Christ." The statues of the Virgin and John the Baptist in the cathedral of Genoa were completed in 1503. His earliest work in Rome is probably the monument of Pietro da Vicenza (1504), in the church of Ara Coeli. The monuments of Cardinal Ascanio Maria Sforza and of the bishop Hieronimus Bassus for the church of S. Maria del Popolo are among his most important works. In 1512, Sansovino executed a group of the "Madonna and Child with St. Anne," now over one of the side altars in the church of S. Agostino. From 1513 to 1528 he was at Loreto, where he cased the outside of the Santa Casa in white marble, covered with reliefs and statuettes in niches; most of the sculpture was executed by assistants. Jacopo Sansovino was his best pupil.

SANSOVINO, JACOPO (1486–1570), Italian sculptor and architect, whose palaces and churches determined the Renaissance character of Venice, was born in Florence on July 2, 1486. In 1502 he entered the Florence workshop of the sculptor Andrea Sansovino, and soon thereafter, as a sign of admiration, he adopted his master's name in exchange for his own family name of Tatti. In 1505 he accompanied Giuliano da Sangallo to Rome, studying there ancient architecture and sculpture while employed by Pope Julius II in the restoration of ancient statues. Back in Florence he carved, from 1511 to 1518, the statue of St. James the Elder as the first of 12 statues of the apostles for the piers under the dome of the cathedral; these had been commissioned originally in 1503 to Michelangelo, who only began one of them, the St. Matthew. It is the influence of this St. Matthew as well as that of Andrea Sansovino which inspired the "St. James." The "Bacchus" in the Museo Nazionale, Florence, created during the same period, was entirely un-Michelangelesque, full of the uncomplicated movement and gaiety of Hellenistic bronzes. From 1518 Jacopo worked in Rome, first on the Madonna and Child in S. Agostino and, probably slightly later, on the St. James (Sta. Maria di Monserrato), building at the same time the churches of S. Marcello in Corso and S. Giovanni dei Fiorentini.

In 1527, after the sack of Rome by the troops of Emperor Charles V, he fled to Venice, where he remained the rest of his life. Appointed chief architect of the city, he built, on the Grand canal, the Palazzo Corner (1532), still very austerely Tuscan with two stories of doubled half columns over a rustic base; in 1536 he began the library of S. Marco, with an open loggia on the ground floor and that free and festive decoration which the spirit of Venice demanded; at the same time he built the adjoining mint, with sombre rusticated half columns. The Loggetta, an open porch at the foot of the campanile of S. Marco, was built in 1540 and decorated with four bronze statues of Apollo, Mercury, Minerva and Peace, symbols of the city's power in war and in the peaceful pursuit of trade and the arts. These figures, elegant, sprightly, strongly moved within themselves, continued an older Venetian tradition that took its inspiration from Titian. The solemn portrait style of the mature Titian is found in a late work, the bronze portrait of the physician Tommaso Rangone over the entrance door to the church of S. Giuliano (1554), which Jacopo also built. The colossal statues of Mars and Neptune in the court of the ducal palace show the severe style of Jacopo's old age (1554–56), as does the monument to the doge Francesco Venier in S. Salvatore (1556–61). Among earlier works are the bronze statuettes of the four evangelists and the bronze door of the sacristy in S. Marco (1540s). The marble statue of the youthful St. John the Baptist (1554) in Sta. Maria de' Frari shows the transition from this style to that of Jacopo's old age. He died in Venice on Sept. 27, 1570.

SAN STEFANO, TREATY OF, a treaty signed between Russia and Turkey on March 3, 1878, concluding the Russo-Turkish War. It created a very great vassal principality of Bulgaria, enlarged Serbia, and increased Montenegro to three times its size. The independence of all three States was recognized by the Porte. Russia obtained the Dobrudja, Ardahan, Kars, Bayazid and Batum, and the demolition of all the Danube fortresses. Improved conditions were promised the Armenian Christians; the autonomy of Bosnia-Hercegovina was to be admitted. But the treaty was viewed with concern by other countries.

In effect this treaty would have disintegrated the Turkish empire. The additional power falling to Russia directly and indirectly would have been tremendous. In the Balkans themselves there were protests from the Armenians and Greeks who, especially, would be sufferers in the rearrangement of territories, and from all the inhabitants of the different ceded provinces. Great Britain was especially opposed to the treaty because of the almost certainty that the Big Bulgaria would prove to be entirely under Russian influence. Austria also saw her Balkan interests threatened, and it was Austria who first demanded that the whole matter should be discussed by a European congress. The consequence was the meeting of the Congress of Berlin (*q.v.*), June 13–July 13, 1878, which entirely redrafted the Treaty of San

Stefano. (See also EASTERN QUESTION.)

SANTA ANA, in area the largest department in El Salvador, bordering Guatemala. Area 768 sq.mi. Pop. (1950) 202,453. nearly 60% rural and concentrated in the southern third of the department. Most of the department is rough land; in the southern third there are several volcanoes, including Volcán de Santa Ana (altitude 7.812 ft.), the highest mountain in the country. The northern part has many deep valleys, tributaries of Lempa valley. Santa Ana produces a substantial portion of El Salvador's coffee. mostly on fertile soils on slopes of volcanoes at altitudes between 1,800 and 4.000 ft. It also produces beans, livestock. vegetables, corn, fruits and cheese. The city of Santa Ana (*q* v.) is the departmental capital. (C. F. J.)

SANTA ANA, capital of the department of Santa Ana, El Salvador. 44 mi. by Inter-American highway and 50 mi. by railway N.W. of San Salvador. Pop. (1950) 51,702. It is situated at 2,120 ft. altitude in a rich agricultural area and a few miles north of several high volcanoes and Lake Coatepeque: famous for its beauty. mineral waters, bathing, fishing and sailing. Santa Ana has modern schools, hospitals, theatres and public buildings and a colonial cathedral of fine Spanish Gothic architecture. It is important in commerce and industry. Various textiles, clothing, foodstuffs, leather goods, liquors, cigars, pottery and wood products are manufactured. Nine miles west of Santa Ana is the city of Chalchuapa, in the midst of extensive archaeological remains, especially at the pre-Spanish town of Pampe nearby. (C. F. J.)

SANTA ANA, a city in the southeast coastal region of southern California, U.S., 35 mi. S.E. of Los Angeles (*q.v.*), 10 mi inland from the ocean shore line and approximately 40 mi. from the mountain ranges to the north and east; the county seat of Orange county and a part of the Los Angeles standard metropolitan statistical area. Santa Ana is located on the freeway that bears its name and which connects Los Angeles to San Diego; it is also served by the Orange county airport and the Los Angeles International airport. The city is within driving range of beach, mountain and desert resorts. The mixing of cool breezes from the ocean and drier winds from the desert over the coastal plains gives it an ideal climate. The public-school system includes facilities through junior college, with special provision for the training of exceptional children. The rich Santa Ana valley is noted for its oranges, avocados, dairy products. beans and cattle. The city also possesses some industry. Santa Ana was laid out in 1869 on land procured from Rancho Santiago de Santa Ana, an old Spanish land grant, and was incorporated in 1886. It has a council-manager form of government, in effect from 1952.

Pop. (1960) 100.350, (WM. H. K.)

SANTA ANNA, ANTONIO LÓPEZ DE (1794–1876), Mexican army officer and political figure, the storm centre of Mexican history for half a century, was born the son of a petty colonial official in Jalapa, Veracruz, on Feb. 21, 1794. He became a cadet in the Spanish colonial army in 1810 and for several years served on the northern frontier against Indians and border ruffians. In 1821 he supported the Plan de Iguala, from which emerged independent Mexico (see MEXICO: Colonial Period). Rebuffed for preferment under the new emperor Agustin de Iturbide—he was already considered a dangerous man—Santa Anna pronounced for the republic which overthrew the empire. After more frontier service he commanded the abortive effort to effect a revolution in Cuba from Yucatán. After helping to overthrow the president he continued his military service in 1829 by defeating an invading Spanish force at Tampico. Following a short retirement he seized power and began the first of five personal administrations, three times as representative of one party and twice as spokesman of the opposition. In 20 years he veered from liberal to ultra-conservative. He led Mexican troops to suppress the Texan revolt but was captured at San Jacinto in east Texas in 1836. He returned to retirement in Mexico through Washington, D.C., but emerged to fight the French occupation forces at Veracruz. Wounded, he lost a leg; a hero, he again became president until he was exiled to Cuba for incompetence and extravagance. In the Mexican-United States war, after a secret agreement with Pres. James K. Polk, he assumed the Mexican presidency, but as commander he prematurely rushed his troops to the north, where desert campaigning, complicated by a drawn battle with Gen. Zachary Taylor, cost him an army. Back in Mexico City he reformed the demoralized government. then engaged Gen. Winfield Scott, who was advancing from Veracruz. He mas defeated, his capital was lost. and he returned to exile in Jamaica and New Granada. In 1853 governmental chaos again recalled him to become president, but age had exaggerated his shortcomings and he was again banished in 1855. Ten years later he sought United States support with which to oust Maximilian, whom French forces had placed on the Mexican throne; at the same time he had offered his services to Maximilian. Santa Anna had prostituted his talents too often; both proposals were refused. A decade later still. a blind and broken old man, he was permitted to return to Mexico City, where he died in poverty on June 21, 1876.

Santa Anna possessed a magnetic personality and real qualities of leadership, but his lack of principles, his pride, love of military glory and extravagance, coupled with disregard for and incompetence in civil affairs, led his country into a series of disasters and himself into obloquy and tragedy. (W. H. CT.)

SANTA BARBARA, a department in northwestern Honduras. bordering Guatemala, and its capital city. Pop. (1950), department. 96,397; city, 3,218. Area (department) 1.975 sq.mi. The population is chiefly in the Ulua and tributary mountain valleys in the southern third of the department and in the Chamelecón lowland across the north central part; the mountainous areas in the northern and central portions are sparsely settled. Modern highways connect some settled areas with railways and with the Inter-Ocean highway near San Pedro Sula. About 50% of the area of the department is in farms. Products include coffee and corn, tobacco, sugar, beans, poultry and rice. (C. F. J.)

SANTA BARBARA, a seaside resort and residential city of California, U.S., 97 mi. N.W. of Los Angeles; the county seat of Santa Barbara county. While the city lies on a coastal shelf, it spreads like a fan from curving beaches to the mesas, slopes and oak-covered canyons of the Santa Ynez mountains. Protected by the Channel Islands and the mountains, Santa Barbara has a mild climate throughout the year.

The city's Museum of Xatural History has artifacts recording the area's early Indian cultures, and the Santa Barbara Historical society's holdings describe the beginnings of the Spanish presidio in 1782 and the story of the construction of the "Queen of the Missions." a neoclassical structure which was founded in 1786. The mission is now the Franciscan headquarters for the Pacific coast. John Charles Frémont (*q.v.*) raised the U.S. flag at the presidio in 1846. claiming the area for the U.S. (see CALIFORNIA: *History*). In 1850 Santa Barbara was incorporated as a city and in 1887 the railroad reached it. Descendants of original Spanish. Mexican and Yankee settlers participate in the annual Old Spanish Days fiesta, recalling Santa Barbara's early history. The city is the centre of a rich orchid, citrus, walnut and cattle-raising area with oil fields and light manufacturing. Nearby are Vandenberg air base and research industries; a campus of the University of California and the Center for the Study of Democratic Institutions. directed by Robert M. Hutchins under the auspices of the Fund for the Republic, have made Santa Barbara an educational centre. Attractions include an art museum, a music academy. botanical gardens and theatre arts, uith multiple opportunities for outdoor recreation and sports. Pop. (1960) 58.768

See *Santa Barbara, a Guide to the Channel City and Its Environs* in the "American Guide Series" (1953). (W. R. J.)

SANTA BARBARA ISLANDS, a chain of four islands lying parallel to the southern coast line of California, at an average distance of 20 mi. from the mainland. The term Channel Islands is sometimes used to designate these islands and four others, including Santa Catalina (*q.v.*). All are part of the state of California.

Santa Cruz is the largest of the Santa Barbara Islands, covering nearly 98 sq.mi. The terrain varies from sea-level valleys to sharp-sloped wooded peaks which exceed 2,400 ft. Two ranches and a small military installation have constituted its maximum population. Sheep and cattle raising are the primary enterprises;

the island abounds with wild and semiwild sheep which are descendants of former domestic flocks. Prior to the advent of prohibition in 1920 the island was also noted for its fine wines.

Anacapa. the smallest of the group, is a razorbacked volcanic ridge which stretches 4½ mi. but averages less than ½ mi. in width. It is broken into three segments, one of which supports a coast guard station and lighthouse.

Santa Rosa, a cattle ranch, shows a marked change in topography. Its 84 sq.mi. are mostly open grasslands, intersected by numerous spring-fed canyons.

San Miguel is a rapidly eroding uninhabited island made up of 15 sq.mi. of weather-cut ravines and shifting sands. It was once valuable for raising livestock, but heavy overgrazing in the mid-1800s surrendered its soil to the ever-present winds. There are large sea elephant and sea lion colonies on the westernmost tip.

The island chain has plant and animal life not found on the mainland, and there are often differences in characteristics of a plant or animal on one island as compared with the same type on another island.

Juan Rodriguez Cabrillo. who explored the coast of California in 1542–43, is believed to have been buried on one of these islands. He found them populated with the now extinct Canaliño Indians. Two of the eight islands termed Channel Islands. Santa Barbara and Xnacapa, were included in the Channel Islands National monument established in 1938. (EA. W.)

SANTA CATALINA, an island near the coast of California, 24 mi. S.S.W. of Los Angeles harbour. The most highly developed of the eight Channel Islands off the coast of southern California, it is 20 mi. long, 8 mi. wide at its greatest width. and has an area of 74 sq.mi. Structurally, Santa Catalina is a small mountain range rising from the continental shelf to a maximum elevation of 2,125 ft. above sea level at Mt. Orizaba. Mountain spurs and canyons transverse to the main range form many interesting headlands and protected coves at the shore line. The climate is of Mediterranean type with warm, dry summers, mild winters and light winter rains. It is generally cooler in summer and milder in winter than the adjacent mainland.

Santa Catalina has been a tourist centre for decades, drawing tens of thousands of visitors annually to its gentle climate, beaches, boating and scenery. Notable attractions are the famous undersea "gardens" near Avalon bay. where luxuriant marine life may be viewed from glass-bottomed boats, and Catalina Bird park. . The island's waters, visited throughout the year by thousands of boating enthusiasts and sportfishermen from nearby mainland ports, are noted fishing grounds, Avalon, population (1950) 1,506, near the southeastern end of the island, is the only city and is the centre of the tourist industry. It has frequent boat and air service from both Long Beach and Los Angeles.

Santa Catalina was discovered in 1542 by Juan Rodriguez Cabrillo, Portuguese navigator in the service of Spain. Sebastián Vizcaino, also sailing under the flag of Spain, rediscovered the island in 1602 on the eve of the feast of St. Catherine and named it Santa Catalina in honour of the saint. A part of the republic of Mexico after 1822, it became part of California with the signing of the Treaty of Guadalupe Hidalgo ending the Mexican War in 1848. Its development as a tourist centre dates from 1919, when it was purchased by William Wrigley. (R. A. K.)

SANTA CATARINA, a southern state of Brazil, bounded on the north by Paraná, on the east by the Atlantic ocean, on the south by Rio Grande do Sul and on the west by the Argentine territory of Misiones. Area 36,601 sq.mi. Pop. (1950) 1,560,502; (1956 est.) 1,852,257.

Immediately behind the coast the Great Escarpment rises like a mountain wall, and the state contains very little level land. Only along the lower Itajai river and around Joinvile and São Francisco are there narrow bits of wet lowland. Santa Catarina Island, on which the state capital, Florianópolis (*q.v.*), is situated. is a ridge of steep hills. The Great Escarpment in the state is broken into a series of steps, deeply dissected by the Itajaí-Açu and its tributaries. Above the scarp, the surface of the Paraná plateau slopes gently westward, drained by the Uruguai river. The coastal zone is hot and rainy, but on the plateau frosts are sometimes experienced in the winter. The southernmost extension of the tropical rain forest occurs along the coast, but in the frost zone at higher altitudes the forest comprises a mixture of broadleaf deciduous trees and taller Araucaria pines. Among the latter are grassy openings, originally covered with tall prairie grasses.

The first settlements by the Portuguese from São Paulo were on the prairies of the highlands and on Santa Catarina Island off the shore., The dense coastal forests were left empty until the arrival of German colonists after 1850. Blumenau, in the valley of the Itajai, was one of the first German towns. and Brazilians of German origin have non spread out from Blumenau throughout the coastal zone and in the valleys of the plateau. Colonies of Italians and Poles also settled in this state.

The economy of the area is varied. The farmers grow maize, to be fed to hogs, and also wheat, potatoes, tobacco. rice and a variety of fruits and vegetables. The chief industries include meat processing, vegetable and fruit canning, textile milling, maté processing (from fhe leaves of the yerba maté tree), sawmilling and brewing. A paper factory is in operation at Blumenau. The best coal in Brazil is mined 69 mi. N.W. of Tubarão along the southern coast. (P. E. J.)

SANTA CLARA (locally VILLA CLARA), capital of Las Villas province, Cuba, about 160 mi. E.S.E. of Havana. It is situated near the geographic centre of the island on the Central highway and is the junction point of the main railroads of Cuba. Initially dependent on the livestock industry, it flourished on sugar and tobacco in the 20th century. Pop. (1953) 77,398.

The city was founded in 1689 by 18 families from Remedios, escaping constant dangers of pirates. It occupies the site of the ancient Indian Cubanacan, which according to some authorities Columbus mistakenly took to be the headquarters of Kublai Khan. (D. R. D.)

SANTA CLARA, a city of Santa Clara county in west central California. U.S., 48 mi. S. of San Francisco and immediately adjacent to the city of San Jose (*q.v.*) on the southeast; a part of the San Jose standard metropolitan statistical area. Santa Clara has a mean temperature of 57° F. and an annual rainfall of 15.19 in. Founded in 1777 as the eighth of the Spanish Franciscan missions in California—hence its title "the Mission city"—it n-as incorporated as a city in 1852 and adopted the council-manager form of government in 1952. The Spanish influence is evident in place names, architecture and the restored mission. The city's economy historically rested upon the processing of prunes, apricots and other fruits and vegetables of the rich Santa Clara valley. In 1941, however. manufacturing for the first time surpassed agriculture in importance and World War II accelerated the industrial trend; after 1950 the population increased considerably. Leading classes of products from the manufacturing plants are Fiberglas, millwork, electrical machinery, chemicals, fabricated metals, processed foods and paper products. The University of Santa Clara. the oldest institution of higher learning in the west, was founded by the Jesuits in 1851 as a college and became a university in 1885. It has five colleges: arts and sciences, business administration, graduate, engineering and law.

Pop. (1960) 58,880. (J. J. HA.)

SANTA CRUZ, ÁLVARO DE BAZAN, 1ST MARQUIS OF (1526–1588). Spanish admiral, born at Granada on Dec. 12, 1526, of an ancient family. In 1564 he aided in the capture of Velez de Gomera, was appointed in 1568 to command the galleys of Naples and was thus brought into close relations with Don John of Austria during the formation of the Holy League (1570). In the operations at Lepanto (Oct. 7, 1571) Bazan was always in favour of the more energetic course: his prompt action averted disaster when the allied line was broken. He accompanied Don John at the taking of Tunis (1572). When Philip II of Spain enforced his claim as heir to the crown of Portugal (1580–81), Santa Cruz held a naval command. In 1583 he was sent against the prior of Crato, an illegitimate representative of the Portuguese royal family. nho nith his friends held the island possessions of Portugal in the Atlantic. His victory off Terceira decided the struggle in favour of Spain. A zealous advocate of war against England, he made to Philip, on Aug. 9, 1583, the first

definite suggestion of the Armada. The king's political and financial embarrassments caused many delays, and Santa Cruz, who was to have commanded, was hindered from acting with effect. He was at Lisbon without the means of fitting out his fleet when Drake burned the Spanish ships at Cádiz (1587). Santa Cruz's independence of judgment finally offended the king and he was held responsible for failures and delays. He died on Feb. 9, 1588, at Lisbon. He was the designer of the great galleons which were employed to carry the trade between Cádiz and Vera Cruz in Mexico.

See C. Fernández Duro, ***La Armada Invencible,*** 2 vol. (1884–85); A. Altolaguirre y Duvale, ***Don Alvaro de Bazán . . . estudio histórico-biográfico*** (1888); ***W.*** Stirling Maxwell, ***Don John*** of ***Austria . . .*** 2 vol. (1883).

SANTA CRUZ, ANDRÉS (1792–1865), Bolivian statesman, was born on Nov. 30, 1792, near La Paz, the son of a Spanish colonial official and an Inca princess. Choosing an army career, he served briefly with the Spanish forces, but fought with the patriots after 1820. When Antonio José de Sucre (*q.v.*) was forced out as president of Bolivia, Santa Cruz was elected to that post, taking the oath of office in May 1829. For two years thereafter he ruled as a virtual dictator, and in 1831 a congress elected him to a new four-year term. Between 1831 and 1835 Santa Cruz earned an enviable reputation as his government promoted industry, commerce, public improvements and education. He became involved in the struggle for power in Peru, the outcome of which was the creation of the short-lived Peruvian-Bolivian confederation, which was opposed by Brazil, Chile and Argentina. Chile opened hostilities against the confederation in Aug. 1836, and at Yungay. in 1839, Santa Cruz's forces were defeated. He resigned from the presidency, was exiled and forbidden to return to Bolivia. He died in France Sept. 23, 1865. ***See*** also BOLIVIA: History.

(J. J. J.)

SANTA CRUZ, a very sparsely inhabited province of southern Argentina, comprising a large part of the area generally known as Patagonia (*q.v.*). The province, which was created by a decree of the federal government in 1956 (with effect from Jan. 1, 1957), is bounded north and south by the 46th and 52nd parallels. It stretches from the Atlantic ocean to the Chilean frontier in the cordillera of the Andes. Pop. (1956 est.) 57,518. Area 94,186 sq.mi. Santa Cruz is a region of constant winds and dust storms which sweep over its dry table lands and its arid. precipitous coast. Rainfall is slight. In spite of the latitude, however, the climate is relatively mild, the temperature being moderated by the proximity of the ocean. The western rim of the province includes forested Andean foothills and a number of beautiful lakes, notably Lake Argentino. nhich can be reached by traveling up the Santa Cruz river from the port of Santa Cruz. Huge glaciers descend from the cordillera into this lake.

There are sheep ranches in the sheltered canyons that cross the desert, but little agriculture. The province's principal line of communication is the shipping service which links its Atlantic ports, where the produce of the interior (mainly wool and sheepskins) is collected for dispatch to Buenos Aires. The southernmost port is Rio Gallegos, the provincial capital. which is a centre for the sheep trade and has a meat-packing plant and a tallow-making industry. It is also the outlet for Argentina's chief coal field at Rio Turbio (160 mi. inland), with which it is connected by railway. The other principal ports are Santa Cruz (about 135 mi. N. of Gallegos) and Puerto Deseado (about 185 mi. N. of Santa Cruz). A railway runs inland from Deseado to Colonia las Heras. Across the northern border, in the province of Chubut, are the military zone and the oil fields of Comodoro Rivadavia. (GE. P.)

SANTA CRUZ, a department in the lowland region of eastern Bolivia, bounded north by Beni, east by Brazil, south by Paraguay and Chuquisaca, and west by Chuquisaca and Cochabamba. It is a frontier area of extraordinary economic potential lying between the Andes and the Mato Grosso plateau. Pop. (1950) 286,145. Area 143,097 sq mi. The topography is generally level, with a few gently rising elevations, notably the Chiquitos highlands. Average annual rainfall, coming largely from October through March, ranges from 100 in. in the north to 50 in. in Santa Cruz city and less farther south. The department is drained by two river systems, flowing north. which converge in the northeastern corner of Beni. The first comprises the Rio Grande, Piray, Yapacani and Maraco, upper tributaries of the Mamoré; the second comprises the San Miguel, Blanco, Baures and Paraguá, tributaries of the Iténez (Guaporé). A few smaller streams flow eastward into the Paraguay. About 40% of the department is prairie and the remainder is woodland. Except for the northern part, which is flooded during the rainy season, the region is quite healthful and has an agreeable climate. The prairie affords good pasturage. and the cleared forest land is unusually fertile. Rice, sugar cane, coffee, cotton, manioc, corn, citrus fruits, vegetables and tobacco are the most commonly produced items, but agriculture in the 1960s was still in an infant stage of development owing to the historic isolation of the area. The region supports 500,000 cattle and large numbers of horses. The population is about one-third of Spanish colonial descent and two-thirds mestizos and Indians.

Post-World War II developments included the completion of three important transportation facilities: a highway 312 mi. in length connecting the department with Cochabamba and the Altiplano; the Corumbá (Braz.)-Santa Cruz railway, providing an outlet to the Atlantic ports of Brazil; and another railway extending from the Argentine frontier to Santa Cruz. Oil exploration and production in the Camiri area were significantly advanced by several foreign companies together with the Bolivian government corporation (Yacimientos Petroliferos Fiscales Bolivianos). Pipelines extend to Sucre and Cochabamba. Petroleum deposits are found throughout much of the sub-Andean zone of Bolivia. Agriculture was enhanced by the introduction of immigrants, chiefly Okinawans and Japanese, and by land reform laws.

The city of Santa Cruz (pop. [1950] 34,837), founded by the Spanish explorer Nuflo de Chávez in 1560, is the capital and only town of consequence in the department. It is situated on the Piray at 1,575 ft. elevation. Local industries comprise sugar mills, distilleries, sawmills, tanneries, furniture and leather goods factories and food-processing plants. The railways converge on Santa Cruz; it is the terminus of the Cochabamba highway, and air service facilities are available. (J. L. TR.)

SANTA CRUZ, a city of California, U.S., 80 mi. S. of San Francisco on the northern promontory of Monterey bay; the county seat of Santa Cruz county. The scenic beauty of the area and its mild climate are its foremost attractions. The area is enhanced by clumps of redwoods which increase to forest proportions in the Santa Cruz mountains just north of the city. The state of California has incorporated much of this area into a state park.

The city was founded by the Franciscans in 1791 and became one of the mission links whereby Spanish civilization was extended all the way from San Diego to San Francisco. The U.S. flag was raised over the town in 1846 and the town was chartered as a city in 1876. The city's growth has been steady with a marked increase after 1950 resulting from the increasing industrialization of the area. In agriculture, Santa Cruz has made marked progress, especially in horticulture. Strawberries are grown almost the year around, and loganberries are perfectly acclimated, having originated there. Artichokes are produced in abundance, as are cherries, apples and grapes. The area also excels in the production of bulbs.

One of the features of Santa Cruz attractive to thousands of tourists is its magnificent sweep of beach. To accommodate these crowds the city has built several facilities, including a long wharf which extends a half mile into the bay. The bay also affords a considerable income from fishing. Santa Cruz has a council-manager form of government, in effect from 1948, and a public junior college called Cabrillo. For comparative population figures see table in CALIFORNIA: Population. (B. L. B.)

SANTA CRUZ DE TENERIFE, a seaport and the capital of Tenerife and of the Canary Islands; in 28° 28' N. and 16° 15' W., on the east coast. Pop. (1950) 75,412 (mun. 103,110). Santa Cruz occupies a small plain which is bounded by rugged volcanic rocks, and seamed by watercourses which are dry almost throughout the year. Scarcely any vegetation, except cactuses and

euphorbias, is to be seen in the neighbourhood.

Almost the entire town was rebuilt in the 19th century. when its population more than trebled. There are many good public buildings, including a school of navigation. technical institute, library, natural history museum and hospital. An aqueduct 5 mi, long brings pure water from the mountains of the interior. Dromedaries from the adjacent islands of Lanzarote and Fuerteventura are used to convey merchandise and in agriculture. The town was bombarded by the British fleet under Robert Blake in 1657, and by Horatio Nelson. who lost his arm during the attack. in 1797. Some British flags lost on that occasion hang in one of the churches. Santa Cruz is an important coaling station and commercial centre *See* CANARY ISLANDS.

SANTA ELENA PENINSULA, in southwestern Guayas province. Ecuador. On the peninsula there is Ecuador's one important oil field. La Libertad has a small refinery. Also on the peninsula there are salt-extracting works and a popular seaside resort. Ores of sulfur. platinum and gold are said to exist but in the early 1960s had not been developed. The peninsula offers fine recreational facilities at Salinas. 75 mi. W. of Guayaquil. due to its ocean beaches and arid climate. It is the northernmost extension of the west-coast desert of South America, only 2° 12' S. of the equator. (P. E. J.)

SANTA FE, a province of central Argentina, between the Chaco in the north and the province of Buenos Aires in the south. Pop. (1960) 1,865,537. Area 51.354 sq.mi. The two chief cities are the provincial capital, Santa Fe, and Rosario (*qq.v.*), which is the third largest city in the republic. The province lies almost entirely within the great humid pampas region and has no wooded land in the south except along the river courses. In the north there are extensive forests of commercially valuable woods. interspersed with grassy *campos*. The surface is a level alluvial plain and the soil is among the most productive in the country. The climate is healthy and moderate, with mean annual temperatures ranging from 63° F. in the south to 68° in the north. Annual rainfall varies from 28 to 35 in. and is more abundant in the river littoral region than in the interior.

The leading crops are alfalfa (lucerne), maize, wheat and flax (the order of importance changes according to world prices and government subsidies), together nith oats, rye and barley. In the northern part of the province peanuts, tobacco, sugar cane and cotton are gromn. Although agriculture is the chief source of wealth, the livestock industry is well developed. The ratio of agriculture to cattle raising varies with alterations in prices and subsidies, as both are competing for the same land. In addition to beef and dairy cattle. large numbers of pigs are raised. The principal industries are based on dairy and forest products, and there are large sugar refineries, flour mills, breweries and distilleries.

The provincial capital has exceptionally good communications nith the surrounding country. It is served by the Mitre and Belgrano railways (300 mi. to Buenos Aires) and is the centre of a highway network which includes roads southward to Rosario (100 mi.) and northnard to Formosa (500 mi.). The capital has an airport. But the traditional line of communication is by the Paraná river. Ocean-going steamers can reach the town of Santa Fe, which has adequate docks to receive them, and the province's long littoral has many small ports nhere the farmers of the interior can load their products onto the steamers that ply up and down the Paraná. The ports are linked by regular river services with Buenos Aires (downstream) and Corrientes and Paraguay (upstream). (GE. P.)

SANTA FE, Argentine city and capital of the province of the same name, located on a channel of the Paraná river approximately 300 mi. N.W. of Buenos Aires. Pop. (1960) 208,350. It was founded in 1573 by a group of settlers under Juan de Garay as Santa Fe de Vera Cruz, several years before the final establishment of Buenos Aires, as a supporting port for the Spanish settlement at Asunción, Parag. During the colonial period it served as a centre for Jesuit missionary activity; the Jesuit college and church date from 1660. Until mid-19th century the city marked the northern limit of provincial expansion and served as a strategic outpost against the Indians of the Chaco region. During the national period the city was one of the centres which attempted to counteract the growing dominance of Buenos Aires. The Argentine constitution was adopted by an assembly at Santa Fe in 1853. In the mid-1850s the first agricultural colonies of European immigrants in Argentina were established north and west of the city The national University of the Littoral is a 20th-century addition to the culture of Santa Fe. Modernization of the port facilities in 1911 made it possible for ocean-going vessels to reach the city, and considerable river trade is carried on with Paraná, capital of Entre Rios, located across the Paraná river from Santa Fe. Railroads and highways link the city nith the Chaco frontier and with the provinces of Santiago del Estero and Córdoba. There is an airport at Sauce Viejo just outside the city. Although Rosario remains the major port of the province, Santa Fe serves as an outlet for the cotton, flax and grain from the northern area.

(Js. R. S.)

SANTA FE, capital of New Mexico, U.S., in the northern part of the state, on the Rio Santa Fe, the seat of Santa Fe county. Located at the foot of the Sangre de Cristo range at an altitude of 7,000 ft., it has a dry. sunny and invigorating climate. The average annual rainfall is 14.49 in. and the average monthly mean temperature ranges from 28 8° F. in January to 69° in July.

Santa Fe was the site of prehistoric Indian pueblos, of which few remains above ground were left when the Spanish came early in the 17th century. The city, the oldest seat of government in the United States, was founded in 1610 as the capital of the province of New Mexico and was officially named La Villa Real de la Santa FC de San Francisco. "Royal City of the Holy Faith of St Francis." For the next 200 years its history was closely related to the history of the Spanish in the southwestern U.S. *(see* NEW MEXICO. *History)*. By 1630 there was a population of 250 Spaniards, 700 Indians and 50 half-breeds; the Spanish were driven out in 1680 but returned in 1692. During the 18th century a considerable trade in sheep, wool, pelts and wines developed, chiefly with Chihuahua in Mexico and with the Indians of the plains; the city later became the centre of an extensive commerce with the United States *(see* SANTA FE TRAIL).

After Mexican independence in 1821, Santa Fe was a part of that country; US. troops took possession of the city in 1846 and it continued to be the capital, first of the territory and then of the state of New Mexico. A railroad built in the 1880s bypassed Santa Fe and its population remained static until New Mexico achieved statehood. Thereafter the number of government employees increased and beginning about that time Santa Fe also became known as a centre for painters and writers as well as for archaeological studies in that area. It has never been an industrial city; its economy in modern times is sustained to some extent by government and largely by the tourist and vacation trade It has a council-manager form of government, in effect since 1955.

The original Spanish plaza is still the heart of the city. Located there is the old governor's palace, built in 1610, occupied continuously until 1909 by the Spanish, Indian, Mexican and U S. governors of New Mexico and now housing the collections of the Historical Society of New Mexico and the exhibits of the Museum of New Mexico and the School of American Research Near the plaza is the chapel of San Miguel (early 17th century) and "the old house" of Indian construction, possibly antedating the Spanish occupation. St. Francis cathedral dates from 1869 and occupies the site of a church built in 1622; it was built by Archbishop John B. Lamy, the "Bishop Latour" of Willa Cather's novel *Death Comes for the Archbishop.* In the northeastern part of the city are the ruins of Ft. Marcy, built by Gen. Stephen W. Kearny in 1846. A stone in the plaza marks the end of the old Santa Fe trail. The modern structures are mainly in the distinctive "Santa Fe" type of architecture, developed (largely since 1910, through the efforts of a small group of persons connected with the School of American Research and the state museum) by combining features from the terraced dwellings of the Pueblo Indians, the crumbling Franciscan missions, and the haciendas of the Spaniard and Mexican. The Art gallery of the Museum of New Mexico is an example of the school (reproducing in a blend the façades of six early New Mexico missions).

Within a 75-mi. radius of Santa Fe are the Indian pueblos of 'Tesuque. San Juan, Santa Clara, San Ildefonso and Taos (one of the few remaining pueblos where the Indians still live in terraced houses); Chimayo, a Spanish plaza (village) famous for its handwoven blankets; the Puyé cliff dwellings and those of Rito de los Frijoles; the Pecos River canyon; the hot springs of Ojo Caliente; the petrified forest near Cerrillos; and the turquoise mines near Bonanza.

The city is served by several highways and by air lines and has bus connections with the railroad at Lamy, 18 mi. S.

For comparative population figures see table in NEW MEXICO: *Population.*

See Paul Horgan, *The Centuries* of *Santa Fe* (1956); Oliver La Farge and Arthur N. Morgan, *Santa Fe* (1959).

SANTA FE TRAIL, the famed wagon trail from Independence. Mo.. to Santa Fe, N.M.. and an important commercial route for 59 years, from 1821 to 1880. when the last section of the railroad was completed. It is possible that in 1541 the Spaniard Francisco Vásquez de Coronado traveled portions of what became the trail. and it is known that in 1806 Zebulon Montgomery Pike. the U.S. government explorer. passed over sections of it. A commercial venture was attempted by William Morrison, an Illinois merchant, who sent Jean Baptiste LaLande with trading goods to Santa Fe in 1804. Neglecting to account to Morrison. LaLande settled in Santa Fe. where Captain Pike saw him in 1807. That the Spaniards were hostile to foreign traders is shown by the reception given Robert McKnight's trading expedition of 1812. Arriving after a revolt against the Spaniards had been suppressed, McKnight and members of his party were imprisoned in Spanish jails until after Mexico won independence from Spain in 1821.

The earliest successful commercial expedition was that of William Becknell. who in 1821 made a profitable journey with $300 worth of goods on pack animals and returned the next year to open the trail with wagons. Although Becknell has been called father of the trail, a number of other traders, John McKnight, Hugh Glenn, Jacob Fowler and Stephen Cooper, followed close on his heels.

The Missouri river terminus was first Franklin. Mo.. then Independence. and later Westport, now Kansas City, Mo. When the early traders set out in May of each year they at first used horses, but these were replaced in subsequent years by teams of mules or oxen. sometimes five or six pairs to a wagon. Though Santa Fe had gold and silver, together with furs, skins and a plentiful supply of wool, the simplest manufactured goods were in great demand. On the westward route the huge wagons were crammed almost to overflowing with hardware and assorted dry goods. After arriving in July and reaching an understanding with Mexican customs officials, most traders sold their cargoes and departed in August with a net profit that ranged from 20% to 40%, though there were some who sold for a loss.

A significant portion of the goods carried to Santa Fe was shipped on to interior parts of northern Mexico and to California. Before 1843 there were no yearly shipments of goods worth more than $450,000, according to Josiah Gregg. Yet it is safe to assume, from other records. that the trade increased.

From its terminus in Missouri the main trail followed almost a straight line for nearly 800 mi. The first of four sections of the journey was from Independence over grasslands to the green meadows and woods of Council Grove in what is now Kansas. Here the freighters organized their train for protection against marauding Indians and made any necessary repairs, aided by a resident blacksmith. From Council Grove to the river crossing nest of the Big Bend on the Arkansas was a second division. The traders then moved from the ford on the Arkansas across the arid. desolate Cimarron desert, and finally, in the fourth section of the trip. to the more hospitable grasses and cedars east of Santa Fe.

An alternative route, to avoid the hot, dry Indian country of the Cimarron, was to follow the Arkansas river westward to an adobe stockade near modern La Junta. Colo.. called Bent's Fort. the leading trading post of the American southwest. Thence the mountain route turned southward through the Raton pass to meet the main trail. This route, though mountainous, had the advantages of better water supply. opportunities for trading at Bent's Fort and less danger from Indians. Yet there were few Indian attacks on any portion of the trail. Josiah Gregg reported that only 11 men were killed by Indians in the period before 1843. Traveling in parallel columns, the nagons could easily form a circle to protect livestock and repel attacking warriors.

The Santa Fe trail was not the one-way wilderness highway of the pioneer settler and his family. Rather it was the two-way route of international trade. Contemporaries have described in their journals the variety of merchants and frontiersmen who sought adventure and profit on the road to Santa Fe. These men opened and maintained a prairie thoroughfare that brought bullion into the United States (especially needed in the years following the panic of 1837). gave Missouri its celebrated mules and helped dispel the notion that the southwest was a great American desert. The traders came to know the varied routes of the southnest and reported weaknesses of the Mexican military forces. Indirectly they hastened United States expansion and prepared the nay for assent to U.S. control nhich came in 1846, when Col. Stephen W. Kearny entered Santa Fe without opposition at the beginning of the Mexican War. Under C.S. rule the Santa Fe trade continued to flourish. especially after U.S. mail by stagecoach was instituted in 1849. In the period after the Civil War the yearly freight expeditions persisted until the tracks of the Santa Fe railroad in 1880 ended the heyday of the wagon caravans.

See Josiah Gregg, *Commerce* of *the Prairies,* 2 vol. (1844 and numerous later editions), the classical account of the trail; R. L. Duffus, *The Santa Fe Trail* (1930), a readable and entertaining account.

(W. R. J.)

SANTAL, the name of a tribal people living in the southeastern districts of Bihar and adjoining parts of West Bengal and Orissa. In 1941 the Santals numbered 2,732,266. They speak Santali, a dialect of Kherwari, a Munda language. In physical type they belong to the Proto-Australoid group. characterized by short stature. dark skin. wavy to curly hair and broad flat nose.

Many Santals are employed seasonally or permanently in the coal mines near Asansol or the steel factories in Jamshedpur, while others work during part of the year as paid agricultural labourers. In the villages, where tribal life continues, the most important economic activity is the cultivation of rice. Each village has a hereditary headman who, assisted by a council of elders, administers the affairs of the village; he also has some religious and ceremonial functions. Two priests perform the duties of sacrificing on behalf of the villagers. Groups of villages are linked together in a larger territorial unit termed a pargana. which also has a hereditary headman. Traditionally men of the pargana met together annually to hunt and to settle disputes involving the members. and the custom persists where game may be found.

The Santals have a patrilineal exogamous clan organization. The clans: 12 in number. are each divided into a number of subdivisions. Membership in the clan and subclan carried certain injunctions and prohibitions with 'regard to style of ornaments, food. house type and religious ritual. Marriage, endogamous with respect to the tribe as a whole, is normally arranged by the parents; payment of a bride price and the marking of the bride's head with vermilion are essential features of the ceremony. Marriage is generally monogamous; polygyny, though permitted, is rare.

Religion centres around the worship of spirits by means of periodic public sacrifices to avert disease and ensure rainfall. The ancestral spirits of the headmen are objects of an important cult.

See W J Culshaw, *Tribal Heritage: a Study of the Santals* (1919); N Datta-Majumdar. "The Santal a Study in Culture Change." Government of India, Department of Anthropology, *Memoir No* 2, *1955 (1956).*

(D. M SP.)

SANTALACEAE, the sandalwood family, dicotyledonous, semiparasitic shrubs, trees and herbs of tropical and temperate regions. There are 30 genera and about 400 species. *Santalum album* is the true sandalwood (*q.v.*). The bastard toadflax, the North American species of *Commandra,* is sometimes parasitic. The other North American species is oil nut or buffalo nut (*Pyrularia pubera)* of the Appalachian region. The *Thesium humi-*

fusum, likewise called the bastard toadflax, is native to Great Britain and is a herbaceous root parasite.

SANTAL PARGANAS (SANTHAL PARGANAS), a district of Bihar, India. Area 5,461 sq.mi. Pop. (1951) 2,322,092. In the east a sharply defined belt of hills stretches for about 100 mi.; west of this a rolling tract of long ridges with intervening depressions covers about 2,500 sq.mi., while there is a narrow strip of alluvial country about 120 mi. long, lying for the most part along the loop line of the Eastern railway running roughly parallel to the Ganges in the north and east of the district. The principal range in the east is that of the Rajmahal hills, which cover about 2,000 sq.mi.; they nowhere exceed 2,000 ft. The alluvial tract has the damp heat and moist soil of the lower Ganges basin, while the undulating and hilly portions are swept by the hot westerly winds of Bihar and are very cool in the winter. Coal is worked in the small Jaintia field. Pakaur is the chief centre of the shellac-making industry.

The early history of British administration is a record of the measures taken to pacify and civilize the Paharias of the Rajmahal hills, who under Mohammedan rule had been turbulent robbers and marauders. The Santals, who numbered 829,025 in 1941, began to migrate there from Chota Nagpur and the adjoining districts in the late 18th century. The oppression of landlords, the exactions of Hindu moneylenders and the consequent loss of land caused a rebellion (the Santal War) in 1855–56. This led to the establishment of a form of administration congenial to the immigrants; and a land settlement was afterward carried out on conditions favourable to the cultivators. The Daman-i-Koh, meaning "the skirts of the hills," a government estate of 1,356 sq.mi., was established as a reserve for them and other aboriginals, such as the Paharias. The district is traversed by both the loop line and the chord line (running parallel to the southwest border) of the Eastern railway. It contains the old Mohammedan city of Rajmahal and the modern commercial mart of Sahibganj (pop., 1951, 25,669), both on the Ganges; and the Hindu place of pilgrimage of Deoghar (Deogarh; pop., 1951, 25,510). The administrative headquarters are at Dumka, or Naya Dumka (pop., 1951, 13,582).

See W. B Oldham, *Santal Parganas Manual* (1898); F. B. Bradley-Birt, *The Story of an Indian Upland* (1905).

SANTA MARIA, a town in Rio Grande do Sul state, Braz., located near the head of the Jacui valley, 150 mi. W. of Pbrto Alegre. Pop. (1950) 44,949. It is an important railroad centre at the crossing of the main line running from São Paulo to the Uruguay border and the main line running from Pbrto Alegre to the Argentine border. It is also served by an airfield and is the junction of several major highways. Industries include railroad shops, breweries, tanneries and meat-processing plants. Santa Maria carries on a large trade in livestock. alfalfa, rice, wine, fruit, maté, coal and timber. The town was once called Santa Maria da Bocca do Monte (St. Mary of the Mountain's Mouth) because of its position at the foot of the Serra Geral. (P. E. J.)

SANTA MARTA, a Caribbean port city of Colombia. capital of the department of Magdalena, on a small bay 40 mi. E.N.E. of the mouth of the Magdalena river. Pop. (1951) 37,005. Santa Marta was founded by Rodrigo de Bastidas in 1525 and is the oldest city of Colombia. From there Gonzalo Jiménez de Quesada led the celebrated expedition inland to found Santa Fe de Bogotá (see BOGOTA). Connected by swampy channels and lakes nith the river, Santa Marta became a port for colonial New Granada. Like its more famous neighbour. Cartagena (*q.v.*), it was occasionally attacked and sacked by foreign corsairs. Simón Bolivar, hero of the independence wars, died at an estate on the edge of the town in 1830. Santa Marta's commerce overtook that of Cartagena in the mid-19th century but then experienced a decline, chiefly because the channels to the Magdalena were inadequate for steamboats. In the 1880s Santa Marta began shipping bananas grown in the hinterland to the south; the United Fruit company dominated the industry after 1899. Its success was especially striking after the completion of the Santa Marta-Fundacibn railroad. This industry was almost killed by the Sigatoka plant disease in the early 1940s but subsequently revived. The city is the seat of a bishopric and has a cathedral. (T. E. N.)

SANTA MAURA (LEUCADIA, LEUKAS, LEVKAS), one of the Ionian Islands (20 mi. north to south, 5–8 mi. east to west; area 114 sq.mi.; pop. [1951] 29,225) off the coast of Acarnania (Greece), south of the entrance to the Gulf of Arta. It is a rugged mass of limestone and bituminous shales (partly Tertiary), rising to 2,000 and 3.000 ft. with limited areas of level ground. The grain crop suffices only for a few months' local consumption; but much olive oil is produced. The vineyards (in the west especially) yield red wine (bought mainly by Rouen. Cette, Trieste and Venice); the currant, introduced about 1859, became the principal source of wealth; and cotton, flax, tobacco and valonia are grown. The salt trade, formerly of importance. suffered from customs regulations. The chief town, Amaxichi (more usually Santa Maura. after the neighbouring fort), is at the northeast end opposite the lagoon. In the southwest is the village of Vasiliki, whence the currant crop is exported.

Cyclopean and polygonal walls at Kaligoni (south of Amaxichi) probably mark the ancient acropolis of Neritus (or Nericus), and the later Corinthian settlement of Leucas. From this point a Roman bridge seems to have crossed to the mainland. Between the town and Fort Santa Maura extends a Turkish aqueduct partly destroyed with the town by the earthquake of 1825. Forts Alexander and Constantine commanding the bridge are relics of the Russian occupation; the other forts are of Turko-Venetian origin. The magnificent cliff, 2.000 ft. high, at Cape Ducato at the south end of the island, still bears the ruined temple of Apollo Leucatas (hence the modern name). At the annual festival of Apollo a criminal was obliged to plunge from the summit into the sea, where, however, an effort was made to pick him up; and it was by the same leap that Sappho and Artemisia, daughter of Lygdamis, are said to have ended their lives.

A theory has been proposed by Dorpfeld that Leukas is the island described in the Odyssey under the name of Ithaca; arguing that the Homeric description of the island and its position, and also the identification of such sites as the palace of Odysseus the harbour of Phorcys, the grotto of the Nymphs and the island Asteris, where the suitors lay in wait for Telemachus, suit Leukas better than the island called Ithaca (*q.v.*). The strait separating it from the mainland is liable to silt. In 1903, however. a canal was completed 50 ft. broad and 17 ft. deep. The island was occupied by Axis troops in 1941.

See P. Goessler, *Leukas-Ithaka* (1904); W. Dorpfeld, *Alt-Ithaka,* 2 vol. (1927).

SANTA MONICA, an oceanside resort and residential city in northwestern Los Angeles county, Calif., U.S., and a part of the Los Angeles standard metropolitan statistical area. It is known throughout the state for its excellent ocean beaches and its suburban homes.

Santa Monica was given its name by Spanish soldiers, who applied it to a spring near the modern city. Between 1828 and 1872 it was a portion of a large ranch owned by Don Francisco Sepulveda. In 1872 the area was acquired by Col. R. S. Baker for use as a sheep farm.

The city appeared three years later, in 1875, as a result of the railroad craze of the 1870s. Santa Monica was selected as the Pacific coast terminus of the Los Angeles to Independence railroad, built to compete with the dominant Southern Pacific. The railroad advertised the advantages of the location as a resort area, an auction of land was held and the settlement of Santa Monica began. Although the only rails laid connected Santa Monica and Los Angeles, population continued to flow in. As early as Nov. 20, 1885, Santa Monica was incorporated as a sixth-class California city. It became a freeholder city through a charter ratified and approved in 1906. A council-manager form of government was established by freehold charter granted March 25, 1947. Industrial development has been limited, but the aircraft industry and various light industries were established.

Pop. (1960) 83,249. (J. M. Wo.)

SANTANA, PEDRO (1801–1864), a leader of the revolution by which the Dominican Republic gained its independence of Haiti, made himself president of the new nation at various inter-

vals from 1844 to 1861. He joined the uprising against Haiti in Feb. 1844. made himself supreme chief in July and had congress elect him president in November. He was forced to retire in 1848 but was recalled to repel the Haitian invasion of 1849. After defeating the enemy. he reassumed dictatorial powers, but permitted the inauguration of his political associate. Buenaventura Báez, to the presidency in September. In 1853 Santana again had himself elected president and, except for two years (1856–58), governed the republic until he negotiated its return to Spain in 1861. Although disappointed with Spanish rule, he fought the rebellion of 1863. Unable to overcome the resistance, he resigned his command in June 1864 and died a few days later. ***See*** also DOMINICAN REPUBLIC: History. (K. M. S.)

SANTANDER, FRANCISCO DE PAULA (1792–1840), Colombian political figure, an able soldier and administrator with most of the gifts of a statesman, was born April 2, 1792, at Rosario de Cúcuta, Colom., near the Venezuelan frontier. At the inception of independence in 1810, Santander left law school to join the patriot army. Promoted rapidly, he escaped the Spanish reconquest of 1816 by fleeing to the eastern lowlands, and returned as brigadier general in the invading force of Simón Bolivar (*q.v.*). Santander was vice-president of Nueva Granada in the republic of Colombia from 1819 to 1821, at which time the constituent congress named him vice-president of Colombia. Re-elected in 1826, Santander continued to be the acting president of Colombia until Sept. 10, 1827. He shaped the government, and found the men, money and supplies for President Bolivar's campaigns in Colombia, Peru and Bolivia. His measures to hold Colombia together after the fighting had ended, however, were undercut by Bolivar, who returned from Peru late in 1826 to end the Venezuelan rebellion. Bolivar retained Venezuela in Colombia only on the basis of obedience to his person, a demand that ended relations between Santander and Bolivar. Santander was exiled in 1828 after the attempt to assassinate Bolivar, but evidence shows only that he knew of the plot. tried to dissuade the conspirators and gave no warning. After dissolution of Gran Colombia in 1830. Santander returned as president (1832–36) of the state of Nueva Granada and then served as senator until his death.

Proud, sensitive, exact in his accounting, Santander typified the best tradition of the colonial official. Legalistic yet flexible, regalistic and centralist, he helped form the tradition of nonmilitaristic governments in Colombia. Colombians justly call him the "man of laws." He was equally important as a defender and focus of Granadian nationalism, especially during 1816–19 and 1827–32. In his last years he restrained the liberal elements of Granadian society who viewed the electoral victory of centrists and conservatives in 1836 as the return of colonial evils. His death, on May 6, 1840, was followed promptly by outbreak of the major civil conflict of 1840–42. ***See*** also COLOMBIA: History. (R. L. GE.)

SANTANDER, an interior department of the republic of Colombia. Pop. (1951) 747,706. Area 11,706 sq.mi. The topography is extremely rugged; the Eastern cordillera of the Andes traverses the department from north to south. Toward the west it includes an extensive area of rainy tropical lowlands, extending to the Magdalena river, that did not become subject to colonization till about mid-20th century. Santander is the principal petroleum-producing department of Colombia, with production centring around Barrancabermeja. Among the agricultural crops tobacco is outstanding, and the manufacture of cigars and cigarettes is an important industry. Coffee is grown on the temperate midslopes of the Andes. A railroad connects the capital city, Bucaramanga (pop., 1951 [mun.], 102,887), with the Magdalena at Puerto Wilches. San Gil. Socorro, Málaga and Vélez are other principal cities, all lying between 3,000 and 7,000 ft. above sea level. (Js. J. P.)

SANTANDER, a maritime province of northern Spain, bounded north by the Bay of Biscay, east by the province of Biscay. south by Burgos and Palencia and west by León and Oviedo. Pop. (1950) 405,420. Area 2,108 sq.mi. Santander was part of the Roman province of Cantabria which, after passing under the empire of the Goths, became the principality of Asturias (*q.v.*). The portion called Asturia de Santa Juliana, or Santillana, was included in the kingdom of Old Castile and, on the subdivision of the old provinces of Spain in 1833, became the province of Santander. The province is traversed from east to west by the Cantabrian mountains (*q.v.*), which in the Picos de Europa reach a height of over 8,600 ft. and send off numerous branches to the sea. The province is traversed from north to south by the railway and high road from Santander by Palencia to Madrid; the highest point on the railway (Venta de Pazozal) is 3.229 ft. above the sea. Other railways connect Santander with Bilbao on the east and with Cabezona de la Sal on the west. The province saw some of the heaviest fighting of the civil war of 1936–39; it was occupied by nationalists in 1937.

SANTANDER, the capital of the Spanish province of Santander, seat of a bishop and one of the chief seaports of Spain; 316 mi. N. of Madrid by rail, on the Bay of Santander, an inlet of the Bay of Biscay. Pop. (1950) 85,640 (mun. 100,069). It is on the inside of a rocky peninsula, Cabo Mayor, which shelters a harbour from 2 to 3 mi. wide and 4 mi. long. Santander is divided into an upper and a lower town. The Muelle is officially named Paseo de Pereda in honour of the great novelist. The harbour was improved after 1850. In the civil war of 1936–39 Santander was attacked by nationalist columns from Biscay, Soncillo and Navarre, well supplied with tanks. It fell Aug. 16, 1937.

SANTAREM, a city of Brazil in Pará state, on the right bank of the Tapajós near its entrance into the Amazon. Pop. (1950), town, 14,061; *município,* 60,229. It is the most important town on the Amazon between Belém and Manaus and is a port of call for all river steamers. Santarém is 434 mi. from Belém by air. The red tile roofs of the whitewashed buildings of the business district give the town an attractive appearance from the river. Most valuable exports of the region are rosewood oil, rubber, lumber and jute. Santarém is a noted distributing centre for native handicraft articles. A few miles south of the city the escarpment of the Santarém plateau rises to an elevation of 400 ft. This plateau, which is crossed by a motor road to Belterra, is one of the most active areas of agricultural colonization in the Amazon valley. Rice, corn, beans, mandioca and malva are the principal crops. The shallow strips of fertile black soils on this high surface also contain large numbers of aboriginal baked clay artifacts.

The Tapajós is navigable for steamers to the rapids 170 mi. above Santarém and for small boats nearly to Diamantino (Mato Grosso). A considerable trade comes from Mato Grosso state and the settlements along the river banks.

Santarém was founded in 1661 as the site of a Jesuit mission to a Tapajó Indian settlement (aldeia) and was formed around a fort built by Pedro Teixeira. It became a city in 1848. A group of Confederate exiles settled in Santarém after the U.S. Civil War; some of their descendants still live in the area, but most of the original settlers returned disillusioned to the United States. (Js. J. P.)

SANTARÉM, a city on the right bank of the Tagus river, Portugal, 51 mi. N.E. of Lisbon by rail. Pop. (1950) 13,114. The older part contains the ruined castle of Alcaçova, famous in the middle ages as a royal residence. Below is Ribeira de Santarém, a comparatively modern river port, and on the opposite bank is Almeirim, a village which was also a royal residence until 1755, when it was almost entirely destroyed by earthquake. Santarém has some trade in fish and agricultural produce. including wine and olive oil. Its chief buildings are an ecclesiastical seminary; the late Gothic church of the Convento da Graça, which contains the tomb of Pedro Alvares Cabral, the first Portuguese to visit South America (1500); the Igreja do Milagro, an early Renaissance church; and the church of Santa Iria (St. Irene), from which the name of the city is derived. There is a fine bridge.

Santarém is the Roman Scallabis, renamed Praesidium Iulium by Julius Caesar. From its position in the Tagus valley it became an important fortress during the wars between the Moors, Portuguese and Spaniards. Alphonso VI of Castile first took it from the Moors in 1093, but it was recaptured and occupied by them until 1147, when Alphonso I of Portugal recovered it. The

Almohades endeavoured to win it back in 1184, but were defeated. The Miguelites were defeated there in 1834 *(see* PORTUGAL: *History)*. The administrative district of Santarém coincides with the eastern part of the ancient province of Estremadura; pop. (1950) 460,193; area 2,583 sq.mi.

SANTA RITA DURÃO, JOSÉ DE: *see* DURÃO, JOSÉ DE SANTA RITA.

SANTAROSA, ANNIBALE SANTORRE DI ROSSI DE POMAROLO, COUNT OF (1783–1825), Piedmontese insurgent and leader in the revival (Risorgimento) of Italy, was born at Savigliano, near Coni, on Nov. 18, 1783. When in 1821 the Austrian army was moved south to coerce the Neapolitans, Santarosa conspired to obtain the intervention of the Piedmontese in favour of the Neapolitans by an attack on the Austrian lines of communication. The conspirators sought the co-operation of the prince of Carignano, afterward Ring Charles Albert. On March 6, 1821, Santarosa and three associates had an interview with the prince, and on the 10th they carried out the military *pronunciamiento* which proclaimed the Spanish constitution. The movement had no real popular support, and very soon collapsed. Santarosa was arrested, but escaped and fled to France and later to England. He accompanied his countryman Giacinto Collegno to Greece in Nov. 1824. He was killed when the Egyptian troops attacked the island of Sphacteria, near Navarino, on May 8, 1825.

SANTA ROSA, a department in southern Guatemala. Area 1.141 sq.mi. Pop. (1957) 141,244. Its capital is Cuilapa (pop. [1960] 3.963). In the highlands there are plantations of coffee, and the farmers raise maize and beans. In the Pacific lowlands the products include sugar cane. rice and sesame. Large herds of beef cattle are fed on hay. In the northeast corner of the department is the beautiful Lake Ayarza. The capital is served by the Inter-American highway, and a branch descends to the coastal lowlands. (P E. J.)

SANTA TECLA, officially NUEVA SAN SALVADOR, capital of the department of La Libertad, El Salvador. Pop. (1958) 37,-927. It was founded in 1854 at the southern base of Volcán de San Salvador, at an altitude of 2,953 ft., to replace the national capital, San Salvador, devastated by an earthquake. It enjoyed that distinction only briefly, however, for in 1859 the government was moved back to a rebuilt San Salvador. Santa Tecla. 7½ mi. by Inter-American highway from San Salvador, is in the most densely settled part of the department and in an important coffee, livestock, corn, vegetable and fruit producing area. (C. F. J.)

SANTAYANA, GEORGE (1863–1952), U.S. philosopher, poet, novelist and literary critic, combined the wisdom of the old world and the new and created his own many-sided world of the mind. He was born in Madrid of Spanish parents on Dec. 16, 1863, and went to the U.S. in 1872. He received his B.A. degree from Harvard university in 1886 and taught philosophy continuously at Harvard from 1889 until 1912, with the exception of a year spent as an advanced student at Cambridge university. In 1912 he resigned his Harvard professorship and returned to Europe, where for many years he traveled extensively. Having settled at a convent in Rome early in World War II, he remained there till his death, which took place on Sept. 26, 1952.

Santayana's reputation rests chiefly on the richness and perceptiveness of his account of human experience in its ethical, social, religious and artistic aspects; on the skill with which he wove such diverse philosophical themes as naturalism, Platonic realism and idealism into the texture of his system; and on the exquisite, poetic quality of his prose style. His system, however, lacks speculative originality and the unity conferred by a single great speculative insight. The several themes of his philosophy are incongruous or perhaps even conflict with one apother; his basic naturalism is difficult to reconcile both with his realism of essences (or universals) and with his idealistic interpretation of mind or spirit. Yet despite these weaknesses of structure his philosophy is comprehensive, penetrating and to a degree systematic. His greatness resides in the catholicity of his interests; in his sensitivity to values in diverse realms of human experience; and in the freedom of his imaginative powers.

Santayana's first published essay in philosophy mas *The Sense of Beauty* (1896). It is a major contribution to aesthetics—perhaps the most important American work in this field. The essay is concerned with "the nature and elements of our aesthetic judgments"; "it is" he adds, "a theoretical inquiry and has no directly hortatory quality." The main thesis of the essay is that aesthetic judgments are the expression of artistic taste and that "to make a judgment is virtually to establish an ideal." Santayana's emphasis on the ideal or formal aspects of aesthetic judgment is combined with an appreciation of the importance of its material or sensuous aspect.

The Life of Reason (1905–06) is a major work consisting of five volumes: *Reason in Common Sense, Reason in Society, Reason in Religion, Reason in Art* and *Reason in Science.* "The life of reason." which Santayana describes as "a presumptive biography of the human intellect," is an interpretation of the role of reason in the manifold activities of the human spirit. The first suggestion for such a work occurred to Santayana in his student days as a result of reading Hegel's *Phenomenology of Spirit;* and, indeed, *The Life of Reason* resembles the *Phenomenology* of Hegel in its conception, though not in its execution. The life of reason, for Santayana as for Hegel, is not restricted to the rational in the sense of the purely intellectual activities of man (though it includes them). The recurrent theme of the five volumes comprising *The Life of Reason* is that reason in all its manifestations is a union of instinct and ideation; it is instinct become reflective and enlightened.

Scepticism and Animal Faith (1923) marks an important departure from his earlier philosophy and serves as "a critical introduccion" to his new system developed in *The Realms of Being,* a four-volume work composed of *The Realm of Essence* (1927/28), *The Realm of Matter* (1930), *The Realm of Truth* (1937) and *The Realm of Spirit* (1940). Santayana displayed in these later works the penetrating insight, the breadth of philosophical vision and the stylistic elegance characteristic of his earlier writings and, at the same time, enhanced his stature as a philosopher by achieving greater theoretical precision, clarity and coherence. *Scepticism and Animal Faith* conveys better than any other single volume of his works the essential import of his philosophy and can be commended as an introduction to and *résumé* of his later system. This essay formulates his skepticism and his theory of immediately apprehended essences and describes the role played by "animal faith" in various forms of knowledge.

"The realm of essence" is the domain of the mind's certain and indubitable knowledge. Essences are universals which possess being or reality but do not exist. The realm of essence comprises colours, tastes, odours and other data of sense as well as the ideal objects of thought and imagination. "The realm of matter" is the world of natural objects; belief in matter rests—as does all belief concerning existence—on animal faith. Naturalism, the dominant theme of his entire philosophy, appears in his later work in his insistence that the realm of matter is prior to the other realms of being.

Santayana's other writings include *Lucifer: a Theological Tragedy* (1924); *Interpretations of Poetry and Religion* (1900); *Three Philosophical Poets: Lucretius, Dante, and Goetke* (1910); *Winds of Doctrine* (1926); *Egotism in German Philosophy* (1940); *Philosophical Opinion in America* (1918); *Clzaracter and Opinion in the United States* (1920); *Soliloquies in England* (1922); *Poems* (1923); *The Unknowable* (1923); *Dialogues in Limbo* (1925); *Platonism and the Spiritual Life* (1927); *Some Turns of Thought in Modern Philosoplzy* (1933); *The Last Puritan,* a novel (1936); *Obiter Scripta* (1936); *Persons and Places,* 2 vol. (1944–45); *The Idea of Christ in the Gospels* (1946); *Dominations and Powers* (1951).

SANTEE-WATEREE-CATAWBA RIVER SYSTEM, a 538-mi.-long inland waterway in the southeastern U.S., begins in North Carolina in the Blue Ridge mountains as the Catawba

river. The headwaters of the Catawba originate near Mt. Mitchell (6,684 ft.), highest point in the United States east of the Mississippi river. The Catawba flows into South Carolina to Great Falls, a distance of 220 mi., where it becomes the Wateree river. Lakes or reservoirs formed by dams on the Catawba are Rhodhiss lake (15 mi. long); Hickory lake (10 mi.); Lake James (10 mi.); Lookout Shoals lake (10 mi.); Mountain Island lake (11 mi.); and Catawba lake (20 mi.). The Santee river is formed 30 mi. S.E. of Columbia, S.C., where the Wateree joins the Congaree river. The Congaree, in turn, is formed at Columbia by the junction of the Saluda and Broad rivers, both of which originate in the eastern segments of the southern Blue Ridge. The stream is known as the Wateree river between Great Falls and its junction with the Congaree river, a distance of 75 mi. The Wateree is navigable for 58 mi. below Camden, S.C. Eight miles northwest of Camden a hydroelectric dam forms Wateree pond (sometimes called Wateree reservoir; 15 mi. long). Near Stateburg, S.C., is Wateree swamp, a densely wooded area which abounds in mink, raccoon, otter, squirrel, opossum, deer, fox, quail and wild turkey.

The Santee, the most important river in South Carolina, flows 143 mi. S.E. into the Atlantic by two mouths, the North Santee and the South Santee, about 15 mi. S. of Georgetown. It flows through comparatively high hills which aid in the erection of dams and has been subjected to extensive navigational and hydroelectric development. Two large dams are Santee dam (48 ft. high, 7.5 mi. long), which forms Lake Marion or Santee reservoir (40 mi. long); and Pinopolis dam (140 ft. high, 2.2 mi. long), on the Cooper river, which forms Lake Moultrie, the latter receiving water diverted from Lake Marion. Lower sections of the Santee river, near its mouth, are lined by old rice plantations now devoted to cattle, vegetable, pulpwood and hunting activities.

(M. C. P.)

SANTIAGO, a province in north central Chile. Although one of eight provinces formed in 1826, Santiago has been subjected to several alterations in outline and administrative subdivisions. Area 6,727 sq.mi. Pop. (1960) 2.429.539, of whom 646.731 live in Santiago (*q.v.*), the provincial and national capital. The province embraces Andean cordillera, longitudinal valley and coastal range and valley terrain. Winter season rains and snow-melt in the Maipo watershed supply the water used for power development and farm and urban needs. River canyons provide summer recreation areas and access to winter resorts (Farellones, Lagunillas and Refugio Alemán). Santiago is a major industrial and agricultural province; in the 1950s its factories employed more than half of Chile's industrial personnel and produced more than half the value of manufactured goods. The bulk of industrial and commercial activity is concentrated in the capital, but there are important farm supply, marketing and product-processing activities at San Bernardo, location of major railroad shops; Puente Alto. a paper and gypsum-processing centre; and Melipilla. Talagante and Buin. In agriculture, dairy and beef production are important. and the main crops (by acreage) are wheat, alfalfa, clover, barley. maize, grapes, potatoes and beans.

Marketing is facilitated by the proximity of urban centres and by the best-developed road system in Chile. Road and rail carriers make almost every point in the province accessible; service to other provinces is good

San Antonio, the chief port and fishing centre. has a flourishing traffic in copper from O'Higgins province (*q.v.*) and such regional products as malting barley, wine and legumes. Nearby are such fashionable beach resorts as Santo Domingo. Cartagena and Algarrobo (Valparaíso province). Mining is conducted at Las Condes-Naltagua (copper). El Volcán (gypsum) and Polpaico (limestone for cement). Chacabuco and Maipu are famed battlefields of the war for independence.

(J. T.)

SANTIAGO (SANTIAGO DE CHILE), capital of the republic of Chile and of the province of Santiago (*q.v.*), is the centre of the nation's political, economic, cultural and ecclesiastical life. The city's preponderance of power and prestige is suggested by its population. Pop. (1960) 646,731 (mun.).

The city was founded by Pedro de Valdivia on Feb. 12, 1541. Its nucleus occupied a defensively advantageous position to the west of Cerro Santa Lucia and between the Mapocho river (north) and a periodic channel of the Mapocho (south), now the Avenida Bernardo O'Higgins, called the Alameda. The westward-sloping alluvial land over which the city has spread ranges in elevation from about 1.600 to 2,100 ft. Dominating the central city is Cerro San Cristóbal (2.779 ft.), which lies to the northeast of Cerro Santa Lucia and north of the Mapocho. A few miles to the west are the coastal ranges, remote and modest ridges compared to the 8,000-ft. cordilleran buttress uhich looms above the city on the east. The higher summits of the Andes form a massive backdrop.

Santiago, originally Santiago del Nuevo Estremo, was elevated to city status and given a coat of arms in 1552. In 1609 the royal *audiencia* was transferred to the community, and in 1651 an episcopal see was created. Few traces of early architecture have survived earthquakes and the pressures of city modernization. The 16th-century churches and convents were shattered in the earthquakes of 1647 and 1730. The cathedral, also damaged in the disasters, burned down in 1769. Only San Francisco among existing churches preserves part of the original colonial structure. The Valparaíso road was finished and the Mapocho bridged by mid-18th century. Efforts to control the river were nullified by the floods of 1609, 1684, 1779 and 1783.

The cathedral, completed in 1619, was reconstructed several times; the Moneda (since 1848 the executive residence), Aduana and Cabildo were finished between 1773 and 1807, and the Alameda was transformed from river bed to principal thoroughfare soon after independence. Nevertheless, major changes in the city's appearance did not occur until after mid-19th century, when wealthy miners and landowners began to build monumental houses. The municipal theatre was constructed in 1857 (reconstructed 1873). It and much of the contemporary architecture were French-inspired.

Broad-scale municipal improvements were notable in the 1870s. Streets were paved and lined with trees, streetcars were introduced, the water system was improved, and the central market was constructed. Numerous plazas were created, but the transformation of rocky Cerro Santa Lucia into a park was the finest gift to posterity. In the 1890s the Mapocho was effectively canalized and the splendid riverside Parque Forestal planted. Later urban improvements are notable in the middle- and upper-class residential districts, which spread upslope from the city nucleus. chiefly after 1930. Industrial development has been greatest in the western part of the city, where low-cost housing projects and spontaneous housing developments are commonly found. In this area city expansion has been greatest toward San Bernardo. In the nuclear part of Santiago, the *Centro,* modern structures of 8–12 stories are clustered. These buildings tend to combine several funcfions: shops, restaurants and theatres open to the street and to street-level galleries; offices, hotels and apartments occupy higher floors. The Plaza de Armas, with its bandstand. statuary and fountains, the flanking cathedral and old public buildings, is a link with the past. Nearby are the congress and supreme court buildings. To the southwest, in the civic centre, the hloneda is surrounded by tall ministry and commercial buildings. Groups of multistoried structures, chiefly residential, lie farther west; other clusters arise east of Cerro Santa Lucia and along major avenues. The pattern of public transportation is adequate, but peak period congestion is serious. Among the public services common to great cities Santiago's spirited volunteer fire department is unique.

City parks include San Cristóbal, which contains gardens, the zoological park, a funicular and the shrine to the Virgin of the Immaculate Conception. The once fashionable Cousifio park remains so only for the independence day military review (Sept. 18). The Quinta Normal de Agricultura contains a boating lagoon, exhibition and rodeo grounds and the museum of natural history. In the Parque Forestal is the Palace of Fine Arts. The museum of contemporary art is located on Cerro Santa Lucia; nearby is the national library building, where archives and historical and archaeological collections are housed.

The University of Chile (founded 1843), the Catholic university

(founded 1888) and the military academy are the best-known educational institutions. There are good civilian and military technical schools.

Santiago is Chile's major and most diversified manufacturing centre. Textiles, food products, shoes and clothing and beverages represent about 60% of manufactures in value. Although the city is the chief market, rail and highway carriers reach most of the country. Passenger rail and bus service with other cities is good. There is a modern international airport.

Summers (October to March) are warm; winter temperatures are not excessively low, but the combination with the atmosphere's high relative humidity produces a penetrating cold. The warm month (January) mean temperature is 69° F.; cold month (July) mean temperature is 46.4" F. Fog is common in winter, and atmospheric pollution (smog) is noticeable most of the year. Precipitation, chiefly a winter phenomenon, averages 15.3 in. per year. Snow, uncommon in the lowlands, forms a mantle upon the cordillera in the winter. (J. T.)

SANTIAGO DE COMPOSTELA (SANTIAGO), a city of northwest Spain, in the province of Corunna; at the northern terminus of a railway from Tuy, near the confluence of the Sar and Sarela rivers, and 32 mi. S.W. of the city of Corunna. Pop. (1950) 52,675 (mun.). The Galician region, of which the city is the centre, is composed of hills which have been strongly folded and faulted and where in consequence metal veins occur. In the ages when metal began to be known in the west people from the Mediterranean moved along the coasts of western Europe. and with these movements was associated the cult of the megaliths In those days navigation was precarious and sailors made for one of a number of small ports which had a common focus inland. Santiago was probably a focus for the numerous ports on the Galician rias. (Cf. Canterbury and St. David's.) At Padron, one of the ports of Santiago, there are two great stones called Barca and Patron (the "ship" and the "skipper"). The tradition of the sanctity of the old stone monuments lingered for centuries and the legend arose that St. James the Apostle had, after his martyrdom in Palestine, been borne thither for burial and that the body was brought ashore at Padron.

After the Moorish conquest the northwest comer was the only part of Spain that retained its independence and it was the region from which the reconquest of Spain for Christendom was begun. This produced a great enthusiasm for the Christian religion, an enthusiasm fanned by the reputed discovery of the bones of St. James at Compostela. A church was built over the relics and a bishopric transferred thither. The city thus became a centre for pilgrims and when the royal family of Castile became connected by marriage with that of Burgundy, which was associated with the Cluniac monks, the site gained an international significance. The road (Route de St. Jacques) of the pilgrims became famous and many of the great romances of the middle ages developed from the tales told by the pilgrims to while away the tedium of the long journey to this remote corner of Spain. (Cf. the Canterbury Tales.) There were also many pilgrims from those western fringes of Europe which had been connected with Galicia ages before in the early days of metal. The city was formerly the capital of Galicia, and is still the seat of a university and of an archbishopric, which long disputed the claim of Toledo to the primacy of all Spain. Its chief industries, apart from agriculture, are brewing, distillation of spirits and the manufacture of linen, paper, soap, chocolate and matches. The city has also been long celebrated for its silversmiths' work.

In 1078 the erection of the present cathedral was begun and it was consecrated in 1211. It is a cruciform Romanesque building. The Puerta Santa is kept closed, except in jubilee years, when it is opened by the archbishop. Perhaps the chief beauty of the cathedral is the Portico de la Gloria, behind the western classic portal. It is a work of the 12th century, and probably the utmost development of which round-arched Gothic is capable. The shafts, tympanums and archivolts of the three doorways which open onto the nave and aisles are a mass of strong sculpture.

The Hospicio de los Reyes, on the north of the Plaza Mayor, for the reception of pilgrims, was begun in 1504 by Enrique de Egas under Ferdinand and Isabella.

SANTIAGO DE CUBA, a city and seaport of Cuba, on the southern coast of the eastern end of the island, capital of the province of Oriente and next to Havana the most important city of the republic. Population of the city (1953) 163,237.

Santiago is situated about 6 mi. inland on a magnificent landlocked bay (6 mi. long and 3 mi. wide), connected with the Caribbean sea by a long, narrow, winding channel with rocky escarpment walls. in places less than 200 yd. apart. The largest vessels have ready entrance to the harbour but direct access to the wharves is impossible for those of more than moderate draft (about 14 ft.). Smith Key. an island used as a watering place, divides it into an outer and an inner basin. To the east of the sea portal stand the Morro, a picturesque fort (begun 1633) on a jutting point 200 ft. above the water, and the Estrella; and to the west the Socapa. West of the harbour are low hills, to the east precipitous cliffs, and north and northeast, below the superb background of the Sierra Maestra, is an amphitheatre of hills over which the city straggles in tortuous streets. The houses are mostly of one story. In the cathedral Diego Velbzquez (c. 1460–1524), conqueror of Cuba, was buried. It has suffered much from earthquakes and has been extensively repaired. Probably the oldest building in Cuba is the convent of San Francisco (a church since the secularization of the religious orders in 1841), which dates in part from the first half of the 16th century. On a hill overlooking the city is a beautiful schoolhouse of native limestone, erected by the U.S. military government as a model for the rest of the island. There is superb mountain scenery on the roads to El Caney and San Luis in the thickly populated valley of the Cauto. In the barren mountainous country surrounding the city are valuable mines of iron, copper and manganese. On these the prosperity of the province largely depends. There are also foundries, soapworks, tanyards and cigar factories. Mineral ores, tobacco and cigars, coffee, cacao, sugar, rum and cabinet woods are the main articles of export.

History.—Santiago is less important politically under the republic than it was when Cuba was a Spanish dependency. The place was founded in 1514 by Diego Velázquez, and the capital of the island was removed thither from Baracoa. Its splendid bay and easy communication with the capital of Santo Domingo, then the seat of government of the Indies, determined its original importance. From Santiago in 1518–19 departed the historic expeditions of Juan de Grijalva, Hernan Cortes and Pánfilo de Narváez. Cortes was the first mayor of Santiago. So important already was the city that its ayuntamiento had the powers of a Spanish city of the second class. In 1522 it received the arms and title of ciudad, and its church was made the cathedral of the island. But before 1550 the drain of military expeditions to the continent, the quarrels of civil, military and ecclesiastical powers and of citizens and the emigration of colonists to the Main produced a gradual decline. In 1589 Havana became the capital. Santiago was occupied and plundered by French corsairs in 1553 and again by a British military force from Jamaica in 1662. The capture of that island had caused an immigration of Spanish refugees to Santiago that greatly increased its importance, and the illicit trade to the same island—mainly in hides and cattle—that flourished from this time onward was a main prop of prosperity. From 1607 to 1826 the island was divided into two departments, with Santiago as the capital of the eastern department. After 1826 Santiago was simply the capital of a province. In July 1741 a British squadron from Jamaica under Adm. Edward Vernon and Gen. Thomas Wentworth landed at Guantbnamo and during four months operated unsuccessfully against Santiago. The climate made great ravages among the British, who lost perhaps 2,000 out of 5,000 men. The bishopric became an archbishopric in 1788. when a suffragan bishopric was established at Havana. After the cession of Santo Domingo to France, and after the French evacuation of that island, thousands of refugees settled in and about Santiago. They founded coffee and sugar plantations and gave a great impulse to trade. There were destructive earthquakes in 1675, 1679, 1766 and 1852. The most notable military and naval events (in Cuba) of the Spanish-American War (*q.v.*) of 1898 took place at and near Santiago.

SANTIAGO DEL ESTERO, a province in northern Argentina. separated from Tucumán in 1820. It is bounded by the provinces of Salta and Chaco in the north and Córdoba in the south. Pop. (1960) 477.156. Area 52.222 sq.mi. Santiago del Estero lies within the Argentine section of the Gran Chaco (*q.v.*) and has the ,general characteristics of that region. Almost the entire surface is a lowland plain. a large part of which is covered with scrub forest. Some of the trees, notably the quebracho. are of considerable commercial value. There are extensive saline areas in the southwest. The climate is extremely hot in summer, the temperature rising to 118° F. Frosts occur occasionally in winter. Rainfall is slight (about 20 in. a year) and quickly evaporates. Therefore agriculture is possible only where the land can be irrigated from the rivers Salado and Dulce. or where seasonal flooding by the rivers take place. The existence of large swamps (esteuos) bordering the Dulce in the vicinity of the provincial capital, Santiago del Estero, explains the name of town and province. The main crops in the irrigated districts are maize. wheat. linseed and cotton. Cattle are raised on the rough Chaco pastures.

The province is crossed by several railways which connect it with many parts of Argentina and with Bolivia and Chile. The railway via Salta to the Chilean port of Antofagasta on the Pacific coast was designed to facilitate exchange of the products of the Chaco for the minerals of Chile's northern desert (copper and nitrate). (Ga. P.)

SANTIAGO DEL ESTERO, Argentine city, capital of the province of the same name. locafed 700 mi. N.W. of Buenos Aires. Pop. (1960) 103.115. Although the climate is extremely hot and dry, the surrounding plains produce considerable wheat. cotton, flax. corn and alfalfa. Founded in 1553 by Spaniards arriving from Peru and moved to its present location on the Dulce river three years later, it is the oldest continuous settlement in Argentine territory.

Highways and excellent rail connections link the city with Córdoba. Tucumán and the Argentine northwest and with the ports of Santa Fe and Rosario. (Js. R. S.)

SANTIAGO DE LOS CABALLEROS (SANTIAGO), a province and its capital city in northern Dominican Republic. A relatively large province (1,201 sq.mi.), it is bounded on the north by the Cordillera Septentrional (to 3.993 ft.) and on the south by the Cordillera Central (to 10.417 ft.). The heart is a wide. east-west plain, known as the Cibao region. which is intersected by the Rio Yaque del Norte. This fertile and populous region makes the province a leading rice and corn producer and the centre of the nation's tobacco industry. Coffee growing and lumbering are also important. The province was established in 184.5. Pop. (1960) 287.941.

The city of Santiago de los Caballeros is situated at about 500 ft. elevation on the banks of the Rio Yaque. Pop. (1960) 83.523. It was founded about 1500 by Bartholomew Columbus and was inhabited by 30 knights of the Order of St. James (Santiago). It was rebuilt near the original site after the 1564 earthquake. Its location near the centre of the Cibao, the most productive region of the nation. has made it a vital hub of coinmunications and trade. Its factories manufacture cigars and cigarettes, coffee, pharmaceuticals. furniture and other products. (D. R. D.)

SANTIAGO MOUNTAINS, a narrow range in the southwestern U.S., extending southeastward across central Brewster county in the Big Bend section of Texas. Formerly the entire 90-mi. chain from near Alpine to the Boquillas canyon of the Rio Grande was mapped as Santiago mountains. but increasing usage restricts the name to the 35-mi. range between Del Norte gap and the Del Norte mountains to the northwest and Dog canyon and the Dead Horse mountains to the southeast, with the portion continuing from Dog canyon across the Boquillas into Mexico frequently known as the Sierra del Carmen. Santiago peak (6.521 ft.), a truncated butte of intrusive rocks, rises some 1.500 ft. above the mountain crest of vertical and overturned Cretaceous limestone strata, which averages about 1,500 ft. above the Marathon basin on the east. Annual precipitation. ranging from 5 to 15 in.. supports an open arid scrub on the lower slopes and a pinyon-juniper association higher up. The drainage system of Maravillas creek practically surrounds the range. Intermittent arroyos and a few springs help support sheep and cattle. U.S. highway 385 from Marathon crosses the range at Persimmon gap (through which went the Comanche trail) to enter the Big Bend National park. (D. D. B.)

SANTIAGO RODRÍGUEZ, a province in northwestern Dominican Republic. Area 394 sq.mi. Pop. (1960) 40.399. It occupies the northern slope and foothills of the Cordillera Central and is drained by several tributaries of the Rio Yaque del Norte, the nation's largest river. Because of semiarid conditions in much of the region, livestock raising rather than cultivation is a principal activity. Crops include cassava. plantains, peanuts, coffee and tobacco. Some lumbering is done in the mountains. The province was created in 1951 from Montecristi province.

The capital. Santiago Rodriguez (pop. [1960] 3,590), was called Sabaneta until 1936. (D. R. D.)

SANTILLANA, ÍÑIGO LÓPEZ DE MENDOZA, MARQUÉS DE (1398–1458), Spanish poet and one of the great figures of his time in both politics and literature, was born at Carrión de los Condes. Palencia. Aug. 19, 1398. and died at Guadalajara. March 25. 1458. As lord of the vast Mendoza estates, he took a leading part in opposing John II and led expeditions against the Moslems. He found time, however, to manage his lands benevolently. patronize the arts, build up an important library and write poetry of high quality. In part his poetry is typical of the 15th century. didactic and stoical in outlook. Latinized in style, often allegorical. He showed originality in collecting proverbs and in writing 42 sonnets, the first in Spanish: these. although angular and uncertain, have an occasional fine line and great historical importance. He is chiefly read for his ten *serranillas,* charming light lyrics in the traditional manner. describing encounters between the knight and the shepherdess; and for his *Proemio*, or preface to his collected works. the first document of literary history and poetic principle in Spanish.

See R. Lapesa, La *obra literaria* del *Marqués* de *Santillana* (1957). (C. C. SH.)

SANTO DOMINGO, a geographic name of several usages in the island of Hispaniola. West Indies. This was the original name of the capital of the Dominican Republic. the oldest European city in the western hemisphere. Christopher Columbus established the first European settlement in the new world on the northern coast of Hispaniola on his second voyage in 1493. After he returned to Spain, his brother Bartholomew founded the city of Santo Domingo on the southern coast in 1496. This name! officially changed in 1936 to Ciudad Trujillo, was restored in 1961 after the assassination of Rafael Trujillo Molina.

Santo Domingo is also the name sometimes given to the entire island of Hispaniola. During the colonial period it was the name given to the Spanish portion. and when the French occupied the western third of the island they called their colony St. Domingue. Also during the colonial period both Spanish and French names were applied to the whole island. The name was frequently corrupted incorrectly to San Domingo in English-speaking countries. The former Spanish colony. officially the Dominican Republic since 1844, is still frequently referred to as Santo Domingo. The former French colony became the Republic of Haiti in 1804.

Santo Domingo is the official name of the federal district of the Dominican Republic. comprising the wide coastal plain and hilly interior region surrounding the capital city of the same name. This district was set up in 1935 out of the former Santo Domingo province and corresponds to the old commune of Santo Domingo. Its 570 sq.mi. area consists of sugar cane plantations and cattle estates. as well as the capital city, and its population (1960) was 367,053. Boca Chica beach resort is located about 20 mi. E. of the capital. See also DOMINICAN REPUBLIC; HAITI; HISPANIOLA. (D. R. D.)

SANTO DOMINGO, capital of the Dominican Republic. on the southeast coast of the island of Hispaniola. Pop. (1960) 367.053. It was founded in 1496 when Bartholomew Columbus moved the first Spanish settlement in Hispaniola to the Ozama river on the south coast. It was called Santo Domingo until 1936,

when the name was changed to Ciudad Trujillo in honour of Rafael Leonidas Trujillo Molina; its original name was restored in 1961 after Trujillo was assassinated and his regime was overthrown. It is the oldest permanent city founded by Europeans in the new world and the seat of the oldest archbishopric; it claims the oldest university (St. Thomas Aquinas, now Santo Domingo university) in the western hemisphere. Until the conquest of Mexico and Peru. Santo Domingo was the centre from which the Spanish possessions in the Americas were governed, but by the end of the colonial period it was a relatively unimportant provincial town. In 1655 its inhabitants defeated a force which was sent by the British government to seize the colony and which later conquered Jamaica

It has retained in part many of the aspects of a Spanish colonial town, with straight, narrow streets intersecting at right angles and low houses abutting on the sidewalk. The cathedral, in Spanish Renaissance style, dates from 1514 and contains the reputed tomb of Christopher Columbus. There are remains of the city walls, with their fortified gates. and of the palace of Diego Columbus. (See COLUMBUS, CHRISTOPHER.)

Santo Domingo has grown rapidly since World War II. and there was much reconstruction after the devastating hurricane of 1930 There are fine public buildings and parks and luxurious tourist hotels. It is the chief seaport of the Dominican Republic; and the harbour, at the mouth of the Ozama river, has been improved so that large vessels can tie up at the dock. It also has modern airports and is connected by air services with the United States and other foreign countries.

See also DOMINICAN REPUBLIC; HISPANIOLA. (D. G. Mo.)

SANTORIN (corruption of St. Irene) or THERA, a volcanic island in the Aegean sea, the southernmost of the Sporades. Officially it is a province in the Greek department of the Cyclades (*q.v.*); divided into 9 communes. Pop. (1951) 9,332.

In shape Santorin forms a crescent and encloses a bay on the north, east and south; on the western side lies the smaller island of Therasia. The encircling wall thus formed, elliptical, and 18 mi. round its inner rim. is broken in two places — toward the northwest by a strait a mile in breadth, where the water is not less than 1,100 ft. deep, and southwest by an aperture about 3 mi. wide, shallow, with Aspronisi (White Island) in the middle. From the bay, cliffs rise perpendicularly to as much as 1,000 ft.; but toward the open sea, both in Santorin and Therasia, the ground slopes and has been converted into broad level terraces of tufaceous agglomerate, which, though bare and ashen, produce the famous Santorin wine. The tufa itself is exported as cement.

Toward the southeast the limestone peak of Mount Elias (1,857 ft.) existed before the volcano was formed. In the middle of the bay lie three small volcanic islands, Palaea-, Mikra- and Nea-Kaümene (Old, Little and New Burnt islands). The highest, Nea-Kaümene, was thrown up in 1707 and 1866 to 351 ft. above the sea. The cliffs show horizontal bands of black lava, white and yellow tufa and other volcanic strata, red, purple, brown and green, with but little herbage. The modern town of Thera (or Phera) is built at the edge of these cliffs, overlooking the bay at a height of 900 ft.

The foundations of the houses and in some cases their sides are excavated in the tufa, so that they are hardly traceable except by their chimneys. Because of the absence of timber they are roofed with barrel vaults. Both wood and occasionally uater are imported from neighbouring islands, for there are no wells and the rain water, collected in cisterns, sometimes fails. The next largest village, Apanomeria ("Upper Part"), near the north entrance, is crowded together in a whitewashed mass above the reddest rocks in the island.

Geology. — Most geologists agree that the whole of the bay was once covered by a single volcanic cone, represented by the outward slope of Santorin and Therasia, with its crater at the Kaumene Islands, and that the bay results from explosion and subsidence.

The Kaumene Islands arose subsequently, and Palaea-Kaumene is considered to be prehistoric. Principal eruptions in historic times were those of 196 B.C. (Strabo 57), when flames arose from the water between Thera and Therasia for four days and an island appeared; of A.D. 726, when again an island was thrown up; of 1570, when Mikra-Kaumene arose; of 1650, which destroyed many lives by noxious exhalations and ended in the upheaval of an island in the sea to the northeast of Santorin, which is now a reef below sea level; that of 1707, when Nea-Kaumene arose; and that of 1866, when Nea-Kaumene was extended toward the south and enlarged threefold.

In the southern parts both of Santorin and Therasia prehistoric dwellings were found at some height above the sea, and there was evidence that these date from a period antecedent to the formation of the bay. This was demonstrated by their position underneath the layer of tufa which covers the islands and by these layers of tufa being broken off precipitously in the same way as the lava rocks, a fact which could only be explained by the supposition that they all fell in together.

In Greek legend the island of Thera originated from a clod of earth presented to the Argonauts by Triton. A colony was left there by Cadmus (Herod. iv, 147.). Subsequently a colony from Sparta, including Minyan refugees from Lemnos, was brought by Theras, who gave the island his own name, in place of Calliste. But the chief event in Thera's history was the planting of its famous colony of Cyrene on the north coast of Africa by Battus in 631 B.C, in accordance with a command of the Delphic oracle. Thera, as a member of the league of the Cyclades, was from 308 to 145 B.C. under the protectorate of the Ptolemies.

The ancient capital occupied a site on the eastern coast now called Mesavouno, between Mount Elias and the sea. It has been excavated since 1895 by Baron Hiller von Gartringen. There are extensive cemeteries; a Heroum of Artemidorus; an Agora; a Royal Portico; a temple of Dionysus and the Ptolemies, later dedicated to the Caesars; the Ptolemaic barracks; and a gymnasium. The main street has narrow lanes to right and left; one leads to the sanctuary of the Egyptian gods. Near the street there is a small theatre beneath the seats of which is a cistern into which rain water drains from the auditorium: water was evidently scarce then as now. Farther southeast are the temples of Ptolemy Euergetes III and of Apollo Carneius; finally, where the rocks fall precipitously, a gymnasium of the Ephebi. Numerous rock carvings and inscriptions have been discovered, as well as statues and vases. Near the west foot of Mount Elias is the temple of Thea Basileia, perfect even to the roof, now dedicated to St. Nicolas Marmorites.

The name Santorin was given after the fourth crusade, when the island formed a portion of the duchy of the archipelago.

SANTOS, a city and seaport of Brazil, in the state of São Paulo, 210 mi. S.W. of Rio de Janeiro and 49 mi. by rail S.E. of São Paulo city. Pop. (1960) 262,048; (1950) 198,405. Santos covers an alluvial plain on the inner side of an island (São Vicente) formed by a tidal channel called the Santos channel or Guarujá river. The commercial district is several miles from the mouth of the channel, but the residential sections extend across the plain and line the beach facing the sea.

Santos is only a few feet above sea level, and its swampy island is drained by deep cement conduits. The channel is free from obstructions, and in front of the city it widens into a bay deep enough for the largest vessels. The water front, once beds of mud and slime and source of many fever epidemics, is faced by a wall of stone and cement. The docks are 4 mi. long and can accommodate about 50 steamers at one time; belt conveyors load several thousand bags of coffee per hour. The British-built but Brazilian-government-owned railway to São Paulo transports the bulk of the state's coffee to Santos. The trains of this profitable railway are hauled up and down the steep coastal range (the Serra do Mar) by cables. A paved highway, including the magnificent Via Anchieta, links Santos with São Paulo.

Santos, the world's leading coffee port, is dominated by its leading export, the aroma of which permeates the city. Its chief public building houses the Coffee exchange, a stock company in which the state government is liable for a part of its liquidating commitments. Santos exceeds Rio de Janeiro in annual tonnage of shipping. Each year 8,000,000 to 13,000,000 bags of coffee are

shipped. The warehouses can store about 5,000.000 bags. and many have modern machinery. Other exports include cotton. sugar, bananas (grown near Santos), castor oil, beef, oranges, hides and some manufactures.

An annual rainfall of about 77 in. and a mean temperature of 69° F. combined formerly to create unhealthful conditions, but the building of drainage canals, extension of sanitation, paving of streets, construction of better houses and port improvements have made Santos a healthful city. A suburban seaside resort, Guarujá, attracts many visitors from inland parts of Brazil.

The first settlement on the São Paulo coast was made in 1532 at São Vicente, about 6 mi. S. of Santos on the island. Other settlements followed, including Santos (1543), and later a small fort was built at the harbour entrance as a protection against Indian raids from the north. The name of the city was taken from the Hospital dos Santos, established by the city's founder. Brás Cubas, and named after a hospital in Lisbon, Port. São Vicente did not prosper, and was succeeded by São Paulo as the capital (1681) and by Santos as the seaport of the colony. Santos was sacked by the English privateer Thomas Cavendish in 1591. (R. M. M)

SANTQS-DUMONT, ALBERTO (1873–1932), Brazilian aviation pioneer. was born in the state of Minas Gerais, Braz.. on July 20. 1873. Educated in France, he spent most of his life in that country. Becoming interested in aerial flight, he made a balloon ascent in 1897 and then began to construct dirigible airships. After many failures he built one which in 1901 won the Deutsch prize and a prize from the Brazilian government for the first flight in a given time from St. Cloud to the Eiffel toner and return. In 1903 he erected at Neuilly the first airship station, where he kept his fleet of dirigibles. Shortly after the successful flight by the Wright brothers in 1903, Santos-Dumont turned his attention to heavier-than-air machines. After experimenting with a vertical-propeller model, he built in 1906 a machine on the principle of the box kite. With it he won the Deutsch-Archdeacon prize in October, and in November he flew 220 m. in 21 sec. In 1909 he produced his famous "demoiselle" or "grasshopper" monoplane, the forerunner of the modern light plane. In 1928. after many years of residence in France, he returned to Brazil. He died July 24, 1932.

See his autobiography, *My Airships: A Story of My Life* (1904).

SANTOS MONTEJO, EDUARDO (1888–), Colombian newspaper editor and political figure, was born Aug. 28. 1888, at Bogotá Colom. He received his lam degree from the National University of Colombia and then studied literature and sociology for two years at the University of Paris. In 1913 he founded *El Tiempo,* Colombia's leading newspaper. Santos began his political career in 1921 as a Liberal and thereafter remained a major party figure. He held every elective office, including the presidency (1938–42). as well as many diplomatic and cabinet posts. Politically. he represented the more conservative element of the Liberal party and long headed the most uncompromising Liberal opposition to the Conservative party. Although he did not play an active political role after 1954. he strongly supported, through *El Tiempo,* the national front. *See* also COLOMBIA: *History.* (*R*. L. GE.)

SANUTO (SANUDO), **MARINO,** the younger (1466–1533), Venetian historian, son of the senator Leonardo Sanuto, was born on May 22. 1466. Marino Sanuto was elected to the *maggior consiglio* when only 20 years old, and became a senator in 1498. He collected a fine library. which was rich in manuscripts and chronicles both Venetian and foreign, including the famous Altino chronicle, the basis of early Venetian history.

His chief works are: *Itinerario in terra ferma* (ed. by M. Rawdon Brown, 1847); *I commentarii della guerra di Ferrara,* an account of the war between the Yenetians and Ercole d'Este (1829); *La Spedizione di Carlo VIII* (manuscript in the Louvre): *Le Vite dei Dogi,* vol. xxii of Muratori's *Rerum Italicarum Scriptores* (1733). The *Diarii,* his most important work which cover the period from Jan 1 1496. to Sept. 1533, were edited by various scholars and published at Venice (58 vol. 1879–1903). Because of the relations of the Venetian republic with the whole of Europe and the east it is practically a universal chronicle.

SAN VICENTE, a department in El Salvador, bordering the Pacific ocean, and its capital city. Area 466 sq.mi. Pop. of the department (1950) 87,577. of which 70% was rural; population is concentrated in the highland valleys of the western part of the department. On the southwestern border rises San Vicente volcano, altitude 7.156 ft. The department produces rice, sugar, cotton. livestock, cheese and vegetables.

San Vicente city (pop.. 1950, 10,950), about 30 mi. E. of San Salvador in an area of volcanic hot springs and geysers, was founded in 1635 on the site of Tehuacan, an ancient Indian settlement. An important commercial city, it manufactures leather goods. textiles. liquors and hats. (C. F. J.)

SÃO FRANCISCO, a river of eastern Brazil, rises in the Serra da Canastra, southwest Minas Gerais. It flows in a general north-northeasterly direction across the great central plateau of Brazil and turns northeastward through the *sertão* (semiarid interior plains) and then southeast in a great bend, entering the Atlantic about 60 mi. N.E. of Aracajú, Sergipe state. Along its course the São Francisco forms the Pernambuco-Bahia and Alagôas-Sergipe state borders. The river has a total length of 1.987 mi. and a fall of 2,700–2,800 ft. It is navigable from Pirapora. in the state of Minas Gerais. for 984 mi. to a point downstream from Juàzeiro, Bahia, and from Piranhas, in the state of Alagôas, 148 mi to the sea. The upper and loner sections of the river are separated by a stretch of nearly 300 mi. in which the São Francisco drops. first gradually and then abruptly, from the plateau toward the coastal plain. The upper portion of this stretch, nearly 100 mi. long above Petrolândia, comprises a series of rapids known as the Sobradinho, navigable at high water. In the lower portion are the spectacular São Francisco falls, where the river plunges through a narrow gorge—in one place only 51 ft. wide—and over three successive falls. altogether 265 ft. This obstructed part of the river is about 190 mi. long, and consists of a series of rapids above the falls and a deep canyon with whirlpools for some distance below. The Paulo Afonso falls are about 193 mi. from the river mouth. Sandbars at the mouth prevent the entry of deep-draft ocean vessels. The river is nearly 1 mi. wide at Penedo, 22 mi. from the Atlantic. Above Juàzeiro its width varies from a narrow channel during drought periods to several miles at flood stage in the rainy season (December to March.) Below Pirapora the only bridge spanning the São Francisco connects Juàzeiro nith Petrolina, in Pernambuco state.

The principal tributaries of the São Francisco are: to the south and east, the Paraopeba, Velhas and Verde-Grande; to the north and west, the Indayá, Abaeté, Paracatú. Urucuia, Carinhanha. Corrente and Grande. Several of these are navigable for long distances by small boats. Estimates of the aggregate navigable channels of the São Francisco river system range from about 1.000 mi. to over 4.000 mi.

The São Francisco river has been a major artery of travel between northeastern and central Brazil since colonial times. Along most of its course it flows through a sparsely settled pastoral region, frequently subject to prolonged drought. It serves to link the highway and railroad that converge at Pirapora with routes running north and east from Juàzeiro and Petrolina. However, river transport is slow and difficult because of shifting channels and great variations in depth and current speed in different seasons. During the dry season steamboats may take two weeks to run from Pirapora to Juizeiro and over a month to return.

The Brazilian government has undertaken a series of related, long-range development programs in the São Francisco valley designed to improve navigation on the river, to reduce disease in the area, to provide flood control and irrigation to make the valley more attractive for agricultural settlement. and to harness the great hydroelectric potential of the Paulo Afonso falls. A major accomplishment was the virtual elimination of malaria, formerly endemic in the upper valley. Construction on the Paulo Afonso hydroelectric project began in 1949. It is expected that the power

available from the project will eventually be distributed throughout most of the states of northeastern Brazil. (R. E P.)

SÃO LEOPOLDO, a city in Rio Grande do Sul. Braz.. located 20 mi. N. of Pôrto Alegre. Pop. (1950) 18,380. This was the first German colony (1824) established in southern Brazil. It is now a rail centre with factories producing pig iron, tanned leather, matches and aluminum ware. São Leopoldo is also served by river boats and is on the main all-weather highway that connects Pôrto Alegre with São Paulo. It is located in the midst of an agricultural country producing rice, hogs, cattle, maize, potatoes. beans. manioc, tobacco and a great variety of old world fruits and vegetables. There are Jesuit and Protestant seminaries in the city. (P. E. J.)

SÃO LUÍS, chief city and capital of the state of Maranhão, Braz., is located on the west side of São Luis Island 300 mi. E.S E. of Belém. Pop. (1950) 79.731. The island is really a long narrow peninsula between the drowned mouths of the Mearim and Itapecuru rivers (São Marcos bay on the nest and São José bay on the east), and it is cut off from the mainland by a shallow side channel, the Canal do Mosquito. It was founded on this strategic site in 1612 by a French naval officer. Daniel de la Touche de La Ravardikre, and named in honour of Louis SIII. It was captured by the Portuguese in 1615; from 1641 to 1644 it mas held by the Dutch. Because of its position where two systems of navigable rivers converge. São Luis has long controlled the commerce of the main part of Maranhão, and it is the chief port for the products of Teresina in Piauí, with which it is connected by rail. Its exports include babaçu (babassu) oil. castor beans, balsam. hides and skins, lumber, cotton, sugar, rice and maize. In the city there are sugar refineries. a brandy distillery (*caxaça*) and plants for the processing of babaçu oil and cacao, for the preserving of fruit and for the manufacture of hammocks and margarine. Since 1679 it has been the seat of a bishopric, and its buildings preserve much of the Portuguese colonial atmosphere, especially the large 17th-century cathedral. Its Institute of History and Geography is one of the oldest in Brazil. São Luis has been the birthplace of many distinguished Brazilian writers and poets. The city was formerly called São Luiz do Maranhão or simply Maranhão. (P. E. J.)

SAÔNE, a river of east France, 298 mi. long, rising in the Faucilles mountains (Vosges), 15 mi. S.W. of Epinal at a height of 1,300 ft. and uniting with the Rhône at Lyons. The name is derived from *Sauconna,* a 4th-century name. Rising in the Vosges Hercynian massif, it meanders in the wide depression on Jurassic and Tertiary rocks between the Plateau of Langres, the CBte d'Or and the mountains of Charolais and Beaujolais on the west, and the western slopes of the Vosges and Jura and the plain of Bresse and the plateau of Dombes on the east. Near Allerey the Saône unites with the Doubs (left), which rivals it in volume and exceeds it in length at this point. At Chalon-sur-Saône it turns south, and passes Mbcon. Below Tréveux its valley narrows, winds past the Mont d'Or group and joins the Rhone at Lyons. The SaBne is canalized from Corre to Lyons, a distance of 233 mi., the normal depth of water being 6½ ft. At Corre (confluence with the Coney) it connects with the Eastern canal, at Heuilley (below Gray) with the Saône-Marne canal, at St. Symphorien (above St. Jean-de-Losne) with the Rhône-Rhine canal. and at St. Jean-de-Losne with the canal de Bourgogne and at Chalon with the Canal du Centre. (*See* RHÔNE.)

SAÔNE-ET-LOIRE, a *département* of east-central France formed from the districts of Autunois, Brionnais, Chalonnais, Charollais and Mbconnais, previously belonging to Burgundy. It is bounded north by the department of Côte d'Or, east by that of Jura, southeast by Ain, south by Rhône and Loire, west by Allier and Nièvre. Pop. (1954) 511,182. Area. 3,331 sq.mi. The department extends down into the valley of the Loire on the west and into that of the Saône on the east, both with Pliocene deposits, from a high, but discontinuous, central north-to-south axis, stretching from the CBte d'Or (Jurassic) to the Beaujolais (largely granitic). The chief break in the highlands is used by the railway through the Charollais from Dijon through Beaune to Digoin on the Loire, and by the canal from Châlon-sur-Saône to Dijon. On the east the department extends beyond the SaBne to include a large part of the region of Bresse which focuses chiefly on Châlon. The heights of the Morvan (2,959 ft. in the department) rise on the northwestern border.

The average temperature at Mbcon (52° or 53° F.), the most temperate spot in the department, is slightly higher than at Paris, the winter being colder and the summer hotter. At the same town the yearly rainfall is about 33 in., but both the rigour of the climate and the amount of rain indreases in the hilly districts.

Agriculture prospers in Saône-et-Loire. Wheat, oats and maize are the chief cereals; potatoes, clover and other fodder. and mangold-wurzels are important, and beets, hemp, colza and rape are also grown. Excellent pasture is found in the valleys of the SaBne and other rivers. The vine, one of the principal resources of the department, is cultivated chiefly in the neighbourhood of Chblon and Mâcon. Of the wines of Mbconnais, the vintage of Thorins is in high repute. The white Charollais oxen are one of the finest French breeds; horses. pigs and sheep are reared. and poultry farming is a thriving occupation in the Bresse. The industrial importance of the department is great, chiefly owing to its coal and iron mines; the chief coal mines are those near Creusot, Autun and Chapelle-sous-Dun. A pit at Épinac is more than 2,600 ft. in depth. Iron is mined at Mazenay and Change, and manganese is found at Romankche and there are quarries of various kinds. There are well-known warm mineral springs containing chloride of sodium and iron at Bourbon-Lancy. The iron and engineering works of Schneider and Company at Le Crcusot are the largest in France. The department also has many distilleries, potteries, porcelain works (Digoin and Charolles), tile works, oil works and glass factories, and manufactures leather goods, esparto goods, sugar and fecula. Its commerce between the north and the midi is facilitated by navigable streams — the Loire, SaBne. Doubs and Seille — the Canal du Centre. which joins Chalon-sur-Saône with Digoin on the Loire, and the canal from Roanne to Digoin and the lateral Loire canal, both following the main river valley. The chief railway of the department is the P.L M.

Saône-et-Loire forms the diocese of Autun; it is part of the district of the 8th army corps (Bourges) ; its educational centre is Lyons and its court of appeal that of Dijon. It is divided into 5 arrondissements — Mbcon, Louhans, Chalon-sur-Saône, Autun, Charolles — 51 cantons, and 590 communes. Mbcon, Chalon-sur-SaBne. Autun, Le Creusot, Cluny, Montceau-Les-Mines, Louhans, Charolles (*qq.v.*), Tournus and Paray-le-Monial are the chief towns in the department. St. Marcellès-Châlon has a Romanesque church, once attached to an abbey where Peter Abélard died; Anzy has a Romanesque church and other remains of an important monastery; Sully has a chbteau of the 16th century; and Semur-en-Brionnais and Varennes-l'Arconce fine Romanesque churches. Prehistoric remains of the Old Stone Age have been found at Solutré near Mâcon, and have given the name Solutrian to a period of prehistoric time.

SÃO PAULO, a state of Brazil, bounded north by Mato Grosso and Minas Gerais, east by Minas Gerais, Rio de Janeiro and the Atlantic, south by the Atlantic and Paraná and west by Mato Grosso. Pop. (1950) 9,134,423. Area 95.452 sq.mi. The state has a coast 373 mi. long, skirted by the well-wooded western slopes of the Serra do Mar. The narrow coastal zone is broken by lagoons. tidal channels and mountain spurs. Above is an extensive plateau with wide grassy plains, 1,500 to 3.000 ft. above sea level. Isolated ranges of low elevation break the surface in places, but in general the state may be described as an undulating tableland sloping toward the Paraná river, its western boundary. The extreme eastern part. however, has an eastward slope and belongs to the Paraiba basin. A number of large rivers flow westward to the Paraná, including the Grande (part of the state's northern boundary), Tietê (traversing the whole state), Aguapei, Peixe and Paranapanema (part of the southern boundary). The Pardo and Turvo are important tributaries of the Grande. Much of western São Paulo is still unsettled. The coastal zone has a hot climate and a heavy rainfall. On the plateau rainfall is ample, but

the air is drier and more bracing, the sun temperature being high and the nighfs cool.

São Paulo is the heartland both for coffee planting and for industry in Brazil; it has been called a locomotive pulling the other states like empty freight cars. Brazil's most populous state, São Paulo in the 1950s contained more than 17% of the nation's population, although only 3% of its area. The value of São Paulo's agricultural production was 40%, that of its industrial production 60%, of the total for Brazil. It grew more than half of the country's leading crop, coffee. It accounted for almost half of Brazil's foreign trade. Figures for income, hydroelectric power, banks, motor vehicles and daily newspapers ranged between 30% and 40% of the national total. The literacy rate was appreciably higher than the average for Brazil. The dynamic capital, São Paulo, dominates the life of the state; with a population of more than 3,000,000 it overtook Rio de Janeiro in the 1950s as Brazil's largest city.

Political importance came with São Paulo's economic growth. The nation's first three civilian presidents after the downfall of Emperor Pedro II in 1889 were Paulistas. Later, São Paulo and Minas Gerais reached a "rotation" agreement regarding the presidency. This broke down in 1930 when Wáshington Luis from São Paulo, tried to impose a Paulista successor during the severe coffee crisis that accompanied the world depression. Getúlio Vargas from Rio Grande do Sul was then swept into office with army backing. Paulistas resented his measures against their state and rose against his regime in July 1932. Although São Paulo's industry was swiftly converted to military production, and 50,000 men were placed in the field, the revolt was put down in three months. Thereafter the state recouped only a part of its political influence.

In the mid-19th century, intensive coffee planting began near Campinas, northwest of the capital. The coffee frontier then moved steadily northward, westward and, in the 20th century, southward into Paraná. The best land occurs in the streaks of *terra roxn* (red-purple earth), a deep, porous soil containing humus. Periodic overproduction of coffee and exhaustion of the older coffee lands led to land subdivision and diversification of agriculture after the 1930s. In order of market value, the leading crops after coffee were, in 1956, cotton, rice, corn, sugar, beans. potatoes, tomatoes, bananas, peanuts, oranges and manioc. Cereals are grown despite somewhat unfavourable climatic conditions. Cotton enjoyed a boom during the American Civil War; then, after nearly disappearing, the industry revived to meet the demand of Brazilian cotton factories. Sugar cane was planted with the first Portuguese settlement and remained the leading crop until the advent of coffee. Stock raising is important in northern and western parts of the state. After 1929 much coffee land was converted to pasturage, and the number of cattle increased fivefold within 25 years. Herds have been improved by imported stock, and horses and mules are also bred; another profitable animal industry is the breeding of swine. Truck farming and dairying have developed with urbanization. The state has excellent agricultural schools and experiment stations at Piracicaba and Campinas and a zootechnic station in the capital.

Immigration is one of the keys to Sio Paulo's economic progress. Coffee was first cultivated by Negro slaves. When these were emancipated in 1888, European workers were already arriving as replacement, aided by private and official subsidies. Between 1870 and 1952 over 2,500,000 immigrants entered, half of them as permanent residents. The principal foreign groups were Italians, Portuguese, Spaniards and Germans. After federal immigration restrictions were imposed in 1934, migration from other Brazilian states met São Paulo's labour needs. Many immigrants were attracted from farms to cities, especially the capital, where they furnished industrial labour. Nearly 200,000 Japanese arrived in the 20th century; they showed greater cohesion as rural settlers, as evidenced by their efficient agricultural co-operative at Cotia, near the capital.

São Paulo is the industrial centre of Brazil, with most of the state's factories located in the capital or within 75 mi. of it. Manufacturing was stimulated during World War I, and Paulistas used their political influence with the federal government to obtain a tax exemption for the port of Santos and protective tariffs. In the 1960s the state had over 52,000 industrial firms employing more than 900,000 persons; although the vast majority were small enterprises, 213 plants had 500 or more employees. The output of pig iron, cast iron and steel was over 600,000 tons annually. Other heavy industries included the assembly of motor vehicles and manufacture of farm machinery. Raw materials for many industries, such as textiles, ceramics, cement, furniture and food processing, are locally available. The principal source of power is hydroelectric. South America's first nuclear energy power plant was purchased for São Paulo in England in 1957. Although poor in minerals, São Paulo produces significant quantities of alumina, mineral water and dolomite.

The state has an extensive network of federal, state and private railroads of varying gauges. These converge upon the capital and upon the cable railway of the pioneer Santos-Jundiai line which links São Paulo with its port. Santos in the early 1960s was the nation's busiest port and the largest coffee-shipping port in the world. Cananéia, Iguape, Sio Sebastiio and Ubatuba are engaged in the coasting trade only; the first two are known for the rice grown in their vicinity. In addition to 4,600 mi. of railroads, São Paulo has 63,000 mi. of highways and 46 airports.

The capital of the state is São Paulo (*q.v.*), and its second city in importance is Santos (*q.v.*). Other leading cities and towns are as follows (population figures, 1950 census, are for municipalities that include large rural areas and even separate villages; distances are by rail from the capital):

Near the capital: Sio Caetano do Sul (59,832; 7 mi.), Santo André (127,032; 11 mi.) and São Bernardo do Campo (29,295; 12 mi.), industrial subcentres on the Santos-Jundiai line; Guarulhos (34.683; 13 mi.).

Along the Paraiba river and the Central do Brasil line, east-northeast from São Paulo to Rio de Janeiro, cradle of the coffee culture in transition to diversified farming and industry: Mogi das Cruzes (61,553; 30 mi.); Taubaté (52,997; 94 mi.), in a rich and healthful agricultural district with important industries; Guaratinguetb. (36,657; 128 mi.).

Along the Santos-Jundiai line: Jundiai (69,165; 37 mi.), in a hilly region with an excellent climate where grapes and some grain and coffee are grown, an industrial centre and terminus for the Paulista lines and a branch of the Sorocabana; Bragança Paulista (51,623; 65 mi.), on a narrow-gauge branch line and in a region of good soil.

On the Paulista and Araraquara lines northwest from Jundiai through the historic coffee region: Campinas (*q.v.*); Limeira (46,-281; 103 mi.), a pioneer district for immigrant coffee workers in the 1840s and now a centre for orange growing and manufacturing; Rio Claro (47,073; 121 mi.); Araraquara (62,688; 196 mi.); Barretos (50,249; 320 mi.), a centre for the cattle industry; Sio José do Rio Prêto (65,852; 345 mi.).

On the Paulista line (western branch) and the Noroeste line in the newer coffee and cotton lands: Bauru (65,452; 251 mi.), a railway junction; Marília (86,844; 330 mi.), a modern pioneer city incorporated in 1929; Tupã (56,682; 377 mi.); Araçatuba (59,452; 426 mi).

On the Mogiana line north-northwest from Campinas toward Minas Gerais: Ribeirão Prêto (92,160; 264 mi.), in a rich coffee district with a medical school belonging to the state university; Franca (53,485; 333 mi.).

On the Sorocabana lines northwest and west of São Paulo (connecting with the southern states and Uruguay and with Mato Grosso and Bolivia to the west): Sorocaba (93,928; 65 mi.). a prosperous manufacturing and commercial city on the Sorocaba river; Itu (30,883; 76 mi.), a historic town with numerous factories and water power from the Tietê; Piracicaba (87,835; 115 mi.), a manufacturing and commercial centre with agricultural school; Presidente Prudente (60,903; 491 mi.).

São Paulo was settled in 1532 by the Portuguese under Martim Afonso de Sousa, who established a colony near Santos at São Vicente, now a resort town. It was originally called the *capitania* of São Vicente (organized 1534) and included the whole of Brazil south from Rio de Janeiro. After the founding in 1554 of São

Paulo city (which succeeded Sbo Vicente as capital of the captaincy in 1681), the Paulista plateau was for a long time the main region of inland settlement in Brazil. Seventeenth-century expeditions (*bandeiras*) roaming the interior from bases on the plateau were largely responsible for the boundaries of the modern nation. From time to time parts of São Vicente were cut off to form other captaincies, from which developed the present southern states. After national independence, Sbo Paulo was a province under the Brazilian empire (1822–89). (R. M. M.)

SAO PAULO, the largest city of Brazil. capital of the state of the same name, largest industrial centre of the nation and seat of an archbishopric, is on the Tietê river 49 mi, by rail N.W. of the port of Santos and 308 mi. by rail S.W. of Rio de Janeiro. Pop. (1950) 2.017.025; (1958 est.) 3,315,553. São Paulo is connected by rail and highway with Rio de Janeiro and many inland cities. It is connected with Santos. its port, by a cable railway and a four-lane highway over the steep coastal escarpment. Its airport is one of the busiest in the world. São Paulo is surrounded by many functionally specialized satellite towns, and it dominates a vast agricultural hinterland. Part of the city occupies ridges that command broad vistas, and part is on alluvial land along the Tietê and smaller rivers. The elevated regions provide healthful residential districts. Although the surrounding lands are clayey with sandy deposits. they are extensively used for truck farming. Nearby hills and reservoirs and the beaches at Santos and Guarujá provide pleasant resort areas. The city is just within the tropics and has high sun temperatures in summer, but its elevation (2.400 ft. above the sea) gives it a temperate climate which occasionally reaches freezing in winter.

São Paulo grew rapidly in modern times. Its population of less than 25.000 in 1872 reached 250.000 in 1901 and 1,000,000 in 1933. To create an adequate source of hydroelectric power, nearby rivers were dammed and their waters pumped over the coastal mountains to supply the Cubatão power plant. In 1956 Sbo Paulo's hydroelectric plants had a capacity of more than 2.000.000 h.p. Because of its great activity, the city has been called the "Chicago of South America." In the 1950s the annual number of licences issued for new buildings averaged more than 16.000. The historic Triangle. or city centre, contains only a portion of São Paulo's characteristic skyscrapers. Traffic is handled by viaducts and by a loop-and-spoke system of broad radial and pcrinietric avenues; but in general urban growth has been swift and uncontrolled. A municipal department of urbanism was created only in 1947. Residential districts of the \yell-to-do. such as Avenida Paulista and Jardim América, are attractively laid out, the more recent of them by private firms influenced by English town planning. They contrast sharply with the crowded slums of the industrial Braz and Mooca districts. Recreation facilities include a stadium seating 80.000 spectators. the Jockey club racecourse and an autodrome, one of the world's largest.

São Paulo has a long history, few traces of which are visible in the modern metropolis. The Jesuits under Manuel da Nóbrega founded it as an Indian settlement in 1554, on the anniversary of the conversion of St. Paul. From this saint the city takes its name. The site was a hill at the confluence of two streams which could be defended against hostile Indians. Three 16th-century paths on the hilltop formed the Triangle which permanently identified the city centre. In the 17th century Sbo Paulo was a base for expeditions (*bandeiras*) that searched the continent for Indian slaves and precious minerals. Although it succeeded São Vicente as capital of the captaincy in 1681 and was raised to the status of city in 1711, São Paulo remained an agrarian town into the 19th century. In 1822 Emperor Pedro I declared national independence there, at a site marked by the museum and monument of Ipiranga. Traditions of the *bandeiras* and colonial autonomy were invoked in 1932, when São Paulo became the seat of an unsuccessful revolt against the regime of Pres. Getúlio Vargas.

The city's modest fortunes before the mid-19th century derived from commerce, sugar growing and diversified agriculture. At that time the spread of coffee planting to the rich red soil of the province opened a source of wealth which contributed to the city's sudden growth after 1880. Favoured by its climate, its strategic location in the transportation network and the availability of a port, Sbo Paulo became a centre for commerce, banking and industry. Immigrants arrived in large numbers as workers and entrepreneurs. For a time Italians outnumbered native Brazilians in the city. Other prominent groups were Portuguese. Spaniards. Germans, east Europeans, Levantines and Japanese. Although immigration fell off after 1934, many foreign quarters have kept their identity. Only about 7% of the inhabitants are Negroes. in contrast to the heavy Negro population of northeastern Brazil.

Industrial development began in the late 19th century. In a few decades São Paulo aith its neighbouring municipalities, notably Santo André, became the foremost industrial centre of South America. Southern Brazil, more prosperous and densely settled than the north. furnished a market for manufactures The territory nithin easy commercial reach of Sbo Paulo contains only 20% of the area of the nation but roughly 50% of iti population, 75% of its highways and railways and 90% of its electric power. In the 1960s Sbo Paulo state produced nearly two-thirds of the value of Brazilian manufactures and the city alone about one-third. Some heavy industry existed—for producing steel. manufacturing plant equipment and assembling trucks and automobiles, for example—but was secondary to the production of light consumer goods, Most of the firms had no more than 20 employees. The branch of industry employing most workers was textiles. followed by mechanical and electrical appliances, building and furniture, foodstuffs and chemical and pharmaceutical products. Except for foreign subsidiaries, industries tend to be owned by families and small groups. In 1952 Brazil's first intercity oil pipeline was opened between Santos and São Paulo, and in 1955 the Cubatão oil refinery, the nation's largest. began operation.

Throughout the 19th century São Paulo was a prominent cultural and intellectual centre. This was largely because of the opening in 1827 of a law academy, one of the first two in Brazil. where many of the nation's most eminent men were educated. This cultural leadership continued in the 20th century. In 1922 Modern Art week, celebrated by a group of young writers, artists and musicians in the Municipal theatre, introduced modernism in the arts to Brazil. The municipal department of culture, founded in 1934, won international recognition for its many activities. São Paulo is a leading centre for libraries (which include the skyscraper municipal library), publishing houses, theatres and museums. The Museum of Modern Art organized the first Biennial exhibition in the Americas (1951). The permanent fairgrounds for the fourth centennial of the city (1954) are distinguished for their modern architecture.

São Paulo has a well-developed system of primary and secondary schools. public and private, and a variety of vocational schools. The literacy rate for persons over six years of age rose from 45% in 1887 to 85% in 1946. The state university. established in 1934. incorporated pre-existing schools of law, polytechnic training, pharmacy and dentistry, agriculture. medicine and others. Faculties of economics, architecture and engineering were added later. An affiliated institution is the school of sociology and politics, founded in 1933 by industrialists and civic leaders as the first advanced course in the social sciences in South America. Another is the Butantã institute, a world-famous research centre for the study of snakes and the production of antitoxins and antivenins. A Catholic university was created in 1946.

Roman Catholicism is the prevailing religion, although Protestant. Jewish and spiritist groups are of some importance.

(R. M. M.)

SÃO SALVADOR, Brazil: *see* SALVADOR.

SAPAJOU, an alternative name for the American capuchin monkeys (*q.v.*), comprising the genus *Cebus*. *See* also PRIMATES.

SAPAN (SAPPAN WOOD). a soluble red dyewood (Malay *sapang*), from a tree belonging to the leguminous genus *Caesalpinia* (*C. sappan*), a native of tropical Asia and the Indian archipelago. The wood is somewhat lighter in colour than Brazil wood and its other allies. but the same tinctorial principle, brazilin, appears to be common to all.

SAPINDACEAE, the soapberry family, a large family of

dicotyledonous plants, with about 150 genera and 2,000 species, chiefly tropical, consisting of trees, shrubs and vines. The leaves are mostly alternate and compound, occasionally simple, while the flowers, mostly small, are irregular or unsymmetrical, mostly polygamodioecious, the fruits various. Important fruit trees include the litchi (*q.v.;* Litchi chinensis) of China; longan (Euphoria *longan*) of China and India; the rambutan (*Nephelium lappaceum*) and pulasan (*Nephelium* mutabile) of the Indo-Malayan region; the akee (*q.v.;* Blighia *sapida*) of Africa; and others. The seeds of Schleichera oleosa yield macassar oil, while the aril surrounding the seeds is edible. Other species yield important timbers, and the bark of still others is rich in saponin. The pride of India or China tree (Koelreuteria) is cultivated in Europe and North America as an ornamental.

SAPIR, EDWARD (1884–1939), U.S. linguist and anthropologist, who made important contributions in the field of American Indian languages, was born on Jan. 26, 1884, in Lauenburg, Pomerania. His parents took him to the United States in 1889 and he was educated at Columbia university (Ph.D., 1909). In 1910 he was named chief of the division of anthropology at the Canadian National museum; in 1925 he joined the staff of The University of Chicago; and in 1927 he moved to Yale university, New Haven, Conn., where he remained as professor of anthropology and general linguistics until his death on Feb. 4, 1939.

Sapir early became interested in linguistics and, chiefly through the influence of Franz Boas (*q.v.*), in American Indian languages, the study of which he continued widely and intensively most of his life. His profound grasp of problems in the Indo-European languages, his quick recognition of contrasts in structure and his ability to abstract the essential characteristics from masses of complex data enabled him to maintain a detached, synoptic view of language even while at work on minute linguistic problems in languages widely different from one another both genetically and structurally. His mind was vigorous, poetic and searching, his style crisp and lucid; by personal contact as well as through his published words he was often productive of work in others. Sapir was a scientist of extraordinary breadth who kept the study of linguistic phenomena in proper perspective as part of the study of man. His book Language (1921) is one of the most stimulating ever written on the subject.

A collection of Sapir's essays, edited by David G. Mandelbaum, appeared in 1949 under the title Selected Writings in Language, *Culture,* and Personality. See also LINGUISTICS. (MY. F.)

SAPODILLA, a tropical evergreen tree, *Achras* sapota (zapote), of the sapote family (Sapotaceae; g.~.)and its delicious fruit. Sapodilla, the name used in southern Florida (the only part of the U.S. where this tree can be grown successfully), doubtless is an adaptation of the Spanish *zapotillo,* "small zapote." In Spanish-speaking countries the name chicozapote is commoner, and in certain English-speaking countries, notably India, naseberry (a corruption of *nispero,* Spanish for the medlar; *q.v.*) is used.

While the fruit is of no great commercial importance in any part of the world, it is much appreciated in many tropical and subtropical areas. It is spheroid to ovoid in shape, rusty brown on the surface and two to four inches in rough diameter. The flavour, very sweet and difficult to describe, has been compared to a combination of pears and brown sugar. The seeds. two to five in number, shining black and the size of flattened beans, are surrounded (when the fruit is ripe) by translucent, yellowish-brown, juicy flesh. When immature, the flesh contains tannin and milky latex and is quite unpalatable. The milky latex, chief source of gum chicle (*q v*), once important in the chewing-gum industry, is extracted by tapping the trunk.

Sapodilla trees occur wild in the forests of southern Mexico and northern Central America. As a cultivated species the tree is medium-sized and of slow growth. The reddish wood is very hard and durable (elaborately carved lintels a thousand years old are still to be seen in some Mayan ruins). The leaves, two to five inches long, are glossy and light green in colour, ovate to elliptic in outline; the flowers are small and inconspicuous. Propagation is usually by means of seed, but superior trees can be reproduced by grafting.

Although sapodilla is probably the best of its family in economic importance, many other economically promising members—among them the star apple (*q.v.*) and the popular zapote, sapote or marmalade plum—are found in the Sapotaceae. (W. Po.)

SAPONINS AND SAPOGENINS. Saponins are water-soluble plant substances characterized by special properties, namely, the ability to lower the surface tension of water and hence to cause foaming, the ability to destroy red blood corpuscles (hemolysis) and the ability to kill fish, all at relatively low concentrations. They probably are present in all plants, having been identified in more than 75 families and more than 500 species. They may be distributed throughout the plant or occur in high concentration in one part of the plant; *e.g.,* the root or bulb, leaves, bark, flowers, fruit flesh or seeds. Their function in the plant is not known. Some appear to serve as a storage form of carbohydrate (*q.v.*) in the plant, whereas others seem to be waste products of plant metabolism.

Common names for plants containing high concentrations of saponins are soap root, soap wort, soap bark, soap plant and amole. These names are indicative of their use as cleansing agents by peoples throughout the world since ancient times. They do not form a scum in hard water, and even in comparatively modern times were preferred to soap for laundering fine fabrics, such as silk shawls. They formerly were used as foaming agents in foam-type fire extinguishers and as wetting agents in agricultural sprays. but were displaced for these purposes by the less expensive synthetic detergents and wetting agents. Saponin solutions are used in photographic emulsions to permit even spreading on the base, and in multilayered coatings to permit spreading and adhesion of successive layers.

Aboriginal peoples throughout all parts of the world have used saponins for catching fish. A quantity of a plant having a high saponin content is crushed and stirred into a pool. After a short time the fish rise to the surface and are taken easily. It is estimated that from 300 to 400 species of plants have been used for this purpose. As early as the 13th century, in order to prevent extermination of fish, laws were passed forbidding the use of fish poisons. Saponins cause death in fish probably by disabling the breathing mechanism of the gills. Although saponins are hemolytic and toxic to warm-blooded animals when injected into the blood stream, they are not absorbed from the intestines. Hence fish killed by saponins can be eaten with safety. The nontoxicity to man on ingestion is evident when one considers that the foaming properties of certain beverages, such as root beer, result from the presence of saponins.

Chemically the saponins belong to a large class of substances known as glycosides (see GLYCOSIDES, NATURAL). When a water solution of a saponin is heated in the presence of a strong acid, the saponin molecule is split into fragments with the addition of the elements of one molecule of water at every point at which scission takes place (hydrolysis). The products are a molecule of sapogenin and several molecules of one or more kinds of sugar (see CARBOHYDRATES). For example, in the hydrolysis of digitonin, one of three different saponins isolated from foxglove leaves, each molecule combines with five molecules of water to yield one molecule of a sapogenin, called digitogenin, one molecule of xylose and four molecules of galactose.

Because several different saponins may occur in the same plant, and because the saponins are amorphous and not readily crystallized. it has been difficult to isolate them in a pure state, and at mid-20th century relatively little work had been done on the chemistry of the saponins themselves. The sapogenins, on the other hand, are crystalline compounds that are purified readily. and a large amount of work had been expended in attempts to determine the way in which the constituent atoms are linked together.

The sapogenins thus far isolated belong to two main types. One type contains 27 carbon atoms with varying numbers of hydrogen and oxygen atoms. They have at least one alcoholic function (hydroxyl group), and contain a carbon framework like that present in the animal and plant alcohols known as sterols. Hence they are called steroid sapogenins. The saponins from foxglove

leaves, sarsaparilla root, yucca and agave belong to this class. Some steroid sapogenins, such as diosgenin, prepared commercially from a Mexican yam, have become valuable raw materials for the synthesis of the female hormone, progesterone, and the adrenal cortical hormone, cortisone.

The second type of sapogenin contains 30 carbon atoms, along with varying amounts of hydrogen and oxygen. They are called triterpene sapogenins because there are three times as many carbon atoms in the molecule as in a terpene molecule (see TERPENES). Like the steroid sapogenins, they contain at least one alcoholic function (hydroxyl group), but in addition they contain an acid function (carboxyl group) and sometimes are called acid sapogenins. Saponins yielding triterpene sapogenins appear to be more widely distributed than those yielding steroid sapogenins. Moreover, the same triterpene sapogenin may occur free, as well as combined with sugars as a saponin.

Oleanolic acid can be obtained by hydrolysis of saponins present in guaiac bark, sugar beets or calendula flowers. It also occurs free in clove buds, in the waxy coatings of olive and mistletoe leaves and in grape skins.

A further point of interest is that the triterpene alcohols, which occur in plant resins, are related closely in structure to the triterpene sapogenins. By replacing the acid function. COOH. of oleanolic acid by the group CH_3, a compound is obtained which is identical with beta-amyrin, a triterpene alcohol isolated from Manila elemi and other resins. (C. R. N.)

SAPOTACEAE, a family of tropical dicotyledonous plants, most of which are trees with leathery leaves. There are 35 genera and about 600 species, many of which are of economic importance as sources of gutta-percha (*q.v.*), balata, shea butter, ironwood, etc.

Chrysophyllum cainito is the West Indian star apple. *Mimusops huberi* is the Brazilian milk tree. *Achras* sapota (zapota) of tropical America, cultivated in all tropical countries, yields the excellent fruit known as the sapodilla (*q.v.*) or naseberry, and the important chicle (*q.v.*), the basis of much chewing gum. *Lucuma nervosa* is the eggfruit or canistel of South America, now naturalized in Florida and the West Indies. The zapote, sapote or marmalade plum is *Calocarpum mammosum* (sapota), one of the commonest fruit trees in Central America.

The important commercial product gutta-percha is chiefly derived from various species of Palaquium and Payena growing in the Malay peninsula and archipelago.

SAPPHIC METRE, certain forms of quantitative verse, named after their supposed originator, the Aeolic poetess Sappho (cf. ALCAICS). For two of her famous metres see CHORIAMBIC VERSE.

Characteristic of all these metres is the emergence of a choriambus (- ⏑ ⏑ -). or perhaps a dactyl (- ⏑ ‾), in the midst of what appears to be a series of feet of other lengths, especially trochees (- -) (*q.v.*). The best-known employment of lines of this sort is in the Sapphic stanza, three Sapphic hendecasyllables followed by an Adonic. thus:

ism sătis terris nĭvĭs atque dirae
grandinis misit pater et rubenti
dextera sacras iaculatus arces
terruit urbem.

This is used occasionally in Latin by Catullus, frequently by Horace, who introduced some small modifications (fourth syllable always long, fifth syllable almost always the end of a word), and by later writers; in the middle ages it was much used for hymns, notably by Gregory the Great.

In modern languages, the Sapphic stanza has been imitated, sometimes with fair success, as by Swinburne:

Heard the flying feet of the Loves behind her
Make a sudden thunder upon the waters,
As the thunder flung from the strong unclosing
Wings of a great wind.

But it remains an exotic, not well suited to modern methods of versification.

SAPPHIRE, a transparent to translucent variety of corundum (*q.v.*), or native aluminum oxide, has been highly prized as a gem stone since about 800 B.C. Its colour normally ranges from very pale blue to deep indigo; the most valued is a medium deep cornflower blue. The colour is due mainly to the presence of small amounts of iron and titanium. Colourless, gray, yellow, pale pink, orange, green, violet and brown varieties of gem corundum also are known as sapphire. Ruby (*q.v.*) is essentially the same mineral, but this name is restricted to corundum that is deep pink, red or purple.

Sapphire generally occurs as pyramidal, rhombohedral, tabular or barrel-shaped crystals. Repeated twinning and lamellar parting are characteristic. The lustre is vitreous to adamantine, but somewhat pearly on parting surfaces. Most sapphire contains abundant inclusions of microscopic size, and reflections of light from these yield a faint ahitish sheen, known as "silk." Tiny, regularly arranged mineral inclusions and elongate cavities are responsible for the asterism shown by star sapphire. Such translucent, milky appearing stones, when properly cut, seem to contain a floating luminous star with six rays.

Much sapphire is unevenly coloured in bands, zones or blotches. It also is dichroic, so that in most varieties the colour changes according to the direction of view in transmitted light. Alexandrite-sapphire appears blue in daylight and reddish or violet in artificial illumination, somewhat like true alexandrite (*q.v.*), a variety of chrysoberyl.

Sapphire is a primary constituent of many igneous rocks, especially syenites, pegmatites and various basic types, and also is found in schists and metamorphosed carbonate rocks. Most commercial production has come from alluvial gravels and other placer deposits, where the sapphire commonly is associated with ruby, garnet, spinel, topaz. tourmaline, zircon and other gem minerals. The best-known occurrences, including some lode deposits, are in Ceylon, Indochina, Burma. Thailand. Australia (Victoria. Queensland, New South Wales). India. Madagascar. the U.S.S.R.. South Africa and the United States (Montana, North Carolina).

Most transparent sapphire is facet cut, generally in the brilliant style. Such gems have considerable sparkle, but they exhibit little fire because of their modest dispersion. Skillful cutting of unevenly coloured stones yields gems with a uniform appearance derived from only small portions of relatively deep colour. Star sapphire and other nontransparent varieties are cut en cabochon rather than faceted.

Despite its great hardness (9), some sapphire is carved or engraved, especially in the orient. Careful heating and cooling under various conditions can induce essentially permanent colour changes in sapphire; *e.g.*, from yellow to colourless or greenish blue and from violet to pink. Other colour changes result from exposure to certain kinds of intense radiation.

Synthetic Sapphire.— Synthetic sapphire has been produced commercially since 1902. Clear, sound material of various colours is manufactured in the form of carrot-shaped boules and slender rods Much is consumed by the jewelry trade. but most synthetic sapphire is used in place of natural sapphire and other materials for the manufacture of jewel bearings. gauges, dies, needle points, thread guides and other specialized components. Some also is used as a high-grade abrasive.

Synthetic star sapphire, with luminous stars more regular and distinct than in most natural stones, is made for gem uses. The asterism is obtained through controlled exsolution of impurities, generally rutile (titanium dioxide) in the form of tiny needles that assume preferred orientations within the host crystals of corundum. See also GEM: Synthetic Gems. (R. H. J.)

SAPPHO (or as she calls herself PSAPPHO), the greatest poetess of Greece, was a native of Lesbos. In spite of her fame almost every detail in her history is doubtful. Only a few of the many and often conflicting statements made about her by ancient authors can be checked by her oan writings. It would seem probable that she came of an aristocratic Mytilenean family (another account connects her nith Eresus) and was born round about 600 B.C., so that she was contemporary with Pittacus and with the poet Alcaeus, with whom she may have exchanged verses.

No less than eight versions of her father's name are recorded by Suidas, of which Scamandronymus, the form given by Herodotus (ii. 135), may be taken as the most acceptable. Her mother is said to have been named Cleis, and if the fragment inc. lib., 17 is rightly ascribed, the statement is supported by the fact that her daughter also was a Cleis.

There is more certainty about her brothers, or at any rate about two of the three. Charaxus and Larichus. She speaks of Larichus as being cupbearer. a position filled by youths of good family, and Charaxus (though not mentioned by name in the extant remains) is evidently the "brother" referred to in $\alpha 3$. We learn from Herodotus and others that he sailed to Egypt and bought a courtesan, Rhodopis. out of slavery, for which Sappho attacked him. a3 seems to be a prayer for his safe return from overseas and a reconciliation nith his sister and $\alpha 4$b perhaps contained a prayer that Doricha may not entangle him again.

The poetess's family is of less interest than the pupils, friends and rivals with whom we meet repeatedly in the fragments of the poems. with their references on the one hand to Atthis, once loved but now estranged, Anactoria. gone far away, Dica, "lovelier than soft Gyriuno," on the other to Andromeda, who stole Xtthis away, Gorgo and others.

In $\alpha 11$ there seems to be a hint of some enmity towards the house of Penthilus. with which Pittacus was connected by marriage, but it happens most frequently that where we have names the thought cannot be followed far, and that in the longer pieces, where affection is most touchingly, or distaste most cuttingly expressed. no names have survived.

Apart from the relations just referred to we know next to nothing of the life of Sappho. She is said to have been banished, like other aristocrats, and to have gone to Sicily. but this flight has left no trace in the remains unless the reference to Aphrodite of Panormus in $\alpha 7$ *App.* be such. As for the story of her passion for Phaon and her leap from the Leucadian rock, it bears every sign of being pure fiction. There are two references to the advance of old age; we cannot tell whether her own or another's. Of the end of her life we know nothing at all.

Sappho's poems are said by Tullius Laurea to have been arranged in nine books. Suidas says there were nine books of lyrical poems, but epigrams, elegeia, etc., besides. The author of P Oxy, 1800, also counts a separate book of elegeia. but his figure for the books of lyrical poems is lost.

From the fragments we know of only eight books of lyrical poems. It appears that these books were, as far as possible. arranged according to metre (book 1, for instance. containing only pieces in the so-called Sapphic stanza, and so on), but in the case of one book (the Epithalamia, perhaps book 8) according to subject. The language seems to be no literary dialect, but the ordinary speech used by the contemporaries of the poetess, and so to differ in a greater or less degree from almost all the other Greek poetry that has come down to us. The conjunction of extreme simplicity of language with intensity of emotion, from which the poetry derives its peculiar effect. as well as the perfection of the form, has hitherto completely baffled translators, Swinburne among the rest.

Until comparatively recent times the poetry of Sappho survived only in the quotations made by ancient authors. The number of the fragments thus preserved was not inconsiderable, but their text was often seriously depraved, and, with two exceptions—the complete or nearly complete poems cited by Dionysius of Halicarnassus and "Longinus"—their extent was insignificant.

At the end of the 19th century there were recovered from the soil of Egypt papyrus rolls and vellum codices, written at dates ranging from the and to the 6th or 7th centuries A.D. which contain authentic texts of Sappho. terribly mutilated indeed, but remarkable for the integrity of their tradition.

Of the older editors. who were concerned only with the quotations. none but Theodor Bergk need be mentioned (Poetae *lyricae graecae,* 4th ed , 1882). The only complete collection of all the known material is in Σαπφοῦς μέλη (Sapphous *Mele;* 1925) by E. Lobel.

SAPPORO, the capital of the prefecture of Hokkaido, Japan. situated 43° 4′ N. and 141° 21′ E., on the Ishikari river with Otaru as its outer port. With a population of 523,839 (1960), it is the largest Japanese city north of Tokyo. The average temperature is 43° F. and the snow season lasts from October to April, making Sapporo a popular centre for skiing and winter sports. Sapporo is the administrative, business and educational centre of Hokkaido.

The city was laid out in 1871 on the American plan, with wide tree-lined boulevards intersecting each other at right angles. Sapporo was made the prefectural capital of Hokkaido in 1886. and owed its early development chiefly to the colonization bureau of the government. Hokkaido university pays special attention to agricultural science. The manufacture of food-stuffs (including flour, dairy products and "Sapporo beer"), sawmills, printing and publishing constitute the chief industries. (R. B. H.)

SAPROPEL is an unconsolidated sedimentary deposit rich in bituminous substances. It is distinguished from peat in being rich in fatty and waxy substances and poor in cellulosic material. When consolidated into rock, sapropel becomes oil shale, bituminous shale or boghead coal. The principal components are certain types of algae which are rich in fats and waxes. Minor constituents are mineral grains and decomposed fragments of spores, fungi, bacteria and nonvascular plants. The organic materials accumulate in water under reducing conditions.

See also SEDIMENTARY ROCKS. (P. D. T.)

SAPROPHYTES, the name given in botany to plants which grow upon decaying organic matter, the products of the decay of which they absorb.

Many fungi (*q.v.*) are saprophytic, as are some orchids (*q.v.*) and other flowering plants.

SAPRU, SIR TEJ BAHADUR (1875–1949), Indian jurist and scholar who played a prominent role in India's constitutional progress, was born on Dec. 8, 1875. Educated at Agra college, he was a member of the United Provinces legislative council (1913–16) and of the imperial legislative council (1916–20). A liberal in politics, he was trusted both by the British government and the Indian intelligentsia for his integrity and wisdom. He was a law member of the viceroy's council (1920–23), and India's delegate to the imperial conference (1923) and to all the three round-table conferences (1930–32), as well as to the joint parliamentary select committee on Indian constitutional reforms. He mas chiefly responsible for bringing about the Gandhi-Irwin pact (1931) which enabled Gandhi to attend the second round-table conference, and the Poona pact (1932), ahich resulted in the modification of the communal award and ending of Gandhi's epic fast. He died on Jan. 20, 1945, at Allahabad. (L. R. S.)

SAPSUCKER, the name given to American woodpeckers of the genus *Sphyrapicus;* there are three North American species—S. varius, the yellow-bellied sapsucker of eastern U.S.; S. ruber, the red-breasted sapsucker, and *S. thyroideus,* the Williamson sapsucker, the two latter inhabiting the western mountain ranges of Canada and the U.S.

All species have a habit of girdling trees with rows of holes. S. *ruber* has a dull red head and breast; this tint is confined to the head and (in the males) throat in *S varius,* and to the throat alone in the male *S.* thyroideus, which has a bright yellow belly.

SARABAND, a slow dance, generally believed to have originated in Spain in the earlier half of the 16th century. The most probable account of the word is that the dance was named after Zarabanda. a celebrated dancer of Seville. Its music is in triple time, generally nith three minims in the bar. Many examples oc-

cur in the Suites and Partitas of Handel and J. S. Bach.

SARACENS, the medieval Christians' name for their Moslem enemies, especially those in Europe. Earlier the Greeks and Romans called *Saraceni* the nomad Arabs of the Syro-Arabian desert who harassed the frontier of the empire.

SARAGOSSA, province. Spain: *see* ZARAGOZA.

SARAGOSSA, the capital of the Spanish province of Zaragoza and formerly of the kingdom of Xragon. lies on the right hank of the Ebro river, 212 mi. by rail northeast of Madrid. Pop. (1960 est.) 291,181 (municipal).

The city is built in a highly cultivated valley. irrigated by innumerable streams which distribute the waters of the Imperial canal. This fertile country contrasts with the surrounding arid Aragonese plain which is exposed to the sweep of violent gales, hot in summer and icy in winter. Saragossa itself preserves much of the character of an old Aragonese city, especially in the area enclosed by the Calle del Coso, the curving highway which follows the line of the old fortifications and bounds the old town on the south. Between the Coso and the river is a network of narrow streets cut by two modern arteries. The easternmost. the Calle de Don Jaime I. connects the Coso with the seven-arched stone bridge, Puente de Piedra, dating from 1447, which links Saragossa proper with the suburb of Altabas. and from which there is a fine view of the town. To the west is the Calle de Don Alfonso I, which runs down to the Plaza del Pilar, where stands one of the two cathedrals. The life of the city is concentrated in these three streets, and in the Plaza de España, into which the Coso runs and from which the broad Paseo de la Independencia leads out to a well-planned late 19th-century residential area to the south. Newer suburbs have sprung up south and southwest of the town.

Of Saragossa's two cathedrals. to each of which the chapter is attached for six months of the year, La Seo is the older (1119–1550). It is chiefly Gothic in style, but the lower walls of the apse are Byzantine. The other cathedral. El Pilar. which owes its name to the pillar upon which, traditionally, the Virgin appeared to St. James on the banks of the Ebro. was built over the ancient temple of Santa María la Mayor in the second half of the 17th century. It was designed by Herrera el Mozo, and the walls of the Angel chapel were decorated by Goya and Francisco Bayeu. Other beautiful churches are Santa Engracia in the Paseo de la Independencia, and San Pablo (1259), which is Mudejar Gothic in style.

La Lonja. the exchange building, in plateresque Gothic style, the palace of the counts of Luna, where the court of justice sits, and the palace of the Condes de Sastago y Argillo are notable public buildings. The Aljaferia palace, to the west of the town. is one of Spain's most beautiful examples of Arab civil architecture and was formerly the court of the hloorish kings of Zaragoza. The university of Saragossa was founded in 1474, and the medical school is its most famous faculty.

Saragossa is an important railway junction, connected with Valladolid, Madrid and Valencia. and with Catalonia and the Basque provinces, and also with France, via the Somport tunnel. Partly because of its rail connections it has developed as an industrial centre. making machinery, glass. leather, chocolate. soap and cement. It is also a centre for trade in the agricultural products of Aragon.

History.—Saragossa (Celtiberian. *Salduba*) became a Roman colony in 25 B.C., and was renamed Caesarea Augusta or Caesaraugusta, from which Saragossa is derived. The chief commercial and military station in the Ebro valley, and the seat of one of the four *conventus juridici* (assizes) of Hither Spain, it was captured in 452 by the Suebi and in 476 by the Visigoths, whose rule lasted until the Moorish conquest in 714. In 777 its Moorish ruler, the viceroy of Barcelona. appealed to Charlemagne for aid against the caliph of Cordova, Abd-er-Rahman I. Charlemagne besieged the Cordovan army in Sarakosta, as the city was then called, but was compelled to withdraw because of a rebellion in Saxony. The Moors were finally expelled by Alfonso I of Aragon in 1118. As capital of Xragon, Saragossa prospered greatly until the second half of the 1 jth century. when the court was transferred to Castile.

In 1710, during the War of the Spanish Succession, the British and Austrian armies defeated the forces of Philip V at Saragossa.

In the Peninsular War (*q.v.*) the city reached the zenith of its fame. An ill-armed body of citizens, led by José de Palafox y Melzi (*q.v.*), held the hastily entrenched city against Marshal Lefebvre-Desnouettes from June 1 j to Aug. 1 j. 1808. The siege was then raised, but mas renewed on Dec. 20, and on Jan. 27, 1809, the invaders entered the city. Even then there was desperate resistance, and not until Feb. 20 were the defenders compelled to capitulate. Thousands perished, mainly through famine and disease. Among the defenders was the famous "Maid of Saragossa." Maria Agustin, whose exploits were described by Byron in *Childe Harold.* In the Spanish Civil War, Saragossa took the Nationalist side. (L. G. L.)

SARAGOSSA, COUNCILS OF (*Concilia Caesaraugustana*). In or about 380 a council of Spanish and Aquitanian bishops adopted at Saragossa eight canons bearing more or less directly on the heresy of Priscillianism (*see* PRISCILLIAN). A second council (592) solved problems raised by the conversion of the West Goths from Arianism to orthodox Christianity.

The third council, in 691. issued five canons on discipline. From Sept. 1 j65 to Feb. 1566 a provincial synod made known the decrees of Trent.

SARAJEVO, capital of the Bosnia and Hercegovina People's Republic, Yugoslavia. Pop. (1961) 142,423, chiefly Serbs and Croats. It lies in a valley 1,800 ft. above sea level.

Though it is still half oriental and wholly beautiful with its hundred mosques. its ancient Turkish bazaar, picturesque wooden houses and cypress groves, it was largely rebuilt after western fashion in 1878. Sarajevo is the seat of a Roman Catholic bishop, an Orthodox metropolitan and the highest Moslem religious authority in Yugoslavia. Notable in the town are the *Begava Djamia* (Džamia), or mosque of Husref Bey, founded in 1465, the Roman Catholic and Orthodox cathedrals, the hospitals, the town hall. the museum and the university. founded in 1946. Near the bazaar is the oldest church in Bosnia. containing a 14th-century picture of the Virgin. The industries include potteries, silk and flour mills, a sugar beet factory. timber and, under state control, a brewery, tobacco. embroidery and carpet factories. Weaving on hand looms is an important industry.

Founded in 1262 by the Hungarian general Cotroman, and named Bosnavar or Vrhbosna, Sarajevo was enlarged two centuries later, and takes its name from the palace (Turkish, *serai*) which he founded. During the wars between Turkey and Austria, ownership was often contested; and it fell before King Matthias I of Hungary in 1480, and before Prince Eugene of Savoy in 1697. Fires laid it waste in 1480, 1644, 1656, 1687 and 1789.

Sarajevo was chosen as the seat of Turkish government in 18 jo instead of Travnik. In 1878 it became the seat of the Austro-Hungarian administration of Bosnia-Hercegovina and subsequently of the Bosnian diet. Under Austrian rule it was largely modernized, but the schools established also served as a focus of Serb nationalist feeling.

Students at Sarajevo perpetrated the murder of the archduke Francis Ferdinand (*q.v.*) which led to World War I. (*See* also DIMITRIJEVIC, DRAGUTIN; JOVANOVIĆ, LJUBA.) In Nov. 1918 the diet at Sarajevo proclaimed union with Yugoslavia.

During World War II, it was nominally included in the kingdom of Croatia and suffered considerable damage from Allied bombing. In 1944 it was reincorporated into Yugoslavia.

SARAN, a district in the Tirhut division of Bihar, Republic of India. Area, 2,669 sq.mi. Pop. (1961) 3,585,531. It is a vast alluvial plain with a general southeasterly inclination as indicated by the flow of the rivers. The principal rivers, besides the Ganges. are the Gandak and Gogra. which are navigable throughout the year. The district has long been noted for its high state of cultivation and dense population. It yields large crops of rice, besides other cereals, pulses, oil seeds. poppy and sugar cañe. The indigo industry, once important, declined, and sugar refining largely took its place. The production of saltpetre is of some importance. Saran is exposed to drought and flood. It suffered from famines in 1874 and 1897. and from floods in 1921, when 20 in. of rain fell in a single night.

A scheme for irrigation from the Gandak river, started in 1878, proved a failure, and the canals were long closed to irrigation. But a Gandak valley project was made a part of India's five-year plan of 1951. At Manjhi there are the remains of a fort. with ramparts still 30 ft. high, which date back to about the 6th century A.D. The administrative headquarters were established at Chapra pop. (1951) 64.309.

SARANAC LAKE, a village of northeastern New York, U.S., is located on Flower lake in the Adirondack mountains, 8 mi. N.W. of Lake Placid on the boundary line between Essex and Franklin counties. Nearby are the Saranac and St. Regis chain of lakes. It is a summer and winter resort with a considerable influx of visitors during the summer season. The U.S. Eastern Amateur Ski association was originally formed there and skiing is a major winter activity. The Mt. Van Hoevenberg bobsled run, operated by the New York state conservation department, is located a short distance from Saranac Lake.

Settlement dates from 1819 and the village originated as an isolated lumbering community and a centre for Adirondack guides. Situated at an altitude of 1.600 ft , Saranac Lake became a pioneer area for the open-air treatment of tuberculosis. The Trudeau sanitarium, founded in 1884 as the Adirondack Cottage sanatorium by Edward L. Trudeau, was the first semicharitable institution of its kind in the U.S. Other sanitariums were established in the vicinity, one of the largest being the New York State Ray Brook institution. In 1957 the American Management association acquired the property of the Trudeau sanitarium, consisting of 90 ac. and about 50 buildings, and established an academy where management personnel pursue advanced training. Robert Louis Stevenson spent the winter of 1887–1888 as a patient at Saranac Lake and it was there he began *The Master of Ballantrae.* Saranac Lake was incorporated in 1880 and in 1929 adopted the village-manager plan of government. For comparative population figures *see* table in NEW YORK: *Population.* (D. E A.)

SARASATE Y NAVASCUES, PABLO MARTIN MELITON (1844–1908), Spanish violinist, was born at Pamplona on March 10. 1844. At 12 he began to study at the Paris conservatoire, where he became the pupil of Jean Alard. He paid the first of many visits to London in 1861 and later toured widely in Europe and America. He was one of the first and most fascinating violinists of his time, his playing being remarkable equally for purity and saeetness of tone and for facility of execution. He composed virtuoso pieces for his instrument filled with the spirit of the Spanish dance. Among works written for him are Lalo's *Symphonie Espagnole* and Bruch's Second Concerto. He died at Biarritz on Sept. 20, 1908.

SARASIN or SARRAZIN, **JEAN FRANÇOIS** (1614–1654), French author, son of Roger Sarasin, treasurer-general at Caen, was born at Hermanville near Caen. He was on terms of intimate friendship with Paul Scarron, with whom he exchanged verses. with Gilles Ménage, and with Paul Pellisson. In 1639 he supported Georges de Scudéry in his attack on Pierre Corneille with a *Discours de la tragédie.* He accompanied Léon Bouthillier, comte de Chavigny, secretary of state for foreign affairs, on various diplomatic errands until 1643–44. He joined in the pamphlet war against Pierre de Montmaur, against whom he directed his *Bellum parasiticum* (1644). He died at Pézénas, on Dec. 5, 1654. The most considerable of his poems were the epic fragments of *Rollon conquérant* and *La guerre espagnole,* with *Dulot vaincu* and the *Pompe funèbre* in honour of Vincent Voiture. As a poet he was overrated, but he wrote excellent pieces of prose narration, the *Histoire* du *siége de Dunkerque* (1649) and the unfinished *Conspiration de Walstein* (1651).

His *Oeuvres* appeared in 1656, *Nouvelles Oeuvres* (2 vol.) in 1674. His *Poésies* were edited in 1877 by Octave Uzanne with an introductory note. A new edition of his *Oeuvres* was published in 1926 by Paul Festugieres. Much of his correspondence is preserved in the library of the Arsenal, Paris. *See* Albert Mennung's *Jean François Sarasins Leben und Werke* (2 vol., Halle, 1902–04).

SARASOTA, a resort city on the west coast of Florida, U.S., is located 50 mi. S. of Tampa on Sarasota bay; the seat of Sarasota county. It is connected by causeways with white-sand beaches on four islands, lying between the bay and the Gulf of Mexico. Its origin is unknown; Sarasota, variously spelled. appeared on maps in the 1700s. Its development from a fishing hamlet began in 1885 when Scotch promoters, headed by Sir John Gillespie, induced 60 families from Scotland to settle there. A quarter of a century later Mrs. Potter Palmer, Chicago social leader, purchased several tracts of land, helped popularize it as a resort and promoted the economy by establishing a model cattle ranch. The city was incorporated in 1914 and has a council-manager form of government in effect since 1946. The economy depends primarily on tourism, cattle raising and the growing of winter vegetables.

Sarasota is the site of the Ringling museums consisting of a large gallery of baroque art, including the most extensive collection in the western hemisphere of the works of Rubens; the Asolo Theatre (1790) brought from near Venice and used for dramatic and musical productions; the John Ringling home, a $1,000,000 replica of a doge's palace, containing rare Venetian art; and a museum of the circus. The first three were a bequest to the state by John Ringling; the museum of the circus was built by the state in 1948 as a memorial to him. Recreation and sports programs include fishing for tarpon and other salt water fish, baseball and golf. The city has a symphony orchestra and art schools.

For comparative population figures *see* table in FLORIDA: *Population.* (A. J. H.)

SARASWATI, a river in the Punjab frequently mentioned in the Rig-Veda. Its meaning. "abounding in pools," suggests that it was at that early period a larger river than now. It is lost in the desert sands toward Rajputana. Corresponding phonetically to the Iranian Haraqaiti (the modern Helmand), the name may have been applied to the Indus by the invading Aryans before they reached the eastern Punjab, but it soon ceased to refer to that river. As the Sarsuti, its present name, it joins the Ghaggar, the dry bed of the Hakra, the lost river of the Indian desert which can still be traced to its junction with the Indus. With the Drishadwati the Saraswati formed the west boundary of Brahmavarta, and was the holy stream of Vedic India. 4s "fluent" it became the personified goddess of eloquence, learning and wisdom, wife of Manu, mother of the Vedas, and a daughter of Brahman. From her the Sarsut Brahmans claim their name *(see* BRAHMA AND BRAHMAN). Another Saraswati, in Gujarat, also loses itself in the sand.

BIBLIOGRAPHY.—A. A. Macdonell and A. B. Keith, *Vedic Index of Names and Subjects* (1912); A. A. Macdonell, *Vedzc Mythology* (1897); E. W. Hopkins, *Epzc Mythology* (1915).

SARATOGA, BATTLES OF. The plan of campaign for the British in America in 1777 sought to isolate New England by occupying the Hudson valley. Gen. John Burgoyne, the author of the plan, coming down from Canada via Lakes Champlain and George, was to meet Viscount Howe, marching up from New York, at Albany. A third, but much smaller force, under Barry St. Leger, was to advance from Oswego down the Mohawk valley and join the other two columns. The plan failed because Howe, the British commander-in-chief, marched on Philadelphia, George Germaine, Viscount Sackville, the secretary of state, having failed to give him definite instructions. Burgoyne, with about 8,000 men, including seven regiments of British regulars and 3,000 Germans, reached Ticonderoga (July 1), which was evacuated by its weak garrison (July 6). He reassembled his army after the pursuit at Skenesborough and marched through the woods and swamps to Fort Edward, which was evacuated by the American commander Maj. Gen. Philip Schuyler, who retreated across the Hudson to Stillwater, 30 mi. above Albany (July 31). The march was most laborious, involving the construction of 40 bridges, and necessitated a long halt at Fort Eduard. Burgoyne should have taken his army back to Ticonderoga, and transferred it to Fort George, where a direct road led to Fort Edward. Had he taken this route, he might have reached Albany by the 16th.

A German detachment, on the advice of "Colonel" Skene, who was also responsible for the recent march, was sent to Bennington to seize horses and supplies, but was surrounded and almost annihilated by the Green Mountain militia, under John Stark (Aug. 16). Burgoyne now became uneasy; he had left nearly 1,000 men to garrison Ticonderoga; he had heard from Howe of

his intention to invade Pennsylvania; and St. Leger was held up before Fort Stanwix (actually St. Leger retreated Aug. 22). But he considered himself bound by his orders to press on to Albany. Having collected 30 days' rations, he crossed the Hudson (Sept. 13) and encamped near Saratoga. The Englishman Gates, who had displaced Schuyler in command (Aug. 19), was encamped 4 mi. away, on Bemis's Heights, with 12,000 men and was daily receiving reinforcements. Burgoyne advanced to the attack (Sept. 19). But Arnold came out with 3,000 men to meet him at Freeman's Farm. After four hours' fierce fighting, Arnold retired, and Burgoyne encamped on the battlefield, but he had lost over 500 men, including a large number of officers, victims of Morgan's sharpshooters, Burgoyne heard (Sept. 21) from Clinton, who had been left in command at New York, that he was about to make a diversion up the Hudson. He sent a dispatch to Clinton (Sept. 27) asking for orders. The answer was never received. Clinton started with a small force (Oct. 3) and captured two forts on the west bank, but he never had any intention of penetrating to Albany.

Burgoyne had now under 5,000 "effectives" left, and his supplies were running short. He reckoned that they might last till the 20th. He led out 1,500 men on reconnaissance (Oct. 7), but the Americans made a fierce counterattack, and led by Arnold, inflicted a severe defeat upon the British army. Next day Burgoyne began his retreat, but Gates, with 20,000 men, surrounded him at Saratoga. Burgoyne opened negotiations on the 14th and the Convention of Saratoga was signed (Oct. 17), Burgoyne insisting that it was not a capitulation, and finding a precedent in the Seven Years' War.

See **F. J. Hudleston, Gentleman Johnny Burgoyne (1928).**

SARATOGA SPRINGS, a city of Saratoga county, New York, U.S., is located in the Adirondack foothills about 30 mi. N. of Albany and 12 mi. W. of the Hudson river. The city is in a region of great historic interest, and is a health and pleasure resort noted since colonial days for the medicinal mineral springs which gave the community its name. Located in the city is Skidmore college for women (1911). Saratoga lake (6 mi long) is 3 mi. S.E. The city is renowned for its thoroughbred and harness races, which attract thousands of summer visitors, and has a National Museum of Racing and a Hall of Fame containing mementos of great horses and riders of the past.

The name comes from an Indian word written in the original Saratoga patent as Ochserantongue or Sarachtogie and is believed to mean "at the beaver dam" or "the place of beavers." It has also been spelled Saraghoga and interpreted "place of swift water."

The 122 springs (heavily charged with carbonic acid gas and containing in varying proportions bicarbonates of lime, sodium, magnesium, chloride of sodium and other minerals) are in a New York state reservation of 1,100 ac. The first iodine in the U.S. was discovered there in 1828. Sir William Johnson is said to have been the first white person who used the waters for medicinal purposes (1767). The therapeutic value of the springs had been known long before to the Indians. A log house for lodging visitors was built in 1771; in 1791 Gideon Putnam bought a large tract of land and put up the first inn; in 1793 Valentine Seaman published a book about the waters which spread the knowledge of their curative properties. Other hotels were built early in the 19th century and by 1820 the springs had become a popular resort. The American Civil War cut off the patronage from the south and brought depression; but soon afterward, with the rebuilding of the United States hotel and the establishment of racing (the August races of the Saratoga Association for the Improvement of the Breed of Horses, organized 1863, drew large attendances) Saratoga Springs again became popular. In the 1870s and 1880s it was one of the most fashionable watering places of North America ("the Queen of Spas"). Commercial exploitation of the springs (bottling the water and liquefying the carbonic acid gas) diminished their flow until they almost disappeared, and the resort was again depressed until the state intervened. first prohibiting pumping of the springs, later acquiring the property (1909) and placing it in charge of the conservation commission (1916).

The Saratoga country was a favourite camping ground of the Iroquois. It became a theatre of hostilities between the English, and the French colonists and their Indian allies. In 1693 a French expedition was checked in a sharp conflict near Mt. McGregor by an English and colonial force. In 1745 the settlement on the Hudson directly east of the present city of Saratoga Springs (called Saratoga at first, later Old Saratoga and now Schuylerville) was attacked by the French and Indians, who massacred many of its inhabitants. The battles of Saratoga (*q.v.*) in the Revolutionary War were fought at Bemis Heights, 12 mi. S.E. of Saratoga Springs. Most of the battlefield was acquired by the state of New York, and congress in 1926 authorized its establishment as a national military park. Saratoga Springs was incorporated as a village in 1826 and as a city in 1915.

Industry is of minor importance and includes chemicals, wallpaper, clothing and bait. For comparative population figures see table in NEW YORK: *Population.* (G. L. F.)

SARATOV, an *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., is larger than the former Saratov government area. It lies on the right bank of the Volga river, with the *oblasts* of Ulyanovsk and Penza on the north, Boronedzh Tambov on the west, Stalingrad on the south, and the West Kazakstan and Kuibyshev on the east. Its area is 38,687 sq.mi. and its pop. (1959) 2,167,000 (urban 1,169,000; rural 998,000). The Saratov geographic region occupies the eastern part of the great central plateau of Russia, which slopes gently to the south until it merges imperceptibly into the steppe region; its eastern slope, deeply cut into by ravines, falls abruptly to the Volga. The higher parts range from 700 to 900 ft. above the sea, while the Volga flows at an elevation of 20 ft. only at Khvalynsk in the north, and thus the river banks have a hilly appearance.

Every geological formation from the Carboniferous to the Miocene is represented, though the older formations are concealed under Cretaceous deposits of fossiliferous marls, flint-bearing clays and iron-bearing sandstones. The boulder clay of the Finland and Olonets ice sheets penetrates into the east of the region, and loess and other post-glacial deposits are found in the southeast. Iron ore is abundant and chalk, lime and white pottery clay are obtained in some parts.

The region is comparatively well drained; the upper course of the Sura, a tributary of the Volga, lies in the north, and the upper Medvedyitsa and Khoper flow south and drain into the Don. They are navigable in spite of their shallows, and ready-made boats are brought in pieces from the Volga, and put together on their shores. The forest has almost disappeared; houses are made of clay and dung is used for fuel.

The climate is severe and continental, with a recorded range of temperature of 119° F. in some parts; at Saratov the average January temperature is 12.4° F., the average July temperature 71.5° F. The Volga at Saratov is frozen for 162 days in the year. Rainfall is scanty and irregular, varying between 8 and 16 in. in normal years and much less in drought years, the rain falling mainly in spring and early summer. The region is arid and rapid desiccation is progressing. In the north and west are sandy black-earth soils, interspersed with dark gray forest lands and gray wooded clays (Volsk, Khvalynsk, the northern part of Petrovsk). In Petrovsk. Serdobsk, Atkarsk and Balashov are clayey black earths, while Balashov contains a strip of rich black earth with a high humus content, although even here there are patches of salt land and salt marshes.

The yield of the soil in Saratov region has become stabilized at a low level because, although the soil contains about 6–10% of humus, its friability disappears after a few years of persistent planting with cereals. The great variability of crop yield, sometimes so low as to reduce the district to starvation (*e.g.*, in 1921), and the appearance of salting indicate the need for more intensive methods of agriculture. Attempts are being made to increase the friability of the soil, to put large areas under grass for several years, and to introduce plough culture and better types of crop rotation, with less fallow, and to introduce the sowing of the more drought resisting types of grain. Marmots, mice and insects are great pests to agriculture. Experimental stations have been

established at eight points and the agronomical faculty of the University of Saratov has an experimental institute. In the Novo-Uzensk district east of the German Volga republic the soil and drought problem is even more acute; here are light brown and brown clayey soils, with some chestnut brown soil and sands and salty areas. In good years crops are successful, in drought years famine is severe. For 50 years the peasants there have been practising a form of irrigation and plans have been made for lagoon irrigation of an extensive area above the town of Novo-Uzensk and near the settlement of Alexandrov-Gai, utilizing the waters of the Great Uzen.

Winter rye is the main crop, summer wheat, millet, oats and sunflower seed come next and potatoes are increasingly grown. Barley forms a very small percentage of the harvest. The region was slow in recovering from the terrible years of 1917–21.

There is a fair amount of stock raising in the district; sheep and working cattle occupy the first place, and horses and pigs are also bred, but on the whole this is a diminishing industry. Cucumbers. melons, watermelons, and vegetables are grown around Saratov, Volsk, Atkarsk and Kamyshin, and in the Novo-Uzensk district. Beetroot cultivation is increasing.

Poultry raising of an export character is carried on, but dairy produce is not much developed. Fishing and the preparation of caviare are important at Kamyshin. A more intensive development of cattle breeding for meat and dairy purposes would lead to greater development of local production of bran and cattle foods, with a probable development of the bacon industry in dependence on by-products from the dairying industry. Flour milling is the main industry. oil pressing from oleaginous seeds is an export industry and there is some tobacco manufacture. There are metalworks dependent on the local iron, and a shale-using electric plant at Saratov. The shale is obtained from the Kashpir beds near Syzran and is brought cheaply by water.

The railway net includes the line from Tambov to Kamyshin, with a branch linking with Penza a line from Tambov to Saratov, one from Volsk on the Volga going through Petrovsk and Atkarsk to Balanda. part of the Penza-Syzran line, and the branch from the Volga through Xovo-Uzensk to Alexandrov-Gai. The region is thus better supplied than the Kuibyshev region and has a good deal of transit trade between shipping and railway lines.

The rate of literacy is considerably higher than in the Kuibyshev region, though it is low among uomen. Saratov university helps to spread a higher standard of culture in the district. The chief towns are Saratov, Kuznetsk (*qq.v.*), Balachov and Volsk; the remaining centres have fewer than 20 000 inhabitants.

The district of Saratov has been inhabited since at least the Neolithic period. The inhabitants of a later epoch left numerous bronze remains in their kurgans (burial mounds) but their ethnological position is still uncertain. In the 8th and 9th centuries the seminomad Burtases peopled the territory and recognized the authority of the Khazar princes.

SARATOV, a city of the Russian S.F S.R., in the oblast of Saratov, in 51° 3j' N., 46" 1' E., on the Volga river, and on the plateau slopes near that river. Landslips from the Sokolov hill (560 ft.) often occur. Two ravines divide the city into three parts. The streets are wide and regular, with broad squares, and there are some fine buildings. Pop. (1959 est.) 581,000.

Industries developed in Saratov include iron smelting, shipbuilding, the making of nails and bolts, sawmilling, flour milling and railway repair shops. A large combine harvester plant was established there.

The shallowness of the Volga river opposite the city and the immense shoals along its right bank proved drawbacks, but Saratov became a river port of some importance. Linked by rail with other shipping points, it built up an extensive collecting and entrepôt trade. The importance of Saratov, a major transfer centre for petroleum, was increased after World War II, a pipe line to Moscow for the transportation of gas being completed in 1946. During the war Saratov had been expanded in order to exploit the sources of the natural gas which had been discovered.

A university nas established there in 1919, and there are institutes and other educational institutions, and various museums.

Saratov was the capital of the Saratov government until 1928 and of the Lower Volga territory from that date until 1934. It came under the control of the Russian S.F.S.R. in 1943.

Saratov was founded at the end of the 16th century, 7 mi. above the modern site, to which it was removed about 1605. Sary-tau or Yellow mountain on which it stands has been inhabited from remote antiquity.

SARAWAK, a British crown colony on the northwest coast of Borneo lying between lat. 0° 50′ and 5° N. and long. 109° 36' and 115° 40' E. Area 47,071 sq.mi. (about the size of England). Pop. (1960) 744.391. It has a coastline of about 450 mi. on the China sea and is bounded on the northeast by British North Borneo and on the southeast by Indonesian Borneo.

Climate and Physical Features. — The climate is tropical but not unhealthy. The thermometer rarely rises above 90° F. and often falls to 70° F. at night. The heat is usually tempered by a breeze but humidity is generally high. The annual rainfall varies between 100 and 200 in. There are no marked seasonal changes but there is more rain from October to March than in the other six months. The alluvial coastal plain varies from 5 to 50 mi, in width The rest of the country consists of forest-covered hills and mountains, a long irregular range forming the spine of the island of Borneo with peaks up to 5,000 and 6.000 ft. These are mostly of sandstone but there are extrusions of limestone forming sheer cliffs and pinnacles. There are many rivers. chief among them being the Rejang, Baram, Limbang and Batang Lupar All of these are navigable; the first-named by ocean-going ships for a distance of 170 mi. (See BORNEO. *Physical Geography.*)

Ethnology. — The main indigenous groups are the Iban (Sea-Dayak), Malay, Melanau. Land-Dayak, and the miscellaneous group of tribes knoan as Kayans, Kenyahs, Kelabits, Muruts and others. The Malays are Mohammedans. the others pagans (animist) except where converted to Christianity. Nonindigenous peoples are Europeans, Chinese. Javanese and Indians. The 1960 census disclosed that Europeans formed 0.2% of the total, Malays 17.4% and Chinese 30.8%. Chinese were formerly encouraged to settle but immigration has in recent years been severely restricted.

Administration. — The governor is assisted by an executive council. The legislative body is a council known as the Council *Negri.* Both these councils contain unofficial as well as official members and consist of persons of all races living in the territory. Administration is conducted by a civil service composed of British and of native officers. The higher posts in the service are at present mainly held by British officials but promotion is open to all.

Local government has been established in most parts of the country. This is in. the hands of local authorities in the rural areas and municipal boards in the towns. All local government bodies have their own treasuries, their revenue consisting of rates levied by the authority supplemented by grants from the central government.

The judicial system comprises a supreme court, circuit courts and magistrates courts administering the ordinary law of the territory, and native courts which apply the native or customary law in appropriate cases.

The governor of Sarawak is also the high commissioner for the state of Brunei, a Malay state under British protection and ruled by a Malay sultan, the land boundaries of which march with those of Sarawak.

History.—Sarawak was known to the explorers and map makers of the 16th century, but its history as a state begins with the arrival of James Brooke (*q.v.*) in 1840. Then part of the sultanate of Brunei, the country was in rebellion against the rapacity of the sultan's officials. Brooke restored order, and a year later was publicly installed at Kuching as rajah of the territory then known as Sarawak which extended from Cape Datu to the Samarahan river, an area of about 7.000 sq.mi.

The rajah immediately began to introduce the elements of good government. He abolished slavery, suppressed head-hunting, and, uith the help of a young naval officer who afterward became Admiral Sir Henry Keppel, expelled pirates from the Saribas and Batang Lupar rivers. Accretions of territory took place from

time to time throughout the 19th century, generally because the native peoples preferred the reasonably good government of Rajah Brooke to the oppression of the Malay nobles, and the country finally attained its present size in 1905.

James Brooke, who had been created a K.C.B. in 1863, was succeeded in 1868 by his nephew Sir Charles Johnson Brooke (1828–1917). In 1888 a treaty was concluded which placed the state under British protection and in return gave the United Kingdom the right to control its foreign relations while leaving the internal administration of the country entirely in the hands of the rajah. The rajah's title was formally recognized by Edward VII in 1904. The third rajah, Sir Charles Vyner Brooke, G.C.M.G. (1874–), succeeded his father in 1917.

In 1941 to mark the centenary of Brooke rule a proposal for a new constitution with a representative legislature was proclaimed, but the Japanese invasion intervened. Such was the disruption, misery and ruin caused by three and a half years of Japanese occupation that the rajah decided, with the consent of his council, to cede the country to the British crown; and on July 1, 1946, the cession was accepted.

The first governor of the new colony, Sir Charles Arden Clarke, was appointed in Oct. 1946.

Social Services.—Primary education is gradually being brought within the reach of all, though the difficulty of the terrain and scattered population make the process a slow one. Teachers are trained at a college in Kuching. Post-primary education is provided on a small scale by one government and a few mission schools. In 1952 there were 41 government schools, 94 run by local authorities, 71 mission schools and 226 Chinese schools. Medical and health services are made available by the government by means of hospitals and dispensaries, many of the latter being mobile and consisting of powered boats operating on the rivers and streams.

The Red Cross society has a branch in Sarawak, and institutions for the care of special sections of the community include a boys' home for juvenile delinquents, a leper settlement, a mental hospital and homes for the aged and destitute at Sibu and Kuching. The Boy Scout and Girl Guide associations find supporters among young people of all races.

Trade and Industry.—The chief exports are mineral oil, rubber, sago flour, pepper, cutch (a tanning extract) and timber. Gold is mined in small quantities and coal of good quality has been found but is somewhat inaccessible. There are several minor industries. Some 13,000 sq.mi. of land are in cultivation, including about 11,000 under rice. Fishing and fish curing are the means of livelihood of many Malays and Chinese.

Imports in 1952 were valued at $382,946,000 and exports at $438,563,000.

Government revenue (1951) totalled $47,349,000 and expenditure $22,517,000. Local currency is the Malayan dollar valued at 32.67 cents U.S. and at 2*s*. 4*d*. in sterling in 1952.

Towns.—The chief towns are Kuching (pop. [1960] 50,585), the capital, having a large Chinese trading community, the main government offices. Anglican and Roman Catholic cathedrals, museum, wharves, warehouses and dockyard; Sibu (pop. [1960] 29,615); and Miri (pop. [1960] 13,347), the centre of the Sarawak oil fields. Other administrative centres with settlements of a few thousand persons are Simanggang, Sarikei, Binatang, Mukah, Bintulu and Limbang.

Communications.—Internal communication is chiefly by water, there being no extensive road system and no railways. There are some 450 mi. of roads in and around the towns and a trunk road from Kuching to Simanggang was under construction in 1953.

There is a modern airfield near Kuching and there are landing grounds in a few other places. A regular air service and good steamship services operate between Sarawak, Singapore and North Borneo.

There are exterior wireless links, and an extensive system of wireless telegraph stations throughout the territory

(C. W. DA.)

SARCOPHAGUS, the name given to a coffin in stone, which on account of its caustic qualities, according to Pliny (H.N. xxxvi. 27), consumed the body in 40 days (Gr. *σαρκοφάγος,* literally "flesh-eating," from *σάρξ,* flesh, *φαγεῖν,* to eat); also by the Greeks to a sepulchral chest, in stone or other material, which was more or less enriched with ornament and sculpture. One of the finest examples known is the sarcophagus of Tutankhamun (c. 1550 B.C.) made of granite and ornamented with angels with outspread wings. Of later date are the green porphyry sarcophagus and the terra-cotta sarcophagus from Clazomenae; both of these date from the early 6th century B.C., and are in the British Museum. The finest Greek examples are those found at Sidon in 1887 by Hamdy Bey, which are now in the Imperial Museum at Constantinople. (See GREEK ART.) Of Etruscan sarcophagi there are numerous examples in terra-cotta; occasionally they are miniature representations of temples, and are sometimes in the form of a couch on which rest figures of the deceased; one of these is in the British Museum. The earliest Roman sarcophagus is that of Scipio in the Vatican (3rd century B.C.), carved in peperino stone.

BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

AN ETRUSCAN TERRA COTTA URN OF THE THIRD CENTURY. B.C., IN THE FORM OF A SARCOPHAGUS

Of later Roman sarcophagi, there is an immense series enriched with figures in high relief, of which the chief are the Niobid example in the Lateran, the Lycomedes sarcophagus in the Capitol, the Penthesilea sarcophagus in the Vatican, and the immense sarcophagus representing a battle between the Romans and the barbarians, in the Museo delle Terme. In later Roman work there was a great decadence in the sculpture, so that in the following centuries recourse was had to the red Egyptian porphyry, of which the sarcophagi of Constantia (A.D. 355) and of the empress Helena (A.D. 589), both in the Vatican, are fine examples. Later, during the Byzantine period, there is a large series, either in museums or in the cloisters of the Italian churches. They are generally decorated with a series of niches with figures in them, divided by small attached shafts with semicircular or sloping covers carved with religious emblems, one of the best examples

THE FRONT OF A SMALL ROMAN SARCOPHAGUS, OF THE THIRD CENTURY B.C., DEPICTING THE FOUR SEASONS

being the sarcophagus of Sta. Barbara, dating from the beginning of the 6th century, at Ravenna, where there are many others.

SARDANABALUS, SARDANAPALLUS or SARDANAPALOS, according to Greek fable, the last great king of Assyria, was undoubtedly Ashurbanipal (*q.v.*). The Greeks took him to be the most effeminate of a line of effeminate princes, but adequate evidence from Assyria proves him to have been quite the opposite. Greek legend has Sardanapalus, frightened by a siege, burning himself and his wives to death in his palace. This was actually the fate into which the mighty Assur-bani-pal frightened his rebellious half-brother, Shamash-shumukin, in the siege of Babylon in 648 B.C.

SARDICA, COUNCIL OF, an ecclesiastical council convened in 343 by the emperors Constantius and Constans, to attempt a settlement of the Arian controversies, which were then at

their height. Of the 170 bishops assembled, about 90 (principally from the West) were Athanasians, while on the other side were 80 Eusebians from the east. The anticipated agreement, however, was not attained; and the result of the council was simply to embitter the relations between the two great religious parties, and those between the western and eastern halves of the empire. For as Athanasius and Marcellus of Ancyra appeared on the scene, and the western bishops declined to exclude them, the Eusebian bishops of the east absolutely refused to take part, and contented themselves with formulating a written protest addressed to numerous foreign prelates.

Especial importance attaches to this council through the fact that Canons 3–5 invest the Roman bishop with a prerogative which became of great historical importance, as the first legal recognition of his jurisdiction over other sees and the basis for the further development of his primacy.

The canons are printed in C. Mirbt, *Quellen zur* Geschichte des *Papsttums* (1901), p. 46 f.; Hefele, Conciliengeschichte, ed. 2, i, 533 et *seq.*

SARDINE, the young of the pilchard (*q.v.*), and also used for other related small herrings when similarly preserved in oil.

SARDINIA (Ital. Sardegna), the second largest island in the Mediterranean, 9,301 sq.mi. in area. Politically it is part of Italy. It lies only 7½ mi. south of the French island of Corsica, from which it is separated by the Strait of Bonifacio. Terranova Pausania (or Olbia) at the northeast end of Sardinia is 145 mi. southwest of Civitavecchia, on the Italian mainland.

Physical Features. — Sardinia differs from the mainland and from Sicily in being geologically a much older country with large expanses of old primary rocks. With Corsica it forms part of a range of mountains rising over 13,000 ft. from the flat floor of the sea. Sardinia is a mountainous island, but there are no clearly defined mountain ranges and no permanent snow or glaciers. It consists largely of a patchwork of rolling plateaus, which do not break down into fertile hills, as is so often the case on the mainland of Italy; except for a few small coastal areas, there is only one plain. the Campidano, which stretches for 60 mi. from Cagliari in the south to Oristano in the west.

The mountains of the eastern half of the island are largely granite. In the northeast, in the Gallura district, which is entirely composed of granite, the highest point is Monte Limbara (4,393 ft) southwest of Terranova; farther south the Gennargentu chain rises to 6,016 ft. in the twin summits of Bruncu Spinta and Punta la Marmora. The northwestern part of Sardinia, Nurra, is volcanic, as are the mountains south of it which come close to the west coast; the highest point is Monte Ferru (3,448 ft.). The southwestern groups of Iglesiente and Sulcis contain the two chief mining districts of the island. Sarrabus in the southeast is a domelike granite region, largely uninhabited and partly covered with trees.

There are only two rivers of any size, the Tirso (94 mi.), which drains most of the middle of the island to the Gulf of Oristano on the west coast, and the Coghinas (65 mi.) which flows through a narrow valley to the north coast. Even they are practically dry by the end of summer.

Climate. — The main causes of Sardinia's poverty and backwardness have been summer drought and violent winds, especially the northwesterly maestrale and the hot moist scirocco. The January and July mean temperatures at Sassari in the north (735 ft.) are 47.3° F. and 75.6" F., and at Cagliari in the south (246 ft.) 48.9" and 76.6". Rainfall reaches 40 in. only in the mountains of Gennargentu and north of Iglesias and is less than 25 in. on all the lower ground. At Cagliari it is only about 19 in. It practically all occurs in late autumn and spring. (M. M. C.)

Flora and Fauna. — There are about 1,950 species of vascular plant mostly of the Mediterranean type (*Silene*, Dianthus, *Genista*, Cistus, etc.) though about 40 seem to have migrated from the steppes of northern Africa in Pliocene times and about 60 show links with Africa and Sicily. The flora is more nearly Corsican than Sicilian. The woody vegetation of lowland and hill (up to 2,900 ft.) consists mainly of evergreen shrubs. the forests having been destroyed by man, leaving, in the dry uncultivated parts, macchia containing mastic, strawberry tree, myrtle, tree heath, etc. In the south a tree spurge, *Euphorbia* dendroides, and in the Nurra the dwarf palm. form part of the macchia. Rock heaths with Helichrysum, Genista, etc., occur here and there among the scrub.

In the montane region (above 2.900 ft.) the trees and shrubs are mostly deciduous. Sweet chestnuts and oaks form most of the forests, though the chestnuts are limited in distribution. The commonest of the three oaks is the holm oak which forms extensive forests in the southwestern and southeastern (e g. Sarrabus) hills and is accompanied in the higher places by the peony. Paeonia *officinalis* and sometimes by tree heath. The cork oak grows specially in the north, in the Gallura area and in the mountains from Mt. Nieddu and Mt. Leruo to opposite Nuoro where the holm oak begins. The sessile oak, adapted to the higher mountains and mostly avoiding the limestones, forms forests chiefly round the Gennargentu massif and Mt. Santa Vittoria, also in the Catena del Marghine. There are alpine mats with thyme, thrift, etc., among the highest peaks.

The wild sheep Ovis musimon, known in Sardinia in classical times, is now found nowhere else but Sardinia and Corsica and is there protected. There are also special varieties of red deer. wild boar, hare and rodents, a Sardinian weasel (*Mustela* boccaniela) and a wild cat (Felis ocreata). The domestic donkeys are very small. Unexpectedly there are no bears. wolves, otters, squirrels or moles; no Italian sparrows or magpies. The Sardinian partridge (Alectoris barbara), unknown anywhere else in Europe but found in Tunisia, Algeria and Morocco, is also protected in the nature reserve at Golfo Aranci. There is a variety of trout like that in Algeria, Asia Minor and Persia. No poisonous or smooth snakes or slow worms are found but one lizard, Lacerta *fitzingeri,* one newt, *Molge rusconii* (a north African form) and one toad. Bufo viridis. Many of the 100 species of beetles are endemic and at least 12 species of butterflies and moths and two genera of land and fresh-water snails are found nowhere else. (X.)

ARCHAEOLOGY AND HISTORY

Prehistoric and Pre-Roman Civilizations. — The earliest evidence of human occupation in Sardinia dates from the time when metal was coming into use in the western Mediterranean. Although some stations (*e.g.*, Macomer in central Sardinia) have yielded lithic industries without metal, a pure Neolithic phase is not so far distinguishable from the Chalcolithic stage. The first habitations were perhaps cave dwellings (*e.g.*, San Bartolomeo and other grottoes near Cagliari and in western Sardinia). but it was not long before the Proto-Sardinians began to live a farming life in hut villages. Cult places in caves (San Michele near Ozieri) and religious monuments (a square platform built of large stones at Monte d'Accoddi, northwest of Sassari) are known. The dead were buried in artificial grottoes, which show an antechamber and one or more cells, generally rectangular in plan, sometimes with pillars and roughly carved symbols or figures. These tombs are called by the Sardinians domus de gianas ("witches' houses") and form more or less extensive cemeteries. the best known of which was excavated at Anghelu Ruju near Alghero. Cist graves in stone circles were found in northern Sardinia (Arzachena), and a few small dolmens still existing in the island must go back to the same period. Menhirs are not infrequent and may be related to sanctuaries and burial places. A good idea of the material civilization and common life is furnished by the funerary equipment at Anghelu Ruju, which includes flint blades, stone axes, maceheads, arrowheads, copper daggers and implements, personal ornaments. Stone "idols" are also present and may be interpreted as attendants of the dead. They show the female form in a quite schematic rendering which recalls similar although not identical figures from the Aegean. Pottery comprises undecorated, impressed and incised wares, differing in shape and ornament, among which curvilinear and "spiral-ribbon" patterns are frequent. The typical bell beakers demonstrate a direct link with the Spanish beaker culture.

This Sardinian Copper Age was still flourishing in the first half of the second millennium B.C., and was apparently influenced and transformed very slowly by the impulse of the Bronze Age civilizations which were already ancient in the near east. Minoan and Mycenaean influence was not as direct as in Sicily, but com-

mercial intercourse with Crete may be proved from the beginning of the Late Minoan period, toward 1 joo B.C (copper pig-ingots with linear A signs found at Serra Ilixi) In any case the breaking of a real Bronze Age culture in Sardinia cannot be perceived till near the end of the second millennium, and in spite of the oriental influence its substantial local ancestry seems indisputable. Its peak is not to be dated earlier than the 8th or 7th century B C., that is to say in the period of historical Phoenician and Greek colonization in the western Mediterranean. And it survived in more or less degenerated forms down to the Carthaginian and Roman conquest of the island.

Since the Proto-Sardinians did not know of any system of writing. native historical records are not available. The Greek sources adumbrate a kind of fabulous golden age in Sardinia before the arrival of the Carthaginian invaders, with intensive cultivation and building. In fact, the monuments suggest a period of cultural flowering and prosperity which may hardly be noticed in any later phase of the history of the island. About 1,000 stone towers, the so-called nuraghi (sing. nuraghe), are still a peculiar feature of the Sardinian landscape. They belong to the Sardinian Bronze Age civilization, which is therefore called nuraghi culture by scholars. These towers are in the shape of a truncated cone and built of large stones laid in more or less regular courses; they contain superposed round chambers capped by tall pointed corbelled roofs and connected with a winding staircase. Such a tower is nothing more than the chief element of complex buildings comprising bastions and turrets with corridors. round chambers and cisterns; *e.g.* those excavated at Abbasanta (the so-called Nuraghe Losa), at Torralba, and at Barumini. The nuraghi are sometimes interlinked in defensive systems (*e.g.* Giara di Gèsturi). But in many cases fortified villages of partially stone-built round huts appear in close connection with the nuraghi, which may therefore be considered as residential castles of chieftains including storerooms, foundries and even places for religious use. Other isolated buildings are in the form of rectangular temples (Serra Orrios), monumental wells (Sàrdara, Serri, Ballao) and fountains (Lomarzu). The graves show a development of earlier local types. The subterranean chamber tombs become bigger, imitating more closely the internal structure of civil habitations. On the other hand grandiose megalithic grave monuments are encountered, deriving from simpler dolmen-corridors or cists, with a rectangular cell covered by a corbelled roof and with a panelled portal slab in the centre of an exedra facade, — the so-called "giants' tombs." Objects for everyday life and for religion. yielded copiously by the dwellings and sanctuaries or found in hoards, include bronze implements and weapons. ornaments, decorated and coarse pottery. However, there is a kind of production which calls for special attention, namely the bronze votive statuettes portraying men, chiefly warriors, women, animals, more infrequently mythological beings and small models of ships or buildings.

The race which built the nuraghi was probably a definite ethnical unity, having its roots in the first prehistoric population of the island. In as far as Sardinian place names produce evidence for a knowledge of the lost language of the Proto-Sardinians, these appear to be of Palaeo-Mediterranean origin with some Iberian affinities. Perhaps Ligurian elements settled on the northern coasts, but there is no doubt that no Indo-European invasion reached the island before the Roman conquest. Classical authors mention some names of native peoples; *e.g.*, the *Ioleis* or *Ilienses*. Archaeological evidence from the nuraghi culture suggests a strongly organized power of tribal states. The working of metal from the local mines may be reckoned to have been the chief source of wealth. However, the presence of Phoenician trade settlements along the Sardinian coasts since the 8th century B.C. must have vigorously contributed to Proto-Sardinian prosperity.

The Phoenician shippers and traders, driven westward in search of metal, included the mining zone of Sardinia in their system of commercial routes and founded trading posts, which became the important towns of Caralis (Cagliari), Nora, Bithia, Sulci. Tharros, Cornus. Attempts at colonization by the Greeks (Olbia in northwestern Sardinia) were unsuccessful because of the jealous opposition of the Phoenicians. After Carthage had attained leadership over the western Phoenicians, the struggle for supremacy in the west caused a more direct control to be exercised over the colonists on the island. After a long period of peaceful coexistence with the indigenous peoples, the Carthaginians began, about 500 B.C., the military conquest of the most productive parts of Sardinia. This drove the proudest of the Proto-Sardinians to a fierce life in a reduced mountain zone, a development that left a noticeable mark upon the character of the later Sardinians. The thriving Phoenician and Carthaginian civilization, with its orientalizing and half-grecizing elements, is copiously documented by the finds of cemeteries, as at Tharros, Sulci and Cagliari, and by the religious and civil monuments of Nora and Cagliari.

Roman Period. — During the first Punic War the Romans tried to take Sardinia. However, not earlier than the end of the war, in 238 B.C., they took advantage of a revolt of Carthaginian mercenaries to demand the surrender of the island. The native tribes opposed the Romans, but were conquered after several bloody campaigns; the island became a province under the government of a praetor or propraetor, to whose jurisdiction Corsica was added soon afterward. A rebellion in 21 j B.C., fostered by the Carthaginians, was quelled by T. Manlius Torquatus. After this the island began to furnish considerable supplies of corn; it was treated as a conquered country. not containing a single free city. and the inhabitants were obliged to pay a tithe in corn and a further money contribution. There were saltworks as early as about 150 B.C. There were two insurrections of the mountain tribes, in 181 and in 114 B.C., but even in the time of Strabo there was considerable brigandage.

In the division of provinces made by Augustus. Sardinia and Corsica fell to the share of the senate, but in **A.D.** 6, Augustus, because of the frequent disturbances, took them over and placed them under a praefectus. In **A.D.** 67 Nero restored Sardinia to the senate (but not Corsica) in exchange for Achaea, and the former was then governed by a *legatus pro praetore;* but Vespasian took it over again before **A.D.** 78, and placed it under an imperial procurator as praefectus. It returned to the senate, not before **A.D.** 83 but certainly before the reign of M. Aurelius, when we find it governed by a proconsul, as it was under Commodus; the latter, or perhaps Septimius Severus, took it over again and placed it under a procurator as praefectus once more. A bronze tablet discovered in 1866 near the village of Esterzili is inscribed with a decree of the time of Otho with regard to the boundaries of three tribes, the Gallienses, Patulienses and Campani, who inhabited the eastern part of the island. Caralis was the only city with Roman civic rights in Sardinia in Pliny's time (when it received the privilege is unknown). A Roman colony had been founded at Turris Libisonis (Porto Torres) and others, later on, at Usellis and Cornus. We hear little of the island under the empire, except as a granary and as remarkable for its unhealthiness and the audacity of its brigands. It was often used as a place of exile. (**MA.** P.)

Vandal and Byzantine Rule. — After they had crossed over into Africa from Spain in 429 the Vandals occupied Sardinia in 456 and held it till its conquest in 534 by the Byzantines under Duke Cyril. Apart from an attempt to retake the island made in 468 by Marcellinus under the emperors Leo I (of the east) and Anthemius (of the west), the Vandal rule was pacific. It allowed of a period of cultural revival, largely motivated by the enforced residence for about 20 years at Cagliari of 120 North African bishops, who had been banished by King Thrasamund. Among the exiled bishops were St. Fulgentius and the bishop of Hippo, who had brought with him the relics of St. Augustine, which were recovered in 720 by the Lombard king Liutprand and taken to Pavia.

The "African" cultural renaissance in Sardinia is testified by the remains of the monastery built by Fulgentius near the basilica of S. Saturnino, Cagliari, as well as by the code of St. Hilary in the capitular library of St. Peter, Rome, and in the Laudian manuscripts of the Bodleian library. Oxford.

Under the Eastern Roman empire Sardinia was one of the seven provinces of the prefecture of Africa of the praetorium. It was under a *praeses* for civil affairs and a ***dux*** for military. In the

8th century the two posts were held successively by the same person. In 552–553 the island was occupied by the Goths under Totila. but after the end of Gothic rule in Italy, Sardinia long remained under the Eastern empire. Letters from Gregory the Great written at the end of the 6th century denounce Byzantine misgovernment and give evidence of pressure being exercised by the Lombards on the Sardinian coast. A Greek inscription found at Portotorres in 1927 shows that this pressure persisted in the early 8th century. when the first Arab attempts to conquer the island (711) were made. These vain attempts were repeated throughout the 8th century and. with greater persistence, in the 9th, when the Arabs sought to take advantage of the extreme difficulty of communication between Byzantium and the island resulting from their capture of Sicily in 827–31. The defense was entrusted to. and stubbornly prosecuted by, the islanders themselves. probably under local leaders, and an autonomous government was set up, at first *de facto* and later *de jure,* when the island was divided into four districts (*giudicati*). Einhard records that in 815 the Sardinians sent ambassadors to the emperor Louis the Pious to seek an alliance against the common enemy. In 851 Pope Leo IV requested the Sardinians to send forces to garrison Rome against the Arabs.

The Giudicati and Italian Influence. — The four Sardinian *giudicati* of Cagliari. Arborea. Torres and Gallura appear clearly defined territorially and politically only in the 11th century, after the defeat in Sardinian waters in 1016 of the Arab chief Mugajd by combined Sardinian. Pisan and Genoese forces. From that time Sardinia became a field for expansion for these republics, as well as for Marseilles and Gaeta, and was opened to the monastic immigration encouraged by the Roman see, which now claimed sovereignty over the island. Of the many competitors for its exploitation: Pisa and Genoa were the most successful and, through alliances with the *giudici,* secured politico — mercantile zones of influence — Pisa mostly in the north and west, Genoa in the south and east. Pisa got for her own archbishop the right to the apostolic legation and the primacy of Sardinia and Corsica. Subsequently Genoa, to counteract its rival, subsidized Barisone I, *giudice* of Arborea, to enable him to acquire for himself the investiture of the whole *Regnum Sardiniae.* This attempt failed, Barisone was arrested for bankruptcy and the *regnum* was granted to Pisa by Frederick Barbarossa. The peace of 1169 brought about a temporary truce between the two republics, soon broken by dissensions among the *giudici,* who sought help and protection now from one of the two city-states: now from the other. The *giudicato* of Cagliari passed through marriage to Pisan families (Massa, Visconti. Donoratico) and finally to the same republic that provided the capital with the notable fortifications that still stand. The *giudicato* of Torres passed from the protection of Pisa to that of Genoa until the marriage of Adelasia, heiress of Gallura and Logudoro, *en seconde noce* to Enzio of Hohenstaufen, natural son of Frederick II. Enzio took the title *rex Sardiniae* but, as he was imprisoned by the Bolognese in 1249, his rule was carried on by vicars. With the battle of Meloria (1284) the influence of Pisa was limited to the districts of Cagliari and Gallura; Genoa controlled the other districts. also through its noble families (Spinola, Malaspina, Doria). Throughout the 11th, 12th and 13th centuries. however, Pisan influence predominated. in the arts almost exclusively, as shown by the many churches built at this time. especially the basilicas of S. Gavino, Portotorres, and Sta. Maria! Xrdara. Important documents on the economic life of the period survive in the *condaghe* or patrimonial registers of ecclesiastics, drawn up in the vernacular. with annotations concerning income and expenditure and property titles.

Aragonese Domination. — In 129j Boniface VIII granted to James II of Aragon the *Regnum Sardiniae et Corsicae,* but Sardinia was effectually conquered by the Aragonese only in 1326, with the help of the *giudicato* of Arborea, which! however, kept its independence and defended itself strenuously against the same Aragonese throughout the 14th century. A war that broke out about 1350 between the *giudice* Mariano IV and King Peter IV of Aragon was won by the latter. who. at the first extraordinary meeting of parliament received from Mariano an oath of fealty (1355). A few years later war was started again by Mariano and carried on heroically by his daughter, Eleonora of Arborea, who signed a new peace treaty with King John I of Aragon (1386). After the death of Eleonora (1404) the *giudicato* was reduced to a fief of Aragon (1410) and. after a last vain attempt at insurrection had been suppressed at the battle of Macomer (1478), brought wholly under the Aragonese crown. Under Aragonese rule, and then under that of Spain. the feudal regime was restored: the administration was unified and placed under a viceroy residing at Cagliari. A Sardinian parliament with three branches (stamenti) — military, ecclesiastical and royal — was set up. Despite the provisions extended by hlphonso V of Aragon to the whole island for the observance of the code of rights promulgated by Mariano IV of Arborea and perfected by Eleonora (1392) — the *Carta de Logu* (university library. Cagliari) — the island's economy. flourishing under the *giudici,* declined. The population, oppressed by taxation, decreased and the island fell into a state of lethargy. (R. Du.)

Modern History. — Sardinia remained a Spanish province until the War of the Spanish Succession. In 1708 Cagliari was bombarded by an English fleet and on its capitulation the island became Austrian. The supreme council of the island was immediately transferred from Madrid to Vienna and Austria was confirmed in possession by the Treaty of Utretcht in 1713. Cardinal Giulio Alberoni, Philip V's minister, hoped to make Sardinia a jumping-off point for the recapture of Spain's former Italian possessions, and in 1717 he dispatched a squadron from Barcelona which recaptured the island. The victory was, however, short-lived. In 1720 by the Treaty of London the Quadruple Alliance united Sicily to Naples under Austrian rule and compensated Victor Amadeus II of Savoy for his loss of Sicily by making him king of Sardinia.

The house of Savoy took an interest in their new kingdom and sought to establish their authority over the feudal nobles and over the church. In 1726 Pope Benedict XIII confirmed the king in the right of presentation to bishoprics and yielded the papal prerogative of investiture to the crown. Throughout the 18th century efforts were made to improve the social and economic conditions of Sardinia: schools in Italian were started in order to link the island more closely with the mainland, empty lands were repopulated with Piedmontese, Ligurians and Corsicans, agriculture was encouraged, the salt pans improved, and some revival of old industries and the introduction of new ones were attempted. In 1793 the French attacked Sardinia and bombarded Cagliari, but were repelled by the islanders. The *stamenti* then presented a memorandum to the king asking for a measure of local autonomy and the opening of all posts. except that of viceroy, to all citizens. Their request was rejected but the movement which it represented found support in a popular revolt rising out of the economic discontent of the people. The revolt lasted for about two years, but faded out on the flight to France of the popular leader, Gian Maria Angioj. In 1799 Charles Emmanuel IV took refuge in Sardinia after his expulsion from Piedmont by the French. His successor Victor Emmanuel lived in Cagliari from 1806 till 1814, when he left his brother Charles Felix there as viceroy. During the next tuo years Charles Felix embarked on various reforms affecting agriculture. taxation, public health and the administration of justice, but it was Charles Albert who took real account of Sardinia's needs. In 1835 he abolished feudal rights, and, though in practice some continued to exist, the ensuing division of seignorial lands among private owners and communes formed the basis of the 19th and 20th century agrarian economy of Sardinia. Charles Albert sought to improve administration and finance, to reform the army. to establish charitable institutions, to improve schools, to open up roads, to improve communications with Genoa and Turin, and in general to spread the language and culture of the mainland. In 1847, at the request of the *stamenti,* Sardinia was united to the other provinces of Piedmont with the same standing in the kingdom; this position was confirmed by the *statuto* of 1848 and Sardinians sat in the Piedmontese parliament. The islanders played an active part in the Italian struggle for unity and independence, and from 1861 Sardinia formed a part of the kingdom of Italy.

On the outbreak of war between Italy and the Allies in 1940 Sardinia had a garrison of between 200,000 and 250,000, including the 9th German motorized division. The island's airfields were used as bases for attack in the Mediterranean. In 1943 Allied air attacks on the island began and increased in intensity as the time for the invasion of Sicily drew near. The Germans had increased the number of air squadrons in Sardinia, but in July Allied air attacks made many airfields unusable. The Allies had expected that a serious attack might have to be made on Sardinia, but early in Oct. 1943 Winston Churchill noted that on Sept. 19 it had fallen as a mere incident in the Italian campaign. It was occupied by a small number of Allied troops, some anti-Fascist exiles returned, and in a short time life had returned more or less to normal.

THE PEOPLE

The census of Nov. 1951 showed that Sardinia had a population of 1,276,023, an increase of 23% on the figure for 1936 (Italy 10.5%). The density of population is 136.2 per sq.mi. (Italy 408.6); in the northeast province of Nuoro it is only 91.5. Apart from the small mountain region of the Valle d'Aosta (74.7 per sq.mi.), the low regional figure was equalled only in the Trentino-Alto Adige. As in Sicily, the vast majority of the people live in compact villages and small towns, mostly in settlements containing 1,000–2,000 people; there are few towns of any size, only one, Cagliari (pop. 1951, 127,381), with more than 100,000 inhabitants.

The birth rate fell from 28.3 per 1,000 in 1936 to 25.7 in 1952 (Italy 18.0), the death rate also fell from 14 to 9, so that the natural increase in 1952 was 16.7 (Italy 7.9). The rate of infant mortality fell to 69 per 1,000 live births in 1951, a great improvement on 89 in 1936 but still very high compared with rates of 41 in Tuscany and 45 in Emilia-Romagna. It was estimated that before the systematic attack on the anopheles mosquito made by British, U.S. and Italian experts in 1947–48 more than 190,000 people were seriously affected by malaria and that 2,000,000 working days were lost annually through the disease. By 1952 there were scarcely any new cases and the number of recrudescent cases was very small. But tuberculosis remained a scourge; in 1952 the death rate was 782 per 1,000,000 of the population, the only region with a higher rate being Trentino-Alto Adige with 849 (Italy 613). The high incidence of infant mortality and of tuberculosis and other diseases like trachoma is undoubtedly connected with poverty and with the unhygienic living conditions which are particularly bad in the remote rural settlements.

Government. — Sardinia is one of the five regions on which a special form of local self-government was conferred by the Italian constitution of 1948 (see also SICILY: Government); the regional statute was adopted by an Italian constitutional law in Feb. 1948. Some measure of local self-government existed after the late summer of 1943, when Sardinia was occupied by the Allies, mainly because the island was cut off from the mainland of Italy and to a great extent left to its own resources. A sense of the need to establish definite contact led the Italian government in March 1944 to appoint a high commissioner for the island, as had been done in Sicily in January, and regional autonomy was granted to Sardinia by an amendment to the Sicilian statute of May 15, 1946.

As in Sicily, the administration of Sardinia was put in the hands of the president of the region, the elected regional assembly, and the giunta, the executive committee of the assembly, the state retaining control of justice, communications and the armed forces. But the assembly's legislative powers are less extensive than those of the Sicilian assembly. The Sardinian assembly was not given authority to legislate on educational matters, it can only "adapt the provisions of the national laws to its particular needs" in every grade of education, nor has it exclusive power, like the Sicilian assembly, to legislate on all questions concerning agriculture, land reclamation. industrv and commerce. In fact. in view of the extreme poverty of Sardinia and of the great need for agrarian reform (see below), it was very important that the statute contained a special provision for the drawing up of a plan by the state and the region together for the economic and social reconstruction of Sardinia. The important executive function of maintaining public order was not (as it was in Sicily) conferred by the statute on the president and the giunta. The Italian government may delegate to the region the right to safeguard public order, in which case this function will be exercised by the president within the limits of directions laid down by the national government.

The president is elected by the assembly from among its members, represents the region, promulgates its laws and together with the *giunta* constitutes the government. He has the right to attend meetings of the Italian council of ministers and to speak though not to vote when Sardinian affairs are discussed, but he does not, like the Sicilian president, hold the rank of minister.

The financial provisions of the statute are framed with regard to the island's poverty. In addition to the proceeds of local taxation, to be raised in conformity with national principles, Sardinia receives a definite proportion of certain state taxes; *e.g.*, nine-tenths of the taxes of lands and buildings in the region and of the taxes on state monopolies. The region also receives rents paid for hydroelectric concessions, and the state has undertaken to make special grants for particular projects of public works and land improvement.

The first regional assembly was elected in May 1949. There are three provinces, Cagliari, Nuoro and Sassari.

ECONOMIC CONDITIONS

Agriculture. — More than half the employed population of Sardinia is engaged in agriculture, and most of the total area of the island is covered by agricultural and forest land. In general, the agrarian economy has remained unchanged for centuries; a certain amount of cereals is grown, but the chief source of livelihood is livestock. Arable farming is regarded mainly as an adjunct to pastoral, and the land is often only plowed to improve the grazing; tree culture (chiefly vines and olives) is confined to a few limited coastal zones and to the areas lying immediately round the centres of habitation. In 1952 48% of the agricultural and forest land was rough permanent pasture (Italy 14.4%), 27.8% arable (Italy 47.3%) and only 3.5% under tree crops (Italy 8.8%). Even in the naturally fertile Campidano most of the land is divided between permanent grazing and arable alternating with grazing.

More than half the farms are 3 ha. ($7\frac{1}{2}$ ac.) or less, more than a quarter under 1 ha., and they often lie far from the towns and villages in which 92% of the people live. The consequent difficulty of farming tlie land well is aggravated by these small farms, being broken up into numerous tiny strips often lying several miles apart and interspersed with bits of other properties. Large estates are few in number and consist mainly of rough pasture and forest. In 1939 only 4.3% of the agricultural income of Sardinia came from estates with an income of over 80,000 lire. Agriculture is dominated by the pathological splitting up of property, by extreme poverty of mobile capital and by very limited investment in farming. There is practically no mechanized cultivation and primitive methods of shallow plowing are still practised; a wooden plow pulled by an ox can still be seen working alongside an iron plow drawn by a horse.

The higher regions produce cork trees, oaks, pines, acacias and sweet chestnuts, but there are only a few remote places where these trees have survived in any numbers the depredations of 19th century speculators and the attacks of the huge herds of sheep and goats. Some effort was made in the 1930s to increase the forest area, chiefly with holm-oak coppices, but reafforestation is made difficult by drought and wind, and the planting of young trees gave way to the slower process of seeding. The most important non-forest tree is the olive. The climate is suited to olive trees, which grow at altitudes up to 2,300 ft., and even a little higher in sheltered valleys, and produce good quality oil particularly in the northwest.

Crops. — Little more wheat is grown than is needed for home consumption, and it is mostly hard wheat which can stand the long dry summers. The yield is low, 9.8 quintals (1 quintal = approx. 225 lb.) per hectare in 1952 (average 16.8 for Italy, 31.3 for Lombard~), and could be raised not only by the use of selected seed, chemical fertilizers and machinery, but by improving the milling which in some districts is still done with grindstones turned by donkeys. Barley does well, and some is grown for fodder, but its yield is also low. Vines can be grown at altitudes up to 3,000 ft.,

but most vineyards are on the edge of the lowlands. Output is small (616,000 hl. in 1952) partly because most of the wines produced have poor keeping qualities, partly because of the lack of storage cellars.

Livestock.—The principal source of wealth is livestock. sheep and goats; Sardinia has more of both than any other region, and nearly a quarter of all the sheep and goats of Italy. The number of cattle compares reasonably well with the average for Italy, the ratio to the population in 1952 being 16.5% compared with 18.4% for Italy. Cattle are mainly bred for work: the local crossbreeds, Sardo-Modicana and Bruno-Sardo. give poor yields of milk but are good workers. Sheep produce the milk from which large quantities of cheese are made and exported to North America and France as well as to the Italian mainland. Mutton is less important, but Sardinian lamb is in demand on the mainland. The wool is coarse in quality. but makes a strong cloth impervious to wet.

Land Reform —In 1940 the Italian government had plans for land reclamation covering about one-third of the island's total area; work had been carried out on a small scheme involving about 54.000 ha. mostly in the marshy Campidano, which was known as one of the plague spots of Italy. The new agricultural settlements of Mussolinia (now Arborea) and Terralba were established and mixed farming on north Italian lines was carried on by settlers from north Italy on farms of 20 ha. each. By 1948 good results were being obtained. The wheat yield averaged 1 j quintals per hectare compared nith Sardinia's average of 8 or 9 quintals, the breed of cattle had improved and from vines grown on the surrounding hills good wines were being produced and exported. Italian agricultural experts knew, however. that not only would the Italian state have to finance any plan of reform. but skilful persuasio would be needed to overcome the obstinate refusal of Sardinian farmers to accept suggestions from outside, particularly if it involved reduction in the size of their flocks and herds and a change from extensive to intensive farming.

Fisheries.—Tunny fishing is of some importance, but is not carried on by Sardinians, who have no liking for the sea, but by Sicilians.

Industry. — The mining industry of Sardinia is of great antiquity. there are workings dating from the Bronze Age, and mining was carried on later by the Phoenicians, the Romans and by the Pisans in the middle ages. The most important minerals now mined are zinc and lead of which Sardinia supplies about 80% and 93% respectively of Italy's production, but antimony, copper, iron, manganese. molybdenum. nickel, cobalt and tin are also mined in small quantities. The chief lead and zinc mines are in Iglesiente in the southwest and much of the smelting is done in the island. There are two coal fields, one in Sulcis in the southwest, around Carbonia, uhere about 1,000,000 tons of coal of poor quality with a high sulphur content are mined annually. The other field in Seui. near Tortoli on the east side of Sardinia, produces better quality coal. but only about 50,000 tons a year. After Italy lost the Istrian coal fields to Yugoslavia under the 1947 treaty, Sardinia produced most of Italy's coal, but the quality is too poor for it to be much used in industry. The granite of Sardinia is used locally and exported. The salt pans at Cagliari and Carloforte are important.

Communications and Ports. — Sardinia is reasonably well-served by railuays. State railway lines of normal gauge connect Terranova with Cagliari, with Porto Torres and Sassari via Chilivani, and with Iglesias via Decimomannu. Narrow-gauge lines run from Tortoli and Sorgoni to Cagliari. from Nuoro via Macomer to Bosa and via Ozieri to Chilivani, and from Palau to Sassari and Alghero, and there are also private lines connected with the mines. There are four main north-south roads and four east-west.

There are few seaports. but some of them have excellent natural harbours. The three chief commercial ports are Cagliari, Terranova Pausania and Porto Torres. Cagliari's harbour is entirely artificial. and the port oues most of its importance to the proximity of the lead and zinc industry and to the export of salt. Terranova handles the bulk of the mail and passenger traffic with Italy. Porto Torres, which lies at the western end of the north coast on the gulf of Asinara, is the port of export for Sassari, the second town in Sardinia, and for iron ore from the mines in Nurra. At the northeast end of Sardinia a group of islands shelter the naval station of La Maddalena, on the south coast of the island of the same name and connected by a causeway with the island of Caprera, famous as the home of Giuseppe Garibaldi. (M. M. C.)

SARDIS, more correctly SARDES (αἰΣάρδεις), the capital of the ancient kingdom of Lydia. the seat of a *conventus* under the Roman Empire. and the metropolis of the province Lydia in later Roman and Byzantine times. was situated in the middle Hermus valley, at the foot of Mt. Tmolus. a steep and lofty spur of which formed the citadel. It was about 2½ mi. south of the Hermus. The earliest reference to Sardis is in Alcman (Bergk, *Fr.* 24, *c.* 650 B.C.); in the Iliad the name Hydē seems to be given to the city of the Maeonian (*i.e.*, Lydian) chiefs. and in later times, Hydē was said to be the older name of Sardis, or the name of its citadel. It is, however, more probable that Sardis was not the original capital of the Maeonians, but that it became so amid the changes which produced the powerful Lydian empire of the 8th century B.C. The city was captured by the Cimmerians in the 7th century, by the Persians and by the Athenians in the 6th, and by Antiochus the Great at the end of the 3rd century. Once at least, under the emperor Tiberius. in A.D. 17, it was destroyed by an earthquake; but it was always rebuilt, and was one of the great cities of Asia Minor till the later Byzantine period. As one of the Seven Churches of Asia, it was addressed by the author of the Apocalypse in terms which seem to imply that its population was notoriously soft and faint-hearted. Its importance was due, first to its military strength, secondly to its situation on an important highway leading from the interior to the Aegean coast, and thirdly to its commanding the wide and fertile plain of the Hermus.

The early Lydian kingdom was far advanced in the industrial arts (see LYDIA), and Sardis was the chief seat of its manufactures. The most important of these trades was the manufacture and dyeing of delicate woollen stuffs and carpets.

In the Hellenistic and Roman periods Sardis was eclipsed by Pergamum (the Attalid capital), by Ephesus (the capital of the province of Asia) and probably also by Smyrna. After Constantinople became the capital of the east a new road system grew up connecting the provinces with the capital. Sardis then lay rather apart from the great lines of communication and lost some of its importance. It still, however, retained its titular supremacy and continued to be the seat of the metropolitan bishop of the province of Lydia, formed in A.D. 295. It is enumerated as third, after Ephesus and Smyrna, in the list of cities of the Thracesian *thema* given by Constantine Porphyrogenitus in the 10th century; but in the actual history of the next four centuries it plays a part very inferior to Magnesia ad Sipylum and Philadelphia (see ALASEHIR), which have retained their pre-eminence in the district. The Hermus valley began to suffer from the inroads of the Seljuk Turks about the end of the 11th century; but the successes of the Greek general Philocales in 1118 relieved the district for the time, and the ability of the Comneni, together with the gradual decay of the Seljuk power, retained it in the Byzantine dominions. The country round Sardis was frequently ravaged both by Christians and by Turks during the 13th century. Soon after 1301 the Seljuk amirs overran the whole of the Hermus and Cayster valleys, and a fort on the citadel of Sardis

was handed over to them by treaty in 1306. Finally in 1390 Philadelphia, which had for some time been an independent Christian city, surrendered to Sultan Bayezid's mixed army of Ottoman Turks and Byzantine Christians, and the Seljuk power in the Hermus valley was merged in the Ottoman empire. The latest reference to the city of Sardis relates its capture (and probable destruction) by Timur in 1402. Its site is now practically deserted.

The ruins of Sardis, so far as they are now visible, are chiefly of the Roman time; but though few ancient sites offered better hope of results, the necessity for heavy initial expenditure was a deterrent (*e.g.*, to H. Schliemann). On the banks of the Pactolus two columns of a great Ionic temple, now known to be that of Cybele-Artemis were still standing. More than one attempt to excavate this temple, the last by G. Dennis in 1882, was made and prematurely brought to an end by lack of funds. In 1910–1914 and also in 1922, the temple site and part of the necropolis were studied by H. C. Butler and others, of the American Society for the Excavation of Sardis.

See reports in *Am. Journal of Archaeology*, 1911–27, and the volumes of *Sardis*, especially I. and II. (H. C. Butler) on the history of the excavations down to 1914, and VI. pts. 1–2 (E. Littmann-W. H. Buckler) on the Lydian inscriptions; results and bibliography in Pauly-Wissowa R. *Enc.* XIII. 2123 f. (Biirchner-Deeters-J. Keil); for the city's history in early Christian times, W. M. Ramsay, *Letters to the Seven Churches* (1904), V. Schultze, *Altchristliche Stadte* II. 2,145 f. (1926).

SARDOU, VICTORIEN (1831–1908), French dramatist, was born in Paris on Sept. 5, 1831. The Sardous were settled at Le Cannet, a village near Cannes, where they owned an estate, planted with olive trees. A night's frost killed all the trees and the family was ruined. Victorien's father, Antoine Léandre Sardou, came to Paris, and earned his living in a succession of employments. Victorien had to make his way as best he could. A play of his, *La Taverne des étudiants*, produced at the Odeon on April 1, 1854, was withdrawn after five nights. Many disappointments followed; some plays were rejected, others were accepted and not performed.

Sardou was now in actual want, and his misfortunes culminated in an attack of typhoid fever. He was dying in his garret, surrounded with his rejected manuscripts. A lady named Mlle. de Brécourt nursed him back to health, and introduced him to Mlle. Déjazet. Then fortune began to smile on the author. It is true that *Candide*, the first play he wrote for Mlle. Déjazet, was stopped by the censor, but *Les Premières Armes de Figaro*, *Monsieur Garat*, and *Les Prés Saint Gervais*, produced almost in succession, had a splendid run, and *Les Pattes de mouche* (1860: afterwards anglicized as *A Scrap of Paper)* obtained a similar success at the Gymnase. *Fédora* (1882) was written expressly for Sarah Bernhardt, as were many of his later plays. He soon ranked with Augier and Dumas. He ridiculed the vulgar and selfish middle-class person in *Nos Intimes* (1861: anglicized as *Peril)*, the gay old bachelors in *Les Vieux Garçons* (1865), the modem Tartufes in *Séraphine* (1868), the rural element in *Nos Bons Villageois* (1866), old-fashioned customs and antiquated political beliefs in *Les Ganaches* (1862), the revolutionary spirit and those who thrive on it in *Rabagas* (1872) and *Le Roi Carotte* (1872), and the then threatened divorce laws in *Divorçons* (1880).

He struck a new vein by introducing a strong historic element in some of his dramatic romances. Thus he borrowed *Theodora* (1884) from Byzantine annals, *La Haine* (1874) from Italian chronicles, *La Duchesse d' Athènes* from the forgotten records of mediaeval Greece. *Patrze* (1869) is founded on the rising of the Dutch *gueux* at the end of the 16th century. The scene of *La Sorcikre* (1904) was laid in Spain in the 16th century. The French Revolution furnished him with three plays, *Les Merveilleuses, Thermidor* (1891) and *Robespierre* (1902). The last named was written expressly for Sir Henry Irving, and produced at the Lyceum theatre, as was *Dante* (1903). The imperial epoch was revived in *La Tosca* (1887) and *Madame Sans Gêne* (1893). Later plays were *La Piste* (1905) and *Le Drame des poisons* (1907).

Sardou married his benefactress, Mlle. de Brécourt, but eight years later he became a widower, and soon after the revolution of 1870 was married again, to Mlle. Soulié. He was elected to the French Academy in 1878. He died at Paris on Nov. 8, 1908.

SARGASSO SEA, a relatively still tract in the central North Atlantic ocean strewn with floating seaweed of the genus *Sargassum* (originally named *Sargaço* by the Portuguese). This tract, bounded approximately by 20° and 35° N. and 30° and 70° W., is roughly elliptical and lies inside of a clockwise setting current system of which the Gulf stream forms part of the western rim. The precipitation is low, evaporation is high and winds are light. Its waters are remarkably clear, warm and saline. *Sargassum*, or gulfweed, belongs to the brown algae and bears small but prominent berrylike bladders *(see* ALGAE: *Classification of Algae: Phaeophyta)*. The pelagic weed drifts with wind and current but apparently maintains itself vegetatively with possibly minor replenishment by coastal plants drifting in from the southwest. The weed supports specialized animals of a type more characteristic of the littoral zone than the open ocean. some of which are found nowhere else. The Sargasso sea was first reported by Columbus who crossed it on his initial "West Indies" voyage; however, Columbus implies in the journal of his first voyage that he had evidence of earlier voyagers through the area and the seaweeds therein, and it is possible that the Carthaginians reached the Sargasso sea as early as 530 B.C. The widely credited story of ships becoming helplessly embedded in the weed has been disproved. The "Michael Sars" oceanographic expedition in 1910 helped delimit the weed area and provided new evidence that the Sargasso sea was the spawning ground of the common eel.

(C. A. Bs.)

SARGENT, JOHN SINGER (1856–1925), Anglo-U.S. painter, was born of American parents in Florence, Italy, on Jan. 12, 1856. Sargent's portraits enjoyed the highest possible reputation during his lifetime, but fell into great disfavour after his death. His work has since been re-evaluated and restored to a position of high esteem. The scintillating bravura of his technique disarmed his contemporaries; his imitators. who saw only the surface aspect of his painting. were sadly lacking his perception, with the unfortunate result that Sargent too was accepted as nothing more than a flashy technician. He had, however, an extraordinary facility for revealing the inner aspects of his sitters' personalities, far exceeding that of any of his followers.

Sargent's father, Fitzwilliam Sargent, a native of Massachusetts, went for his medical training to Philadelphia where he married Mary Newbold Singer. Two years before Sargent's birth his parents went to Europe, a trip which culminated in their permanent establishment abroad.

Sargent showed his special aptitudes from his earliest childhood. which was spent in Nice, Rome, Dresden and other parts of Europe with periodic returns to Florence. He took drawing lessons of a desultory kind, interrupted by the exigencies of schooling and a life of constant travel. His mother, who loved to sketch in water colours, recognized and encouraged his unusual gifts.

Sargent's awakening to the enchantment of visual expression came to him. he once mentioned. at Miirren, Switz., in the summers of 1868 to 1870. His early drauings were painstaking efforts to show every variation in rock forms, or in the verdure that sprang from their crevices. In 1873 he won a prize for drawing at the Florence Accademia. In 1876 he visited the United States for the first time and established his U.S. citizenship.

Sargent's formal art training was received in the Paris studio of Carolus Duran and at the École des Beaux-Arts. His first exhibited work was a portrait of Miss Frances Watts, a neighbour at Nice, at the 1877 Salon.

Sargent himself later declared, perhaps with characteristic modesty, that he was by no means a brilliant pupil, and that he only acquired his amazing technical skill by continued concentrated effort. What he did recognize, with instant appreciation and lifelong acknowledgment, was the scientific precision of the method taught by Duran, who had based his theories on a close study of

BY COURTESY OF MUSEUM OF FINE ARTS, BOSTON

DETAIL OF THE CHILD FROM "DAUGHTERS OF EDWARD D. BOIT" BY JOHN SINGER SARGENT. IN THE MUSEUM OF FINE ARTS, BOSTON, MASS.

Frans Hals and Velázquez. Sargent made this technique his own, and it gave him, at the start, the assured mastery of his materials.

His second picture, "En route pour la Pêche" (Corcoran gallery, Washington, D.C.), exhibited in the Salon of 1878, won an honourable mention. The following year he exhibited a portrait of Duran, which he had painted in 1877 at the age of 21, which was instantly acclaimed. Shortly after, he made a pilgrimage to Spain, producing in the Prado gallery various studies which, after his death, were sold at phenomenal prices. On returning from Spain he showed the influence of Velázquez. "El Jaleo" (Fenway court, Boston) was a dramatic rendering of a Spanish café scene. More penetrating in its psychological insight was the "Pailleron Children," son and daughter of Édouard Pailleron, the poet and playwright. In Venice in 1880 he had a studio in the Palazzo Rezzonico and painted the tragically beautiful portrait "Mrs. Charles Gifford Dyer" (Art institute, Chicago) and his Chilean friend Señor Subercaseaux in a gondola. Criticized for "its four corners and a void," the "Daughters of Edward Darley Boit," painted in 1882, was a truly remarkable achievement in asymmetrical balance. Henry James, who praised the picture, said the artist had done "nothing more felicitous."

Among his friends in Nice was the English essayist and novelist Violet Paget (Vernon Lee) whose brilliantly conceived portrait (Tate gallery, London) Sargent did in 1881. Another of the Nice group was Ben del Castillo, a Cuban-American, through whom Sargent met Virginie Avegno from Louisiana, who had come to Paris, married Pierre Gautreau and become a celebrated figure in French society. He painted a full-length portrait of her (Metropolitan Museum of Art, New York city) in a black evening gown, daringly décolleté, contrasting with what he called her "lavender or blotting-paper colour" skin. When shown at the 1884 Salon criticism by both the press and the Gautreau family led Sargent to remove the picture to his studio where it remained as "Madame X" until 1915. Sargent decided to try his luck in London, spent the summer in England and bought the studio of James A. Whistler in Chelsea.

In England he painted the Vickers, Robert Louis Stevenson and an enchanting children's group, "Carnation, Lily, Lily, Rose," shown at the Royal Academy, London, in 1887 and bought for the Tate gallery.

In 1887 he again visited the United States, primarily to paint Mrs. Henry Marquand at Newport, R.I., and Mrs. Adrian Iselin in New York. While in Boston he painted an exacting portrait of Mrs. Jack Gardner. At the St. Botolph club. Sargent had his first one-man show in the United States. In 1890 he was commissioned to do the frieze of the prophets for the Boston Public library. Extensions of this commission kept him busy with the library murals until 1919. In Dec. 1890 he went to Egypt to gather information about ancient religion as background material for the Boston murals, and while in Cairo he painted the "Egyptian Girl," his only full-length female nude. In 1889 Sargent was made a chevalier of the Legion of Honour, in 1891 an associate of the National Academy, New York, and in 1894 an associate of the Royal Academy of London. In 1897 he became an officer of the Legion of Honour and a full academician in both New York and London. His portrait of the noted Spanish dancer Carmencita, painted in New York in 1890, was acquired for the Luxembourg museum in Paris.

Sargent numbered among his sitters princes and princesses, musicians, actors. teachers, uriters, statesmen and diplomats. The great group portraits of the duke of Marlborough and his family (1905), the Ladies Acheson (1902), the daughters of the Hon. Percy Wyndham (1900), the Misses Hunter (1902); a noble series of single portraits, notably those of the duke and duchess of Connaught (1908), the duke (1901) and duchess of Portland (1902), Lord Russell of Killowen (1900) and Francis Penrose, Esq. (1898); and the portraits of innumerable beautiful women, the duchess of Sutherland (1904), the countess of Warwick (1904), Lady Agnew (1893), Lady Ian Hamilton (1896) and Mrs. Hammersley (1893), increased his ever-growing prestige. It became a distinction to be painted by him, and hundreds clamoured for the honour. Universities offered him degrees and he won many medals and awards. Unmoved by this acclamation, which included the offer of an English knighthood, he retained the serene simplicity of manner that made him so exceptional and so distinguished a figure.

Sargent was never a popular painter, in the sense of being generally understood. Painting is a language not easily read; its apparent simplicity and directness of appeal are misleading. Pictures as brilliant, uncompromising and authoritative in their presentation of character as Sargent's inevitably awakened much resentment along with admiration. His accomplishments were no less inscrutable for being so frank in expression. They became more tantalizing because they looked so amazingly easy to imitate. Sargent was imitated. but never with distinction. Referred to as a psychologist or a satirist, he was accused of deliberately accentuating the less pleasing qualities in his sitters. "I chronicle," he once said, "I do not judge." Though his outlook on life was essentially indulgent, his sense of humour was irrepressible, and the rectitude of his realism struck at the deep-rooted preference of humans to be seen not as they are but as they should like to be.

Sargent painted what he saw, but he caught. subconsciously perhaps, fugitive betrayals of passing thought: a restless movement, a smile, a glance. This subtle power of definition has been, in all ages, the peculiar gift of great portrait painters. The astonishing variety and scope of his work implies that he was almost indifferent to the form in which he worked. Before the strange, the unexpected, the bizarre, his resource and his freshness were unfailing. No invention was permitted to degenerate into a formula; he never repeated himself.

At the height of his fame, in 1910, he decided to give up the painting of portraits; having grown tired of the tyranny of sitters, he had begun to lose interest in his work. This decision was typical of his artistic integrity. Only in exceptional instances was he afterward induced to paint portraits. He was never wealthy, though he lived on a generous scale, and was always ready to help a student or artist. Deliberately, he avoided the scattering of his energies; an omnivorous reader. a passionate musician. an excellent host and an entertaining guest, he found his leisure all too adequately filled.

During his first summer of freedom, in a holiday spirit. he began to play with water colour, the medium in which he had done his earliest work. The results may be seen in the brilliance, lightness and certainty of touch of the 80 sketches bought by the Brooklyn museum.

In 1916, when the Boston library murals were nearly done, he was commissioned to do the rotunda of the Boston Museum of Fine Arts, and in 1922 he painted two murals for the Widener library at Harvard University. As a man of 60 living in a rapidly changing world, Sargent did not have the vision to accomplish

the two last tasks in a manner adequate to the times. Thus his mural work which had at first widened his reputation now served to weaken it.

A quieter life in London was better suited to Sargent's temperament than the social exactions of Boston. In London he was to know an honour no living painter had ever experienced: a magnificent series of his portraits, bequeathed to the nation by Asher Wertheimer. were hung in the National gallery. It was later placed in a wing in the Tate gallery along with other works by Sargent — the portraits of Lord Ribblesdale (1902), Coventry Patmore (1895), Octavia Hill (1899), the actress Ellen Terry as Lady Macbeth (1899) and others. Sargent is represented in the principal galleries oi the world. but the Metropolitan museum in New York and the Boston Museum of Fine Arts are particularly rich in fine examples.

In surveying Sargent's immense achievement. the most striking characteristic is his extraordinary vitality. The beautiiul suavity of his style. acquired through the discipline of years. never lost its spontaneity. He shirked no labour; he would paint a head 20 times over in order to establish an appearance of fluency and ease. His insight into character m-ent far beyond ordinary perception. either of artists or of laymen; at its best it was as miraculous as his technical skill. He was entirely lacking in sentimentality; he never painted a beauty or charm that was not in direct relation with his subject. This severity was his strength in contradistinction to much art of the period which perpetuated the worship of purely irrelevant sweetness.

Subjects mere drawn from every class oi society. In their variety. boldness and wit, and in the distinction of their presentation, they epitomize his age. The human panorama. in its every maniiestation, he found endlessly diverting. Delineating it as he did with uncompromising directness. his work, in its unflinching yet happy realism, bears the stamp of truth.

A tall commanding presence. nith a close-cut beard at a time when nine men out of ten were clean-shaven he made an instant impression upon those who met him. During the last years of his liie, with his great size, his dark hair and beard turned silver-white, his florid complexion and an air about him of singular freshness and calm, he had a look as of some serene and beneficent Jove.

Sargent never married. He had been a devoted son and brother, and was survived by his two sisters. Emily Sargent and Mrs. Francis Ormond. He died on April 15, 192j. His body was interred at Brookwood cemetery. Surrey. Memorial services were held at Westminster abbey and a memorial tablet was placed in the crypt of St. Paul's cathedral, London.

SARGON, more correctly SARRU-KINU ("the legitimate king"), an Assyrian general who, on the death of Shalmaneser IV. during the siege of Samaria, seized the crown on the 12th of Tebet 722 B.C. He claimed to be the descendant oi the early kings, and accordingly assumed the name. of a famous king of Babylonia who had reigned about 2,000 years before him. His first achievement was the capture of Samaria. 27.200 of its inhabitants being carried into captivity. Meanwhile Babylon had revolted under a Chaldaean prince, Merodach-baladan. who maintained his. power there for 12 years. In 720 B.C. Yahu-bihdi of Hamath led Arpad. Damascus and Palestine into revolt: this was suppressed, and the Philistines and Egyptians were defeated at Raphia (mod. er-Raia). In 719 B.C. Sargon defeated the Minni to the east oi Armenia, and in 717 overthrew the combined iorces of the Hittites and Moschi (Old Testament Meshech). The Hittite city of Carchemish was placed under an Assyrian governor, and its trade passed into Xssyrian hands.

The following year Sargon was attacked by a great confederacy of the northern nations—Ararat. the Moschi, Tibareni, etc.—and in the course oi the campaign he marched into the land of the Medes in the direction of the Caspian. In 715 B.C. the hlinni were defeated, and one of their chieis. Dāyuku or Daiukku (Deioces), transported to Hamath. In 714 B.C. the army of Rusas oi Ararat was annihilated, and a year later five Median chieis, including Arbaku (Arbaces) became tributary. Cilicia and the Tibareni also submitted as well as the city of Malatia, eastern Cappadocia being annexed to the Assyrian empire. A league was formed between Merodach-baladan and the princes of the west, but before the coniederates could move, an Assyrian army was sent against Ashdod, and Edom, Moab and Judah submitted to Sargon, who was free to turn his attention to Babylonia, and Merodach-baladan was driven from Babylon, where Sargon was crowned king. Shortly after this Sargon sent a statue oi himself to Cyprus and annexed the kingdom oi Commagene. He was murdered in 705 B.C., probably in the palace he had built at Dur-Sargina, now Khorsabad, which was excavated by P. E. Botta.

Olmstead, *History of Assyria* (1923), 206–208; Sydney Smith, *Cambridge Ancient History*, vol. iii (1925), 43–60. For Sarpon the Ancient, founder of the Accadian Empire, see S. Langdon, *Cambridge Ancient History*, vol. i (1923), 402–408.

SARK (SERCQ), one of the smaller Channel Islands, lying 7 mi. east of Guernsey, is 3 mi. long and 1½ mi. in extreme breadth. Area 1.9 sq.mi.; pop. (1951) 528. It is divided into Great Sark (the more northerly) and Little Sark, connected by the Coupée, an isthmus more than 100 yd. long but only 6 ft. wide. with precipices going down 300 it. on each side to the sea. The coastal scenery is of considerable beauty. Creux, the harbour of Sark, on the east side, communicates with the interior solely by two tunnels, one dating from 1588, the other from 1868. There is another harbour (opened 1949) at La hfasseline. The island is highest (375 it.) about the centre of Great Sark, where stand the church, a few dwellings and a mill. Groups of houses at La Ville, Valette, Collinette, Dixcart and in Little Sark, suggest much earlier settlements. About the 6th century the Celtic saint, St. Magloire, founded a monastery there. There is little record of permanent settlement until the 16th century, when Elizabeth I granted the island as a manor to Helier de Carteret who, as its first seigneur, repeopled the island. dividing the land among 40 iarmers. De Carteret set up a scheme of government — partly manorial, partly parochial—which still prevails; the lordship of the island is still in the hands of a hereditarv seigneur (or dame in the event of female inheritance). The island is-included in the bailiwick of Guernsey, but has a court of justice of its own. There is also a court of chief pleas. whose members are the holders of the 40 original properties, and whose president is the seneschal. the principal government officer and judge of the island, appointed by the seigneur. Farming, fishing and the tourist trade are the chief occupations.

(B. C. DE G.)

SARMATAE or **SAUROMATAE** (the second form is mostly used by the earlier Greek writers, the other by the later Greeks and the Romans), a people whom Herodotus (iv. 21, 117) puts on the eastern boundary of Scythia (*q.v.*) beyond the Tanais (*Don*). He says expressly that they were not pure Scythians, but, being descended from young Scythian men and Amazons (iv. 110–117), spoke an impure dialect and allowed their women to take part in war and to enjoy much freedom. Hippocrates classes them as Scythian. From this we may infer that they spoke a language cognate with the Scythic. The greater part of the barbarian names occurring in the inscriptions of Olbia, Tanais, and Panticapaeum are supposed to be Sarmatian, and as they have been well explained from the Iranian language now spoken by the Ossetes of the Caucasus, these are supposed to be the representatives of the Sarmatae and can be shown to have a direct connection with the Alani (*q.v.*), one of their tribes. By the 3rd century B.C. the Sarmatae appear to have supplanted the Scyths proper in the plains of south Russia, where they remained dominant until the Gothic and Hunnish invasions. Their chief divisions were the Rhoxolani (*q.v.*), the Iazyges (*q.v.*), with whom the Romans had to deal on the Danube and Theiss, and the Alani. M. I. Rostovtzev has put serious difficulties in the way of the assumption that Sauromatae and Sarmatae were actually the same people; see his *Iranians and* Greeks *in S. Russia* (1922), and *Skifiya i Bospor* (192j).

SARMIENTO, DOMINGO FAUSTINO (1811–1888),

Argentine educator. writer and statesman, the "schoolmaster president." representative of liberal and anticlerical elements receptive to ideas from abroad. was born in the interior province of San Juan on Feb. 15, 1811. Sarmiento liked to compare his career as a self-made man with that of Abraham Lincoln, whom he greatly admired. Throughout his long public career as provincial legislator, cabinet minister and governor, diplomatic representative. president and national senator. Sarmiento's motto mas "to govern is to educate." That motto emphasized the role he believed public education must play in creating a nation of industrious and responsible citizens. In his efforts to build a new Argentina Sarmiento's principal model was the United States, but he used ideas from other countries also, adapting them to his country's needs.

Exiled to Chile for political activities (1840–52), Sarmiento became an important figure in Chilean journalism and politics as a newspaper editor and as an intimate friend and supporter of Manuel Montt (*q.v.*). In 1812, under Montt's sponsorship. Sarmienro became the founding director of the first normal school in South America, the second such school in the western hemisphere. In 1845 the Chilean government sent Sarmiento abroad to study educational methods in Europe and the United States. He returned in early 1848 a fervent admirer of Horace Mann's educational ideas and convinced that the United States was the nation Latin America should emulate. Subsequently. Sarmiento .participated in Gen. J. J. de Grquiza's overthrow of the dictator Juan Manuel de Rosas (*q.v.*) at Caseros on Feb. 3, 1852, and during the next decade enhanced his reputation as a publicist and educator while also playing an active role in Argentine politics.

For three years (1865–68) Sarmiento represented Argentina in Washington. He spent little time there, however, preferring instead to travel extensively through the United States studying everything that might be useful to his country. In 1868 Sarmiento was elected to the presidency, although he did not return to Argentina until after the election was over. Despite a war with Paraguay, Sarmiento's administration (1868–74) laid the foundations for later national progress by fostering public education. immigration, commerce! agriculture and the construction of transportation and communication facilities. After 1874, though he continued to be active in public affairs. education remained his primary interest until his death on Sept. 11, 1888, in Asuncion, Parag.

Many pages of the 52 volumes of Sarmiento's published works are devoted to educational themes. His *Facundo* (1845), a sociological interpretation of Argentine dictatorship. has been translated into several languages as one of the masterpieces of Latin-American literature. The celebration of the 50th anniversary of Sarmiento's death (1938) occurred when reactionary indigenous fascists were launching bitter attacks on Argentine civil liberties and democratic principles. Defenders of those institutions have fostered public interest in Sarmiento's career by publicizing his efforts in support of those institutions and his opposition to dictatorial regimes.

SARNIA, county seat of Lambton county, Ontario. Can., on the St. Clair river and Lake Huron. Sarnia is well served by highways and railroads and has transriver communication with Port Huron, Mich., via the St. Clair railway tunnel, the Bluewater bridge and ferry service. The site was visited by French explorers as early as 1627. The first French settlers arrived in 1807. but Malcolm Cameron was the real founder of an English-speaking settlement in 1833. In 1836 it was named (Port) Sarnia, the Roman name for the island of Guernsey, upon the suggestion of Sir John Colborne, lieutenant governor of Upper Canada and formerly lieutenant governor of Guernsey. Oil was discovered in Lambton county in 1858; by 1899 there was a refinery at Sarnia and the city became a petroleum centre. Sarnia has extensive harbour facilities. oil refineries (crude oil is supplied by pipeline from western Canada), extensive petrochemical industries, a salt industry, a grain elevator and a diversity of small manufacturing industries. Oil products are transmitted to central Ontario by two pipelines. The publicly owned Polymer corporation, built in 1942, pioneered the manufacture of synthetic rubber in Canada. Pop. (1961) 50.976. (G. FN.)

SARNO (anc. *Sarnus*), a town of Campania, Italy, in the province of Salerno. 15 mi. N.E. of that city and 30 mi. E. of Naples by the main railway. Pop. (1957 est.) 29,526 (commune). It lies at the foot of the Apennines, 92 ft. above sea level, near the sources of the Sarno (anc. *Sarnus*), a stream connected by canal with Pompeii and the sea. Teias was defeated here by Narses in A.D. 552. Sarno has the ruins of a medieval castle, which belonged to Count Francesco Coppola, who took an important part in the conspiracy of the barons against Ferdinand of Aragon in 1485. Walter of Brienne is buried in the ancient church of S. Maria della Foce rebuilt in 1701. The travertine which forms round the springs of the Sarno was used even at Pompeii as building material.

SARPEDON, in Greek legend, son of Zeus and Laodameia, Lycian prince and hero of the Trojan war. He fought on the side of the Trojans and was slain by Patroclus. Apollo rescued his body and, by the command of Zeus, handed it over to Sleep and Death, by whom it was conveyed for burial to Lycia, where a sanctuary (Sarpedoneum) was erected in his honour. In later tradition. Sarpedon was the son of Zeus and Europa and the brother of Minos. Having been expelled from Crete by the latter, he and his comrades sailed for Asia, where he finally became king of Lycia.

SARPI, PAOLO (baptized PIETRO) (1552–1623), 'C'enetian state theologian and antipapal pamphleteer, was born in Venice on Aug. 14. 1552. After the premature death of his father. he came into the care of an uncle and a Servite friar. Capella, under whose influence he entered the Servite order in his 15th year. Sarpi's talents were outstanding and his intellectual curiosity unlimited. In the field of physics and even of anatomy he is credited with important discoveries, but his writings on scientific subjects are lost. In 1570, at Mantua, he caused a sensation by a brilliant defense of more than 100 theses, upon which Duke Gonzaga secured his transfer from Venice to Mantua where the friar often exhibited his skill in debate by defending the most daring propositions. In 1579 he became provincial of his order, and in 1588 its procurator general in Rome. Three attempts to get him a bishopric proved unsuccessful, in spite of Venice's backing; his relations with leading Protestants were well known in Rome. Sir Henry Wotton, the English envoy, described him as "a true Protestant in a monk's habit." These disappointments further exacerbated his long-standing antipapal feelings. In the conflict between Venice and Paul V over the signoria's interference with papal jurisdiction and ecclesiastical immunity, Sarpi, since 1606 its official theologian. encouraged resistance. The threatened censures, he urged. must be ignored; they were invalid, for the pope was exceeding his powers. Fear of Venice's breaking with Rome and the risk of civil war in Italy induced the neighbouring states to intervene and a compromise was reached on April 21. 1607, chiefly through France's mediation. On Oct. 5, 1607, Sarpi was the object of a murderous attack; there is no evidence of the crime having been engineered in Rome, and Paul V reprobated it energetically. Though excommunicated in the same year. Sarpi continued to say mass. He died on Jan. 16, 1623, unreconciled, it seems. with the church.

Sarpi's literary remains consist largely of pamphlets written by himself or under his inspiration during the conflict between Venice and Paul V. He is now chiefly remembered for his exceedingly biased *Istoria del concilio tridentino* ("History of the Council of Trent") published in London in 1619, under the pseudonym of Pietro Soave Polano, by Marcantonio de Dominis, archbishop of Spalato, a fugitive from the Inquisition. The book created a sensation: it was the first detailed account of a council which Sarpi described as "a large-scale, highly successful deception maneuver" of the papal curia. But the work is important. for its author seems to have had access to documents that were later lost.

SARRAUT, ALBERT PIERRE (1872–), French politician, prime minister at the time of German remilitarization of the Rhineland (1936). He was born at Bordeaux, on July 28, 1872. Early associated as journalist with the radical *Dépêche de Toulouse*, of which his brother Maurice was to become editor, he was elected deputy in the Aude *département* in 1902 and was junior minister in several governments from 1906 onward. He was governor general of Indochina. 1911–14. After being under-secretary of state for war for a year, he went back to Indochina at the end of 1916 for a second term of three years. He was minister of colonies in four successive governments from Jan. 1920 to March 1924 and was appointed ambassador to Turkey, in March 1925. The next year. however. he was elected senator. He was minister of the interior under Raymond Poincaré, July 1926–Nov. 1928, three times navy minister and three times minister of colonies in six different cabinets between Feb. 1930 and Oct. 1933. Sarraut was prime minister for a short time in 1933 (Oct. 26–Nov. 27). He was minister of the interior in Gaston Doumergue's government formed after the riots of Feb. 6. 1934. In Jan. 1936 he formed a caretaker government till the elections of June. He favoured a vigorous reaction to Germany's military reoccupation of the Rhineland (March 7). but failed to overcome hesitation in the cabinet and parliament. He was again minister in all governments from June 1937 till June 1940. Sarraut withdrew from public life at that date but edited the *Dépêche* after his brother was murdered on Dec. 2, 1943, until his own deportation to Germany on June 6, 1944. In 1950 he was chairman of the conference between France and the Indochina state at Pau and then became president of the assembly of the French union. (D. R. GE.)
